Their common food in this inhospitable region was a little rice boiled with some flesh or fowl procured from Quito; and, intead of fluid water, their pot was filled with ice. They had the same resource with regard to what they drank: and while they were eating, every one was obliged to keep his plate over a chafing-dish of coals, to prevent his provisions from freezing. The same was done with regard to the water. At first they imagined the drinking strong liquors would diffuse a heat through the body, and consequently render it less sensible of the painful sharpness of the cold; but, to their surprise, they felt no manner of strength in such liquors, nor were they any greater preservative against the cold than common water. Andes.

At the same time, they found it impossible to keep the Indians together. On their first feeling of the climate, their thoughts were immediately turned on deserting their masters. The first instance they had of this kind was so unexpected, that had not one, of a better disposition than the rest, staid and acquainted them of their design, it might have proved of very bad consequence. The affair was this: There being on the top of the rock no room for pitching a tent for the Indians, they used every evening to retire to a cave at the foot of the mountain; where, besides a natural diminution of the cold, they could keep a continual fire; and consequently enjoyed more comfortable quarters than their masters. Before they withdrew at night, they fastened on the outside the door of the hut, which was so low that it was impossible to go in or out without stooping; and as every night the hail and snow which had fallen formed a wall against the door, it was the business of one or two of the Indians to come early and remove this obstruction. For though the negro servants were lodged in a little tent, their hands and feet were so covered with chilblains, that they would rather have suffered themselves to have been killed than move. The Indians therefore came constantly up to despatch this work betwixt nine and ten in the morning: but they had not been there above four or five days, when they were not a little alarmed to see ten, eleven, and twelve o'clock come, without any news of their labourers; when they were relieved by the honest servant mentioned above, who had withstood the seduction of his countrymen, and informed his masters of the desertion of the four others. As soon as the snow was cleared away from the door, they despatched the Indian to the corregidor of Quito, who with equal despatch sent other Indians, threatening to chastise them severely if they were wanting in their duty.

But the fear of punishment was not sufficient to induce them to support the rigour of this situation; for within two days they deserted. The corregidor therefore, to prevent any other inconvenience, sent four Indians under the care of an alcade, and gave orders for their being relieved every fourth day.

Twenty-three tedious days our artists spent on this rock, viz. to the sixth of September, and even without any possibility of finishing their observations of the angles: for when it was fair and clear weather with them, the others, on whose summits the signals which formed the triangles for measuring the degrees of the meridian, were hid in the clouds; and when those were clear, Pichincha was involved in clouds. It was therefore necessary to erect their signals in a lower situation, and

Andes. and in a more favourable region. This, however, did not produce any change in their habitation till the beginning of December; when, having finished the observations which particularly concerned Pichincha, they proceeded to others; but with no abatement either of inconveniences, cold, or fatigue; for the places where they made their observations being necessarily on the highest parts of the deserts, the only respite in which they enjoyed some little ease was during the short interval of passing from one to the other.

In all their stations subsequent to that on Pichincha, during their fatiguing mensuration of the degrees of the meridian, each company lodged in a field-tent, which, though small, they found less inconvenient than the hut on Pichincha; though at the same time they had more trouble, being oftener obliged to clear it from the snow, as the weight of it would otherwise have demolished the tent. At first, indeed, they pitched it in the most sheltered places; but on taking a resolution that the tents themselves should serve for signals, to prevent the inconvenience of having others of wood, they removed them to a more exposed situation, where the impetuosity of the winds sometimes tore up the piquets, and blew them down.

Though this mountain is famous for its great height, it is considerably lower than the mountain of Cotopaxi: but it is impossible to conceive the coldness of the summit of the last-mentioned mountain from that felt on this; since it must exceed every idea that can be formed by the human mind, though they are both seated in the midst of the torrid zone. In all this range of mountains, there is said to be a constant inferior boundary, beyond which the snow never melts: this boundary, in the midst of the torrid zone, is said by some to be 2434 fathoms above the level of the sea; by others, only 2400 fathoms. The snow indeed falls much lower, but then it is subject to be melted the very same day. According to Humboldt, there are in the Andes 40 volcanoes or burning mountains, which throw out fire and smoke with a terrible noise. The height of Chimborazo, said to be the highest peak of the Andes, has been determined by geometrical calculations to be 20,282 feet. Humboldt, who visited this region in 1802, found the height of the volcanic cone of Tunguragua to be 16,500 feet; the summit of Pichincha 15,840 feet; that of Antisana 19,150 feet. The dreadful volcano of Cotopaxi is only 260 feet lower than this last. Such is the climate on these mountains, that the region adapted to the growth of all kinds of European grain is between 6000 and 9000 feet above the level of the sea. The limit of perpetual congelation under the equator, has been fixed by Humboldt at 15,700 feet. On the declivity of the Andes, at the height of from 3000 to 5000 feet, there reigns a perpetual spring temperature, which never varies more than seven or nine degrees of Fahrenheit.

The Andes give birth to a vast number of rivers, some of which are very large. Some hurry along with a prodigious rapidity; while others form beautiful cascades, or run through holes in rocks, which look like bridges of a stupendous height. There is a public road through the mountains, 1000 miles in length, part of which runs from Quito to Cusco. See ANDES, SUPPLEMENT.

ANDES, a hamlet of Mantua in Italy, the birthplace of Virgil. Hence the epithet *Andinus* (Silius Italicus). Now called *Pietola*, two miles to the west of Mantua.

Andes || Andrapodocapeli.

ANDETRIUM; ANDRETIUM (Strabo): ANDECRIUM, or ANDRECIUM (Ptolemy): An inland town of Dalmatia. The genuine name is *Andetrium* (Inscription). It is described as situated near Salonæ, on a naturally strong and inaccessible rock, surrounded with deep valleys, with rapid torrents; from which it appears to be the citadel now called *Clissa*. E. Long. 17. 46. N. Lat. 43. 20.

ANDEUSE, a city of Languedoc in France, situated in E. Long. 3. 40. and N. Lat. 43. 45.

ANDOMADUNUM; ANDOMATUNUM (Ptolemy); and ANTEMATUNUM (Antonine); CIVITAS LINGONUM (Tacitus): A city of Gallia Belgica; now *Langres* in Champagne, situated on an eminence (which seems to justify the termination *dunum*), on the borders of Burgundy, at the springs of the Marne. Tacitus calls an inhabitant *Lingon*. E. Long. 5. 22. N. Lat. 48. 0.

ANDOVER, a large market town in Hampshire, which is situated on a branch of the river Test. It has several inns, which afford good accommodation for travellers; and has a market on Saturday, well stocked with provisions. It is governed by a bailiff, a steward, a recorder, ten approved men, and twenty-two capital burgesses, who yearly choose the bailiff. Population 3295 in 1811. The living is a vicarage valued at 171l. 4s. 4d. in the king's books. W. Long. 0. 56. N. Lat. 51. 20.

ANDRACHNE, BASTARD ORPINE. See BOTANY *Index*.

ANDRADA, DIEGO DE PAYVA D', or ANDRADIUS, a learned Portuguese, born at Coimbra, who distinguished himself at the council of Trent, where King Sebastian sent him as one of his divines. There is scarce any Catholic author who has been more quoted by the Protestants than he, because he maintained some opinions a little extravagant concerning the salvation of the Heathens. Andrada was esteemed an excellent preacher. His sermons were published in three parts, the second of which was translated into Spanish by Benedict de Alcoran. Many encomiums have been bestowed upon Andrada. Osorius, in his preface to the "Orthodox Explanations of Andradius," gives him the character of a man of wit, vast application, great knowledge in the languages, with all the zeal and eloquence necessary to a good preacher; and Rosweidus says, that he brought to the council of Trent the understanding of a most profound divine, and the eloquence of a consummate orator.

ANDRAPODISMUS, in ancient writers, the selling of persons for slaves. Hence also *andrapodistes*, a dealer in slaves, more particularly a kidnapper, who steals men or children to sell them; a crime for which the Thessalians were noted.

ANDRAPODOCAPELI, in antiquity, a kind of dealers in slaves. The *Andrapodocapeli* had a particular process for taking off moles and the like disfigurements on the faces of the slaves they kept for sale, by rubbing them with bran. At Athens, several places in the forum were appointed for the sale of slaves. Upon the first day of every month, the merchants called Ανδραποδοκαπηλοι brought them into the market, and exposed

Andrapodocapeli ‖ Andreas.

exposed them to sale; the crier standing upon a stone erected for that purpose, called the people together.

ANDREA, St, a small village on the Malabar coast in the East Indies, founded originally by the Portuguese. It takes its name from a church dedicated to St Andrew, and served by the priests of St Thomas.—On the shore of St Andrea, about half a league out in the sea, lies Mud-bay, a place which few in the world can parallel. It is open to the wide ocean, and has neither island nor bank to break the force of the billows, which come rolling with great violence from all parts, in the south-west monsoons: but on this bank of mud they lose themselves in a moment; and ships lie on it as secure as in the best harbour, without motion or disturbance. It reaches about a mile along shore, and has been observed to shift its place from the northward about three miles in 30 years. From St Andrea to Kranganor, about twelve leagues to the south, the water has the bad property of causing swellings in the legs of those who drink it constantly. Some it affects in one leg, and some in both. It causes no pain, but itching; nor does the swelled leg seem heavier to the owner than the small one, though some have been seen a yard in circumference at the ancle. The Romish legends impute the cause of this distemper (for which no preventive or cure hath been hitherto found) to a curse laid by St Thomas upon his murderers and their posterity; though, according to the Romans themselves, St Thomas was killed by the Tillinga priests at Meliaphur, on the coast of Coromandel, about 400 miles distant, and where the natives have not this distemper.

ANDREAS, John, a celebrated canonist in the 14th century, was born at Mugello, near Florence; and was professor of canon law at Padua, Pisa, and afterwards at Bologna. It is said that he macerated his body with fasting: and lay upon the bare ground every night for 20 years together, covered only with the skin of a bear. This is attested by very good authors; but if the story which Poggius tells of him in his jests be true, he must afterwards have relaxed much of this continency: "Joannem Andream (says he), doctorem Bononiensem, cujus fama admodum vulgata est, subagitantem ancillam domesticam uxor deprehendit: re insueta stupefacta mulier in virum versa, Ubi nunc, ait, Joannes, est sapientia vestra? Ille nil amplius locutus, In vulva istius, respondit, loco admodum sapientiæ accommodato." The French translation of this perhaps will not be displeasing.

Jean, dit André, fameux Docteur des Loix,
Fut pris un jour au péché d'amourette:
Il acolloit une jeune soubrette.
Sa femme vint, fit un signe de croix.
Ho ho, dit elle, est ce vous? non je pense:
Vous, dont par-tout en vante la prudence.
Qu'est devenu cet esprit si subtil?
Le bon André, poursuivant son négoce,
Honteux pourtant, ma foi, repondit-il,
Prudence, esprit, tout gît dans cette fosse.

Since it is agreed that John Andreas had a bastard, this story is at the bottom very probable; and it was perhaps with the mother of Banicontius that his wife found him. Andreas had a beautiful daughter, named *Novella*, whom he loved extremely: and he is said to have instructed her so well in all parts of learning, that when he was engaged in any affair which hindered him from reading lectures to his scholars, he sent his daughter in his room; and lest her beauty should prevent the attention of the hearers, she had a little curtain drawn before her. To perpetuate the memory of this daughter, he entitled his commentary upon the Decretals of Gregory IX. the *Novellæ*. He married her to John Calderinus, a learned canonist. The first work of Andreas was his Gloss upon the Sixth Book of the Decretals, which he wrote when he was very young. He wrote also Glosses upon the Clementines; and a Commentary *in regula Sexti*, which he entitled *Mercuriales*, because he either engaged in it on Wednesdays (*dicbus Mercurii*), or because he inserted his Wednesdays disputes in it. He enlarged the Speculum of Durant, in the year 1347. This is all which Mr Bayle mentions of his writings, though he wrote many more. Andreas died of the plague at Bologna in 1348, after he had been a professor 45 years; and was buried in the church of the Dominicans. Many eulogiums have been bestowed upon him. He has been called *Archidoctor decretorum*: In his epitaph, *Rabbi doctorum: lux, censor, normaque morum;* "Rabbi of the doctors, the light, censor, and rule of manners:" And it is said, that Pope Boniface called him *lumen mundi*, "the light of the world."

Andreas.

ANDREAS, *John*, was born a Mahometan, at Xativa in the kingdom of Valencia, and succeeded his father in the dignity of alfaqui of that city. He was enlightened with the knowledge of the Christian religion by being present at a sermon in the great church of Valencia on the day of Assumption of the Blessed Virgin, in the year 1487. Upon this he desired to be baptized; and, in memory of the calling of St John and St Andrew, he received the name John Andreas. "Having received holy orders (says he), and from an alfaqui and a slave of Lucifer, become a priest and minister of Christ; I began, like St Paul, to preach and publish the contrary of what I had erroneously believed and asserted; and, with the assistance of Almighty God, I converted at first a great many souls of the Moors, who were in danger of hell, and under the dominion of Lucifer, and conducted them into the way of salvation. After this, I was sent for by the most catholic princes King Ferdinand and Queen Isabella, in order to preach in Grenada to the Moors of that kingdom, which their majesties had conquered: by God's blessing on my preaching, an infinite number of Moors were brought to abjure Mahomet, and to turn to Christ. A little after this, I was made a canon by their grace; and sent for again by the most Christian Queen Isabella to Arragon, that I might be employed in the conversion of the Moors of those kingdoms, who still persisted in their errors, to the great contempt and dishonour of our crucified Saviour, and the prodigious loss and danger of all Christian princes. But this excellent and pious design of her majesty was rendered ineffectual by her death." At the desire of Martin Garcia, bishop of Barcelona, he undertook to translate from the Arabic, into the language of Arragon, the whole law of the Moors; and after having finished this undertaking, he composed his famous work of *The Confusion of the Sect of Mahumed;* it contains twelve chapters,

Andreini || Andrew.

chapters, wherein he has collected the fabulous stories, impostures, forgeries, brutalities, follies, obscenities, absurdities, impossibilities, lies, and contradictions, which Mahomet, in order to deceive the simple people, has dispersed in the writings of that sect, and especially in the Alcoran, which, as he says, was revealed to him in one night by an angel, in the city of Meke; though in another place he contradicts himself, and affirms that he was 20 years in composing it. Andreas tells us, he wrote this work, that not only the learned amongst Christians, but even the common people, might know the different belief and doctrine of the Moors; and on the one hand might laugh and ridicule such insolent and brutal notions, and on the other might lament their blindness and dangerous condition. This book, which was published at first in Spanish, has been translated into several languages; all those who write against the Mahometans quote it very much.

ANDREINI, Isabella, a native of Padua, was an excellent poetess, and one of the best comedians in Italy, towards the beginning of the 17th century. The Intenti of Pavia thought they did their society an honour by admitting her a member of it; and she, in acknowledgement of this honour, never forgot to mention amongst her titles that of *Academica Infanta;* her titles were these, "Isabella Andreini, comica, gelosa, academica infanta, detta l'accessa." She was also a woman of extraordinary beauty: which, added to a fine voice, made her charm both the eyes and ears of the audience. She died of a miscarriage, at Lyons, the 10th of June 1604, in the 42d year of her age. Her death being a matter of general concern and lamentation, there were many Latin and Italian elegies printed to her memory: several of these pieces were placed before her poems in the edition of Milan, in 1605. Besides her sonnets, madrigals, songs, and eclogues, there is a pastoral of hers entitled Myrtilla, and letters, printed at Venice in 1610. She sung extremely well, played admirably on several instruments, understood the French and Spanish languages, and was not unacquainted with philosophy.

ANDRELINUS, Publius Faustus, born at Forli in Italy. He was long time professor of poetry and philosophy in the university of Paris. Louis XII. of France made him his poet laureat; and Erasmus tells us he was likewise poet to the queen. His pen was not wholly employed in making verses; for he wrote also moral and proverbial letters in prose, which were printed several times. His poems which are chiefly in Latin, are inserted in vol. i. of the *Deliciæ Poetarum Italorum*. M. de la Monnoie tells us, "that Andrelinus, when he was about 22 years old, received the crown of laurel: That his love verses, divided into four Books, entitled *Livia*, from the name of his mistress, were esteemed so fine by the Roman Academy, that they adjudged the prize of the Latin elegy to the author." He died in 1518. This author's manner of life was not very exemplary; yet he was so fortunate, says Erasmus, that though he took the liberty of rallying the divines, he was never brought into trouble about it.

ANDREW, St, the apostle, born at Bethsaida in Galilee, brother to Simon Peter. He had been a disciple of John the Baptist, and followed Jesus upon the testimony given of him by the Baptist (John i. 30, 37, &c.). He followed our Saviour with another of John's disciples, and went into the house where Jesus lodged; here he continued from about four o'clock in the afternoon till it was night. This was the first disciple whom our Saviour received into his train. Andrew introduced his brother Simon, and they passed a day with Christ, after which they went to the marriage in Cana (*id.* ii.), and at last returned to their ordinary occupation. Some months after, Jesus meeting them while they were both fishing together, called them to him, and promised to make them fishers of men. Immediately they left their nets, followed him (Mat. iv. 19.), and never afterwards separated from him.

Andrew || Andrew's.

After our Saviour's ascension, his apostles having determined by lot what parts of the world they should severally take, Scythia and the neighbouring countries fell to St Andrew, who according to Eusebius, after he had planted the gospel in several places, came to Patræ in Achaia, where, endeavouring to convert the proconsul Ægeas, he was by that governor's orders scourged, and then crucified. The particular time of his suffering martyrdom is not known; but all the ancient and modern martyrologies, both of the Greeks and Latins, agree in celebrating his festival upon the 30th of November. His body was embalmed, and decently interred at Patræ by Maximilla, a lady of great quality and estate. Afterwards it was removed to Constantinople by Constantine the Great, and buried in the great church, which he had built to the honour of the apostles. There is a cross to be seen at this day in the church of St Victor at Marseilles, which is believed by the Romanists to be the same that St Andrew was fastened to. It is in the shape of the letter X, and is enclosed in a silver shrine. Peter Chrysologus says, that he was crucified upon a tree; and the spurious Hippolytus assures us it was an olive tree.

Andrew, or *Knights of St Andrew*, an order of knights, more usually called the order of the Thistle. See Thistle.

Knights of St Andrew, is also an order instituted by Peter the Great of Muscovy in 1698; the badge of which is a golden medal; on one side whereof is represented St Andrew's cross, with these words, *Cazar Pierre monarque de tout le Russie*. This medal, being fastened to a blue ribbon, is suspended from the right shoulder.

St Andrew's Cross, one in form of the letter X. See Cross.

St Andrew's Day, a festival of the Christian church, celebrated on the 30th of November, in honour of the apostle St Andrew.

ANDREW'S, St, a town of Fifeshire in Scotland, once the metropolis of the Pictish kingdom, lying in W. Long. 2. 25. N. Lat. 56. 18. If we may credit legend, St Andrew's owes its origin to a singular accident. St Regulus (or *Rule*, as he is likewise called), a Greek of Achaia, was warned by a vision to leave his native country, and visit Albion, an isle placed in the remotest part of the world; and to take with him the arm-bone, three fingers, and three toes, of St Andrew. He obeyed, and set sail with his companions, but had a very tempestuous passage. After being tossed for some time on a stormy sea, he was at last shipwrecked on the coast of Otholania, in the territories of Hergustus king of the Picts, in the year 370. On hear-

Andrew's. ing of the arrival of the strangers, with their precious relics, the king immediately gave orders for their reception, afterwards presenting the saint with his own palace, and building near it the church, which still bears the name of *St Regulus*.

At this time the place was styled *Mucross*, or the *land of boars:* all round was forest, and the lands bestowed on the saint were called *Byrehid*. The boars equalled in size the ancient Erymanthian; as a proof of which, two tusks, each sixteen inches long and four thick, were chained to the altar of St Andrew's. St Regulus changed the name to *Kilrymont;* and established here the first Christian priests of the country, called *Culdees*. The church was supreme in the kingdom of the Picts; Ungus having granted to God and St Andrew, that it should be the head and mother of all the churches in his dominion. He also directed that the cross of St Andrew should become the badge of the country. In 518, after the conquest of the Picts, he removed the episcopal see to St Andrew's, and the bishop was styled *maximus Scotorum episcopus*. In 1441, it was erected into an archbishopric by Sextus IV. at the intercession of James III. In 1616, the priory was suppressed; and, in 1617, the power of election was transferred to eight bishops, the principal of St Leonard's college, the archdeacon, the vicars of St Andrew's, Leuchars, and Cupar. This see contained the greatest part of the shire of Fife, with a part of Perth, Forfar, and Kincardine shires, and a great number of parishes, churches, and chapels in other dioceses.

The town of St Andrew's was erected into a royal borough by David I. in the year 1140, and its privileges afterwards confirmed. The charter of Malcolm II. is preserved in the tolbooth; and appears written on a bit of parchment, but the contents equally valid with what would at this time require whole skins. Here also are kept the silver keys of the city; which, for form's sake, are delivered to the king, if he should visit the place, or to a victorious enemy, in token of submission. In this place, likewise, is to be seen the monstrous axe which, in 1646, took off the heads of Sir Robert Spotswood and other distinguished loyalists. The town underwent a siege in 1337; at which time it was possessed by the English and other partizans of Baliol; but the loyalists, under the earls of March and Fife, made themselves masters of it in three weeks, by the help of their battering machines.

St Andrew's is now greatly reduced in the number of its inhabitants. In 1811 they were about 3300. It is impossible to ascertain the sum when it was the seat of the primate; all that can be known is, that during the period of its splendour, there were between sixty and seventy bakers; but now nine or ten are sufficient for the place. It is a mile in circuit, and contains three principal streets. On entering the west port, a well built street, straight, and of a vast length and breadth, appears; but so grass-grown, and presenting such a dreary solitude, that it forms the perfect idea of having been laid waste by the pestilence.

The cathedral of St Andrew's was founded by Bishop Arnold in 1161, but did not attain its full magnificence till 1318. Its length from east to west was 370 feet; that of the transept, 322. But though this vast pile was 157 years in building, John Knox, in June 1559, effected its demolition in a single day; and so effectually has it been destroyed, that nothing now remains but part of the east and west ends, and of the south side. Andrew's.

Near the east end is the chapel of St Regulus; the tower of which is a lofty equilateral triangle, of 20 feet each side, and 103 feet high; the body of the chapel remains, but the two side chapels are ruined. The arches of the windows and doors are round, and some even more than semicircles; an undoubted proof of their antiquity.

The priory was founded by Alexander I. in 1122; and the monks (canons regular of St Augustine) were brought from Scone in 1140, by Robert bishop of this see. By an act of Parliament, in the time of James I. the prior had precedence of all abbots and priors, and on the days of festival wore a mitre and all episcopal ornaments. Dependent on this priory were those of Lochleven, Portmoak, Monimusk, the isle of May, and Pittenweem, each originally a seat of the Culdees. The revenues of the house were vast, viz. in money 2237l. 2s. 10½d.; 38 chalders 1 boll 3 firlots of wheat; 132 ch. 7 bolls of bear; 114 ch. 3 bolls 1 peck of meal; 151 ch. 10 bolls 1 firlot 1 peck and a half of oats; 3 ch. 7 bolls of pease and beans: 480 acres of land also belonged to it. Nothing remains of the priory except the walls of the precinct, which show its vast extent. In one part is a most artless gateway, formed only of seven stones. This enclosure begins near the cathedral, and extends to the shore.

The other religious houses were, one of Dominicans founded in 1274, by Bishop Wishart; another of Observantines, founded by Bishop Kennedy, and finished by his successor Patrick Graham in 1478; and, according to some, the Carmelites had a fourth.

Immediately above the harbour stood the collegiate church of Kirk-heugh, originally founded by Constantine III. who, retiring from the world, became here a Culdee. From its having been first built on a rock, it was styled, *Præpositura Sanctæ Mariæ de rupe*.

On the east side of the city are the poor remains of the castle, on a rock overlooking the sea. This fortress was founded in 1481, by Bishop Trail, who was buried near the high altar of the cathedral, with this singular epitaph:

Hic fuit ecclesiæ directa columna, fenestra
Lucida, thuribulum redolens, campana sonora.

The castle was the residence of Cardinal Beaton; who, after the death of George Wishart, apprehending some danger, caused it to be fortified so strongly as to be at that time deemed impregnable. In this fortress, however, he was surprised and assassinated by Norman Lesly with 15 others. They seized on the gate of the castle early in the morning of May 29. 1546; it having been left open for the workmen who were finishing the fortifications: and having placed sentinels at the door of the cardinal's apartment, they awakened his numerous domestics one by one; and, turning them out of the castle, they, without violence, tumult, or offering an injury to any other person, inflicted on Beaton the death he justly merited. The conspirators were immediately besieged in this castle by the regent, earl of Arran; and notwithstanding they had acquired no greater strength than 150 men, they resisted all his efforts for five months. This, however, was owing to the

Andrew's. the unskilfulness of the besiegers more than to the strength of the place or the valour of the besieged; for in 1547 the castle was reduced and demolished. The entrance of it is still to be seen; and the window is shown, out of which it is said the cardinal leaned to glut his eyes with the cruel martyrdom of George Wishart, who was burnt on a spot beneath.

In the church of St Salvator is a most beautiful tomb of Bishop Kennedy, who died, an honour to his family, in 1466. The Gothic work is uncommonly elegant. Within the tomb were discovered six magnificent maces, which had been concealed here in troublesome times. One was given to each of the other three Scotch universities, and three are preserved here. In the top is represented our Saviour; around are angels, with the instruments of the passion.

With these are shown some silver arrows, with large silver plates affixed to them, on which are inscribed the arms and names of the noble youth, victors in the annual competitions in the generous art of archery, which were dropt but a few years ago; and golf is now the reigning game. That sport, and foot-ball, were formerly prohibited, as useless and unprofitable to the public; and at all *weapon schawings*, or reviews of the people, it was ordered, that *fute-ball and golfe be utterly cryed down, and that bowe-markes be made at ilk parish kirk, a pair of butts and schutting be used; and that ilk man schutte sex shottes at least, under the paine to be raiped upon them that cummes not, at least twa pennyes to be given to them that cummis to the bow-markes to drink.*

The celebrated university of this city was founded in 1411, by Bishop Wardlaw. It consisted once of three colleges. 1. St Salvator's, founded in 1458, by Bishop Kennedy. This is a handsome building, with a court or quadrangle within: on one side is the church, on another the library; the third contains apartments for students: the fourth is unfinished. 2. St Leonard's college was founded by Prior Hepburn, in 1522. This is now united with the last, and the buildings sold, and converted into private houses. 3. The new, or St Mary's college, was established by Archbishop Hamilton in 1552; but the house was built by James and David Bethune, or Beaton, who did not live to complete it. This is said to have been the site of a *schola illustris* long before the establishment even of the university, where several eminent clergymen taught, gratis, the sciences and languages. But it was called the *new college*, because of its late erection into a divinity college by the archbishop.

The university is governed by a chancellor, an office originally designed to be perpetually vested in the archbishop of St Andrews; but since the Reformation, he is elected by the two principals, and the professors of both the colleges.

The rector is the next great officer; to whose care are committed the privileges, discipline, and statutes of the university. The colleges have their rectors, and professors of different sciences, who are indefatigable in their attention to the instruction of the students, and to that essential article their morals. The place possesses several very great advantages respecting the education of youth. The air is pure and salubrious; the place for exercise, dry and extensive; the exercises themselves are healthy and innocent. The university is fixed in a peninsulated country; remote from all commerce with the world, the haunt of dissipation. From the smallness of the society, every student's character is perfectly known. No little irregularity can be committed, but it is instantly discovered and checked: vice cannot attain a head in this place, for the incorrigible are never permitted to remain the corrupters of the rest. Andrew's, Andrews.

The trade of St Andrew's was once very considerable. So late as the reign of Charles I. this place had thirty or forty trading vessels, and carried on a considerable herring and white fishery, by means of busses, in deep water; which fisheries had for ages been the grand source of their commerce, wealth, and splendour. After the death of the king, this whole coast, and St Andrew's in particular, became a scene of murder, plunder, and rapine: every town suffered in proportion to its magnitude and opulence. Nor were those hypocritical ruffians satisfied with the shipping, merchandise, plate, cattle, and whatever came within their sight; they also laid the whole coast under contribution. St Andrew's was required to pay 1000l.; but the inhabitants not being able to raise that sum after being thus plundered, the general compounded for 500l. which was raised by a loan at interest, and hath remained a burden upon the corporation, it is believed, ever since.

The harbour is artificial, guarded by piers, with a narrow entrance, to give shelter to vessels from the violence of a very heavy sea, by the encroachments of which it has suffered much. The manufactures this city might in former times possess, are now reduced to one, that of golf balls; which, trifling as it may seem, maintains a great number of people. It is, however, commonly fatal to the artists; for the balls are made by stuffing a great quantity of feathers into a leathern case, by help of an iron rod, with a wooden handle, pressed against the breast, which seldom fails to bring on a consumption.

ANDREWS, *Lancelot*, bishop of Winchester, was born at London in 1555, and educated at Cambridge. After several preferments, he was made bishop, first of Chichester, then of Ely, and, in 1610, was raised to the see of Winchester. This very learned prelate, who was distinguished by his piety, charity, and integrity, may be justly ranked with the best preachers and completest scholars of his age; he appeared to much greater advantage in the pulpit than he does now in his works, which abound with Latin quotations and trivial witticisms. His sermons, though full of puns, were suited to the taste of the times in which he lived, and were consequently greatly admired. He was a man of polite manners and lively conversation; and could quote Greek and Latin authors, or even pun, with King James. There is a pleasant story related of him in the life of Waller the poet. When that gentleman was young, he had the curiosity to go to court, and stood in the circle to see King James dine; where, among other company, there sat at table two bishops, Neale and Andrews. The king proposed aloud this question, Whether he might not take his subjects money when he needed it, without all this formality of parliament? Neale replied, "God forbid you should not; for you are the breath of our nostrils." Whereupon the king turned, and said to the bishop of Winchester, "Well, my lord, what

Andrews || Androgeus.

say you?" "Sir (replied the bishop), I have no skill to judge of parliamentary cases." The king answered, "No put-offs, my lord; answer me presently." "Then, Sir (said he), I think it lawful for you to take my brother Neale's money, for he offers it." Mr Waller says, the company was pleased with this answer, but the wit of it seemed to affect the king; for a certain lord coming soon after, his majesty cried out, "O, my lord, they say you lig with my lady." "No, Sir (says his lordship, in confusion), but I like her company because she has so much wit." "Why then (says the king) do not you lig with my lord of Winchester there?" This great prelate was in no less reputation and esteem with King Charles I. than he had been with his predecessors. He died at Winchester house in Southwark, September 27. 1626, in the 71st year of his age; and was buried in the parish church of St Saviour's, where his executors erected to him a very fair monument of marble and alabaster, on which is an elegant inscription, in Latin, written by one of his chaplains. Milton also, at 17 years of age, wrote a beautiful elegy on his death, in the same language. Bishop Andrews had, 1. A share in the translation of the Pentateuch, and the historical books from Joshua to the first book of Chronicles exclusively. He also wrote, 2. *Tortura Torti*, in answer to a work of Cardinal Bellarmine, in which that cardinal assumes the name of *Matthew Tortus*. 3. A Manual of Private Devotions; and, 4. A Manual of Directions for the Visitation of the Sick; besides the Sermons and Tracts, in English and Latin, published after his death.

ANDREWS, *James Pettit*, a late English writer. See SUPPLEMENT.

ANDRIA, in Grecian antiquity, public entertainments first instituted by Minos of Crete, and, after his example, appointed by Lycurgus at Sparta, at which a whole city or a tribe assisted. They were managed with the utmost frugality; and persons of all ages were admitted.

ANDRIA, a city and a bishop's see in the territory of Bari, in the kingdom of Naples. It is pretty large, well peopled, and seated in a spacious plain, four miles from the Adriatic coast. E. Long. 17. 4. N. Lat. 41. 15.

ANDRISCUS, a man of mean extraction, who, pretended to be the son of Perseus last king of Macedonia, took upon him the name of *Philip*, for which reason he was called *Pseudo-Philippus*, the *False Philip*. After a complete victory over Juventus, the Roman prætor sent against him, he assumed kingly power, but exercised it with vast cruelty. At last, the Romans obliged him to fly into Thrace, where he was betrayed and delivered into the hands of Metellus. This victory gained Macedonia once more into the power of the Romans, and to Metellus the name of *Macedonicus*, but cost the Romans 25,000 men. Andriscus adorned the triumph of Metellus, walking in chains before the general's chariot.

ANDROAS, or ANDRODAMAS, among ancient naturalists, a kind of pyritæ, to which they attributed certain magical virtues.

ANDROGEUS, in fabulous history, the son of Minos king of Crete, was murdered by the Athenian youth and those of Megara, who envied his being always victor at the Attic games. But Minos having taken Athens and Megara, obliged the inhabitants to send him an annual tribute of seven young men and as many virgins, to be devoured by the Minotaur; but Theseus delivered them from that tribute.

Androgynes.

ANDROGYNES, in *Natural History*, a name given to those living creatures which, by a monstrous formation of their generative parts, seem (for it is only seeming) to unite in themselves the two sexes, that of the male and of the female. This *lusus naturæ*, this defect, or perhaps redundancy, in the animal structure, is described by medical authors in the following manner: "There is a depravation in the structure of the parts intended by nature for propagation, when, besides those concealed parts that are found necessary for the discharge of prolific functions, the *pudenda* of the other sex likewise appear. This monstrous production of nature is diversified in four different ways; of which three appear in males and one in females. In men, the female pudendum, clothed with hair, sometimes appears contiguous to the perinæum; at other times, in the middle of the scrotum; at other times, which constitutes the third diversity, through that part itself which in the midst of the scrotum exhibits the form of a pudendum, urine is emitted. Near that part which is the test of puberty, and above the pudendum, even in females, the masculine genitals appear in some, conspicuous in all their three forms, one resembling the *veretrum* or yard, the other like the two testicles: but for the most part it happens, that, of the two instruments of generation, one is feeble and inert; and it is extremely rare that both are found sufficiently valid and proper for feats of love: nay, even in a great many, both these members are deficient and impotent, so that they can perform the office neither of a male nor of a female."

With respect to them, it appears, from a collation of all the circumstances which have been observed by naturalists worthy of credit, that there is no such thing as a perfect *androgyne*, or real hermaphrodite; that is to say, a living creature, which, by its unnatural, or rather preternatural structure, possesses the genuine powers of both sexes, in such a manner as to be qualified for performing the functions of either with success: the irregularity of their fabrication almost always consists in something superfluous added to one of the two sexes, which gives it the appearance of the other, without bestowing the real and characteristical distinction; and every *hermaphrodite* is almost always a very woman. Since this monstrous exhibition of nature is not such as to abrogate the rights or destroy the character of humanity amongst human beings, this involuntary misfortune implies no right to deprive those upon whom it is inflicted by nature of the privileges natural to every citizen; and as this deficiency is no more infectious than any other corporeal mutilation, it is not easy to see why marriage should be prohibited to one of these unhappy beings, merely on account of its equivocal appearance, which acts in the character of its prevailing sex. If such a creature, by the defect of its construction, should be barren, this does not infer any right of dissolving the marriage which it may have contracted, more than the same sterility proceeding from any cause whether known or unknown, if his or her consort should not on that account require a divorce.

It

Androgynes. It is only the licentious abuse either of one or the other sex which can be subjected to the animadversion of the police. See HERMAPHRODITE.

Such are the sentiments of the authors of the French Encyclopédie. After all, we cannot forbear to add that from such heterogeneous matches nature seems to recoil with innate and inextinguishable horror. Nor are any of these invincible aversions implanted in our frame without a final cause worthy of its Author. We would gladly ask these free-thinking gentlemen, In cases where the sexes are so unnaturally confounded, how the police can, by its most severe and rigorous animadversions, either detect or prevent those licentious abuses against which they remonstrate? Since, therefore, an evil so baneful to human society could no otherwise be prevented than by the sanction of Nature against such horrible conjunctions, the instinctive antipathy which they inspire was highly worthy of her wisdom and purity.

ANDROGYNES, in ancient mythology, creatures of whom, according to the fable, each individual possessed the powers and characters of both sexes, having two heads, four arms, and two feet. The word itself is compounded of two Greek radical words; ανηρ, in genitive ανδρος, a *male*; and γυνη, a *female*. Many of the rabbinical writers pretend, that Adam was created double, one body being male, the other female, which in their origin not being essentially joined, God afterwards did nothing but separate them.

The gods, says Plato in his *Banquet*, had formed the structure of man round, with two bodies and two sexes. This fantastic being, possessing in itself the whole human system, was endowed with a gigantic force, which rendered it insolent, insomuch that it resolved to make war against the gods. Jupiter, exasperated, was going to destroy it; but, sorry at the same time to annihilate the human race, he satisfied himself with debilitating this double being, by disjoining the male from the female, and leaving each half to subsist with its own powers alone. He assigned to Apollo the task of repolishing these two half bodies, and of extending their skins so that the whole surface might be covered. Apollo obeyed, and fastened it at the *umbilicus*: If this half should still rebel, it was once more to be subdivided by another section, which would only leave it one of the parts of which it was then constituted; and even this fourth of a man was to be annihilated, if it should persist in its obstinacy and mischief. The idea of these *androgynes* might well be borrowed from a passage in Moses, where that historian of the birth and infancy of nature, describes Adam as calling Eve *bone of his bone* and *flesh of his flesh*. However this may be, the fable of Plato has been used with great ingenuity by a French poet, who has been rendered almost as conspicuous by his misfortunes as by his verses. With the ancient philosopher, he attributes the propensity which attracts one of the sexes towards the other, to the natural ardour which each half of the *androgynes* feels for re-union; and their inconstancy, to the difficulty which each of the separated parts encounters in its efforts to recover its proper and original half. If a woman appears to us amiable, we instantly imagine her to be that moiety with whom we should only have constituted one whole, had it not been for the insolence of our original double-sexed progenitor: Androgynous, Androides.

> The heart, with fond credulity impress'd,
> Tells us the half is found, and hopes for rest;
> But 'tis our curse, that sad experience shows,
> We neither find our half, nor gain repose.

ANDROGYNOUS, in *Zoology*, an appellation given to animals which have both the male and female sex in the same individual.—In *Botany*, the term is applied to such plants as bear both male and female flowers on the same root.

ANDROIDES, in *Mechanics*, a human figure, which, by certain springs or other movements, is capable of performing some of the natural motions of a living man. The motions of the human body are more complicated, and consequently more difficult to be imitated, than those of any other creature; whence the construction of an *androides*, in such a manner as to imitate any of these actions with tolerable exactness, is justly supposed to indicate a greater skill in mechanics than any other piece of workmanship whatever.

A very remarkable figure of this kind appeared in Paris, in the year 1738. It represented a flute-player, and was capable of performing many different pieces of music on the German flute; which, considering the difficulty of blowing that instrument, the different contractions of the lips necessary to produce the distinctions between the high and low notes, and the complicated motions of the fingers, must appear truly wonderful.

This machine was the invention of M. Vaucanson, member of the Royal Academy of Sciences; and a particular description of it was published in the Memoirs of the Academy for that year.

The figure itself was about five feet and a half in height, situated at the end of an artificial rock, and placed upon a square pedestal four feet and a half high and three and a half broad. The air entered the body by three pipes separated one from the other. It was conveyed to them by nine pair of bellows, three of which were placed above and six below. These were made to expand and contract regularly in succession by means of an axis of steel turned round by some clock-work. On this axis were different protuberances at proper distances, to which were fixed cords thrown over pulleys, and terminating in the upper boards of the bellows, so that, as the axis turned, these boards were alternately raised and let down. A contrivance was also used to prevent the disagreeable hissing fluttering noise usually attending the motion of bellows. This was by making the cord, by which the bellows was moved, press, in its descent, upon one end of a smaller lever, the other end of which ascending forced open the small leathern valve that admitted the air, and kept it so, till, the cord being relaxed by the descent of the upper board, the lever fell, and the air was forced out. Thus the bellows performed their functions constantly without the least hissing, or other noise, by which it could be judged in what manner the air was conveyed to the machine. The upper boards of three of the pairs of bellows were pressed down by a weight of four pounds, that of three others by a weight of two pounds, and

Androides. and those of the three remaining ones by nothing but their own weight.

The three tubes, by which the air entered, terminated in three small reservoirs in the trunk of the figure. There they united, and, ascending towards the throat, formed the cavity of the mouth, which terminated in two small lips adapted in some measure to perform their proper functions. Within this cavity also was a small moveable tongue; which, by its play, at proper periods, admitted the air, or intercepted its passage to the flute.

The fingers, lips, and tongue, received their proper directions by means of a steel cylinder turned by clockwork. It was divided into 15 equal parts, which by means of pegs pressing upon the ends of 15 different levers, caused the other extremities to ascend. Seven of these levers directed the fingers, having wires and chains affixed to their ascending extremities, which being attached to the fingers, caused them ascend in proportion as the other extremity was pressed down by the motion of the cylinder, and *vice versa*. Thus the ascent or descent of one end of a lever produced a similar ascent or descent in the corresponding finger, by which one of the holes of the flute was occasionally opened or stopped, as by a living performer. Three of the levers served to regulate the ingress of the air, being contrived so as to open and shut, by means of valves, the three reservoirs of air above mentioned, so that more or less strength might be given, and a higher or lower note produced as occasion required. The lips were, by a similar mechanism, directed by four levers, one of which opened them, to give the air a freer passage; the other contracted them; the third drew them backward; and the fourth pushed them forward. The lips were projected upon that part of the flute which receives the air; and, by the different motions already mentioned, modified the tone in a proper manner.—The remaining lever was employed in the direction of the tongue, which it easily moved so as to shut or open the mouth of the flute.

Thus we see how all the motions necessary for a German flute player could be performed by this machine; but a considerable difficulty still remains, namely, how to regulate these motions properly, and make each of them follow in just succession. This, however, was effected by the following simple method. The extremity of the axis of the cylinder was terminated on the right side by an endless screw, consisting of twelve threads, each placed at the distance of a line and a half from the other. Above this screw was fixed a piece of copper, and in it a steel pivot, which, falling in between the threads of the screw, obliged the cylinder to follow the threads, and, instead of turning directly round, it was continually pushed to one side. Hence, if a lever was moved, by a peg placed on the cylinder, in any one revolution, it could not be moved by the same peg in the succeeding revolution, because the peg would be moved a line and a half beyond it by the lateral motion of the cylinder. Thus, by an artificial disposition of those pegs in different parts of the cylinder, the statue was made, by the successive elevation of the proper levers, to exhibit all the different motions of a flute-player, to the admiration of every one who saw it.

The construction of machines capable of imitating even the mechanical actions of the human body, show exquisite skill; but what shall we say of one capable, not only of imitating actions of this kind, but of acting as external circumstances require, as though it were endued with life and reason? This, nevertheless, has been done. M. de Kempelen, a gentleman of Presburg in Hungary, excited by the performances of M. de Vaucanson, at first endeavoured to imitate them, and at last far excelled them. This gentleman constructed an androides capable of playing at chess!—Every one who is in the least acquainted with this game must know, that it is so far from being mechanically performed, as to require a greater exertion of the judgment and rational faculties than is sufficient to accomplish many matters of greater importance. An attempt, therefore, to make a wooden chess-player, must appear as ridiculous as to make a wooden preacher or counsellor of state. That this machine really was made, however, the public have had ocular demonstration. The inventor came over to Britain in 1783, where he remained above a year with his automaton. Androides.

It is a figure as large as life, in a Turkish dress, sitting behind a table, with doors of three feet and a half in length, two in depth, and two and a half in height. The chair on which it sits is fixed to the table, which runs on four wheels. The automaton leans its right arm on the table, and in its left hand holds a pipe: with this hand it plays after the pipe is removed. A chess board of 18 inches is fixed before it. This table or rather cupboard, contains wheels, levers, cylinders, and other pieces of mechanism; all which are publicly displayed. The vestments of the automaton are then lifted over its head, and the body is seen full of similar wheels and levers. There is a little door in its thigh, which is likewise opened; and with this, and the table also open, and the automaton uncovered, the whole is wheeled about the room. The doors are then shut, and the automaton is ready to play; and it always takes the first move.

At every motion the wheels are heard; the image moves its head, and looks over every part of the chess board. When it checks the queen, it shakes its head twice, and thrice in giving check to the king. It likewise shakes its head when a false move is made, replaces the piece, and makes its own move; by which means the adversary loses one.

M. de Kempelen remarks as the most surprising circumstance attending his automaton, that it had been exhibited at Presburg, Vienna, Paris, and London, to thousands, many of whom were mathematicians and chess-players, and yet the secret by which he governed the motion of its arm was never discovered. He prided himself solely in the construction of the mechanical powers, by which the arm could perform ten or twelve moves. It then required to be wound up like a watch, after which it was capable of continuing the same number of motions.

The automaton could not play unless M. de Kempelen or his substitute was near it to direct its moves. A small square box, during the game, was frequently consulted by the exhibiter; and herein consisted the secret, which he said he could in a moment communicate. He who could beat M. de Kempelen was, of course, certain of conquering the automaton. It was made in 1769. His own account of it was:

" C'est

Androides ‖ Androna.

" C'est une bagatelle qui n'est pas sans merite du côté du mechanisme: mais les effets n'en paroissent si merveilleux que par la hardiesse de l'idée, et par l'heureux choix des moyens employés pour faire illusion."

The strongest and best armed loadstone was allowed to be placed on the machine by any of the spectators.

As the inventor of this admirable piece of mechanism hath not yet thought proper to communicate to the public the means by which it is actuated, it is in vain for any, except those who are exquisitely skilled in mechanics, to form conjectures concerning them.—Many other curious imitations of the human body, as well as that of other animals, have been exhibited, though none of them equal to the last mentioned one. See the article AUTOMATON.

ANDROLEPSY, in Grecian antiquity, an action allowed by the Athenians against such as protected persons guilty of murder. The relations of the deceased were empowered to seize three men in the city or house whither the malefactor had fled, till he were either surrendered, or satisfaction made some way or other for the murder.

ANDROMACHE, the wife of the valiant Hector, the mother of Astyanax, and daughter of Eëtion king of Thebes in Cilicia. After the death of Hector and the destruction of Troy, she married Pyrrhus; and afterwards Helenus the son of Priam, with whom she reigned over part of Epirus.

ANDROMEDA, in *Astronomy*, a northern constellation, behind Pegasus, Cassiopeia, and Perseus. It represents the figure of a woman chained; and is fabled to have been formed in memory of Andromeda, daughter of Cepheus and Cassiopeia, and wife of Perseus, by whom she had been delivered from a sea monster, to which she had been exposed to be devoured for her mother's pride. Minerva translated her into the heavens.

The stars in the constellation Andromeda, in Ptolemy's catalogue are 23, in Tycho's 22, in Bayer's 27, in Mr Flamsted's no less than 84.

ANDROMEDA, the name of a celebrated tragedy of Euripides, admired by the ancients above all the other compositions of that poet, but now lost.

It was the representation of this play, in a hot summer day, that occasioned that epidemic fever, or phrensy, for which the Abderites are often mentioned, wherein they walked about the streets, rehearsing verses, and acting parts of this piece. See ABDERA.

ANDROMEDA, or *March Cystus*. See BOTANY *Index*.

ANDRON, in Grecian antiquity, denotes the apartment in houses designed for the use of men; in which sense it stands opposed to *Gynæceum*.—The Greeks also gave their dining-rooms the title of *andron*, because the women had no admittance to feasts with the men.

ANDRONA, in ancient writers, denotes a street, or public place, where people met and conversed together. In some writers, *androna* is more expressly used for the space between two houses; in which sense, the Greeks also use the term ανδρωνας, for the way or passage between two apartments.

ANDRONA is also used, in ecclesiastical writers, for that part in churches destined for the men. Anciently it was the custom for the men and women to have separate apartments in places of worship, where they performed their devotions asunder; which method is still religiously observed in the Greek church. The ανδρων, or *androna*, was in the southern side of the church, and the women's apartment on the northern.

Androna, Andronicus.

ANDRONICUS I. COMNENUS, emperor of the East, was the son of Isaac, and grandson of Alexius Comnenus. Naturally endowed with a vigorous habit of body, and a firm mind, active, temperate, martial, and eloquent, he shines as one of the most conspicuous characters of his age. Following the bent of his inclination, he attended the Roman army in their retreat; but in their march through Asia Minor, wandering into the mountains, he fell into the hands of some Turkish huntsmen, was carried to the sultan, and remained his prisoner. But regaining his liberty, both his virtues and vices soon recommended him to the favour of his cousin Manuel, the reigning emperor. The vicious heart of Andronicus manifested itself clearly in maintaining a licentious correspondence with Eudocia the emperor's niece, while the emperor himself lived in public incest with her sister Theodora. His martial spirit gained him a considerable command in Cilicia, where he laid siege to Mopsuestia: but by a successful sally of the enemy, he was obliged to raise the siege, and retire in considerable disorder. Inflamed with a desire of revenging the infamy of their sister in his blood, the brothers of Eudocia made an unsuccessful attempt to assassinate Andronicus at midnight in his tent; but being providentially awakened, he defended himself with surprising bravery, forced his way through his enemies, and escaped in safety. Afterwards engaging in a treasonable correspondence, with the emperor of Germany and the king of Hungary, he was arrested, and thrown into confinement. He remained in this state about twelve years, and after several repeated attempts to escape, he at last effectuated his purpose, and fled for refuge to the court of the great duke of Russia. The cunning of Andronicus soon found means to regain his favour with the emperor Manuel; for having exerted all his influence, he succeeded in obtaining the Russian prince, to engage to join his troops with those of Manuel, in the invasion of Hungary. Accordingly, on account of his important service, he obtained a free pardon from the emperor, and after an expedition to the Danube, returned with him to Constantinople. He again fell under the displeasure of the emperor, by refusing to take an oath of allegiance to the prince of Hungary, his intended son-in-law, and consequently presumptive heir to the crown, and was thereupon returned to his former command in Cilicia. While residing here, his powerful address captivated the heart of Philippa, daughter of the Latin prince of Antioch, and sister to the empress Maria; and in her company, he spent his time in all the amusements that country could afford, till the emperor's resentment put a stop to their correspondence. Thus circumstanced, he collected a band of adventurers, and undertook a pilgrimage to the holy land, where by his insinuating turn of mind, he so far succeeded in gaining the favour of the king and clergy, as to be invested with the lordship of Berytus on the coast of Phœnicia. In this neighbourhood, Theodora the beautiful widow of Baldwin, king of Jerusalem, and nearly allied in blood to him, resided. The personal accomplishments and address of Andronicus captivated her heart, and she became

Andronicus.

came the third victim to his artful seduction, and lived publicly as his concubine. Still pursued by the emperor with unabating resentment, he was forced to take refuge in Damascus, and then in several other places in the east, till at length he settled in Asia Minor. While residing here, he made frequent incursions into the province of Trebizond, and seldom returned without success. After several occurrences, Theodora was made captive, by the governor of Trebizond, along with her two children, and sent to Constantinople: upon which Andronicus implored and obtained pardon. He acted the affected penitent in such a manner, that he again ingratiated himself into the favours both of the church and state: but was sent to dwell at Oenoë, a town situated on the Euxine coast.

In the year 1177 Manuel died, and was succeeded by his son Alexius II. a youth about twelve or fourteen years of age, without wisdom or experience, by which the ambition of Andronicus was again called into action. A civil war having been occasioned, by the misconduct of the empress in Constantinople, the public mind was directed towards Andronicus, as the only person whose rank and accomplishments could restore the public tranquillity. Incited by the patriarchs and patricians, he marched towards Constantinople, which he entered, took possession of the palace, confined the empress, consigned her minister to death, assumed the office of protector, put to death many persons of distinction, tried and executed the queen, on a charge of corresponding with the king of Hungary, and vowed fidelity to the young emperor upon his coronation, at the same time teaching the necessity of an experienced ruler, to assuage the evils that threatened the empire; upon which his adherents called out "Long live Alexius and Andronicus, Roman emperors." While he affected reluctance, he was elevated to a partnership in the empire. This conjunction of the royal power was soon dissolved, by the murder of the unfortunate Alexius. The body of the deceased being brought into his presence, striking it with his foot, he said, "Thy father was a knave, thy mother a whore, and thyself a fool." Having arrived at the dignity of sole emperor, A. D. 1183, he continued to sway the sceptre, with a mixture of justice and bounty towards his subjects at large, but those whom he feared or hated he governed with the most cruel tyranny. The noble families that were either cut off, or exiled by him, were all allied to the Comneni. Some of these were engaged in revolt; and the public calamity was heightened, by an invasion of the Sicilians, in which they took and sacked Thessalonica. A rival without merit, and a people without arms, at last overturned his throne. A descendant from the first Alexius, in the female line, named Isaac Angelus, being singled out by Andronicus, as a victim to his cruelty, he with courage and resolution defended his life and liberty, slew his executioner, fled to the church of St Sophia, and there took refuge with several of his friends. Isaac was instantly raised by the populace, from a sanctuary to a throne. When this event took place, Andronicus was absent from Constantinople; but he no sooner heard of it, than he with the utmost speed returned. Upon his arrival there, he found himself deserted by all, and was seized, and dragged in chains before the new emperor. All the eloquence he displayed was of no avail; for Isaac delivered him into the hands of those whom he had injured, and for the space of three days, he endured with uncommon patience, all the insults and torments that were inflicted upon him. In the midst of these he would frequently cry out, "Lord have mercy upon me," and, "why will you bruise a broken reed." At last, two friendly or furious Italians, plunging their swords into his body, put a period to his life. His death, in the 73d year of his age, terminated the dynasty of the Comneni. (*Gen. Biog.*).

Andronicus & Andros.

Andronicus of Cyrrhus, an Athenian astronomer, built at Athens an octagon tower, with figures carved on each side, representing the eight principal winds. A brass Triton at the summit, with a rod in its hand, turned round by the wind, pointed to the quarter from whence it blew. From this model is derived the custom of placing weathercocks on steeples.

ANDROPHAGI, in *Ancient Geography*, the name of a nation whose country, according to Herodotus, was adjacent to Scythia. Their name, compounded of two Greek words, signifies *man-eaters*. Herodotus does not inform us whether their manner of subsisting corresponded with their name: whether they were so savage as to eat human flesh. See the article ANTHROPOPHAGI. They are represented, however, as the most barbarous and fierce of all nations. They were not governed by laws; the care of their cattle was their chief employment. Their dress was like that of the Scythians; and they had a language peculiar to themselves.

ANDROPOGON, or MAN'S-BEARD. See BOTANY *Index*.

ANDROS, one of the ancient Cyclades, lying between Tenedos and Eubœa: being one mile distant from the former, and ten from the latter. The ancients gave it various names, viz. Cauros, Lasia, Nonagria, Epagris, Antandros, and Hydrusia. The name of *Andros* it received from one Andreus, appointed, according to Diodorus Siculus, by Rhadamanthus, one of the generals, to govern the Cyclades, after they had of their own accord submitted to him. As to the name of *Antandros*, the same author tells us, that Ascanius the son of Æneas, being taken prisoner by the Pelasgians, gave them this island for his ransom, which on that account was called *Antandros*, or "delivered for one man." The name of *Hydrusia* it obtained in common with other places well supplied with water. It had formerly a city of great note, bearing the same name, and situated very advantageously on the brow of a hill, which commanded the whole coast. In this city, according to Strabo and Pliny, stood a famous temple dedicated to Bacchus. Near this temple, Mutianus, as quoted by Pliny, tells us, there was a spring called the *gift of Jupiter*; the water of which had the taste of wine in the month of January, during the feast of Bacchus, which lasted seven days. The same author adds, that the waters, if carried to a place whence the the temple could not be seen, lost their miraculous taste. Pausanias makes no mention of this spring; but says, that, during the feast of Bacchus, wine flowed, or was at least by the Andrians believed to flow, from the temple of that god. The priests, no doubt, found their account in keeping up this belief, by conveying, through secret conduits, a great quantity of wine into the temple.

The Andrians were the first of all the islanders who joined

Andros. joined the Persians at the time Xerxes invaded Greece; and therefore Themistocles, after the victory at Salamis, resolved to attack the city of Andros, and oblige the inhabitants to pay large contributions for the maintenance of his fleet. Having landed his men on the island, he sent heralds to the magistrates, acquainting them, that the Athenians were coming against them with two powerful divinities, *persuasion* and *force;* and therefore they must part with their money by fair means or foul. The Andrians replied, That they likewise had two mighty deities who were very fond of their island, viz. *poverty* and *impossibility;* and therefore could give no money. Themistocles, not satisfied with this answer, laid siege to the town; which he probably made himself master of and destroyed, as we are informed by Plutarch, that Pericles, a few years after, sent thither a colony of 250 Athenians. It was, however, soon retaken by the Persians; and, on the overthrow of that empire by Alexander the Great, submitted to him, along with the other islands. On his death it sided with Antigonus, who was driven out by Ptolemy. The successors of the last mentioned prince held it till the time of the Romans; when Attalus, king of Pergamus, besieged the metropolis at the head of a Roman army; and, having taken it, was by them put in possession of the whole island. Upon the death of Attalus the republic claimed this island, as well as his other dominions, in virtue of his last will.

Andros is now subject to the Turks; and contains a town of the same name, with a great many villages. It is the most fruitful island in all the Archipelago, and yields a great quantity of silk. There are said to be about 12,000 inhabitants, besides those of the villages Arni and Amoldeos, who are about two hundred, have a different language and customs, and are called *Albanois*. There are seven monasteries, a great number of churches, and a cathedral for the bishops of the Roman Catholic persuasion; but most of the inhabitants are of the Greek communion. The Jesuits had a house and a church in this island; but they were forced to quit them long ago. Here are some delightful valleys; but the air is bad, and the water of the city worse. The women would be agreeable enough, if it was not for their dress, which is very unbecoming; for they stuff out their clothes without the least regard to their shape: but the Albanese women make a much better appearance. The peasants make wicker-baskets, wherewith they supply the greatest part of the Archipelago. They have all sorts of game in the woods and mountains, but know not how to take them for want of guns. Their principal food is goats flesh; for there is no fish to be met with on their coasts. When they are sick, they are obliged to let the disease take its natural course, having neither physician nor surgeon on the island. A cadi, assisted by a few of the principal persons of the island, has the management of civil affairs, and his residence is in the castle: an aga, who presides over the military force, lives in a tower without the city. About two miles from the present town are still to be seen the ruins of a strong wall, with the fragments of many columns, chapiters, bases, broken statues, and several inscriptions, some of which mention the senate and people of Andros, and the priests of Bacchus; from which it is probable that this was the site of the ancient city. E. Long. 25. 30. N. Lat. 37. 50. Andros || Anec.

ANDROS, in *Ancient Geography*, an island in the Irish sea (Pliny), called *Hedros* by Ptolemy. Now *Bardsey*, distant about a mile from the coast of North Wales.

ANDROSACE. See BOTANY *Index*.

ANDRUM, a kind of hydrocele, to which the people of Malabar are very subject.—Its origin is derived from the bad quality of the country waters, impregnated with certain salts, the source of most other diseases that affect the Malabrians. Its signs, or symptoms, are an erysipelas of the scrotum, returning every new moon, by which the lymphatics, being eroded, pour a serous saline humour into its cavity. The andrum is incurable; those once seized with it have it for life; but it is not dangerous nor very troublesome to those used to it; though sometimes it degenerates into an hydrosarcocele. The method of prevention is by a heap of sand fetched from a river of the province Mangatti, and strewed in the wells. This is practised by the rich. As to the cure, they have only a palliative one; which is by incision, or tapping, and drawing off the water from the scrotum, once in a month or two.

ANDRYALA, DOWNY SOW-THISTLE. See BOTANY *Index*.

ANDUXAR, a city in the province of Andalusia, in Spain, situated on the Guadalquiver. It is defended by a good castle, and contains about 14,000 inhabitants. It is adorned with handsome churches and several religious houses, and inhabited by many families of high rank. The land about it abounds in corn, wine, oil, honey, and fruit of all sorts; and the inhabitants carry on a considerable trade in silk. W. Long. 4. 2. N. Lat. 37. 45.

ANDUZE, a town of France, in the department of the Gard, seated on the river Gardon. It carries on a considerable trade in serges and woollen cloth. E. Long. 3. 42. N. Lat. 43. 39.

ANECDOTE, (*Anecdota*), a term used by some authors for the titles of *Secret Histories:* but it more properly denotes a relation of detached and interesting particulars. The word is Greek, ανεκδοτα, q. d. *things not yet known* or *hitherto kept secret*. Procopius gives this title to a book which he published against Justinian and his wife Theodora; and he seems to be the only person among the ancients who has represented princes such as they are in their domestic relation.—Varillas has published Anecdotes of the House of Medicis.

ANECDOTES is also an appellation given to such works of the ancients as have not yet been published. In which sense, M. Muratori gives the name *Anecdota Græca* to several writings of the Greek fathers, found in the libraries, and first published by him.—F. Martene has given a *Thesaurus Anecdotarum Novus*, in folio, 5 vols.

ANEE, in commerce, a measure for grain, used in some provinces of France. At Lyons it signifies also a certain quantity of wine, which is the load an ass can carry at once: which is fixed at 80 English quarts, wine measure.

Anemometer ‖ Anemoscope.

ANEMOMETER, in *Mechanics*, implies a machine for measuring the force and velocity of the wind.

Various machines of this kind have been invented at different times, and by different persons. The following has been often experienced, and found to answer the intention.

* Plate XXXIII. fig. 2.

An open frame of wood, ABCDEFGHI *, is supported by the shaft or arbor I. In the two cross-pieces HK, LM, is moved a horizontal axis QM, by means of the four sails *ah*, *cm*, O*f*, *gh*, exposed to the wind in a proper manner. Upon this axis is fixed a cone of wood, MNO; upon which, as the sails move round, a weight R, or S, is raised by a string round its superficies, proceeding from the smaller to the larger end NO. Upon this larger end or base of the cone, is fixed a rocket-wheel *k*, in whose teeth the click X falls, to prevent any retrograde motion from the depending weight.

The structure of this machine sufficiently shows that it may be accommodated to estimate the variable force of the wind; because the force of the weight will continually increase as the string advances on the conical surface, by acting at a greater distance from the axis of motion; consequently, if such a weight be added on the smaller part M, as will just keep the machine in equilibrio in the weakest wind, the weight to be raised, as the wind becomes stronger, will be increased in proportion, and the diameter of the cone NO may be so large in comparison to that of the smaller end at M, that the strongest wind shall but just raise the weight at the greater end.

If, for example, the diameter of the axis be to that of the base of the cone NO as 1 to 28; then, if S be a weight of one pound at M on the axis, it will be equivalent to 28 pounds when raised to the greater end: if therefore, when the wind is weakest, it supports one pound on the axis, it must be 28 times as strong as to raise the weight to the base of the cone. If therefore a line or scale of 28 equal parts be drawn on the side of the cone, the strength of the wind will be indicated by that number on which the string rests.

ANEMONE, Wind-flower. See Botany *Index*.

Sea-Anemone. See *Animal-Flower*.

ANEMOSCOPE, a machine that shows either the course or velocity of the wind. (See also the article *Wind-Gauge*).

The machine which shows the course of the wind, or from what point of the compass it blows, consists of an index moving upon an upright circular plate, like the dial of a clock, on which the 32 points of the compass are drawn instead of the hours. The index, which points to the divisions on the dial, is turned by a horizontal axis, having a trundle-head at its external extremity. This trundle-head is moved by a cog-wheel on a perpendicular axis; on the top of which a vane is fixed, that moves with the course of the wind, and puts the whole machine in motion. The whole contrivance is extremely simple; and nothing required in the construction, but that the number of cogs in the wheel, and rounds in the trundle-head, be equal; because it is necessary, that, when the vane moves entirely round, the index of the dial also make a complete revolution.—An anemoscope of this kind is placed in one of the turrets of the queen's palace. The anemoscope, calculated for indicating the force or velocity of the wind is the same with what most writers call an *anemometer;* and we have accordingly described one of those machines under that article. We shall here add another, contrived by the late Mr Pickering, and published in the Philosophical Transactions, N° 473. This anemoscope is a machine four feet and a quarter high, consisting of a broad and weighty pedestal, a pillar fastened into it, and an iron axis of about half an inch diameter fastened into the pillar. Upon this axis turns a wooden tube; at the top of which is placed a vane, of the same materials, 21 inches long, consisting of a quadrant, graduated, and shod with an iron rim, notched to each degree; and a counterpoise of wood, as in the figure, on the other. Through the centre of the quadrant runs an iron pin, upon which are fastened two small round pieces of wood, which serve as moveable radii to describe the degrees upon the quadrant, and as handles to a velum or sail, whose pane is one foot square, made of canvas, stretched upon four battens, and painted. On the upper batten, next to the shod rim of the quadrant, is a small spring which catches at every notch corresponding to each degree, as the wind shall, by pressing against the sail, raise it up; and prevents the falling back of the sail, upon lessening of the force of the wind. At the bottom of the wooden tube, is an iron index, which moves round a circular piece of wood fastened to the top of the pillar on the pedestal, on which are described the 32 points of the compass. The figure of this machine is given on Plate XXXIII. fig. 3. where *a* is the pedestal; *b*, the pillar on which the iron axis is fitted; *c*, the circle or wood, on which are described the 32 points of the compass; *e*, the wooden tube upon its axis; *f*, the velum; *g*, the graduated quadrant; *h*, the counterpoise of the vane. The adjoining figure represents the velum, which takes off: *a* is the plane of the velum; *b*, the spring; *cc*, the wooden radii; *dd*, the holes through which the pin in the centre of the quadrant goes. Its uses are the following.

Anemoscope.

1. Having a circular motion round the iron axis, and being furnished with a vane at top, and index at the bottom, when once you have fixed the artificial cardinal points, described on the round piece of wood on the pillar, to the same quarters of the heavens, it gives a faithful account of that quarter from which the wind blows. 2. By having a velum or sail elevated by the wind along the arch of the quadrant to a height proportionable to the power of the column of wind pressing against it, the relative force of the wind, and its comparative power, at any two times of examination, may be accurately taken. 3. By having a spring fitted to the notches of the iron with which the quadrant is shod, the velum is prevented from returning back upon the fall of the wind; and the machine gives the force to the highest blast, since the last time of examination, without the trouble of watching it.

The ingenious contriver of this machine tells us, that he carefully examined what dependence may be had upon it, during the storms of February 1743-4, and found that it answered exceedingly well; for that, in such winds as the sailors call *violent storms*, the machine had six degrees to spare for a more violent gust, before it comes to a horizontal position. It is cer-

tainly

Anemoscope || Angel.

tainly to be depended upon in ordinary weather, the velum being hung so tenderly as to feel the most gentle breeze. There is however reason to fear, that the exposing the anemoscope to all winds for a continuance, must disorder it, especially irregular blasts and squalls. It may not therefore be amiss, in violent weather, for the observer to take the tube with its vane and velum in his hand, in order to know the force of the wind; and when he has finished his observations, to carry the machine into the house, till the violence of the storm is abated, when it may be placed in its former situation.

ANETHUM, Dill and Fennel. See Botany *Index*.

ANEURISM, in *Surgery*, a throbbing tumor, distended with blood, and formed by a dilatation or rupture of an artery. See Surgery *Index*.

ANGARI, or Angarii, in antiquity, denote public couriers, appointed for the carrying of messages. The ancient Persians, Budæus observes, had their αγγαρειον δρομημα; which was a set of couriers on horseback, posted at certain stages or distances, always in readiness to receive the dispatches from one, and forward them to another, with wonderful celerity, answering to what the moderns call *posts*, q. d. *positi*, as being posted at certain places or stages. The angari were also called by the Persians *astandæ*; by the Greeks ἡμεροδρομοι, on account of the long journeys they made in one day, which, according to Suidas, amounted not to less than 1500 stadia.

ANGARIA, in Roman antiquity, a kind of public service imposed on the provincials, which consisted in providing horses and carriages for the conveyance of military stores and other public burdens. It is sometimes also used for a guard of soldiers, posted for the defence of a place. In a more general sense it is used for any kind of oppression, or services performed through compulsion.

ANGAZYA, one of the Comora islands, lying between the north end of Madagascar and the coast of Zanguebar in Africa, from Lat. 10° to 15° S. It is inhabited by Moors, who trade with divers parts of the continent, in cattle, fruits, and other commodities of the island; which they exchange for callicoes and other cotton cloths. The houses here are built of stone, and lime made of calcined oyster shells; with which the walls and roof are plastered in a very elegant manner. The government of Angazya is a pure aristocracy; the island being subject to ten lords, who have all the title of *Sultan*. The people are very careful of their women; never permitting strangers to see them, without permission from a sultan, or an order which the stranger brings with him. Many of them read and write Arabic with great facility: and some even understand Portuguese, which they learn from their intercourse with Mosambique, whither they trade in vessels of 40 tons burden.

ANGEIOTOMY, in *Surgery*, implies the opening a vein or artery, as in bleeding; and consequently includes both arteriotomy and phlebotomy.

ANGEL, a spiritual intelligent substance, the first in rank and dignity among created beings. The word *angel* is Greek, and signifies a *messenger*: the Hebrew מלאך signifies the same thing. The angels are in Daniel (chap. iv. ver. 13, &c.) called עירים, or *watchers*, from their vigilance: for the same reason they are, in the remains we have of the prophecy attributed to Enoch, named *Egregori*; which word imports the same in Greek. Angel.

Angels, therefore, in the proper signification of the word, do not import the nature of any being, but only the office to which they are appointed, especially by way of message or intercourse between God and his creatures; in which sense they are called the *ministers of God*, who do his pleasure, and *ministering spirits* sent forth to minister for them who shall be heirs of salvation. That there are such beings as we call *angels*, that is, certain permanent substances, invisible and imperceptible to our senses, endued with understanding and power superior to that of human nature, created by God, and subject to him as the Supreme Being; ministring to his divine providence in the government of the world by his appointment, and more especially attending the affairs of mankind; is a truth so fully attested by Scripture, that it cannot be doubted. Nay, the existence of such invisible beings was generally acknowledged by the ancient heathens, though under different appellations: the Greeks called them *demons*; and the Romans *genii*, or *lares*. Epicurus seems to have been the only one among the old philosophers who absolutely rejected them. Indeed, the belief of middle intelligences influencing the affairs of the world, and serving as ministers or interpreters between God and man, is as extensive as the belief of a God; having never, so far as we know, been called in question by those who had any religion at all.

The creation of angels is not indeed expressly mentioned by Moses in the first of Genesis, yet it is generally considered by judicious expositors as implied. The reason why the sacred historian is silent on this subject, is supposed by Berrington to be the natural proneness of the Gentile world, and even of the Jews, to idolatry*. And it is thought, if they worshipped mere material elements, which was the case, much more might they be inclined to worship such superior and sublime beings as angels. But a better reason is perhaps given by other writers, viz. that this first history was purposely and principally for information concerning the visible world; the invisible, of which we know but in part, being reserved for a better life†. When created.

* *On the Creation*, p. 81. See also *Severianus on the Creation*.

† *Assembly's Annot. on Gen.* i. 30.

On what day they were created has been matter of conjecture. It is a point on which learned men have differed. The Socinians, indeed, hold, says Bishop Hopkins‡, that it was long before the account given by Moses: but it must have been within the six days creation; because, as we are informed, that within this space God made heaven and earth, and all things that are therein. All the writers that we have seen on this subject, think they were included in the first day's work, when the heavens were framed.

‡ *Works*, p. 505.

It has been thought by some persons, that the words of Job, "When the morning stars sang together, and all the sons of God shouted for joy," militate against the creation of angels within the six days. About the meaning of these words, however, expositors are not agreed; but admitting that they refer literally to angels, Dr Lightfoot, Caryl, and others, see no difficulty in the passage. The Doctor thinks they were created on the first day with the heavens; and that they were spectators of God's works in the other parts of the creation,

Angel.

and praised and magnified the Lord for his works all along; singing and shouting when God laid the foundation of the temple, Ezra iii.

On a subject of this nature it would be imprudent to *indulge* a spirit of conjecture; Scripture is the only standard by which truth and error can be tried, and to this we must ultimately appeal. It is acknowledged that Moses has not expressly mentioned angels by name; yet, as we have remarked, their creation is undoubtedly implied; for the heavens must include all that are in them; and therefore it is that the divine penman says, in the conclusion of his narrative, "Thus the heavens and the earth were finished, and *all* the host of them." Of the *host* of heaven, the angels must form a considerable part; they are expressly called the *heavenly host*, and the *armies of heaven*, Dan. iv. 35. Luke ii. 13. And if divine authority be admitted as decisive, the reasons adduced by Jehovah for the sanctification of a sabbath, demonstrate that they did not exist previous to the creation of the heavens. It is, surely, asserted with propriety, that in *six days* the Lord made heaven and earth, the sea, and ALL that *in them is*. Similar to which is a declaration of the divine historian relating to the same fact.—"And God blessed the seventh day, and sanctified it; *because* that in it he had rested from ALL his work which God created and made," Gen. ii. 3. Now if angels existed prior to the six days of creation, the language of Moses is far from being accurate and intelligible; and especially when it is considered that the obscurity might have been removed by adding, "from all the work which God had *then* created and made."

† *Bod. Divin.* vol. i. p. 422.

But if angels were created before the heavens, where could they exist? For, as the learned Gill † has remarked, "though angels have no bodies, and so are not in place circumscriptively; yet as they are creatures, they must have an *ubi*, a somewhere in which they are definitely; so that they are here, and not there, and much less everywhere: Now where was there an *ubi*, a somewhere for them to exist in, before the heavens and the earth were made? It is most reasonable, therefore, to conclude, that as God prepared an habitation for all the living creatures before he made them; as the sea for the fishes, the expanse, or air, for the fowls, and the earth for men and beasts; so he made the heavens first, and then the angels to dwell in them."

That this was the fact, will appear very evident, if the words of Moses be impartially considered. "In the beginning (says he) God created the heavens and the earth;" which words must refer either to the beginning of *creation* or of *time*: if to the former, and angels previously existed, the language is neither *intelligible* nor conformable to *truth*; if to the latter, the difficulty remains; for what is time but the measure of created existence. "Time (says the judicious Charnock *) began with the foundation of the world: before the beginning of the creation and the beginning of time, there could be nothing but eternity: nothing but what was uncreated, that is, nothing but what was without beginning." But if angels were in a pre-existent state, the historian's language is unaccountably strange and inaccurate: for if the phrase *in the beginning*, which is remarkably emphatical, refer to the creation of the heavens and the earth *only*, they are unhappily expressed; so expressed, indeed, as to convey no meaning to those who consider words as the vehicle of thought, and as intended to express clearly to others the meaning of the writer. For the *natural obvious* sense is as follows—"In the beginning of the creation of the heavens and the earth, God created the heavens and the earth;" which language is not only a departure from that perspicuity and precision which distinguish all his narrations, but entirely irrational and absurd.

* *Works*, vol. i. 112.

Angel.

That the words *in the beginning* refer to the first creation, cannot be doubted, if it be remembered, that JEHOVAH himself founds a claim to *eternity* on this very ground: "Before the day was, I am he."—"Before the mountains were brought forth, or ever thou hadst formed the earth and the world, even from everlasting to everlasting thou art God," Isa. xliii. 13. Psal. ix. 2. See also Prov. viii. 22, 23, &c. Now there could be no propriety in this kind of reasoning, if angels or any other creature existed before the creation of the world, because all claims to eternity from such premises would apply even to Gabriel as well as to JEHOVAH. "Before the world was," is, in Scripture language, a phrase always expressive of eternity; and on this principle the evangelist John asserts the divinity of Jesus Christ in the first chapter of his history. For this purpose he alludes to the words of Moses, and introduces his divine master to notice by celebrating the first act of his creative power. "In the beginning (says he) was the Word," that is, Dr Doddridge remarks §, before the foundation of the world, or the first production of any creature: and Dr Sherlock ‡ is clearly of opinion, that the words, in their most common and usual acceptation, signify the first creation of all things, and are a demonstration of the divinity of Christ. Of the same mind was Dr Owen. He says, that if the phrase *beginning* does not absolutely and formally express *eternity*, yet it doth a pre-existence to the whole creation, which amounts to the same thing; for nothing can pre-exist before all creatures but the nature of God, which is eternal, unless we suppose a creature before the creation of any. But what is meant by this expression is fully declared by other passages of Scripture: "I was set up from everlasting, before the *beginning*, or ever the earth was;" "Glorify thou me with thine own self, with the glory which I had with thee before the world was;" both which passages not only explain the text, but undeniably prove the pre-existence of Christ the Son of God *. It should be remembered, that, in the passage under consideration, the evangelist's argument for the *divinity* of Jesus Christ is grounded on his pre-existing the creation of the world; and it is consequently asserted, that he is the creator of all things: but if angels had a being before the period to which he alludes, the argument loses all its force, and no more proves the divinity of Christ than the divinity of an angel (A).

§ *Family Expositor.*

* *On the Trinity*, p. 43.

If, therefore, the words of Moses be impartially viewed

(A) Of this Socinus and his followers were aware; and therefore they endeavoured to evade the force of the

Angel.

viewed in their natural obvious meaning, and compared with other passages of Scripture that relate to the same subject, we have no doubt but every unprejudiced mind will perceive, that as he intended to give a summary history of the creation of all things both in heaven and in earth, he has done it in language intelligible and accurate, and in terms sufficiently explicit.

Their nature, power, employment, &c.

As to the nature of these beings, we are told, that they are spirits: but whether pure spirits divested of all matter, or united to some thin bodies or corporeal vehicles, has been a controversy of long standing. Not only the ancient philosophers, but some of the Christian fathers, were of opinion that angels were clothed with ethereal or fiery bodies, of the same nature with those which we shall one day have when we come to be equal to them. But the more general opinion, especially of later times, has been, that they are substances entirely spiritual, though they can at any time assume bodies, and appear in human or other shapes.

That the angelical powers and abilities vastly excel those of man, cannot be denied, if we consider, that their faculties are not clogged or impeded, as ours are, by any of those imperfections which are inseparable from corporeal being: so that their understandings are always in perfect vigour; their inclinations regular; their motions strong and quick; their actions irresistible by material bodies, whose natural qualities they can controul, or manage to their purposes, and occasion either blessings or calamities, public or private, here below; instances of which are too numerous to mention.

Besides their attendance on God, and their waiting and executing of his commands, they are also presumed to be employed in taking care of mankind and their concerns: and that every man had such a tutelar or guardian angel, even from his birth, was a firm belief and tradition among the Jews; and our Saviour himself seems to have been of the same sentiment. The heathens were also of the same persuasion, and thought it a crime to neglect the admonitions of so divine a guide. Socrates publicly confessed himself to be under the direction of such an angel, or demon, as several others have since done. And on this tutelar genius of each person they believed his happiness and fortune depended. Every genius did his best for the interest of his client; and if a man came by the worst, it was a sign the strength of his genius was inferior to that of his opponent, that is, of an inferior order; and this was governed by chance. There were some genii, whose ascendant was so great over others, that their very presence entirely disconcerted them; which was the case of that of Augustus in respect of that of Mark Antony; and for the same reason, perhaps some persons have wit, and speak well, when others are absent, in whose presence they are confounded, and out of countenance. The Romans thought the tutelar genii of those who attained the empire to be of an eminent order; on which account they had great honours shown them. Nations and cities also had their several genii. The ancient Persians so firmly believed the ministry of angels, and their superintendance over human affairs, that they gave their names to their months, and the days of their months; and assigned them distinct offices and provinces: and it is from them the Jews confess to have received the names of the months and angels, which they brought with them when they returned from the Babylonish captivity. After which, we find they also assigned charges to the angels, and in particular the patronage of empires and nations; Michael being the prince of the Jews, as Raphael is supposed to have been of the Persians.

Angel.

The Mahometans have so great a respect for the angels, that they account a man an infidel who either denies their existence, or loves them not. They believe them to be free from sin, enjoying the presence of God, to whom they are never disobedient: that they have subtle pure bodies, being created of light; and have no distinction of sexes, nor do they need the refreshment of food or sleep. They suppose them to have different forms and offices: That some adore God in several postures; others sing his praises, and intercede for men; some carry and encompass his throne; others write the actions of men, and are assigned guardians to them.

As the number of these celestial spirits is very great, it is likewise reasonable to believe that there are several orders and degrees among them, which is also confirmed by Scripture; whence some speculative men have distributed them into nine orders, according to the different names by which they are there called; and reduced these orders into three *hierarchies*, as they call them; to the first of which belong seraphim, cherubim, and thrones; to the second, dominions, virtues, and powers; and to the third, principalities, archangels, and angels. They imagine, farther, that there are some who constantly reside in heaven; others who are ministers, and sent forth, as there is occasion, to execute the orders they receive from God by the former. The Jews reckon but four orders or companies of angels, each headed by an archangel; the first order being that of Michael, the second of Gabriel, the third of Uriel, and the fourth of Raphael; but though the Jews believe them to be four, yet it seems there were rather seven. The Persians also held, there were subordinate degrees among the angels.

Of the fallen angels.

Although the angels were originally created perfect, good, and obedient to their Master's will, yet some of them sinned, and kept not their first estate, but left their habitation; and so, of the most blessed and glorious, became the most vile and miserable of all God's creatures. They were expelled the regions of light, and cast down to hell, to be reserved in everlasting chains under darkness, until the day of judgment. With heaven they lost their heavenly disposition, which delighted once in doing good and praising God; and fell into a settled rancour against him, and malice against

---

the apostle's reasoning, by interpreting the phrase *in the beginning* either in a figurative sense, or as referring to the beginning of John the Baptist's ministry. We will only subjoin, that we do not remember to have seen any writer deviate from the primary obvious meaning of the passage, who had not some hypothesis to support inimical to truth.

Angel. against men; their inward peace was gone; all desire of doing good departed from them; and, instead thereof, revengeful thoughts and despair took possession of them, and created an eternal hell within them.

When, and for what offence, these apostate spirits fell from heaven, and plunged themselves into such an abyss of wickedness and woe, are questions very hard, if not impossible to be determined by any clear evidence of Scripture. As to the time, we are certain that it could not be before the sixth day of creation; because on that day it is said, "God saw every thing that he had made, and behold it was very good:" but that it was not long after it is very probable, as it must have preceded the fall of our first parents. Some have imagined it to have been after; and that carnality, or lusting to converse with women upon earth, was the sin which ruined them: an opinion (B) built upon a mistaken interpretation of Scripture, as if angels were meant by *the sons of God* who are said to have begotten the mighty men of old on the daughters of men. Others have supposed, that the angels, being informed of God's intention to create man after his own image, and to dignify his nature by Christ's assuming of it, and thinking their glory to be eclipsed thereby, envied man's happiness, and so revolted; and with this opinion that of the Mahometans has some affinity; who are taught, that the devil, who was once one of those angels who are nearest to God's presence, and named *Azazil*, forfeited paradise for refusing to pay homage to Adam at the command of God. But on what occasion soever it first showed itself, pride seems to have been the leading sin of the angels; who, admiring and valuing themselves too much on the excellence of their nature and the height of their station, came at length to entertain so little respect for their Creator, as to be guilty of downright rebellion and apostasy.

It is certain from Scripture, that these fallen angels were in great numbers, and that there were also some order and subordination preserved among them; one especially being considered as their prince, and called by several names, *Beelzebub*, *Satan*, or *Sammael* by the Jews; *Ahârimam* by the Persians; and *Eblis* by the Mahometans. Their constant employment is not only doing evil themselves, but endeavouring by all arts and means to seduce and pervert mankind, by tempting them to all kind of sin, and thereby bringing them into the same desperate state with themselves.

ANGEL is likewise a title given to bishops of several churches. In this sense St Paul is understood by some authors, where he says, *Women ought to be covered in the church, because of the angels.* The learned Dr Prideaux observes, that the minister of the synagogue, who officiated in offering up the public prayers, being the mouth of the congregation, delegated by them as their representative, messenger, or angel, to speak to God in prayer for them, was therefore, in the Hebrew language, called the *angel* of the church; and from thence the bishops of the seven churches of Asia are, by a name borrowed from the synagogue, called the *angels* of those churches. Angel || Angelites.

ANGEL, in commerce, the name of a gold coin formerly current in England. It had its name from the figure of an angel represented upon it, weighed four pennyweights, and was twenty-three and a half carats fine. It had different values in different reigns; but is at present only an imaginary sum, or money of account, implying ten shillings.

ANGEL-fish. See SQUALUS, ICHTHYOLOGY *Index.*

ANGELIC, or ANGELICAL, something belonging to, or that partakes of, the nature of angels. We say an *angelical* life, &c. St Thomas is styled the *angelical doctor.* The angelical salutation is called by the Romanists *Ave Maria;* sometimes simply *angelus.*

ANGELIC Garment (*Angelica vestis*), among our ancestors, was a monkish garment, which laymen put on a little before their death, that they might have the benefit of the prayers of the monks. It was from them called *angelical*, because they were called *angeli*, who by these prayers *animæ saluti succurrebant.* Hence, where we read the phrase *monachus ad succurrendum* in our old books, it must be understood of one who had put on the habit when he was at the point of death.

ANGELICA. See BOTANY *Index.*

ANGELICS, ANGELICI, in church history, an ancient sect of heretics, supposed by some to have got this appellation from their excessive veneration of angels; and by others, from their maintaining that the world was created by angels.

ANGELICS is also the name of an order of knights, instituted in 1191, by Angelus Flavius Comnenus, emperor of Constantinople.

ANGELICS is also a congregation of nuns, founded at Milan in 1534, by Louisa Torelli, countess of Guastalla. They observe the rule of St Augustine.

ANGELITES, in ecclesiastical history, a sect of Christian heretics, in the reign of the emperor Anastasius, and the pontificate of Symmachus, about the year 494, so called from Angelium, a place in the city of Alexandria, where they held their first meetings. They were called likewise *Severites*, from one Severus, who was the head of their sect; as also *Theodosians*, from one

(B) This opinion seems to have been originally occasioned by some copies of the Septuagint, which, in the days of St Austin, had in this place *the angels of God.* Lactantius supposes the angels, who were guilty of this enormity, had been sent down by God to guard and take care of mankind; and being endued with free-will, were charged by him not to forfeit the dignity of their celestial nature, by defiling themselves with the corruptions of the earth; but that the devil at length enticed them to debauch themselves with women. He adds, that not being admitted into heaven by reason of the wickedness into which they had plunged themselves, they fell down to the earth, and became the devil's ministers; but that those who were begotten by them, being neither angels nor men, but of a middle nature, were not received into hell, no more than their parents were into heaven. Hence arose two kinds of demons, celestial and terrestrial. These are unclean spirits, the authors of whatever evils are committed, and whose prince is the devil. From hence very probably proceeded the notions of *Incubi*, or demons who are supposed to have carnal knowledge of women.

Angelites || Angelos.

one among them named Theodosius, whom they made pope at Alexandria. They held, that the persons of the Trinity are not the same; that none of them exists of himself, and of his own nature; but that there is a common god or deity existing in them all, and that each is God, by a participation of this deity.

ANGELO, MICHAEL. There were five celebrated Italian painters of this name, who flourished in the 16th and 17th centuries; but the two most distinguished of them are these.—First, Michael Angelo Buonarotti, who was a most incomparable painter, sculptor, and architect, born in 1474, in the territory of Arezzi in Tuscany. He was the disciple of Dominico Ghirlandaio; and erected an academy of painting and sculpture in Florence, under the protection of Lorenzo di Medicis; which, upon the troubles of that house, was obliged to remove to Bologna. About this time he made an image of Cupid, which he carried to Rome, broke off one of its arms, and buried the image in a place he knew would soon be dug up, keeping the arm by him. It was accordingly found, and sold to Cardinal St Gregory for an antique; until Michael, to their confusion and his own credit, discovered his artifice, and confirmed it by the deficient arm which he produced: it is rather unusual for the manufacturers of antiques to be so ingenuous. His reputation was so great at Rome, that he was employed by Pope Sixtus to paint his chapel; and by the command of Pope Paul III. executed his most celebrated piece, *The Last Judgment*. He has the character of being the greatest designer that ever lived; and it is universally allowed that no painter ever understood anatomy so well. He died immensely rich at Rome, in 1564.—Secondly, Michael Angelo de Caravaggio, born at that village in Milan, in 1569. He was at first no more than a bricklayer's labourer; but he was so charmed with seeing some painters at work, that he immediately applied himself to the art; and made such progress in a few years, that he was admired as the author of a new style of painting. It was observed of Michael Angelo Buonarotti, that he was incomparable in designing, but knew little of colouring; and of Caravaggio, that he had as good a gout in colouring as he had a bad one in designing. There is one picture of his in the Dominican church at Antwerp, which Rubens used to call his master. It is said of this painter, that he was so strangely contentious, that the pencil was no sooner out of his hand but his sword was in it. He died in 1609.

ANGELO, St, a small but strong town of Italy, in the Capitanata. There are several other towns and castles of the same name in Italy, and particularly the castle of St Angelo at Rome. E. Long. 15. 56. N. Lat. 41. 43.

ANGELOS, Los, a province of Mexico, the ancient republic of Tlascala, of which a city called *Tlascala* was once the capital. That city is now reduced to an inconsiderable village, and has given place to another called *Puebla des los Angelos*, or the city of Angels. It is situated in W. Long. 103. 12. and N. Lat. 19. 13. It was formerly an Indian town; but in 1530 was entirely abandoned by the natives, on account of the cruelties of the Spaniards. A succeeding viceroy of Mexico, by a milder treatment, recalled them; and the town is now exceedingly rich and populous, so as even to vie with Mexico itself in magnificence. It is situated on the river Zacatula, in a fine valley, about 25 leagues to the eastward of Mexico. In the middle is a beautiful and spacious square, from whence run the principal streets in direct lines, which are crossed by others at right angles. One side is almost entirely occupied by the magnificent front of the cathedral; while the other three consist of piazzas, under which are the shops of tradesmen. The city is the see of a bishop, suffragan to the archbishop of Mexico, and we may form a judgment of the wealth of the place by the revenue of the cathedral and chapter, which amounts to 300,000 pieces of eight annually. It must be remembered, however, that in all popish countries the wealth of the laity by no means bears the same proportion to that of the clergy as in Britain. What contributes greatly to increase the riches of this province is, that here is situated the city of Vera Cruz, the natural centre of all the American treasures belonging to Spain. See VERA CRUZ.

Angelos || Anger.

ANGELOT, an ancient English gold coin, struck at Paris, while under subjection to the English. It was thus called from the figure of an angel supporting the scutcheon of the arms of England and France. There was another coin of the same denomination struck under Philip de Valois.

ANGELOT is also used in *Commerce* to denote a small, fat, rich sort of cheese, brought from Normandy. Skinner supposes it to have been thus called from the name of the person who first made it up in that form, and perhaps stamped it with his own name. Menage takes it to have been denominated from the resemblance it bears to the English coin called *angelot*. It is made chiefly in the Pays de Bray, whence it is also denominated *angelot de Bray*. It is commonly made in vats, either square or shaped like a heart.

ANGER, a violent passion of the mind, consisting in a propensity to take vengeance on the author of some real or supposed injury done the offended party.

Anger is either deliberative or instinctive; and the latter kind is rash and ungovernable, because it operates blindly, without affording time for deliberation or foresight. Bishop Butler very justly observes, that anger is far from being a selfish passion, since it is naturally excited by injuries offered to others as well as to ourselves; and was designed by the Author of nature not only to excite us to act vigorously in defending ourselves from evil, but to interest us in the defence or rescue of the injured and helpless, and to raise us above the fear of the proud and mighty oppressor.

Neither, therefore, is all anger sinful: hence the precept, "Be ye angry and sin not."—It becomes sinful, however, and contradicts the rule of Scripture, when it is conceived upon slight and inadequate provocations, and when it continues long. It is then contrary to the amiable spirit of charity, which "suffereth long, and is not easily provoked." Hence these other precepts, "Let every man be slow to anger;" and, "Let not the sun go down upon your wrath."

These precepts, and all reasoning indeed upon the subject, suppose the passion of anger to be within our power; and this power consists not so much in any faculty we have of appeasing our wrath at the time (for we are passive under the smart which an injury or affront occasions, and all we can then do is to prevent its breaking out into action), as in so mollifying our minds

Anger. minds by habits of just reflection, as to be less irritated by impressions of injury, and to be sooner pacified.

As reflections proper for this purpose, and which may be called the *sedatives* of anger, the following are suggested by Archdeacon Paley, in his excellent treatise of *Moral and Political Philosophy* *.—"The possibility of mistaking the motives from which the conduct that offends us proceeded; how often *our* offences have been the effect of inadvertency, when they were mistaken for malice; the inducement which prompted our adversary to act as he did, and how powerfully the same inducement has, at one time or other, operated upon ourselves; that he is suffering perhaps under a contrition, which he is ashamed, or wants opportunity, to confess; and how ungenerous it is to triumph by coldness or insult over a spirit already humbled in secret; that the returns of kindness are sweet, and that there is neither honour nor virtue nor use in resisting them—for some persons think themselves bound to cherish and keep alive their indignation, when they find it dying away of itself. We may remember that others have their passions, their prejudices, their favourite aims, their fears, their cautions, their interests, their sudden impulses, their varieties of apprehension, as well as we: we may recollect what hath sometimes passed in our own minds, when we have got on the wrong side of a quarrel, and imagine the same to be passing in our adversary's mind now; when we became sensible of our misbehaviour, what palliations we perceived in it, and expected others to perceive; how we were affected by the kindness, and felt the superiority of a generous reception and ready forgiveness; how persecution revived our spirits with our enmity, and seemed to justify the conduct in ourselves which we before blamed. Add to this, the indecency of extravagant anger; how it renders us, whilst it lasts, the scorn and sport of all about us, of which it leaves us, when it ceases, sensible and ashamed; the inconveniences and irretrievable misconduct into which our irascibility has sometimes betrayed us; the friendships it has lost us; the distresses and embarrassments in which we have been involved by it, and the sore repentance which on one account or other it always costs us.

* Book III. Part ii. chap. 7.

"But the reflection calculated above all others to allay that haughtiness of temper which is ever finding out provocations, and which renders anger so impetuous, is that which the gospel proposes; namely, that we ourselves are, or shortly shall be, suppliants for mercy and pardon at the judgment-seat of God. Imagine our secret sins all disclosed and brought to light; imagine us thus humbled and exposed; trembling under the hand of God; casting ourselves on his compassion; crying out for mercy—imagine such a creature to talk of satisfaction and revenge, refusing to be entreated, disdaining to forgive, extreme to mark and to resent what is done amiss; imagine, I say, this; and you can hardly feign to yourself an instance of more impious and unnatural arrogance."

Physicians and naturalists have recorded instances of very extraordinary effects of this passion. Borrichius cured a woman of an inveterate tertian ague, which had baffled the art of physic, by putting the patient in a furious fit of anger. Valeriola made use of the same means, with the like success, in a quartan ague. The same passion has been equally salutary to paralytic, gouty, and even dumb persons; to which last it has sometimes given the use of speech. Etmuller gives divers instances of very singular cures wrought by anger; among others, he mentions a person laid up in the gout, who being provoked by his physician, flew upon him, and was cured. It is true, the remedy is somewhat dangerous in the application, when a patient does not know how to use it with moderation. We meet with several instances of princes to whom it has proved mortal; e. g. Valentinian the first, Wenceslaus, Matthias Corvinus, king of Hungary, and others. There are also instances wherein it has produced the epilepsy, jaundice, cholera morbus, diarrhœa, &c. In fact, this passion is of such a nature, that it quickly throws the whole nervous system into preternatural commotions, by a violent stricture of the nervous and muscular parts; and surprisingly augments not only the systole of the heart and of its contiguous vessels, but also the tone of the fibrous parts in the whole body. It is also certain, that this passion, by the spasmodic stricture it produces in the parts, exerts its power principally on the stomach and intestines, which are highly nervous and membranous parts; whence the symptoms are more dangerous, in proportion to the greater consent of the stomach and intestines, with the other nervous parts, and almost with the whole body. The unhappy influence of anger likewise, on the biliary and hepatic ducts, is very surprising; since by an intense constriction of these, the liver is not only rendered scirrhous, but stones also are often generated in the gall-bladder and biliary ducts: these accidents have scarcely any other origin than an obstruction of the free motion and efflux of the bile, by means of this violent stricture. From such a stricture of these ducts likewise proceeds the jaundice, which in process of time lays a foundation for calculous concretions in the gall-bladder. Lastly, By increasing the motion of the fluid, or the spasms of the fibrous parts, by means of anger, a larger quantity of blood is propelled with an impetus to certain parts; whence it happens that they are too much distended, and the orifices of the veins distributed there opened. It is evident from experience, that anger has a great tendency to excite enormous hæmorrhages, either from the nose, the aperture of the pulmonary artery, the veins of the anus; or in women, from the uterus, especially in those previously accustomed and disposed to such evacuations.

Anger ‖ Angerona.

ANGERMANNIA, or ANGERMANLAND, a province of Sweden, bounded on the north by Lapland and Bothnia, on the east by the gulf of Bothnia, and Medelpadia, and on the west by Jempti and Herndel. It is full of rocks, mountains, and forests; and there is one very high mountain called *Scull*. It has excellent iron works, and lakes abounding with fish.

ANGERMOND, a town in the duchy of the lower Rhine, in Germany, subject to the king of Prussia. E. Long. 6. 20. N. Lat. 51. 10.

ANGERONA, in *Mythology*, the name of a Pagan deity whom the Romans prayed to for the cure of the *quinsy*, in Latin *angina*. Pliny calls her the *goddess of silence* and *calmness of mind*, who banishes all uneasiness and melancholy. She is represented with her mouth covered, to denote patience and refraining from complaints. Her statue was set up, and sacrificed to, in the temple of the goddess Volupia, to show

Angerona lia || Anghiera.

show that a patient enduring of affliction leads to pleasure.

ANGERONALIA, in antiquity, solemn feasts held by the Romans on the 21st of December, in honour of Angerona, or Angeronia, the goddess of patience and silence. Festus and Julius Modestus, quoted by Macrobius, Saturn. lib. i. cap. 10. derive the name from *angina*, "quinsy;" and suppose the goddess to have been thus denominated, because she presided over that disease. —Others suppose it formed from *angor*, "grief, pain;" to intimate that she gave relief to those afflicted therewith.—Others deduce it from *angeo*, "I press, I close," as being reputed the goddess of silence, &c.

ANGERS, a city of France, and capital of the former duchy of Anjou, now the department of the Maine and Loire. It is seated a little above the place where the Sarte and the Loire lose themselves in the Maine. This last river divides the city into two equal parts, called the High and the Low Town. There are twelve parishes in the city, and four in the suburbs, which contained 28,927 inhabitants in 1817. Besides these, there are eight chapters, and a great number of convents for both sexes. Its greatest extent is along the declivity of a hill, which reaches quite down to the river side. The castle was built by St Louis, about the middle of the 13th century. The walls, fosses, and numerous towers which yet subsist, evince its former magnificence: and its situation in the centre of the city, on a rock overhanging the river, conduces to give it an air of grandeur, though at present in decay. It was the principal residence of the kings of Sicily, as dukes of Anjou, but is now in a state of total ruin. The cathedral of Angers is a venerable structure; and although it has undergone many alterations in the course of ages since its construction, yet the architecture is singular, and deserves attention. Here lies interred with her ancestors the renowned Margaret, daughter of René king of Sicily, and queen of Henry VI. of England. She expired, after her many intrepid but ineffectual efforts to replace her husband on the throne, in the year 1482, at the castle of Dampierre in Anjou, Near the church of St Michael is the handsomest square in the city, from whence runs a street which has the name of the church. On one side of this street is the town-house; which has a fine tower, with a clock, raised upon an arch which serves for a passage into the great square. There are two large bridges, which keep up a communication between the two parts of the city; and in the lesser of these there is another square, which serves for a market. The university of Angers was founded in 1398, and the academy of belles letters in 1685. This last consists of thirty academicians. At the end of the suburb of Bresigny are the quarries of Angers, so famous for the fine slate which is got from thence. The pieces are of the thickness of a crown piece, and a foot square. All the houses in Angers are covered with this slate, which has gained it the appellation of the *Black City*. The walls with which King John of England surrounded it in 1214 remain nearly entire, and are of very great circumference. W. Long. 0. 35. N. Lat. 47. 30.

ANGHIERA, a town of Italy, in the duchy of Milan, and capital of a county of the same name. It is seated on the eastern side of the lake Maggiore, in E. Long. 8. 40. N. Lat. 45. 42.

Angina || Anglesey.

ANGINA, in *Medicine*, a violent inflammation of the throat, otherwise called *quinsy*. See MEDICINE *Index*.

Angina Pectoris. See MEDICINE *Index*.

ANGIOSPERMIA, in the Linnæan system of botany, the second order in the class didynamia. It consists of those plants of that class, whose seeds are enclosed in a pericarpium. In this order the stigma is generally obtuse. These are the *personati* of Tournefort.

ANGITIÆ LUCUS or NEMUS, (Virg.), situated on the west side of the Lacus Fucinus. The inhabitants are called *Lucenses*, by Pliny. Angitia was sister of Medea, who taught antidotes against poison and serpents, according to Sil. Italicus. But Servius on Virgil says, that the inhabitants called Medea by this name for the same reason. The town is now called *Luco*.

ANGLE, the inclination of two lines meeting one another in a point. See GEOMETRY. See also ANGLE in the SUPPLEMENT.

Angle of Incidence, in *Optics*, the angle which a ray of light makes with a perpendicular to that point of the surface of any medium on which it falls; though it is sometimes understood of the angle which it makes with the surface itself.

Angle of Refraction now generally means the angle which a ray of light, refracted by any medium, makes with a perpendicular to that point on the surface of which it was incident; but has sometimes been understood of the angle which it makes with the surface of the refracting medium itself.

ANGLER, a person who practises the art of angling, whether as a diversion or otherwise. See the article ANGLING.

ANGLER, the English name of a species of lophus. See LOPHUS, ICHTHYOLOGY *Index*.

ANGLES, an ancient German nation, originally a branch of the Suevi: who, after various migrations, settled in that part of Denmark, and duchy of Sleswick, which to this day is called *Angel*, and of which the city of Flensburgh is the capital. Here they were known, even in the time of Tacitus, by the name of *Angli*. The origin of this name is variously accounted for. According to Saxo-Grammaticus, they were called *Angli*, from one Angulus, son to Humblus king of Denmark. Widischind, a Saxon writer, will have them to be called *Angli*, from an island in the corner or angle of the sea, which they conquered. Goropius derives their name from the Saxon word *Angel* or *Engel*, signifying a fish-hook; the Angles, like the other Saxon nations, being greatly addicted to piracy, and on that account being so named by the neighbouring nations; as if, like hooks, they caught all that was in the sea. To this nation the British ambassadors are said to have applied, when soliciting succours against the Scots and Picts. The Angles, therefore, came over in greater numbers than any other Saxon nation; and accordingly had the honour of giving the name of *Anglia* to England. See ENGLAND.

ANGLESEY, ISLE OF, is the most western county of North Wales. It is 24 miles in length, 18 in breadth, and sends one member to parliament. It is separated from Caernarvonshire by a strait called *Menai*, and on every other side is surrounded by the sea.

Anglesey. It is a fertile spot, and abounds in corn, cattle, flesh, fish, and fowls.

At Port Aethwy, the most general ferry into the island, there is a great passage of cattle. It is computed that the island sends forth annually from 12,000 to 15,000 head, and multitudes of sheep and hogs. It is also computed that the remaining stock of cattle is 30,000. In 1770 upwards of 90,000 bushels of corn were exported, exclusive of wheat. The improvement in husbandry has greatly increased since the suppression of smuggling from the isle of Man: before that time every farmer was mounted on some high promontory, expecting the vessel with illicit trade; but since that period, he sets in earnest to industry and cultivation. Not but that the island was in the most remote times famous for its fertility: Mon, Mam Gymry, the Nursing mother of Wales, was a title it assumed even in the 12th century.

This island is divided into 77 parishes, of which most of the churches are situated near the shores. By an account given on the 13th of August 1563, there were 2010 households, or families, in Anglesey; allowing five to a family, the whole number of inhabitants at that period was 10,050. In 1811, the number of houses was 7183, of families 7706, and of inhabitants 37,045. Of these families 5376 were occupied in agriculture, 1453 in trade and manufactures, and 877 in other occupations. It appears then that since 1563 the number of inhabitants has nearly quadrupled. The chief town is BEAUMARIS.

In ancient times this island was called *Mon*, *Mona*, or *Moneg*. It was the great nursery of the religion of the Druids, being the residence of the grand druid, or chief pontiff, and consequently of all the learned doctors in that religion.

Many ancient monuments of druidism still remain in the island.—At Tre'r Dryw, or the habitation of the arch druid, are several mutilated remains, which have been described by Mr Rowlands. His *Bryn Gwyn*, or *Brein Gwyn*, or royal tribunal, is a circular hollow of 180 feet in diameter, surrounded by an immense agger of earth and stones, evidently brought from some other place, there not being any mark of their being taken from the spot. It has only a single entrance. This is supposed to have been the grand consistory of the druidical administration.—Not far from it was one of the *Gorseddau*, now in a manner dispersed, but which once consisted of a great copped heap of stones, on which sat aloft a druid, instructing the surrounding people *multa de Deorum immortalium vi et potestate disputare, et juventuti tradunt*: Cæs. lib. vi.—Here were also the relicks of a circle of stones, with the *cromlech* in the midst; but all extremely imperfect. Two of the stones are very large; one, which serves at present as part of the end of a house, is 12 feet 7 inches high, and 8 feet broad; and another 11 feet high, and 23 feet in girth. Some lesser stones yet remain. This circle, when complete, was one of the temples of the druids, in which their religious rites were performed. It is the conjecture of Mr Rowlands, that the whole of these remains were surrounded with a circle of oaks, and formed a deep and sacred grove: *Jam per se roborum elegunt lucos, neque ulla sacra sine ea fronde conficiunt;* (Plin. Hist. Nat. xv. 44.).—Near this is *Caer Leb*, or the moated intrenchment; of a square form, with a double rampart, and broad ditch intervening, and a lesser on the outside. Within are foundations of circular and of square buildings. This Mr Rowland supposes to have been the residence of the arch druid, and to have given the name, *Tre'r Dryw*, to the township in which it stands. At Trev Wry are several faint traces of circles of stones, and other vestiges of buildings; but all so dilapidated, or hid in weeds, as to become almost formless. *Bod-druddn*, or the habitation of the druids, *Tre'r-Beirdd*, or that of the bard, and *Bodowyr*, or that of the priests, are all of them hamlets, nearly surrounding the seat of the chief druid, composing the essential part of his suite. At the last is a thick cromlech, resting on three stones. Anglesey.

The shore near Porthamel, not far from hence, is famed for being the place where Suetonius landed, and put an end in this island to the druid reign. His infantry passed over in flat-bottomed boats, perhaps at the spot still called *Pant yr Yscraphie*, or the valley of *Skiffs*. His cavalry crossed partly by fording, partly by swimming. Of the conflict on this occasion we have the following animated description by Tacitus *: * *Annal.* xiv. 30.

"Stat pro littore diversa acies, densa armis virisque, intercursantibus fœminis in modum furiarum, veste ferali, crinibus dejectis, faces preferebant; *druidæque* circum, preces diras sublatis ad cœlum manibus fundentes. Novitate aspectus percutere militem, ut quasi hærentibus membris, immobile corpus vulneribus præberent. Dein cohortationibus ducis, et se ipse stimulantes, ne muliebre et fanaticum agmen pavescerent, inferunt signa, sternuntque obvios et igni suo involvunt. Præsidium posthac impositum vicis, excisique luci, sævi superstitionibus sacri. Nam cruore captivo adolere aras, et hominum fibris consulere deos fas habebant."—Thus Englished: "On the shore stood a motley army in close array, and well armed; with women running wildly about in black attire, with dishevelled hair, and like the furies brandishing their torches; surrounded by the druids, lifting up their hands to heaven, and pouring forth the most dreadful imprecations. The soldier stood astonished with the novelty of the sight. His limbs grew torpid, and his body remained motionless, resigned to every wound. At length, animated by their leader, and rousing one another not to be intimidated with a womanly and fanatic band, they displayed their ensigns, overthrew all who opposed them, and flung them into their own fires. After the battle, they placed garrisons in the towns, and cut down the groves consecrated to the most horrible superstitions: for the Britons held it right to sacrifice on their altars with the blood of their captives, and to consult the gods by the inspection of human entrails." There are no traces of any Roman works left in this country, Their stay was so short, that they had not time to form any thing permanent.

Near the ferry of Moel y Don appear the fine woods of Sir Nicholas Bayley, skirting the Menai for a considerable way. The wooded part of the island is on this side. It commences at Llanidan, and recals the ancient British name of Anglesey, *Ynys Dywyll*, or the *Dark Island*, on account of the deep shade of its groves: but at present it is (except in this part) entirely divested of trees; and the climate so averse to their growth, that in most parts it is with great difficulty the

Anglesey. the gentry can raise a plantation round their houses. Plas Newydd, the seat of Sir Nicholas Bayley, lies close upon the water, protected on three sides by venerable oaks and ashes. The view up and down this magnificent river-like strait is extremely fine. The shores are rocky; those on the opposite side covered with woods; and beyond soar a long range of Snowdonian Alps. Here stood a house built by Gwenllian, a descendant of Cadrod Hardd. The mansion has been improved, and altered to a castellated form by the present owner.

In the woods are some very remarkable druidical antiquities. Behind the house are to be seen two vast cromlechs. The upper stone of one is 12 feet 7 inches long, 12 broad, and four thick, supported by five tall stones. The other is but barely separated from the first; is almost a square of five feet and a half, and supported by four stones. The number of supporters to cromlechs is merely accidental, and depends on the size or form of the incumbent stone. These are the most magnificent we have, and the highest from the ground; for a middle-sized horse may easily pass under the largest. In the lands of Llugwy, indeed, there is a most stupendous one of a rhomboidal form. The greatest diagonal is $17\frac{1}{2}$ feet, the lesser 15, and the thickness three feet nine inches; but its height from the ground is only two feet: it was supported by several stones. The Welsh, who ascribe every thing stupendous to our famous British king, call it *Arthur's Quoit*. In the woods at this place are some druidical circles nearly contiguous to each other.

At a small distance from Beaumaris, on the shore, stand the remains of Llanvaes, or the Friars. It was founded by Prince Llewelyn ap Jerwerth, and, according to the general tradition of the country, over the grave of his wife Joan, daughter of King John, who died in 1237, and was interred on the spot. Here also were interred a son of a Danish king, Lord Clifford, and many barons and knights who fell in the Welsh wars. It was dedicated to St Francis, and consecrated by Howel bishop of Bangor, a prelate who died in 1240. The religious were Franciscans, or minor friars. Their church and house were destroyed, and their lands wasted, in the insurrection made soon after the death of Llewelyn, last Welsh prince, by his relation Madoc. Edward II. in consideration of their misfortunes, remitted to them the payment of the taxes due to him, which before the war were levied at the rate of 12l. 10s. These friars were strong favourers of Owen Glendwr. Henry IV. in his first march against Owen, plundered the convent, put several of the friars to the sword, and carried away the rest; but afterwards set them at liberty, made restitution to the place, but peopled it with English recluses. It possibly was again reduced to ruin; for Henry V. by patent, establishes here eight friars, but directs that only two should be Welsh. At the dissolution, Henry VIII. sold the convent and its possessions to one of his courtiers. They became in latter days the property of a family of the name of *White* (now extinct), who built here a good mansion. It of late became, by purchase, the property of Lord Bulkeley. The church is turned into a barn, and the coffin of the princess Joan now serves for a watering trough. A little farther is Castell Aber Llienawg, a small square fort, with the remains of a little round tower at each corner. In the middle stood a square tower. A fosse surrounds the whole. A hollow way is carried quite to the shore, and at its extremity is a large mound of earth designed to cover the landing. This castle was founded by Hugh Lupus earl of Chester, and Hugh the Red earl of Shrewsbury, in 1098, when they made an invasion, and committed more savage barbarities on the poor natives, especially on one Kenred a priest, than ever stained the annals of any country. Providence sent Magnus king of Norway to revenge the cruelties. His coming was to all appearance casual. He offered to land, but was opposed by the earls. Magnus stood in the prow of his ship, and calling to him a most expert bowman, they at once directed their arrows at the earl of Shrewsbury, who stood all armed on the shore. An arrow pierced his brain through one of his eyes, the only defenceless part. The victor, seeing him spring up in the agonies of death, insultingly cried out in his own language, *Leite loupe*, "Let him dance." This fort was garrisoned so lately as the time of Charles I. when it was kept for the parliament by Sir Thomas Cheadle; but was taken by Colonel Robinson in 1645. Anglesey.

Above Llandonna is a high hill, called *Bwrrd Arthur*, or Arthur's round table: the true name was probably *Din* or *Dinas Sulwy:* for a church immediately beneath bears that of *Llanvihangle Din-Sulwy*. On the top of it is a great British post surrounded by a double row of rude stones with their sharp points uppermost; and in some parts the ramparts are formed of small stones. In the area are vestiges of oval buildings; the largest is formed with two rows of flat stones set on end. These had been the temporary habitations of the possessors. It had been a place of vast strength: for, besides the artificial defence, the hill slopes steeply on all sides, and the brink next to the ramparts is mostly precipitous. It is worth while to ascend this hill for the sake of the vast prospect, and intermixture of sea, rock, and alps, most savagely great.

About two miles south of Plas Gwyn, the seat of Paul Panton, Esq. was situated Penmynnydd, once the residence of the ancestors of Owen Tudor, second husband to Catherine of France, queen dowager of Henry V.; "who beyng (as honest Halle informs us) young and lustye, folowyng more her own appetyte than frendely consaill, and regardyng more her private affection than her open honour, toke to husband privily (in 1428) a goodly gentylman, and a beautiful person, garniged with manye godly gyftes both of nature and of grace, called *Owen Teuther*, a man brought forth and come of the noble lignage and auncient lyne of Cadwalader, the last kynge of the Britonnes." The match, important in its consequences, restored the British race of princes to this kingdom: These reigned long, under the title of the House of Tudor; the mixed race having ceased on the accession of Henry VII. grandson to our illustrious countryman. The remains of the residence of the Tudors are, the door of the gateway: part of the house, and the great chimneypiece of the hall, are to be seen in the present farm-house. Some coats of arms, and dates of the building or time of repairs, are to be seen, with the initial letters of the names of the owners. The Tudors, for a considerable space before the extinction of their race, assumed the name of *Owen*. Richard

Anglesey. was the last male of the family, and was sheriff of the county in 1657. Margaret, heiress of the house, married Coningsby Williams, Esq. of Glan y gors, in this island, who possessed it during his life. It was afterwards sold to Lord Bulkeley, in whose descendant it still continues. In the church of Penmynndydd is a most magnificent monument of white alabaster, removed at the dissolution from the abbey of Llanvaes to this place; probably erected in memory of one of the House of Tudor, who had been interred there. On it is the figure of a man in complete armour, a conic helm, and mail guard down to his breast; his lady is in a thick angular hood; their feet rest on lions, and their heads are supported by angels.

On the western point of the bay is a small cape, flat at top, called *Castell Mawr*, joined to the land by a low isthmus. It is composed of limestone, which is carried to distant parts in small vessels, which lie in a small channel near the rock, and by their numbers frequently enliven the view. Roman coins have been found in this neighbourhood; but there are no vestiges of there having been any station. Beyond Castlemawr, on the shore, are vast blocks of black marble filled with shells, coralloids, and fungitæ.

At Trysclwyn mountain is the most considerable body of copper ore perhaps ever known. The part of Trysclwyn which contains it is called *Parys mountain*. Of this mountain, and the works there carried on, we have the following very curious and particular account by Mr Pennant*:—"The external aspect of the hill is extremely rude, and rises into enormous rocks of coarse white quartz. The ore is lodged in a bason, or hollow, and has on one side a small lake, on whose waters, distasteful as those of Avernus, no bird is known to alight. The whole prospect of this tract has, by the mineral operations, assumed a most savage appearance. Suffocating fumes of the burning heaps of copper arise in all parts, and extend their baneful influence for miles round. In the adjacent parts vegetation is nearly destroyed: even the mosses and lichens of the rocks have perished; and nothing seems capable of resisting the fumes but the purple melic grass, which flourishes in abundance. It is thought that the ore had been worked in a very distant period. Vestiges of the ancient operations appear in several parts, carried on by trenching, and by heating the rocks intensely, then suddenly pouring on water, so as to cause them to crack or scale; thus awkwardly supplying the use of gunpowder. Pieces of charcoal were also found, which proves that wood was made use of for that purpose. As the Britons imported all works in brass, it is certain that the Romans were the undertakers of these mines; and it is very probable that they sent the ore to Caerhen to be smelted, the place where the famous cake of copper was discovered. They might likewise have had a smelting hearth in this island; for a round cake of copper was discovered at Llanvaethlle, a few miles from this place. Its weight was fifty pounds, and it had on it a mark resembling an *L*.

* *Tour in Wales*, II. 236.

"In the year 1762, one Alexander Frazer came into Anglesey in search of mines. He visited Parys mountain; called on Sir Nicholas Bayley, and gave him so flattering an account of the prospect, as induced him to make a trial, and sink shafts. Ore was discovered; but before any quantity could be gotten, the mines were overpowered with water. In about two years after, Messrs Roe and Co. of Macclesfield applied to Sir Nicholas for a lease of Penrhyn ddu mine in Caernarvonshire; with which they were, much against their wills, compelled to take a lease of part of this mountain, and to carry on a level, and make a fair trial. The trial was accordingly made; ore was discovered; but the expences overbalanced the profits. They continued working to great loss; and at length determined to give the affair up. They gave their agent orders for that purpose: but he, as a final attempt, divided his men into ten several companies, of three or four in a partnership, and let them sink shafts in various places, about eight hundred yards eastward of a place called the *Golden Venture*, on a presumption that a spring, which issued from near the place, must come from a body of mineral. His conjecture was right; for in less than two days they met with, at the depth of seven feet from the surface, the solid mineral, which proved to be that vast body which has since been worked to such advantage. The day that this discovery was made was March 2. 1768: which has ever since been observed as a festival by the miners. Soon after this discovery, another adventure was begun by the reverend Mr Edward Hughes, owner of part of the mountain, in right of his wife Mary Lewis of Llys Dulas; so that the whole of the treasure is the property of Sir Nicholas Bayley and himself. The body of copper ore is of unknown extent. The thickness has been ascertained in some places by the driving of a level under it, several years ago, and it was found to be in some places twenty-four yards. The ore is mostly of the kind called by Cronsted, *Pyrites cupri flavo-viridescens*, and contains vast quantities of sulphur. It varies in degrees of goodness; some of it is rich, but the greater part poor in quality.

Anglesey.

"There are other species of copper ore found here. Of late a vein of the *Pyrites cupri griseus* of Cronsted, about seven yards wide, has been discovered near the west end of the mountain: some is of an iron gray, some quite black; the first contains sixteen lb. of copper per 100lb.; the last forty. An ore has been lately found, in form of loose earth, of a dark purplish colour; and the best of it has produced better than eight in twenty. Some years ago, about thirty pounds of native copper were found in driving a level through a turbery; some was in form of moss, some in very thin leaves.

"It is quarried out of the bed in vast masses; is broken into small pieces; and the most pure part is sold raw, at the rate of about 3l. to 6l. per ton, or sent to the smelting-houses of the respective companies to be melted into metal. Mr Hughes has great furnaces of his own at Ravenhead near Liverpool, and at Swansea in South Wales. An idea of the wealth of these mines may be formed, by considering that the Macclesfield Company have had at once fourteen thousand tons of ore upon bank, and Mr Hughes thirty thousand.

"The more impure ore is also broken to the size of about hens eggs; but in order to clear it from the quantity of sulphur with which it abounds, as well as other adventitious matter, it must undergo the operation of burning. For that purpose it is placed between two parallel walls of vast length: some kilns are 20, others

Anglesey. 40, and 50 yards in length; some 10, others 20, feet wide, and above four feet in height. The space between is not only filled, but the ore is piled many feet higher, in a convex form, from end to end. The whole is then covered with flat stones, closely luted with clay; and above is placed a general integument of clay, and small rubbish of the work, in order to prevent any of the fumes from evaporating. Of late, some kilns have been constructed with brick arches over the ore, which is found to be the best method of burning. Within these few years, attempts are made to preserve the sulphur from flying away; and that is done by flues made of brick, whose tops are in form of a Gothic arch, many scores of feet in length. One end of these opens into the beds of copper which are to be burnt. Those beds are set on fire by a very small quantity of coal, for all the rest is effected by its own phlogiston. The volatile part is confined to, and directed to the flues; in its course the sulphureous particles strike against their roofs, and fall to the bottom in form of the finest brimstone; which is collected and carried to adjacent houses, where it is melted into what is called in the shops *stone brimstone*.

"The beds of copper, thus piled for burning, are of vast extent. Some contain 400 tons of ore, others 2000. The first require four months to be completely burnt, the last near ten. Thus burnt, it is carried to proper places to be pressed, or washed, and made merchantable. By this process the ore is reduced to a fourth part in quantity, but considerably improved in quality: and by this means the water is strongly or richly impregnated with copper, which is dissolved by the acid quality of the sulphur; and is collected or precipitated again by iron in the above-described pits. The iron is also dissolved.

"But a far richer produce of copper is discovered from the water lodged in the bottom of the bed of ore, which is highly saturated with the precious metal. This is drawn up, either by means of whimsies or windmills, to the surface, and then distributed into numbers of rectangular pits 36 feet long, some pits more some less, 12 to 15 feet broad, and 20 inches deep. To speak in the language of the adept, Venus must make an assignation with Mars, or this solution will have no effect. In plain English, a quantity of iron must be immersed in the water. The kind of iron is of no moment; old pots, hoops, anchors, or any refuse, will suffice; but of late, for the convenience of management, the adventurers procure new plates, four feet long, one and a half broad, and three quarters of an inch thick. These they immerse into the pits. The particles of copper instantly are precipitated by the iron, and the iron is gradually dissolved into a yellow ochre. Great part of it floats off by the water, and sinks to the bottom. The plates, or the old iron (as it happens), are frequently taken out, and the copper scraped off; and this is repeated till the whole of the iron is consumed. The copper thus procured differs little from native copper, and is prized accordingly, and sold for prices from 25l. to 45l. a ton.

"This discovery is far from new: it has been practised long in the Wicklow mines in Ireland; and above a century in those of Hern-grundt in Hungary, where it is called *ziment copper*. The waters of the Hungarian mines are much more strongly impregnated with copper than those of Parys mountain. The first effects its operation in about 12 or 20 days, the last requires two months. Horse shoes, iron made in shape of hearts and other forms, are put into the foreign waters; and when perfectly transmuted, are given as presents to curious strangers. Anglesey.

"The ore is not got in the common manner of mining, but is cut out of the bed in the same manner as stone is out of a quarry. A hollow is now formed in the solid ore open to the day, and extends about 100 yards in length, about 40 yards in breadth, and 24 yards in depth. The ends are at present undermined, but supported by vast pillars and magnificent arches, all metallic; and these caverns meander far under ground. These will soon disappear, and thousands of tons of ore be gotten from both the columns and roofs. The sides of this vast hollow are mostly perpendicular, and access to the bottom is only to be had by small steps cut in the ore; and the curious visitor must trust to them and a rope, till he reaches some ladders, which will conduct him the rest of the descent. On the edges of the chasms are wooden platforms, which project far; on them are windlasses, by which the workmen are lowered to transact their business on the face of the precipice. There suspended, they work in mid air, pick a small place for a footing, cut out the ore in vast masses, and tumble it to the bottom with great noise. In such situations they form caverns, and there appear safely lodged till the rope is lowered to convey them up again. Much of the ore is blasted with gunpowder, eight tons of which are said to be annually used for the purpose.

"Nature hath been profuse in bestowing her mineral favours on this spot: for above the copper ore, and not more than three quarters of a yard beneath the common soil, is a bed of yellowish greasy clay, from one to four yards thick, containing lead ore, and yielding from 600 to 1000 pounds weight of lead from one ton; and one ton of the metal yields not less than 47 ounces of silver. Mixed with the earth, are frequently certain parts of the colour of cinnabar. Whether these are symptomatic of the sulphureous arsenical silver ores or of quicksilver, I will not pretend to decide. Something interferes with the successful smelting of this earth in the great; insomuch that it has not yet been of that profit to the adventurers which might reasonably be expected from the crucible assays of it; and they have at this time about 8000 tons on bank undisposed of. This place has been worked for lead ore in very distant times. In the bottom of the pool was found an ancient smelting hearth of grit stone, and several bits of smelted lead, of about four inches in length, two in breadth, and half an inch thick.

"These works have greatly added to the population of the island: for about 1500 persons are employed; who, with their families, are supposed to make near 8000 persons, getting their bread from these mines. The little village of Amlwch, the port of the place, is increasing fast, and the market grows considerable. At the season of the greatest work, Mr Hughes's men alone receive for many weeks 200l. in one week, and 150l. in another, merely for subsistence. The port is no more than a great chasm between two rocks, running far into land, and dry at low water; into

Anglesey, Angling.

into which sloops run, and lie secure to receive their lading."

Near Kemlyn bay is a quarry of marble, common to this place, some parts of Italy, and to Corsica, and known in the shops by the name of *Verdi di Corsica*. It colours are green, black, white, and dull purple, irregularly disposed. In different blocks one or other of the colours is frequently wanting; but among the green parts are oftener found narrow veins of a most elegant and silky white asbestos. It is a compound species of marble: part is calcareous, and may be acted on by nitric acid. The green parts partake of the nature of jasper. It is apt to be intersected by small cracks, or by asbestine veins, therefore incapable of taking a high polish. This quarry lies on the lands of Monachty, in the parish of Llan-Fair-Ynghornwy; and it is found again in the isle of Skerries, off this parish. Neither the quarry nor the asbestos are at present in use. In Rhoscolyn parish, a green amianthus, or brittle asbestos, is met with in great plenty in a green marble similar to the above; but by reason of the inflexible quality of its fibres not applicable to the same use. See ANGLESEY, SUPPLEMENT.

ANGLING, among sportsmen, the art of fishing with a rod, to which are fitted a line, hook, and bait. See *FISHING-Rod*, *FISHING-Hook*, *FISHING-Fly*.

The angler's first business is to attract the fish to the place intended for angling. The method of doing this, in standing waters, by throwing in grains, chopped worms, and the like, is well known: but the chief difficulty is in running rivers and brooks. The method, in this case, is to prepare a tin box capable of holding some hundreds of worms, bored on all sides, and full of holes of such a size as they may be just able to crawl out at; there must be a plummet fastened to this box to sink it, and a line to draw it back at pleasure; in this case it is to be thrown into the water in a proper place, above which the angler may stand under cover. The worms will slowly and gradually crawl out of this box, and the fish will be gathered about to feed on them; the baited hook is to be thrown in higher up and carried down by the stream. If this method do not bring the fish about the place in a little time, there is reason to suspect that some pike lies lurking thereabout, and deters them: in this case, it is proper to throw out a baited hook, and he will generally be taken; after this the attempt will succeed.

When the angler takes his stand, he is to shelter himself under some tree or bush, or stand so far from the brink of the water that he can only discern his float; as the fish are timorous and easily frightened away. The angling rod must be kept in a moderate state, neither too dry nor too moist: in the first case, it will be brittle; in the other, rotten. When pastes are used, it is proper to mix a little tow with them, and rub them over with honey; finally, a small anointing with butter is of great use to keep them from washing off the hook. The eyes of any fish that is taken are an excellent bait for almost any other kind of fish. The best way of angling with the fly is down the river, and not up; neither need the angler ever make above half a dozen of trials in one place, either with fly or ground bait, when he angles for trout: by that time the fish will either offer to take, or refuse the bait and not stir at all.

In a pond, the best place for the angler to take his stand is usually that where the cattle go up into water: in rivers, if breams are fished for, it should be in the deepest and most quiet places; if eels, under the banks of rivers that hang over; perch are to be expected in clean places, where the stream is swift; and chub in deep shaded holes: roach are mostly found where the perch are, and trout only in swift and clear streams. Places where there are many weeds, or old stumps of trees, harbour fish in great numbers, and they usually bite freely there; but there is danger of entangling the line, or fastening the hook to the weeds. In case of this accident, recourse is to be had to a ring of lead, of about six inches round, fastened to a small packthread: this ring is to be thrust over the rod, and let fall into the water. It will descend to the place where the hook is entangled; and then, by pulling the packthread gently, the hook will be soon disengaged, or at the worst it can only be broke off near the end of the line; whereas, when this is not employed, the rod itself is sometimes broken, or the line nearer its upper end.

Angling || Anglus.

Deep waters are best for angling in, for the fish do not love to be disturbed by wind and weather.

The openings of sluices and mill dams always bring fish up the current to seek for the food which is brought with the stream; and angling in these places is usually successful.

The best season is from April to October; for, in very cold stormy weather, the fish will not bite; the best times of the day are from three till nine in the morning, and from three in the afternoon till sunset. In an easterly wind, there is never much sport for the angler; the southerly winds are the best for his purpose, and a warm but lowering day is most of all to be chosen; a gentle wind, after a sudden shower, to disturb the water, makes a very good opportunity for the angler: the cooler the weather in the hottest months, the better; but in winter, on the contrary, the warmer the day the better. A cloudy day, after a bright moonlight night, is always a good day for sport; for the fish do not care for going after prey in the bright moonshine, and are therefore hungry the next morning.

Those who are fond of angling might save themselves some fruitless trouble, by observing when small fish in a jar take or refuse food. See FISH.

The several methods of angling for salmon, trout, carp, tench, perch, pike, dace, gudgeon, roach, flounder, &c. may be seen under the article FISHING.

ANGLO-CALVINISTS, a name given by some writers to the members of the church of England, as agreeing with the other Calvinists in most points except church government.

ANGLO-Saxon, an appellation given to the language spoken by the English Saxons; in contradistinction from the true Saxon, as well as from the modern English.

ANGLUS, THOMAS, an English priest, well known for the singularity of his opinions, and several little tracts which he wrote in the 17th century. He went by several names. Mr Baillet says his true name was *White*; but that he used to disguise it under that of *Candidus*, *Albus*, *Bianchi*, and *Richworth*; but he was most known in France by the name of *Thomas Anglus*.

Des

Anglus || Angola.

Des Cartes generally called him Mr *Vitus*. He passed some time in most countries of Europe; but his longest stay was at Rome and Paris. When he was in England, he lived a considerable time in the family of Sir Kenelm Digby; and seems to have had a great esteem for the opinions of this gentleman, as may be seen in his writings, particularly in the Preface to his Latin work concerning the Institutions of the Peripatetic Philosophy, according to the hypothesis of Sir Kenelm. He was a great advocate for the Peripatetic philosophy. He attempted even to make the principles of Aristotle subservient to the explaining the most impenetrable mysteries of religion; and with this view he engaged in the discussion of predestination, free will, and grace. Mr Baillet says, "What he wrote upon this subject resembles the ancient oracles for obscurity." In such abstruse points as we have mentioned, he was much embarrassed; and, by giving too great scope to his own thoughts, he pleased neither the Molinists nor Jansenists. He is allowed, however, to have been a man of an extensive and penetrating genius. On the 10th of June 1658, the congregation of the Index Expurgatorius at Rome condemned some treatises of Thomas Anglus. The doctors of Douay censured also 22 propositions extracted from his Sacred Institutions. He published his *Supplicatio postulativa justitiæ*, in opposition to their censure; wherein he complains that they had given him a vague undetermined censure, without taxing any particular proposition. He died some time after the restoration of Charles II. but in what year is uncertain.

ANGOL, a city of Chili in South America, now in ruins. W. Long. 72. 59. S. Lat. 37. 36.

ANGOLA, a kingdom on the western coast of Africa, lying, according to the most probable accounts, between Lat. 8. 30. and 16. 21. S. forming a coast of upwards of 480 miles; but how far it extends from west to east, has never been exactly determined. Angola Proper is bounded on the north by the river Danda, which separates it from Congo; and on the south by the Coanza, by which it is separated from Benguela. This last, however, is now included in the kingdom of Angola, having been conquered by its monarchs, though it still retains the name of a kingdom, and is included in the dimensions we have just now given. The air here is very hot and unwholesome, and the country mountainous; there being but few plains to be met with in it, except on the sea-coast, and between the huge ridges of mountains.

1 Originally a province Congo.

That part of the kingdom which we have distinguished by the name of *Angola Proper*, was subject to the kings of Congo in the year 1484, when the Portuguese first discovered the country: but how long it had been so before that time, is not known; the inhabitants being utterly destitute of chronology, and having no other way of distinguishing past events, but by saying they happened in such a king's reign. Neither, though Angola became a distinct kingdom since its discovery by the Portuguese, is it known with more certainty at what time that revolution happened; or whether the Portuguese were not concerned in assisting the viceroy of the king of Congo, who governed the province of Angola, to set up for himself.

All accounts agree, that this kingdom was founded by one *Ngola* or *Angola*, from whom it took its name. According to the tradition of the country, this Ngola was a smith, and the inventor of that trade, in which he had been instructed by the demons of the country. In consequence of this, he became exceeding rich, not in gold, silver, or shell money, which were not at that time in use, but in corn, cattle, and fruits, which were then exchanged in traffic. The country being not long after visited by a grievous famine, Ngola generously relieved his distressed countrymen, and saved the lives of some thousands. In gratitude for this generosity, he was unanimously chosen king: and hence the smith's trade is reckoned among the royal arts of Angola.

Angola.

2 Tradition concerning its becoming a distinct kingdom.

According to other accounts, which can be more depended upon, Ngola was the king of Congo's viceroy; who, having become powerful by the reduction of several of the neighbouring states, was induced to set up for himself. Dreading, nevertheless, the power of his old master, he chose to send him the usual tribute and presents annually, till he reckoned himself firmly seated on the throne, and had secured it to his descendants. His measures were greatly facilitated by the wars which the king of Congo was then engaged in with the *Giagas*, a barbarous nation in the neighbourhood. These made such a powerful inroad into his dominions that he was glad to ask asssistance from Ngola; not as a subject, but as a friend and ally. This was readily granted; and the two monarchs continued ever after sending presents and assistance to each other, and encouraging a mutual commerce between their subjects.

3 More authentic account.

Ngola lived to a great age, highly respected by his subjects, and in alliance with the king of Congo and the Portuguese, whose numerous settlements on the coast had made them become very powerful. According to the custom of the country, he had many wives and concubines. By his chief favourite he had three daughters, *Zunda Riangola*, *Tumba Riangola*, and another whose name is unknown. Towards the latter part of his life, the king's chief care was to secure the crown to the eldest of these; for which purpose he consulted his beloved queen, who encouraged him in the design with all the eloquence in her power. By her advice, he sent for his lieutenant-general, a favourite slave, whom he had created viceroy over the whole kingdom to acquaint him with his resolution. The artful minister did not fail to applaud his design, though his intention was to defraud the princess, and seize the throne for himself. He accordingly took the opportunity, one day, when that princess and the whole court were employed in sowing their lands, to spread a report that the Angolic enemies had entered the kingdom, and were destroying every thing with fire and sword. In this confusion, the treacherous viceroy conducted the three princesses to the royal palace; and acquainting Ngola with the pretended danger, urged him to betake himself to a speedy flight. The frighted monarch, unable to stir with age, desired his minister to take the most proper means for his safety: whereupon, being a stout young fellow, he takes his majesty on his back, and carries him into a neighbouring wood; where he no sooner had him in a convenient place, than he stabbed him with a dagger. This stratagem was too shallow to remain long concealed; the murderer was quickly discovered, and many of the nobles rose in arms against him; but finding his party too strong to be opposed, they were at last obliged to submit, and suffer him

4 Ngola the first king.

5 Murdered by his prime minister, who seizes the throne.

Angola.

him quietly to ascend the throne, upon his publicly declaring that he had not seized it but with a view of securing it to the princess Zunda Riangola.

To this princess the usurper palliated his conduct in the best manner he could; and she had art enough to disguise her resentment so effectually, that he never discovered the smallest occasion for jealousy. At last, his sudden death gave Zunda an opportunity of ascending the throne peaceably; when she behaved with such moderation and justice, as to gain the love and affection of all her subjects. Her jealous temper prevented her from marrying; and, by giving too much way to it, she came at last to dread as rivals the two sons of her younger sister Tumba, and to form designs against their life. To accomplish her purposes, she ordered them to be brought to court, pretending to have them educated under her own eye. This was declined for some time; but at length the queen prevailed so far as to have the eldest sent to her; whom she no sooner got in her power than she caused him to be massacred, with all his attendants; only one escaping, all covered with wounds, to carry the dreadful news to the princess and her husband.

6 Death of the usurper, who is succeeded by Zunda Riangola.

7 Murders her nephew.

On hearing of this bloody act, the afflicted parents immediately sallied forth at the head of all their vassals. They were waited for by Queen Zunda at the head of a numerous army; but no sooner did her soldiers perceive the parents of the deceased prince, than they immediately abandoned the queen to their resentment. Tumba immediately rushed upon her sister, and stabbed her to the heart; after which, she commanded her entrails to be taken out, and thrown into the hole in which her son's body had been cast. Upon this Tumba was crowned queen of Angola, and invited her husband to participate with her in the management of public affairs. This offer he was too wise to accept; and Tumba, upon his refusal, resigned the crown into the hands of her surviving son, named *Angola Chilivagni*. He proved a great and wise prince, extending his dominions by conquest, and gaining the love of his subjects by the moderation and equity of his government.

8 Is herself murdered by her sister.

9 Dambi Angola a cruel tyrant.

He was succeeded by one of his younger sons, named *Dambi Angola;* who no sooner ascended the throne, than he put all his brethren to death, lest they should unite in favour of the eldest. The rest of his reign proved conformable to such a beginning. He was a monster of cruelty, avarice, lewdness, and perfidy. Death, however, in a short time, happily delivered his subjects from this tyrant; who, notwithstanding his infamous life, was buried with the greatest magnificence; and a mount was erected over his grave, consisting, according to the custom of the country, of a prodigious number of human victims which had been sacrificed to his ghost.

10 Ngola Chilivagni, his conquests.

Dambi Angola was succeeded by Ngola Chilivagni, a warlike and cruel prince. He conquered many nations, and made the most dreadful inroads into the kingdom of Congo, along the rivers of Danda, Lucalla, Zanda, and Coanza; whose waters were often tinged with the blood of thousands whom he massacred in his incursions. Notwithstanding these butcheries, Ngola Chilivagni showed such generosity to those who readily submitted to him, that he was sure to conquer, not only wherever he came, but wherever he seemed to direct his forces. At last, as if weary of conquest, he planted a tree on the banks of the Coanza, about eight leagues from Loanda San Paulo, as a boundary to his ravages. This tree the Portuguese called *Isanda* or *Isandaura;* and afterwards erected a fortress near it.

Angola.

11 Fancies himself a god.

The same folly and insolence which took place in the breast of Alexander the Great, on account of his rapid conquests, soon puffed up the mind of this petty African tyrant. Because he had conquered and ravaged some of the neighbouring countries, and brought under his subjection a few cowardly barbarians, he first fancied himself invincible, and then that he was a god. He demanded the same adoration and respect that was paid to their other deities; and with this demand his subjects were servile enough to comply. This pretended deity however, was forced to submit to the fate of other mortals, and died without leaving a successor behind him.

On the decease of Ngola Chilivagni, the states elected Ngingha-Angola-Chilombo-Kickasanda, great nephew to Queen Tumba's husband, as his successor. He proved such a rapacious and cruel tyrant, that his subjects universally wished for his death; which, luckily for them, soon happened. He was interred with the usual pomp and solemnities, particularly that of having a whole hetacomb of human victims sacrificed upon his grave. His son Bandi Angola, who succeeded him, proved yet a greater tyrant than his father; so that he soon became intolerable to his subjects. A general revolt ensued, in which his subjects called in the cannibal Giagas to their assistance. These immediately poured in like a band of hungry dogs hastening to feed upon a carcass; and having defeated and devoured the forces of the tyrant, besieged him in an inaccessible mountain; where, not being able to come at him, they resolved to reduce him by famine. Bandi Angola applied to the king of Congo for assistance. As it was the interest of that prince to hinder the ravenous Giagas from entering into the Angolic dominions, whence they could so easily pass into his own, he did not hesitate at granting his request; and ordered a strong reinforcement of the Portuguese, of whose valour he had a high opinion, and of whom he entertained a great number at his court, to march to the assistance of the king of Angola. The command of the army was given to one of the most experienced Portuguese officers; who, depending more on the handful of Europeans he had under his command than on the Congoese, attacked the rebels, though greatly superior in number; and having utterly defeated them, restored the king of Angola to his throne.

12 Revolt against Bandi Angola.

13 Quelled by the assistance of the king of Congo and the Portuguese.

This essential piece of service so endeared the Portuguese to Bandi Angola, that he took them into his service, and even into his council. Their general became a great favourite of the king, but much more so of his daughter, who conceived a violent passion for him. Unfortunately for them both, the amour was carried on with so little precaution on her part, that the king quickly discovered it; and immediately formed a resolution of exterminating the Portuguese all at once. Such violent measures, however, could not be concerted so privately but the princess got some intelligence of it; and having apprised her lover of his danger, he immediately withdrew into Congo, taking with him as many of his countrymen as he conveniently could. The king of Congo expressed such strong resentment against Bandi

14 The king's daughter falls in love with the Portuguese general;

15 who retires to Congo.

Angola. Bandi Angola for his ingratitude, that the Portuguese general would have probably prevailed upon him to declare war against Angola, had he not been obliged to defend his own dominions against a neighbouring prince who then made an invasion. This afforded that general a fair pretence of asking leave to return home; promising to come with such reinforcements as would enable the king of Congo to revenge himself for the affront put upon him by the Angolic monarch. His real intention, however, was to give the king of Portugal an opportunity of seizing upon the kingdom of Angola.

16 ays a plan r the con- uest of ngola be- ore the ing of ortugal. On his return to Lisbon, the Portuguese general having laid his plan before the king, it was so well relished, that an armament was ordered to be fitted out, well furnished with every necessary for building fortresses, &c. and a sufficient number of men. The wind proving favourable all the way back, the Portuguese soon arrived safe at Loanda San Paulo; whence the general dispatched a messenger to acquaint the king of Congo with his arrival, and to make him some rich presents. These were no sooner gone than the admiral sailed up the Coanza; and, landing without opposition in the kingdom of Angola, set about erecting a fortress in a convenient situation, which was completed in a few days.

The king being informed of the return of the Portuguese, and of their fortifying themselves on advantageous ground, gathered together a numerous army:

17 Defeats the Angolans. but his forces, though upwards of 100,000 in number, were utterly defeated by the Portuguese; and numbers killed, and many more carried into slavery. The admiral now ravaged the whole country, putting all to fire and sword, and making himself master of every advantageous spot of ground. The king, however, had still the good luck to escape all the stratagems that were laid for him; and once more got safe to his inaccessible fortress.

All this time Bandi Angola had himself tyrannized, and allowed his favourites to tyrannize, in such a manner, that his subjects were become no less weary of his government than when they formerly revolted. Being now exasperated beyond measure at the calamitous war of which he had been the occasion, they formed a design of putting an end to his life; and in order to draw him out of his retreat, where he wallowed in all manner of debauchery, they had recourse to the following stratagem: A deputation was sent, acquainting him with the revolt of one Cuculo Cabazzo; who, at the head of a numerous band, committed the most cruel ravages. They besought his majesty, either to levy a sufficient number of troops, and march in person against him, or to allow them to arm themselves against him. The credulous king complied with this last proposal; and granted them leave to raise what force might be thought necessary. Four days after, notice was sent to the king, that his subjects had attacked the rebels, and had been repulsed with loss; but that, if his majesty would but condescend to animate them with his presence, the sight of him would inspire them with such courage, that they would assuredly prove victorious. This had the desired effect; and the king set out a few days after, without any other precaution than his own guards, to head his army, which was encamped on the banks of the Lucalla. He no sooner appeared in view than all the chief officers came out to meet him; and having under pretence of paying their respects, gradually separated him from his guards, they fell upon him and dispatched him at once. Angola.

18 Bandi Angola murdered.

Bandi Angola was succeeded by his son Ngola Bandi, whose mother had been a slave, and whose title to the crown was consequently disputable, according to the laws of the country. Of this the new king being well apprised, thought proper to begin his reign by murdering every person who had opposed his election. He began with the *Tendula*, or commander of the king's rear guard; who, by his office, is the chief of the electors, and the person who governs the kingdom during the interregnum. Him he ordered to be put to death with all his family. These were followed by the principal officers of his father's court; all his concubines, together with their parents and near relations, whom he caused to be butchered; together with his half-brother, his father's son by a favourite concubine, and then but an infant. He did not spare even the son of his sister Zingha Bandi, whom she had by one of her paramours. The interest of his sister had contributed greatly to raise this tyrant to the throne; and his ingratitude, with the murder of her son, so exasperated her, that she swore to be revenged on him in the same way.

19 Cruelty of the new king.

20 Makes war on the Portuguese, and is reduced to great distress.

The Portuguese were the next objects of his resentment. These he so much dreaded on account of their valour and policy, that he immediately declared war, resolving not to lay down his arms till he had exterminated them to the last man, or driven them totally out of his dominions. His rashness, however, cost him dear. Myriads of the Angolic poltroons were overthrown by a handful of Portuguese; and the king himself was forced to fly, first into the island of Chiconda in the river Coanza, and then into the deserts of Oacco. Here his conquerors, out of great clemency, allowed him to live among the wild beasts, without any other sustenance than what the deserts afforded. He had the misfortune also to lose his queen and two sisters Cambi and Fungi who were taken prisoners by the Portuguese, but honourably treated.

The king being informed of this, sent an embassy to treat of their ransom and an exchange of prisoners. The proposal was readily agreed to; and the princesses were sent back, laden with presents. The king, however, refused to perform his part of the agreement, and thereby plunged himself into still greater difficulties. A new Portuguese viceroy being arrived about this time, Ngola was quite at a loss how to excuse the non-performance of his part of the treaty. At last he had recourse to his exasperated sister Zingha; and having excused, as well as he could, the murder of her son, proposed to send her on a splendid embassy to the viceroy. Having consented, but without forgetting her resentment, she set out, as plenipotentiary for the king of Angola, with a magnificent retinue; was received with all the honour due to her rank, and lodged in a splendid palace prepared for her.

21 His treachery.

22 Sends his sister Zingha on an embassy.

23 Her haughty behaviour.

At the first audience Zingha had of Don John (the Portuguese viceroy), she was greatly surprised to find a stately elbow chair prepared for him to sit upon, and for herself only a rich tapestry spread on the floor, with a velvet cushion embroidered with gold, and placed over against the chair of state. Dissembling her displeasure, however,

Angola. however, she beckoned to one of the ladies of her retinue, commanded her to lay herself down on her elbows and knees upon the carpet, and sat herself upon her back during the whole time of the audience. She behaved with such address and dignity, as to gain the admiration of the whole council. A proposal was made of entering into an alliance offensive and defensive with the king of Angola, provided he acknowledged himself the vassal of the king of Portugal, and submitted to pay a yearly tribute. To this Zingha replied, that such conditions were indeed fit to be imposed upon those who had been conquered by the sword; but not upon a great and powerful monarch, who only sought their friendship and alliance: upon which the treaty was concluded on both sides, without any other conditions than the exchange of prisoners. The audience being over, Don John took notice to Zingha, as he conducted her out of the hall, that the lady who had served her as a seat, continued still in the same posture; upon which she replied, That it did not become the ambassadress of a great monarch to make use of the same chair twice, so she looked upon her as a piece of cast-off goods not worthy of further notice.

Zingha was so taken with the honours done her by the Portuguese, and so intent upon observing the order, dress, arms, &c. of their troops, that she staid at Loanda a considerable time; during which she was instructed in the Christian religion, and consented to be baptized. Don John and his spouse were her sponsors; who dismissed her soon after, with all possible honours, and highly satisfied with her reception and success. At her return, she took care to have the articles ratified by her brother; who expressed his approbation of them, and the highest obligations to her. He even went so far as to desire the viceroy to send him some proper persons to instruct him in the Christian religion, which he said he was very desirous of embracing. This request was immediately granted; and Don Denis de Fiara, a negro priest, a native of Angola, was despatched, along with an officer of distinction, to stand godfather to the king. These met at first with a gracious reception: but when they came to talk of baptism, Ngola altered his tone, and told them it was too much below his dignity to receive it from the son of one of his slaves, and sent them both back. This was cried up by the courtiers as a princely act: but Zingha represented, that it could not fail to exasperate the viceroy; and tried all possible means to dissuade him from it, but in vain. He suffered, however, his other two sisters, Cambi and Fungi, to be baptized; which was performed in 1625, with a splendour suited to their dignity.

24 Embraces the Christian religion.

25 War again declared a gainst the Portuguese.

As no experience seems to have been a sufficient antidote against the innate folly of Ngola Bandi, he soon after took it into his head to make war on the Portuguese, and invaded some of their territories. This last action proved his ruin: his troops were all cut off, and himself forced to swim for his life to a small island in the Coanza, about a mile long, and two bow-shots in breadth; whither the Portuguese pursued and surrounded him; so that he had no other chance, but either to fall into their hands, or be devoured by the wild beasts with which the place swarmed. From both these dangers he was relieved by a dose of poison, given him, as was supposed, by his sister Zingha. Before this time, however, he had taken care to send his eldest son to the country of the Giagas, and put him under the care of one of their chiefs, called *Giaga Caza*, whom he besought to take care of him, and protect him from his aunt Zingha, as he rightly imagined she would not fail of attempting his life, in order to secure herself on the throne. Angola.

26 The king poisoned.

27 Zingha Bandi crowned queen.

Zingha Bandi was crowned queen of Angola, without opposition, in 1627.—She was a very artful woman, endowed with great presence of mind, firm in her resolutions, of an intrepid courage, and a great mistress in the art of dissimulation. She inherited a large share of her brother's jealous and cruel temper, to which she would not hesitate to sacrifice her nearest relations, if they gave her the least umbrage.—To this jealousy, therefore, she resolved to sacrifice her nephew, as well knowing he had a better title to the crown than herself. She made use of the most solemn oaths to draw him out of the hands of his guardian, protesting that she had accepted of the throne with no other view than to preserve it for him. But Giaga, being well acquainted with her temper, was proof against all her oaths and fair speeches.—Zingha, finding this method ineffectual, pretended a desire of resigning the crown to her nephew, to which she said she had no other objection, than that she was afraid he was yet incapable of assuming the reins of government. She therefore desired an interview with him, though ever so short, that she might satisfy herself in this particular, and promised to detain him no longer than Giaga should think necessary. Giaga thought there could be no danger in consenting to a short interview; and therefore sent the unfortunate prince to her, attended by a magnificent retinue. The cruel queen no sooner got him in her power, than she murdered him with her own hand, and caused his body to be thrown into the Coanza, ridding herself, by that inhuman act, of a dangerous rival, as well as revenging herself on her brother, as she had sworn to do, for the murder of her son.

28 She murders her nephew.

Zingha's next scheme was to rid herself of the Portuguese, who had established themselves in such a manner as to be almost entire masters of the country. They had built fortresses on every convenient spot that suited them, especially near her principal towns, which they could level with the ground with the greatest ease. They had engrossed all her commerce, were become very wealthy, and their numbers increased daily; so that they were dreaded not only by her subjects, but by all the neighbouring nations. As Zingha was of a martial temper, she did not long hesitate. She quickly made all necessary provisions, strengthened herself by alliances with the Giagas, and other idolatrous nations, and even with the Dutch and the king of Congo. With this combined force she attacked the Portuguese so suddenly and unexpectedly, that she gained some advantages over them: and the Dutch made themselves masters of San Paulo de Loanda, and soon after of some of the best provinces in the kingdom. This happened in the year 1641; and the Portuguese did not recover these places till the year 1648, when the Dutch were entirely driven out of Angola.

29 Declares war again the Portuguese.

30 Her bad success.

Zingha's successes proved still more short-lived. Her allies the Congoese were so completely overthrown, that they were forced to sue for peace; which the Portuguese did not grant till they had gained a sufficient

Angola.

ficient number of hostages, and obliged the Congoese to deliver up to them some considerable posts, upon which they immediately erected fortresses. Zingha's troops were now defeated in every battle; and these defeats followed one another so close, that she was soon abandoned, not only by her allies, but by her own troops. She was now constrained to abandon her dominions, and retire to some of the eastern deserts, whither the Portuguese did not think it worth while to follow her.

Zingha being reduced to such distress, the Portuguese, after giving her some time to ruminate on her situation, sent her proposals of peace, upon condition that she should become tributary to the crown of Portugal. This proposal she rejected with scorn; and let them know, that however her dastardly subjects might submissively and shamefully behave towards them, their queen disdained subjection to any foreign power. On this haughty answer, the Portuguese, to mortify her still more, set up a king in her place. The person they pitched upon was named *Angola Oarij*, or *Aaru*, who was of the royal family. Before he was crowned, the Portuguese obliged him to turn Christian; and he was accordingly baptized by the name of John. The new king, however, soon died of grief, at seeing himself so hardly treated by his masters the Portuguese. They quickly set up another, named *Philip;* who bore the yoke with more patience, and lived to the year 1660.

31 efuses to come tributary to iem.

32 hey set up king.

In the mean time Zingha, exasperated at seeing herself deprived of eleven of the best provinces in her dominions, and her authority in the remaining six greatly weakened, renounced the Christian religion, and embraced all the horrid and bloody customs of the Giagas, whom she outdid even in their own barbarity. —We have already hinted the barbarity of this nation in eating human flesh. In this Zingha not only joined them, but took pleasure in devouring the raw flesh of human victims, and drinking their blood while warm both at her sacrifices and at her public meals.—She affected a martial and heroic spirit, together with an utter aversion to the male sex; but, according to the Portuguese, maintained a number of the strongest and lustiest youths, in whose embraces she gave a full scope to her inclinations, and managed matters with such secrecy that her intrigues could never be discovered. At the same time she ordered many of her own sex to be ripped up, when their incontinency was manifested by their pregnancy; and their bodies with those of the infants to be cast to wild beasts.

33 Zingha's apostasy and horrid barbarity.

But what made her most admired, as well as dreaded, by her subjects, was a notion, that she had by various stratagems inculcated upon them, of her being able to penetrate into the most secret thoughts. To keep up this apprehension, she ordered the bones of her deceased brother to be brought from the island where he was poisoned, locked up in a chest covered with coarse plates of silver, and laid on a fine carpet upon a pedestal. A number of singhillos or priests were ordered to offer sacrifices to these bones, and to keep lamps continually burning before them. To this place she herself frequently repaired, to assist at those rites, which, as she gave out, and every body believed, engaged the spirit of the deceased to inform her of every thing that was done, said, or even designed, either in the kingdom or out of it.—To procure, however, as much real intelligence as possible, she kept vast numbers of spies all over the kingdom, who constantly gave her notice of what happened in their respective circles; and this she so cunningly improved to her own ends, that her subjects looked upon her as a kind of deity from whom nothing could be concealed.

Angola.

34 Her influence over the Giagas.

By such means as these, Zingha gained such authority over the Giagas, that they were ready, at the very first indication of her will, to follow her through the most dreadful dangers, and to engage in the most desperate enterprises. She now made many strenuous and daring efforts to drive out the Portuguese; but though she had, in all probability, more valour and skill than her enemies, their fire arms gave them such an advantage, that she was always defeated with great loss. Perceiving therefore the folly of attempts of this kind, she contented herself with making continual inroads into their country, carrying off or destroying every thing that fell in her way. Though she spared neither Europeans, nor blacks, who were subjects of the mock monarchs set up by the Portuguese, yet the case of the former was peculiarly dreadful when they happened to be taken prisoners. They were either roasted by a slow fire, or had their flesh cut off in pieces, and devoured before their faces, in the manner related by Mr Bruce of the Abyssinian oxen *. In this manner she infested the Portuguese territories for 28 years, scarce ever allowing them a moment's cessation of arms. Their mock kings were often obliged to shelter themselves from her fury in an inaccessible rock called *Maopongo;* and they themselves could never hope to enjoy their dominions with any kind of peace so long as this furious queen continued alive. They in vain exhausted all their politics either to reduce her by force, or to mollify her by presents and fair offers. The one she rejected with disdain, and always found means to baffle the other. Nor would she hearken to any terms, unless they consented to resign all their conquests. The refusal of this demand was so commonly followed by some marks of her resentment, that it was with the utmost difficulty the Portuguese could prevail on any body to carry their proposals to her; and as for Zingha, she disdained to make any to them, except those of the hostile kind. The terror of her arms procured her a free passage wherever she directed her course; all the inhabitants of a province making no less haste to abandon, than she to invade it. Thus she continued to advance, till at length she was got so far as the small island of Dangii in the river Coanza. The Portuguese now found themselves under the necessity of raising an army of negroes, in order to drive her out of it. Accordingly they surrounded the island, and intrenched themselves along the banks on both sides of the river; but while they were busy at their work, Zingha attacked them with such advantage, that she killed and wounded several hundreds of the blacks, and some of the white men. Elated with this advantage, she was preparing for another attack; when she perceived, to her surprise, that the Portuguese had drawn their lines so close, and raised them to such a height, that they overlooked her whole camp, and could fire upon her naked soldiers as if they shot at a mark.—Thus great numbers of her men were cut off, particularly her chief officers. The queen, now perceiving the

35 Her terrible ravages.

* See *Abyssinia.*

Angola.

danger of her situation, amused the Portuguese with proposals of an accommodation; and having obtained a truce for three days, crossed the river in the dead of the night, and led her forces to the province of Oacco. The next morning, the Portuguese, seeing no human creature upon the island, began to apprehend some new stratagem; but, upon landing some of their troops, they perceived themselves over-reached, and deprived of the fairest opportunity they ever had of forcing her to surrender at discretion.

36 Outwits the Portuguese.

Zingha staid no longer in that province whither she had retired, than till she was assured that the Portuguese were retired from the Coanza; and then, crossing that river once more, marched directly towards the kingdom of Metamba, which had been invaded by some of the neighbouring princes. The speed with which she led her forces thither, and recruited her army with multitudes of Giagas, who were all emulous of fighting under her banner, quickly enabled her to recover some of her territories in that kingdom. Beginning now to think herself successful, she again attacked the Portuguese; but was defeated with great loss, so as to be obliged to send for fresh troops. To complete her misfortunes, she received news that the Giaga Cassangi had taken the advantage of her absence, to enter the kingdom of Metamba with a numerous army, had carried off the greatest part of the inhabitants, destroyed all the fruits of the earth, plundered the towns of all that was valuable, and set fire to the rest, leaving that kingdom in a manner desolate. To add to all this, her troops, exasperated at the loss of their wives, children, and goods, which were carried to the farthest corner of Benguela, were all on the point of revolting.

37 Her complicated misfortunes.

38 The Portuguese send an embassy to her.

Notwithstanding these disasters, Zingha behaved with such resolution and address, that the Portuguese, who, according to character, had probably instigated the Giaga against her, were so much afraid of her joining with him in alliance against them, that they despatched one Anthony Coglio, a learned priest and an excellent negociator, with Don Gaspar Borgia an eminent officer, under pretence of negociating a peace between them, first to the Giaga, and afterwards to the queen. They met with a very civil reception from the first, who told them that he was very willing to live at peace with that princess, and even to let her enjoy the kingdom of Metamba, though he was the rightful heir to it, provided she would lay down her arms. This answer encouraged the priest to try whether he could prevail on him to embrace the Christian religion; but that was declined by the Giaga in such strong terms, that the priest thought proper to desist, and set out for Zingha's camp.

39 The proposals rejected.

The ambassadors, at their first arrival, met with such a polite reception, as made them hope for success; but after she had heard their proposals, she assumed a haughty threatening tone, and told them in the conclusion of her speech, "That it did not become her dignity to lay down her arms, till she had brought the war she had begun to an honourable conclusion: that as to the Giagas, whose sect she had embraced some years before, and who had furnished her with such a prodigious number of forces to fight in her defence, her honour and interest required that she should still keep them in her service, and under her protection: and lastly, that as to herself, she remembered, indeed, that she had formerly embraced Christianity; but that it was not now a proper season to propose her returning to it, and they ought to remember that they themselves were the cause of her abandoning it."

Angola.

Borgia, perceiving that she was not to be wrought upon by religious motives, shifted the topic; and told her, that she had gained honour enough in war, and that it was now high time to think of granting peace and tranquillity to the subjects of two such powerful kingdoms, and accept of the favour and friendship of the king of Portugal, which was offered her by his viceroy. To this the queen made answer, that she was perfectly well acquainted with the valour and strength of the Portuguese, and should esteem it an honour to be allied to that monarch; but that she thought it just that their respective claims to the dominions which she justly inherited from her ancestors, and of which he had unjustly deprived her, should first of all be decided, either by the sword or by some equitable judges.

Borgia, vainly imagining that he had now obtained enough, set off immediately for Loanda San Paulo; but left the priest, on some pretence or other, to see whether, in the time of sickness, he could make any impression on the inflexible mind of Zingha, who now laboured under a lingering disease. Coglio, however, found all his arts to no purpose; and, upon the queen's recovery, she commenced the war with more fury than ever.

40 Zingha's narrow escape.

For some time hostilities were carried on with various success; Zingha being sometimes victorious and sometimes defeated. In one attempt of the latter kind, before the fortress of Massangana, she not only lost a great number of men, but had her two sisters Cambi and Fungi taken prisoners, she herself escaping with the utmost difficulty. Exasperated by this loss, she led her troops into some of the best provinces of the Portuguese, and reduced them to a mere wilderness. Still, however, she had the mortification to find her losses vastly greater than what she gained; and had now the additional misfortune of losing her sister Fungi, who was put to death by the Portuguese for treachery, and seeing her allies the Dutch totally expelled out of Angola.

41 Begins to relent;

Zingha being thus oppressed with a complication of misfortunes, and conscious of the crimes she had committed, began seriously to consider whether such a continued series of disasters was not owing to the displeasure of the God of the Christians. To this opinion she seemed to have inclined; and therefore began to treat with more lenity such Christians as fell into their hands, especially if they happened to be priests or monks. To these she now began to listen with some attention; and ordered them under severe penalties, to be treated with all possible respect; yet, without losing in the least that invincible hatred she had conceived against those who had stripped her of her dominions, or dropping her resolution never to make peace till she had recovered them.

42 but still resists the artifices of the Portuguese.

The viceroy, Don Salvador Correa, who had driven out the Dutch, being apprised of the regard shown to the clergy by Queen Zingha, thought proper to send some capuchins to her, in hopes that they might now find her more tractable. But Zingha was still proof against

Angola. against their utmost art; observing, however, that if they would consent to restore what they had unjustly taken from her, she would not only return to the Christian religion, but encourage it to the utmost of her power.

The viceroy, being now afraid that Zingha might make an alliance against him with the king of Congo, first raised a powerful army, and then acquainted that monarch, that, if he designed to prevent the total ruin of his dominions, he must immediately make reparation for all the damage he had caused to the Portuguese by his alliance with the Dutch. The fame of the Portuguese valour so intimidated the king that he submitted to a treaty almost on the viceroy's own terms; and as soon as this treaty was concluded, Don Ruy Pegado, an old experienced officer, was despatched to Zingha, offering a firm and lasting alliance with her, provided she renounced the Giagan sect, and returned to the bosom of the church. To this embassy she returned the old answer, namely, that the Portuguese themselves had been the occasion of all that had happened; as they had not only stripped her of her hereditary dominions, but dared to proclaim one of her vassals king of Angola; but, provided these dominions were restored, she would immediately embrace Christianity.

43 Their infamous conduct. All this time the furious Queen Zingha went on with her ravages, notwithstanding the viceroy kept plying her with letters for near three years. At last he had recourse to the artifice of taking advantage of the remorse for her crimes with which Zingha was sometimes affected, in order to procure the peaceable enjoyment of his own ill-gotten conquests.

It is easy to see, that had this viceroy, or the priests he employed, really intended to convert Zingha to Christianity, they ought to have so far set her an example, as at least to abandon part of the countries of which they had robbed her: but, instead of this, they impiously made use of the sacred name of our Saviour, in order to deter a poor savage African from recovering what justly belonged to her.

44 She returns to Christianity. Queen Zingha, at last, came to incline so much to return to the Christian religion, that a general murmur ran through her army. But having, by various artifices, reconciled the minds of her subjects to this event, she explained her design in a set speech; offering at the same time liberty to those who chose to abandon her on this account to go where they would; and such was their attachment to her, that even on such a sudden and important change in her resolutions, they expressed no uneasiness, but on the contrary applauded her to the highest degree.

The Portuguese, after having been harassed in a terrible manner for 28 years, and at last obliged to profane the name of their Saviour to procure a peace, began now freely to enjoy the fruits of their villany. A

45 Treaty with the Portuguese proposed. treaty was set on foot between the viceroy and Zingha; which, however, was not easily concluded. She demanded the release of her sister Cambi, whose Christian name was Donna Barbara; and the Portuguese demanded a ransom of 200 slaves or an equivalent in money. This Zingha did not well relish; and, being pressed to a compliance, threatened them with a more furious war than any they had yet experienced. Upon this the viceroy was obliged to have recourse to the usual method of sending priests to persuade her to comply through motives of religion. These hypocrites effected their purpose; and the slaves were sent, as if Christianity required the delivering up innocent people to those who had no lawful authority over them; but not being able to conclude a lasting peace about the cession of the Angolic provinces, they were forced to conclude a short truce, and sent back her sister. Angola.

This princess was received by Zingha in a very affectionate manner: and, some time after, the queen, her mind being probably weakened through the infirmities of old age, not only was thoroughly reconciled to the Portuguese, but looked upon them as her best friends. She encouraged the Christian religion; had a church built in her capital; made several laws against Paganism; and, *to encourage marriage*, she herself wedded a handsome young fellow in the 75th year of her age.

The Portuguese now imagining they would at last gain their point, proposed to her the following terms, as the basis of a lasting treaty between the two nations. 46 The Portuguese terms. 1. "That they should yield to her, *as a present*, some of the countries of which they had already robbed her. 2. That, in consideration of the said present, which should in nowise be interpreted as an investiture, the queen should pay yearly a certain acknowledgment to the king of Portugal, who should be at liberty to withdraw the said present whenever she failed of making the said acknowledgment. 3. That a free commerce should be opened between those two states, as well for slaves as for other merchandises. 4. That the queen should molest none of the lords that were feudatory to the Portuguese, whatever damages or ravages they might have committed during the late wars between them. 5. That she should restore all the Portuguese slaves that had taken refuge in her dominions. 6. That she should deliver up the Giaga Colanda, who had revolted from the Portuguese, upon condition that his crime should go unpunished."

The queen, having now a thorough view of the deep-rooted villany of those with whom she had to do, conceived such displeasure against the Portuguese, that she fell sick. During this sickness, Father Anthony, her chief confidant, and a creature of the viceroy, never left off soliciting her to make her peace with God, and to accept of the terms offered her by the Portuguese: but Zingha, though worn out with age and sickness, had still the good sense to perceive, that there was no connexion between making her peace with God and complying with such infamous terms; and therefore 47 The queen's noble answer. gave the following answer, which, under such circumstances, shows a magnanimity scarce equalled in any age or in any country. 1. "That as to her conversion, as it was neither owing to any desire of obtaining a peace, or other worldly motives, but the Divine grace by which she was recalled, she was resolved to persevere in it to her last breath. 2. That as to her going over to the Giagan sect, she had in a great measure been forced to it by the Portuguese viceroy. 3. That the king of Portugal would do a generous act in restoring some of her Angolic dominions; but it would be more so, were he to restore them all. 4. That as to her paying homage to him, neither her mind nor heart were base enough to consent to it; and that as she had refused the proposal while she lived among the Giagas, much more did she think herself

above

Angola. above it now she was a Christian queen, and owed neither tribute nor homage to any but to the Supreme Power, from whom she had received both her being and her kingdom: That, nevertheless, if she could be convinced that there was any thing in her dominions that would be acceptable to his Portuguese majesty, she would voluntarily make him a present of it; and as to the rest of the articles, such was her desire of making a firm and lasting peace with them, that she should make no difficulty of consenting to them."

This answer was not altogether satisfactory to the viceroy; but the priest, finding it impossible to make any impression upon her mind, easily prevailed upon him to consent to the following terms: 1. "That the river Lucalla should be the boundary between the dominions of the Portuguese and of Queen Zingha. 2. That neither side should henceforth give any reception to the fugitive slaves of the other, but send them back without any delay, together with the prisoners which had been taken during the last year. 3. That the queen should remain wholly free and exempt from all tribute and homage whatever, provided she agreed to the other articles."

48 Articles of the treaty.

49 The peace signed.

These terms were at last signed by the queen and viceroy in the month of April 1657, and ratified by the king of Portugal in the month of November the same year.—The only difficulty the queen had concerning this treaty was with regard to the Giaga Colanda: and the manner in which she extricated herself from it, with her subsequent behaviour, cannot fail to give us a high idea of the mental abilities of this African heroine.

50 Zingha's honourable behaviour.

The Giagan chief, weary of the Portuguese yoke, had retired from them, at the head of 1000 stout soldiers, and a much greater number of slaves, some leagues beyond the river Lucalla, and put himself under the queen's protection. This she readily granted, as he was very able to be serviceable to her in case the perfidious conduct of the Portuguese should oblige her to renew the war. She could not therefore but look upon it as unjust and dishonourable, to deliver up a brave chief who had devoted himself to her service, and whom she had taken under her special protection, to a nation with whose perfidy she was so well acquainted. To save her honour, therefore, some time before the ratification of the treaty, she sent privately for the Giaga, and acquainted him with the demand of the Portuguese; telling him, at the same time, that though she doubted not of the viceroy's keeping his word, and forgiving his offence, yet she advised him to go out of her dominions, and settle himself and his men in some country distant from the Portuguese frontiers; but forbade him, on pain of her highest displeasure, to commit the least outrage or hostility within their dominions.

The Giaga thanked her majesty, and seemed to acquiesce with her advice, but did not follow it. On the contrary, he had no sooner reached his fortress, than he set himself about fortifying it in such a manner as looked rather like defiance than defence: and, having gathered a considerable army, soon spread a general terror around him. Of this the Portuguese failed not to complain to the queen: who immediately marched against him, surprised and defeated his army; and he

51 Defeats and kills the Giaga Colanda.

himself being killed in the action, his head was cut off and sent to the Portuguese. Angola.

This was among the last memorable actions performed by this famous queen; who, now finding herself unfit for the fatigues of war, contented herself (in 1658) with dispatching an old experienced general against a neighbouring prince who had invaded her territories. He proved no less successful than herself, and quickly forced the aggressor to submit to her terms. She now gave herself up to study the best method of propagating Christianity among her subjects; and for this purpose sent a solemn embassy to Rome, to pay homage to the Pope in her name, to request a fresh supply of missionaries. To this letter she received an answer from his Holiness in 1662; and it was read in the church that same year, in the most public and solemn manner. The day appointed was the 15th of July; on which she repaired to the church at the head of a numerous retinue, and having the letter hanging about her neck in a purse made of cloth of gold. The concourse was so great, that the church could not contain one half of the people, so that none were admitted but persons of rank. The father having finished the mass, read the letter at the altar in the Portuguese language; and the secretary interpreted it in that of the country. The queen, who had stood all the while it was reading, went towards the altar, and on her knees received it from the father; and having kissed it, and sworn afresh upon the gospel to continue in obedience to the church of Rome, kissed the letter again, put it into the purse, and returned to the palace amidst the shouts and acclamations of many thousands of her subjects. On that day she gave a magnificent treat to the Portuguese resident, and to all her court, in two great porticos, and she herself vouchsafed to eat after the European manner; that is, sitting on a stately elbow chair, with a high table before her, covered with the finest linen, and with dishes, plates, knives, and forks, all of silver gilt. She bestowed some largesses upon her chief officers, released a good number of slaves, and at night appeared at the head of her ladies of honour, both she and they dressed in the Amazonian manner. They performed a kind of combat, in which the queen, though upwards of eighty years of age, behaved with all the vigour and activity of a woman of thirty.

52 Encourages Christianity.

53 Ceremonie at receiving a letter from the pope.

Her life, however, was not lengthened in proportion to her vigour and activity; for in the month of September she was seized with an inflammation in her throat; which, in December, having seized her breast and lungs, she expired on the 17th of that month, and was succeeded by her sister Barbara.

54 Zingha dies.

The deceased queen was buried with extraordinary pomp; and out of regard to her, Barbara was inaugurated a second and third time, with the greatest pomp, and the most joyful acclamations. She was a very zealous Christian, but wanted her sister's abilities, and had the misfortune of being in the decline of life, lame, and almost blind. Besides this, she had been married to a proud ill-natured husband, named Mona Zingha: who, though to her he owed all his fortune and advancement, being himself no more than the son of a slave, used her with such cruelty, even in the late queen's life, that she was obliged to take refuge in the palace, from whence he had the insolence immediately to

55 Succeeded by her sister Barbara.

56 Cruelty of her husband Mona Zingha to her.

Angola. to fetch her. This so exasperated Queen Zingha, that she had well nigh ordered him to be cut in pieces before her face; but pardoned him at the request of Father Anthony, who probably knew he was privy to some religious secrets, which he might, in case of such emergency, have disclosed. On Barbara's accession to the throne, however, he not only redoubled his cruelty to her, in hopes of getting the management of affairs entirely into his own hands, but invented accusations against Anthony himself, with a design to extirpate both him and his religion. He gave out that the late queen had been poisoned by some favourite European dishes, with which Brother Ignatio used to regale her during her last illness; and attributed his wife's lameness and blindness to some sorceries or charms used by the convent against her. He had even persuaded, or rather forced, his queen to consent that some of the singhillos or priests should be brought to counter-charm her distemper.

57 He accuses Father Anthony:

58 Who reprimands the queen.

Father Anthony, far from being intimidated at the accusations brought against him, repaired immediately to the palace; where he boldly reprimanded the queen for giving ear to these jugglers, threatening at the same time to leave her dominions, and carry off with him all the crosses and other religious utensils, from which alone they could have any benefit. The queen returned a very submissive answer; and promised to deliver up the counter-charms which she at that time had upon her, before sunset; which she accordingly did, and sent them to the convent by the hands of her secretary. This so exasperated her husband, and all the Giagan sect, that they resolved upon the destruction of all the priests and Europeans, and even the queen herself. This, however, was found improper to be attempted; and Mona Zingha was so much chagrined at his disappointment, that he retired to his own estate; giving out, that he designed to meddle no more with state affairs; but, in reality, to concert measures for engrossing the sovereignty to himself, and to deprive his wife of her life and crown.

To accomplish his purpose, he sent a messenger to her, desiring her to repair to his house, where he had something of importance to communicate; but she declining the invitation by the advice of Father Anthony, he found himself disappointed, and begged leave to retire to a neighbouring province, which was under his government. He was again disappointed, and forbid to stir out of the province of Metamba. The queen was, however, guilty of an error not long after, in sending Mona Zingha, at the head of an army, to

59 Mona Zingha revives the Giagan rites;

quell a revolt on the frontiers. On his returning victorious, he thought himself strong enough to revive the ancient Giagan rites, and therefore ordered 100 slaves to be sacrificed to the manes of the deceased queen. Though the queen was immediately apprised of his intention, and dispatched a messenger expressly commanding him to desist; yet Mona, by distributing some presents, particularly some European wines, among the counsellors, effected his purpose with impunity. He did

60 and poisons Father Anthony.

not forget to send some of this wine to Father Anthony; but to prevent suspicion, presented him only with a small quantity, to be used, as he said, at the mass; adding, that if it proved agreeable, he would supply him with a larger quantity. The unsuspecting priest drank about two glasses of it; and in about a quarter of an hour was seized with violent convulsions in his bowels, and other symptoms of being poisoned. By proper assistance, however, he recovered: yet so far was he disabled by this dose, that he was obliged to abandon his mission. Angola.

61 The queen dies.

The queen's infirmities in the mean time daily increasing, Mona Zingha was soon delivered from all further opposition on her part, by her death, which happened on the 24th of March 1666. Upon this, Mona Zingha made all possible haste to get himself elected king; and immediately renounced the Christian religion, raising a persecution at the same time against its professors. He even wrote to the Portuguese viceroy, acquainting him with his having renounced Christianity, which he had only embraced out of complaisance to his queen, and with his design to revive the Giagan rites.

62 Cruelties of Mona Zingha.

To shew that he meant to be as good as his word, he ordered all the children under six years of age, that could be found, to be sacrificed in honour of their infernal deities. He also recalled the singhillos, and heaped many favours upon them; so that they became entirely devoted to his purposes. He likewise caused many of his subjects to be privately poisoned; and then gave out, that their unaccountable deaths were owing to their having abandoned the religion of their ancestors, and embraced Christianity; which he styled the religion of a parcel of famished strangers, who, through their extreme misery, had been forced to leave their native country, and seek for a livelihood in the richest provinces of Africa.

By these and such like stratagems he almost entirely extirpated Christianity, and any appearances of civilization which had been introduced among his subjects. His career, however, was stopped by Don John the princess Barbara's first husband, from whom she had been divorced on account of his having another wife. He soon compelled the usurper to fly into an island in the Coanza; but not having the precaution to reduce him entirely, Mona Zingha found means to retrieve his affairs, and at last defeated and killed Don John himself, by which he became master of the throne without any further opposition. He was no sooner re-established, than he began to pursue his butcheries with more fury than ever; when, on a sudden, Don Francisco, the son of Don John, appeared at the head of an army in

63 He is defeated and killed.

opposition to the usurper; and in the first engagement Mona Zingha being defeated and killed, Don Francisco became sole master of the empire.

It is not known whether this prince kept to the terms of the alliance made by Queen Zingha with the Portuguese or not. These, however, have preserved their conquests, and for some time they allowed the natives to choose a king for themselves, or rather they chose him for them, as we have already noticed. These

64 Low state of the kings set up by the Portuguese.

kings enjoyed only a mere shadow of royalty; their whole grandeur consisting in being allowed to breed peacocks, and adorn themselves with their feathers, which was forbidden to their subjects under pain of perpetual slavery. The last of these kings was named Ngola Sedesio, who disliking an empty name of royalty, revolted from the Portuguese, and carried on a long war with them; but being at last defeated and killed, his head was cut off, salted, and sent to Lisbon in pickle. After this the Portuguese seem not to have thought it safe to trust their Angolic subjects even with the

Angola, Angon.

the name of a king of their own, but have vested the power entirely in their viceroy; but, as to the extent of his dominions, and how matters stand between him and that race of Angolic princes who have preserved their liberty, we are entirely in the dark.

65 Division into provinces.

When in its greatest splendour, the kingdom of Angola contained the 17 following provinces: Chessama, Sumbi, Benguela, Rimba, Sietta, High and Low Bembea, Temba, Oacco, Cabezzo, Lubolo, Loanda, Bengo, Danda, Mosiche, Higher and Lower Ilamba, Oraij, and Embacca. The provinces conquered by the Portuguese during the wars above mentioned were, Danda, Mosiche, Bengo, the Higher and Lower Ilamba, Oraij, Embacca, Benguela, Sietta, Cabezzo, Lubolo, and

66 Rivers.

Oacco.

The principal rivers are those already mentioned, viz. the Danda and Coanza. The Coanza is large, deep, and rapid. It empties itself into the Atlantic ocean about latitude 9° 20′ south, twelve leagues south of Loanda the capital of the kingdom. It is navigable for 150 miles, and abounds with variety of fish. It forms several islands, has some cataracts, and one in particular which bears its name. As for its source, and the length of ground it crosses from east to west before it comes to the Portuguese settlements, it is absolutely unknown, as well as the countries through which it runs. Its mouth, which runs between the capes Palmerino and Lego, is above a league wide; the northern shore is the deepest, and along which the vessels sail. The fall of this river into the ocean is so rapid, that the sea appears quite muddy for two or three leagues below it. Its mouth is not easily perceived from the open sea, by reason of an island quite covered with high trees which lies just before it. The two principal islands formed by this river are called *Massander* and *Motchiamia*. The one is six leagues long, and about two miles broad: it is very fertile in maize, millet, and some other grains, which are reaped at three different seasons of the year. It produces likewise vast quantities of manhioc, a root of which they make a coarse kind of meal, which serves instead of bread. Here also grow great numbers of palm and other fruit trees of various kinds. The island of Motchiamia is four or five miles long, and one in breadth, mostly plain, and producing variety of roots and herbs. It likewise abounds in cattle; and there were formerly five or six Portuguese families settled upon it, who drove a considerable trade in those commodities, and likewise in slaves.

Concerning the river Danda we know little or nothing: only, that though its mouth is not above 70 or 80 miles distant from that of the Coanza, yet their distance grows so considerably wider as you penetrate further into the inlands, as to be much above twice if not thrice that space; though how much, is not exactly known.

The manners, religion, and dress, &c. of the inhabitants, are much the same with the Congoese. See CONGO.

ANGOLA *Pea*, or *Pigeon pea*. See CYTISUS, BOTANY *Index*.

ANGON, in the ancient military art, a kind of javelin used by the French. They darted it at a considerable distance. The iron head of this weapon resembled a fleur-de-luce. It is the opinion of some writers, that the arms of France are not fleurs-de-luce, but the iron point of the angon or javelin of the ancient French.

Angon || Angoy.

ANGOR, among ancient physicians, a concentration of the natural heat: the consequence of which is a pain of the head, palpitation, and sadness.

ANGOT, a province or kingdom of Abyssinia, formerly rich and fertile, but almost ruined by the Gallas, a wandering nation in the internal parts of Africa, who dispossessed the Abyssinian monarchs of all that was worth possessing.

ANGOULESME, a city of France, the capital of the former duchy of Angoumois, now the department of Charente, and the see of a bishop. It is seated on the top of a hill, surrounded with rocks, at the foot of which runs the river Charente. The inhabitants are said to be about 8000, and have a considerable trade in paper, which they manufacture. E. Long. 0. 14. N. Lat. 45. 39.

ANGOUMOIS, formerly a province of France, now a district, bounded on the north by Poitou, on the east by Limosin and Marche, on the south by Perigord, and on the west by Saintonge. Through this province run the rivers Touvre and Charente. This last is full of excellent fish; and though it often overflows its banks, it is so far from doing any damage, that it greatly enriches the soil. The Touvre is full of trouts. The air is generally warmer than at Paris, though the country is hilly. The soil produces plenty of wheat, rye, oats, Spanish corn, saffron, grapes, and all sorts of fruits. Here are several iron mines, which yield a very good sort of iron.

ANGOURA, ANGORA, or ANGORI, a city of Asia, in Anatolia, formerly called *Ancyra*, and still full of remarkable antiquities, which are so many marks of its ancient magnificence. It is at present one of the best cities in Anatolia; its streets are full of pillars and old marbles, among which are some of porphyry and jasper. The greatest part of the pillars are smooth and cylindrical; some are channelled spirally; but the most singular are oval, with plate bands before and behind from the top to the bottom of the pedestal. The houses are now made of clay, which is sometimes intermixed with fine pieces of marble. The walls of the city are low, with very mean battlements. The masonry of the walls is intermixed with pillars, architraves, capitals, and other ancient fragments, especially that of the towers and gates. The castle of Angora has a triple enclosure; and the walls are of large pieces of white marble, and a stone much like porphyry.

The basha of Angora has about 30 purses income; and there are here about 300 janizaries, under the command of a sardar. The Turks are said to be 40,000, the Armenians 4000 or 5000, and the Greeks 600. The Armenians have seven churches, besides a monastery, and the Greeks two. They breed the finest goats in the world; and their hair, which is of a dazzling white, is almost as fine as silk, and nine inches in length: it is worked into very fine stuffs, particularly camblet. All the inhabitants are employed in this manufacture. Several large caravans pass through this city to different places. E. Long. 32. 5. N. Lat. 39. 30. See ANCYRA.

ANGOY, a kingdom of Loango in Africa, bounded

Angoy. ed on the north by Cacongo, and on the south by Congo; from the former of which it is separated by the river Cabinda, and from the latter by the river Zaire. It is but of small extent; being only a vassal province of Cacongo, till the mani or prince, who had married a Portuguese's daughter, was persuaded by his father-in-law to make himself independent. This he effected at a favourable juncture, the king of Loango having but just before revolted from the king of Congo, and the king of Cacongo from the new king of Loango. The country is full of woods and thickets; and has no towns of any note, except one called Bomangoy, situated on the north bank of the Zaire, and not far from its mouth. Its chief port is Cabinda, called also Kabenda, or Cubenda, situated on the mouth of a river of the same name, about five leagues north of Cape Palmerino, on the north side of the Zaire's mouth. The bay is very commodious for trade, or wooding and watering along the shore. It is flat and marshy in some places; but ascends gradually about three miles inland, and then forms itself into a ridge of hills. On the ascent of these is situated a town belonging to the father-in-law of the king above mentioned, where he constantly kept a stock of wood ready cut, to sell to foreign ships at an easy rate. From these wood piles, south-west along the bay, lie scattered a number of fishermen's huts, on each side a small fresh-water river which falls into the bay; and thence all the water for ships is brought in casks to the mouth of the river, which is so shallow, that even at full flood it can only be entered by a yawl carrying a cask or two. The town stands on the round point of the bay looking to the westward; and the English have a factory on the south-west of the road.

The country round the bay is mostly barren; owing chiefly to the laziness of the inhabitants, which often occasions a scarcity of provisions. The wild beasts swarm so in the woods, that they destroy all the tame kinds; so there are no cattle bred here but hogs. From the woods in this country some monkeys have been brought away which in shape and stature resembled the human species. Civet cats abound here in great plenty, and parrots may be bought for three or four ordinary knives. The coasts abound so with oysters, that the sailors quickly load their boats with them; they being found lying in great heaps like small rocks. The natives follow the occupation of fishing more than any other. They fish both in the sea and in the rivers, making use of drag nets, which have long canes fixed at equal distances, instead of corks, to show when any fish is caught. These nets are made of a peculiar kind of root, which, after being beaten, may be spun like hemp.

The dress of the inhabitants is the same with that of the Congoese. They allow polygamy, and the best beloved wife hath the command of the rest; but is no less liable to be turned out, if she proves unfaithful. The ladies of the blood-royal have the privilege of choosing their husbands out of any, even the meanest rank; and have even the power of life and death over them; as likewise over their paramours, if any of them are caught tripping: but the husbands are by no means entitled to expect the same fidelity from their royal ladies. Women of the lower rank are obliged, when they receive a stranger, to admit him for a night or two into their embraces. This obliged the missionaries, who travelled through this country, to give notice of their approach to any of their houses, that none of the female sex might enter within their doors.—Their religion consists chiefly in a variety of superstitious customs; such as powdering their public and domestic idols with the dust of a kind of red wood, on the first day of the moon, and paying a kind of worship to that planet. If, on that night, it happens to shine clear and bright, they cry out, "Thus may I renew my life as thou dost;" but if the air is cloudy, they imagine the moon hath lost her virtue, and pay her no respect. We do not hear of their offering any sacrifices to their idols; though they commonly consult them about the success of their enterprises, thefts, or such like. The king of Congo still styles himself sovereign of Angoy; but the king of this little state pays neither tribute nor homage to any foreign power. Angoy, Angra.

ANGRA, a city of Tercera, one of the Azores; the capital, not only of that island, but of all the rest, and the residence of the governor. It is seated on the south side, near the middle of the longest diameter of the island, on the edge of the sea. The harbour is the only tolerable one in the whole island, being equally secured against storms and the efforts of an enemy. It is of the form of a crescent; the extremities of which are defended by two high rocks, that run so far into the sea as to render the entrance narrow, and easily covered by the batteries on each side. From this harbour the town is said to derive its name, the word *Angra* signifying a creek, bay, or station for shipping; and this is the only convenient one among all the Azores. The opening of the port is from the east to the south-west; and, according to Frezier, it is not above four cables length in breadth, and not two of good bottom. Here ships may ride in great safety during the summer; but as soon as the winter begins, the storms are so furious, that the only safety for shipping is the putting to sea with all possible expedition. Happily, however, these storms are preceded by infallible signs, with which experience has made the inhabitants perfectly well acquainted. On these occasions the Pico, a high mountain in another of the Azores, is overcast with thick clouds, and grows exceedingly dark; but what they look upon as the most certain sign is the fluttering and chirping of flocks of birds round the city for some days before the storm begins.

The town is the see of a bishop, under the jurisdiction of the archbishop of Lisbon. It hath five parishes, a cathedral, four monasteries, as many nunneries, besides an inquisition and bishop's court, which extends its jurisdiction over all the Azores, Flores, and Corvo. It is surrounded by a wall and a dry ditch, and is defended by a castle rendered famous by the imprisonment of King Alphonso by his brother Peter in 1668. Of late the fortifications have been much neglected. Though most of the public and private buildings have a good appearance externally, they are but indifferently furnished within; but for this poverty the Portuguese excuse themselves, by saying, that too much furniture would prove inconvenient in so warm a climate.

At Angra are kept the royal magazines for anchors, cables, sails, and other stores for the royal navy, or occasionally for merchantmen in great distress. All ma-

Angrivarii || Anguinum

ritime affairs are under the inspection of an officer called *Desembergrador*, who hath subordinate officers and pilots for conducting ships into the harbour, or to proper watering places. The English, French, and Dutch, have each a consul residing here, though the commerce of any of these nations with the Azores is very inconsiderable.

ANGRIVARII, (Tacitus): a people of Germany situated between the Weser and the Ems, and eastward reaching beyond the Weser, as far as the Cherusci, on which side they raised a rampart (Tacitus); to the south, having the Tubantes on the Ems, and on the Weser where it bends to the forest Bacemis; to the west, the Ems and the confines of the Bructeri; and to the north, the territory of the Angrivarii lay between the Chamavi and Ansibarii. Ptolemy places them between the Cauchi and Suevi or Catti. Supposed now to contain a part of the county of Schaumburg, the half of the bishopric or principality of Minden to the south, the greatest part of the bishopric of Osnaburg, the north part of the country of Teclenburg, and a part of the county of Ravensburg. A trace of the name of the people still remains in the appellation *Energn*, a small town in the county of Ravensburg.

ANGUILLA, one of the West India or Caribbee islands, lying in about 18° 15′ N. Lat. It has its name from its snake-like form; and is about ten leagues in length and three in breadth. It was first discovered by the English in 1650, when it was filled with alligators and other noxious animals; but they, finding the soil fruitful, and proper for raising tobacco and corn, settled a colony on it, and imported live cattle, which have since multiplied exceedingly. But the colony not being settled under any public encouragement, each planter laboured for himself, and the island became a prey to every rapacious invader, which disheartened the inhabitants so much, that all industry was lost among them. Their chief sufferings were from a party of wild Irish, who landed here after the Revolution, and treated them worse than any of the French pirates who had attacked them before. The people of Barbadoes, and other English Caribbees, knowing the value of the soil, several of them removed to Anguilla, where they remained for many years, and even carried on a profitable trade, though without any government either civil or ecclesiastical. In 1745, their militia, though not exceeding 100 men, defended a breastwork against 1000 French who came to attack them; and at last obliged them to retire with the loss of 150 men, besides carrying off some of their arms and colours as trophies of their victory. Since that time the inhabitants have subsisted mostly by farming; though they still plant sugar, and the island is said to be capable of great improvements.

ANGUILLIFORM, an appellation given by zoologists, not only to the different species of eels, but to other animals resembling them in shape.

ANGUINA. See TRICOSANTHES.

ANGUINUM OVUM, a fabulous kind of egg, said to be produced by the saliva of a cluster of serpents, and possessed of certain magical virtues. The superstition in respect to these was very prevalent among the ancient Britons, and there still remains a strong tradition of it in Wales. The account Pliny * gives of it is as follows: Præterea est ovorum genus in magna "Galliarum fama, omissum Græcis. Angues innume-

*Lib. xix. 3.

"ri æstate convoluti, salivis faucium corporumque spu- "mis artifici complexu glomerantur; anguinum appel- "latur. Druidæ sibilis id dicunt in sublime jactari, "sagoque oportere intercipi, ne tellurem attingat; "profugere raptorem equo: serpentes enim insequi, "donec arceantur amnis alicujus interventu."—Of which the following may serve as a translation: from *Mason's Caractacus;* the person speaking, a Druid.)

Anguinum || Anhalt.

But tell me yet
From the grot of charms and spells,
Where our matron sister dwells,
Brennus, has thy holy hand
Safely brought the Druid wand,
And the potent *Adder-stone*,
Gender'd 'fore th' autumnal moon?
When, in undulating twine,
The foaming snakes prolific join;
When they hiss, and when they bear
Their wond'rous egg aloof in air:
Thence before to earth it fall,
The *Druid* in his hallow'd pall
Receives the prize,
And instant flies,
Follow'd by th' envenom'd brood,
'Till he cross the crystal flood.

This wondrous egg seems to be nothing more than a bead of glass, used by the Druids as a charm to impose on the vulgar, whom they taught to believe, that the possessor would be fortunate in all his attempts, and that it would gain the favour of the great.

Our modern Druidesses (says Mr Pennant, from whom we extract) give much the same account of the *ovum anguinum*, *glain naidr*, as the Welsh call it, or the *adder gem*, as the Roman philosopher does; but seem not to have so exalted an opinion of its powers, using it only to assist children in cutting their teeth, or to cure the chincough, or to drive away an ague.

These beads are of a very rich blue colour; some plain, others streaked. For their figure, see Plate XXXVI. fig. 22. N° 1, 2, 3.

ANGUIS, or SNAKE, in *Zoology*, a genus belonging to the order of amphibia serpentes. See OPHIOLOGY *Index*.

ANGURIA, the WATER MELON. See BOTANY *Index*.

ANGUS, a district of the county of Forfar in Scotland. It was an earldom belonging to the Douglasses, now extinct.

ANGUSTICLAVIA, in Roman antiquity, a tunica embroidered with little purple studs. It was worn by the Roman knights, as the laticlavia was by the senators.

ANHALT, a principality of Germany, in the circle of Upper Saxony, is a long narrow tract, situated for the most part betwixt the rivers Elbe and Saal, about 90 miles in length from east to west, but of unequal breadth, the greatest being on the east side, which is but 35 miles. The house of Anhalt, from whence the electors of Saxony and Brandenburg are said to derive their original, is a very ancient and honourable family. The best genealogists deduce their origin from Berenthobaldus, who made war upon the Thuringians in the sixth century: it has produced many princes who make a great figure in the German history.

Anhalt || Anjengo.

story. Joachim Ernest, who died in 1586, left five sons, who divided the principality among them. All of them having children, and being of equal authority, they unanimously agreed to submit to the eldest of the family, who has the supreme government, which is *Anhalt Dessau*. The others are, *Anhalt Bernburg*, *Anhalt Schaumburg*, *Anhalt Coethen*, and *Anhalt Zerbst*. The last house became extinct in 1793. The three houses of Dessau, Bernburg, and Coethen, have votes in the new German diet, established in 1814. The population of all the principalities in 1815, was 123,000; the revenue about 113,000l. sterling. The tax on lands is four per cent. which, rating them at 20 years purchase, is not quite one shilling in the pound. Upon an emergency the subjects are able to raise half a million dollars extraordinary. The towns in these little states are not so numerous in proportion to the extent of country as in Saxony, but better peopled. It is bounded on the south by the county of Mansfeld, on the west by the duchy of Halberstadt, on the east by the duchy of Saxony, and on the north by the duchy of Magdeburg. It abounds in corn, and is watered by the Sadle and Mulda; its principal trade is in beer.

ANHELATIO, or ANHELITUS, among physicians, a shortness of breath.

ANHINGA. See ORNITHOLOGY *Index*.

ANHOLT, an island of Denmark, in North Jutland, lying in the Categat, eight miles from the coast of Jutland, ten from Zealand, and seven from Holland. It is dangerous for seamen, for which reason there is a lighthouse.

ANIAN, a name sometimes given to the strait lying between the north-east of Asia and the north-west of America.

ANIAN is also the name of a barren sandy desert lying on the east coast of Africa. It is so excessively hot and otherwise inhospitable, that it contains but very few inhabitants, except some wandering Arabs who live in camps.

ANIELLO, or MASSANIELLO. See History of NAPLES.

ANJENGO, a small town and factory, with a fort, on the coast of Malabar, in the peninsula on this side the Ganges, belonging to the East India Company. The fort is small, but neat and strong; it is a square with four bastions, having eight guns mounted on each, carrying a ball of 18 pounds. Two of these bastions face the sea, the other two the country. Besides these, there is a line of 18 or 20 guns pointing towards the sea, of 18 and 24-pounders. About a pistol shot from the back of the fort runs a river, which, besides being a security to the factory, adds much to the agreeable situation of the place. This river has its source in some distant mountains; and, descending in a course from the north and east, it afterwards turns in several pleasing meanders so far to the west as to wash the bottom of our factory's garden, and at last winding to the south, it empties itself into the sea. Several beautiful small islands too, which are washed by its current, diversify the scenery, and greatly heighten the beauty of the prospect. This settlement supplies our East India Company with pepper; and its situation is also very convenient for giving proper intelligence to our ships touching here from Europe, or from any part of India. E. Long. 76. 1. N. Lat. 7. 0.

ANIL, in *Botany*, a synonyme of a species of indigofera. See INDIGOFERA, BOTANY *Index*.

Anil || Animal.

ANIMA, among divines and naturalists, denotes the soul or principle of life, in animals. See SOUL.

ANIMA, among chemists, denotes the volatile or spirituous parts of bodies.

ANIMA Hepatis, is a name by which some call *sal martis*, or *salt of iron*, on account of its supposed efficacy in diseases of the liver.

ANIMA Mundi, a certain pure ethereal substance or spirit, diffused, according to many of the ancient philosophers, through the mass of the world, informing, actuating, and uniting the divers parts thereof into one great, perfect, organical, and vital body or animal. Plato treats at large of the ψυχη τϖ κοσμϖ, in his *Timæus;* and is even supposed to be the author of the *dogma;* yet are interpreters much at a loss about his meaning. Aristotle, however, taking it in the common and obvious sense, strenuously opposes it. The modern Platonists explain their master's *anima mundi* by a certain universal ethereal spirit, which in the heavens exists perfectly pure, as retaining its proper nature; but on earth pervading elementary bodies, and intimately mixing with all the minute atoms thereof, it assumes somewhat of their nature, and becomes of a peculiar kind.—So the poet:

Spiritus intus alit, totosque infusa per artus
Mens agitat molem; et magno se corpore miscet.

They add, that this *anima mundi*, which more immediately resides in the celestial regions as its proper seat, moves and governs the heavens in such a manner, as that the heavens themselves first received their existence from the fecundity of the same spirit: for that this *anima*, in being the primary source of life, everywhere breathed a spirit like itself, by virtue whereof various kinds of things were framed conformable to the divine ideas.

ANIMA Saturni, a white powder obtained by pouring distilled vinegar on litharge; of considerable use in enamelling. See ENAMEL.

ANIMADVERSION, in matters of literature, is used to signify, sometimes correction, sometimes remarks upon a book, &c. and sometimes a serious consideration upon any point.

ANIMAL, in *Natural History*, an organized and living body, which is also endowed with sensation: thus, minerals are said to grow or increase, plants to grow and live, but animals alone to have sensation.

It is this property of sensation alone that can be deemed the essential characteristic of an animal; and by which the animal and vegetable kingdoms seem to be so essentially separated, that we cannot even imagine the least approximation of the one to the other. Those naturalists, indeed, who have supposed the distinction between animals and vegetables to consist in any thing else than what we have already mentioned, have found themselves greatly embarrassed; and have generally agreed, that it was extremely difficult, if not impossible, to settle the boundaries between the animal and vegetable kingdoms. But this difficulty will be easily seen to arise from their taking the characteristic marks of the animal kingdom from something that was evidently common to both. Thus Boerhaave at-

Animal. tempted to distinguish an animal from a vegetable, by the former having a mouth, which the latter has not: but here, as the mouth of an animal is only the instrument by which nourishment is conveyed to its body, it is evident that this can be no essential distinction, because vegetables also require nourishment, and have instruments proper for conveying it into their bodies; and where the end is the same, a difference in the means can never be essential. The fixing the difference in an animal's having a gula, stomach, and intestines, as is done by Dr Tyson, is as little to the purpose.

The power of moving from one place to another, hath by many been thought to constitute their difference; and indeed, in most cases, it is the obvious mark by which we distinguish an animal from a vegetable: but Lord Kames hath given several very curious instances of the locomotive power of plants; some of which, as he says, would do honour to an animal.—"Upon the slightest touch, the sensitive plant shrinks back and folds up its leaves, similar to a snail; which on the slightest touch retires within its shell. A new species of the sensitive plant hath been lately discovered. See DIONÆA. If a fly perch upon one of its flower leaves, it closes instantly, and crushes the insect to death. There is not an article in botany more admirable than a contrivance, visible in many plants, to take advantage of good weather, and to protect themselves against bad. They open and close their flowers and leaves in different circumstances; some close before sunset, some after; some open to receive rain, some close to avoid it. The petals of many flowers expand in the sun; but contract at night, or on the approach of rain. After the seeds are fecundated, the petals no longer contract. All the trefoils may serve as a barometer to the husbandman; they always contract their leaves on an impending storm. Some plants follow the sun, others turn from it. Many plants, on the sun's recess, vary the position of their leaves, which is styled the *sleep of plants*. A singular plant * was lately discovered in Bengal. Its leaves are in continual motion all day long; but when night approaches, they fall down from an erect posture to rest.

* A species of the *Hedysarum*.

"A plant has a power of directing its roots for procuring food. The red whortleberry, a low evergreen plant, grows naturally on the tops of our highest hills, among stones and gravel. This shrub was planted in an edging to a rich border, under a fruit wall. In two or three years, it overran the adjoining deep-laid gravel walk; and seemed to fly from the border, in which not a single runner appeared. An effort to come at food in a bad situation, is extremely remarkable in the following instance: Among the ruins of Newabbey, formerly a monastery in Galloway, there grows on the top of a wall a plane tree about 20 feet high. Straitened for nourishment in that barren situation, it several years ago directed roots down the side of the wall, till they reached the ground ten feet below; and now the nourishment it afforded to those roots during the time of their descending is amply repaid, having every year since that time made vigorous shoots. From the top of the wall to the surface of the earth, these roots have not thrown out a single fibre; but are now united in a single root.

"Plants, when forced from their natural position, are endowed with a power to restore themselves. A hop plant, twisting round a stick, directs its course from south to west, as the sun does. Untwist it, and tie it in the opposite direction; it dies. Leave it loose in the wrong direction: it recovers its natural direction in a single night. Twist a branch of a tree so as to invert its leaves, and fix it in that position: if left in any degree loose, it untwists itself gradually, till the leaves be restored to their natural position. What better can an animal do for its welfare? A root of a tree, meeting with a ditch in its progress, is laid open to the air. What follows? It alters its course like a rational being, dips into the ground, surrounds the ditch, rises on the opposite side to its wonted distance from the surface, and then proceeds in its original direction. Lay a wet sponge near a root laid open to the air; the root will direct its course to the sponge. Change the place of the sponge: the root varies its direction. Thrust a pole into the ground at a moderate distance from a scandent plant: the plant directs its course to the pole, lays hold of it, and rises on it to its natural height. A honeysuckle proceeds in its course, till it be too long for supporting its weight; and then strengthens itself by shooting into a spiral. If it meet with another plant of the same kind, they coalesce for mutual support; the one screwing to the right, the other to the left. If a honeysuckle twig meets with a dead branch, it screws from the right to the left. The claspers of briony shoot into a spiral, and lay hold of whatever comes in their way for support. If, after completing a spiral of three rounds, they meet with nothing, they try again by altering their course."——

Animal.

By comparing these and other instances of seeming voluntary motion in plants, with that share of life wherewith some of the inferior kinds of animals are endowed, we can scarce hesitate at ascribing the superiority to the former; that is, putting sensation out of the question. Mussels, for instance, are fixed to one place as much as plants are; nor have they any power of motion, besides that of opening and shutting their shells: and in this respect they have no superiority over the motion of the sensitive plant; nor doth their action discover more sagacity, or even so much as the roots of the plane tree mentioned by Lord Kames.

Mr Buffon, who seems to be desirous of confounding the animal and vegetable kingdoms, denies sensation to be any essential distinction. "Sensation (says he) more essentially distinguishes animals from vegetables: but sensation is a complex idea, and requires some explication. For if sensation implied no more than motion consequent upon a stroke or an impulse, the sensitive plant enjoys this power. But if, by sensation, we mean the faculty of perceiving and comparing ideas, it is uncertain whether brute animals are endowed with it. If it should be allowed to dogs, elephants, &c. whose actions seem to proceed from motives similar to those by which men are actuated, it must be denied to many species of animals, particularly to those which appear not to possess the faculty of progressive motion. If the sensation of an oyster, for example, differed only in degree from that of a dog; why do we not ascribe the same sensation to vegetables, though in a degree still inferior? This distinction, therefore, between the animal and vegetable, is neither sufficiently general nor determined.

"From

Animal. "From this investigation we are led to conclude, that there is no absolute and essential distinction between the animal and vegetable kingdoms; but that nature proceeds, by imperceptible degrees, from the most perfect to the most imperfect animal, and from that to the vegetables; and the fresh water polypus may be regarded as the last of animals and the first of plants."

It were to be wished, that philosophers would on some occasions consider, that a subject may be dark as well on account of their inability to see, as when it really affords no light. Our author boldly concludes, that there is no essential difference between a plant and an animal, because we ascribe sensation to an oyster, and none to the sensitive plant; but we ought to remember, that though we cannot perceive a distinction, it may nevertheless exist. Before Mr Buffon, therefore, had concluded in this manner, he ought to have proved that some vegetables were endowed with sensation.

It is no doubt, however, as much incumbent on those who take the contrary side of the question, to prove that vegetables are not endowed with sensation, as it was incumbent on Mr Buffon to have proved that they are. But a little attention will show us, that the difficulty here proceeds entirely from our inability to see the principle of sensation. We perceive this principle in ourselves, but no man can perceive it in another. Why then does every individual of mankind conclude that his neighbour has the same sensations with himself? It can only be from analogy. Every man perceives his neighbour formed in a manner similar to himself; he acts in a similar manner on similar occasions, &c. Just so it is with brute animals. It is no more doubtful that they have sensations, than that we have them ourselves. If a man is wounded with a knife, for instance, he expresses a sense of pain, and endeavours to avoid a repetition of the injury. Wound a dog in the same manner, he will also express a sense of pain; and, if you offer to strike him again, will endeavour to escape, before he feels the stroke. To conclude here, that the action of the dog proceeded from a principle different from that of the man, would be absurd and unphilosophical to the last degree.

We must further take notice, that there are sensations essentially distinct from one another; and in proportion as an animal is endowed with more or fewer of these different senses, it is more or less perfect as an animal; but, as long as one of them remains, it makes not the least approach to the vegetable kingdom; and, when they are all taken away, is so far from becoming a vegetable, that it is only a mass of dead matter. The senses of a perfect animal, for instance, are five in number. Take away one of them, suppose sight; he becomes then a less perfect animal, but is as unlike a vegetable as before. Suppose him next deprived of hearing: his resemblance to a vegetable would be as little as before; because a vegetable can neither feel, taste, nor smell, and we suppose him still to enjoy these three senses. Let us, lastly, suppose him endowed only with the sense of feeling, which, however, seems to include that of taste, and he is no more a vegetable than formerly, but only an imperfect animal. If this sense is then taken away, we connect him not with the vegetable kingdom, but with what Mr Buffon calls *brute matter*. It is to this kingdom, and not to the vegetable, that animals plainly approximate as they descend. Indeed, to suppose an approximation between the vegetable and animal kingdoms, is very absurd: for, at that rate, the most imperfect animal ought to be the most perfect plant; but we observe no such thing. All animals, from the highest to the lowest, are possessed of vegetable life; and that, as far as we can perceive, in an equal degree, whether the animal life is perfect or imperfect; nor doth there seem to be the smallest connexion between the highest degree of vegetation and the lowest degree of sensation. Though all animals, therefore, are possessed of vegetable life, these two seem to be as perfectly distinct and incommensurate to one another as any two things we can possibly imagine. Animal.

The power of vegetation, for instance, is as perfect in an onion or leek, as in a dog, an elephant, or a man; and yet, though you threaten a leek or an onion ever so much, it pays no regard to your words, as a dog would do; nor, though you wound it, does it avoid a second stroke. It is this principle of self-preservation in all animals, which, being the most powerful one in their nature, is generally taken, and with very good reason, as the true characteristic of animal life. This principle is undoubtedly a consequence of sensation; and as it is never observed to take place in vegetables, we have a right to say that the foundation of it, namely sensation, belongs not to them. There is no animal, which makes any motion in consequence of external impulse where danger is threatened, but what puts itself in a posture of defence; but no vegetable whatsoever does so. A muscle, when it is touched, immediately shuts its shell; and as this action puts it in a state of defence, we conclude that it proceeded from the principle of self-preservation. When the sensitive plant contracts from a touch, it is no more in a state of defence than before; for whatever would have destroyed it in its expanded state, will also do it in its contracted state. We conclude, therefore, that the motion of the sensitive plant proceeds only from a certain property called by physicians *irritability*; and which, though our bodies possess it in an eminent degree, is a characteristic neither of animal nor vegetable life, but belongs to us in common with brute matter. It is certain that an electrified silk thread shows a much greater variety of motions than any sensitive plant. If a bit of silk thread is dropt on an electrified metal plate, it immediately erects itself; spreads out the small fibres like arms; and, if not detained, will fly off. If a finger is brought near it, the thread seems greedily to catch at it. If a candle approaches, it clasps close to the plate, as if afraid of it.—Why do we not conclude that the thread in this case is really afraid of the candle? For this plain reason, That its seeming flight is not to get away from the candle, but to get towards the electrified metal; and, if allowed to remain there, will suffer itself to be burnt without offering to stir.—The sensitive plant, in like manner, after it has contracted, will suffer itself to be cut in pieces, without making the least effort to escape. The case is not so with the meanest animal. A hedgehog, when alarmed, draws its body together, and expands its prickles, thereby putting itself in a posture of defence. Throw it into water; and the same principle of self-

preservation

Animal. preservation prompts it to expand its body and swim. A snail, when touched, withdraws itself into its shell; but if a little quicklime is sprinkled upon it, so that its shell is no longer a place of safety, it is thrown into agonies, and endeavours to avail itself of its locomotive power in order to escape the danger. In mussels and oysters, indeed, we cannot observe this principle of self-preservation so strongly, as nature has deprived them of the power of progressive motion: but, as we observe them constantly to use the means which nature has given them for self-preservation, we can have no reason to think that they are destitute of that principle upon which it is founded.

But there is no need of arguments drawn from the inferior creation. We ourselves are possessed both of the animal and vegetable life, and certainly must know whether there is any connection between vegetation and sensation, or not.—We are conscious that we exist; that we hear, see, &c.: but of our vegetation we are absolutely unconscious. We feel a pleasure, for instance, in gratifying the calls of hunger and thirst; but of the process by which our aliment is formed into chyle, the chyle mixed with the blood, the circulation of that fluid, and the separation of all the humours from it, we are altogether ignorant. If we then, who are more perfect than other vegetables, are utterly insensible of our own vegetable life, why should we imagine that the less perfect vegetables are sensible of it?

To illustrate our reasoning here by an example.—The direction of the roots of the plane tree mentioned by Lord Kames, shows as much sagacity, if we are to look only to the outward action, as can be observed in any motion of the most perfect animal whatever; nevertheless, we have not the least suspicion, either that the tree saw the ground at a distance, or that it was informed of its being there by the rest of its roots. If a wound is made in the body of a man, and a loss of substance is to be repaired, the same sagacity will be observed in the arrangement of the fibres, not only as if they were animated, but they will dispose of themselves seemingly with a degree of wisdom far superior to what we have any idea of; yet this is done without our having the least knowledge either how it is done, or of its being done at all. We have therefore in ourselves a demonstration, that vegetable life acts without knowing what it does: and if vegetables are ignorant of their most sagacious actions, why should we suspect that they have a sensation, let it be ever so obscure, of any of their inferior ones, such as contracting from a touch, turning towards the sun, or advancing to meet a pole.

Thus we may easily give Mr Buffon a reason why we ascribe sensation to an oyster, and none to a vegetable; namely, because we perceive the vegetable do nothing but what is also performed in our own bodies, without our having the least sensation of it; whereas on oyster puts itself in a defensive posture on the approach of danger; and this being an action similar to our own upon a like occasion, we conclude that it proceeds from the same principle of sensation. Here it may also be observed, that though the inferior animals are deficient in the number, they are by no means so in the acuteness of their sensations; on the contrary, though a mussel or an oyster is probably endowed with no other sense than that of feeling, yet this sense is so exquisite, that it will contract upon the slightest touch, such as we would be altogether insensible of. Animal.

As to that power of contractility, or irritability, which is observed in some plants; our solids have it, when deprived both of vegetable and animal life: for a muscle, cut out of a living body, will continue to contract, if it is irritated by pricking it, after it has neither sensation nor vegetation.

A very good moral reason may also be adduced why we do not believe vegetables to be endowed with sensation.—Had they been so, we must suppose them to suffer pain when they are cut or destroyed; and, if so, what an unhappy state must they be in, who have not the least power to avoid the injuries daily offered them! In fact, the goodness of the Deity is very conspicuous in not giving to vegetables the same sensations as to animals; and, as he hath given them no means of defence, though we had not been told it by himself, we might have known that he gave them for food for animals; and, in this case, to have endowed them with sensation would have been a piece of cruelty. Though animals without number prey upon one another, yet all of them have some means of defence; from whence we may justly conclude, that their mutual destruction was not an original appointment of the Creator, but what he foresaw would happen in a course of time, and which he therefore gave every one of them some means of guarding against. It may no doubt be here objected, that the giving some means of self-defence to every animal cannot be reckoned a sufficient proof that it was not the original design of the Creator that they should be destroyed, seeing these means are not always effectual for their preservation. This objection, however, cannot be completely obviated without a solution of the question concerning the origin of evil among the works of a perfectly good Being. But whatever difficulty there may be in solving this question, it is certain, that, as some means of self-defence is given to every animal, it has been the original design of the Creator, that in all cases one species of animals should not be destroyed at the pleasure of any other species; and as no means of self-defence is given to any vegetable, it is plain that they have been destined for a prey to every species of animals that had access to them. Philosophers have insisted much on the necessity of one animal's devouring another, that there might be room sufficient for all; but this, so far from being a system worthy of the divine wisdom, seems to us to be a reflection upon it, as if the Author of nature could not have found means to preserve the life of one part of his creatures, without the destruction and misery of the rest. The sacred writings leave us at no loss to see how this carnivorous disposition came in; and, in the next world, this piece of perfection (as the sanguinary philosophers above mentioned would have it to be) seems to be left out; for there, it is said, "They shall not hurt nor destroy; the lion shall eat straw like the ox, and there shall be no more pain."

When speaking of the food of plants, we took occasion to mention a certain power totally different from that of attraction or repulsion, by which the food of a plant, after it was attracted, or otherwise brought to it, was assimilated to its substance. This power, which we there distinguish by the name of *transmutation*, belongs

Animal, Animal-Flower.

longs in a more eminent degree to animals. The alimentary substance is changed into two kinds of matter: (1.) An excrementitious one, which passes off through the intestines; and (2.) A fluid, which is the direct pabulum of the animal. Different substances, however, are not equally changeable by this process. The human stomach is not capable of acting upon any animal substance till it has lost its vital principle: the stomachs of some animals cannot act upon creatures of their own species: some have an apparatus for grinding their food after it is swallowed, &c. and there are no animals but what are subject to death by taking certain substances into their stomach. Some substances also, though they resist the action of the stomach, and pass unchanged into the system, produce no bad effects. Thus, madder will turn the bones of animals red; rhubarb will communicate its purgative nature to the milk, and its deep yellow colour to the urine.—All these changes, however, seem to belong to the vegetative part of our system: for as every one of them are performed without our knowledge of the manner how; and not only so, but while we are absolutely unconscious of their being done; we can have no reason to suppose, that the *animal* life, properly so called, is at all connected with them, any farther than as they are at present the means of preserving the creature alive, and making the connexion betwixt the principle of life and this visible creation.

The description and classing of animals make a considerable part of Natural History, known by the name of *Zoology*.

ANIMAL, used adjectively, denotes any thing belonging to, or partaking of, the nature of animals. Thus, animal actions, those that are peculiar to animals; such are sensation and muscular motion.

ANIMAL-Flower, in *Zoology*, a name given to several species of animals belonging to the genus ACTINIA of Linnæus. They have likewise been distinguished by the names of *Urtica Marina*, or *Sea-nettle*, from their supposed property of stinging; and *Sea-anemone*, from their claws or tentacles being disposed in regular circles, and tinged with a variety of bright lively colours, resembling the petals of some of our most beautiful flowers. As to one species particularly, mentioned by Abbé Dicquemarre, (Phil. Trans. for 1773, art. 37.) the purest white, carmine, and ultramarine, are said to be scarce sufficient to express their brilliancy. The bodies of some of them are hemispherical, of others cylindrical, and of others shaped like a fig. Their substance likewise differs: some are stiff and gelatinous, others fleshy and muscular; but all of them are capable of altering their figure when they extend their bodies and claws in search of food. They are found on many of the rocky coasts of the West India islands, and likewise on some parts of the coast of England.

They have only one opening, which is in the centre of the uppermost part of the animal; round this are placed rows of fleshy claws; this opening is the mouth of the animal, and is capable of great extension. The animals themselves, though exceedingly voracious, will bear long fasting. They may be preserved alive a whole year, or perhaps longer, in a vessel of sea-water, without any visible food; but, when food is presented, one of them will successively devour two mussels in their shells, or even swallow a whole crab as large as a hen's egg. In a day or two the crab-shell is voided at the mouth, perfectly cleared of all the meat. The mussel shells are likewise discharged whole, with the two shells joined together, but entirely empty, so that not the least particle of fish is to be perceived on opening them. An anemone of one species will even swallow an individual of another species; but after retaining it ten or twelve hours, will throw it up alive and uninjured. Through this opening also it produces its young ones alive, already furnished with little claws, which, as soon as they fix themselves, they begin to extend in search of food.

Animal-Flower.

One of the extremities of the sea-anemone resembles, as we have said, the outward leaves of that flower; while its limbs are not unlike the shag or inner part of it. By the other extremity it fixes itself, as by a sucker, to the rocks or stones lying in the sand; but it is not totally deprived of the power of progressive motion, as it can shift its situation, though very slowly.

A particular species of animal-flowers has been found in some of the islands ceded to Britain at the last treaty of peace with France; and the following account of them was published in the Philosophical Transactions, vol. lvii. by Mr Ellis, in a letter to Lord Hillsborough.

"This compound animal, which is of a tender fleshy substance, consists of many tubular bodies swelling gently towards the upper part, and ending like a bulb or very small onion: on the top of each is its mouth, surrounded by one or two rows of tentacles, or claws, which when contracted look like circles of beads.

"The lower part of all these bodies has a communication with a firm fleshy wrinkled tube, which sticks fast to the rocks, and sends forth other fleshy tubes, which creep along them in various directions. These are full of different sizes of these remarkable animals, which rise up irregularly in groups near to one another.

"This adhering tube, that secures them fast to the rock, or shelly bottom, is worthy of our notice. The knobs that we observe, are formed in several parts of it by its insinuating itself into the inequalities of the coral rock, or by grasping pieces of shells, part of which still remain in it, with the fleshy substance grown over them.

"This shows us the instinct of nature, that directs these animals to preserve themselves from the violence of the waves, not unlike the anchoring of mussels, by their fine silken filaments that end in suckers; or rather like the shelly basis of the serpula, or worm shell, the tree oyster, and the slipper barnacle, &c. whose bases conform to the shape of whatever substance they fix themselves to, grasping it fast with their testaceous claws, to withstand the fury of a storm.

"When we view the inside of this animal dissected lengthwise, we find like a little tube leading from the mouth to the stomach, from whence there rise eight wrinkled small guts, in a circular order, with a yellowish soft substance in them; these bend over in the form of arches towards the lower part of the bulb, from whence they may be traced downwards, to the narrow part of the upright tube, till they come to the fleshy adhering tube, where some of them may be perceived entering into a papilla, or the beginning of an animal of the like kind, most probably to convey it nourishment.

Animal-Flower.

nourishment till it is provided with claws; the remaining part of these slender guts is continued on in the fleshy tube, without doubt, for the same purpose of producing and supporting more young ones from the same common parent.

"The many longitudinal figures that we dissover lying parallel to each other, on the inside of the semi-transparent skin, are all inserted in the several claws round the animal's mouth, and are plainly the tendons of the muscles for moving and directing the claws at the will of the animal; they may be likewise traced down to the adhering tube.

"As this specimen has been preserved in spirits, the colour of the animal, when living, cannot be certainly known; it is at present of a pale yellowish brown.

"With regard to its name, it may be called *Actinia sociata*, or the *Cluster Animal flower*."

The Abbé Dicquemarre, by many curious though cruel experiments, related to the Phil. Trans. for 1773, has shown that these animals possess, in a most extraordinary degree, the power of reproduction; so that scarce any thing more is necessary to produce as many sea anemonies as we please, than to cut a single one into as many pieces. A sea anemone being cut in two by a section through the body, that part, where the limbs and mouth are placed, ate a piece of a mussel offered to it soon after the operation, and continued to feed and grow daily for three months after. The food sometimes passed through the animal; but was generally thrown up again, considerably changed, as in the perfect sea anemone. In about two months, two rows of limbs were perceived growing out of the part where the incision was made. On offering food to this new mouth, it was laid hold of and eaten; and the limbs continually increasing, the animal gradually became as perfect as those which had never been cut. In some instances, however, he found that, when one of these creatures was cut through, new limbs would be produced from the cut place, those at the mouth remaining as before: so that a monstrous animal was the consequence, having two mouths, and feeding at both ends. Having put some of them into a pan of water, set over a slow fire, he found that they lost their life at 30 degrees of Reaumur's thermometer. To avoid the imputation of cruelty in these experiments, the author argues the favourable consequences that have attended his operations on the sea anemonies which have been so fortunate as to fall into his hands; as he hath not only multiplied their existence, but also renewed their youth; which last, he adds, "is surely no small advantage."

In Hughes's Natural History of Barbadoes, an account is also given of several species of animal-flowers. They are there described as only found in a bason in one particular cave; and of the most remarkable species mentioned by him we have the following description.

"In the middle of the bason, there is a fixed stone, or rock, which is always under water. Round its sides, at different depths, seldom exceeding 18 inches, are seen, at all times of the year, issuing out of little holes, certain substances that have the appearance of fine radiated flowers, of a pale yellow, or a bright straw colour, slightly tinged with green, having a circular border of thick set petals, about the size of, and much resembling, those of a single garden marigold, except that the whole of this seeming flower is narrower at the discus, or setting-on of the leaves, than any flower of that kind.

Animal-Flower || Animal System.

"I have attempted to pluck one of these from the rock, to which they are always fixed; but never could effect it: for as soon as my fingers came within two or three inches of it, it would immediately contract, close together its yellow border, and shrink back into the hole of the rock; but if left undisturbed for about four minutes, it would come gradually in sight, expanding, though at first very cautiously, its seeming leaves, till it last it appeared in its former bloom. However, it would again recoil, with a surprising quickness when my hand came within a small distance of it. Having tried the same experiment by attempting to touch it with my cane, and a small slender rod, the effect was the same.

"Though I could not by any means contrive to take or pluck from the rock one of these animals entire; yet I once cut off (with a knife which I had held for a long time out of sight, near the mouth of a hole out of which one of these animals appeared) two of these seeming leaves. These, when out of the water, retained their shape and colour; but, being composed of a membrane-like substance, surprisingly thin, it soon shrivelled up, and decayed."

The reproductive power of the Barbadoes animal-flower is prodigious. Many people coming to see these strange creatures, and occasioning some inconvenience to a person through whose grounds they were obliged to pass, he resolved to destroy the objects of their curiosity, and, that he might do so effectually, caused all the holes out of which they appeared, to be carefully bored and drilled with an iron instrument, so that we cannot suppose but their bodies must have been entirely crushed to a pulp: nevertheless, they again appeared in a few weeks from the very same places.

Plate XXXIV. fig. 1. represents the actinia sociata, or clustered animal-flower, described by Mr Ellis, with its radical tube adhering to a rock: (a) One of the animals stretching out its claws. Fig. 2. A perpendicular dissection of one of the bodies, to show the gullet, intestines, stomach, and fibres or tendons that move the claws: (a) A young one arising out of the adhering tube. Fig. 3. The actinia aster, or animal-flower of the newly ceded islands. Fig. 4. The actinia anemone, or sea anemone from the same place. Fig. 5. The under part of the same by which it adheres to the rocks. Fig. 6. The actinia helianthus, or the sea sun-flower, from ditto. Fig. 7. The under part of the same. Fig. 8. The actinia dianthus, or sea carnation, from the rocks at Hastings in Sussex. This animal adheres by its tail, or sucker, to the upper part of the projecting rocks opposite to the town; and, when the tide is out, has the appearance of a long white fig; this is the form of it when put into a glass of sea water. It is introduced here as a new variety of this animal not yet described.

Animals, Animalcule.

Animals, the preparation of, for collections or museums. See Quadrupeds, Birds, Rfptiles.

Pairing of Animals. See Pairing.

ANIMALCULE, in general, signifies a little animal; and thus the term might be applied to every animal which is considerably inferior in size to ourselves.

1 Common acceptation of the word.

It hath been customary, however, to distinguish by the name of *animalcules* only such animals as are of a size so diminutive, that their true figure cannot be discerned without the assistance of glasses; and more especially it is applied to such as are altogether invisible to the naked eye, and cannot even be perceived to exist but by the assistance of microscopes.

By the help of magnifying glasses, we are brought into a kind of new world; and numberless animals are discovered, which from their minuteness must otherwise for ever have escaped our observation; and how many kinds of these invisibles there may be, is still unknown; as they are discerned of all sizes, from those which are barely invisible to the naked eye, to such as resist the action of the microscope, as the fixed stars do that of the telescope, and with the best magnifiers hitherto invented appear only as so many moving points.

2 Different sizes of animalcules.

The smallest living creatures our instruments can show are those that inhabit the waters: for though possibly animalcules equally minute, or perhaps more so, may fly in the air, or creep upon the earth, it is scarce possible to bring such under our examination; but water being transparent, and confining the creatures in it, we are able, by applying a drop of it to our glasses, to discover, to a certain degree of smallness, all that it contains.—Some of the most curious of these animalcules, which have been described by microscopical observers, we shall here give an account of,

3 Hair-like insect.

1. *The Hair-like Insect.* This is so called by Mr Baker on account of its shape; being extremely slender, and frequently an hundred and fifty times as long as broad. The body or middle part, which is nearly straight, appears, in some, composed of such rings as the windpipe of land animals is made up of; but in others seems rather scaled, or made up of rings that obliquely cross one another. Its two ends are hooked or bent, pretty nearly in the same degree, but in a direction opposite to one another; and as no eyes can be discerned, it is difficult to judge which is the head or tail. Its progressive * motion is very singular, being performed by turning upon one end as a centre, and describing almost a quarter of a circle with the other, as represented in the figure. Its motions are very slow, and require much patience and attention in the observer. These creatures are so small, that millions of millions of them might be contained in an inch square. When viewed singly, they are exceedingly transparent, and of a beautiful green colour; but when numbers of them are brought together, they become opaque, lose their green colour, and grow entirely black.

* Plate XXXV. Fig. 1.

4 Its extreme smallness, &c.

5 Delights in society.

Notwithstanding the extreme minuteness of these animalcules, they seem to be fond of society; for, after viewing for some time a parcel of them taken up at random, they will be seen disposing themselves in a kind of regular order†. If a multitude of them are put into a jar of water, they will form themselves in a regular body, and ascend slowly to the top, where after they have remained for some time exposed to the air, their green colour changes to a beautiful sky blue. When they are weary of this situation, they form themselves into a kind of rope, which slowly descends as low as they intend; but if they happen to be close to the side of the jar, they will descend upon it. They are so nearly of the specific gravity of water itself, that they will either remain at the bottom, float on the surface, or be suspended in the middle, according as they are originally placed, or as they themselves have a mind.

† Fig. 2.

Animalcule.

A small quantity of the matter containing these animalcules‡ having been put into a jar of water, it so happened, that one part went down immediately to the bottom, whilst the other continued floating on the top. When things had remained for some time in this condition, each of these swarms of animalcules began to grow weary of its situation, and had a mind to change its quarters. Both armies, therefore, set out at the same time, the one proceeding upwards, and the other downwards; so that, after some hours journey, they met in the middle. A desire of knowing how they would behave on this occasion, engaged the observer to watch them carefully; and to his surprise he saw the army that was marching upwards, open to the right and left, to make room for those that were descending. Thus, without confusion or intermixture, each held on its way: the army that was going up, marching in two columns to the top, and the other proceeding in one column to the bottom, as if each had been under the direction of wise leaders.

‡ Fig. 3.

6 Seems possessed of a considerable degree of sagacity.

The hair-like insect was first discovered in a ditch at Norwich, one end of which communicates with the river there, and the other end with a second ditch, into which several kennels empty themselves. The length of this ditch, when Mr Baker wrote his account of this animalcule, was at least 100 yards, and its breadth nine. The bottom, for more than a foot thick, was covered with a blackish green substance, in appearance like mud, made up for the most part of these insects; but supposing only a half or a quarter part of it to be composed of them, according to the dimensions we have given, their numbers must exceed all imagination.

7 Found in prodigious quantity.

2. *Eels in paste*, &c. When paste is allowed to stand till it becomes sour, it is then found to be the habitation of numberless animalcules, which may be discerned by the naked eye; and though their form cannot be perfectly distinguished, their motion is very perceptible, and the whole paste will seem to be animated. Fig. 4. represents one of these anguillæ magnified. The most remarkable property of these insects is, that they are viviparous. If one of them is cut through near the middle, several oval bodies of different sizes will be seen to issue forth. These are young anguillæ, each of them coiled up and enclosed in its proper membrane, which is so exquisitely fine, as scarcely to be discernible by the greatest magnifier, while it encloses the embryo animal. The largest and most forward immediately break through this covering, unfold themselves, and wriggle about in the water nimbly; others get out, uncoil, and move themselves about more slowly; and the least mature continue entirely without motion. The *uterus*, or vessel that contains all these oval bodies, is composed of many ringlets, not unlike the aspera arteria of land animals, and seems to be considerably elastic; for as soon as the animalcule is cut in two, the oval bodies are thrust out with some degree of violence, from the springing back or action of this bowel. An

8 Eels in paste viviparous.

Animalcule.

hundred and upwards of the young ones have been seen to issue from the body of one single eel, whereby the prodigious increase of them may be accounted for; as probably several such numerous generations are produced in a short time. They seem to be all prolific; and unless trial happens to be made upon one that has brought forth all its young, or when the paste has been kept for a very long time, the experiment will always succeed.—This property of these eels being viviparous renders it highly improbable that they ever become flies.

Animalcules of a similar kind are likewise found in vinegar; and, like those already described, are found to be viviparous. But it is not only in acid matters that such appearances are observed. In some fields of wheat, many grains may be observed, that appear blackish outwardly, as if scorched; but when opened are found to contain a soft white substance, which, attentively considered, appears to be nothing else than a congeries of threads or fibres lying close to each other in a parallel direction, much resembling the unripe down of some thistles on cutting open the flower heads before they begin to blow. This fibrous matter discovers not the least sign of life or motion, unless water is applied; but immediately on wetting, provided the grains of wheat have been newly gathered, the supposed fibres separate, and appear to be living creatures. Their motions at first are very languid; but gradually become more vigorous, twisting and wriggling themselves somewhat in the manner of the eels in paste, but always slower than they, and with a great deal less regularity.

9 Similar creatures found in blighted wheat.

If the grains of wheat are grown dry by keeping, and in that condition are cut open, the fibrous matter is very distinguishable; and, on putting water to it, will separate with great readiness, and seem like fine tubes or threads tapering at both ends; but not the least motion will be perceived till they have been in water for several hours, and sometimes they will never move at all. But if the same grains are steeped in water for three or four hours, or buried for some days in the earth, till they are fully saturated with moisture, and then opened with a penknife; on taking out a small portion of the white matter carefully, and spreading it thin upon a slip of glass, the animalcules will be seen bundled together, and extended longitudinally, but without motion; and though, upon the application of water, they will not revive so soon as those taken from fresh grains, whose moisture has never been exhaled; yet, after remaining an hour or two in water, they are constantly found alive and vigorous, even though the grains have been kept in a dry condition for several years. It is necessary, however, to adapt, in some measure, the time of continuing the grains in water or earth to the age and dryness of them: for if they are not opened before they are too much softened, the animalcules will be dead; and unless the husks are opened to let those creatures out after they have been steeped, they inevitably perish in them: otherwise, they will continue alive in water for many months; and, should the water dry away, may be revived again by giving them a fresh supply.

10 How discoverable.

11 Precautions necessary in making the experiment.

12 Proteus, why so called.

3. *The Proteus.* This animalcule has been dignified by Mr Baker with the name of *Proteus*, on account of its assuming a great number of different shapes, so as scarce to be known as the same animal in its various transformations; and indeed, unless it be carefully watched while passing from one shape to another, it will often become suddenly invisible, as happened more than once to Mr Baker.

Animalcule.

13 Where found.

When water, wherein any sort of vegetable has been infused, or animals preserved, has stood quietly for some days, or weeks, in any glass or other vessel, a slimy substance will be collected about the sides: some of which being taken up with the point of a penknife, placed on a slip of glass in a drop of water, and looked at through the microscope, will be found to harbour several kinds of little animals that are seldom found swimming about at large; among which the proteus is one. Its shape is better understood from the figure, than from any description that could be given. Its substance and colour seem to resemble that of a snail; and its whole shape seems to bear a considerable resemblance to that of a swan. It swims to and fro with great vivacity; but will now and then stop for a minute or two; during which time its long neck is usually employed as far as it can reach, forwards, and on every side, with a somewhat slow, but equable motion, like that of a snake, frequently extending thrice the length of its body, and seemingly in search of food.

14 Its shape, colour, &c.

There are no eyes, nor any opening in the head like a mouth to be discerned: but its actions plainly prove it to be an animal that can see; for though multitudes of different animalcules swim about in the same water, and its own progressive motion is very swift, it never strikes against any of them, but directs its course between them with a dexterity wholly unaccountable, should we suppose it destitute of sight.

15 Its transformations.

When the proteus is alarmed, it suddenly draws in its long neck, represented in fig. 5. and 6. transforming itself into the shape represented in fig. 7. when it becomes more opaque, and moves about very slowly with the large end foremost. When it has continued some time in this posture, it will often, instead of the head and neck it had formerly, put forth a new one, with a kind of wheel machinery represented fig. 8. the motions of which draw a current of water to it from a considerable distance. Having often pulled in and thrust out the short head, sometimes with and sometimes without the wheel-work, the creature, as if weary, will remain motionless for a while; then its head and long neck will be very slowly protruded, as in fig. 9. and it soon resumes its former agility. Sometimes it disposes of its neck and head, as represented in fig. 10.

16 Vorticellæ, where found.

4. *The Wheel Animal*, or *Vorticella*. This wonderful animalcule is found in rain water that has stood some days in leaden gutters, or in hollows of lead on the tops of houses; or in the slime or sediment left by such water; and perhaps may also be found in other places; but if the water standing in gutters of lead, or the sediment left behind it, has any thing of a red colour in it, one may be almost certain of finding them therein. Though it discovers no signs of life except when in the water, yet it is capable of continuing alive for many months after it is taken out of the water, and kept in a state as dry as dust. In this state it is of a globular shape, exceeds not the bigness of a grain of sand, and no signs of life appear: but being put into water, in the space of half an hour a languid motion begins, the globule turns itself about, lengthens itself by slow degrees,

Animalcule.

degrees, assumes the form of a lively maggot, and most commonly in a few minutes afterwards puts out its wheels; swimming vigorously through the water, as if in search of food; or else, fixing itself by the tail, works the wheel in such a manner as to bring its food to it.

Fig. 23. and 24. show the wheel animal in its globular form; fig. 11. and 12. in its maggot state; and fig. 13, 14, 15, 16, 17, 18, 19, 20, 21, and 22, show the different appearances of its wheels, and also its various intermediate changes between the globular and maggot state.

17 Its wheel-work described.

The most remarkable part of this animalcule is its wheel-work. This consists of a couple of semicircular instruments, round the edges of which many little fibrillæ move themselves very briskly, sometimes with a kind of rotation, and sometimes in a trembling or vibrating manner. When in this state, it sometimes unfastens its tail, and swims along with a great deal of swiftness, seemingly in pursuit of its prey. Sometimes the wheels seem to be entire circles, armed with small teeth, like those of the balance wheel of a watch, appearing projected forwards beyond the head, and extending sidewise somewhat wider than its diameter. The teeth or cogs of these wheels seem to stand very regularly at equal distances: but the figure of them varies according to their position, the degree of their protrusion, and perhaps the will of the animal itself. They appear sometimes like minute oblong squares, rising at right angles from the periphery of a circle, like ancient battlements on a round tower; at other times, they terminate in sharp points, and altogether resemble a kind of Gothic crown. They are often seen in a kind of curved direction, all bending the same way, and seeming like so many hooks; and now and then the ends of them will be perceived to be clubbed like mallets. This figure, however, as well as the first, they assume but rarely.

As these wheels are everywhere excessively transparent, except about their circular rim or edge, where the cogs are set, it is very difficult to determine by what contrivance they are turned about, or what their real figure is, though they seem exactly to resemble wheels moving round upon an axis. It is also hardly possible to be certain whether those circular bodies in which the teeth are set, are of a flat form, or hollow and conical; but they seem rather to be of a conical figure. The difficulty of conceiving how an articulation could be contrived so as to cause a real rotation, hath caused many people imagine that there was a deception in this case: But Mr Baker assures us, that when the wheels are fully protruded, they never fail to show all the visible marks of a regular rotation; and, in some positions, the same cogs or teeth may be traced by the eye during a complete revolution.

18 Shows all the marks of a real rotation.

19 Shows great quickness of sensation.

All the actions of this creature seem to imply sagacity and quickness of sensation. At the least touch or motion in the water, they instantly draw in their wheels; and Mr Baker conjectures, that their eyes are lodged somewhere about the wheels; because, while in the maggot state, its motions are slow and blundering; but after the wheels are protruded, they are performed with great regularity, swiftness, and steadiness.

Notwithstanding the minuteness of this animalcule, the microscope generally discovers others in the same drop of water, compared with which the wheel-animal may be said to be a whale. The transparency of its body, therefore, allows its internal parts to be seen, which cannot be perceived in the minutest animalcules, on account of the smallness of their size. *a*, Is the appearance of the head; and though it is everywhere transparent, a ring or circle, more particularly remarkable for its clearness, is commonly perceived about the middle of the forehead, a little above the mouth. This, Mr Baker thinks, might justly be called the seat of the brain. Many vessels which seem to take their origin from thence are discernible in the head, wherein some transparent fluid appears continually agitated by a kind of fluctuating motion.

Animalcule.

Fig. 15.

20 Description of its internal parts.

The thorax, *b*, is joined to the head by a very short neck, *c*, and appears to be about the sixth part of the whole length of the animal. In the middle of the thorax is placed the heart, *d*, where its systole and diastole are plainly visible. It is seen through the back of the insect, shutting and opening alternately with great regularity and exactness. Its size is proportionable to the creature's bigness; and its shape, during the systole, is nearly circular, being composed seemingly of two semilunar parts, which then approach each other laterally, and form between them a roundish or horse-shoe-like figure, whose upper side is flat, and the under one convex. The diastole is performed by a seeming separation, or opening, of these two semilunar parts, whereby the transverse diameter of the heart is very much enlarged. This separation begins exactly in the middle of the lower part next the tail; and opens to such a considerable width upwards, that the two parts, when at their utmost distension, seem only joined by an arched vessel at their anterior end. The alternate motions of contraction and dilatation are performed with great strength and vigour, in pretty much the same time as the pulsation of the arteries of a man in health. The motions of the heart are communicated to all the internal parts of the thorax, and seem to extend a great deal further; for a strict examination discovers, at the same time, throughout the whole animal, contractions and dilatations going on, that are apparently correspondent thereto. These motions of the heart, however, are sometimes suspended or imperceptible for two or three minutes: after which they are renewed, and go on again with the same regularity as before. From the under part of the thorax proceeds a small transparent horn represented at *a*, fig. 11. and 12. It is never visible but when the animal turns on its back or side.

The blood or circulating fluid of the wheel-animal is so absolutely colourless, that the current of it through the vessel is undistinguishable by glasses. A sort of irregular agitation of some fluid is indeed perceived, which is perhaps a compound motion of currents running different ways, and forming such an appearance, though no single current is anywhere distinctly visible.

Immediately below the thorax is another annular division, *e*, joining upwards to the thorax and downwards to the abdomen, the entrance whereof it serves occasionally to enlarge or diminish. The abdomen, *f*, is by much the largest part of the animal, and contains the stomach and intestines. When the insect is full of food, these bowels appear opaque and of a blood-red colour, extending quite through the belly and great

Animalcule. part of the tail, and exhibiting a variety of contractions and dilatations. The belly is capable of stretching out greatly in length, or being shortened very much, and widening its diameter. It assumes many shapes, and becomes occasionally a case for all the other parts of the body.

21 Other kinds of wheel animals. Besides the above-mentioned one, there are found in the waters several other species of animals furnished with wheels, some of which appear to have a rotatory, and others a vibratory, motion. Fig. 25. represents a kind found in the ditch at Norwich, where the hair-like insect is produced. They differ from the foregoing only in having very long tails. Fig. 26, 27, and 28, represent a species of wheel animals, which are also covered with shells. The body of this species consists of three parts, in like manner as the other; only the thorax and abdomen, in this, are not separated by any gut, or intermediate vessel, but are joined immediately together. The heart is plainly perceived, having a regular systole and diastole, at *a*, as in the former species. These creatures occasionally draw themselves entirely within their shells; and the shell then appears terminated by six short spikes on one side and two on the other.

22 Manner of producing their young ones. The young ones of this species are carried in oval sacculi, or integuments, fastened externally on the lower part of their shells somewhere about the tail; these sacculi are sometimes opaque only at one end, and seemingly empty at the other; sometimes they appear opaque in the middle, with a transparency all round, as in fig. 26. When the young one is about to burst its integuments, the parent assists it greatly, by wagging its tail, and striking the oval bag, so that the young one's head becomes as it were forced into the water, though the tail cannot be so soon disengaged. In this condition the young one sets its wheel a-going, and exerts all its endeavours to free itself from its confinement. When it has got clear, it swims away, wagging its tail as the old one does, and leaving the integument adhering to the shell of the parent. The old one then uses a number of efforts to get rid of this incumbrance, striking against it with her tail, fixing the end of her tail upon it, and then darting her body forward; with several very odd motions not easily to be described. This kind of wheel animals are great tormentors of the water flea, *Pulex aquaticus arborescens* of Swammerdam; of which a figure is given from that author (Plate XXXVI.): fig. 2. shows the natural size of the flea; and fig. 1. shows it magnified, with some of the wheel animals adhering to it. These insects are often found in great numbers in the same water: and when that is the case, it is not uncommon to discover five or six of these crustaceous wheel-animals fastened by their tail to the shell or horns of the flea; causing it, seemingly, a vast deal of uneasiness: nor can they be driven away, or shaken off, by all the efforts the flea can use for that purpose.

Fig. 28. *b*.

23 Infest the Pulex Aquaticus.

24 Bell-flower animal. 5. *The Bell-flower Animal*, or *Plumed Polype*. These animalcules dwell in colonies together, from ten to fifteen (seldom falling short of the former number, or exceeding the latter), in a slimy kind of mucilaginous or gelatinous case; which, out of the water, has no determined form, appearing like a little lump of slime; but, when expanded therein, has some resemblance to the figure of a bell with its mouth upwards; and is usually about half an inch long, and a quarter of an inch in diameter. These bells, or colonies, are to be found adhering to the large leaves of duckweed, and other aquatic plants. They may be most easily discovered by letting a quantity of water, with duckweed in it, stand quietly for three or four hours in glass vessels in a window, or other place whence a strong light comes: for then, if any are about the duckweed, they will be found, on careful inspection, extending themselves out of their cases, and making an elegant appearance.

Animalcule.

25 Where discovered.

The bell, or case, which these animals inhabit, being very transparent, all the motions of its inhabitants may be discerned through it distinctly. It seems divided internally into several apartments, or rather to contain several smaller sacculi, each of which encloses one of these animals. The openings at the tops of these sacculi, are but just sufficient to admit the creature's head and a small part of its body to be thrust out beyond them, the rest remaining always in the case. It can, however, occasionally retire into its case altogether; and never fails to do so when alarmed by any sudden motion of the water, or of the vessel which contains it.

26 Motions of the whole colony. Beside the particular and separate motion which each of these creatures is able to exert within its own case, and independent of the rest; the whole colony together has a power of altering the position of the bell, or even of removing it from one place to another; and hence this bell is sometimes found standing perfectly upright, as in fig. 29. and 33. and sometimes bending the upper part downwards, as in fig. 30. As these animalcules seem not to choose to stay together in societies whose number exceeds 15, when the colony happens to increase in number, the bell may be observed to split gradually, beginning from about the middle of the upper or anterior extremity, and proceeding downwards towards the bottom, as in fig. 32. till they at last separate entirely, and become two complete colonies independent of each other, one of which sometimes removes to another part of the vessel.

27 Description of an individual. The arms of each individual of this colony are set round the head, to the number of 40, having each the figure of an Italic *f*, one of whose hooked ends is fastened to the head; and all together, when expanded, compose a figure shaped somewhat like a horse's shoe, convex on one side next the body, but gradually opening and turning outwards, so as to leave a considerable area within the outer extremities of the arms. When the arms are thus extended, the creature, by giving them a vibrating motion, can produce a current in the water, which brings the animalcules, or whatever other minute bodies are within the sphere of its action, with great velocity to its mouth, situated between the arms; where they are taken in if liked, or driven away by a contrary motion. The food is conveyed immediately from the mouth or opening between the arms, through a narrow neck, into a passage seemingly correspondent to the œsophagus in land animals; down which it passes into the stomach, where it remains for some time, and then is voided upwards, in small round pellets, through a gut whose exit is near the neck. The body consists of three divisions; in the uppermost of which are contained all the above-mentioned intestines, which are only to be discerned when the creature is full, at which time they become opaque. The other two divisions,

Animal-cule.

visions, which are probably fixed to the bell, seem to be of no other use than to give the creature a power of contraction and extension. The arms are not able to contract like those of the common polype; but when the animal retires into its case, they are brought together in a close and curious order, so as to be easily drawn in. Though their general appearance, when expanded, is that of a cup whose base and top are of a horse-shoe form, they sometimes separate into four parts, and range themselves as in fig. 36. so as to resemble four separate plumes of feathers. Though their eyes cannot be discovered, yet Mr Baker thinks they have some perception of the light: for when kept in the dark, they always remain contracted; but on being exposed to the light of the sun or of a candle, they constantly extend their arms, and show evident signs of being pleased.

28 Seem to have a perception of light.

Fig. 29. represents one complete colony or bell standing erect, with all the animals out of their kingdom, and their arms extended, exhibiting all together a very pretty appearance: *a*, represents two oval bodies, supposed by Mr Baker to be eggs.

Fig. 30. shows all the creatures withdrawn into their cells, and the end of the bell hanging downwards.

Fig. 33. shows the bell erect, with only one of the animals coming out, in order to show its connexion with the bell.

Fig. 34. shows the head and arms of a single polype closing together, and disposing themselves in order to be drawn into the bell.

Fig. 35. shows one complete animal greatly magnified, to show its several parts more distinctly; viz. *a*, the head, resembling a horse shoe; *bb*, the arms seen from one side; *c*, the narrow neck; *d*, the œsophagus; *e*, the stomach; *f*, the gut, or last intestine through which the food passes after being digested in the stomach; *g*, the anus, where the fæces are discharged in little pellets; *hi*, that part of the bell which surrounds the body of the animal, and closes upon it when it retires down.

Fig. 37. The head and arms seen in front.

29 Globe-animal.

6. *The Globe-animal.* This animalcule, represented fig. 38. seems exactly globular, having no appearance of either head, tail, or fins. It moves in all directions, forwards or backwards, up or down, either rolling over and over like a bowl, spinning horizontally like a top, or gliding along smoothly without turning itself at all. Sometimes its motions are slow, at other times very swift; and, when it pleases, it can turn round, as it were, upon an axis, very nimbly, without removing out of its place. The whole body is transparent, except where the circular black spots are shown in the figure. Some of the animals have no spots, and others from one to seven. The surface of the whole body appears, in some, as if all over dotted with points; in others, as if granulated like shagreen: but their more general appearance is, as if beset thinly round with short moveable hairs or bristles, which probably are the instruments by which their motions are performed. The animalcules may be seen by the naked eye, but appear only like moving points.

30 Pipe-animal.

7. *The Pipe-animal.* These creatures are found on the coast of Norfolk, living in small tubes or cases of sandy matter, in such multitudes as to compose a mass sometimes of three feet in length. Fig. 39. shows a piece of such a congeries broke off, where *aaaa* represent the mouths or openings of the pipes wherein the little animals make their abode. Fig. 40. shows one single pipe, with its inhabitant, separated from the rest, and magnified nine or ten times in diameter. The pipe or case *b* is made of sand, intermixed here and there with minute shells, and all cemented together by a glutinous slime, probably issuing from the animal's own body *c*, which is composed of muscular ringlets like those of a worm, capable of great extension or contraction. The inferior end or head, *d*, is exceedingly beautiful, having round it a double row of little arms disposed in a very regular order, and probably capable of extension, in order to catch its food, and bring it to its mouth. Some of these tubes are found petrified, and constitute one species of syringoides.

Animal-cule.

31 Sometimes found petrified.

32 Insects with net-like arms.

8. *An Insect with net-like arms.* The properties and shape of this little animal are very extraordinary. It is found only in cascades, where the water runs very swift. There these insects are found in clusters, standing erect on their tails; and resembling, when all together, the combs of bees at the time they are filled with their aureliæ. On being taken out of the water, they spin threads, by which they hang exactly in the same manner as the garden spider. Fig. 42. shows one of these insects magnified. Its body appears curiously turned as on a lathe; and at the tail are three sharp spines, on which it raises itself, and stands upright in the water; but the most curious apparatus is about its head, where it is furnished with two instruments like fans or nets, which serve to provide its food. These it frequently spreads out and draws in again; and when drawn up, they are folded together with the utmost nicety and exactness, so as to be indiscernible when brought close to the body. At the bottom of these fans a couple of claws are fastened to the lower part of the head, which, every time the nets are drawn in, conduct to the mouth of the animal whatever is taken in them. When the creature does not employ its nets, it thrusts out a pair of sharp horns, as in fig. 41. where the insect is shown magnified about 400 times.

Some of these creatures being kept with water in a vial, most of them died in two days; and the rest, having spun themselves transparent cases (which were fastened either to the sides of the glass, or to pieces of grass put into it), seemed to be changed into a kind of chrysalis: but, before taking this form, they appeared as in fig. 43. which shape they likewise assumed when weary with catching their food, or when lying in wait for it. None of them lived above three days; and though fresh water was given them two or three times a-day, yet, in a few hours, it would stink to a degree scarce conceivable, and that too at several yards distance, though in proportion to the water, all the included insects were not more than as 1 to 150,000. This makes it probable, that it is necessary for them to live in a rapid stream, lest they should be poisoned by the effluvia issuing from their own bodies, as no doubt they were in the vial.

33 Surprising property of spoiling water.

34 An aquatic worm.

9. *A curious aquatic worm.* This animalcule is shown, magnified, at fig. 31. It is found in ditch water; and is of various sizes, from $\frac{1}{40}$ to $\frac{1}{2}$ of an inch in length. About the head it is somewhat of a yellowish colour; but all the rest of the body is perfectly colourless and transparent, except the intestines, which are considerably

Animalcule.

considerably opaque, and disposed as in the figure. Along its sides are several papillæ, with long hairs growing from them: it has two black eyes, and is very nimble. But the most remarkable thing in this creature is a long horn or proboscis; which, in the large ones, may be seen

35 Its horn or proboscis.

with the naked eye, if the water is clear, and is sometimes $\frac{1}{10}$ of an inch in length: this it waves to and fro as it moves in the water, or creeps up the side of the glass; but it is not known whether it is hollow, or of what use it is to the creature itself.

36 Spermatic animals, when discovered.

10. *Spermatic Animals*, and *Animalcula Infusoria*. The discovery of living animalcules in the semen of most animals is claimed by Mr Leeuwenhoek and Mr Nicholas Hartsoeker, who both say they published it about the end of the year 1677 or beginning of 1678: but Mr Leeuwenhoek having given the most particular description of, and made by far the greatest number of experiments, concerning them, the discovery is commonly attributed to him.

37 General appearance the same in every animal.

According to this naturalist, these animalcules are found in the semen masculinum of every kind of animal: but their general appearance is very much the same, nor doth their size differ in proportion to the bulk of the animal to which they belong. The bodies of all of them seem to be of an oblong oval form, with long tapering slender tails issuing from them; and as by this shape they resemble *tadpoles*, they have been frequently called by that name; though the tails of them, in proportion to their bodies, are much longer than the tails of tadpoles are: and it is observable, that the animalcules in the semen of fishes have tails much longer and more slender than the tails of those in other animals; insomuch, that the extremity of them is not to be discerned without the best glasses, and the utmost attention. Fig. 21.

Pl. XXXII.

N° 1, 2, 3, 4, represent the spermatic animalcula of the rabbit; and N° 5, 6, 7, 8, those of a dog; according to Mr Leeuwenhoek.

38 Inconceivable number and minuteness.

The numbers of these animalcula are inconceivable. On viewing with a microscope the milt or semen masculinum of a living cod fish, innumerable multitudes of animalcules were found therein of such a diminutive size, that he supposed at least 10,000 of them capable of being contained in the bulk of a grain of sand; whence he concludes, that the milt of this single fish contained more living animalcules than there are to be found people living in the whole world. To find the comparative size of these animalcules, Mr Leeuwenhoek placed a hair of his head near them; which hair, through his microscope, appeared an inch in breadth; and he was satisfied, that at least 60 such animalcules could easily lie within that diameter; whence, their bodies being spherical, it follows, that 216,000 of them are but equal to a globe whose diameter is the breadth of a hair. He observed, that when the water wherewith he had diluted the semen of a cod fish was exhaled, the little bodies of the animalcules burst in pieces; which did not happen to those in the semen of a ram: and this he imputes to the greater firmness and consistency of the latter, as the flesh of a land animal is more compact than fish.

39 Are continually in motion.

These animalcules appear to be very vigorous, and tenacious of life: for they may be observed to move long after the animal from which they are taken is dead. They have this peculiarity also that they are continually in motion, without the least rest or intermission, provided there is fluid sufficient for them to swim about in. These animalcula are peculiar to the semen; nothing that has the least token of life being discovered, by the best glasses, either in the blood, spittle, urine, gall, or chyle. Great numbers, however, are to be found in the whitish matter that sticks between the teeth; some of which are of an oval figure, and others resemble eels.

Animalcule.

40 Animalcula infusoria.

The *Animalcula Infusoria* take their name from their being found in all kinds either of vegetable or animal infusions. Indeed there is scarcely any kind of water, unless impregnated with some mineral substance, but what will discover living creatures.—Mr Leeuwenhoek says, that at first he could discern no living creatures in rain water; but after standing some days he discovered innumerable animalcules, many thousands of times less than a grain of sand, and in proportion to a mite as a bee is to a horse.—In other rain water, which had likewise stood some time, he found the smallest sort he had ever seen; and, in a few days more, met with others eight times as big as these, and almost round. In another quantity of rain water that had been exposed like the former, he discovered a kind of animalcules with two little horns in continual motion. The space between the horns was flat, though the body was roundish, but tapering a little towards the end; where a tail appeared, four times as long as the body, and the thickness of a spider's web. He observed several hundreds of these within the space a grain of sand would occupy. If they happened on the least filament or string, they were entangled in it; and then would extend their bodies into an oblong round, and struggle hard to disengage their tails. He observed a second sort of an oval figure, and imagined the head to stand at the sharpest end. The body was flat, with several small feet moving exceeding quick, but not discernible without a great deal of attention. Sometimes they changed their shape into a perfect round, especially when the water began to dry away. He met also with a third sort, twice as long as broad, and eight times smaller than the first: yet in these he discerned little feet, whereby they moved very nimbly. He perceived likewise a fourth sort, a thousand times smaller than a louse's eye, and which exceeded all the rest in briskness; he found these turning themselves round, as it were upon a point, with the celerity of a top. And he says, there were several other sorts.

41 Mr Leeuwenhoek's account of animalcules in rain water.

42 Surprising production of these animalcules.

The production of *animalcula infusoria* is very surprising. In four hours time, an infusion of cantharides has produced animalcula less than even the tails of the spermatic animals we have already described. Neither do they seem to be subject to the fate of other animals; but, several kinds of them at least, by dividing themselves in two, to enjoy a sort of immortality. Nor do the common methods by which other animals are destroyed, seem to be effectual for destroying their vital principle. Hot mutton gravy, secured in a phial with a cork, and afterwards set among hot ashes to destroy as effectually as possible every living creature that could be supposed to exist in it, has nevertheless been found swarming with animalcules after standing a few days.

43 Mr Ellis's account of animalcules from infusion of potatoes.

In the Philosophical Transactions, vol. lix. we have the following curious account, given us by Mr Ellis, of animalcules produced from an infusion of potatoes and of hempseed.

"On

Animalcule.

"On the 25th of May 1768, Fahrenheit's thermometer 70°, I boiled a potato in the New River water till it was reduced to a mealy consistence. I put part of it, with an equal proportion of the boiling liquor, into a cylindrical glass vessel that held something less than half a wine pint, and covered it close immediately with a glass cover. At the same time, I sliced an unboiled potato; and, as near as I could judge, put the same quantity into a glass vessel of the same kind; with the same proportion of New River water not boiled; and covered it with a glass cover; and placed both vessels close to each other.

"On the 26th of May, 24 hours afterwards, I examined a small drop of each, by the first magnifier of Wilson's microscope, whose focal distance is reckoned at $\frac{1}{50}$ part of an inch; and, to my amazement, they were both full of animalcula of a linear shape, very distinguishable, moving to and fro with great celerity; so that there appeared to be more particles of animal than vegetable life in each drop.

"This experiment I have repeatedly tried, and always found it to succeed in proportion to the heat of the circumambient air; so that even in winter, if the liquors are kept properly warm, at least in two or three days, the experiment will succeed.

"What I have observed are infinitely smaller than spermatic animals, and of a very different shape; the truth of which every accurate observer will soon be convinced of, whose curiosity may lead him to compare them; and I am persuaded he will find they are no way akin.

"At present I shall pass over many other curious observations, which I have made on two years experiments, in order to proceed to the explaining a hint which I received last January from M. de Saussure of Geneva, when he was here; which is, that he found one kind of these animalcula infusoria that increase by dividing across into nearly two equal parts.

"I had often seen this appearance in various species, a year or two ago, as I found upon looking over the minutes I had taken when I made any new observation; but always supposed the animal, when in this state, to be in coition.

"Not hearing, till after M. de Saussure left this kingdom, from what infusion he had made his observation; his friend Dr de la Roche of Geneva informed me, the latter end of February last, that it was from hempseed.

44 From an infusion of hempseed.

"I immediately procured hempseed from different seedsmen in different parts of the town. Some of it I put into New River water, some into distilled water, and some I put into very hard pump water. The result was, that in proportion to the heat of the weather, or the warmth in which they were kept, there was an appearance of millions of minute animalcula in all the infusions; and, some time after, some oval ones made their appearance, as at fig. 3. *b*, *c*. These were much larger than the first, which still continued: these wriggled to and fro in an undulatory motion, turning themselves round very quick all the time that they moved forwards. I was very attentive to see these animals

45 Divide themselves into two.

divide themselves; and at last I perceived a few of the appearance of fig. 3. *a*, as it is represented by the first magnifier of Wilson's microscope; but I am so well convinced by experience that they would separate, that I did not wait to see the operation: however, as the following sketches, which I have drawn from five other species, will very fully explain this extraordinary phenomenon, there will be no difficulty in conceiving the manner of the first. See fig. 4, 5, 6, 7, 8.

Animalcule.

"The proportion of the number of these animals which I have observed to divide in this manner, to the rest, is scarce 1 to 50; so that it appears rather to arise from hurts received by some few animalcula among the many, than to be the natural manner in which these kinds of animals multiply; especially if we consider the infinite quantity of young ones which are visible to us through the transparent skins of their bodies, and even the young ones that are visible in those young ones while in the body of the old ones.

"But nothing more plainly shows them to be zoophytes than this circumstance, That when, by accident, the extremity of their bodies has been shrivelled for want of a supply of fresh water, the applying more fresh water has given motion to the part of the animal that was still alive: by which means, this shapeless figure has continued to live and swim to and fro all the time it was supplied with fresh water.

"I cannot finish this part of my remarks on these animals, without observing, that the excellent Linnæus has joined the *beroë* with the *volvox*, one of the animalcula infusoria. The beroë is a marine animal, found on our coast; of a gelatinous transparent nature, and of an oval or spherical form, from half an inch to an inch diameter; divided like a melon into longitudinal ribs, each of which is furnished with rows of minute fins; by means of which, this animal, like the animalcula infusoria, can swim in all directions with great swiftness. In the same manner I have seen most of those minute animals move so swift that we could not account for it, without supposing such a provision in nature, which is really true, but cannot be seen till the animals grow faint for want of water; then, if we attend, we may with good glasses plainly discover them.

46 Beroë described.

47 Method of discovering the fins of animalcules.

"I have lately found out, by mere accident, a method to make their fins appear very distinctly, especially in the larger kind of animalcula, which are common to most vegetable infusions; such as the terebella. This has a longish body, with a cavity or groove at one end, like a gimlet: by applying, then, a small stalk of the horse-shoe geranium (or geranium zonale of Linnæus), fresh broken, to a drop of water in which these animalcula are swimming, we shall find that they will become torpid instantly; contracting themselves into an oblong oval shape, with their fins extended like so many bristles all round their bodies. The fins are in length about half the diameter of the middle of their bodies. Before I discovered this expedient, I tried to kill them by different kinds of salts and spirits; but though they were destroyed by this means, their fins were so contracted, that I could not distinguish them in the least. After lying in this state of torpidity for two or three minutes, if a drop of clean water is applied to them, they will recover their shape, and swim about immediately, rendering their fins again invisible."

Fig. 3, 4, 5, 6, 7, 8, represent different species of animalcula infusoria, mentioned by Mr Ellis as belonging to the genus volvox of Linnæus.

Fig. 3. represents the volvox ovalis, or egg-shaped volvox;

Animalcule.

volvox; at (b) and (c) it is expressed in its natural shape; at (a) the manner in which it becomes two animals, by separating across the middle. This was found in the infusion of hempseed; but is found in other vegetable infusions, particularly that of tea seed.

Fig. 4. is the volvox torquilla, or wryneck. At (a) is represented its divided state; at (b) and (c) its natural state; this is common to most vegetable infusions, as is the following:

Fig. 5. is the volvox volutans, or the roller. At (a) the animal is separated, and becomes two distinct beings, each swimming about and providing for itself: this is often the prey of another species of this genus, especially while it is weak by this separation, not being so active for some time till it can recover itself. At (c) the animal appears to be hurt on one side; this impression in a little time is succeeded by another in the opposite side, as at (b), which soon occasions a division. At (d) is the side view, and at (e) the front view, of the natural shape of the animal.

Fig. 6. is the volvox oniscus, or wood-louse. At (a) is the natural shape of it, as it appears full of little hairs, both at the head and tail; with those at the head, it whirls the water about to draw its prey to it; the feet, which are many, are very visible, but remarkably so in a side-view at (d). At (b) it is represented beginning to divide; and at (c) the animals are ready to part: in this state, as if in exquisite pain, they swim round and round, and to and fro, with uncommon velocity, violently agitated till they get asunder. This was found in an infusion of different kinds of pine branches.

Fig. 7. is the volvox terebella, or the gimlet. This is one of the largest of the kind, and is very visible to the naked eye. It moves along swiftly, turning itself round as it swims, just as if boring its way: (a) and (b) are two views of its natural shape; (c) shows the manner of its dividing. When they are separated, the lower animal rolls very awkwardly along, till it gets a groove in the upper part: (d) represents one of them lying torpid, by means of the juice of the horse-shoe geranium, with its fins extended. This animal is found in many infusions, particularly of grass or corn.

Fig. 8. is the volvox vorax, or glutton. This animal was found in an infusion of the Tartarian pine; it varies its shape very much, contracting and extending its proboscis, turning it to and fro, in various directions, as at a, b, c, d, e. It opens its proboscis underneath the extremity, when it seizes its prey. The less active animals, that have lately been divided, such as those at fig. 3. (a), and at fig. 4. (a), serve it as food, when they come in its way: these it swallows down instantly, as it is represented at fig. 8. h and i. At (f) it is ready to divide, and at (g) it is divided; where the hinder part of the divided animal has got a proboscis or beak, to procure nourishment for itself, and soon becomes a distinct being from the fore part.

Thus we have given as full an account as our limits would admit, of the most curious kinds of animalcules that have hitherto been observed. We cannot, however, dismiss this subject, without taking notice of some of the most remarkable hypotheses which have been formed concerning their nature and origin.

Before the invention of microscopes, the doctrine of equivocal generation, both with regard to animals and plants of some kinds, was universally received: but this instrument soon convinced every intelligent person, that those plants which formerly were supposed to be produced by equivocal generation arose from seeds, and the animals, in like manner, from a male and female. But as the microscope threw light upon one part of nature, it left another involved in darkness: for the origin of the animalcula infusoria, or of the spermatic animals already mentioned, remains as yet as much unknown as that of many other kinds was when the doctrine of equivocal generation reigned in full force.

Animalcule.

48 Doctrine of equivocal generation exploded.

49 Supposed discovery concerning generation.

The discovery of spermatic animalcules was thought to throw some light on the mysterious affair of generation itself, and these minute creatures were imagined to be each of them individuals of the same species with the parent. Here the infinite number of these animalcules was an objection, and the difficulty remained as great as before: for, as every one of these animalcules behoved to be produced from a male and female, to explain their origin by animalcular generation in the same manner, was only explaining generation by itself.

This hypothesis, therefore, having proved unsatisfactory, others have been invented. M. Buffon, particularly, hath invented one, by which he at once annihilates the whole animalcular world; and in this he hath been followed by several very ingenious philosophers. For a particular account of this, so far as it concerns generation, we must refer to that article; but as he gives such a particular account of his having examined the human semen, that we cannot doubt of his accuracy, we shall here contrast his account with that of Mr Leeuwenhoek already mentioned.

50 M. Buffon's experiments on the human semen.

Having procured the seminal vessels of a man who died a violent death, he extracted all the liquor from them while they were still warm; and having examined a drop of it with a double microscope, it had the appearance, fig. 9. Large filaments appeared, which in some places spread out into branches, and in others intermingled with one another. These filaments clearly appeared to be agitated by an internal undulatory motion, like hollow tubes, which contained some moving substance. He saw distinctly this appearance changed for that fig. 10. Two of these filaments, which were joined longitudinally, gradually separated from each other in the middle, alternately approaching and receding, like two tense cords fixed by the ends, and drawn asunder in the middle. These filaments were composed of globules that touched one another, and resembled a chaplet of beads. After this, he observed the filament swelled in several places, and perceived small globular bodies issue from the swelled parts, which had a vibratory motion like a pendulum. These small bodies were attached to the filaments by small threads, which gradually lengthened as the bodies moved. At last, the small bodies detached themselves entirely from the filaments, drawing after them the small thread, which looked like a tail. When a drop of the seminal liquor was diluted, these small bodies moved in all directions very briskly; and had he not seen them separate themselves from the filaments, he would, he says, have thought them to be animals. The seminal matter was at first too thick, but gradually became more fluid; and, in proportion as its fluidity increased, the filaments disappeared,

Animalcule.

disappeared, but the small bodies became exceedingly numerous. Each of them had a long thread or tail attached to it, from which it evidently endeavoured to get free. Their progressive motion was extremely slow, during which they vibrated to the right and left, and at each vibration they had a rolling unsteady motion in a vertical direction.

At the end of two or three hours, the seminal matter becoming still more fluid, a greater number of these moving bodies appeared. They were then more free of encumbrances; their tails were shorter; their progressive motion was more direct, and their horizontal motion greatly diminished. In five or six hours, the liquor had acquired almost all the fluidity it could acquire without being decomposed. Most of the small bodies were now disengaged from their threads; their figure was oval. They moved forward with considerable quickness, and, by their irregular motions backward and forward, they had now more than ever the appearance of animals. Those that had tails adhering to them, seemed to have less vivacity than the others; and of those that had no tails, some altered more their figure and their size. In twelve hours, the liquor had deposited at the bottom of the vial a kind of ash-coloured gelatinous substance, and the fluid at top was almost as transparent as water. The little bodies being now entirely freed from their threads, moved with great agility, and some of them turned round their centres. They also often changed their figures, from oval becoming round, and often breaking into smaller ones. Their activity always increased as their size diminished. In 24 hours, the liquor had deposited a greater quantity of gelatinous matter, which, being with some difficulty diluted in water, exhibited an appearance somewhat resembling lace. In the clear semen itself only a few small bodies were now seen moving; next day, these were still farther diminished; and after this nothing was to be seen but globules, without the least appearance of motion. Most of the above-mentioned appearances are shown fig. 10, 11, 12, 13, 14, 15, 16. Fig. 17. and 18. represent an appearance of the globules in another experiment, in which they arranged themselves as troops, and passed very quickly over the field of the microscope. In this experiment they are found to proceed from a small quantity of gelatinous mucilage.

From these experiments, M. Buffon concludes, that what have been called *spermatic animals*, are not creatures really endowed with life, but something proper to compose a living creature; and he distinguishes them by the name of *organic particles*. The same individual kinds of animals he declares he has found in the fluids separated from the ovaria of females: and for the truth of this appeals to the testimony of Mr Needham, who was an eye witness of his experiments. He also brings

51 Needham's experiment on the milt of the calmar.

an additional proof of his doctrine from Mr Needham's observation on the milt of the *calmar*, a species of cuttle fish. Here the spermatic animals, at least what have the only appearance of life, are vastly larger than in any other creature, so as to be plainly visible to the naked eye. When magnified, they appear as at fig. 19. and 20. *a*. Their first appearance is at fig. 19. *a* and *b*, when they resemble springs enclosed in a transparent case. These springs were equally perfect at first as afterwards; only in time they contracted themselves, and became like a kind of screw. The head of the case is a species of valve which opens outward, and through which every thing within may be forced out. It contains, besides, another valve, *b*, a little barrel *c*, and a spongy substance *d e*. Thus the whole machine consists of an outer transparent cartilaginous case *a*, the superior extremity of which is terminated by a round head formed by the case itself, and performs the office of a valve. This external case contains a transparent tube: which includes the spring, a piston or valve, a little barrel, and spongy substance. The screw occupies the superior part of the tube and case, the piston and barrel are situated in the middle, and the spongy substance occupies the inferior part. These machines pump the liquor of the milt; the spongy substance is full of this liquor; and, before the animal spawns, the whole milt is only a congeries of these bodies which have sucked up all the liquor of it. Whenever these small machines are taken out of the body of the animal, and put in water, or exposed to the air, they begin to act, as represented in fig. 19. and 20; the spring mounts up, and is followed by the piston, the barrel, and the spongy substance which contains the liquor: and, as soon as the spring and the tube in which it is contained begin to issue out of the case, the spring plaits, and the whole internal apparatus moves, till the spring, the piston, and the barrel, have entirely escaped from the case. When this is effected, all the rest instantly follow, and the milty liquor which had been pumped in, and confined to the spongy substance, runs out through the barrel.

Animalcule.

Fig. 20.

According to this account, the milt of the calmar contains no animalcules; and therefore we may from analogy conclude, that the small moving bodies which are to be seen in the semen of other animals, are not really creatures endowed with life. M. Buffon extends the analogy still further: and concludes, that all the moving bodies which are to be found in the infusions either of animal or vegetable substances are of a similar nature. "To discover (says he) whether all the parts of animals, and all the seeds of plants, contained moving organic particles, I made infussions of the flesh of different animals, and of the seeds of more than 20 different species of vegetables; and after remaining some days in close glasses, I had the pleasure of seeing organic moving particles in all of them. In some they appeared sooner, in others later; some preserved their motions months, and others soon lost it. Some at first produced large moving globules resembling animals, which changed their figure, split, and became gradually smaller. Others produced only small globules, whose motions were extremely rapid; and others produced filaments, which grew longer, seemed to vegetate, and then swelled and poured forth torrents of moving globules."

52 Conclusion against the existence of animalcules.

This last observation gave rise to a new system. Baron Munchansen, perceiving that the last-mentioned moving globules, after moving for some time, began again to vegetate, concluded that they were first animals and then plants. This strange hypothesis Mr Ellis has overturned in the paper already quoted, in which he asserts that they are no other than the seeds of that genus of fungi called *mucor* or *mouldiness*, and that their motion is owing to numbers of minute animalcules attacking them for food. "Having (says he), at the request of Dr Linnæus, made several experiments

53 Baron Munchansen's theory.

54 Disproved by Mr Ellis.

Animalcule.

on the infusion of mushrooms in water, in order to prove the theory of Baron Munchansen, that their seeds are first animals, and then plants (which he takes notice of in his System of Nature, p. 1326, under the genus of chaos, by the name of *chaos fungorum seminum*), it appeared evidently, that the seeds were put into motion by very minute animalcules, which proceeded from the putrefaction of the mushroom: for by pecking at these seeds, which are reddish, light, round bodies, they moved them about with great agility in a variety of directions; while the little animals themselves were scarcely visible, till the food they had eaten had discovered them. The satisfaction I received from clearing up this point, led me into many other curious and interesting experiments.

"The ingenious Mr Needham supposes these little transparent ramified filaments, and jointed or coralloid bodies, which the microscope discovers to us on the surface of most animal and vegetable infusions when they become putrid, to be zoophytes, or branched animals; but to me they appear, after a careful scrutiny with the best glasses, to be of that genus of fungi called *mucor* or *mouldiness*; many of which Michelius has figured, and Linnæus has accurately described.

"Their vegetation is so amazingly quick, that they may be perceived in the microscope even to grow and feed under the eye of the observer.

Mr Needham has pointed out to us a species that is very remarkable for its parts of fructification. (See Philosophical Transactions, vol. xlv. tab. 5. fig. 3. a, A). This, he says, proceeds from an infusion of bruised wheat.

"I have seen the same species arise from the body of a dead fly, which was become putrid by lying floating for some time in a glass of water, where some flowers had been, in the month of August 1768. This species of mucor sends forth a mass of transparent filamentous roots; from whence arise hollow stems, that support little oblong oval seed vessels, with a hole on the top of each. From these I could plainly see minute globular seeds issue forth in great abundance with an elastic force, and turn about in the water as if they were animated.

"Continuing to view them with some attention, I could just discover, that the putrid water which surrounded them was full of the minutest animalcula; and that these little creatures began to attack the seeds of the mucor for food, as I have observed before in the experiment on the seeds of the larger kind of fungi or mushrooms. This new motion continued the appearance of their being alive for some time longer: but soon after, many of them arose to the surface of the water, remaining there without motion; and a succession of them afterwards coming up, they united together in little thin masses, and floated to the edge of the water, remaining there quite inactive during the time of observation.

"As this discovery cleared up many doubts which I had received from reading Mr Needham's learned dissertation, I put into the glass several other dead flies; by which means this species of mucor was propagated so plentifully, as to give me an opportunity of frequently trying the same experiment to my full satisfaction.

"Lastly, These jointed coralloid bodies, which Mr Needham calls *chaplets*, and *pearl-necklaces*, I have seen frequently very distinctly. These appear not only on an infusion of bruised wheat when it becomes putrid, but on most other bodies when they throw up a viscid scum and are in a state of putrefaction. These, then, are evidently no more than the most common mucor, the seeds of which are everywhere floating in the air; and bodies in this state afford them a natural proper soil to grow upon. Here they send downwards their fine transparent ramified roots into the moisture which they float upon; and from the upper part of the scum, their jointed coralloid branches rise full of seed into little groove-like figures. When a small portion of these branches and seeds are put into a drop of the same putrid water upon which the scum floats, many of these millions of little animalcula with which it abounds, immediately seize them as food, and turn them about with a variety of motions, as in the experiments on the seeds of the common mushrooms, either singly, or two or three seeds connected together; answering exactly to Mr Needham's description, but evidently without any motion of their own, and consequently not animated.

Animalcule.

55 M. Buffon's opinion of different kind of animalcules.

M. Buffon, however, is not content with denying life only to those beings where the signs of it are the most equivocal; but includes in the same rank of organic particles, almost every animal too small to be discovered by the naked eye, and even some of those whose motions are evidently perceptible to the eye. "Almost all microscopic animals," says he, "are of the same nature with the moving bodies in the seminal fluids and infusions of animal and vegetable substances. The eels in paste, in vinegar, &c. are all of the same nature, and derived from the same origin. There are, perhaps, as many beings that either live or vegetate, produced by a fortuitous assemblage of organic particles, as by a constant and successive generation. Some of them, as those of the calmar, are only a kind of machines, which, though exceedingly simple, are very active. Others, as the spermatic animalcules, seem to imitate the movements of animals. Others resemble vegetables in their manner of growth and extension. There are others, as those of blighted wheat, which at pleasure can be made alternately either to live or die, and it is difficult to know to what they should be compared. There are still others, and in great numbers, which are at first a kind of animals, then become a species of vegetables, and again return alternately to their vegetable state. The eels in paste have no other origin than the union of the organic particles of the most essential part of the grain. The first eels that appear are certainly not produced by other eels; but though they are not propagated themselves, they fail not to engender other living eels. By cutting them with the point of a lancet, we discover smaller eels issuing in great numbers out of their bodies. The body of this animal seems to be only a sheath or sac, containing a multitude of smaller animals, which perhaps are other sheaths of the same kind, in which the organic matter is assimilated into the form of eels."

56 His reasoning inconclusive.

Though we can by no means pretend to account for the appearance of these animalcules, yet we cannot help observing, that our ignorance of the cause of any phenomenon is no argument against its existence. Though we are not able to account in a satisfactory manner for the

Animalcule.

the origin of the native Americans, we suppose M. Buffon himself would reckon it absurd to maintain that the Spaniards on their arrival there found only *organic particles* moving about in disorder. The case is the very same with the eels in paste. They are exceedingly minute in comparison with us; but, with the solar microscope, Mr Baker has made them assume a more respectable appearance, so as to have a diameter of an inch and a half, or two inches, and a length proportionable. They swam up and down very briskly; the motion of their intestines was plainly visible; when the water dried up, they died with apparent agonies, and their mouths gaped very wide. Were we to find a creature of the size of this magnified eel, gasping in a place where water had lately been, we certainly would never conclude it to be an *organic particle*, or a fortuitous assemblage of them; but a fish. Why then should we conclude otherwise with regard to the eel while in its natural state, than that it is a little fish? In reasoning on this subject, we ought always to remember, that, however essential the distinction of bodies into great and small may appear to us, they are not so to the Deity; with whom, as Mr Baker well expresses himself, "an atom is as a world, and a world but as an atom."—Were the Deity to exert his power for a little, and give a natural philosopher a view of a quantity of paste filled with eels, from each of whose bodies the light was reflected as when it passes through a solar microscope; instead of imagining them organic particles, the paste would appear like a little mountain; he would probably look upon the whole as a monstrous assemblage of serpents, and be afraid to come near them. Whenever, therefore, we discover beings to appearance endowed with the principle of self-preservation, or whatever else we make the characteristic of animals, neither the smallness of their size, nor the impossibility of our knowing how they come there, ought to cause us doubt of their being really animated. —At the same time, it must also be remembered, that *motion* is not always a characteristic of animal life, even though the moving bodies should avoid one another, or any seeming obstacle placed in their way. We know, that inanimate bodies, when electrified, will avoid others endowed with an electricity of the same kind, and adhere to those which have the opposite one. As we are by no means acquainted with the utmost powers of electricity, but on the contrary, from what we do know of it, have all the reason in the world to conclude that it can produce effects utterly beyond our comprehension, it is impossible for us to know what share it may have in producing the motions observed in vegetable infusions, or in the semen of animals.—We may also further observe, that though in Mr Ellis's experiment of the boiled potato he took it for granted that every seed of animal life would be destroyed by the boiling water, yet even this cannot be proved; nay, on the contrary, it hath been proved by undeniable experiments, that the human body itself hath endured a heat of 240 degrees of Fahrenheit (28 degrees above that of boiling water) without injury. The eggs of these animalcula might therefore be strong enough to resist the heat hitherto used in Mr Ellis's or any other experiment.

A considerable objection to the existence of animalcules in the semen, or any other part of animal bodies, must arise from the total exclusion of air, which is found so necessary to the life of larger animals. Some instances, however, have been observed of large animals being found in such situations as they could not possibly have enjoyed the least benefit from the air for a great number of years; and in this state they have not only lived, but lived much longer than they would otherwise have done.

Animalcule.

67 Animals sometimes found living in solid bodies.

In Toulon harbour and road, are found solid hard stones, and perfectly entire; containing in different cells, secluded from all communication with the air, several living shell fish, of an exquisite taste, called *Dactyli*, i. e. Dates: to come at these fish, the stones are broken with mauls. Also, along the coast of Ancona, in the Adriatic, are stones usually weighing about 50 pounds, and sometimes even more; the outside rugged, and easily broken, but the inside so hard, as to require a strong arm and an iron maul to break them; within them, and in separate niches, are found small shell-fish, quite alive, and very palatable, called *Solenes* or *Cappe lunghe*. These facts are attested by Gassendi, Blondel, Mayol, the learned bishop of Sulturara, and more particularly by Aldrovandi a physician of Bologna. The two latter speak of it as a common fact which they themselves saw.

In the volume for 1719, of the Academy of Sciences at Paris, is the following passage:

"In the foot of an elm, of the bigness of a pretty corpulent man, three or four feet above the root, and exactly in the centre, has been found a live toad, middle sized, but lean, and filling up the whole vacant space: no sooner was a passage opened, by splitting the wood, than it scuttled away very hastily: a more firm and sound elm never grew; so that the toad cannot be supposed to have got into it. The egg whence it was formed, must, by some very singular accident, have been lodged in the tree at its first growth. There the creature had lived without air, feeding on the substance of the tree, and growing only as the tree grew. This is attested by Mr Hubert, professor of philosophy at Caen."

The volume for the year 1731 has a similar observation, expressed in these words:

"In 1719, we gave an account of a fact, which, though improbable, is well attested; that a toad had been found living and growing in the stem of a middling elm, without any way for the creature to come out or to have got in. M. Seigne, of Nantes, lays before the academy a fact just of the very same nature, except that instead of an elm, it was an oak, and larger than the elm, which still heightens the wonder. He judges, by the time requisite for the growth of the oak, that the toad must have subsisted in it, without air, or any adventitious aliment, during 80 or 100 years. M. Seigne seems to have known nothing of the fact in 1719."

With the two foregoing may be classed a narrative of Ambrose Parée, chief surgeon to Henry III. king of France, who, being a very sensible writer, relates the following fact, of which he was an eye-witness.

"Being (says he) at my seat, near the village of Meudon, and overlooking a quarryman whom I had set to break some very large and hard stones; in the middle of one we found a huge toad, full of life, and without any visible aperture by which it could get

Animalcule, Animated.

there. I began to wonder how it received birth, had grown, and lived; but the labourer told me, it was not the first time he had met with a toad, and the like creatures, within huge blocks of stone, and no visible opening or fissure."

Observations of living toads, found in very hard and entire stones, occur in several authors, particularly Baptist Fulgosa doge of Genoa, the famous physicians Agricola and Horstius, and Lord Verulam; others give very specious accounts of snakes, frogs, crabs, and lobsters, being found alive, enclosed within blocks of marble, rocks, and large stones.

An instance similar to these, of the truth of which we have no reason to doubt, was observed in this country in the year 1773, where a large toad was found in the middle of a piece of coal having not the least visible crack or fissure.

58 The subject still obscure.

Upon the whole, therefore, though philosophers are not yet able to discover how these minute creatures are produced; yet, that there really are animals much smaller than what we can discern with our naked eye, seems to be indisputable. The subject, however, is still evidently obscure, and will no doubt require the utmost attention of philosophers, as well as further improvements in the construction of microscopes, fully to investigate it.

Animalcula are said to be the cause of various disorders. The itch, from several experiments, is affirmed to be a disorder arising from the irritations of a species of animalcula found in the pustules of that ailment; whence the communication of it by contact from one to another is easily conceived, as also the reason of the cure being effected by cutaneous applications. On this foundation some have attributed the smallpox and measles, and infectious diseases; others the epilepsy, &c. to animalcules. Langius goes farther, and pretends to reduce all diseases in general to the same principle. A late writer at Paris, who assumed the title of an English physician, has done more. He not only accounts for all diseases, but for the operation of all medicines, from the hypothesis of animalcules. He has peculiar animalcules for every disease; scorbutic animalcules, podagrical animalcules, variolous animalcules, &c. all at his service. *Journ. des Sçav.* tom. lxxxii. p. 535, &c.

But as most discoveries in natural philosophy have laid a foundation for the warm imaginations of some men to form visionary theories, to the great prejudice of real knowledge; so those relating to animalcula have been drawn in, however improperly, to support the most whimsical and chimerical systems.

Animalcules, Invisible.—Naturalists suppose another species or order of invisible animalcules, viz. such as escape the cognizance even of the best microscopes, and give many probable conjectures in relation to them. Reason and analogy give some support to the existence of infinite imperceptible animalcules. The naked eye, say some, takes in from the elephant to the mite; but there commences a new order reserved only for the microscope, which comprehends all these from the mite to those 27 millions of times smaller; and this order cannot be yet said to be exhausted, if the microscope be not arrived at its last perfection. See further on this subject the article Microscope.

ANIMATED, or Animate, in a general sense, denotes something endowed with animal life. It also imports a thing to be impregnated with vermine or animalcules. Animated || Anjou.

Animated Horse-Hairs. See *Horse-Hairs.*

ANIMATION signifies the informing an animal body with a soul.—The different hypotheses of physicians and philosophers, concerning the time of animation, have had their influence on the penal laws made against artificial abortions: it having been made capital to procure miscarriage in the one state, while in the other it was only deemed a venial crime. The emperor Charles V. by a constitution published in 1532, put the matter on another footing; instead of the distinction of an animated and unanimated fœtus, he introduced that of a vital and non-vital fœtus, as a thing of more obvious and easy decision, and not depending on any system either of creation, traduction, or infusion. Accordingly a fœtus is said, in a legal sense, to be animated, when it is perceived to stir in the womb; which usually happens about the middle of the term of gestation.

ANIME, in *Heraldry*, a term used when the eyes of a rapacious creature are borne of a different tincture from the creature itself.

Anime, a resin exsuding from the trunk of a large American tree, called by Piso *jetaiba*, by the Indians *courbaril*, (a species of Hymenæa). This resin is of a transparent amber colour, a light agreeable smell, and little or no taste. It dissolves entirely, but not very readily, in rectified spirit of wine; the impurities, which are often in large quantity, remaining behind. The Brazilians are said to employ anime in fumigations for pains and aches proceeding from a cold cause: with us, it is rarely, if ever, made use of for any medicinal purposes.

ANIMETTA, among ecclesiastical writers, denotes the cloth wherewith the cup of the eucharist is covered.

ANINGA, in commerce, a root which grows in the Antilles islands, and is pretty much like the China plant. It is used by sugar bakers for refining the sugar.

ANJOU, a province and duchy of France before the revolution, bounded on the east by Touraine, on the south by Poictou, on the west by Bretagne, and on the north by Maine. It is now included under the departments of the Mayne and Loire, and the Sarte and Mayenne. It is 70 miles in length, and in breadth 60. Through this province run five navigable rivers: the Loire, which divides it into two parts; the Vienne, the Toue, the Mayenne, and the Sarte.

The air is temperate, and the country agreeably diversified with hills and meadows. There are 33 forests of oak trees mixed with beech. The country produces white wine, wheat, barley, rye, oats, pease, beans, flax, hemp, walnuts, and some chesnuts. In Lower Anjou they make cyder. There are fruit trees of all kinds, and pasture proper for horses. The greatest riches of the province consist in cows, oxen, and sheep. There are several coal and iron mines; and yet there are but two forges in the whole province. There are quarries of marble and of slate; as well as quarries of white stone, proper for building, on the side of the river Loire. Here are also several saltpetre works and some glass-houses. The remarkable towns, besides

besides Angers the capital, are Saumur, Brisac, Pons de Cea, La Fleche, and Beaufort.

ANIO, (Cicero, Horace, Priscian); ANIEN, (Statius); now *il Teverone:* a river of Italy, which falls into the Tiber, three miles to the north of Rome, not far from Antemnæ. It rises in a mountain near Treba, (Pliny); and running through the country of the Æquiculi or Æqui, it afterwards separated the Latins from the Sabines; but nearer its mouth, or confluence, it had the Sabines on each side. It forms three beautiful lakes in its course, (Pliny). In the territories of Tibur it falls from a great height, and there forms a very rapid cataract; hence the epithet *præceps*, and hence the steam caused by its fall, (Horace). *Anienus* is the epithet formed from it, (Virgil, Propertius). *Anienus* is also the god of the river, (Propertius, Statius.)

ANISUM, or ANISE. See PIMPINELLA, BOTANY *Index*.

ANKER, a liquid measure at Amsterdam. It contains about 32 gallons English measure.

ANKLE, in *Anatomy*, the joint which connects the foot to the leg.—We have an account of the menses being regularly evacuated at an ulcer of the ankle, *Edin. Med. Obs.* vol. iii. art. 29.

ANN, or ANNAT, in *Scots Law*, is half a years stipend, which the law gives to the executors of ministers of the church of Scotland, over and above what was due to the minister himself for his incumbency.

ANNA, one of the three principalities into which Arabia Deserta is divided.

ANNA, one of the chief cities of the above principality, and formerly a famed mart-town, is situated in Lat. 33. 57. and E. Long. 42. 10. on the river Euphrates, in a fruitful and pleasant soil. It has two streets, which are divided by the river. That on the Mesopotamia side is about two miles long, but thinly peopled, and by none but tradesmen; that on the opposite side is about six miles in length, and it is there that the principal inhabitants of the city dwell. Every house has some ground belonging to it; and these grounds are loaded with noble fruit trees, as lemons, oranges, citrons, quinces, figs, dates, pomegranates, olives, all very large and in great plenty. Some of the flat grounds are sown with corn and other grain, which yield likewise a considerable crop. This city is the common rendezvous of all the robbers that infest the country, and from which they disperse themselves into all parts of the desert. Here they meet to consult; here they hold their grand council, and deliberate where to rob next with success. It is with great difficulty that the Turkish aga, and the janizaries who are kept here, can levy the tribute imposed by the Turks on all the commodities carried through this city, which is one of the great thoroughfares for the passing of the caravans that go to and from Aleppo, Tripoli, Damascus, Bagdad, and some other parts of the Turkish empire.

ANNA *Comnena*, daughter of the emperor Alexius Comnenus I. was not less distinguished by her elevated rank than by her mental qualifications. Her superiority of mind began early to display itself. Despising and neglecting the effeminacy and voluptuousness of the court in which she was educated, she directed her attention to literary pursuits. Indulging her favourite studies, she solicited the acquaintance of the more eminent philosophers of that period.

Anna || Annals.

But the pursuits of literature did not induce her entirely to abandon society; she gave her hand to Nicephorus Bryennius, a young nobleman of a respectable family. This accomplished woman was, however, actuated with unjustifiable ambition; and, during the last illness of her father, she united with the empress Irene, in attempting to prevail upon that monarch to disinherit his own son, and give the crown to her husband. The affection and virtue of the father prevailed over female address and intrigue. But the ambition of Comnena was not diminished; for she entered into a conspiracy to depose her brother; and when her husband displayed a timidity and hesitation in this unjust enterprise, she exclaimed, that "Nature had mistaken their sexes, for he ought to have been the woman."

Either through the vigilance of her brother, or the timidity of her husband, the treasonable plot was discovered, and Anna punished with the confiscation of all her property. But generosity has an opportunity of displaying its real nature when an enemy is vanquished; thus was the generosity of her brother displayed on the present occasion, by returning all her property. Ashamed, however, of her base conduct, she retired from court, and never more possessed any influence there. Disappointed ambition took shelter among the walks of literature, and she employed herself in her solitude in writing the history of her father's reign. This production of her pen is still extant, and composes a part of the collection of the Byzantine historians. The stores of rhetoric are ransacked to embellish this work, and every effort made to enrich it with science; but the general complexion of it is rather like an apology, than an impartial narrative. It must, however, be acknowledged, that she is not more partial than many other Latin historians, and that her history contains many valuable facts and observations. (*Gen. Biog.*).

ANNABON. See ANNOBON.

ANNALE, in the church of Rome, a term applied to the masses celebrated for the dead during a whole year.

ANNALIS CLAVUS, the nail which the prætor, consul, or dictator, drove into the wall of Jupiter's temple annually upon the ides of September, to show the number of years. But this custom was superseded by reckoning years by consulships. The ceremony was sometimes performed to avert the plague, &c.

ANNALS, in matters of literature, a species of history, which relate events in the chronological order wherein they happened. They differ from perfect history in this, that annals are but a bare relation of what passes every year, as a journal is of what passes every day; whereas history relates not only the transactions themselves, but also the causes, motives, and springs of actions. Annals require nothing but brevity; history demands ornament.—Cicero informs us of the origin of annals. To preserve the memory of events, the *Pontifex Maximus*, says he, wrote what passed each year, and exposed it on tables in his own house, where every one was at liberty to read: this they called *annales*

Annals, Annan.

annales maximi; and hence the writers who imitated this simple method of narrating facts were called *annalists.*

ANNAN, the capital of Annandale, a division of Dumfrieshire in Scotland; a small town, containing 2500 inhabitants, and situated on a river of the same name, in W. Long. 3. 10. N. Lat. 54. 56. This place, which is a royal borough, has some trade in wine, and exports annually between 20 and 30,000 Winchester bushels (10 and 15,000 bolls) of corn. Vessels of about 250 tons can come within half a mile of the town; and of 60, as high as the bridge; which consists of five arches, defended by a gateway. A fabric for carding and spinning of cotton has lately been erected, and the town begins to increase. Here was formerly a castle; which was built by the Bruces, after they became lords of Annandale. Upon the death of David II. the son of King Robert, in 1371, this castle (Lochmaben), and the lordship of Annandale, came to Thomas Randolph earl of Murray, and went with his sister Agnes to the Dunbars, earls of March: after their forfeiture it went to the Douglasses, who also lost it by the same fate; and then having come to Alexander duke of Albany, he, for rebelling against his brother King James III. and plundering the fair of Lochmaben in 1484, was also forfeit. Since which time it continued in the hands of the king, and became the great key of the west border.

The stewarty or district of Annandale, of which Lochmaben castle was the chief fortalice, is a fertile vale, 24 miles long, and about 14 miles broad. From its vicinity to England, and the continual incursions and predatory wars of the borderers, the greatest part of it was uncultivated and common; but since the beginning of the present century, or rather within the last thirty years, all these wastes and commons have been divided and brought into culture, and the country has assumed a new appearance; which may be ascribed not only to the division of the commons, but likewise to the improvement made in the roads, and particularly in the great western road from Edinburgh to London by Moffat, Gratney, and Carlisle, running through this vale, and carried on by some gentlemen of the country, after they had obtained an act of parliament for levying a toll to defray the expence of making and keeping it in repair.

Annandale formed a part of the Roman province of Valentia; and Severus's wall ending here, it abounds with Roman stations and antiquities. The camps at Birrens in Middlebie, and on the hill of Burnswark, are still entire, and their form is preserved; and the traces and remains of a military road are now visible in different parts of the country. The ruins of the house or castle of Auchincass, in the neighbourhood of Moffat, once the seat of that potent baron, Thomas Randolph, earl of Murray, lord of Annandale, and regent of Scotland in the minority of David II. covers above an acre of ground, and even now conveys an idea of the plan and strength of the building. The ancient castle of Comlongan, formerly belonging to the Murrays, earls of Annandale, and now to Lord Stormont, is still in a tolerable state of preservation; but except this castle and that of Hoddam, most of the other old fortalices and towers are now taken down, or in ruins.

Annandale is a marquisate belonging to the Johnstones, and the chief of the name.

Annan Annano.

ANNAND, WILLIAM, dean of Edinburgh in Scotland, the son of William Annand minister of Ayr, was born at Ayr in 1633. Five years after, his father was obliged to quit Scotland with his family, on account of their loyalty to the king, and adherence to the episcopal government established by law in that country. In 1651, young Annand was admitted a scholar in University college in Oxford; and though he was put under the care of a presbyterian tutor, yet he took all occasions to be present at the sermons preached by the loyal divines in and near Oxford. In 1656, being then bachelor of arts, he received holy orders from the hands of Dr Thomas Fulwar, bishop of Ardfert or Kerry in Ireland, and was appointed preacher at Weston on the Green near Bicester in Oxfordshire, where he met with great encouragement from Sir Francis Norris, lord of that manor. After he had taken the degree of master of arts, he was presented to the vicarage of Leighton-Buzzard in Bedfordshire; where he distinguished himself by his edifying manner of preaching, till 1662, when he went into Scotland, in quality of chaplain to John earl of Middleton, the king's high commissioner to the church of that kingdom. In the latter end of the year 1663, he was instituted to the Tolbooth church at Edinburgh, and from thence was removed some years after to the Tron church of that city, which is likewise a prebend. In April 1676, he was nominated by the king to the deanery of Edinburgh; and in 1685, he commenced doctor of divinity in the university of St. Andrew's. He wrote, 1. *Fides Catholica;* or, The Doctrine of the Catholic Church, in eighteen grand Ordinances, referring to the word, sacraments, and prayer, in purity, number, and nature, catholically maintained, and publicly taught, against heretics of all sorts. Lond. 1671-2, 4to. 2. Solutions of many proper and profitable questions, suitable to the nature of each Ordinance, &c. printed with the Fides Catholica. 3. *Panem Quotidianem;* or, A short Discourse, tending to prove the legality, decency, and expediency, of set forms of prayers in the Churches of Christ, with a particular Defence of the Book of Common Prayer of the Church of England. Lond. 1661, 4to. 4. *Pater Noster,* Our Father; or, The Lord's Prayer explained, the sense thereof, and duties therein, from Scripture, History, and the Fathers, methodically cleared, and succinctly opened. Lond. 1670, 8vo. 5. *Mysterium Pietatis;* or, The Mystery of Godliness, &c. Lond. 1672, 8vo. 6. *Doxologia;* or, Glory to the Father, the Church's Hymn, reduced to glorifying the Trinity. Lond. 1672, 8vo. 7. *Dualitas;* or, A twofold subject displayed and opened, conducible to godliness and peace in order: First, *Lex loquens,* the honour and dignity of magistracy, with the duties thereupon, &c.; Secondly, *Duorum Unitas;* or, The agreement of magistracy and ministry, at the election of the honourable magistrates at Edinburgh and opening of the Diocesan Synod of the Reverend Clergy there. Edin. 1674, 4to. Dr Annand died the 13th of June 1689, and was honourably interred in the Grey-Friars church in Edinburgh.

ANNANO, a strong fort of Italy, in the duchy of Milan.

Anjou || Anne.

Milan. It has been twice taken by the French; but was restored to the duke of Savoy in 1706. It is seated on the river Tanaro, in E. Long. 8. 30. N. Lat. 44. 40.

ANNAPOLIS, the chief town in Maryland, in North America; it stands upon a sort of peninsula on the west side of the Chesapeake, and is a small town, but well built. It contained 2000 inhabitants in 1810. It was once known by the name of *Severn*. It received its present name in 1694, when it was made a port town, and the residence of a collector and naval officer. W. Long. 76. 10. N. Lat. 38. 25.

ANNAPOLIS ROYAL, a town of Nova Scotia, is seated on the bay of Fundy; and, though a mean place, was formerly the capital of the province. It has one of the finest harbours in America, capable of containing 1000 vessels at anchor in the utmost security. The place is also protected by a fort and garrison. At the bottom of the harbour is a point of land, which divides two rivers; and on each side there are pleasant meadows, which in spring and autumn are covered with all sorts of fresh-water fowl. There is a trade carried on by the Indians with furs, which they exchange for European goods. W. Long. 65. 22. N. Lat. 45. 10.

ANNATES, among ecclesiastical writers, a year's income of a spiritual living.

These were, in ancient times, given to the pope through all Christendom, upon the decease of any bishop, abbot, or parish clerk, and were paid by his successor. At the Reformation they were taken from the pope, and vested in the king; and, finally, Queen Anne restored them to the church, by appropriating them to the augmentation of poor livings.

ANNE, queen of Great Britain, second daughter of King James II. by his first wife, Anne Hyde, was born in 1664. In 1683, she married George, prince of Denmark, by whom she had several children, but none of them arrived at the age of maturity. On the death of King William, she ascended the throne, A. D. 1702, and her reign comprehends one of the most illustrious periods of English history. Possessed, however, of a very feeble character, which did not permit her to act for herself, this period is the reign of her counsellors, and favourites; and she exhibited no decided inclination which could influence state affairs, except a strong desire for tory principles, both in church and state. In the commencement of her reign, being entirely governed by the duchess of Marlborough, she was induced to follow out the premeditated designs of her predecessors with respect to Louis XIV. king of France, and for many years repeated success attended her armies with glory. These were at length, after a fruitless protraction of hostilities, terminated by the peace of Utrecht, in 1713. This peace was chiefly owing to the acquired influence of a female favourite of the opposite party. By an act of the legislature in the year 1706, the union of the English and Scottish nations was formed, which event contributed more than the former towards the prosperity of the kingdom. Yet these successful events prevented not the contention of parties which prevailed during the greatest part of her reign. And about the close of it, when this spirit was just on the eve of breaking into a flame, the queen manifested an ardent desire, that the exiled part of her family should succeed to the throne, and so conduced towards the superiority of the tories, as that they were inclined to push to the utmost extremity their plans, with respect to the government both of the church and state. The death of Queen Anne in August 1714, of a dropsy, in the fiftieth year of her age, and thirteenth of her reign, was therefore equally to the disappointment of the one, and to the triumph of the other. In her private station she supported the character of an amiable woman, and not devoid of understanding, although her indolence and yielding temper prevented her from exerting it. She was generally well beloved by her subjects, whose prejudices coincided with her own, and the title of the *Good Queen Anne* best expresses their sentiments. Although her own dispositions and accomplishments had no share in the honour, yet this age was rendered a sort of Augustan age of British literature, on account of the several eminent writers who flourished under her reign (*Gen. Biog.*).

Anne.

ANNE Boleyn, queen of Henry VIII. king of England, daughter of Sir Thomas Boleyn, a noblemen of a powerful family, and numerous alliances. The daughter of the duke of Norfolk was her mother, and during the reign of the former king her father had been honoured with several embassies. Mary the king's sister, who married Lewis XII. king of France, carried over this lady with her at an early age, where she imbibed the freedom, the vivacity, and the openness of manners of that nation. After the death of Lewis, that queen returned to England, and Anne continued to attend her royal mistress. Having some time after left her service, she was introduced into the family of the duchess of Alençon. In addition to all her acquired accomplishments, she possessed the greatest personal elegance, and was highly famed in that age.

History does not explicitly mention whether or not it was on her account, but upon her return to England the king expressed his scruples concerning his union with Catharine of Arragon. Enamoured, however, of Anne, he expressed his attachment to her; but she was possessed of too much virtue and policy, to confer any improper favours. This prudent and virtuous restraint only increased the passion of Henry; and placing her at court, he distinguished her by many marks of royal favour. The impetuous king at length came to the resolution to divorce his queen, to make way for his favourite Anne. In this instance, the injury done to that queen proved the cause of the final separation of England from the dominion of the pope. Various delays and difficulties occurring to the divorce, Henry privately married Anne during the month of November 1532, and in April following he publicly declared her queen of England. The famous Queen Elizabeth was the first fruits of this marriage, who was born the September following. For some time she enjoyed a considerable share of the royal favour, and she made use of that influence in subduing the haughty prelate Wolsey, and widening the breach between the king and the pope. But this favour was not of long continuance; for the king, every varying in his temper, and disappointed at her being brought to bed of a dead male child, imbibed a new passion for Jane Seymour; and troubled at the evil inclinations of the Catholics, he allowed the jealousy of conjugal affection to enter his bosom, which her thoughtless demeanour tended in

Anne, Annealing.

a great measure to realize. The king's jealousy still increasing, she was accused of adultery with several of the household officers, and even with her own brother, Lord Rochfort. She was accordingly tried on a charge of high treason, and although proof was very scanty, yet she was condemned to be beheaded; which sentence was executed in May 1536. Her behaviour on that occasion was a singular mixture of firmness and unusual levity. She avowed being guilty of many excesses, yet to the last resolutely denied any serious guilt. Although her character has been greatly depreciated by several authors, yet a letter written by her to the king after condemnation, gives a much higher idea of her character than these partial accounts would endeavour to convey.

The important part which she and her daughter acted in the Reformation has drawn upon her memory many malignant and vicious stories, by those of the Catholic party, who were likewise induced to this by the expectation of being conductive to the injury of Protestantism, by stigmatizing the various characters and motives of its promoters. These various accounts are, however, for the most part refuted by facts universally known, or have no evidence or probability by which they may be supported. Respecting her innocence of the charge on which she lost her life, it is a matter of uncertainty, yet it appears to be less certain that she was guilty than that her husband was a bloody and capricious tyrant. (*Gen. Biog.*).

St Anne's Day, a festival of the Christian church, celebrated by the Latins on the 26th of July, but by the Greeks on the 9th of December. It is kept in honour of Anne or Anna, mother of the Virgin Mary.

ANNEALING, by the workmen called *nealing*, is particularly used in making glass: it consists in placing the bottles, &c. whilst hot, in a kind of oven or furnace, where they are suffered to cool gradually: they would otherwise be too brittle for use.—Metals are rendered hard and brittle by hammering: they are therefore made red hot, in order to recover their malleability; and this is called *nealing*.

The difference between unannealed and annealed glass, with respect to brittleness, is very remarkable. When an unannealed glass vessel is broken, it often flies into a small powder, with a violence seemingly very unproportioned to the stroke it has received. In general, it is in greater danger of breaking from a very slight stroke than from one of some considerable force. One of those vessels will often resist the effects of a pistol bullet dropped into it from the height of two or three feet; yet a grain of sand falling into it will make it burst into small fragments. This takes place sometimes immediately on dropping the sand into it: but often the vessel will stand for several minutes after, seemingly secure; and then, without any new injury, it will fly to pieces. If the vessel be very thin, it does not break in this manner, but seems to possess all the properties of annealed glass.

The same phenomena are still more strikingly seen in glass drops or tears. They are globular at one end, and taper to a small tail at the other. They are the drops which fall from the melted mass of glass on the rods on which the bottles are made. They drop into the tubs of water which are used in the work; the greater part of them burst immediately in the water. When those that remain entire are examined, they discover all the properties of unannealed glass in the highest degree. They will bear a smart stroke on the thick end without breaking; but if the small tail be broken, they burst into small powder with a loud explosion. They appear to burst with more violence, and the powder is smaller, in an exhausted receiver than in the open air. When they are annealed, they lose these properties.

Annealing.

Glass is one of those bodies which increase in bulk when passing from a fluid to a solid state. When it is allowed to crystallize regularly, the particles are so arranged, that it has a fibrous texture: it is elastic, and susceptible of long-continued vibrations; but when a mass of melted glass is suddenly exposed to the cold, the surface crystallizes, and forms a solid shell round the interior fluid parts: this prevents them from expanding when they become solid. They, therefore, have not the opportunity of a regular crystallization; but are compressed together with little mutual cohesion: On the contrary, they press outward to occupy more space, but are prevented by the external crust. In consequence of the effort of expansion in the internal parts, the greater number of glass drops burst in cooling; and those which remain entire are not regularly crystallized. A smart stroke upon them communicates a vibration to the whole mass, which is nearly synchronous in every part: and therefore the effort of expansion has little more effect than if the body were at rest; but the small tail and the surface only are regularly crystallized. If the tail be broken, this communicates a vibration along the crystallized surface, without reaching the internal parts. By this they are allowed some expansion; and overcoming the cohesion of the thin outer shell, they burst it, and are dispersed in powder.

In an unannealed glass vessel, the same thing takes place. Sometimes the vibration may continue for a considerable time before the internal parts overcome the resistance. If the vessel be very thin, the regular crystallization extends through the whole thickness; or at least the quantity of compressed matter in the middle is so inconsiderable as to be incapable of bursting the external plate.

By the process of annealing, the glass is kept for some time in a state approaching to fluidity; the heat increases the bulk of the crystallized part, and renders it so soft, that the internal parts have the opportunity of expanding and forming a regular crystallization.

A similar process is now used for rendering kettles and other vessels of cast iron less brittle: of it the same explanation may be given. The greater number of metals diminish in bulk when they pass from a fluid to a solid state; iron, on the contrary, expands.

When cast iron is broken, it has the appearance of being composed of grains: forged or bar iron appears to consist of plates. Forged iron has long been procured, by placing a mass of cast iron under large hammers, and making it undergo violent and repeated compression. A process is now used for converting cast iron into forged, by heat alone. The cast iron is placed in an air furnace, and kept for several hours in a degree of heat, by which it is brought near to a fluid state. It is then allowed to cool gradually, and is found to be converted into forged iron. This process

is

Annealing. is conducted under a patent; although, if Reaumur's experiments upon cast iron be consulted, it will appear not to be a new discovery.

By these experiments, it is ascertained, that if cast iron be exposed for any length of time to a heat considerably below its melting point, the texture and properties are not changed: but if it be kept in a heat near the melting point, the surface soon becomes lamellated like forged iron; and the lamellated structure extends farther into the mass in proportion to the length of time in which it is exposed to that degree of heat. When it is continued for a sufficient time, and then allowed to cool gradually, it is found to possess the lamellated structure throughout.

Cast iron, then, is brittle, because it has not had the opportunity of crystallizing regularly. When it is exposed to cold while fluid, the surface becoming solid, prevents the inner parts from expanding and arranging themselves into regular crystals. When cast iron is brought near to the melting point, and continued for a sufficient length of time in that degree of heat, the particles have the opportunity of arranging themselves into that form of crystals by which forged iron is distinguished, and by which it possesses cohesion and all its properties.

There appears, therefore, to be no other essential difference between forged and cast iron, except what arises from the crystallization. Cast iron is indeed often not sufficiently purified from other substances which are mixed with the calx. It appears also to contain a considerable quantity of calx unreduced; for during the process for converting it into forged iron, by heat alone, a pale flame arises from the metal till near the end of the process. This is owing to fixed air which the heat forces off from the calx. The expulsion of this air reduces the calx, and therefore frees the metal from that injurious mixture.

That this explanation of the annealing of iron is probable, appears also from the well-known fact of forged iron being incomparably more difficult of fusion than cast iron. A piece of forged iron requires a very violent heat to melt it; but when it is reduced to a small powder, it melts in a much lower degree of heat. Iron diminishes in bulk when it passes into a fluid state, while most other metals increase in volume. The expansion which heat occasions in bringing them to their melting point, will be favourable to their fluidity, by gradually bringing the particles to the same state of separation in which they are when the mass is fluid; but the expansion of iron by heat removes it farther from that state, and keeps it in the state which is favourable to the continuance of it in a crystallized form. It will not melt till the heat expand it so much that the cohesion of crystallization be overcome. When it is reduced to a minute powder before it be exposed to the heat, it melts sooner. The crystals having been destroyed, that cohesion has no effect in preventing it from passing into a state of fluidity.

Upon the same principles may be explained the almost peculiar property of welding possessed by iron, and the conversion of forged iron into steel.

But perhaps they may also be applied to platina, a metal which has lately gained much attention. It possesses some of the properties of iron. It is still more difficult of fusion than that metal. It is susceptible of being welded. The natural grains of it can scarcely be melted in the focus of the most powerful burning glass; but when it is dissolved in aqua regia, and precipitated by potash, it has been melted in small globules by the blowpipe. When precipitated by muriate of ammoniac, it has been melted in a considerable mass in the heat of a furnace; but is said to be brittle. Annealing ‖ Annesley.

Many attempts have been made to procure a mass of it in a malleable state, but without success. It is said that the process is now discovered by a chemist in Spain. The treatment of the metal is probably very simple. Perhaps it only consists in precipitating it in a minute powder from aqua regia, exposing it to a strong heat which melts it, and keeping it for some time in a state nearly fluid, that it may, like iron, crystallize regularly: by this it will possess all its metallic properties. See ANNEALING, SUPPLEMENT.

ANNECY, a city of Savoy, seated between Chamberry and Geneva, on the banks of a lake of the same name, from whence run several brooks, which flow through the town, and uniting at length, form a river. There are piazzas in most of the streets of the town, which serve to shelter the inhabitants from rain. It has several collegiate and parish churches, as well as convents for men and women. The lake is about nine miles long and four broad. E. Long. 6. 12. N. Lat. 45. 53.

ANNESLEY, ARTHUR, earl of Anglesey, and lord privy seal in the reign of King Charles II. was the son of Sir Francis Annesley, Baronet, Lord Mount-Norris, and Viscount Valentia, in Ireland; and was born at Dublin on the 10th of July 1614. He was for some time at the university of Oxford, and afterwards studied the law at Lincoln's Inn. He had a considerable share in the public transactions of the last century; for in the beginning of the civil war he sat in the parliament held at Oxford; but afterwards became reconciled to the opposite party, and was sent commissioner to Ulster, to oppose the designs of the rebel Owen Roe O'Neal. He engaged in several other affairs with great success. He was president of the council of state after the death of Oliver, and was principally concerned in bringing about the Restoration; soon after which, King Charles II. raised him to the dignity of a baron, by the title of Lord Annesley, of Newport-Pagnel, Bucks; and a short time after he was made earl of Anglesey. During that reign he was employed in some very important affairs, was made treasurer of the navy, and afterwards lord privy seal. In October 1680, his lordship was charged by one Dangerfield, in an information delivered upon oath, at the bar of the house of commons, with endeavouring to stifle evidence in relation to the Popish plot, and to promote the belief of a Presbyterian one. The uneasiness he received from this attack did not prevent his speaking his opinion freely of those matters in the house of lords, particularly in regard to the Popish plot. About the same time he answered the Lord Castlehaven's Memoirs, in which that nobleman endeavoured to paint the Irish rebellion in the lightest colours; and a sharp dispute was raised, which ended in the seal's being taken from him. He was a person of great abilities, had uncommon learning, and was well acquainted with the constitution and laws of England. He wrote, besides his Animadversions on Castlehaven's

Annesley || Annihilation.

Memoirs, 1. The Privileges of the House of Lords and Commons stated. 2. A Discourse on the House of Lords. 3. Memoirs. 4. The History of the Troubles in Ireland, from the rebellion in 1611 till the Restoration. 5. Truth unveiled, in behalf of the Church of England;—and some other works. He died in April, 1686, in the 73d year of his age; and was succeeded by his son James.

ANNEXATION, in *Law*, a term used to imply the uniting of lands or rents to the crown.

ANNIHILATION, the act of reducing any created being into nothing.

Christians, Heathens, Jews, Siamese, Persians, divines, philosophers, &c. have their peculiar systems, sentiments, conjectures, not to say dreams, concerning annihilation; and we find great disputes among them about the reality, the possibility, the means, measures, prevention, ends, &c. of annihilation.

The first notions of the production of a thing from, or reduction of it to, nothing, Dr Burnet shows, arose from the Christian theology; the words *creation* and *annihilation*, in the sense now given to them, having been equally unknown to the Hebrews, the Greeks, and the Latins.

The ancient philosophers in effect denied all annihilation as well as creation, resolving all the changes in the world into new modifications, without supposing the production of any thing new, or destruction of the old. By daily experience, they saw compounds dissolved; and that in their dissolution nothing perished but their union or connexion of parts: when in death the body and soul were separated, the man they held was gone, but that the spirit remained in its original the great soul of the world, and the body in its earth from whence it came; these were again wrought by nature into new compositions, and entered new states of being which had no relation to the former.

The Persian bramins hold, that after a certain period of time, consisting of 71 joogs, God not only annihilates the whole universe, but every thing else, angels, souls, spirits, and all, by which he returns to the same state he was in before the creation; but that, having breathed a while, he goes to work again, and a new creation arises, to subsist 71 joogs more, and then to be annihilated in its turn. Thus they hold there have been almost an infinite number of worlds: but how many joogs are elapsed since the last creation, they cannot certainly tell; only in an almanack written in the Shanscrit language in 1670, the world is said to be then 3,892,771 years old from the last creation.

The Siamese heaven is exactly the hell of some Socinians and other Christian writers; who, shocked with the horrible prospect of eternal torments, have taken refuge in the system of annihilation. This system seems countenanced by Scripture; for that the words *death*, *destruction*, and *perishing*, whereby the punishment of the wicked is most frequently expressed in Scripture, do most properly import annihilation and an utter end of being. To this Tillotson answers, that these words, as well as those corresponding to them in other languages, are often used, both in Scripture and other writings, to signify a state of great misery and suffering, without the utter extinction of the miserable. Thus God is often said in Scripture to bring *destruction* on a nation, when he sends judgment upon them, but without exterminating or making an end of them. So, in other languages, it is frequent, by *perishing*, to express a person's being made miserable; as in that known passage in Tiberius's letter to the Roman senate: *Ita me dii, deæque omnes, pejus perdant, quam hodie perire me sentio.* As to the word *death*, a state of misery which is as bad, or worse than death, may properly enough be called by that name; and thus the punishment of wicked men after the day of judgment is in the book of Revelation frequently called the *second death.* Annihilation.

Some Christian writers allow a long time of the most terrible torments of sinners; and after that suppose that there shall be an utter end of their being. Of this opinion Irenæus appears to have been; who, according to M. du Pin, taught that the souls, at least of the wicked, would not subsist eternally; but that, after having undergone their torments for a certain period, they would at last cease to be at all. But Tillemont, Petit, Didier, and others, endeavour to defend Irenæus from this imputation, as being too favourable to the wicked.

It has been much disputed among divines, whether, at the consummation of all things, this *earth* is to be annihilated, or only purified, and fitted for the habitation of some new order of beings. Gerard in his Common Places, and Hakewil in his Apology, contend earnestly for a total abolition or annihilation. Ray, Calmet, and others, think the system of renovation or restitution more probable, and more consonant to Scripture, reason, and antiquity. The fathers who have treated on the question are divided; some holding that the universe shall not be annihilated, but only its external face changed; others asserting, that the substance of it shall be destroyed.

How widely have the sentiments of mankind differed as to the possibility and impossibility of annihilation! According to some, nothing so difficult; it requires the infinite power of the Creator to effect it: some go further, and seem to put it out of the power of God himself. According to others nothing so easy: Existence is a state of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all; it will do itself; nay, what is more, it requires an infinite power to prevent it.

Many authors consider preservation as a continual reproduction of a thing, which, subsisting no longer of itself, would every moment return into nothing. Gassendi on the contrary asserts, that the world may indeed be annihilated by the same power which first created it, but that to continue it there is no occasion for any power of preservation.

Some divines, of which number the learned Bishop King seems to be, hold annihilation for the greatest of all evils, worse than even the utmost torments of hell flames; whilst others, with some of the eastern philosophers, acknowledge annihilation for the ultimate pitch of happiness human nature is capable of; that sovereign good, that absolute beatitude, so long vainly sought for by the philosophers, is found here. No wonder it had been so long concealed; for who would have thought of looking for the *summum bonum*, where others have placed the sum of misery?

The said prelate proposes it as a question, Whether suffering eternal torments be a greater evil than not existing? He thinks it highly probable, that the damned

Annihilation || Annobon.

will be such fools, that feeling their own misery in the most exquisite degree, they will rather applaud their own conduct, and choose to be, and to be what they are, rather than not to be at all; fond of their condition, however wretched, like people enraged, they will persist in their former sentiments without opening their eyes to their folly, and persevere by way of indignation and revenge. Mr Bayle refutes him on this head; but might, one would think, have saved himself the trouble.

The Talapoins hold it the supreme degree of happiness to have the soul totally annihilated, and freed from the burden and slavery of transmigrations. They speak of three Talapoins, who, after a great number of transmigrations, became gods; and when arrived at this state, procured this further reward of their merit, to be annihilated. The ultimate reward of the highest perfection man can arrive at is *neiurepan*, or annihilation; which at length is granted to those who are perfectly pure and good, after their souls have wandered many thousand years through various bodies.

ANNI NUBILES, in *Law*, denotes the marriageable age of a woman, viz. after she has arrived at twelve.

ANNIVERSARY, the annual return of any remarkable day. Anniversary days, in old times, more particularly denoted those days in which an office was yearly performed for the souls of the deceased, or the martyrdom of the saints was yearly celebrated in the church.

ANNOBON, a small island of Africa, on the coast of Loango, belonging to the Portuguese. It lies in E. Long. 5. 10. S. Lat. 1. 50. and receives its name from being discovered on New-year's-day. According to Pyrard, it is about five or six French leagues in compass; but Baudrand says, it is ten leagues round. Here are two high mountains, the tops of which being continually covered with clouds, occasion frequent rains. On the south-east of the island are two rocks; one of which is low, and upon a level with the surface of the sea; the other higher and larger, but both dangerous in the night to shipping; but between them the channel is deep and clear. These rocks are inhabited by vast numbers of birds, so tame, that the sailors frequently catch them with their hands. On the same side of the island is a convenient watering place at the foot of a rivulet, which tumbles from the mountains down to a valley covered with orange and citron trees, &c. and affording a pleasant and refreshing shade; but the road on the north-west side is difficult and dangerous, though most frequented by ships who have no intention of touching upon the continent. In either place it is difficult to take in a sufficient quantity of water, on account of the violent breaking of the sea, and a stone intrenchment erected by the negroes, from which they annoy all strangers that attempt to land. The true road for shipping lies on the north-east side, where they may anchor in seven, ten, thirteen, or sixteen fathoms, on a fine sand close to the land, opposite to the village where the negroes have thrown up their intrenchments.

The climate is wholesome, and the air clear and serene for the greatest part of the year. Every part of the island is watered by pleasant brooks and fresh water springs, which, however, at the new and full moons, or in all high tides, acquire a brackishness. The banks of every rivulet are covered with palms, whence the inhabitants extract their wine by incision. Here are a number of fertile valleys, which produce Turkey corn, rice, millet, yams, potatoes, &c. and afford pasture for abundance of oxen, sheep, goats, &c. Poultry and fish also abound here: but the only mercantile production is cotton, which is esteemed equal in quality to any produced in India, though the quantity is small. Annobon || Annual.

In the year 1605, the Dutch admiral Matelief found 200 negroes, and two Portuguese, on Annobon, most of them able to bear arms, expert in the use of them, and trained up in military discipline. La Croix says, it has a town opposite to the road that contains above 100 houses, the whole surrounded by a parapet. Most of their dwellings are cane huts. In the whole island there is not a single house built of stone, and only two of wood, which belong to the Portuguese. All the inhabitants are meanly clothed; the women go bareheaded, and have also the upper part of the body naked, modesty being defended by a piece of linen wrapt under their stomach, and falling down in the form of a petticoat, or wide apron, to the knees. As to the men, they wear only a linen girdle round the loins, with a small flap before. The women carry their children on their backs, and suckle them over the shoulder. All the inhabitants are subject to the Portuguese governor, who is the chief person in the island; at the same time that the negroes have their own chief subordinate to him. They are all rigid Catholics, having either been compelled or persuaded by the arguments of the Portuguese to embrace that faith; and, like all other converts, they are bigotted in proportion to the novelty of the belief, and their ignorance of the true tenets.

ANNO DOMINI, i. e. the year of our Lord; the computation of time from our Saviour's incarnation.

ANNOMINATION, in *Rhetoric*, the same with what is otherwise called *paronomasia*. See PARONOMASIA.

ANNONA, in Roman antiquity, denotes provision for a year of all sorts, as of flesh, wine, &c. but especially of corn. Annona is likewise the allowance of oil, salt, bread, flesh, corn, wine, hay, and straw, which was annually provided by the contractors for the maintenance of an army.

ANNONA, the *Custard Apple*. See BOTANY *Index*.

ANNONÆ PRÆFECTUS, in antiquity, an extraordinary magistrate, whose business it was to prevent a scarcity of provisions, and to regulate the weight and fineness of bread.

ANNONAY, a small town of France, in the department of Ardeche, formerly Upper Vivarais, seated on the river Deunre. E. Long. 4. 52. N. Lat. 45. 15.

ANNOT, a small city on the mountains of Provence in France. E. Long. 7. 0. N. Lat. 44. 4.

ANNOTATION, in matters of literature, a brief commentary, or remark, upon a book or writing, in order to clear up some passage, or draw some conclusion from it.

ANNOTTA. See ANOTTA.

ANNUAL, in a general sense, an appellation given to whatever returns every year, or is always performed within that space of time.

ANNUAL Motion of the Earth. See ASTRONOMY.

ANNUAL Leaves, are such leaves as come up afresh in the spring, and perish in winter. These stand opposed to *Evergreens*.

Annual || Annuity.

ANNUAL Plants, called also simply *annuals*, are such as only live their year, i. e. come up in the spring and die again in the autumn; and accordingly are to be recruited every year.

ANNUALRENT is used, in *Scots Law*, to denote a yearly profit due by a debtor in a sum of mony to a creditor for the use of it.

Right of ANNUALRENT, in *Scots Law*, the original method of burdening lands with a yearly payment for the loan of money, before the taking of interest for money was allowed by statute.

ANNUEL OF NORWAY, of which mention is made in the acts of parliament of King James III. was an annual payment of a hundred merks sterling, which the kings of Scotland were obliged to pay to the kings of Norway, in satisfaction for some pretensions which the latter had to the Scottish kingdom, by virtue of a conveyance made thereof by Malcom Kenmore, who usurped the crown after his brother's decease. This annuel was first established in 1266: in consideration whereof the Norwegians renounced all title to the succession to the isles of Scotland. It was paid till the year 1468, when the annuel, with all its arrears, was renounced in the contract of marriage between King James III. and Margaret daughter of Christian I. king of Norway, Denmark, and Sweden.

ANNUITY, a sum of money, payable yearly, half-yearly, or quarterly, to continue a certain number of years, for ever, or for life.

An annuity is said to be in arrear, when it continues unpaid after it falls due. And an annuity is said to be in reversion, when the purchaser, upon paying the price, does not immediately enter upon possession; the annuity not commencing till some time after.

Interest on annuities may be computed either in the way of simple or compound interest. But compound interest being found most equitable, both for buyer and seller, the computation by simple interest is universally disused.

I. *Annuities for a certain time.*

PROBLEM 1. Annuity, rate, and time, given; to find the amount, or sum of yearly payments, and interest.

RULE. Make 1 the first term of a geometrical series, and the amount of 1l. for a year the common ratio; continue this series to as many terms as there are years in the question, and the sum of this series is the amount of 1l. annuity for the given years; which, multiplied by the given annuity, will produce the amount sought.

EXAMPLE. An annuity of 40l. payable yearly, is forborn and unpaid till the end of 5 years: What will then be due, reckoning compound interest at 5 per cent. on all the payments then in arrear?

1 5 5 4 5

1 : 1.05 : 1.1025 : 1.157625 : 1.21550625? whose sum is 5.52563125l.; and $5.25563125 \times 40 = 221.02525 = 221$l. 0s. 6d. the amount sought.

The amount may also be found thus: Multiply the given annuity by the amount of 1l. for a year; to the product add the given annuity, and the sum is the amount in two years; which multiply by the amount of 1l. for a year; to the product add the given annuity, and the sum is the amount in 3 years, &c. The former question wrought in this manner follows: Annuity.

40 am. in 1 year.	126.1 am. in 3 years.
1.05	1.05
42.00	132.405
40	40
82 am. in 2 years.	172.405 am. in 4 years.
1.05	1.05
86.10	181.02525
40	40
126.1 am. in 3 years.	221.02525 am. in 5 years.

If the given time be years and quarters, find the amount for the whole years, as above: then find the amount of 1l. for the given quarters; by which multiply the amount for the whole years; and to the product add such a part of the annuity as the given quarters are of a year.

If the given annuity be payable half yearly, or quarterly, find the amount of 1l. for half a year or a quarter; by which find the amount for the several half-years or quarters, in the same manner as the amount for the several years is found above.

PROB. 2. Annuity, rate, and time given: to find the present worth, or sum of money that will purchase the annuity.

RULE. Find the amount of the given annuity by the former problem; and then, by compound interest, find the present worth of this amount, as the sum due at the end of the given time.

EXAMP. What is the present worth of an annuity of 40l. to continue 5 years, discounting at 5 per cent. compound interest?

By the former problem, the amount of the given annuity for 5 years, at 5 per cent. is 221.02525; and by compound interest, the amount of 1l. for 5 years, at 5 per cent. is 1.276281562 5.

And, 1.276281562 5)221.02525000(173.179= 173l. 3s. 7d. the present worth sought.

The present worth may be also found thus: By compound interest, find the present worth of each year by itself, and the sum of these is the present worth sought. The former example done in this way follows:

1.276281562 5)40.000000000	(31.3410
1.21550625)40.0000000	(32.9080
1.157625)40.00000	(34.5535
1.1025)40.000	(36.2811
1.05)40.0	(38.0952
Present worth	173.1788

If the annuity to be purchased be in reversion, find first the present worth of the annuity, as commencing immediately, by any of the methods taught above; and then, by compound interest, find the present worth of that present worth, rebating for the time in reversion; and this last present worth is the answer.

EXAMP.

Annuity. EXAMP. What is the present worth of a yearly pension or rent of 75l. to continue 4 years, but not to commence till three years hence, discounting at 5 per cent.?

.05 : 1 : : 75 : 1500
1.05×1.05×1.05×1.05=1.21550625
1.21550625)1500.00000(1234.05371
1500
1234.05371

265.94629, present worth of the annuity, if it was to commence immediately.

1.05×1.05×1.05=1.157625 *L. s. d.*
1.157625)265.94629(229.7344=229 1 8¾

PROB. 3. Present worth, rate, and time given; to find the annuity.

RULE. By the preceding problem, find the present worth of 1l. annuity for the rate and time given; and then say, As the present worth thus found to 1l. annuity, so the present worth given to its annuity; that is, divide the given present worth by that of 1l. annuity.

EXAMP. What annuity, to continue 5 years, will 173l. 3s. 7d. purchase, allowing compound interest at 5 per cent.?

.05 : 1 : : 1 : 20l.
1.05×1.05×1.05×1.05×1.05=1.276281562 5
1.276281562 5)20.00000000(15.6705
20
15.6705

4.3295 present worth of 1l. annuity.
4.329)173.179(40l. annuity. *Ans.*

II. *Annuities for ever, or freehold Estates.*

In freehold estates, commonly called *annuities in fee-simple*, the things chiefly to be considered are, 1. The annuity or yearly rent. 2. The price or present worth. 3. The rate of interest. The questions that usually occur on this head will fall under one or other of the following problems.

PROB. 1. Annuity and rate of interest given, to find the price.

As the rate of 1l. to 1l. so the rent to the price.

EXAMP. The yearly rent of a small estate is 40l.: What is it worth in ready money, computing interest at 3½ per cent.?

As .035 : 1 : : 40 : 1142.857142=*L.*1142 17 1⅕.

PROB. 2. Price and rate of interest given, to find the rent or annuity.

As 1l. to its rate, so the price to the rent.

EXAMP. A gentleman purchases an estate for 4000l. and has 4½ per cent for his money: Required the rent.

As 1 : .045 : : 4000 : 1 : 180l. rent sought.

PROB. 3. Price and rent given, to find the rate of interest.

As the price to the rent, so 1 to the rate.

EXAMP. An estate of 180l. yearly rent is bought for 4000l.: What rate of interest has the purchaser for his money?

As 4000 : 180l. : : 1 : .045 rate sought. Annuity.

PROB. 4. The rate of interest given, to find how many years purchase an estate is worth.

Divide 1 by the rate, and the quot is the number of years purchase the estate is worth.

EXAMP. A gentleman is willing to purchase an estate, provided he can have 2½ per cent. for his money: How many years purchase may he offer?

.025)1.000(40 years purchase. *Ans.*

PROB. 5. The number of years purchase, at which an estate is bought or sold, given; to find the rate of interest.

Divide 1 by the number of years purchase, and the quot is the rate of interest.

EXAMP. A gentleman gives 40 years purchase for an estate: What interest has he for his money?

40)1.000(.025 rate sought.

The computations hitherto are all performed by a single division or multiplication, and it will scarcely be perceived that the operations are conducted by the rules of compound interest; but when a reversion occurs, recourse must be had to tables of annuities on compound interest.

PROB. 6. The rate of interest, and the rent of a freehold estate in reversion, given; to find the present worth or value of the reversion.

By Prob. 1. find the price or present worth of the estate, as if possession was to commence presently; and then, by the Tables, find the present value of the given annuity, or rent, for the years prior to the commencement; subtract this value from the former value, and the remainder is the value of the reversion.

EXAMP. A has the possession of an estate of 130l. per annum, to continue 20 years; B has the reversion of the same estate, from that time for ever: What is the value of the estate, what the value of the 20 years possession, and what the value of the reversion, reckoning compound interest at six per cent.?

By Prob. 1. .06)130.00(2166.6666 value of the estate.
By Tables 1491.0896 val. of the possession.

675.5770 val. of the reversion.

PROB. 7. The price or value of a reversion, the time prior to the commencement, and rate of interest, given, to find the annuity or rent.

By the Tables, find the amount of the price of the reversion for the years prior to the commencement; and then by Prob. 3. find the annuity which that amount will purchase.

EXAMP. The reversion of a freehold estate, to commence 20 years hence, is bought for 675.577l. compound interest being allowed at 6 per cent.: Required the annuity or rent?

By the Tables the amount of 675.577l. for 20 years, at 6 per cent. is } *L* 2166 6

By Prob. 2. 2166.6×.06=130.0 rent sought.

III. *Life Annuities.*

The value of annuities for life is determined from observations made on the bills of mortality. Dr. Halley, Mr.

Annuity. Mr Simpson, and Mons. de Moivre, are gentlemen of distinguished merit in calculations of this kind.

Dr Halley had recourse to the bills of mortality at Breslaw, the capital of Silesia, as a proper standard for the other parts of Europe, being a place pretty central, at a distance from the sea, and not much crowded with traffickers or foreigners. He pitches upon 1000 persons all born in one year, and observes how many of these were alive every year, from their birth to the extinction of the last, and consequently how many died each year, as in the first of the following Tables; which is well adapted to Europe in general. But in the city of London there is observed to be a greater disparity in the births and burials than in any other place, owing probably to the vast resort of people thither, in the way of commerce, from all parts of the known world. Mr Simpson, therefore, in order to have a table particularly suited to this populous city, pitches upon 1280 persons all born in the same year, and records the number remaining alive each year till none were in life.

It may not be improper, however, to observe, that however perfect tables of this sort may be in themselves, and however well adapted to any particular climate, yet the conclusions deduced from them must always be uncertain, being nothing more than probabilities, or conjectures drawn from the usual period of human life. And the practice of buying and selling annuities on lives, by rules founded on such principles, may be justly considered as a sort of lottery or chance work, in which the parties concerned must often be deceived. But as estimates and computations of this kind are now become fashionable, we shall subjoin some brief account of such as appear most material.

Dr Halley's Table on the Bills of Mortality at Breslaw.

22	448	46	237	70	69	94	1
23	441	47	228	71	65	95	0

From the preceding Tables the probability of the continuance or extinction of human life is estimated as follows.

1. The probability that a person of a given age shall live a certain number of years, is measured by the proportion which the number of persons living at the proposed age has to the difference between the said number and the number of persons living at the given age.

Thus, if it be demanded, what chance a person of 40 years has to live seven years longer? from 445, the number of persons living at 40 years of age in Dr Halley's table, subtract 377, the number of persons living at 47 years of age, and the remainder 68 is the number of persons that died during these seven years; and the probability or chance that the person in the question shall live these 7 years is as 377 to 68, or nearly as $5\frac{1}{2}$ to 1. But, by Mr Simpson's table, the chance is something less than that of 4 to 1.

2. If the year to which a person of a given age has an equal chance of arriving before he dies, be required, it may be found thus: Find half the number of persons living at the given age in the tables, and in the column of age you have the year required.

Thus, if the question be put with respect to a person of 30 years of age, the number of that age in Dr Halley's table is 531, the half whereof is 265, which is found in the table between 57 and 58 years; so that a person of 30 years has an equal chance of living between 27 and 28 years longer.

3. By the tables, the premium of insurance upon lives may in some measure be regulated.

Thus,

Annuity. Thus, the chance that a person of 25 years has to live another year, is, by Dr Halley's table, as 80 to 1; but the chance that a person of 50 years has to live a year longer is only 30 to 1; and, consequently, the premium for insuring the former ought to be to the premium for insuring the latter for one year, as 30 to 80, or as 3 to 8.

PROB. I. To find the value of an annuity of 1l. for the life of a single person of any given age.

Mons. de Moivre, by observing the decrease of the probabilities of life, as exhibited in the table, composed an algebraic theorem or canon, for computing the value of any annuity for life; which canon we here lay down by way of

RULE. Find the complement of life; and, by the tables, find the value of 1l. annuity for the years denoted by the said complement; multiply this value by the amount of 1l. for a year, and divide the product by the complement of life; then subtract the quot from 1; divide the remainder by the interest of 1l. for a year; and this last quot will be the value of the annuity sought, or, in other words, the number of years purchase the annuity is worth.

EXAMP. What is the worth of an annuity of 1l. for an age of 50 years, interest at 5 per cent.?

86
50 age given.
—
36 complement of life.

By the tables, the value is 16.5468
Amount of 1l. for a year, 1.05

The

Annuity.

The value of 1l. annuity for a single life.

Age.	3 *per c.*	3½ *perc.*	4 *per c.*	4½ *perc.*	5 *per c.*	6 *per c.*
76	4.05	3.98	3.91	3.84	3.78	3.65
77	3.63	3.57	3.52	3.47	3.41	3.30
78	3.21	3.16	3.11	3.07	3.03	2.95
79	2.78	2.74	2.74	2.67	2.64	2.55
80	2.34	2.31	2.31	2.26	2.23	2.15

The above table shows the value of an annuity of one pound for a single life, at all the current rates of interest; and is esteemed the best table of this kind extant, and preferable to any other of a different construction. But yet those who sell annuities have generally one and a half or two years more value, than specified in the table, from purchasers whose age is 20 years or upwards.

Annuities of this sort are commonly bought or sold at so many years purchase: and the value assigned in the table may be so reckoned. Thus the value of an annuity of one pound for an age of 50 years, at 3 per cent. interest, is 12.51; that is, 12l. 10s. or twelve and a half years purchase. The marginal figures on the left of the column of age serve to shorten the table, and signify, that the value of an annuity for the age denoted by them is the same with the value of an annuity for the age denoted by the numbers before which they stand. Thus the value of an annuity for the age of 9 and 10 years is the same; and the value of an annuity for the age of 6 and 14, for the age of 3 and 24, &c. is the same. The further use of the table will appear in the questions and problems following.

QUEST. 1. A person of 50 years would purchase an annuity for life of 200l.: What ready money ought he to pay, reckoning interest at 4½ per cent.?

	L.
By the table the value of 1l. is	10.8
Multiply by	200
Value to be paid in ready money,	2164.00 *Ans.*

QUEST. 2. A young merchant marries a widow lady of 40 years of age, with a jointure of 300l. a-year, and wants to dispose of the jointure for ready money: What sum ought he to receive, reckoning interest at 3½ per cent.?

	L.
By the table, the value of 1l. is	13.98
	400
Value to be received in ready money,	4194.00 *Ans.*

PROB. 2. To find the value of any annuity for the joint continuance of two lives; one life failing, the annuity to cease.

Here there are two cases, according as the ages of the two persons are equal or unequal.

1. If the two persons be of the same age, work by the following

RULE. Take the value of any one of the lives from the table; multiply this value by the interest of 1l. for a year; subtract the product from 2; divide the foresaid value by the remainder; and the quot will be the value of 1l. annuity, or the number of years purchase sought. Annuity.

EXAMP. What is the value of 100l. annuity for the joint lives of two persons, of the age of 30 years each, reckoning interest at 4 per cent.?

By the table, one life of years is -	14.68
Multiply by -	.04
Subtract the product -	5872
From - -	2.0000
Remains - -	1.4128

And 1.4128)14.68(10.39 value of 1l. annuity.
And 10.39 × 100 = 1039 the value sought.

2. If the two persons are of different ages, work as directed in the following

RULE. Take the values of the two lives from the table; multiply them into one another, calling the result the first product; then multiply the said first product by the interest of 1l. for a year, calling the result the second product; add the values of the two lives, and from their sum subtract the second product; divide the first product by the remainder, and the quot will be the value of 1l. annuity, or the number of years purchase sought.

EXAMP. What is the value of 70l. annuity for the joint lives of two persons, whereof one is 40 and the other 50 years of age, reckoning interest at 5 per cent.?

By the table, the value of 40 years is -	11.83
And the value of 50 years is - -	10.35
First product,	122.4405
Multiply by	.05
Second product,	6.122025
Sum of the two lives, - - -	22.180000
Second product deduct, - -	6.122025
Remainder, -	16.057975

And 16.057975)122.4405(7.62 value of 1l. annuity.
70

533.40 value sought.

PROB. 3. To find the value of an annuity upon the longest of two lives; that is, to continue so long as either of the persons is in life.

RULE. From the sum of the values of the single lives subtract the value of the joint lives, and the remainder will be the value sought.

EXAMP. What is the value of an annuity of 1l. upon the longest of two lives, the one person being 30, and the other 40 years of age, interest at 4 per cent.?

By the table, 30 years is - -	14.68
40 years is - -	13.20
	27.88
Value of their joint lives, by Prob. 2. Case 2. is	9.62
Value sought, - - -	18.26

If

Annuities. If the annuity be any other than 1l. multiply the answer found as above by the given annuity.

If the two persons be of equal age, find the value of their joint lives by Case 1. of Prob. 2.

PROB. 4. To find the value of the next presentation to a living.

RULE. From the value of the successor's life subtract the joint value of his and the incumbent's life, and the remainder will be the value of 1l. annuity; which, multiplied by the yearly income, will give the sum to be paid for the next presentation.

EXAMP. A enjoys a living of 100l. per annum, and B would purchase the said living for his life after A's death: The question is, What he ought to pay for it, reckoning interest at 5 per cent. A being 60, and B 25 years of age?

	L.
By the table, B's life is - -	13.46
Joint value of both lives, by Prob. 2. is	6.97
The value of 1l. annuity, - -	6.49
Multiply by - -	100
Value of next presentation, -	649.00

The value of a direct presentation is the same as that of any other annuity for life, and is found for 1l. by the table; which being multiplied by the yearly income, gives the value sought.

PROB. 5. To find the value of a reversion for ever, after two successive lives; or to find the value of a living after the death of the present incumbent and his successor.

RULE. By Prob. 3. find the value of the longest of the two lives, and subtract that value from the value of the perpetuity, and the remainder will be the value sought.

EXAMP. A, aged 50, enjoys an estate or living of 100l. per annum; B, aged 30, is entitled to his lifetime of the same estate after A's death; and it is proposed to sell the estate just now, with the burden of A and B's lives on it: What is the reversion worth, reckoning interest at 4 per cent.?

	L.
By the table, A's life of 50 is -	11.34
B's life of 30 is -	14.68
Sum,	26.02
Value of their joint lives found by Prob. 2. Case 2. is -.	8.60
Value of the longest life, -	17.42 sub.
From the value of the perpetuity,	25.00
Remains the value of 1l. reversion,	7.58
Multiply by	100
Value of the reversion, - -	758.00

PROB. 6. To find the value of the joint continuance of three lives, one life failing, the annuity to cease.

RULE. Find the single values of the three lives from the table; multiply these single values continually, calling the result the product of the three lives; multiply that product by the interest of 1l. and that product again by 2, calling the result the double product; then, from the sum of the several products of the lives, taken two and two, subtract the double product; divide the product of the three lives by the remainder, and the quot will be the value of the three joint lives. Annuities.

EXAMP. A is 18 years of age, B 34, and C 56; What is the value of their joint lives, reckoning interest at 4 per cent.?

By the table, the value of A's life is 16.1, of B's 14.12, and of C's 10.01.

16.1 × 14.12 × 10.01 = 2275.6, product of the three lives.

.04

91.024

2

182.048, double product.

Product of A and B, 16.1 × 14.12 × 227.33

A and C, 16.1 × 10.01 = 161.16

B and C, 14.12 × 10.00 = 141.34

Sum of all, two and two, -	529.83
Double product subtract, -	182.048
Remainder, -	347.782

And 347.782)2275.600(6.54 value sought.

PROB. 7. To find the value of an annuity upon the longest of three lives.

RULE. From the sum of the values of the three single lives taken from the table, subtract the sum of all the joint lives, taken two and two as found by Prob. 2. and to the remainder add the value of the three joint lives, as found by Prob. 6. and that sum will be the value of the longest life sought.

EXAMP. A is 18 years of age, B 34, and C 56: What is the value of the longest of these three lives, interest at 4 per cent.?

By the table, the single value of A's life is	16.1
single value of B's life is	14.12
single value of C's life is	10.01
Sum of the single values,	40.23
By Prob. 2. the joint value of A and B is	10.76
joint value of A and C is	8.19
joint value of B and C is	7.65
Sum of the joint lives,	26.60
Remainder, -	13.63
By Prob. 6. the value of the 3 joint lives is	6.54
Value of the longest of the 3 lives, -	20.17

Other problems might be added, but these adduced are sufficient for most purposes. The reader probably may wish that the reason of the rules, which, it must be owned, are intricate, had been assigned: but this could not be done without entering deeper into the subject than was practicable in this place. See CHANCES. See also ANNUITIES, SUPPLEMENT.

Annuities. *Annuities, Borrowing upon;* one of the methods employed by government for raising supplies.

Of this there are two methods; that of borrowing upon annuities for terms of years, and that of borrowing upon annuities for lives.

During the reigns of King William and Queen Anne, large sums were frequently borrowed upon annuities for terms of years, which were sometimes longer and sometimes shorter. In 1693, an act was passed for borrowing one million upon an annuity of 14 per cent. or of 140,000l. a year for 16 years. In 1691, an act was passed for borrowing a million upon annuities for lives, upon terms which in the present times would appear very advantageous. But the subscription was not filled up. In the following year the deficiency was made good by borrowing upon annuities for lives at 14 per cent. or at a little more than seven years purchase. In 1695, the persons who had purchased those annuities were allowed to exchange them for others of 96 years, upon paying into the exchequer 63 pounds in the hundred; that is, the difference between 14 per cent. for life, and 14 per cent. for 96 years, was sold for 63 pounds, or for four and a half years purchase. Such was the supposed instability of government, that even these terms procured few purchasers. In the reign of Queen Anne, money was upon different occasions borrowed both upon annuities for lives and upon annuities for terms of 32, of 89, of 98, and of 99 years. In 1719, the proprietors of the annuities for 32 years were induced to accept in lieu of them South Sea stock to the amount of eleven and a half years purchase of the annuities, together with an additional quantity of stock equal to the arrears which happened then to be due upon them. In 1720, the greater part of the other annuities for terms of years both long and short were subscribed into the same fund. The long annuities at that time amounted to 666,821l. 8s. $3\frac{1}{2}$d. a-year. On the 5th of January 1775, the remainder of them, or what was not subscribed at that time, amounted only to 136,453l. 12s. 8d.

During the two wars which began in 1739, and in 1755, little money was borrowed either upon annuities for terms of years, or upon those for lives. An annuity for 98 or 99 years, however, is worth nearly as much money as a perpetuity, and should, therefore, one might think, be a fund for borrowing nearly as much. But those who, in order to make family settlements, and to provide for remote futurity, buy into the public stocks, would not care to purchase into one of which the value was continually diminishing; and such people make a very considerable proportion both of the proprietors and purchasers of stock. An annuity for a long term of years, therefore, though its intrinsic value may be very nearly the same with that of a perpetual annuity, will not find nearly the same number of purchasers. The subscribers to a new loan, who mean generally to sell their subscription as soon as possible, prefer greatly a perpetual annuity redeemable by parliament, to an irredeemable annuity for a long term of years of only equal amount. The value of the former may be supposed always the same, or very nearly the same; and it makes, therefore, a more convenient transferable stock than the latter.

During the two last-mentioned wars, annuities, either for terms of years or for lives, were seldom granted but as premiums to the subscribers to a new loan, over and above the redeemable annuity to interest upon the credit of which the loan was supposed to be made. They were granted, not as the proper fund upon which the money was borrowed; but as an additional encouragement to the lender. Annuities.

Annuities for lives have occasionally been granted in two different ways; either upon separate lives, or upon lots of lives, which in French are called *Tontines*, from the name of their inventor. When annuities are granted upon separate lives, the death of every individual annuitant disburdens the public revenue so far as it was affected by his annuity. When annuities are granted upon tontines, the liberation of the public revenue does not commence till the death of all the annuitants comprehended in one lot, which may sometimes consist of twenty or thirty persons, of whom the survivors succeed to the annuities of all those who die before them; the last survivor succeeding to the annuities of the whole lot. Upon the same revenue more money can always be raised by tontines than by annuities for separate lives. An annuity, with a right of survivorship, is really worth more than an equal annuity for a separate life; and from the confidence which every man naturally has in his own good fortune, the principle upon which is founded the success of all lotteries, such an annuity generally sells for something more than it is worth. In countries where it is usual for government to raise money by granting annuities, tontines are upon this account generally preferred to annuities for separate lives. The expedient which will raise most money, is almost always preferred to that which is likely to bring about in the speediest manner the liberation of the public revenue.

In France a much greater proportion of the public debts consists in annuities for lives than in England. According to a memoir presented by the parliament of Bourdeaux to the king in 1764, the whole public debt of France is estimated at twenty-four hundred millions of livres; of which the capital, for which annuities for lives had been granted, is supposed to amount to three hundred millions, the eighth part of the whole public debt. The annuities themselves are computed to amount to thirty millions a-year, the fourth part of one hundred and twenty millions, the supposed interest of that whole debt. It is not the different degrees of anxiety in the two governments of France and England for the liberation of the public revenue, which occasions this difference in their respective mode of borrowing; it arises altogether from the different views and interests of the lenders.

In Britain, the seat of government being in the greatest mercantile city in the world, the merchants are generally the people who advance money to government. By advancing it they do not mean to diminish, but on the contrary, to increase their mercantile capitals; and unless they expected to sell with some profit their share in the subscription for a new loan, they never would subscribe. But if by advancing their money they were to purchase, instead of perpetual annuities, annuities for lives only, whether their own or those of other people, they would not always be so likely to sell them with a profit. Annuities upon their own lives they would always sell with loss; because no man will give for an annuity upon the life

Annuities || Annunciada.

life of another whose age and state are nearly the same with his own, the same price which he would give for one upon his own. An annuity upon the life of a third person, indeed, is no doubt, of equal value to the buyer and the seller; but its real value begins to diminish from the moment it is granted, and continues to do so more and more as long as it subsists. It can never, therefore, make so convenient a transferable stock as a perpetual annuity, of which the real value may be supposed always the same, or very nearly the same.

In France, before the revolution, the seat of government not being in a great mercantile city, merchants did not make so great a proportion of the people who advance money to government. The people concerned in the finances, the farmers general, the receivers of the taxes which were not in farm, the court bankers, &c. made the greater part of those who advance their money in all public exigencies. Such people were commonly men of mean birth, but of great wealth, and frequently of great pride. They were too proud to marry their equals, and women of quality disdained to marry them. They frequently resolved, therefore, to live bachelors; and having neither any families of their own, nor much regard for those of their relations, whom they were not always very fond of acknowledging, they desired only to live in splendour during their own time, and were not unwilling that their fortune should end with themselves. The number of rich people, besides, who were either averse to marry, or whose condition of life rendered it either improper or inconvenient for them to do so, was much greater in France than in England. To such people, who had little or no care for posterity, nothing could be more convenient than to exchange their capital for a revenue, which is to last just as long, and no longer, than they wish it to do.

ANNUITY OF TEINDS, in *Scots Law*, a certain proportion of the teinds of erected benefices formerly payable to the crown, but now gone into disuse.

ANNULAR, in a general sense, something in the form of, or resembling a ring. It is also a peculiar denomination of the fourth finger, commonly called the *ring finger*.

ANNULET, in *Architecture*, a small square member in the Doric capital, under the quarter round.

ANNULET is also a narrow flat moulding, which is common to divers places of the columns, as in the bases, capitals, &c. It is the same member which Vitruvius calls a *fillet;* Palladio, a *listil* or *cincture;* Scamozzi, and Mr Brown, a *supercilium*, *list*, *tinea*, *eyebrow*, *square*, *rabbit*. See ARCHITECTURE.

ANNULET, a little circle, born as a charge in coats of arms, as also added to them as a *difference*. Among the Romans it represented liberty and nobility. It also denotes strength and eternity, by reason of its circular form.

ANNULOSA, a type, or great division of the animal kingdom, comprehending five classes; see SUPPLEMENT.

ANNULLING, a term sometimes used for cancelling or making void a deed, sentence, or the like.

ANNUNCIADA, ANNUNTIADA, or ANNUNCIATA, an order of knighthood in Savoy, first instituted by Amadeus I. in the year 1409: their collar was of 15 links, interwoven one with another, in form of a true lover's knot: and the motto, F. E. R. T. signifying, *Fortitudo ejus Rhodum tenuit*. Amadeus VIII. gave the name *Annunciada* to this order, which was formerly known by that of *the knot of love;* changing at the same time the image of St Maurice patron of Savoy, which hung at the collar, for that of the Virgin Mary; and instead of the motto above mentioned, substituting the words of the angel's salutation.

Annunciada || Anolympiades.

ANNUNCIADA is also the title of several religious orders, instituted at different times, and at different places, in honour of the annunciation. See the next article.

ANNUNCIATION, the tidings brought by the angel Gabriel to the Virgin Mary of the incarnation of Christ.

ANNUNCIATION is also a festival, kept by the church on the 25th of March, in commemoration of these tidings. This festival appears to be of very great antiquity. There is mention made of it in a sermon which goes under the name of *Athanasius*. Others carry it up to the time of Gregory Thaumaturgus, because there is a sermon likewise attributed to him upon the same subject. But the best critics reject both these writings as spurious. However, it is certain, this festival was observed before the time of the council of Trullo, in which there is a canon forbidding the celebration of all festivals in Lent, excepting the Lord's day, and the feast of the annunciation: so that we may date its original from the seventh century.

In the Romish church, on this feast, the pope performs the ceremony of marrying or cloistering a certain number of maidens, who are presented to him in the church, clothed in white serge, and muffled up from head to foot: An officer stands by, with purses containing notes of 50 crowns for those who make choice of marriage, and notes of a hundred for those who choose to veil.

ANNUNCIATION, is likewise a title given by the Jews to a part of the ceremony of the passover.

ANNUNCIATOR, the name of an officer in the church of Constantinople. It was his business to inform the people of the festivals that were to be celebrated.

ANODYNE, from α privative, and οδυνω, *doleo;* or α neg. and ωδυνη, *pain*), a term applied to medicines which ease pain, and procure sleep. They are divided into three sorts, viz. 1. Paregorics, or such as assuage pain. 2. Hypnotics, or such as relieve by procuring sleep. 3. Narcotics, or such as ease the patient by stupifying him.

Opiates and narcotics destroy sensation. Some hypnotics and paregorics, as nitre, camphor, &c. procure ease and sleep by removing the offending cause. Camphor is said to be the best anodyne in nervous cases and at the decline of fevers. The doses of these medicines are generally regulated by the pulse.

ANOINTERS, a religious sect in some parts of England, so called from the ceremony they used of anointing all persons before they admitted them into their church. They founded their opinion of anointing upon the fifth of James, ver. 14. and 15.

ANOLYMPIADES, in antiquity, a name given by the Elians to those Olympic games which had been celebrated under the direction of the Pisæans and Arcadians. The Elians claimed the sole right of managing the Olympic games, in which they sometimes

Anolympiades || Anomœans.

met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Elians were at that time reduced very low; this, as well as those managed by the inhabitants of Pisa, they called ανολυμπιαδας, that is, "unlawful Olympiads;" and left them out of their annals, wherein the names of their victors and other occurrences were registered.

ANOMALISTICAL YEAR, in *Astronomy*, the time that the earth takes to pass through her orbit: it is also called the *Periodical Year*. The space of time belonging to this year is greater than the tropical year, on account of the precession of the equinoxes. See ASTRONOMY.

ANOMALOUS, a term applied to whatever is irregular, or deviates from the rule observed by other things of the like nature.

ANOMALOUS Verbs, in *Grammar*, such as are not conjugated conformably to the paradigm of their conjugation. They are found in all languages. In Latin, the verb *lego* is the paradigm of the third conjugation; and runs thus, *lego, legis, legit:* by the same rule it should be *fero, feris, ferit;* but we say, *fero, fers, fert: fero*, then, is an anomalous verb. In English the irregularity relates often to the preter tense and passive participle; for example, *give*, were it formed according to rule, would make *gived* in the preter tense and passive participle; whereas, in the former, it makes *gave*, and in the latter *given*.

ANOMALY, in *Astronomy*, an irregularity in the motion of the planets, whereby they deviate from the aphelion or apogee.

ANOMIA, in *Zoology*, a genus of insects belonging to the order of vermes testacea. Their shell is bivalve, and the valves are unequal. One valve is perforated near the hinge; affixed by that perforation to some other body. There are 25 species of the anomia: of which only two are natives of the British seas, viz. 1. The ephippium, with the habit of an oyster; the one side convex, the other flat, perforated; adherent to other bodies, often to oyster shells, by a strong tendinous ligature; colour of the inside perlaceous. Size, near two inches diameter. 2. The sqnammula, with shells resembling the scales of fish; very delicate, and silvery; much flatted, perforated; very small. Adheres to oysters, crabs, lobsters, and shells. This species of the genus are commonly called *Beaked Cockles*. No name has been given to the fish that inhabits it; for the recent shells of this kind are so very rare, that there is scarcely one to be found perfect. They are perhaps, as well as that which has given its form to the *cornu ammonis*, inhabitants of the deepest parts of the ocean; consequently it must be some extraordinary agitation of that great body of water that can bring them at all to our knowledge in their recent state. See CONCHOLOGY *Index*.

The fossil species of the *Anomia* genus are uncommonly numerous in this island, in our chalk pits and limestone quarries; and in Gloucestershire they are as common on the ploughed lands as pebbles on other places.

ANOMOEANS, in ecclesiastical history, the name by which the pure Arians were called in the fourth century, in contradistinction to the Semi-Arians. The word is formed from the Greek ανομοιος, *different, dissimilar:* For the pure Arians asserted, that the Son was of a nature different from, and in nothing like, that of the Father: whereas the Semi-Arians acknowledged a likeness of nature in the Son; at the same time that they denied, with the pure Arians, the consubstantiality of the Word. The Semi-Arians condemned the Anomœans in the council of Seleucia; and the Anomœans in their turn condemned the Semi-Arians in the councils of Constantinople and Antioch, erasing the word ομοιος, *like*, out of the Formula of Rimini and that of Constantinople.

Anomœans || Anorexia.

ANOMORHOMBOIDIA, in *Natural History*, the name of a genus of spars; the word is derived from the Greek ανωμαλης, *irregular*, and ρομβοιδης, a *rhomboidal* figure. The bodies of this genus are pellucid crystalline spars of no determinate or regular external form, but always breaking into regularly rhomboidal masses; easily fissile, and composed of plates running both horizontally and perpendicularly through the masses, but cleaving more readily and evenly in a horizontal, than in a perpendicular direction; the plates being ever composed of irregular arrangements of rhomboidal concretions. Of this genus there are five known species. 1. A white, bright, and shattery one; found in great quantities in the lead mines of Derbyshire, Yorkshire, and Wales. 2. A milk-white, opaque, and shattery one, found in some parts of France, and very plentifully in Germany, and sometimes in Wales and Scotland, and in the hills of Yorkshire. 3. A hard, dull, and snow-white one, found in some of the mines in Derbyshire, and in many of our northern counties. 4. A hard, gray, and pellucid one, found in the lead mines of Yorkshire, and very common in Germany. And, 5. A pellucid and colourless one; this is found in the lead mines of Derbyshire and Yorkshire. All these in some degree have the double refraction of the Iceland crystal. See *ICELAND Crystal*.

ANONIS. See ONONIS, BOTANY *Index*.

ANONYMOUS, something that is nameless, or of which the name is concealed. It is a term usually applied to books which do not express the author's name, or to authors whose names are unknown.

ANONYMOUS, in commerce. Parnerships in trade in France are styled anonymous, when they are not carried on under any particular name, but wherein each of the partners trades visibly on his own account, and in his own name; after which all the partners give one another an account of their profit or loss in trade. These sorts of partnerships are concealed, and known only to the parties themselves.

ANONYMOUS Partnerships in Trade, are also in France, such, wherein persons of fortune and quality deposite sums of money, in order to share of the profits and loss. To this end those who furnish the capital have no trouble in carrying on the trade, nor do their names appear to be any way interested therein.

ANONYMOUS, in *Law*. The sending anonymous letters demanding money, &c. is felony by the Black Act, 9 Geo. I. cap. xxii.

ANOREXIA, ANOREXY, (from α negative, and ορεξις, *appetite*): a want of appetite, or a loathing of food. The disorder is either original or symptomatic. When it is original, its causes are bad diet, too free drinking, voraciousness, &c.: In which cases, a vomit or two of ipecacuanha may be taken; and temperance, a light but cordial nourishing diet, and daily exercise

persisted

Anorexia, Anossi.

persisted in, will generally effect a recovery. But it is more frequently a symptom of some other disorder; and then the cure depends on the removal of the original one.

ANOSSI, a province of the island of Madagascar, lying between Lat. 23. 18. and 26. 0. S. It is watered by many rivers, most of which run into the *Franchere*, *Ramevatte*, or *Immour*, the spring of which is in a mountain called *Manghage*, and discharges itself into the sea in Lat. 25. 18. S. The mouth of this river is often stopped, and the course to the sea interrupted, unless kept open by the overflowings of great rains and high tides. The water runs salt one league above the mouth, particularly in a free communication with the sea. A lake, called *Ambou*, is formed at the mouth, half a league wide, with depth sufficient for any ship if the mouth of the river was kept open. Next in bigness to the Franchere, is the Manghasia, which springs from a mountain called *Siliva*, and empties itself into the sea, where large ships may ride at anchor. Crocodiles breed in these and all the other rivers of the island.

Between the two rivers above mentioned lies Cape St Romain, half a mile distant from the mouth of the Franchere, and which runs from the north-west six or seven leagues into the sea. When the cape is passed the coast forms a great bay, in the shape of a cross, which extends to the mouth of a river called *Dian Panouge* or *Pitorah*. In the middle of this bay the land runs out, and almost forms a peninsula called *Tholangare*. Fort Dauphin lies to the north of this peninsula, and Port Dauphin over against it. This province has several other peninsulas and small islands belonging to it. The country is beautiful; abounds in fruit trees; is fertile in pastures for cattle; and, if carefully cultivated, would produce all the necessaries of life. It is surrounded by high mountains, which are covered with woods and shrubs; but, about four miles distant from Fort Dauphin, the adjacent hills are quite destitute of verdure. The French often dug in this neighbourhood, expecting to meet with mines of gold and silver, particularly in one mountain where several springs flow near each other and empty themselves into a neighbouring river. In this river they found several stones and heaps intermixed with yellow clay, with a great quantity of black and white spangles shining like silver, which they carefully pounded and washed, but without effect. About 60 yards above these springs the grass, and every sort of vegetable, appears half dried and yellow, from a metalline sulphur, which gives that aspect; but the top of the mountain is covered with a fresh and beautiful verdure. It is said that the Portuguese found gold at the foot of this mountain on the north side, but that the place they had dug was filled up by the chiefs of the country after the Portuguese had been driven out.

The province of Anossi is inhabited by three different sorts of whites, and four sorts of negroes. The whites are distinguished by the names of *Rohandrians*, *Anacandrians*, and *Ondzatsi*. The whites are distinguished from the negroes by the general names of *Raferamini* or *Rahimini;* and the Rohandrians are distinguished above the other whites. When they proceed to an election of a sovereign, whom they call *Ompiandrian*, or *Dian Bahouache*, he is chosen from the Rohandrian race. Next to him the others hold the rank of princes, and are honoured as such by all the rest of the subjects. The Anacandrians are descendants of the chiefs, but who have degenerated, and are accounted the bastards of princes, or those who are descended from a Rohandrian and any inferior white or black woman. These are likewise called by the name of *Ontempassemaca*, or people from the sandy parts of Mecca, from whence, they say, came the Rohandrians. Both the Rohandrians and Anacandrians wear long hair, which hangs down in curls; and enjoy the privilege of killing beasts. The Ondzatsi, or lowest class of whites, are descended from the bastards of the Anacandrians. These are all fishermen, and are allowed to kill no land animal except a chicken. Anossi.

The four classes of negroes are named *Voadziri*, *Lohavohits*, *Ontsoa* and *Ondeves*. The Voadziri, the most powerful and the richest, are masters of several villages; and descended from the original lords of the country. They enjoy the privilege of killing beasts, when at a distance from the whites, and no Rohandrian or Anacandrian in the village. The Lohavohits are descendants from the Voadziri, and also lords; but with this difference, that the one commands a whole district, and the jurisdiction of the others extends only to their own village and family. They are also permitted to kill those beasts they intend to eat, when at a distance from the whites. The Ontsoa are next to the Lohavohits, and are their near relations. The Ondeves are the lowest of all, being originally slaves by father and mother. The Voadziri, Lohavohits, and Ontsoa, enjoy the privilege of submitting themselves, on the death of their lord or king, to any chief they please. In return for such homage, the new lord makes them a present, in consequence of which he becomes heir to all their possessions. Hence the lower classes both of whites and blacks, when death approaches, are under the greatest concern and anguish of mind, well knowing that their lords will not fail to deprive their children of every thing they possess. The Ondeves have not the same liberty with the others; but, in times of famine, the chiefs are obliged to supply them with necessaries; which if they fail to do, they have the liberty of submitting themselves to new masters. The inhabitants of this province have no temples, and very little appearance of religion; only they keep up a custom of immolating beasts upon particular occasions, as in sickness, planting yams or rice, on assemblies, &c. They offer the first born beast to the devil and to God, naming the devil first, in this manner, *Dianbilis Aminhanhabare*, or "Lord Devil and God."—There are several towns on the river Franchere; and near this river the Portuguese had a fort built upon a steep rock, and several buildings below, with enclosures, which furnished all sorts of necessaries for their subsistence; but they were all massacred by the natives.

This province seems originally to have been inhabited by negroes. The whites or Raferamini settled in it about 200 years ago, and conquered the negroes. But they themselves were conquered by the French, though under the government of a king whom they honoured as a god. In 1642, Captain Rivault obtained permission to establish a colony in this part of the island; and accordingly he took possession of it in the name of the king of France, in the month of September, that same year.

Anossi, Anotta.

year. The French landed 200 men, well armed, and provided with store of ammunition and other necessaries for building a fort, which they immediately set about; but no sooner did the natives observe their intention, than they used their utmost art to prevent their design from taking effect. This created a war, in which the French were victors; and, the natives becoming in time much better reconciled to them, they intermarried, and lived up and down in several towns at some distance from one another, not above five or six in a place. This tranquillity lasted for some years; but at last the natives, growing jealous, resolved to free themselves from a foreign yoke; and accordingly formed a conspiracy to cut off all the French in one day; which they soon after effected, not leaving a single person alive. In 1644 the above-mentioned Fort Dauphin was erected in Lat. 25. 6. S. Many buildings were erected, behind the fort, adjoining to the governor's house, with great enclosures that produced every sort of fruit and kitchen herb. In 1656 it was accidentally destroyed by fire; but was soon after repaired, and still continues, notwithstanding the catastrophe above mentioned, and its garrison carries on frequent wars with the natives.

ANOTTA, or ARNOTTA, in dyeing, an elegant red colour, formed from the pellicles or pulp of the seeds of the BIXA, a tree common in South America. It is also called *Terra Orleana*, and *Roucou*.

The manner of making anotta is as follows: The red seeds, cleared from the pods, are steeped in water for seven or eight days, or longer, till the liquor begins to ferment; then strongly stirred, stamped with wooden paddles and beaters, to promote the separation of the red skins; this process is repeated several times, till the seeds are left white. The liquor, passed through close cane sieves, is pretty thick, of a deep red colour, and a very ill smell; in boiling, it throws up its colouring matter to the surface in form of scum, which is afterwards boiled down by itself to a due consistence, and made up while soft into balls. The anotta commonly met with among us, is moderately hard and dry, of a brown colour on the outside, and a dull red within. It is difficultly acted upon by water, and tinges the liquor only of a pale brownish yellow colour. It very readily dissolves in rectified spirit of wine; and communicates a high orange or yellowish red. Hence it is used as an ingredient in varnishes, for giving more or less of an orange cast to the simple yellows. Alkaline salts render it perfectly soluble in boiling water, without altering its colour. Wool or silk boiled in the solution acquires a deep, but not a very durable, orange dye. Its colour is not changed by alum or by acids, any more than by alkalies: but when imbibed in cloth, it is discharged by soap, and destroyed by exposure to the air. It is said to be an antidote to the poisonous juice of manioc or cassava.—Labat informs us, that the Indians prepare anotta greatly superior to that which is brought to us, of a bright shining red colour, almost equal to carmine: that, for this purpose, instead of steeping and fermenting the seeds in water, they rub them with the hand, previously dipped in oil, till the pellicles come off, and are reduced into a clear paste; which is scraped off from the hands with a knife, and laid on a clean leaf in the shade to dry. De Laet, in his notes on Margrave's Natural History of Brazil, mentions also two kinds of anotta; one of a permanent crimson colour, used as a fucus or paint for the face; and another which gives a colour inclining more to that of saffron. This last, which is our anotta, he supposes to be a mixture of the first sort with certain resinous matters, and with the juice of the root of the tree. The wax or pulp in which the seeds are enclosed is a cool agreeable rich cordial, and has been long in use among the Indians and Spaniards in America, who still mix it with their chocolate, both to heighten the flavour and raise the colour. It is said to be a successful remedy in bloody fluxes. The roots have much the same properties with the wax.

Anotta || Ansarians

ANOUT, a small island in the Schagerrack, or that part of the sea of Denmark which has Norway on the north, Jutland on the west, and the isle of Zeeland on the south. It lies in 13. 0. E. Long. and 56. 36. N. Lat.

ANQUETIL, LEWIS PETER, a French historian. See SUPPLEMENT.

ANQUETIL DU PERRON, A. H. an eminent French oriental scholar. See SUPPLEMENT.

ANSÆ, in *Astronomy*, implies the parts of Saturn's ring projecting beyond the disk of the planet.—The word is Latin, and properly signifies *handles;* these parts of the ring appearing like handles to the body of the planet.

ANSARIANS, a people of Syria, so called in the country, but styled in De l'Isle's maps *Ensarians*, and in those of D'Anville, *Nassaris*. The territory occupied by these Ansaria is that chain of mountains which extends from Antakia to the rivulet called *Nahr-el-Kabir*, or the Great River. The history of their origin, though little known, is yet instructive. The following account is from the *Bibliotheque Orientale* of Assemani, a writer who has drawn his materials from the best authorities.

"In the year of the Greeks, 1202 (A. D, 891), there lived at the village of Nasar, in the environs of Koufa, an old man, who, from his fastings, his continual prayers, and his poverty, passed for a saint. Several of the common people declaring themselves his partizans, he selected from among them twelve disciples to propagate his doctrine. But the commandant of the place, alarmed at his proceedings, seized the old man, and confined him in prison. In this reverse of fortune, his situation excited the pity of a girl who was slave to the gaoler, and she determined to give him his liberty. An opportunity soon offered to effect her design. One day when the gaoler was gone to bed intoxicated, and in a profound sleep, she gently took the keys from under his pillow, and after opening the door to the old man, returned them to their place unperceived by her master: the next day when the gaoler went to visit his prisoner, he was extremely astonished at finding he had made his escape, and the more so since he could perceive no marks of violence. He therefore judiciously concluded he had been delivered by an angel, and eagerly spread the report, to avoid the reprehension he merited: the old man, on the other hand, asserted the same thing to his disciples, and preached his doctrines with more earnestness than ever. He even wrote a book, in which, among other things, he says, 'I such a one, of the village of Nasar, have seen Christ who is the word of God, who is Ahmad, son of Mohammed, son of Hanafa, of the race of Ali;

who

Ansarians || Anselm.

who also is Gabriel: and he said to me, Thou art he who readeth (with understanding); thou art the man who speaketh truth; thou art the camel which preserveth the faithful from wrath; thou art the beast which carrieth their burden; thou art the (Holy) Spirit, and John, the son of Zachary. Go, and preach to men that they make four genuflections in praying; two before the rising of the sun, and two before his setting, turning their faces towards Jerusalem: and let them say, three times, God Almighty! God Most High! God Most Great! Let them observe only the second and third festival; let them fast but two days annually; let them not wash the prepuce, nor drink beer, but as much wine as they think proper; and lastly, let them abstain from the flesh of carnivorous animals.' This old man passing into Syria, propagated his opinions among the lower orders of the country people, numbers of whom believed in him: And after a few years he went away, and nobody ever knew what became of him."

Such was the origin of these Ansarians, who are, for the most part, inhabitants of the mountains before mentioned.

The Ansaria are divided into several tribes or sects; among which are distinguished the Shamsia, or adorers of the sun; the Kelbia, or worshippers of the dog; and the Kadmousia, who are said to pay a particular homage to that part in women which corresponds to the priapus.

Many of the Ansaria believe in the metempsychosis; others reject the immortality of the soul; and in general, in that civil and religious anarchy, that ignorance and rudeness which prevail among them, these peasants adopt what opinions they think proper, following the sect they like best, and frequently attaching themselves to none.

Their country is divided into three principal districts, farmed by the chiefs called *Mokaddamim*. Their tribute is paid to the pacha of Tripoli, from whom they annually receive their title. Their mountains are in general not so steep as those of Lebanon, and consequently are better adapted to cultivation; but they are also more exposed to the Turks; and hence, doubtless, it happens, that with greater plenty of corn, tobacco, wines, and olives, they are more thinly inhabited than those of their neighbours the MARONITES and the DRUSES.

ANSE, an ancient town of France, in the Lyonois, ten miles north of Lyons. Long. 6. 55. N. Lat. 45. 55.

ANSELM, archbishop of Canterbury, in the reigns of William Rufus and Henry I. He was born in the year 1033, at Aost, a town in Savoy at the foot of the Alps. He became a monk in the abbey of Bec in Normandy; of which he was afterwards chosen prior, and then abbot. In the year 1092, he was invited over to England by Hugh earl of Chester; and in the year following was prevailed on, as we are told, with great difficulty, to accept the archbishopric of Canterbury. He enjoined celibacy on the clergy; for which he was banished by King Rufus, but recalled by Henry at his coming to the crown. He refused to consecrate such bishops as were invested by the king, according to Pope Urban's decree; flatly denying it to be the king's prerogative: for this he was outed again; till, the pope and king agreeing, he was recalled in 1107. In short, from the day of his consecration to that of his death, he was continually employed in fighting the prerogative of the church against that of the crown; and for that purpose spent much of his time in travelling backwards and forwards between England and Rome, for the advice and direction of his holiness. At the council of Bari, in the kingdom of Naples, the pope being puzzled by the arguments of the Greeks against the Holy Ghost's proceeding from the Father, be called upon Anselm, who was present, and he discussed their objections with great applause. Priests call him a resolute saint; to other people he appears to have been an obstinate and insolent priest. He wrought many miracles, if we believe the author of his life, both before and after his death, which happened at Canterbury, in the 76th year of his age, anno 1109. He was canonized in the reign of Henry VII. Anselm, though we may disregard him as a saint, deserves to be remembered as one of the principal revivers of literature, after three centuries of profound ignorance.

Anselm || Ansibarii.

His works have been printed in different years, and at different places, viz. Nuremb. 1491. Paris 1544 and 1549. Venice 1549. Cologne 1573 and 1612. Lyons 1630. But the best is that of Father Gerberon, printed at Paris 1675. It is divided into three parts; the first contains dogmatical tracts, and is entitled *Monologia;* the second contains practical and devotional tracts; the third part consists of letters, in four books.

ANSER, the trivial name of a species of anas. See ANAS, ORNITHOLOGY *Index*.

ANSER, in *Astronomy*, a small star, of the fifth or sixth magnitude, in the milky way, between the swan and eagle, first brought into order by Hevelius.

ANSERES, the name which Linnæus gives to his third order of birds. See ORNITHOLOGY *Index*.

ANSIBARII, or ANSIVARII, an ancient people of Germany, situated somewhere in the neighbourhood of the Chauci. All we know of their history is, that, in the reign of the emperor Nero, they were driven from their own possessions by the Chauci. Being then in a forlorn condition, they took possession of some uninhabited lands, which had been used as pasture for the horses of the Roman soldiers. They were led by one Boiocalus, a man of great valour, and of known fidelity to the Romans. He remonstrated to the Romans, who objected to their taking possession of these lands, That the territory in dispute was large; and requested, that it might be allowed to an unhappy people driven from their own habitations: that, at the same time, wide tracts might be retained for the horses and cattle of the soldiers to graze in; that it was inconsistent with humanity to famish men in order to feed beasts, &c.: and at last, lifting up his eyes to heaven, he asked the celestial luminaries how they could behold a desolate soil, and if they would not more justly let loose the sea to swallow up usurpers, who had engrossed the whole earth? To this the Roman commander, Avitus, replied, That the weakest must submit to the strongest; and that since the gods, to whom they had appealed, had left the sovereign judgment to the Romans, they were resolved to suffer no other judges than themselves. To Boiocalus himself, however, he privately offered lands as a reward for his long attachment to the Romans; but this offer the brave German rejected, as a price for betraying

Ansibarii. Ansiko, Anson.

betraying his people: adding, "A place to live in we may want, but a place to die in we cannot." The Ansibarii now invited the neighbouring nations to join them against the Romans; but they, dreading the power of that nation, refused to give them any assistance; upon which they applied to the neighbouring nations, begging leave to settle in their territories; but being everywhere driven out as enemies and intruders, these unhappy people were reduced to wander up and down till every one of them perished.

ANSIKO, a kingdom of Africa, bounded on the west by the river Umbre which runs into the Zaire, the kingdom of Wangua, and the Amboes who border on Loango; on the north, by some deserts of Nubia; and on the south, by Songo and Sonda, provinces of Congo. Here are great numbers of wild beasts, as lions, rhinoceroses, &c. and many copper mines. The king of Ansiko, or the great Macoco, commands 13 kingdoms, and is esteemed the most powerful monarch in Africa. The inhabitants of Angola have a tradition, that this is the proper country of the Giagas, who came originally from Sierra Leona, and overran, like a torrent, the whole coast as far as Benguela; that, being weakened by numerous battles, and unable to force the defiles in order to return to Sierra Leona, they arrived on the borders of Monomotapa, where being defeated, they were forced to remain in the provinces of Ansiko. Be this as it will, the Ansikans yield not in the least to the Giagas in fierceness and barbarity. They are so accustomed to the eating of human flesh, that it is asserted they have markets where it is publicly sold, and that there are no other graves for the dead than the bellies of the living. They try the courage of their prisoners of war by shooting at them as at marks, directing their arrows above or around their heads; and whoever discovers the least signs of fear, is immediately devoured without remedy. Those who appear intrepid and resolute, have their noses and ears bored, and two fore teeth of the upper jaw drawn. They are then improved in barbarity, by accustoming them to the most horrid cruelties.

The Ansikans are neat, well proportioned, and strong; wandering about from place to place, without either sowing or reaping. They are dreaded for their extreme brutality, and never traded with by the Europeans. Their language is barbarous, and difficult to be learned, even by the inhabitants of Congo. The most distinguished among them wear red and black caps of Portuguese velvet; the lower ranks go naked from the waist upwards; and, to preserve their health, anoint their bodies with a composition of pounded white sandal wood and palm oil. Their arms are battle axes, and small but very strong bows, adorned with serpents skins. Their strings are made of supple and tender shoots of trees, that will not break, and their arrows of hard and light wood. These people, who kill birds flying, shoot with such surprising swiftness, that they can discharge 28 arrows from the bow before the first falls to the ground. With equal dexterity they manage their battle axes; one end of which is sharpened and cuts like a wedge, and the other flattened like a mallet, with a handle set between, about half the length of the iron, rounded at the end like an apple, and covered with the skin of a serpent.—The current money in this country is the zimbis or shell, which is fished for, and passes among several African nations.—They worship the sun as their chief deity; whom they represent by the figure of a man, and the moon by that of a woman. They have also an infinite number of inferior deities, each individual having a particular idol whom he addresses on certain occasions.

ANSLO, a sea port town of Norway, in the province of Aggerhuys, with a bishop's see. The supreme court of justice is held here for Norway. It is seated on a bay of the same name. E. Long. 10. 14. N. Lat. 50. 24.

ANSON, GEORGE, a gentleman whose merit and good fortune, as a naval commander, exalted him to the rank of nobility. He was the son of William Anson, Esq. of Huckborough, in Staffordshire; and, showing an early inclination for the sea, received a suitable education. The first command he enjoyed was that of the Weasel sloop, in 1722; but the most memorable action of his life, and the foundation of his future good fortune, took place on his receiving the command of five ships, a sloop, and two victuallers, equipped to annoy the Spaniards in the South seas, and to co-operate with Admiral Vernon across the isthmus of Darien; an expedition the principal object of which failed by the unaccountable delay in fitting him out. He sailed, however, in Sept. 1740; doubled Cape Horn in a dangerous season; lost most of his men by the scurvy; and with only one remaining ship, the Centurion, crossed the great Pacific ocean. If no considerable national advantage resulted from this voyage, Commodore Anson made his own fortune, and enriched his surviving companions, by the capture of a rich galleon on her passage from Acapulco to Manilla; with which he returned home round the Cape of Good Hope. If he was lucky in meeting this galleon, he was no less fortunate in escaping a French fleet then cruising in the Channel, by sailing through it during a fog. He arrived at Spithead in June 1744. In a short time after his return, he was appointed rear-admiral of the blue, and one of the lords of the admiralty. In April 1745, he was made rear-admiral of the white, and the following year vice-admiral of the blue; at which time he was chosen to represent the borough of Heydon in parliament. In 1747, being on board the Prince George of 90 guns, in company with Admiral Warren, and 12 other ships, he intercepted, off Cape Finisterre, a powerful fleet, bound from France to the East and West Indies; when, by his valour and conduct, he again enriched himself and his officers, and at the same time strengthened the British navy, by taking six men of war and four East Indiamen, not one of them escaping. The French admiral, M. Jonquiere, on presenting his sword to the conqueror, said, *Monsieur, vous avez vaincu l'Invincible, et la Gloire vous suit:* "Sir, you have conquered the Invincible, and Glory follows you;" pointing to the ships, named the *Invincible* and the *Glory*, he had taken. For his signal services, his late majesty created him baron of Soberton in Hants. The same year he was appointed vice-admiral of the red; and, on the death of Sir John Norris, was made vice-admiral of England. In 1748 he was made admiral of the blue: he was afterwards appointed first lord of the admiralty, and was at length made admiral and commander in chief of his majesty's fleet; in which rank

Anson || Ant-eggs.

rank he continued, with a very short interval, until his death; and the last service he performed was to convey Queen Charlotte to England. He died in June 1762. No performance ever met with a more favourable reception, than the account of Anson's Voyage round the World. Though it is printed under the name of his chaplain, it was composed under his lordship's own inspection, and from the materials he himself furnished, by Mr Benjamin Robins.

ANSPACH, MARQUISATE OF, a small territory of Franconia, in Germany, bounded on the north by the bishoprics of Wartsburg and Bamberg, which last likewise lies to the west; by the earldoms of Holach and Oeting, with the bishopric of Aichstet, on the south; and the palatinate of Bavaria and the territory of Nuremberg on the east. The country is fruitful, and interspersed with woods, which render it agreeable for hunting. Besides the city Anspach, which is the capital, the chief towns are Kreglin, Swasbach, and Kreilsheim. Since 1806 it belongs to Bavaria.

ANSPACH is a small but pretty town, very well built, and has several churches. It is walled round, but has no other fortifications. In the palace there is a remarkable cabinet of curiosities. It is seated on a river of the same name. E. Long. 10. 42. N. Lat. 49. 14.

ANSPESSADES, in the French armies, a kind of inferior officer in the foot, below the corporals, but above the common sentinels. There are usually four or five of them in a company.

ANSTRUTHER, EASTER and WESTER, two royal boroughs of Scotland, situated on the south-east coast of Fife, containing about 1300 inhabitants in 1811. W. Long. 2. 45. N. Lat. 56. 12.

ANT, in *Zoology*. See FORMICA and TERMES. See also the article ANT in the SUPPLEMENT.

ANT-Bear, or *Ant-eater*, in *Zoology*. See MYRMECOPHAGA.

ANT-eggs, a name popularly given to a kind of little white balls found in the banks or nests of ants, ordinarily supposed to be the ova of this insect.

Late naturalists have observed that these are not properly the ants eggs, but the young brood themselves in their first state; they are so many little vermiculi wrapped up in a film or skin, composed of a sort of silk, which they spin out of themselves as silk worms and caterpillars do. At first they are hardly observed to stir; but, after a few days continuance, they exhibit a feeble motion of flexion and extension; and begin to look yellowish and hairy, shaped like small maggots, in which shape they grow up till they are almost as large as ants. When they pass their metamorphosis, and appear in their proper shape, they have a small black speck on them close to the anus of the enclosed ant, which M. Leeuwenhoek probably enough imagines to be the fæces voided by it. Dr Edward King opened several of these vulgarly reputed eggs; in some of which he found only a maggot in the circumstances above described; while in another the maggot had begun to put on the shape of an ant about the head, having two little yellow specks, where the eyes were to be. In others, a further progress was observed, the included maggots being furnished with every thing to complete the shape of an ant, but wholly transparent, the eyes only excepted, which were as black as bugles. Lastly, in others he took out very perfect and complete ants, which immediately crept about among the rest. These supposed ants eggs are brought up every morning in summer near the top of the bank, where they are lodged all the warm part of the day, within reach of the sun's influence. At night, or if it be cool, or like to rain, they carry them down to a greater depth; so that you may dig a foot deep e'er you come at them. The true ants eggs are the white substance, which, upon opening their banks, appears to the eye like the scatterings of fine white sugar, or salt, but very soft and tender. Examined by a microscope, it is found to consist of several pure white appearances, in distinct membranes, all figured like the lesser sort of bird's eggs, and as clear as a fish's bladder. The same substance is found in the bodies of the ants themselves. On this spawn, when emitted, they lie in multitudes, to brood, till in some time it is turned into little vermicules as small as mites, commonly called *ants eggs*.

Ant eggs || Anta.

ANT-Hills, are little hillocks of earth, which the ants throw up for their habitation and the breeding of their young. They are a very great mischief to dry pastures, not only by wasting so much land as they cover, but by hindering the scythe in mowing the grass, and yielding a poor hungry food pernicious to cattle. The manner of destroying them is to cut them into four parts from the top, and then dig into them so deep as to take out the core below, so that, when the turf is laid down again, it may lie somewhat lower than the level of the rest of the land: by this means it will be wetter than the rest of the land, and this will prevent the ants from returning to the same place, which otherwise they would certainly do. The earth that is taken out must be scattered to as great a distance every way as may be, otherwise they will collect it together, and make another hill just by. The proper time for doing this is winter; and if the places be left open, the frost and rains of that time of the year will destroy the rest: but in this case care must be taken that they are covered up early enough in the spring, otherwise they will be less fertile in grass than the other places. In Hertfordshire they use a particular kind of spade for this purpose. It is very sharp, and formed at the top into the shape of a crescent, so that the whole edge makes up more than three-fourths of a circle; this cuts in every part, and does the business very quickly and effectually. Others use the same instruments that they do for mole-hills. Human dung is a better remedy than all these, as is proved by experiment; for it will kill great numbers of them, and drive all the rest away, if only a small quantity of it be put into their hills.

ACID of ANTS, an acid produced by distilling millions of these insects, either without addition, or with water. It resembles vinegar in many respects; but differs from it in forming crystals with magnesia, iron, and zinc. Its attractions are not yet determined, but are supposed to coincide with those of vinegar.

ANTA, in the *Ancient Architecture*, a square pilaster, placed at the corners of buildings.

ANTA, or *Ante*, a small kingdom on the Gold coast of Africa, extending about ten leagues in length.—The country is covered with large trees, among which stand a number of fine villages. The soil is exceedingly rich, and the face of the country beautiful. The

Anta ‖ Antæus.

air is also much more salubrious than in other places of the Gold coast; it being observed by all writers, that the number of deaths here bears no proportion to that on any other part on the coasts of Guinea. This country contains the following villages, which deserve a particular description on account of the commerce they drive; viz. *Bourtrey*, *Tokorari*, *Sukoada*, and *Sama*; for which, see those articles.—Formerly Anta was potent and populous, inhabited by a bold and rapacious people, who greatly annoyed the Europeans by their frequent incursions; but by continual wars with their neighbours they are now greatly enfeebled, and the country in a manner depopulated. The spirit of the few remaining inhabitants is fled: they are desponding, dispirited and abject, seeking protection from the Dutch and other Europeans who have forts on this coast, and looking upon them as their best friends.

ANTACIDS, in *Pharmacy*, an appellation given to all medicines proper to correct acid or sour humours.

Under the class of Antacids come, 1. Absorbents: as chalk, coral, sea-shells, hæmatites, and steel filings. 2. Obtundents; as oils and fats. 3. Immutants; as lixivious salts and soaps.

ANTÆUS, in fabulous history, a giant of Libya, son of Neptune and Terra. Designing to build a temple to his father, of men's skulls, he slew all he met; but Hercules fighting him, and perceiving the assistance he received from his mother, (for by a touch of the earth he refreshed himself when weary), lifted him up from the ground and squeezed him to death.

Antæus was king of Mauritania; and from several circumstances, with which we are supplied by various authors, it appears extremely probable that he was the same person with Atlas: they were both of them the sons of Neptune, who reigned over Mauritania, Numidia, and a great part of Libya; as may be naturally inferred from his having such particular marks of distinction conferred upon him by the inhabitants of those regions. They both ruled with absolute power over a great part of Africa, particularly Tingitana. Hercules defeated and slew Antæus in the same war wherein he took the Libyan world from Atlas: both Atlas and Antæus invaded Egypt, and contended with Hercules in the wars with the gods, and were both vanquished by him. Antæus, as well as Atlas, was famed for his knowledge in the celestial sciences: from whence we may fairly conclude them to have been the same king of Mauritania.

Antæus, in his wars with Hercules, who commanded an army of Egyptians and Ethiopians, behaved with great bravery and resolution. Receiving large reinforcements of Libyan troops, he cut off vast numbers of Hercules's men; but that celebrated commander having at last intercepted a strong body of Mauritanian or Libyan forces sent to the relief of Antæus, gave him a total overthrow, wherein both he and the best part of his forces were put to the sword. This decisive action put Hercules in possession of Libya and Mauritania, and consequently of all the riches in those kingdoms; hence arose the fable that Hercules finding Antæus, a giant of an enormous size, with whom he was engaged in single combat, to receive fresh strength as often as he touched his mother earth when thrown upon her, at last lifted him up in the air and squeezed him to death. Hence likewise may be deduced the fable, intimating, that Hercules took Atlas's globe upon his own shoulders, overcame the dragon that guarded the orchards of the Hesperides, and made himself master of all the golden fruit. The golden apples, so frequently mentioned by the old mythologists, were the treasures that fell into Hercules's hands upon Antæus's defeat, the Greeks giving the Oriental word מלא *riches*, the signification annexed to their own term, μηλα, *apples*. After the most diligent and impartial examination of all the different hypotheses of historians and chronologers, relating to Atlas and Antæus, we find none so little clogged with difficulties as that of Sir Isaac Newton. According to that illustrious author, Ammon, the father of Sesac, was the first king of Libya, or that vast tract extending from the borders of Egypt to the Atlantic ocean; the conquest of which country was effected by Sesac in his father's lifetime. Neptune afterwards excited the Libyans to a rebellion against Sesac; slew him, and then invaded Egypt under the command of Atlas or Antæus, the son of Neptune, Sesac's brother and admiral. Not long after, Hercules, the general of Thebais and Ethiopia for the gods or great men of Egypt, reduced a second time the whole continent of Libya, having overthrown and slain Antæus near a town in Thebais, from that event called Antæa or Antæopolis: this, we say, is the notion advanced by Sir Isaac Newton, who endesvours to prove, that the first reduction of Libya by Sesac happened a little above a thousand years before the birth of Christ, as the last by Hercules did some few years after.

Antæus ‖ Antavar

ANTAGONIST, denotes an adversary, especially in speaking of combats and games.

Antagonist Muscles, in *Anatomy*, those which have opposite functions; as flexors and extensors, abductors, and addnctors, &c.

ANTANACLASIS, in *Rhetoric*, a figure which repeats the same word, but in a different sense; as *dum vivimus vivamus*.

ANTAGOGUE, in *Rhetoric*, a figure by which, when the accusation of the adversary is unanswerable, we load him with the same or other crimes.

ANTANDROS, in *Ancient Geography*, a town of Mysia, on the sea-coast, at the foot of Mount Alexandria, a part of Mount Ida, (Strabo, Ptolemy): it was a town of the Leleges, (Strabo); anciently called *Edonis*, then *Cimmeris*, (Pliny, Stephanus). It takes its name from Antandros, a general of the Æolians: it is now called *S. Dimitri*.

ANTAPHRODISIACS, in *Pharmacy*, medicines proper to diminish the semen, and consequently extinguish or lessen all desires of venery.

ANTARCTIC, in a general sense, denotes something opposite to the northern or arctic pole. Hence antarctic circle is one of the lesser circles of the sphere, and distant only 23° 30′ from the south pole, which is likewise called antarctic for the same reason.

ANTARES, in *Astronomy*, the name of a star of the first magnitude, called also the scorpion's heart. Its longitute is 60° 13′ 14″ of Sagittarius; and its latitude 43° 51′ 26″ south.

ANTAVARE, a province of the island of Madagascar, lying about 21° 30′ S. Lat. and bounded by the

Antavare || Antecursores.

the province and cape of Manousi. The greatest part of it is watered by the river Mananzari, whose source is in the red mountains of Ambohitsmene.

ANTE, in *Heraldry*, denotes that the pieces are let into one another in such a form as there is expressed; for instance, by dove tails, round, swallow tails, or the like.

ANTEAMBULONES, in Roman antiquity, servants who went before persons of distinction to clear the way before them. They used this formula, *Date locum domino meo*, i. e. "Make room or way for my master."

ANTECEDENT, in general, something that goes before another, either in order of time or place.

ANTECEDENT, in *Grammar*, the words to which a relative refers.

ANTECEDENT, in *Logic*, is the first of the two propositions in an enthymeme.

ANTECEDENT, in *Mathematics*, is the first of two terms of a ratio, or that which is compared with the other.

ANTECEDENCE, in *Astronomy*, an apparent motion of a planet towards the west, or contrary to the order of the signs.

ANTECESSOR, one that goes before. It was an appellation given to those who excelled in any science. Justinian applied it particularly to professors of civil law; and, in the universities of France, the teachers of law take the title *antecessors* in all their theses.

ANTECURSORES, in the Roman armies, a party of horse detached before, partly to get intelligence, provisions, &c. and partly to choose a proper place to encamp in. These were otherwise called *antecessores*, and by the Greeks *prodromi*.

Antedate || Antediluvians.

ANTEDATE, among lawyers, a spurious or false date prior to the true date of a bond, bill, or the like.

ANTEDILUVIAN, in a general sense, implies something that existed before the flood.

Antediluvian World; the earth as it existed before the flood. See EARTH.

ANTEDILUVIANS, a general name for all mankind who lived before the flood, and so includes the whole of the human race from Adam to Noah and his family.

1 Chronology of the first ages.

As Moses has not set down the particular time of any transaction before the flood, except only the years of the father's age wherein the several descendants of Adam in the line of Seth were begotten, and the length of their several lives; it has been the business of chronologers to endeavour to fix the years of the lives and deaths of those patriarchs, and the distance of time from the creation to the deluge. In this there could be little difficulty, were there no varieties in the several copies we now have of Moses's writings; which are, the Hebrew, the Samaritan, and the Greek version of the Septuagint; but as these differ very considerably from one another, learned men are much divided in their opinion concerning the chronology of the first ages of the world; some preferring one copy, and some another.

That the reader may the better judge of the variations in the three copies in this period, they are exhibited in the following table, with the addition of those of Josephus as corrected by Dr Wells and Mr Whiston.

A Table of the Years of the Antediluvian Patriarchs.

	Their ages at their sons birth.				Years they lived after their sons birth.			Length of their lives.		
	Heb.	Sam.	Sept.	Jos.	Heb.	Sam.	Sept.	Heb.	Sam.	Sept.
Adam,	130	130	230	130	800	800	700	930	930	930
Seth,	105	105	205	105	807	807	707	912	912	912
Enos,	90	90	190	90	815	815	715	905	905	905
Cainan,	70	70	170	70	840	840	740	910	910	910
Mahalaleel,	65	65	165	65	830	830	730	895	895	895
Jared,	162	62	162	62	800	785	800	962	847	962
Enoch,	65	65	165	65	300	300	200	365	365	365
Methuselah,	187	67	167	187	782	653	802	969	720	969
Lamech,	182	53	188	182	595	600	565	777	653	753
Noah was aged, at the flood,	600	600	600	600						
To the Flood,	1657	1307	2262	1556						

To this Table it will be necessary, in order to explain the consequences of these variations, to add separate chronological tables, showing in what year of his contemporaries the birth and death of each patriarch happened, according to the computation of each of the said three copies.

Antedi-luvians.

A Chronological TABLE *of the Years of the Patriarchs, according to the Computation of the Hebrew.*

	Years of the world.	Years of Seth.	Years of Enos.	Years of Cainan.	Years of Mahalaleel.	Years of Jared.	Years of Enoch.	Years of Methuselah.	Years of Lamech.	Years of Noah.
Adam created, -	1									
Seth born, -	130									
Enos born, -	235	105								
Cainan born, -	325	195	90

Jared, Methuselah, and Lamech, die,	1307		The Flood,			847		720	653	600

To the varieties exhibited in the two last tables, others might be added, by admitting the various readings of some numbers in the Samaritan and Septuagint: for as to the Hebrew copies, there is here a constant agreement among them.

The manuscript from which the Samaritan Pentateuch was published, agrees exactly with the Samaritan numbers given by Eusebius. But St Jerome tells us, that in his time, there were some Samaritan copies which make Methuselah 187 years old at the birth of Lamech, and Lamech 182 at the birth of Noah, just as the Hebrew does. Now if these numbers be approved as the true original numbers, the interval from the creation to the flood will be 1556 years; differing from the Hebrew computation but 100 years in the age of Jared at the birth of Enoch; and if this last be allowed to be a mistake of the transcriber, by his dropping a number, and writing 62 instead of 162, as has been suspected, the Samaritan will be perfectly reconciled with the Hebrew, and all difference between them vanish.

Scaliger, on the authority of an old Samaritan chronicle, having at the end a table of the years of the patriarchs to the time of Moses, would correct two of the Samaritan numbers in Eusebius; viz. instead of 65, the age of Mahalaleel when he begat Jared, he thinks it should be 75; and instead of 67, the age of Methuselah when he begat Lamech, he would have it 77. By which alterations he reckons 20 years more to the flood than Eusebius and the manuscript; that is, 1327. But, as he acknowledges the table, whereon he grounds these corrections, contains some great absurdities, it seems unreasonable to oppose it to the joint authority of Eusebius and the Samaritan manuscript.

As to the Septuagint, in the common editions of that version, the age of Methuselah at the birth of Lamech is 167; and consequently the sum of this period, according to them, is no more than 2242. But, in this case, Methuselah will outlive the flood 14 years; and we may well wonder, with Eusebius, where he was preserved. To obviate this objection, we are told, that, in some copies, Methuselah is said to have lived but 782 (not 802) years after the birth of Lamech, and no more than 949 in all. But the Alexandrian manuscript entirely takes away the difficulty, by giving the same number in this place with the Hebrew.

Pezron is of opinion, that the age of Lamech, at the birth of Noah, should be but 182, as it is both in the Hebrew and in Josephus, supposing, with St Austin, that the present number is the error of the scribe who first copied the original Septuagint manuscript in Ptolemy's library. So that he computes 2256 years to the flood. And, if this correction be admitted, and one more mentioned also by St Austin, viz. that Lamech lived 595 years after the birth of Noah, and not 565, as in the present copies, there will then remain no other difference between the Septuagint and the Hebrew than 600 years added to the ages of the six patriarchs when they begat their sons, and Methuselah will, conformably to the Hebrew and Samaritan, die in the year of the flood.

Having premised this chronological view, we shall proceed to the history of the antediluvian patriarchs.

Of Adam in Paradise.

Of the great progenitor we are told, that "the Lord God took the man and put him into the garden." These words plainly indicate, that Adam was not created within the precincts of Paradise; and it is afterwards said, upon his being turned out of the garden, "He

Antedilu-vians.

was sent to till the ground whence he was taken."—As to the situation of this garden, concerning which there has been so much learned but uncertain inquiry, see the article PARADISE.

Adam was doubtless created in the prime of his life, with all his powers and faculties in the highest degree of strength and vigour. His body would be graceful, and well proportioned; while his countenance was comely, and glowed with all the lustre of youthful innocence. The poet thus describes our first parents:

> Adam the goodliest man, of men since born
> His sons; the fairest of her daughters Eve.
> ———for in their looks divine
> The image of their glorious Maker shone. MILTON.

Many have entertained an opinion (as mentioned under the article ADAM), that our first parent was created an adept in knowledge and in science, a consummate philosopher, and an accomplished divine. But the very reverse of this must be true, providing we give credit to the account which Moses gives of him. If Adam was created with intuitive knowledge, for what end was he endowed with the senses of a man, through which ideas might be conveyed to his mind, and make him capable of such improvements as arise from experience and observation? And if he originally possessed such a fund of valuable knowledge, why had he such an ardent thirst for an unwarrantable portion of more, and for the sake of this additional pittance forfeited his happiness and life? Besides, if Adam was at first all light and knowledge, and was soon after reduced to a state of ignorance and error, this transition would make a retrograde in the system of nature, quite dissimilar to that uniformity which obtains thoughout the whole of the divine government and economy. Moses introduces our first parents into life in the most natural manner, as having capacities to acquire knowledge, senses to receive impressions from objects round them, and a sufficient degree of reason to form a judgement of the things perceived: yet all these faculties can only be considered as so many instruments, by the exercise of which they might be enabled to discharge the duties of their future life.

Smellie's Translation, vol. iii. p. 50. &c. (the passage here abridged).

The following portrait of our first progenitor when he first came into life, drawn by the inimitable pencil of Buffon, is extremely beautiful, while it is dissonant from no part of the Mosaic history. "Let us suppose a man in the same situation with him who first received existence; a man whose organs were perfectly formed, but who was equally new to himself, and to every object which surrounded him. Were he to give a history of his thoughts, and of the manner in which he received impressions, he might give some such information as this. I remember the moment when my existence commenced. It was a moment replete with joy, with amazement and anxiety. I neither knew what I was, where I was, nor whence I came. I opened my eyes. But what an amazing increase of sensation! The light, the celestial vault, the verdure of the earth, the transparency of the waters, gave animation to my spirits, and conveyed pleasures which exceed the powers of expression. At first I believed that all these objects existed within me, and formed a part of myself. When, turning mine eyes to the sun, his splendour overpowered me. I voluntarily shut out the light, and felt a small degree of pain. During this moment of darkness, I imagined that I had lost the greatest part of my being. I was then roused with a variety of sounds. The singing of birds and the murmuring breezes formed a concert, which excited most sweet and enchanting emotions. I listened, and was convinced that these harmonious sounds existed within me.—I made a step forwards; and afterwards renewing my motion, I walked with my face turned towards the heavens; till I struck against a palm tree, and felt some degree of pain. Seized with terror, I ventured to lay my hand upon the object, and perceived it to be a being distinct from myself, because it did not, like touching my own body, give me a double sensation. I resolved then to feel every object I saw, and had a strong desire to touch the sun; but stretching out my hands to embrace the heavens, they met without any intermediate object. All objects appeared to me equally near; and it was not till after many trials that I learned to use my eye as a guide to my hand. At last the train of my ideas was interrupted, and I lost the consciousness of my existence. My sleep was profound; but having no mode of measuring time, I knew nothing of its duration. When I awakened, I was astonished to find by my side another form, perfectly similar to my own. I conceived it to be another self; and instead of losing by my sleep, I imagined myself to be double. I ventured to lay my hand upon this new being. With rapture and astonishment I perceived that it was not myself, but something much more glorious and desirable."

Antedilu-vians.

This philosophical detail coincides with the opinion that, excepting what portions of knowledge Adam might acquire by the exercise of his senses, his Maker taught him every thing that was necessary for his comfort and subsistence. But before the Almighty gave any instructions to our first parents, we must suppose he inspired them with the knowledge of the meaning of every word which they heard him speak; otherwise it would have been impossible that he could have had any such communication with them. The words which they heard and were made to understand, being imprinted upon their memories, would serve as the foundation of a language, which they would afterwards increase and enlarge as new objects began to multiply, and hence give rise to new terms and definitions.

One of the first lessons taught to Adam by his infallible Director, would be the necessity of food for the support of his life. Accordingly Moses informs us, that for this purpose a grant was made him to eat of every tree of the garden, excepting one. At the same time it was made known to him, in what manner he was to repair the decays of nature, namely, by eating of *the tree of life*. Then, in order to qualify him for social intercourse, he was ordered to exercise his faculty of speech, by giving names to different creatures. The author of the book of Ecclesiasticus says of our first parents, "They received the use of the five operations of the Lord; and in the sixth he imparted to them understanding; and in the seventh, speech to interpret the cogitations thereof." The meaning cannot be, that he gave them every word they were to pronounce, more than every idea which their senses were to convey to their understanding. Our talents, and

Antediluvians.

and the exercise of them, may be both said to be given us of God; but whatever capacities we receive from him, it is supposed that we ourselves must improve them, before we can attain to any acquirements whatever. Although Adam had heard and understood the words of God, yet Moses does not give the least hint that he ever attempted to speak before this time. For if he had, as some imagine, innate knowledge and proper terms for every thing presented to him, what occasion was there to bring animals before him to see what names he would impose upon them? Some writers have endeavoured to turn into ridicule the whole of this transaction, and have asked, how could all creatures upon earth appear at one time before Adam? not only one, but many days would have elapsed before he could give each a name. But this objection arises from not understanding the words of Moses. What our translators render, to see what he would call THEM, is in the original, to see what name he would call IT. "And whatsoever Adam called IT, (viz. the living creature), that was the name of IT." The meaning seems to be no more than this: God brought a few creatures to Adam, to make him try to name them; and whatever he called any of them, that continued to be its name. And no doubt he would denominate every animal before him, from its external appearance, from its size, its colour, or its voice: And in process of time, he would give names to all those creatures which Providence brought within his view, or with which he became afterwards acquainted.

The next thing in which God instructed Adam, though probably in a trance or vision, was his near relation to Eve, as being a part of his own body. This piece of knowledge was imparted to him, in order to cement the greater love and affection between the two during the remaining period of their lives.

These, according to Moses, are all the transactions in which our first parents were interested during their abode in paradise, till they lost their innocence, and forfeited the enjoyments of their happy situation. And nothing can be more evident, than that the instructions which they received bespoke the infantile state of their minds; though there is no doubt but further and higher dispensations of knowledge would have been communicated to them, as they became able to bear them, and had their minds matured by experience and reflection.

3 How long our first parents retained their innocence.

How long our first parents retained their innocence, we are nowhere told. Many assert that they fell on the very first day of their creation. But Moses mentions so many transactions on that day, as must have engrossed the whole of their attention, and prevented them from falling into such temptations as arise from indolence and want of reflection. Besides, if, in such circumstances as they were placed, they could not refrain from an open violation of the Divine law for the space of one day, it would bespeak a deceitfulness of heart in them greater than in most of their posterity. It is somewhat singular, that many of the great trials recorded in sacred writing were limited to 40 days; which in prophetic style is sometimes equivalent to 40 years. This appears from the history of Moses, of Elijah, of Nineveh, and of the Jewish nation after the death of Christ. And, what is very remarkable, he, of whom Adam was a type, was tempted 40 days in the wilderness. Agreeable to this part of the Divine economy, perhaps the trial of our first parents lasted so long. However, that they remained for a considerable time in the garden, appears highly probable from this consideration, that their indulgent Creator, who had manifested his tender concern for them while innocent, and extended his mercy to them when fallen, would never have turned them out of paradise, and sent them into an uncultivated world, before they had acquired the arts of living, and were capable of providing against the vicissitudes of their future lot. The particulars of this memorable transaction are considered under the article FALL.

Antediluvians.

Moses gives us no farther account of Adam's life after leaving the garden, but that he begat some children, and died at such an age. Yet we have no reason to doubt, but the venerable patriarch ever after led a life of penitence, and of the strictest piety. The various communications which he had enjoyed with his Maker in paradise, and which were probably renewed to him after his fall, could not fail to make the deepest impressions upon his mind. The gracious respite he had met with, from the execution of the sentence denounced against him, would make him cautious of offending for the time to come; lest the next violation of the Divine authority should put an end to his existence. The *cherubim and flaming sword*, or the devouring flame, on the *east of Eden* (which might continue burning all his life) would be to him what the vestiges of the ark were to Noah and his sons, an awful memorial of the danger of incurring the Divine displeasure. Besides, his worldly comforts being in a great measure withdrawn, his mind would be naturally disposed for relishing those pleasures which flow from piety and religion.

4 Of their progeny.

The first thing which we hear of Adam in his new situation was, that *he knew Eve his wife, and she conceived and bare Cain.* Afterwards, we are told, she bare Abel. When the brothers were grown up, they betook themselves to distinct employments; the former to husbandry, and the latter to the keeping of sheep. Their inward dispositions were still more different; Cain being wicked and avaricious, but Abel just and virtuous.

In process of time they brought their respective offerings to God; Cain of the fruit of the ground, and Abel of the firstlings of his flock: but they met with very different success; for God accepted the offering of Abel, but Cain's he did not accept; the consequences of which are related under the articles ABEL and CAIN.

Soon after the murder of Abel, his loss was made up to his parents in another son they had, whom Eve named *Seth*, that is "appointed;" because he was appointed instead of Abel whom Cain slew.

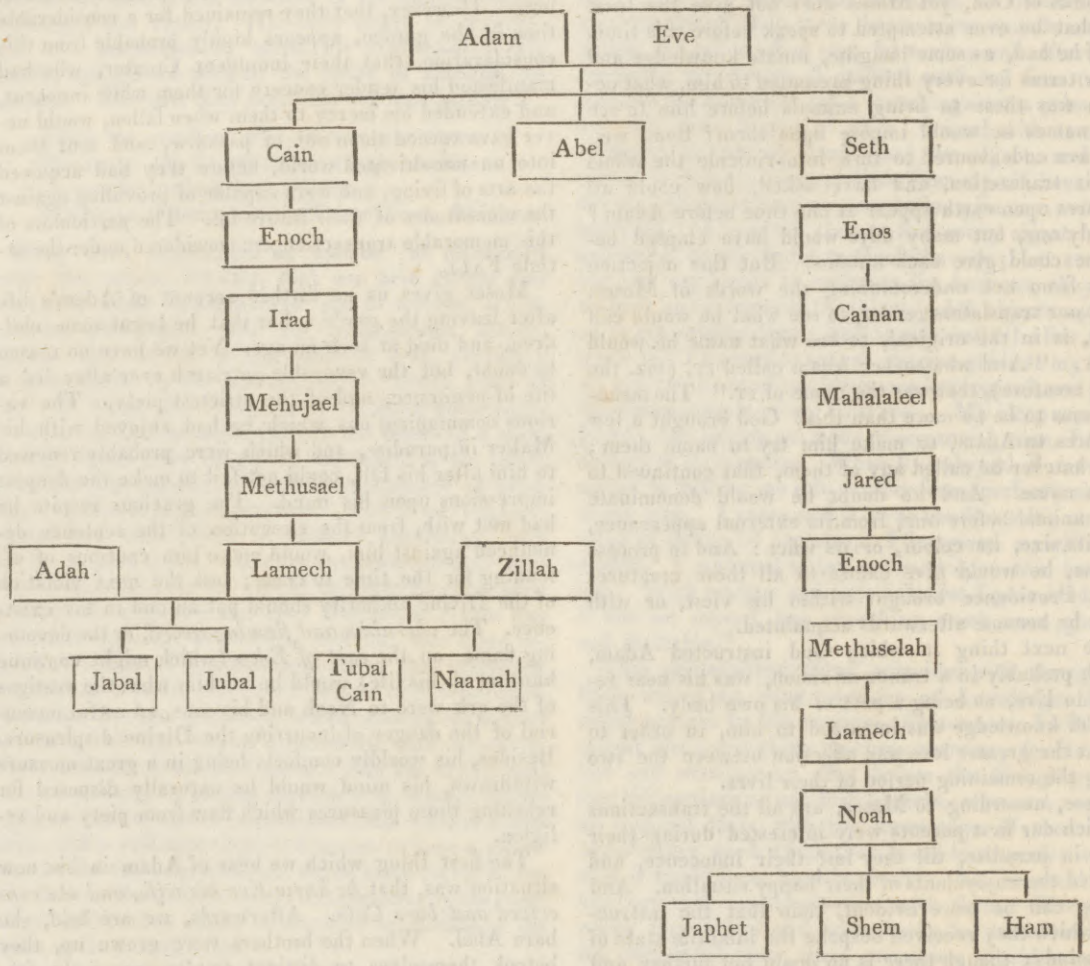
As the whole progeny of Adam, of whom we have any mention in Scripture, were the descendants of Cain and Seth, it may be proper to give the following

Genealogical

Antediluvians.

Antediluvians.

Genealogical TABLE *of the* ANTEDILUVIANS.



5 Of the line of Cain.

The sacred historian, confining himself chiefly to the line of Seth, from whence Noah was descended, has acquainted us with very few particulars relating to that of Cain: nor can we thus form any conjectures how long he or any of his descendants lived. All we know is, that Lamech, the fifth in descent from him, married two wives, Adah and Zillah, the first known instance of polygamy; that by the former he had two sons, Jabal, who was the first that dwelt in tents, and fed cattle, and Jubal, the inventor of music; and by the other, a son named Tubal-Cain, who found out the art of forging and working metals. Zillah likewise brought him a daughter named Naamah, supposed to have invented spinning and weaving: and we are told that, on some occasion or other, Lamech made a speech to his wives, the explication of which has greatly puzzled the interpreters. See LAMECH.

6 The line of Seth.

Moses proceeds to tell us, that Seth had a son born to him called *Enos*, and that *then began men to call upon the name of the Lord.* Commentators give us three different senses of these words. Some think the words should be rendered, *Then men profaned in calling on the name of the Lord;* and that even Enos arrogated to himself a power as if he had been a god. But this sense seems harsh and unnatural. There is nothing more unlikely, than that Adam's grandchildren, who lived under his own eye, would so soon shake off parental authority, and apostatize from the belief and worship of the one true God. Others think, that though men had hitherto worshipped God in private, yet they now instituted public assemblies, met in larger societies for solemn and social worship, and introduced liturgies and forms for more effectually paying their homage to the Almighty. This indeed is a very natural comment from those who place religion in modes and set forms of worship. But it is scarcely credible, that Adam and his family had never met together to worship God till now, when we are told that Cain and Abel, and probably both their families along with them, brought their offerings to the Lord; this they no doubt did every Sabbath day. Others, therefore, put a more consistent interpretation upon the words, namely,

Miln's Physico-Theol. Lectures, p. 142, &c.

Antediluvians. namely, that *men now called themselves by the name of the Lord.* The meaning of which is, that about this period, the family of Seth, who adhered to God and his worship, began to give themselves a denomination, expressive of their relation and regards to him. They distinguished themselves from the irreligious family of Cain, and assumed the title of the *sons* or *children* of God: which designation was afterwards applied to them by Moses; it was even used after the flood, and adopted by the writers of the New Testament.

Of the three next descendants of Seth, Cainan, Mahalaleel, and Jared, and of Methuselah and Lamech, the grandfather and father of Noah, Moses has recorded no more than their several ages. The oriental authors commend them, as they do Seth and Enos, for their piety, and the salutary injunctions they left behind them, forbidding their children all intercourse with the race of cursed Cain.

Enoch the son of Jared, and father of Methuselah, was a person of most extraordinary piety, *walking with God*, as the Scripture expresses it, for at least the last three hundred years of his life; as a reward for which exemplary behaviour in so corrupt an age, he was taken up by God into heaven, without tasting death. See ENOCH.

7 Corruption of the human race. Moses afterwards informs us, *When men began to multiply*, i. e. when the earth was filled with inhabitants, and tribes formerly living remote began to approach nearer to one another, *Daughters were born unto them:* meaning in greater abundance than formerly; which seems to hint, that at this period there were considerably more females than males born into the world. Some think that Moses, being now about to mention the wickedness of the Antediluvians, introduces the posterity of Cain as being the chief cause of their corruption; and that he styles them *men* and *daughters of men*, because they were sensual and earthly; in which sense the word *men* is sometimes used in the Scriptures.

The sons of God saw the daughters of men that they were fair; and they took them wives of all that they chose. These words have given rise to many absurd and ridiculous comments both of Jews and Christians. There are two meanings affixed to them, which may be mentioned as the most probable. Whenever the name of God is added to any thing, it not only denotes God's being the efficient cause, but it heightens and increases its usual meaning. For which reason any thing that is excellent in its kind, or uncommonly lofty and magnificent, was by the Jews said to be of God, or of the Lord. Thus the angels are called the *sons of God.* And Adam being created with a nobler image than any other creature, is said to be made in the *image of God.* The cedars of Lebanon are called the *cedars of the Lord;* and great mountains, the *mountains of God.* Therefore by the *sons of God* in this place are meant men of great opulence, power, and authority. And by way of contrast, the historian introduces those of poor and mean circumstances in life, and calls them the *daughters of men.* The words thus explained, are not an unlikely description of that dissolute age. The great and mighty in this world are commonly most addicted to sensual gratifications, because they have so many incentives to inflame their passions, and so few restraints to curb them; and, instead of using their power to punish and discountenance vice, are too often the greatest examples and promoters of lasciviousness and debauchery. Thus, these *sons of God*, these great men, when they happened to meet with the daughters of their inferiors, gazed upon them as fit objects to gratify their lust; and from among these they *took to themselves*, in a forcible manner, *wives*, or (as it may be rendered) *concubines, of all that they chose*, whether married or unmarried, without ever asking their consent. No wonder, then, that the earth should be *filled with violence*, when the highest rank of men were above the restraint of law, of reason, and religion, and not only oppressed the poor, but with impunity treated them and their children in such a base and cruel manner. Antediluvians.

But there are other writers who cannot relish the above opinion; because they think it a harsh and unnatural construction, to call great and powerful persons the *sons of God*, and all mean and plebeian women the *daughters of men.* Besides, the text does not say, that the *sons of God* offered any violence to these inferior women; but that they saw that they were *fair*, and made choice of them for wives. And wherein is the heinousness of the offence, if men of a superior rank marry their inferiors, especially when an excess of beauty apologizes for their choice? Or why should a few unequal matches be reckoned among the causes of bringing upon the world an universal destruction? For these reasons many are of opinion, that the descendants of Seth, who were styled the *sons of God* on account of their near relation to him, saw the *daughters of men*, i. e. the impious progeny of Cain, and by intermarriages became associated with them; and surrendering to those enchantresses their hearts and their freedom, they surrendered at the same time their virtue and their religion. From this union proceeded effects similar to what has happened ever since. When a pure society mixes with a profane, the better principles of the one become soon tainted by the evil practices of the other; which verifies the old adage, *Evil communication corrupts good manners.* Thus it appears, that the great source of universal degeneracy was owing to the posterity of Seth mingling with the progeny of Cain, in opposition to what their pious fathers had strictly charged them. *Milt.* p. 265.

It is afterwards said, *There were giants in the earth in those days: and also after that, when the sons of God came in unto the daughters of men, and they bare children to them, the same became mighty men, which were of old men of renown.* Translators are not agreed about the meaning of the word *giants.* Some render the word, *violent and cruel men;* others, men who *fall upon* and *rush forward*, as a robber does upon his prey: the meaning then is, that they were not more remarkable for their strength and stature, than for their violence and cruelty. In Luther's German translation of the Bible, this word is rendered *tyrants.* It is generally agreed, that in the first ages of the world, men were of a gigantic stature; though Moses does not mention them as giants till after the union of the families of Seth and Cain, when men used their superiority in bodily strength for the purposes of gratifying their unhallowed passions.

At this period of the world, and long after, political power and bodily strength went hand and hand together.

Antediluvian.

gether. Whoever was able to encounter and kill a fierce and dangerous wild beast, and clear the country of noxious animals, or who was able in the day of battle to destroy most of his enemies, was looked up to by the rest of his companions as the fittest to be their leader and commander. Thus Nimrod, from being a *mighty hunter*, became a great king, and, grasping at power, was never satisfied till every obstacle to his ambition was removed. And it appears from history, that all his successors have pretty nearly trodden in the same path. These *giants* then, or *sons of God*, might be the chief warriors, who formed themselves into chosen bands, and living among a cowardly and effeminate people, had no curb to their cruelty and lust. From them might spring an illegitimate race, resembling their fathers in body and mind, who, when they grew up, having no inheritance, would be turned loose upon the world, and follow no other employment but theft, rapine, and plunder. Thus they became *mighty men* and *men of renown, and procured themselves a name:* but this was owing to the mischief they did, and the feats of savage cruelty which they performed.

8 God's forbearance.

Mankind running thus headlong into all manner of vice, were admonished to repent; and God, out of his great mercy, was pleased to grant them a convenient time for that purpose; no less than 120 years, during which space, but no longer, he declared his Spirit should "strive with man," or endeavour to awaken and reclaim them from their wicked course of life.

Amidst this general corruption, one man, however, was found to be just and perfect in his generation, walking with God. This extraordinary person was Noah, the son of Lamech; who, not thinking it sufficient to be righteous himself, unless he did his utmost to turn others likewise to righteousness by admonition as well as

9 Preaching of Noah.

example, became a preacher to the abandoned race among which he lived, employing both his counsel and authority to bring them to a reformation of their manners, and to restore the true religion among them. But all he could do was to no purpose; for they continued incorrigibly obstinate; so that at length (as Josephus tells us), finding himself and family in imminent danger of some violence in return for his good will, he departed from among them, with his wife and children.

10 Mankind incorrigible.

On his departure, it is probable they fell into greater disorders than before; having now none to controul, or even to trouble them with unwelcome advice. Moses assures us, that the wickedness of man was great in the earth, and that every imagination of the thoughts of his heart was continually evil; and that "the earth was corrupt and filled with violence, all flesh having corrupted his way upon the earth." These words leave no room to inquire into the particular crimes of the Antediluvian world, which seems to have been overrun with a complication of all manner of debauchery and wickedness, and above all with violence and injustice towards one another.

11 The whole world destroyed by a flood except Noah and his family.

Things being in this state, God, as the sacred historian pathetically expresses it, "repented that he had made man on earth, and it grieved him at his heart." And the time of forbearance being elapsed, he passed the sentence of their utter destruction by a flood of waters; a sentence which likewise included the beasts of the earth, and every creeping thing, and the fowls of the air. But Noah found grace in the eyes of the Lord;" who had before acquainted him with his design of bringing a deluge on the earth, and directed him to make an ark, or vessel, of a certain form and size, capable of containing not only himself and family, but such numbers of animals of all sorts as would be sufficient to preserve the several species, and again replenish the earth, together with all necessary provisions for them. All these injunctions Noah performed; and, by God's peculiar favour and providence, he and those that were with him survived this tremendous calamity. See the article DELUGE.

Antediluvians.

12 Traditional history of the Antediluvians.

As to any further transactions before the flood, we are left entirely in the dark by the sacred historian. The Jews and eastern nations, however, have made ample mends for the silence of Moses, by the abundance of their traditions. The only part of these, which can be connected in any thing like history, is what follows.——After the death of Adam, Seth, with his family, separated themselves from the profligate race of Cain, and chose for their habitation the mountain where Adam was buried, the Cainites remaining below, in the plain where Abel was killed; and, according to our historians, this mountain was so high, that the inhabitants could hear the angels singing the praises of God, and even join them in that service. Here they lived in great purity and sanctity of manners. Their constant employment was praising God, from which they had few or no avocations; for their only food was the fruit of the trees which grew on the mountain, so that they had no occasion to undergo any servile labours, nor the trouble of sowing and gathering in their harvest. They were utter strangers to envy, injustice, or deceit. Their only oath was, "By the blood of Abel;" and they every day went up to the top of the mountain to worship God, and to visit the body of Adam, as a mean of procuring the Divine blessing. Here, by contemplation of the heavenly bodies, they laid the foundations of the science of astronomy; and lest their inventions should be forgotten, or lost before they were publicly known, understanding, from a prediction of Adam's, that there would be a general destruction of all things, once by fire, and once by water, they built two pillars, one of brick, and the other of stone, that if the brick one happened to be overthrown by the flood or otherwise destroyed, that of stone might remain. This last, Josephus says, was to be seen in his time in the land of Syriad, (thought to be in Upper Egypt).

The descendants of Seth continued in the practice of virtue till the 40th year of Jared, when an hundred of them hearing the noise of the music and the riotous mirth of the Cainites, agreed to go down to them from the holy mountain. On their arrival in the plain, they were immediately captivated by the beauty of the women, who were naked, and with whom they defiled themselves; and this is what is meant by the intermarriage of the sons of God with the daughters of men, mentioned by Moses. The example of these apostate sons of Seth was soon followed by others; and from time to time great numbers continued to descend from the mountain, who in like manner took wives from the abandoned race of Cain. From these marriages sprung the giants (who, however, according to Moses,

Antediluvians. Moses, existed before); and these being as remarkable for their impiety as for their strength of body, tyrannized in a cruel manner, and polluted the earth with wickedness of every kind. This defection became at last so universal, that none were left in the holy mountain, except Noah, his wife, his three sons, and their wives.

13 Profane history. *Berosus's Babylonian Antiquities.* Berosus, a Chaldean historian, who flourished in the time of Alexander the Great, enumerates ten kings who reigned in Chaldea before the flood; of whom the first, called *Alorus*, is supposed to be Adam, and Xisuthrus, the last, to be Noah.—This Alorus declared that he held his kingdom by divine right, and that God himself had appointed him to be the pastor of the people. According to our historian, in the first year of the world, there appeared out of the Red sea, at a place near the confines of Babylonia, a certain *irrational* animal called *Oannes*. He had his whole body like that of a fish; but beneath his fish's head grew another of a different sort (probably a human one). He had also feet like a man, which proceeded from his fish's tail, and a human voice, the picture of him being preserved ever after. This animal conversed with mankind in the day time, without eating any thing: he delivered to them the knowledge of letters, sciences, and various arts: he taught them to dwell together in cities, to erect temples, to introduce laws, and instructed them in geometry: he likewise showed them how to gather seeds and fruits, and imparted to them whatever was necessary and convenient for a civilized life; but after this time there was nothing excellent invented. When the sun set, Oannes retired into the sea, and continued there all night. He not only delivered his instructions by word of mouth, but, as our author assures us, wrote of the origin of things, and of political economy. This, or a similar animal, is also mentioned by other authors.

Of Alasporus, the second king, nothing remarkable is related. His successor, Amelon, or Amillarus, was of a city called *Pantabibla*. In his time another animal resembling the former appeared, 260 years after the beginning of this monarchy. Amelon was succeeded by Metalarus; and he by Daonus, all of whom were of the same city. In the time of the latter four animals of a double form, half man and half fish, made their appearance. Their names were *Euedocus*, *Eneugamus*, *Encubulus* and *Anementas*. Under the next prince, who was likewise of Pantabibla, appeared another animal of the same kind, whose name was *Odacon*. All these explained more particularly what had been concisely delivered by Oannes.

In the reign of the tenth king, Xisuthrus, happened the great deluge, of which our author gives the following account: Cronus, or Saturn, appeared to Xisuthrus in a dream, and warned him, that on the fifteenth of the month Dæsius mankind would be destroyed by a flood, and therefore commanded him to write down the original, intermediate state, and end of all things, and bury the writings under ground in Sippara, the city of the sun; that he should also build a ship, and go into it with his relations and dearest friends, having first furnished it with provisions, and taken into it fowls and four-footed beasts; and that, when he had provided every thing, and was asked whither he was sailing, he should answer, *To the gods, to pray for happiness to mankind.* Xisuthrus did not disobey; but built a vessel, whose length was five furlongs, and breadth two furlongs. He put on board all he was directed; and went into it with his wife, children, and friends. The flood being come, and soon ceasing, Xisuthrus let out certain birds, which finding no food, nor place to rest upon, returned again to the ship. Xisuthrus, after some days, let out the birds again; but they returned to the ship, having their feet daubed with mud: but, when they were let go the third time, they came no more to the ship, whereby Xisuthrus understood that the earth appeared again; and thereupon he made an opening between the planks of the ship, and seeing that it rested on a certain mountain, he came out with his wife, and his daughter, and his pilot: and having worshipped the earth, and raised an altar, and sacrificed to the gods, he and those who went out with him disappeared. They who were left behind in the ship, finding that Xisuthrus and the persons that accompanied him did not return, went out themselves to seek for him, calling him aloud by his name; but Xisuthrus was no more seen by them: only a voice came out of the air, which enjoined them, as their duty was, to be religious; and informed them, that on account of his own piety he was gone to dwell with the gods, and that his wife and daughter and pilot were partakers of the same honour. It also directed them to return to Babylon, and that, as the fates had ordained, they should take the writings from Sippara, and communicate them to mankind; and told them, that the place where they were was the country of Armenia. When they had heard this, they offered sacrifice to the gods, and unanimously went to Babylon; and when they came thither, they dug up the writings at Sippara, built many cities, raised temples, and rebuilt Babylon. Antediluvians

14 Antediluvian kings of Egypt. The Egyptians, who would give place to no nation in point of antiquity, have also a series of kings, who, as is pretended, reigned in Egypt before the flood: and to be even with the Chaldeans, began their account the very same year that theirs does according to Berosus.

There was an ancient chronicle extant among the Egyptians, not many centuries ago, which contained 30 dynasties of princes who ruled in that country, by a series of 113 generations, through an immense space of 36,525 years, during which Egypt was successively governed by three different races; of whom the first were the Auritæ, the second the Mestræi, and the third the Egyptians.

But this extravagant number of years Manetho (to whose remains we must chiefly have recourse for the ancient Egyptian history) has not adopted; however, in other respects, he is supposed to have been led into errors in chronology by this old chronicle, which yet seems to have been a composition since Manetho's time.

15 Sanchoniatho's Phœnician history. The account given by Berosus is manifestly taken from the writings of Moses; but we have another account of the first ages of mankind, in which no mention is made of the flood at all. This is contained in some fragments of a Phœnician author called *Sanchoniatho*, who is by some said to have been contemporary with Gideon, by others to have lived in the days of King David; while some boldly assert there never was such

Antediluvians. such a person, and that the whole is a fiction of Philo Biblius, in opposition to the books of Josephus, written against Apion. To gratify the reader's curiosity, however, we have subjoined an account of the first ten generations mentioned by him, which are supposed by the compilers of the Universal History to correspond to the generations mentioned by Moses before the flood.

Sanchoniatho having delivered his cosmogony, or generation of the other parts of the world, begins his history of mankind with the production of the first pair of mortals, whom Philo, his translator, calls *Protogonus* and *Æon;* the latter of whom found out the food which was gathered from trees.

Their issue were called *Genus* and *Genea*, and dwelt in Phœnicia: but when the great droughts came, they stretched forth their hands to heaven towards the sun; for him they thought the only God and Lord of heaven, calling him *Beelsamen*, which in Phœnician is *Lord of heaven*, and in Greek *Zeus*.

Afterwards from Genus, the son of Protogonus and Æon, other mortal issue was begotten, whose names were *Phos*, *Phur*, and *Phlox;* that is, *Light*, *Fire*, and *Flame*. These found out the way of germinating fire, by the rubbing of pieces of wood against each other, and taught men the use thereof. They begat sons of vast bulk and height, whose names were given to the mountains on which they seized: so from them were named Mount *Cassius*, *Libanus*, *Antilibanus*, and *Brathys*.

Of these last were begotten Memrumus and Hypsuranius; but they were so named by their mothers, the women of those times, who without shame lay with any man they could light upon. Hypsuranius inhabited Tyre, and he invented the making of huts of reeds and rushes and the papyrus. He also fell into enmity with his brother Usous, who first invented a covering for his body out of the skins of the wild beasts which he could catch. And when violent tempests of winds and rains came, the boughs in Tyre, being rubbed against each other, took fire, and burnt the wood there. And Usous, having taken a tree, and broke off its boughs, was so bold as to venture upon it into the sea. He also consecrated two rude stones, or pillars, to fire and wind; and he worshipped them, and poured out to them the blood of such wild beasts as had been caught in hunting. But when these were dead, those that remained consecrated to them stumps of wood and pillars, worshipping them, and kept anniversary feasts unto them.

Many years after this generation came Agreus and Halicus, the inventors of the arts of hunting and fishing, from whom huntsmen and fishermen are named.

Of these were begotten two brothers, the inventors of iron and of the forging thereof: one of these, called *Chrysor*, the same with Hephestus, or Vulcan, exercised himself in words and charms and divinations: found out the hook, bait, and fishing-line, and boats slightly built; and was the first of all men that sailed. Wherefore he also was worshipped after his death for a god: and they called him *Zeus Michius*, or Jupiter the engineer; and some say his brother invented the way of making walls of brick.

Afterwards from this generation came two brothers; one of whom was called *Technites*, or the Artist; the other *Geinus Autochthon*, [the home-born man of the earth]. These found out to mingle stubble, or small twigs, with the brick earth, and to dry them in the sun, and so made tyling. Antediluvians.

By these were begotten others; of which one was called *Agrus* [Field]; and the other *Agrouerus*, or *Agrotes* [Husbandman], who had a statue much worshipped, and a temple carried about by one or more yoke of oxen, in Phœnicia; and among those of Byblus he is eminently called the *greatest of the gods*. These found out how to make courts about men's houses, and fences, and caves or cellars. Husbandmen, and such as use dogs in hunting, derive from these; and they are also called *Aletæ* and *Titans*.

Of these were begotten Amynus and Magus, who showed men to constitute villages and flocks.

In these men's age there was one Eliun, which imports in Greek *Hypsistus* [the most high] and his wife was named *Beruth*, who dwelt about Byblus: and by him was begot one Epigerus, or Autochthon, whom they afterwards called *Uranus* [heaven]; so that from him that element which is over us, by reason of its excellent beauty, is called *heaven;* and he had a sister of the same parents called *Ge* [the earth]; and by reason of her beauty the earth had her name given to it.

Hypsistus, the father of these, dying in fight with wild beasts, was consecrated, and his children offered sacrifices and libations to him.—But Uranus taking the kingdom of his father, married his sister Ge, and had by her four sons; Ilus, who is called *Cronus*, [or Saturn]; Betylus; Dagon, who is Siton, or the god of corn; and Atlas: but by other wives Uranus had much issue.

As to the customs, policy, and other general circumstances of the Antediluvians, we can only form conjectures.

The only thing we know as to their religious rites is, that they offered sacrifices, and that very early, both of the fruits of the earth and of animals; but whether the blood and flesh of the animals, or only their milk and wool, were offered, is a disputed point.— 16

Arts, &c. of the Antediluvians.

Of their arts and sciences, we have not much more to say. The Antediluvians seem to have spent their time rather in luxury and wantonness, to which the abundant fertility of the first earth invited them, than in discoveries or improvements, which probably they stood much less in need of than their successors. The art of working metals was found out by the last generation of Cain's line; and music, which they might be supposed to practise for their pleasure, was not brought to any perfection, if invented, before the same generation. Some authors have supposed astronomy to have been cultivated by the Antediluvians, though this is probably owing to a mistake of Josephus: but it is to be presumed, the progress they made therein, or in any other science, was not extraordinary; it being even very doubtful whether letters were so much as known before the flood. See ALPHABET.

As to their politics and civil constitutions, we have not so much as any circumstances whereon to build conjecture. It is probable, the patriarchal form of government, which certainly was the first, was set aside when tyranny and oppression began to take place, and much sooner among the race of Cain than that of Seth. It seems also that their communities were but few, and consisted

Antediluvians.

consisted of vastly larger numbers of people than any formed since the flood: or rather, it is a question, whether, after the union of the two great families of Seth and Cain, there were any distinction of civil societies, or diversity of regular governments, at all. It is more likely, that all mankind then made but one great nation, though living in a kind of anarchy, divided into several disorderly associations; which, as it was almost the natural consequence of their having, in all probability, but one common language, so it was a circumstance which greatly contributed to that general corruption which otherwise perhaps could not have so universally overspread the Antediluvian world. And for this reason chiefly, as it seems, so soon as the posterity of Noah were sufficiently increased, a plurality of tongues was miraculously introduced, in order to divide them into distinct societies, and thereby prevent any such total depravation for the future. See *Confusion of Tongues*.

Of the condition of the Antediluvians, Mr Whitehurst, in his *Inquiry into the original state and formation of the earth**, has given us the following picture: "Under a mild and serene sky, and when the spontaneous productions of the earth were more than sufficient for the calls of nature, without art or labour, mankind had no need of any other protection from the inclemency of the seasons, nor of barns for winter's store, than the benevolent Author of nature had plentifully provided for them. Consequently, in a state of nature like this, there was no temptation to acts of violence, injustice, fraud, &c.; every one having plenty and enough, each equally partook of the numerous blessings thus amply provided for him. Power and property being equally diffused, men lived together in perfect peace and harmony, without law, and without fear; therefore it may be truly said of the Antediluvians, that they slept away their time in sweet repose on the ever-verdant turf. Such apparently was the state of nature in the first ages of the world, or from the creation to the first convulsion in nature, whereby the world was not only universally deluged, but reduced to a heap of ruins." But our ingenious author, whose *Inquiry* is not professedly repugnant to revelation, seems here to have lost himself in a pleasing reverie. At least he has forgot to inform us, For what purpose, under such circumstances, he supposes the deluge to have been sent upon the earth; and, How we are to understand the account given by Moses, who represents the Antediluvians, not as an innocent race, quietly reposing on the ever-verdant turf, but as a corrupt generation, by whom "the earth was filled with violence."

* P. 282, 283.

17 Of the longevity of the Antediluvians.

One of the most extraordinary circumstances which occurs in the Antediluvian history, is the vast length of human lives in those first ages, in comparison with our own. Few persons now arrive at eighty or an hundred years; whereas, before the flood, they frequently lived to near a thousand: a disproportion almost incredible, though supported by the joint testimonies of sacred and profane writers. Some, to reconcile the matter with probability, have imagined that the ages of those first men might possibly be computed, not by solar years, but months; an expedient which reduces the length of their lives rather to a shorter period than our own. But for this there is not the least foundation; besides the many absurdities that would thence follow, such as their begetting children at about six years of age, as some of them in that case must have done, and the contracting of the whole interval between the creation and the deluge to considerably less than two hundred years, even according to the larger computation of the Septuagint. Antediluvians.

Again: Josephus, the Jewish historian, and some Christian divines, are of opinion, that before the flood, and some time after, mankind in general did not live to such a remarkable age, but only a few beloved of God, such as the patriarchs mentioned by Moses. They reason in this manner: Though the historian records the names of some men, whose longevity was singular, yet that is no proof that the rest of mankind attained to the same period of life, more than that every man was then of a gigantic stature, because he says, *in those days there were giants upon the earth*. Besides, had the whole of the Antediluvians lived so very long, and increased in numbers in proportion to their age, before the flood of Noah, the earth could not have contained its inhabitants, even supposing no part of it had been sea. And had animals lived as long, and multiplied in the same manner as they have done afterwards, they would have consumed the whole produce of the globe, and the stronger would have extinguished many species of the weaker. Hence they conclude, that for wise and good ends, God extended only the lives of the patriarchs, and a few beside, to such an extraordinary length.

But most writers maintain the longevity of mankind in general in the early world, not only upon the authority of sacred, but likewise of profane history. And for such a constitution, the moral reasons are abundantly obvious. When the earth was wholly unpeopled, except by one pair, it was necessary to endow men with a stronger frame, and to allow them a longer continuance upon earth for peopling it with inhabitants. In the infant state of every mechanical art, relating to tillage, building, clothing, &c. it would require many years experience to invent proper tools and instruments to ease men of their labour, and by multiplied essays and experiments to bring their inventions to any degree of maturity and perfection. Every part of their work must have been exceedingly arduous from such a penury and coarseness of tools, and must have required longer time and more strength of body than afterwards, when mechanical knowledge was introduced into the world. If parents at this period had not continued long with their children, to have taught them the arts of providing for themselves, and have defended them from the attacks of wild beasts, and from other injuries to which they were exposed, many families would have been totally extinguished. But one of the best and most valuable ends which longevity would answer was, the transmitting of knowledge, particularly of religious knowledge, to mankind. And thus, before writing was invented, or any such easy and durable mode of conveyance was found out, a very few men served for many generations to instruct their posterity, who would not be at a loss to consult living and authentic records. 18 Moral reasons for this longevity.

The natural causes of this longevity are variously assigned. Some have imputed it to the sobriety of the Antediluvians, and the simplicity of their diet; alleging that they had none of those provocations to gluttony, which 19 Natural causes of it.

Antediluvians. which wit and vice have since invented. Temperance might undoubtedly have some effect, but not possibly to such a degree. There have been many temperate and abstemious persons in later ages, who yet seldom have exceeded the usual period.—Others have thought that the long lives of those inhabitants of the old world proceeded from the strength of their stamina, or first principles of their bodily constitutions: which might, indeed, be a concurrent, but not the sole and adequate cause of their longevity; for Shem, who was born before the deluge, and had all the virtue of the antediluvian constitution, fell three hundred years short of the age of his forefathers, because the greatest part of his life was passed after the flood.—Others have imputed the longevity of the Antediluvians to the excellency of their fruits, and some peculiar virtue in the herbs and plants of those days. But to this supposition it has been objected, that as the earth was cursed immediately after the fall, its productions we may suppose gradually decreased in their virtue and goodness till the flood; and yet we do not see the length of men's lives decrease considerably, if at all, during that interval. Waving this objection, as the import of the curse is variously interpreted, it appears certain that the productions of the earth were at first, and probably continued till after the deluge, of a different nature, from what they were in future times. Buffon supposes this difference may have continued gradually to diminish for many ages subsequent to that catastrophe. The surface of the globe (according to his theory) was in the first ages of the world less solid and compact; because, gravity having acted only for a short time, terrestrial bodies had not acquired their present density and consistence. The produce of the earth, therefore, must have been analogous to its condition. The surface being more loose and moist, its productions would of course be more ductile and capable of extension. Their growth, therefore, and even that of the human body, would require a longer time of being completed. The softness and ductility of the bones, muscles, &c. would probably remain for a longer period, because every species of food was more soft and sueculent. Hence the full expansion of the human body, or when it was capable of generating, must have required 120 or 130 years; and the duration of life would be in proportion to the time of growth, as is uniformly the case at present: For if we suppose the age of puberty, among the first races of men, to have been 130 years, as they now arrive at that age in 14 years, the age of the Antediluvians will be in exact proportion to that of the present race; since by multiplying these two numbers by seven, for example, the age of the present race will be 98, and that of the Antediluvians will be 910. The period of man's existence, therefore, may have gradually diminished in proportion as the surface of the earth acquired more solidity by the constant action of gravity: and it is probable that the period from the creation, to the days of David, was sufficient to give the earth all the density it was capable of receiving from the influence of gravitation; and consequently that the surface of the earth has ever since remained in the same state, and that the terms of growth in the productions of the earth, as well as the duration of life, have been invariably fixed from that period.

It has been further supposed, that a principal cause of the longevity under consideration was the wholesome constitution of the Antediluvian air, which, after the deluge, became corrupted and unwholesome, breaking, by degrees, the pristine crasis of the body, and shortening men's lives, in a very few ages, to near the present standard. Antediluvians.

The temperature of the air and seasons before that catastrophe are upon very probable grounds supposed to have been constantly uniform and mild: the burning heats of summer and the severities of winter's cold were not then come forth, but spring and autumn reigned perpetually together: And indeed, the circumstance above all others most conducive to the prolongation of human life in the postdiluvian world, appears to be an equal and benign temperature of climate (see the article LONGEVITY); whence it seems reasonable to infer, that the same cause might have produced the same effect in the Antediluvian world.

29 Whether any flesh might be eaten before the flood.

Whether flesh was permitted to be eaten before the deluge, is a question which has been much debated. By the permission expressly given to Noah, for that purpose, after the flood, and God's assigning vegetables only for food to man, as well as beast, at the creation, one would imagine it was not lawful before: yet others have supposed, that it was included in the general grant of power and dominion given to Adam by God over the animal creation; and the distinction of beasts into clean and unclean, which was well known before the flood, is insisted on as a strong argument on this side.

But in answer to this it has been observed that, if so, it does not appear what occasion there was to renew this grant after the flood, and to add, "Every moving thing that liveth shall be food for you, even as the green herb have I given you all things." This surely implies that the green herb and fruits of the trees were all that was granted to man at first; but now, over and above that, was added the grant of animal food; for in a deed of gift, all is specified that is given or granted, and whatever is not expressly mentioned is excluded, or not given. Here man's food is appointed and specified; what is not expressly mentioned is therefore reserved and not granted. Besides, his grant or appointment of man's food respected not Adam only, but all his posterity, till an additional grant was made.

To the animals no further grant was made than at first; but to man another was made immediately after his fall and expulsion from Paradise, implied in these words: "In the sweat of thy face shalt thou eat bread, till thou return unto the ground." This was in truth a punishment for his transgression, as well as a grant of other food, but yet what was now become necessary to him. Paradise no doubt was planted with the most excellent fruits, sufficient to have sustained his life in health and vigour in his innocent state; but after his transgression, being thrust out from that happy abode, and having then only the fruits of the common earth to feed on; which were not so nutritious as those of Paradise, he stood in need of something else to sustain life; and therefore bread produced by culture and other preparations for his food was now added, which before was not necessary, and thence called the *staff of life*. This seems a plain reason why bread was added after he came to live on the common earth; though

Antediluvians.

though perhaps another reason also for that addition may be given from the change that happened in man's body after his fall. Bread being now become the staff of life, Cain, the first man born, became a tiller of the ground, or an husbandman; as the next in birth, Abel, became a keeper or feeder of sheep.

As to the distinction between clean and unclean, this solely respected animals offered in sacrifice in the Antediluvian world; as is evident from hence, that Noah, upon his coming out of the ark, "took of every clean beast and of every clean fowl, and offered burnt offerings unto the Lord;" and that upon the grant of animal food to him and his posterity, which was posterior in time to the sacrifice, there is not the least mention of any distinction between clean and unclean with respect to food, but the very contrary, since the grant runneth: "Every moving thing that liveth shall be meat for you, even as the green herb have I given you all things." That distinction of clean and unclean as to food, came in with the law of Moses, and was different from that of sacrifices, there being several creatures clean for food which were not to be offered in sacrifice.

But another objection here occurs. What occasion was there for keeping sheep, when none of them could be eaten? In answer to this it has been observed, that sheep and other animals might at this period be of great use to men besides yielding them food. Their flocks, no doubt, consisted of such creatures as were of the domestic kind, and such as by the divine law were pronounced clean and fit for being offered in sacrifice; therefore numbers would be kept for this very purpose. Their skins, besides serving men as garments, might answer many other valuable intentions. Vestments of hair and wool soon succeeded the ruder coverings of skins; consequently great profit would be derived from such animals as could be shorn, especially in countries where the inhabitants led a pastoral life and dwelt in tents. And we afterwards find that Abel's sacrifice was of this kind. They might use several of these animals, as they still do in some parts of the world, for bearing of burdens and drawing of carriages: for we may take it for granted that the first inventions for easing men of labour, would be of the simplest kind, and such as came easiest to hand. But keeping flocks of sheep, goats, and such like, would be of great utility, by affording quantities of milk, which is found to be the most nourishing diet both to the young and the old; and their carcases, though not used as food, might answer some useful purposes perhaps in manuring the soil.

21 Increase of mankind before the flood.

The Antediluvian world was, in all probability, stocked with a much greater number of inhabitants than the present earth either actually does, or perhaps is capable of containing or supplying. This seems naturally to follow from the great length of their lives, which exceeding the present standard of life in the proportion, at least, of ten to one, the Antediluvians must accordingly in any long space of time double themselves, at least in about the tenth part of the time in which mankind do now double themselves. It has been supposed that they began to beget children as early, and left off as late, in proportion, as men do now; and that the several children of the same father succeeded as quickly one after another as they usually do at this day: and as many generations, which are but successive with us, were contemporary before the flood, the number of people living on the earth at once would be by that means sufficiently increased to answer any defect which might arise from other circumstances not considered. So that, if we make a computation on these principles, we shall find, that there was a considerable number of people in the world at the death of Abel, though their father Adam was not then 130 years old; and that the number of mankind before the deluge would easily amount to above one hundred thousand millions (even according to the Samaritan chronology), that is, to twenty times as many as our present earth has, in all probability, now upon it, or can well be supposed capable of maintaining in its present constitution.

Antediluvians.

The following table, made upon the above-mentioned principles by Mr Whiston, shows at least what a number of people might have been in the Antediluvian world.

Number of mankind.	Year of the world.	Year of doubling.	Series.
4	2	2	1
8	6	4	2
16	12	6	3
32	20	8	4

But

Antediluvians.

But according to a later * writer upon the subject, the above table, though the numbers there may be thought sufficient for the peopling of the earth, we could by no means depend upon, for several reasons; particularly,

* *Cockburn upon the Deluge.*

22 Objection to Mr Whiston's table.

1. It is laid down there as a foundation, that the Antediluvians would double themselves every 40 years; as indeed they would, and in less time, after there came to be 100 marriages. Now, had the author observed this regular progression in his computation, by adding forty years to every former period of the age of the world, the amount, instead of two millions of millions, &c. would have been above five millions of millions at the year 1656, the age of the world at the deluge, according to the Hebrew numbers, which he contends for. What would the sum then have been, had we carried on the computation for 600 years more, according to the Septuagint?

2. He supposes the period of doubling must have been much shorter in the earliest ages, and much longer in the later, contrary to reason and fact. For mankind being sprung from one pair only, the increase at first must have been very slow, but come on very fast when a considerable number were married. His table therefore is made not regularly, but according to fancy, by unequal starts or chasms at great intervals in the latter part, where it should have been most regular; it would seem with no other view than to raise such a number, upon the whole, as might be thought sufficient to people the earth.

3. In that calculation the two material points, the time of nursing and the age of puberty, are quite overlooked, by which all compntations of the numbers in the Antediluvian world must be regulated. What unavoidable mistakes this omission must occasion, will be seen by examining the first ten numbers of the said table.

Years of the world and intervals of doubling.	Number of increase according to the intervals.	
1	2	Adam and Eve.
2	4	Cain and Abel.
6	8	
12	16	
20	32	
30	64	
42	128	
56	256	
72	512	
90	1024	
110	2048	

On this table it may be observed, 1. That though there were but two persons created at first, this computation makes four persons in the second year of the world. This could not possibly be, except Cain had been born within 12 months after the creation, which is highly improbable, and Abel in the second year, yet far more improbable; and in that case Eve could not have suckled Cain.

Cockburn, p. 108.

2. In the sixth year of the world we have eight persons, that is, six children of Eve's in six years. "But (our author adds) what shall Eve do with six infants in six years? Where could she find so many wet nurses for them? Or would the mother of all living deny her children that nourishment which the Creator had appointed for their first food, the milk in her breasts? Do they consider that there was but one woman in the world to do for herself, her husband, and her children, what belongs to women to do? We should surely have more respect and compassion for the mother of all mankind, than to lay such an intolerable burden upon her, whose sorrow for her own deception, and thereby ruining both herself and her husband, must have been very great for many years. In punishment of which, though God had said *he would greatly multiply her sorrow and conception*, the meaning was not, that she should have a child every year, which could not be, because the nature of that food and nourishment appointed by himself for her children would not permit it. Nor yet when he commanded them to *increase and multiply and replenish the earth*, could the command be obeyed in such a manner as was contrary to the order of nature and providence. But the method intended to answer the design of the command was to prolong their lives to above 800 and 900 years, and their prolific powers for 340 and 360 years of that term of life, that by slow and sure and long continuance of increase they might people the earth in due time."

Antediluvians.

3. The same exception lies to all the following periods of doubling, where the number far exceeds what it could possibly be in fact; but we shall pass them over, and come to the last of them in the year 110, in which the number of mankind is made 2048. Now in the year 110, not one of Adam's children was married, because not yet come to the age of puberty. In that year of the world there could be no more than 18 or 20 persons, at single births, besides Adam and Eve. It is a great mistake therefore to imagine, that the periods of doubling were much shorter in the earlier times than in the latter; the contrary of which is evident to reason.

According to our author, two errors have been fallen into in treating of this point; namely, 1. That in the first ages of the world, both before and after the Flood, men began to propagate their kind as early as they commonly do at present. 2. That the children of the same father succeeded one after another as fast as they do now, that is, that the women brought forth children every year. The first of these errors he confutes, by shewing that the several periods or stages of man's life bear a just proportion to one another, and to the whole term of life; and that the period of puberty or maturity has not been the same at all times, but is according to the length or brevity of life in the different ages of the world, according to that remark of St Augustine, *Tanto serior fuit proportione pubertas, quanto vitæ totius major annositas.* Moses, he observes, gives the age of the world from the creation to the deluge, and from that period to his own time, chiefly by generations. A generation is the interval of years between the births of father and son. This the Latins call *ætas*, and the Greeks γενεα. Now, a generation, or the interval of years between father and son, has not been, neither possibly could be, the same in all ages from the beginning, as Vossius justly observes; but has varied greatly according to the length or brevity of man's life in the several periods of the world. Since the ordinary term of man's life has been reduced to 70 and 80 years, the time of puberty is in proportion to this brevity of life, and reckoned at 20 or 21, which is the fourth part of a life of fourscore. The several

Id. p. 81.

23 Of the ag of puberty among th Antediluvians.

stages

Antediluvians.

stages of human life are infancy, childhood, youth, manhood, full age, declension, old or decrepit age; all which commonly bear a proportion to the whole term of life. Now the bounds and limits of these several stages cannot be precisely the same in all, but vary in respect of the disposition of men's bodies, their course of life, and also the places and ages in which they live. In the Antediluvian world then, when men lived to upwards of 800 and 900 years, can it be thought that they passed through the several stages of life in as short time as men do now, who seldom exceed 80, and not one in ten arrives at that age? But if the Antediluvians arrived at puberty or manhood as soon as men do now, then would the several stages of human life have been lost or confounded, and men would have started from childhood to manhood at once, without any due or regular intervals, contrary to the order of nature: But if, according to the present economy of nature, man is but a youth at 20, which is a fourth part of our term of life, we may reasonably conclude, there would be a suitable proportion of years in a much longer term of life, since nature is constant and uniform in her operations. And though in so long a life as the Antediluvians enjoyed, the time of puberty might be a fifth or sixth part of their term of life, yet would they be but youths at 150 or 160; which bears much the same proportion to the whole of their life as 20 is to that of ours.

The other is an error, he thinks, which could never have been fallen into, had it been considered that every mother suckled her own children in those early days: and indeed where could she have found another to have done it for her?

Taking it for granted, then, that it was an universal custom for women to suckle their children as well before as after the flood, the next question is, for how long time they continued nurses? He shows various instances, that when man's life was reduced to 130 or 140 years, the ordinary time of nursing was two years; he thence infers, that for three or four generations after the flood, when men lived to about 400 years, the time would be so much longer in proportion, and would not be less than three or four years; and consequently, that before the flood, when life was protracted to 800 or 900 years, it would be still longer, in proportion to their longevity; so that five years might be the ordinary time of nursing in the old world; and therefore that we cannot reckon less than six years between the births. For man's life being prolonged to so many hundred years at first for the more speedy peopling of the earth, he came by slow degrees to mature age, there being a long time required to rear up a body that was to last near 1000 years. The intervals, therefore, of infancy, childhood, youth, and mature age, were so much longer in proportion to ours as the difference is between our term of life and theirs: and 150 or 160 years, with respect to their longevity, was no more in proportion than 20 is to the brevity of our life. As the Antediluvians therefore were so very long in growing up to mature age, he concludes, that the time of nursing could not be shorter than five years, and that the distance between the births in a regular way must be set at six years.

24 Of the time allotted for nursing in those early days.

25 Distance between the births.

Upon the whole, he thinks it evident that there could be no such speedy increase of mankind at the beginning as is imagined; that the time of nursing above specified was no more than necessary for that strength of constitution which was to last for 800 and 900 years; and that women who were to continue bearing children for 340 or 360 years of their life, should have them but slowly and at the distance of several years, that their strength might hold out, and that they might not be overburdened with too many cares at once; and therefore when Eve's first child was six years old, it was time enough for her to have another, and so on, though possibly sometimes twins.

Antediluvians.

26 Cockburn's calculation of the increase of mankind.

These points being discussed, he proceeds, 1. To compute what number upon the whole might be born into the world from the creation to near the time of the deluge; and then, 2. To state the needful deductions for deaths and other deficiencies.

I. 1. How long the parents of mankind continued in paradise, we know not; though longer perhaps than is commonly imagined. We shall even suppose two or three years, in which time there was no child born, nor any attempt towards it. We shall allow them two or three years more to lament their fall, and the miserable estate their want of faith and disobedience had brought them to, from a most happy condition; and suppose Cain to be born six years after the creation (in which supposition few, probably, will be apt to think us too hasty), and Abel again six years after him, and so every sixth year Eve to have had a child, the first seven, eight, or nine whereof probably were all males (the males being longer in coming to maturity than the females); and this distance between the births will also be thought a sufficient allowance. At this rate of increase Adam would have in 100 years 16 children, in 200 years 32, and in 400 years 64 children; when we will suppose Eve to have left off child-bearing. Nor need the number of Adam's children be thought too great, when there are instances in those later ages, and this short period of man's life, of those who have had 40 children at single births by two successive wives, and of many others who have had 20, 25, and 30, by one wife; though in such cases it is not to be supposed that the women suckled their children.

2. Though it is reasonable to think that the Antediluvians, notwithstanding their longevity, came to mature age at 150; yet, as we are not sure that they all married so soon as they were ripe for marriage, and that the earliest in the genealogies is born in the 162d year of his father, who might probably be a first born, our author does not suppose Cain, Abel, or any of the succeeding children or grandchildren of Adam to have married till they were 160, but to have had children from 161 or 162 till they were of the age of 500, at the fore-named distance or interval between the births; though Noah we know had three sons after he was 500, at the due intervals. And to all the Antediluvians we may allow, without fear of exceeding, 50 or 54 children in general, according to the course of nature, and the longevity of those first ages of the world.

3. Let us next inquire in what number of years the men of that world might double themselves, notwithstanding the long intervals between the births. The increase indeed will be found very small for the first 300 or 400 years, as they were late in coming to maturity; but the succeeding ages will swell the account exceedingly.

Antediluvians.

exceedingly. Let us suppose at present (what shall be proved afterwards) that in the year of the world 500, there were 200 persons only, male and female, of full age to marry, the men at 160, the women at 120 or thereabout. The first or second year after the marriage will probably produce 100 births from 100 couple, and every sixth year after 100 more. At this slow progression the 200 married persons will, in 19 or 20 years, be increased to 600: so that the number of mankind would be trebled in 20 years, after there came 100 pair to be married. And in this manner they would increase and multiply every 20 years, or in that space treble themselves.

It may perhaps be objected, that though it appears that such an increase might be at first from the first 100 marriages, yet they could not continue thus to multiply at such periods; because, according to the rule we have laid down, none of the issue of these 100 first marriages could increase the number of mankind till the men had attained the age of 160. It is true they could not: but then it must be remembered, that the first 100 pair are still adding every sixth year 100 more to the number of mankind, even till after the 400 born in the first 20 years are married, and begin a new stock for increase; so that when there came to be some hundred couples married, the increase and multiplication would come on very fast, and in 1000 years mankind would be prodigiously increased.

But though there be nothing in this supposition contrary to reason, viz. That after the year of the world 500, they might treble themselves in 20 years; yet we will not reckon upon so short an interval, but will allow a much longer time even to their doubling themselves, and shall exhibit two tables of doubling; the first at the interval of 50 years (much too long indeed), the other at the interval of 40 years, and both beginning at the year 500, when there could not be fewer (whatever more there might be) than 100 married or marriageable persons descended from Adam and Eve.

Years of the World.	Number of Mankind.
500	200

2050	429,496,729,600

Antediluvians.

This table is calculated at the long interval of 50 years, that it may appear that even by under-rating the number of mankind, there would be so many millions born into the world before the deluge came, that they would be obliged to spread themselves over the face of the earth, though but one half of the sum total of 429,496 millions had been alive at the time of the deluge; but as the interval here allowed may appear to be too long for the time of doubling, the second is calculated at the interval of 40 years, which comes nearer to the truth of the case, though even this may exceed the time of doubling.

Years of the World.	Number of Mankind.
500	200
540	400

2020	54,975,581,388,800

The first table is brought down no lower than to the year 2050, and the second to the year 2020, though

Antediluvians. though there remain by the first 206, and by the second 236 years to the flood: the reason is, that in those last 200 years of the world, mankind would not increase in any measure equal to what they had done in the preceding years (though regularly the increase should have been much greater); because that violence was then great in the earth, and thousands, yea millions, might have been cut off by untimely deaths; for which cause the world's destruction was determined 120 years before the flood came.

27 Objection answered. II. But now against this immense number of mankind that might in a regular and ordinary way have been born into the world between the creation and the deluge in 2056 years, it will no doubt be objected by some (as it has been done to far less numbers), that all such calculations are mere guess work, the product of fruitful imaginations.

But it should be considered, that in calculations of this nature some regular order or method must be observed: and though, according to the course of nature such an increase and multiplication of mankind there might have been periodically, especially at the beginning, when the command was *to increase and multiply and replenish the earth;* yet we will not suppose that all things went on thus regularly, without difference or interruption. We do not know what extraordinary obstructions or interruptions there might be to such a regular increase. Though every married pair might by the course of nature have had such a number of children as has been mentioned, yet the Divine Providence might order it otherwise in manifold instances, and it might possibly be in the old world, as it has been since the flood, viz. that some marriages have produced many children, others few, and some none at all. Allowing, therefore, for all such obstructions and deficiencies, and likewise for all casualties and accidents (to which men might be liable in that world as well as in the present), in as ample a manner as can be desired, let the former number be reduced to one half, viz. to 27,487,790,694,400, that is, 27 billions, or millions of millions, four hundred and eighty-seven thousand seven hundred and ninety millions, six hundred and ninety-four thousand and four hundred. And this we shall now suppose to be the whole number of those who were born into the world before the deluge. But from this sum is to be subtracted the number of those who died before that time.

Of those in the genealogies from Adam by Seth, Enoch was translated at the age of 365, Lamech the father of Noah died just before the flood at 753, Mahalaleel at 895. Adam and the other five patriarchs lived to about 900. Before the year 900, therefore, we may suppose there were no deaths except that of Abel, who was slain, a young man, but that all born within that period were alive altogether. But in the tenth century death began to reign, and Adam and Eve, we may presume, were the first over whom death had power in a natural way, as their disobedience was the cause of it. The children also born of them in the first hundred years would also die in this 10th century, those born in the second hundred would die in the 11th, those born in the third century would die in the 12th, and so on. But though we are far from thinking that after the beginning of the 10th century (till which time few or none died), the deaths would be equal to the births; yet as we have made large concessions all along, we shall do the same in this case, and suppose them upon the whole to have been equal, especially since we cannot precisely say how long that violence or bloodshed, which was their crying sin, came to prevail; and therefore will reduce the last sum mentioned to one half again, to allow for the deaths and prevailing violence, and suppose the total number of mankind alive upon earth at the time of the deluge to have been no more than 13,743,895,347,200, that is, 13 billions or millions of millions, seven hundred and forty-three thousand eight hundred and ninety-five millions, three hundred and forty-seven thousand and two hundred; a number vastly exceeding that of the present inhabitants of the whole earth. Antedi'uvians.

28 Probability of the above calculation. Notwithstanding the very large allowances and abatements made to reduce the number of mankind, yet even the last reduction to 13 billions or millions of millions, &c. seems so vastly great, that it will hardly be thought possible that such a number of men could ever be at one time upon the earth. Now, though we pretend to no certainty in this point (which made it the more requisite to allow largely for deaths and deficiencies), yet the calculation we have given must appear highly probable, since it is founded upon grounds certain and undeniable: for instance,

1. It cannot be denied but that the Antediluvians were come to the age of puberty and marriage at 160 years, when we find a son born in 162. Nor,

2. Can it be said, that they could not have children at the age of 500, when we have an instance of one that had three sons at due distances after that age. Neither,

3. Can it be alleged that we have not allowed a due distance or interval between the births, viz. six years, when most will be of opinion that it could not be so long. Nor yet,

4. Can it be judged that we have made the period of doubling far too short, when we had before showed that after 100 marriages consummated, they would treble themselves in half the time we have taken for their doubling. Nor,

5. Will any one make a doubt, but that there might be 200 persons of mature age for marriage in the year of the world 500, the men at 160, the women younger. Nevertheles, as this is the foundation of our calculation, we shall now show that there was at least such a number of persons marriageable at that age of the world.

It may be observed, that as we take 160 for the years of maturity and marriage, according to that period all married or marriageable in the year 500 must have been born in or before the year 340; the males at least, though the females, coming sooner to maturity, might some of them be born later or after the year 380. Now, according to this stated period of marriage,

1. In or before the year 340, Adam might have had 54 children, males and females, or 27 pair married or fit for marriage.

2. Cain, whom we suppose to be but six years younger than Adam (which by the by is more than others allow), and to have married in the year 166, might have in the year 340, 28 children, or 14 pair fit for marriage, which added to the former, makes 41 pair.

Antediluvians || Antenati.

3. Abel, married six years later, that is, in the year 172, and whom we shall suppose slain in the year 225 or 226, could in that case have no more than eight or nine children, or four pair, which with the former make 45 pair.

4. Adam's third son, married in the year 178, will afford us in the year 340, 26 children, or 13 pair, which increase the number of marrigeable persons to 58 pair.

5. A fourth son of Adam's, married in the year 184, will give us in the year 340, 25 children, or 12 pair; which makes the number of pairs 70.

6. A fifth son of Adam's, married in the year 190, might in the year 340 have 24 children, or 12 pair again, which increase the former number to 82 pair.

7. A sixth son of Adam's, married in the year 196, would have in the year 340, 22 children, or 11 pair; which added to the former make up 93 pair.

8. A seventh son of Adam's, married in the year 202, will, in the year 340, give us 20 children, or 10 pair: which makes in the whole 103 pair, already three pair more than we reckoned upon. I need therefore go no farther or to the eighth or ninth son; but the following eight or nine births I may reasonably take to have been daughters, and married to the brothers that preceded them.

Here are now no more than 14 children of Adam's married, who have given us the 100 pair we have reckoned upon, and three over. We might yet have 13 pair to bring into the account, all born before the year 340, and marriageable in the year 500, which would very much increase the number of mankind. And by this the reader may perceive that we have been far from building on uncertain or precarious foundations, since we have omitted 13 pair more, which we might have taken into the account. And if it be considered that the command given to Adam was to increase and multiply and replenish the earth, no doubt can be made, but that his own and his children's marriages were fruitful in the procreation of children, that the earth might be inhabited.

ANTEGO. See ANTIGUA.

ANTEJURAMENTUM, by our ancestors called *juramentum calumniæ*, an oath which anciently both accuser and accused were to take before any trial or purgation.—The accuser was to swear that he would prosecute the criminal; and the accused to make oath, on the day he was to undergo the ordeal, that he was innocent of the crime charged against him.

ANTELOPE, in *Zoology*. See CAPRA.

ANTELUCAN, in ecclesiastical writers, is applied to things done in the night or before day. We find frequent mention of the antelucan assemblies (*Cœtus antelucani*) of the ancient Christians, in times of persecution, for religious worship.

ANTEMURALE, in the ancient military art, denotes much the same with what the moderns call an *out-work*.

ANTENATI, in modern English history, is chiefly understood of the subjects of Scotland, born before King James the First's accession to the English crown, and alive after it. In relation to these, those who were born after the accession were denominated *Postnati*. The antenati were considered as aliens in England, whereas the postnati claimed the privilege of natural subjects.

Antenati || Antestature.

ANTENCLEMA, in *Oratory*, is where the whole defence of the person accused turns on criminating the accuser. Such is the defence of Orestes, or the oration for Milo: *Occisus est, sed latro. Exsectus, sed raptor.*

ANTENICENE, in ecclesiastical writers, denotes a thing or person prior to the first council of Nice. We say the Antenicene faith, Antenicene creeds, Antenicene fathers.

ANTENNÆ, in the history of insects, slender bodies with which nature has furnished the heads of these creatures, being the same with what in English are called *horns* or *feelers*. See ENTOMOLOGY *Index*.

ANTENOR, a Trojan prince, came into Italy, expelled the Enganians on the river Po, and built the city of Padua, where his tomb is said to be still extant.

ANTEPAGMENTA, in the *Ancient Architecture*, the jambs of a door. They are also ornaments, or garnishings, in carved work, of men, animals, &c. made either of wood or stone, and set on the architrave.

ANTEPENULTIMA, in *Grammar*, the third syllable of a word from the end, or the last syllable but two.

ANTEPILANI, in the Roman armies, a name given to the hastati and principes, because they marched next before the triarii, who were called *pilani*.

ANTEPILEPTICS, among physicians, medicines esteemed good in the epilepsy.

ANTEPOSITION, a grammatical figure, whereby a word, which by the ordinary rules of syntax ought to follow another, comes before it. As when, in the Latin, the adjective is put before the substantive, the verb before the nominative case, &c.

ANTEPREDICAMENTS, among logicians, certain preliminary questions which illustrate the doctrine of predicaments and categories.

ANTEQUIERA, a handsome town of Spain, in the kingdom of Granada, divided into two parts, the upper and lower. The upper is seated on a hill, and has a castle: the lower stands in a fertile plain, and is watered with a great number of brooks. There is a large quantity of salt in the mountain; and five miles from the town, a spring famous for the cure of the gravel. W. Long. 4. 40. N. Lat. 36. 51.

ANTERIOR, denotes something placed before another, either with respect to time or place.

ANTEROS, in *Mythology*, one of the two Cupids who were the chief of the number. They are placed at the foot of the Venus of Medicis; this is represented with a heavy and sullen look, agreeably to the poetical description of him, as the cause of love's ceasing. The other was called Eros.

ANTESIGNANI, in the Roman armies, soldiers placed before the standards, in order to defend them, according to Lipsius; but Cæsar and Livy mention the antesignani as the first line, or first body, of heavy-armed troops. The velites, who used to skirmish before the army, were likewise called *antesignani*.

ANTESTATURE, in *Fortification*, a small retrenchment

Antestature || Anthesteria.

trenchment made of palisadoes, or sacks of earth, with a view to dispute with an enemy the remainder of a piece of ground.

ANTESTARI, in Roman antiquity, signifies to bear witness against any one who refused to make his appearance in the Roman courts of judicature, on the day appointed, and according to the tenor of his bail. The plaintiff, finding the defendant after such a breach of his engagement, was allowed to carry him into court by force, having first asked any of the persons present to bear witness. The person asked to bear witness in this case, expressed his consent by turning his right ear, which was instantly taken hold of by the plaintiff, and this was to answer the end of a subpœna. The ear was touched upon this occasion, says Pliny, as being the seat of memory, and therefore the ceremony was a sort of caution to the party to remember his engagement.

ANTHELION. See CORONA and PARHELION.

ANTHELIX, in *Anatomy*, the inward protuberance of the external ear, being a semicircle within, and almost parallel to the helix. See ANATOMY.

ANTHELMINTICS, among physicians, medicines proper to destroy worms.

ANTHEM, a church song performed in cathedral service by choristers, who sung alternately. It was used to denote both psalms and hymns, when performed in this manner. But, at present, anthem is used in a more confined sense, being applied to certain passages taken out of the Scriptures, and adapted to a particular solemnity. Anthems were first introduced in the reformed service of the English church, in the beginning of the reign of Queen Elizabeth.

ANTHEMIS, CHAMOMILE. See BOTANY *Index*.

ANTHERA, in *Botany*, that part of the stamen which is fixed on the top of the filamentum, within the corolla: it contains the pollen or fine dust, which, when mature, it emits for the impregnation of the plant, according to Linnæus. The APEX of Ray, Tournef. and Rivin.; *Capsula staminis*, of Malpighi.

ANTHERICUM, SPIDER-WORT. See BOTANY *Index*.

ANTHESPHORIA, in antiquity, a Sicilian festival instituted in honour of Proserpine. The word is derived from the Greek ανθος, *flower*, and φερω, *I carry*; because that goddess was forced away by Pluto when she was gathering flowers in the fields. Yet Festus does not ascribe the feast to Proserpine; but says it was thus called by reason ears of corn were carried on this day to the temples.—Anthesphoria seems to be the same thing with the *florisertum* of the Latins, and answers to the harvest-home among us.

ANTHESTERIA, in antiquity, was a feast celebrated by the Athenians in honour of Bacchus. The most natural derivation of the word is from the Greek ανθος (*flos*), a flower, it being the custom at this feast to offer garlands of flowers to Bacchus.

The anthesteria lasted three days, the 11th, 12th, and 13th of the month; each of which had a name suited to the proper office of the day. The first day of the feast was called πιθοιγια, i. e. *opening of the vessels*, because on this day they tapped the vessels, and tasted the wine. The second day they called χοες, *congii*, the name of a measure containing the weight of 10 pounds; on this they drank the wine prepared the day before. The third day they called χυτροι, *kettles*: on this day they boiled all sorts of pulse in kettles; which however they were not allowed to taste, as being offered to Mercury. Anthesteria || Anthony.

ANTHESTERION, in ancient chronology, the sixth month of the Athenian year. It contained 29 days; and answered to the latter part of our November and beginning of December. The Macedonians called it *dæsion* or *desion*. It had its name from the festival anthesteria kept in it.

ANTHISTIRIA. See BOTANY *Index*.

ANTHOCEROS, or HORN-FLOWER. See BOTANY *Index*.

ANTHOLOGION, the title of the service book used in the Greek church. It is divided into 12 months, containing the offices sung throughout the year, on the festivals of our Saviour, the Virgin, and other remarkable saints.

ANTHOLOGY, a discourse of flowers, or of beautiful passages from any authors.—It is also the name given to a collection of epigrams taken from several Greek poets.

ANTHOLYZA, MAD-FLOWER. See BOTANY *Index*.

ANTHONY, SAINT, was born in Egypt in 251, and inherited a large fortune, which he distributed among his neighbours and the poor, retired into solitude, founded a religious order, built many monasteries, and died anno 356. Many ridiculous stories are told of his conflicts with the devil, and of his miracles. There are seven epistles extant attributed to him.

St Anthony is sometimes represented with a fire by his side, signifying that he relieves persons from the inflammation called after his name; but always accompanied by a hog, on account of his having been a swineherd, and curing all disorders in that animal. To do him the greater honour, the Romanists in several places keep at common charges a hog denominated *St Anthony's hog*, for which they have great veneration. Some will have St Anthony's picture on the walls of their houses, hoping by that to be preserved from the plague; and the Italians, who do not know the true signification of the fire painted at the side of their saint, concluding that he preserves houses from being burnt, invoke him on such occasions. Both painters and poets have made very free with this saint and his followers: the former by the many ludicrous pictures of his temptation; and the latter, by divers epigrams on his disciples or friars: one of which is the following, printed in Stephen's World of Wonders:

Once fedd'st thou, Anthony, an herd of swine,
And now an herd of monks thou feedest still.
For wit and gut alike both charges bin;
Both loven filth alike; both like to fill
Their greedy paunch alike: nor was that kind
More beastly, sottish, swinish, than this last.
All else agrees: one fault I only find,
Thou feedest not thy monks with oaken mast.

ANTHONY, or *Knights of St ANTHONY*, a military order, instituted by Albert duke of Bavaria, Holland, and Zealand, when he designed to make war against the Turks in 1382. The knights wore a collar of gold

Anthony ‖ Anthropolatria.

gold made in form of a hermit's girdle, from which hung a stick cut like a crutch, with a little bell, as they are represented in St Anthony's pictures.

St ANTHONY also gives the denomination to an order of religious founded in France about the year 1095, to take care of those afflicted with St Anthony's fire; (see the next article).—It is said, that, in some places, these monks assume to themselves a power of giving, as well as removing, the *ignis sacer*, or erysipelas; a power which stands them in great stead for keeping the poor people in subjection, and extorting alms. To avoid the menaces of these monks, the country people present them every year with a fat hog a piece. Some prelates endeavoured to persuade Pope Paul III. to abolish the order; *quæstuarios istos sancti Anthonii, qui decipiunt rusticos et simplices, eosque innumeris superstitionibus implicent, de medio tollendos esse.* But they subsist, notwithstanding, to this day, in several places.

St ANTHONY'S *Fire*, a name properly given to the erysipelas. Apparently it took this denomination, as those afflicted with it made their peculiar application to St Anthony of Padua for a cure. It is known, that anciently particular diseases had their peculiar saints: thus, in the ophthalmia, persons had recourse to St Lucia; in the toothach, to St Apollonia; in the hydrophobia, to St Hubert, &c.

ANTHORA, the trivial name of a species of aconitum. See ACONITUM, BOTANY *Index*.

ANTHORISMUS, in *Rhetoric*, denotes a contrary description or definition of a thing from that given by the adverse party.—Thus, if the plaintiff urge, that to take any thing away from another without his knowledge or consent, is a theft; this is called ὅρος, or definition. If the defendant reply, that to take a thing away from another without his knowledge or consent, provided it be done with design to return it to him again, is not theft; this is an Ανθορισμος.

ANTHOSPERMUM, the AMBER TREE. See BOTANY *Index*.

ANTHOXANTHUM, or VERNAL GRASS. See BOTANY *Index*.

ANTHRACIS, ANTHRACIAS, or ANTHRACITIS, names promiscuously used by ancient naturalists for very different fossils, viz. the carbuncle, hæmatites, and a kind of asteria. See CARBUNCLE, &c.

ANTHRACOCIS, in *Medicine*, a corrosive scaly ulcer either in the bulb of the eye or the eyelids.

ANTHRAX, a Greek term, literally signifying a burning coal, used by the ancients to denote a gem, as well as a disease, more generally known by the name of *carbuncle*.

ANTHRAX is sometimes also used for lithanthrax or pit coal.

ANTHROPOGLOTTUS, among zoologists, an appellation given to such animals as have tongues resembling that of mankind, particularly to the parrot kind.

ANTHROPOGRAPHY, denotes the description of the human body, its parts, structure, &c. See ANATOMY.

ANTHROPOLATRÆ, in church history, an appellation given to the Nestorians, on account of their worshipping Christ, notwithstanding that they believed him to be a mere man.

ANTHROPOLATRIA, the paying divine honours to a man; supposed to be the most ancient kind of idolatry. Anthropolatria, Anthropolites.

ANTHROPOLITES, a term denoting petrifactions of the human body, as those of quadrupeds are called *zoolites*.

It has been doubted whether any real human petrifactions ever occur, and whether those which have been supposed such were not mere *lusus naturæ*. But the generality of naturalists best versed in this branch assure us of real anthropolites being sometimes found. And indeed, as it is universally admitted that the zoolites are frequently seen, what negative argument therefore can be brought against the existence of the others? Are not the component parts of the human body nearly similar to those of the brute creation? Consequently, correspondent matter may be subject to, and acquire, the like accidental changes, wherever the same power or causes concur to act upon either object. If the former are not so common, it may be accounted for, in some measure, by reflecting that human bodies are generally deposited in select and appropriate places; whereas the bones of animals are deposited everywhere, and falling into various beds of earth, at a greater or less depth, there is more probability of their encountering the petrifying agent. Could we credit some authors who have treated on this subject, they will tell us of entire bodies and skeletons that were found petrified. One in particular, discovered at Aix in Provence, anno 1583, in a rocky cliff, the cerebrum whereof, when struck against a piece of steel, produced sparks, the bones being at the same time friable. The reports of Happel and Kircher are too absurd for belief. Van Helmont's strange relations, together with those of Jean à Costa, must also be rejected as fabulous. Scheuhzer has published an engraved figure, which he calls the *Antediluvian man:* how far it is authentic, it would be rash to say. It is, however, asserted by many respectable writers on natural history, that whole skeletons petrified have been brought to light from certain old mines, which remained closed up and disused for several centuries. These indeed are acknowledged to be very rare. Yet it is a known fact, that detached parts (*osteolithi*) are sometimes found, especially in situations where either the water, the soil, or both, have been observed to possess a strong petrescent quality. The human vertebræ, fragments or portions of the tibia, and even the whole cranium itself, have been seen in an absolute state of petrifaction. Some of these are said to appear vitriolated or mineralized. As to the petrified bones of pretended giants, they are more probably real zoolites, the bones of the larger animals. All these bones are found in various states, and under different appearances. Some are only indurated; others calcined, vitriolated, or mineralized; some, again, are simply incrusted; whilst others have been proved completely petrified. Notwithstanding what is here advanced, it may be granted that a positive *lusus naturæ*, in some hands, is repeatedly mistaken for a real petrifaction. They are, however, distinguishable at all times by an experienced naturalist; particularly by the two following rules: First, We may determine that fossil a *lusus naturæ*, which, on a strict examination, is observed to deviate in any material degree from the true *res analogica existens*. Secondly, By the same parity of reasoning, these fossil

shells

Anthropolites || Anthropophagi.

shells are to be esteemed certain petrifications, and genuine Antediluvian *reliquiæ*, in which, on a comparison with their *analogues*, collected from the sea, there appears an exact conformity in size and figure. This comparative observation will hold good for all fossils; that is, such as present themselves either under the animal or vegetable form. It is nevertheless worthy of notice, that all testaceous fossils are not petrified; since some kinds of them have been found in beds of sand, which retained their original perfect shape and quality, but at the same time they proved very brittle, indeed scarcely bearing the most gentle touch. Shells of this description are always dissoluble by acids, in contradistinction to the petrified or calcareous fossil shells, whose property it is to resist the action of such like *menstrua*. See further the article PETRIFACTION.

ANTHROPOLOGY, a discourse upon human nature.

ANTHROPOLOGY, among divines, denotes that manner of expression, by which the inspired writers attribute human parts and passions to God.

ANTHROPOMANCY, a species of divination, performed by inspecting the entrails of a human creature.

ANTHROPOMORPHA, a term formerly given to the primates of that class of animals which have the greatest resemblance to the human kind.

ANTHROPOMORPHISM, among ecclesiastical writers, denotes the heresy or error of the Anthropomorphites. See the next article.

ANTHROPOMORPHITES, in *Church History*, a sect of ancient heretics, who, taking every thing spoken of God in Scripture in a literal sense, particularly that passage of Genesis in which it is said, *God made man after his own image*, maintained that God had a human shape. They are likewise called *Audeans*, from Audeus their leader.

ANTHROPOMORPHOUS, something that bears the figure or resemblance of a man. Naturalists give instances of anthropomorphous plants, anthropomorphous minerals, &c. These generally come under the class of what they call *lusus naturæ*, or monsters.

ANTHROPOPATHY, a figure or expression by which some passion is ascribed to God, which properly belongs only to man.

ANTHROPOPHAGI, (of ανθρωπος, a *man*, and φαγω, to *eat*, MEN-EATERS). That there have been, in almost all ages of the world, nations who have followed this barbarous practice, we have abundance of testimonies.

The Cyclops, the Lestrygons, and Scylla, are all represented in Homer, as *Anthropophagi*, or man-eaters; and the female phantoms, Circe, and the Sirens, first bewitched with a show of pleasure, and then destroyed. This, like the other parts of Homer's poetry, had a foundation in the manners of the times preceding his own. It was still, in many places, the age spoken of by Orpheus.

When men devour'd each other like the beasts,
Gorging on human flesh.——

According to Herodotus, among the Essedonian Scythians, when a man's father died, the neighbours brought several beasts, which they killed, mixed up their flesh with that of the deceased, and made a feast. Among the Massagetæ when any person grew old, they killed him and ate his flesh; but if he died of sickness, they buried him, esteeming him unhappy. The same author also assures us, that several nations in the Indies killed all their old people and their sick, to feed on their flesh: he adds, that persons in health were sometimes accused of being sick, to afford a pretence for devouring them. According to Sextus Empiricus, the first laws that were made, were for the preventing of this barbarous practice, which the Greek writers represent as universal before the time of Orpheus. Anthropophagi.

Of the practice of anthropophagy in later times, we have the testimonies of all the Romish missionaries who have visited the internal parts of Africa, and even some parts of Asia. Herrera speaks of great markets in China, furnished wholly with human flesh, for the better sort of people. Marcus Paulus speaks of the like in his time, in the kingdom of Concha towards Quinsay, and the island of Zapengit; others, of the great Java; Barbosa, of the kingdom of Siam and island of Sumatra; others, of the islands in the gulf of Bengal, of the country of the Samogitians, &c.

The philosophers Diogenes, Chrysippus, and Zeno, followed by the whole sect of Stoics, affirmed, that there was nothing unnatural in the eating of human flesh; and that it was very reasonable to use dead bodies for food, rather than to give them a prey to worms and putrefaction. In order to make the trial, however, whether there was any real repugnancy in nature to the feeding of an animal with the flesh of its own species, Leonardus Floroventius fed a hog with hog's flesh, and a dog with dog's flesh; upon which he found the bristles of the hog to fall off, and the dog to become full of ulcers.

When America was discovered, this practice was found to be almost universal, insomuch that several authors have supposed it to be occasioned through a want of other food, or through the indolence of the people to seek for it; though others ascribe its origin to a spirit of revenge.

It appears pretty certain from Dr Hawkesworth's account of the Voyages to the South seas, that the inhabitants of the island of New Zealand, a country unfurnished with the necessaries of life, eat the bodies of their enemies. It appears also to be very probable, that both the wars and anthropophagy of these savages, take their rise and owe their continuance to irresistible necessity, and the dreadful alternative of destroying each other by violence, or of perishing by hunger. See vol. iii. p. 447. et seq. and vol. ii. p. 389, &c.

Mr Marsden also informs us, that this horrible custom is practised by the Battas, a people in the island of Sumatra. "They do not eat human flesh (says he) as a means of satisfying the cravings of nature, owing to a deficiency of other food; nor is it sought after as a gluttonous delicacy, as it would seem among the New Zealanders. The Battas eat it as a species of ceremony; as a mode of showing their detestation of crimes, by an ignominious punishment; and as a horrid indication of revenge and insult to their unfortunate enemies. The objects of this barbarous repast are the prisoners taken in war, and offenders convicted and condemned for capital crimes. Persons of the former

Anthropophagi, Anthropophagia.

former description may be ransomed or exchanged, for which they often wait a considerable time; and the latter suffer only when their friends cannot redeem them by the customary fine of twenty beenchangs, or eighty dollars. These are tried by the people of the tribe where the fact was committed, but cannot be executed till their own particular raja or chief has been acquainted with the sentence; who, when he acknowledges the justice of the intended punishment, sends a cloth to cover the delinquent's head, together with a large dish of salt and lemons. The unhappy object, whether prisoner of war or malefactor, is then tied to a stake: the people assembled throw their lances at him from a certain distance; and when mortally wounded, they run up to him, as if in a transport of passion; cut pieces from the body with their knives; dip them in the dish of salt and lemon juice; slightly broil them over a fire prepared for the purpose; and swallow the morsels with a degree of savage enthusiasm. Sometimes (I presume according to the degree of their animosity and resentment) the whole is devoured; and instances have been known, where, with barbarity still aggravated, they tear the flesh from the carcass with their mouths. To such a depth of depravity may man be plunged, when neither religion nor philosophy enlighten his steps! All that can be said in extenuation of the horror of this diabolical ceremony is, that no view appears to be entertained of torturing the sufferers; of increasing or lengthening out the pangs of death: the whole fury is directed against the corpse, warm indeed with the remains of life, but past the sensation of pain. I have found a difference of opinion in regard to their eating the bodies of their enemies slain in battle. Some persons long resident there, and acquainted with their proceedings, assert that it is not customary; but as one or two particular instances have been given by other people, it is just to conclude, that it sometimes takes place, though not generally. It was supposed to be with this intent, that Raja Neabin maintained a long conflict for the body of Mr Nairne, a most respectable gentleman and valuable servant of the India Company, who fell in an attack upon the campong of that chief, in the year 1775."

It may be said, that whether the dead body of an enemy be eaten or buried, is a matter perfectly indifferent. But whatever the practice of eating human flesh may be in itself, it certainly is relatively, and in its consequences, most pernicious. It manifestly tends to eradicate a principle, which is the chief security of human life, and more frequently restrains the hand of the murderer, than the sense of duty or the dread of punishment. Even if this horrid practice originates from hunger, still it must be perpetuated from revenge. Death must lose much of its horror among those who are accustomed to eat the dead; and where there is little horror at the sight of death, there must be less repugnance to murder. See some further observations on this subject, equally just and ingenious, by Dr Hawkesworth, *ut supra*.

ANTHROPOPHAGIA, the act or habit of eating human flesh. This is pretended by some to be the effect of a disease, which leads people affected with it to eat every thing alike. Some choose only to consider it as a species of PICA. The annals of Milan furnish an extraordinary instance of anthropophagy. A Milanese woman named Elizabeth, from a depraved appetite, like what women with child, and those whose menses are obstructed, frequently experience, had an invincible inclination to human flesh, of which she made provision by enticing children into her house, where she killed and salted them: a discovery of which having been made, she was broken on the wheel and burnt in 1519.

Anthropophagia || Antichris

ANTHROPOSCOPIA, from ανθρωπος, and σκοπεω, *I consider*, the art of judging or discovering a man's character, disposition, passions, and inclinations, from the lineaments of his body. In which sense, anthroposcopia seems of somewhat greater extent than physiognomy or metoposcopy. Otto has published an Anthroposcopia, *sive judicium hominis de homine ex lineamentis externis*.

ANTHROPOTHYSIA, the inhuman practice of offering human sacrifices. See SACRIFICE.

ANTHUS, in *Ornithology*, a synonyme of a species of loxia. See LOXIA, ORNITHOLOGY *Index*.

ANTHYLLIS, KIDNEY-VETCH. See BOTANY *Index*.

ANTHYPOPHORA, in *Rhetoric*, a figure of speech; being the counterpart of an hypophora. See HYPOPHORA.

ANTI, a Greek preposition, which enters into the composition of several words, both Latin, French, and English, in different senses. Sometimes it signifies *before*, as an antichamber; and sometimes *opposite* or *contrary*, as in the names of these medicines, anti-scorbutic, anti-venereal.

ANTI, in matters of literature, is a title given to divers pieces written by way of answer to others, whose names are usually annexed to the anti. See the *Anti* of M. Baillet; and the *Anti-Baillet* of M. Menage: there are also *Anti-Menagiani*, &c. Cæsar the dictator wrote two books by way of answer to what had been objected to him by Cato, which he called *Anti-Catones;* these are mentioned by Juvenal, Cicero, &c. Vives assures us, he had seen Cæsar's *Anti-Catones* in an ancient library.

ANTIBACCHIUS, in ancient poetry, a foot consisting of three syllables, the two first long, and the last one short; such is the word āmbīrĕ.

ANTIBES, a sea port town of France, in the department of Var, with a strong castle. Its territory produces excellent fruit; and the town stands opposite to Nice, in the Mediterranean. E. Long. 7. 9. N. Lat. 43. 42.

ANTICHAMBER, an outer chamber for strangers to wait in, till the person to be spoken with is at leisure.

ANTICHORUS, in *Botany*. See BOTANY *Index*.

ANTICHRIST, among ecclesiastical writers, denotes a great adversary of Christianity, who is to appear upon the earth towards the end of the world.

We have demonstrations, disputations, and proofs, in great order and number, both that the pope is, and that he is not, Antichrist.

F. Calmet is very large in describing the father and mother of Antichrist, his tribe and pedigree, his wars and conquests, his achievements against Gog, Magog, &c.

Some place his capital at Constantinople, others at Jerusalem, others at Moscow, and some few at London; but the generality at Rome, though these last are divided

Antichrist. vided. Grotius and some others suppose Rome Pagan to have been the seat of Antichrist: most of the Lutheran and reformed doctors contend earnestly for Rome Christian under the papal hierarchy. In fact, the point having been maturely debated at the council of Gap, held in 1603, a resolution was taken thereupon, to insert an article in the Confession of Faith, whereby the pope is formally declared to be Antichrist.—Pope Clement VIII. was stung to the quick with this decision; and even King Henry IV. of France was not a little mortified, to be thus declared, as he said, an imp of Antichrist.

M. le Clerc holds, that the rebel Jews and their leader Simon, whose history is given by Josephus, are to be reputed as the true Antichrist. Lightfoot and Vanderhart rather apply this character to the Jewish Sanhedrim. Hippolitus and others held that the devil himself was the true Antichrist; that he was to be incarnate, and make his appearance in human shape before the consummation of all things. Others among the ancients held that Antichrist was to be born of a virgin by some prolific power imparted to her by the devil. A modern writer * of the female sex, whom many hold for a saint, has improved on this sentiment; maintaining that Antichrist is to be begotten by the devil on the body of a witch by means of the semen of a man caught in the commission of a certain crime, and conveyed, &c.

* Bayle's Dictionary, voce *Bourignon.*

Hunnius and some others, to secure Antichrist to the pope (notwithstanding that this latter seemed excluded by not being of the tribe of Dan), have broke in upon the unity of Antichrist, and assert that there is to be both an eastern and a western Antichrist.

Father Malvenda, a Jesuit, hath published a large work entitled *Antichristo*, in which this subject is amply discussed. It consists of thirteen books. In the first he relates all the opinions of the fathers with regard to Antichrist. In the second, he speaks of the times when he shall appear; and shows, that all the fathers who supposed Antichrist to be near at hand, judged the world was near its period. In the third, he discourses of his origin and nation; and shows that he is to be a Jew of the tribe of Dan: this he founds on the authority of the fathers; on the passage in Genesis xlix. 17. *Dan shall be a serpent by the way*, &c.; on that of Jeremiah viii. 16. where it is said, *The armies of Dan shall devour the earth*; and on Rev. vii. where St John, enumerating all the tribes of Israel, makes no mention of that of Dan. In the fourth and fifth books he treats of the signs of Antichrist. In the sixth, of his reign and wars. In the seventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his persecutions: and in the rest, of the coming of Enoch and Elias, the conversion of the Jews, the reign of Jesus Christ, and the death of Antichrist, after he has reigned three years and a half. See also *Lowman on the Revelation.*

How endless are conjectures! Some of the Jews, we are told, actually took Cromwell for the Christ; while some others have laboured to prove him Antichrist himself. Pfaffius assures us he saw a folio book in the Bodleian library, written on purpose to demonstrate this latter position.

Upon the whole, the Antichrist mentioned by the apostle John, 1 Ep. ii. 18. and more particularly described in the book of Revelation, seems evidently to be the same with the *Man of Sin*, &c. characterized by St Paul in his Second Epistle to the Thessalonians, ch. ii. And the entire description literally applies to the excesses of papal power. Had the right of private judgment, says an excellent writer, been always adopted and maintained, Antichrist could never have been; and when that sacred right comes to be universally asserted, and men follow the voice of their own reason and consciences, Antichrist can be no more. Antichrist ‖ Antieyra.

ANTICHRISTIANISM, a state or quality in persons or principles, which denominates them antichristian, or opposite to the kingdom of Christ.

M. Jurieu takes the idea of the unity of the church to have been the source of *Antichristianism*. Had not mankind been infatuated with this, they would never have stood in such awe of the anathemas of Rome. It is on this the popes erected their monarchical power.

ANTICHRISTIANS, properly denote the followers or worshippers of Antichrist.

ANTICHRISTIANS are more particularly understood of those who set up or believe a false Christ or Messiah.

ANTICHTHONES, in *Ancient Geography*, an appellation given to the inhabitants of opposite hemispheres.

ANTICOR, or ANTICOEUR, among *Farriers*, an inflammation in a horse's throat, being the same with the quinsy in mankind. See FARRIERY.

ANTICOSTE, a barren island lying in the mouth of the river St Lawrence, in North America. W. Long. 64. 16. N. Lat. 49. 40.

ANTICYRA, in *Ancient Geography*, a town in Phocis, on the Corinthian bay, opposite to Cirrha, lying to the west on the same bay. The Phoceans seizing the temple of Apollo at Delphi, a war, called *the sacred*, commenced, and lasted ten years; when Philip, father of Alexander the Great, avenged the god by destroying many of the cities of the pillagers. Anticyra was one of the number. It was again taken and subverted by Attilius a Roman general in the war with the Macedonians. It afterwards became famous for its hellebore. That drug was the root of a plant, the chief produce of the rocky mountains above the city, and of two kinds, the black, which had a purgative quality, and the white, which was an emetic. Sick persons resorted to Anticyra to take the medicine, which was prepared there by a peculiar and very excellent recipe: Hence the adage, *Naviget Anticyram*, (Horace). By the port in the second century was a temple of Neptune, not large, built with selected stones, and the inside white-washed: the statue of brass. The agora or market-place was adorned with images of the same metal; and above it was a well with a spring, sheltered from the sun by a roof supported by columns. A little higher was a monument formed with such stones as occurred, and designed, it was said, for the sons of Iphitus. One of these, Schedius, was killed by Hector, while fighting for the body of Patroclus, but his bones were transported to Anticyra; where his brother died after his return from Troy. About two stadia or a quarter of a mile distant was a high rock, a portion of the mountain, on which a temple of Diana stood; the image bigger than a large woman, and made

Anticyra || Antigonea.

by Praxiteles. The walls and other edifices at Anticyra were probably erected, like the temple of Neptune, with stones or pebbles. The site is now called *Asprospitia*, or *The White Houses;* and some traces of the buildings from which it was so named remain. The port is landlocked, and frequented by vessels for corn. Some paces up from the sea is a fountain.

ANTIDESMA, Chinese Laurel. See Botany *Index*.

ANTIDICOMARIANITES, ancient heretics who pretended that the Holy Virgin did not preserve a perpetual virginity, but that she had several children by Joseph after our Saviour's birth. Their opinion was grounded on some expressions of our Saviour, wherein he mentions his brothers and his sisters; and of St Matthew, where he says, that Joseph knew not Mary till she had brought forth her first-born son. The Antidicomarianites were the disciples of Helvidius and Jovinian, who appeared in Rome toward the close of the fourth century.

ANTIDORON, in *Ecclesiastical Writers*, a name given by the Greeks to the consecrated bread, out of which the middle part, marked with the cross, wherein the consecration resides, being taken away by the priest, the remainder is distributed after mass to the poor. On the sides of the antidoron are impressed the words *Jesus Christus vicit*. The word is formed from δωρον, *donum*, "a gift," as being given away *loco muneris*, or in charity. The antidoron is also called *panis præsanctificatus*. Some supposed the antidoron to be distributed in lieu of the sacrament, to such as were prevented from attending in person at the celebration; and thence derive the origin of the word, the eucharist being denominated *doron*, "gift," by way of eminence.

ANTIDOSIS, in antiquity, denotes an exchange of estates, practised by the Greeks on certain occasions with peculiar ceremonies, and first instituted by Solon.

When a person was nominated to an office, the expence of which he was not able to support, he had recourse to the antidosis: that is, he was to seek some other citizen of better substance than himself, who was free from this, and other offices; in which case the former was excused. In case the person thus substituted denied himself to be the richest, they were to exchange estates, after this manner; the doors of their houses were close shut up and sealed, that nothing might be conveyed away: then both took an oath to make a faithful discovery of all their effects, except what lay in the silver mines, which by the laws was excused from all imposts: accordingly, within three days, a full discovery and exchange of estates was made.

ANTIDOTE, among physicians, a remedy taken to prevent, or to cure, the effects of poison, &c.

ANTIENT. See Ancient.

ANTIGONEA, or Antigonia, in *Ancient Geography*, a town of Bithynia, so called from Antigonus, the son of Philip, and afterwards called *Nicæa* (Strabo, Stephanus). Another of Epirus, to the north of the Montes Ceraunii, opposite to the city of Oricum (Polybius, Ptolemy). A third of Arcadia, namely *Mantinea*, so called in honour of King Antigonus, (Plutarch, Pausanias). A fourth in Macedonia, in the territory of Mygdonia (Pliny, Ptolemy). A fifth in the territory of Chalcidice, in Macedonia, on the east side of the Sinus Thermaicus (Livy). A sixth of Syria, built by Antigonus, not far from Antioch, on the Orontes (Stephanus); but soon after destroyed by Seleucus, who removed the inhabitants to Seleucia, a town built by him (Diodorus Siculus). A seventh of Troas, called Alexandria in Pliny's time. Antigonea Antigonus

ANTIGONUS I. one of the captains of Alexander the Great, was the son of Philip a Macedonian nobleman. After Alexander's death, a division of the provinces taking place, Pamphylia, Lycia, and Phrygia Major fell to his share. But Perdiccas, well acquainted with his ambitious spirit and great abilities, determined to divest him of his government, and laid plans for his life, by bringing various accusations against him. Antigonus, aware of the danger, retired with his son Demetrius into Greece, where he obtained the favour and protection of Antipater; and in a short time Perdiccas dying, a new division taking place, he was invested not only with the government of the former provinces, but also with that of Lycaonia. He was likewise entrusted with the command of the Macedonian household troops, and upon Eumenes being declared a public enemy, he received orders to prosecute the war against him with the utmost vigour. On the commencement of this war, Eumenes suffered a total overthrow, and was obliged to retire with only 600 brave followers to a castle situated on an inaccessible rock, where he might rest in safety from all the assaults of Antigonus. In the interval, his friends assembling a new army for his relief, were routed by Antigonus, who now began to exhibit the great projects of his ambition. Polysperchon succeeding to the tutorship of the young king of Macedon after Antipater's death, Antigonus resolved to set himself up as lord of all Asia. On account of the great power of Eumenes, he greatly desired to gain him over to his interest; but that faithful commander effecting his escape from the fortress where he was closely blockaded, raised an army, and was appointed the royal general in Asia. The governors in Upper Asia co-operating with him, he succeeded in several engagements against Antigonus, but was at last delivered up to him through treachery, and put to death. Upon this, the governors of Upper Asia yielded to Antigonus. Those whom he suspected, he either sacrificed to his resentment or displaced them from their offices. Then seizing upon all the treasures at Susa, he directed his march towards Babylon, of which city Seleucus was governor. Seleucus fled to Ptolemy, and entered into a league with him, together with Lysimachus and Cassander, with the intention of giving a check to the exorbitant power of Antigonus, who, notwithstanding this, made a successful attempt upon the provinces of Syria and Phenicia. Yet these provinces were soon after recovered by Ptolemy, who defeated his son Demetrius, while he himself was employed in repelling Cassander, who had made rapid progress in Lesser Asia. They were again taken by Antigonus, and he being flushed with his success, planned an expedition against the Nabathæan Arabs, dwelling in the deserts adjacent to Judea; but on the first enterprise against the town of Petra, his general Athenæus, with almost all his troops, was cut to pieces by the Arabs. Antigonus then sent his son against them, who returned after forcing them to reasonable terms. Demetrius then

Antigonus. then expelled Seleucus from Babylon, and success attending his arms wherever he went, the confederates were obliged to make a treaty with Antigonus, in which it was stipulated, that he should remain in possession of all Asia, but that the Greek cities should continue in possession of their liberty. This agreement was soon violated, under the pretence that garrisons had been placed in some of these cities by Antigonus. At first Ptolemy made a successful descent in Lesser Asia and on several of the islands of the Archipelago; but he was at length defeated by the successful arms of Demetrius in a sea-fight, who also took the island of Cyprus, with many prisoners. On this victory Antigonus was so elated that he assumed the title of king, and bestowed the same upon his son; and from that time, B. C. 306, his reign in Asia, and that of Ptolemy in Egypt, and of the other captains of Alexander in their respective governments, properly commence.

Irritated at the hostile conduct of Ptolemy, Antigonus prepared a numerous army and a formidable fleet, and having taken the command of the army, he gave the command of the fleet to Demetrius, and hastened to attack him in his own dominions. After enduring the severest hardships, they met in the vicinity of Mount Cassius; but Ptolemy acted with such valour and address that Demetrius could gain no advantage over him; and after several fruitless attempts, he abandoned the undertaking. He next attempted the reduction of Rhodes, but meeting with obstinate resistance, he was obliged to make a treaty upon the best terms that he could, having been called to join Antigonus against Cassander, who at this time had formed a confederacy with Seleucus and Lysimachus. When Demetrius united his forces with those of Antigonus, they advanced to Phrygia, and having met the enemy at Ipsus, a decisive battle was fought, in which Antigonus fell, in the 84th year of his age, B. C. 301.

Ardent in his passions, Antigonus frequently used improper means for their gratification; but as a soldier he was sagacious, active, brave, and fortunate. An insatiable ambition, however, the general passion of great men, proved a strong stimulus to all his actions; but with these blemishes better qualities were blended in his character. The violence and temerity of youth were tempered by the clemency and moderation of advanced life, and he endeavoured to conciliate the affections of those whom force had subjected to his power. In matters of private concern he was strictly just; for when his brother wished him to listen to a cause in private where he was concerned, he exclaimed, "No, my dear brother, I will hear it in the open court of justice, because I mean to do justice." When flattered with the title of god, he replied, "My chamberlain well knows the contrary;" and similar philosophical sentiments would frequently drop from his lips. He apologized for the rigour of his taxes by saying, "Alexander reaped Asia, but I only glean it." He shone with peculiar lustre in domestic retirement. Notwithstanding the strong ambition of his son Demetrius, he continued in perfect harmony both with him and all his family. The son had a full share of the authority of the father; and one day saluting his son upon his return from hunting in the presence of some ambassadors, he desired them to tell their masters upon what terms he lived with his son. (*Gen. Biog.*).

ANTIGONUS *Gonatus*, son of Demetrius Poliorcetes, was the grandson of the former Antigonus. His character was eminently distinguished by humanity and mildness of disposition. When he besieged Thebes under the command of his father, he strongly remonstrated against the loss of so many lives for such an insignificant object. Filial affection was so powerful in his mind, that when his father was taken prisoner by Seleucus, he generously offered himself in his stead, and being rejected, he wore deep mourning, and refrained from all festivals and amusements during his father's imprisonment. Informed of his death, all the floods of sorrow burst from his tender heart, and sailing with a fleet to meet his ashes, he received them with all the demonstrations of filial sensibility and dutiful respect. By the death of his father he became master of all the European dominions of Demetrius, together with the kingdom of Macedon and various other cities in Greece. The Gauls invading his country, he defeated and expelled them, but was soon after routed by Pyrrhus king of Epirus. Some time after, however, Pyrrhus was slain at Argos; and when his head was brought him by his son, he expressed the highest displeasure, and throwing his robe over it, he gave orders to search for his body, and to inter the same with all funeral honours. With singular kindness, also, he treated Helenus, the son of that unfortunate king, who fell into his hands by the fortune of war. Antigonus || Antigua.

In the evening of his reign, he so cultivated the arts of peace, and so conciliated the minds of his subjects, that he secured their affections both to himself and his descendants. The taking of the citadel of Corinth by intrigue was the meanest action of his reign, but he improved that event in maintaining the freedom of the small states of Greece, and in increasing his own dominions. The Achæans, and Aratus their famous chief, vigorously opposed his measures, and at length recovered Corinth; but Antigonus was so inclined to peace, that notwithstanding this event, he pursued his wonted plan, and left his kingdom in peace about the 80th year of his life, and the 44th of his reign, B. C. 243; and Demetrius II. his son, next ascended the throne. (*Gen. Biog.*).

ANTIGRAPHUS, in antiquity, an officer of Athens, who kept a counterpart of the apodecti, or chief treasurer's accounts, to prevent mistakes, and keep them from being falsified.

ANTIGRAPHUS is also used, in middle-age writers, for a secretary or chancellor. He is thus called, according to the old glossarists, on account of his writing answers to the letters sent to his master. The antigraphus is sometimes also called *archigraphus;* and his dignity *antigraphia* or *archigraphia*.

ANTIGRAPHUS is also used in Isidorus for one of the notes of sentences which is placed with a dot to denote diversity of sense in the translations.

ANTIGRAPHUS is also applied in ecclesiastical writers to an abbreviator of the papal letters. In which sense the word is used by Pope Gregory the Great in his register. Of late days the office of antigraphus consists in making minutes of bulls from the petitions agreed to by his holiness, and renewing the bulls after engrossing.

ANTIGUA, one of the Antilles or Caribbee islands, situated 20 leagues east of St Christopher's, in

Antigua ‖ Antilibanus.

W. Long. 61. 45. and N. Lat. 17. 6. It is about 50 miles in circumference, and is reckoned the largest of all the British leeward islands.

This island having no rivers, and but few springs, or such as are brackish, the inhabitants are obliged to preserve the rain water in cisterns. The air here is not so wholesome as in the neighbouring islands, and it is more subject to hurricanes; but it has excellent harbours, particularly English Harbour, which is capable of receiving the largest man of war in the navy. Here is also a dock yard, supplied with all stores and conveniences for repairing and careening ships. The principal trade, however, is carried on in the harbour of St John's, the capital, situated in the north-west part of the island, and which has water sufficiently deep for merchant vessels. The island contains 59,838 acres of land, of which about 34,000 are appropriated to the growth of sugar, including those which are annexed as pasture grounds. The other staples are cotton, wool, and tobacco.

This island was first attempted to be settled by Sir Thomas Warner, about the same time with St Christopher's and Nevis: but no establishment then took place. It was afterwards granted by Charles II. to Lord Willoughby, then governor of Barbadoes, who settled a colony upon it in the space of a few years. In a short time, but by what means is not evident, it became again the public property. It raises at present about 16,000 hogsheads of sugar, which was at first of a very bad quality, unfit for the English market; but the planters have greatly improved their staple since, and it is now as good as in any of the other islands. It has continued unmolested in all the late wars with France. It is divided into five parishes, St John's Town, Falmouth, Porham, Bridge Town, and St Peter's. According to returns in 1817 the number of white inhabitants was 2102, exclusive of troops, of free people of colour 1747, of free blacks 438, and of slaves 31,452. The slaves had increased 1170 since 1807, when the slave trade was abolished.

ANTIGUGLER, is a crooked tube of metal, so bent as easily to be introduced into the necks of bottles, and used in decanting liquors, without disturbing them. For this purpose the bottle should be a little inclined, and about half a spoonful of the liquor poured out, so as to admit an equal quantity of air; let one end of the bent tube be stopped with the finger, whilst the other is thrust into the body of the liquor near to the bubble of air already admitted. When the finger is taken off, the bottle will have vent, and the liquor will run out steadily and undisturbed.

ANTIHECTICS, in *Pharmacy*, medicines good in hectical disorders.

ANTIHECTICUM POTERII, the name of a medicine formerly much celebrated, but now laid aside in common practice.

ANTILIBANUS, in *Ancient Geography*, a mountain of Cœlosyria, which bounds it on the south, running parallel with Libanus: they both begin a little above the sea, Libanus near Tripolis, Antilibanus at Sidon: and both terminate near the mountains of Arabia, which run to the north of Damascus, and the mountains of Traconitis, and there end in other mountains, (Strabo). The Scripture, making no distinction between Libanus and Antilibanus, calls them by the common name *Lebanon*.

ANTILLES, the French name for the CARIBBEE islands. Antilles ‖ Antimetabole.

ANTILOGARITHM, the complement of the logarithm of a sine, tangent, or secant; or the difference of that logarithm from the logarithm of 90 degrees.

ANTILOGY, in matters of literature, an inconsistency between two or more passages of the same book.

ANTILOPE. See CAPRA.

ANTIMENSIUM, a kind of consecrated table-cloth, occasionally used in the Greek church, in places where there is no proper altar. F. Goar observes, that in regard the Greeks had but few consecrated churches, and that consecrated altars are not things easy to be removed, that church has, for many ages, made use of certain consecrated stuffs or linens, called *antimensia*, to serve the purposes thereof.

ANTIMENSIUM, in the Greek church, answers to the *altare portabile*, or portable altar in the Latin church. They are both only of late invention, though Habertus would have them as old as St Basil. But Durant and Bona do not pretend to find them in any author before the time of Bede and Charlemagne.

Antimensia is also applied to other tables, used in offices of religion, besides those whereon the eucharist is administered: such, e. g. are those whereon the host is exposed, &c. The origin of the antimensia is described by Meursius: when the bishop had consecrated a church, the cloth which had been spread on the ground and over the communion table, was torn in pieces, and distributed among the priests, who carried each a fragment away, to serve to cover the tables in their churches and chapels. Not that it was necessary that such cloths should be laid on all tables; but only on those which either were not consecrated, or at least whose consecration was doubted of.

ANTIMERIA, in *Grammar*, a figure whereby one part of speech is used for another: e. g. *velle suam cuique est*, for *voluntas sua cuique est*; also *populus lātè rex*, for *populus lātè regnans*.

ANTIMERIA, in a more restrained sense, is a figure where the noun is repeated instead of the pronoun. The antimeria is frequent in the Hebrew, and is sometimes retained in our version of the Old Testament accordingly: e. g. *Hear my voice, ye wives of Lamech*, for *my wives*, Gen. iv. 23.

ANTIMETABOLE, in *Rhetoric*, a figure which sets two things in opposition to each other. The word is Greek, compounded of ἀντὶ *against*, and μεταβολὴ from μεταβαλλω, I *shift* or *transfer*, i. e. shifting, or setting two things over-against each other. This figure is twice exemplified in an apophthegm of Musonius; which, on account of its excellence, is called *aureum monitum*, the golden maxim or precept.

Αν τι πραξης καλον μετα πονε, ομεν πονος οιχεται, το δε καλον μενει.

Αν τι ποιησης αισχρον μετα ηδονης, το μεν ηδυ οιχεται, το δε αισχρον μενει.

In English thus:

"Allowing the performance of an honourable action to be attended with labour; the labour is soon over, but the honour immortal: whereas, should even pleasure wait on the commission of what is dishonourable, the pleasure is soon gone, but the dishonour eternal."

ANTIMETATHESIS,

Antimetathesis ‖ Antimony.

ANTIMETATHESIS, in *Rhetoric*, is the inversion of the parts or members of an antithesis. Such is that of Cicero in Verrem, lib. iv. cap. 52. "Compare this peace with that war; the arrival of this governor with the victory of that general; his profligate troops with the invincible army of the other; the luxury of the former with the temperance of the latter: you will say, that Syracuse was founded by him who took it; and taken by him, who held it when founded."

ANTIMONARCHICAL, an appellation given to whatever opposes monarchical government.

ANTIMONIALS, in *Medicine*, preparations of antimony. See PHARMACY.

ANTIMONY, a blackish mineral substance, staining the hands, full of long, shining, needle-like striæ, hard, brittle, and considerably heavy. It is found in different parts of Europe, as Bohemia, Saxony, Transylvania, Hungary, France, and England; commonly in mines by itself, intermixed with earth and stony matters. Sometimes it is blended with the richer ores of silver, and renders the extraction of that metal difficult by volatilizing a part of the silver, or, in the language of the miners, *robbing the ore*. See METALLURGY, for the different operations.

Antimony is the *stibium* of the ancients; by the Greeks called στιμμι. The reason of its modern denomination, *antimony*, is usually referred to Basil Valentine, a German monk; who, as the tradition relates, having thrown some of it to the hogs, observed, that after purging them violently, they immediately grew fat upon it. This made him think, that by giving his fellow monks a like dose, they would be the better for it. The experiment, however, succeeded so ill, that they all died of it: and the medicine thenceforward was called *antimony*, q. d. *anti-monk*.

Uses. Antimony at first was of service only in the composition of paint. Scripture describes it to us as a sort of paint, with which the women blackened their eyebrows. Jezebel, understanding that Jehu was to enter Samaria, painted her eyes with antimony; or, according to the Hebrew, "put her eyes in antimony." As large black eyes were thought the finest, they of both sexes, who were careful of their beauty, rubbed their eyes, eyelids, and round their eyes, with a needle dipped in a box of paint made of antimony, with a design of blackening them.—At this day, the women of Syria, Arabia, and Babylonia, anoint and blacken themselves about the eyes; and both men and women put black upon their eyes in the desert, to preserve them from the heat of the sun and the piercing of its rays. M. Darvieux tells us, that the Arabian women border their eyes with a black colour made of tutty, which the Arabians call *rebel*. They draw a line of this kind of blacking without the corner of their eyes, to make them appear larger. Isaiah, in his enumeration of the several ornaments belonging to the daughters of Sion, has not forgot the needles which they made use of in painting their eyes and eyelids. Nor has this practice escaped the lash of Juvenal:

> *Ille supercilium madida fuligine tinctum*
> *Obliqua producit acu, pingitque trementes*
> *Attollens oculos.*

Ezekiel, discovering the irregularities of the Jewish nation under the idea of a debauched woman, says, that she bathed and perfumed herself, and that she anointed her eyes with antimony. Job shows sufficiently how much antimony was in esteem, by calling one of his daughters a vessel of antimony, or a box to put paint in, *cornu stibii*. The author of the book of Enoch says, that before the deluge the angel Azlcel taught young women the art of painting themselves. Antimony.

Tertullian and St Cyprian have declaimed very warmly against this custom of painting the eyes and eyebrows, which was much practised in Africa even by the men: *Inunge oculos tuos non stibio diaboli, sed collyrio Christi*, says St Cyprian. Pliny, speaking of the Roman ladies, says, that they painted their very eyes: *Tanta est decoris affectatio, ut tingantur oculi quoque*. Sardanapalus painted his eyes and eyebrows. Josephus reproaches the seditious with the same, who assumed the name of zealots, and made themselves masters of the temple of Jerusalem.

The modern uses of antimony are very numerous and important. It is a common ingredient in specula or burning concaves, serving to give the composition a finer texture. It makes a part in bell metal, and renders the sound more clear. It is mingled with tin, to make it more hard, white, and sounding; and with lead, in the casting of printers letters, to render them more smooth and firm. It is also a general help in the melting of metals, and especially in casting of cannon-balls. It is likewise made use of for purifying and heightening the colour of gold. See CHEMISTRY *Index*.

For a long time this mineral was esteemed poisonous. In 1566, its use was prohibited in France by an edict of parliament; and in 1609, one Besnier was expelled the faculty for having given it. The edict was repealed in 1650; antimony having a few years before been received into the number of purgatives. In 1668, a new edict came forth, forbidding its use by any but doctors of the faculty. It is now universally allowed, that pure antimony in its crude state has no noxious quality, and that though many of its preparations are most virulently emetic and cathartic, yet, by a slight alteration or addition, they lose their virulence, and become mild in their operation.

The virtues of antimony in the diseases of animals are greatly extolled. Pigs that have the measles are at all times recovered by it, which proves it a great purifier of the blood. Horses who have running heels that cannot be cured by the common methods used by the farriers, will generally be cured by this medicine in a little time. The manner of using it is this: Mix one drachm with every feeding of oats which the horse has in a morning. It is best put together in one place, buried under a few oats; and the horse's head being withheld a little, and then let go just against that place, he will take it all in at a mouthful. Some horses do not dislike it: others obstinately refuse it, but to these it may be easily given in balls. The virtues of this drug in fattening cattle have been thought imaginary, but experiment proves it to be a real truth. A horse that is lean and scabby, and not to be fatted by any other means, will become fat on taking a dose of antimony every morning for two months together. A boar fed for brawn, and having an ounce of antimony

Antimony || Antioch.

mony given him every morning, will become fat a fortnight sooner than others put into the stye at the same time, and fed in the same manner, but without the antimony.

ANTINOE. See ENFINE.

ANTINOEIA, in antiquity, annual sacrifices, and quinquennial games, in memory of Antinous the Bithynian. They were instituted at the command of Adrian, the Roman emperor, at Mantinea, in Arcadia, where Antinous was honoured with a temple and divine worship.

ANTINOMIANS, in ecclesiastical history, certain heretics who maintain the law of no use or obligation under the gospel-dispensation, or who hold doctrines that clearly supersede the necessity of good works and a virtuous life. The Antinomians took their origin from John Agricola about the year 1538; who taught that the law is no ways necessary under the gospel; that good works do not promote our salvation, nor ill ones hinder it; that repentance is not to be preached from the decalogue, but only from the gospel.

This sect sprung up in England during the protectorate of Oliver Cromwell, and extended their system of libertinism much farther than Agricola the disciple of Luther. Some of their teachers expressly maintained, that as the elect cannot fall from grace, nor forfeit the Divine favour, the wicked actions they commit are not really sinful, nor are to be considered as instances of their violation of the divine law; and that consequently they have no occasion either to confess their sins, or to break them off by repentance. According to them, it is one of the essential and distinctive characters of the elect, that they cannot do any thing which is either displeasing to God or prohibited by the law.—Luther, Rutherford, Schlusselburg, Sedgwick, Gataker, Witsius, Bull, Williams, &c. have written refutations; Crisp, Richardson, Saltmarsh, &c. defences, of the Antinomians; Wigandus, a comparison between ancient and modern Antinomians.

The doctrine of Agricola was in itself obscure, and perhaps represented worse than it really was by Luther, who wrote with acrimony against him, and first styled him and his followers *Antinomians*. Agricola stood on his own defence, and complained that opinions were imputed to him which he did not hold. Nicholas Amsdorf fell under the same odious name and imputation, and seems to have been treated more unfairly than even Agricola himself. It is rather hard to charge upon a man all the opinions that may be inferred from things that have hastily dropped from him, when he himself disavows such inferences.

ANTINOUS, the favourite of Adrian, was born at Bithynus in Bithynia. His beauty engaged the heart of Adrian in such a manner, that there never was a more boundless and extravagant passion than that of this emperor towards this youth. After his death, the emperor ordered divine honours to be paid him; and he also erected a city of his name. See ENFINE.

ANTIOCH, a city of Syria, in Asia, situated on the river Orontes, in E. Long. 36. 5. N. Lat. 36. 10. It was built by Seleucus Nicator, founder of the Syro-Macedonian empire, who made it his capital. It stood on the above-mentioned river, about 20 miles from the place where it empties itself into the Mediterranean; being equally distant from Constantinople and Alexandria in Egypt, that is, about 700 miles from each. Seleucus called it *Antioch*, from his father's name, according to some; or from that of his son, according to others. He built 16 other cities bearing the same name; of which one, situated in Pisidia, is probably that where the name of *Christians* was first given to the followers of Jesus Christ. But that situated on the Orontes by far eclipsed, not only all the others of this name, but all the cities built by Seleucus. Antigonus, not long before, had founded a city in that neighbourhood, which from his own name he had called *Antigonia*, and designed it for the capital of his empire: but it was razed to the ground by Seleucus, who employed the materials in building his metropolis, and also transplanted the inhabitants thither. Antioch.

The city of Antioch was afterwards known by the name of *Tetrapolis*, being divided as it were into four cities, each of them being surrounded with its proper wall, besides a common one which enclosed them all. The first of these cities was built by Seleucus Nicator, as already mentioned; the second by those who flocked thither on its being made the capital of the Syro-Macedonian empire; the third by Seleucus Callinicus; and the fourth by Antiochus Epiphanes.—About four or five miles distant, stood a place called *Daphne*, which was nevertheless reckoned a suburb of Antioch. Here Seleucus planted a grove, and in the middle of it built a temple which he consecrated to Apollo and Diana, making the whole an asylum. To this place the inhabitants of Antioch resorted for their pleasures and diversions; whereby it became at last so infamous, that "to live after the manner of Daphne" was used as a proverb to express the most voluptuous and dissolute way of living. Here Lucius Verus, the colleague of M. Aurelius, chose to take up his residence, instead of marching against the Parthians; while his general Cassius forbade by proclamation any of his soldiers to enter or even go near the place. In short, so remarkable was Daphne of old, that the metropolis itself was distinguished by it, and called *Antioch near Daphne*.

Though Antioch continued to be, as Pliny calls it, the queen of the East, for near 1600 years; yet scarce any city mentioned in history hath undergone such calamities, both from the attacks of its enemies, and its being naturally subject to earthquakes. The first disaster mentioned in history which befel the Antiochians happened about 145 years before Christ. Being at that time very much disaffected to the person and government of Demetrius their king, they were continually raising tumults and seditions; insomuch that he found himself at last obliged to solicit assistance from the Jews; and was furnished by Jonathan, one of the Maccabees, with 3000 men; by which reinforcement, believing himself sufficiently strong to reduce the mutineers by force, he ordered them immediately to deliver up their arms. This unexpected order caused a great uproar in the city. The inhabitants ran to arms, and invested the king's palace, to the number of 120,000, with a design to put him to death. All the Jews hastened to his relief, fell upon the rebels, killed 100,000 of them, and set fire to the city. On the destruction of the Syrian empire by the Romans, Antioch submitted to them as well as the other cities of that kingdom, and continued for a long time under their dominion. About the year 115, in the reign of the

Antioch. the emperor Trajan, it was almost entirely ruined by one of the most dreadful earthquakes mentioned in history. Trajan himself happened to be there at that time, being returned from an expedition against the Parthians; so that the city was then full of troops, and strangers come from all quarters either out of curiosity or upon business and embassies: the calamity was by this means felt almost in every province of the Roman empire. The earthquake was preceded by violent claps of thunder, unusual winds, and a dreadful noise under ground. The shock was so terrible, that great numbers of houses were overturned, and others tossed to and fro like a ship at sea. Those who happened to be in their houses were for the most part buried under their ruins: those who were walking in the streets or in the squares, were, by the violence of the shock, dashed against each other, and most of them either killed or dangerously wounded. This earthquake continued, with some small intermission, for many days and nights; so that vast numbers perished. The most violent shock, according to the Acts of St Ignatius, was on a Sunday, December 23. By this Trajan was much hurt, but escaped through a window. Dion Cassius pretends, that he was taken out of the window by one who exceeded the human size in tallness. The same historian adds, that Mount Lison, which stood at a small distance from the city, bowed its head and threatened to fall down upon it: that other mountains fell; that new rivers appeared, and others that had flowed before forsook their course and vanished. When the earthquake ceased, a woman was heard crying under the ruins; which being immediately removed, she was found with a living child in her arms. Search was made for others; but none was found alive, except one child which continued sucking its dead mother.

No doubt, Trajan, who was an eye-witness of this terrible calamity, would contribute largely towards the re-establishment of Antioch in its ancient splendour. Its good fortune, however, did not continue long; for in 155, it was almost entirely burnt by accidental fire; when it was again restored by Antoninus Pius. In 176 or 177, the inhabitants having sided with Cassius, the above-mentioned Roman general, who had revolted from M. Aurelius, that emperor published a severe edict against them, deprived them of all their privileges, suppressed their public assemblies, and took from them the shows and spectacles to which they were greatly addicted: but his anger being soon appeased, he restored them to their former condition, and even condescended to visit their city. In 194, having sided with Niger against Severus, the latter deprived them of all their privileges, and subjected Antioch as a mere village to Laodicea; but, however, pardoned them the next year, at the entreaties of his eldest son, then a child.

When the power of the Roman empire began to decline, Antioch became the bone of contention between them and the eastern nations; and, accordingly, on the breaking out of a Persian war, it was almost always sure to suffer. In 242, it was taken and plundered by Sapor; and, though he was defeated by Gordian, it underwent the same misfortune in the time of Valerian, about 18 years after; and after the defeat and captivity of Valerian, being taken by the Persian monarch a third time, he not only plundered it, but levelled all the public buildings with the ground. The Persians, however, being soon driven out, this unfortunate city continued free from any remarkable calamity till about the time of the division of the Roman empire by Constantine in 331. It was then afflicted with so grievous a famine, that a bushel of wheat was sold for 400 pieces of silver. During this grievous distress, Constantine sent to the bishop 30,000 bushels of corn; besides an incredible quantity of all kinds of provisions, to be distributed among the ecclesiastics, widows, orphans, &c. In the year 347, Constantine II. caused a harbour to be made at Seleucia, for the conveniency of Antioch. This was effected at an immense expence; the mouth of the Orontes, where the port was made, being full of sands and rocks. When the emperor Julian set out on his expedition against the Persians, he made a long stay at Antioch; during which time, many of the Roman provinces were afflicted with a famine, but which raged more violently at Antioch than in other places. The ecclesiastical writers of those times say, that this famine followed Julian from place to place; and as he continued longer at Antioch than any other city, it raged more violently there than anywhere else. To remedy this evil, Julian fixed the price of corn: by which means the famine was greatly increased, the merchants conveying their corn privately to other places, so that this metropolis was reduced to a most deplorable situation. In 381, in the reign of Theodosius the Great, Antioch was again visited by a famine, accompanied by a grievous plague. The latter soon ceased: but, the famine still continuing, the bishop, Libanius, applied to Icarius, count of the East, requesting him by some means or other to relieve the poor, who had flocked from all parts to the metropolis, and were daily perishing in great numbers; but to this Icarius gave no other answer, than that they were abhorred and justly punished by the gods. This inhuman answer raised great disturbances; which, however, were terminated without bloodshed. In 387, Theodosius, finding his exchequer quite drained, and being obliged to be at an extraordinary expence in celebrating the fifth year of the reign of his son Arcadius, and the tenth of his own, an extraordinary tax was laid upon all the people in the empire. Most of the cities submitted willingly to this: but the people of Antioch, complaining of it as an unreasonable oppression, crowded to the house of Flavianus, their bishop, as soon as the edict was published, to implore his protection. Being unable to find him, they returned to the forum; and would have torn the governor in pieces, had not the officers who attended him kept back with great difficulty the enraged multitude, till he made his escape. Upon this, they broke some of the emperor's statues, and dragged others through the city, uttering the most injurious and abusive expressions against him and his whole family. They were, however, dispersed by a body of archers, who, by wounding only two of the rabble, struck terror into all the rest. The governor proceeded against the offenders with the utmost cruelty; exposing some to wild beasts in the theatre, and burning others alive. He did not spare even the children, who had insulted the emperor's statues; and caused several persons to be executed, who had been only spectators of the disorder. In the mean time a report was spread, that a body of troops was at hand, with orders to plunder the Antioch.

city

Antioch. city, and put all to the sword, without distinction of sex or age; upon which the citizens abandoned their dwellings in the utmost terror and confusion, retiring to the neighbouring mountains with their wives and families. As the report proved groundless, some of them returned; but the greater part dreading the cruelty of the governor, and the displeasure of the emperor, continued in their retreats. To those who returned, St Chrysostom preached some homilies, which have reached our times, and are greatly admired; and which are said by St Chrysostom himself, as well as some cotemporary writers, to have had a considerable effect in reforming the lives of this licentious and dissolute people. On hearing the news of this tumult, Theodosius was so much enraged, that he commanded the city to be destroyed, and its inhabitants to be put to the sword without distinction; but this order was revoked before it could be put into execution, and he contented himself with a punishment similar to that inflicted by Severus above mentioned. He appointed judges to punish the offenders; who proceeded with such severity, and condemned such numbers, that the city was thrown into the utmost consternation. On this occasion St Chrysostom and the hermits, who were very numerous in the neighbourhood, exerted all their eloquence in behalf of the unhappy people, and obtained a respite for those who had been condemned. They next proceeded to draw up a memorial to the emperor in favour of the citizens in general; and being joined by Flavianus, at last obtained a general pardon, and had the city restored to all its former privileges.

In the year 458, Antioch was almost entirely ruined by an earthquake, which happened on the 14th of September; scarce a single house being left standing in the most beautiful quarter of the city. The like misfortune it experienced in 529, during the reign of the emperor Justin; and in 15 years after, being taken by Cosrhoes king of Persia, that insulting and haughty monarch gave it up to his soldiers, who put all they met to the sword. The king himself seized on all the gold and silver vessels belonging to the great church; and caused all the valuable statues, pictures, &c. to be taken down and conveyed to Persia, while his soldiers carried off every thing else. The city being thus completely plundered, Cosrhoes ordered his men to set fire to it; which was accordingly done so effectually, that none of the buildings even without the walls escaped. Such of the inhabitants as escaped slaughter were carried into Persia and sold as slaves.

Notwithstanding so many and so great calamities, the city of Antioch soon recovered its wonted splendour; but in a short time underwent its usual fate, being almost entirely destroyed by an earthquake in 587, by which 30,000 persons lost their lives. In 634, it fell into the hands of the Saracens, who kept possession of it till the year 858, when it was surprised by one Burtzas, and again annexed to the Roman empire. The Romans continued masters of it for some time, till the civil dissensions in the empire gave the Turks an opportunity of seizing upon it as well as the whole kingdom of Syria. From them it was again taken by the Crusaders in 1098. In 1262, it was again taken by Bibaris sultan of Egypt, who put a final period to its glory.

Antioch, now called *Antakia*, is a ruinous town, whose houses, built with mud and straw, and narrow and miry streets, exhibit every appearance of misery and wretchedness. These houses are situated on the southern bank of the Orontes, at the extremity of an old decayed bridge: they are covered to the south by a mountain; upon the slope of which is a wall, built by the Crusaders. The distance between the present town and this mountain may he about 400 yards, which space is occupied by gardens and heaps of rubbish, but presents nothing interesting. Antioch ‖ Antiochia

Notwithstanding the unpolished manners of its inhabitants, Antioch was better calculated than Aleppo to be the emporium of the Europeans. By clearing the mouth of the Orontes, which is six leagues lower down, boats might have been towed up that river, though they could not have sailed up, as Pococke has asserted; its current being too rapid. The natives, who never knew the name Orontes, call it, on account of the swiftness of its stream, *El aasi*, that is, the rebel. Its breadth at Antioch, is about forty paces. Seven leagues above that town it passes by a lake abounding in fish, and especially in eels. A great quantity of these are salted every year, but not sufficient for the numerous fasts of the Greek Christians. It is to be remembered, we no longer hear at Antioch, either of the Grove, or Daphne, or of the voluptuous scenes of which it was the theatre.

The plain of Antioch, though the soil of it is excellent, is uncultivated, and abandoned to the Turcomans; but the hills on the side of the Orontes, particularly opposite Serkin, abound in plantations of figs and olives, vines, and mulberry trees, which, a thing uncommon in Turkey, are planted in quincunx, and exhibit a landscape worthy our finest provinces.

Seleucus Nicator, who founded Antioch, built also at the mouth of the Orontes, on the northern bank, a large and well fortified city, which bore his name, but of which at present not a single habitation remains; nothing is to be seen but heaps of rubbish, and works in the adjacent rock, which prove that this was once a place of very considerable importance. In the sea also may be perceived the traces of two piers, which are indications of an ancient port, now choked up. The inhabitants of the country go thither to fish, and call the name of the place *Souaidia*.

ANTIOCHETTA, a town of Turkey in Asia, in Caramania, with a bishop's see, over against the island of Cyprus. E. Long. 32. 15. N. Lat. 36. 20.

ANTIOCHIA, in *Ancient Geography*, a town of Assyria, situated between the rivers Tigris and Tornadotus (Pliny).—Another of Caria, on the Meander; called also *Pythopolis*, *Athymbra*, and *Nyssa*, or *Nysa*, (Stephanus): but Strabo says, that Nysa was near Tralles.—A third of Cilicia Trachea, on Mount Cragus (Ptolemy).—A fourth called *Epidaphnes*, the capital of Syria, distinguished from cities of the same name, either by its situation on the Orontes, by which it was divided, or by its proximity to Daphne (see ANTIOCH).—A fifth Antiochia, a town of Comagene, on the Euphrates (Pliny).—A sixth of Lydia *Tralles*, so called (Pliny).—A seventh, of Margiana (Strabo, Pliny, Ptolemy), on the river Margus, taking its name from Antiochus, son of Seleucus, who rebuilt it, and walled it round, being before called *Alexandria*,

Antiochia ‖ Antiparos.

from Alexander the founder, and surnamed Syria; in compass seventy stadia; whither Orodes carried the Romans, after the defeat of Crassus (Pliny).—An eighth, in Mesopotomia, on the lake Calirrhoe, the old name of Edessa (Pliny).—A ninth Antiochia, on the river Mygdonius, in Mesopotomia, situated at the foot of Mount Masius, and is the same with Nisibis (Strabo, Plutarch). It was the bulwark and frontier town of the Romans against the Parthians and Persians, till given up to the Persians, by Jovinian, by an ignominious peace (Ammian, Eutropius).—A tenth Antiochia, was that situated in the north of Pisidia (Luke, Ptolemy, Strabo): it was a Roman colony, with the appellation *Cæsarea*. There is an Antiochia at Mount Taurus, mentioned by Ptolemy, but by no other author.

ANTIOCHIAN SECT or *Academy*, a name given to the fifth academy, or branch of Academies. It took the denomination from its being founded by Antiochus, a philosopher contemporary with Cicero.—The Antiochian academy succeeded the Philonian. As to point of doctrine, the philosophers of this sect appear to have restored that of the ancient academy, except that in the article of the criterion of truth. Antiochus was really a Stoic, and only nominally an Academic.

Antiochian Epocha, a method of computing time from the proclamation of liberty granted the city of Antioch about the time of the battle of Pharsalia.

ANTIOCHUS, the name of several kings of Syria. See that article.

Antiochus of *Ascalon*, a celebrated philosopher, the disciple of Philo of Larissa, the master of Cicero, and the friend of Lucullus and Brutus. He was founder of a fifth academy: but, instead of attacking other sects, he set himself down to reconcile them together, particularly the sect of the Stoics with that of the ancient academy.

ANTIOPE, in fabulous history, the wife of Licus, king of Thebes, who, being deflowered by Jupiter in the form of a satyr, brought forth Amphion and Zethus.—Another Antiope was queen of the Amazons; and, with the assistance of the Scythians, invaded the Athenians; and was vanquished by Theseus.

ANTIPÆDOBAPTISTS, (derived from αντι, *against*, παις, παιδος, *child*, and βαπτιζω, *baptize*, whence βαπτιστης), is a distinguishing denomination given to those who object to the baptism of infants; because they say infants are incapable of being instructed, and of making that profession of faith which entitles them to this ordinance, and an admission into church communion. See Anabaptists and Baptists.

ANTIPAROS, an island in the Archipelago, opposite to Paros, from which it is separated by a strait about seven miles over. It is the *Oleares* or *Oliaros*, mentioned by Strabo, Pliny, Virgil, Ovid, &c.; and was, according to Heraclides Ponticus, as quoted by Stephanus, first peopled by a Phœnician colony from Sidon. According to Mr Tournefort's account, it is about 16 miles in circumference, produces a little wine and cotton, with as much corn as is necessary for the maintenance of 60 or 70 families, who live together in a village at one end of the island, and are mostly Maltese and French corsairs.

The island is remarkable for a subterraneous cavern or grotto, accounted one of the greatest natural curiosities in the world. It was first discovered in the last century by one Magni an Italian traveller, who has given us the following account: "Having been informed (says he) by the natives of Paros, that in the little island of Antiparos, which lies about two miles from the former, a gigantic statue was to be seen at the mouth of a cavern in that place, it was resolved that we (the French consul and himself) should pay it a visit. In pursuance of this resolution, after we had landed on the island, and walked about four miles through the midst of beautiful plains and sloping woodlands, we at length came to a little hill, in the side of which yawned a most horrid cavern, that, with its gloom, at first struck us with terror, and almost repressed curiosity. Recovering the first surprise, however, we entered boldly; and had not proceeded above 20 paces, when the supposed statue of the giant presented itself to our view. We quickly perceived, that what the ignorant natives had been terrified at as a giant, was nothing more than a sparry concretion, formed by the water dropping from the roof of the cave, and by degrees hardening into a figure that their fears had formed into a monster. Incited by this extraordinary appearance, we were induced to proceed still further, in quest of new adventures in this subterranean abode. As we proceeded, new wonders offered themselves; the spars, formed into trees and shrubs, presented a kind of petrified grove; some white, some green; and all receding in due perspective. They struck us with the more amazement, as we knew them to be mere productions of nature, who, hitherto in solitude, had, in her playful moments, dressed the scene as if for her own amusement.

Antiparos.

"But we had as yet seen but a few of the wonders of the place, and we were introduced as yet only into the portico of this amazing temple. In one corner of this half-illuminated recess, there appeared an opening of about three feet wide, which seemed to lead to a place totally dark, and that one of the natives assured us contained nothing more than a reservoir of water. Upon this we tried, by throwing down some stones, which rumbling along the sides of the descent for some time, the sound seemed at last quashed in a bed of water. In order, however, to be more certain, we sent in a Levantine mariner, who, by the promise of a good reward, with a flambeau in his hand, ventured into this narrow aperture. After continuing within it for about a quarter of an hour, he returned, carrying some beautiful pieces of white spar in his hand, which art could neither imitate nor equal. Upon being informed by him that the place was full of these beautiful incrustations, I ventured in once more with him, for about 50 paces, anxiously and cautiously descending by a steep and dangerous way. Finding, however, that we came to a precipice which led into a spacious amphitheatre, if I may so call it, still deeper than any other part, we returned; and being provided with a ladder, flambeaux, and other things to expedite our descent, our whole company, man by man, ventured into the same opening, and, descending one after another, we at last saw ourselves all together in the most magnificent part of the cavern.

"Our candles being now all lighted up, and the whole place completely illuminated, never could the eye be presented with a more glittering or a more magnifi-

Antiparos. cent scene. The roof all hung with solid icicles, transparent as glass, yet solid as marble. The eye could scarce reach the lofty and noble ceiling; the sides were regularly formed with spars; and the whole presented the idea of a magnificent theatre, illuminated with an immense profusion of lights. The floor consisted of solid marble; and in several places, magnificent columns, thrones, altars, and other objects, appeared, as if nature had designed to mock the curiosities of art. Our voices, upon speaking or singing, were redoubled to an astonishing loudness; and upon the firing of a gun, the noise and reverberations were almost deafening. In the midst of this grand amphitheatre rose a concretion of about 15 feet high, that, in some measure, resembled an altar; from which, taking the hint, we caused mass to be celebrated there. The beautiful columns that shot up round the altar, appeared like candlesticks; and many other natural objects represented the customary ornaments of this sacrament.

"Below even this spacious grotto, there seemed another cavern; down which I ventured with my former mariner, and descended about 50 paces by means of a rope. I at last arrived at a small spot of level ground, where the bottom appeared different from that of the amphitheatre, being composed of soft clay, yielding to the pressure, and in which I thrust a stick to about six feet deep. In this, however, as above, numbers of the most beautiful crystals were formed; one of which, particularly resembled a table. Upon our egress from this amazing cavern, we perceived a Greek inscription upon a rock at the mouth; but so obliterated by time, that we could not read it. It seemed to import, that one Antipater, in the time of Alexander, had come thither; but whether he penetrated into the depths of the cavern, he does not think fit to inform us."

From this account Mr Tournefort's differs considerably. Mr Magni mentions only one descent or precipice from the entry of the cave to the grotto, or most magnificent part; Mr Tournefort says that there were many very dangerous precipices and rugged ways, through which they were obliged to pass sometimes on their back, and sometimes on their belly, but gives no particular account of his journey till he come to the grand cavern. This indeed he describes very pompously; but as by it he evidently wants to support a favourite hypothesis, namely, the vegetation of stones, perhaps the particulars are not altogether to be depended upon. He informs us, that, at the entry into the cavern, he met with a Greek inscription almost effaced, containing a good number of proper names; and that there was a tradition among the inhabitants, that these were the names of those who had conspired against Alexander the Great, and having missed their aim, had taken refuge in this grotto.

The most particular account, however, of this famous grotto that hath hitherto been published, appeared in the British Magazine, in a letter signed *Charles Saunders*, and dated Feb. 24. 1746-7; which, as it is very particular, and seems to bear sufficient marks of authenticity, we shall here insert. "Its entrance lies in the side of a rock, about two miles from the seashore; and is a spacious and very large arch, formed of rough craggy rocks, overhung with brambles and a great many climbing plants, that give it a gloominess which is very awful and agreeable. Our surgeon, myself, and four passengers, attended by six guides with lighted torches, entered this cavern about eight o'clock in the morning in the middle of August last. We had not gone 20 yards in this cavity when we lost all sight of day light: but our guides going before us with light, we entered into a low narrow kind of alley, surrounded every way with stones all glittering like diamonds by the light of our torches; the whole being covered and lined throughout with small crystals, which gave a thousand various colours by their different reflections. The alley grows lower and narrower as one goes on, till at length one can scarce get along it. At the end of this passage we were each of us presented with a rope, to tie about our middles; which when we had done, our guides led us to the brink of a most horrible precipice. The descent into this was quite steep, and the place all dark and gloomy. We could see nothing, in short, but some of our guides with torches in a miserable dark place, at a vast distance below us. The dreadful depth of this place, and the horror of the descent through a miserable darkness into it, made me look back to the lane of diamonds, if I may so call it, through which we had just passed; and I could not but think I was leaving heaven, to descend into the infernal regions. The hope of something fine at my journey's end tempted me, however, to trust myself to the rope and my guides at the top, to let myself down. After about two minutes dangling in this posture, not without much pain as well as terror, I found myself safe, however, at the bottom; and our friends all soon followed the example. When we had congratulated here with one another on our safe descent; I was inquiring where the grotto, as they called it, was. Our guides, shaking their heads, told us, we had a great way to that yet: and led us forward about 30 yards under a roof of ragged rocks, in a scene of terrible darkness, and at a vast depth from the surface of the earth, to the brink of another precipice much deeper and more terrible than the former. Two of the guides went down here with their torches first; and by their light we could see, that this passage was not so perpendicular indeed as the other, but lay in a very steep slant, with a very slippery rock for the bottom; vast pieces of rough rugged rocks jutting out in many places on the right hand, in the descent, and forcing the guides sometimes to climb over, sometimes to creep under them, and sometimes to round them; and on the left, a thousand dark caverns, like so many monstrous wells, ready, if a foot should slip, to swallow them up for ever. We stood on the edge to see these people with their lights descend before us; and were amazed and terrified to see them continue descending till they seemed at a monstrous and most frightful depth. When they were at the bottom, however, they hollaed to us; and we, trembling and quaking, began to descend after them. We had not gone 30 feet down, when we came to a place where the rock was perfectly perpendicular; and a vast cavern seemed to open its mouth to swallow us up on one side, while a wall of rugged rock threatened to tear us to pieces on the other. I was quite disheartened at this terrible prospect, and declared I would go back; but our guides assured us there was no danger; and the rest of the company resolving to see the bottom now they were come so far, I would not leave them: so on we went to a corner where there

Antiparos.

Antiparos. there was placed an old slippery and rotten ladder, which hung down close to the rock; and down this, one after another, we at length all descended. When we had got to the bottom of this, we found ourselves at the entrance of another passage, which was terrible enough indeed; but in this there was not wanting something of beauty. This was a wide and gradual descent; at the entrance of which one of our guides seated himself on his breech, and began to slide down, telling us we must do the same. We could discover, by the light of his torch, that this passage was one of the noblest vaults in the world. It is about nine feet high, seven wide, and has for its bottom a fine green glossy marble. The walls and arch of the roof of this being as smooth and even in most places as if wrought by art, and made of a fine glistering red and white granite, supported here and there with columns of a deep blood-red shining porphyry, made, with the reflection of the lights, an appearance not to be conceived. This passage is at least 40 yards long; and of so steep a descent, that one has enough to do, when seated on one's breech not to descend too quickly. Our guides, that we kept with us, could here keep on each side of us; and, what with the prodigious grandeur and beauty of the place, our easy travelling through it, and the diversion of our now and then running over one another whether we would or not; this was much the pleasantest part of our journey. When we had entered this passage, I imagined we should at the bottom join the two guides we had first set down; but alas! when we were got there we found ourselves only at the mouth of another precipice, down which we descended by a second ladder not much better than the former. I could have admired this place also, would my terror have suffered me; but the dread of falling, kept all my thoughts employed during my descent. I could not but observe, however, as my companions were coming down after me, that the wall, if I may so call it, which the ladder hung by, was one mass of blood-red marble, covered with white sprigs of rock crystal as long as my finger, and making, with the glow of the purple from behind, one continued immense sheet of amethysts. From the foot of this ladder we slided on our bellies through another shallow vault of polished green and white marble, about 20 feet: and at the bottom of this joined our guides. Here we all got together once again, and drank some rum, to give us courage before we proceeded any farther. After this short refreshment, we proceeded by a strait, but somewhat slanting passage, of a rough, hard, and somewhat coarse stone, full of a thousand strange figures of snakes rolled round, and looking as if alive; hut in reality as cold and hard as the rest of the stone, and nothing but some of the stone itself in that shape. We walked pretty easily along this descent for near 200 yards; where we saw two pillars seemingly made to support the roof from falling in; bnt in reality it was no such thing; for they were very brittle, and made of a fine glittering yellow marble. When we had passed these about 200 yards, we found ourselves at the brink of another very terrible precipice: but this our guides assured us was the last; and there being a very good ladder to go down by, we readily ventured. At the bottom of this steep wall, as I may call it, we found ourselves for some way upon plain even ground; but, after about 40 yards walking, were presented by our guides with ropes again; which Antiparos. we fastened about our middles, though not to be swung down by, but only for fear of danger, as there are lakes and deep waters all the way from hence on the left hand. With this caution, however, we entered the last alley: and horrible work it was indeed to get through it. All was perfectly horrid and dismal here. The sides and roof of the passage were all of black stone; and the rocks in our way were in some places so steep, that we were forced to lie all along on our backs, and slide down; and so rough, that they cut our clothes, and bruised us miserably in passing. Over our heads, there was nothing but ragged black rocks, some of them looking as if they were every moment ready to fall in upon us; and, on our left hands, the light of our guides torches shewed us continually the surfaces of dirty and miserably looking lakes of water. If I had heartily repented of my expedition often before, here I assure you I was all in a cold sweat, and fairly gave myself over for lost; heartily cursing all the travellers that had written of this place, that they had described it so as to tempt people to see it, and never told us of the horrors that lay in the way. In the midst of all these reflections, and in the very dismallest part of all the cavern, on a sudden we had lost four of our six guides. What was my terror on this sight! The place was a thousand times darker and more terrible for want of their torches; and I expected no other but every moment to follow them into some of these lakes, into which I doubted not but they were fallen. The remaining two guides said all they could indeed, to cheer us up; and told us we should see the other four again soon, and that we were near the end of our journey. I do not know what effect this might have upon the rest of my companions; but I assure you I believed no part of the speech but the last, which I expected every moment to find fulfilled in some pond or precipice. Our passage was by this time become very narrow, and we were obliged to crawl on all-fours over rugged rocks; when in an instant, and in the midst of these melancholy apprehensions, I heard a little hissing noise, and saw myself in utter, and not to be described, darkness. Our guides called indeed cheerfully to us, and told us that they had accidentally dropped their torches into a puddle of water, but we should soon come to the rest of them, and they would light them again; and told us there was no danger, and we had nothing to do but to crawl forward. I cannot say but I was amazed at the courage of these people; who were in a place where, I thought, four of them had already perished, and from whence we could none of us ever escape; and determined to lie down and die where I was. Words cannot describe the horror or the extreme darkness of the place. One of our guides, however, perceiving that I did not advance, came up to me, and clapping his hand firmly over my eyes, dragged me a few paces forward. While I was in this strange condition, expecting every moment death in a thousand shapes, and trembling to think what the guide meant by this rough proceeding, he lifted me at once over a great stone, set me down on my feet, and took his hand from before my eyes. What words can describe at that instant my astonishment and transport! Instead of darkness and despair, all was splendour and magnificence before me: our guides all appeared about us: the place was illuminated by 50

Antiparos. torches, and the guides all welcomed me into the grotto of Antiparos. The four that were first missing, I now found had only given us the slip, to get the torches lighted up before we came; and the other two had put out their lights on purpose, to make us enter out of utter darkness into this pavilion of splendour and glory. I am now come to the proper business of this letter: which was to describe this grotto. But I must confess to you that words cannot do it. The amazing beauties of the place, the eye that sees them only can conceive. The best account I can give you, however, pray accept of.

"The people told us, the depth of this place was 485 yards; the grotto, in which we now were, is a cavern of 120 yards wide, and 113 long, and seems about 60 yards high in most places. These measures differ something from the accounts travellers in general give us; but you may depend upon them as exact, for I took them with my own hand. Imagine then with yourself, an immense arch like this, almost all over lined with fine and bright crystallized white marble, and illuminated with 50 torches; and you will then have some faint idea of the place I had the pleasure to spend three hours in. This, however, is but a faint description of its beauties. The roof, which is a fine vaulted arch, is hung all over with icicles of white shining marble, some of them ten feet long, and as thick as one's middle at the root; and among these hang a thousand festoons of leaves and flowers, of the same substance; but so very glittering, that there is no bearing to look up at them. The sides of the arch are planted with seeming trees of the same white marble, rising in rows one above another, and often enclosing the points of the icicles. From these trees there are also hung festoons, tied as it were from one to another in vast quantities; and in some places among them there seem rivers of marble winding through them in a thousand meanders. All these things are only made, in a long course of years, from the dropping of water, but really look like trees and brooks turned to marble. The floor we trod upon was rough and uneven, with crystals of all colours growing irregularly out of it, red, blue, green, and some of a pale yellow. These were all shaped like pieces of saltpetre; but so hard, that they cut our shoes; among these, here and there, are placed icicles of the same white shining marble with those above, and seeming to have fallen down from the roof and fixed there; only the big end of these is to the floor. To all these our guides had tied torches, two or three to a pillar, and kept continually beating them, to make them burn bright. You may guess what a glare of splendour and beauty must be the effect of this illumination, among such rocks and columns of marble. All round the lower part of the sides of the arch are a thousand white masses of marble, in the shape of oak trees. Mr Tournefort compares them to cauliflowers, but I should as soon compare them to toadstools. In short, they are large enough to enclose, in many places, a piece of ground big enough for a bedchamber. One of these chambers has a fair white curtain, whiter than satin, of the same marble, stretched all over the front of it. In this we all cut our names, and the date of the year, as a great many people have done before us. In a course of years afterwards, the stone blisters out like this white marble over the letters. Mr Tournefort thinks the rock grows like oaks or apple trees for this reason; but I remember I saw some of the finest cockle and muscle shells, in the rock thereabouts, that ever I saw in my life. I wonder whether he thinks they grow there too. Besides, if this rock grows so fast, the cavern ought to be all grown up by this time; and yet, according to his measures and mine, the cavern seems on the other hand to be turned larger since. Indeed, all that I can gather from his account of this glorious place is, that he had drank a bottle or two too much before he went down into it."

Antiparos, Antipas.

ANTIPAS HEROD, or HEROD-ANTIPAS, the son of HEROD the Great, by one of his wives called Cleopatra, a native of Jerusalem. Herod the Great, in his first will, appointed Antipas his successor in the kingdom; but afterwards, altering that will, he named his son Archelaus his successor, giving to Antipas the title only of tetrarch of Galilee and Peræa.

Antipas took a great deal of pains in adorning and fortifying the principal places of his dominions. He married the daughter of Aretas king of Arabia; whom he divorced about the year of Christ 33, to marry his sister-in-law Herodias, wife to his brother Philip, who was still living. St John the Baptist exclaiming continually against this incest, was taken into custody by order of Antipas, and imprisoned in the castle of Machærus, (Mat. xiv. 3, 4. Mark i. 14. vi. 17, 18. Luke iii. 19, 20.). Josephus says, that Antipas caused St John to be laid hold of, because he drew too great a concourse of people after him; and that he was afraid lest he should make use of the authority which he had acquired over the minds and affections of the people, to induce them to revolt. But the evangelists, who were better informed than Josephus, as being eye witnesses of what passed, and acquainted in a particular manner with St John and his disciples, assure us that the true reason of imprisoning St John was the aversion which Herod and Herodias had conceived against him for the liberty he had used in censuring their scandalous marriage. The virtue and holiness of St John were such, that even Herod feared and respected him; but his passion for Herodias had prevailed with him to have killed that prophet, had he not been restrained by his apprehensions of the people, who esteemed John the Baptist as a prophet. (Mat. xiv. 5, 6.). One day, however, while the king was celebrating the festival of his birth, with the principal persons of his court, the daughter of Herodias danced before him; and pleased him so well, that he promised with an oath to give her whatever she should ask of him. By her mother's advice she asked the head of John the Baptist: upon which the king commanded John to be beheaded in prison, and the head to be given her. Aretas, king of Arabia, to revenge the affront which Herod had offered to his daughter, declared war against him, and overcame him in a very obstinate engagement. Herod being afterwards detected as a party in Sejanus's conspiracy, was banished by the emperor Caius to Lyons in Gaul; whither Herodias accompanied him.

This Antipas is the Herod who, being at Jerusalem at the time of our Saviour's passion (Luke xxiii. 11.), ridiculed him, by dressing him in a white robe, and directing him to be conducted back to Pilate, as a mock king, whose ambition gave him no umbrage. The time when Antipas died is not known: however, it is certain

Antipas ‖ ntipathy.

certain he died in exile, as well as Herodias. Josephus says, that he died in Spain, whither Caius upon his coming to Gaul, the first year of his banishment, might order him to be sent.

ANTIPATER, the disciple of Aristotle, and one of Alexander the Great's generals, was a man of great abilities, and a lover of the sciences; but was accused of poisoning Alexander. He subdued the revolted Thracians, relieved Megalopolis, and overthrew the Spartans there. He died 321 years before the Christian era.

ANTIPATER, an Idumean of illustrious birth, and possessed of great riches and abilities, taking advantage of the confusion into which the two brothers Hyrcanus and Aristobulus plunged Judea by their contest for the office of high priest, took such measures as to gain Hyrcanus that office, and under his government to obtain the absolute direction of all affairs; while his great abilities and application to business made him so considerable, that he was honoured as much as if he had been invested with the royal authority in form: but he was at last poisoned by a Jew, named Malachus, 43 years before the Christian era. He left, among his other children, the famous Herod king of the Jews.

ANTIPATER, *Cælius*, a Roman historian, who wrote a history of the Punic war, much valued by Cicero. The emperor Adrian preferred him to Sallust.

ANTIPATER of Sidon, a Stoic philosopher, and likewise a poet, commended by Cicero and Seneca: he flourished about the 171st Olympiad. We have several of his epigrams in the *Anthologia*.

ANTIPATHY, in *Physiology*, is formed from the two Greek words, αντι *contrary*, and παθος *passion*. Literally taken, the word signifies *incompatibility*: but for the most part the term *antipathy* is not used to signify such incompatibilities as are merely physical; it is reserved to express the aversion which an animated or sensitive being feels at the real or ideal presence of particular objects. In this point of view, which is the light in which we at present consider the term, *antipathy*, in common language, signifies "a natural horror and detestation, an insuperable hatred, an involuntary aversion, which a sensitive being feels for some other object, whatever it is, though the person who feels this abhorrence is entirely ignorant of its cause, and can by no means account for it. Such is, they say, the natural and reciprocal hostility between the salamander and the tortoise; between the toad and the weasel; or between sheep and wolves. Such is, the invincible aversion of particular persons against cats, mice, spiders, &c.: a prepossession which is sometimes so violent, as to make them faint at the sight of these animals. Of these and a thousand other antipathies, the ancient naturalists, the schoolmen, and the vulgar, form so many legends; and relate them as certain facts, that they may demand an explication of them from the philosophers. But these sages begin with investigating whether such antipathies actually exist or not.

To explore the matter without prejudice, we shall find it necessary to abstract from the subjects of this disquisition, 1. All such antipathies as are not ascertained; as that which is supposed to be felt by hens at the sound of a harp whose strings are made of a fox's bowels, between the salamander and tortoise, and between the weasel and the toad. Nothing is less confirmed, or rather nothing is more false, than these facts, with which vulgar credulity and astonishment are amused and actuated: and though some of these antipathies should be ascertained, this would be no proof that the animals which feel them are not acquainted with their causes, according to their mode and proportion of knowledge; in which case it will be no longer the antipathy which we have defined. Antipathy.

2. We must abstract those antipathies which can be extinguished or resumed at pleasure; those fictitious aversions, which certain persons feel, or pretend to feel, with affected airs, that they may appear more precise and finical, or singularly and prodigiously elegant; that they may seem to have qualities so exquisitely fine, as require to be treated with peculiar delicacy. One who bestows any attention on the subject, would be astonished to find how many of these chimerical aversions there are, which are pretended, and passed upon the world by those who affect them as natural and unconquerable.

3. When we abstract those aversions the causes of which are known and evident; we shall be surprised after our deduction of those pretended antipathies from the general sum, how small, how inconsiderable, is the quantity of those which are conformable to our definition. Will any one pretend to call by the name of *antipathy*, those real, innate, and incontestable aversions which prevail between sheep and wolves? Their cause is obvious; the wolf devours the sheep, and subsists upon his victims; and every animal naturally flies with terror from pain or destruction; sheep ought therefore to regard wolves with horror, which for their nutrition tear and mangle the unresisting prey. From principles similar to this, arises that aversion which numbers of people feel against serpents; against small animals, such as reptiles in general, and the greatest number of insects. During the credulous and susceptible period of infancy, pains have been taken to impress on our minds the frightful idea that they are venomous; that their bite is mortal; that their sting is dangerous, productive of tormenting inflammations or tumours, and sometimes fatal: they have been represented to us as ugly and sordid; as being, for that reason, pernicious to those who touch them; as poisoning those who have the misfortune to swallow them. These horrible prepossessions are industriously inculcated from our infancy; they are sometimes attended and supported by dismal tales, which are greedily imbibed, and indelibly engraved on our memories. It has been taught us both by precept and example, when others at their approach have assumed in our view the appearance of detestation and even of terror, that we should fly from them, that we should not touch them. Is it then wonderful (if our false impressions as to this subject have been corrected neither by future reflections nor experiments) that we should entertain, during our whole lives, an aversion for these objects, even when we have forgot the admonitions, the conversations, and examples, which have taught us to believe and apprehend them as noxious beings? and in proportion to the sensibility of our frame, in proportion as our nerves are irritable, our emotions at the sight of what we fear will be more violent, especially if they anticipate

our

Antipathy. our expectation, and seize us unprepared, though our ideas of what we have to fear from them are the most confused and indistinct imaginable. To explain these facts, is it necessary to fly to the exploded subterfuge of occult qualities inherent in bodies, to latent relations productive of antipathies, of which no person could ever form an idea?

It is often sufficient to influence a person who had formerly no aversion for an object, if he lives with some other associate who gives himself up to such capricious panics; the habit is insensibly contracted to be agitated with disagreeable emotions at the presence of an object which had been formerly beheld with indifference and cold blood. I was acquainted (says the author of the article *Antipathy* in the French Encyclopédie) with a person of a very sound understanding, whom thunder and lightning by no means terrified; nay, to whom the spectacle appeared magnificent and the sound majestic: yet to a mind thus seemingly fortified against the infectious terror, no more was necessary than spending the summer with a friend in whom the appearance of lightning excited the strongest emotions, and whom the remotest clap of thunder affected with extravagant paroxysms, to become timid in excess at the approach of thunder; nor could he ever afterwards surmount the fear which it inspired. The frightful stories of dogs and cats, which have killed their masters, or which have given them mortal wounds, are more than sufficient to inspire a timorous person with aversion against these animals; and if the olfactory nerves of such a person be delicate, he will immediately discover the smell of them in a chamber: disturbed by the apprehension which these effluvia excite in his mind, he gives himself up to the most violent uneasiness, which is tranquillized when he is assured that the animal is no longer in the room. If by chance, in the search which is made to calm the uneasiness of this timorous person, one of these creatures should at last be discovered, every one presently exclaims, *A miracle;* and admits the reality of *antipathies* into his creed; whilst all this is nothing but the effect of a childish fear, founded on certain confused and exaggerated ideas of the hazard which one may run with these animals. The *antipathy* which some people entertain against eels, though they are eaten by others with pleasure, arises from nothing but the fear of serpents, to which these fishes are in some degree similar. There are likewise other *antipathies* which do not originate in the imagination, but arise from some natural incongruity; such as we often remark in children, for particular kinds of victuals, with which their taste is not offended, but which their stomachs cannot digest, and which are therefore disgorged as soon as swallowed.

To what then are those *antipathies* of which we have heard so much reducible! Either to legendary tales; or to aversions against objects which we believe dangerous; or to a childish terror of imaginary perils; or to a disrelish, of which the cause is disguised; or to a ridiculous affectation of delicacy; or to an infirmity of the stomach; in a word, to a real or pretended reluctance for things which are either invested, or supposed to be invested, with qualities hurtful to us. Too much care cannot be taken in preventing, or regulating, the *antipathies* of children; in familiarizing them with objects of every kind; in discovering to them, without emotion, such as are dangerous; in teaching them the means of defence and security, or the methods of escaping their noxious influence: and, when the rational powers are matured by age, in reflecting on the nature of those objects which we fear, in ascertaining what has been told concerning their qualities, or in vigorously operating upon our own dispositions to overcome those vain repugnancies which we may feel. See SYMPATHY, which is the opposite of *Antipathy*. Antipathy || Antiphony.

ANTIPATHY, in *Ethics*, hatred, aversion, repugnancy. *Hatred* is entertained against persons; *aversion*, and *antipathy* indiscriminately, against persons or things; and *repugnancy* against actions alone.

Hatred is more voluntary than *aversion*, *antipathy*, or *repugnancy*. These last have greater affinity with the animal constitution. The causes of ANTIPATHY are less known than those of *aversion*. *Repugnancy* is less permanent than either the one or the other. We hate a vicious character, we feel *aversion* to its exertions: we are affected with ANTIPATHY for certain persons at first sight; there are some affairs which we transact with *repugnancy*.—*Hatred* calumniates; *aversion* keeps us at a distance from certain persons: ANTIPATHY makes us detest them; *repugnancy* hinders us from imitating them.

ANTIPATRIS (Acts xxiii. 31.), a town of Palestine, anciently called *Caphar Saba*, according to Josephus, but named *Antipatris* by Herod the Great, in honour of his father Antipater. It was situated in a pleasant valley near the mountains, in the way from Jerusalem to Cæsarea. Josephus places it at about the distance of seventeen miles from Joppa.

ANTIPELARGIA, among the ancients, a law, whereby children are obliged to furnish necessaries to their aged parents. The ciconia, or stork, is a bird famous for the care it takes of its parents when grown old. Hence, in some Latin writers, this is rendered *lex ciconiaria*, or the stork's law.

ANTIPHONARY, ANTIPHONARIUM, a service book, which contained all the invitatories, responsories, collects, and whatever else was sung or said in the choir, except the lessons. This is otherwise called *responsarium*, from the responses therein contained. The author of the Roman *antiphonary* was Pope Gregory the Great. We also find mention of nocturnal and diurnal *antiphonaries*, for the use of the daily and nightly offices; summer and winter *antiphonaries;* also *antiphonaries* for country churches, &c. By the provincial constitutions of Archbishop Winchelsey, made at Merton, A. D. 1305, it is required that one of these should be found in every church within the province of Canterbury. The use of these, and many other popish books, was forbid by the 3d and 4th of Edward VI. c. 10.

ANTIPHONY, the answer made by one choir to another, when the psalm or anthem is sung between two.

ANTIPHONY sometimes denotes a species of psalmody, wherein the congregation being divided into two parts, repeat the psalms, verse for verse, alternately. In this sense, antiphony stands contradistinguished from symphony, where the whole congregation sings together.

Antiphony differs from responsorium, because in this latter the verse is only spoken by one person, where-

ntiphony ‖ ntiquare.

as in the former, the verses are sung by the two choirs alternately. The original of antiphonal singing in the western churches is referred to the time of St Ambrose, about the year 374. That father is said to have first introduced it into the church of Milan, in imitation of the custom of the eastern church, where it appears to be of greater antiquity, though as to the time of its institution, authors are not agreed; it was most probably introduced at Antioch, between the year of Christ 347 and 356.

ANTIPHONY is also used to denote the words given out at the beginning of the psalm, to which both the choirs are to accommodate their singing.

ANTIPHONY, in a more modern sense, denotes a kind of composition made of several verses extracted out of different psalms, adapted to express the mystery solemnized on the occasion.

ANTIPODES, in *Geography*, a name given to those inhabitants of the globe that live diametrically opposite to each other. The word is Greek, and compounded of *αντι*, *opposite*, and *πους*, *a foot*; because their feet are opposite to each other.

The antipodes lie under opposite meridians and opposite parallels; in the same degree of latitude, but of opposite denominations, one being north and the other south. They have nearly the same degree of heat and cold, days and nights of equal length, but in opposite seasons. It is noon to one when midnight to the other; and the longest day with the one is the shortest with the other.

Plato is esteemed the first who thought it possible that the antipodes subsisted, and is looked upon as the inventor of the word. As this philosopher apprehended the earth to be spherical, he had only one step to make to conclude the existence of the antipodes.

The ancients, in general, treated this opinion with the highest contempt; never being able to conceive how men and trees could subsist suspended in the air with their feet upwards, for so they apprehended they must be in the other hemisphere.

They never reflected that these terms *upwards* and *downwards* are merely relative; and signify only nearer to, or farther from, the centre of the earth, the common centre to which all heavy bodies gravitate; and that, therefore, our antipodes have not their feet upwards and head downwards any more than ourselves; because they, like us, have their feet nearer the centre of the earth, and their heads farther from it. To have the head downwards and feet upwards, is to place the body in a direction of gravity tending from the feet to the head: but this cannot be supposed with regard to the antipodes; for they, like us, tend toward the centre of the earth, in a direction from head to foot.

ANTIPOLIS, in *Ancient Geography*, now ANTIBES, on the coast of Provence, a colony of the Massilians, near the river Verus, in Gallia Narbonensis (Livy), three leagues to the west of Nice. E. Long. 7. 9. N. Lat. 43. 42.

ANTIQUARE, among Roman lawyers, properly denotes the rejecting of a new law, or refusing to pass it. In which sense, *antiquating* differs from *abrogating*; as the latter imports the annulling an old law, the former the rejecting a new one.

ANTIQUARE is also used for a law's growing obsolete, or into disuse, either by age or non-observance.

Antiquarii. Antiquary.

ANTIQUARII, a name given to copiers of old books. After the decline of learning among the Romans, and when many religious houses were erected, learning was chiefly in the hands of the clergy; the greatest number of whom were regulars, and lived in monasteries. In these houses were many industrious men who were continually employed in making new copies of old books, either for the use of the monastery or for their own emolument. These writing monks were distinguished by the name of *Antiquarii*. They deprived the poor librarii, or common scriptores, of great part of their business, so that these found it difficult to gain a subsistence for themselves and families. This put them upon finding out more expeditious methods of transcribing books. They formed the letters smaller, and made use of more jugations and abbreviations than had been usual. They proceeded in this manner till the letters became exceedingly small; the abbreviations were very numerous, and extremely difficult to be read. This in some measure accounts for the great variety of hands in the species of writing called *Modern Gothic*. When a number of copies were to be made of the same work, it was usual to employ several persons at the same time in writing it; each person, except him who wrote the first skin, began where his fellow was to leave off.

ANTIQUARY, a person who studies and searches after monuments and remains of antiquity; as old medals, books, statues, sculptures, and inscriptions; and, in general, all curious pieces that may afford any light into antiquity.

In the chief cities of Greece and Italy, there were persons of distinction called *antiquaries*, whose business it was to show strangers the antiquities of the place, to explain the ancient inscriptions, and to give them all the assistance they could in this way of learning.—Pausanias calls these antiquaries *Εξηγηται*. The Sicilians call them *mystagogi*.

There was an ancient college of antiquaries erected in Ireland by Ollamh Fodhla, 700 years before Christ, for composing a history of that country: And to this, say the Irish historians, it is owing that the history and antiquities of that kingdom may be traced back beyond those of most other nations.

There is a society of antiquaries in London, and another in Edinburgh, incorporated by the king's charter. See SOCIETY.

ANTIQUARY is also used by ancient writers for the keeper of the antiquarium or cabinet of antiquities. The officer is otherwise called *archæota*, or antiquary of a king, a prince, a state or the like.

Henry VIII. gave John Leland the title of his *antiquary*; a title which, says the author of his life, nobody ever enjoyed besides himself. But the restriction, we suppose, was only intended to be understood in respect of the kings of England. M. Schott, we find, had the title of *antiquary* to the king of Prussia; P. Pedruzzi, that of *antiquary* of the duke of Parma; M. Galland resided some time in Turkey under the title of *antiquary* of the king of France.—The university of Oxford have still their antiquary, under the denomination of *custos archivorum*.—The kings of Sweden have been at great expences in order to illustrate the antiquity of their country, having established an academy of antiquaries with this single view.—The office

of

Antiquary || Antiquities.

of the ancient Irish antiquaries was to preserve the genealogies of the kings of Ireland, to correct the regal tables of succession, and deliver down the pedigree of every collateral branch of the royal family.

ANTIQUATED, something obsolete, out of date, or out of use.

ANTIQUE, in a general sense, something that is ancient: but the term is chiefly used by sculptors, painters, and architects, to denote such pieces of their different arts as were made by the ancient Greeks and Romans. Thus we say, an antique bust, an antique statue, &c.

ANTIQUE is something contradistinguished from *ancient*, which signifies a less degree of antiquity. Thus antique architecture is frequently distinguished from ancient architecture.

ANTIQUITIES, a term implying all testimonies, or authentic accounts, that have come down to us, of ancient nations. Bacon calls antiquities *the wrecks of history*, or such particulars as industrious and learned persons have collected from genealogies, inscriptions, monuments, coins, names, etymologies, archives, instruments, fragments of history, &c.

Antiquities form a very extensive science, including "an historical knowledge of the edifices, magistrates, offices, habiliments, manners, customs, ceremonies, worship, and other objects worthy of curiosity, of all the principal ancient nations of the earth."

This science is not a matter of mere curiosity, but is indispensable to the theologian; who ought to be thoroughly acquainted with the antiquities of the Jews, to enable him properly to explain numberless passages in the Old and New Testaments: to the lawyer, who without the knowledge of the antiquities of Greece and Rome, can never well understand and properly apply the greatest part of the Roman laws: to the physician and the philosopher, that they may have a complete knowledge of the history and principles of the physic and philosophy of the ancients: to the critic, that he may be able to understand and interpret ancient authors: to the orator and poet; who will be thereby enabled to ornament their writings with numberless images, allusions, comparisons, &c.

Antiquities are divided into sacred and profane, into public and private, universal and particular, &c. It is true, that the antiquaries (especially such as are infected with a spirit of pedantry, and the number of these is great) frequently carry their inquiries too far, and employ themselves in laborious researches after learned trifles; but the abuse of a science ought never to make us neglect the applying it to rational and useful purposes.

Many antiquaries also restrain their learned labours to the eclaircissement of the antiquities of Greece and Rome: but this field is far too confined, and by no means contains the whole of this science, seeing it properly includes the antiquities of the Jews, Egyptians, Persians, Phœnicians, Carthaginians, Hetruscans, Germans, and, in general, all those principal nations mentioned in ancient history: so far as any accounts of them are come down to us.

If to the general subjects above-mentioned we add the particular study of antiques, of the statues, bass-reliefs, and the precious relicks of architecture, painting, camaieus, medals, &c. it is easy to conceive that antiquities form a science very extensive and very complicated, and with which only a very small acquaintance could have been attainable by any one man, if our predecessors had not prepared the way for us; if they had not left us such inestimable works as those of Gronovius, Grævius, Montfaucon, Count Caylus, Winckelman, the Hebraic antiquities of D. Iken of Bremen, the Grecian antiquities of Brunnings, the Roman antiquities of Nieupoort, and especially that work which is entitled *Bibliographia Antiquaria Joh. Alberti Fabricii*, professor at Hamburgh, &c. &c. Nor must we here forget that very valuable work, with which our countryman Mr Robert Wood has lately enriched this science, and which is so well known, and so justly esteemed by all true connoisseurs, under the title of the *Ruins of Palmyra*, and those of *Baalbec*. It is by this work that we are fully convinced of the grandeur and magnificence, the taste and elegance, of the buildings of the ancients. We here see that the invention of these matters is not all owing to the Greeks, but that there were other nations who served them as models. For though many of the edifices of Palmyra are to be attributed to the emperor Aurelian, and to Odenatus and his wife Zenobia, who reigned there about the year 264, yet there are found at the same place ruins of buildings that appear to be of far greater antiquity, and that are not less beautiful. The ancient Persepolis is sufficient to prove this assertion. When we duly reflect on all these matters, and especially if we attempt to acquire any knowledge of this science, we shall soon be convinced that it but ill becomes a petit-maitre to laugh at a learned antiquary.

Antiquities

The knowledge of those monuments of the ancients, the works of sculpture, statuary, graving, painting, &c. which they call *antiques*, requires a strict attention with regard to the matter itself on which the art has been exercised; as the wax, clay, wood, ivory, stones of every kind, marble, flint, bronze, and every sort of metal. We should begin by learning on what matter each ancient nation principally worked, and in which of the fine arts they excelled: For the matter itself, as the different sorts of marble, compositions of metals, and the species of precious stones, serve frequently to characterize the true antique, and to discover the counterfeit. The connoisseurs pretend also to know, by certain distinct characters in the design and execution of a work of art, the age and nation where it was made. They find, moreover, in the invention and execution, a degree of excellence which modern artists are not able to imitate. Now, though we ought to allow, in general, the great merit of the ancients in the polite arts, we should not, however, suffer our admiration to lead us into a blind superstition. There are pieces of antiquity of every sort, which have come down to us; some that are perfectly excellent: and others so wretched, that the meanest among modern artists would not acknowledge them. The mixture of the good and bad has taken place in all subjects, at all times and in all nations. The misfortune is, that most of our great antiquaries have been so little skilled in designing as scarcely to know how to draw a circle with a pair of compasses. It is prejudice, therefore, which frequently directs them to give the palm to the ancients, rather than a judgment directed by a knowledge of the art. That character

Antiquity || Antiseptics.

of expression which they find so marvellous in the works of antiquity, is often nothing more than a mere chimera. They pretend that the artists of our days constantly exaggerate their expressions; that a modern Bacchus has the appearance of a man distracted with intoxication; that a Mercury seems to be animated with the spirit of a fury; and so of the rest. But let them not decide too hastily. Almost all the antique figures are totally void of all spirit of expression; we are forced to guess at their characters. Every artificial expression requires, moreover, to be somewhat exaggerated. A statue or portrait is an inanimate figure; and must therefore have a very different effect from one which, being endowed with life, has the muscles constantly in play, and where the continual change of the features, the motion of the eyes, and the looks more or less lively, easily and clearly express the passions and sentiments. Whereas, in a figure, that is the produce of art, the delicate touches, that should express the passions, are lost to the eyes of the spectators: they must therefore be struck by strong bold characters, which can affect them at the first glance of the eye. A very moderate artist is sensible, at the same time, that he is not to give his figures extravagant expressions, or to place them in distorted attitudes.

ANTIQUITY signifies time or ages past long ago. Thus, we say, the heroes of antiquity, &c.

ANTIQUITY is also used to denote the works or monuments of antiquity. See ANTIQUITIES.

ANTIQUITY likewise expresses the great age of a thing; and in this sense we say, the antiquity of a family, the antiquity of a kingdom.

ANTIRRHINUM, SNAP-DRAGON, or CALVES SNOUT. See BOTANY *Index*.

ANTIRRHIUM, in *Ancient Geography*, a promontory at the mouth of the Corinthian bay, where it is scarce a mile broad, and where it separates Ætolia from the Peloponnesus; so called from its opposite situation to Rhium in Peloponnesus (Pliny): both are now called the *Dardanelles of Lepanto*.

ANTISABBATARIANS, a modern religious sect who oppose the observance of the Christian sabbath. The great principle of the Antisabbatarians is, that the Jewish sabbath was only of ceremonial, not moral obligation; and consequently is abolished by the coming of Christ.

ANTISAGOGE, in *Rhetoric*, a figure differing little from that called *concession*. The following passage from Cicero is an instance of it: *Difficilis ratio belli gerendi; at plena fidei, plena pietatis: et si dicas, magnus labor, multa pericula proponuntur; at gloria ex his immortalis est consecutura.* See CONCESSION.

ANTISCII, in *Geography*, people who live on different sides of the equator, whose shadows at noon are projected opposite ways. Thus the people of the north are Antiscii to those of the south: the one projecting their shadows at noon towards the north pole, and the other towards the south pole.

ANTISCORBUTICS, medicines good in scorbutic cases.

ANTISEPTICS (from *αντι* and *σηπτος*, *putrid*, of *σηπω*, *to putrefy*), an appellation given to such substances as resist putrefaction.

We have some curious experiments in relation to antiseptic substances by Dr Pringle, who has ascertained their several virtues. Thus, in order to settle the antiseptic virtue of salts, he compared it with that of common sea salt; which being one of the weakest, he supposes equal to unity, and expresses the proportional strength of the rest by higher numbers, as in the following table. Antiseptics.

Salts, their antiseptic virtue.

Sea salt -	1	Saline mixture -	3
Sal gemmæ -	1+	Nitre - -	4+
Tartar vitriolated	2	Salt of hartshorn	4+
Spiritus Mindereri	2	Salt of wormwood	4+
Tartarus solubilis	2	*Borax* -	12+
Sal diureticus -	2+	Salt of amber -	20+
Crude *sal ammoniac*	3	Alum -	30+

In this table the proportions are marked in integral numbers: only to some there is added the sign +, to show, that those salts are possessed of a stronger antiseptic virtue than the number in the table expresses, by some fractions: unless in the three last, where the same sign imports that the salt may be stronger by some units.

Some resinous and other substances even exceed the antiseptic virtues of the neutral salts; thus myrrh, asafœtida, terra japonica, and aloes, are at least 12 times more antiseptic than sea salt. Two grains of camphor are equivalent to 60 grains of that salt. An infusion of a few grains of Virginian snake-root, in powder, exceeds 12 times its weight of sea salt. Chamomile flowers have nearly the same extraordinary quality. The Jesuits bark has it also. Besides these, pepper, ginger, saffron, contrayerva root, are 12 times more antiseptic than sea salt. Dried sage, rhubarb, the root of the wild valerian, mint, angelica, ground ivy, senna, green tea, red roses, wormwood, mustard, and horse radish, were likewise found more antiseptic than the standard.

To the class of antiseptic medicines may likewise be added fermented liquors, acids, spirits, and even those plants called *anti-acids*, and erroneously supposed hasteners of putrefaction, particularly horse radish. Now vegetables, possessing this virtue, are the more valuable, in that being usually free of acrimony, they may be taken in much greater quantities than either spirits, acids, resins, or even the neutral salts.

Antiseptics are prescribed in all putrid, malignant, and pestilential cases. It is to be remarked, however, that different kinds of them are to be given in different diseases, and even in different stages of the same disease. Thus, the bark is a specific in gangrene, when the vessels are relaxed, and the blood resolved or disposed to putrefaction; but will fail, if the vessels are too full, or the blood be too thick. With the same caution is the bark to be used in wounds, viz. chiefly in cases of absorbed matter, when it infects the humours, and brings on a hectic fever.

By the great antiseptic virtue of alum, the bark, and other astringents, it should seem, that astriction had no small share in the cure of putrid disorders; and, indeed, the very nature of putrefaction consists in a separation or disunion of the parts. But as astringents are improper to be administered in many cases, contrayer-

Antiseptics || Antitactæ.

va root, snake root, camphor, &c. may supply their place; which, though highly antiseptic, have very little, or any, of an astringent quality.

ANTISPASMODICS, are medicines proper for the cure of spasms and convulsions. Opium, balsam of Peru, and the essential oils of many vegetables, are the principal in this class of medicines. Opium excels, for its immediate effects. Peruvian balsam, in many instances, produces more lasting benefit than opium, and sometimes succeeds where opium fails. As antispasmodics, the essential oils differ in this from opium, that they act more on a particular part than on the system in general, and have no soporific effect. Some medicines remove spasms by immediate contact, as asses milk, cream, oil of almonds; others by repelling heat, as gas, sulphur, nitre, sal ammoniac, &c. And where the strictures are produced by inanition and a defect of vital heat, spasms are removed by those medicines that restore the *vis vitæ*, such as valerian, castor, musk, &c.

ANTISTASIS, in *Oratory*, a defence of an action from the consideration that, had it been omitted, worse would have ensued. This is called by Latin writers *comparativum argumentum;* such, *e. g.* would be the general's defence who had made an inglorious capitulation, That, without it, the whole army must have perished.

ANTISTHENES, a Greek philosopher, and founder of the Cynics. He was born at Athens, and passed the former part of his life as a soldier. Having afterwards been an attendant at the lectures of Socrates, he was principally charmed with those exhortations of that great philosopher, which persuaded to frugality, to temperance, and to moderation; these Antisthenes was resolved to practise by carrying every precept to its utmost extent. Permitting therefore his beard to grow, he went about the streets in a thread-bare coat, scarcely to be distinguished from a common beggar. He prided himself upon the most rigid virtue, and thought himself obliged to attack the vicious wherever he found them. This gave him some reputation in the city; but it may be supposed, that, in a place so very luxurious as Athens, he had more enemies than disciples. His philosophy consisted rather in action than speculation: it was therefore his constant maxim, That to be virtuous was to be happy, and that all virtue consisted in action; that the wise man should live for himself, contented in all situations, and happy alone in the consciousness of his own virtue. He acknowledged nothing to be good but what was honourable; and asserted, that virtue might be acquired by practice. Laertius tells us there were 10 tomes of his works; and he has given us many of his apophthegms.

ANTISTOCHEON, in *Grammar*, the using one letter instead of another: as *olli* for *illi*.

ANTISTROPHE, in *Grammar*, a figure by which two things mutually depending on one another, are reciprocally converted; as, *the servant of the master, the master of the servant.*

ANTISTROPHE, among lyric poets, that part of a song and dance in use among the ancients, which was performed before the altar, in returning from west to east; in opposition to strophe. See STROPHE and ODE.

ANTITACTÆ, in church history, a branch of Gnostics, who held, that God was good and just, but that a creature had created evil; and consequently that it is our duty to oppose this author of evil, in order to avenge God of his adversary. Antitactæ || Antitypes.

ANTITHENAR, in *Anatomy*, a name given to the adductor indicis. See ANATOMY, *Table of the Muscles.*

ANTITHESIS, in *Rhetoric*, a contrast or opposition of words or sentiments. Such is that of Cicero, in the second Catilinarian: "On one side stands modesty, on the other impudence; on one fidelity, on the other deceit; here piety, there sacrilege; here continency, there lust, &c." Such also is that of Augustus to some seditious young men, *Audite, juvenes, senem, quem juvenem senes audivere.* Such again is that of Seneca: *Curæ læves loquuntur, ingentes stupent.* And that of Virgil:

Flectere si nequeo superos, Acheronta movebo.

St Augustine, Seneca, Salvian, and many other ancient writers, seem greatly to affect antitheses; but among the moderns they are generally decried. Desmaretz represents them as the favourites of young writers. The following is an example of modern antithesis.

——Though gentle, yet not dull;
Strong, without rage; without o'erflowing, full.

ANTITHESIS is sometimes used for controversy. In this sense, we meet with *antithetic* method, *antithetic* discourses, &c. Marcion composed a volume of Antitheses, or contrarieties and oppositions between the law and the gospel.

ANTITRAGUS MUSCULUS, in *Anatomy*, a muscle of the ear. See ANATOMY, *Table of the Muscles.*

ANTITRINITARIANS, those who deny the trinity, and teach that there are not three persons in the Godhead. Thus the Samosatenians, who do not believe the distinction of persons in God; the Arians, who deny the divinity of the Word, and the Macedonians, who deny that of the Holy Spirit, are all properly Antitrinitarians. Among the moderns, Antitrinitarians are particularly understood of Socinians, called also Unitarians.

The *Bibliotheca Antitrinitariorum*, or *Antitrinitarian Library*, is a posthumous work of Christopher Sandius, an eminent Antitrinitarian; wherein he gives a list, digested in order of time, of all the Socinian or modern Antitrinitarian authors, with a brief account of their lives, and a catalogue of their works. See UNITARIAN.

ANTITYPE, a Greek word, properly signifying a type or figure corresponding to some other type.

The word antitype occurs twice in the New Testament; viz. in the epistle to the Hebrews, ix. 24. and in St Peter, 1 Ep. iii. 21. where its genuine import has been much controverted. The former says, that "Christ is not entered into the holy places made with hands, which are, αντιτυπα, the figures or antitypes of the true—now to appear, in the presence of God for us." Now τυπος signifies the pattern by which another thing is made; and as Moses was obliged to make the tabernacle, and all things in it, according to the pattern shown him in the mount, the tabernacle so formed was the antitype of what was shown to Moses: any thing, therefore, formed according to a model or pattern,

Antitype ‖ Antoine.

tern, is an antitype. In the latter passage, the apostle speaking of Noah's flood, and the deliverance only of eight persons in the ark from it, says Ω και ημας αντιτυπον νυνσωζει βαπτισμα, *Baptism being an antitype to that, now saves us; not putting away the filth of the flesh, but the answer of a good conscience towards God, &c.* The meaning is, that righteousness, or the answer of a good conscience towards God, now saves us by means of the resurrection of Christ, as formerly righteousness saved these eight persons by means of the ark, during the flood. The word antitype, therefore, here signifies a general similitude of circumstances; and the particle ω, *whereunto*, refers, not to the immediate antecedent, υματος, *water*, but to all that precedes.

ANTITYPE, among the ancient Greek fathers, and in the Greek liturgy, is also applied to the symbols of bread and wine in the sacrament. Hence it hath been argued, by many Protestants, that the Greeks do not really believe the doctrine of transubstantiation; because they call the bread and wine *antitypes*, αντιτυπα, q. d. figures, similitudes; and this even after the consecration.

ANTIUM, in *Ancient Geography*, a city of the Volsci, (Livy); situated on the Tuscan sea, yet without a harbour, because they had a neighbouring hamlet called *Ceno*, with a harbour, (Strabo). The Romans gained their first reputation in naval affairs against the Antiates; part of whose ships they conveyed into the arsenal of Rome, and part they burnt; and with their beaks or rostra adorned the pulpit erected in the forum, thence called *Rostra*, (Livy, Florus). Here stood a famous temple of Fortune, (Horace). Addison says, there were two Fortunæ worshipped at Antium.—It is now extinct, but the name still remains in the *Capo d' Anzo*.

ANTIVARI, a strong town of Turkey in Europe, in Dalmatia, a Greek archbishop's see, and subject to the Turks. E. Long. 19. 15. N. Lat. 42. 20.

ANTIVIRGILIAN HUSBANDRY, an appellation given to Mr Tull's new method of horse-hoeing husbandry. See AGRICULTURE.

ANTLER, among sportsmen, a start or branch of a deer's attire.

Brow ANTLER, denotes the branch next the head; and,

Bes ANTLER, the branch next above the brow antler.

ANTLIA, an ancient machine, supposed to be the same with our pump. Hence the phrase *in antliam condemnari*, according to the critics, denotes a kind of punishment whereby criminals were condemned to drain ponds, ditches, or the like.

ANTOECI, in *Geography*, those inhabitants of the earth who live under the same meridian, and at the same distance from the equator: the one toward the north, and the other toward the south. Hence they have the same longitude: and their latitude is also the same, but of a different denomination. They are in the same semicircle of the meridian, but in opposite parallels. They have precisely the same hours of the day and night, but opposite seasons; and the night of the one is always equal to the day of the other.

ANTOINE, a town of France, in Dauphiny, in the diocese of Vienne, with a celebrated abbey. It is seated among the mountains, 13 miles east of Lyons. E. Long. 5. 20. N. Lat. 45. 43.

Antoine ‖ Antonides.

ANTONA, (Tacitus); a river of Britain, which Camden supposes to be a faulty reading for Avuona or Aufona, (the Avon).

ANTONACUM, ANTONNACUM, or ANTUNNACUM, a town of the Treviri; now *Andernach*, below Coblentz. E. Long. 7. 5. N. Lat. 50. 25.

ANTONIA, a citadel of Jerusalem, the origin of which we have in Josephus: who says, that Hircanus, the first high-priest of that name, built Baris near the temple, a house with turrets, where he generally resided. Herod afterwards made it stronger, for the security and defence of the temple; and in honour of Mark Antony, who then commanded in the east, called it *Antonia*. It was very extensive, and could accommodate a Roman legion: from it there was a full view of the temple.

ANTONIA, *Saint*, a town of France, in the department of Lot and Garonne, and in the diocese of Rhodez, whose fortifications are demolished. It is seated on the river Aveiron. E. Long. 0. 55. N. Lat. 44. 10.

ANTONIAN WATERS, medicinal waters of Germany, very pleasant to the taste, and esteemed good in many chronic and hypochondriac cases. See TONSTEIN.

ANTONIANO, SILVIO, a man of great learning, who raised himself from a low condition by his merit, was born at Rome in the year 1540. When he was but ten years old, he could make verses upon any subject proposed to him; and these so excellent, though pronounced extempore, that even a man of genius could not compose the like without a good deal of time and pains. The duke of Ferrara coming to Rome, to congratulate Marcellus II. upon his being raised to the pontificate, was so charmed with the genius of Antoniano, that he carried him to Ferrara, where he provided able masters to instruct him in all the sciences. From thence he was sent for by Pius IV. who made him professor of the belles lettres in the college at Rome. Antoniano filled this place with so much reputation, that, on the day when he began to explain the oration, *pro Marco Marcello*, he had a vast crowd of auditors, and among these no less than 25 cardinals. He was afterwards chosen rector of the college; and after the death of Pius IV. being seized with a spirit of devotion, he joined himself to Philip Neri, and accepted the office of secretary to the sacred college, offered him by Pius V. which he executed for 25 years with the reputation of an honest and able man. He refused a bishopric which Gregory XIV. would have given him; but he accepted the office of secretary to the briefs, offered him by Clement VIII. who made him his chamberlain, and afterwards a cardinal. Antoniano killed himself by too great fatigue: for he spent whole nights in writing letters; which brought on a sickness, whereof he died, in the 63d year of his age. He wrote with such ease and fluency, that he never almost made any blot or rasure; and it is said of him, that he preserved the flower of his virginity during his whole life.

ANTONIDES VANDER GOES, JOHN, an eminent Dutch poet, born at Goes in Zealand, the 3d of April 1647. His parents were Anabaptists, people of good character, but of low circumstances. They went to live at Amsterdam when Antonides was about four years

Antonides, Antoninus.

old; and, in the ninth year of his age, he began his studies, under the direction of Hadrian Junius and James Cocceius. Antonides took great pleasure in reading the Latin poets, and carefully compared them with Grotius, Heinsius, &c. By this means he acquired a taste for poetry, and enriched his mind with noble ideas. He first attempted to translate some pieces of Ovid, Horace, and other ancients; and, having formed his taste on these excellent models, he at length undertook one of the most difficult tasks in poetry, to write a tragedy: This was entitled *Trazil*, or, *The invasion of China*. Antonides, however, was so modest, as not to permit it to be published. Vondel, who was then engaged in a dramatic piece, which was taken also from some event that happened in China, read Antonides's tragedy; and was so well pleased with it, that he declared, if the author would not print it, he would take some passages out of it, and make use of them in his own tragedy. He accordingly did so; and it was reckoned much to the honour of Antonides, to have written what might be adopted by so great a poet as Vondel was acknowledged to be by all good judges. Upon the conclusion of the peace between Great Britain and Holland, in the year 1674, Antonides wrote a piece, entitled *Bellona aan band*, i. e. "Bellona chained;" a very elegant poem, consisting of several hundred verses. He next wrote an ingenious heroic poem, which he entitled *The River Y* (the river on which Amsterdam is built).

Antonides's parents had bred him up an apothecary; but his remarkable genius for poetry soon gained him the esteem and friendship of several persons of distinction; and particularly of Mr Buisero, one of the lords of the admiralty at Amsterdam, and a great lover of poetry, who sent him at his expence to pursue his studies at Leyden, where he remained till he took his degree of doctor of physic, and then his patron gave him a place in the admiralty. In 1678, Antonides married Susanna Bermans, a minister's daughter, who had also a talent for poetry. His marriage was celebrated by several eminent poets, particularly by the famous Peter Francius, professor of eloquence, who composed some Latin verses on the occasion. After marriage, he did not much indulge his poetic genius; and within a few years he fell into a consumption, of which he died on the 18th September 1684, being then but thirty-seven years and a few months old. He is esteemed the most eminent Dutch poet after Vondel. His works have been printed several times, having been collected by Father Antony Tansz. The last edition was printed by Nicholas Ten Hoom, at Amsterdam, in the year 1714, in 4to, under the direction of David Van Hoogstraaten, one of the masters of the Latin school of that city, who added to it also the life of the poet.

ANTONINUS Pius, a celebrated Roman emperor, was born A. D. 86, at Lanuvium in Italy. Distinguished for eminence of character, his family had long maintained the honour of the house of Nismes in Gaul, from whence they had descended. Both his father and grandfather had held the office of consul. Arius Antoninus, his maternal grandfather, by his amiable disposition and love of literature, had acquired an eminent character, and was very intimate with Pliny the younger. Under him the young Titus after his father's death completed his education. His character on arriving at the age of maturity, manifested itself in the most promising manner. To an improved understanding, a virtuous heart, a mild and dignified character, and a noble eloquence, he joined a happy physiognomy. Simple in his taste, and guided by temperance in all his actions and sentiments, he was entirely free from all affectation and pomposity. Antoninus.

In the year 120, among the many public honours which his birth and connexions gave him a claim to, he was elevated to the high post of consul, and was afterwards appointed by Adrian to be one of the four consulars, betwixt whom the supreme power of Italy was divided. Becoming in his turn proconsul of Asia, he acquitted himself with such reputation that he even excelled his grandfather Arius who had formerly enjoyed that high trust. Returning from Asia he was not only received into the favour, but likewise the confidence and council of Adrian, and was always disposed to act with lenity. He married Annia Faustina, the daughter of Annius Verus, whose character was far from being untaxed with reproach; but his lenient disposition induced him to avoid public scandal, and he behaved towards his aged father-in-law with the most becoming respect. Two sons and two daughters were the fruits of this marriage. The sons died when they were young, and the eldest daughter, who was married to Lamia Sylvanus, died when Titus proceeded towards his Asiatic government. Faustina the youngest married Marcus Aurelius, who was afterwards emperor.

After the death of Verus, Adrian resolving to adopt Antoninus, he was induced to accept of the succession to so important a charge as the Roman empire, although with a considerable degree of reluctance, and was accordingly nominated by Adrian in February 25. A. D. 138, in the presence of the council of the chief senators, who at the same time created him his colleague in performing the proconsular and tribunitial duties. Extending his plans of adoption still farther, Adrian caused Antoninus adopt the son of Verus, then seven years of age, and Marcus Annius, afterwards named Aurelius, then seventeen years of age, a relation of Adrian's, and nephew to his own wife. The dutiful and merited attention which Antoninus bestowed on Adrian during the last months of his illness, gives a very high idea of his character. On July 10. A. D. 138, he succeeded to the empire amidst the universal acclamations of the senate and people, who anticipated in his well tried virtues that happiness which a good and wise sovereign is able to bestow upon his subjects.

The Roman world enjoyed such tranquillity under his reign that it affords few materials for history; yet it is to be regretted that Capitolinus is the only historian from whom any direct information can be received concerning this peaceful period, and he is none of the most perspicuous. It however appears that the usual honours and titles, together with the addition of the surname of Pius, which both his conduct and zeal in defending and honouring the memory of his predecessor united to suggest, were willingly conferred upon him by the senate. In the beginning of his reign there were several conspiracies formed against him, but this only afforded him an instance of signalizing his clemency, which he did in the most striking manner. Although he was unable to prevent justice from taking its due

course

Antoninus. course against the ringleaders, he prohibited all investigation after their accomplices, and took the son of Attilius, one of the principal conspirators, under his protection. Various commotions were raised in several parts of the empire; but by the vigilance of his lieutenants, these were easily quelled. The incursions of the Brigantes in Britain were restrained, and a new wall which was built to the north of that of Adrian, from the mouth of the Esk to that of Tweed, and which was called the *Wall of Antoninus*, was fixed as the boundary of the Roman province in Britain. The reign of Antoninus upon the whole was singularly peaceful, and realized a saying of Scipio, "That he preferred saving the life of one citizen, to destroying a thousand enemies."

A desire of promoting the interest of his people, of protecting them from oppression, of administering justice through every corner of the realm, and of being instrumental to the happiness and peace of his government, influenced all his proceedings. He delighted greatly in laying before the senate the motives of all his actions; and in his manner of living and conversing he employed the same prudential economy and air of equality, which had so distinguished his predecessors Trajan and Adrian. On account of the sweetness of his temper he bore with firmness many indignities offered him; and under his reign the race of informers was entirely extinguished, and condemnations and confiscations were very rare. The various public calamities which occurred in his time were all relieved by him with the greatest benevolence. He avoided as much as possible laying any burthens upon his people, and on this account made few journeys through his dominions. He was frugal in the use of the public revenues, but profuse in his own patrimony, a great economist, devoid of avarice, and very liberal towards works of ornament and utility, and even towards gratifying the pleasure of his people. A temple in honour of Adrian in Rome, and perhaps the amphitheatre and aqueduct at Nismes, were his chief buildings.

Jurisprudence was to this emperor, like that of his predecessor, an interesting subject for improvement; and several decrees which he issued, display his commendable spirit of equity. The natural consequence of this equity was, that Antoninus acquired a reputation and fame which no military atchievements could have conferred; and his friendship was courted by the neighbouring princes.

There is scarcely a blot to be found to tarnish his character; and frugality, modesty, and harmless amusement continued to employ his private hours. It may perhaps be admitted that he was too indulgent towards an unworthy wife, and that the divine honours he bestowed on her memory were not merited by her conduct. In the management of his complicated business, he was exact to such a degree that it was even ridiculed by some; but he found the daily advantage of this accuracy. The growing virtue of Marcus Aurelius soon drew his attention after he ascended the throne, and having given him his daughter in marriage, he declared him Cæsar. Nor was he mistaken in his choice; for Aurelius acted with the utmost fidelity and affection amid all the honours that he continued to confer upon him. Enjoying this large share of domestic bliss, in the 74th year of his life he was seized with a fever at his favourite country seat of Lori. Convinced of his approaching fate, he convened the principal officers of the state, and confirmed his election of Aurelius, and gave him the imperial ensigns. A delirium ensued, in an interval of which he gave the watchword *Æquanimitas*, and calmly resigned his breath in the 23d year of his reign. His ashes were consigned to the tomb of Adrian, and divine honours paid to his memory. He was universally regretted, and succeeding emperors bore his name as a badge of honour. The senate and his successor erected a sculptured pillar to his memory, which is still shown to strangers as one of the chief ornaments of Rome. (*Gen. Biog.*). Antoninus.

Antoninus Philosophus, *Marcus Aurelius*, the Roman emperor, born at Rome, the 26th of April, in the 121st year of the Christian era. He was called by several names till he was admitted into the Aurelian family, when he took that of Marcus Aurelius Antoninus. Hadrian, upon the death of Cejonius Commodus, turned his eyes upon Marcus Aurelius; but, as he was not then 18 years of age, and consequently too young for so important a station, he fixed upon Antoninus Pius, whom he adopted, upon condition that he should likewise adopt Marcus Aurelius. The year after this adoption, Hadrian appointed him questor, though he had not yet attained the age prescribed by the law. After the death of Hadrian, Aurelius married Faustina, the daughter of Antoninus Pius, by whom he had several children. In the year 139, he was invested with new honours by the emperor Pius, in which he behaved in such a manner as endeared him to that prince and the whole people.

Upon the death of Pius, which happened in the year 161, he was obliged by the senate to take upon him the government; in the management of which he took Lucius Verus as his colleague. Dion Cassius says, that the reason of doing this was, that he might have leisure to pursue his studies, and on account of his ill state of health; Lucius being of a strong vigorous constitution, and consequently more fit for the fatigues of war. The same day he took upon him the name of Antoninus, which he gave likewise to Verus his colleague, and betrothed his daughter Lucilla to him. The two emperors went afterwards to the camp; where, after having performed the funeral rites of Pius, they pronounced each of them a panegyric to his memory. They discharged the government in a very amicable manner. It is said that, soon after Antoninus had performed the apotheosis of Pius, petitions were presented to him by the Pagan priests, philosophers, and governors of provinces, in order to excite him to persecute the Christians; which he rejected with indignation, and interposed his authority for their protection, by writing a letter to the common assembly of Asia, then held at Ephesus (A). The happiness which the empire began to enjoy under these two emperors was interrupted, in the year 162, by a dreadful inundation of the Tiber, which

(A) Eusebius has preserved this letter, Hist. Eccles. lib. iv. cap. 13. but he falsely ascribes it to Antoninus Pius, whereas it was wrote by Marcus Antoninus, as Valerius makes it appear in his annotations on Eusebius.

Antoninus. which destroyed a vast number of cattle, and occasioned a famine at Rome. This calamity was followed by the Parthian war; and at the same time the Catti ravaged Germany and Rhætia. Lucius Verus went in person to oppose the Parthians; and Antoninus continued at Rome, where his presence was necessary.

During this war with the Parthians, about the year 163 or 164, Antoninus sent his daughter Lucilla to Verus, she having been betrothed to him in marriage, and attended her as far as Brundusium: he intended to have conducted her to Syria; but it having been insinuated by some persons, that his design of going into the east was to claim the honour of having finished the Parthian war, he returned to Rome. The Romans having gained a victory over the Parthians, who were obliged to abandon Mesopotamia, the two emperors triumphed over them at Rome in the year 166; and were honoured with the title of *Fathers of their country*. This year was fatal, on account of a terrible pestilence which spread itself over the whole world, and a famine under which Rome laboured: it was likewise in this year that the Marcomanni, and many other people of Germany, took up arms against the Romans; but the two emperors having marched in person against them, obliged the Germans to sue for peace. The war, however, was renewed the year following, and the two emperors marched again in person; but Lucius Verus was seized with an apoplectic fit, and died at Altinum. The Romans were now defeated with great slaughter; and the emperor, not choosing to burden his subjects with new taxes, exposed to sale the furniture of the palace, the gold and silver plate belonging to the crown, and his wife's rich garments embroidered with gold, and a curious collection of pearls, which Adrian had purchased during his long progress through the provinces of the empire, and was called *Adrian's cabinet*.

In the year 170, Antoninus made vast preparations against the Germans, and carried on the war with great vigour. During this war, in 174, a very extraordinary event is said to have happened, which, according to Dion Cassius, was as follows: Antoninus's army being blocked up by the Quadi, in a very disadvantageous place, where there was no possibility of procuring water; in this situation, being worn out with fatigue and wounds, oppressed with heat and thirst, and incapable of retiring or engaging the enemy, in an instant the sky was covered with clouds, and there fell a vast quantity of rain: the Roman army were about to quench their thirst, when the enemy came upon them with such fury, that they must certainly have been defeated, had it not been for a shower of hail, accompanied with a storm of thunder and lightning, which fell upon the enemy, without the least annoyance to the Romans, who by this means gained the victory (B). Antoninus. In 175, Antoninus made a treaty with several nations of Germany. Soon after, Avidius Cassius, governor of Syria, revolted from the emperor: this insurrection, however, was put an end to by the death of Cassius, who was killed by a centurion named *Anthony*. Antoninus behaved with great lenity towards those who had been engaged in Cassius's party; he would not put to death, nor imprison, nor even sit in judgment himself upon any of the senators engaged in this revolt; but he referred them to the senate, fixing a day for their appearance, as if it had been only a civil affair. He wrote also to the senate, desiring them to act with indulgence rather than severity; nor to shed the blood of any senator or person of quality, or of any other person whatsoever; but to allow this honour to his reign, that, even under the misfortune of a rebellion, none had lost their lives, except in the first heat of the tumult. In 176, Antoninus visited Syria and Egypt: the kings of those countries, and ambassadors also from Parthia, came to visit him. He staid several days at Smyrna; and, after he had settled the affairs of the east, went to Athens, on which city he conferred several honours, and appointed public professors there. From thence he returned to Rome with his son Commodus, whom he chose consul for the year following, though he was then but 16 years of age, having obtained a dispensation for that purpose. On the 27th of September, the same year, he gave him the title of *Imperator;* and on the 23d of December, he entered Rome in triumph, with Commodus, on account of the victories gained over the Germans. Dion Cassius tells us, that he remitted all the debts which were due to himself and the public treasury during 46 years, from the time that Hadrian had granted the same favour, and burnt all the writings relating to these debts. He applied himself likewise to correct many enormities, and introduced several excellent regulations. In the year 179, he left Rome with his son Commodus, in order to go against the Marcomanni, and other barbarous nations; and the year following gained a considerable victory over them, and would, in all probability, have entirely subdued them in a very short time, had he not been taken with an illness, which carried him off on the 17th of March 180, in the 59th year of his age, and 19th of his reign. The whole empire regretted the loss of so valuable a prince, and paid the greatest regard to his memory: he was ranked amongst the gods, and almost every person had a statue of him in their houses. His book of meditations has been much admired by the best judges.

Antonine's

(B) The Pagans, as well as Christians, according to Mr Tillement (p. 621. art xvi.), have acknowledged the truth of this prodigy, but have greatly differed as to the cause of such a miraculous event; the former ascribing it, some to one magician and some to another: In Antoninus's pillar, the glory is ascribed to Jupiter, the god of rain and thunder. But the Christians affirmed, that God granted this favour at the prayer of the Christian soldiers in the Roman army, who are said to have composed the twelfth or Melitene legion; and, as a mark of distinction, we are told that they received the title of the *Thundering legion*, from Antoninus (Euseb. Eccles. Hist. lib. v. cap. 5.). Mr Moyle, in the letters published in the second volume of his works, has endeavoured to explode this story of the Thundering Legion; which occasioned Mr Whiston to publish an answer, in 1726, entitled, *Of the Thundering Legion; or, Of the miraculous deliverance of Marcus Antoninus and his army, upon the prayers of the Christians.*

Antoninus. *Antonine's Column.* See Column.

Antoninus's Wall, the name of the third rampart or defence that had been built or repaired by the Romans against the incursions of the North Britons. It is called by the people in the neighbourhood, *Graham's Dyke*; from the notion that one Graham, or Grimus, first made a breach in it after the retreat of the Romans out of Britain. The first barrier erected by the Romans was the chain of forts made by Agricola * from the frith of Forth to that of Clyde, in the year 81, to protect his conquest from the inroads of the Caledonians. The second was the vallum, or dyke, flung up by Adrian † in the year 121. It terminated on the western side of the kingdom at *Axelodunum*, or *Brugh*, on the Solway sands, and was supposed to have reached no further than *Pons Ælii*, or *Newcastle*, on the eastern. But from an inscription lately discovered, it appears to have extended as far as the wall of Severus ‡. This rampart of Adrian's was situated much farther south than Agricola's chain; the country to the north having been either, according to some authors, recovered by the native Britons after the departure of Agricola; or, according to others, voluntarily slighted by Adrian. However, this work of Adrian's did not long continue to be the extreme boundary of the Roman territories to the north in Britain. For Antoninus Pius, the adopted son and immediate successor of Adrian, having, by his lieutenant Lollius Urbicus, recovered the country once conquered by Agricola, commanded another rampart to be erected between the friths of Forth and Clyde, in the track where Agricola had formerly built his chain of forts. The great number of inscriptions which have been found in or near the ruins of this wall, or rampart, to the honour of Antoninus Pius, leave us no room to doubt its having been built by his direction and command. If the fragment of a Roman pillar with an inscription, now in the college library of Edinburgh, belonged to this work, as it is generally supposed to have done, it fixes the date of its execution to the third consulship of Antoninus, which was A. D. 140, only 20 years after that of Adrian, of which this seems to have been an imitation. This wall or rampart, as some imagine, reached from Caer-ridden on the frith of Forth to Old Kirkpatrick on the Clyde; or, as others think, from Kinniel on the east to Dunglass on the west. These different suppositions hardly make a mile of difference in the length of this work, which, from several actual mensurations, appears to have been 37 English or 40 Roman miles. Capitolinus, in his life of Antoninus Pius, directly affirms, that the wall which that emperor built in Britain was of turf. This in the main is unquestionably true; though it is evident (from the vestiges of it still remaining, which not very many years ago were dug up and examined for near a mile together) that the foundation was of stone. Mr Camden also tells us, from the papers of one Mr Anthony Pont, that the principal rampart was faced with square stone, to prevent the earth from falling into the ditch. The chief parts of this work were as follows: 1. A broad and deep ditch, whose dimensions cannot now be discovered with certainty and exactness, though Mr Pont says, it was 12 feet wide. 2. The principal wall or rampart was about 12 feet thick at the foundation, but its original height cannot now be determined. This wall was situated on the south brink of the ditch. 3. A military way on the south side of the principal wall, well paved, and raised a little above the level of the ground. This work, as well as that of Adrian, was defended by garrisons placed in forts and stations along the line of it. The number of these forts or stations, whose vestiges were visible in Mr Pont's time, was 18, situated at about the distance of two miles from each other. In the intervals between the forts, there were turrets or watch towers. But the number of these, and their distance from each other, cannot now be discovered. Antoninus.

It is not a little surprising, that though it is now more than 1600 years since this work was finished, and more than 1300 since it was slighted, we can yet discover from authentic monuments, which are still remaining, by what particular bodies of Roman troops almost every part of it was executed. This discovery is made from inscriptions upon stones, which were originally built into the face of the wall, and have been found in or near its ruins, and are carefully preserved. The number of stones with inscriptions of this kind now extant, is 11: of which six may be seen at one view in the college of Glasgow, one in the college of Aberdeen, one in the college of Edinburgh, one in the collection of Baron Clerk, one at Cochnoch house, and one at Calder house. From these inscriptions it appears in general, that this great work was executed by the second legion, the vexillations of the sixth legion and of the twentieth legion, and one cohort of auxiliaries. If these corps were all complete, they would make in all a body of 7800 men. Some of these inscriptions have suffered greatly by the injuries of time and other accidents; so that we cannot discover from them, with absolute certainty, how many paces of this work were executed by each of these bodies of troops. The sum of the certain and probable information contained in these inscriptions, as it is collected by the learned and illustrious Mr Horsley, stands thus:

	Paces.
The second legion built - - -	11,603
The vexillation of the sixth legion -	7411
The vexillation of the twentieth legion -	7801
All certain - -	26,815
The vexillation of the twentieth legion, the monument certain, and the number probable	3411
The same vexillation, on a plain monument, no number visible, supposed - - -	3500
The sixth legion, a monument, but no number, supposed - - - -	3000
Cohors prima Cugernorum - -	3000
Total	39,726

or 39 miles 726 paces, nearly the whole length of the wall. It would have been both useful and agreeable to have known how long time these troops were employed in the execution of this great work. But of this we have no information. Neither do we know what particular bodies of troops were in garrison in the several forts and stations along the line of this wall, because these garrisons were withdrawn before the *Notitia Imperii* was written.

Though we cannot discover exactly how many years this

See *Agricola.*

See *Adrian.*

See *Severus.*

Antonio. this wall of the emperor Antonius continued to be the boundary of the Roman territories in Britain, yet we know with certainty that it was not very long. For we are told by an author of undoubted credit, that, in the reign of Commodus, A. D. 180, "he had wars with several foreign nations, but none so dangerous as that of Britain. For the people of the island, having passed the wall which divided them from the Romans, attacked them, and cut them to pieces."

Dio. l. 72. p. 802.

ANTONIO, NICHOLAS, knight of the order of St James and canon of Seville, did great honour to the Spanish nation by his Bibliotheque of their writers. He was born at Seville in 1617, being the son of a gentleman whom King Philip IV. made president of the admiralty established in that city in 1626. After having gone through a course of philosophy and divinity in his own country, he went to study law at Salamanca; where he closely attended the lectures of Francisco Ramos del Manzano, afterwards counsellor to the king and preceptor to Charles II. Upon his return to Seville, after he had finished his law studies at Salamanca, he shut himself up in the royal monastery of Benedictines, where he employed himself several years in writing his *Bibliotheca Hispanica*, having the use of the books of Bennet de la Sana, abbot of that monastery and dean of the faculty of divinity at Salamanca. In the year 1659, he was sent to Rome by King Philip IV. in the character of agent general from the prince: he had also particular commissions from the inquisition of Spain, the viceroys of Naples and Sicily, and the governor of Milan, to negotiate their affairs at Rome. The cardinal of Aragon procured him, from Pope Alexander VII. a canonry in the church of Seville, the income whereof he employed in charity and purchasing of books; he had above 30,000 volumes in his library. By this help, joined to continual labour, and indefatigable application, he was at last enabled to finish his Bibliotheca Hispanica, in four volumes in folio, two of which he published at Rome in the year 1672. The work consists of two parts; the one containing the Spanish writers who flourished before the 15th century, and the other those since the end of that century. After the publication of these two volumes, he was recalled to Madrid by King Charles II. to take upon him the office of counsellor to the crusade; which he discharged with great integrity till his death, which happened in 1684. He left nothing at his death but his vast library, which he had brought from Rome to Madrid; and his two brothers and nephews being unable to publish the remaining volumes of his Bibliotheca, sent them to Cardinal d'Aguisne, who paid the charge of the impression, and committed the care thereof to Monsieur Martin, his librarian, who added notes to them in the name of the cardinal.

ANTONIO, ST one of the Cape de Verd islands, lying in E. Long. 0. 26. N. Lat. 18. 10. It is separated from St Vincent's by a clear navigable channel two leagues in breadth. On the north side it has a good road for shipping, with a collection of fresh water rising from springs, which, however, scarcely merits the name of a pond. The island stretches from north-east to south-west, and is filled with mountains; one of which is of so extraordinary a height, as to be compared with the Peak of Teneriffe: Its top is constantly covered with snow, and, notwithstanding the clearness of the sky, is generally hid in clouds. Here are produced a variety of fruits; oranges, lemons, palms, melons, &c. and some sugar canes. The potatoes and melons are particularly excellent, and are much sought after by mariners. But notwithstanding all this plenty, the inhabitants live in the most wretched poverty. They are in number about 500, chiefly negroes, under the protection of the Portuguese, whose language they speak, and imitate their manners. To the north-west stands a village, containing about twenty huts; and at least 50 families, under the direction of a governor, or, as they call him, a *captain*, a priest, and a schoolmaster.

Antonio, Antonius.

ANTONIO, ST, a Dutch fort in Axim, on the Gold coast of Africa. It stands on a high rock, which projects into the sea in form of a peninsula; and is so environed by rocks and dangerous shoals, as to be inaccessible to an enemy but by land, where it is fortified by a parapet, drawbridge, and two batteries of heavy cannon. Besides this it has a battery towards the sea. The three batteries consist of 24 cannon. Its form is triangular; the building is neat, strong, and commodious for the extent, that being but small, on account of the narrowness of the rock on which it is built. The garrison is usually composed of 25 white men, and an equal number of negroes, under the command of a serjeant. It is maintained at the expence of the West India Company; and when well stored with provisions, is capable of making a long defence against any number of negroes. It is, however, as well as all other forts on this coast, liable to inconveniences from the heavy and continual rains, which damage the walls, and render frequent reparations necessary. This obliges the Dutch always to keep ready a quantity of lime or cement made of calcined oyster shells, of which the coast produces great numbers. This settlement was first founded by the Portuguese during the reign of Emanuel. They fixed it first upon a small point; where, finding themselves insecure, they built the fort where it now stands. They were driven out by the Dutch in 1641; and upon the conclusion of a peace with the States General, the fort remained by treaty in the hands of the Dutch West India Company, who have kept possession of it ever since.

ANTONIUS, MARCUS, a famous Roman orator. While he filled the office of prætor, Sicily fell to his lot, and he cleared the seas of the pirates which infested that coast. He was made consul with A. Posthumius Albinus, in the year of Rome 653; when he opposed the turbulent designs of Sextus Titus, tribune of the people, with great resolution and success. Some time after, he was made governor of Cilicia, in quality of proconsul; where he performed so many great exploits, that he obtained the honour of a triumph. We cannot omit observing, that in order to improve his great talent for eloquence, he became a scholar to the greatest men at Rhodes and Athens, in his way to Cilicia, and when on his return to Rome. Soon after he was appointed censor; which office he discharged with great reputation, having carried his cause before the people, against Marcus Duronius, who had preferred an accusation of bribery against him, in revenge for Antonius's having erased his name out of the list of senators, which this wise censor had done, because Duronius, when tribune of the people, had abrogated a law

law which restrained immoderate expence in feasts. He was one of the greatest orators ever known at Rome; and it was owing to him, according to the testimony of Cicero, that Rome might boast herself a rival even to Greece itself in the art of eloquence. He defended, amongst many others, Marcus Aquilius; and moved the judges in so sensible a manner, by the tears he shed, and the scars he showed upon the breast of his client, that he carried his cause. He never would publish any of his pleadings, that he might not, as he said, be proved to say in one cause, what might be contrary to what he should advance in another. He affected to be a man of no learning. His modesty, and many other qualifications, rendered him no less dear to many persons of distinction, than his eloquence made him universally admired. He was unfortunately killed during those bloody confusions raised at Rome by Marius and Cinna. He was discovered in the place where he had hid himself, and soldiers were sent to dispatch him: but his manner of addressing them had such an effect, that none but he who commanded them, and had not heard his discourse, had the cruelty to kill him. His head was exposed before the rostra, a place which he had adorned with his triumphal spoils. This happened 90 years before the Christian era.

ANTONIUS, *Marcus*, the triumvir, grandson to the former, was very handsome in his youth; for which reason he was greatly beloved by Curio, a senator, who by carrying him about in all his debaucheries, made him contract such heavy debts, that his own father forbade him his house. Curio, however, was so generous as to bail him for 250 talents. When the civil war broke out, Curio took Cæsar's party, and prevailed with Antonius to do the same; for which he was made a tribune of the people, and in that office did Cæsar great service. Cæsar having made himself master of Rome, gave Antonius the government of Italy: At the battle of Pharsalia, Cæsar confided so much in him, that he gave him the command of the left wing of his army, whilst he himself led the right. After Cæsar was made dictator he made Antonius general of the horse, though he had never been prætor; in which command he exerted his power with the utmost violence. He was made consul, when Cæsar enjoyed that honour for the fifth time, the last year of that usurper's life. On Cæsar's death, he harangued the populace with great art, and raised their fury against his murderers; flattering himself that he should easily get into the place which Cæsar had filled; but his haughty behaviour made him lose all the advantages his affected concern for Cæsar had gained him. His ill treatment of Octavius, and quarrel with him, produced another civil war; which ended in an accommodation between him, Octavius, and Lepidus, fatal to the peace of Rome. They agreed to share the supreme power among them; and many of the most illustrious Romans were sacrificed by proscription to cement this bloody league, which is known by the name of the *Second Triumvirate*. But the triumvirs were too ambitious, and hated one another too much, to be long united. Antonius went into Asia to raise money for his soldiers: during his absence, Fulvia his wife quarrelled with Octavius. When Antonius was in Asia, indulging himself in all manner of luxury, the famous Cleopatra inspired him with the most violent passion. Hearing of the quarrel between Fulvia and Octavius, and finding Octavius was become publicly his enemy, Antonius entered into a confederacy with Sextus Pompeius, who was still master of Sicily. He then went into Italy, in order to fight Octavius; but Fulvia, who had been the author and promoter of this war, dying, Octavius and Antonius came to an agreement. One of the conditions of this new peace was, that they should together attack Pompey, though the former had lately made an alliance with him. Antonius then married Octavia, sister of Octavius, as a pledge of their renewed friendship: but returned soon after to his beloved Cleopatra, and again lived with her in Alexandria. Octavius took hold of this pretence to inveigh against him, and begin the war again. At last they engaged in a sea fight at Actium, in which Octavius gained a complete victory; which was followed by the deaths both of Antonius and Cleopatra. The infatuated Antonius fell upon his own sword; and Cleopatra stung herself to death with an asp, as was supposed, to avoid gracing the victor's triumph at Rome.

ANTONOMASIA, a form of speech, in which, for a proper name, is put the name of some dignity, office, profession, science or trade; or when a proper name is put in the room of an appellative. Thus a king is called his *majesty;* a nobleman, his *lordship*. We say the *philosopher* instead of Aristotle, and the *orator* for Cicero: Thus a man is called by the name of his country, a *German*, an *Italian;* and a grave man is called a *Cato*, and a wise man a *Solomon*.

ANTOSIANDRIANS, a sect of rigid Lutherans, who oppose the doctrine of Osiander relating to justification. These are otherwise denominated *Osiandromastiges*.—The Antosiandrians deny that man is made just, with that justice wherewith God himself is just; that is, they assert, that he is not made essentially, but only imputatively, just; or, that he is not really made just, but only pronounced so.

ANTRIM, the most northerly county of Ireland. It is bounded by that of Down on the south-east, that of Londonderry on the west, from which it is separated by the river Bann, part of Armagh on the south, St George's channel on the east, and the Deucaledonian ocean on the north. Its greatest length is about 46 miles, its greatest breadth abont 27; and it contains 972 square miles, or 622,059 English acres. Though the country is much encumbered with bogs and marshes, yet it enjoys a pretty good air; and it is well peopled, chiefly with Protestants. Where it is free from bogs the soil is fruitful. It sends five members to parliament, two for the shire, and one for each of the three principal towns, Belfast, Carrickfergus, and Lisburn.

Certain narrow valleys, called *glyns*, beginning here, and running a great way along the coast, belonged formerly to the Bissets, noblemen of Scotland, who having been obliged to quit that country for having assassinated Patrick earl of Athole upon a private quarrel, came hither, and had a great estate bestowed upon them by Henry III. of England; of which in the reign of Edward II. a part was forfeited by the rebellion of Hugh, then chief of the family. Another tract near this, called the *Rowte*, belonged anciently to the Macguillers, but now to the M'Donnels, earls of Antrim.

Upon the coast of this county are the promontories

Antrim || Antwerp.

called by Ptolemy, *Robogdium*, *Vennicinium* and *Boræum*, now *Fair Foreland*, *Ramshead*, and *St Helen's head*. The river also, styled by the same author *Vidua*, and now *Crodach*, runs through this county.—Here also is the remarkable natural curiosity called the *Giant's Causeway*, for a description of which see that article. See ANTRIM, SUPPLEMENT.

ANTRIM, the capital town of the county of Antrim, in Ireland, seated at the north end of the lake Lough Neagh, about six miles from the mouth of the bay, having a good road before it, with a pier near the place, within which vessels lie dry at low water. It was anciently a borough of great consequence, as appears from the mayor's being admiral of a considerable extent of coast, as well in Down as in this county; the corporation enjoying the customs paid by all vessels within those bounds, the creeks of Bangor and Belfast only excepted. This grant, however, the crown repurchased, and thereupon transferred the custom-house to Belfast, to which town it is now much inferior as well in size as in trade. It is, however, still a place of note, and formerly sent two members to the Irish house of commons. It gives the title of *earl* to the noble family of M'Donnel.—At Antrim is a seat, with noble demesnes, and beautiful and highly cultivated lands, of the earl of Massareene. W. Long. 6. 26. N. Lat. 54. 45.

ANTRUM, among *Anatomists*, a term used to denote several cavities of the body: as the *antrum highmorianum*, or that in the maxillary or jaw bone; *antrum pylori*, or that at the bottom of the pylorus, &c.

ANTWERP, a city of the duchy of Brabant, in the Netherlands, formerly capital of the marquisate of Antwerp, otherwise called the *marquisate of the holy Roman empire*, situated in E. Long. 4. 15. N. Lat. 51. 12. It lies in a low marshy ground on the Scheld, 24 miles from Brussels to the north. It is the third city in rank in Brabant, large and well built, containing 22 squares, and above 200 streets, all straight and broad, especially that called the *Mere*, in which six coaches can go abreast. Most of the houses are of freestone, and have an air of antiquity, being high, with courts before and gardens behind. At the head of the Mere is a crucifix of brass thirty-three feet high. The cathedral dedicated to the Virgin Mary, the stadthouse, and the exchange, are magnificent structures: the latter is the first building of that kind in Europe, and on its model the exchanges of London and Amsterdam are built. Its pillars are all of blue marble, and carved, but all in a different manner. The exchange cost the city 300,000 crowns. Antwerp, towards the end of the fifteenth century, was one of the most celebrated towns that ever existed. The Scheld, on which it stands, being 20 feet deep at low water, and rising 20 feet more at flood, ships of the greatest burden came up to the queys, as in the river Thames at London; but when the United Provinces formed themselves into a free state, after having shaken off the yoke of Spain, they got the entire command of the navigation of the Scheld; which ruined the trade of Antwerp, and transferred it to Amsterdam. This made the inhabitants turn their heads to painting, jewelling, and banking, which they have continued to this day with great success and reputation; for at Antwerp bills of exchange may be negotiated for any sum to any part of Europe; and in the time of Queen Anne's wars, two brothers of the name of De Koning, paid the one the army of France, and the other that of the confederates. Besides, here is a fine manufacture of tapestry and lace; and, for the promoting of trade, an insurance company has been erected. This city was the see of a bishop, who, as abbot of St Bernard, was the second prelate in Brabant. The bishopric was of great extent, and the cathedral a most noble pile, with one of the finest steeples in the world. The emperor, Charles V. when he made his entry into Antwerp, said it ought to be put in a case, and showed only once a year for a rarity. The house of the hanse towns, built when the city was in its flourishing condition, is a stately building, with magazines above for dry goods, and cellars below for wet, and in the middle story were 300 lodging rooms for merchants; but now it is turned to a horse barrack. There is a market here, called the *Friday's Market*, because it is held every Friday, where all sorts of household goods, pictures, and jewels, are sold by auction. No city in the Netherlands has so many and so fine churches as this. Many of them, particularly the cathedral and Jesuits church, are adorned with paintings, by Sir Peter Paul Rubens, who was a native of this city; and by Quintin Masseys, who is said to have been a blacksmith; but having fallen in love with a painter's daughter, and been told by her father, when he asked her of him in marriage, that he would have none but a painter for his son-in-law, he went to Italy to study painting, and, in a few years, returned so eminent in his new profession, that he found no difficulty in obtaining the father's consent. He is interred at the entry of the cathedral, where his effigy is put up, with an inscription, signifying, that conjugal love made an Apelles of a blacksmith. The above mentioned Jesuits church is extremely magnificent, and the chapel of the Virgin, joining to it, still more so. Among the cloisters the most remarkable are, the noble and rich abbey of St Michael, on the banks of the Scheld, the apartments of which are truly royal, and in which sovereign princes were often lodged; and the English nunnery, of the order of St Teresa, the nuns of which never wore linen, nor ate flesh, and lay upon straw: the grates of the convent are so dismal, that it looks like a prison. As to the fortifications of the city, it is environed with a fine wall, planted with rows of trees on each side, with walks between, broad enough for two coaches to go abreast, being also defended by a very strong, large, regular citadel, in form of a pentagon, erected by the duke of Alva in 1568, which commands the town and the neighbouring country. The magistracy of this city is chosen only out of the several patrician families; and consists of two burgomasters and 18 echevins, besides inferior magistrates. Among the privileges granted to it by its princes, there is one by which every person born in it is a citizen, though both his father and mother were foreigners.

Antwerp.

In 1585, Antwerp underwent a remarkable siege by the duke of Parma. It was then the most wealthy city in the Netherlands, and had long been the object of his designs; but the difficulties attending the enterprise obliged him to postpone it for a considerable time. In order to succeed, it was necessary to cut off the

communication

Antwerp. communication of the city with Holland, Ghent, and all places above and below Antwerp on the Scheld. To effect this, he laid siege to Liskenhousk and Tillo, places of the utmost consequence to the security and commerce of the city: both were obstinately defended; and the siege of the latter was raised, after it had been carried on for three months: however, the duke gained several other posts on the river, where he built forts, and greatly annoyed the shipping and trade of the city. He next laid siege to Dendermonde, in order to cut off the communication with Ghent, in which he succeeded by the reduction of the town. His next attempt was on Vilvorde: this place he took by assault, and thereby cut off the communication with Brussels. Finding, however, this method of hemming in the city tedious, and ineffectual while an opening to the mouth of the river remained, he formed a design of building a bridge adross the Scheld, the extremities of which were to be defended by strong forts and outworks. He began with collecting great quantities of wood at Callo and Fort St Philip, where he intended the bridge should be built; but his project was for some time retarded by the Antwerpers, who broke down the dykes, overflowed the whole country, and carried off his magazines by the inundation. Not discouraged by this loss, he applied himself diligently to repair it, and with incredible expedition cut a canal from Steken to Callo, by which he carried off the waters. He then set to work upon the bridge, and finished it in seven months, without any interruption from the Zealanders. During the building of this bridge, Aldegonde, governor of Antwerp, proposed to build a fort on Couvensteyn dyke, in order to secure that important post, and then break down the dyke when the bridge was near finished: but he was violently opposed by certain citizens; who apprehended that their lands and villas would be destroyed by the inundation. This unseasonable opposition, with the negligence of the magistrates, who, because the markets were high, had not laid in a sufficient stock of corn, occasioned the loss of the city. However, in despite of all the duke of Parma's precantion, the Zealanders found means to throw in a convoy of corn; but the citizens, knowing they would not run the risk of carrying it back again, so cheapened the price, that these bold traders refused ever to bring their goods again to so bad a market. The Antwerpers, having thus through avarice brought on their ruin, began in a short time to suffer by famine; they then pressed the Zealanders to attempt something for their relief, but it was now too late. While the magistrates were deliberating on some means for destroying the bridge, which they might have prevented from being ever completed, one Ginebelli, a Mantuan engineer, offered his services, undertaking at a certain expence to blow it into the air. Even in this extremity the expence was grudged: but necessity at last overcame this obstacle; Ginebelli was furnished with two large vessels, a number of small boats, and every thing necessary. He formed the two large vessels into fire ships, which he set adrift with the stream, deceiving the enemy by means of false fires lighted up in the fleet of small boats. The train of one of the fire ships was expended before the time expected, and she blew up with a terrible explosion, but with little damage to the bridge. The other was more successful, carrying off all the outworks, setting fire to the whole bridge, and burying above 500 soldiers in the ruins it made. The bridge however, was repaired, and the Antwerpers were soon reduced to the greatest straits, and obliged to surrender. It is said that the city of Amsterdam had obstructed every measure for the relief of Antwerp, hoping to profit by its destruction. By a stipulation between Spain and Holland at the peace of Westphalia in 1648, the navigation of the Scheld was closed. The emperor Joseph made an attempt to break this agreement in 1785, but did not succeed. At length, when the place fell into the hands of the French in 1792, the navigation of the river was declared open. Subsequent to this period, docks and store-houses were built, and the port improved. It was surrendered to the allies in 1814, after the capitulation of Paris, and now begins to revive. It contains at present 61,800 inhabitants. Antwerp, Anubis.

ANUBIS, a symbolical deity of the Egyptians, was regarded as the faithful companion of Osiris and of Isis. Temples and priests were consecrated to him, and his image was borne in all religious ceremonies.

Cynopolis, the present Minieh, situated in the Lower Thebais, was built in honour of Anubis. The temple wherein he was worshipped no longer subsists. The priests celebrated his festivals there with great pomp, and consecrated the dog to him as his living representation. "Anubis (says Strabo) is the city of dogs, the capital of the Cynopolitan prefecture. These animals are fed there on sacred aliments, and religion has decreed them a worship." An event, however, related by Plutarch, brought them into considerable discredit with the people. Cambyses having slain the god Apis, and thrown his body into a field, all animals respected it except the dogs, which alone ate of his flesh. This impiety diminished the popular veneration for them.

Cynopolis was not the only city which burned incense on the altars of Anubis. He had chapels in almost all the temples. On solemnities, his image always accompanied those of Isis and Osiris. Rome having adopted the ceremonies of Egypt, the emperor Commodus, to celebrate the Isiac feasts, shaved his head, and himself carried the god Anubis. The statue of this god was either of massive gold or gilt, as well as the attributes that accompanied him. Anubis signifies *gilded*. The denomination was mysterious; and the Egyptian priests, it would seem, had not given it without reason.

The signification of this emblematical deity is thus explained by Plutarch: "The circle which touches and separates the two hemispheres, and which is the cause of this division, receiving the name of *horizon*, is called *Anubis*. He is represented under the form of a dog, because that animal watches day and night." St Clemens of Alexandria, who was well informed in the mystic theology of the Egyptians, favours this explication. The two dogs, says he, (the two Anubes) are the symbols of two hemispheres which environ the terrestrial globe. He adds in another place: Others pretend that these animals, the faithful guardians of men, indicate the tropics, which guard the sun on the south and on the north like porters.

According to the former of these interpretations,

Anubis || Aorasia.

the priests, regarding Anubis as the horizon, gilded his statue; to mark, that this circle, receiving the first rays of the sun, appears sparkling with brightness on his rising, and that at his setting he reflects his last rays upon the earth. They said, in their sacred fables, that Anubis was the son of Osiris, but illegitimate. In fact, he only gives to the earth a borrowed light; and cannot be esteemed, like Horus, as the father of the day, or as the legitimate offspring of Osiris. It may be added, that the visible horizon turning with the sun, is his inseparable companion.

In the latter of these explications, where Anubis represents the tropics, he is also the faithful guardian of Isis and Osiris. In fact, the course of the sun and of the moon is contained between the circles wherein the solstices are performed. They neither deviate to the right nor left. These limits assigned by the Author of nature might therefore, in hieroglyphic language, be represented by a divinity with the head of a dog, who seemed to oppose the passage on the side of the two poles. The other opinion, notwithstanding, seems more natural, and to be more analogous to the ideas of the priests.

Upon the whole, it is reasonable to imagine, that Anubis at first was only a symbolical image, invented by astronomers to give a sensible expression of their discoveries; that afterwards, the people, accustomed to see it in their temples, which were the depositaries of science, adored it as a deity; and that the priests favoured their ignorance by connecting it with their religion. The worship of Anubis introduced, that of the dog became his emblem. Almost all the gods of the Gentiles have originated in this manner.

ANUS, in *Anatomy*, the lower extremity of the intestinum rectum, or orifice of the fundament.

ANVIL, a smith's utensil, serving to place the work on to be hammered or forged. The face or uppermost part of the anvil, must be very flat and smooth, without flaws, and so hard that a file will not touch it. At one end there is sometimes a pike, bickern or beak-iron, for the rounding of hollow work. The whole is usually mounted on a firm wooden block.—Forged anvils are better than those of cast work, and the best have the upper part made of steel. Locksmiths have a smaller kind of anvil called the *stake*, which is used for setting small cold work straight. See ANVIL, SUPPLEMENT.

ANVILLE, JEAN B. B. D', a celebrated French geographer. See SUPPLEMENT.

ANXUR, in *Ancient Geography*, a city of the Volsci, in Latium; called *Tarracina*, by the Greeks and Latins: Now *Terracina;* situated on an eminence (Livy, Horace, Sil. Italicus). *Anxuras*, a citizen of Anxur (Livy). And the epithet *Anxurus*, a name of Jupiter, worshipped without a beard at Anxur (Virgil). Though others read *Axuras*, or *Axyras*, without a razor. E. Long. 14. 5. Lat. 41. 18.

AONIDES, in *Mythology*, one of the many appellations of the muses; so called from Aonia, a part of ancient Bœotia.

AORASIA, in *Antiquity*, the invisibility of the gods. The word is Greek, ἀοραστια, and derived from ἀ priv. and ὁραω, *to see*. The opinion of the ancients with regard to the appearance of the gods to men, was that they never showed themselves face to face, but were known from their backs as they withdrew. Neptune assumed the form of Calchas to speak to the two Ajaces; but they knew him not till he turned his back to leave them, and discovered the god by his majestic step as he went from them. Venus appeared to Æneas in the character of a huntress; but her son knew her not till she departed from him: her divinity was then betrayed by her radiant head, her flowing robe, and her majestic pace.

Aorist || Aornus.

AORIST, among grammarians, a tense peculiar to the Greek language, comprehending all the tenses; or rather, expressing action in an indeterminate manner, without any regard to past, present, and future.

AORISTIA, in the sceptic philosophy, denotes that state of the mind wherein we neither assert nor deny any thing positively, but only speak of things as seeming or appearing to us in such a manner. The aoristia is one of the great points or terms of scepticism, to which the philosophers of that denomination had continual recourse by way of explication, or subterfuge. Their adversaries, the dogmatists, charged them with dogmatizing, and asserting the principles and positions of their sect to be true and certain.

AORNUS, a very high rock of India, having its name from its extraordinary height, as being above the flight of a bird. Its circuit was about 25 miles, its height 11 furlongs, and the way leading up to the top artificial and narrow. At the bottom, on one side, ran the river Indus; on the top was a fine plain, part of which was covered with a thick wood; the rest arable land, with a fountain furnishing abundance of excellent water. This rock was taken by Alexander the Great, in whose time there was a report that Hercules had attempted it in vain; however, according to Arrian, this report was without foundation. It is probable indeed, that it was raised after the place was taken, in order to magnify Alexander's exploit. While the Macedonian monarch was preparing all things necessary for the siege, an old man with his two sons, who had long lived in a cave near the summit, came and offered to show him a private way of ascending. This being readily accepted, Ptolemy, with a considerable body of light-armed troops, was despatched with them, with orders, in case they succeeded, to intrench themselves strongly upon the rock, in the wood to which the old man was to direct them, before they ventured to attack the Indians. Ptolemy exactly executed his orders; and gave notice, by a lighted torch set upon a pole, that he had got safely up. Upon this, Alexander gave immediate orders for a body of troops to attempt the passage by which the rock was commonly ascended; but they were repulsed with great slaughter. He then sent an Indian with letters to Ptolemy, desiring him, the next time an attack was made by the common way, to fall upon the enemy behind. but in the mean time, those who defended the rock attacked Ptolemy with great vigour; but were at last repulsed, though with much difficulty: but the next day, when Alexander renewed the attack, though Ptolemy attacked the Indians in the rear, the Macedonians were repulsed on both sides. At last, the king perceiving that the strength of the Indians lay in the straitness and declivity of the way by which they were attacked, caused a great quantity of trees to be felled, and with them filled the cavities between the plain on which

Aornus ‖ pædusia.

which the Indians were encamped and the highest of his own advanced posts. The Indians at first derided his undertaking; but at length perceiving the ardour with which the work was carried on, and having felt the effects of the missile weapons of the Macedonians, they sent deputies to propose terms of capitulation. Alexander suspecting that their design was only to amuse him till they made their escape, withdrew his troops from the avenues. As soon as he knew the Indians were descended, he, with 700 of Ptolemy's light-armed foot, took possession of the deserted rock, and then made a signal for his forces to fall upon the flying Indians. They, setting up a loud shout, so terrified the fugitives, that numbers of them fell from the rocks and precipices, and were dashed to pieces, while the greatest part of the remainder were cut off in the roads.

AORTA, in *Anatomy*, the great artery which rises immediately from the left ventricle of the heart, and is from thence distributed to all parts of the body. It is divided into two grand trunks, distinguished by the epithets *ascending* and *descending*. See ANATOMY.

AOUSTA, or AOST, a town of Italy, in Piedmont, and capital of the duchy of the same name, a bishop's see, and subject to the king of Sardinia. It is remarkable for several monuments of the Romans, and for the birth of Anselm archbishop of Canterbury. It is seated at the foot of the Alps, on the river Doria. E. Long. 7. 33. N. Lat. 45. 58.

AOUSTA, a territory of Piedmont, with the title of a duchy. It is a valley 30 miles in length, and extends from the pass of St Martin's, near the frontiers of Yvree, to St Bernard. It abounds in pastures, and all sorts of fruits. The capital is of the same name.

AOUTA, the name of the paper mulberry tree at Otaheite in the South sea, from which a cloth is manufactured that is worn by the principal inhabitants. See the article BARK.

APACHES, a people of New Mexico in North America. They are brave, resolute, and warlike, fond of liberty, and the inveterate enemies of tyranny and oppression. Of this disposition the Spaniards had fatal experience towards the end of the last century, when they revolted against the Catholic king, massacred several of his officers, and committed the greatest devastations. Ever since, they have remained the allies, not the subjects of the Spaniards; and the viceroy of Mexico has been obliged to maintain a more formidable garrison, and a greater number of troops.

APÆDUSIA, denotes ignorance or unskilfulness in what relates to learning and the sciences. Hence also persons uninstructed and illiterate are called *apædeutæ*. The term *apædeutæ* was particularly used among the French in the time of Huet; when the men of wit at Paris were divided into two factions, one called by way of reproach *apædeutæ*, and the others *eruditi*. The *apædeutæ* are represented by Huet as persons who, finding themselves either incapable or unwilling to undergo a severe course of study in order to become truly learned, conspire to decry learning, and turn the knowledge of antiquity into ridicule, thus making a merit of their own incapacity. The *apædeutæ* in effect were the men of pleasure; the *eruditi* the men of study. The *apædeutæ* in every thing preferred the modern writers to the ancient, to supersede the necessity of studying the latter. The *eruditi* derided the moderns, and valued themselves wholly on their acquaintance with the ancients.

Apædusia ‖ Apamea.

APAGOGE, in *Logic*. See ABDUCTION.

APAGOGE, in the Athenian law, the carrying a criminal taken in the fact to the magistrate. If the accuser was not able to bring him to the magistrate, it was usual to take the magistrate along with him to the house where the criminal lay concealed, or defended himself.

APAGOGE, in *Mathematics*, is sometimes used to denote a progress or passage from one proposition to another; when the first having been once demonstrated, is afterwards employed in the proving of others.

APAGOGICAL DEMONSTRATION, an indirect way of proof, by showing the absurdity of the contrary.

APALACHIAN MOUNTAINS, more properly called the *Allegany Mountains*, have their southern beginning in the latitude of 34°, extending northerly through the United States, and running nearly parallel with the sea coast to the latitude of 41° north. The length of the chain is about 800 miles. Their height is not great, being in general not above 3000 feet. Their summits, in many cases, form a continued line, neither broken by transverse fissures, nor elevated into peaks. They include properly three or four distinct ridges, the westmost of which is called Laurel Mountain, and the eastmost Blue Mountain; and they thus cover a space of a hundred miles in breadth. Between these ridges the soil is generally excellent. The valleys are wide, and not steep, and the hills are often wooded to their summits. These mountains divide the United States like a back bone, and direct the course of the rivers on the one side to the sea, and on the other to the Mississippi. Chesnuts and small oaks are the trees that principally grow on these mountains, with some *chinkapin* * and other small shrubs. The grass is thin, mixed with vetch and small pease; and in some places there is very little vegetable appearance.

* Fagus pumila.

The rocks of the Apalachian mountains are mostly of a light gray colour; some are of a coarse-grained marble like alabaster; others of a metallic lustre: some pieces are in the form of slate, and brittle; others in lumps, and hard: and some appear with spangles, or covered over with innumerable small shining specks, like silver. These frequently appear at the roots of trees when blown down. The different spars are found mostly on the highest and steepest parts of the hills, where there is little grass and few trees; but the greatest part of the soil between the rocks is generally a dark sandy-coloured kind of mould, and shallow.

APAMEA, or APAMIA, the name of several ancient cities.

1. One of Bithynia, formerly called *Myrlea*, from Myrlus, general of the Colophonians: destroyed by Philip, father of Perseus; and given to his ally Prusias, who rebuilt it, and called it *Apamea*, from the name of his queen Apama (Strabo). Stephanus says, that Nicomedes Epiphanes, son of Prusias, called it after his mother; and that it had its ancient name from Myrlea, an Amazon. The Romans led a colony thither (Strabo);

Apamea || Apanthropy.

bo); called *Colonia Apamena* (Pliny, Appian). The gentilitious name is *Apamæus* and *Apamenus* (Trajan in a letter to Pliny).

2. Another *Apamea*, called *Cibotus*, of Phrygia, at some distance from the Meander (Agathodæmon); but by a coin of Tiberius, on the Meander. The name is from Apame, mother of Antiochus Soter, the founder, and the daughter of Artabazus (Strabo). The rise, or at least the increase, of Apamea, was owing to the ruins of Celenæ. The inhabitants were called *Apamienses;* and, though inland, were worshippers of Neptune. The reason, it has been conjectured, was, that they had suffered often from earthquakes, of which he was the supposed author. Mithridates gave a hundred talents towards the restoration of the city; which, it is said, had likewise been overthrown in the time of Alexander. Their tribute money was remitted to them for five years on the same account under the emperor Tiberius. The subterraneous passage of the Lycus and the other streams, showed that the ground had many cavities; and these, it has been surmised, rendered the region very liable to be shaken.

3. A third, on the confines of Parthia and Media, surnamed *Raphane* (Strabo, Pliny).

4. A fourth *Apamea*, a town of Mesene, an island in the Tigris (Pliny, Ammian); where a branch of the Euphrates, called the *Royal River*, falls into the Tigris (Ptolemy).

5. A fifth in Mesopotamia, on the other side of the Euphrates, opposite to Zeugma on this side, both founded by Seleucus, and joined by a bridge, from which the latter takes its name (Pliny, Isidor. Characenus).

6. A sixth *Apamea*, now *Famia*, also in Syria, below the confluence of the Orontes and Marsyas; a strong city, and situated in a peninsula, formed by the Orontes and a lake. "It is here (says Strabo) that the Seleucidæ had established the school and nursery of their cavalry." The soil of the neighbourhood, abounding in pasturage, fed no less than 30,000 mares, 300 stallions, and 500 elephants; instead of which, the marshes of Famia at present scarcely afford a few buffaloes and sheep. To the veteran soldiers of Alexander, who here reposed after their victories, have succeeded wretched peasants, who live in perpetual dread of the oppressions of the Turks and the inroads of the Arabs.

Apamea was also the ancient name of *Pella*, in the Decapolis.

APANAGE, or APPENNAGE, in the French customs, lands assigned by a sovereign for the subsistence of his younger sons, which revert to the crown upon the failure of male issue in that branch to which the lands are granted.

APANOMIA, a town of Santorin, an island in the Mediterranean sea, called in this part by some the *sea of Candia*. It has a spacious harbour, in the form of a half moon; but the bottom is so deep, that ships cannot anchor there. E. Long. 25. 59. N. Lat. 36. 18.

APANTHROPY, in *Medicine*, denotes a love of solitude, and aversion for the company of mankind. Apanthropy is by some reckoned among the symptoms, by others among the species or degrees of melancholy; and also passes for an ill indication in leucophlegmatic cases.

APARINE, in *Botany*, a synonyme of the urticularia and several other plants. Aparine || Apaulia.

APARITHMESIS, in *Rhetoric*, denotes the answer to the protasis or proposition itself. Thus, if the protasis be, *Appellandi tempus non erat*,—the aparithmesis is, *At tecum anno plus vixi.*

APARTISMENUS, in the ancient poetry, an appellation given to a verse, which comprehended an entire sense or sentence in itself. This is sometimes also written *apartemenus*, i. e. suspended, as not needing any following verse.

APATHY, among the ancient philosophers, implied an utter privation of passion, and an insensibility of pain. The word is compounded of *α* priv. and *παθος*, *affection*. The Stoics affected an entire apathy; they considered it as the highest wisdom to enjoy a perfect calmness or tranquillity of mind, incapable of being ruffled by either pleasure or pain. In the first ages of the church, the Christians adopted the term *apathy*, to express a contempt of all earthly concerns; a state of mortification, such as the gospel prescribes. Clemens Alexandrinus, in particular, brought it exceedingly in vogue; thinking hereby to draw the philosophers to Christianity, who aspired after such a sublime pitch of virtue. Quietism is only apathy disguised under the appearance of devotion.

APATURIA, in antiquity, a solemn feast celebrated by the Athenians in honour of Bacchus. The word is usually derived from *απατη*, *fraud*. It is said to have been instituted in memory of a fraudulent victory obtained by Melanthus, king of Athens, over Xanthus, king of Bœotia, in a single combat, which they agreed upon, to put an end to a debate between them relating to the frontiers of their countries. Hence Budæus calls it *festum deceptionis*, "the feast of deceit."

Other authors give a different etymology of this feast: They tell us, that the young Athenians were not admitted into the tribes on the third day of the apaturia, till their fathers had first sworn that they were their own children; and that till that time, they were supposed, in some measure, to be without fathers, *απατορες*; whence the feast, say they, took its name. Xenophon, on the other hand, informs us, that the relations and friends met on this occasion, and joined with the fathers of the young people who were to be received into the tribes; and that from this assembly the feast took its name; that in *απατουρια*, the *α*, far from being a privative, being here a conjunctive, signifies the same thing with *ομυ*, *together*. This feast lasted four days: the first day, those of the same tribe made merry together; and this they called *δορπια*. The second day, which they called *αναῤῥυσις*, they sacrificed to Jupiter and Minerva. The third day, which they called *κουρεωτις*, such of their young men and maids as were of age were admitted into their tribes. The fourth day they called *επιβης*.

APAULIA, in antiquity, the third day of a marriage solemnity. It was thus called because the bride, returning to her father's house, did *απαυλιζεσθαι του νυμφιου*, lodge apart from the bridegroom. Some will have the apaulia to have been the second day of the marriage, viz. that whereon the chief ceremony was performed; thus called by way of contradistinction from the first day, which was called *προαυλια*. On the

Ape || Apelles.

the day called *απαυλια* (whenever that was), the bride presented her bridegroom with a garment called *απαυλητηρια*.

APE, in *Zoology*, the general English name of a very numerous race of animals, the natural history of which is given at large under the article SIMIA; comprehending *Apes*, properly so called, or such as want tails; and *Monkeys* and *Baboons*, or such as have tails, the former *long*, and the other *short*, ones. See SIMIA.

Sea APE, a name given by Steller to a marine animal which he saw on the coast of America, and is thus described *. "The head appeared like that of a dog, with sharp and upright ears, large eyes, and with both lips bearded: the body round and conoid; the thickest part near the head; the tail forked; the upper lobe the longest: the body covered with thick hair, gray on the back, reddish on the belly. It seemed destitute of feet. It was extremely wanton, and played a multitude of monkey tricks. It sometimes swam on one side, sometimes on the other side of the ship, and gazed at it with great admiration. It made so near an approach to the vessel, as almost to be touched with a pole; but if anybody moved, it instantly retired. It would often stand erect for a considerable space, with one-third of its body above water; then dart beneath the ship, and appear on the other side; and repeat the same thirty times together. It would frequently arise with a sea plant, not unlike the bottle gourd, toss it up, and catch it in its mouth, playing with it numberless fantastic tricks.

* *Hist. of Kamtschatka*, p. 136.

APELYTES, Christian heretics in the second century, who affirmed that Christ received a body from the four elements, which at his death he rendered back to the world, and so ascended into heaven without a body.

APELLA, among physicians, a name given to those whose prepuce is either wanting or shrunk, so that it can no longer cover the glans. Many authors have supposed this sense of the word *Apella* warranted from the passage in Horace, *credat Judæus Apella non ego*. But, according to Salmasius and others, *Apella* is the proper name of a certain Jew, and not an adjective signifying *circumcised*.

APELLES, one of the most celebrated painters of antiquity. He was born in the island of Cos, and flourished in the time of Alexander the Great, with whom he was in high favour. He executed a picture of this prince, holding a thunderbolt in his hand: a piece, finished with so much skill and dexterity, that it used to be said there were two Alexanders; one invincible, the son of Philip; the other inimitable, the production of Apelles. Alexander gave him a remarkable proof of his regard: for when he employed Apelles to draw Campaspe, one of his mistresses, having found that he had conceived an affection for her, he resigned her to him; and it was from her that Apelles is said to have drawn his Venus Anadyomene.

One of Apelles's chief excellencies was his making his pictures exactly resemble the persons represented; insomuch that the physiognomists are said to have been able to form a judgment of the person's destiny as readily from his portraits as if they had seen the originals. But what is called *grace* was the characteristic of this artist. His pencil was so famous for drawing fine lines, that Protogenes discovered by a single line that Apelles had been at his house. Protogenes lived at Rhodes: Apelles sailed thither, and went to his house with great eagerness to see the works of an artist who was known to him only by name. Protogenes was gone from home: but an old woman was left watching a large piece of canvass, which was fitted in a frame for painting. She told Apelles that Protogenes was gone out; and asked him his name, that she might inform her master who had inquired for him. "Tell him (says Apelles) he was inquired for by this person;"—at the same time taking up a pencil, he drew on the canvass a line of great delicacy. When Protogenes returned, the old woman acquainted him with what had happened. That artist, upon contemplating the fine stroke of the line, immediately pronounced that Apelles had been there; for so finished a work could be produced by no other person. Protogenes, however, himself drew a finer line of another colour; and, as he was going away, ordered the old woman to show that line to Apelles if he came again; and to say, "This is the person for whom you are inquiring." Apelles returned, and saw the line: he would not for shame be overcome; and therefore, in a colour different from either of the former, he drew some lines so exquisitely delicate, that it was utterly impossible for finer strokes to be made. Protogenes now confessed the superiority of Apelles, flew to the harbour in search of him, and resolved to leave the canvass with the lines on it for the astonishment of future artists. Apelles.

Apelles showed great liberality of mind towards Protogenes. With ideas enlarged by education and literature, he was incapable of harbouring little jealousies of noble competitors; on the contrary, he was the first who made the works of Protogenes to be valued as they deserved among the Rhodians. He acknowledged that Protogenes was in some respects superior to himself; but that in one particular himself excelled, viz. in knowing when to take his hand from the picture; an art which Protogenes had not yet learned, and therefore over-worked his pieces. Apelles equally disapproved of too elaborate diligence, or too hasty negligence in execution. A studied work of Protogenes he esteemed less on the one account; and on the other, when a silly painter once brought him a picture, and said, "This I painted in a hurry,"—he replied, "Though you had not told me so, I perceived it was painted in haste: but I wonder you could not execute more such pieces in the same time."

There are two stories related of Apelles, which show him to be at once an artist of modesty, in amending even trifling improprieties, when pointed out to him by competent judges; and yet of self-confidence sufficient to make him know the perfection and value of his own paintings. It was customary with Apelles to expose to public view the works which he had finished, and to hide himself behind the picture, in order to hear the remarks passed on it by persons who chanced to view it. He once overheard himself blamed by a shoemaker for a fault in the slippers of some picture: he corrected the fault which the man had noticed: but on the day following the shoemaker began to animadvert on the leg; upon which Apelles with some anger looked out from behind the canvass, and bade him

keep

Apelles ‖ Apenninus.

keep to his own province, "Ne sutor ultra crepidam." It is well known that Alexander forbade any one besides Apelles to paint his portrait. We are not, however, to conclude from this, that Alexander was a more skilful judge of painting than he was of poetry. Like Augustus, he cherished the fine arts more from vanity than taste. A remarkable proof is given of this prince's inability to discern merit, and of the painter's freedom in expressing the mortification he felt, when a work of his was not sufficiently commended. "Alexander (says Ælian, lib. ii. c. 3. Var. Hist.) having viewed the picture of himself which was at Ephesus, did not praise it as it deserved. But when a horse was brought in, and neighed at seeing the figure of a horse in the picture, as though it had been a real horse; *O king!* (said Apelles) *this horse seems to be by far a better judge of painting than you.*" It happened more than once that the horses drawn by him were mistaken for real ones, by living horses which saw and neighed at the pictures. In his finishing a drawing of this animal, a remarkable circumstance is related of him. He had painted a horse returning from battle, and had succeeded to his wishes in describing every other mark that could indicate a mettlesome steed, impatient of restraint; there was wanting nothing but a foam of a bloody hue issuing from the mouth. He again and again endeavoured to express this, but his attempts were unsuccessful. At last, with vexation, he threw against the reins of the horse a sponge which had in it many colours; a mixture of which coming out of the sponge, and tinging the reins, produced the very effect desired by the painter.

The works of Apelles were all admired; but the most celebrated were the picture of Alexander in the temple of Diana at Ephesus, and that of Venus emerging from the sea. Alexander was drawn with thunder in his hand; and such relief was produced by the chiaro scuro in this piece, that the fingers seemed to shoot forward, and the thunderbolt to be out of the picture. His Venus Αναδυομενη was esteemed the most exquisite figure which the pencil could create: it is therefore extolled by the Roman poets Propertius and Ovid; and the poet of Sidon, Antipater, has left us the following Greek epigram on it:

Των αναδυομεναν απο μαζηος αξιν θαλαττας
Κυπριν Απελλειη μοχθον οραα γραφιδος,
Ως χερι συμμαρψασα διαδροχον υδατι καιταν
Εκθλιβει νοτερων αφρον απο πλοκαμων,
Αυται νυν ερεωσιν Αθηναιη τε και Ηρη
"Ουκ ετι σοι μορφας εις εριν ερχομεθα."

Anth. iv. 12.

Graceful as from her natal sea she springs,
Venus, the labour of Apelles, view:
With pressing hand her humid locks she wrings,
While from her tresses drips the frothy dew:
Ev'n Juno and Minerva now declare,
"No longer we contend whose form's most rare."

APENE, in antiquity, a kind of chariot wherein the images of the gods were carried in procession on certain days, attended with a solemn pomp, songs, hymns, dancing, &c. It was very rich, made sometimes of ivory, or of silver itself, and variously decorated.

APENNINUS, now the *Apennine;* a mountain, or ridge of mountains, running through the middle of Italy, from north-west to south-west, for 700 miles, in the form of a crescent (Pliny); beginning at the Alps in Liguria, or the Rivierra di Genoa; and terminating at the strait of Messana, or at Reggio, and the promontory Leucopetra; and separating, as by a back or ridge, the Adriatic from the Tuscan sea (Pliny, Strabo, Ptolemy, Polybius, Vitruvius). This mountain, though high, is greatly short of the height of the Alps. Its name is Celtic, signifying a *high mountain.* Apenninus ‖ Apepsia.

APENRADE, a town of Denmark in the duchy of Sleswick, seated at the bottom of a gulf in the Baltic sea, between Flensbourg and Hadaschleben. It is 25 miles north from Sleswick. E. Long. 9. 28. N. Lat. 55. 4.

APENZEL, a town of Switzerland, in the canton of the same name, seated on the river Chus, E. Long. 9. 1. N. Lat. 47. 31. The canton itself, which was allied to the others in 1513, consists only of three or four valleys; having the town and abbey of St Gall on the north; the county of Toggenburg on the west; the lordship of Sax in the canton of Zurich, and that of Gambs in the canton of Schweitz, on the south; and the Rheinthall, or Rhine-valley, on the east. Its greatest length is about thirty miles, and its breadth about twenty. It yields good pasturage, and consequently is not destitute of cattle, milk, butter, or cheese. Considerable quantities also of wheat, rye, barley, oats, beans, pease, flax, and wine, are produced in it: besides a great deal of fruit, wood, and turf; with mineral waters, and warm baths. There are many mountains in the canton, the highest of which is that called the *Hohesantis*, or the *Hohe Mesmer*, which commands a prospect of a prodigious extent. There are also several lakes and rivers. The inhabitants, who are partly Protestants, and partly Roman Catholics, subsist chiefly by their manufactures of linen, crape, fustian, and thread, or by bleaching, and the sale of their cattle, butter, cheese, horses, wood, and coal. Of the twenty-three parishes in the canton, four are Popish, and nineteen Protestant. Before the Reformation, the inhabitants were subject to the abbot of St Gall; but they then shook off his yoke, and united themselves with the other cantons: after that, however, there were violent animosities between the Papists and Protestants, the former continually persecuting the latter, till at last, in 1587, by the mediation of the other cantons, the two parties came to an accommodation, by which certain districts were assigned to each party, whereas before they lived promiscuously together: and though these two divisions now constitute but one canton, yet each forms a distinct community or free state, sending its particular representatives to the diets of the confederacy, and having its separate councils and officers. In spirituals, the Papists are subject to the bishop of Constance, but the Protestants to their own consistory. The canton contains altogether 326 square miles, and and 55,414 inhabitants.

APEPSIA, (from α negative, and πεπτω, to *digest*), indigestion.

Abstemiousness and excess are alike causes of indigestion. An over-distension of the stomach may in some measure injure its proper tone; and long fasting, by inducing a bad quality in the juices secerned into the

Apepsia || Aphasia.

the stomach, renders it feeble, and generates wind. Hard drinking, and any of the causes of an anorexy, also injure digestion.

The columbo root is said to be particularly useful when the stomach is languid, the appetite defective, digestion with difficulty carried on, or when a nausea with flatulency attends. It is prescribed in substance, with any grateful aromatic, or infused in Madeira wine, now and then interposing gentle doses of the tincture of rhubarb.

A mixture of mustard seed with the columbo root is of admirable utility in complaints of this kind; particularly where acidity and flatulence prevail much in the primæ viæ.

APER, in *Zoology*, a synonyme of the sus scrofa. See Sus.

APERIENTS, in the *Materia Medica*, an appellation given to such medicines as facilitate the circulation of the humours by removing obstructions. The five aperient roots of the shops are, smallage, fennel, asparagus, parsley, and butchers broom.

APERTURE, the opening of any thing, or a hole or cleft in any continuous object.

Aperture, in *Geometry*, the space between two right lines which meet in a point and form an angle.

Aperture, in *Optics*, a round hole in a turned bit of wood or plate of tin, placed within the side of a telescope or microscope, near to the object glass, by means of which more rays are admitted, and a more distinct appearance of the object is obtained.

Apertures, or *Apertions*, in *Architecture*, are used to signify doors, windows, &c.

APETALOSE, or Apetalous, among botanists, an appellation given to such plants as have no flower leaves.

APEX, the vertex or summit of any thing.

Apex, in antiquity, the crest of a helmet, but more especially a kind of cap worn by the flamens.

Apex, among grammarians, denotes the mark of a long syllable, falsely called a *long accent*.

APHACA, in *Ancient Geography*, the name of a place in Syria, situated between Heliopolis and Byblus, near Lebanon; infamous for a temple of Venus, called *Aphacetis*, near which was a lake, round which fire usually burst forth, and its waters were so heavy, that bodies floated on them. The temple was destroyed by Constantine, as being a school of incontinence, (Eusebius). The name is of Syriac origin, signifying *embraces*.

APHÆRESIS, in *Grammar*, a figure by which a letter or syllable is cut off from the beginning of a word. Thus *ciconia*, by aphæresis, is written *conia; contemnere, temnere; omittere, mittere*, &c.

A like retrenchment at the end of a word is called apocope.

Aphæresis, in *Medicine*, denotes a necessary taking away or removal of something that is noxious.—In surgery, it signifies an operation whereby something superfluous is taken away.

APHANES, Parsley Root. See Botany *Index*.

APHASIA, (from α, and $\varphi\eta\mu\iota$, "I speak,") in the sceptic philosophy, denotes a state of doubt, wherein a person not knowing what to determine on, it is best for him to be silent. In this sense, *aphasia* stands opposed to *phasis*, under which are included both assertion and negation.

Aphasia || Aphis.

APHEK, the name of several cities mentioned in Scripture. 1. Aphek, in the tribe of Judah, where the Philistines encamped when the ark was brought from Shiloh, which was taken by them in battle, 1 Sam. iv. 1, 2, &c. It is thought to be the same with Aphekah mentioned in Josh. xv. 53. 2. Aphek in the valley of Jezreel, where the Philistines encamped while Saul and his army were near Jezreel, upon the mountains of Gilboa, Sam. xxix. 1, &c. 3. Aphek, a city belonging to the tribe of Asher, near the country of the Sidonians; (Josh. xix. 30. and xiii. 4.). 4. Aphek, a city of Syria, one of the principal in Benhadad's kingdom, near which the battle was fought between Ahab and Benhadad, wherein the Syrians were worsted; and whereof, as they retreated with precipitation into the city, the walls fell upon them, and crushed in pieces 27,000 (1 Kings xx. 26. *et seq.*). This city lay between Heliopolis and Byblus.

APHELIUM, or Aphelion, in *Astronomy*, is that point in any planet's orbit, in which it is farther distant from the sun, being that end of the greater axis of the elliptical orbit of the planet most remote from the focus where the sun is.

APHIOM, Karahissart, a town of Natolia, in Asiatic Turkey; it is named *Aphiom*, because it produces a great deal of opium, called *aphiom* by the Turks. E. Long. 30. 26. N. Lat. 38. 35.

APHIS, the Puceron, Vine-fretter, or Plant-louse. See Entomology *Index*.

Linnæus enumerates 33 species of the aphis, all of them inhabitants of particular plants, from which their trivial names are taken; as aphis *ribi*, *ulmi*, *rosæ*, &c. And he adds, that there seems to be a greater variety of plants producing aphides than there are different sorts of this insect. But some late observers have been able to distinguish more than double the above number of species; and it is probable that many more remain still to be added, as many of the same kind of plants are found to support two or three quite different sorts of aphides. Thus the plum tree has two sorts very distinct from each other; one of a yellowish green, with a round short body; the other of a bluish green, as it were enamelled with white, and the shape more oblong. On the gooseberry bush and currant the same aphides may be found; but each of these is inhabited by two very different species: the one being of a dusky green, with a short plump body; the other of paler green, the body more taper, and transversely wrinkled. The rose tree, again, supports not less than three distinct species: the largest is of a deep green, having long legs of a brownish cast, with the joints of a very dark brown, as also are the horns and antennæ; a second sort is of a paler green, has much shorter legs, and a more flat body; the third sort is of a pale red, its body transversely wrinkled, and is most frequently on the sweet-briar.

The extraordinary nature of these insects has for some time past justly excited the wonder and attention of naturalists. They were long ranked among the animals which had been classed with the true androgynes spoken of by Mr Breynius; for having never been catched copulating, it was hastily concluded that they

Aphis. they multiplied without copulation. This, however, was but a doubt, or at best a mere surmise: but this surmise was believed and adopted by Mr Reaumur; and though he supported it by some observations peculiar to himself, the question remained still undecided, till Mr Bonnet seemed to have cleared it up in the affirmative, by taking and shutting up a young aphis at the instant of its birth, in the most perfect solitude, which yet brought forth in his sight 95 young ones. The same experiment being made on one of the individuals of this family, that had been tried with its chief, the new hermit soon multiplied like its parent; and one of this third generation, in like manner brought up in solitude, proved no less fruitful than the former. Repeated experiments, in this respect, as far as the fifth or sixth generation, all uniformly presenting the observer with *fecund virgins*, were communicated to the Royal Academy of Sciences; when an unforeseen and very strange suspicion, imparted by Mr Trembley to Mr Bonnet engaged him anew in a series of still more painful experiments than the foregoing. In a letter which that celebrated observer wrote to him from the Hague, the 27th January 1741, he thus expresses himself: "I formed, since the month of November, the design of rearing several generations of solitary pucerons, in order to see if they would all equally bring forth young. In cases so remote from usual circumstances, it is allowed to try all sorts of means; and I argued with myself, Who knows but that one copulation might serve for several generations?" This "*who knows*," to be sure, was next to avouching nothing; but as it came from Mr Trembley, it was sufficient to persuade Mr Bonnet that he had not gone far enough in his investigation. If the fecundity of aphides was owing to the secret copulation suggested by Mr Trembley; this copulation served at least five or more successive generations. Mr Bonnet therefore reared to the amount of the tenth generation of solitary aphides, and had the patience to keep an account of the days and hours of the births of each generation. In short it was discovered, That they are really distinguished by sexes: That there are males and females amongst them, whose amours are the least equivocal of any in the world: that the males are produced only in the tenth generation, and are but few in number: that these, soon arriving at their full growth, copulate with the females: that the virtue of this copulation serves for ten generations: that all these generations, except the first, (from the fecundated eggs), are produced viviparous; and all the individuals are females, except those of the last generation, among whom, as we have already observed, some males make their appearance to lay the foundation of a fresh series.—These circumstances have been confirmed by other naturalists. In particular we have a curious and accurate detail of them by Dr Richardson of Rippon, in the Philosophical Transactions, vol. xi. art. 22. an extract of which we shall here insert, in order to give the reader as full an insight into the nature of these singular insects, as can be done by a mere detail of facts in themselves utterly unaccountable.

"The great variety of species which occur in the insects now under consideration, may make an inquiry into their particular nature seem not a little perplexed; having them, however, skilfully reduced under their proper genus, the difficulty is by this means considerably diminished. All the insects comprehended under any distinct genus, we may reasonably suppose to partake of one general nature; and, by diligently examining any of the particular species, may thence gain some insight into the nature of all the rest. With this view I have chosen, out of the various sorts of aphides, the largest of those found on the rose tree; not only as its size makes it the more conspicuous, but as there are few others of so long a duration. This sort appearing early in the spring, continues late in the autumn; while several are limited to a much shorter term, in conformity to the different trees and plants from whence they draw their nourishment. Aphis.

1. "If at the beginning of February the weather happens to be so warm as to make the buds of the rose tree swell and appear green; small aphides are frequently to be found upon them, not larger than the young ones in summer when first produced. But there being no old ones to be found at this time of the year, which in summer I had observed to be viviparous, I was formerly not a little perplexed by such appearances, and almost induced to give credit to the old doctrine of equivocal generation. That the same kind of animal should at one time of the year be viviparous, and at another time oviparous, was an opinion I could then by no means entertain. This, however, frequent observation has at last convinced me to be fact; having found those aphides which appear early in the spring, to proceed from small black oval eggs, which were deposited on the last year's shoots in autumn; though when it happens that the insects make too early an appearance, I have observed the greatest part to suffer from the sharp weather that usually succeeds, by which means the rose trees are some years in a manner freed from them.

"Those which withstand the severity of the weather seldom come to their full growth before the month of April; at which time they usually begin to breed, after twice casting off their exuviæ or outward covering. It appears then that they are all females, which produce each of them a very numerous progeny, and that without having intercourse with any male insect. As I observed before, they are viviparous; and what is equally uncommon, the young ones all come into the world backwards. When they first come from the parent they are enveloped by a thin membrane, having in this situation the appearance of an oval egg; which, I apprehend, must have induced Reaumur to suspect that the eggs discovered by Bonnet were nothing more than mere abortions. These egg-like appearances adhere by one extremity to the mother; while the young ones contained in them extend the other; by that means gradually drawing the ruptured membrane over the head and body to the hind feet. During this operation, and for some time after, by means of something glutinous, the fore part of the head adheres to the vent of the parent. Being thus suspended in the air, it soon frees itself from the membrane in which it was confined, and after its limbs are a little strengthened, is set down on some tender shoot, and then left to provide for itself.

2. "In the spring months, there appear on the rose trees but two generations of aphides, including those which immediately proceed from the last year's eggs; the warmth of the summer adds so much to their fertility,

Aphis. lity, that no less than five generations succeed one another in the interval. One is produced in May, which casts off its covering; while the months of June and July each supply two more, which cast off their coverings three or four times, according to the different warmth of the season. The frequent change of the outward covering is the more extraordinary, as it is the oftenest repeated when the insects come the soonest to their growth; which I have sometimes observed to happen in ten days, where warmth and plenty of nourishment have mutually conspired. From which considerations I am thoroughly convinced that these various coverings are not connate with the insect; but that they are, like the scarf skin, successively produced.

"Early in the month of June, some of the third generation which were produced about the middle of May, after casting off their last covering, discover four erect wings, much longer than their bodies; and the same is observable in all the succeeding generations, which are produced during the summer months; without, however, distinguishing any diversity of sex, as is usual in several other kinds of insects. For some time before the aphides come to their full growth, it is easy to discover which of them will have wings, by a remarkable fullness of the breast, which, in the others, is hardly to be distinguished from the body. When the last covering is rejected, the wings, which were before folded up in a very narrow compass, gradually extend themselves in a most surprising manner, till their dimensions are at last very considerable. But these winged ones have the peculiarity, that the number of them does not seem so much to depend on their original structure, as on the quantity or quality of the nourishment with which they are supplied; it being frequently observed, that those on a succulent shoot have few or none with wings among them, while others of the same generation, on a less tender branch, are most of them winged; as if only the first rudiments of wings were composed in the former, while nature thought proper to expand them in the latter, that they might be more at liberty to supply their wants.

"The increase of these insects in the summer time is so very great, that, by wounding and exhausting the tender shoots, they would frequently suppress all vegetation, had they not many enemies which restrain them. To enumerate the variety of other insects that in their worm and fly state are constantly destroying them, would exceed the bounds of the present design: there is one, however, so singular in the manner of executing its purpose, that I cannot pass by it without some further notice. This is a very small black ichneumon fly, with a slender body and very long antennæ, which darts its pointed tail into the bodies of the aphides, at the same time depositing an egg in each. This egg produces a worm which feeds upon the containing insect till it attains its full growth; when it is usually changed to that kind of fly from whence it came. In this, however, it is sometimes prevented by another sort of small black fly, which wounds this worm through its pearl-like habitation; and by laying one of its eggs therein, instead of the former fly, produces its own likeness. I must, however, further observe, notwithstanding these insects have many enemies, they are not without friends; if we may consider those as such who are very officious in their attendance, for the good things they expect to to reap thereby. The ant and the bee are both of this kind, collecting the honey in which the aphides abound: but with this difference, that the ants are constant visitors, the bee only when flowers are scarce. To which let me also add, that the ants will suck in the delicious nectar while the aphides are in the act of discharging it from the anus; but the bees only collect it from the leaves on which this honey dew has fallen. Aphis.

3. "In the autumn I find three more generations of aphides to be produced; two of which make their appearance in the month of August, and the third usually appears before the middle of September. As the two first differ in no respect from those which we meet with in summer, it would be wasting time to dwell any longer upon them; but the third differing greatly from all the rest, demands our giving it a more serious attention. Though all the aphides which have hitherto appeared were females, in this tenth generation are found several male insects; not that they are by any means so numerous as the females, being only produced by a small number of the former generation. To which I must further add, that I have observed those which produced males, previously to have produced a number of females; which in all respects resembling those already described, I shall decline taking into any further consideration.

"The females have at first altogether the same appearance with those of the former generations; but in a few days their colour changes from a green to a yellow, which is gradually converted into an orange colour before they come to their full growth. They differ likewise in another respect, at least from those which occur in the summer, that all those yellow females are without wings. The male insects are, however, still more remarkable; their outward appearance readily distinguishing them from the females of this and of all other generations. When first produced, they are not of a green colour like the rest, but of a reddish brown; and have afterwards, when they begin to thicken about the breast, a dark line along the middle of the back. These male insects come to their full growth in about three weeks time, and then cast off their last covering; the whole insect being, after this operation, of a bright yellow colour, the wings only excepted. But after this they soon change to a darker yellow; and in a few hours to a very dark brown; if we except the body, which is something lighter coloured, and has a reddish cast. They are of the winged sort; and the wings, which are white at first, soon become transparent, and at length appear like very fine black gauze.

"The males no sooner come to maturity than they copulate with the females; in which act they are readily discovered, as they remain in conjunction for a considerable time, and are not easily disturbed. The commerce between them continues the whole month of October, and may be observed at all times of the day, though I have found it most frequent about noon; especially when the weather is moderately warm, and the sun overcast. The females, in a day or two after their intercourse with the males, I have observed to lay their eggs; which they usually do near the buds, when they are left to their own choice. Where there are a number crowded together, they of course inter-

Aphis || Aphrodisia.

fere with each other: in which case they will frequently deposite their eggs on other parts of the branches, or even on the spines with which they are beset."

These insects are found in great numbers not only on the stems and leaves, but even upon roots of many trees and plants. Those trees that are most loaded with the insects, as already observed, suffer greatly from them. The plant-lice thrust their sharp-pointed rostrum into the substance of the leaf to draw out their sustenance, which warps the stems and leaves, and occasions in the latter cavities underneath, and swellings above; nay, even in some, a kind of hollow gall filled with insects, as is often seen on elm leaves.

It appears astonishing that the slight puncture of so small an animal should so greatly disfigure a plant; but it must be remembered, that plant-lice always live in numerous associations, which increase visibly by the prodigious fruitfulness of those insects; so that although each puncture be slight, yet the number of them is so great, so reiterated, that it is no longer a wonder the leaves should be disfigured. Lovers of gardening and plants are extremely anxious to free and cleanse their trees from this vermine; but their care often proves unavailing, the insect is so fruitful that it soon produces a fresh colony. The best and surest method of extirpating it is to put on the trees infested with them some larvæ of the plant-louse lion, or aphidivorous flies; for those voracious larvæ destroy every day a great number of the insects, and that with so much the more facility, as the latter remain quiet and motionless in the neighbourhood of those dangerous enemies, who range over heaps of plant-lice, which they gradually waste and diminish.

APHLASTUM, in the ancient navigation, a wooden ornament, shaped like a plume of feathers, fastened on the goose's or swan's neck used by the ancient Greeks in the heads of their ships. The aphlastum had much the same office and effect in a ship that the crest had on the helmet. It seems also to have had this further use, viz. by the waving of a party-coloured ribband fastened to it, to indicate from what quarter the wind blew.

APHONIA, among physicians, signifies a suppression or total loss of voice. It is never a primary disease; but a consequence of many different disorders. The cure is to be effected by removing the disorder from whence the aphonia proceeds.

APHORISM, a maxim or principle of a science; or a sentence which comprehends a great deal in a few words. The word comes from *αφοριζω, I separate;* q. d. a choice or select sentence. The term is chiefly used in medicine and law. We say the aphorisms of Hippocrates, of Sanctorius, of Boerhaave, &c. aphorisms of the civil law, &c.

APHRACTI, in the ancient military art, denotes open vessels, without decks or hatches, furnished only at head and stern with cross planks, whereon the men stood to fight.

APHRODISIA, in antiquity, festivals kept in honour of Venus, the most remarkable of which was that celebrated by the Cyprians. At this solemnity several mysterious rites were practised: all who were initiated to them offered a piece of money to Venus as a harlot, and received as a token of the goddess's favour a measure of salt, and a *φαλλος*; the former, because salt is a concretion of sea water, to which Venus was thought to owe her birth; the latter, because she was the goddess of wantonness.

Aphrodis || Apis.

APHRODISIACS, among physicians, medicines which were supposed to increase the quantity of semen, and create an inclination to venery.

APHRODITA. See HELMINTHOLOGY *Index.*

APHRODITE, in *Mythology*, a name of Venus, derived from *αφρος, froth;* because, according to the poets, Venus is supposed to have been produced from the froth or foam of the sea.

APHRONITRE, in *Natural History*, a name given by the ancients to a particular kind of natrum.

APHTHÆ, in *Medicine*, small, round, and superficial ulcers arising in the mouth. See MEDICINE *Index.*

APHTHARTODOCETÆ, a sect, sworn enemies of the council of Chalcedon. The word is derived from *αφθαρτος, incorruptible*, and *δοκεω, I imagine;* and was given them, because they imagined the body of Jesus Christ was incorruptible and impassible, and not capable of death. They arose among the Eutychians, and made their appearance in the year 535.

APHYLLANTHES, LEAFLESS FLOWER, or BLUE MONTPELIER PINK. See BOTANY *Index.*

APIARY, a place where bees are kept. See the article BEE. See also APIARY, SUPPLEMENT.

APIASTER, in *Ornithology*, the trivial name of a species of the merops. See MEROPS, ORNITHOLOGY *Index.*

APICES, in *Botany*, the same with ANTHERÆ.

APICIUS. There were at Rome three of that name, famous for their gluttony. The second is the most celebrated of the three. He lived under Tiberius, spent immense sums on his belly, and invented divers sorts of cakes which bore his name. He kept as it were a school of gluttony at Rome. After having spent two millions and a half in entertainments, finding himself very much in debt, he examined into the state of his affairs; and seeing that he had but 250,000 livres remaining, he poisoned himself, out of apprehension of starving with such a sum. He had prostituted himself when very young to Sejanus.

APINA, or *Apinæ*, a town of Apulia, built by Diomedes, as was also Tricæ (Pliny). *Apinæ* and *Tricæ* is a proverbial saying for things trifling and of no value (Martial); and *Apinarii* was the appellation for triflers or buffoons, (Trebellius Pollio).

APION, a famous grammarian, born in Egypt, was a professor at Rome in the reign of Tiberius. He had all the arrogance of a mere pedant, and amused himself with difficult and insignificant inquiries. One of his principal works are his Antiquities of Egypt.

APIS, in *Mythology*, a divinity worshipped by the ancient Egyptians at Memphis. It was an ox, having certain exterior marks; in which animal the soul of the great Osiris was supposed to subsist. The animal had the preference to all others, as being the symbol of agriculture, the improvement of which that prince had so much at heart.

According to several learned writers on the Egyptian religion, Apis was only a symbolical deity. "Amongst the animals consecrated to ancient rites (says Ammianus Marcellinus), Mnevis and Apis are the most celebrated; the first is an emblem of the sun, the second

Apis. cond of the moon." Porphyry tells us, that Apis bore the characteristic signs of the two stars; and Macrobius, who confirms this opinion, adds, that he was equally consecrated to them both.

This bull, become the object of public adoration, it may be supposed, could not be born like other animals; accordingly the priests published that his origin was celestial. "An Apis is seldom born, (says Pomponius Mela.) He is not produced by the ordinary laws of generation. The Egyptians say he owes his birth to celestial fire." Plutarch explains this passage: "The priests pretend that the moon diffuses a generative influence, and as soon as a cow who takes the bull is struck by it, she conceives an Apis. Accordingly we discover in him the signs of that star.

Such were the fables industriously spread by those who presided over the divine institutions. The vulgar, to whom this emblematical deity presaged abundance, received them eagerly, and implicitly believed them. Pliny has described the characters which distinguished this sacred bull: "A white spot, resembling a crescent, on the right side, and a lump under the tongue, were the distinguishing marks of Apis." When a cow, therefore, which was thought to be struck with the rays of the moon, produced a calf, the sacred guides went to examine it, and if they found it conformable to this description, they announced to the people the birth of Apis, and fecundity.

"Immediately (says Ælian) they built a temple to the new god, facing the rising sun, according to the precepts of Mercury, where they nourished him with milk for four months. This term expired, the priests repaired in pomp to his habitation, and saluted him by the name of Apis. They then placed him in a vessel magnificently decorated, covered with rich tapestry, and resplendent with gold, and conducted him to Nilopolis, singing hymns, and burning perfumes. There they kept him for forty days. During this space of time, women alone had permission to see him, and saluted him in a particular manner. After the inauguration of the god, in this city, he was conveyed to Memphis with the same retinue, followed by an innumerable quantity of boats sumptuously decked out. There they completed the ceremonies of his inauguration, and he became sacred to all the world. Apis was superbly lodged, and the place where he lay was mystically called *the bed*. Strabo having visited his palace, thus describes it: "The edifice where Apis is kept, is situated near the temple of Vulcan. He is fed in a sacred apartment, before which is a large court. The house in which they keep the cow that produced him, occupies one of its sides. Sometimes, to satisfy the curiosity of strangers, they make him go out into this court. One may see him at all times through a window; but the priests produce him also to public view." Once a year (says Solinus) they present a heifer to him, and the same day they kill her.

A bull, born in so marvellous a manner, must be possessed of supernatural knowledge. Accordingly the priests published, that he predicted future events by gestures, by motions, and other ways, which they construed according to their fancy. "Apis (says Pliny) has two temples called *Beds*, which served as an augury for the people. When they come to consult him, if he enters into a particular one, it is a favourable presage, and fatal if he passes into the other. He gives answers to individuals by taking food from their hands. He refused that offered him by Germanicus, who died soon after." It would be unjust to conclude, that this respectable writer gave credit to such auguries. He relates the opinion of the Egyptians, and contents himself with citing facts without offering his judgement. Apis.

Such was the installation of Apis. His anniversary was always celebrated for seven days. The people assembled to offer sacrifices to him, and what is extraordinary, oxen were immolated on the occasion. This solemnity did not pass without prodigies. Ammianus Marcellinus, who has collected the testimonies of the ancients, relates them in these words: "During the seven days in which the priests of Memphis celebrate the birth of Apis, the crocodiles forget their natural ferocity, become gentle, and do no harm to anybody."

This bull, however, so honoured, must not exceed a mysterious term fixed for his life. "Apis (says Pliny) cannot live beyond a certain number of years. When he has attained that period they drown him in the fountain of the priests; for it is not permitted, adds Ammianus Marcellinus, to let him prolong his life beyond the period prescribed for him by the sacred books." When this event happened, he was embalmed, and privately let down into the subterraneous places destined for that purpose. In this circumstance, the priests announced that Apis had disappeared; but when he died a natural death, before this period arrived, they proclaimed his death, and solemnly conveyed his body to the temple of Serapis.

"At Memphis was an ancient temple of Serapis which strangers were forbidden to approach, and where the priests themselves only entered when Apis was interred. It was then (says Plutarch) that they opened the gates called *Lethe* and *Cocythe* (of oblivion and lamentation), which made a harsh and piercing sound."

Ammianus Marcellinus, and Solinus, paint with great energy the general despair of the Egyptians, who with cries and lamentations demanded another Apis from heaven.

According to Plutarch, the term prescribed for the life of Apis was 25 years; which number marked a period of the sun and of the moon, and the bull was consecrated to these two bodies. Syncellius, in his Chronography, when he comes down to the 32d Pharoah, called *Aseth*, says, "before Aseth, the solar year consisted of 360 days. This prince added five to complete its course. In his reign a calf was placed amongst the gods, and named *Apis*." And in the Bibliotheca of Fabricius we have the following passage: "It was customary to inaugurate the kings of Egypt at Memphis, in the temple of Apis. They were here first initiated in the mysteries, and were religiously invested; after which they were permitted to bear the yoke of the god through the town to a place called the *Sanctuary*, the entrance of which was prohibited to the profane. There they were obliged to swear that they would neither insert months nor days in the year, and that it should remain composed of 365 days, as had been established by the ancients." From these facts, Mr Savary, in his Letters on Egypt, infers, that Apis was the tutelar divinity of the new form given to the solar year, and of the cycle of 25 years, discovered at the same

Apis ‖ Apobaterion.

same time. This deity, besides, had a marked relation to the swelling of the Nile, as is testified by a great number of historians. The new moon which followed the summer solstice, was the era of this phenomenon, on which the eyes of every body were fixed: And Pliny speaks as follows on this subject: "Apis had on his right side a white mark, representing the crescent: This mark (continues Ælian) indicated the commencement of the inundation." If Apis possessed the characteristic signs which proved his divine origin, he promised fertility and abundance of the fruits of the earth. It seems demonstrated, therefore, Mr Savary adds, that this sacred bull, the guardian of the solar year of 365 days, was also regarded as the genius who presided over the overflowing of the river. The priests, by fixing the course of his life to 25 years, and by making the installation of a new Apis concur with the renewal of the period above mentioned, had probably perceived, as the result of long meteorological observations, that this revolution always brought about abundant seasons. Nothing was better calculated to procure a favourable reception of this emblematical deity from the people, since his birth was a presage to them of a happy inundation, and of all the treasures of teeming nature.

The solemnity of his inauguration was called *Apparition*. That which was renewed every year towards the 12th or 13th of the month *Payn*, which corresponds with the 17th or 18th of June, was called *the birth of Apis*. It was a time of rejoicing, which Ælian describes in the following manner: "What festivals! what sacrifices take place in Egypt at the commencement of the inundation! It is then that all the people celebrate the birth of Apis. It would be tedious to describe the dances, the rejoicings, the shows, the banquets, to which the Egyptians abandon themselves on this occasion, and impossible to express the intoxication of joy which breaks forth in all the towns of the kingdom."

These observations Mr Savary thinks further confirmed by the name of this respectable bull; *Apis*, in the Egyptian tongue, signifying number, measure. This epithet perfectly characterizes an animal established as the guardian of the solar year, the type of the cycle of 25 years, and the presage of a favourable inundation.

Monsieur Huet, bishop of Avranches, has endeavoured to prove that Apis was a symbolical image of the patriarch Joseph, and has supported his opinion with all his erudition. Dr Bryant apprehends that the name of *Apis* was an Egyptian term for a father; that it referred to the patriarch Noah; and that the crescent which was usually marked on the side of the animal, was a representation of the ark.

APIS, or *Bee*. See ENTOMOLOGY *Index*, and BEE.

APIUM, PARSLEY. See BOTANY *Index*.

APIVOROUS, in *Ornithology*, a synonyme of a species of falco. See FALCO, ORNITHOLOGY *Index*.

APLUDA. See BOTANY *Index*.

APOBATANA, the metropolis of Media, and where the kings kept their treasure (Isiodorus Characenus); supposed to be the same with *Ecbatana*.

APOBATERION, in antiquity, a valedictory speech or poem made by a person on departing out of own country, and addressed to his friends or relations. Apobaterion ‖ Apocalypse.

APOBATHRA, a place near Sestos (Strabo); the landing place where Xerxes's ships were frozen and stuck in the ice (Eustathius).

APOCALYPSE, REVELATION, the name of one of the sacred books of the New Testament, containing revelations concerning several important doctrines of Christianity. The word is Greek, and derived from *αποκαλυπτω*, to *reveal* or *discover*.

This book, according to Irenæus, was written about the year 96 of Christ, in the island of Patmos, whither St John had been banished by the emperor Domitian. But Sir Isaac Newton places the writing of it earlier, viz. in the time of Nero. Some attribute this book to the arch-heretic Cerinthus: but the ancients unanimously ascribed it to John, the son of Zebedee, and brother of James; whom the Greek fathers called the *Divine*, by way of eminence, to distinguish him from the other evangelists. This book has not, at all times, been esteemed canonical. There were many churches in Greece, as St Jerome informs us, which did not receive it: neither is it in the catalogue of canonical books prepared by the council of Laodicea, nor in that of St Cyril of Jerusalem: but Justin, Irenæus, Origen, Cyprian, Clemens of Alexandria, Tertullian, and all the fathers of the fourth, fifth, and the following centuries, quote the Revelation as a book then acknowledged to be canonical. The Alogians, Marcionites, Cerdonians, and Luther himself, rejected this book: but the Protestants have forsaken Luther in this particular; and Beza has strongly maintained against his objections, that the Apocalypse is authentic and canonical.

The Apocalypse consists of twenty-two chapters. The three first are an instruction to the bishops of the seven churches of Asia Minor. The fifteen following chapters contain the persecutions which the church was to suffer from the Jews, heretics, and Roman emperors. Next St John prophesies of the vengeance of God, which he will exercise against those persecutors, against the Roman empire, and the city of Rome; which, as the Protestants suppose, he describes under the name of Babylon the great whore, seated upon seven hills. In the last place, the 19th, 20th, 21st, and 22d chapters, describe the triumph of the church over its enemies, the marriage of the Lamb, and the happiness of the church triumphant.

"It is a part of this prophecy (says Sir Isaac Newton), that it should not be understood before the last age of the world; and therefore it makes for the credit of the prophecy, that it is not yet understood. The folly of interpreters has been to foretel times and things by this prophecy, as if God designed to make them prophets. By this rashness they have not only exposed themselves, but brought the prophecy also into contempt. The design of God was much otherwise: He gave this and the prophecies of the Old Testament, not to gratify men's curiosities, by enabling them to foreknow things; but that, after they were fulfilled, they might be interpreted by the events; and his own providence, not the interpreters, be then manifested thereby to the world. And there is already so much of the prophecy fulfilled, that as many as will take pains

Apocalypse || Apocrypha.

pains in this study, may see sufficient instances of God's providence.

There have been several other works published under the title of *Apocalypses*. Sozomen mentions a book used in the churches of Palestine, called the *Apocalypse* or *Revelation of St Peter*. He also mentions an Apocalypse of St Paul: which the Cophtæ retain to this day. Eusebius also speaks of both these Apocalypses. St Epiphanius mentions an Apocalypse of Adam; Nicephorus, an Apocalypse of Esdras: Gratian and Cedrenus, an Apocalypse of Moses, another of St Thomas, and another of St Stephen; St Jerome, an Apocalypse of Elias. Porphyry, in his life of Plotin, makes mention of the Apocalypse or Revelations of Zoroaster, Zostrian, Nicothæus, Allogenes, &c.

APOCOPE, among grammarians, a figure which cuts off a letter or syllable from the end of a word; as *ingeni* for *ingenii*.

APOCRISARIUS, in ecclesiastical antiquity, a sort of resident in an imperial city, in the name of a foreign church or bishop, whose office was to negotiate, as proctor at the emperor's court, in all ecclesiastical causes in which his principals might be concerned. The institution of the office seems to have been in the time of Constantine, or not long after, when, the emperors being become Christians, foreign churches had more occasions to promote their suits at court than formerly. However, we find it established by law in the time of Justinian. In imitation of this officer, almost every monastery had its Apocrisarius, or resident, in the imperial city.

The title and quality of Apocrisary became at length appropriated to the pope's agent, or *nuncio*, as he is now called; who resided at Constantinople, to receive the pope's despatches, and the emperor's answers. The word is formed from *αποκρινειν*, *to answer*.

APOCRUSTICS, in *Medicine*, the same with repellents.

APOCRYPHA, or APOCRYPHAL BOOKS, such books as are not admitted into the canon of Scripture, being either not acknowledged as divine, or considered as spurious. The word is Greek; and derived from *απο*, and *κρυπτω*, to *hide* or *conceal*.

When the Jews published their sacred books, they gave the appellations of *canonical* and *divine* only to such as they then made public: such as were still retained in their archives they called *apocryphal*, for no other reason but because they were not public; so that they might be really sacred and divine, though not promulgated as such.

Thus, in respect of the Bible, all books were called *apocryphal* which were not inserted in the Jewish canon of Scripture. Vossius observes, that, with regard to the sacred books, none are to be accounted apocryphal, except such as had neither been admitted into the synagogue nor the church, so as to be added to the canon, and read in public.

The Protestants do not only reckon those books to be apocryphal which are esteemed such in the church of Rome, as the prayer of Manasseh king of Judah, the third and fourth books of Esdras, St Barnabas's epistle, the book of Hermos, the addition at the end of Job, and the 151st psalm; but also Tobit, Judith, Esther, the book of Wisdom, Jesus the son of Sirach, Baruch the prophet, the Song of the Three Children, the History of Susannah, the History of Bel and the Dragon, and the first and second books of the Maccabees. Apocrypha || Apodosis.

It is now pretended that these books were not received by the Jews, or so much as known to them. None of the writers of the New Testament cite or mention them: neither Philo nor Josephus speak of them. The Christian church was for some ages an utter stranger to these books. Origen, Athanasius, Hillary, Cyril of Jerusalem, and all the orthodox writers, who have given catalogues of the canonical books of Scripture, unanimously concur in rejecting these out of the canon. And for the New Testament, they are divided in their opinions, whether the epistle to the Hebrews, the epistle of St James, and the second epistle of St Peter, the second and third epistles of St John, the epistle of St Jude, and the Revelation, are to be acknowledged as canonical or not.

The Protestants acknowledge such books of Scripture only to be canonical as were so esteemed to be in the first ages of the church; such as are cited by the earliest writers among the Christians as of divine authority, and after the most diligent inquiry were received and so judged to be by the council of Laodicea. The several epistles above mentioned, and the book of Revelation, whatever the sentiments of some particular persons are or may have been of them, are allowed by all the reformed churches to be parts of the canon of the New Testament.

The apocryphal books, however, according to the sixth article of the church of England, are to be read for example of life and instruction of manners; but it doth not apply them to establish any doctrine.

APOCYNUM. See DOGS-BANE, BOTANY *Index*.

APODECTÆ, in antiquity, a denomination given to ten general receivers appointed by the Athenians to receive the public revenues, taxes, debts, and the like. The apodectæ had also a power to decide controversies arising in relation to money and taxes, all but those of the most difficult nature and highest concern, which were reserved to the courts of judicature.

APODECTÆI, in the Athenian government, officers appointed to see that the measures of corn were just.

APODES, in a general sense, denotes things without feet. Zoologists apply the name to a fabulous sort of birds, said to be found in some of the islands of the new world, which, being entirely without feet, supported themselves on the branches of trees by their crooked bills.

APODES, in the Linnæan system, the name of the *first order* of fishes, or those which have no belly fins. See ICHTHYOLOGY *Index*.

APODICTICAL, among philosophers, a term importing a demonstrative proof, or systematical method of teaching.

APODOSIS, in *Rhetoric*, makes the third part of a complete exordium, being properly the application or restriction of the *protasis*. The apodosis is the same with what is otherwise called *axiosis*; and stands opposed to *protasis*: e. g. *protasis*, all branches of history are necessary for a student; *catescene*, so that, without these, he can never make any considerable figure;

Apodosis || Apollinarians.

gure; *apodosis*, but literary history is of a more especial use, which recommends it, &c.

APODYTERIUM, in the ancient baths, the apartments where persons dressed and undressed.

APOGEE, in *Astronomy*, that point in the orbit of a planet which is at the greatest distance from the earth. The apogee of the sun is that part of the earth's orbit which is at the greatest distance from the sun; and consequently the sun's apogee, and the earth's aphelion, are one and the same point.

APOLIDES, in antiquity, those condemned for life to the public works, or exiled into some island, and thus divested of the privileges of Roman citizens.

APOLLINARIAN GAMES, in Roman antiquity, were instituted in the year of Rome 542. The occasion was a kind of oracle delivered by the prophet Marcus after the fatal battle at Cannæ, declaring that to expel the enemy, and cure the people of an infectious disease which then prevailed, sacred games were to be annually performed in honour of Apollo; the prætor to have the direction of them, and the decemviri to offer sacrifices after the Grecian rite. The senate ordered that this oracle should be observed the rather, because another of the same Marcus, wherein he had foretold the overthrow at Cannæ, had come true; for this reason, they gave the prætor 12,000 ases out of the public cash to defray the solemnity. There were sacrified an ox to Apollo, as also two white goats, and a cow to Latona; all with their horns gilt. Apollo had also a collection made for him, besides what the people who were spectators gave voluntarily. The first prætor by whom they were held was P. Cornelius Sylla. For some time they were moveable or indictive; but at length were fixed, under P. Licinius Varus, to the fifth of July, and made perpetual. The men, who were spectators at these games, wore garlands on their heads; the women performed their devotions in the temples at the same time, and at last they caroused together in the vestibules of their houses, the doors standing open. The Apollinarian games were merely scenical; and at first only observed with singing, piping, and other sorts of music; but afterwards there were also introduced all manner of mountebank tricks, dances, and the like: yet so as that they still remained scenical; no chariot races, wrestling, or the like laborious exercises of the body, being ever practised at them.

APOLLINARIANS, APOLLINARISTS, called also by Epiphanius *Dimaritæ*, ancient heretics, who denied the proper humanity of Christ, and maintained that the body which he assumed was endowed with a sensitive, and not a rational, soul, but that the Divine Nature supplied the place of the intellectual principle in man. This sect derived its name from Apollinaris, bishop of Laodicea, in the fourth century.

The Apollinarians have been charged with other opinions, such as, the Millenarian and Sabellian, the pre-existence of the body of Christ, and the passion of his Deity; but ecclesiastical writers are not agreed with respect to these and other particulars. Their doctrine was first condemned by a council of Alexandria in the year 362, and afterwards in a more formal manner by a council at Rome in 375; and by another council in 378, which deposed Apollinaris from his bishopric. Notwithstanding all, his doctrine spread through most of the churches of the east: and his followers were subdivided into various sects. In 388, The emperor Theodosius enacted a law, forbidding them to hold assemblies, to have any ecclesiastics or bishops, or to dwell in cities. The rigorous execution of this law, in concurrence with the decrees of different councils, reduced them to a very small number, and their doctrine had no long duration. Apollinari

APOLLINARIS, CAIUS SULPICIUS, a very learned grammarian, born at Carthage, lived in the 2d century, under the Antonines; he is supposed to be the author of the verses which are prefixed to the comedies of Terence, and contain the arguments of them. He had for his successor in the profession of grammar Helvius Pertinax, who had been his scholar, and was at last emperor.

APOLLINARIS SIDONIUS, *Caius Lollius*, an eminent Christian writer and bishop in the 5th century, was born of a noble family in France. He was educated under the best masters, and made a prodigious progress in the several arts and sciences, but particularly in poetry and polite literature. After he had left the schools, he applied himself to the profession of war. He married Papianilla, the daughter of Avitus, who was consul, and afterwards emperor, by whom he had three children. But Majorianus in the year 457 having deprived Avitus of the empire, and taken the city of Lyons, in which our author resided, Apollinaris fell into the hands of the enemy. However, the reputation of his learning softened Majorianus's resentment, so that he treated him with the utmost civility, in return for which Apollinaris composed a panegyric in his honour; which was so highly applauded, that he had a statue erected to him at Rome, and was honoured with the title of *Count*. In the year 467 the emperor Anthemius rewarded him for the panegyric which he had written in honour of him, by raising him to the post of governor of Rome, and afterwards to the dignity of a patrician and senator, and erecting a statue to him. But he soon quitted these secular employments for the service of the church. The bishopric of Clermont being vacant in 472 by the death of Eparchus, Apollinaris, who was then only a layman, was chosen to succeed him without any interest or solicitation on his part, in which see he acted with the greatest integrity. Clermont being besieged by the Goths, he animated the people to the defence of that city, and would never consent to the surrender of it; so that, when it was taken about the year 480, he was obliged to retire; but he was soon restored by Evariges king of the Goths, and continued to govern the church as he had done before. He died in peace the 21st of August 487; and his festival is still observed in the church of Clermont, where his memory is held in great veneration. He is esteemed the most elegant writer of his age, both in prose and verse. He wrote a great many little pieces; but preserved none but those which he thought were worthy of being continued down to posterity. He collected himself the nine books which we have remaining of his letters. His chief pieces in poetry are the three panegyrics upon the emperors Avitus, Majorianus, and Anthemius. The rest of them are a collection of poems addressed to his friends upon particular subjects. His letters contain a variety of particulars relating to polite literature and profane history.

APOLLINARIUS,

Apollinarius, Apollo.

APOLLINARIUS, CLAUDIUS, a learned bishop of Hierapolis, who, about the year 170, presented to Marcus Aurelius an excellent Apology for the Christians.

APOLLINARIUS *the Younger*, thus called to distinguish him from his father, called *Apollinarius the Elder*, was at first lector or reader of Laodicea, and afterwards bishop of that city. He was universally esteemed the greatest man of his age, both for learning and piety, and a most accurate and nervous defender of the faith against all its enemies: but notwithstanding this, on his advancing some opinions that were not approved, he was anathematized as an heretic by the second general council of Constantinople in 381.

APOLLO, in *Mythology*, a Pagan deity worshipped by the Greeks and Romans. Cicero mentions four of this name: the most ancient of whom was the son of Vulcan; the second a son of Corybas, and born in Crete; the third an Arcadian, called *Nomian*, from his being a great legislator; and the last, to whom the greatest honour is ascribed, the son of Jupiter and Latona.

Apollo had a variety of other names, either derived from his principal attributes, or the chief places where he was worshipped. He was called the *Healer*, from his enlivening warmth and cheering influence; *Pæan*, from the pestilential heats: to signify the former, the ancients placed the Graces on his right hand; and for the latter, a bow and arrows in his left: *Nomius*, or the shepherd, from his fertilizing the earth, and thence sustaining the animal creation: *Delius*, from his rendering all things manifest: *Pythius*, from his victory over Python; *Lycias*, *Phœbus*, and *Phaneta*, from his purity and splendour. As Apollo is almost always confounded by the Greeks with the sun, it is no wonder that he should be dignified with so many attributes. It was natural for the most glorious object in nature, whose influence is felt by all creation, and seen by every animated part of it, to be adored as the fountain of light, heat, and life. The power of healing diseases being chiefly given by the ancients to medicinal plants and vegetable productions, it was natural to exalt into a divinity, the visible cause of their growth. Hence he was also styled the *God of Physic;* and that external heat which cheers and invigorates all nature, being transferred from the human body to the mind, gave rise to the idea of all mental effervescence coming from this god; hence, likewise, poets, prophets, and musicians, are said to be *Numine afflati*, inspired by Apollo.

Whether Apollo was ever a real personage, or only the great luminary, many have doubted. Indeed, Vossius has taken great pains to prove this god to be only a metaphorical being, and that there never was any other Apollo than the sun. "He was styled the *Son of Jupiter* (says this author), because that god was reckoned by the ancients the author of the world. His mother was called *Latona*, a name which signifies *hidden;* because, before the sun was created, all things were wrapped up in the obscurity of chaos. He is always represented as beardless and youthful, because the sun never grows old or decays. And what else can his bows and arrows imply, but his piercing beams?" And he adds, that all the ceremonies which were performed to his honour, had a manifest relation to the great source of light which he represented. Whence (he concludes) it is in vain to seek for any other divinity than the sun, which was adored under the name of Apollo." However, though this be in general true, yet it does appear, from many passages in ancient authors, that there was some illustrious personage named *Apollo*, who, after his apotheosis, was taken for the sun; as Osiris and Orus in Egypt, whose existence cannot be called in question, were, after their death, confounded with the sun, of which they became the symbols, either from the glory and splendour of their reigns, or from a belief that their souls had taken up their residence in that luminary. Apollo.

Of the four Apollos mentioned by Cicero, it appears that the three last were Greeks, and the first an Egyptian; who, according to Herodotus, was the son of Osiris and Isis, and called *Orus*. Pausanias is of the same opinion as Herodotus, and ranks Apollo among the Egyptian divinities. The testimony of Diodorus Siculus is still more express; for in speaking of Isis, after saying that she had invented the practice of medicine, he adds, that she taught this art to her son Orus, named *Apollo*, who was the last of the gods that reigned in Egypt.

It is easy to trace almost all the Grecian fables and mythologies from Egypt. If the Apollo of the Greeks was said to be the son of Jupiter, it was because Orus the Apollo of the Egyptians had Osiris for his father, whom the Greeks confounded with Jupiter. If the Greek Apollo was reckoned the god of eloquence, music, medicine, and poetry, the reason was, that Osiris, who was the symbol of the sun among the Egyptians, as well as his son Orus, had there taught those liberal arts. If the Greek Apollo was the god and conductor of the Muses, it was because Osiris carried with him in his expedition to the Indies singing women and musicians. This parallel might be carried on still further; but enough has been said to prove that the true Apollo was that of Egypt.

To the other perfections of this divinity the poets have added beauty, grace, and the art of captivating the ear and the heart, no less by the sweetness of his eloquence, than by the melodious sounds of his lyre. However, with all these accomplishments, he had not the talent of captivating the fair with whose charms he was enamoured. But the amours and other adventures related of this god during his residence on earth, are too numerous, and too well known, to be inserted here. His musical contests, however, being more connected with the nature of this work, must not be wholly unnoticed.

To begin, therefore, with the dispute which he had with Pan, that was left to the arbitration of Midas.

Pan, who thought he excelled in playing the flute, offered to prove that it was an instrument superior to the lyre of Apollo. The challenge was accepted; and Midas, who was appointed the umpire in this contest, deciding in favour of Pan, was rewarded by Apollo, according to the poets, with the ears of an ass for his stupidity.—This fiction seems founded upon history. Midas, according to Pausanias, was the son of Gordius and Cybele; and reigned in the Greater Phrygia, as we learn from Strabo. He was possessed of such great riches, and such an inordinate desire of increasing them by the most contemptible parsimony, that,

Apollo

that, according to the poets, he converted whatever he touched into gold. However, his talent for accumulation did not extend to the acquirement of taste and knowledge in the fine arts; and, perhaps, his dulness and inattention to these provoked some musical poets to invent the fable of his decision in favour of Pan against Apollo. The scholiast upon Aristophanes, to explain the fiction of his long ears, says, that it was designed to intimate that he kept spies in all parts of his dominions.

Marsyas, another player on the flute, was still more unfortunate than either Pan or his admirer Midas. This Marsyas, having engaged in a musical dispute with Apollo, chose the people of Nisa for judges. Apollo played at first a simple air upon his instrument; but Marsyas, taking up his pipe, struck the audience so much by the novelty of its tone, and the art of his performance, that he seemed to be heard with more pleasure than his rival. Having agreed upon a second trial of skill, it is said that the performance of Apollo, by accompanying the lyre with his voice, was allowed greatly to excel that of Marsyas upon the flute alone. Marsyas, with indignation, protested against the decision of the judges; urging that he had not been fairly vanquished according to the rules stipulated, because the dispute was concerning the excellence of their several instruments, not their voices; and that it was wholly unjust to employ two arts against one.

Apollo denied that he had taken any unfair advantages of his antagonist, since Marsyas had employed both his mouth and fingers in performing upon his instrument; so that, if he was denied the use of his mouth, he would be still more disqualified for the contention. The judges approved of Apollo's reasoning, and ordered a third trial. Marsyas was again vanquished; and Apollo, inflamed by the violence of the dispute, flayed him alive for his presumption. See MARSYAS.

Pausanias relates a circumstance concerning this contest, that had been omitted by Diodorus, which is, that Apollo accepted the challenge from Marsyas, upon condition that the victor should use the vanquished as he pleased.

Diodorus informs us, that Apollo soon repenting of the cruelty with which he had treated Marsyas, broke the strings of the lyre, and by that means put a stop, for a time, to any further progress in the practice of that new instrument.

The next incident to be mentioned in the history of Apollo is his defeat of the serpent Python.

The waters of Deucalion's deluge, says Ovid, which had overflowed the earth, left a slime from whence sprung innumerable monsters; and among others the serpent Python, which made great havock in the country about Parnassus. Apollo, armed with his darts, put him to death; which, physically explained, implies, that the heat of the sun having dissipated the noxious steams, these monsters soon disappeared: or if this fable be referred to history, the serpent was a robber, who haunting the country about Delphos, and very much infesting those who came hither to sacrifice; a prince, who bore the name of Apollo, or one of the priests of that god, put him to death.

This event gave rise to the institution of the Pythian games, so frequently mentioned in the Grecian history; and it was from the legend of Apollo's victory over the Python that the god himself acquired the name of *Pythius*, and his priestess that of PYTHIA. The city of Delphos, where the famous oracles were so long delivered, was frequently styled *Pytho*.

Apollo.

As Apollo was the god of the fine arts, those who cultivated them were called *his sons*. Of this number was Philammon of Delphos, whom the poets and mythologists make the twin-brother of Autolychus, by the nymph Chione, and Apollo and Mercury. It is pretended that both these divinities were favoured by the nymph on the same day, and that their sires were known from their different talents. Philammon, a great poet and musician, was reported to be the offspring of the god who presides over those arts; and Autolychus, from the craftiness and subtility of his disposition, was said to have sprung from Mercury, god of theft and fraud. Philammon is one of the first, after Apollo, upon fabulous record, as a vocal performer, who accompanied himself with the sound of the lyre: his son was the celebrated Thamyris. See THAMYRIS.

There can be no doubt but that Apollo was more generally revered in the Pagan world than any other deity; having, in almost every region of it, temples, oracles, and festivals, as innumerable as his attributes: the wolf and hawk were consecrated to him, as symbols of his piercing eyes; the crow and the raven, because these birds were supposed to have by instinct the faculty of prediction; the laurel, from a persuasion that those who slept with some branches of that tree under their heads received certain vapours, which enabled them to prophecy. The cock was consecrated to him, because by his crowing he announces the rising of the sun; and the grashopper on account of his singing faculty, which was supposed to do honour to the god of music. Most of the ancient poets have celebrated this tuneful insect, but none better than Anacreon, Ode xliii.

Plato says that the grashopper sings all summer without food, like those men who, dedicating themselves to the Muses, forget the common concerns of life.

The swan was regarded by the ancients as a bird sacred to Apollo in two capacities; first, as being, like the crow and raven, gifted with the spirit of prediction; and, secondly, for his extraordinary vocal powers. The sweetness of his song, especially at the approach of death, was not only extolled by all the poets of antiquity, but by historians, philosophers, and sages; and to call a great writer the *swan* of his age and nation, was a full acknowledgement of his sovereignty. Thus Horace calls Pindar *the Theban swan*.

Plutarch, who was himself a priest of Apollo, impressed with the highest respect and veneration for him and for music, in his dialogue upon that art, makes one of his interlocutors say, that an invention so useful and charming could never have been the work of man, but must have originated from some god, such as Apollo, the inventor of the flute and lyre, improperly attributed to Hyagnis, Marsyas, Olympus, and others; and the proofs he urges in support of this assertion, show, if not its truth, at least that it was the common and received opinion.

All dances and sacrifices, says he, used in honour of Apollo,

Apollo. Apollo, are performed to the sound of flutes: the statue of this god at Delos, erected in the time of Hercules, had in its right hand a bow; and on the left stood the three Graces, who were furnished with three kinds of instruments, the lyre, the flute, and the syrinx. The youth also who carries the laurel of Tempe to Delphos, is accompanied by one playing on the flute; and the sacred presents formerly sent to Delos by the Hyperboreans, were conducted thither to the sound of lyres, flutes, and shepherds pipes. He supports these facts by the testimonies of the poets Alcæus, Alcman, and Corinna.

It seems as if the account of Apollo could not be concluded by any thing that is left to offer on the subject, so properly, as by part of the celebrated hymn of Callimachus, which during many ages was performed and heard by the most polished people on the globe with the utmost religious zeal, at the festivals instituted to this god.

Ha! how the laurel, great APOLLO's tree,
And all the cavern, shakes! Far off, far off,
The man that is unhallow'd: for the god
Approaches. Hark! he knocks; the gates
Feel the glad impulse, and the sever'd bars
Submissive clink against their brazen portals.
Why do the Delian palms incline their boughs,
Self-mov'd; and hovering swans, their throats releas'd
From native silence, carol sounds harmonious?

Begin, young men, the hymn: let all your harps
Break their inglorious silence; and the dance,
In mystic numbers trod, explain the music.
But first, by ardent pray'r and clear lustration,
Purge the contagious spots of human weakness:
Impure, no mortal can behold Apollo.
So may you flourish, favour'd by the god,
In youth with happy nuptials, and in age
With silver hairs, and fair descent of children;
So lay foundations for aspiring cities,
And bless your spreading colonies increase.
Pay sacred rev'rence to Apollo's song;
Lest wrathful the far-shooting god emit
His fatal arrows. Silent nature stands:
And seas subside, obedient to the sound
Of Io! Io Pæan! nor dares Thetis
Longer bewail her lov'd Achilles' death.
For Phœbus was his foe. Nor must sad Niobe
In fruitless sorrow persevere, or weep,
Ev'n thro' the Phrygian marble. Hapless mother!
Whose fondness could compare her mortal offspring
To those which fair Latona bore to Jove.
Io! again repeat ye, Io Pæan!

Recite Apollo's praise till night draws on,
The ditty still unfinish'd; and the day
Unequal to the godhead's attributes
Various, and matter copious of your songs.
Sublime at Jove's right hand Apollo sits,
And thence distributes honour, gracious king,
And theme of verse perpetual. From his robe
Flows light ineffable! his harp, his quiver,
And Lactian bow, are gold: with golden sandals
His feet are shod. How rich! how beautiful!
Beneath his steps the yellow min'ral rises;
And earth reveals her treasures. Youth and beauty
Eternal deck his cheek; from his fair head
Perfumes distil their sweets; and cheerful health,
His duteous handmaid, through the air improv'd
With lavish hand diffuses scents ambrosial.
Apollo, Apollodorus.
The spearman's arm by thee, great god, directed,
Sends forth a certain wound. The laurel'd bard,
Inspir'd by thee, composes verse immortal.
Taught by thy art divine, the sage physician
Eludes the urn, and chains or exiles death.

Perpetual fires shine hallow'd on thy altars,
When annual the Carnean feast is held;
The warlike Libyans, clad in armour, lead
The dance; with clanging swords and shields they beat
The dreadful measure: In the chorus join
Their women; brown, but beautiful: such rites
To thee well pleasing———

———The monstrous Python
Durst tempt thy wrath in vain; for dead he fell,
To thy great strength and golden arms unequal,
Io! while thy unerring hand elanc'd
Another and another dart, the people
Joyfully repeated *Io! Io Pæan!*
Elance the dart, Apollo; for the safety
And health of man, gracious thy mother bore thee!

PRIOR.

APOLLO Belvidere, ranked the first in the first class of ancient statues, and so called from having been placed in the Belvidere of the Vatican at Rome by Pope Julius II. where it remained for 300 years, and till Rome was taken and plundered by the French in 1797. This celebrated statue was found in the ruins of ancient Antium about the end of the 15th century. The artist is unknown. The excellence of this statue, which has attracted universal admiration, consists in the elegance and sublimity of the expression. Beside this, there are many ancient statues referred to the first which are distinguished by peculiar beauties.

APOLLODORUS, a famous architect under Trajan and Hadrian, was born at Damascus. He had the direction of the bridge of stone which Trajan ordered to be built over the Danube in the year 104, which was esteemed the most magnificent of all the works of that emperor. Hadrian, one day as Trajan was discoursing with this architect upon the buildings he had raised at Rome, would needs give his judgment, and showed he understood nothing of the matter. Apollodorus turned upon him bluntly, and said to him, Go paint gourds, for you are very ignorant of the subject we are talking upon. Hadrian at this time boasted of his painting gourds well. The insult cost Apollodorus his life.

APOLLODORUS, a celebrated painter of Athens, about 408 years before the birth of Christ, was the first who invented the art of mingling colours, and of expressing the lights and shades. He was admired also for his judicious choice of subjects, and for beauty and strength of colouring surpassed all the masters that went before him. He excelled likewise in statuary.

APOLLODORUS the Athenian, a famous grammarian, the son of Asclepiades and disciple of Aristarchus. He wrote many works not now extant; but his most famous production was his Bibliotheca, concerning the origin of the gods. This work consisted of 24 books, but only three are now in being. Several other pieces of his are to be found in Fabricius's *Bibliotheca Græca*.

Apollodorus ll Apollonius.

There were various other persons of this name. Scipio Testi, a Neapolitan, has written a treatise of the Apollodoruses, which was printed at Rome in 1555; and Dr Thomas Gale published a work of the same kind in 1675.

APOLLONIA, the name of several ancient cities, particularly of a colony of the Milesians in Thrace, from which Lucullus took away a colossus of Apollo, and placed it in the capitol. The greatest part of the town was situated in a small island in the Euxine, in which was a temple of Apollo (Strabo). Pliny says the colossus was 30 cubits high, and cost 500 talents. There was also an Apollonia at Mount Parnassus, near Delphi (Stephanus). Troezen was formerly called *Apollonia*.

APOLLONIA, feasts sacred to Apollo, instituted upon the following occasion. Apollo, having vanquished Python, went with his sister Diana to Ægialea; but, being driven from thence, he removed to the island Crete. The Ægialeans were soon after visited with a plague; upon which, consulting the soothsayers, they were ordered to send seven young men and as many virgins, to appease those deities and bring them back into their country. Apollo and Diana being thus appeased, returned to Ægialea; in memory of which they dedicated a temple to Pitho, the *goddess of persuasion*; whence a custom arose of choosing every year seven young men, and as many virgins, to go as it were in search of Apollo and Diana.

APOLLONIA, in *Geography*, a promontory of Africa, upon the coast of Guinea, near the mouth of the river Mancu.

APOLLONIUS, the author of the *Argonautics*, and surnamed *The Rhodian*, from the place of his residence, is supposed to have been a native of Alexandria, where he is said to have recited some portion of his poem while he was yet a youth. Finding it ill received by his countrymen, he retired to Rhodes; where he is conjectured to have polished and completed his work, supporting himself by the profession of rhetoric, and receiving from the Rhodians the freedom of their city. He at length returned, with considerable honour, to the place of his birth; succeeding Eratosthenes in the care of the Alexandrian library in the reign of Ptolemy Euergetes, who ascended the throne of Egypt in the year before Christ 246. That prince had been educated by the famous Aristarchus, and rivalled the preceding sovereigns of his liberal family in the munificent encouragement of learning. Apollonius was a disciple of the poet Callimachus; but their connexion ended in the most violent enmity, which was probably owing to some degree of contempt expressed by Apollonius for the light compositions of his master. The learned have vainly endeavoured to discover the particulars of their quarrel.—The only work of Apollonius which has descended to modern times is his poem above mentioned, in four books, on the Argonautic expedition. Both Longinus and Quintilian have assigned to this work the mortifying character of mediocrity: "But (says Mr Hayley) there lies an appeal from the sentence of the most candid and enlightened critics to the voice of Nature; and the merit of Apollonius has little to apprehend from the decision of this ultimate judge. His poems abound in animated description, and in passages of the most tender and pathetic beauty. How finely painted is the first setting forth of the Argo! and how beautifully is the wife of Chiron introduced, holding up the little Achilles in her arms, and showing him to his father Peleus as he sailed along the shore! But the chief excellence in our poet, is the spirit and delicacy with which he has delineated the passion of love in his Medea. That Virgil thought very highly of his merit in this particular, is sufficiently evident from the minute exactness with which he has copied many tender touches of the Grecian poet. Those who compare the third book of Apollonius with the fourth of Virgil, may, I think, perceive not only that Dido has some features of Medea, but that the two bards, however different in their reputation, resembled each other in their genius; and they both excel in delicacy and pathos."—The ancient scholia upon his *Argonautics*, still extant, are extremely useful, and full of learning.

Apollonius Apollos.

APOLLONIUS of Perga, a city of Pamphylia, was a great geometrician, under the reign of Ptolemy Euergetes, which reaches from the 2d year of the 133d Olympiad to the 3d year of the 139th. He studied a long time at Alexandria, under the disciples of Euclid: and composed several works, of which that only of the Conics remains.

APOLLONIUS, a Pythagorean philosopher, born at Tyana in Cappadocia, about the beginning of the first century. At 16 years of age he became a strict observer of Pythagoras's rules, renouncing wine, women, and all sorts of flesh; not wearing shoes, letting his hair grow, and wearing nothing but linen. He soon after set up for a reformer of mankind, and chose his habitation in a temple of Æsculapius, where he is said to have performed many wonderful cures. Philostratus has wrote the life of Apollonius, in which there are numberless fabulous stories recounted of him. We are told that he went five years without speaking; and yet, during this time, that he stopped many seditions in Cilicia and Pamphylia: that he travelled, and set up for a legislator; and that he gave out he understood all languages, without having ever learned them: that he could tell the thoughts of men, and understood the oracles which birds gave by their singing. The Heathens were fond of opposing the pretended miracles of this man to those of our Saviour; and by a treatise which Eusebius wrote against one Hierocles, we find that the drift of the latter, in the treatise which Eusebius refutes, seems to have been to draw a parallel betwixt Jesus Christ and Apollonius, in which he gives the preference to this philosopher. M. du Pin has wrote a confutation of Philostratus's life of Apollonius.

Apollonius wrote some works, viz. four books of Judicial Astrology; a treatise upon the Sacrifices, showing what was proper to be offered to each deity; and a great number of letters; all of which are now lost.

APOLLOS, in Scripture history, a Jew of Alexandria, who came to Ephesus during the absence of St Paul, who was gone to Jerusalem (Acts xviii. 24.). Apollos was an eloquent man, and well versed in the Scriptures; and as he spoke with zeal and fervour, he taught diligently the things of God: but knowing only the baptism of John, he was no more than a catechumen, or one of the lowest order of Christians, and did not as yet distinctly know the mysteries of the Christian doctrine. However, he knew that Jesus

Christ

Apollos ‖ pologue.

Christ was the Messiah, and declared himself openly to be his disciple. When therefore he was come to Ephesus, he began to speak boldly in the synagogue, and to show that Jesus was the Christ. Aquila and Priscilla having heard him, took him home with them; instructed him more fully in the ways of God; and baptized him, probably in the name of Jesus Christ.

Some time after this he had a mind to go into Achaia; and the brethren having exhorted him to undertake this journey, they wrote to the disciples, desiring them to receive him. He arrived at Corinth; and was there very useful in convincing the Jews out of the Scriptures, and demonstrated to them that Jesus was the Christ. Thus he watered what St Paul had planted in this city (1 Cor. iii. 6.): but the great fondness which his disciples had for his person had like to have produced a schism; some "saying, I am of Paul; others, I am of Apollos; I am of Cephas." However, this division, which St Paul speaks of in the chapter last quoted, did not prevent that apostle and Apollos from being closely united by the bands of charity. Apollos hearing that the apostle was at Ephesus, went to meet him, and was there when St Paul wrote the first epistle to the Corinthians; wherein he testifies that he had earnestly entreated Apollos to return to Corinth, but hitherto had not been able to prevail with him; that nevertheless, he gave him room to hope that he would go when he had an opportunity. St Jerome says, that Apollos was so dissatisfied with the division which had happened upon his account at Corinth, that he retired into Crete with Zena, a doctor of the law; and that this disturbance having been appeased by the letter which St Paul wrote to the Corinthians, Apollos returned to this city, and was bishop thereof. The Greeks make him bishop of Duras; others say, he was bishop of Iconium in Phrygia; and others, that he was bishop of Cæsarea.

APOLLYON, a Greek word that signifies *the destroyer*, and answers to the Hebrew *Abaddon*. St John in the Revelation (ix. 11.) says, that an angel having opened the bottomless pit, a thick smoke issued out of it; and with this smoke locusts, like horses, prepared for battle, and commanded by the angel of the bottomless pit, called in Hebrew *Abaddon*, but in the Greek *Apollyon*.

APOLOGETIC, Apologetical, something said or written, by way of excuse or apology, for any action or person.

The Apologetic of Tertullian is a work full of strength and spirit. He there vindicates the Christians from all that had been objected to them; particularly from the abominable crimes said to be perpetrated at their meetings, and their want of love and fidelity to their country. The ground of this last accusation was, their refusing to take the accustomed oaths, and swear by the tutelar gods of the empire.—Tertullian addresses his Apologetic to the magistrates of Rome, the emperor Severus being then absent.

APOLOGUE, in matters of literature, an ingenious method of conveying instruction by means of a feigned relation called a *moral fable*.

The only difference between a parable and an apologue is, that the former, being drawn from what passes among mankind, requires probability in the narration; whereas the apologue, being taken from the supposed actions of brutes, or even of things inanimate, is not tied down to the strict rules of probability. Æsop's fables are a model of this kind of writing.

Apologue ‖ Apono.

APOLOGY, a Greek term, literally importing an excuse or defence of some person or action.

APOMELI, among ancient physicians, a decoction of honey and vinegar, much used as a detergent, promoter of stool, urine, &c.

APOMYOS Deus (*απο*, and *μυια*, *fly*), in the Heathen mythology, a name under which Jupiter was worshipped at Elis, and Hercules as well as Jupiter at the Olympic games. These deities were supplicated under this name, to destroy or drive away the vast number of flies which always attended at the great sacrifices; and in those who accompanied the Olympic games, the first was always to the Apomyos, or Myiagrus Deus, that he might drive away the flies from the rest. The usual sacrifice was a bull.

APONEUROSIS, among physicians, a term sometimes used to denote the expansion of a nerve or tendon in the manner of a membrane: sometimes for the cutting off a nerve; and, finally, for the tendon itself.

APONO, Peter d', one of the most famous philosophers and physicians of his age, born in the year 1350, in a village about four miles from Padua. He studied some time at Paris, and was there promoted to the degree of doctor in philosophy and physic. When he came to practise as a physician, he is said to have insisted on very large sums for his visits: we are not told what he demanded for the visits he made in the place of his residence; but it is affirmed that he would not attend the sick in any other place under 150 florins a-day; and when he was sent for by Pope Honorius IV. he demanded 400 ducats for each day's attendance. He was suspected of magic, and prosecuted by the Inquisition on that account. "The common opinion of almost all authors (says Naude) is, that he was the greatest magician of his age; that he had acquired the knowledge of the seven liberal arts, by means of the seven familiar spirits, which he kept enclosed in a crystal; and that he had the dexterity to make the money he had spent come back into his purse." The same author adds, that he died before the process against him was finished, being then in the 80th year of his age; and that, after his death, they ordered him to be burnt in effigy, in the public place of the city of Padua; designing thereby to strike a fear into others of incurring the like punishment, and to suppress the reading three books which he had wrote; the first being the Heptameron, which is printed at the end of the first volume of Agrippa's work; the second, that which is called by Trithemius *Elucidareum necromanticum Petri de Albano;* and the last, that which is entitled by the same author, *Liber experimentorum mirabilium de annulis secundum xxviii. mansiones lunæ.* His body being secretly taken up by his friends, escaped the vigilance of the inquisitors, who would have burnt it. It was removed several times, and was at last placed in the church of St Augustin, without an epitaph or any mark of honour. The most remarkable book which Apono wrote, was that which procured him the surname of *Conciliator;* he wrote also a piece entitled *De medicina omnimoda.* There is a story told of him, that, having no well in his house, he caused his neighbour's to be carried into the street by devils, when

Apono || Aporia.

when he heard they had forbidden his maid fetching water thence. He had much better (says Mr Bayle) have employed the devils to make a well in his own house, and have stopped up his neighbour's; or, at least, transported it into his house, rather than into the street.

APONOGETON. See BOTANY *Index*.

APONUS, a hamlet near Patavium, with warm baths. It was the birthplace of Livy, (Martial); and is now called *Albano*. E. Long. 10. N. Lat. 45. 15.

APOPEMPTIC, in the ancient poetry, a hymn addressed to a stranger on his departure from a place to his own country. The ancients had certain holidays, wherein they took leave of the gods with *apopemptic* songs, as supposing them returning each to his own country. The deities having the patronage of divers places, it was but just to divide their presence, and allow some time to each. Hence it was, that among the Delians and Milesians we find feasts of Apollo, and among the Argians feasts of Diana, called *Epidemiæ*, as supposing these deities then more peculiarly resident among them. On the last day of the feast they dismissed them, following them to the altars with *apopemptic* hymns.

APOPHASIS, a figure in *Rhetoric*, by which the orator, speaking ironically, seems to wave what he would plainly insinuate; as, *Neither will I mention those things; which, if I should, you notwithstanding could neither confute, nor speak against them.*

APOPHLEGMATIZANTS, in *Pharmacy*, medicines proper to clear the head from superfluous phlegm, whether by spitting or by the nose.

APOPHTHEGM, a short, sententious, and instructive remark, pronounced by a person of distinguished character. Such is that of Cyrus: *He is unworthy to be a magistrate, who is not better than his subjects.* Or this: *He that will not take care of his own business, will be forced to take care of that of others.* Or that of Artaxerxes Mnemon, when reduced to hunger by the loss of his baggage: *How much pleasure have I hitherto lived a stranger to?* Or that of Cato, *Homines nihil agendo discunt malè agere.* Or, finally, that of Augustus, *Festina lentè.* The apophthegms of Plutarch are well known.

APOPHYGE, in *Architecture*, a concave part or ring of a column, lying above or below the flat member. The French call it *le conge d'en bas* or *d'en haut:* the Italians, *cavo di basso* or *di sopra;* and also *il vivo di basso.* The apophyge originally was no more than the ring, or ferril, at first fixed on the extremities of wooden pillars, to keep them from splitting; which afterwards was imitated in stone.

APOPHYSIS, in *Anatomy*, a process or protuberance of a bone. See ANATOMY.

APOPLEXY, a distemper in which the patient is suddenly deprived of all his senses, and of voluntary motion. See MEDICINE *Index*.

APORIA, is a figure in *Rhetoric*, by which the speaker shows, that he doubts where to begin for the multitude of matter, or what to say in some strange and ambiguous thing; and doth, as it were, argue the case with himself. Thus Cicero says, *Whether he took them from his fellows more impudently, gave them to a harlot more lasciviously, removed them from the Roman people more wickedly, or altered them more presumptuously, I cannot well declare.*

Aporia || Apostasy.

APORON, or APORIME, a problem difficult to resolve, and which has never been resolved, though it be not, in itself, impossible.

The word is derived from απορος, which signifies something very difficult, and impracticable; being formed from the privative α, and πορος, *passage*. Such we conceive the quadrature of the circle; the duplicature of the cube; the trisection of an angle, &c. When a question was proposed to any of the Greek philosophers, especially of the sect of Academists; if he could not give a solution, his answer was Απορω, *I cannot see through it.*—This word is also used by some law writers for an inexplicable speech or discourse.

APOSIOPESIS, in *Rhetoric*, otherwise called *reticency* and *suppression;* a figure, by which a person really speaks of a thing, at the same time that he makes a show as if he would say nothing of it. The word comes from αποσιωπαω, *I am silent.*—It is commonly used to denote the same with ELLIPSIS. Jul. Scaliger distinguishes them. The latter, according to him, being only the suppression of a word; as *me, me; adsum qui feci;* the former, the omitting to relate some part of the action; as,

Dixerat, atque illam media inter talia ferro
Collapsam adspiciunt————————

where the poet does not mention how Dido killed herself.—This figure is of use to keep up the grandeur and sublimity of a discourse.

APOSPHRAGISMA, (from απο, and σφραγιζω, *I seal*), in antiquity, the figure or impression of a seal.—It was forbid among the ancients to have the figure or image of God on their rings and seals. To this purpose the precept of Pythagoras, Εν δακτυλιω εικονα Θεου μη περιφερειν! But in process of time, this was little regarded; it was usual enough to have the figures of Egyptian and other deities, as well as of heroes, monsters, friends, ancestors, and even brutes, on their *dactyli* or ring-seals. Thus Cæsar had the image of Venus, Pollio of Alexander, Augustus of the *Sphinx*, Pompey of a frog, Lentulus of his grandfather, &c.

APOSTASIS, in *Medicine*, the same with abscess.

APOSTASY, the abandoning the true religion. The primitive Christian church distinguished several kinds of apostasy. The first, of those who went over entirely from Christianity to Judaism; the second, of those who mingled Judaism and Christianity together; and the third, of those who complied so far with the Jews, as to communicate with them in many of their unlawful practices, without making a formal profession of their religion. But the fourth sort was of those who, after having been some time Christians, voluntarily relapsed into Paganism.

The perversion of a Christian to Judaism, Paganism, or other false religion, was punished by the emperors Constantius and Julian with confiscation of goods; to which the emperors Theodosius and Valentinian added capital punishment, in case the apostate endeavoured to pervert others to the same iniquity: A punishment too severe for any temporal laws to inflict; and yet the zeal of our ancestors imported it into this country; for we find by Bracton, that in his time apostates were to be

Apostasy ‖ Apostle.

be burnt to death. Doubtless the preservation of Christianity, as a national religion, is, abstracted from its own intrinsic truth, of the utmost consequence to the civil state: which a single instance will sufficiently demonstrate. The belief of a future state of rewards and punishments, the entertaining just ideas of the moral attributes of the supreme Being, and a firm persuasion that he superintends and will finally compensate every action in human life (all which are clearly revealed in the doctrines, and forcibly inculcated by the precepts, of our Saviour Christ), these are the grand foundation of all judicial oaths: which call God to witness the truth of those facts, which perhaps may be only known to him and the party attesting: all moral evidence therefore, all confidence in human veracity, must be weakened by apostasy, and overthrown by total infidelity. Wherefore all affronts to Christianity, or endeavours to depreciate its efficacy, in those who have once professed it, are highly deserving of censure. But yet the loss of life is a heavier penalty than the offence, taken in a civil light, deserves; and, taken in a spiritual light, our laws have no jurisdiction over it. This punishment, therefore, has long ago become obsolete; and the offence of apostasy was, for a long time, the object only of the ecclesiastical courts, which corrected the offender *pro salute animæ*. But about the close of the last century, the civil liberties to which we were then restored being used as a cloak of maliciousness, and the most horrid doctrine subversive of all religion being publicly avowed both in discourse and writings, it was thought necessary again for the civil power to interpose, by not admitting those miscreants to the privileges of society, who maintained such principles as destroyed all moral obligation. To this end it was enacted, by statute 9 and 10 William III. c. 32. That if any person educated in, or having made profession of the Christian religion, shall, by writing, printing, teaching, or advised speaking, deny the Christian religion to be true, or the holy Scriptures to be of divine authority, he shall, upon the first offence, be rendered incapable to hold any office or place of trust; and, for the second, be rendered incapable of bringing any action, or of being guardian, executor, legatee, or purchaser of lands, and shall suffer three years imprisonment without bail. To give room, however, for repentance, if, within four months after the first conviction, the delinquent will in open court publicly renounce his error, he is discharged for that once from all disabilities.

APOSTATA CAPIENDO, in the *English Law*, a writ that formerly lay against a person who, having entered into some order of religious, broke out again, and wandered up and down the country.

APOSTATE, one who deserts his religion. Among the Romanists, it signifies a man who, without a legal dispensation, forsakes a religious order of which he had made profession.

A POSTERIORI, or demonstration *à posteriori*. See DEMONSTRATION.

APOSTIL, in matters of literature, the same with a marginal note.

APOSTLE properly signifies a messenger or person sent by another upon some business; and hence, by way of eminence, denotes one of the disciples commissioned by Jesus Christ to preach the gospel.

Apostle.

Our blessed Lord selected twelve out of the number of his disciples to be invested with the apostleship. Their names were Simon Peter, Andrew, James the greater, John, Philip, Bartholomew, Thomas, Matthew, James the less, Jude, surnamed Lebbeus or Thaddeus, Simon the Canaanite, and Judas Iscariot. Of these, Simon, Andrew, James the greater, and John, were fishermen; and Matthew a publican, or receiver of the public revenue: of what profession the rest were, we are not told in Scripture: though it is probable they were fishermen.

There are various conjectures as to the reason of our Saviour's making choice of *twelve* apostles. The most probable is, that it might be in allusion to the twelve patriarchs, as the founders of their several tribes; or to the twelve chief heads or rulers of those tribes, of which the body of the Jewish nation consisted. This opinion seems to be countenanced by what our Saviour tells his apostles, that "when the Son of man shall sit on the throne of his glory, *they* also shall sit upon twelve thrones judging the twelve tribes of Israel."

Our Lord's first commission to his apostles was in the third year of his public ministry, about eight months after their solemn election; at which time he sent them out by two and two. They were to make no provision of money for their subsistence in their journey, but to expect it from those to whom they preached. They were to declare, that the kingdom of heaven, or the Messiah, was at hand; and to confirm their doctrine by miracles. They were to avoid going either to the Gentiles or to the Samaritans, and to confine their preaching to the people of Israel. In obedience to their Master, the apostles went into all the parts of Palestine inhabited by the Jews, preaching the gospel, and working miracles. The evangelical history is silent as to the particular circumstances attending this first preaching of the apostles; and only informs us, that they returned, and told their Master of all that they had done.

Their second commission, just before our Lord's ascension into heaven, was of a more extensive and particular nature. They were now not to confine their preaching to the Jews, but to "go and teach ALL nations, baptizing them in the name of the Father, and of the Son, and of the Holy Ghost." Accordingly they began publicly, after our Lord's ascension, to exercise the office of their ministry, working miracles daily in proof of their mission, and making great numbers of converts to the Christian faith. This alarmed the Jewish Sanhedrim; whereupon the apostles were apprehended, and being examined before the high priest and elders, were commanded not to preach any more in the name of Christ. But this injunction did not terrify them from persisting in the duty of their calling; for they continued daily, in the temple, and in private houses, teaching, and preaching the gospel.

After the apostles had exercised their ministry for twelve years in Palestine, they resolved to disperse themselves in different parts of the world, and agreed to determine by lot what parts each should take. According to this division, St Peter went into Pontus, Galatia, and those other provinces of the Lesser Asia. St Andrew had the vast northern countries of Scythia and Sogdiana allotted to his portion. St John's was partly the same with Peter's, namely the Lesser Asia.

St

Apostle. St Philip had the Upper Asia assigned to him, with some parts of Scythia and Colchis. Arabia Felix fell to St Bartholomew's share. St Matthew preached in Chaldea, Persia, and Parthia. St Thomas preached likewise in Parthia; as also to the Hyrcanians, Bactrians, and Indians. St James the less continued in Jerusalem, of which church he was bishop. St Simon had for his portion Egypt, Cyrene, Libya, and Mauritania; St Jude, Syria and Mesopotamia; and St Matthias, who was chosen in the room of the traitor Judas, Cappadocia and Colchis. Thus, by the dispersion of the apostles, Christianity was very early planted in a great many parts of the world. We have but very short and imperfect accounts of their travels and actions.

In order to qualify the apostles for the arduous task of converting the world to the Christian religion, they were, in the first place, miraculously enabled to speak the languages of the several nations to whom they were to preach: and, in the second place, were endowed with the power of working miracles, in confirmation of the doctrines they taught; gifts which were unnecessary, and therefore ceased, in the after ages of the church, when Christianity came to be established by the civil power.

St Paul is frequently called the *apostle*, by way of eminence; and the *apostle of the Gentiles*, because his ministry was chiefly made use of for the conversion of the Gentile world, as that of St Peter was for the Jews, who is therefore styled the *apostle of the circumcision*. The several apostles are usually represented with their respective badges or attributes; St Peter with the keys; St Paul with a sword; St Andrew with a cross or saltier; St James minor with a fuller's pole; St John with a cup, and a winged serpent flying from it; St Bartholomew with a knife; St Philip with a long staff, whose upper end is formed into a cross; St Thomas with a lance; St Matthew with a hatchet; St Matthias with a battle axe; St James major with a pilgrim's staff and a gourd bottle; St Simon with a saw; and St Jude with a club.

This appellation was also given to the ordinary travelling ministers of the church.—Thus St Paul, in the Epistle to the Romans, xvii. 7, says, "Salute Andronicus and Junia, my kinsmen and fellow prisoners, who are of note among the apostles." It was likewise a title given to those sent by the churches to carry their alms to the poor of other churches. This usage they borrowed from the synagogues, who called those whom they sent on this message by the same name; and the function or office itself αποστολη, *apostle*, q. d. *mission*. Thus St Paul, writing to the Philippians, tells them that Epaphroditus their apostle had ministered to his wants, ch. ii. 25.

The appellation is given in like manner to those persons who first planted the Christian faith in any place. Thus Dionysius of Corinth is called the *apostle of France;* Xavier, *the apostle of the Indies*, &c. In the East Indies the Jesuit missionaries are also called *apostles*.

Apostle is also used among the Jews for a kind of officer anciently sent into the several parts and provinces in their jurisdiction, by way of visitor or commissary, to see that the laws were duly observed, and to receive the moneys collected for the reparation of the temple, and the tribute payable to the Romans. The Theodosian code, lib. 14. *De Judæis*, calls those *apostoli, qui ad exigendum aurum atque argentum, à patriarcha certo tempore diriguntur*. Julian the apostate remitted the Jews the *apostle*, αποστολη; that is, as he himself explains it, the tribute they had been accustomed to send him. These apostles were a degree below the officers of the synagogue called *patriarchs*, and received their commissions from them. Some authors observe, that St Paul had borne this office; and that it is this he alludes to in the beginning of the epistle to the Galatians; as if he had said, Paul, no longer an apostle of the synagogue, nor sent thereby to maintain the law of Moses, but now an apostle and envoy of Jesus Christ, &c. St Jerome, though he does not believe that St Paul had been an apostle of this kind, yet imagines that he alludes to it in the passage just cited. Apostle.

Apostle, in the Greek liturgy, is particularly used for a book containing the epistles of St Paul, printed in the order wherein they are to be read in churches, through the course of the year. Another book of the like kind, containing the Gospels, is called Ευαγγελιον, *Gospel*.—The apostle, of late days, has also contained the other canonical epistles, the Acts of the Apostles, and the Revelation. Hence it is also called *Acts of the Apostles*, Πραξαποστολος; that being the first book in it.

Apostle is also thought by many to have been the original name for bishops, before the denomination *bishop* was appropriated to their order, Thus Theodoret says expressly, the same persons are anciently called promiscuously both bishops and presbyters, whilst those who are now called bishops were called *apostles*. In the arsenal of Bremen, there are twelve pieces of cannon called the *Twelve Apostles*, on a supposition that the whole world must be convinced, and acquiesce in the preaching of such apostles.

Apostles Creed: a formula, or summary of the Christian faith, drawn up, according to Ruffinus, by the apostles themselves: who, during their stay at Jerusalem, soon after the Lord's ascension, agreed upon this *creed*, as a rule of faith, and as a *word of distinction* by which they were to know friends from foes. Baronius, and some other authors, conjecture, that they did not compose it till the second year of the reign of Claudius, a little before their dispersion. As to their manner of composiug it, some fancy, that each apostle pronounced his article, which is the reason of its being called *symbolum apostolicum*, it being made up of sentences jointly contributed, after the manner of persons paying each their club (*symbolum*), or share of a reckoning.

But there are reasons which may induce us to question whether the apostles composed any such creed as this. For, first, Neither St Luke in the Acts, nor any other ecclesiastical writer before the 5th century, make any mention of an assembly of the apostles in order to the composing of a creed. Secondly, The fathers of the three first centuries, in disputing against the heretics, endeavoured to prove that the doctrine contained in this creed was the same which the apostles taught; but they never pretend that the apostles composed it. Thirdly, If the apostles had made this creed, it would have been the same in all churches, and in all ages; and

Apostle || Apostolic.

and all authors would have cited it after the same manner. But the case is quite otherwise. In the second and third ages of the church, there were as many creeds as authors, and one and the same author sets down the creed after a different manner in several places of his works; which is an evidence that there was not at that time any creed which was reputed to be the apostles. In the fourth century Ruffinus compares together the three ancient creeds of the churches of Aquileia, Rome, and the East, which differ very considerably in the terms. Besides, these creeds differed not only in the terms and expressions, but even in the articles, some of which were omitted in one or other of them; such as those of the *descent into hell*, the *communion of the saints*, and the *life everlasting*. From these reasons it may be gathered, that though this creed may be said to be that of the apostles in regard to the doctrines contained therein, yet it is not to be referred to them as the authors and first composers of it. Who was the true author of it, is not easy to determine; though its great antiquity may be inferred from hence, that the whole form, as it now stands in the English liturgy, is to be found in the works of St Ambrose and Ruffinus, the former of whom flourished in the third century, and the latter in the fourth century.

The primitive Christians, in regard they always concealed this and their other mysteries, did not publicly recite the creed, except at the times of baptism; which, unless in case of necessity, were only in Easter and Whitsuntide. The constant repeating of it was not introduced into the church till the end of the fifth century; about which time Petrus Gnapheus, bishop of Antioch, prescribed the recital of it every time divine service was performed.

APOSTOLARE, Apostolicare, *apostolizing*, in some middle age writers, denotes the being preferred to the dignity of pope.

APOSTOLATE, in a general sense, is used for mission. In this sense, Olearius has a discourse concerning the apostolate of Christ.

Apostolate more properly denotes the dignity or office of an apostle of Christ; but it is also used, in ancient writers, for the office of a bishop. In this sense we meet with several letters, petitions, requests, &c. directed to bishops, under the title of your *apostolate*, or *apostolatus vester*. But as the title *apostolicus* had been appropriated to the pope, so that of *apostolate*, became at length restrained to the sole dignity of the popedom. Every bishop's see was anciently dignified with the title of *sedes apostolica*, an apostolical see, which is now the peculiar denomination of the see of Rome.

APOSTOLI, in *Law*, denote those letters missive which are demanded in cases of appeal.

APOSTOLIC, Apostolical, something that relates to the apostles, or descends from them. Thus we say, the *apostolical* age, *apostolical* doctrine, *apostolical* character, constitutions, traditions, &c.

Apostolic, in the primitive church, was an appellation given to all such churches as were founded by the apostles; and even to the bishops of those churches, as being the reputed successors of the apostles.—These were confined to four, viz. Rome, Alexandria, Antioch, and Jerusalem. In after times, other churches assumed the same quality, on account, principally, of the conformity of their doctrine with that of the churches which were apostolical by foundation, and because all bishops held themselves successors of the apostles, or acted in their diocese with the authority of apostles.

Apostolic || Apostolici.

The first time the term *apostolical* is attributed to bishops as such, is in a letter of Clovis to the council of Orleans, held in 511, though that king does not there expressly denominate them *apostolical* (but *apostolica sede dignissimi*) highly worthy of the apostolical see. In 581, Guntram calls the bishops, met at the council of Maçon, *apostolical* pontiffs, *apostolici pontifices*.

In progress of time, the bishop of Rome growing in power above the rest, and the three patriarchates of Alexandria, Antioch, and Jerusalem, falling into the hands of the Saracens, the title *apostolical* was restrained to the pope and his church alone. Though some of the popes, and St Gregory the Great, not contented to hold the title by this tenure, began at length to insist, that it belonged to them by another and peculiar right, as being the successors of St Peter. The council of Rheims in 1049 declared that the pope was the sole apostolical primate of the universal church. And hence a great number of apostolicals; *apostolical* see, *apostolical* nuncio, *apostolical* notary, *apostolical* brief, *apostolical* chamber, *apostolical* vicar, &c.

Apostolical Constitutions. See Constitution.

Apostolical Traditions. See Tradition.

Apostolical Fathers is an appellation usually given to the writers of the first century who employed their pens in the cause of Christianity. Of these writers, Cotelerius, and after him Le Clerc, have published a collection in two volumes, accompanied both with their own annotations and the remarks of other learned men.

APOSTOLIANS, a sect of the Mennonites, which first sprung up in the year 1663, and derived its name from Apostool, one of the Mennonite ministers at Amsterdam. They concurred with them in doctrine, and admitted to their communion those only who professed to believe all the sentiments which are contained in their public confession of faith.

APOSTOLICI, or Apostolics, was a name assumed by three different sects, on account of their pretending to imitate the manner and practice of the apostles. The first apostolici, otherwise called *Apotactitæ* and *Apotactici*, rose out of the Encratitæ and Catharі in the third century. They made profession of abstaining from marriage, and the use of wine, flesh, money, &c.

Gerhard Sagarelli was the founder of the second sect; he obliged his followers to go from place to place as the apostles did, to wander about clothed in white, with long beards, dishevelled hair, and bare heads, accompanied with women, whom they called their spiritual sisters. They likewise renounced all kinds of property and possessions, inveighed against the growing corruption of the church of Rome, predicted its overthrow, and the establishment of a purer church on its ruins. Sagarelli was burnt alive at Parma in the year 1300, and was afterwards succeeded by Dulcinus, who added to the character of an apostle those of a prophet and a general, and carried on a bloody

Apostolici || Apoteichismus.

and dreadful war for the space of more than two years against Reynerius, bishop of Vercelli; he was at length defeated, and put to death in a barbarous manner in the year 1307. Nevertheless, the sect subsisted in France, Germany, and in other countries, till the beginning of the 15th century, when it was totally extirpated under the pontificate of Boniface IX.

The other branch of apostolici was of the twelfth century. These also condemned marriage, preferring celibacy, and calling themselves the chaste brethren and sisters; though each was allowed a spiritual sister, with whom he lived in a domestic relation; and on this account they have been charged with concubinage: they held it unlawful to take an oath; they set aside the use of baptism; and in many things imitated the Manichees. Bernard wrote against this sect of apostolici.

APOSTOLICUM is a peculiar name given to a kind of song or hymn, anciently used in churches. The apostolicum is mentioned by Greg. Thaumaturgus as used in his time. Vossius understands it as spoken of the apostles creed: Suicer thinks this impossible, for that this creed was then unknown in the churches of the east.

APOSTROPHE, in *Rhetoric*, a figure by which a person who is either absent or dead is addressed as if he were present and attentive to us. This figure is, in boldness, a degree lower than the address to personified objects (see PERSONIFICATION); since it requires a less effort of imagination to suppose persons present who are dead or absent, than to imitate insensible beings and direct our discourse to them. The poems of Ossian abound with the most beautiful instances of this figure. "Weep on the rocks of roaring winds, O Maid of Inistore! Bend thy fair head over the waves, thou fairer than the ghost of the hills when it moves in a sunbeam at noon over the silence of Morven! He is fallen! Thy youth is low: pale beneath the sword of Cuchullin!

APOSTROPHE, in *Grammar*, the contraction of a word by the use of a comma: as *call'd* for *called*, *tho'* for *though*.

APOTACTITÆ, or APOTACTICI, an ancient sect, who affecting to follow the evangelical counsels of poverty, and the examples of the apostles and primitive Christians, renounced all their effects and possessions. It does not appear that they gave into any errors during their first state; some ecclesiastical writers assure us they had divers holy virgins and martyrs under the persecution of Dioclesian in the fourth century; but they afterwards fell into the opinions of the Encratitæ, and taught that the renouncing of all riches was not only a matter of counsel and advice, but of precept and necessity. And hence the sixth law in the Theodosian code joins the Apotactitæ with the Eunomians and Arians.

APOTEICHISMUS, in the ancient military art, a kind of line of circumvallation drawn round a place in order to besiege it. This was also called *periteichismus*. The first thing the ancients went about, when they designed to lay close siege to a place, was the apoteichismus; which sometimes consisted of a double wall or rampart, raised of earth; the innermost to prevent sudden sallies from the town, the outermost to keep off foreign enemies from coming to the relief of the besieged. This answered to what are called *lines of contravallation* and *circumvallation* among the moderns.

Apoteichismus || Apotheosis

APOTHECARY, one who practises the art of pharmacy. In London, the apothecaries are one of the city companies. They were incorporated by a charter from King James I. procured at the solicitation of Dr Mayerne and Dr Aitkens; till that time they only made a part of the grocers company; plums, sugar, spice, Venice treacle, mithridate, &c. were sold in the same shop and by the same person. The reason of separating them was, that medicines might be better prepared, and in opposition to divers persons who imposed unwholesome remedies on the people. By an act which was made perpetual in the ninth year of George I. they are exempted from serving upon juries, or in ward and parish offices. They are obliged to make up their medicines according to the formulas prescribed in the college dispensatory; and are liable to have their shops visited by the censors of the college, who are empowered to destroy such medicines as they think not good.

They have a hall in Black Friars, where there are two fine laboratories, out of which all the surgeons chests are supplied with medicines for the British royal navy.

To his majesty belong two apothecaries: the salary to the first, 320l.; to the second, 275l.—To the household belong also two.

The charitable dispensation of medicines by the Chinese is well deserving notice. They have a stone which is ten cubits high, erected in the public squares of their cities; on this stone are engraven the names of all sorts of medicines, with the price of each; and when the poor stand in need of any relief from physic, they go to the treasury, where they receive the price each medicine is rated at.

APOTHECARY, *Apothecarius*, in writers of the middle age, denotes a shop-keeper or warehouse-keeper.

APOTHECARIUS is also used to denote a store-keeper, or officer appointed to have the direction of a magazine, granary, &c. In which sense *apothecarii* is sometimes rendered by *horearii* and *rationarii*.

APOTHEOSIS, in antiquity, a heathen ceremony, whereby their emperors and great men were placed among the gods. The word is derived from απο, and Θεος, *God*.

After the apotheosis which they also called *deification* and *consecration*, temples, altars, and images were erected to the new deity; sacrifices, &c. were offered, and colleges of priests instituted.

It was one of the doctrines of Pythagoras, which he had borrowed from the Chaldees, that virtuous persons after their death were raised into the order of the gods. And hence the ancients deified all the inventors of things useful to mankind; and those who had done any important services to the commonwealth. Tiberius proposed to the Roman senate the apotheosis of Jesus Christ, as is related by Eusebius, Tertullian, and Chrysostom.

Juvenal rallying the frequent apotheoses, introduces poor Atlas, complaining that he was ready to sink under the burden of so many new gods as were every day added to the heavens. Seneca ridicules the apotheosis of Claudius with admirable humour.

The ceremony, according to Herodian's description,

was

Apotheosis || Apparatus.

was as follows: After the body of the deceased had been burnt with the usual solemnities, an image of wax, exactly resembling him, was placed on an ivory couch, where it lay for seven days, attended by the senate and ladies of the highest quality in mourning; and then the young senators and knights bore the bed of state through the Via Sacra to the old forum, and from thence to the Campus Martius, where it was deposited upon an edifice built in form of a pyramid. The bed being thus placed amidst a quantity of spices and other combustibles, and the knights having made a solemn procession round the pile, the new emperor, with a torch in his hand, set fire to it, whilst an eagle, let fly from the top of the building, and mounting in the air with a firebrand, was supposed to convey the soul of the deceased to heaven; and thenceforward he was ranked among the gods.

We often meet with the consecration or apotheosis of emperors represented on medals: where we see the pyramids of several stories, each growing less and less; we see also the eagles flying away with the souls of the deceased emperors. A gem in the museum of Brandenburg represents the apotheosis of Julius Cæsar, mounted upon the celestial globe, and holding a helm in his hand, as if he were now the governor of heaven, as before of the earth. See DEIFICATION.

APOTHERAPIA, (from *αποθεραπευω*, *I cure*), in *Physic*, properly denotes a complete or finished cure.

APOTHERAPIA is also used in the gymnastic art, for the last part of all regular exercise, viz. friction, or unction with oil, before as well as after bathing. The design of this was partly to cleanse the skin from any filth or dust it might have contracted during the exercise, and partly to remove weariness.

APOTOME, in *Geometry*, the difference between two incommensurable lines.

APOTOME, in *Music*, the difference between a greater and a lesser semi-tone; expressed by the ratio, 128; 125.

APOTROPÆ, (from *αποτρεπω*, *I avert*), in the ancient poetry, verses composed for averting the wrath of incensed deities; and the deities invoked for averting any threatened misfortune were called *Apotrepeans;* they were also called *Alexiaci*, from *αλεξω*, *I drive away;* and *Averrunci* from *averrunco*, which denotes the same.

APOZEM, in *Medicine*, the same with decoction. See DECOCTION.

APPARATUS, a term used to denote a complete set of instruments, or other utensils, belonging to any artist or machine.

APPARATUS is frequently used for the operation of cutting for the stone. For this there are three sorts of apparatus, viz. the small, great, and high apparatus. See SURGERY.

APPARATUS is also used as a title of several books composed in form of catalogues, bibliothecas, dictionaries, &c. for the ease and conveniency of study. The apparatus to Cicero is a kind of concordance, or collection of Ciceronian phrases, &c. The *apparatus sacer* of Possevin, is a collection of all kinds of ecclesiastical authors, printed in 1611, in three volumes.—Glossaries, comments, &c. are also frequently called *apparatuses*.

Apparent, Apparition.

APPARENT, in a general sense, something that is visible to the eyes, or obvious to the understanding.

APPARENT, among mathematicians and astronomers, denotes things as they appear to us, in contradistinction from real or true; thus we say, the apparent diameter, distance, magnitude, place, figure, &c. of bodies.

APPARENT Heir, in *Law*. No inheritance can vest, nor can any person be the actual complete heir of another, till the ancestor is previously dead. *Nemo est hæres viventis*. Before that time the person who is next in the line of succession is called an *heir apparent*, or *heir presumptive*. Heirs *apparent* are such, whose right of inheritance is indefeasible, provided they outlive the ancestor; as the eldest son or his issue, who must by the course of the common law be heirs to the father whenever he happens to die. Heirs *presumptive* are such, who, if the ancestor should die immediately, would in the present circumstances of things be his heirs: but whose right of inheritance may be defeated by the contingency of some nearer heir being born; as a brother, or nephew, whose presumptive succession may be destroyed by the birth of a child; or daughter, whose present hopes may be hereafter cut off by the birth of a son. Nay, even if the estate hath descended, by the death of the owner, to such brother, or nephew, or daughter, in the former cases, the estate shall be divested, and taken away by the birth of a posthumous child; and, in the latter, it shall also be totally divested by the birth of a posthumous son.

APPARITION, in a general sense, denotes simply the appearance of a thing. In a more limited sense, it is used for a spectre or ghost. Several instances of apparitions occur in the Bible; that of Samuel, raised by the witch of Endor, has occasioned great disputes. We find great controversies among authors, in relation to the reality, the existence or non-existence, the possibility or impossibility, of apparitions. The Chaldeans, the Jews, and other nations, have been the steady assertors of the belief of apparitions. The denial of spirits and apparitions is by some made one of the marks of infidelity, if not of atheism. Many of the apparitions we are told of in writers, are doubtless mere delusions of the sense; many others are fictitious, contrived merely to amuse, or answer some purpose. Apparitions, it is certain, are machines that on occasion have been of good service both to generals, to ministers of state, to priests, and others.

Partial darkness, or obscurity, are the most powerful means by which the sight is deceived: night is therefore the proper season for apparitions. Indeed the state of the mind, at that time, prepares it for the admission of these delusions of the imagination. The fear and caution which must be observed in the night; the opportunity it affords for ambuscades and assassinations; depriving us of society, and cutting off many pleasing trains of ideas, which objects in the light never fail to introduce, are all circumstances of terror: and perhaps, on the whole, so much of our happiness depends upon our senses, that the deprivation of any one may be attended with proportionable horror and uneasiness. The notions entertained by the ancients respecting the soul, may receive some illustration from these principles. In dark or twilight, the imagination frequently transforms

Apparition || Appeal

an inanimate body into a human figure; on approaching, the same appearance is not to be found: hence they sometimes fancied they saw their ancestors; but not finding the reality, distinguished these illusions by the name of *shades*.

Many of these fabulous narrations might originate from dreams. There are times of slumber when we are not sensible of being asleep. On this principle, Hobbes has ingeniously accounted for the spectre which is said to have appeared to Brutus. "We read," says he, "of M. Brutus, that at Philippi, the night before he gave battle to Augustus Cæsar, he saw a fearful apparition, which is commonly related by historians as a vision; but, considering the circumstances, one may easily judge it to have been but a short dream. For sitting in his tent, pensive, and troubled with the horror of his rash act, it was not hard for him, slumbering in the cold, to dream of that which most affrighted him; which fear, as by degrees it made him wake, so it must needs make the apparition by degrees to vanish: and having no assurance that he slept, he could have no cause to think it a dream, or any thing but a vision."—The well known story told by Clarendon, of the apparition of the duke of Buckingham's father, will admit of a similar solution. There was no man in the kingdom so much the subject of conversation as the duke; and from the corruptness of his character, he was very likely to fall a sacrifice to the enthusiasm of the times. Sir George Villiers is said to have appeared to the man at midnight: therefore there is the greatest probability that the man was asleep; and the dream affrighting him, made a strong impression, and was likely to be repeated.

APPARITOR, among the Romans, a general term to comprehend all attendants of judges and magistrates appointed to receive and execute their orders. *Apparitor*, in England, is a messenger that serves the process of a spiritual court, or a beadle in a university who carries the mace.

APAUMEE, in *Heraldry*, denotes one hand extended, with the full palm appearing, and the thumb and fingers at full length.

APPEAL, in *Law*, the removal of a cause from an inferior to a superior court or judge, when a person thinks himself aggrieved by the sentence of the inferior judge. Appeals lie from all the ordinary courts of justice to the house of lords. In ecclesiastical cases, if an appeal is brought before a bishop, it may be removed to the archbishop; if before an archdeacon, to the court of arches, and thence to the archbishop; and from the archbishop's court to the king in chancery.

APPEAL, in *Common Law*, denotes an accusation by a private subject against another for some heinous crime; demanding punishment on account of the particular injury suffered, rather than for the offence against the public.

This private process, for the punishment of public crimes, had probably its original in those times, when a private pecuniary satisfaction, called a *weregild*, was constantly paid to the party injured, or his relations, to expiate enormous offences. This was a custom derived to the English, in common with other northern nations, from their ancestors the ancient Germans; among whom, according to Tacitus, *luitur homicidium certo armentorum ac pecorum numero; recipitque satisfactionem universa domus.* In the same manner, by the Irish Brehon law, in case of murder, the brehon or judge was used to compound between the murderer and the friends of the deceased who prosecuted him, by causing the malefactor to give unto them, or to the child or wife of him that was slain, a recompense which they called an *eriach*. And thus we find in the Anglo-Saxon laws (particularly those of King Athelstan) the several weregilds for homicide established in progressive order, from the death of the ceorl or peasant, up to that of the king himself. And in the laws of Henry I. we have an account of what other offences were redeemable by weregild, and what were not so. As, therefore, during the continuance of this custom, a process was certainly given for recovering the weregild by the party to whom it was due; it seems that, when these offences by degrees grew no longer redeemable, the private process was still continued, in order to ensure the infliction of punishment upon the offender, though the party injured was allowed no pecuniary compensation for the offence. Appeal.

But though appeals were thus, in the nature of prosecutions for some atrocious injury, committed more immediately against an individual, yet it also was anciently permitted, that any subject might appeal another subject of high treason, either in the courts of common law, or in parliament, or (for treasons committed beyond the seas) in the court of the high constable and marshal. The cognizance of appeals in the latter still continues in force; and so late as 1631, there was a trial by battle awarded in the court of chivalry, on such an appeal of treason: but that in the first was *virtually* abolished by the statutes 5 Edw. III. c. 9. and 2 Edw. III. c. 24. and in the second *expressly*, by statute 1 Hen. IV. c. 14. So that the only appeals now in force for things done within the realm, are appeals of felony and mayhem.

An appeal of felony may be brought for crimes committed either against the parties themselves or their relations. The crimes against the parties themselves are *larceny*, *rape*, and *arson*. And for these, as well as for mayhem, the persons robbed, ravished, maimed, or whose houses are burnt, may institute this private process. The only crime against one's relation, for which an appeal can be brought, is that of *killing* him, by either murder or manslaughter. But this cannot be brought by every relation; but only by the wife for the death of her husband, or by the heir male for the death of his ancestor; which heirship was also confined by an ordinance of Henry I. to the four nearest degrees of blood. It is given to the wife on account of the loss of her husband; therefore, if she marries again, before or pending her appeal, it is lost and gone: or, if she marries after judgment, she shall not demand execution. The heir, as was said, must also be heir male, and such a one as was the next heir by the course of the common law at the time of the killing of the ancestor. But this rule has three exceptions: 1. If the person killed leaves an innocent wife, she only and not the heir, shall have the appeal. 2. If there be no wife, and the heir be accused of the murder, the person, who next to him would have been heir male, shall bring the appeal. 3. If the wife kills her husband, the heir may appeal her of the death. And, by the statute of Glou-

cester,

Appeal. cester, 6 Edw. I. c. 9. all appeals of death must be sued within a year and a day after the completion of the felony by the death of the party: which seems to be only declaratory of the old common law; for in the Gothic constitutions we find the same "*præscriptio annalis, quæ currit adversus actorem, si de homicida ei non constat intra annum à cæde facta, nec quenquam interca arguat et accuset.*

These appeals may be brought previous to any indictment; and, if the appellee be acquitted thereon, he cannot afterwards be indicted for the same offence. In like manner as by the old Gothic constitution, if any offender gained a verdict in his favour, when prosecuted by the party injured, he was also understood to be acquitted of any crown prosecution for the same offence; but, on the contrary, if he made his peace with the king, still he might be prosecuted at the suit of the party. And so, in England, if a man be acquitted on an indictment of murder, or found guilty, and pardoned by the king, still he ought not (in strictness) to go at large, but be imprisoned or let to bail till the year and day be past, by virtue of the statute 3 Hen. VIII. c. 1. in order to be forthcoming to answer any appeal for the same felony, not having as yet been punished for it: though, if he hath been found guilty of manslaughter on an indictment, and hath had the benefit of clergy, and suffered the judgment of the law, he cannot afterwards be appealed: for it is a maxim in law, "that *nemo bis punitur pro eodem delicto.*" Before this statute was made, it was not usual to indict a man for homicide within the time limited for appeals; which produced very great inconvenience.

If the appellee be acquitted, the appellor (by virtue of the statute of Westm. 2. 13 Edw. I. c. 12.) shall suffer one year's imprisonment, and pay a fine to the king, besides restitution of damages to the party for the imprisonment and infamy which he has sustained: and, if the appellor be incapable to make restitution, his abettors shall do it for him, and also be liable to imprisonment. This provision, as was foreseen by the author of Fleta, proved a great discouragement to appeals; so that thenceforward they ceased to be in common use.

If the appellee be found guilty, he shall suffer the same judgment, as if he had been convicted by indictment: but with this remarkable difference, that on an indictment, which is at the suit of the king, the king may pardon and remit the execution; on an appeal which is at the suit of a private subject, to make an atonement for the private wrong, the king can no more pardon it, than he can remit the damages required on an action of battery. In like manner as, while the weregild continued to be paid as a fine for homicide, it could not be remitted by the king's authority. And the ancient usage was, so late as Henry IV's time, that all the relations of the slain should drag the appellee to the place of execution: a custom, founded upon that savage spirit of family resentment which prevailed universally through Europe after the irruption of the northern nations, and is peculiarly attended to in their several codes of law; and which prevails even now among the wild and untutored inhabitants of America: as if the finger of nature had pointed it out to mankind, in their rude and uncultivated state. However, the punishment of the offender may be remitted, and discharged by the concurrence of all parties interested; and as the king by his pardon may frustrate an indictment, so the appellant by his release may discharge an appeal: "*nam quilibet potest renunciare juri pro se introducto.*" Appeal || Appellation.

APPEARANCE, in a general sense, the exterior surface of a thing, or that which immediately strikes the senses.

Appearance, in *Law*, signifies a defendant's filing a common or special bail, on any process issued out of a court of judicature.

APPELLANT, in a general sense, one who appeals. See Appeal.

Appellants, in church history, an appellation given to such of the catholic clergy as appeal from the constitution unigenitus to a general council.

APPELLATION, the name by which any thing is known or distinguished when spoken of. See Name.

Nothing can be more foreign to the original meaning of many words and proper names, than their present appellations, frequently owing to the history of those things being forgotten, or an ignorance of the language in which they were expressed. Who, for example, when the crier of a court bawls out, "O yes, O yes," would dream that it was a proclamation commanding the talkers to become hearers, being the French word *Oyez*, "listen," retained in our courts ever since the law pleadings were held in French? Or would any person suppose that the headland on the French coast, near Calais, called by our seamen Blackness, would be so titled from its French name of *Blanc Nez*, or the *White Headland*.

King Henry the Eighth having taken the town of Boulogne in France, the gates of which he brought to Hardes in Kent, where they are still remaining, the flatterers of that reign highly magnified this action, which, Porto Bello like, became a popular subject for signs; and the port or harbour of Boulogne, called *Boulogne Mouth*, was accordingly set up at a noted inn in Holborn. The name of the inn long outliving the sign and fame of the conquest, an ignorant painter, employed by a no less ignorant landlord, to paint a new one, represented it by a bull and a large gaping human mouth (answering to the vulgar pronunciation of *Bull and Mouth*). The same piece of history gave being to the *bull and gate*, originally meant for Boulogne gate, and represented by an embattled gate or entrance into a fortified town.

The *barber's pole* has been the subject of many conjectures; some conceiving it to have originated from the word *poll*, or head, with several other conceits as far-fetched and as unmeaning: but the true intention of that party-coloured staff was to show that the master of the shop practised surgery, and could breathe a vein as well as mow a beard; such a staff being to this day, by every village practitioner, put into the hand of a patient undergoing the operation of phlebotomy. The white band which encompasses the staff, was meant to represent the fillet, thus elegantly twined about it.

Nor were the *chequers*, (at this time a common sign of a public house) less expressive, being the representation of a kind of draught-board called *tables*, and showed that there that game might be played. From their colour, which was red, and the similarity to a lattice,

it

Appellation || Appetite.

it was corruptly called the *red lettuce*, which word is frequently used by ancient writers to signify an alehouse.

The Spectator has explained the sign of the *bell-savage inn* plausibly enough, in supposing it to have been originally the figure of a beautiful female found in the woods, called in French *la belle sauvage*. But another reason has since been assigned for that appellation, namely, that the inn was once the property of Lady Arabella Savage, and familiarly called *Bell Savage's Inn*, probably represented, as at present, by a bell and a savage or wild man, which was a rebus for her name; rebusses being much in fashion in the 16th century; of which the bolt and tun is an instance.

The three blue balls prefixed to the doors and windows of pawnbrokers shops, by the vulgar humorously enough said to indicate that it is two to one that the things pledged are never redeemed, was in reality the arms of a set of merchants from Lombardy, who were the first that publicly lent money on pledges. They dwelt together in a street, from them named Lombard Street, in London, and also gave their name to another at Paris. The appellation of Lombard was formerly all over Europe considered as synonymous with that of usurer.

At the institution of yeomen of the guards, they used to wait at table on all great solemnities, and were ranged near the buffets; this procured them the name of *buffetiers*, not very unlike in sound to the jocular appellation of *beef-eaters*, now given them; though probably it was rather the voluntary misnomer of some wicked wit, than an accidental corruption arising from ignorance of the French language.

The opprobrious title of *bum bayliffe*, so constantly bestowed on the sheriff's officers, is, according to Judge Blackstone, only the corruption of *bound bayliffe*, every sheriff's officer being obliged to enter into bonds and to give security for his good behaviour, previous to his appointment.

A *cordwainer* seems to have no relation to the occupation it is meant to express, which is that of a shoemaker. But *cordonier*, originally spelt *cordaunier*, is the French word for that trade; the best leather used for shoes coming originally from Cordova in Spain. Spanish-leather shoes were once famous in England.

APPELLATIVE NAMES, in *Grammar*, in contradistiction to proper names, are such as stand for universal ideas, or a whole rank of beings, whether general or special. Thus, *fish*, *bird*, *man*, *city*, *river*, are common or appellative names; and so are *trout*, *eel*, *lobster*; for they all agree to many individuals, and some to many species. See NAME.

APPELLEE, among lawyers, the person against whom an appeal is brought. See APPEAL.

APPENDIX, in literature, a treatise or supplement added at the end of a work, to render it more complete.

APPERCEPTION, or ADPERCEPTION, a term used by Leibnitz and his followers for consciousness.

APPETITE, in a general sense, the desire of enjoying some object, supposed to be conducive to our happiness. When this inclination is guided by reason, and proportioned to the intrinsic value of the object, it is called *rational appetite*; as, on the other hand, it is denominated *sensitive appetite*, when we have only a blind propensity to a thing, without determinate ideas of the good qualities for which we desire it. Appetite || Applause

Appetites are passions directed to general objects, in contradistinction to passions directed to particular objects, which retain their proper name. Thus we say, an *appetite* for fame, for glory, for conquest, for riches; but we say the *passion* of love, of gratitude, of envy, &c. Appetite may be also distinguished from passion, since the latter has no existence till a proper object be presented; whereas the former exists first, and then is directed to an object.

APPETITE, in *Medicine*, a certain painful or uneasy sensation, always accompanied with a desire to eat or drink.—An excessive appetite is called by physicians *bulimy* or *fames canina*; a defect or loss of it *anorexy*; and that after things improper for food, *pica*.

APPIA VIA, a way reaching from Rome through Capua to Brundusium, between 330 and 350 miles long. Appius Claudius, surnamed *Cæcus*, in the year of the city 441, carried it from the Porta Capena to Capua (Livy, Frontinus). It was afterwards carried on to Brundusium; but by whom, or when, is uncertain. It was laid with very hard stone, brought from a great distance, large, and squared (Diodorns); and it was so wide, that several waggons could go abreast. Statius calls it *the queen of roads*. Its course is described by Horace, Strabo, and Antonine.

APPIAN, an eminent writer of the Roman history in Greek, under the reigns of Trajan and Hadrian. He was of a good family in Alexandria in Egypt; whence he went to Rome, and there distinguished himself so well as an advocate, that he was chosen one of the procurators of the empire, and the government of a province was committed to him. He did not complete the Roman history in a continued series; but wrote distinct histories of all nations that had been conquered by the Romans, in which he placed every thing relating to those nations in the proper order of time. His style is plain and simple: in the opinion of Phocius, he has shown the greatest knowledge of military affairs, and the happiest talent at describing them, of any of the historians; for while we read him, we in a manner see the battles which he describes. Of all this voluminous work there remains only what treats of the Punic, Syrian, Parthian, Mithridatic, and Spanish wars, with those against Hannibal, the civil wars, and the wars in Illyricum, and some fragments of the Celtic or Gallic wars.

APPIUS CLAUDIUS, a Sabine by birth, one of the principal inhabitants of Regillum: His shining merit having drawn the envy of his fellow citizens upon him, he retired to Rome with all his family. Appius was admitted into the senate, and was made consul with Publius Servilius Priscus, in 258 from the building of Rome; but he was hated by the plebeians, being an austere opposer of their clamours and seditions. The Claudian family continued long one of the most illustrious of the patrician families in Rome; and several in succession of the name of Appius supported the same stern character that distinguished their first founder.

APPLAUSE, an approbation of something, signified by clapping the hands, still practised in theatres.—Applause, in antiquity, differed from ACCLAMATION, as the latter was articulate and performed with the voice, the former with the hands. Among the Romans,

mans, applause was an artificial musical kind of noise, made by the audience or spectators to express their satisfaction. There were three species of applause, denominated from the different noises made in them, viz. *Bombus*, *Imbrices*, and *Testæ*; the first a confused din, made either by the hands or the mouth; the second and third, by beating on a sort of sounding vessels placed in the theatres for this purpose. Persons were instructed to give applause with skill; and there were even masters who professed to teach the art. The proficients in this way let themselves out for hire to the vain-glorious among the poets, actors, &c. and were properly disposed to support a loud applause. These they called *Laudicæni*, and Σοφοκλεις. At the end of the play, a loud peal of applause was expected, and even asked of the audience, either by the chorus or the persons who spoke last. The formula was *Spectatores plaudite*, or *Valete et plaudite*. The plausores, or applauders, were divided into chori, and disposed in theatres opposite to each other, like the choristers in cathedrals, so that there was a kind of concert of applauses.

APPLE, the fruit of the pyrus malus. See PYRUS, BOTANY *Index*.

APPLE of the Eye, a name not unfrequently given to the pupil. See ANATOMY.

APPLES of Love. See LYCOPERSICON, BOTANY *Index*.

Mad APPLES. See MELONGENA, BOTANY *Index*.

APPLEBY, the county town of Westmoreland, where the assizes are held, is seated on the banks of the river Eden, which almost surrounds it. It was formerly a very considerable town, and had great privileges: but it is long ago gone to decay, and now only consists of mean houses in one broad street, which runs with an easy ascent from north to south; at the head of which is the castle, almost entirely surrounded by the river. It has two churches; a town-hall, in which the assizes are held; a county jail; and an hospital for a governess and twelve widows, founded in 1651 by a daughter of Lord Clifford. It is governed by a mayor, twelve aldermen, a common council, and two serjeants at mace, &c. It contained 2160 inhabitants in 1811, and sends two members to parliament. W. Long. 3. 52. N. Lat. 54. 30.

APPLICATION, in a general sense, is the laying two things together, in order to discover their agreement or disagreement.

APPLICATION, in *Geometry*, is used either for division; for applying one quantity to another, whose areas, but not figure, shall be the same; or, for transferring a given line into a circle or other figure, so that its ends shall be in the perimeter of the figure.

APPLICATION, in *Theology*, is particularly used, by some divines, for the act whereby our Saviour transfers, or makes over to us, what he had earned or purchased by his holy life and death. Accordingly it is by this application of the merits of Christ that we are to be justified and entitled to grace and glory. The sacraments are the ordinary means or instruments whereby this application is effected.

APOGGIATURA, in *Music*, a small note inserted by the practical musician, between two others, at some distance.

APPOINTEE, a foot soldier in the French army before the revolution, &c. who for long service and bravery received pay above private sentinels. They were suppressed in France, except in the regiment of French guards, where forty appointees were retained to each company of 150 men.

Till the year 1670, they had also captains and lieutenants under the appellation of *appointees*, who, without residing in the regiment, received their pay.

APPOINTEE, in *Heraldry*, the same as *aguiseé*: Thus we say, a cross appointée, to signify that with two angles at the end cut off, so as to terminate in points.

APPOINTMENT, in a general sense, the same as ASSIGNATION.

APPOINTMENT, in a particular sense, denotes a pension or salary given by great lords and princes to persons of worth and parts, in order to retain them in their service. The term is chiefly used among the French. The king of France gave large appointments to several of the officers in his service. Appointments differ from wages, in that the latter are fixed and ordinary, being paid by the ordinary treasurers; whereas appointments are annual gratifications granted by *brevet* for a time uncertain, and are paid out of the privy purse.

APPOSER signifies an examiner. In the court of exchequer there is an officer called the *foreign apposer*. In the office of confirmation, in the first liturgy of Edward VI. the rubric directs the bishop, or such as he shall appoint, to appose a child; and a bishop's examining chaplain was anciently called his *poser*.

APPOSITION, in *Grammar*, the placing two or more substantives together, in the same case, without any copulative conjunction between them; as *Ardebat Alexim, delicias domini*.

APPRAISER (from *ad*, "to," and *pretium*, "value"), one who rates or sets a value upon goods, &c. He must be a skilful and honest person. It is not a business of itself, but is practised by brokers of household furniture; to which set of men the word is chiefly applied: Yet upholsterers and other brokers are employed, or even any person or persons who are supposed to be skilled in the commodities to be appraised or valued. They are employed in cases of death, executions brought in upon goods, or of stock to be turned over from one person to another, or divided between copartners; and are called *sworn appraisers*, from their taking an oath to do justice between party and party. They sometimes appraise on behalf of both sides, each party agreeing to have the same appraiser or appraisers; sometimes in opposition, each party choosing one or more of a side; and sometimes by commission or deputation of trustees, masters in chancery, &c.

APPRAISING, the act of rating, valuing or setting a price on goods, by a person who is a competent judge, and is authorized thereto. See APPRAISER.

APPREHENSION, in *Logic*, denotes the simple attention of the mind to an object presented either to our sense or our imagination, without passing a judgement or making any inference.

APPREHENSION, is likewise used to express an inadequate and imperfect idea; and thus it is applied to our knowledge of God, in contradistinction to comprehension.

APPREHENSION, in *Law*, signifies the seizing a criminal, in order to bring him to justice.

APPRENTICE,

Apprentice, Apprentice-ship.

APPRENTICE, (from *apprendre*, "to learn,") one who is bound by covenant to serve a tradesman or artificer a certain time, upon condition of the master's instructing him in his art or mystery.

Apprentices may likewise be bound to husbandmen, or even to gentlemen; and they, as well as tradesmen in England, are compellable to take the children of the poor, whom the overseers, with the consent of two justices, may bind till the age of 24 years. Apprentices may be discharged on reasonable cause; but if any, whose premium has been less than ten pounds, run away from their masters, they are compellable to serve out the time of absence, or give satisfaction for it, at any period within seven years after expiration of the original contract. Apprentices gain a settlement in that parish where they last served 40 days; and by the 5th of Elizabeth, c. 4. they have an exclusive right to exercise the trade in which they have been instructed, in any part of England. However, the resolutions of the courts have in general rather confined than extended the restriction of this statute. See Blackstone's Com. vol. i. p. 426, &c.

In France, the sons of tradesmen, living in their father's house till seventeen years of age, are reputed to have served an apprenticeship. In that country, the times of serving are different in the different professions, from three years to eight. After serving out an apprenticeship, the person becomes what they call an *aspirant*, or candidate for mastership, and is to be examined by proper officers as to his skill and proficiency, and also to exhibit a *chef d'œuvre* or masterpiece in the art he has been bred to, before he be suffered to set up to practise for himself.

Anciently, benchers in the inns of court were called *apprentices of the law*, in Latin *apprenticii juris nobiliores;* as appears by Mr Selden's note on Fortescue: and so the learned Plowden styles himself. Sir Henry Finch, in his *Nomotechnia*, writes himself, *apprentice de ley:* Sir Edward Coke in his *Inst.* says *Apprenticii legis*, in pleading, are called *homines consiliarii et in lege periti;* and in another place, *apprentices* and other counsellors of law.

Apprentices indentures and articles of clerkship, pay of duty 6s. Parish indentures are excepted, and pay 6d. only, by 5 William III. c. 21. For fees given with apprentices, clerks, or servants, bound or articled by indentures, from 1l. to 50l. masters pay for every pound 6d.; and for fees above 50l. one shilling in the pound. 8 Ann. c. 9.

For an account of the more recent statutes and regulations on this subject, see APPRENTICE, SUPPLEMENT.

APPRENTICESHIP, the servitude of an apprentice, or the duration of his indenture.

Seven years seem anciently to have been, all over Europe, the usual term established for the duration of apprenticeships in the greater part of incorporated trades. All such incorporations were anciently called *universities*, which indeed is the proper Latin name for any incorporation whatever. The university of smiths, the university of taylors, &c. are expressions which we commonly meet with in the old charters of ancient towns. When those particular incorporations which are now peculiarly called *universities* were first established, the term of years which it was necessary to study, in order to obtain the degree of master of arts, appears evidently to have been copied from the term of apprenticeship in common trades, of which the incorporations were much more ancient. As to have wrought seven years under a master properly qualified was necessary in order to entitle any person to become a master, and to have himself apprentices in a common trade; so to have studied seven years under a master properly qualified was necessary to entitle him to become a master, teacher or doctor (words anciently synonymous), in the liberal arts, and to have scholars or apprentices (words likewise orginally synonymous) to study under him.

Apprenti ship.

By the 5th of Elizabeth, commonly called the *statute of apprenticeship*, it was enacted, that no person should for the future exercise any trade, craft, or mystery at that time exercised in England, unless he had previously served to it an apprenticeship of seven years at least; and what before had been the bye-law of many particular corporations, became in England the general and public law of all trades carried on in market towns. For though the words of the statute are very general, and seem plainly to include the whole kingdom, by interpretation its operation has been limited to market towns; it having been held, that in country villages a person may exercise several different trades, though he has not served a seven years apprenticeship to each, they being necessary for the conveniency of the inhabitants, and the number of people frequently not being sufficient to supply each with a particular set of hands.

By a strict interpretation of the words, too, the operation of this statute has been limited to those trades which were established in England before the 5th of Elizabeth, and has never been extended to such as have been introduced since that time. This limitation has given occasion to several distinctions which, considered as rules of police, appear as foolish as can well be imagined. It has been adjudged, for example, that a coachmaker can neither himself make, nor employ journeymen to make his coach wheels, but must buy them of a master wheelwright, this latter trade having been exercised in England before the 5th of Elizabeth. But a wheelwright, though he has never served an apprenticeship to a coachmaker, may either himself make, or employ a journeyman to make, coaches; the trade of a coachmaker not being within the statute, because not exercised in England at the time when it was made. The manufacturers of Manchester, Birmingham, and Wolverhampton, are many of them upon this account not within this statute; not having been exercised in England before the 5th of Elizabeth.

In France the duration of apprenticeships is different in different towns and in different trades. In Paris, five years is the term required in a great number; but before any person can be qualified to exercise the trade as a master, he must, in many of them, serve five years more as a journeyman. During this latter term he is called the *companion* of his master, and the term itself is called his *companionship*.

In Scotland there is no general law which regulates universally the duration of apprenticeships. The term is different in different corporations. Where it is long, a part of it may generally be redeemed by paying a small fine. In most towns, too, a very small fine is sufficient to purchase the freedom of any corporation.

The

Apprenticeships, Apprising.

The weavers of linen and hempen cloth, the principal manufactures of the country, as well as all other artificers subservient to them, wheelmakers, reedmakers, &c. may exercise their trades in any town corporate without paying any fine. In all towns corporate, all persons are free to sell butcher's meat upon any lawful day of the week. Three years is in Scotland a common term of apprenticeship, even in some very nice trades: and in general there is no country in Europe in which corporation laws are so little oppressive.

Apprenticeships were altogether unknown to the ancients. The reciprocal duties of master and apprentice make a considerable article in every modern code. The Roman law is perfectly silent with regard to them. There is no Greek or Latin word which expresses the idea we now annex to the word apprentice; a servant bound to work at a particular trade for the benefit of a master during a term of years, upon condition that the master shall teach him that trade.

Wealth of Nations, vol. i. p. 190.

Long apprenticeships Dr Smith considers as altogether unnecessary. The arts which are much superior to common trades, such as those of making clocks and watches, contain no such mystery as to require a long course of instruction. The first invention of such beautiful machines, indeed, and even that of some of the instruments employed in making them, must, no doubt, have been the work of deep thought and long time, and may justly be considered as among the happiest efforts of human ingenuity: but when both have been fairly invented and are well understood; to explain to any young man, in the completest manner, how to apply the instruments, and how to construct the machines, cannot well require more than the lessons of a few weeks; perhaps those of a few days might be sufficient. In the common mechanic trades, those of a few days might certainly be sufficient. The dexterity of hand, indeed, even in common trades, cannot be acquired without much practice and experience. But a young man would practise with much more diligence and attention, if from the beginning he wrought as a journeyman, being paid in proportion to the little work which he could execute, and paying in his turn for the materials which he might sometimes spoil through awkwardness and inexperience. His education in this way generally would be more effectual, and always less tedious and expensive. The master, indeed, would be a loser; he would lose all the wages of the apprentice, which he now saves, for seven years together. In the end, perhaps, the apprentice himself would be a loser. In a trade so easily learnt he would have more competitors; and his wages when he came to be a complete workman, would be much less than at present. The same increase of competition would reduce the profits of the masters as well as the wages of the workmen. The trades, the crafts, the mysteries, would be all losers: but the public would be a gainer: the work of all artificers coming in this way much cheaper to market.

APPRISING, in *Scots Law*, the name of that action by which a creditor formerly carried off the estate of his debtor for payment. It is now abolished, and adjudications are appointed in place of it. Adjudications, charter, resignation, *clarè constat*, cognition of heirs, heritable right, confirmation, novodamus, principal and original instrument of surrender, retour, seisin, and service in Scotland, pay by different acts 4s. 9d. duty.

Apprising ‖ Appropriation.

APPROACH, or APPROACHING, in a general sense, the acceding or coming together of two or more things.

APPROACHES, in *Fortification*, the works thrown up by the besiegers, in order to get nearer a fortress, without being exposed to the enemy's cannon.

APPROACHING, in fowling, a term used to express such devices as are contrived for the getting within shot of shy birds. It is principally used in marshy low places. The best method of approaching is by means of three hoops tied together at proper distances according to the height of the man that is to use it, and having boughs of trees tied all round it, with cords to hang it over his shoulders: a man getting into this, conceals himself, and approaches by degrees towards his game in the form of a moving bush. Geese, ducks, and teal, quit the waters in the evening, and pass the night in the fields; but at the approach of morning they return to the water again, and even when on the water they will retire to great distances, on the approach even of a horse or cow, so that the business of the stalking horse is of little use; but this device of approaching by the moving bush succeeds tolerably well with them.

APPROACHING, in *Gardening*, the inoculating or ingrafting the sprig of one tree into another, without cutting it off the parent tree.

APPROBATION, a state or disposition of the mind, wherein we put a value upon, or become pleased with, some person or thing. Moralists are divided on the principle of approbation, or the motive which determines us to approve and disapprove. The Epicureans will have it to be only self-interest: according to them, that which determines any agent to approve his own action, is its apparent tendency to his private happiness; and even the approbation of another's action flows from no other cause but an opinion of its tendency to the happiness of the approver, either immediately or remotely. Others resolve approbation into a moral sense, or a principle of benevolence, by which we are determined to approve every kind affection either in ourselves or others, and all publicly useful actions, which we imagine to flow from such affection, without any view therein to our own private happiness.

APPROBATION, is more particularly used, in speaking of recommendations of books, given by persons qualified or authorized to judge of them. Those appointed to grant licenses and imprimaturs, frequently express their approbation of books. Books were formerly subjected to a licenser in England, (see 13th Car. II. c. 33.), which act is long since expired; and being incompatible with the noble principles of the Revolution, has never since been, and it is hoped never will be, revived.

APPROPRIATION, in the canon law, a severing of a benefice ecclesiastical to the proper and perpetual use of some religious house. See the article PARSON.

The contrivance of appropriations seems to have sprung from the policy of the monastic orders, who have never been deficient in subtle inventions for the increase of their own power and emoluments. At the first establishment of parochial clergy, the tithes

Appropriation.

of the parish were distributed in a fourfold division; one for the use of the bishop, another for maintaining the fabric of the church, a third for the poor, and the fourth to provide for the incumbent. When the sees of the bishops became otherwise amply endowed, they were prohibited from demanding their usual share of these tithes, and the division was into three parts only. And hence it was inferred by the monasteries, that a small part was sufficient for the officiating priest; and that the remainder might well be applied to the use of their own fraternities (the endowment of which was construed to be a work of the most exalted piety), subject to the burden of repairing the church and providing for its constant supply. And therefore they begged and bought, for masses and obits, and sometimes even for money, all the advowsons within their reach, and then appropriated the benefices to the use of their own corporation. But, in order to complete such appropriation effectually, the king's license, and consent of the bishop, must first be obtained; because both the king and the bishop, may some time or other have an interest, by lapse, in the presentation to the benefice; which can never happen if it be appropriated to the use of a corporation, which never dies: and also because the law reposes a confidence in them, that they will not consent to any thing that shall be to the prejudice of the church. The consent of the patron also is necessarily implied, because the appropriation can be originally made to none but to such spiritual corporation as is also the patron of the church; the whole being indeed nothing else but an allowance for the patrons to retain the tithes and glebe in their own hands, without presenting any clerk, they themselves undertaking to provide for the service of the church. When the appropriation is thus made, the appropriators and their successors are perpetual parsons of the church; and must sue and be sued, in all matters concerning the rights of the church by the name of *parsons*.

This appropriation may be severed, and the church become disappropriate, two ways; as, first, If the patron or appropriator presents a clerk, who is instituted and inducted to the parsonage: for the incumbent so instituted and inducted is to all intents and purposes complete parson; and the appropriation being once severed, can never be reunited again, unless by a repetition of the same solemnities. And, when the clerk so presented is distinct from the vicar, the rectory thus vested in him becomes what is called a *sinecure*; because he hath no cure of souls, having a vicar under him to whom that cure is committed. Also, if the corporation which has the appropriation is dissolved, the parsonage becomes disappropriate at common law; because the perpetuity of person is gone, which is necessary to support the appropriation.

In this manner, and subject to these conditions, may appropriations be made at this day: and thus were most, if not all of the appropriations at present existing originally made; being annexed to bishoprics, prebends, religious houses, nay, even to nunneries, and certain military orders, all of which were spiritual corporations. At the dissolution of monasteries, by statutes 27 Hen. VIII. c. 28. and 31 Hen. VIII. c. 13. the appropriation of several parsonages, which belonged to those respective religious houses (amounting to more than one third of all the parishes in England), would have been by the rules of the common law disappropriated; had not a clause in those statutes intervened, to give them to the king in as ample a manner as the abbots, &c. formerly held the same at the time of their dissolution. This, though perhaps scarcely defensible, was not without example: for the same was done in former reigns, when the alien priories (that is, such as were filled by foreigners only) were dissolved and given to the crown. And from these two roots have sprung all the lay appropriations or secular parsonages which we now see in the kingdom; they having been afterwards granted out from time to time by the crown. See the artiele *Parson and Vicar*.

Approver || Appulse.

APPROVER, in *Law*, one who, professing felony in himself, appealeth or impeacheth another or more of his accomplices. He is so called from the French *approuver*, *comprobare*, because he must prove what he hath alleged in his appeal. This proof was anciently either by battle, or by the country, at the choice of the appellee; and the form of this accusation may be found in Crompt. Just. 250.

Approvers of the king, are those who have the letting of the king's demesnes in small manors, &c. In the statute of the 1st of Ed. III. c. 8. sheriffs are called the king's *approvers*.

It being in the discretion of the court to suffer one to be an approver, this method of late hath seldom been practised. But we have, in cases of burglary and robbery on the high way, what seems to amount to the same by statute; it being ordained, that where persons charged with such crimes out of prison, discover two others concerned in the crime, they shall have a pardon, &c. Stat. 5th Anne, c. 31.

Approver is particularly used, in ancient law writers, for a bailiff or land steward, appointed to have the care of a manor, franchise, or the like, and improve and make the most of it for the benefit of his master. In this sense, the word is also written *appruare*.

APPROXIMATION, in *Arithmetic* and *Algebra*, the coming nearer and nearer to a root, or other quantity sought, without expecting to be ever able to find it exactly.

APPUI, in the manege, (q. d. rest to stay upon the hand), is the reciprocal effort between the horse's mouth and the bridle-hand, or the sense of the action of the bridle on the hand of the horseman.

A just appui of the hand, is the nice bearing up or stay of the bridle, so that the horse, being awed by the sensibility and tenderness of his mouth, dares not rest too much upon the bitmouth, nor check or beat upon the hand to withstand it. A horse is said to have no appui, when he is too apprehensive of the hand, and cannot bear the bit. He is said to have too much appui, when he rests or throws himself too much upon the bit. Horses designed for the army ought to have a full appui upon the hand. To give a horse a good appui, he should be galloped, and put often back.

APPULSE, in *Astronomy*, the approach of any planet, to a conjunction with the sun, or a star. It is a step towards a transit, occultation, conjunction, eclipse, &c. Mr Flamsted, M. de la Hire, and others, have given observations of the moon's appulses to the Pleiades. *Phil. Trans.* N° 76. p. 361. *M. Acad. Science, an.* 1708.

APRICOT,

Apricot || Apta.

APRICOT, in *Botany*. See PRUNUS.

APRIES, son of Psammis, king of Egypt; the same with Pharaoh Hophrah in Jeremiah and Ezekiel. He ruined Sidon, and some say he put Jeremiah to death. He thought neither God nor man could dethrone him; which yet was easily done by Amasis, and he himself was strangled by the Egyptians.

APRIL, the fourth month of the year, according to the common computation; but the second, according to that of the astronomers. It contains 30 days.—The word is derived from *aprilis*, of *aperio*, "I open;" because the earth, in this month, begins to open her bosom for the production of vegetables. In this month the sun travels through the sign of Taurus.

A PRIORI, a kind of demonstration. See DEMONSTRATION.

APRON, in *Naval Architecture*, is a piece of curved timber fixed behind the lower part of the stern, immediately above the foremost end of the keel.

APRON is also a name given to a platform or flooring of plank, raised at the entrance of a dock, against which the dock gates are shut.

APRON, in *Gunnery*, a piece of lead which caps or covers the vent or touch-hole of a great gun.

APSIS, or ABSIS, signifies the bowed or arched roof of a house, room, or oven, &c. as also the ring or compass of a wheel.

APSIS, in ecclesiastical writers, denotes an inner part in the ancient churches, wherein the clergy sat, and where the altar was placed. It is supposed to have been thus called, because covered with an arch or vault of its own, by the Greeks called αψις, by the Latins *absis*. Apsis, in this sense, amounts to the same with what is otherwise called *choir*, *concha*, *camera*, and *presbyterium*; and stands opposed to the *nave* or body of the church.

APSIS is more particularly used for the bishop's seat, or throne, in ancient churches. This was peculiarly called *apsis gradata*, because raised on steps above the ordinary stalls. It was also denominated *exedra*, and in latter times *tribune*.

ASPIS is also used for a reliquary, or case, wherein the relicks of saints were anciently kept. It took the name *apsis*, from its being round or arched at the top; or perhaps from the place where it was kept. The *apsis* was commonly placed on the altar: it was usually of wood, sometimes also of gold and silver, with sculptures, &c.

APSIS, in *Astronomy*, a term used indifferently for either of the two points of a planet's orbit, where it is at greatest or least distance from the sun or earth; and hence the line connecting those points is called the line of the *apsides*. The word is Greek, and derived from απτω, *to connect*. The apsis, at the greatest distance from the sun, is called the *aphelion*, and at the greatest distance from the earth the *apogee*; while that at the least distance from the sun is termed the *perihelion*, and at the least distance from the earth the *perigee*.

APSIRTIDES. See ABSORUS.

APTA, or APTA JULIA, (Pliny); now *Apte*, in Provence, on the river Calavon, seven leagues to the north of Aix, and nine to the north of Avignon. In the Notitiæ it is called *Civitas Aptensium*: Pliny reckons it among the Latin towns. That it was a colony, appears from an inscription on a stone found at Arles, (Sirmond). E. Long. 5. 56. N. Lat. 43. 23.

Apta || Apuleius.

APTERA, (Strabo, Stephanus); APTYRON, (Pliny); APTERIA, (Ptolemy): An inland town of Crete, whose port was Cisamus, on the west side of the island, (Strabo); 12 miles to the south of Cydonia towards the Montes Leuci, and as many from the Sinus Amphimales. So called from the Sirens, who, being there vanquished in song by the Muses, stript themselves of their wings, and out of grief leaped into the sea, (Stephanus). There was a town of Lycia of the same name. E. Long. 25. N. Lat. 35. 50.

APTERA, a term used by Linnæus for his seventh order of insects, comprehending such as have no wings.

APTHANE, a title anciently given to the higher degrees of nobility in Scotland. See THANE.

APTITUDE, (from *aptus*, "fit"), the natural disposition any thing hath to serve for such or such a purpose.—Thus, oil hath an *aptitude* to burn, and water to extinguish fire.

APTITUDE, or APTNESS, is often used, in speaking of the talents of the mind, for a promptitude, or disposition to learn things with ease and expedition: in which sense *aptness* amounts to the same with what the Greeks call ευμαθια, *bona indoles*, and we sometimes *docility*. Charlton divides *aptness* into three parts, viz. *acuteness*, *sagacity*, and *memory*.

APTOTE, among grammarians, an indeclinable noun, or one which has no variation of cases.

APULEIUS, LUCIUS, a Platonic philosopher, universally known by his performance of the Golden Ass. He lived in the second century, under the Antonines; and was born at Madura, a Roman colony in Africa. He studied first at Carthage, then at Athens, and afterwards at Rome, where he learned the Latin tongue without the help of a master. He was a man of a curious and inquisitive disposition, especially in religious matters: this prompted him to take several journeys, and to enter into several societies of religion. He spent his whole fortune almost in travelling; so that, at his return to Rome, when he was about to dedicate himself to the service of Osiris, he had not money enough to defray the expence attending the ceremonies of the reception, and was obliged to pawn his clothes to raise the necessary sum. He supported himself afterwards by pleading causes: and as he was a great master of eloquence, and of a subtle genius, many considerable causes were trusted to him. But he availed himself more by a good marriage than by his pleadings; a widow, named *Pudentilla*, who was neither young nor handsome, but wanted a husband and was very rich, took a great fancy to him. This marriage drew upon him a troublesome law suit. The lady's relations, pretending he made use of sorcery to gain her heart and money, accused him of being a magician before Claudius Maximus proconsul of Africa. Apuleius was under no great difficulty of making his defence. As Pudentilla was determined, from considerations of health, to enter upon a second marriage, even before she had seen this pretended magician, the youth, deportment, pleasing conversation, vivacity, and other agreeable qualities of Apuleius, were charms sufficient to engage her heart. He had the most favourable opportunities too of gaining her friendship, for he lodged some time at her house: Pudentilla's eldest son

Apuleius ‖ Apus.

having a great friendship for him, was likewise desirous of the match, and solicited him in favour of Pudentilla. "Do you make a wonder said Apuleius, in his defence) that a woman should marry again, after having lived a widow 13 years? It is much more wonderful that she did not marry again sooner. You think that magic must have been employed to prevail with a widow of her age to marry a young man; on the contrary, this very circumstance shows how little occasion there was for magic." He offered to prove by his marriage-contract, that he got nothing of Pudentilla but a promise of a very moderate sum, in case he survived her and had children by her. He was also obliged to make such confessions in court as Pudentilla would gladly have excused He said she was neither handsome nor young, nor such as could any ways tempt him to have recourse to enchantments: moreover, he added, that Pontianus her son proposed the marrying his mother to him only as a burden, and the action of a friend and philosopher. He also took notice of many inconveniences which attend the marrying of widows, and spoke highly of the advantages of a maid above a widow: "A handsome virgin (said he), let her be ever so poor, is abundantly portioned; she brings to her husband a heart quite new, together with the flower and first fruits of her beauty. It is with great reason that all husbands set so great a value upon the flower of virginity: all the other goods which a woman brings her husband are of such a nature, that he may return them again, if he has a mind to be under no obligation to her: that alone cannot be restored, it remains in the possession of the first husband. If you marry a widow, and she leaves you, she carries away all that she brought you." Upon which passage Mr Bayle makes a very coarse remark, viz. "That this good which is never taken back out of the hands of a husband, is very chimerical; and that there is never a baker nor a butcher, who would lend sixpence upon this unperishable possession." The apology is still extant, and is reckoned a very fine piece. Apuleius was extremely indefatigable in his studies: and composed several books, some in verse, and others in prose; but most of them have been lost. He took great pleasure in declaiming, and was heard generally with great applause: When he declaimed at Oeea, the audience cried out with one voice, that they ought to confer upon him the honour of citizen. The citizens of Carthage heard him with great satisfaction, and erected a statue to him; and several other cities did him the same honour. Several critics have published notes on Apuleins's Golden Ass, and there have been translations of it into different languages.

APULIA, now PUGLIA, a territory of Italy, bordering on the Adriatic, and extending from the river Frento to Tarentum in length, and from the Adriatic to the Lucani in breadth. *Apuli* the people (Horace); divided into the *Apulia Daunia*, now called *Puglia Pinna* or the *Capitanata*; and into the *Apulia Peucetia*, now *Terra di Bari*, (Pliny, Ptolemy). Apulia abounded in sheep, which yielded the finest wool (Martial). It is now the east side of the kingdom of Naples.

APUS, *Avis Indica*, in *Astronomy*, a constellation of the southern hemisphere placed near the pole, between the triangulum australe and the chameleon, supposed to represent the bird of paradise.

APYCNI SUONI, in *Music*, sounds distant one or more octaves, and yet concord.

Apycni ‖ Aqua Vitæ.

APYCNOS, in *Music*, is said of the diatonic genus, on account of its having spacious intervals, in comparison of the chromatic and enharmonic.

APYREXY, among physicians, denotes the intermission of a fever.

APYROUS, a word applied to denote that property of some bodies, by which they resist the most violent fire without any sensible alteration. Apyrous bodies ought to be distinguished from those which are refractory. Refractory substances are those which cannot by violent heat be fused, whatever other alteration they may sustain. But a body, properly speaking, apyrous, can neither be fused by heat, nor can undergo any other change. Diamonds were long thought to be possessed of this property. But some late experiments have shown, that diamonds may be entirely dissipated or evaporated by heat, and are therefore not entitled to be ranked among apyrous substances. Perhaps there is no body in nature essentially and rigorously apyrous. But it is sufficient that there be bodies apyrous relatively to the degree of fire which art can produce, to entitle them to that name.

AQUA, a term frequently met with in the writings of physicians, chemists, &c. for certain medicines, or menstruums, in a liquid form, distinguished from each other by peculiar epithets, as *Aqua Alexiteria*, *Aqua Aluminosa*, *Aqua Mirabilis*, *&c.* for which see PHARMACY.

Aqua Extincta, or *Extinguished Water*, is aquafortis into which some river water has been poured, in order to qualify it, and render it less corrosive. Its use is to get the silver from the aquafortis that served to part gold from it.

Aqua Fortis, a name given by artists to nitric acid of a certain strength, from its dissolving power. See CHEMISTRY *Index*.

Aqua Marina, a name by which the jewellers call the beryl, on account of its sea-green colour. See BERYL.

Aqua Regia, a compound of nitric and muriatic acid, in different proportions according to the purpose for which it is intended. It is usually made by dissolving in nitric acid, sal ammoniac, or common salt, both which are combinations of muriatic acid with alkali. When made with sal ammoniac, the common proportion is one part of this salt to four parts of nitric acid; but to dissolve platina, equal parts are requisite. A purer aqua regia may be made by simply mixing the two acids. It is particularly used as a menstruum for gold; it likewise dissolves all other metals, except silver. The gold dissolved in aqua regia is, in fact, dissolved in the oxygenated muriatic acid only, which gives out its oxygen to the gold, and then dissolves the oxide: for metals are not soluble in acids until they are oxidated. See CHEMISTRY *Index*.

Aqua Secunda, aquafortis diluted with much pure water. It is employed in several arts, to clear the surface of metals and certain stones.

Aqua Tofana, a poison much used in Italy in the seventeenth century. See SUPPLEMENT.

Aqua Vitæ, is commonly understood of what is otherwise called *brandy*, or spirit of wine either simple, or prepared with aromatics. Some, however, distinguish

Aqua Vitæ ‖ Aquæ Pannoniæ.

distinguish between them; appropriating the term *brandy* to what is drawn from wine, or the grape; and *aqua vitæ* to that drawn after the same manner from malt, &c.

Aquæ Augustæ (Ptolemy); *Aquæ Tarbellicæ* (Antonine); *Aquensis Civitas*, in the Notitia. Now *Acqs*, or *Dax*, a town in Gascony, on the river Adour, famous for its baths. W. Long. 1. 40. N. Lat. 43. 56.

Aquæ Bilbilitanæ, (Antonine): baths 24 miles to the west of Bilbilis. Now *Banos de Alhama*, in Aragon.

Aquæ Calidæ, (Ptolemy); *Aquæ Solis*, (Antonine); a place of the Belgæ in Britain, famous for its hot waters. Now Bath in Somersetshire. W. Long. 1. 5. Lat. 51. 20.

Aquæ Calidæ, (Ptolemy); *Aquicaldensis*, (Pliny); formerly in great repute, and a public bath; whose ruins still remain, testimonies of the Roman grandeur. Now *Orense*, in Galicia, still famous for its baths; on the river Minho, 54 miles south-east of Compostella. W. Long. 8. 30. N. Lat. 42. 30. Also a place in the bay of Carthage, (Strabo). Other *Aquicaldenses*, to the north of Gerunda in Catalonia, (Ptolemy).

Aquæ Calidæ, a colony between the rivers Serbetes and Savus, in Mauritania Cæsariensis (Ptolemy).

Aquæ Celeinæ, (Ptolemy); or *Cilinæ*, (Antonine). Now *Caldas*, a hamlet on the Minho, in Galicia.

Aquæ Convenarum, a hamlet of Gaul, in Aquitaine, (Antonine), and on the borders of the Convenæ, or le Cominge, at the foot of the Pyrenees, near the source of the Garonne. Now Bagneres. W. Long. 3. 39. N. Lat. 42. 20.

Aquæ Cutiliæ, a lake of the Sabines, in the territory of Reat (Pliny); *Lacus Cutiliensis*, (Varro); with a moveable island in it, (Seneca, Pliny); supposed to be the centre of Italy, (Varro). The waters were medicinal, and extremely cold, good for a weak stomach and in weak nerves; they seemed to act by a kind of suction, which approached to a bite, (Pliny). Vespasian used them every summer; and there he died, (Sueton. Xiphilin from Dio). Now *Lago di Contigliano*.

Aquæ Flaviæ, a town on the confines of Galicia and Portugal, so called from Vespasian and Titus. The inhabitants are called *Aquiflavienses* on coins. Now called *Chiaves*, a mean hamlet; but the ruins of its bridge testify its former grandeur. W. Long. 6. 6. N. Lat. 41. 40.

Aquæ Helvetiæ, described by Tacitus as a municipal town, and much frequented for its excellent water; and though he does not mention its name, Cluverius supposes it to be Baden, in Switzerland, on the rivulet Limat, which soon after falls into the Aar. It is called the Upper, to distinguish it from another called the Lower Badén, in Alsace. E. Long. 8. 49. N. Lat. 47. 55.

Aquæ Merom (Joshua), famous for the defeat of Jabin: supposed to be the lake called *Samachonites*, or *Semechonites*, by Josephus; into which the river Jordan falls, before it comes to the sea of Genesereth, or Galilee.

Aquæ Pannoniæ, famous baths of Austria, now called *Baden*, 28 miles to the south of Vienna.

Aquæ Patavinæ, are baths in the territory of Venice near Padua, (Pliny); called *Fontes Aponi* (Livy, Martial). Now *Bagni d'Abano*. E. Long. 13. 48. N. Lat. 45. 15.

Aquæ Patavinæ ‖ Aquæduct.

Aquæ Quintianæ, put by Ptolemy in room of the *Aquæ Cilinæ* of Antonine. Now supposed to be *Sarria*, a town of Galicia, on a rivulet of the same name, three leagues to the south of Lugo.

Aquæ Sextiæ, a colony to the north of Marseilles, so called both from the founder Sextius Clavinus, and from its quantity of water, and number of cold and hot springs; built after the defeat of the Salyes, or Salvii, whose territory in the south of Provence, reached from the Rhone on the borders of Italy, (Livy, Velleius, Strabo, Ptolemy). By an inscription the colony appears to have been either increased or renewed by Augustus. In the Notitia it is called *Civitas Aquensis*. Now *Aix*. Here the Teutones and Cimbri were defeated with great slaughter by Marius. E. Long. 6. 4. N. Lat. 48. 4.

Aquæ Statiellæ, or *Statiellorum*, (Pliny), a town in Liguria, on the river Bormia. Now *Acqui*, a town of Montferrat. E. Long. 8. 40. N. Lat. 44. 45.

Aquæ Tauri, hot waters or baths in Tuscany, at the distance of three miles from the sea, said to be discovered by a bull, hence the appellation. There are still to be seen the ruins of these baths. Now *Aquapendente*, in Orvieto. E. Long. 12. 40. N. Lat. 42. 20.

AQUÆDUCT, in *Hydraulics* and *Architecture*, a structure formed for conveying water from one place to another, over grounds that are unequal. The word is compounded of the Latin substantive *aqua*, water, and *ductus*, a channel by which that water may be conducted.

Architects distinguish two kinds of aquæducts; the *visible*, and the *subterraneous*.—The *visible* are constructed in valleys or marshes, and protracted in longitude or latitude as the situation requires. They are composed of adminicula for supporting the arches and confining the stream, and of arcades.—The *subterraneous* are formed, by piercing the mountains, and conducting them below the surface of the earth. They are built of stone hewn or rough: and covered above with vaults, or with flat stones, which may be termed *flags*; these flags shelter the waters from the heat of the sun.

They divide them still into *double* and *triple* aquæducts; that is to say, such as are supported either by two or by three ranges of arcades. Such was the aquæduct which Procopius records to have been built by Cosroes king of the Persians, for the city of Petra in Mingrelia: it had three conduits upon the same line, each elevated above the other.

Frequently aquæducts are paved. Sometimes the waters flow through a natural channel of clay. Frequently they are conveyed by pipes of lead into reservoirs of the same metal, or into troughs of hewn stone. The channels are cut with an imperceptible descent, that the current may be accelerated by its own weight. Parallel to its course, on each side, is cut a narrow footpath, where people may walk when necessary. By conduits, or grooves, the waters are conveyed into large cisterns, but not forced above their original level. To make them rise and issue from their apertures

Aquæduct. apertures with force, they must be confined in tubes of a small diameter, and abruptly fall from a considerable declivity.

Aquæducts of every kind were long ago the wonders of Rome: the vast quantities of them which they had; the prodigious expence employed in conducting waters over arcades from one place to another, at the distance of 30, 40, 60, and even 100 miles, which were either continued or supplied by other labours, as by cutting mountains and piercing rocks; all this ought to surprise us: nothing like this is undertaken in our times: we dare not even think of purchasing public conveniency at so dear a rate. Appius the censor advised and constructed the first aquæduct. His example gave the public luxury a hint to cultivate these objects; and the force of prodigious and indefatigable labour diverted the course of rivers and floods to Rome. Agrippa, in that year when he was ædile, put the last hand to the magnificence of these works. It is chiefly in this respect that the modern so much resembles the ancient city of Rome. For this advantage, she is peculiarly indebted to Sextus V. and to Paul V. who for grandeur and magnificence emulated the masters of the universe *. There are still to be seen, in different places contiguous to Rome, striking remains of these aquæducts; arches continued through a long space, over which were extended the canals which carried the water to the city. The arches are sometimes low, sometimes raised to a vast height, to humour the tumidities or depressions of the ground. There are some which have two arcades; one constructed above the other; and this precaution was observed, lest the height of a single arcade, if extended as far as the situation required, might render the structure less firm and permanent. They are commonly of bricks: which by their cement cohere so strongly, that the parts are not separated without the utmost difficulty.—When the elevations of the ground were enormous, it became necessary to form *subterraneous* aquæducts. These carried the waters to to such aquæducts as were raised above ground, in the declivity or at the foot of mountains. If the artificial channel of the water was not susceptible of a downward bias but by passing through a rock, through this they cut a passage at the same height with the superior aqueduct: such a one may be seen above the city of Tivoli, and at the place called *Vivacaro*. The canal which formed the course of the aquæduct is hewn out of the rock to the extent of more than a mile, about five feet in height and four in breadth.

* See *New Memoirs of Italy*, vol. i.

There is one thing, however, which deserves to be remarked. It is, that these aquæducts, which might have been directed in a straight line to the city, did not arrive at it but by frequent and winding mazes. Some have said that this oblique track was pursued to avoid the expence which must attend the building of arcades to an extraordinary height: others, that it was their intention to diminish the impetuosity of the current; which, rolling in a straight line through an immense space, must always have increased its velocity, must have worn the canals by perpetual and forcible attrition, and of consequence afforded an impure and unwholesome draught to the inhabitants. But since there was so great a descent between the cascade of Tivoli and Rome, it is demanded why they should go to draw water from the same river at the distance of more than 20 miles higher; nay, of more than 30 miles, if we reckon the curvatures of its direction through that mountainous country? It is replied, the motive of obtaining the water more salubrious and more limpid, was sufficient to make the Romans think their labour necessary, and their expence properly bestowed; and to those who reflect that the waters of this river were impregnated with mineral particles, and by no means wholesome, the answer will appear satisfactory. Aquæd

If any one will cast his eyes upon Plate 128th of the Antiquities of Father Montfaucon, he will see with how much care these immense works were constructed. From distance to distance spiramenta were left, that, if the water should happen to be stopped by any accident, it might gradually disembogue, till they could clear its ordinary passage. There were likewise, even in the very canals which conveyed the water, cavities considerably deeper than its internal surface, into which the stream was precipitated, and where it remained stagnant till it was refined from mud and feculence; and ponds, where it might expand itself till it was purified.

The aquæduct of the *Aqua Marcia* had an arch of 16 feet in diameter. The whole was composed of three different kinds of stone; one of them reddish, another brown, and a third of an earth colour. Above, there appeared two canals; of which the highest was fed by the new waters of the Tiverone, and the lower by what they called the *Claudian* river. The entire edifice is 70 Roman feet high. Near this aquæduct, we have in Father Montfaucon the plan of another with three canals; the highest supplied by the water called *Julia*, that in the middle from Tepula, and the lowest from the Aqua Marcia. Vol. iv.

The arch of the aquæduct of the Aqua Claudia is of hewn stone, very beautiful: that of the aquæduct of the Aqua Neronia is of bricks: they are each of them 72 Roman feet in height.

The canal of the aquæduct which was called the *Aqua Appia*, deserves to be mentioned for a singularity which is observed in it; for it is not, like the others, plain, nor gradual in its descent; but much narrower at the lower than the higher end.

The consul Frontinus, who superintended the aquæducts under the emperor Nerva, mentions nine of them which had each 13,594 pipes of an inch in diameter. Vigerus observes, that, in the space of 24 hours, Rome received 500,000 hogsheads of water.

We might likewise have mentioned the aquæduct of Drusus, and that of Riminius: but we shall satisfy ourselves with observing here, that Augustus caused all the aquæducts to be repaired; and afterwards pass to other monuments of the same kind, and still more important, which give the most striking ideas of Roman magnificence.

One of these monuments is the aquæduct of Metz, of which a great number of arcades still remain. These arcades crossed the Moselle, a river which is broad and vast at that place. The copious sources of Gorze furnished water for the representation of a sea fight. This water was collected in a reservoir: from thence it was conducted by subterraneous canals formed of hewn stone, and so spacious that a man could walk erect in them: it traversed the Moselle upon its superb and lofty arcades, which may still be seen at the distance of two

Aquæduct || Aquarius.

two leagues from Metz; so nicely wrought and so firmly cemented, that, except those parts in the middle which have been carried away by the ice, they have resisted, and will still resist, the severest shocks of the most violent seasons. From these arcades, other aquæducts conveyed the waters to the baths, and to the place where the naval engagement was mimicked.

If we may trust Colmenarus, the aquæduct of Segovia may be compared with the most admired labours of antiquity. There still remain 159 arcades, wholly consisting of stones enormously large, and joined without mortar. These arcades, with what remains of the edifice, are 102 feet high; there are two ranges of arcades, one above another. The *aqueduct* flows through the city, and runs beneath the greatest number of houses which are at the lower end.

After these exorbitant structures, we may be in some degree believed when we speak of the *aqueduct* which Louis XIV. caused to be built near Maintenon, for carrying water from the river Bucq to Versailles: it is perhaps the greatest aqueduct which now subsists in the world: it is 700 fathoms in length, and contains 242 arcades.

AQUAMBOE, one of the greatest monarchies on the coast of Guinea in Africa, stretching 20 miles in breadth, and ten times that space in length from east to west. According to Bosman, the coast is divided into a great number of petty royalties, but all of them subject to the king of Aquamboe, who indiscriminately uses an unlimited authority over them and the meanest of his subjects. His despotism gave rise to a proverbial saying, that "there are only two ranks of men at Aquamboe; the royal family, and slaves." The natives of this country are haughty, turbulent, and warlike; and their power is formidable to all the neighbouring nations. They grievously infest such nations as are tributaries to the king of Aquamboe, entering their territories by troops, and carrying off from the inhabitants whatever they think proper; nor do they ever meet with any opposition from the inhabitants, as they are sensible the king would not fail to resent this as an indignity offered to him.

AQUAPENDENTE. See Fabricius.

AQUARIANS, Christians in the primitive church who consecrated water in the eucharist instead of wine. This they did under pretence of abstinence and temperance; or, because they thought it universally unlawful to eat flesh or drink wine. Epiphanius calls them *Encratites*, from their abstinence; St Austin, *Aquarians*, from their use of water; and Theodoret, who says they sprang from Tatian, *Hydroporastatæ*, because they offered water instead of wine.

Besides these, there was another sort of Aquarians, who did not reject the use of wine as unlawful; for they administered the eucharist in wine at evening service; but, in their morning assemblies, they commonly used water, for fear the smell of wine should discover them to the heathens.

AQUARIUS, the Water-carrier, in *Astronomy*, the 11th sign of the zodiac, reckoning from Aries; from which also the 11th part of the ecliptic takes its name.—The sun moves through Aquarius in the month of January; it is marked thus, ♒.

The poets feign, that Aquarius was Ganymede, whom Jupiter ravished under the shape of an eagle, and carried away into heaven, to serve as a cup-bearer, in the room of Hebe and Vulcan; whence the name.—Others hold, that the sign was thus called, because, when it appears in the horizon, the weather usually proves rainy.

Aquarius || Aquatinta.

The stars in the constellation Aquarius, in Ptolemy's catalogue, are 45; in Tycho's 41; in Hevelius's 47; in Flamsted's 108.

AQUARTIA. See Botany *Index*.

AQUATIC, in *Natural History*, an appellation given to such things as live or grow in water.

AQUATINTA, a method of etching on copper, lately invented, by which a soft and beautiful colour is produced, resembling a fine drawing in water colours or Indian ink.

Previous to the operation upon the plate, the following powder must be prepared.—Take of asphaltum and fine transparent rosin, equal parts, suppose two ounces of each, and pound them separately. Through a muslin sieve (which may be formed with part of a chipbox of three or four inches diameter) sift upon a sheet of paper a thin stratum of the asphaltum, above which sift a similar layer of the rosin, and upon this another layer of asphaltum, continuing these alternate layers till both of the powders are exhausted; then pass the mixtures through the same sieve upon the paper once or twice, or till both appear to be sufficiently incorporated; when the powder is ready for use. Some, instead of the above mixture, use gum sandarach pounded.

The main process is as follows:—A copperplate being polished in the usual way, lay the etching ground upon it, and etch the outlines of your design in the manner directed under the article Etching: The ground is then to be softened with a little grease, and wiped off with a piece of rag: leaving, however, as much grease upon the plate as just to dim the copper. You now sift your powder upon the surface of the plate; after which, strike the other side of it pretty smartly against the edge of the table, in order to discharge it of the loose powder: This done, with a hand-vice hold the back of the plate over a chaffing dish of charcoal fire, till it become so hot as to give pain upon being touched with the back of the hand; and the powder which adhered to the grease will now be fixed to the plate. The plate being then suffered to cool, take turpentine varnish mixed with ivory black; and with a hair pencil dipt in it, cover all the lights or places where there is no work or shades. A rim or border of bees-wax is now to be raised under the plate: Then having reduced the aquafortis to a proper strength by vinegar or water, you pour it on, and let it stand five minutes for the first or lightest shade: after which, pour it off; and having washed the plate with water, set it on edge to dry: Then with the varnish stop up your light shades: pour on the aquafortis for the second tint, and let it stand five minutes more; proceeding in the same manner for every tint till you produce the darkest shades. If a bold open ground is wanted in any part, this requires an after operation: The ground must be laid as the other, by sifting on the powder; only this powder is much coarser, and the plate must be much more heated in order that the particles of the powder may spread, and form small circles: even good clean rosin will do by itself.

In

Aquatinta || Aquila.

In etching landscapes, the sky and distant objects are also performed by a second operation, and the powder is sifted upon the plate with a finer sieve. If the trees or any part of the fore-ground require to be higher finished, the plate must be entirely cleansed from grease with bread, and a ground laid in the common way of etching; when you may finish as highly and neatly as you please with the needle or point, by stippling with dots, and biting up those parts, or by a rolling-wheel.

The preceding is the method for prints of one single tint. But if different colours are to be expressed, there will be required as many different plates, each plate having only the part etched upon it which is designed to be charged with its proper colour; unless (as may happen in particular subjects) some of the colours are so distant from each other as to allow the printer room to fill them in with his rubber without blending them; in which case, two or more different colours may be printed from the same plate at once.—Where different plates are necessary, a separate one, having a pin in each corner, must be provided as a sole or bottom to the aquatinta plates; and these again must be exactly fitted, having each a small hole in their corners for passing over the pins of the sole; the said pins serving the double purpose of retaining the plates successively in their due position, and of directing the printer in placing the paper exactly on each plate so as not to shift; by which means each tint or colour will be exactly received on its proper place.—This is the method practised at Paris. A landscape or similar subject, however, may be printed off at once in the different proper colours, by painting these upon the plate. In this case, the colours must be pretty thick in their consistence; and the plate must be carefully wiped in the usual way after the laying on of each tint, as well as receive a general wipe upon its being charged with all the tints.

This art is kept as secret as possible by those who practice it; and it is believed that no particular explanation or directions, before the present, have been communicated to the public. In order to succeed, however, great care and judgment are requisite; and much depends upon a certain nicety of management, which is only attainable by practice.

AQUAVIVA, a town of the kingdom of Naples, and province of Bari.

AQUEDUCT. See AQUÆDUCT.

AQUEOUS, in a general sense, something partaking of the nature of water, or that abounds with it.

Aqueous Humour. See ANATOMY, p. 276.

AQUILA, in *Ornithology*, a synonyme of the eagle. See FALCO.

AQUILA, the EAGLE, in *Astronomy*, a constellation of the northern hemisphere; usually joined with Antinous. The stars in the constellation Aqua and Antinous, in Ptolemy's catalogue, are 15; in Tycho's 19; in Hevelius's 42; in the Britannic catalogue, 71.

AQUILA, a fine large city of Italy, and the capital of Abruzzo, seated on a hill, on the banks of the river Pescaro, near its source. It has an ancient castle, and is a bishop's see immediately under the pope. The land about it produces great plenty of saffron. It was very near being all destroyed by an earthquake, in February 1703. The first shock was so terrible, that the inhabitants abandoned the city; but returning to vespers, it being Candlemas day, the shocks followed one another with such violence, that 24,000 people perished, and great numbers were wounded; 800 were killed in one single church; many other churches, monasteries, noble buildings, and the townhouse, were either swallowed up or overturned, together with the greater part of the city and its walls. Aquila stands 30 miles from the sea, and about 16 from the confines of the pope's dominions. E. Long. 14. 20. N. Lat. 42. 20.

Aquila || Aquilei

AQUILEGIA, COLUMBINE. See BOTANY *Index.*

AQUILEIA, a large city of the Carni, or Veneti, and a noble Roman colony, which was led thither between the first and second Macedonian wars, (Livy). It is washed by two rivers, the Natiso and Turrus, (Pliny). The reason of leading this colony was, in order to be a bulwark against the neighbouring barbarians. The colony was afterwards increased with 1500 families by a decree of the senate, (Livy); from which it became a very famous port town, (Herodian). The emperor Julian ascribes the appellation to the augury of an eagle at the time of building it; but Isaac Vossius on Mela, to the great plenty of water, as if the town were called *Aquilegia.* The harbour, at the mouth of the Natiso, is distant 60 stadia from the city; so that ships of burden are towed up the river, (Strabo). In 452 it was besieged by Attila with an innumerable host of barbarians. The walls were assaulted by a formidable train of battering rams, moveable turrets, and engines that threw stones, darts, and fire; and the monarch of the Huns employed the forcible impulse of hope, fear, emulation, and interest, to subvert the only barrier which delayed the conquest of Italy. Aquileia was at that period one of the richest, the most populous, and the strongest of the maritime cities of the Hadriatic coast. Three months were consumed without effect in the siege; till the want of provisions and the clamours of his army compelled Attila to relinquish the enterprise, and reluctantly to issue his orders that the troops should strike their tents the next morning and begin their retreat. But as he rode round the walls, pensive, angry, and disappointed, he observed a stork preparing to leave her nest in one of the towers, and to fly with her infant family towards the country. He seized, with the ready penetration of a statesman, this trifling incident which chance had offered to superstition; and exclaimed in a loud and cheerful tone, that such a domestic bird, so constantly attached to human society, would never have abandoned her ancient seats, unless those towers had been devoted to impending ruin and solitude. The favourable omen inspired an assurance of victory; the siege was renewed and prosecuted with fresh vigour; a large breach was made in the part of the wall from whence the stork had taken her flight; the Huns mounted to the assault with irresistible fury; and the succeeding generation could scarcely discover the ruins of Aquileia. The place, however, is still called *Aquileia;* and there are several inscriptions and antiquities to be seen in it, which are worthy of a traveller's notice; and, though dwindled into a poor village, it gives a title to the patriarch of Aquileia.

The

Aquileia ‖ Aquinum.

The patriarch is named by the Venetians, and resides at Udino, because the town of Aquileia belongs to the House of Austria. E. Long. 13. 20. N. Lat. 45. 40.

AQUILICIUM, or AQUILICIANA, in Roman antiquity, sacrifices performed in times of excessive drought, to obtain rain of the gods.

AQUILINE, something belonging to or resembling an eagle: Thus an aquiline nose is one bent somewhat like an eagle's beak.

AQUILO, is used by Vitruvius for the north-east wind; or that which blows at 45° from the north toward the east point of the horizon.—The poets gave the name *aquilo* to all stormy winds dreaded by the mariner.

AQUILUS, among the ancients, a dark or dusky colour approaching to black. Hence some of the Heathen gods were called *dii aquili*, q. d. *nigri*.

AQUIMINARIUM, in antiquity, a kind of lustral vessels, wherein the Romans carried their holy water for expiation and other religious offices.

AQUINAS, ST THOMAS, styled the *Angelical Doctor*, was of the ancient and noble family of the counts of Aquino, descended from the kings of Sicily and Arragon; and was born in the castle of Aquino, in the Terra di Lavora in Italy, in the year 1224 or 1225. He entered into the order of the Dominicans; and, after having taught school divinity in most of the universities of Italy, at last settled at Naples; where he spent the rest of his life in study, in reading of lectures, and in acts of piety; and was so far from the views of ambition or profit, that he refused the archbishopric of that city, when it was offered him by Pope Clement IV. He died in 1274, leaving an amazing number of writings, which were printed at Venice in 17 vols. folio, in the year 1490. He was canonized by Pope John XXII. in the year 1323; and Pius V. who was of the same order with him, gave him, in 1567, the title of the Fifth Doctor of the church, and appointed his festival to be kept with the same solemnity as those of the other four doctors. His authority has always been great in the schools of the Roman Catholics. Lord Herbert, in his life of Henry VIII. tells us, that one of the principal reasons which induced that king to write against Luther was, that the latter had spoken contemptuously of Thomas Aquinas.

AQUINO, PHILIP D', in Latin *Aquinas* or *Aquinius*, having turned from Judaism, had a pension from the clergy of France; and acquired much reputation by his knowledge of the Hebrew language, which he taught at Paris, in the reign of Louis XIII. and by the books he published, among which is his *Dictionarium Hebræo-Chaldæo-Thalmudico-Rabbinicum*. His grandson, Anthony D'Anquin, was first physician to Louis XIV.

AQUINO, a town of Italy, in the kingdom of Naples, and Terra di Lavora; a bishop's see, but ruined by the emperor Conrade, and now consisting of about 35 houses. It was the birthplace of the poet Juvenal, and of Thomas Aquinas. E. Long. 14. 30. N. Lat. 41. 32.

AQUINUM, in *Ancient Geography*, a large municipal town, and a Roman colony on the borders of the Samnites, washed by the river Melpha (Strabo). The inhabitants are called *Aquinates*. Now *Aquino*, but almost in ruins, in the territory of Lavora. E. Long. 17. 11. N. Lat. 41. 35.

Aquinum ‖ Arabia.

AQUITANIA, in *Ancient Geography*, one of the three principal divisions of Gallia Comata (Cæsar); bounded by the Garonne, the Pyrenees, and the ocean: this is the *Aquitania Cæsariana*, or *Vetus*. Augustus set the different boundaries, viz. the Loire, the Cevennes, the Pyrenees, and the ocean (Strabo). It was called *Gallia Aquitanica* (Pliny); and in the old Notitiæ *Provincia Aquitanica*. The people are called *Aquitani* (Cæsar). Now comprising Guienne (which seems to be a corruption of Aquitania) and Gascony.

AR, in *Ancient Geography*, the metropolis of Moab, in Arabia Petræa (Moses), and the royal residence, situated on the east side of the river Arnon. It was called also *Rabba* (Joshua): and to distinguish it from Rabba of the Ammonites, *Rabbat Moab*, and on coins *Rabbath Moma* (Reland). Eusebius says it was called *Areopolis* in his time, from *Ar* and *Polis*. The inhabitants are called *Areopolitæ*. St Jerome says that this city was entirely destroyed by an earthquake when he was a young man.

ARA THURIBULI, the altar of incense, in *Astronomy*, a southern constellation, not visible in our hemisphere, consisting, according to Ptolemy, of seven stars; and according to Sharp's Catalogue, annexed to that of Mr Flamsted, of nine stars.

ARA, in *Astronomy*, a southern constellation, containing eight stars.

ARAB or ARABIAN HORSE. See EQUUS.

ARABESQUE, or ARABESK, something done after the manner of the Arabians. *Arabesque*, *Grotesque*, and *Moresque*, are terms applied to such paintings, ornaments of friezes, &c. where there are no human or animal figures, but which consist wholly of imaginary foliages, plants, stalks, &c. The words take their rise from hence, that the Moors, Arabs, and other Mahometans, use these kind of ornaments; their religion forbidding them to make any images or figures of men or other animals.

1 Whence named.

ARABIA, a country of Asia, famous from the remotest antiquity for the independency of its inhabitants during the vast conquests of the Assyrians, Persians, Greeks, and Romans; and, in later times, for being the centre of an empire equal, if not superior, in extent to any that ever existed.

This country, or at least the greater part of it, was in the earliest ages called *Arabah*. Concerning the etymology of this word there are various conjectures. It has most generally been derived from the Hebrew word ערב, signifying *the west*, *mixture*, or *traffic*; but, according to M. Volney, *Arab*, in the ancient language of these countries, signifies a *solitude* or *desert*. In its largest extent, Arabia lies between the 12th and 35th degrees of N. Lat. and the 36th and 61st of E. Long. Its greatest length from north to south is about 1430 miles, and its breadth from east to west is 1200. It is bounded on the west by Palestine, part of Syria, the isthmus of Suez, and the Red sea, called by the Arabs the sea *Al Kolzom*; on the east by the Euphrates, the Persian gulf, and bay of Ormus; on the north, by part of Syria, Diyar Becr, Irak, and Khuzestan; and on the south by the straits of Babelmandel and the Indian ocean. It grows narrower as we approach the frontiers of Syria and Diyar Becr:

2 Boundaries, &c.

Arabia. Becr: and, by reason of the proximity of the Euphrates to the Mediterranean, may be looked upon as a peninsula, and that one of the largest in the whole world. —Arabia Proper, however, is much narrower, including little more than what was comprehended by the ancients under the name of Arabia Felix, which we shall presently describe; and here the Arabs have been settled almost since the flood.

3 Division. The first division of the peninsula of Arabia was into *Arabah* and *Kedem*, as we learn from Scripture; the first of which implies the west, and the other the east, denoting the situation of the two countries. Ptolemy was the first who divided the peninsula we speak of into three parts, Arabia Petræa, Arabia Deserta, and Arabia Felix, which division has generally prevailed since his time.

Arabia Petræa, on the east was bounded by Syria and Arabia Deserta; on the west, by Egypt, or rather the isthmus of Suez, which separates Asia from Africa, and the Hieropolitan gulf or western arm of the Red sea; on the north, by Palestine, the lake Asphaltites, and Cœlosyria; and on the south by Arabia Felix. This tract did not admit of much cultivation, the greatest part being covered with dry sands, or rising into rocks, interspersed here and there with some fruitful spots. Its metropolis was Petra, which by the Syrians was styled *Rakam*, and in Scripture *Joktheel*. Several other cities of Arabia Petræa are mentioned by Ptolemy; but as it is very improbable sueh a barren country should abound with large cities, we must look upon them as inconsiderable places.

Arabia Deserta was bounded on the north by the Euphrates, which separated it from Mesopotamia; on the west, by Syria, Judæa, and Arabia Petræa; on the east, by a ridge of mountains which separated it from Babylonia and Chaldea; on the south, by Arabia Felix, from which it was likewise separated by several ridges of hills. By far the greatest part of this kingdom, as well as the former, was a lonesome desert, diversified only with plains covered with sand, or mountains consisting of naked rocks and precipices; nor were they ever, unless sometimes at the equinoxes, refreshed with rain. The few vegetables which they produced were stunted by a perpetual drought, and the nourishment afforded them by the nocturnal dews was greatly impaired by the heat of the sun in the day-time. Throughout the deserts were found huge mountains of sand, formed by the violence of the winds that continually blew over them in the day-time, though they ceased in the night. Wells and fountains were for the most part exceedingly rare; however, notwithstanding the sterility of these countries, the vast plains of sand just now mentioned were interspersed with fruitful spots, which appeared here and there like so many islands in the midst of the ocean. These being rendered extremely delightful by their verdure, and the more so by the neighbourhood of those frightful deserts, the Arabs encamped upon them; and having consumed every thing they found upon one, removed to another, as is the custom of their descendants the Bedoweens at this day. These fruitful spots were likewise frequent in Libya, and by the Egyptians called *auases*, or *abases*, as we learn from Strabo. The barren part of Arabia Felix, bordering upon the Red sea, was in like manner interspersed with abases; which probably gave the name of *Abaseni* to a nation settled there, and in the adjacent fertile region. A body of these, it is said, crossing the straits of Babelmandel, passed into Ethiopia, which from them received the name of *Abassia*. From this account of Arabia Deserta, we may reasonably conclude, that the towns said by Ptolemy to have been situated in it were places of very little consequence. Arabia.

Arabia Felix was bounded on the north by the two kingdoms just described; on the south, by the Red sea; on the east and west, by part of that sea, together with the Arabian and Persian gulfs. In Strabo's time, it was divided into five provinces, by the oriental historians called *Yaman*, *Hejaz*, *Tehamah*, *Najd*, and *Yamama*. In this district stood several towns, particularly Nysa, famous for being the birthplace of Bacchus; and Musa, or Muza, a celebrated emporium or harbour, where the Arabian merchants resorted with their frankincense, spices, and perfumes. These two were situated in the province of Yaman. In that of Hejaz stood the still more famous cities of Mecca and Medina; also Thaisa or Taisa, Gjudda or Joddo, Yanbo or Al Yanbo, and Madian, the Modiana of Ptolemy, and the Midian or Madian of Scripture.

4 When peopled. At what time the above-mentioned kingdoms were first peopled we have no certain accounts. The most considerable nations inhabiting Arabia Petræa, in the early ages, were the Ishmaelites, the Nabatæi or Nabatheans, the Cedræi or Kedareni, and the Agareni or Hagareni; and of these the Ishmaelites were the most powerful, if they did not comprehend all the rest; and if the Hagareni were not the same people with them, they must at least have been nearly related. Kimchi, an oriental historian, insinuates, that they were originally the children of Hagar by an Arab, after she had left Abraham. In after ages, the names of all the nations situated here were absorbed in that of *Saracens*, by which the Ishmaelites are distinguished in the Jerusalem Targum. A nation is also mentioned by Pliny, called *Arraceni*, and *Saraceni* by Ptolemy and Dioscorides, which was probably no other than the Ishmaelites above mentioned. In Arabia Deserta several tribes resided, all of whom were very obscure, except the Aisitæ and Araei. The former are supposed by Bochart to have been Job's countrymen, and the latter to have been the same with the Hagareni, Arraceni, or Saraceni, above mentioned. Arabia Felix was inhabited by many different tribes; the most remarkable of which were the Sabæi, Gerræi, Minæi or Minnæi, Atramitæ, Marinatæ, Catabani, Ascitæ, Homeritæ, Sapphoritæ, Omanitæ, Saraceni, Nabathæi, Thamydeni, and Bnizomenæ; but neither their limits nor situation can now be determined with any manner of precision.

5 Division of the Arab. According to the oriental historians, the Arabs are to be divided into two classes; viz. the *old lost Arabians*, and the *present*. The most famous tribes among the former were those of Ad, Thamud, Tasm, Jades, Jorham, Amalek, Amtem, Hasbem, Abil, and Bar. Concerning these, though now entirely lost and swallowed up among other tribes, there are some remarkable traditions, of which the following may serve as a specimen.

The

Arabia.

6 Tradition concerning the tribe of Ad.

The tribe of Ad deduced their origin from Ad the son of Aws, or Uz, the son of Aram, the son of Shem, who, after the confusion of tongues, settled in Al Abkaf, or the winding sands in the province of Hadramant, on the confines of Yaman, where his posterity greatly multiplied. Their first king was Sheddad, the son of Ad, who built a stately palace, and made a delightful garden in the deserts of Aden, which he designed as an imitation of the celestial paradise. This garden he called *Irem:* and when it was finished, he set out with a great retinue to take a view of it; but, having some thoughts of assuming divine honours, he was destroyed by a tempest from heaven, while yet a day's journey from his paradise. The garden and palace, however, were preserved, though invisible, as a monument of divine vegeance.

After the death of Sheddad, the kingdom of Ad was governed by a long series of princes, concerning whom many fables are related by the eastern writers. The conclusion of their history, however, is as follows. "The Adites, in process of time, falling from the worship of the true God into idolatry, God sent the prophet Hûd, supposed to be the same with Heber, to preach to and reclaim them. But they refusing to acknowledge his mission, or to obey him, God sent a hot and suffocating wind, which blew seven nights and eight days, and entering at their nostrils passed through their bodies, and destroyed them all, a very few only excepted, who had listened to Hûd, and retired with him to another place." Others relate, "that before this terrible catastrophe, they had been previously chastised with a three years drought; and therefore sent Kail Ebn Ithar, and Morthen Ebn Sdaa, with 70 other principal men, to Mecca, then in the hands of the tribe of Amalek, whose prince was Moahwiyah Ebn Becr, to obtain of God some rain. Kail having begged of God that he would send rain to the people of Ad, three clouds appeared, a white, a red, and a black one; and a voice from heaven ordered him to choose which he would. Kail failed not to make choice of the last, thinking it would be laden with most rain; but when this cloud came over them, it proved to be fraught with the divine vengeance, and a tempest broke forth from it which destroyed them all.

7 Arabs from whom descended.

The *present Arabs*, according to their own historians, are sprung from Kahtan, the same with Joktan, the son of Eber, and Adnan, descended in a direct line from Ishmael the son of Abraham. The former of these they called *genuine* or *pure* Arabs, and the latter the *naturalized* or *insititious* Arabs.

Joktan the son of Eber had 13 sons, who some time after the confusion of languages settled in Arabia, extending themselves from Mesha to Sephar, a mountainous place in the south-eastern part of that peninsula. According to the Arabian historians, he had 31 sons, all of whom left Arabia and went into India, except two, viz. Yarab and Jorham; the former of whom, they say, gave the name both to their country and language. Ishmael and his mother Hagar having been dismissed by Abraham, entered into the wilderness of Paran, as related in the book of Genesis. The sacred historian informs us, that during his residence in the wilderness he married an Egyptian; and the Arabian writers say that he also took to wife the daughter of Modab king of Hejaz, lineally descended from Jorham the founder of that kingdom. By the Egyptian he was probably the father of the Scenite or wild Arabs; and having allied himself to the Jorhamites, he is considered by the Arabians as the father of the greatest part of their nation.

Arabia.

8 Joktan the first king.

Kahtan, or Joktan, is said to have first reigned, and worn a diadem, in Yaman; but the particulars of his reign we nowhere learn. He was succeeded by Yarab already mentioned, he by Yashab, and Yashab by Abd Shems. He was successful in his expeditions against his enemies, carried off great spoils, and took many of them prisoners. He is said to have built the city of Saba or Mareb, and above it a stupendous mound or building, which formed a vast reservoir, containing all the water that came down from the mountains. By means of this reservoir the kings of Yaman not only supplied the inhabitants of Saba and their lands with water, but likewise kept the territories they had subdued in greater awe, as by cutting off their communication with it they could at any time greatly distress them.

9 Reservoir of Saba.

Abd Shems was succeeded by his son Hamyar, from whom the tribe of Hamyar is said to take its name; and he by a series of 17 kings, concerning whom we have no remarkable particulars, except that from one of them, called *Africus*, the continent of Africa took its name. The last of these was succeeded by a daughter named *Balkis* or *Belkis*, whom some will have to be the queen of Sheba who paid a visit to Solomon. After Balkis came Malca, surnamed *Nasherolneam* on account of his magnificence and liberality. Having had bad success in an expedition, where his army was overwhelmed by torrents of sand, he caused a brazen statue to be erected, with the following inscription in the old Hamyaritic character: "There is no passage behind me, no moving farther; the son of Sharhabil." He was succeeded by Shamar Yaraash, so called on account of his being affected with a constant tremour. To this prince the city of Samarcand is said to owe its existence. After Shamar Yaraash we have a list of 15 kings, of whom nothing worth mentioning is recorded, except of one Abu Carb Asaad, who adorned the Caaba or temple of Mecca with tapestry, and first introduced Judaism among the Hamyarites. He was put to death by his subjects, probably on account of religion. The last of the 15 kings above mentioned was called *Abrahah*, who was succeeded by his son Sabban. He had that famous sword called *Samsannah*, which afterwards came into the hands of the caliph Al Rashid. This prince was succeeded by Dhu Shanater, who had six fingers on each hand. He was abandoned to unnatural lust, and dethroned for abusing some of the noblest youths in the kingdom. To him succeeded Yusef, who lived about 70 years before Mahomet. He persecuted all those who would not turn Jews, putting them to death by various tortures, the most common of which was throwing them into a glowing pit of fire; whence he had the appellation of the *lord of the pit*. This persecution is taken notice of in the Koran. The last of the Hamyaritic monarchs was Dhu Jadan, according to Abulfeda; but, according to others, the Yusef just mentioned, who was surnamed *Dhu Nowas* on account of his flowing curls, and was the last who reigned in an uninterrupted succession. He was a bigotted Jew, as already mentioned: and treated his subjects with such

10 Balkis supposed to be the queen of Sheba.

11 Samarcand by whom built.

12 Yusef a bloody persecutor.

Arabia.

such barbarity, that they were obliged to ask the assistance of Elesbaas, or Elasbaan, king of Ethiopia, against him. Dhu Nowas, not being able to make head against the Ethiopians, was at last driven to such extremity, that he forced his horse into the sea, and lost both his life and crown together.

13 His subjects call in the king of Ethiopia, who dethrones Yusef.

The king of Ethiopia, having thus become master of Yaman, established there the Christian religion, and fixed upon the throne one Abryat an Ethiopian. He was succeeded by Abraha Ebn-Al Sabah, surnamed the *Slit-nosed*, from a wound he had formerly received in it. He was likewise styled *lord of the elephant*, from a story too ridiculous to deserve notice. He was succeeded by two other Ethiopian princes; but at last Sief Ebn Dhu Yazan, of the old royal family of Hamyar, having obtained assistance from the king of Persia, which had been denied him by the emperor Heraclius, recovered his throne, and drove out the Ethiopians; but was himself slain by some of them who were left behind. The succeeding princes were appointed by the Persians, till Yaman fell into the hands of Mahomet.

14 Christian religion established in Arabia.

15 Ethiopians driven out.

16 Terrible inundation by the breaking down of the reservoir of Saba.

We have already taken notice of the vast mound or reservoir made by Abd Shems, from which he supplied the city of Saba with water. This building stood like a mountain above the city, and was by the Sabæans esteemed so strong, that they were under no fear of its ever failing. The water rose almost to the height of 20 fathoms; and was kept in on every side by a work so solid, that many of the inhabitants had their houses upon it. About the time of Alexander the Great, however, a terrible inundation happened. According to the Arabian historians, God being displeased at the pride and insolence of the inhabitants of this city, resolved to humble them: and for this purpose sent a mighty flood, which broke down the mound by night whilst the inhabitants were asleep, and carried away the whole city with the neighbouring towns and people. This inundation is styled in the Koran the *inundation of Al Haram;* and occasioned so terrible a destruction, that from thence it became a proverbial saying to express a total dispersion, "that they were gone and scattered like Saba."—By this accident no less than eight tribes were forced to remove their habitations; some of which gave rise to the kingdoms of Hira and Ghassan.

17 Origin, &c. of the kingdom of Hira.

The kingdom of Hira was founded by Malec, a descendant of Cahlan the brother of Hamyar; but after three descents, the throne came by marriage to the Lakhmians, who were descendants of Lakhm the son of Amru, the son of Abd Ems. These princes, whose general name was *Mondar*, preserved their dominion, notwithstanding some small interruption from the Persians, till the caliphate of Abu Becr, when Al Mondar Maghrur, the last of them, lost his life and crown by the arms of Khaled-Ebn-Al-Walid. This kingdom continued 622 years and eight months, according to Ahmed Ebn Yusef. Its princes were under the protection of the kings of Persia, and were their lieutenants over the Arabs of Irak, as the kings of Ghassan were for the Roman emperors over those of Syria.

18 Of Ghassan.

The kingdom of Ghassan was founded by the tribe of Azd, who according to some, settling in Syria Damascena, near a water called *Ghassan*, from thence took their name; but others say they went under this appellation before they left Yaman. Having driven out the Dajaamian Arabs, who before possessed the country, they made themselves masters of a considerable territory. Here they maintained themselves, according to some 400, according to others 600, and according to Abulfeda 613 years, when the last of their kings submitted to the caliph Omar, and embraced the Mahometan religion; but receiving afterwards a disgust, soon returned to Christianity, and took refuge in Constantinople.

Arabia.

19 Of Hejaz.

The kingdom of Hejaz was founded by Jorham the son of Kahtan, where princes of his line reigned till the time of Ishmael, who married the daughter of Modad one of those princes. Some authors relate that Kidar, one of Ishmael's sons, had the crown resigned to him by his uncles the Jorhamites: but, according to others, the descendants of Ishmael expelled that tribe; who, retiring to Johainah, were after various adventures destroyed by an inundation. After the expulsion of the Jorhamites, the government of Hejaz seems not to have continued long in the hands of one prince, but to have been divided among the heads of tribes, almost in the same manner as the Arabs of the desert are governed at this day. The tribe of Khozaab, after the above mentioned inundation of Saba, fled into the kingdom of Hejaz, and settled themselves in a valley called *Marri* near Mecca. Here they founded an aristocracy, assuming to themselves both the government of the city of Mecca, and the custody of the Caaba or temple there. They continued masters of this city and territory, as well as presidents of the Caaba, for many ages, till at length one Kosa, of the tribe of Koreish, circumvented Abu Gabshan, a weak and silly man, of whom, while in a drunken humour, he bought the keys of the temple for a bottle of wine; but when Abu Gabshan grew cool, and reflected on his imprudence, he sufficiently repented of what he had done; whence the Arabian proverbs, "More vexed with late repentance than Abu Gabshan; More foolish than Abu Gabshan," &c. The tribe of Khozaab endeavoured afterwards to give some disturbance to the Koreish in the possession of the keys of the Caaba, which furnished the latter with a pretence for depriving them of the civil government of Mecca. After the Koreish had possessed themselves of this city, they kept up the same form of government which had prevailed there before. Besides these kingdoms, there were many others of lesser note, of which we find nothing remarkable.

20 Tribe of Khozaab assumes the government of Mecca.

21 Folly of Abu Gabshan.

Thus we have briefly mentioned the most memorable events recorded by the Arabian historians previous to the time of Mahomet; but, before entering upon an account of that famous impostor and the kingdom founded by him, it will be proper to take notice of several circumstances in different parts of the world, which at that time concurred to facilitate his scheme, and without which, in all probability, he would never have been able to accomplish it.

22 Causes of Mahomet's success.

The first and great cause of Mahomet's success in his imposture, was the gross corruption and superstition with which the Christian religion was at that time obscured in all parts of the world. Had the pure doctrines of Christianity been then as publicly known as the ridiculous fopperies which deformed the Eastern and Western churches, Mahometanism could never have got a hearing. But along with the true religion, mankind seemed also to have lost the use of their rational

Arabia.

rational faculties, so that they were capable of swallowing the grossest absurdities; such as it now appears almost incredible that any of the human race could receive as truths. Another cause was, the manner of government and way of life among the Arabs. Divided into small independent tribes, they never were capable of a firm union but by superstition; and had Mahomet attempted their conquest in any other way, it was impossible he could have succeeded. As there were also among them Jews, Pagans, and Christians of all sorts, this impostor, by adopting something out of every religion then extant, cunningly recommended himself to the professors of every one of them. Add to all this, that by allowing of polygamy, and setting forth his paradise as consisting in the enjoyment of women, he adapted himself to the corrupt dispositions of mankind in general.

If the distracted state of religion favoured the designs of Mahomet on the one hand, the weakness of the Grecian and Persian monarchies assisted him no less powerfully on the other. Had those once formidable empires been in their vigour, either of them would have been sufficient to crush Mahometanism in its birth; but both of them were then strangely reduced. The Roman empire had continued to decline after the time of Constantine; the western parts of it were then entirely overrun by the Goths and other barbarous nations; and the eastern, or Greek empire, was so much reduced by the Huns on the one hand, and the Persians on the other, as to be incapable of making any great effort. The Persian monarchy itself was in little better condition. It is true, they ravaged the dominions of the Greeks, and often overcame them in the field; but that was owing more to the weakness of the Grecian empire, than to the strength of the Persians, and so effectually did the intestine broils, which arose chiefly on account of religion, weaken the kingdom of Persia, that the most considerable part of it was annexed by the caliph Omar to his dominions.

As the Greeks and Persians were then in a languishing situation, so the Arabs were strong and flourishing. Their country had been peopled at the expence of the Grecian empire; whence the violent proceedings of the different religious sectaries forced many to take refuge in Arabia. The Arabs were not only a populous nation, but unacquainted with the luxuries and delicacies of the Greeks and Persians. They were inured to hardships of all kinds, and consequently much better fitted than their effeminate neighbours to endure the fatigues of war, as the event very fully verified.

23 Mahomet's birth, descent, &c.

Mahomet was born in the year of Christ 569. According to the eastern historians, he was descended in a direct line from Ishmael. Keder, or, as the Arabians call him *Kidar*, after his father Ishmael's death, communicated his name to the greatest part of Arabia Petræa. He was succeeded in his authority and possessions by his son Hamal; Hamal by Nabat, and Nabat by Salaman. After Salaman came Al Homeisa, then Al Yasa, whose son Odad was succeeded by Odd the father of Adnan. Counting ten generations forward in the same line, we come at last to Fehr, who seems to

24 Fehr head of the Koreish.

have distinguished himself by some glorious actions, as he was denominated *Koreish*, on account of his bravery. He is to be considered as the root of the politest and most celebrated tribe of the Arabs. He had three sons, Galeb, Mohareb, and Al Hareth. From Mohareb the Banu Mohareb, denominated likewise *Sheiban*, took their origin; from Al Hareth, the Banu Al Kholoj: and from Galeb in a direct line, the impostor Mahomet. Galeb was the father of Lowa; and he of Caab, whose son Morrah had for his immediate descendant Kelab the father of Kosa. It was this Kosa who aggrandized the tribe of the Koreish, by purchasing the keys of the Caaba from Abu Gabshan, as we have already related. By this he not only aggrandized his tribe, but became the prince of it himself. He was succeeded by his second son Abd Menaf, to whom the *prophetic light*, which is said to have manifested itself in his face, gave the right of primogeniture. Abd Menaf was succeeded by his son Amni, surnamed *Hashem*, or "one that broke bread," on account of his singular generosity during a famine at Mecca. Having amassed great sums of money, he took a journey into Syria, where he purchased a vast quantity of meal, which he made into cakes, and divided with his own hands amongst the people of Mecca. He likewise killed a prodigious number of camels, with which he fed them, and relieved them in the time of their distress; and finding that the soil about Mecca was so barren as to produce no fruits but what are common in the deserts, and consequently no corn or grain, which the Meccans are obliged to bring from other places, he appointed two caravans to set out yearly for that purpose, the one in summer, and the other in winter; by means of which the city was amply supplied with provisions of all kinds. The provisions brought by them, were distributed twice a-year; and Hashem, by his prudent conduct, raised the glory of his people to the highest pitch; insomuch, that all the neighbouring great men and heads of tribes made their court to him. Nay, so great veneration is the memory of Hashem held in by the Arabs, that from him the family of Mahomet among them are called *Hashemites;* and he who presides over Mecca and Medina, who must always be of the race of Mahomet, has to this day the title of the "Chief or Prince of the Hashemites."

Arabia.

25 Hashem's generosity.

Hashem died at Gaza in Syria, and was succeeded by his son Abdal Motalleb or Mateleb. He is said to have been extremely affable and easy of access, as well as just and generous to a great degree; so that, in the beginning of the month *Ramadan*, he entertained the poor upon the flat roof of his house, and afterwards supplied the fowls of the air and wild beasts of the field with provisions of various kinds, which he ordered his servants to leave upon the summits of the neighbouring mountains. The well which God showed to Hagar in the wilderness is said to have been miraculously discovered to Abdal Motalleb, about 500 years after it had been filled up by Amru, prince of the Jorhamites. This well is by the Arabs called *Zemzem;* which some derive from her calling to Ishmael, when she spied it, in the Egyptian tongue, *Zem, Zem*, i. e. Stay, Stay: though others ascribe it to a different origin. The water of this well, which is on the east side of the Caaba, and covered with a small building and cupola, is highly reverenced; being not only drank with particular devotion by the pilgrims, but also sent in bottles as a great rarity to most parts of the Mahometan dominions.

26 Well Zemzem discovered by Abdal Motalleb.

Abdalla the father of Mahomet, was a younger son of

Arabia.

of Abdal Motalleb, and remarkable for his beauty. In his 24th or 25th year, he married Amina, the daughter of Waheb, the son of Abdal Menaf. She is represented as the most beautiful, prudent, and virtuous lady of her tribe; and consequently the most worthy of such an extraordinary person as Abdalla. He died young, and, in his father's lifetime, left his widow and infant son in very mean circumstances; his whole substance consisting only of five camels and one female Ethiopian slave. Abdal Motalleb was, therefore, obliged to take care of his grandson Mahomet; which he not only did during his life, but at his death enjoined his eldest son Abu Taleb to provide for him for the future. Abu Taleb was extremely kind to his nephew, and instructed him in the business of merchandise: for which purpose he took him into Syria when he was but 13 years of age, recommending him to Khadijah, a noble and rich widow, for her factor; in whose service he behaved so well, that she married him, and thus raised him to an equality with the richest in Mecca.

27 Mahomet at first a merchant.

28 Begins to broach his doctrine.

Though Mahomet had probably formed a design of introducing his new religion pretty early, he did not think proper to avow it till the 40th year of his age. The grand article of his faith was, the unity of the divine nature, which he pretended was violated by the Jews and Christians no less than by the Pagans; for which reason, he resolved to make an attempt to rescue the world from the ignorance and superstition which prevailed at that time. This reformation he intended should begin in his own family; and therefore, having retired with his household to a cave in Mount Hara, near Mecca, he there opened the secret of his mission to Khadijah; acquainting her that the angel Gabriel had just appeared to him, and told him that he was appointed the Apostle of God. He also repeated to her a passage which he said had been revealed to him by the ministry of the angel, with an account of many prodigies which happened at his birth. (See MAHOMET). This pretended revelation was received by Khadijah with the greatest joy; and in a kind of ecstasy she immediately communicated the good news to her cousin Waraka Ebn Nawfal, who, being a Christian, could write in the Hebrew character, and was pretty well versed in the Scriptures both of the Old and New Testament. He very readily came into her opinion, swore by God that what she said was true, and that "Mahomet was the great prophet foretold in the law by Moses the son of Amram."

29 Converts his wife and cousin, &c.

Mahomet finding his first step successful, as Waraka was a very considerable person, began to entertain great hopes of accomplishing his design. He next converted his servant Zeid, to whom he gave his liberty on the occasion, which afterwards became a rule to his followers; and then Ali the son of Abu Taleb, though at that time only nine or ten years of age. This last, however, making no account of the other two, he used to call *the first of believers*. The next person he applied to was Abu Becr, a man of very considerable authority among the Koreish. He was easily gained over, and by his influence several others; so that Mahomet now made his mission no longer a secret. To Abu Becr he gave the name of *Al Saddik*, or *the faithful witness;* because he not only vouched for every thing he said, but also greatly increased the number of his followers. Mahomet likewise complimented him with the title of *Atik*, or *preserved;* intimating thereby that he was certainly saved from hell fire. Arabia.

Having given out that he was commanded from heaven to admonish his near relations, Mahomet directed Ali to prepare an entertainment, and invite to it the sons and descendants of Abdal Motalleb. He intended to open his mind to them: but Abu Laheb, one of Mahomet's uncles, making the company break up before the prophet had an opportunity of speaking to them, he was obliged to invite them again the next day. Having now proposed the matter, he asked which of them would become his wazir, prime minister, or vicegerent. This was accepted by Ali; upon which Mahomet said to him, "This is my brother, my deputy, and my (*caliph*) successor, or vicar; therefore show yourselves submissive and obedient to him." At this speech all the company fell a-laughing, telling Abu Taleb that he must now pay obedience and submission to his own son. Notwithstanding this repulse, however, Mahomet was so far from being discouraged, that he began to preach to the people in public. They heard him with some patience till he began to upbraid them with the idolatry, obstinacy, and perverseness of themselves and their fathers; which so highly provoked them, that they openly declared themselves his enemies, except some few who were converted. The prophet was now protected by the authority of his uncle Abu Taleb; who, however, was earnestly solicited to persuade his nephew to desist, and at last threatened with an open rupture in case he could not prevail on him so to do. This had such an effect upon Abu Taleb, that he advised his nephew not to push the matter any farther; representing the great danger he and his followers would otherwise run: but our prophet was not to be so intimidated; and told his uncle plainly, that "if they set against him the sun on his right hand, and the moon on his left, he would not abandon his enterprise." Abu Taleb, therefore, finding him so firmly resolved, used no further arguments, but promised to stand by him to the utmost of his power: so that notwithstanding the people of his tribe came to a determination to expel both Mahomet and his followers, he found a powerful support in his uncle against all their machinations.

30 Rejected by the Koreish.

31 His resolution.

Mahomet now entered upon his apostolic function with uncommon diligence and application; and soon gained over his uncle Hamza, and Omar Ebn Al Khattah, a person very much esteemed, and who before had been his violent opposer. Notwithstanding this success, however, the Koreish continued their opposition, and came to a resolution to proscribe all who had embraced Mahomet's doctrine. In consequence of this resolution, the *Moslems*, as his followers were called, were now treated with such severity, that they found it no longer safe to continue in Mecca: nay, several of them in the fifth year of his mission found themselves obliged to fly into Ethiopia, where they were kindly received by the Najashi or king of that country, who refused to deliver them up to those whom the Koreish sent to demand them. At this refusal they were so exasperated, that they came to a resolution to suppress effectually the new religion, which had now made a considerable progress. In order to this, they entered into a solemn league or covenant against the Hashemites,

32 His followers persecuted.

Arabia.

Hashemites, and the family of Abdal Motalleb in particular, engaging themselves to contract no marriages with them, nor to have any manner of communication with them otherwise; and, to give this the greater weight, they reduced it into writing, and laid it up in the Caaba. Upon this the tribe became divided into two factions; and all the family of Hashem, both Moslems and unbelievers, repaired to Abu Taleb as their head; except only Abdal Uzza; surnamed Abu Laheb, the son of Abdal Motalleb, who, out of hatred to his nephew and his doctrine, went over to the opposite party. After this the authority of Abu Taleb was scarce sufficient to protect Mahomet from the fury of the Koreish; who, according to Al Jannabi, made frequent attempts upon him; sometimes endeavouring to destroy him by force, at other times by secret wiles and machinations: nay, to compass their end, he tells us that they had recourse to magic, enchantments, and diabolical illusions. In short, they gave him at last so much trouble, that he was obliged to change his habitation, and seek a new asylum for himself and his companions. This he found in the house of one Orkam, which was advantageously situated on a hill called *Safa*. Here he converted Orkam's family, and the house was afterwards held in high estimation by the Moslems.

33 The Koreish enter into a league against him.

34 Their writing destroyed by a worm.

The two factions into which the tribe of Koreish was divided subsisted for five years, when they were put an end to by a very strange accident. Mahomet told his uncle Abu Taleb, that God had manifestly showed his disapprobation of the covenant entered into against them, by sending a worm to eat out every word of the instrument except the name of God. With this particular Abu Taleb, immediately acquainted the Koreish; offering, in case it proved false, to deliver up his nephew to them; but if it should prove true, he insisted that they ought to lay aside their animosity, and annul the league they had made against the Hashemites. To this they acquiesced; and going to inspect the writings, found it to be as Abu Taleb had told them; the words "In thy name, O God," being the only ones which remained. On so remarkable a proof of the divine displeasure, the league was immediately annulled, and all the acts of hostility between the two parties ceased.

35 Mahomet ill persecuted by the Koreish.

After this memorable event Mahomet remained with his uncle Abu Taleb, who survived the reconciliation only about eight months. The same year also died Khadijah, Mahomet's wife. Her death, as well as that of his uncle, proved a great detriment to his affairs; for the Koreish, notwithstanding the former reconciliation, began now to persecute him with more violence than ever. He was therefore obliged to fly for shelter to Al Tayef; which he chose on account of its being the residence of his uncle Al Abbas, whose protection he imagined he would be able to secure. In this, however, he found himself mistaken: and though he staid a month in the city, during which time he gained over a few, yet at last the lower sort of people rose against him, and obliged him to return to Mecca. This refusal, though it greatly discouraged the new converts, did not in the least abate the zeal of Mahomet; on the contrary, he continued to preach boldly to the public assemblies at the pilgrimage to Mecca, exclaiming against idolatry, and particularly against the worship of two idols Allat and Al Uzzua, to which the tribes, especially the women of that of Thakif, were very much addicted. By this the prophet was often exposed to great danger: however, he gained some converts, and amongst them six of the inhabitants of Yathreb, of the Jewish tribe of Khazraj; who, on their return home, failed not to speak much in commendation of their new religion, and exhorted their fellow citizens immediately to embrace it. These converts of the tribe of Khazraj, are by the Arab writers called *Al Ansar*, *Al Ansarii*, or *Ansars*; that is, assistants, favourers, supporters, &c. because they assisted and supported the prophet when he was pursued to the very brink of destruction. They first met Mahomet on a little hill called *Al Akabah*, where a temple stood, and where they first took an oath to exert themselves in support of their new apostle and his religion. An uninterrupted friendship and harmony reigned for a long time amongst the members of the Jewish tribes of Khazraj, Koreidha, and Nadir, whose great progenitor, says the Arabs, was Aaron the son of Amram. Mahomet therefore insinuating himself into the good graces of the Ansars, they readily embraced his religion, and proved of very considerable service.

Arabia.

36 Ansars, who.

37 Mahomet's journey to heaven,

The next remarkable thing recorded of Mahomet is the invention of his night journey to heaven. This he probably intended to supply the place of miracles. The absurdities contained in that relation, however, are so great, that when he related it to his uncle Al Abbas, and Omm Hana, the daughter of Abu Taleb, they endeavoured to dissuade him from making it public. This advice he was so far from following, that he related the whole to Abu Jahl, one of his most inveterate enemies, who ridiculed him for it, and placed the story in such a ridiculous light to the Koreish, that they were on the point of insulting him; several of his followers also left him; and the whole design had probably been ruined, had not Abu Becr vouched for his veracity, and declared, that, if Mahomet affirmed it to be true, he firmly believed the whole. This declaration not only retrieved the prophet's credit, but increased it to such a degree, that he was sure of making his disciples swallow whatever he pleased; and on this occasion it is said by some that he gave Abu Becr the name of the *faithful witness*, as we have already related.

38 almost proves the ruin of his cause.

In the twelfth year of Mahomet's mission, twelve men of Yathreb, or Medina, of whom ten were of the tribe of Kharaj, and two of that of Aws, came to Mecca, and took an oath of fidelity to the prophet at the hill Al Akabah. When they had solemnly engaged to do all required of them, Mahomet sent one of his disciples, named *Masab Ebn Omair*, home with them, to instruct them more fully in the grounds of their new religion. Masab being arrived at Medina, with the assistance of the new proselytes, gained several others; and acquainting Mahomet with the success of his mission, desired leave to form a congregation of Moslems at Medina. This the prophet readily granted; in consequence of which, the new Moslems regularly assembled, to the number of forty persons, in the house of Saad Ebn Khaithama. The next year Masab returned to Mecca, accompanied by 73 men and two women of Medina, who had professed Mahometanism, besides several others who were yet unbelievers. On their arrival they sent immediately to Mahomet, and offered

39 Congregation of Moslems formed at Medina.

Arabia.

offered him their assistance, of which he now stood in the greatest need; for his adversaries were by this time grown so powerful in Mecca, that he could not stay there much longer without imminent danger. He therefore accepted their proposal, and met them one night by appointment at the hill Al Akabah. At this interview he was attended by his uncle Al Abbas; who, though then an unbeliever, wished his nephew well, and made a speech to the people of Medina; wherein he told them, that as Mahomet was obliged to quit his native city and seek an asylum elsewhere, and as they had offered him their protection, they would do well not to deceive him; and if they were not firmly resolved to defend, and not to betray him, they had better declare their minds, and let him seek for protection somewhere else. Upon their protesting their sincerity, Mahomet swore to be faithful to them, a part of the Koran being read to all present, on condition they should protect him from all insults, as heartily as they would do their own wives and families. They then asked him what recompense they were to expect if they should happen to be killed in his quarrel: he answered, Paradise; upon which they pledged their faith to him, after Mahomet had chosen twelve out of their number, who were to have the same authority under him that the twelve apostles had under Christ.

Finding now a confederacy formed in his favour, our prophet began to pull off the mask as to his true sentiments concerning the means of reformation. Hitherto he had propagated his religion by fair means only; and in several passages of the Koran, which he pretended were revealed before this time, he declared, that his business was only to preach and admonish; that he had no authority to compel any person; and that whether they believed or not, was none of his concern, but belonged solely to God. But no sooner did he find himself enabled, by the alliance above mentioned, to resist his enemies, than he gave out that God had allowed him and his followers to defend themselves; and at length, as his forces increased, he pretended not only to have leave to act on the defensive, but to attack the infidels, destroy idolatry, and set up the true religion by the power of the sword. To this he was excited by an apprehension that pacific measures would greatly retard, if not entirely overthrow, his designs; and therefore he determined to use the most violent methods to convert the Pagan Arabs, or rather to extend his own authority.

40 The Koreish resolve to put Mahomet to death.

The Koreish, in the mean time, finding that Mahomet had considerably extended his influence, and hearing of the league concluded with the Ansars, began to think it absolutely necessary that he should be prevented from escaping to Medina; and, in order to do this the more effectually, they resolved in a council, wherein it is said the devil assisted in person, to put an end to his life. To accomplish this with the greater safety, they agreed that a man should be chosen out of every tribe, and that each should have a blow at him; that so the guilt of his death might fall equally on all the tribes; and thus the Hashemites would be prevented from attempting to revenge the death of their kinsman, as they were much inferior in power to the rest of the tribes put together. Mahomet now directed his companions to repair to Medina, where, in consequence of the late treaty, they might be assured of protection. This they accordingly did: but he himself, with Abu Becr and Ali, remained behind; not having received, as he pretended, the divine permission to retire. Here he narrowly watched the motions of the Koreish, and was soon apprised of their machinations: for the abovementioned conspiracy was scarcely formed, when by some means or other it came to Mahomet's knowledge; and he gave out that it was revealed to him by the angel Gabriel, who also commanded him to retire from Mecca. The conspirators were already assembled at the prophet's door; but he, to amuse them, ordered Ali to lie down in his place, and wrap himself in his green cloak: this Ali complied with, and Mahomet miraculously, according to the Arabs, escaped to the house of Abu Becr. The conspirators, in the mean time, perceiving through a crevice Ali wrapped up in the green cloak, took him for Mahomet himself, and watched there till morning, when Ali arose, and they found themselves deceived. The prophet next retired in company with Abu Becr to a cave in Mount Thur, a hill a little south of Mecca. Here he had a still more narrow escape; concerning which we have the following account from an Arabic tradition. "The Koreish having detached a party from Mecca to reconnoitre the mouth of the cave, when they came there, found it covered by a spider's web, and a nest built at the entrance by two pigeons, which they saw, and which had laid two eggs therein. On sight of this they reasoned with themselves in the following manner: 'If any person had lately entered this cavern, the eggs now before us would infallibly have been broken, and the spider's web demolished; there can therefore be nobody in it:' after which they immediately retired. As the prophet, therefore, and his friend, were now saved so miraculously by means of the pigeon's eggs and the interposition of the spider's web, he afterwards enjoined his followers, in memory of so remarkable an event, to look upon pigeons as a kind of sacred animals, and never to kill a spider."

Arabia.

41 He outwits them and escapes.

42 In great danger at Mount Thur.

43 He is pursued and overtaken, but still escapes.

The prophet and Abu Becr having staid in this cave three days in order to recover a little from their consternation, set out for Medina; but the Koreish, being informed of the route they had taken, sent a party after them, under the command of Soraka Ebn Malec. These overtook them; and, as the Arab historians tell us, Soraka's horse fell down when he attempted to seize Mahomet. Upon this he recommended himself to the prophet's prayers, and remounted his horse without hurt: but, as he still continued the pursuit, his horse fell down with him a second time; upon which he returned to Mecca, without offering any farther violence: and Mahomet, thus happily delivered from the greatest dangers, arrived without farther molestation at Medina, where he was received with the greatest demonstrations of joy. This flight of the prophet from Mecca to Medina was reckoned so remarkable by the Moslems, that they made it the era from whence all their remarkable transactions were dated, calling it the *Era of the Hegira*, or *flight*. The beginning of the Hegira corresponded with the 16th of July, A. D. 622.

44 Era of the Hegira.

On Mahomet's arrival at Mecca, his first care was to build a mosque for his religious worship, and a house for himself. The city of Medina at that time was inhabited

Arabia. habited partly by Jews and partly by heretical Christians, that formed two factions which persecuted one another with great violence. This gave the impostor such an opportunity of propagating his new religion, that in a short time the city was entirely at his devotion. Here he strengthened himself by marrying Ayesha the daughter of Abu Becr, though then only seven years of age, and gave his own daughter Fatima in marriage to Ali, the son of Abu Taleb. The next point he had in view was the union of the Mohajerin, or those who fled from Mecca on account of their religion, with the Ansars above mentioned. To facilitate this, after his mosque and house were finished, he established among the Moslems a fraternity, the principal statute of which was, that they should not only treat one another like brethren, but likewise most cordially love and mutually cherish one another to the utmost of their power. But lest even this should prove insufficient, he coupled the individuals of the two bodies of Ansars and Mohajerin; and this was the last transaction of the first year of the Hegira.

45 Union of the Ansars and Mohajerin.

The next year was ushered in according to Abulfeda, with a change of the *Kebla*, or place whither the Mahometans were to turn their faces in prayer. At first it had been declared to be perfectly indifferent where they turned their faces. Afterwards he directed them to pray with their faces towards the temple of Jerusalem, probably with a view to ingratiate himself with the Jews; and now, in order to gain the Pagan Arabs, he ordered his followers to pray with their faces towards the east. This inconstancy gave great offence, and occasioned the apostasy of many of his disciples. About this time Mahomet receiving advice that a rich caravan of the Koreish was on the road from Syria to Mecca, he detached his uncle Hamza, at the head of 30 horse, to seize upon it; who accordingly lay in wait for it in one of the woods of Yamana, through which it was to pass: here, however, he was informed that the caravan was guarded by 300 men, so that he returned without making any attempt; but the prophet made the proper dispositions for acting hereafter against the Koreish with success. This year also Mahomet sent out a party of 60 or 80 horse, all Mohajerin, except one who was an Ansar, to make reprisals on the Koreish. They were met by a party of their enemies, and both sides immediately prepared for an engagement: however, they parted without bloodshed, except one of the Koreish, who was killed by an arrow shot by one of the Moslems.

46 Mahomet takes a caravan, and gains the battle of Bedr.

Mahomet having now put himself into an offensive posture, began in earnest to make reprisals on the Koreish. His first exploit was the taking of a caravan attended by a small guard; and this being accomplished by a party consisting only of nine men, contributed greatly to encourage the Moslems. But what most established the impostor's affairs, and was indeed the true foundation of all his future greatness, was his gaining the battle of *Bedr;* of which we have the following account.—The prophet being informed that Abu-Sofian Ebn Harb escorted a caravan of the Koreish with only 30 or 40 men, resolved to advance at the head of a small detachment of his troops to intercept it. To this he was excited by the riches of the caravan, which consisted of a large quantity of merchandise, consisting of the riches of Syria, carried on the backs of a thousand camels. He therefore sent out a party to reconnoitre it, with orders to wait in some convenient place where they might remain undiscovered. But Abu Sofian having notice of Mahomet's motions, despatched a courier to Mecca, requesting succours from his countrymen, that he might be able to defend the caravan. Upon this Mahomet drew together all his force, which amounted to no more than 313, while his enemies consisted of very near 1000, Abu Sofian having been reinforced by the Meccans with 950 men. The two armies did not long remain in a state of reaction: but before the battle three champions from each party engaged each other in single combat. In this the Moslem champions were victorious, and the event greatly discouraged the Korcish. Mahomet, in the meantime, taking advantage of this lucky event, offered up his prayers to God with great fervency and vehemence; after which, feigning himself in a trance, he pretended that God had assured him of victory. Then throwing an handful of dust or gravel towards the enemy, he cried out, "May the faces of them be confounded;" and attacked the Koreish with such bravery, that they were soon put to flight, leaving 70 dead on the spot, and having as many taken prisoners. The loss on Mahomet's side was only 14 men, and among the prisoners was Al Abbas, the prophet's uncle.

Though this action may seem of little consequence in itself, it was of very great advantage to Mahomet's affairs at that time. He was immediately treated with the highest respect by the Najashi, or king of Ethiopia, who received a particular account of the victory soon after it was gained; while the superstitious Moslems did not fail to look upon it as an evident declaration of heaven in their favour. Nay, notwithstanding the small number of enemies to be overcome, and who were only mortal men, these ignorant bigots did not hesitate to own the assistance of no less than 4000 angels, who according to them, rode on black and white horses, having on their heads white and yellow sashes, that hung down between their shoulders.

Notwithstanding this disaster, however, Abu Sofian made a pretty good retreat, and conducted the greatest part of the caravan to Mecca. This chagrined the Moslems, though they found great spoil on the field of battle; the division of which had likely to have proved fatal to their cause, by the quarrels that it occasioned among them. So violent, indeed, were the disputes on this occasion, that the impostor was obliged to pretend an immediate revelation from heaven, empowering him to retain a fifth part for religious purposes, and to distribute the rest equally. This became a law for his successors; but, with regard to himself, the prophet often took the liberty of infringing it; for which, no doubt, a new revelation was always a ready and convenient salvo. As for those who were slain on Mahomet's part in this battle, they were all looked upon by the Moslems as martyrs; and the prophet perceiving among the prisoners two of his inveterate enemies, immediately caused their heads to be struck off.

47 His law concerning the division of spoils.

The Koreish, in order to be revenged on Mahomet for their late defeat at Bedr, sent Amru Ebn Al As, who afterwards conquered Egypt, with some other of their principal people, on an embassy to the king of Ethiopia,

Arabia. Ethiopia, in order to interest him in the quarrel. To do this the more effectually, they accused Mahomet and his followers of speaking disrespectfully of JESUS and his mother MARY; which accusation they hoped would likewise induce him to deliver up the Moslem refugees that were then at his court. But the bad success that had attended the arms of the Koreish hitherto, joined to the excuses made by the refugees, not only hindered the Najashi from delivering them up, but also prompted him to dismiss the ambassadors, and return the presents they had brought him. In the mean time, Abu Sofian, who had sworn never to use perfumes or enjoy women till he had another battle with Mahomet, set out from Mecca with a body of 200 horse. He advanced to a post within three miles of Medina; from whence he sent a detachment, who burnt a barn, together with a man in it that was winnowing wheat. Mahomet being informed of this outrage, moved immediately towards him with a detachment of cavalry; but Abu Sofian was so intimidated by his approach, that he fled with precipitation, leaving behind him all the sacks of flour or meal that had been brought for the subsistence of his troops. Instead therefore of coming to an engagement with the impostor, as he had sworn, he contented himself with alarming the country, and pillaging such as he suspected of favouring Mahometanism.—This year also Mahomet conquered the tribes called *Banu Solcim*, *Ghatfan*, and the *Banu Kainoka;* plundering likewise a rich caravan belonging to the Koreish, and acquiring from thence 25,000 dirhems for his own share of the plunder.

48 Abu Sofian's cowardice.

In the year of Christ 625, being the third of the Hegira, the Koreish assembled an army of 3000 men, among whom were 200 horse and 700 armed with coats of mail. The command of this army was given to Abu Sofian, who was attended with his wife Henda Bint Otba, and sat down at a village about six miles distant from Medina. Mahomet being much inferior to the enemy, resolved at first to keep himself within the town, and receive them there; but afterwards, by the advice of his companions, marched out against them at the head of 1000 according to some, 1050 according to others, or, as some say, only 900 men. Of these 200 were cuirassiers; but he had only one horse beside his own in the whole army. He distributed three standards among his troops; of which one was given to the tribe of Aws, another to that of Khazraj, and the third to the Mohajerin. The grand standard was carried before the prophet by Mosaab Ebn Omair. With these forces Mahomet formed a camp in a village near Ohod, a mountain about four miles north of Medina, which he contrived to have on his back: and the better to secure his men from being surrounded, he placed 50 archers, the flower of his troops in the rear, with strict orders not to quit their post. On the other hand, the army of the Koreish was drawn up in the form of a crescent, and made a very good appearance. The right wing was commanded by Khaled Ebn Al Walid, afterwards so terrible to the Greeks; the left by Acrema Ebn Abu Jahl; and the centre by Abu Sofian. The corps de reserve was headed by Abu Sofian's wife, accompanied by 15 other matrons, who performed the office of drummers,

49 Battle of Ohod.

lamenting the fate of their countrymen slain at Bedr, in order to animate the troops who attended them. The attack was begun by the Moslems, who fell upon the enemy with such fury, that their centre immediately began to give way. Ali, or, according to Abulfeda, Hamza, slew Arta the enemy's great standard-bearer; which struck them with such terror, that they soon betook themselves to flight, falling foul upon their own corps de reserve. Victory had now been no longer doubtful, notwithstanding the vast inferiority of Mahomet's troops, had not the 50 archers, contrary to the prophet's express command, quitted their post to pillage the enemy. Upon this Khaled, perceiving the Moslem army to be greatly exposed, attacked them in the rear with such bravery, that he turned the fortune of the day. Not content with putting the troops there in disorder, he cried out with all his might, "Mahomet is slain;" and this had such an effect upon the Moslems, that they immediately took to their heels, nor could the utmost endeavours of the prophet himself afterwards rally them. He therefore found himself obliged to quit the field of battle; in doing which he was very near losing his life, being struck down by a shower of stones, and wounded in the face by two arrows, which occasioned the loss of two of his fore-teeth. He likewise received a contusion on his upper lip; and had even been killed on the spot, had not one of his companions, named *Telha*, Abu Becr's nephew, received a blow that was levelled at him. On this occasion Telha received a wound in his hand, which deprived him ever after of the use of some of his fingers. Of the Moslems 70 were slain; among whom were Hamza, the prophet's uncle, and Mosaab, the standard-bearer. Amongst the wounded were Abu Becr, Omar, and Othman; but as soon as they understood that the prophet was safe, they returned to the charge with a considerable body, and after an obstinate dispute, carried him off. The good retreat made by these champions so discouraged the troops of Abu Sofian, that they did not pursue the flying enemy, but contented themselves with remaining masters of the field of battle; nor did that general, though he exulted not a little in his victory, make any further use of it than to give Mahomet a challenge to meet him the next year at Bedr, which was accepted; and after his return to Mecca, he desired a truce with the Moslems, which was readily granted.

Arabia.

50 Mahomet defeated.

51 He apologizes for defeat.

This defeat had like to have proved the total ruin of the impostor's affairs, and must have inevitably done so had the conquerors made the least use of their victory. Some of his followers now asserted, that had he been really a prophet sent from God, he could not have been thus defeated: and others were exasperated on account of the loss of their friends and relations who had been slain in the late engagement. To still the murmurs of the former, he laid the blame on the sins of those who had accompanied him; and, to pacify the latter, he pretended a revelation from heaven, wherein the period of all men's lives was said to be unalterably fixed, without regard to their own actions, or to any external objects: so that those who were killed in battle behoved to have died, though they had remained at home in their own houses. By the assistance of this last doctrine he encouraged his followers to fight, without

Arabia.

out fear, for the propagation of their faith, as all their caution would not be sufficient to avert their destiny, or prolong their lives even for a single moment.

The next year, (A. D. 626), Mahomet, besides several other less considerable successes, redueed a fortress belonging to the Jewish tribe of Al Nadir, who had revolted on account of the defeat at Ohod. On this occasion, by an express revelation as he pretended, he kept the whole booty to himself: and, about the same time, forbade his followers the use of wine, or to play at games of chance, on account of the disturbances and quarrels which were likely to be excited by that means among them. This year also he marched with a body of infantry to Bedr, to meet Abu Sofian, as he had promised the year before: but that general's heart failing him, he returned home without facing the prophet; and this piece of cowardice the Moslems did not fail to

52 Siege of Medina.

impute to a terror sent immediately from God. The year following, however, the Koreish, in conjunction with the tribe of Ghatfan, and the Jews of Al Nadir and Koreidha, assembled an army of 12,000 men, with which they formed the siege of Medina; thus threatening the impostor and all his followers with utter destruction at once. On the enemy's approach, Mahomet, by the advice of a Persian named *Salman*, ordered a deep ditch to be dug round the city, and went out to defend it with 3000 men. The Arabs having invested the town, both sides remained in a state of inactivity for some time; which was so well employed by the impostor, that he found means to corrupt some of the leading men in the enemy's camp. The good effects of this soon appeared; for a champion having advanced to the Moslem intrenchments, and challenged the best man in their army to fight him in single combat, the challenge was immediately accepted by Ali, who slew him and another that came to his assistance; after which, those who had been corrupted by Mahomet's agents so soured a considerable part of the forces, that

53 The siege raised.

they deserted their camp; upon which all the rest were obliged to raise the siege and return home.

The prophet, being now happily delivered from the most powerful combination that had ever been formed against him, was visited by the angel Gabriel; who asked him, whether he had suffered his men to lay down their arms, when the angels had not laid down theirs? ordering him at the same time to go immediately against the tribe of Koreidha, and assuring him that he himself would lead the way. Upon this Mahomet immediately set out for the fortress of the Koreidhites, and pushed on the siege with so much vigour, that, though it was deemed impregnable, he obliged the garrison to capitulate in 25 days. The Koreidhites, not daring to trust themselves to the impostor's mercy, surrendered at discretion to Saad Ebn Moadh, prince of the tribe of Aws, hoping that he, being one of their old friends and confederates, would have some regard for them. Here, however, they found themselves disappointed; for Saad, being highly provoked at them for assisting the Koreish while in league with Mahomet, ordered the men to be put to the sword, the women and children made slaves, and their goods divided

54 Khoreidhites massacred.

among the Moslems. This sentence was no sooner heard by Mahomet, than he cried out that Saad had pronounced the sentence of God; and, in consequence of this decision, ordered the men, to the number of 600 or 700, to be immediately massacred. The women and children were also carried into captivity. Their immoveable possessions were given to the Mohajerin, and the goods divided equally.

Arabia.

Mahomet now continued to be successful, gradnally reducing the Arab tribes one after another. In 628, he sent an agent to Constantinople, desiring leave of the Greek emperor to trade with his subjects; which was immediately granted. The same year also he concluded a peace for ten years with the inhabitants of Mecca, and obtained liberty the next year to perform his devotions at the Caaba. What tended considerably to bring about this pacification was an account brought to the Koreish by one whom they had sent with an actual defiance to Mahomet, of the prodigious veneration which his followers had for him. This messenger acquainted them that he had been at the courts both of the Roman emperors and of the kings of Persia, but never saw any prince so highly respected as Mahomet was by his companions. Whenever he made the ablution, in order to say his prayers, they ran and caught the water which he had used; whenever he spit, they licked it up, and gathered up every hair that fell from him, with great veneration. This intimated how desperately they would fight in his defence, and probably inclined his enemies to avoid hostilities. In 629, the impostor began to think of propagating his religion beyond the bounds of Arabia, and sent messengers to several neighbouring princes to invite them to embrace Mahometanism; but, before sending the letters, he caused a silver seal to be made, on which were engraved in three lines the following words, "MAHOMET THE APOSTLE OF GOD." This seal he believed would procure the letters to which it was affixed a more favourable reception at the courts of those princes whither they were directed. The first to whom he applied was Khosru Parvis the king of Persia; but he, finding that Mahomet had put his own name before his, tore the letter in pieces, and sent away the messenger very abruptly. He also sent a letter to the same purpose to Constantinople; but though the emperor Heraclius dismissed his messengers honourably, he refused to abandon the Christian faith. Besides these, he wrote five other letters, which he distributed among those who he thought would be most likely to acknowledge him for an apostle. However, we do not hear that by means of letters he ever introduced his religion into a foreign country.—

55 Prodigious veneration for Mahomet.

56 He invites foreign princes to embrace his religion.

But while our impostor was thus going on in the full career of success, and indnstriously propagating his infamous falsehoods by all the means he could think of, he was poisoned by a maid, who wanted, as she said, to make an experiment whether he was a prophet or not. This was done by communicating some poison to a shoulder of mutton, of which one of his companions, named *Bashar Ebn Al Bara*, eating heartily, died upon the spot; and Mahomet himself, though he recovered a little, and lived three years after, yet never enjoyed perfect health. Notwithstanding this misfortune, however, he still continued his enterprises. The year 630 proved remarkably fortunate. It was ushered in by the conversion of Khaled Ebn Al Walid, Amru Ebn Al As, and Othman Ebn Telha, three of the most considerable persons among the Koreish; and this soon enabled him to become master of the whole peninsula of Arabia. This year also the inhabitants of Mecca

57 Is poisoned, but recovers.

Arabia.

58 Meccans violate the treaty with Mahomet.

took it into their heads to violate the treaty concluded with Mahomet: for the tribe of Becr, who were the confederates of the Koreish, attacking those of Khozaab, who were in alliance with Mahomet, massacred 20 of them, and afterwards retired; being supported in this action by a party of the Koreish themselves.—The consequence of this violation was soon apprehended; and Abu Sofian himself made a journey to Medina, in order to heal the breach and renew the truce: but in vain; for Mahomet, glad of this opportunity, refused to see him. Upon this he applied to Abu Becr, Ali, Omar, and Fatima, to intercede for their countrymen with the prophet; but some of these giving him rough answers, and others none at all, he was obliged to return to Mecca as he came. Mahomet immediately gave orders for the necessary preparations, that he might surprise the Meccans, who were by no means in a condition to receive him; but Hateb Ebn Abu Baltaa, hitherto a faithful Moslem, attempted to give them notice of their danger by a letter; though without effect. His letter was intercepted: and he alleged in his excuse, that the only reason he had for his conduct was to induce the Koreish to treat his family with kindness. This excuse the prophet accepted, as he had greatly distinguished himself at the battle of Bedr, but strictly forbade any such practices for the future; which having done, he immediately made the necessary dispositions for setting forward.

Mahomet's army, on this occasion, was composed of Mohajerin, Ansars, and other Arabs, who had lately become proselytes. As they drew near to Mecca, he set up his standards, and advanced in order of battle to Mar Al Dharan, a place about four parasangs from Mecca, where the whole army encamped. Here he ordered 10,000 fires to be lighted, and committed the defence of the camp to Omar, who cut off all communication with the town, so that the Meccans could receive no certain advice of their approach. Among others that came from Mecca to reconnoitre the Moslem camp, Abu Sofian Ebn Harb, Hakim Ebn Hezam, and Bodail Ebn Warka, fell into Omar's hands; and being conducted to Mahomet, were obliged to embrace Mahometanism in order to save their lives.

The first rumour of this expedition had not a little terrified the Koreish, though they were not apprised that the prophet had resolved upon a war; but perceiving now, upon the report of Abu Sofian, who had been sent back to them, that the enemy was at their gates, they were thrown into the utmost consternation. Of this Mahomet being informed, he resolved to take advantage of the confusion that then reigned among them. He therefore first despatched Hakem and Bodail to the Meccans, inviting them to take an oath of allegiance to him, and become converts to his new religion; after which, he made the following disposition of his forces. Al Zobeir was ordered to advance with a detachment toward the town on the side of Mount Cada. Saad Ebn Obad, prince of the tribe Khazraj, marched by his order with another detachment towards the height of Coba, which commands the plain of Mecca. Ali commanded the left wing of the army, consisting of Ansars and Mohajerin. The prophet put into his hands the great standard of Mahometanism, with orders to post himself upon Mount Al Hajun, and to plant the standard there; strictly enjoining him, however, not to stir from thence till he himself arrived, and till a proper signal should be given him from Saad for that purpose. Khaled led the right wing, consisting of the Arabs lately converted, with which he was to possess himself of the plain of Mecca. Abu Obeidah commanded in the centre, which consisted entirely of infantry; the prophet himself remained in the rear, from whence he could most easily despatch his orders to all the generals as occasion should require. He expressly prohibited Khaled and all his other officers from acting offensively unless they were first attacked. Things being in this situation, the army upon a signal given put itself immediately in motion. The prophet mounted his camel with great alacrity, and was that day clothed in red. Al Zobeir pursued the route assigned him without opposition; nor did Saad discover the faintest traces of an enemy: Ali took possession of his post without the loss of a man; and in like manner Abu Obeidah seized on the suburbs. Khaled, however, in his march to the plain, was met by a large body of the Koreish and their confederates, whom he immediately attacked and defeated, putting 28 of them to the sword. Not content with this, he pursued them into the town, and massacred a great number of the inhabitants; which so terrified the rest, that some shut themselves up in their houses, while others fled different ways in order to avoid the fury of the merciless and impious tyrant, who was now become master of the city. Thus was Mecca reduced, with the loss only of two men on the side of the impostor.

Arabia.

59 Mecca taken.

Mahomet being now master of the city, made his public entry into it exactly at sunrising. When the first tumult was over, he went in procession round the Caaba seven times, touching the corner of the black stone with the staff in his hand, as often as he passed it, with great devotion. Then he entered the Caaba; where observing several idols in the form of angels, and the statues of Abraham and Ishmael with the arrows of divination in their hands, he caused them all to be destroyed. He also broke in pieces with his own hands a wooden pigeon, that had long been esteemed a deity by the idolatrous Koreish. Afterwards entering into the interior part of the Caaba, he repeated with a loud voice the form used at this day by the Mahometans, "Allah Akbar, God is great," &c. turning towards every part of the temple. Then he prayed between the two pillars there, with two inclinations, as well as without the Caaba; saying to those that attended him, "This is your Kebla, or the place towards which you are to turn your faces in prayer."

Having thus effectually subdued the Koreish, put an end to all commotions, and purged the Caaba of 360 idols, the prophet's next care was to ingratiate himself with the people. Sending therefore for some of the principal of them, he asked them what kind of treatment they expected from him, now he had conquered them? To this they replied, "None but what is favourable, O generous brother:" upon which he dismissed them, telling them they were from that moment a free people. After this, pretending a new revelation, he restored the keys of the Caaba to Othman Ebn Telha, who was in possession of them before; and who was now so much affected by this piece of justice, that he immediately became a proselyte. Next day the prophet declared Mecca an asylum, and publicly

Arabia.

gave out that he would maintain to the utmost of his power the inviolable security of the place. He then was solemnly inaugurated; after which he proscribed, according to some, six men and four women, according to others, eleven men and one woman: but of these only three men and one woman were put to death; the rest being pardoned on their embracing Mahometanism, and one woman making her escape. The remainder of this year was spent in various expeditions against different tribes of the Arabs, which were in general attended with success.

The 9th year of the Hegira, being that of Christ 631, is called by the Mahometans the year of *Embassies;* for the Arabs, who had hitherto been expecting the issue of the war between Mahomet and the Koreish, no sooner saw that tribe, which was the most considerable of the whole, submit to him, than they began to come in to him in great numbers, and to send embassies to make their submissions to him, both while at Mecca and after his return to Medina, whither he had returned soon after the taking of Mecca: and this good fortune continued without interruption to the year 632, when the famous impostor breathed his last, having just reduced under his subjection the whole peninsula of Arabia, and being ready to break into the neighbouring kingdoms in order to satisfy his ambition.

60 Mahomet dies.

61 Great confusion on his death.

The death of Mahomet occasioned such a consternation in Mecca, that the governor hid himself, fearing to be called to an account for his former conduct; and the inhabitants, upon the first arrival of this melancholy news, considered themselves as destitute of all manner of protection. After the first impressions of their fear, however, were over, they began to meditate a revolt; but were prevented by one Sohail Ebn Amru, a principal man of the Koreish. The tumults at Medina, however, were not so easily appeased. The news of this sad event were no sooner published there, than a number of people assembled before his door, crying out, "How can our apostle be dead! Our intercessor, our mediator has not entirely left us! He is taken up into heaven, as was Isa (Jesus); therefore he shall not be buried." This was confirmed by Omar; who drew his sword, and swore, that if any person affirmed Mahomet to be dead, he would cut off his hands and his feet. "The apostle of God (says he) is not dead: he is only gone for a season, as Moses the son of Amram was gone from the people of Israel for 40 days, and then returned to them again." The populace therefore kept the body above ground, even after the belly began to swell; nor could the prophet's uncle Al Abbas, notwithstanding this, convince them to the contrary. Upon hearing of these transactions, Abu Becr immediately posted from Al Sonah, another quarter of the city, and expostulated with them in the following manner: "Do you worship Mahomet, or the god of Mahomet? If the latter, he is immortal, and liveth for ever; but if the former, you are in a manifest error, for he is certainly dead." The truth of this assertion he immediately evinced from several passages of the Koran, in so clear and conclusive a manner, that he not only satisfied Omar, but calmed the minds of all the people.

The prophet having left no directions concerning a successor, very warm disputes arose between the Mohajerin and the Ansars about the right of electing a caliph. The former insisted on having that right, because they had attended Mahomet in his flight to Medina; and the others, because they had supported him when expelled from his native city, &c. In short, the disputes became so hot, that an open rupture must have commenced, had not they been terminated by a proposal that each party should choose a caliph. This amused them a little for the present; but not proving perfectly agreeable to the Mohajerin, Abu Becr proposed two persons, Omar and Abu Obeidah, offering to swear allegiance to him on whom the suffrages of both parties should fall. But this producing no decision, Omar swore fealty to Abu Becr, and his example was followed by all the Moslems on the spot; upon which he was acknowledged both by the Mohajerin and Ansars as the rightful successor of Mahomet.

Arabia.

62 Abu Becr succeeds him.

63 Ali dissatisfied.

These transactions, however, were not at all agreeable to Ali, who, as son-in-law to the prophet, had undoubtedly the best title to the succession. He expostulated with Abu Becr about the manner of his election, which had been effected without his knowledge; and received for answer, that the exigence of affairs would not admit of deliberation; and that, had not the election been so sudden, the opposite party would have wrested the power entirely out of their hands. Ali was in Fatima's apartment when Abu Becr had the good luck to be elected caliph; and, upon the arrival of the news, expressed great dissatisfaction. He found himself, however, soon obliged to change his note, when the new caliph sent Omar with orders to burn the house where he and his friends were assembled, in case he did not concur in supporting the election. But notwithstanding his forced compliance on this occasion, it is not to be doubted that he reckoned himself injured; and his pretensions were thought to be just by a great number of Moslems: which notion is entertained by a very considerable party of Mahometans even at this day; and these are called *Shiites* or *sectaries*.

Soon after Abu Becr's accession, many of the Arabs refused to pay the tribute imposed upon them by Mahomet, and even attempted to shake off his yoke altogether. This so alarmed the caliph and his subjects at Medina, that, fearing a general revolt, they sent all not able to bear arms into the cavities of the rocks and mountains, and put themselves in as good a posture of defence as the short time would permit. In the mean time Khaled was despatched with an army of 4500 men to reduce the rebels: and he soon coming up with them, gave them a total defeat, brought off a vast quantity of plunder, and made many of their children slaves. Nor was he content with this; for being sent by Abu Becr to Malek Ebn Noweirah, an eminent person among the Arabs, and famous for his skill in poetry as well as his horsemanship and bravery, to bring him over by fair means, he immediately ordered his head to be cut off. By this means, indeed, he extinguished all the remains of rebellion; but rendered himself exceedingly obnoxious to Abu Becr, who would have put him to death, had not Omar strongly interceded for him: for Khaled had greatly exceeded his commission, as Malek had returned to Mahometanism, and had offered to pay the money. This was not, however, the only piece of service Khaled performed at this time; he also defeated and killed Moseilama, who had set up for a prophet in the time of Mahomet, and even wanted to take the grand impostor himself into company with him. The same

64 Rebellions extinguished by Khaled.

Arabia.

same general likewise defeated and dispersed the troops of another prophet, called *Toleiah Ebn Khowailed*, obliging himself to remain concealed till after the death of Abu Becr. About the same time another body of rebels committed great disorders in the province of Bahrein. Against these Abu Becr despatched Al Ola at the head of a considerable army, who soon obliged them to return to Mahometanism; having put great numbers of them to the sword, and plundered their country in a dreadful manner.

65 War with the Greeks.

Abu Becr having now no enemy to contend with in Arabia, and being free from all apprehensions of a competitor, resolved next to turn his arms against the Greek emperor. Some skirmishes had happened, in the time of Mahomet, between the Moslems and Greeks; in one of which Zeid, a Moslem commander, had been killed. To revenge his death, his son Osama was on the point of making an irruption into Syria at the time of Mahomet's decease. This enterprise the caliph ordered him to go on with; and it was executed by Osama with great success. He entered Syria, and laid waste the country, doing the Greeks a good deal of damage: after which he returned to Arabia without any considerable loss.

66 Kingdom of Hira destroyed.

Soon after the caliph sent Khaled at the head of a powerful army to invade Irak, and put an end to the kingdom of Hira. In this undertaking he was attended with his usual success. The king Al Mondar Al Maghrur lost his life in defence of his dominions; and the kingdom was totally destroyed, after it had continued 622 years and eight months, as we have already hinted. The inhabitants became tributaries; and, according to Eutychius, the tribute collected on this occasion amounted to 70,000 pieces of money. This, according to Al Makin, was the first tribute money ever brought to Medina.

The exigence of the caliph's affairs in Syria, however, did not suffer Khaled long to remain in Irak. Before the departure of the army under his command, Abu Becr had come to a resolution to invade Syria; and finding his design approved by the principal officers of his court, he sent circular letters to the petty princes of Yaman, the chief men of Mecca, &c. informing them of his intention to take Syria out of the hands of the infidels; acquainting them, at the same time, that a war for the propagation of the true religion was an act of obedience to God. To these letters they paid a proper regard; and in a very short time appeared at Medina at the head of their respective troops, and pitched their tents round the city. Here they staid till the Moslem army destined to act against the emperor was completely formed, and in a capacity to begin its march. The caliph having viewed the troops from the top of a hill, and prayed to God for success, attended the generals a little way on foot. As the generals were on horseback, they could not forbear expressing their uneasiness at the caliph's thus demeaning himself; but he told them, that it signified little whether they walked on foot or rode, as they had all the same views, viz. the service of God, and the propagation of religion. At parting, he addressed Yezid Ebn Abu Sofian, whom he had invested with the supreme command, in the following manner: "Take care, Yezid Ebn Abu Sofian, to treat your men with tenderness and lenity. Consult with your officers on all pressing occasions, and encourage them to face the enemy with bravery and resolution. If you shall happen to be victorious, destroy neither old people, women, nor children. Cut down no palm trees, nor burn any fields of corn. Spare all fruit trees, and slay no cattle but such as you shall take for your own use. Adhere always inviolably to your engagements, and put none of the religious persons you shall meet with in monasteries to the sword. Offer no violence to the places they serve God in. As for those members of the synagogues of Satan *who shave their crowns*, cleave their skulls, and give them no quarter, except they embrace Islamism (Mahometanism), or pay tribute."

67 Abu Becr's directions to his general.

Arabia

The Greek emperor was greatly alarmed at the approach of the Moslem army; however, he made all necessary preparations for his defence, and sent out a detachment to reconnoitre the enemy. These having fallen in with the Arabs, a battle ensued, in which the Greeks were defeated with the loss of 1200, while the Arabs lost only 120 men. This was succeeded by a great many skirmishes, in which the Moslems were generally victorious. The rich spoil taken on these occasions were sent as a present to the caliph; who having acquainted the inhabitants of Mecca with his good success, they were thereby so elated, that they furnished him with a strong reinforcement, which was immediately ordered into Syria. The Greek emperor, in the mean time, having ordered another body of his troops to advance towards the frontiers, they found an opportunity of engaging the Moslem army under Abu Obeidah, a person of great piety, but little experience in war. Him they totally defeated; and Abu Becr was so much provoked at his defeat, that he deprived him of the command, which was given to Khaled, who was for this purpose recalled from Irak. That general's first exploit was the reduction of Bostra, a very rich and populous city of Syria Damascena; which, however, he accomplished by treachery rather than by force of arms. Having left a garrison of 400 men in Bostra, and being joined by Abu Obeidah's forces, he laid siege to Damascus with an army of 45,000 men. This so alarmed the emperor, that he despatched an army of 100,000 men, commanded by one Werdan, to the relief of that city. Khaled, on hearing of the approach of this formidable army, was for marching immediately with all his forces, and giving them battle; but this was opposed by Abu Obeidah, as it would enable the inhabitants of Damascus to procure fresh supplies both of arms and provisions, and consequently render the reduction of the place more difficult. It was, therefore, at last agreed that a body of troops should be detached under Derar Ebn Al Wazar, an excellent officer, and an implacable enemy to the Christians (as indeed were all the Moslem generals except Abu Obeidah), to fight the enemy, whilst the siege was carried on by the two generals.

68 The Moslems defeated.

69 Damascus besieged

Khaled, fearing lest Derar's furious zeal and hatred to the Christians should prove fatal to his troops, told him before his departure, that though they were commanded to fight for the propagation of their religion, yet they were not allowed to throw away the lives of their men; and therefore ordered him to retire to the main body of the army, in case he found himself pressed by a superior force. But Derar, deaf to this salutary admonition, with his small body of troops rushed upon

70 The Gr defeate with gr slaught

Arabia.

upon the whole Christian army, notwithstanding the vast disproportion of numbers. He charged them, however, with such bravery, that he penetrated to the spot where the general gave his orders, killed the standard-bearer, and carried off the standard itself, in which was a cross richly adorned with precious stones. Nay, he would in all probability have put Werdan's army to flight, had not the general's son, the commandant of Hems, arrived in the heat of the engagement, with a body of 10,000 men; with which he attacked the Moslems so briskly in the rear, that he forced them to retire, and took Derar himself prisoner. This so discouraged them, that they would have taken to their heels, had not Rafi Ebn Omeirah animated them with the following words: "What! do you not know, that whoever turns his back upon his enemies offends God and his prophet? and that the prophet declared the gates of paradise should be open to none but such as fought for religion? Come on! I will go before you. If your captain be dead, or taken prisoner, yet your God is alive, and sees what you do." This exhortation had such an effect upon his troops, that returning to the charge, they maintained their ground with unparalleled bravery, till Khaled arrived with a considerable body of infantry and 1000 horse. The arrival of this general soon turned the fortune of the day. A party of the imperial army went over to the Moslems, and the rest took to their heels. Derar also was retaken, and carried off in triumph. However, Werdan having collected the scattered remains of his forces, and received a reinforcement from the emperor, found his army still to amount to 70,000 men, with which he resolved to make another attempt for the relief of Damascus. They were attended with still worse success in this second attempt than they had been before; being utterly defeated, with the loss of 50,000 men, so that they were no more in a condition to attempt any thing; and, in consequence of this, the city was soon taken, notwithstanding the utmost efforts of the besieged.

71 The city taken.

72 Abu Beer dies, and is succeeded by Omar.

This disastrous event happened in the year 634; and the very day that Damascus was taken, Abu Beer died of a consumption in the 63d year of his age. He was succeeded by Omar, who was proclaimed caliph that very day; and the first title assigned him was, *The caliph of the caliph of the apostle of God.* But the Arabs considering, that by the additions to be continually made at the accession of every new caliph, the title would become too long, they with one voice saluted him, *Emperor of the believers;* which illustrious title descended afterwards to his successors by a kind of incontestable right.

The new caliph was no sooner settled than he replaced Abu Obeidah in the command of the army in Syria, being greatly displeased with the cruel and bloodthirsty disposition of Khaled. He also commanded Abu Obeidah to have an eye upon Palestine, and to invade it as soon as an opportunity offered. Khaled bore his disgrace with great magnanimity; and swore, that though he had always had the greatest regard for Abu Beer, and the utmost aversion to Omar, he would submit to God's will, and obey the new caliph as the lawful successor of Mahomet. The Moslem forces in the mean time having made all proper dispositions for improving the advantages they had gained, Abu Obeidah sent a detachment of 500 horse to a place called *Dair Abel Kodos*, about 30 miles from Damascus, to plunder the Christians there. In this place there lived a priest so eminent for his sanctity, that the neighbouring people of all ranks resorted to him for his blessing and instruction. When any person of distinction married, he took with him his new spouse, in order to receive this holy man's benediction. The fame of this priest's sanctity drew such numbers of people to that place every Easter, that a great fair was kept annually at his house, to which were brought vast quantities of the richest silk, plate, jewels, &c. When the Arabs drew near to this place, to which they were conducted by a Christian, they were informed that the governor of Tripoli had married his daughter to a person of distinction, who had carried his lady to the above-mentioned priest. She was attended by a guard of 5000 men; besides which, the Jews, Greeks, Copts, and Armenians, at that time assembled about the monastery, amounted to 10,000. Notwithstanding this, the Moslem commander determined to carry off the lady; and having told his men, that they should either enjoy the riches of the Christians, or the pleasures of paradise, he commanded them to fall on the enemy. The impetuosity of these enthusiasts at first bore all down before them; but the Christians, perceiving they were but a handful of men, surrounded them on all sides, and resolved to make them pay dear for their temerity. But Abu Obeidah, being informed of their dangerous situation, immediately despatched Khaled with a strong detachment to the relief of his distressed countrymen. The consequence of this was, that the Christians were entirely defeated, and the unhappy lady carried off, with 40 maids that waited upon her, as well as all the wealth brought to the above-mentioned fair; among which were many rich garments curiously wrought, and in particular one adorned with the effigies of our Saviour. All these were sold for ten times their weight of gold to some of the opulent Arabs of Yaman. The young lady was given to Abdallah, who kept her to the reign of Yezid. Of this advantage Abu Obeidah sent notice to the caliph by a letter, in which he also acquainted him that some of his men had drunk wine. These delinquents, by the advice of Ali, had each of them 80 stripes bestowed upon the soles of their feet: after which, many others, who had never been suspected of drinking this prohibited liquor, made a voluntary confession, and received the same chastisement.

73 Governor of Tripoli's daughter carried off.

74 Punishment of some soldiers who had drunk wine.

The Moslem general next set about reducing the principal fortresses in Syria, and soon became master of Kinnisrin, Baalbec, Adestan, Shaizar, and Hems; on the news of which, the Greek emperor Heraclius, resolving if possible to put a stop to the cruel and unprovoked ravages of these barbarians, sent against them an army of 240,000 men, commanded by one Manuel, whom the Arabs called *Mahan*. But this vast multitude was utterly defeated by Khaled; upon whom Abu Obeidah conferred the supreme command, on account of his superior skill in military affairs. This battle was fought near a village called *Yermouk;* and, according to the Arabian historians, the Christians had 150,000 men killed and 40,000 taken prisoners, while the Moslems lost no more than 4030 men.

75 The Greeks utterly defeated at Yermouk.

The defeat at Yermouk was immediately followed by

Arabia.

by the loss of the whole province of Palestine. The reduction of Jerusalem was one of its first consequences; and Omar, being apprised of the success of his arms, immediately set out to visit that holy place, at the request, it is said, of the inhabitants. The caliph was attended in his journey by a numerous retinue, most of whom afterwards returned home. He rode upon a red camel, and carried with him two sacks, one of which contained a sort of provision consisting of barley, rice, or wheat, sodden and unhusked, and the other fruits. Before him he had a leather bottle, very necessary in these desert countries to put water in; and behind him a wooden platter. Before he left the place where he had rested the preceding night, he constantly said the morning prayer; after which he addressed himself to his attendants in a devout strain, always uttering before them some pious ejaculations. Then he communicated his provision to them; every one of his fellow travellers eating with him out of the same platter, without the least distinction. His clothes were made of camels hair, and were in a very tattered condition; nor could any thing be more mean or sordid than the figure he made. On the road he distributed justice among his subjects; concerning which we have several anecdotes; but that most to his honour is the following: Having observed some poor tributaries exposed to the heat of the sun, a very cruel punishment in those hot countries, for not being able to pay the sum demanded of them, he ordered them to be released; telling his attendants, that he once heard the apostle of God say, "Do not afflict men in this world; for those who do so, God shall punish in hell fire at the day of judgment." His orders were immediately executed, to the great grief of the oppressors; and the caliph continued his route. On the confines of Syria he was met by Abu Obeidah attended by an escort, who conducted him to the Moslem camp, where he was received with the utmost demonstrations of joy; and from thence to Jerusalem. The morning after his arrival, he said prayers and preached to the troops. In his sermon he repeated the following passage out of the Koran. "Whomsoever God shall direct, he shall be rightly directed; and whomsoever he shall cause to err, thou shalt not find any to defend or to direct." Upon this a Christian rose up, and said aloud twice, "God causes no one to err." Omar made no answer to him, but commanded the Moslems near him to strike off the infidel's head if he repeated those words again; but the priest took care to give him no further interruption. After the conclusion of his sermon, he pitched his tent, made of hair, within sight of the city: then he signed the articles of capitulation; by which the inhabitants were entitled to the free exercise of their religion, the possession of their properties, and his protection.

76 Omar visits Jerusalem.

77 Anecdote of him.

The articles of capitulation being signed, Omar, in pursuance of his engagements, gave the inhabitants a schedule, by which they were secured in the full possession of all that had been agreed upon: after which the gates were opened to him, and he entered the town. He was waited upon by the patriarch Sophronius, with whom he conversed familiarly, and asked him many questions concerning the antiquities of the city. One of the first places they visited was the temple of the resurrection, in the midst of which Omar sat down; and when the hour of prayer was come, told the patriarch he had a mind to pray, and desired him to show him a place for that purpose. Sophronius told him he might do so where he was; but this he absolutely refused. Then the patriarch led him to St Constantine's church; but he likewise declined praying there. At last he said his prayers upon one of the steps of the east gate of the church; telling the patriarch afterwards, that had he prayed in any of the churches, the Moslems would infallibly have taken it from them, which, he said, they might attempt as it was, and therefore gave him a paper wherein the Moslems were commanded not to pray on the steps of St Constantine's church in any numbers, but only one by one. After this he desired the patriarch to show him a place where he might erect a mosque; and was conducted to the place where Jacob's stone lay, on which he slept when he saw the vision of the ladder. This stone had been hitherto slighted, and no building suffered to be erected upon it, in order to fulfil our Saviour's prophecy, that the habitation of the Jews should be left unto them desolate, and that not one stone should be left upon another. In consequence of this neglect it was entirely covered with dirt, which the caliph immediately began to carry away in his vest; and the Moslems soon hastening to assist him, the stone was cleared in a very short time. We are told by Theophanes, that when Omar entered the temple of the resurrection, he was clad in such mean and dirty apparel, that the patriarch took great offence at his appearance, and with much difficulty at last prevailed upon him to put on some clean linen and clothes till his own could be washed. The same author relates, that when the patriarch first saw Omar in that place, he could not forbear crying out, "This is of a truth the abomination of desolation, spoken of by Daniel the prophet, standing in the holy place!" These words, as Mr Ockley imagines, being overheard by the Moslems, they trumped up a story of the patriarch's having owned that the conquest of Jerusalem by Omar was foretold by the prophet Daniel; and that an ancient prophecy was kept in Jerusalem, concerning Omar, wherein his person was described, his name and religion specified, and he declared to be the only man that could reduce that city.

Before the caliph left Syria, he divided that country into two parts; one of which, that lay between Haûran or Aûran and Aleppo, which was not perfectly conquered, he committed to the care of Abu Obeidah, giving him the strictest orders to reduce it as soon as possible. Yezid Ebn Abu Sofian was commanded to take upon him the care of the other, which comprehended Palestine, and the sea coast, and to make himself absolute master of it, having a body of troops assigned him for that purpose. He also directed Amru Ebn Al As to invade Egypt, then in a very languishing condition, with a body of Moslem forces. After having made these dispositions for extending his conquests, Omar set out for Medina, where he arrived in perfect health, to the great joy of the inhabitants, who apprehended, from his long stay at Jerusalem, that he had intended to fix his residence there.

78 He returns to Medina.

Soon after Omar's departure, Yezid advanced to Cæsarea; but found the place so strong that he was obliged to continue some time in a state of inaction.

Abu

Arabia. Abu Obeidah, in the mean time, advanced towards Aleppo, the citadel of which was at that time the strongest in Syria. The citizens were struck with the utmost consternation at his approach. They had at that time two governors, who were brothers, and resided in the castle, which was situated at a little distance from the city. The names of these two governors, who were of very different dispositions, were Youkinna and John. Their father, by the emperor Heraclius's appointment, presided over all that tract which lay betwixt Aleppo and the Euphrates; and, after his death, the chief management of affairs devolved upon Youkinna, his brother John spending his time mostly in devotion and acts of charity. He would therefore gladly have prevailed upon Youkinna to purchase a peace from the Arabs with money, rather than make his country a scene of blood and ravages; but this not suiting the martial genius of Youkinna, he armed a considerable number of the citizens, among whom were several Christian Arabs, and distributed money among them. He then told his men that he intended to act offensively against the Arabs, and even to engage them if possible before they drew too near. To inspire them with the greater resolution, he observed, that the Moslem army was divided into several bodies; one of which had orders to besiege Cæsarea, another to march to Damascus, and the third to invade Egypt. Having thus animated his troops, he put himself at the head of 12,000 of them, and marched forwards to get intelligence of the enemy's motions.

79 A Moslem detachment defeated by Youkinna. Abu Obeidah, in the mean time, had sent before him Caab Ebn Damarah, with 1000 men: giving him express orders not to fight till he had received information of the enemy. Youkinna's spies discovered Caab and his men resting themselves and watering their horses without the least apprehension of danger; of which the general being apprised, he posted one part of his troops in ambuscade, and with the other attacked the Moslems. The Arabs behaved with their usual valour; and at first repulsed the Christians, notwithstanding their superiority in numbers; but being attacked by the troops that lay in ambush, they were at last forced to retire; having 170 killed, and almost all the rest wounded.

80 Aleppo submits to Abu Obeidah. After Youkinna's departure, the inhabitants of Aleppo, considering the calamities that awaited them if their city should be taken by storm, submitted without delay to Abu Obeidah, and were taken under the protection of the caliph. This disagreeable news being communicated to Youkinna, he posted home with all possible expedition, lest an attempt should be made on the castle in his absence. On his arrival at Aleppo, he was so highly incensed against the inhabitants,

81 Cruelty of Youkinna. that he threatened them with death if they did not disannul the treaty with the Arabs, and deliver up the authors of it into his hands. This demand not being immediately complied with, he fell upon the citizens with great fury, and killed 300 of them; among whom was his brother John, whose head he caused to be struck off, charging him with being the author and abettor of the late pernicious scheme. He would have made a much greater slaughter, had not the Moslem army at that instant arrived before the town; upon which Youkinna retired into the castle with a considerable body of troops; but before this could be effected, he was obliged to sustain an attack from the Arabs, Arabia. in which he lost 3000 men. The action was no sooner ended than the inhabitants of Aleppo brought out forty of Youkinna's men, and as a proof of their fidelity delivered them into Abu Obeidah's hands. Of these seven embraced Mahometanism, and the rest were beheaded.

82 He is besieged in the citadel. Immediately after Youkinna had shut himself up in the castle, a council of war was held in the Moslem camp, wherein it was deliberated what measures were to be pursued on the present occasion. Khaled gave it as his opinion, that the castle ought immediately to be attacked with all the Arab forces, before the emperor had time to send them any assistance. This advice was followed by Abu Obeidah, who caused the citadel to be immediately invested; and soon after he had surrounded it with all his forces, made a most vigorous assault. The besieged defended themselves with great bravery, and after a very warm dispute drove the enemy into their camp; and as they threw a great many stones out of their military engines, many of the Moslems were killed, and a much greater number wounded. This encouraged Youkinna to make a sally with a strong party of the garrison the following night. The fires being then out in the Moslem camp, and the besiegers not expecting such an unseasonable visit, 60 of them were killed on the spot, and 50 taken prisoners. Youkinna, however, being briskly attacked by Khaled, who soon drew together a body of troops to oppose him, lost about 100 men in his retreat. The next day, he caused the prisoners to be beheaded in sight of the Moslem camp; and receiving advice that a strong party of Arabian cavalry was sent out to forage, he ordered a body of his horse to drive them to their camp; which they accordingly did, killed 130 of them, seized all their camels, horses, &c. and then retired to the mountains. Here they proposed to remain concealed till the following night, and then return to the castle; but Abu Obeidah, being informed of what had happened, detached Khaled and Derar with a body of troops to pursue the Greeks, and revenge the late affront. Khaled, being informed of the route the Christians had taken, possessed himself of the only pass by which they could return to the castle; and having posted there a body of his men whose courage he could depend upon, took 300 of the Greeks prisoners as they attempted to return, and put all the rest to the sword. The next morning, to retaliate Youkinna's cruelty, the prisoners were all brought out and beheaded in sight of the garrison.

83 His vigorous defence. Notwithstanding this disaster, Youkinna made several sallies with good success, wherein he killed a great number of the enemy, and harassed them to such a degree, that Abu Obeidah found himself obliged, for his greater security, to remove his camp to about a mile's distance from the castle; by which manœuvre he likewise hoped that Youkinna would be less upon his guard. Herein, however, he found himself mistaken: for the Greek commander, by the prudent measures he took, eluded all surprise: and though Abu Obeidah continued the siege for four months after the last mentioned blow given to the garrison by Khaled, yet he had scarce any hopes of making himself master of it at last. Having nothing material to write to the caliph, he remained a long time silent; at which

Arabia. Omar being very much concerned, wrote to him, desiring an account of the affairs in Syria. Abu Obeidah acquainted him that the city of Aleppo had submitted to him; and that the citadel was the only place which held out in all that country, before which he had lost a great number of men, which, he said, had induced him to think of raising the siege, and moving with his army in that tract which lay between Antioch and Aleppo. This news was by no means agreeable to the caliph, who commanded his general to continue the siege at all events, and sent him a reinforcement of Arab troops, together with 70 camels, to assist the infantry in their march.

84 The citadel taken by stratagem. Among the troops sent by Omar in this occasion, there was an Arab of a gigantic size, called *Dames*, who was a man of great courage and resolution. He observing the little progress made by the Moslems, bethought himself of a stratagem by which that fortress might be reduced, which seemed so difficult to be accomplished by force. He therefore desired that Abu Obeidah would assign him the command of a party consisting only of thirty men; which at Khaled's request was readily granted. Then he begged the general to raise the siege, and retire to about three miles distance from the castle, which was likewise immediately complied with. The following night Dames, who had posted himself with his party very near the citadel, found means to seize a Greek, from whom he learned that Youkinna, after the siege was raised, had exacted large sums of money from the citizens, on account of the treaty they had concluded with the Arabs; and that he was one of those who had endeavoured to make their escape from the oppression of such a tyrant, by leaping down from the wall. This man Dames took under his protection; but beheaded five or six others who fell into his hands, and could give no good account of themselves. He then covered his head and shoulders with a goat's skin, and took a dry crust in his hand, creeping on the ground till he got close to the foot of the wall. If he heard any noise, or suspected any person to be near, he made such a noise with his crust as a dog does when he is gnawing a bone; his companions sometimes walking, and sometimes creeping after him in the same manner. He had before despatched two of his men to Abu Obeidah, to desire that a detachment of horse should be sent him by break of day to support his small party, and facilitate the execution of the plan he had formed. At last Dames found an opportunity of raising seven men upon his shoulders, who stood upon one another's shoulders in such a manner that the highest reached the top of the wall. Here he soon placed himself, seized a watchman whom he found asleep, and threw him over the wall. Two others, whom he found in the same condition, he stabbed with his dagger, and threw them over likewise. Then he let down his turban, and drew up the second of his brethren, as they two did the third, and by their help Dames himself and all the rest were enabled to mount the wall. He then privately stabbed the sentry at each of the gates, and put his men in possession of every one of them. The soldiers of the garrison, however, were at last alarmed, and surrounded the Arabs, who were on the point of perishing, when Khaled appeared at the head of a detachment of cavalry. On the sight of that general, who was now grown terrible to the Christians, the besieged threw down their arms, and surrendered at discretion. Youkinna and some of the principal officers turned Mahometans, in order to save their possessions; and the castle, being taken by storm, was pillaged by the Moslems. Dames acquired great glory by this exploit; and, out of complaisance to him, the army did not decamp from Aleppo till he and his men were perfectly cured of their wounds.

Arabia. 85 Youkinna's apostasy.

After the reduction of the citadel of Aleppo, Abu Obeidah intended to march to Antioch; but was diverted by Youkinna, who was now become a violent enemy to the Christians. He told the Moslem general, that his conquest of that part of the country would not be complete without the reduction of Azaz, a place of great importance, where Theodorus, Youkinna's cousin-german, was commandant. This fortress he proposed to become master of, by putting himself at the head of 100 Arab horse, dressed in the Greek habit, who were to attend him to Azaz. Upon his arrival there, he was to assure Theodorus that he was still in reality a Christian, and had taken that opportunity to escape from the Moslem camp. But to make his story more probable, Abu Obeidah was to send after him a detachment of 1000 horse, who were to pursue him as far as Morah, a village in the neighbourhood of Azaz, with orders to post themselves there; from whence, if such a measure should be found necessary, they might easily advance to Azaz, to facilitate the conquest of that place. To this scheme Abu Obeidah agreed; but Youkinna with all his men were immediately taken prisoners by Theodorus, who had been informed of the whole affair by a spy in the Moslem camp, who had sent him a letter by a pigeon. The fortress, however, was soon reduced, and Youkinna regained his liberty; but was soon after taken prisoner a second time, and brought before his old master Heraclius, who then resided at Antioch. He told the emperor, that he had only pretended to embrace Mahometanism, in order to be able to do his imperial majesty the more essential service; and so far gained upon him, that he was soon after appointed governor of that city; the consequence of which was, that the Arabs were put in possession of it by his treachery.

86 He is taken prisoner and brought before Heraclius.

87 Attempts assassination of Omar miscarries.

The emperor being quite disheartened at his continual bad success, it was suggested to him by the king of Ghassan, who had fled to him for refuge, as we have already observed, that, however desperate his affairs might be, they would be perfectly restored by the assassination of the caliph. This piece of service he undertook to perform for the emperor; and despatched one Wathek Ebn Mosafer, an Arab of his tribe, and a resolute young man, to Medina for that purpose. Wathek, some time after his arrival there, having observed the caliph to fall asleep under a tree, on which he had placed himself so as not to be observed by any one, drew his dagger, and was upon the point of stabbing him; but, as the Arab writers tell us, he was deterred by a lion, who walked round the caliph, and licked his feet till he awoke, after which he instantly went away. This struck Wathek with a profound reverence for Omar; he came down from his tree where he had been confined by the lion, confessed his design, and embraced the Mahometan religion.

88 The Greek sent defeated

Soon after the reduction of Antioch, Abu Obeidah

Arabia.

sent an account of his success to Omar; and receiving an order to invade the mountainous parts of Syria, he asked his general officers which of them would command the body of troops destined for this purpose. One Meisarah Ebn Mesrouk having offered his service, the general gave him a black standard, with the following inscription upon it in white letters: "There is but one God; Mahomet is the Apostle of God." The body assigned him for this purpose consisted of 300 Arabs, and 1000 black slaves commanded by Dames. Meisarah, at the head of his troops, with some difficulty ascended the mountains, and, with much more, advanced to that part where the emperor's forces were posted. The cold was so intense on the summits of those mountains, that the Arabs, who had been accustomed to a warm climate, could hardly bear it. For some time they could not meet with a single person to give them intelligence of the enemy's motions; but at last they took a Greek prisoner, who informed them, that the imperial army, which consisted of 30,000 men, lay encamped on a spot not three leagues distant. The prisoner refusing to profess Mahometanism, they cut off his head, and then marched towards the imperial camp. The Greeks, hearing of their approach, advanced to meet them; and the Moslems being surrounded on all sides, were on the point of being all cut off, when Khaled appeared at the head of 3000 horse, and after him Ayab Ebn Ganem with 2000 more. At the approach of the horse under the command of the terrible Khaled, the Greeks retired, leaving all their tents, together with their rich furniture and effects, to the Arabs. In this engagement, one of Omar's chief favourites, named *Abdalla Ebn Hodasa*, was taken prisoner, and sent directly to Constantinople. The caliph was so much concerned at this, that he sent a letter to Heraclius, desiring his release; which the emperor not only complied with, but made him many valuable presents, sending at the same time a jewel of immense value as a present to the caliph. This Omar offered to the jewellers of Medina, but they were ignorant of its value: the Moslems therefore begged him to keep it for his own use; but this he said he could not be answerable for to the public. It was therefore sold, and the money deposited in the public treasury.

89 Omar's disinterestedness.

About this time also Khaled advanced with a body of troops as far as the Euphrates, and took Manbij, Beraa, Balos or Balis; exacting of the inhabitants 100,000 dinars for their present security, and imposing on them an annual tribute for the future. He also made himself master of Raaban, Dulouc, Korus, the Cyrus or Cyrrhus of the ancients, and several other fortified towns, nothing being now able to stand before him. Amru Ebn Al As now likewise prepared for the reducing some places in Palestine that still held out. While he remained in this province, he had a conference with Constantine the emperor's son, who endeavoured to persuade him to make peace with the Christians; but this he not agreeing to, unless they would consent to pay tribute, all hopes of an accommodation vanished, and the generals on both sides prepared to enter upon action. In the mean time an officer came from the Christian camp, dressed in very rich apparel, who challenged the stoutest man among the Moslems to fight him in single combat. The challenge was accepted by a young Arab officer of Yaman; who being animated by a notion, derived from the prophet himself, that "the spirits of the martyrs rest in the crops of green birds, that eat of the fruits and drink of the rivers of paradise," discovered an uncommon eagerness to encounter his enemy. But the Christian officer not only killed this youth, but two or three more of the Moslems who came to his assistance. He was then attacked by Serjabil Ebn Hosanah, one of the generals, but a man so weakened by fasting, that he could scarce stand before him, and would therefore have been undoubtedly killed, had not a Greek horseman very opportunely interposed, and with one blow of his scimitar cut off the Christian's head. Serjabil, greatly surprised at this deliverance, asked the horseman who he was, and from whence he came; to which he replied in the following terms: "I am the unfortunate Toleiha Ebn Khowaid, who set up for a prophet, and, lying against God, pretended to inspiration." In consequence of having saved his life, Serjabil introduced him to Amru; and writing a letter to Omar, wherein he acquainted him with the signal proof Toleiha had given of his repentance, he obtained his pardon from the caliph.

Arabia.

90 Account of Toleiha the false prophet.

Though the two armies did not come to a general engagement, yet they had frequent skirmishes, in which the Arabs always got the better, and in some the Greeks suffered very considerably. This, together with the severity of the season, which was then uncommonly cold, so dejected the soldiery, that they began to desert in great numbers. Constantine, therefore, finding his troops to diminish daily, and the Arabs to grow stronger and stronger, took the advantage of a tempestuous night to escape to Cæsarea, which Yezid had not been able to take, leaving his camp to be plundered by the enemy. This city was soon after invested by Amru; and at the same time, Youkinna having made himself master of Tripoli by treachery, seized 50 ships from Cyprus and Crete, which carried a supply of arms and provisions for the emperor's troops, and had entered the port without knowing that the Arabs were masters of the town. With these ships he undertook an expedition against Tyre; and telling the inhabitants that he brought a supply of arms and provisions for Constantine's army, he was admitted into the town, and received with great kindness. Here, however, he had not been long before he was discovered by one of his own soldiers, and put under arrest, with 900 of his men. He was, however, set at liberty by those to whose care he was committed; and then opened the gates of the town to Yezid, by whom it had been invested. Constantine having got intelligence at Cæsarea of the loss of Tripoli and Tyre, was so disheartened, that he set sail from that city with all his family and the greatest part of his wealth; and the citizens then thought proper to make the best terms they could with Amru. The surrender of this city was followed by that of all the other cities and fortresses in the province; and thus the Arabs drove the Greeks out of the whole country of Syria extending from the Mediterranean to the Euphrates. This conquest was completed in the 18th year of the Hegira, six years after it had been undertaken.

91 Youkinna taken prisoner.

92 Tyre and Cæsarea reduced.

This year there happened such violent storms of hail in the peninsula of the Arabs, that a considerable extent of territory was laid waste by them, and a great num-

93 Violent storms, plague, &c.

Arabia. ber of animals of various kinds destroyed. An epidemical distemper likewise raged at Medina, which spread itself all over the neighbouring territory, and swept away great numbers of people. Syria was also visited by a dreadful plague; so that the Moslems lost there 25,000 men, among whom were Abu Obeidah himself, Yezid Ebn Abu Sofian, and many other persons of distinction. In short, so great was the mortality occasioned by the plague, both in Arabia and Syria, that the Arabs style the 18th year of the Hegira the *year of destruction*.

94 Egypt reduced; Amru Ebn Al As, having now executed the caliph's orders in Syria, set out on his expedition against Egypt. His first attempt was on Tarma, a town situated on the isthmus of Suez. This he reduced after a month's siege; and having narrowly viewed its situation, he formed a design of cutting through the isthmus, and thus joining the Mediterranean and Red sea: but this project was not well relished by the caliph, who apprehended that it would facilitate the entrance of the Christians into the peninsula of Arabia. From Tarma he marched to Mesr, the Memphis of the ancient geographers; which, after a siege of seven months, was delivered up to him by the treachery of Al Mokawkas the governor. From Mesr he continued his march towards Alexandria, and having defeated the emperor's army, closely invested that city. While his army lay before this capital, Amru himself had the misfortune to be taken prisoner and carried into the town. Being brought before the governor, he asked him why he committed such ravages and depredations in the Christian territories? To this Amru resolutely answered, "We are come hither to oblige you either to profess Mahometanism, or pay an annual tribute to the caliph; to one of which conditions you must submit, or be all of you put to the sword." A Greek who stood by hearing this, told the governor that Amru was certainly the Moslem general, and therefore desired him to cut off his head. Upon this Werdan, one of Amru's slaves, perceiving the extreme danger his master was in, gave him a box on the ear, exclaiming against his impudence for talking in such a manner. The governor being imposed upon by this shallow artifice, not only saved his life, but to show his generosity, dismissed him without ransom. This was soon followed by the loss of Alexandria, and that by the conquest of the whole kingdom: after which, Amru despatched Okba Ebn Nara with a body of troops to penetrate farther

95 together with Barca and Tripoli. into Africa; and that general made himself master of all the country lying between Barca and Zoweilah, reducing under his dominion also that part of the continent which now forms the piratical kingdom of Tripoli in Barbary.

Soon after the Moslems had made themselves masters of Alexandria, a grievous famine raged in Arabia, particularly at Medina, then the residence of the caliph. This obliged Omar to write to Amru to send him a supply of corn, with which Egypt at that time abounded. In compliance with this order, Amru sent a train of camels laden with corn, in a continued line from Egypt to Medina; the first of which were entering Medina when the last were leaving Alexandria. But this method of conveying corn proving too tedious and expensive, he ordered him to clear the Amnis Trajanus of Ptolemy, now the Khalis, which runs from one end of Cairo to the other, of the sand and gravel with which it was choked. This he accordingly did, and by that means rendered the communication between Egypt and Arabia much more easy than it had formerly been. Arabia.

96 The Persians defeated. While the Arabs thus extended their conquests in the west, they were no less successful in the east. We have already taken notice of Khaled's having been sent into Irak to reduce the kingdom of Hira, and of his being recalled to assist in the conquest of Syria. As the kings of Hira were under the protection of the Persian monarchs, the destruction of that kingdom necessarily brought on a war with the Persians. After the departure of Khaled, the command of the forces was left with Abu Obeid Ebn Masud, together with Al Mothanna Ebn Haretha, Amru Ebn Hasem, and Salit Ebn Kis. Abu Obeid having passed a river contrary to the advice of the other generals, was killed, and his troops in great danger; however, Al Mothanna made an excellent retreat, and repassed the river without any considerable loss. After this he fortified himself in his camp till he received a considerable reinforcement from the caliph; when the Moslem army marched to Dir Hind, and thence continued to make frequent excursions, ravaging that part of Irak that lay next to the Euphrates. A body of 12,000 chosen horse was now despatched against those invaders, under the command of one Mahran. At first the Persians had the advantage, and obliged the Arabs to retire; but they were soon brought back by Al Mothanna, and the battle lasted from noon till sunset. At last Al Mothanna, engaging Mahran in single combat, laid him dead at his feet; upon which the Persians fled to Al Madayen, a town situated on the Tigris, about a day's journey from Bagdad. After this a powerful army was despatched by the Persians under the command of one Rustam: but he also was killed, and his troops were entirely dispersed. At the same time, Abu Musa, another Moslem general, defeated a formidable body of troops under the command of Al Harzaman, a noble Persian, at Ahwaz.

Not content with those victories, soon after the reduction of Damascus, the caliph despatched Saad Ebn Abu Wakkas, to dislodge the Persians from some districts they possessed in the neighbourhood of the Euphrates. Saad having drawn together a body of 12,000 men, advanced to Kadesia, a city bordering upon the deserts of Irak; where, having utterly defeated an army of 120,000 Persians, he made himself master of the opulent city of Al Madayen, and possessed himself of Yezdejerd's treasury, which was so rich, if we may believe the Arabian writers, that Saad took out of it three thousand millions of dinars, amounting to two thousand and twenty-five millions of pounds sterling; an enormous and almost incredible sum. From thence Saad went to that part of the palace where the king's plate was deposited, which he carried off, as well as an immense quantity of camphire with which another part of the palace was entirely filled. This last the Arabs seemed to have carried off merely for the sake of plundering, as they were so much unacquainted with the nature of it, that they mixed it with their bread, which gave it a bitter and disagreeable taste. Afterwards the Arab general carried off the crown and royal garments, adorned with gold and jewels of inestimable value. He also plundered his armoury, which was well stored

97 Incredible treasure taken from them.

with

Arabia. with all sorts of weapons; after which he caused the roof of his porch to be opened, where he found another treasure, equal in value to ten millions of crowns. He also found among the furniture of the palace a piece of silk tapestry, 60 cubits square, which was adorned with a great variety of beautiful flowers, herbs, and plants, formed of gold, silver, and jewels, the most valuable that could be procured. This being brought to Omar, he cut it in pieces, and distributed it among the Moslems: and that part which fell to Ali's share, and which was yet none of the best, he sold for 20,000 crowns.

98 Mesopotamia reduced. In the 20th or 21st year of the Hegira, the Arabs, still unsated with conquest, invaded Mesopotamia under Aiyad Ebn Ganem, where the city of Edessa submitted on the first summons. From Edessa he marched to Constantia, or Constantina, supposed to be the Nicephorium of the ancients. This he took by storm, as likewise Daras, where he massacred all the people he found in the place; and these repeated successes so terrified the rest of the fortified towns, that they all submitted without resistance. At the same time Al Mogheirah Ebn Shaabah, one of the caliph's commanders, made himself master of Shiz, a place famous for the birth of Zerdusht the Persian philosopher, and overran the whole province of Aderbijan. He also possessed himself of all the country of Armenia bordering on Mount Taurus; nay, he in a manner obliged the whole region to own the authority of the caliph, and penetrated into Cappadocia. The same year also Saad made himself master of Ahwas, the capital of Khuzestan (the ancient Susiana); in consequence of which he became master of the greatest part, if not the whole, of that province; at the same time that Al Nooman conquered the greatest part of Khorasan. But while Omar's troops were thus irresistibly overrunning the finest countries in the known world, a period was put to his conquests and his life by a Persian named *Abu Lulua*, who stabbed him thrice in the belly while he was performing his devotions at Medina. The reason of this was, because the caliph refused to remit him some part of the tribute which, according to the Mahometan custom, he was obliged to pay for the free exercise of his religion. The Arabs, perceiving that he had killed their sovereign, immediately rushed upon him; but the assassin defended himself so desperately, that he killed seven of them and wounded thirteen: but at last one of the caliph's attendants threw his vest over him, and seized him; upon which he stabbed himself, and soon after expired.

99 Omar murdered.

Omar having languished three days after the wounds given him by the Persian, expired in the 10th, 11th, or 12th year of his reign, and after his death Othman Ebn Assan was chosen; though Ali had a better title, and seems indisputably to have been the most virtuous, if not the only virtuous person, as well as the bravest warrior, among them. He was inaugurated in the 24th year of the Hegira, nearly coincident with the year of our Lord 645.

100 Succeeded by Othman.

Othman was no sooner settled on the throne, than he commanded Al Mogheirah to complete the conquest of the territory of Hamadan; which he easily accomplished, and at the same time reduced Bira, a strong castle in Mesopotamia, which either had never submitted, or had revolted on the departure of the Moslem troops out of that province. Another army, under Abdallah Ebn Amar, was also despatched into Persia to deprive Yezdejerd of the poor remains of his dominions; and this was done so effectually, that the unhappy monarch was obliged to fly to Sijestan and abandon Persia altogether. Arabia.

In the 27th year of the Hegira, the island of Cyprus was reduced by Moawiyah; who soon after conquered the island of Aradus, and took Ancyra; after which he reduced the island of Rhodes, broke in pieces the famous Colossus, and sold the metal of it to a Jew of Edessa. In the mean time another of the Arab commanders entered Isauria, where he committed dreadful depredations, plundering many towns and villages, putting a great number of people to the sword, and carrying off 5000 prisoners. In the 31st year of the Hegira, one Habib having made an irruption into that part of Armenia, which was still unconquered, defeated a body of the emperor's troops, pursuing them as far as Mount Caucasus, and laying waste all the neighbouring territory. About the same time also, Abul Abar, who had been constituted admiral by Moawiyah, gave the emperor Constans a signal defeat by sea, on the coast of Lycia, in which such a number of Christians were killed, that the neighbouring sea was dyed with their blood.

101 Colossus of Rhodes destroyed.

102 Insurrections against the caliph.

But while Othman was thus carrying every thing irresistibly before him abroad, he neglected to secure the affections of his subjects at home, which soon proved his ruin. Sedition was industriously propagated through all the provinces of the empire, and articles of accusation brought against the caliph. The chief of these were, That he had recalled one who had been banished by the prophet; that he had removed Saad, an officer of distinguished bravery, and supplied his place by one who drank wine, and was otherwise of a scandalous life; that he had squandered away vast sums among his favourites; that he had removed Amru from the government of Egypt, to which he had preferred his own foster brother; and, lastly, that he had presumed to sit on the top of Mahomet's pulpit, whereas Abu Becr had always sat on the highest step and Omar on the lowest. To this formidable accusation the poor caliph pleaded guilty, and promised to make all the reparation in his power; but his condescension only served to increase the insolence of the rebels. They were however appeased by Ali; and public tranquillity had undoubtedly been restored, had it not been for Ayesha, one of Mahomet's widows, who procured the destruction of the caliph by a scheme truly worthy of the wife of such a husband. That traitress, being desirous of raising one of her favourites named Telha to the dignity of caliph, prevailed on Merwan the secretary of state to write a letter to the prefect of Egypt, enjoining him to put to death Mahomet Ebn Abu Becr, with whom it was sent, and who was to be his successor. This letter Merwan took care should be discovered: and Mahomet taking it for a genuine order of the caliph, published the supposed injury all over the neighbouring countries. He then marched with a body of rebels to Medina, where the innocent caliph was besieged in his palace; and, notwithstanding all his protestations, nothing less than his death could satisfy the enraged multitude. In this deplorable situation Othman sent to Ali for assistance; who commanded his two sons Hasan and

Arabia.

and Hosein to defend the palace gates. This they did for some time with fidelity enough, till finding the caliph reduced to great straits for want of water, they abandoned their posts; upon which the rebels easily made themselves masters of the palace, and cruelly murdered the caliph, in the 82d year of his age, after he had reigned 12 years. His body remained three days unburied; and was at last thrown into a hole made for it, without the usual ablution, or the least funeral solemnity.

103 He is murdered.

The arms of the Moslems had hitherto been so successful, and their conquests so rapid, that they may seem not only to have vied with Alexander, but to have bid fairer for universal monarchy than any nation either before or since.—The ruin of mighty empires always originates from the impossibility of keeping them united. Divisions arise; civil wars break out; and the kingdom being weakened by these intestine feuds, the common enemies take advantage of them to ruin the whole fabric. If we consider Mahomet, as in truth he was, not as an enthusiast, but as a politician and the founder of an empire; we shall find him in that capacity superior perhaps to any that ever existed. The empire of Alexander the Great, which arose with still more rapidity than that of the Arabs, had no support but from his own ambition and personal qualifications. While he lived, he was without a rival, because all were afraid of him; but when he died, the bands of union, whereby his empire had been held together, were immediately dissolved. His captains were not inspired with the same veneration for his son, who was unborn at the time of his death, that they had for his father; and therefore they sought not to conquer for him, but for themselves; and the consequence was that the kingdom fell to pieces the moment that he died. The same thing happened to the empires of Jenghis Khan, Tamerlane, and others, who made vast conquests in a short time. They erected mighty empires indeed; but their duration, we may say, was but momentary. The empire of the Romans was founded on a kind of enthusiastic desire of aggrandizing the city of Rome: patriotism became fashionable; and as the city never ceased to exist, those who conquered always had the same end in view, namely, to exalt the republic more and more. This empire, therefore, was not only very extensive, but very durable; though as it was impossible that mankind could always continue to venerate a city, the same divisions that ruined other empires at last brought this to an end. The foundation of Mahomet's empire seemed to be still more firm. He was not only the king, but, we may say, the god of his people. Whatever enthusiasm people may show in defending their country, nay even their nearest relations, experience has taught us that it is greatly inferior to what is shown by those who fight in defence of religion. This enthusiasm Mahomet had taken care not only to bring over to his side, but to exalt to its highest pitch, by inculcating upon his followers, that their rewards in the next world should be proportionable to the fury with which they fought in this. To live at peace, except with those who submitted to his will, did not at all enter into his plan; and he who made no conquests, or at least did not strive to make them, was no true believer. By this means, let his empire be ever so much extended, the temptation to making fresh conquests was still equally strong; and not only the commanders of armies, but every private person, had the most powerful motives to urge him towards the conquest of the whole world, had that been possible. The only thing Mahomet seems to have failed in was, the appointment of the succession to the apostleship; and why he was deficient in this is inconceivable. From this one source proceeded the divisions which ruined his empire when it was scarce erected, and of which we are now to give the history.

Arabi

104 Causes the dec of the M lem em

Though the prophet had been so deficient in providing for the safety of his kingdom as not to name a successor at his death; yet his son-in-law Ali was always of opinion that the succession belonged of right to him; and that it ought to be, like that of other kingdoms, hereditary. This disposition to render the apostleship hereditary in the family, was, in all probability, what disgusted the Moslems with Ali: against whom they could otherwise have no objection; for he was endowed with every amiable quality; a firm believer in Mahomet; and of such unparalleled strength and courage, that he never declined a combat to which he was challenged, nor ever failed to come off victorious; for which reason he was styled by his countrymen, "the lion of God."

105 Charac of Ali.

On the death of Othman, however, notwithstanding the prejudices against Ali, as none could pretend so good a right to the caliphate as he, the Arabs immediately took the oath of allegiance to him, though with an intention to break it as soon as possible, as was fully evinced by the event. The disturbances which happened immediately on Ali's succession were owing partly to the machinations of Ayesha, who having got Othman murdered on purpose to raise Telha to the dignity of caliph, and now finding Ali unanimously chosen, resolved to destroy him also. She therefore pretended great concern for the death of the late caliph, and accused Ali of being his murderer; but being reproved by one of the Moslems for endeavouring to blacken an innocent person, when she could not but know herself guilty; she replied, that Othman's infidelity had indeed made her his enemy, but that she had forgiven him upon his repentance. At the time of Ali's inauguration she was at Mecca, where she enjoyed a very considerable share of influence and authority. At her instigation, Telha Ebn Obeidallah, and Zobeir Ebn Al Awam, began to represent to Ali, that the murderers of Othman ought to be brought to condign punishment: offering themselves at the same time for that purpose. This they did purely to sow dissension, for they themselves had been deeply concerned in the murder: and Ali, sufficiently aware of their intention, told them it was impossible till the empire should be more settled. Finding themselves disappointed in this attempt, they next begged the government of Cufa and Basra, that they might with the greater facility extinguish any rebellion that should happen. Here again Ali was aware of their intention; and refused their request, under pretence that he stood in need of persons of their great capacity, as counsellors, about his person. Then they desired leave to perform a pilgrimage to Mecca, which the caliph could not refuse; and they were no sooner got there, than they set about raising an army against him without any provocation at all.

106 He is c sen cali

107 Disturb ces rais by Ayes

This, however, was not the only source of discord at

Arabia.

at present. Ali had been displeased with the governors of provinces appointed by Othman; and therefore dismissed them immediately upon his accession. This was very impolitic; but he was prompted to do it by that rashness and want of prudence which is inseparable from, or rather is the very essence of, great courage. The consequence of this was, that Moawiyah, governor of Syria, was, immediately upon his dismission by Ali, proclaimed caliph by the troops under his command. Thus the Moslems were divided into two factions; the one under Moawiyah and Ayesha, who adhered to the house of Ommiyah, to which Othman and Moawiyah belonged; and the other to Ali. The adherents of the house of Ommiyah were called *Motazalites*, or *separatists*.

108 Id Moawiyah.

109 Ali raises an army.

Ali, finding how matters were situated, and that a very strong party was formed against him, endeavoured to ingratiate himself as much as possible with the Koreish; and to raise an army against Ayesha, who had now taken the field, and even reduced the city of Basra. He made a formal speech to the people on hearing this bad news, and desired their assistance. But though he was very much beloved on account of his personal merit, and the best orator of the age, he could not with all his eloquence for some time prevail on them to give a decisive answer in his favour. At last Ziyad Ebn Hantelah stept to Ali of his own accord, and said, "Whosever retreats, we will advance." Upon this two Ansars, doctors of the law, stood up, and pronounced Ali innocent of the death of Othman; which decision soon induced the Ansars and the body of the people to espouse his quarrel. He then left Medina with a body of 900 men, and advanced to Arrabah, where he was joined by several other parties. From this place he wrote to the people of Cufa and Medina, pressing them to send him farther assistance, and to dispose the Motazalites to an accommodation. From Medina he very soon obtained a large supply of horses, arms, and other necessaries; and from Cufa he obtained with difficulty a reinforcement of 8000 men.

Being greatly animated by this seasonable supply, Ali advanced towards Basra, where the troops of Ayesha were ready to receive him. Both parties seemed averse to an engagement; and Ayesha began to be very much intimidated at the sight of Ali's army, which, however, was inferior to her own: but, by some means or other, a battle was at last brought about, in which Ayesha was defeated and taken prisoner. The only remarkable effort that was made by the troops of Ayesha in this engagement, was in defence of her person. It is said, that no fewer than 70 men who held her camel by the bridle, had their hands cut off successively; and that the pavilion in which she sat was so full of darts and arrows, that it resembled a porcupine. Ayesha was treated very kindly by Ali, who at first set her at liberty, but afterwards confined her to her house at Medina, and commanded her to interfere no more with state affairs, though he still allowed her to perform the pilgrimage to Mecca.

110 He defeats and takes Ayesha prisoner.

After this victory, Ali had no enemies to contend with either in Arabia, Irak, Egypt, Persia, or Khorasan. A strong party, however, still remained in Syria, headed by Moawiyah, who founded his claims to the caliphate on a pretended declaration of Othman that he should be his successor. In this defection he was joined by Amru Ebn Al As, who had obtained a promise of the government of Egypt, provided Moawiyah could be advanced to the dignity of caliph. Arabia.

Ali, with his usual good nature, endeavoured to bring the rebels to a sense of their duty, and often sent proposals of accommodation to Moawiyah; but he still remained inflexible. Perceiving therefore, that it would be necessary to invade Syria, he entered that country with an army of 70,000 men, while Moawiyah advanced to meet him with 80,000; and by repeated reinforcements Ali's army at last amounted to 90,000 and Moawiyah's to 120,000. The two armies came in sight of each other towards the close of the 36th year of the Hegira, when they seemed ready to enter upon action; but only some skirmishes happened between them, wherein neither party sustained any considerable loss. The first month of the 37th year was spent in fruitless negotiations; but in the second month they began to fight in different parties, without ever hazarding a general engagement. These battles continued, according to some, for 40 days, and according to others, 110. Moawiyah's loss amounted to 45,000 men, and Ali's to 25,000, among whom were 26 who had been intimately acquainted with Mahomet himself, and were dignified with the title of *The Companions*. The most famous of these was Ammar Ebn Yasar, Ali's general of horse, who was upwards of 90 years of age, and was highly esteemed by both parties. The loss of this general so exasperated Ali, that he charged the Syrians with a body of 12,000 men, broke them, and challenged Moawiyah to fight him in single combat. This challenge Moawiyah declined, insisting that it was not a fair one, as Ali could not but be sensible of his superiority in strength. As the challenge was given in the hearing of both armies, Amru insisted that Moawiyah could not in honour refuse it; but the coward made no other reply than that Amru aspired to the caliphate himself, and wanted to enjoy it after his death. The battle being now renewed with great fury, Moawiyah's forces were pushed to their camp; which had certainly been taken, had not Amru bethonght himself of the following stratagem to retrieve Moawiyah's affairs, when he seemed on the very brink of destruction. He ordered some of his men to fix copies of the Koran to the points of their lances, and carry them to the front of the battle, crying out at the same time, "This is the book that ought to decide all differences between us; this is the book of God between us and you, that absolutely prohibits the effusion of Moslem blood." This produced the desired effect. The caliph's troops threw down their arms, and even threatened him with death if he did not sound a retreat; which he therefore found himself obliged to do, and thus had a decisive victory wrested out of his hands.

111 Moawiyah challenged to a single combat by Ali.

112 Amru's stratagem.

According to this new mode of decision, the two parties were each to choose their arbitrator; but even this was not allowed to Ali, though Moawiyah had liberty to choose Amru Ebn Al As. The troops of Irak, not content with offering so gross an affront to the caliph, insisted on naming for his arbitrator Abu Musa Al Ashavi; a very weak man, and one who had already betrayed him. The consequence of this appointment was, that Ali was deposed by both arbitrators; and he accordingly dropt his title to the caliphate, but without

113 Ali deposed.

Arabia.

without laying down his arms, or putting himself in Moawiyah's power.

After this decision, Ali retired to Cufa; where he was no sooner arrived, than 12,000 of those troops who had themselves forced him to accept of the arbitration, pretending to be offended with the step he had taken, revolted from him. These were called *Kharejites*, that is, rebels or revolters: and *Mohakkemites*, or judiciarians, because they affirmed that Ali had referred to the judgment of men what ought to have been only referred to the judgment of God; and, therefore, that instead of keeping the peace he had made with Moawiyah, he ought to pursue his enemies, who were likewise the enemies of God, without mercy. To this Ali replied, That as he had given his word, he ought to keep it; and, in so doing, he only followed what was prescribed by the law of God. The Kharejites replied, That God was the only judge between him and Moawiyah, and that consequently he had committed an enormous sin, of which he ought sincerely to repent. This irritating Ali, he with some warmth replied, That if any sin had been committed on this occasion, it was by themselves, who had forced him to take the steps of which they now complained. This answer not proving agreeable, they chose for their general Abdallah Ebn Waheb, who appointed for their rendezvous Naharwan, a town situated between Waset and Bagdad, about four miles to the eastward of the Tigris. Here they assembled an army of 25,000 men; and Ali, having tried gentle methods ineffectually, at last marched against them in person. Before he attacked them, however, he planted a standard without the camp, and made proclamation by sound of trumpet, that whoever should repair to it should have quarter, and whoever would retire to Cufa should find a sanctuary there. This had such an effect, that Abdallah's army was soon reduced to 4000 men, with whom he rushed upon the caliph's forces; but all of them were cut in pieces, except nine who escaped.

114 He defeats the Kharejites.

Had Ali marched against Moawiyah immediately after the defeat of the Kharejites, and while his troops were flushed with victory, he had probably reduced him entirely: but by allowing his troops to refresh themselves, they all deserted him, and Moawiyah's party had an opportunity of gathering still more strength; and though Moawiyah's troops often made incursions into the territories of Ali, the latter seems afterwards to have acted only on the defensive. At last the Kharejites, imagining that it would be for the good of the Moslem affairs, that Moawiyah, Ali, and Amru, were dead, despatched assassins to murder all the three. Moawiyah was wounded, but recovered; Amru's secretary was killed by mistake; but Ali was wounded with a poisoned sword, which occasioned his death. The assassin was taken, and Ali would have pardoned him had he recovered, but ordered him to be put to death if he died, that he might, as he said, "have an immediate opportunity of accusing him before God." Even in this order he shewed his usual clemency, as he ordered the assasin to be despatched at one blow, and without torture of any kind.

115 They attempt to murder Ali, Amru, and Moawiyah.

116 Ali assassinated.

Thus fell Ali, the most virtuous of all the Mahometan caliphs, after he had reigned near five years, and lived 63. He was pressed by those about him to nominate a successor before he died; but this he declined, saying, he would follow the example of the Apostle of God, who had not named any: and, as his son Hasan inherited his father's piety, though not his courage, he was declared caliph without any scruple. Moawiyah, however, behaved in such a manner towards him, as showed his hostile intentions; and those about Hasan pressed him to declare war immediately. This Hasan, who was of an exceeding mild and peaceable disposition, could hardly be persuaded to do; and though he at last took the field, yet he immediately perceived his incapacity to dispute the empire with Moawiyah; and therefore resigned it, in spite of all the remonstrances of his friends, to a traitor, who caused him after some years to be poisoned by his wife.

117 Succeeded by Hasan

118 who resigns the caliphate to Moawiya

Moawiyah being thus left sole master of the Moslem empire, found himself under the necessity of reducing the Kharejites, who were his enemies as well as Ali's, and had now gathered together a considerable army. Against these rebels the caliph would have despatched Hasan, but that prince refused; upon which he sent the Syrian troops against them, who were defeated: however the Cufans, being at last persuaded to take up arms, soon extinguished the rebellion, and settled Moawiyah more firmly than ever on the Moslem throne. In the 48th year of the Hegira, the caliph sent his son Yezid with a powerful army to besiege Constantinople. In this expedition he was attended by three or four of the *Companions*, who, notwithstanding their age, were prompted by zeal to undergo incredible fatigues. The Moslem forces too, though they suffered extremely, were animated to surmount all difficulties by a tradition, according to which the prophet in his lifetime declared, "That the sins of the first army that took the city of Constantinople should be forgiven." Concerning the particulars of this expedition we are in the dark: only, in general, that it proved unsuccessful; and in it Abu Ayub, who had been with Mahomet at the battles of Bedr and Ohod, lost his life. His tomb is held in such veneration by the Moslems, that the sultans of the Ottoman family gird their swords on at it on their accession to the throne. In the 54th year of the Hegira, the Arabs made an irruption into Bukharia, and defeated a Turkish army that opposed them. The Turks lost a great number of men; and the queen, who commanded in person, with great difficulty made her escape. She had only time to put on one of her buskins; the other fell into the hands of the Arabs, who valued it at no less than 2000 dinars. About this time also, according to the Greek historians, a treaty was concluded between the emperor and the Moslems, whereby the latter were allowed to keep the territories they had seized; in consideration of which they were to pay 3000 pounds weight of gold, 50 slaves, and as many choice horses. To these dishonourable conditions they were obliged to submit in consequence of their late unsuccessful expedition to Constantinople, and some other defeats they had received. This peace was to continue for 30 years. The next year, Moawiyah, having conferred the government of Khorasan upon Saad, Othman's grandson, that general, soon after his promotion, passed the Jihun, or Amu, the Oxus of the ancients, and advanced with a body of troops to Samarcand, which opened its gates to him on his approach; soon after which he defeated an army of Usbeck Tartars, and marched directly to Tarmud, or Tarmid,

119 Constantinople besieged without success.

120 Turks defeated.

Arabia.

mid, which also surrendered without opposition. The 57th year of the Hegira was remarkable for nothing but vast swarms of locusts, which did incredible damage in Syria and Mesopotamia; and great discontents on account of the caliph's having nominated for his successor his son Yezid, a person of scandalous life, and no way worthy of the throne. The 58th year of the Hegira was rendered remarkable by the death of Ayesha, Mahomet's widow; and the 60th by that of Moawiyah, after having reigned, from Hasan's resignation, nineteen years, three months, and five days: but concerning his age authors are not agreed. He was interred at Damascus, which was made the residence of the caliphs as long as the house of Ommiyah continued on the throne.

121 Moawiyah dies.

122 Succeeded by Yezid.

Yezid was proclaimed, in consequence of his nomination, the same day his father died. His inauguration was performed on the new moon of the month Rajeb, corresponding to April 7. 680. Immediately after his election, he wrote to Al Walid, governor of Medina, to seize Hosein, the remaining son of Ali, and Abdallah Ebn Zobeir, in case they refused to acknowledge his right. He accordingly tendered the oath of allegiance to Hosein, who returned an evasive answer, and found means to escape to his own house. As for Abdallah, he delayed waiting upon the governor, under various pretences, for 24 hours; after which he made his escape to Mecca; hither Hosein followed him; but received an invitation from the people of Cufa, who promised to assist him in vindicating the rights of his father Ali and himself. In the mean time, Yezid, being informed of Al Walid's negligence in suffering Abdallah and Hosein to escape, removed him from his employment, appointing in his room Amru Ebn Saad, at that time commandant of Mecca. The new governor immediately despatched against Abdallah, Amer Ebn Zobeir, Abdallah's own brother, who mortally hated him; but Abdallah having engaged Amer in the field, defeated and took him prisoner; which greatly raised his reputation at Medina, although Hosein's superior interest among them still rendered him incapable of aspiring to the caliphate by himself.

123 Hosein and Abdallah refuse to acknowledge him.

While Abdallah was thus strengthening himself at Mecca and Medina, Hosein was doing the same at Cufa. On the first notice of their inclinations, he had sent to them Moslem Ebn Okail, to whom, as representative of the son of Ali, they had taken an oath of allegiance, and were now very pressing on Hosein to honour their city with his presence. Besides this, Hosein was supported by the forces of Irak, who retained a great veneration for the memory of his father, and had all along considered the government of Moawiyah as a downright usurpation.

Notwithstanding all these steps taken at Cufa in favour of Hosein, the deliberations of the conspirators were carried on with such secrecy, that Al Nooman, the governor, continued a stranger to them, even after the Cufans had determined immediately to enter upon action with an army of 18,000 men. At last, however, he began to be roused from his lethargy; but Yezid being displeased with his conduct, removed him from his government, appointing for his successor Obeidallah Ebn Ziyad. This governor entered the city in the evening, and was received with all possible demonstrations of joy by the Cufans, who mistook him for Hosein, owing to a black turban which he had on his head, resembling that which Hosein usually wore. His first care was to extinguish the sedition that had been excited by Moslem. In order to this, he commanded a trusty servant to disguise himself, and personate a stranger come out of Syria to see the inauguration of Hosein: that he might get admission into Moslem's house, and penetrate all his counsels. This commission was faithfully executed; and Obeidallah understanding that Moslem lodged in the house of one Sharik, who was then sick, sent a messenger to Sharik, letting him know that he intended to visit him on a certain day. Sharik immediately came to a resolution to receive him, and appointed Moslem a place in the corner of the room whence he might rush out upon Obeidallah and kill him. The visit was accordingly made; but Moslem's heart failing him, the governor escaped: Hani, however, in whose house Moslem had first lodged, was imprisoned by Obeidallah. Upon the news of this, Moslem assembled about 4000 men, and besieged Obeidallah in the castle. The governor, however, not in the least dispirited, made a speech to Moslem's followers; which had such an effect upon them that they all deserted him except about 30. By the favour of the night, Moslem escaped to a poor woman's cottage in the neighbourhood; but being betrayed by her son, Obeidallah sent a detachment of 80 horse to seize him. Moslem made a gallant resistance, and thrice cleared the house of them; but being at last overpowered with numbers, and grievously wounded, he was taken and brought to Cufa. While on the road, he endeavoured to send an account of his bad success to Hosein, then, as he supposed, on the road to Cufa; but without success. When arrived at the castle he begged a draught of water: but those who stood by told him he should have none till he drank the hamim, or boiling liquor, which the Mahometans pretend is drunk by the damned in hell; and soon after this, being brought before the governor, he was beheaded along with Hani, and both their heads sent as a present to Yezid.

Arabia.

124 Hosein's obstinacy.

Hosein, in the mean time, was preparing to set out for Cufa, having received the most favourable advices from Moslem, of whose fate he was ignorant, and who had sent him a list of 140,000 men that were ready to obey his orders. This the wisest of his friends represented as a desperate enterprise, and entreated him to drop it, or at least to defer his journey till he should be better assured of success: but Hosein was deaf to all salutary counsel; nay, he would not, by the most earnest entreaties, be prevailed upon to forbear taking his wives and children along with him. The consequences of this obstinacy may be easily imagined: Obeidallah despatched first 1000 and then 5000 men against him; with orders, however, not to offer any violence to him provided he submitted himself. To these terms the infatuated Hosein would not agree: he offered indeed to return home, if Obeidallah would permit; but that not being granted, he desperately engaged the troops of Obeidallah, and was, after long resistance, cut in pieces with all his men. His head was brought to Obeidallah, who struck it over the mouth with a stick, and treated it with great contempt. He was also inclined to have put his family to death: but probably feared an insurrection, as the people of Cufa expressed

125 He is defeated and killed.

Arabia. great resentment on account of Hosein's death; nor was it at all agreeable to the caliph Yezid, who treated the family of the unfortunate Hosein with the greatest kindness.

This year, the 61st of the Hegira, Yezid appointed Salem Ebn Ziyad governor of Khorasan; who, soon after entering upon the government, made an irruption into the Turkish territories. He took his wife along with him in this expedition, who was delivered of a child in the neighbourhood of Samarcand; on which occasion she is said to have borrowed some jewels from the prince of Sogd's lady, which she afterwards carried off with her. In the mean time Salem detached Mohalleb with a considerable body of troops to Khowarazm, the principal city of the Turks or Tartars in those parts, from which he extorted the immense sum of 50,000,000 pieces of money; from whence advancing to Samarcand, he forced the inhabitants of that city also to pay him an immense sum; and then retired with little loss, into the province he governed.

In the mean time Abdallah Ebn Zobeir, finding himself, by the death of Hosein, at the head of the partizans of the house of Hashem, who were greatly oppressed by Yezid, began in earnest to aspire to the caliphate. As he had therefore never owned the authority of Yezid, he now openly declared against him,
126 Abdallah proclaimed caliph. and was proclaimed caliph at Medina soon after the arrival of Hosein's family in that place. Soon after his inauguration, to render himself the more popular, he expatiated on the circumstances of Hosein's death, which indeed were very tragical, and represented the Cufans as the most abandoned and perfidious villains upon earth. This went so well down with the citizens of Mecca and Medina, that they flocked to him in great numbers, so that he soon found himself at the head of a considerable force. The caliph Yezid being informed of his progress, swore he would have him in chains; and accordingly sent a silver collar for him to Merwan, then governor of Medina: but the interest of Abdallah was now so strong, that he laughed at the menaces both of the caliph and Merwan. Nay, the governor of Mecca, though he secretly hated him, thought it good policy, as matters then stood, to keep up a good understanding with Abdallah: but this coming to the ears of Yezid, he deposed the governor; appointing in his place Walid Ebn Otbah, a man of known fidelity, and a bitter enemy of Abdallah. The new governor, therefore, immediately on his accession, used all his art and skill to circumvent Abdallah; but to no purpose, as the latter was always on his guard. This conduct, however, giving him great disgust, as well as terrible apprehensions, he wrote to the caliph, informing him that all the disturbances were owing to the untractable disposition of Walid; and that, if he would send a person of a different character, peace would soon be restored. This letter, the caliph very injudiciously gave ear to, and dismissed his faithful governor, appointing in his room one who was totally unqualified for that post. The people of Medina now having fresh intelligence of Yezid's dissolute manner of life, renounced their allegiance to him, and formally deposed him in a very singular manner. After they
127 Yezid formally deposed. had assembled in the mosque, about the pulpit there, one of them said, "I lay aside Yezid as I do this turban," and immediately threw his turban on the ground. Another said, "I put away Yezid as I do this shoe," casting away his shoe at the same time. These examples being followed by others, there was a large heap of shoes and turbans almost instantly formed upon the spot. They then dismissed Yezid's governor, and banished from the city all the friends and dependants of the house of Ommiyah. These, to the number of about 8000, took refuge in the house of Merwan Ebn Al Hakem, where they were so closely besieged by Abdallah's party, that they found themselves obliged to send to Yezid for immediate assistance; acquainting him, that if they were not succoured, they must all inevitably perish. The caliph, though he wondered that such a number of men should suffer themselves to be so cooped up without making the least resistance, despatched Moslem Ebn Okba to Medina, with a considerable body of troops, to quell the disturbances. He ordered him to spare Ali the son of Hosein and his family, as they had no hand at all in the disturbances: then he was to summon the town of Medina to surrender for three days successively; which if they refused, he was to take it by storm, and give it up to be plundered by the soldiers for three whole days. Arabia.

The inhabitants of Medina being now sensible of their danger, suffered the friends of the house of Ommiyah to withdraw quietly out of the city; though before they departed, a promise was extorted from them not to appear in arms against the reigning faction. Moslem, in the mean time, advanced towards the city at the head of 5000 foot and 12,000 horse; and having summoned it according to his instructions, upon its refusal made the necessary preparations for an attack. The garrison, however, for a considerable time, made a vigorous defence; but at last, most of the Ansars and principal officers being killed, the Arabs proposed
128 Medina ken and plundere by the c liph's fo ces. a capitulation. Moslem, however, would hearken to no terms, and insisted on their surrendering at discretion; which being refused, he entered the city after a faint resistance. Ali was treated with great respect; but all the men that had carried arms were put to the sword, and Moslem suffered his troops to ravish 1000 women, and to pillage the city for three days successively. Those that escaped the slaughter he forced to acknowledge themselves the slaves and vassals of Yezid. For this extreme severity he was surnamed by the Arabs *Al Musreif*, or *The extravagant*, and ever after considered as an impious person, especially as the prophet had declared that the wrath of God should most certainly remain upon those who sacked or plundered the city of Medina.

After the reduction of Medina, Moslem directed his course to Mecca, where Abdallah then resided; but he died by the way, and the command of the troops devolved upon Hosein Ebn Thamir Al Selwi. This general advanced to Mecca, which he besieged for 40 days, battering the town with such fury, that he beat down a great part of the famous temple there, and burnt the rest; nor would the city itself have escaped the same fate, had not an end been put to the war by the arrival of certain accounts of the death of Yezid,
129 Yezid d who departed this life in the 64th year of the Hegira, answering to the year 684 of the Christian era, having lived 39, and reigned three years and six or eight months. On the news of his death, Hosein offered to take

Arabia.

take the oath of allegiance to Abdallah; but the latter at that time durst not trust him, of which he had afterwards sufficient reason to repent.

130 Yezid was succeeded by his son Moawiyah II. who was proclaimed caliph at Damascus the same day that his father died; but being of a weakly constitution, and unable to bear the fatigues of government, resigned the crown six weeks after his inauguration, and died soon after without naming a successor.

This abdication having left the Moslem empire absolutely without a master, great commotions ensued. On the death of Yezid, Obeidallah Ebn Ziyad, governor of Basra, represented to the citizens that they ought to choose a protector till a new caliph should be chosen; and if the person so chosen should be disagreeable to them, they might then remain in the state of independency under the protector whom they had chosen. The inhabitants perceiving the drift of this speech, complimented him with that honour; which he accepted with seeming difficulty: but sending a deputy to Cufa, the inhabitants of that city not only refused to acknowledge his authority, but threw dust and gravel at his messenger. This coming to the ears of the people of Basra, they not only deprived Obeidallah of the dignity they had newly conferred upon him, but even expelled him the city. Nor could he prevail upon the Najari, a tribe of Ansars, to espouse his quarrel, nor even upon his own relations, though he distributed among them great part of the sixteen millions of pieces of money which he had found in the treasury of Basra, and kept the remainder to himself. Nay, so odious had he rendered himself to all ranks, on account of his cruelties, particularly the death of Hosein the son of Ali, that his brother Abdallah was unable to protect him from the fury of the populace, though he kept him concealed in women's clothes, and distributed among the mob 200,000 pieces of money. He was therefore at last constrained to leave the city, attended by a guard of 100 men. Immediately after his departure, the mob plundered his house, and pursued him, so that he was obliged to exchange his camel for an ass, and thus with the utmost difficulty escaped into Syria.

131 Obeidallah forced to flee into Syria.

In the mean time, Hosein Ebn Thamir, being returned into Syria with the forces under his command, gave a faithful account of the situation of affairs in Arabia to Merwan Ebn Al Hakem. He also acquainted him of the offer he had made to Abdallah of the oath of allegiance, which the latter had refused, or at least would not come to Damascus in order to be invested with the supreme authority there. On this account he advised Merwan to take care of himself and the rest of the house of Ommiyah, who had fled to Damascus after their expulsion from Medina. On this discourse Merwan was inclined to submit to Abdallah; but was diverted from it by Obeidallah, who insisted that no superior ought to be acknowledged by Merwan, who was at the head of the Koreish. The people of Damascus had constituted Dahak Ebn Kais their protector, who inclined to Abdallah. The Basrans were at this juncture entirely in tumult and confusion, not being able to agree about a protector after the expulsion of Obeidallah; so that at last they wrote to Abdallah, offering him the government of their territory. This he accepted, but could not be prevailed upon to stir from Mecca; nor could Merwan be persuaded to suffer any of the Syrians to perform the pilgrimage to Mecca, lest they should join Abdallah, and thereby contribute to his exclusion from the throne. Arabia.

In the midst of this confusion Abdallah might have easily secured the caliphate to himself, had he not with the utmost imprudence as well as inhumanity given orders for the extermination of the house of Ommiyah. This ruined his affairs; for they being now obliged to provide for their own safety, Merwan was proclaimed caliph at Damascus; and thus the whole Moslem empire was rent into two potent factions, the one under Merwan and the other under Abdallah.

132 Merwan proclaimed caliph at Damascus.

We have already observed, that Dahak Ebn Kais inclined to favour Abdallah. This he continued to do after Merwan was proclaimed caliph, insomuch that a battle soon ensued between his followers and those of Merwan, in which Dahak was defeated and killed; and thus Merwan became master of all the province of Syria. Soon after this victory, Merwan advanced with a considerable body of troops towards Egypt; but sent before him Amru Ebn Said with a detachment, in order to facilitate his passage. That general having defeated Abdalrahman, Abdallah's lieutenant, in several brisk actions, he at last surrendered the whole country to Merwan for a sum of money, and retired with the Arabs under his command to Hejaz. The Syrian troops, therefore, immediately took possession of that country, and obliged the inhabitants to take an oath of allegiance to Merwan; who having appointed his son Abdalaziz to preside over Egypt, returned with the greatest part of his forces to Damascus. Here he was informed that Abdallah had despatched against him his brother Musab with a considerable army. Against him Merwan despatched Amru Ebn Said; who having soon come up with him, gave him a total defeat, and dispersed his troops in such a manner that Musab found it impossible to rally them again.

133 Abdallah's forces defeated by Merwan's.

In the 65th year of the Hegira, the inhabitants of Cufa, pretending to be seized with remorse of conscience for their treachery to Hosein the son of Ali, raised an insurrection against both the caliphs, and therefore assembled a body of 16,000 men, under the command of one Soliman, who was to revenge the death of Hosein, upon Obeidallah Ebn Ziyad and his adherents. But while Soliman and his troops remained yet inactive, Al Mokhtar, who had served under Abdallah, and was disgusted at not having been promoted as he expected, arrived at Cufa, and representing the incapacity of Soliman, who indeed appears to have been totally unfit for such an enterprise, offered to take the command upon himself. This, however, was refused; and as Al Mokhtar had no opinion of Soliman's military capacity, he found means to draw off 2000 of his troops; while 10,000 more chose rather to violate the oaths they had taken, than run the risk of being cut to pieces by a superior enemy. Soliman, however, put a good face upon the matter; and, telling his troops that they were to fight for another world and not this, set forward to invade Syria with the 4000 who remained with him: but being advanced as far as Eksas upon the Euphrates, he found that he had lost 1000 men by desertion; nor was he joined by the Separatists of Basra and Al Madayen, though they had promised him a reinforcement. Firmly persuaded, however,

134 The Cufans revolt.

135 Joined by Al Mokhtar.

136 Soliman's folly and enthusiasm.

Arabia. however, that his cause was the cause of heaven, Soliman continued his march all night, and next day arrived at the tomb of Hosein, where his men performed their devotions with such enthusiasm of penitence, that one present swore he never saw such crowding about the black stone in the temple of Mecca itself.—Continuing still to advance, he received a friendly letter from Abdallah Ebn Yezid, the governor of Cufa, advising him to return, and representing to him the folly of engaging so powerful an army as would be sent against him, with a handful of men: but Soliman, imagining that he was only recalled in order to support Abdallah Ebn Zobeir in his pretensions to the caliphate, persisted in his resolution of penetrating into Syria. He told his troops, that they would never be nearer the two Hoseins (Hosein, and his brother Hasan, to whom also the Shiites gave that name) than they were at present; and that should they at this time meet with death, they would be in a state of repentance, and consequently could never die in a more proper time; and after this speech, continuing still to advance, he was at last met by Obeidallah, at the head of 20,000 horse, who, after an obstinate engagement, cut to pieces Soliman and all his troops.

137 He is cut in pieces with all his men.

138 Merwan dies.

Soon after this decisive action died the caliph Merwan, after he had reigned eleven months. He is said by some authors to have been poisoned by his wife Zeinab, Moawiyah's widow. Her he had married, with a promise that her son Khaled should succeed him; but afterwards altering the succession in favour of his own son Abdalmalec, young Khaled reproached him with his breach of promise: upon this Merwan calling him *bastard*, the child complained to his mother; who, to be revenged for this affront, is said to have poisoned him, or smothered him with a pillow.

In the beginning of the caliphate of Abdalmalec, Al Mokhtar, who had been imprisoned by the governor of Cufa, was released at the intercession of Abdallah Ebn Omar, who had married his sister. The year following, having put himself at the head of the Shiite sectaries, he sent proposals of alliance to Abdallah Ebn Zobeir; but he, justly suspecting his sincerity, by a stratagem cut off near 3000 of his men. Upon this disaster, Al Mokhtar, fearing the house of Ali might be intimidated, sent a letter to Mahomet Ebn Hanifyah, one of that family, in which he offered his assistance with a powerful army. This offer Mahomet declined, declaring himself only for pacific measures; but though he and all the rest of Ali's family behaved in the most peaceable manner, Abdallah did not think himself safe till they owned his authority. He therefore imprisoned them, together with 17 of the principal citizens of Cufa, whom he threatened to put to death, and afterwards burn their bodies, if they did not within a limited time take an oath of allegiance to him. Al Mokhtar being informed of the distressed situation they were in, sent a body of 750 horse to Mecca, under Abu Abdallah, to release them. That general not only executed his orders with great bravery, but took Abdallah himself prisoner, whom he would have cut to pieces on the spot, had he not been released at the intercession of Mahomet, who for the present adjusted the differences to the mutual satisfaction of all parties. After this reconciliation, Abu Abdallah, or rather Mahomet himself, distributed among 4000 of Ali's friends a sum of

139 Narrow escape of the family of Ali.

money brought for that purpose, in order to indemnify them for the losses they had sustained. Thus the friends of Ali were happily delivered, when only two days of the time granted them by Abdallah remained, and a sufficient quantity of wood and other combustibles was collected, in order to consume their bodies. Notwithstanding the reconciliation, however, that had lately taken place, Mahomet Ebn Kanifyah thought proper to post himself on a mountain near Mecca with a body of 4000 men. Arabia.

The Cufans having received advice before Merwan's death, that he had sent Obeidallah with a powerful army towards their city, and even given them permission to plunder it in case it should be taken, appointed Yezid Ebn Ares, a man of undaunted courage, to oppose him; but Merwan dying before Obeidallah could execute his commission, an end was put for the present to this expedition. The memory of it, however, still remained; and Al Mokhtar, to whom Obeidallah was personally obnoxious, assembled a body of troops to act offensively against him, and even against the Syrian caliph himself in case he should support Obeidallah. Among other preparations for this enterprise, Al Mokhtar caused a kind of portable throne to be made, telling his troops, that "it would be of the same use to them that the ark was to the children of Israel." It was therefore carried on a mule before the troops that were to march against Obeidallah, and the following prayer said before it: "O God! grant that we may live long in thy obedience; help us; and do not forget us, but protect us." This expedient was so well adapted to the hot-headed enthusiasts who composed Al Mokhtar's army, that they attacked Obeidallah's camp, defeated him, and gained a complete victory. Obeidallah himself was killed in the action, his head sent to Al Mokhtar, and his body reduced to ashes.—By this victory the sectaries were rendered so formidable, that Nisibin or Nisibis, and several other cities, surrendered to them without opposition. They now began to entertain thoughts of deposing both the caliphs, and placing on the Moslem throne one of the family of Ali; but all their towering hopes were soon frustrated by the defeat and death of Al Mokhtar by Musab brother to Abdallah Ebn Zobeir. Al Mokhtar, after being defeated in a general engagement by Musab, fled to the castle of Cufa, where he defended himself with great bravery for some time; but being at last killed, his men, to the number of 7000, surrendered at discretion, and were all of them put to the sword on account of the outrages they had committed.

140 Impiety of Al Mokhtar.

141 Obeidallah defeated and kille

142 Al Mokhtar defeated and killed by Musab.

The next year, the 68th of the Hegira, the Azarakites, so denominated from Nafe Ebn Al Azarak, the author of their sect, having assembled a considerable force, made an irruption into Irak. They advanced almost to the gates of Cufa, and penetrated to Al Madayen. Being sworn enemies of the house of Ommiyah, and acknowledging no government, spiritual or temporal, they committed terrible ravages in every part of the Moslem territories through which they passed. They carried their excesses to such a height as to murder all the people they met with, to rip open women with child, and commit every species of cruelty that could be invented upon the inhabitants without distinction. The governor of Mawsel and Mesopotamia, being

143 Horrid cruelties committe by the Azarakites

Arabia. ing informed of these unparalleled outrages, marched against them with a body of troops, and carried on a brisk war with them for eight months. During this period their leader Nafe Ebn Al Azarak died; and was succeeded by Katri Ebn Al Fojat, under whose conduct they continued their depredations. Musab not being pleased with his lieutenant's management of the war, recalled him, and sent in his place one Omar Ebn Abdallah Temini, who gave the Azarakites a great overthrow at Naisabur in Khorasan, put many of them to the sword, and pursued the rest as far as Ispahan and the province of Kerman. Here having received a reinforcement, they returned into the province of Ahwaz, and did incredible damage to the country through which they passed. But Omar advancing against them a second time, they retired at his approach to Al Madayen, ravaging the district belonging to the city in a dreadful manner. However, Omar pursuing them thither also, they fled into the province of Kerman, and thence gradually dispersed themselves. This year there was a grievous famine in Syria, which suspended all military operations.

144 They are defeated and dispersed.

The next year, being the 69th of the Hegira, Abdalmalec left Damascus to march against Musab. In his absence he left Amru Ebn Said governor of the city; but he immediately seized upon it for himself, which obliged the caliph to return. After several skirmishes had happened between some detachments of the caliph's troops with those of Amru, a pacification was concluded at the intercession of the women: but Abdalmalec barbarously put Amru to death with his own hand, notwithstanding his promise; and was immediately seized with such a tremor, that he lost the use of almost all his faculties, and was obliged to be laid in bed. In the mean time the palace was attacked by Yahyah, Amru's brother, at the head of 1000 slaves. After a warm dispute, they forced open the gates, killed several of the guards, and were upon the point of entering the palace, when the people within threw Amru's head among them. This so cooled their ardour, that they desisted from the attempt; and some money having been afterwards distributed among them they retired. So great, however, was Abdalmalec's avarice, that after the tumult was appeased, he recalled all the money which had been distributed, and commanded it to be deposited in the public treasury.

145 Barbarity of Abdalmalec.

146 Disgraceful treaty with the Greeks.

In the 70th year of the Hegira, the Greeks made an irruption into Syria; and Abdalmalec having occasion for all his forces to act against Abdallah Ebn Zobeir, was obliged to pay a tribute of 1000 dinars per day, according to Theophanes, and send every year 365 slaves and as many horses to Constantinople. In this treaty, it was also stipulated, that the revenues of Cyprus, Armenia, and Heria, should be equally divided between the caliph and the Greek emperor.

147 Musab defeated and killed by Abdalmalec.

Abdalmalec being now at leisure to pursue his intended expedition against Musab, marched against him in person; and having arrived at Masken, a small town on the frontiers of Mesopotamia, where he was waited for by Musab, the latter was defeated through the treachery of his troops, and himself killed. After the battle, Abdalmalec repaired to Cufa, where he was received with the utmost submission; and people of all ranks came in crowds to take the oath of allegiance to him. He then ordered vast sums of money to be distributed among them, and gave a splendid entertainment to his new subjects, to which even the meanest of them were not refused admittance. During this entertainment, the unfortunate Musab's head was presented to the caliph; upon which one of the company took occasion to say to him, "I saw Hosein's head in this same castle presented to Obeidallah: Obeidallah's to Al Mokhtar; Al Mokhtar's to Musab; and now at last Musab's to yourself." This observation so affected the caliph, that, either to avert the ill omen, or from some other motive, he ordered the castle to be immediately demolished. Abdallah Ebn Zobeir, in the mean time, having received the melancholy news of the defeat and death of his brother, assembled the people of Mecca, and from the pulpit made a speech suitable to the occasion. He also did his utmost to put Mecca in a proper posture of defence, expecting a speedy visit from his formidable competitor, who now gave law to Irak, Syria, and Egypt, without controul. Arabia.

Soon after Abdalmalec's return to Damascus, he appointed his brother Bashar governor of Cufa, and Khaled Ebn Abdallah governor of Basra. The latter had no sooner entered upon his office, than he indiscreetly removed from the command of the army Al Mohalleb, one of the greatest generals of the age; appointing in his room Abdalaziz, who was greatly his inferior in military skill. Of this dismission the Azarakites being informed, they immediately attacked Abdalaziz, entirely defeated him, and took his wife prisoner. A dispute arising among the victors about the price of that lady, one of them, to end it, immediately cut off her head. Upon this disaster, Khaled was commanded to replace Al Mohalleb, which he did; and having in conjunction with him attacked the Azarakites, forced their camp, and entirely defeated them.

148 Azarakites defeated.

In the 72d year of the Hegira, Abdalmalec having no enemy to contend with but Abdallah Ebn Zobeir, made great preparations for an invasion of Hejaz, giving the command of the army to be employed on this occasion to Al Hejaj, one of his most warlike and eloquent captains. Before that general had put his army in march for Mecca, he offered his protection to all the Arabs there that would accept of it. Abdallah being informed of the enemy's approach, sent out several parties of horse to reconnoitre, and give him intelligence of their motions. Between these and some of Al Hejaj's advanced guards several skirmishes happened, in which Abdallah's men had generally the worst. This encouraged Al Hejaj to send to the caliph for a reinforcement, his troops amounting to no more than 2000 men, who were insufficient for reducing Mecca. He assured him at the same time, that Abdallah's fierceness was very much abated, and that his men deserted to him daily. The caliph, upon this, ordered a reinforcement of 5000 men under the command of Tharik Ebn Amer; but notwithstanding this additional strength, he made but little progress in the siege for some time. While he battered the temple of Mecca with his machines, it thundered and lightened so dreadfully, that the Syrians were struck with terror, and refused to play them any longer upon that edifice. Upon this Al Hejaj stuck the corner of his vest into his girdle, and putting into it one of the stones that was to be

149 Mecca besieged by Al Hejaj.

Arabia.

be discharged out of the catapults, slang it into the town, and this occasioned the recommencement of the operations. The next morning the Syrians were annoyed by fresh storms, which killed 12 men, and quite dispirited them. Al Hejaj, however, animated them, by observing that he was a son of Tehama; that this was the storm of Tchama, and that their adversaries suffered as much as they. The day following some of Abdallah's men were killed by a very violent storm, which gave Al Hejaj a further opportunity of animating his troops. At last, Abdallah having been deserted by most of his friends, 10,000 of the inhabitants of Mecca, and even by his own sons Hamza and Khobeib, desired to know his mother's sentiments as to what course he was to take. He represented to her, that he was almost entirely abandoned by his subjects and relations; that the few who persisted in their fidelity to him could scarce enable him to defend the city any longer; and that the Syrian caliph would grant him any terms he could think fit to demand. His mother, however, being of an inflexible resolution, and not able to bear the thoughts of seeing her son reduced to the rank of a private person, being herself the daughter of Abu Becr, the first caliph, advised him by no means to survive the sovereignty, of which he was on the point of being deprived. This advice being agreeable to his own sentiments, he resolved to die in defence of the place. In pursuance of this resolution, he defended the city, to the amazement of the besiegers, for ten days, though destitute of arms, troops, and fortifications. At last, having taken a final leave of his mother, and being animated by despair, he made a sally upon the enemy, destroyed a great number of them with his own hand, and was at length killed fighting valiantly upon the spot. At the last interview he had with his mother, she is said to have desired him to put off a coat of mail he had on for his defence; and, in order to inspire him with the greater fortitude, she gave him a draught in which a whole pound of musk had been infused. Al Hejaj ordered his head to be cut off, and his body to be affixed to a cross; and by reason of the musk he had drank, the body emitted a grateful odour for several days.

150 Abdallah killed.

By the reduction of Mecca, and the death of Abdallah Ebn Zobeir, Abdalmalec remained sole master of the Moslem empire; but he sustained a great loss next year, in having an army of 100,000 men totally cut off by the Khazarians in Armenia. The governor, however, having marched in person against them at the head of only 40,000 men, but all chosen troops, penetrated into the heart of Armenia, defeated and dispersed a large body of the Khazarians, drove them into their temples, and reduced them to ashes. One of his generals also defeated an army of 80,000 Khazarians at the Iron or Caspian Gates, and destroyed a great number of them, obliging the rest to embrace the Mahometan religion.

151 Khazarians reduced.

152 Cruelty of Al Hejaj.

Al Hejaj, in consequence of his services, was made governor, first of Medina, and then of Irak, Khorasan, and Sijistan; in all which places he behaved with the greatest cruelty. Having entered the city of Cufa muffled up in his turban, he was surrounded by crowds of people who pressed forward to see him. He told them their curiosity would soon be gratified; which he effectually did, by ascending the pulpit, and treating them in a very coarse manner; swearing that he would make the wicked bear his own burden, and fit him with his own shoe; and telling them among other things, that "he imagined he saw the *heads* of men ripe and ready to be gathered, and turbans and beards besprinkled with blood." At Basra he made a speech much to the same purpose; and, to give the inhabitants a taste of his discipline, caused one of them who had been informed against as a rebel to be beheaded on the spot without any trial. So great indeed was the abhorrence in which he was held by those over whom he presided, that having once recommended himself to the prayers of a religious Moslem, the latter instantly prayed that it would please God to kill Al Hejaj quickly; "for nothing, said he, could be more advantageous for himself or the people." In consequence of these cruelties, rebellions were soon raised against him; but they were easily suppressed, and Al Hejaj continued in the full enjoyment of all his employments till he died.

Arabia.

153 Saleh and Shebib rebel.

In the 76th year of the Hegira, one Saleh Ebn Marj, a hot-headed enthusiast, and Shebib Ebn Zeid, a Kharejite, took up arms against the caliph. They had conspired against him the year before when on a pilgrimage to Mecca; and Al Hejaj had been ordered to seize them: but at that time they found means to make their escape; and having now assembled about 120 men, Saleh was proclaimed emperor of the faithful at Daras in Mesopotamia. The governor soon received intelligence of their motions; and ordered a body of 500 men, under the command of one Adi, to march against them: but that general, being afraid to attack them notwithstanding his superiority in numbers, demanded a reinforcement. He therefore was supplied with 500 more troops, with which he advanced to Daras; but being still afraid of the rebels, he entered into negociations with them; during which they attacked him, entirely defeated his army, and made themselves masters of his camp. Upon this the governor sent a detachment of 1500 horse against them; but the rebels, notwithstanding the smallness of their number, defended themselves in such a manner, that the caliph's troops were forced to dismount and fight on foot. The engagement continued till night; when the rebels, finding themselves unable to contend with such numbers, retired to Mawsel. After this, Al Hejaj being informed that they had taken post at Dascara, sent against them an army of 5000 men. The rebels hearing of this formidable army, abandoned their camp; but were so closely pursued, that they found themselves obliged to stand an engagement at Modbaj, a small village on the Tigris. Saleh's forces, consisting only of three companies of 30 men each, were soon thrown into disorder, and himself killed: but Shebib made an excellent retreat to a neighbouring castle; from whence he sallied out at midnight on the caliph's forces, penetrated to the very heart of the camp, where he wounded the general himself, and dispersed the greatest part of his army.

154 Their bravery.

155 Saleh killed.

After this victory, the rebels became terrible even to Al Hejaj himself, whom they afterwards defeated in several engagements; and taking advantage of his being at Basra, made themselves masters of Cufa with little opposition. Al Hejaj was now constrained to write

156 Al Hejaj defeated by Shebib.

Arabia.

write to the caliph for a strong detachment of the Syrian troops, with which he advanced against Shebib; whose army bearing no proportion to that of Al Hejaj, the former was totally defeated, had his wife's brother killed in the action, and was obliged to fly into Kerman. Having refreshed his men in this province, he again advanced to Ahwaz, where he was met by one of Al Hejaj's generals at the head of the Syrian army. Shebib defended himself with incredible valour, and several times repulsed the caliph's forces; but being overpowered by numbers, as his army consisted of no more than 600 men, he was at last put to flight, and in passing a bridge, was thrown off by his horse and drowned. His body was drawn up by a net, and the head sent to Al Hejaj, who was not a little pleased at the sight. After his death, the rebels quarrelled among themselves, so that the caliph's troops cut off the greatest part of them. The remainder, under Katri Ebn Fojat, fled to Tabrestan. Here they were kindly received by Ashid the king, who assigned them a part of his territories for their habitation. But they had not been long settled before they insisted upon Ashid's either embracing Mahometanism, or paying them an annual tribute; which he refusing, they drove him into Irak, where he implored the caliph's protection. Ashid afterwards conducted a body of Moslem troops into Tabrestan; where they fell upon the rebels with such fury, that they killed Katri himself, cut a great number of his men to pieces, and took all the rest prisoners.

157 Shebib's valour and death.

158 Ingratitude of the rebels.

159 They are all destroyed.

This year also (the 76th of the Hegira) money was first coined in Arabia. Before this time, the dinars, or gold coins, had Greek inscriptions; and the dirhems, or silver ones, Persic inscriptions. The first erection of a mint in Arabia was occasioned by the following accident. Abdalmalec added to the letters he wrote to the Greek emperor this short passage of the Koran, "Say, God is one;" or "Say, there is one God;" and then inserted the year of the Hegira, with the name of the prophet, in such a manner as gave the emperor great offence. Upon this he wrote to Abdalmalec, desiring him to alter that manner of writing, or he would send him some coins in which the name of Mahomet should be mentioned in such a manner as would not prove very agreeable. Abdalmalec now resolved to coin money of his own; and accordingly some dirhems were this year stamped by Al Hejaj, with the inscription "*Alla Samad*, "God is eternal;" which gave great offence to the superstitious Moslems, as they imagined that the name of God would be thereby profaned by the touch of unclean persons.

160 Money first coined in Arabia.

In the 77th year of the Hegira, the Arabs made an incursion into the imperial territories, and had Lazica and Bernucium betrayed to them; and the next year they made themselves masters of Africa Propria, demolishing the city of Carthage so effectually, that scarce a vestige of it was left. They were soon driven out, however, by John the Patrician, a man of great valour and experience in war; but returning with a superior force, they obliged John in his turn to fly to Constantinople.

161 Carthage demolished.

The 79th year of the Hegira is remarkable for nothing but the rebellion of Abdalrahman in Persia; who drove the khan, or emperor of the Turks, Tartars, or Moguls, out of that country: but the following year, one of the Greek generals, named Heraclius, penetrated into Syria as far as Samosata, and destroyed 200,000 Arabs, ravaging the country in a terrible manner; and Abdalrahman was defeated and killed by Al Hejaj, after a great number of engagements, some say 81, and others 100. In the 83d year of the Hegira, the nobility of Armenia revolting, drove the Arabs out of that province; but Mahomet, one of the caliph's generals, entering the country with a powerful army, got the authors of the revolt into his hands, and caused them all to be burnt alive. Encouraged by this success, the Moslems invaded Cilicia under one Azar; but were, to the number of 10,000, cut in pieces by Heraclius; and the next year, having again entered that country, 12,000 of them were destroyed by the same general, and the rest forced to fly into their own country.

Arabia.

162 200,000 Arabs destroyed by Heraclius.

In the 86th year of the Hegira died the caliph Abdalmalec, after a reign of 21 years. He is said to have had such a stinking breath, that the flies which accidentally settled on his lips were almost instantly struck dead by it. He was succeeded by Al Walid, who greatly extended the Moslem dominions. The first year of his reign, one of his generals having passed the Oxus (now the Jihun), defeated a numerous army of Turks and Tartars. He then overran and entirely reduced the countries of Sogd or Sogdiana, Bagrass, Shash, Targana, and the whole immense tract going under the name of Mawaralnahr, or Great Bukharia. He also conquered the khan of Khowarazm, obliging him to pay an annual tribute of two millions of dinars. About the same time another general, called Mahomet, made an irruption into India, and subdued a considerable part of that country. He also entirely subdued the kingdom of Al Sind, lying between Persia and India. In this expedition, Derar king of Al Sind was defeated and killed, and had his head cut off by Mahomet.

163 Abdalmalec dies.

164 Prodigious conquests of the Moslems.

In the 90th year of the Hegira, the Moslems made an irruption into Cappadocia, defeated the emperor's army who opposed them, and took the city of Tyana. The next year they made another incursion into the imperial territories, whence they carried off numbers of slaves; and the year following one Othman penetrated into the heart of Cilicia, where he made himself master of several cities, but does not appear to have long kept his conquests.

In the 93d year of the Hegira, answering to that of Christ 712, Tarik Ebn Zarka made a descent on Spain, defeated Roderic, the last king of the Goths, reduced the city of Toledo, and overran a considerable part of the kingdom. Being afterwards joined by Musa, commander of the African Moslems, the two generals made themselves masters of most of the fortresses, subjugating in a manner the whole country, and obliging it to pay tribute to the caliph. In these expeditions the Moslems acquired spoils of immense value; and, amongst other things, an exceeding rich table, called by the Arab writers "the table of Solomon the son of David." According to these writers, this table consisted entirely of gold and silver, and was adorned with three borders of pearls; but Roderic of Toledo, a Spanish historian, says it consisted of one entire stone, of a green colour, and of an immense size, having no less than 365 feet. He adds, that it was found

165 They make a descent on Spain,

166 and overrun the whole country.

Arabia.

found in a certain village or town, near the mountain called in his days *Jibal Soliman*, or "the mountain of Solomon."

After Musa and Tarik had committed dreadful depredations in Spain, they were both recalled by the caliph; but the next year, Tarik having undertaken another expedition into the same country, landed a body of 12,000 men at Gibraltar, with which he plundered the whole province of Bætica, and overran the greatest part of Lusitania. Roderic hearing of these depredations, sent against him an army of raw undisciplined troops, who were easily defeated, and most of them left dead on the spot; which so animated the Arab commander, that he resolved not to lay down his arms till he had made an absolute conquest of Spain. About the same time that Tarik made such progress in Spain, another Moslem general entered Pisidia with a powerful army, took the city of Antioch, and, after having ravaged the country, retired into the caliph's territories with very little loss.

167 Al Hejaj dies.

In the 95th year of the Hegira died Al Hejaj governor of Irak, &c. after he had presided over that country 20 years. He exercised such cruelties upon those who were in subjection to him, that he is said to have killed 120,000 men, and to have suffered 50,000 men and 30,000 women to perish in prison. To excuse this cruelty, he used frequently to say, That a severe, or even violent government, is better than one too weak and indulgent; as the first only hurts particular persons, but the latter the whole community. This year also the Arabs gained a complete victory in Spain over Roderic king of the Goths, who perished in the action. In this campaign, Tarik possessed himself of immense treasures; by which means he was enabled to reward not only his officers, but common soldiers also. In the eastern parts of the world also, the Arabs were this year very formidable; Moslema, an Arab general, having entered the imperial territories, ravaged the whole province of Galatia, carrying off with him many rich spoils, and a vast number of prisoners. The Greek emperor, hearing that Al Walid designed to attack him both by sea and land, sent some of his nobles to treat of a peace; and, among other things, desired them to bring him a particular account of the force with which the caliph designed to invade the Greek empire. This they represented as so terrible, that it would be next to impossible to oppose it. The emperor therefore caused a great number of light ships to be built, the walls to be repaired, and ordered such of the citizens as had not laid up provisions for three years to depart the city. Al Walid, in the mean time, continued his warlike preparations with the utmost vigour, being determined to make himself master of Constantinople in a single campaign.

168 Al Walid dies, and is succeeded by Soliman.

In the 96th year of the Hegira died the caliph Al Walid; and was succeeded by his brother Soliman. This year the Moslem conquests on the east side were increased by the reduction of Tabrestan and Jurgan or Georgia. In Spain, also, the city of Toledo which had revolted was reduced, and Cæsarea Augusta, now Saragossa, as well as several others. The next year Moslema set out for Constantinople, which he besieged without success till the 99th year of the Hegira; at which time he was obliged to return, after having lost before it 120,000 men. The soldiers were reduced to

169 Constantinople unsuccessfully besieged.

Arabia.

the greatest extremities of hunger, being forced to live upon hides, the roots and bark of trees, the most noisome animals, and even the dead bodies of their companions. This year also (the 99th of the Hegira) is remarkable for the death of the caliph Soliman. According to some, he was poisoned by Yezid his brother, governor of Persia, who was displeased with his having appointed his cousin-german, Omar Ebn Abdalaziz, as his successor, to the exclusion of himself. According to others he died of an indigestion; which is not greatly to be wondered at, if, as those authors say, he used to devour 100 pounds weight of meat every day, and dine very heartily after eating three lambs roasted for breakfast. In the latter part of his reign, the Moslems were by no means successful in Spain: the kingdom of Navarre being founded at this time by Pelagius, or Pelayo, whom the Arabs were never able to reduce.

170 Death of Soliman.

The new caliph Omar Ebn Abdalaziz was by no means of a martial character; but is said to have been very pious, and possessed of very amiable qualities. He suppressed the usual malediction, which was solemnly pronounced by the caliphs of the house of Ommiyah against the house of Ali; and always showed great kindness to the latter. He was poisoned by Yezid, after a short reign of two years and five months. It is related, as an instance of this caliph's humility, that when Moslema visited him in his last sickness occasioned by the poison, he lay upon a bed of palm tree leaves, supported by a pillow formed of beasts skins, and covered with an ordinary garment. He had also on a dirty shirt; for which Moslema blamed his sister Fatima, Omar's wife; but she excused herself by telling him, that the emperor of the faithful had not another shirt to put on.

171 New caliph poisoned.

Concerning Yezid the successor of Omar we find very little worth mentioning. He did not long enjoy the dignity he had so iniquitously purchased, dying after a reign of little more than four years. He died of grief for a favourite concubine named *Hababah*, who was accidentally choked by a large grape which stuck in her throat.

Yezid was succeeded by his brother Hesham, who ascended the throne in the 105th year of the Hegira. In the second and third year of his reign, several incursions were made into the imperial territories, but generally without success. In the 109th year of the Hegira, Moslema drove the Turks out of Armenia and Aderbijan, and again confined them within the Caspian Gates. The next year he obliged them to take an oath that they should keep their own country; but this they soon violated, and were again driven back by Moslema. About this time also the Arabs, having passed the Pyrenees, invaded France to the number of 400,000, including women and slaves, under the command of one Abdalrahman. Having advanced to Arles upon the Rhone, they defeated a large body of French that opposed them; and having also defeated Count Eudo, they pursued him through several provinces, wasted the whole country with fire and sword, making themselves masters of the city of Tours, most of which they reduced to ashes. Here, however, a stop was put to their devastations by Charles Martel; who coming up with them near the above-mentioned city, engaged them for seven days together, and at last gave them a total overthrow.

172 The Turks defeated.

173 France invaded by the Arabs.

174 They are utterly defeated by Charles Martel.

Arabia. overthrow. The French general made himself master of all their baggage and riches; and Abdalrahman, with the shattered remains of his army, reached the frontiers of Spain with the utmost difficulty. The following year also, according to some historians, the Arabs were overthrown at Illiberis, scarce any of them making their escape. To make amends for this bad fortune, however, the caliph's arms were successful against the Turks, who had again invaded some of the eastern provinces.

In the 125th year of the Hegira died the caliph Hesham, after a reign of 19 years, seven months, and eleven days. He was succeeded by Al Walid II. who is represented as a man of a most dissolute life, and was assassinated the following year on account of his professing *Zendicism*, a species of infidelity nearly resembling Sadducism. He was succeeded by Yezid the son of Al Walid I. who died of the plague, after a reign of six months: and was succeeded by Ibrahim Ebn Al
175 eign of erwan. Walid, an imprudent and stupid prince. He was deposed in the 127th year of the Hegira by Merwan Ebn Mahomet, the governor of Mesopotamia; who gave out, as an excuse for his revolt, that he intended to revenge the murder of the caliph Al Walid II. He was no sooner seated on the throne, than the people of Hems rebelled against him. Against them the caliph marched with a powerful army; and asking them what could excite them to this rebellion, summoned them to surrender. They assured him that they were disposed to admit him into their city; and, accordingly, one of the gates being opened, Merwan entered with about 3000 of his troops. The men that entered with him were immediately put to the sword; and the caliph himself escaped with great difficulty. However, he afterwards defeated them in a pitched battle, put a great number of them to the sword, dismantled the city, and crucified 600 of the principal authors of the revolt.

This, however, was far from quieting the commotions in different parts of the empire. The inhabitants of Damascus soon followed the example of those of Hems, and deposed the caliph's governor; but Merwan, immediately after the extinction of the former rebellion, marched to Damascus with great celerity, entered the city by force, and brought to condign punishment the authors of the revolt. Peace, however, was no sooner established at Damascus, than Soliman Ebn Hesham set up for himself at Basra, where he was proclaimed caliph by the inhabitants. Here he assembled an army of 10,000 men, with whom he marched to Kinnissin, where he was joined by vast numbers of Syrians, who flocked to him from all parts. Merwan, receiving advice of Soliman's rapid progress, marched against him with all the forces he could assemble, and entirely defeated him. In this engagement Soliman lost 3000 men; so that he was obliged to fly to Hems, where 900 men took an oath to stand by him to the last. Having ventured, however, to attack the caliph's forces a second time, he was defeated, and again forced to fly to Hems. But, being closely pursued by Merwan, he constituted his brother Said governor of the city, leaving with him the shattered remains of his troops, and himself fled to Tadmor. Soon after his departure Merwan appeared before the town, which he besieged for seven months; during which time he battered it incessantly with 80 catapults. The citizens, Arabia. being reduced to the last extremity, surrendered, and delivered Said into the caliph's hands. In consideration of this submission, Merwan pardoned the rebels, and took them all under his protection. About the same time, another pretender to the caliphate appeared at Cufa; but Merwan took his measures so well, that he extinguished this rebellion before it could come to any height.

176 Notwithstanding the success, however, that had hi- A party formed a- therto attended Merwan, a strong party was formed gainst him against him in Khorasan by the house of Al Abbas. in Khora- The first of that house that made any considerable fi- san. gure was named *Mahomet*, who flourished in the reign of Omar Ebn Abdalaziz. He was appointed chief of the house of Al Abbas about the hundredth year of the Hegira; and is said to have prophesied, that after his death, one of his sons, named *Ibrahim*, should preside over them till he was killed, and that his other son Abdallah, surnamed *Abul Abbas Al Saffah*, should be caliph, and exterminate the house of Ommiyah. Upon this Al Saffah was introduced as the future sovereign, and those present kissed his hands and feet.

After the decease of Mahomet, his son Ibrahim nominated as his representative in Khorasan one Abu Moslem, a youth of 19 years of age; who beginning to raise forces in that province, Merwan despatched against him a body of horse under the command of Nasr 177 Ebn Sayer; but that general was entirely defeated by Merwan's Abu Moslem, and the greatest part of his men killed. forces de- The next year (the 128th of the Hegira) Merwan feated. made vast preparations to oppose Abu Moslem, who after the late victory began to grow formidable to several parts of the empire. According to some authors, Merwan gained two victories over some of Ibrahim's generals; but the year following, Abu Moslem brought such a formidable army into the field, that the caliph's troops could not make head against them; his officers in Khorasan therefore were obliged either to take an oath of allegiance to Ibrahim, or to quit the province within a limited time.

In the 130th year of the Hegira, the caliph's general Nasr having drawn together another army, was again defeated by Khataba another of Ibrahim's generals, and forced to fly to Raya, a town of Dylam, according to some, or of Khorasan, according to others. 178 The next year Ibrahim having foolishly taken it into Ibrahim put his head to go on a pilgrimage to Mecca, attended by to death. a numerous retinue splendidly accoutred, was seized and put to death by Merwan; and the year following Abu Abbas was proclaimed caliph at Cufa. As soon as the ceremony was ended, he sent his uncle Abdallah with a powerful army to attack Merwan's forces that were encamped near Tubar at a small distance from Mosul, where that caliph was then waiting for an account of the success of his troops under Yezid governor of Irak, against Khataba one of Al Saffah's generals. Khataba receiving advice of Yezid's approach, immediately advanced against him, and entirely defeated him; but in crossing the Euphrates, the waters of which were greatly swelled, he was carried away by the current and drowned. The pursuit, however, was continued by his son Hamid, who dispersed the fugitives in such a manner that they could never afterwards be rallied. At the news of this disaster, Merwan was

Arabia.

at first greatly dispirited; but soon recovering himself, he advanced to meet Abdallah. In the beginning of the battle, the caliph happened to dismount; and his troops perceiving their sovereign's horse without his rider, concluded that he was killed, and therefore immediately fled; nor was it in the power of the caliph himself to rally them again, so that he was forced to fly to Damascus; but the inhabitants of that city, seeing his condition desperate, shut their gates against him. Upon this he fled to Egypt, where he maintained himself for some time; but was at last attacked and killed by Saleh, Abdallah's brother, in a town of Thebais, called *Busir Kurides*. The citizens of Damascus, though they had shamefully deserted Merwan, refused to open their gates to the victors; upon which Saleh entered the city by force, and gave it up to be plundered for three days by his soldiers.

179 Merwan himself defeated,

180 and killed.

By the total defeat and death of Merwan, Al Saffah remained sole master of the Moslem throne; but we hear of no very remarkable events that happened during his reign: only that he massacred great numbers of the partisans of the house of Ommiyah; and that Constantine Copronymus, taking advantage of the intestine divisions among the Moslems, ravaged Syria. The caliph died of the small-pox in the 136th year of the Hegira, in the 33d year of his age; and was succeeded by his brother Al Mansur. In the beginning of Al Mansur's reign, hostilities continued against the house of Ommiyah, who still made resistance, but were always defeated. Abdallah, however, the caliph's uncle, caused himself to be proclaimed caliph at Damascus; and having assembled a powerful army in Arabia, Syria, and Mesopotamia, advanced with great expedition to the banks of the Masius near Nisibis, where he encamped. Al Mansur, being informed of this rebellion, despatched Abu Moslem against Abdallah. This general, having harassed him for five months together, at last brought him to a general action; and having entirely defeated him, forced him to fly to Basra. Notwithstanding all his services, however, Abu Moslem was soon after ungratefully and barbarously murdered by Al Mansur, on some ridiculous pretences of being deficient in respect towards him.

181 Reign of Al Mansur.

182 He murders Abu Moslem.

After the death of Abu Moslem, one Sinan, a Magian, or adorer of fire, having made himself master of that general's treasures, revolted against the caliph; but he was soon defeated by Jamhur Ebn Morad, who had been sent against him with a powerful army. In this expedition Jamhur having acquired immense riches, the covetous disposition of the caliph prompted him to send a person express to the army to seize upon all the wealth. This so provoked Jamhur, that he immediately turned his arms against his master; but was soon defeated, and entirely reduced. The following year (the 139th of the Hegira), one Abdalrahman, of the house of Ommiyah, after the entire ruin of that family in Asia, arrived in Spain, where he was acknowledged caliph; nor did he or his descendants ever afterwards own subjection to the Arabian caliphs.

183 Abdalrahman proclaimed caliph in Spain.

184 Attempt to assassinate the caliph.

The 140th year of the Hegira is remarkable for an attempt to assassinate the caliph. This attempt was made by the Rawandians; an impious sect, who held the doctrine of metempsychosis or transmigration.—They first offered Al Mansur divine honours, by going in procession round his palace, as the Moslems were wont to do round the Caaba; but the caliph, highly incensed at this impiety, ordered 100 of the principal of them to be imprisoned. These, however, were soon released by their companions; who then went in a body to the palace with an intention to murder their sovereign; but he being a person of uncommon bravery, though he was surprised with very few attendants, mounted a mule, and advanced towards the mutineers, with an intention to sell his life as dear as possible. In the mean time, Maan Ebn Zaidat, one of the chiefs of the Ommiyan faction, who had concealed himself in order to avoid the caliph's resentment, sallied out of his retreat, and putting himself at the head of Al Mansur's attendants, charged the rebels with such fury, that he entirely defeated them. This generosity of Maan was so remarkable, that it afterwards passed into a proverb. On this occasion 6000 of the Rawandians were killed on the spot, and the caliph delivered from instant death: he was, however, so much disgusted with the Arabs on account of this attempt, that he resolved to remove the capital of his empire out of their peninsula; and accordingly founded a new city on the banks of the Tigris, which from that time to this has been known by the name of *Bagdad*. The foundations of it were laid in the 145th year of the Hegira, and finished four years after.

Arabia

185 He removes the seat of empire to Bagdad.

On the removal of the seat of government to Bagdad, the peninsula of the Arabs seems all at once to have lost its consequence, and in a short time the inhabitants seem even to have detached themselves from the jurisdiction of the caliphs: for in the 156th year of the Hegira, while Al Mansur was yet living, they made irruptions into Syria and Mesopotamia, as if they had designed to conquer these countries over again for themselves; and though the Arabs, properly so called, continued nominally subject to the caliphs of Bagdad till the abolition of the caliphate by Hulaku the Tartar, yet they did not become subject to him when he became master of that city. There is even the strongest reason to believe that the Arabs (i. e. the inhabitants of the peninsula properly called *Arabia*) have remained independent, not only of Hulaku, but of every other conqueror that the world hath yet produced.

The perpetual independence of the Arabs, indeed, "has been the theme of praise among strangers and natives. The kingdom of Yemen, it is true, has been successively subdued by the Abyssinians, the Persians, the sultans of Egypt, and the Turks; the holy cities of Mecca and Medina have repeatedly bowed under a Seythian tyrant; and the Roman province of Arabia embraced the peculiar wilderness in which Ismael and his sons must have pitched their tents in the face of their brethren. Yet these exceptions are temporary or local; the body of the nation has escaped the yoke of the most powerful monarchies; the arms of Sesostris and Cyrus, of Pompey and Trajan, could never achieve the conquest of Arabia; the present sovereign of the Turks may exercise a shadow of jurisdiction, but his pride is reduced to solicit the friendship of a people whom it is dangerous to provoke and fruitless to attack. The obvious causes of their freedom are inscribed on the character and country of the Arabs. Many ages before Mahomet, their intrepid valour had been severely felt by their neighbours in offensive and defensive war. The patient and active virtues of a soldier

186 Nations independence of the Arabs.

Arabia.

dier are insensibly nursed in the habits and discipline of a pastoral life. The care of the sheep and camels is abandoned to the women of the tribe; but the martial youth, under the banner of the emir, is ever on horseback, and in the field, to practise the exercise of the bow, the javelin, and the scimitar. The long memory of their independence is the firmest pledge of its perpetuity; and succeeding generations are animated to prove their descent and to maintain their inheritance. Their domestic feuds are suspended on the approach of a common enemy; and in their last hostilities against the Turks, the caravan of Mecca was attacked and pillaged by fourscore thousand of the confederates. When they advance to battle, the hope of victory is in the front; and in the rear, the assurance of a retreat. Their horses and camels, who in eight or ten days can perform a march of four or five hundred miles, disappear before the conqueror; the secret waters of the desert elude his search; and his victorious troops are consumed with thirst, hunger, and fatigue, in the pursuit of an invisible foe, who scorns his efforts, and safely reposes in the heart of the burning solitude. The arms and deserts of the Bedoweens are not only the safeguards of their own freedom, but the barriers also of the Happy Arabia, whose inhabitants, remote from war, are enervated by the luxury of the soil and climate. The legions of Augustus melted away in disease and lassitude: and it is only by a naval power that the reduction of Yemen has been successfully attempted. When Mahomet erected his holy standard, that kingdom was a province of the Persian empire; yet seven princes of the Homerites still reigned in the mountains; and the vicegerent of Chosroes was tempted to forget his distant country and his unfortunate master. The historians of the age of Justinian represent the state of the independent Arabs, who were divided by interest or affection in the long quarrel of the East: the tribe of Ghassan was allowed to encamp on the Syrian territory; the princes of Hira were permitted to form a city about 40 miles to the southward of the ruins of Babylon. Their service in the field was speedy and vigorous; but their friendship was venal, their faith inconstant, their enmity capricious: it was an easier task to excite than to disarm these roving barbarians: and, in the familiar intercourse of war, they learned to see, and to despise, the splendid weakness both of Rome and of Persia. From Mecca to the Euphrates, the Arabian tribes were confounded by the Greeks and Latins, under the general appellation of Saracens; a name which every Christian mouth has been taught to pronounce with terror and abhorrence.

187 Their domestic freedom and character.

"The slaves of domestic tyranny may vainly exult in their national independence; but the Arab is personally free; and he enjoys, in some degree, the benefits of society, without forfeiting the prerogatives of nature. In every tribe, superstition, or gratitude, or fortune, has exalted a particular family above the heads of their equals. The dignities of sheich and emir invariably descend in this chosen race; but the order of succession is loose and precarious; and the most worthy or aged of the noble kinsmen are preferred to the simple, though important, office of composing disputes by their advice, and guiding valour by their example. The momentary junction of several tribes produces an army: their more lasting union constitutes a nation; and the supreme chief, the emir of emirs, whose banner is displayed at their head, may deserve, in the eyes of strangers, the honours of the kingly name. If the Arabian princes abuse their power, they are quickly punished by the desertion of their subjects, who had been accustomed to a mild and parental jurisdiction. Their spirit is free, their steps are unconfined, the desert is open, and the tribes and families are held together by a mutual and voluntary compact. The softer natives of Yemen supported the pomp and majesty of a monarch; but if he could not leave his palace without endangering his life, the active powers of government must have been devolved on his nobles and magistrates. The cities of Mecca and Medina present, in the heart of Asia, the form or rather the substance of a commonwealth. The grandfather of Mahomet, and his lineal ancestors, appear in foreign and domestic transactions as the princes of their country; but they reigned like Pericles at Athens, or the Medici at Florence, by the opinion of their wisdom and integrity: their influence was divided with their patrimony; and the sceptre was transferred from the uncles of the prophet to a younger branch of the tribe of Koreish. On solemn occasions they convened the assembly of the people; and, since mankind must be either compelled or persuaded to obey, the use and reputation of oratory among the ancient Arabs is the clearest evidence of public freedom. But their simple freedom was of a very different cast from the nice and artificial machinery of the Greek and Roman republics, in which each member possessed an undivided share of the civil and political rights of the community. In the more simple state of the Arabs, the nation is free, because each of her sons disdains a base submission to the will of a master. His breast is fortified with the austere virtues of courage, patience, and sobriety; the love of independence prompts him to exercise the habits of self-command; and the fear of dishonour guards him from the meaner apprehension of pain, of danger, and of death. The gravity and firmness of the mind is conspicuous in its outward demeanour; his speech is slow, weighty, and concise; he is seldom provoked to laughter; his only gesture is that of stroaking his beard, the venerable symbol of manhood; and the sense of his own importance teaches him to accost his equals without levity, and his superiors without awe. The liberty of the Saracens survived their conquests: the first caliphs indulged the bold and familiar language of their subjects: they ascended the pulpit to persuade and edify the congregation; nor was it before the seat of empire was removed to the Tigris, that the Abbassides adopted the proud and pompous ceremonial of the Persian and Byzantine courts.

Arabia.

188 Civil wars and private revenge.

"In the study of nations and men, we may observe the causes that render them hostile or friendly to each other, that tend to narrow or enlarge, to mollify or exasperate the social character. The separation of the Arabs from the rest of mankind has accustomed them to confound the ideas of stranger and enemy; and the poverty of the land has introduced a maxim of jurisprudence, which they believe and practise to the present hour. They pretend, that in the division of the earth the rich and fertile climates were assigned to the other branches of the human family; and that

Arabia. the posterity of the outlaw Ismael might recover, by fraud or force, the portion of inheritance of which he had been unjustly deprived. According to the remark of Pliny, the Arabian tribes are equally addicted to theft and merchandise: the caravans that traverse the desert are ransomed or pillaged; and their neighbours, since the remote times of Job and Sesostris, have been the victims of their rapacious spirit. If a Bedoween discovers from afar a solitary traveller, he rides furiously against him, crying, with a loud voice, "Undress thyself; thy aunt, (*my wife*) is without a garment." A ready submission entitles him to mercy; resistance will provoke the aggressor, and his own blood must expiate the blood which he presumes to shed in legitimate defence. A single robber, or a few associates, are branded with their genuine name; but the exploits of a numerous band assume the character of lawful and honourable war. The temper of a people, thus armed against mankind, was doubly inflamed by the domestic license of rapine, murder, and revenge. In the constitution of Europe, the right of peace and war is now confined to a small, and the actual exercise to a much smaller, list of respectable potentates; but each Arab, with impunity and renown, might point his javelin against the life of his countryman. The union of the nation consisted only in a vague resemblance of language and manners; and in each community the jurisdiction of the magistrate was mute and impotent. Of the time of ignorance which preceded Mahomet, 1700 battles are recorded by tradition: hostility was embittered with the rancour of civil faction; and the recital, in prose or verse, of an obsolete feud was sufficient to rekindle the same passions among the descendants of the hostile tribes. In private life, every man, at least every family, was the judge and avenger of its own cause. The nice sensibility of honour, which weighs the insult rather than the injury, sheds its deadly venom on the quarrels of the Arabs: the honour of their women, and of their *beards*, is most easily wounded; an indecent action, a contemptuous word, can be expiated only by the blood of the offender; and such is their patient inveteracy, that they expect whole months and years the opportunity of revenge. A fine or compensation for murder is familiar to the barbarians of every age: but in Arabia the kinsmen of the dead are at liberty to accept the atonement, or to exercise with their own hands the law of retaliation. The refined malice of the Arabs refuses even the head of the murderer, substitutes an innocent to the guilty person, and transfers the penalty to the best and most considerable of the race by whom they have been injured. If he falls by their hands, they are exposed in their turn to the danger of reprisals; the interest and principal of the bloody debt are accumulated; the individuals of either family lead a life of malice and suspicion, and 50 years may sometimes elapse before the account of vengeance be finally settled. This sanguinary spirit, ignorant of pity or forgiveness, has been moderated, however, by the maxims of honour, which require in every private encounter some decent equality of age and strength, of numbers and weapons.

189 Annual truce. An annual festival of two, perhaps of four months, was observed by the Arabs before the time of Mahomet; during which their swords were religiously sheathed both in foreign and domestic hostility: and this partial truce is more strongly expressive of the habits of anarchy and warfare.

Arabia

190 Their social qualifications and virtues

"But the spirit of rapine and revenge was attempered by the milder influence of trade and literature. The solitary peninsula is encompassed by the most civilized nations of the ancient world; the merchant is the friend of mankind; and the annual caravans imported the first seeds of knowledge and politeness into the cities, and even the camps of the desert. The arts of grammar, of metre, and of rhetoric, were unknown to the freeborn eloquence of the Arabians; but their penetration was sharp, their fancy luxuriant, their wit strong and sententious, and their more elaborate compositions were addressed with energy and effect to the minds of their hearers. The genius and merit of a rising poet was celebrated by the applause of his own and the kindred tribes. A solemn banquet was prepared, and a chorus of women, striking their cymbals, and displaying the pomp of their nuptials, sung in the presence of their sons and husbands the felicity of their native tribe; that a champion had now appeared to vindicate their rights; that a herald had raised his voice to immortalize their renown. The distant or hostile tribes resorted to an annual fair which was abolished by the fanaticism of the first Moslems; a national assembly that must have contributed to refine and harmonize the barbarians. Thirty days were employed in the exchange, not only of corn and wine, but of eloquence and poetry. The prize was disputed by the generous emulation of the bards; the victorious performance was deposited in the archives of princes and emirs; and we may read in our own language the seven original poems which were inscribed in letters of gold, and suspended in the temple of Mecca. The Arabian poets were the historians and moralists of the age; and if they sympathized with the prejudices, they inspired and crowned the virtues of their countrymen. The indissoluble union of generosity and valour was the darling theme of their song: and when they pointed their keenest satire against a despicable race, they affirmed, in the bitterness of reproach, that the men knew not how to give, nor the women to deny. The same hospitality which was practised by Abraham, and celebrated by Homer, is still renewed in the camps of the Arabs. The ferocious Bedoweens, the terror of the desert, embrace, without inquiry or hesitation, the stranger who dares to confide in their honour and to enter their tent. His treatment is kind and respectful: he shares the wealth or the poverty of his host; and, after a needful repose, he is dismissed on his way, with thanks, with blessings, and perhaps with gifts.

191 Love of poetry.

192 Ancient idolatry.

"The religion of the Arabs, as well as of the Indians, consisted in the worship of the sun, the moon, and the fixed stars; a primitive and specious mode of superstition. The bright luminaries of the sky display the visible image of a deity: their number and distance convey to a philosophic, or even a vulgar eye, the idea of boundless space: the character of eternity is marked on these solid globes, that seem incapable of corruption or decay: the regularity of their motions may be ascribed to a principle of reason or instinct; and their real or imaginary influence encourages the vain belief that the earth and its inhabitants are the object of their peculiar care. The science of astronomy was cultivated

Arabia. cultivated at Babylon; but the school of the Arabs was a clear firmament and a naked plain. In their nocturnal marches, they steered by the guidance of the stars: their names, and order, and daily station, were familiar to the curiosity and devotion of the Bedoween; and he was taught by experience to divide in 28 parts the zodiac of the moon, and to bless the constellations who refreshed, with salutary rains, the thirst of the desert. The reign of the heavenly orbs could not be extended beyond the visible sphere; and some metaphysical powers were necessary to sustain the transmigration of souls and the resurrection of bodies; a camel was left to perish on the grave, that he might serve his master in another life; and the invocation of departed spirits implies that they were still endowed with consciousness and power. Each tribe, each family, each independent warrior, created and changed the rites and the object of his fantastic worship; but the nation in every age, has bowed to the religion as well as to the language of Mecca. The genuine antiquity of the Caaba extends beyond the Christian era. In describing the coast of the Red sea, the Greek historian Diodorus has remarked between the Thaumaudites and the Sabæans, a famous temple, whose superior sanctity was revered by *all* the Arabians: the linen or silken veil, which is annually renewed by the Turkish emperor, was first offered by a pious king of the Homerites, who reigned 700 years before the time of Mahomet. A tent or a cavern might suffice for the worship of the savages, but an edifice of stone and clay has been erected in its place; and the art and power of the monarchs of the east have been confined to the simplicity of the original model. A spacious portico encloses the quadrangle of the Caaba; a square chapel, 24 cubits long, 23 broad, and 27 high; a door and a window admit the light; the double roof is supported by three pillars of wood; a spout (now of gold) discharges the rain water, and the well Zemzem is protected by a dome from accidental pollution. The tribe of Koreish, by fraud or force, had acquired the custody of the Caaba; the sacerdotal office devolved through four lineal descents to the grandfather of Mahomet; and the family of the Hashemites, from whence he sprung, was the most respectable and sacred in the eyes of their country. The precincts of Mecca enjoyed the rights of sanctuary; and, in the last month of each year, the city and the temple was crowded with a long train of pilgrims, who presented their vows and offerings in the house of God. The same rites which are now accomplished by the faithful Mussulmans were invented and practised by the superstition of the idolaters. At an awful distance they cast away their garments: seven times, with hasty steps, they encircled the Caaba, and kissed the black stone; seven times they visited and adored the adjacent mountains; seven times they threw stones into the valley of Mina; and the pilgrimage was achieved, as at the present hour, by a sacrifice of sheep and camels, and the burial of their hairs and nails in the consecrated ground. Each tribe either found or introduced into the Caaba their domestic worship; the temple was adorned or defiled with 360 idols of men, eagles, lions, and antelopes; and most conspicuous was the statue of Hebal, of red agate, holding in his hand seven arrows, without heads or feathers, the instruments and symbols of profane divination. But this statue was a monument of Syrian arts; the devotion of the ruder ages was content with a pillar or a tablet; and the rocks of the desert were hewn into gods or altars in imitation of the black stone of Mecca, which is deeply tainted with the reproach of an idolatrous origin. From Japan to Pern, the use of sacrifice has universally prevailed; and the votary has expressed his gratitude or fear by destroying or consuming, in honour of the gods, the dearest and most precious of their gifts. The life of a man is the most precious oblation to deprecate a public calamity; the altars of Phœnicia and Egypt, of Rome and Carthage, have been polluted with human gore, the cruel practice was long preserved among the Arabs; in the third century, a boy was annually sacrificed by the tribe of the Dumatians; and a royal captive was piously slaughtered by the prince of the Saracens, the ally and soldier of the emperor Justinian. The father of Mahomet himself was devoted by a rash vow, and hardly ransomed for the equivalent of 100 camels. The Arabs, like the Jews and Egyptians, abstained from the taste of swine's flesh; and they circumcised their children at the age of puberty: the same customs, without the censure or the precept of the Koran, have been silently transmitted to their posterity and proselytes; and it has been sagaciously conjectured, that the artful legislator indulged the stubborn prejudices of his countrymen.

193 The Caaba or temple of Mecca.

Arabia.

194 Sacrifices and rites.

"Arabia was free: from the adjacent kingdoms, which were shaken by the storms of conquest and tyranny, the persecuted sects fled to the happy land where they might profess what they thought, and practise what they professed; and the religions of the Sabians and Magians, of the Jews and Christians, were disseminated from the Persian gulf to the Red sea. In a remote period of antiquity, Sabianism was diffused over Asia by the science of the Chaldeans and the arms of the Assyrians. From the observations of 2000 years, the priests and astronomers of Babylon deduced the eternal laws of nature and providence. They adored the seven gods or angels who directed the course of the seven planets, and shed their irresistible influence on the earth. The attributes of the seven planets, with the twelve signs of the zodiac and the twenty-four constellations of the northern and southern hemisphere, were represented by images and talismans; and seven days of the week were dedicated to their respective deities; the Sabians prayed thrice each day; and the temple of the moon at Haran was the term of their pilgrimage. But the flexible genius of their faith was always ready either to teach or to learn. The altars of Babylon were overturned by the Magians; but the injuries of the Sabians were revenged by the sword of Alexander. Persia groaned about 500 years under a foreign yoke; and the purest disciples of Zoroaster escaped from the contagion of idolatry, and breathed with their adversaries the freedom of the desert. Seven hundred years before the death of Mahomet the Jews were settled in Arabia: but a far greater multitude was expelled from the holy land in the wars of Titus and Hadrian. The industrious exiles aspired to liberty and power: they erected synagogues in the cities and castles in the wilderness; and their Gentile converts were confounded with the children of Israel, whom they resembled in the outward mark of circumcision.

197 The Jews.

Arabia.

198 The Christians.

cision. The Christian missionaries were still more active and successful; the Catholics asserted their universal reign; the sects whom they oppressed successivcly retired beyond the limits of the Roman empire; the Marcionites and Manichæans dispersed their *fantastic* opinions and apocryphal gospels; the churches of Yemen, and the princes of Hira and Ghassan, were instructed in a purer creed by the Jacobite and Nestorian bishops." Such was the state of religion in Arabia previous to the appearance of Mahomet. See N° 22. *supra.*

As the Arabs are one of the most ancient nations in the world, having inhabited the country they at present possess almost from the deluge, without intermixing with other nations, or being subjugated by any foreign power, their language must have been formed soon after, if not at, the confusion of Babel. The two principal dialects of it were, that spoken by the Hamyarites and other genuine Arabs, and that of the Koreish, in which Mahomet wrote the Koran. The first is styled by the Oriental writers the *Arabic* of *Hamyar*, and the other *the pure* or *defecated.* As Yarab, grandfather of Hamyar, is supposed by the Oriental writers to have been the first whose tongue deviated from the Syriac to the Arabic, the Hamyaritic dialect according to them must have approached nearer to the purity of the Syriac; and consequently have been more remotc from the true genius of the Arabic than that of any other tribe. The dialect of the Koreish, termed by the Koran *the perspicuous and clear Arabic*, is referred to Ishmael as its author; who, say the above-mentioned writers, first spoke it; and, as Dr Pococke believes, after he had contracted an alliance with the family of Jorham by marriage, formed it of their language and the original Hebrew. As, therefore, the Hamyaritic dialect partook principally of the Syriac, so that of the Koreish was supposed to consist chiefly of the Hebrew. But, according to Jallalo'ddin, the politeness and elegance of the dialect of the Koreish ought rather to be attributed to their having, from the remotest antiquity, the custody of the Caaba, and dwelling in Mecca the centre of Arabia. The Arabs are full of the commendations of their language, which is very harmonious, expressive, and, as they say so immensely copious, that no man uninspired can be a perfect master of it in its utmost extent. How much, in this last article, it is superior to the Greek and Latin tongues, in some measure appears from hence, that sometimes a bare enumeration of the Arabic names of one particular thing, and an explication of them, will make a considerable volume. Notwithstanding this, the Arabs believe the greatest part of their language to be lost; which will not seem improbable, when we consider how late the art of writing became generally practised among them. For though it was known to Job their countryman, to the Edomites, as well as the other Arabian nations bordering upon Egypt and Phœnicia, and to the Hamyarites many centuries before Mahomet, as appears from some ancient monuments said to be remaining in their character: yet the other Arabs, and those of Mecca in particular, unless such of them as were either Jews or Christians, were to the time of Moramer perfectly ignorant of it. It was the ancient Arabic language preceding the reign of Justinian, which so nearly resembled the Ethiopic; for since that time, and especially since the age of Mahomet, all the Arabic dialects have been not a little corrupted. This is now the learned language of the Mahometans, who study it as the European Christians do the Hebrew, Greek, and Latin.

Arabia

199 Letters.

The character used by them, the most ancient of any peculiar to the Arabs, wherein the letters were not distinctly separate, went by the appellation of *Al Mosnad*, from the mutual dependency of its letters or parts upon one another. This was neither publicly taught, nor suffered to be used, without permission first obtained. Could we depend upon what Al Firauzabadius relates from Ebn Hashem, this character must have been of a very high antiquity; since an inscription in it, according to the last author, was found in Yaman as old as the time of Joseph. Be that as it will, Moramer Ebn Morra of Anbar, a city of Irak, who lived not many years before Mahomet, was the inventor of the present Arabic character, which Bashar the Kendian, who married the sister of Abu Sofiàn, is said to have learned from the house of Anbar, and to have introduced at Mecca but a little time before the institution of Mahometanism. Moramer's alphabet the Oriental authors agree to have been very different from the ancient one of the Hamyarites, since they distinguish the Hamyaritic and Arabic pens. In Mahomet's time, the Morameric alphabet had made so small a progress, that no one in Yaman could either write or read it; nay, Mahomet himself was incapable of doing either; for which reason he was called the *illiterate prophet.* The letters of this alphabet were very rude; being either the same with, or very much like, the Cufic, which character is still found in inscriptions and the titles of ancient books; nay, for many years, it was the only one used by the Arabs, the Koran itself being the first written therein. In order to perpetuate the memory of Moramer's invention, some authors call the Arabic letters *Al Moramer*, i. e. *the progeny of Moramer.* The most remarkable specimens of the *Cufic* character (so denominated from Cufa, a city of Irak, where some of the first copies of the Koran were written) are the following: Part of that book in it on vellum, brought from Egypt by Mr Greaves; some other fragments of the same book in it published by Sir John Chardin; certain passages of a MS. in the Bodelian library; the legends on several Saracenic coins dug up not many years ago on the coast of the Baltic, not far from Dantzic; and, according to Mr Professor Hunt, those noble remains of it that are, or were lately, to be seen in Mr Joseph Ames's valuable collection of antique curiosities. As to the true origin of the ancient and modern Arabic alphabets, we must own ourselves pretty much in the dark. See ALPHABET.

200 Learning

The Arabian learning may be divided into two periods, viz. *Ante-Mahometan* and *Mahometan.*

The Arab learning, in this first period, consisted, according to Abulpharagius, in the knowledge of their language, the propriety of discourse, the composition of verse, and the science of the stars: but their chief attention seems to have been directed to oratory and poetry.

The same period is more distinguished, at least from the time of Al-Mamon, the seventh caliph of the family of the Abassides, who flourished about the year 820, and has the honour of being the founder of the

Arabia. the modern Arabian learning. He sent for all the best books out of Chaldea, Greece, Egypt, and Persia, relating to physic, astronomy, cosmography, music, chronology, &c. and pensioned a number of learned men, skilled in the several languages and sciences, to translate them into Arabic. By this means, divers of the Greek authors, lost in their own country and language, have been preserved in Arabic. From that time Arabia became the chief seat of learning; and we find mention by Abulpharagius, Pococke, D'Herbelot, and Hottinger, of learned men, and books without number.

The revival of learning in the tenth century, by Gerbert, known after his elevation to the pontificate by the title of Silvester II. and afterwards among the Europeans in general, may be ascribed to the instructions and writings of the Arabian doctors and philosophers, and to the schools which they founded in several parts of Spain and Italy. And in the 12th century, the inquisitive of different countries frequented the schools of the Saracens in Spain, and disseminated the knowledge which they obtained there after their return. At this time, many of the learned productions of the Arabians were translated into Latin, which facilitated the general progress of science.

The philosophy of the Arabians, before Mahomet, was Sabian, and included the system and ceremonies of that sect of idolaters. This it was that Mahomet set himself to decry; and he is even said by some to have carried his opposition so far, as to prohibit, if not punish, all study of philosophy. But his followers, by degrees, got over this restraint: the love of learning increased; till, under the memorable caliphate of Al Mamon, Aristotle's philosophy was introduced and established among them; and from them propagated with their conquests, through Egypt, Africa, Spain, and other parts. As they chose Aristotle for their master, they chiefly applied themselves to that part of philosophy called *logic*, and thus became proficients in the knowledge of words rather than things. Whence they have been sometimes denominated *Masters of the wisdom of words;* sometimes the *Talking sect*. Their philosophy was involved in quaint arbitrary terms and notions, and their demonstrations drawn from thence as from certain principles, &c. *Walch. Hist. Log.* lib. ii. sec. 2. § 1.

Their physic succeeded the Grecian; and their physicians handed down the art to us, having made considerable improvements, chiefly in the pharmaceutical and chemical parts.

It is certain we owe to them most of our spices and aromatics, as nutmegs, cloves, mace, and other matters of the produce of India. We may add, that most of the gentler purgatives were unknown to the Greeks, and first introduced by the Arabs, as manna, senna, rhubarb, tamarinds, cassia, &c. They likewise brought sugar into use in physic, where, before, only honey was used. They also found the art of preparing waters and oils, of divers simples, by distillation and sublimation. The first notice of the smallpox and the measles is likewise owing to them. Lastly, The restoration of physic in Europe took its rise from their writings. M. le Clerc has given a sketch, and Dr Freind an ample history, of the Arabian physic. We have also a *Notitia* of all the Arabian physicians by Fabricius.

Their poetry may be divided into two ages. The ancient, according to Vossius, was no other than rhyming; was a stranger to all measure and rule; the verses loose and irregular, confined to no feet, number of syllables, or any thing else, so that they rhymed at the end: oftentimes all the verses in the poem ended with the same rhyme. It is in such verse that the Alcoran is said to be written. Arabia.

The modern Arabian poetry takes its date from the caliphate of Al Raschid, who lived toward the close of the eighth century. Under him poetry became an art, and laws of prosody were laid down. Their comparisons, in which they abound, are taken, with little choice, from tents, camels, hunting, and the ancient manners of the Arabs.

201 Mechanical arts. That some of the Arabs had a good degree of knowledge in several mechanical arts, appears from Strabo, who informs us, that the people of Tamna and the adjacent provinces had magnificent temples, and elegant houses, built in the Egyptian taste. The same author likewise relates, that in Arabia Felix, besides the husbandmen, there were many artificers; and amongst others, those who made palm wine, which he intimates, was much used by the Arabs. As for the exercise of arms and horsemanship, they looked upon this as one of their principal accomplishments, being obliged to practise and encourage it by reason of the independency of their tribes, whose frequent jarring made wars almost continual amongst them, which for the most part ended in field battles. Hence it became an usual saying amongst them, that God had bestowed four peculiar things on the Arabs, viz. *turbans instead of diadems, tents instead of walls and houses, swords instead of intrenchments, and poems instead of written laws.* The principal arms used by the ancient Arabs were bows and arrows, darts or javelins, and broadswords or scimitars. The bows and arrows were the most ancient of these; being used by Ishmael himself, according to Scripture. It is probable also, that some of them were acquainted with every branch of the military art cultivated by their neighbours the Egyptians, Syrians, and Phœnicians.

202 Commerce. Before the Portuguese interrupted the navigation of the Red sea, the Arabs were the factors of all the trade that passed through that channel. Aden, which is situated at the most southern extremity of Arabia upon the Indian ocean, was the mart in those parts. The situation of its harbour, which opened an easy communication with Egypt, Ethiopia, India, and Persia, had rendered it, for many ages, one of the most flourishing factories in Asia. Fifteen years after it had repulsed the great Albuquerque, who attempted to demolish it in 1513, it submitted to the Turks, who did not long remain masters of it. The king of Yemen, who possessed the only district in Arabia that merits the title of *Happy*, drove them from thence, and removed the trade to Mocha, a place in his dominions which till then was only a village.

This trade was at first inconsiderable; consisting principally in myrrh, incense, aloes, balm of Mecca, some aromatics, and medicinal drugs. These articles, the exportation of which is continually retarded by exorbitant imposts, and does not exceed at present 30,625l. were at that time more in repute than they have been since; but must have been always of little consequence.

Arabia. consequence. Soon after a great change ensued from the introduction of coffee.

Though this article is generally used in the Arabian entertainments, none but the rich citizens have the pleasure of tasting the berry itself. The generality are obliged to content themselves with the shell and the husk of this valuable production. These remains, so much despised, make a liquor of a pretty clear colour, which has a taste of coffee without its bitterness and strength. These articles may be had at a low price at Betelfagui, which is the general market for them. Here likewise is sold all the coffee which comes out of the country by land. The rest is carried to Mocha, which is 35 leagues distant, or to the nearer ports of Loheia or Hodeida, from whence it is transported in small vessels to Jodda. The Egyptians fetch it from the last-mentioned place, and all other nations from the former.

The quantity of coffee exported may be estimated at twelve millions five hundred and fifty thousand weight. The European companies take off a million and a half; the Persians three millions and a half; the fleet from Suez six millions and a half; Indostan, the Maldives, and the Arabian colonies on the coast of Africa, fifty thousand; and the caravans a million.

As the coffee which is bought up by the caravans and the Europeans is the best that can be procured, it costs about 8½d. a pound. The Persians, who content themselves with that of an inferior quality, pay no more than about 6½d. a pound. The Egyptians purchase it at the rate of about 8d.; their cargoes being composed partly of good and partly of bad coffee. If we estimate coffee at about 7⅜d. a pound, which is the mean price, the profits accruing to Arabia from its annual exportation will amount to 384,343l. 15s. This money does not go into their coffers; but it enables them to purchase the commodities brought from the foreign markets to their ports of Jodda and Mocha.

Mocha receives from Abyssinia, sheep, elephants teeth, musk, and slaves. It is supplied from the eastern coast of Africa with gold, slaves, amber, and ivory; from the Persian gulf, with dates, tobacco, and corn; from Surat, with a vast quantity of coarse, and a few fine linens; from Bombay and Pondicherry, with iron, lead, and copper, which are carried thither from Europe; from Malabar, with rice, ginger, pepper, Indian saffron, with coire, cardamom, and also with planks; from the Maldives, with gum benzoin, aloes wood, and pepper, which these islands take in exchange; from Coromandel, with 400 or 500 bales of cottons, chiefly blue. The greatest part of these commodities, which may fetch 262,500l. are consumed in the interior parts of the country. The rest, particularly the cottons, are disposed of in Abyssinia, Socotora, and the eastern coast of Africa.

None of the branches of business which are managed at Mocha, as well as throughout all the country of Yaman, or even at Sanaa the capital, are in the hands of the natives. The extortions with which they are perpetually threatened by the government deter them from interfering in them. All the warehouses are occupied by the Banians of Surat or Guzerat, who make a point of returning to their own country as soon as they have made their fortunes. They then resign their settlements to merchants of their own nation, who retire in their turn, and are suceeeded by others. Arabia

The European companies, who enjoy the exclusive privilege of trading beyond the Cape of Good Hope, formerly maintained agents at Mocha. Notwithstanding it was stipulated by a solemn capitulation, that the imposts demanded should be rated at two and a quarter per cent. they were subject to frequent extortions: the governor of the place insisting on their making him presents which enabled him to purchase the favour of the courtiers, or even of the prince himself. However, the profits they obtained by the sale of European goods, particularly cloths, made them submit to these repeated humiliations. When these several articles were furnished by Grand Cairo, it was then impossible to withstand the competition, and the fixed settlements were therefore given up.

The trade was carried on by ships that sailed from Europe with iron, lead, copper, and silver, sufficient to pay for the coffee they intended to buy. The supercargoes, who had the care of these transactions, settled the accounts every time they returned. These voyages, which at first were pretty numerous and advantageous, have been successively laid aside. The plantations of coffee, made by the European nations in their colonies, have equally lessened the consumption and the price of that which comes from Arabia. In process of time these voyages did not yield a sufficient profit to answer the high charges of undertaking them on purpose. The companies of England and France then resolved, one of them to send ships from Bombay, and the other from Pondicherry, to Mocha, with the merchandise of Europe and India. They even frequently had recourse to a method that was less expensive. The English and French visit the Red sea every year. Though they dispose of their merchandise there to good advantage, they can never take in cargoes from thence for their return. They carry, for a moderate freight, the coffee belonging to the companies, who lade the vessels with it, which they despatch from Malabar and Coromandel to Europe. The Dutch company, who prohibit their servants from fitting out ships, and who send no vessels themselves to the gulf of Arabia, are deprived of the share they might take in this branch of commerce. They have also given up a much more lucrative branch, that of Jodda.

Jodda is a port situated near the middle of the gulf of Arabia, 20 leagues from Mecca. The government there is of a mixed kind: the grand signior and the xeriff of Mecca share the authority and the revenue of the customs between them. These imposts are levied upon the Europeans at the rate of 8 per cent. and upon other nations at 13. They are always paid in merchandise, which the managers oblige the merchants of the country to buy at a very dear rate. The Turks who have been driven from Aden, Mocha, and every part of Yaman, would long ago have been expelled from Jodda, if there had not been room to apprehend that they might revenge themselves in such a manner as to put an end to their pilgrimages and commerce.

The coins which are current at Mocha, the principal port of the Red sea, are dollars of all kinds; but they abate five per cent. on the pillar dollars, because they are reckoned not to be the purest silver, and the 203 Coins.

dollar,

Arabia || Aracan.

dollar weight with them is 17 drachms 14 grains. All their coins are taken by weight, and valued according to their pureness. The gold coins current here are ducats of Venice, Germany, Turkey, Egypt, &c. The comasses are a small coin, which are taken at such a price as the government sets on them; and they keep their accounts in an imaginary coin, called *cabeers*, of which 80 go to a dollar. For an account of the ancient coins called *dinars* and *dirhems*, see these two articles.

Gum ARABIC. See GUM.

ARABICI, a sect who sprung up in Arabia about the year 207, whose distinguishing tenet was, that the soul died with the body, and also arose again with it.

Eusebius, lib. vi. c. 38. relates that a council was called to stop the progress of this rising sect; and that Origen assisted at it, and convinced them so thoroughly of their error that they abjured it.

ARABIS, BASTARD TOWER MUSTARD. See BOTANY *Index*.

ARABISM, ARABISMUS, an idiom or manner of speaking peculiar to the Arabs or the Arabic language.

ARABIST, a person curious of, and skilled in, the learning and language of the Arabians: such were Erpenius and Golius. The surgeons of the 13th century are called *Arabists* by Severinus.

ARABLE LANDS, those which are fit for tillage, or which have been formerly tilled.

ARACAN, the capital of a small kingdom to the north-east of the bay of Bengal, situated in E. Long. 93. 0. N. Lat. 20. 30. It has the conveniency of a spacious river, and a harbour large enough to hold all the ships in Europe. It is said by Schouten to be as large as Amsterdam; but the houses are slight, being made with palm trees and bamboo canes, and covered with leaves of trees. They are seldom above six feet high, but have many windows or air-holes. But the people of the highest rank are much better accommodated. They have no kitchens, chimneys, or cellars, which obliges the women to dress the victuals out of doors. Some of the streets are on the ridges of rocks, wherein are a great many shops. Their orchards and gardens contain all the fruits common to the Indies, and their trees are green all the year. Their common drink is toddy; which is the sap of the cocoa tree, and when new, will intoxicate like wine, but soon grows sour. Elephants and buffaloes are very numerous here, and are made use of instead of horses. They have plenty of provisions, and but little trade: for when Mr Charnock was here in 1686, with six large ships, there was nothing to be had in the way of commerce; and yet the country produces lead, tin, stick lac, and elephants teeth. The Mogul's subjects come here to purchase these commodities; and sometimes meet with diamonds, rubies, and other precious stones. They were formerly governed by a king of their own, called the king of the *White Elephant;* but this country has been conquered by the king of Pegu. They pay little or no regard to the chastity of their women, and the common sailors take great liberties among them. Their religion is Paganism; and the idols, temples, and priests are very numerous. The dress of the better sort is very slight, for it consists chiefly of a piece of white cotton over their arms, breast, and belly, with an apron before. The complexion of the women is tolerable: they wear thin flowered gauze over their breast and shoulders, and a piece of cotton, which they roll three or four times round their waist, and let it hang as low as their feet. They curl their hair, and put glass rings in their ears, and stretch them of a monstrous length. On their arms and legs they have hoops of copper, ivory, silver, &c. The country produces great quantities of rice, and the water is good. Their flocks of sheep and herds of cattle are also numerous near Aracan; but what they say of the towns and villages, with which the country is pretended to be overspread, may be doubted. Captain Hamilton affirms, that there are but few places inhabited, on account of the great number of wild elephants and buffaloes, which would destroy the fruits of the ground; and that the tigers would destroy the tame animals. There are some villages near the sea, inhabited by a few miserable fishermen, who can just keep themselves from starving, though they are out of the reach of oppression. The rich burn the dead bodies; but the poor, who are not able to buy wood, throw them into the river.

Aracan || Arack.

ARACHIS, See BOTANY *Index*.

ARACHNE, in fabulous history, a young maid of Lydia, said to have been the inventress of spinning. She is fabled to have been so skilful in this art, as to challenge Minerva at it; who tore her work, and struck her, which disgrace driving her to despair, she hanged herself. Minerva from compassion brought her to life, and transformed her into a spider, which still employs itself in spinning.

ARACHNOIDES, in *Anatomy*, an appellation given to several membranes; as the tunic of the crystalline humour of the eye, the external lamina of the pia mater, and one of the coverings of the spinal marrow.

ARACK, ARRACK, or RACK, a spirituous liquor imported from the East Indies, used by way of dram and in punch.

The word *arack*, according to Mr Lockyer, is an Indian name for strong waters of all kinds; for they call our spirits and brandy *English arack*. But what we understand by the name *arack*, he affirms, is really no other than a spirit procured by distillation from a vegetable juice called *toddy*, which flows by incision out of the cocoa-nut tree, like the birch juice procured among us. The toddy is a pleasant drink by itself, when new, and purges those who are not used to it: and, when stale, it is heady, and makes good vinegar. The English at Madras use it as leaven to raise their bread with.

Others are of opinion, that the arack, or arrack, is a vinous spirit obtained by distillation, in the East Indies, from rice or sugar, fermented with the juice of cocoa nuts.

The Goa arrack is said to be made from the toddy, the Batavia arack from rice and sugar; and there is likewise a kind of shrub from which arack is made.

Goa and Batavia are the chief places for arack. At Goa there are divers kinds: single, double, and treble distilled. The double distilled, which is that commonly sent abroad, is but a weak spirit in comparison with Batavia arack; yet, on account of its peculiar and agreeable flavour, is preferred to all the other aracks of India. This flavour is attributed to the earthen ves-

Arack. sels which they use at Goa to draw the spirit; whereas at Batavia they use copper stills.

The Parier araek made at Madras, and the Columbo and Quilone arrack at other places, being fiery hot spirits, are little valued by the Europeans, and therefore rarely imported; though highly prized among the natives. In the best Goa arack, the spirits of the eocoa juice do not make above a sixth or eighth part.

The manner of making the Goa araek is this: The juice of the trees is not procured in the way of tapping as we do; but the operator provides himself with a parcel of earthen pots, with bellies and necks like our ordinary bird bottles: he makes fast a number of these to his girdle, and any way else that he commodiously can about him. Thus equipped, he elimbs up the trunk of a cocoa tree; and when he comes to the boughs, he takes out his knife, and cutting off one of the small knots or buttons, he applies the mouth of the bottle to the wound, fastening it to the bough with a bandage; in the same manner he cuts off other buttons, and fastens on his pots, till the whole number is used: this is done in the evening, and descending from the tree, he leaves them till the next morning; when he takes off the hottles, which are mostly filled, and empties the juice into the proper receptaele. This is repeated every night, till a suffieient quantity is produced; and the whole being then put together, is left to ferment, which it soon does. When the fermentation is over, and the liquor or wash is become a little tart, it is put into the still, and a fire being made, the still is suffered to work as long as that which comes over has any considerable taste of spirit.

The liquor thus procured is the low wine of arack; and this is so poor a liquor, that it will soon corrupt and spoil if not distilled again, to separate some of its phlegm; they therefore immediately after pour back this low wine into the still, and rectify it to that very weak kind of proof spirit, in which state we find it. The araek we meet with, notwithstanding its being of a proof test, according to the way of judging by the crown of bubbles, holds but a sixth, and sometimes but an eighth part of alcohol, or pure spirit; whereas our other spirits, when they show that proof, are generally esteemed to hold one half pure spirit. *Shaw's Essay on Distilling.*

There is a paper of observations on arack, in the *Melanges d'Histoire Natur.* tom. v. p. 302. By fermenting, distilling, and rectifying the juice of the American maple, which has much the same taste as that of the cocoa, the author says, he made arack not in the least inferior to any that comes from the East Indies; and he thinks the juice of the sycamore and of the birch tree would equally answer the end.

Besides the common sorts of Goa and Batavia arack, there are two others less generally known; these are the bitter arack and the black arack.

By stat. 11th Geo. I. c. 30. arack, on board a ship within the limits of any port of Great Britain, may be searched for and seized, together with the package; or if found unshipping or unshipped, before entry, may be seized by the officers of excise, in like manner as by the officers of the customs.—Upon an exeise officer's suspicion of the concealment of araek, and oath made of the grounds of such suspicion before the commissioners or a justice of peace, they may empower him to enter such suspected places, and seize the liquors, with the casks, &c. If the offieers are obstructed, the penalty is 100l.

Arack || Aradus. Arack is not to be sold but in warehouses, entered as directed in the 6th of Geo. I. c. 21. upon forfeiture, and the casks, &c. If permits are not returned which are granted for the removal of arack, or if the goods are not sent away within the time limited, the penalty is treble the value. If the permits are not returned, and the decrease is not found to be sufficient, the like quantity is forfeited. Permits are not to be taken out but by direction in writing of the proprietor of the stock, or his known servant, upon forfeiture of 50l. or three months imprisonment.

By stat. 9th Geo. II. c. 35. if araek is offered to sale without a permit, or by any hawker, pedlar, &c. with a permit, the person to whom it is offered may seize and carry it to the next warehouse belonging to the customs or excise, and bring the person offering the same before any justice of the peace, to be committed to prison, and proseeuted for the penalties ineurred by sueh offenee. The person seizing such goods may prosecute in his own name; and on recovery is entitled to one-third part of the gross produce of the sale; and the commissioners are, if desired, upon a eertifieate from the justice of the offender's being committed to prison, to advance to the seizer 15s. per gallon for the arack so seized.

Arack (except for the use of seamen, two gallons each) found in any ship or vessel arriving from foreign parts, at anchor, or hovering within the limits of any port, or within two leagues of the shore, and not proceeding on her voyage (unless in case of unavoidable neeessity and distress of weather, notice whereof must be given to the collector or ehief offieer of the port upon the ship's arrival), is forfeited, with the boxes, easks, or other package, or the value thereof.

ARACK is also the name of a spiritnous liquor made by the Tartars of Tungusia, of mares milk, left to sour, and afterwards distilled twice or thriee between two earthen pots closely stopped, whence the liquor runs through a small wooden pipe. It is more intoxicating than brandy.

ARAD, in *Ancient Geography*, a city lying to the south of Judah and the land of Canaan, in Arabia Petræa. The Israelites having advanced towards the land of Canaan (Numb. xxi. 1.), the king of Arad opposed their passage, defeated them, and took a great booty from them; but they destroyed his eountry as soon as they beeame masters of the land of Canaan (Numb. xxxiii.). Arad was rebuilt, and Ensebius places it in the neighbourhood of Kades, at the distanee of 20 miles from Hebron. The Israelites in their passage through the wilderness, having departed from Sepher, eame to Arad, and from thence to Makkelath.

ARADUS, in *Ancient Geography*, an island between the borders of Phœnieia and Seleucia, at the distance of 20 stadia from a dangerous coast: all of it a roek surrounded by the sea, in compass seven stadia; and forming a very powerful city and republie. It is now called *Ronad;* but not a single wall is remaining of all that multitude of houses which, according to Strabo, were built with more stories than even those of Rome. The liberty enjoyed by the inhabitants had rendered it very populous; and it subsisted by naval commerce,

Aradus ‖ ræometer.

commerce, manufactures, and arts. At present the island is deserted; nor has tradition even retained the memory of a spring of fresh water in its environs, which the people of Aradus discovered at the bottom of the sea, and from which they drew water in time of war by means of a leaden bell and a leathern pipe fitted to its bottom.

ARÆ PHILÆNON, or PHILÆNORUM (Strabo); to the south of the Syrtis Major; but in Peutinger more westerly, to the south almost of the Syrtis Minor. In Strabo's time, the altars were not extant, but a village of the same name stood on the spot. On a dispute about limits, between the Cyreneans and Carthaginians, it was agreed that two of each people should set out on the same day, and that where they should happen to meet, there the limits of both should be fixed. The Philæni, two brothers, Carthaginians, undertook it for Carthage: these, after having advanced a great many miles into the territory of the Cyreneans, were met by their antagonists; who, enraged at their being beforehand with them so far, gave them the option of either returning back, or of being buried alive on the spot. Like zealous patriots, they chose the latter; and there the Carthaginians raised two altars in honour of the Philæni. (Sallust, Valerius Maximus).

ARÆOMETER, an instrument to measure the density or gravity of fluids.

The aræometer, or waterpoise, is usually made of glass; consisting of a round hollow ball, which terminates in a long slender neck hermetically sealed at top: there being first as much running mercury put into it as will serve to balance or keep it swimming in an erect position.

The stem is divided into degrees (as represented Plate XXXVI. fig. 23.); and by the depth of its descent into any liquor, the lightness of that liquor is concluded: for that fluid in which it sinks least must be heaviest; and that in which it sinks lowest lightest.

Mr Homberg has invented an aræometer, described in Phil. Transact. N° 262. thus: *A* is a glass bottle or matrass, with so slender a neck that a drop of water takes up in it above five or six lines, or half of an inch. Near that neck is a small capillary tube *D*, about six inches long, and parallel to the neck.—To fill the vessel, the liquor is poured in at the mouth *B* (which is widened to receive a tunnel), till it run out at *D*, that is, till it rise in the neck to the mark *C*, by which means you have always the same bulk or quantity of liquor; and consequently, by means of the balance, can easily tell, when different liquors fill it, which weighs most, or is most intensely heavy.

Some regard, however, is to be had in these trials to the season of the year, and degree of heat and cold in the weather; because some liquors rarefy with heat and condense with cold more than others, and accordingly take up more or less room.

By means of this instrument, the ingenious author has made a table to show the different weights of the same bulk of the most considerable chemical liquors both in summer and winter as follows:

	Weighed in summer.	In winter.
The aræometer full of	*oz. dr. gr.*	*oz. dr. gr.*
Quicksilver, -	11 00 06 -	11 00 32
Oil of tartar, -	01 03 08 -	01 03 13

Aræometer ‖ Aral.

The instrument itself weighed, when empty, one drachm twenty-eight grains. See HYDROMETER in this work, and ARÆOMETER in the SUPPLEMENT.

ARÆOPAGUS. See AREOPAGUS.

ARÆOSTYLE, in *Architecture*, a term used by Vitruvius, to signify the greatest interval which can be made between columns.

ARÆOTICS, in *Medicine*, remedies which rarefy the humours, and render them easy to be carried off by the pores of the skin.

ARAF, among the Mahometans. See ALARAF.

ARAFAH, the ninth day of the last month of the Arabic year, named *Dhoulhegiat;* on which the pilgrims of Mecca perform their devotions on a neighbouring mountain called *Arafat*. The Mahometans have a very great veneration for this mountain, because they believe that Adam and Eve, after they were banished out of Paradise, having been separated from each other during 120 years, met afterwards on this mountain.

ARAFAT, or GIBEL EL ORPHAT, *the mountain of knowledge*, a mountain in Arabia near Mecca. The Mahometans say this was the place where Adam first met with and knew his wife Eve after their expulsion from Paradise. This mountain not being large enough to contain all the devotees that come annually in pilgrimage to Mecca, stones are set up all round it to show how far it reaches. The pilgrims are clad in robes of humility and mortification, with their heads uncovered. They seem to be very much affected; for the tears flow down their cheeks, and they sob and sigh most bitterly, begging earnestly for remission of sins, and promising to lead a new life. They continue here about four or five hours, and at half an hour after sunset they all decamp to perform a religious duty called *Asham nomac*. After this, they all receive the honourable title of *hadgees*, which is conferred upon them by the imam or priest. This being pronounced, the trumpet sounds, and they all return to Mecca.

ARAGON. See ARRAGON.

ARAL, a great lake in the kingdom of Khowarazm, lying a little to the eastward of the Caspian sea. Its length from north to south is said to be near 150 miles, and its breadth from east to west about 70. The shore on the west side is high and rocky, and destitute of good water: yet there are abundance of wild horses, asses, antelopes, and wolves; as also a fierce creature called a *jolbart*, which the Tartars say is of such a prodigious strength as to carry off a horse. It is surprising that this lake should be quite unknown to geographers till within these few years. Several great rivers, which were supposed to run into the Caspian sea, are now known to fall into this lake, particularly the Sihun or Sirr, and the Ghihun or Amo, so often

Aral || Aranjuez.

mentioned by the Oriental historians. This lake, like the Caspian sea, has no visible outlet. Its water is also very salt; and for that reason is conveyed by the neighbouring inhabitants by small narrow canals into sandy pits, where the heat of the sun, by exhaling the water, leaves them a sufficient quantity of salt. The same kinds of fish are found in the Aral that are found in the Caspian sea. The former is also called the *Lake of Eagles*.

ARAHUM, or HARAHUM, in ancient writers, denotes a place consecrated or set apart for holy purposes. Hence the phrase *in araho jurare*, or *conjurare*, "to make oath in the church;" because, by the Ripuarian laws, all oaths were to be taken in the church on the relicks of the saints.

ARALIA, the ANGELICA TREE. See BOTANY *Index*.

ARAM, or *Aramæa Regio*, in *Ancient Geography*, the Hebrew name of Syria, so called from Aram the son of Shem, (Moses, Josephus).

ARAM Beth-Rehob, in *Ancient Geography*, was that part of Syria lying to the north of Palestine; because Rehob was its boundary towards that quarter, (Moses); allotted to the tribe of Asher, (Judges); where it joins Sidon, (Joshua).

ARAM-Dammasek, or Syria Damascena, in *Ancient Geography*, a principal part of Syria, and more powerful than the rest (2 Sam.), taking its name from Damascus, the principal city.

ARAM-Maacha, in *Ancient Geography*, a district of Syria, at the foot of Mount Hermon, (2 Samuel, 1 Chronicles); on the borders of the half tribe of Manasseh, on the other side the Jordan, called the coast of *Maachathi*, (Moses, Joshua).

ARAM-Naharaim, in *Ancient Geography*, i. e. Aram or Syria of the Rivers, or Mesopotamia, situated between the Euphrates and Tigris; which is the reason of the name.

ARAM-Soba or *Zoba*, in *Ancient Geography*, which David conquered, was a country near the Euphrates, where afterwards Palmyra stood: the Euphrates bounded it on the east, as the land of Canaan and Syria Damascena did on the west, (2 Samuel).

ARAMONT, a town of Languedoc in France, seated on the river Rhone. E. Long. 4. 52. N. Lat. 43. 54.

ARANEA, the SPIDER. See ENTOMOLOGY *Index*.

ARANJUEZ, a town in the province of New Castile, where the king of Spain has a palace and gardens which are reckoned the most delightful in the world.

This place is 20 miles from Madrid, by a noble road, planted on each side with trees, lately made at the expence of 120,000l. sterling. It is delightfully situated at the conflux of the rivers Tagus and Jarama; which run through the gardens, and add new beauty to this charming spot, where art and nature seem to go hand in hand with the most pleasing and rural simplicity. On one side fine avenues of stately oaks and lofty elms convey the truest ideas of magnificence, while they afford the most reviving shade; on the other, the sudden transitions to lawns and wilderness, the cascades of water breaking through the thickets, the tuneful songs of numberless birds sheltered in these cool recesses, the occasional appearance and passage of the monarch attended by the grandees of his kingdom; all these objects united, and concentred in one point, fill the imagination with pleasing ideas, and impress the mind of a traveller with a thousand agreeable sensations. Aranjuez

The general situation is in a very large plain surrounded with large hills, of a most disagreeable aspect indeed, but seldom appearing, being well hidden by the noble rows of trees that extend across the flat in every direction. The main body of the palace is an old building, to which have been lately added two new wings. The first part of the building was erected by Philip II. who purchased the estate, planted many of the avenues, and, in order to extend his chase, or to indulge his splenetic disposition, had all the vines that grew on the hills rooted up. By that means he drove away the inhabitants, and rendered the environs of his villa a perfect desert.—The apartments are good; but contain nothing very particular to take off from the enjoyment of so many fine objects abroad. In one of the new wings is a playhouse, and in the other a chapel. Part of the ceiling of the former was painted by Mengs, who was also sent to Rome to paint a holy family for the principal altar in the chapel. There are seven fine pictures of Luca Jordano in the apartment called *El Cabinete Antiguo*, and six others in that *De los Mayordomos*. The portraits of the grand duke and duchess of Tuscany, by Mengs, are in a new apartment, called the *king's dressing-room*. In the chapel, over the great altar, there is a fine picture of the Annunciation, by Titian, presented by him to Charles V. and brought from the convent of Juste, after the death of that emperor. The porcelain cabinet, where there are several large pieces of the king's own manufacture, is also an object of curiosity to a traveller.

As to the gardens, the whole of them may be thrown into three grand divisions, distinguished by the names of La Huerta Valenciana, Los Deleites, and El Cortijo. In the Huerta Valenciana, agriculture and gardening are carried on in the same manner as in that fruitful province, and they plough with horses. In the Cortijo they use oxen, as in Andalusia; and in other places they scratch up the ground with mules, as is still practised in some parts of Spain. Whichever way one looks round, a constant variety pleases the eye, and enraptures the mind. At one moment the sturdy buffalo moves before you, drawing his heavy burden; soon after, the slow camel, with his ponderous load; while the swift zebra with his striped garment frisks over the plains. If you approach the farm, every object of convenience is consulted, and in the dairy every degree of neatness. The Dutch cow enjoys a luxuriant pasture, the brood mares greatly enliven the landscape, and the stables are filled with the most excellent horses; and an immense nursery furnishes all manner of trees and plants. The fine avenue, which serves also for a public walk, called *Calle de Reyna*, has nothing equal to it at Versailles. It is three miles long, quite straight from the palace gate, crossing the Tagus twice before it loses itself in the thickets, where some noble spreading elms and weeping poplars hang beautifully over the deep still pool. Near this road is a flower garden for the spring, laid out with great taste by Mr Wall during his ministry. The gay variety of flowers

Aranjuez, Arar.

at this time of year is particularly pleasing to the eye; but its beauty soon fades on the approach of summer. As the weather grows hot, the company that choose to walk retire to a garden in an island of the Tagus, on the north side of the palace. This is a heavenly place, cut into various walks and circular lawns, which in their primitive state may have been very stiff and formal: but in the course of a century, Nature has obliterated the regular forms of art; the trees have swelled out beyond the line traced for them, and destroyed the enfilade by advancing into the walks or retiring from them. The sweet flowering shrubs, instead of being clipped and kept down, have been allowed to shoot up into trees, and hang over the statues and fountains they were originally meant to serve as humble fences to. The jets-d'eau dash up among the trees, and add fresh verdure to the leaves. The terraces and balustrades built along the river, are now overgrown with roses, and other luxuriant bushes, hanging down into the stream, which is darkened by the large trees growing on the opposite banks. Many of the statues, groupes, and fountains, are handsome, some masterly, the works of Algardi: all are placed in charming points of view, either in open circular spots, at a distance from the trees, or else in gloomy arbours, and retired angles of the wood. The banks of this wood, called the Ila, are also enlivened by elegant yachts for the amusement of the royal family.

The town or village formerly consisted of the palace, its offices, and a few miserable huts, where the ambassadors, and the attendants of the court, endeavoured to lodge themselves as well as they could, but always very uncomfortably; many of the habitations were vaults half under ground. What determined the king to build a new town, and to embellish the environs, was an accident that happened at the nuncio's; a coach broke through the ceiling of his dining-room, and fell in upon the table. The court then began to apply very considerable sums to the purpose of erecting proper dwellings for the great number of persons that flock to the place where the sovereign resides; near 10,000 are supposed to live here two or three months in spring; the king keeps 115 sets of mules, which require a legion of men to take care of them. Above a million sterling has been laid out at Aranjuez since the year 1763; and it must be acknowledged, that wonders have been performed: several fine streets drawn in straight lines with broad pavements, a double row of trees before the houses, and a very noble road in the middle; commodious hotels for the ministers and ambassadors; great squares, markets, churches, a theatre, and an amphitheatre for bull feasts, have been raised from the ground; besides the accession of two new wings to the palace. Neatness and convenience have been more studied and sought for than show in the architecture, but altogether the place has something truly magnificent in the coup d'œil.

ARAR, (Cæsar, Strabo); *Araris*, (Dio Cassius); *Saucona*, (Ammian): A river of Celtic Gaul, now the *Saone;* which rises out of Mount Vogesus on the confines of Lorrain, runs through the Franche Comté and Burgundy, and below Lyons falls into the Rhone. It is so incredibly slow, that the eye cannot distinguish which way it moves, (Cæsar); and therefore Pliny calls it the *Sluggish river*. Its course is from north to south. It is famous for a bridge of Cæsar, which was built by the soldiers in one day. It is navigable equally with the Rhone.

Arar, Ararat.

ARARAT, the name of the mountain on which Noah's ark rested, after the abatement of the waters of the universal deluge. Concerning this mountain there are various conjectures; though it is almost universally allowed to be in Armenia Major. Some are of opinion that it is one of the mountains which divide Armenia on the south from Mesopotamia and that part of Assyria inhabited by the *Curds;* from whom these mountains took the name of *Curdu* or *Cardu*, by the Greeks turned into *Gordyæi*, &c. Others, that it lies towards the middle of Armenia, near the river Araxes, above 280 miles distant from the above mentioned mountains, making it belong to Mount Taurus; but the Armenians are positive that Noah's Ararat is no other than a mountain to which they now give the name of *Masis*, which lies about 12 leagues to the east of Erivan, and four leagues from the Aras. It is encompassed by several petty hills: on the tops of them are found many ruins, thought to have been the buildings of the first men, who were, for some time, afraid to descend into the plains. It stands by itself, in form of a sugar-loaf, in the midst of a very large plain, detached, as it were, from the other mountains of Armenia, which make a long chain. It consists, properly speaking, of two hills; the lesser of which is the more sharp and pointed: the higher, on which it is said the ark rested, lies to the north-west of it, and rises far above the neighbouring mountains. It seems so high and big, that, when the air is clear, it may be seen four or five days journey off; yet travellers think the height is not extraordinary. Chardin is of opinion that he passed a part of Mount Caucasus which is higher; and Poullet thinks the height of Mount Masis, or Ararat, not above twice as great as that of Mount Valerian near Paris. They therefore think that its being visible at such a great distance is owing to its lonely situation in a vast plain, and upon the most elevated part of the country, without any mountains before it to obstruct the view. Nor is the snow with which it is always covered from the middle upwards any argument of its height; for in this country, ice hath often been observed in the mornings of the middle of July. (See ARMENIA). Certain it is, however, that this mountain hath never yet been ascended; which the Armenians pretend was owing to the interposition of angels, in order to disappoint the curiosity of those who wanted to advance to such a sacred place as that whereon the ark rested: but the excess of cold may very reasonably be supposed able to frustrate all such attempts, without any supernatural interposition. The most distinct account we have of this mountain is that given by M. Tournefort: which, however, being much swelled with immaterial circumstances, it is needless to trouble our readers with at length. He tells us, that this mountain is one of the most disagreeable sights upon earth, without either houses, convents, trees, or shrubs; and seems as if continually wasting and mouldering away. He divides it into three regions: The lowermost, he says, is the only one which contains any human creatures, and is occupied by a few miserable shepherds that tend scabby flocks; and here are also found some partridges: the second is inhabited by crows and tigers; and all the

Ararat || Aratus.

the rest is covered with snow, which half the year is involved in thick clouds. On the side of the mountain that looks towards Erivan is a prodigious precipice, from whence rocks of an immense size are continually tumbling down with a hideous noise. This precipice seems quite perpendicular; and the extremities are rough and blackish, as if smutted with smoke. The soil of the mountain is loose, and on the sandy parts it is impossible to take a firm step; so that our traveller encountered great difficulties in his ascent and descent of this mountain; being often obliged, in order to avoid the sand, to betake himself to places where great rocks were heaped on one another, under which he passed as through caverns, or to places full of stones, where he was forced to leap from one stone to another. If we may believe Struys, a Dutch writer, however, all these difficulties may be surmounted. He assures us, he went five days journey up Mount Ararat, to see a Romish hermit: that he passed through three regions of clouds; the first dark and thick, the next cold and full of snow, and the third colder still; that he advanced five miles every day; and when he came to the place where the hermit had his cell, he breathed a very serene and temperate air; that the hermit told him, that he perceived neither wind nor rain all the 25 years he had dwelt there; and that on the top of the mountain there reigned a still greater tranquillity, whereby the ark was preserved uncorrupted. He farther pretends, that the hermit gave him a cross made out of the wood of the ark, together with a certificate; a formal copy of which the author has given in his sham relation.

ARASSI, a maritime, populous, and trading town of Italy, in the territory of Genoa. E. Long. 7. 20. N. Lat. 44. 3.

ARATEIA, in antiquity, a yearly festival celebrated at Sicyon, on the birth day of Aratus, wherein divers honours were paid by a priest consecrated to this service, who for distinction's sake wore a ribband bespangled with white and purple spots. The Arateia were solemnized with much pomp of music, the choristers of Bacchus attending.

ARATUS, general of the Achæans, conquered Nicocles tyrant of Sicyon. Two years after he surprised the castle called *Acrocorinthus*, and drove out the king of Macedonia: he delivered Argos from its tyrants, and was poisoned by Philip II. king of Macedonia, whom he had newly restored. He was about 62 when he died, the second year of the 141st Olympiad. He was interred at Sicyon, and received the greatest honours from his countrymen. His son, who had also been prætor, was poisoned by King Philip. Polybius gives us so great a character of Aratus the father's Commentaries or History, that the loss of so valuable a work is highly to be regretted.

ARATUS, a Greek poet, born at Soli, or Solæ, a town in Cilicia, which afterwards changed its name, and was called *Pompeiopolis*, in honour of Pompey the Great. He flourished about the 124th, or according to some, the 126th Olympiad, in the reign of Ptolemy Philadelphus king of Egypt. He discovered in his youth a remarkable poignancy of wit, and capacity for improvement; and having received his education under Dionysius Heracleotes, a Stoic philosopher, he espoused the principles of that sect. Aratus was physician to Antigonus Gonatus, the son of Demetrius Poliorcetes, king of Macedon: this prince being a great encourager of learned men, sent for him to court, admitted him to his intimacy, and encouraged him in his studies. The *Phænomena* of Aratus, which is still extant, gives him a title to the character of an astronomer as well as a poet; in this piece he describes the nature and motion of the stars, and shows the particular influences of the heavenly bodies, with their various dispositions and relations. He wrote this poem in Greek verse: it was translated into Latin by Cicero; who tells us, in his first book *De Oratore*, that the verses of Aratus are very noble. This piece was translated by others as well as Cicero; there being a translation by Germanicus Cæsar, and another into elegant verse by Festus Avienus. An edition of the *Phænomena* was published by Grotius, at Leyden, in quarto, 1600, in Greek and Latin with the fragments of Cicero's version, and the translations of Germanicus and Avienus; all which the editor has illustrated with curious notes. He was certainly much esteemed by the ancients, since we find so great a number of scholiasts and commentators upon him. There are several other works also ascribed to Aratus. Suidas mentions the following: Hymns to Pan; Astrology and Astrothesy; a composition of Antidotes; an Επιθυτικον on Theopropus; an Ηθοποια on Antigonus; an Epigram on Phila, the daughter of Antipater, and wife of Antigonus; an Epicedium of Cleombrotus; a Correction of the Odyssey; and some Epistles in prose. Virgil, in his Georgics, has imitated or translated many passages from this author; and St Paul has quoted a passage of Aratus. It is in his speech to the Athenians (Acts xvii. 28.) wherein he tells them, that some of their own poets have said, Του γαρ και γενος εσμεν: "For we are also his offspring." These words are the beginning of the fifth line of the *Phænomena* of Aratus.

Aratus || Araxes.

ARAVA, a fortress of Upper Hungary, on a river of the same name. E. Long. 20. 0. N. Lat. 47. 20.

ARAUCO, a fortress and town of Chili, in South America; situated in a fine valley, on a river of the same name. The bravery of the natives drove the Spaniards out of their country even without fire arms. W. Long. 73. 20. S. Lat. 38. 10. See ARAUCANIA, SUPPLEMENT.

ARAUSIO, or *Civitas Arausiensis*, or *Arausicorum* (Notitiæ); *Colonia Secundanorum* (Mela, Pliny, Coins); so called, because the veterans of the second legion were there settled: The capital of the Cavares, in Gallia Narbonensis. Now *Orange*, in the west of Provence, on an arm of the rivulet Egue, which soon after falls into the Rhone, from which it is distant a league to the east, at the foot of a mountain. Here is an ancient amphitheatre to be still seen. E. Long. 4. 46. N. Lat. 44. 10.

ARAW, a town of Swisserland, in Argow, seated on the river Aar. It is handsome, large, and remarkable for its church, its fountain, and the fertility of the soil. E. Long. 8. 0. N. Lat. 47. 25.

ARAXES, now the Aras, a river of Armenia Major, which takes its rise in a mountain called *Ablos*, where the Euphrates also hath its origin. From this mountain it runs eastward with a serpentine course, discharging itself into the Caspian sea, after a run of upwards of 500 miles, during which it receives some considerable

Arba. siderable rivers. Some have imagined that it hath its rise in Mount Ararat; but Tournefort assures us that it comes no nearer that mountain than 12 miles. The Araxes is a very rapid river, and is supposed to be the Gihon mentioned by Moses. Besides this extreme rapidity, it is very apt to overflow after rains; so that they have in vain endeavoured to build bridges over it; though some of them appear, from the few arches remaining, to have been built of the best materials, and in the strongest manner. Such is the vehemence of its current after the thawing of the adjacent snows, or some fierce rains, that neither banks nor dikes can resist it; so that nothing can be more terrible than the noise and violence of its waves at such times: but in winter, when its waters are low, it is fordable in some places on camels.

ARBA, in *Ancient Geography*, an island and city of Illyria, now *Arbe*, in the gulf of Quarnaro. Of this island, which has been but slightly noticed by geographers, we have the following description by the abbé Fortis.

In the Roman times, it is probable that there were no other cities in Arbe but that which bears the name of the island, in the neighbourhood of which ancient monuments are frequently dug up.

This city of Arbe, though the capital of a small island, not above thirty miles round, wholly uncultivated, and uninhabitable in the highest part that faces the channel of Morlacca, has always maintained itself with decorum. That it was inhabited by civilized people in the Roman times, is evident, by the inscriptions that have been frequently discovered there, and others still remaining at Arbe. In the lower times it suffered all the calamities to which the neighbouring countries were subjected, but it always recovered itself with honour even after dissolution.

The archives of the community of Arbe contain some ancient papers that are truly valuable, and they are kept with great jealousy; by them it appears, that in the eleventh century, gold and silk were not rare among the inhabitants. Arbe was subject to the kings of Hungary; afterwards it became dependent on Venetian feudatories; and at last was taken under the immediate dominion of the most serene republic, by which a governor is appointed who has the title of count and captain. The number of people on the island does not much exceed three thousand souls, distributed in a few parishes, which might be officiated by a small number of priests: Yet, through a monstrous inconsistency that falls very heavy on the poor inhabitants, they have to maintain no less than three convents of friars, and as many of nuns, besides the considerable charge of near sixty priests, who have a very scanty provision.

The climate of Arbe is none of the happiest; the winter season is horrid, especially when agitated by the violent northerly winds, which sometimes transform the intermediate seasons into winter, and cause the summer itself to disappear. These furious winds do great damage to the island, particularly in the winter and spring. Two years ago, about twelve thousand sheep perished in one night, of cold, in the common pastures of the mountain; where, according to the custom over all Dalmatia, they are left in the open air the whole year round. The salt fog raised by the dreadful commotion of the waves, which often roar between the mountains of Arbe and the opposite Alps, in the narrow channel of Morlacca, consumes all the buds of the plants and corn, if it happens to be driven upon the island by the wind; and it is followed by a cruel scarcity of every kind of product. This calamity communicates its baneful influence even to the flesh of the animals left on the pastures, that becomes ill tasted, in consequence of the bitterness and bad nourishment of the food. Abstracting from these irregularities, the air of Arbe is healthful; nor ought the constant summer fevers among the inhabitants to be attributed to its influence, as they are, more probably, derived from unwholesome food, and a way of life differing little from that of the Hottentots. Arba.

The appearance of the island is exceedingly pleasant. On the east it has a very high mountain, of the same substance as the Morlacca, of which it was once a part. At the foot of this mountain, the rest of the island is extended to the westward, and divided into beautiful and fruitful plains interspersed with little hills fit to bear the richest products. At the extremity that looks to the north, a delightful promontory, called Loparo, stretches into the sea; it is crowned with little hills, which almost quite enclose a fine cultivated plain. Near this promontory are the two small islands of S. Gregorio and Goli, very useful to shepherds and fishers. The coast of Arbe, that faces the Morlacca mountains, is quite steep and inaccessible; and the channel between them is extremely dangerous, being exposed to furious winds, and without a single port on either side. The long and narrow island of Dolin, lying parallel to the island of Arbe, along the coast of Barbado, forms a channel less dangerous, though by no means so secure as it is beautiful to look at. There are several harbours in the neighbourhood of the city of Arbe, by which the trade of the best part of the island is facilitated.

The city stands on a rising ground between two harbours, which form a peninsula; it contains about a thousand inhabitants, among whom are many noble families, but few of them are rich. Among the most remarkable curiosities of the island, the Arbegiani are proud of many egregious relicks, and particularly of the head of S. Christofano their protector; but the lovers of sacred antiquity will find something much more singular in the three heads of Shadrach, Meshech, and Abednego, which are venerated there with great devotion. Four of the principal gentlemen are keepers of the sanctuary, and to their care the precious records of the city are also committed. Among these records there is a transaction of 1018, by which the city of Arbe promises to the doge of Venice, Ottone Orfeolo, a tribute of some pounds *de serta serica*, "of wrought silk," and in case of contravention, pounds *de auro obrizo*, "of pure gold."

In the last age there was a learned bishop of Arbe, named Ottavio Spaderi, who would not permit the relicks of S. Christofano to be exposed to the public veneration, on the solemnity of the saint's day, because he doubted of their authenticity. The mob rose, and was going to throw him down from the top of the hill on which the cathedral stands; nor did the tumult cease after the day was past. The government sent an armed vessel to deliver the prelate from the danger

the

Arba, Arbaces.

he was in: and the pope thought proper to give him a more tractable spouse in Italy.

The nature of the soil of Arbe is not the same in every situation; nay it would be difficult to find a country where there is so great a variety in so little space. There is a very great difference between the ground of the extremity of the mountain above the channel of Barbado, and the sides of it on the one part towards the island, and on the other facing the ridge of Morlacca. Nor is the top of the mountain itself always of the same structure: for in some parts it is extended in a fine level plain, partly woody and partly cultivable; in other places it is quite rocky, and composed of bare marble. The ground at the foot of the mountain, where it stretches towards the shore, opposite to Jablanaz, is nothing but marble; and in the district of Barbado it is gravelly, and a good soil for vines. The wine of Barbado is of excellent quality, and in great estimation; hardly any other product is cultivated along that coast, as the vines succeed so well, notwithstanding the negligent culture. Below the pretended ruins of Colento the land bears vines, olives, mulberry, and other fruit trees, and also corn in the lowest parts. All the lower part of the island is composed alternately of little hills and valleys, and of a substance for the most part very different from that of the mountain and its adjacencies. As the organization of the mountain is wholly of marble, so that of the hills is generally arenaceous. The whetstone forms a large part, and frequently contains *ostracites* and *lenticulares;* the exterior stratum is commonly friable. The valleys, which according to appearances should be full of sand, are provided with an excellent soil, with such a mixture of very minute sand as is requisite to keep it light. Springs of fresh water are by nature well distributed over the island, and maintain a proper humidity when the summer is not excessively dry; so that the dark verdure of the hills covered with wood, the luxuriance of the vines, and freshness of the corn ground, form a spectacle extremely cheerful and agreeable.

The island of Arbe would have every thing requisite for the subsistence of its small population, if the land was cultivated by a people less stupid and lazy.

It produces, however, firewood, of which many cargoes are annually sent to Venice; corn, oil, excellent wine, brandy, and silk, since very ancient times; it also exports hides, wool, sheep, hogs, and horses of a good breed. There is also abundance of good salt made on the island; and the fishing of tunny and mackarel, notwithstanding it is managed in a slovenly and awkward manner, makes no inconsiderable article of trade to the Arbegiani, who like all their neighbours, find their account in selling this commodity to strangers rather than to the Venetians. Yet, with all these natural products, the island is very far from being rich, or even in a tolerably flourishing state; because there is much land left uncultivated, and the peasants are lazy.

ARBACES governed Media under Sardanapalus. Seeing him spinning among a company of his women, he stirred up his people to revolt, and dethroned Sardanapalus: who thereupon burnt himself in his palace. Arbaces being crowned, began the monarchy of the Medes, which lasted 317 years under nine kings, till Astyages was expelled by Cyrus. Arbaces reigned 22 years, and died A. M. 3206. See MEDIA.

ARBALEST, or CROSS BOW. See *CROSS-Bow.*

Arbal Arbe

ARBELA, now IRBIL, a city of Assyria, lying in E. Long. 44. 5. N. Lat. 35. 15. It is famous for the last and decisive battle fought in its neighbourhood between Alexander the Great and Darius Codomannus. This battle was fought 331 years before Christ, and the event of it determined the fate of the Persian empire. Arrian relates, that Darius's army consisted of a million of foot and 40,000 horse; according to Diodorus, there were 200,000 horse and 800,000 foot; Plutarch relates, that the horse and foot together made up a million: and Justin gives us exactly half Diodorus's number. The Macedonian army, according to Arrian consisted of 40,000 foot and 7000 horse.

Upon receiving notice of the vast strength of the enemy, Alexander expressed neither surprise nor apprehension; but having "commanded a halt, he encamped four days, to give his men rest and refreshment. His camp being fortified by a good intrenchment, he left in it the sick and infirm, together with all the baggage; and, on the evening of the fourth day, prepared to march against the enemy with the effective part of his army, which was said to consist of 40,000 infantry and 7000 horse, unencumbered with any thing but their provisions and armour. The march was undertaken at the second watch of the night, that the Macedonians, by joining battle in the morning, might enjoy the important advantage of having an entire day before them, to reap the full fruits of their expected victory. About half way between the hostile camps, some eminences intercepted the view of either army. Having ascended the rising ground, Alexander first beheld the barbarians, drawn up in battle array, and perhaps more skillfully marshalled than he had reason to apprehend. Their appearance, at least, immediately determined him to change his first resolution. He again commanded a halt, summoned a council of war; and different measures being proposed, acceded to the single opinion of Parmenio, who advised that the foot should remain stationary until a detachment of horse had explored the field of battle and carefully examined the disposition of the enemy. Alexander, whose conduct was equalled by his courage, and both surpassed by his activity, performed those important duties in person at the head of his light horse and royal cohort. Having returned with unexampled celerity, he again assembled his captains, and encouraged them by a short speech. Their ardour corresponded with his own; and the soldiers, confident of victory, were commanded to take rest and refreshment. *Gillies' Hist. of Greece.*

"Meanwhile Darius, perceiving the enemy's approach, kept his men prepared for action. Notwithstanding the great length of the plain, he was obliged to contract his front, and form in two lines, each of which was extremely deep. According to the Persian custom, the king occupied the centre of the first line, surrounded by the princes of the blood and the great officers of his court, and defended by his horse and foot guards, amounting to 15,000 chosen men. These splendid troops, who seemed fitter for parade than battle, were flanked on either side by the Greek mercenaries and other warlike battalions, carefully selected from the whole army. The right wing consisted of the Medes, Parthians, Hyrcanians and Sacæ: the left was chiefly occupied by the Bactrians, Persians, and Cardusians.

Arbela. dusians. The various nations composing this immense host were differently armed, with swords, spears, clubs, and hatchets: while the horse and foot of each division were promiscuously blended, rather from the result of accident than by the direction of design. The armed chariots fronted the first line, whose centre was farther defended by the elephants. Chosen squadrons of Scythian, Bactrian, and Cappadocian cavalry advanced before either wing, prepared to bring on the action, or after it began to attack the enemy in flank and rear. The unexpected approach of Alexander within sight of his tents prevented Darius from fortifying the wide extent of his camp; and, as he dreaded a nocturnal assault from enemies who often veiled their designs in darkness, he commanded his men to remain all night under arms. This unusual measure, the gloomy silence, the long and anxious expectation, together with the fatigue of a restless night, discouraged the whole army, but inspired double terror into those who had witnessed the miserable disasters on the banks of the Granicus and the Issus.

"At daybreak Alexander disposed of his troops in a manner suggested by the superior numbers and deep order of the enemy. His main body consisted of two heavy-armed phalanxes, each amounting to above 16,000 men. Of these the greater part formed into one line; behind which he placed the heavy-armed men, reinforced by his targeteers, with orders, that when the outspreading wings of the enemy prepared to attack the flanks and rear of his first line, the second should immediately wheel to receive them. The cavalry and light infantry were so disposed on the wings, that while one part resisted the shock of the Persians in front, another, by only facing to the right or left, might take them in flank. Skilful archers and darters were posted at proper intervals, as affording the best defence against the armed chariots, which (as Alexander well knew) must immediately become useless whenever their conductors or horses were wounded.

"Having thus arranged the several parts, Alexander with equal judgment led the whole in an oblique direction towards the enemy's left; a manœuvre which enabled the Macedonians to avoid contending at once with superior numbers. When his advanced battalions, notwithstanding their nearness to the enemy, still stretched towards the right, Darius also extended his left, till, fearing that by continuing this movement, his men should be drawn gradually off the plain, he commanded the Scythian squadrons to advance, and prevent the farther extension of the hostile line. Alexander immediately detached a body of horse to oppose them. An equestrian combat ensued, in which both parties were reinforced, and the barbarians finally repelled. The armed chariots then issued forth with impetuous violence; but their appearance only was formidable; for the precautions taken by Alexander rendered their assault harmless. Darius next moved his main body, but with so little order, that the horse, mixed with the infantry, advanced, and left a vacuity in the line, which his generals wanted time or vigilance to supply. Alexander seized the decisive moment, and penetrated into the void with a wedge of squadrons. He was followed by the nearest sections of the phalanx, who rushed forward with loud shouts, as if they had already pursued the enemy. In this part of the field, the victory was not long doubtful; after a feeble resistance the barbarians gave way; and the pusillanimous Darius was foremost in the flight. Arbela ‖ Arbitrary.

"The battle, however, was not yet decided. The more remote divisions of the phalanx, upon receiving intelligence that the left wing, commanded by Parmenio, was in danger, had not immediately followed Alexander. A vacant space was thus left in the Macedonian line, through which some squadrons of Persian and Indian horse penetrated with celerity, and advanced to the hostile camp. It was then that Alexander derived signal and well-earned advantages from his judicious order of battle. The heavy-armed troops and targeteers, which he had skillfully posted behind the phalanx, speedily faced about, advanced with a rapid step, and attacked the barbarian cavalry, already entangled among the baggage. The enemy, thus surprised, were destroyed or put to flight. Meanwhile the danger of his left wing recalled Alexander from the pursuit of Darius. In advancing against the enemy's right, he was met by the Parthian, Indian, and Persian horse, who maintained a sharp conflict. Sixty of the *Companions* fell; Hephæstion, Cœnus, and Menidas, were wounded. Having at length dissipated this cloud of cavalry, Alexander prepared to attack the foot in that wing. But the business was already effected, chiefly by the Thessalian horse; and nothing remained to be done, but to pursue the fugitives, and to render the victory as decisive as possible.

"According to the least extravagant accounts, with the loss of 500 men, he destroyed 40,000 of the barbarians, who never thenceforth assembled in sufficient numbers to dispute his dominion in the east. The invaluable provinces of Babylonia, Susiana, and Persis, with their respective capitals of Babylon, Susa, and Persepolis, formed the prize of his skill and valour. The gold and silver found in those cities amounted to thirty millions sterling; the jewels and other precious spoil, belonging to Darius, sufficed, according to Plutarch, to load 20,000 mules, and 5000 camels." The consequences of this victory the reader will find narrated under the article PERSIA.

ARBERG, a town of Swisserland, in the canton of Bern, with a handsome castle, where the bailiff resides. It is seated on the river Aar, in a kind of island. E. Long. 7. 15. N. Lat. 47. 0.

ARBITER, in the *Civil Law*, implies a judge nominated by the magistrate, or chosen voluntarily by the two contending parties, in order to decide their differences.

The civilians make a difference between *arbiter* and *arbitrator*, though both found their power on the compromise of the parties; the former being obliged to judge according to the customs of the law, whereas the latter is at liberty to use his own discretion, and accommodate the differences in the manner that appears to him most just and equitable.

ARBITRARY, that which is left to the choice or arbitration of men, or not fixed by any positive law or injunction.

Arbitrary Punishment, in *Law*, denotes, such punishments as are by statute left to the discretion of the judge. It is a general rule in arbitrary punishments, that the judge cannot inflict death. Hence all punishments that are not capital have acquired the name of *arbitrary*

Arbitrary ‖ Arburg.

arbitrary punishments, even although they be expressly pointed out by statute.

ARBITRATION, is where the parties, injuring and injured, submit all matters in dispute, concerning any personal chattels or personal wrong, to the judgement of two or more arbiters or arbitrators; who are to decide the controversy: and, if they do not agree, it is usual to add, that another person be called in as umpire (*imperator* or *impar*), to whose sole judgment it is then referred; or frequently there is only one arbitrator originally appointed. This decision, in any of these cases, is called an *award*. And thereby the question is as fully determined, and the right transferred or settled, as it would have been by the agreement of the parties or the judgment of a court of justice. See LAW.

ARBITRATOR, a private extraordinary judge, chosen by the mutual consent of parties, to determine controversies between them. See ARBITER and ARBITRATION.

ARBOIS, a small populous town of France, in the department of Jura, formerly Franche Compte, famous for its wines. E. Long. 5. 40. N. Lat. 46. 55.

ARBON, an ancient town in Swisserland, on the south banks of the lake Constance, in Thurgaw. It has a castle built by the Romans, and is under the jurisdiction of the bishop of Constance. In the time of war, the Swiss have a right to put in a garrison. The Popish and Protestant religions are equally tolerated in this town. E. Long. 9. 30. N. Lat. 4. 38.

ARBOR, in *Botany*, a tree. Trees are by Linnæus classed in the seventh family of the vegetable kingdom, and are distinguished from shrubs in that their stems come up with buds on them; but this distinction holds not universally, there being rarely any buds on the large trees in India.

ARBOR, in *Mechanics*, the principal part of a machine, which serves to sustain the rest; also the axis or spindle on which a machine turns, as the *arbor* of a crane, windmill, &c.

ARBOR Dianæ. See CHEMISTRY *Index*.

ARBOR Vitæ. See THUYA, BOTANY *Index*.

ARBORESCENT, an epithet applied to such objects as resemble trees.

ARBORIST, a person skilled in that part of botany which treats of trees.

ARBORESCENT Star-fish, in *Zoology*, a species of asterias. See ASTERIAS.

ARBORIBONSES, in modern history, priests of Japan, who live an erratic life, and subsist on alms. They dwell in caverns, and cover their heads with bonnets made of the bark of trees.

ARBOUR, in *Gardening*, a kind of shady bower, formerly in great esteem; but of late rejected on account of its being damp and unwholesome.

Arbours are generally made of lattice work, either of wood or iron; and covered with elms, limes, hornbeams; or with creepers, as honeysuckles, jasmines, or passion flowers; either of which will answer the purpose very well, if rightly managed.

ARBROATH. See ABERBROTHICK.

ARBURG, a town of Swisserland, in the canton of Bern, on the river Aar. It is small, but very strong, being seated on a rock, and defended by a good fortress cut out of the rock. E. Long. 7. 55. N. Lat. 47. 10.

Arburg ‖ Arbuthnot

ARBUSCULA, is used by Bradley to denote a little or dwarf tree, above the rank of shrubs, but below that of trees; such, e. g. as the elder.

ARBUSTUM, implies a number or multitude of trees planted for the fruit's sake.

The word was more peculiarly applied to a place planted with trees for fastening vines to, which are hence called by Columella *arbustivæ*.

ARBUSTUM is sometimes also used to denote an orchard, or field wherein trees are planted at such distance that there is room for ploughing and growing corn between.

ARBUTHNOT, ALEXANDER, principal of the university of Aberdeen in the reign of James VI. of Scotland, was born in the year 1538. He studied first at Aberdeen; and was afterwards sent over to France, where, under the famous Cujacius, he applied himself to the study of the civil law. In the year 1563, he returned to Scotland, and took orders. Whether he was ordained by a bishop or by presbyters, is a matter of uncertainty. In 1568, he was appointed minister of Arbuthnot and Logie Buchan; and in the following year, Mr Alexander Anderson being deprived, our author was made principal of the king's college at Aberdeen, in his room. In the general assembly which met at Edinburgh in the years 1573 and 1577, he was chosen moderator; and to the end of his life was an active supporter of the reformed religion. He died in 1583, in the 45th year of his age; and was buried in the College church of Aberdeen. We are told in the Biographia, that he was eminent as a poet, a philosopher, a mathematician, a lawyer, a divine, and a physician. He wrote *Orationes de origine et dignitate juris*, printed at Edinburgh, 1572, 4to. His cotemporary Thomas Maitland wrote a copy of Latin verses on the publication of this book: they are printed in the *Delic. Poet. Scot.* He published Buchanan's History of Scotland in the year 1582.

ARBUTHNOT, *John*, M. D. the son of an Episcopal clergyman in Scotland, was born soon after the Restoration at Arbuthnot near Montrose. After acquiring a competent knowledge of the elementary parts of education, he was sent to the college of Aberdeen, where the buddings of those great qualities and those sallies of wit, which contributed so much to his future greatness, soon made their appearance. Having there gone through a course of academical studies, and obtained the degree of doctor of physic, he went to London, in order to reap the fruits both of his natural and acquired abilities. He then began to display his talents, in teaching mathematics, in which he was very expert. "An Examination of Dr Woodward's Account of the Deluge," &c. in 1697, first made him known to the learned world. This performance was received with great applause; and in 1700 a treatise "On the Usefulness of Mathematical Learning" still increased his reputation. A very interesting paper "On the Regularity of the Births of both Sexes," demonstrating from authentic proofs the universal similarity which is observed by nature in this circumstance, and drawing from these several political and moral inferences, which he presented to the Royal Society,

ciety, procured his election in 1704 into that body. Meanwhile, in his own proper profession, he was acquiring considerable eminence, and was appointed, on account of his great medical knowledge, physician extraordinary to Prince George of Denmark, and shortly afterwards one of the physicians in ordinary to Queen Anne. He was admitted in 1710 a fellow of the college. He formed about this period a very intimate acquaintance, which lasted with unabating tenderness and affection during the rest of his life, with these great literary men, Pope, Gay, and Swift. In 1714 he engaged in an extensive design, of making a satire upon all the abuses of science in every branch in co-operation with Pope and Swift, which was to be written under the form of the history of a fictitious character, and in the grave ironical style. The plan was never finished, but the "Memoirs of Martinus Scriblerus," published in Pope's works, form a part; of which, much is the performance of Dr Arbuthnot. It is very probable, that the whole of the first book is of his composition, in which the great profoundness of knowledge that is discerned, and the good-natured pleasantry with which the satire is directed, has gained it the character of one of the most original, learned, and interesting pieces in the English language. Those parts which relate to anatomy, the manners and customs of antiquity, and logic, are particularly his performance. On the death of Queen Anne, he made a visit to Paris, in order to drive away the melancholy, which attended him on account of that circumstance, which was a severe stroke to him, and destrnctive not only to his personal, but also to his political views. Returning from thence, as his medical services were no longer required at St James's, he retired from it, and followed at large the practice of his profession; yet he did not thence give up his literary pursuits, but pursued them with great ardour, although long intervals take place between the times of his publications. A work entitled "Tables of Ancient Coins, Weights, and Measures," explained and exemplified in several dissertations, in a 4to vol. appeared in 1727, which is the chief of his serious performances. Although there are several inaccuracies in it, which could hardly be avoided in so intricate a subject, it is a work of great merit, and has ever since been considered as the standard authority. A treatise "On the Nature and Choice of Aliments," which was published in 1732, and another published in 1733, "On the Effects of Air on Human Bodies," finish the list of his sterling works. Both these were well received by the faculty, and continue to be still esteemed, and are occasionally read and quoted. Respecting his humorous works, which were the productions of his leisure hours, they are so confounded with those of his contemporaries, that it is not easy to distinguish them. But a piece which, independent of any other, would raise him to the character of the first humorous writer in the English language, entitled the "History of John Bull," is confidently ascribed to him. This is conducted with great wit and humour, and all the circumstances and characters are most admirably adapted. Among his several avowed ironical pieces are "A Treatise concerning the Altercation or Scolding of the Ancients," and the "Art of Political Lying."

In the year 1751, there were published two small volumes, entitled "The Miscellaneous Works of Dr Arbuthnot;" but the greatest part of what they contain is denied by his son to be of his composition. As it was customary for him, when any comical occurrence took place, which struck his fancy, to write concerning it in a large folio which lay in his parlour; it is very probable, that many slight and imperfect essays, which had gone out of his remembrance, might get abroad into the world. Through all his pieces of this kind there runs a vein of good-natured pleasantry; and this tends to confirm the character given of him by Swift, to a lady who desired to know his opinion concerning Dr Arbuthnot, "He has more wit than we all have, and his humanity is equal to his wit." Although his writings are free from that gall and rancour, too common among party writers, yet they cannot be said to be altogether free from a party spirit. He, however, cannot be excused in one instance, of allowing his personal dislike to overrule his humanity, viz. in the "Memorandums of the six days preceding the death of a late Right Reverend" (meaning Bishop Burnet). The indignation of a virtuous man towards an infamous character, is sufficient to justify his severity in his bitter "Epitaph on Colonel Chartres:" and this severity was probably aggravated by party spirit. Although he had no proper poetical talent, yet he made an effort to try his genius in that kind of composition. A piece, published in Dodsley's collection, is valuable for its philosophical sentiment, which is entitled ΓΝΩΘΙ ΣΕΑΥΤΟΝ, *Know thyself.* He was also skilled in music; and Sir J. Hawkins mentions an anthem and a burlesque song, which are ascribed to him.

In these occupations he passed his days, amid all the pleasures that can render domestic life happy, in the affection and estimation of his friends, beloved and esteemed by all his literary associates, who have each taken great pains to celebrate their mutual friendship. Swift in one of his poems sincerely laments that he is

> "Far from his kind Arbuthnot's aid,
> Who knows his art, but not his trade."

Pope has dedicated to him an epistle, called a "Prologue to the Satires." He was full of humility and resignation in all the dispensations of Providence. Of his two sons, he witnessed the death of one; and the other, with some daughters, survived him. At length, from an inveterate asthma, he fell into a dropsical disorder; and, in order to try the effect of a change of air, he repaired to Hampstead, but without the least gleam of hope respecting a recovery, as he assured his friends Pope and Swift. Returning to his house in London, he died February 27. 1734-5. His latest letters display a great serenity of mind, an exemplary piety, a contempt of vice, and a glowing desire of virtue. (*Gen. Biog.*).

ARBUTUS, the STRAWBERRY TREE. See BOTANY *Index*.

ARC, JOAN OF, generally called the *Maid of Orleans*, one of the most famed heroines in the annals of history, was born about the beginning of the 15th century at Domremy, near Vaucouleurs in Lorrain, where her father, a peasant, named James d'Arc, resided. When she was able in the least degree to earn a sustenance for herself, her parents, who were but poor, put her to service at a small inn, where she performed

Arc. formed several offices, more properly belonging to the other sex, such as riding the horses to water without a saddle, and attending them in the fields, and many other similar services, which greatly displayed her masculine habit of body. At the time when Charles VII. was reduced to a very low condition, and the greatest part of his country had been overrun by the English, Joan, probably then at the age of 27 or 28, imagined that she saw several visions, and that in one of these she was commanded by St Michael, to go immediately to the relief of Orleans, at that time closely besieged by the English army, and then to procure the consecration of the king at Rheims. In February 1429, her parents took her to the governor of Vaucouleurs, named Baudricourt, who at first held her pretended inspiration to be no more than an idle tale, and treated it with the contempt such a thing would have deserved; but at last induced by her entreaties, he sent her to Chinon, where the king then was, in order that she might be introduced to him. Charles, whether it proceeded from earnest or not, in order to sound her, determined to present her to a company of his nobles, where no mark of dignity tended to distinguish him from them; and, it is asserted, that she immediately recognized him, and informed him of secrets which he had endeavoured to conceal from every person. She boldly engaged to accomplish the two objects of her mission, and required that they should arm her with a consecrated sword, which lay in the church of St Catharine of Fierbois; and although she had never seen it, she accurately described every particular concerning it. The manner in which she acted inspired many with confidence; and certain doctors of the church were appointed to inspect into the nature of her inspiration, and matrons to give proofs of her virginity. The report which they gave was very favourable; but being next put into the hands of the parliament, they treated her as frantick, and demanded that she should shew them a miracle. She answered, that although she had not any at that time to present, she would soon accomplish one at Orleans. At length being fully armed and mounted, she was sent to Orleans along with the army destined for its relief. By displaying a consecrated banner, she soon cleansed the camp of intemperance; and by her whole deportment, animated the soldiers by her exemplary enthusiasm. Entering Orleans, she introduced a convoy, and boldly attacking the English in their forts, she routed them with great slaughter, and struck them with such a panic that they were even obliged to raise the siege with great precipitation. The dignity of a superior mind and a brave heroism reigned through all her actions. Various other successes followed in a short time, and the dismayed English everywhere fled before the hand of a conquering enemy, whom they had but lately contemned. Joan now thinking it proper to perform her other promise of crowning the king at Rheims, proceeded with him through the kingdom, in order to receive submission of the towns as he marched, which he did without any opposition. Arriving at Rheims, the keys of the city were delivered to him, and, entering the town, he was anointed and crowned with the holy oil of Clovis, Joan standing by his side in full armour, and displaying her consecrated banner. Charles filled with gratitude for her important services, ennobled her family, and conferred upon it the title of *the Sys*, with a conformable estate in land. The two objects of her mission being now accomplished, Joan prepared to retire into the country; but Dunois, the general, being sensible of her importance on account of her pretended inspiration, endeavoured to persuade her to remain in arms until the English should be fully driven from the country; which by his persuasions he effected. Advised by him, she cast herself into Compeigne, then closely besieged by the English and the duke of Burgundy. Having there made a sally upon the enemy, she drove them from their entrenchments; but being basely deserted by her followers, she was taken prisoner. Upon her capture, the English enjoyed a malignant gratification, and resolved to shew her no mercy on account of the change she had occasioned in their affairs. The duke of Bedford, the regent, having ransomed her from the captors, appointed a criminal prosecution against her upon the charges of employing sorcery and magic, and of being impious. He was joined in the accusation by the clergy, and by the university of Paris. She was carried in irons before an ecclesiastical commission at Rouen, where several capricious interrogatories were put to her during a trial of about four months, to which she answered with steadiness and gravity. Among several other questions, she was interrogated why she had assisted at the coronation of Charles with her standard in her hand. She boldly replied, "Because the person who shared in the danger, had a right to share in the glory." Her defence was not so strong concerning her pretended inspiration and visions, which were the most dangerous points of the attack. She appealed to the pope upon being accused on these grounds of impiety and heresy; but her appeal was not allowed. At length she was condemned of being a blasphemer and sorceress, and accordingly delivered over to the power of the civil magistrate. A view of the dreadful punishment that awaited her, at last overpowered her resolution; and she endeavoured to escape it, by making a disavowal of her pretended revelations, and a full renunciation of her errors. Her sentence was then changed into perpetual imprisonment, but this punishment did not assuage the fury of her barbarous enemies. They craftily laid a man's dress in her chamber, and she, induced by the sight of an apparel in which she had gained so much honour, put it on; and upon being discovered, her enemies condemned her to the stake, interpreting the action into a relapse of heresy. She suffered her punishment in June 1431, at the market-place of Rouen, with great firmness; and even the English themselves beheld the scene with tears. Her death will for ever cast an indelible stigma on the character of her cruel prosecutors. Charles did nothing towards avenging her cause: but ten years afterwards, contented himself with procuring the restoration of her memory by the pope, and a reversion of the process. She was styled in that act, a "martyr to her religion, her country, and her king." In their enthusiastic admiration, her countrymen were not so slow in honouring her memory. Many marvellous stories were related by them concerning her death. Some supposed that she was not actually dead, and continually expected, that, as formerly, she would come, and at their head lead them on to victory. A consist- Arc.

ent

Arc || rcangis.

ent and uniform judgment respecting the actions and address of this personage cannot be made by posterity. That she gave herself up to the influence of a heated fancy, and that she was confident in the idea of her divine inspiration, and that this notion was so improved by certain favourites of Charles, as to excite the emotions of the public, seems to be the most probable supposition. That the appearance of the Maid of Orleans tended to give a decisive turn to the contest between the English and the French, has never in the least been questioned.

The praise and exploits of this noble heroine have formed the subject of various works both in prose and verse. In verse, that of Voltaire is very licentious and burlesque, and is an injury to her memory; but it has in a great degree been repaired by that most spirited and sublime poem of Southey, in English, which represents her in the most lively and striking colours of heroism and virtue; and by that of Chapelain, although it did not meet with such success. (*Gen. Biog.*).

ARCADE, in *Architecture*, is used to denote any opening in the wall of a building formed by an arch.

ARCADI, or ARCADIANS, the name of a learned society at Rome. See ACADEMY.

ARCADIA, an inland district in the heart of Peloponnesus (Strabo). It is mountainous, and fitter for pasture than corn; and therefore chiefly celebrated by bucolic or pastoral poets, who feign Pan the god of shepherds, to be the guardian of it (Virgil). It has to the north Achaia, to the east Argos and Laconia, Messenia to the south, and Elis to the west. According to Pliny, the wine of this country cured barrenness in women, and inspired the men with rage; and the berries of the yew gathered there were so strong a poison, that whoever slept or took refreshment under that tree was sure to die. In Strabo's time there were few cities remaining in it, most of them being destroyed in the Grecian wars. Eustathius says, that the country was anciently called *Pelasgia*, from Pelasgos, who brought the people, from roots, herbs, and leaves of trees, to feed on acorns, especially beech mast; as Artemidorus observes, that the Arcadians usually lived on acorns. It was also called *Lycaonia*, *Gigantis* and *Parrhasia* (Stephanus). The Arcadians are greatly commended for their love of, and skill in, music, (Virgil, Polybius). To imitate the Arcadians, is to labour and toil for the benefit of others, never conquering their own, but the enemies of others (Hesychius). This probably took its rise from the ancient Arcadians being accustomed to hire themselves out as mercenaries to foreign nations. Homer commends their martial prowess, their pastures, their sheep, and their country well watered. The gentilitious name is *Arcades;* who boasted of their great antiquity, and that they were older than the sun and moon (Apollonius Rhodius, Nonnius, Plutarch, Ovid, Statius). They were the first who had a year of three months, and therefore called *Proceleni*, because their year was prior to that adjusted in Greece to the course of the moon (Censorinus).

ARCANGIS, in the Turkish armies, an inferior kind of infantry, which serve as *enfans perdus*, and to harass and pillage the enemy's frontiers. The Arcangis are an order inferior to the Janizaries; and when any of them distinguish themselves, are usually preferred into the Janizaries order. They have no pay, but are to subsist on their plunder.

Arcangis || Arch.

ARCANUM, among physicians, any remedy, the preparation of which is industriously concealed, in order to enhance its value.

ARCANUM, in *Ancient Geography*, a villa of Q. Cicero, Tully's brother, in Latium, (Cicero). Now Arce, in the Terra di Lavora, in the kingdom of Naples, on the borders of the Campagna di Roma, on the river Melpis, between Arpinum and Aquinum.

ARCBOUTANT, in building, an arched buttress. See BUTTRESS.

ARCESILAUS, a celebrated Greek philosopher, about 300 years before the Christian era, was born at Pitane, in Eolis. He founded the second academy, which is called the *second school.* He was a man of great erudition, and well versed in the writings of the ancients. He was remarkable for the severity of his criticisms; but nevertheless he knew how to accommodate himself to the age, and pursue the allurements of pleasure. He had a great number of disciples. His doctrines were different in several respects from those of the ancient school: and perhaps he was led into this diversity of opinions by many capital errors in the ancient school, such as the incredible arrogance of the dogmatists, who pretended to assign causes for all things; the mysterious air they had thrown upon the doctrine of ideas; the entirely discarding the testimony of the senses; the objection of the Pyrrhonists, who now began to broach their opinions; the powerful opposition of the Stoics and Peripatetics, who discovered the feeble parts of the Academic philosophy. These might have given cause to reform the ancient school, and to found a new one. The middle school, therefore, laid it down as a principle, that we could know nothing, nor even assure ourselves of the certainty of this position; from whence they inferred, that we should affirm nothing, but always suspend our judgement. They advanced, that a philosopher was able to dispute upon every subject, and bring conviction with him, even upon contrary sides of the same question; for there are always reasons of equal force both in the affirmative and negative of every argument. According to this doctrine, neither our senses nor even our reason, are to have any credit: and therefore, in common affairs, we are to conform ourselves to received opinions. Arcesilaus was succeeded by his disciple Lacydes.

ARCH, in *Geometry*, any part of the circumference of a circle or curved line, lying from one point to another, by which the quantity of the whole circle or line, or some other thing sought after, may be gathered. See BRIDGE and CENTER.

ARCH, a concave or hollowed piece of building, constructed in such a manner that the several stones of which it is composed keep one another in their places. The terms *arch* and *vault* properly differ only in this, that the arch expresses a narrower, and the vault a broader piece of the same kind. The principal difference in the form of arches is, that some are circular, and others elliptical; the former having a larger or smaller part of a circle, the other of an ellipsis. What are called *strait arches*, are those frequently used for doors and windows, the upper and under edges of which are straight and parallel, and the ends and joints

Arch
||
Archangel.

joints all pointing toward a centre. The space between two piers of a bridge is called an *arch*, because usually arched over.

Triumphal ARCHES are magnificent entries into cities, erected to adorn a triumph, and perpetuate the memory of the action. The arches of Titus and Constantine make at this time a great figure among the ruins of old Rome.

ARCH, in composition, signifies *chief*, or of the *first* class: as archangel, archbishop, &c.

ARCHÆUS, or ARCHEUS. See ARCHEUS.

ARCHANGEL, an angel occupying the eighth rank in the celestial hierarchy. See ANGEL and HIERARCHY.

ARCHANGEL, a city of Russia, in the province of Dwina, situated on the east side of the river Dwina, about six miles from the White sea, in E. Long. 39. N. Lat. 64. 30. The city extends about three miles in length and one in breadth. It is rich, populous, built in the modern taste, and is a metropolitan see. It rose from a castle built on the spot by Basilowitz II. to protect the increasing trade brought there by the discovery of the White sea by the English, and took its name from a monastery built in honour of the archangel Michael. Before this period the commercial intercourse between Russia and the northern parts of Europe had been long carried on by the Hanseatic towns; which usually sailed to Revel or Narva, and from thence passed through Dorpt or Plescof and Novogorod, where their factories were established. The accidental discovery of Archangel, in 1553, deprived the Hanseatic towns of a great part of this lucrative commerce, and transferred it to the English. On the 11th of May, in the above-mentioned year, three ships sailed from Deptford, in order to explore the northern seas, under the command of Sir Hugh Willoughby. Two of these vessels penetrated as high as the 72d degree of latitude, to the coast of Spitzbergen; and being afterwards forced by stress of weather into the bay of the river Arzina in Russian Lapland, both their crews were frozen to death. Richard Chancellor, who commanded the other ship, called the *Bonaventure*, discovering the country bordering upon the White sea, landed near the mouth of the Dwina, in a bay, which he denominated the *Bay of St Nicholas*, from a convent of that name near the present port of Archangel. The czar Iwan Basilowitz, being informed of his arrival, invited him to his court, where he was hospitably entertained, and the czar indulged the English with a free trade in his dominions: in consequence of this permission, a company of merchants was incorporated in London; and being encouraged by particular privileges from the czar, set on foot a considerable commerce, to the mutual advantage of both nations. This traffic the English for some time enjoyed without competition. The Dutch, however, and other nations, gradually insinuated themselves into this commerce; which they carried on to a very great disadvantage, as not being favoured with those privileges which the czar had granted to the English company. These were at last suddenly annihilated by Alexis Michaelovitch; who in 1648 banished the English merchants from all his dominions. The cause of this expulsion is generally imputed to the resentment which the czar conceived against the English for the execution of Charles I. with whom he was closely connected by leagues of amity and alliance: but in effect he abolished the company's privileges in the year before that event; and his indignation against the English for their rebellion, Mr Coxe affirms, was only a political pretext; the real motive being derived from the offers made by the Dutch to pay duties of export and import to the amount of 15 per cent. if they were indulged with the liberty of carrying on as free a trade as the English throughout his dominions. For not long afterwards, the czar suffered William Prideaux, Cromwell's agent, to reside at Archangel; and permitted the English to renew their commerce in that port upon the same footing with other foreigners. And upon this footing alone our merchants ever after continued to trade.

Archang
Archbish

The commodities chiefly imported into Archangel, were gold and silver stuffs and laces, gold wire, cochineal, indigo, and other drugs for dyeing; wine, brandy, and other distilled spirits. The customs arising to the czar were computed at 200,000 rubles a-year, and the number of foreign ships at 400 annually. But upon the building of Petersburg, Peter the Great abolished the immunities of Archangel, and removed the commerce of the White sea to the havens of the Baltic. Still, however, its exports of tar were considerable; in 1730, to the amount of 40,000 lasts, of 11 barrels each. It sends, during winter, great quantities of the rawaga, a small species of three-finned cod, to Petersburg frozen.

In 1752 Elizabeth again restored the ancient immunities of Archangel; and its present trade is not inconsiderable. It supplies the government of Archangel, part of those of Nishnei-Novogorod and Casan, with European commodities; and draws in exchange from those parts corn, flax, hemp, coarse linen, cordage, sails, masts and tallow, which are mostly conveyed by the Dwina: it forms also a principal communication with the northern and western parts of Siberia, from whence the merchants procure furs, skins, and iron.

The houses of Archangel are generally of wood, but well contrived; and every chamber is provided with a stove, as a fence against the cold, which is here excessive in the winter. The streets are paved with broken pieces of timber and rubbish, disposed so unskilfully, that one cannot walk over it without running the risk of falling, except when the streets are rendered smooth and equal by the snow that falls and freezes in the winter. Notwithstanding the severity of the cold in this place, there is always plenty of good provisions; butchers meat, poultry, wild fowl: and fish, in a great variety, are sold surprisingly cheap.

The most remarkable edifice in Archangel is a large townhouse, built of square stones in the Italian manner, and divided into three parts. One of these consists of large commodious apartments, for the accommodation of merchants, strangers as well as natives: here they are permitted to reside with their merchandise till the month of October, when all the foreign ships set sail for their respective countries. Then, too, the native traders are obliged to remove their quarters from the townhouse. In 1793 great part of this city and suburbs was destroyed by fire, but has since been elegantly rebuilt.

ARCHBISHOP, the name of a church dignitary of

Archbishop. of the first class. Archbishops were not known in the east till about the year 320; and though there were some soon after this who had the title, yet that was only a personal honour, by which the bishops of considerable cities were distinguished. It was not till of late that archbishops became metropolitans, and had suffragans under them. Athanasius appears to be the first who used the title *Archbishop*, which he gave occasionally to his predecessor; Gregory Nazianzen, in like manner, gave it to Athanasius; not that either of them were entitled to any jurisdiction, nor even any precedence in virtue of it. Among the Latins, Isidore Hispalensis is the first that speaks of archbishops. He distinguishes four orders or degrees in the ecclesiastical hierarchy, viz. patriarchs, archbishops, metropolitans, and bishops.

The archbishop, beside the inspection of the bishops and inferior clergy in the province over which he presides, exercises episcopal jurisdiction in his own diocese. He is guardian of the spiritualties of any vacant see in his province, as the king is of the temporalties; and exercises ecclesiastical jurisdiction in it. He is entitled to present by lapse to all the ecclesiastical livings in the disposal of his diocesan bishop, if not filled within six months. He has likewise a customary prerogative, upon consecrating a bishop, to name a clerk or chaplain to be provided for by such bishop; in lieu of which it is now usual to accept an option. He is said to be enthroned when vested in the archbishopric; whereas bishops are said to be installed.

The ecclesiastical government of England is divided into two provinces, viz. Canterbury and York. Canterbury hath the following suffragan bishoprics appertaining to it, St Asaph, Bangor, Bath and Wells, Bristol, Chichester, Litchfield and Coventry, St David's, Ely, Exeter, Glouccster, Hereford, Landaff, Lincoln, London, Norwich, Oxford, Peterborough, Rochester, Salisbury, Winchester, and Worcester. To York appertaineth the bishoprics of Carlisle, Chester, and Durham; to which may be added the bishopric of Sodor and Man, whose bishop is not a lord of parliament. See CANTERBURY and YORK.

The archbishop of Canterbury had anciently, viz. till the year 1152, jurisdiction over Ireland as well as England, and was styled a *patriarch*, and sometimes *alterius orbis papa*, and *orbis Britannici pontifex*. Matters were done and recorded in his name thus, *Anno pontificatus nostri primo*, &c. The first archbishop of Canterbury was Austin, appointed by King Ethelbert, on his conversion to Christianity, about the year 598. He was also *regatus natus*. He even enjoyed some special marks of royalty; as, to be patron of a bishopric, which he was of Rochester; and to make knights, coin moneys, &c. He is still the first peer of England, and the next to the royal family; having precedence of all dukes and all great officers of the crown. It is his privilege, by custom, to crown the kings and queens of this kingdom. He may retain and qualify eight chaplains; whereas a duke is allowed by statute only six. He has, by common law, the power of probate of wills and testaments, and granting letters of administration. He has also a power to grant licenses and dispensations in all cases formerly sued for in the court of Rome, and not repugnant to the law of God. He accordingly issues special licenses to marry, to hold two livings, &c. and he exercises the right of conferring degrees. He also holds several courts of judicature: as, court of arches, court of audience, prerogative court, and court of peculiars. Archbishop || Archdeacon.

The archbishop of York has the like rights in his province as the archbishop of Canterbury. He has precedence of all dukes not of the royal blood; and of all officers of state, except the lord high chancellor. He has also the rights of a count palatine over Hexamshire. The first archbishop of York was Paulinus, appointed by Pope Gregory about the year 622. He had formerly jurisdiction over all the bishops of Scotland; but in the year 1470, Pope Sextus IV. created the bishop of St Andrew's archibishop and metropolitan of all Scotland.

Scotland, whilst episcopacy prevailed in that country, had two *archbishops*, of St Andrew's and Glasgow; of which the former was accounted the metropolitan; and, even before it arrived at the dignity of an archbishopric, resisted with great spirit all the attempts of the archbishops of York in England to become the metropolitans of Scotland. The sees of Argyll, Galloway, and the Isles, were suffragans to Glasgow; all the others in the kingdom to St Andrew's.

Ireland has four archbishops; of Armagh, Dublin, Cashel, and Tuam; of which the former is primate of all Ireland.

ARCHBISHOPRIC, in *Ecclesiastical Geography*, a province subject to the jurisdiction of an archbishop.

ARCHBUTLER, one of the great officers of the German empire, who presents the cup to the emperor on solemn occasions. This office belongs to the king of Bohemia.

ARCHCHAMBERLAIN, an officer of the empire, much the same with the great chamberlain in England. The elector of Brandenburg was appointed by the golden bull archchamberlain of the empire.

ARCHCHANCELLOR, a high officer, who, in ancient times, presided over the secretaries of the court. Under the two first races of the kings of France, when their territories were divided into Germany, Italy, and Arles, there were three archchancellors: and hence the three archchancellors still subsisting in Germany; the archbishop of Mentz being archchancellor of Germany, the archbishop of Cologn, and the archbishop of Treves.

ARCHCHANTOR, the president of the chantors of a church.

ARCHCOUNT, a title formerly given to the earl of Flanders, on account of his great power and riches.

ARCHDEACON, an ecclesiastical dignitary or officer next to a bishop, whose jurisdiction extends either over the whole diocese or only a part of it. He is usually appointed by the bishop himself; and hath a kind of episcopal authority, originally derived from the bishop, but now independent and distinct from his. He therefore visits the clergy; and has his separate court for punishment of offenders by spiritual censures, and for hearing all other causes of ecclesiastical cognizance. There are 60 archdeacons in England.

ARCHDEACON's Court, is the most inferior court in the whole ecclesiastical polity. It is held in the archdeacon's absence, before a judge appointed by himself and called his *official;* and its jurisdiction is sometimes in

Archdeacon || Archers.

in concurrence with, sometimes in exclusion of, the bishop's court of the diocese. From hence, however, by statute 24 Hen. VIII. c. 12. there lies an appeal to that of the bishop.

ARCHDRUID, the chief or pontiff of the ancient druids of a nation. See DRUID.

ARCHDUKE, a title peculiar to the house of Austria; all the sons of which are archdukes, and the daughters archduchesses. See DUKE.

ARCHELAUS, a celebrated Greek philosopher, the disciple of Anaxagoras, flourished about 440 years before Christ. He read lectures at Athens, and did not depart much from the opinions of his master. He taught that there was a double principle of all things, namely, the *expansion* and *condensation* of the air, which he regarded as infinite. Heat, according to him, was in continual motion. Cold was ever at rest. The earth, which was placed in the midst of the universe, had no motion. It originally resembled a wet marsh, but was afterwards dried up; and its figure, he said, resembled that of an egg. Animals were produced from the heat of the earth, and even men were formed in the same manner. All animals have a soul, which was born with them: but the capacities of which vary according to the structure of the organs of the body in which it resides.—Socrates, the most illustrious of his disciples, was his successor.

ARCHELAUS, the son of Herod the Great, was declared king of Judea the second year after the birth of Christ. He put to death 3000 persons before he went to Rome to be confirmed by Augustus. However, that emperor gave him half of what had been possessed by his father; but at length, on fresh complaints exhibited against him by the Jews, he banished him to Vienne in Gaul, A. D. 6. where he died.

ARCHELAUS, the son of Apollonius, one of the greatest sculptors of antiquity, was a native of Ionia, and is thought to have lived in the time of the emperor Claudius. He executed, in marble, the apotheosis of Homer. This masterpiece in sculpture was found in 1568, in a place named *Fratocchia*, belonging to the princes of Colonna, where, it is said, the emperor Claudius had a pleasure house. Father Kircher, Cupert, Spanheim, and several other learned antiquaries, have given a description and explication of this work.

ARCHERS, a kind of militia or soldiery armed with bows and arrows. The word is formed of *arcus*, "a bow;" whence *arcuarius*, and even *arquis*, and *arquites*, as they are also denominated in the corrupt state of the Latin tongue.

Archers were much employed in former times; but they are now laid aside, excepting in Turkey and some of the eastern countries; where there are companies of archers still subsisting in their armies, and with which they did terrible execution at the battle of Lepanto.—As an exercise, the practice of archery is still kept up in many places. See the article ARCHERY.

In France, the officers who attend the lieutenants de police and provosts, to make captures, seizures, arrests, &c. are called *archers;* though their arms be only halberds or carabines. In this sense they say, the *archers* of the *grand prevot de l'hotel;* of the *prevot des marchands;* the city *archers;* the *archers de guet*, or of the watch, &c.—Small parties of *archers*, called also *gens de marechaussée*, are continually patrolling on the great roads, to secure them against robbers.—The carriages of Lyons, &c. are always escorted by a party of archers. To the diligence of these archers or marshal's men, it is partly owing, that persons now travel in all parts of France in the utmost security; there being fewer robberies on the highway in that whole kingdom in a year than about London in a week.

Archers Archery

ARCHERY, the art or exercise of shooting with a bow and arrow.

In most nations, the bow was anciently the principal implement of war; and by the expertness of the archers alone was often decided the fate of battles and of empires.—In this island archery was greatly encouraged in former times, and many statutes were made for the regulation thereof; whence it was that the English archers in particular became the best in Europe, and procured them many signal victories.

The *Artillery Company* of London, though they have long disused the weapon, are the remains of the ancient fraternity of bowmen or archers. Artillery (*artillérie*) is a French term signifying *archery;* as the *king's bowyer* is in that language styled *artillier du roy:* And from that nation the English seem to have learnt at least the cross-bow archery. We therefore find that William the Conqueror had a considerable number of bowmen in his army at the battle of Hastings, when no mention is made of such troops on the side of Harold: And it is supposed that these Norman archers shot with the arbalet (or cross-bow), in which formerly the arrow was placed in a groove, being termed in French a *quadrel*, and in English a *bolt*.

Archæologia, vol. v

Of the time when shooting with the long bow first began among the English, at which exercise they afterwards became so expert, there appear no certain accounts. Their chronicles do not mention the use of archery as expressly applied to the cross bow, or the long bow, till the death of Richard I. who was killed by an arrow at the siege of Limoges in Guienne, which Hemmingford mentions to have issued from a cross bow.—After this, which happened in 1199, there appear not upon record any notices of archery for nearly 150 years, when an order was issued by Edward III. in the 15th year of his reign, to the sherives of most of the English counties for providing 500 white bows and 500 bundles of arrows, for the then intended war against France. Similar orders are repeated in the following years; with this difference only, that the sheriff of Gloucestershire is directed to furnish 500 painted bows as well as the same number of white. The famous battle of Cressy was fought four years afterwards, in which our chroniclers state that we had 2800 archers, who were opposed to about the same number of the French, together with a circumstance which seems to prove, that by this time we used the long bow, whilst the French archers shot with the arbalest. The circumstance alluded to is as follows: Previously to the engagement there fell a very heavy rain, which is said to have much damaged the bows of the French, or perhaps rather the strings of them. Now the long bow (when unstrung) may be most conveniently covered, so as to prevent the rain's injuring it; nor is there scarcely any addition to the weight from a case; whereas the arbalest is of a most inconvenient form to be sheltered from the weather. As therefore, in the year 1342, orders were issued to the sherives of each county

rchery. county to provide 500 bows, with a proper proportion of arrows, it seems probable that these were long bows, and not the arbalest.

At the above-mentioned battle, the English ascribed their victory chiefly to the archers.—The battle of Poictiers was fought A. D. 1356, and gained by the same means.

Sometimes the archers gained great victories without even the least assistance from the men-at-arms; as particularly, the decisive victory over the Scots at Homildon, A. D. 1402. In that bloody battle, the men-at-arms did not strike a stroke, but were mere spectators of the valour and victory of the archers. The earl of Douglas, who commanded the Scotch army in that action, enraged to see his men falling thick around him by showers of arrows, and trusting to the goodness of his armour (which had been three years in making), accompanied by about eighty lords, knights, and gentlemen, in complete armour, rushed forward, and attacked the English archers sword-in-hand. But he soon had reason to repent his rashness. The English arrows were so sharp and strong, and discharged with so much force, that no armour could repel them. The earl of Douglas, after receiving five wounds, was made prisoner; and all his brave companions were either killed or taken. Philip de Comines acdnowledges, what our own writers assert, that the English archers excelled those of every other nation; and Sir John Fortescue says again and again,—"that the might of the realme of England standyth upon archers." The superior dexterity of their archers gave the English a great advantage over their capital enemies the French and Scots. The French depended chiefly on their men-at-arms, and the Scots on their pikemen; but the ranks of both were often thinned and thrown into disorder by flights of arrows before they could reach their enemies.

nry's st. vol. v. 463.

James I. of Scotland, who had seen and admired the dexterity of the English archers, and who was himself an excellent archer, endeavoured to revive the exercise of archery among his own subjects, by whom it had been too much neglected. With this view, he ridiculed their awkward manner of handling their bows, in his humorous poem, of Christ's Kirk on the Green; and procured the following law to be made in his first parliament, A. D. 1424, immediately after his return to Scotland: "That all men might busk thame to be archares fra the be 12 years of age; and that ilk ten punds worth of land thair be made bow markes, and speciallie near paroche kirks, quhairn upon halie dayis men may cum, and at the leist schute thryse about, and have usage of archarie; and whasa usis not archarie, the laird of the land sal rais of him a wedder; and giff the laird raises not the said pane, the king's shiref, or his ministers, sal rais it to the king." But the untimely death of that excellent prince prevented the effectual execution of this law.

There is not found any act of parliament of Henry V. in relation to archery, and all the orders in Rymer till the battle of Agincourt relate to great guns, from which he seems at first to have expected more considerable advantage than from the training of bowmen. It should seem, however, that this sort of artillery, from its unwieldiness, bad and narrow roads, together with other defects, was as yet but of little use in military operations. In the year 1417 this king therefore ascribes his victory at Agincourt to the archers, and directs the sherives of many counties to pluck from every goose six wing-feathers for the purpose of improving arrows, which are to be paid for by the king. Archery.

In 1421, though the French had been defeated both at Cressy, Poictiers, and Agincourt, by the English archers, yet they still continued the use of the cross bow; for which reason, Henry V. as duke of Normandy, confirms the charters and privileges of the balistarii, who had been long established as a fraternity in his city of Rouen. *Archæologia.*

In the fifth of Edward IV. an act passed, that every Englishman, and Irishman dwelling with Englishmen, shall have an English bow of his own height, which is directed to be made of yew, wych, hazel, ash, or awburne, or any other reasonable tree according to their power. The next chapter also directs that butts shall be made in every township, which the inhabitants are obliged to shoot up and down every feast day, under the penalty of a halfpenny when they shall omit this exercise.

In the 14th year, however, of this same king, it appears by Rymer's *Fœdera*, that 1000 archers were to be sent to the duke of Burgundy, whose pay is settled at sixpence a day, which was a considerable sum in these times, when the value of money was so much higher than it is at present. This circumstance seems to prove, very strongly, the great estimation in which archers were still held. In the same year, Edward, preparing for a war with France, directs the sherives to procure bows and arrows, "as most specially requisite and necessary."

On the war taking place with Scotland, eight years after this, Edward provides both ordnance and archers; so that though the use of *artillery* (as we now term it) was then gaining ground, yet that of the bow and arrow was not neglected.

Richard III. by his attention to archery, was able to send 1000 bowmen to the duke of Bretagne, and he availed himself of the same troops at the battle of Bosworth.

During the reign of Henry VII. however, there appears no order relative to gunpowder or artillery; whilst on the other hand, in 1488, he directs a large levy of archers to be sent to Brittany, and that they shall be reviewed before they embark. In the 19th year of his reign, the same king forbids the use of the cross bow, because "the long bow had been much used in this realm, whereby honour and victory had been gotten against outward enemies, the realm greatly defended, and much more the dread of all Christian princes by reason of the same."

During the reign of Henry VIII. several statutes were made for the promotion of archery. The 8th Eliz. c. 10. regulates the price of bows, and the 13th Eliz. c. 14. enacts, that bow staves shall be brought into the realm from the Hanse towns and the Eastward; so that archery still continued to be an object of attention in the legislature.

In Rymer's *Fœdera* there is neither statute or proclamation of James I. on this head; but it appears by Dr Birch's life of his son (Prince Henry), that at eight years of age, he learned to shoot both with the

Archery. bow and gun, whilst at the same time this prince had in his establishment an officer who was styled *bow-bearer*. The king granted a second charter to the Artillery Company, by which the powers they had received from Henry VIII. were considerably extended.

Charles I. appears, from the dedication of a treatise entitled *The Bowman's Glory*, to have been himself an archer; and in the eighth year of his reign he issued a commission to the chancellor, lord mayor, and several of the privy council, to prevent the fields near London being so enclosed as to "interrupt the necessary and profitable exercise of shooting," as also to lower the mounds where they prevented the view from one mark to another.

Catharine of Portugal (queen to Charles II.) seems to have been much pleased with the sight at least of this exercise; for in 1676, by the contribution of Sir Edward Hungerford and others, a silver badge for the marshal of the fraternity was made, weighing 25 ounces, and representing an archer drawing the long bow (in the proper manner) to his ear, with the following inscription: *Reginæ Catharinæ Sagittarii.* The supporters are two bowmen, with the arms of England and Portugal. In 1682 there was a most magnificent cavalcade and entertainment given by the Finsbury archers, when they bestowed the titles of "duke of Shoreditch," "marquis of Islington," &c. upon the most deserving. Charles II. was present upon this occasion; but the day being rainy, he was obliged soon to leave the field.

So lately as the year 1753 targets were erected in the Finsbury fields, during the Easter and Whitsun holidays; when the best shooter was styled Captain for the ensuing year, and the second Lieutenant.

Why this military weapon was so decisive in the battles of former days, the following reasons may be suggested.

Before the introduction of fire arms the enemy could only be struck at a distance by slings, the bow used by the ancients, or the cross bow; to all which the English long bow was infinitely superior. As for slings, they never have been used in the more northern parts of Europe by armies in the field; nor does their use indeed seem to have been at all convenient or extensively practicable, for two principal reasons: In the first place, slingers cannot advance in a compact body, on account of the space to be occupied by this weapon in its rotatory motion; in the next place, the weight of the stones to be carried must necessarily impede the slingers greatly in their movements. The bow of the ancients again, as represented in all their reliefs, was a mere toy compared with that of our ancestors; it was therefore chiefly used by the Parthians, whose attacks (like those of the present Arabs) were desultory. As for the cross bow, it is of a most inconvenient form for carriage, even with the modern improvements; and, in case of rain, could not easily be secured from the weather. After the first shot, moreover, it could not be recharged under a considerable time, whilst the bolts were also heavy and cumbersome. The English long bow, on the other hand, together with the quiver of arrows, was easily carried by the archer, as easily secured from the rain, and recharged almost instantaneously. It is not therefore extraordinary, that troops, who solely used this most effectual weapon, should generally obtain the victory, even when opposed to much more numerous armies. Archery.

It may be urged, that these losses having been experienced by our enemies, must have induced them to practise the same mode of warfare.—But it is thought that the long bow was not commonly used even in England till the time of Edward III. when the victory at Cressy sufficiently proclaimed the superiority of that weapon. It required, however, so much training before the archer could be expert, that we must not be surprised if soon afterwards this military exercise was much neglected, as appears by the preambles of several ancient statutes. Whilst the military tenures subsisted, the sovereign could only call upon his tenants during war, who therefore attended with the weapons they had been used to, and which required no previous practice. On the other hand, the English archers were obliged by acts of parliament, even in time of peace, to erect butts in every parish, and to shoot on every Sunday and holiday, after repairing perhaps to these butts from a considerable distance, whilst the expence of at least a yew bow is represented as being a charge which they were scarcely equal to. The king and parliaments of this country having thus compelled the inhabitants to such training, the English armies had (it should seem) the same advantage over their enemies as the exclusive use of fire-arms would give us at present.

It appears also, by what hath been already stated, that the long bow continued to be in estimation for more than two centuries after gunpowder was introduced, which probably arose from muskets being very cumbersome and unwieldy. It is well known that rapid movements are generally decisive of the campaign; and for such the archers were particularly adapted, because, as they could not be annoyed at the same distance by the weapons of the enemy, they had scarcely any occasion for armour. The flower of ancient armies likewise was the cavalry, against which the long bow never failed to prevail, as man and horse were too large objects to be missed: and hence the great number of French nobility who were prisoners at Cressy, Poictiers, and Agincourt; for being dismounted (if not wounded) whilst they were also clad in heavy armour, they could not make their escape. The same reason accounts for the English obtaining these signal victories with so inferior numbers; for the nobility and gentry thus becoming prisoners, the other parts of the French army made little or no resistance. No wonder, therefore, that in England the greatest anxiety was shown to promote the exercise of this most important weapon, and that so many statutes were made for that purpose.

In Scotland, also, little less attention, though apparently not with equal success, was shown to the encouragement of the art. In both kingdoms, it was provided, that the importers of merchandise should be obliged, along with their articles of commerce, to import a certain proportion of bows, bow staves, and shafts for arrows. In both, every person was enjoined to hold himself provided in bows and arrows, and was prescribed the frequent use of archery. In both, a restraint was imposed upon the exercise of other games and sports, lest they should interfere with the use of the bow; for it was intended, that people should

rchery. be made expert in the use of it as a military weapon, by habituating them to the familiar exercise of it as an instrument of amusement. As there was no material difference between the activity and bodily strength of the two people, it might be supposed that the English and Scots wielded the bow with no unequal vigour and dexterity: but from undoubted historical monuments it appears that the former had the superiority; of which one instance has been already narrated. By the regulations prescribed in their statute book for the practice of archery, we find that the English shot a very long bow, those who were arrived at their full growth and maturity being prohibited from shooting at any mark that was not distant upwards of 220 yards.

In the use of the bow, great dexterity as well as strength seems to have been requisite. Though we hear of arrows at Cheviot Chase which were a yard long, yet it is by no means to be supposed that the whole band made use of such, or could draw them to the head. The regulation of the Irish statute of Edward IV. viz. that the bow should not exceed the height of the man, is allowed by archers to have been well considered; and as the arrow should be half the length of the bow, this would give an arrow of a yard in length to those only who were six feet high. A strong man of this size in the present times cannot easily draw above 27 inches, if the bow is of a proper strength to do execution at a considerable distance. At the same time it must be admitted, that as our ancestors were obliged by some of the old statutes to begin shooting with the long bow at the age of seven, they might have acquired a greater slight in this exercise than their descendants, though the latter should be allowed to be of equal strength.

As the shooting with the long bow was first introduced in England, and practised almost exclusively for nearly two centuries, so it hath occasioned a peculiar method of drawing the arrow to the ear and not to the breast. That this is contrary to the usage of the ancients is very clear from their reliefs, and from the tradition of the Amazons cutting off one of their paps, as it occasioned an impediment to their shooting. The Finsbury archer is therefore represented in this attitude of drawing to the ear, both in the *Bowman's Glory*, and in the silver badge given by Catharine to the Artillery Company. Not many years ago there was a man named Topham, who exhibited surprising feats of strength, and who happened to be at a public house near Islington, to which the Finsbury archers resorted after their exercise. Topham considered the long bow as a plaything, only fit for a child; upon which one of the archers laid him a bowl of punch, that he could not draw the arrow two-thirds of its length. Topham accepted this bet with the greatest confidence of winning; but bringing the arrow to his breast instead of his ear, he was greatly mortified by paying the wager, after many fruitless efforts.

As to the distance to which an arrow can be shot from a long bow with the best elevation of 45 degrees, that must necessarily depend much both upon the strength and slight of the archer; but in general the distance was reckoned from eleven to twelve score yards. The butts for exercise, as above noticed, were directed to be distant upwards of 220 yards. There is indeed a tradition, that an attorney of Wigan in Lancashire (named Leigh) shot a mile in three flights; but the same tradition states, that he placed himself in a very particular attitude, which cannot be used commonly in this exercise. According to Neade, an archer might shoot six arrows in the time of charging and discharging one musket. Archery.

The archers consider an arrow of from 20 to 24 drop weight to be the best for flight or hitting a mark at a considerable distance, and that yew is the best material of which they can be made. As to the feathers, that of a goose is preferred; it is also wished, that the bird should be two or three years old, and that the feather may drop of itself. Two out of three feathers in an arrow are commonly white, being plucked from the gander; but the third is generally brown or gray, being taken from the goose; and, from this difference in point of colour, informs the archer when the arrow is properly placed. From this most distinguished part therefore the whole arrow sometimes receives its name: And this, by-the-by, affords an explanation of the gray goose wing in the ballad of Cheviot Chase. Arrows were armed anciently with flint or metal heads, latterly with heads of iron; of these there were various forms and denominations. By an act of parliament made the 7th of Henry IV. it was enacted. That for the future all the heads for arrows and quarrels should be well boiled or brased, and hardened at the points with steel; and that every arrow head or quarrel should have the mark of the maker; workmen disobeying this order, were to be fined and imprisoned at the king's will, and the arrow heads or quarrels to be forfeited to the crown.

Arrows were reckoned by sheaves, a sheaf consisting of 24 arrows. They were carried in a quiver, called also an *arrow case*, which served for the magazine; arrows for immediate use were worn in the girdle. In ancient times phials of quicklime, or rather combustible matter, for burning houses or ships, were fixed on the heads of arrows, and shot from long bows. This has been also practised since the use of gunpowder. Neade says, he has known by experience, that an archer may shoot an ounce of fireworks upon an arrow twelve score yards. Arrows with wildfire, and arrows for fireworks, are mentioned among the stores at Newhaven and Berwick, in the 1st of Edward VI. *Grose on Ancient Armour.*

The force with which an arrow strikes an object at a moderate distance, may be conceived from the account given by King Edward VI. in his journal; wherein he says, that 100 archers of his guard shot before him two arrows each, and afterwards altogether; and that they shot at an inch board, which some pierced quite through and struck into the other board; divers pierced it quite through with the heads of their arrows, the board being well-seasoned timber; their distance from the mark is not mentioned.

To protect our archers from the attacks of the enemy's horse, they carried long stakes pointed at both ends; these they planted in the earth, sloping before them. In the first of Edward VI. 350 of these were in the stores of the town of Berwick, under the article of archers stakes; there were also at the same time eight bundles of archers stakes in Pontefract castle.

To prevent the bowstring from striking the left

Archery. arm, the arm is covered with a piece of smooth leather, fastened on the outside of the arm; this is called a *bracer;* and to guard the fingers from being cut by the bowstring, archers wore shooting gloves. Chaucer, in his prologue to the Canterbury Tales, thus describes an archer of his day:

And he was clade in cote and hode of grene,
A sheaf of peacock arwes bright and keen,
Under his belt he bare full thriftily:
Wel coude he dresse his takel yewmanly,
His arwes dronped not with fetheres lowe,
And in his hand he bare a mighty bowe,
A not hed hadde he, with broune visage,
Of wood craft coude he wel all the usage;
Upon his arms he had a gai bracer,
And by his side a swerd and a bokeler,
And on the other side a gaie daggere
Harneised wel, and sharpe as pointe of spere:
A cristofre on his breast of silver shene,
A horn he bare, the baudrick was of grene,
A forester was he sothely as I gesse.

Though archery continued to be encouraged by the king and legislature for more than two centuries after the first knowledge of the effects of gunpowder, yet by the latter end of the reign of Henry VIII. it seems to have been partly considered as a pastime. Arthur, the elder brother of Henry, is said to have been fond of this exercise, insomuch that a good shooter was styled Prince Arthur. We are also informed that he pitched his tent at Mile End in order to be present at this recreation, and that Henry his brother also attended. When the latter afterwards became king, he gave a prize at Windsor to those who should excel in this exercise; and a capital shot having been made, Henry said to Barlow (one of his guards), "If you still win, you shall be duke over all archers." Barlow therefore having succeeded, and living in Shoreditch, was created duke thereof. Upon another occasion, Henry and the queen were met by 200 archers on Shooter's hill, which probably took its name from their assembling near it to shoot at marks. This king likewise gave the first charter to the Artillery Company in the 29th year of his reign, by which they are permitted to wear dresses of any colour except purple and scarlet, to shoot not only at marks but birds, if not pheasants or herons, and within two miles of the royal palaces. They are also enjoined by the same charter not to wear furs of a greater price than those of the martin. The most material privilege, however, is, that of indemnification for murder, if any person passing between the shooter and the mark is killed, provided the archers have first called out *fast.*

The following description of an archer, his bow, and accoutrements, is given in a MS. written in the time of Queen Elizabeth. "Captains and officers should be skilful of that most noble weapon, and to see that their soldiers according to their draught and strength have good bowes, well nocked, well strynged, every strynge whippe in their nocke, and in the myddes rubbed with wax, braser and shuting glove, some spare strynges trymed as aforesaid, every man one shefe of arrows, with a case of leather defensible against the rayne, and in the same fower and twentie arrowes, whereof eight of them should be lighter than the residue, to gall or astoyne the enemye with the hailshot of light arrows, before they shall come within the danger of the harquebuss shot. Let every man have a brigandine, or a little cote of plate, a skull or huf kyn, a mawle of leade of five foote in lengthe, and a pike, and the same hanging by his girdle, with a hook and a dagger; being thus furnished, teach them by musters to marche, shoote, and retire, keepinge their faces upon the enemy's. Sumtyme put them into great nowmbers, as to battell apparteyneth, and thus use them often times practised, till they be perfecte; ffor those men in battel ne skirmish can not be spared. None other weapone maye compare with the same noble weapon." Archery.

The long bow, as already observed, maintained its place in our armies long after the invention of firearms. Nor have there been wanting experienced soldiers who were advocates for its continuance, and who in many cases even preferred it to the harquebus or musket. King Charles I. twice granted special commissions under the great seal for enforcing the use of the long bow. The first was in the 4th year of his reign: but this was revoked by proclamation four years afterwards, on account of divers extortions and abuses committed under sanction thereof. The second, anno 1633, in the ninth year of his reign, to William Neade and his son, also named William, wherein the former is styled an ancient archer, who had presented to the king a warlike invention for uniting the use of the pike and bow, seen and approved by him and his council of war; whereof his majesty had granted them a commission to teach and exercise his loving subjects in the said invention, which he particularly recommended the chief officers of his trained bands to learn and practise; and the justices and other chief magistrates throughout England, are therein enjoined to use every means in their power to assist Neade, his son, and all persons authorized by them in the furtherance, propagation, and practice of this useful invention. Both the commissions and proclamation are printed at large in Rymer. At the breaking out of the civil war, the earl of Essex issued a precept, dated in November 1643, for stirring up all well affected people by benevolence, towards the raising a company of archers for the service of the king and parliament.

Archery with the long bow continues to be used as a manly exercise by the inhabitants of Geneva, and in many parts of Flanders; nor is it totally neglected in Great Britain. There are several societies of archers in England; the chief of which are, the *Woodmen of Arden,* and the *Toxopholite.* But the most noted society of this kind, now existing, is

The *Royal Company of Archers* in Scotland.—The ancient records of this Company having been destroyed by fire about the beginning of the last century, no authentic traces of their institution now remain. It is said that they owe their origin to the commissioners appointed in the reign of James I. of Scotland for enforcing and overseeing the exercise of archery in different counties. Those commissioners, who were in general men of rank and power, picking out amongst the better sort of people under their cognizance the most expert archers, formed them into a company, and upon perilous occasions made a present of their services to the king as his chief body guards; in which situation

rchery. tion they often distinguished themselves for their loyalty, their courage, and skill in archery. This rank of the king's principal body guards the Royal Company still claim, within seven miles of the metropolis of Scotland.

Certain it is, that by an act of the privy council of Scotand, in 1677, this company was recognized under the name and title of "His Majesty's Company of Archers:" and by the same act a piece of plate of the value of 20l. sterling was ordered to be given to be shot for by them at their annual parades, called *Weapon-shawings*, and to be called *The King's Prize*.

At this period the Royal Company consisted, as it does at present, of the principal nobility and gentry of Scotland. But their unfortunate attachment to anti-revolution principles, upon that event's taking place, put almost a period to their existence: Their public parades or marches were discontinued, and the royal prize was withheld.

Upon the accession of Queen Anne, their former splendour was revived; and in the year 1703 they obtained a royal charter, confirming in general terms all their former rights and privileges, and conferring others upon them. But their partiality to the family of Stuart was at various after periods the cause of a temporary prosperity and decline.

These unhappy differences of opinion having totally subsided, the Royal Company are now more numerous and flourishing than ever, and perhaps even more dexterous archers. His present Majesty, as a mark of his royal patronage and approbation, has been pleased to revive the royal prize, which for the first time was shot for upon the 28th of July 1788 by a numerous and respectable meeting.

The Woodmen of Arden and the Toxophilite have lately been pleased to admit the members of the Royal Company to the freedom of their societies: these grants have been followed by reciprocal diplomas from the Royal Company; so that the three chief societies of archers in Britain may be said to be now incorporated into one.

The prizes belonging to this Company, and which are annually shot for, are, 1. A silver arrow, given by the town of Musselburgh, which appears to have been shot for as early as the year 1603. The victor in this, as in the other prizes, except the king's prize, has the custody of it for a year, then returns it with a medal appended, on which are engraved any motto and device which the gainer's fancy dictates. 2. A silver arrow given by the town of Peebles, A. D. 1626. 3. A silver arrow given by the city of Edinburgh, A. D. 1709. 4. A silver punch bowl of about the value of 50l. made of Scottish silver at the expence of the Company, A. D. 1720. And, 5. The king's prize above mentioned, which becomes the absolute property of the winner. All these prizes are shot for at what is termed *Rovers*, the marks being placed at the distance of 185 yards.

Besides these, there is another prize annually contended for at butt or point-blank distance, called the *Goose*. The ancient manner of shooting for this prize was, a living goose was built in a turf butt, having the head only exposed to view; and the archer who first hit the goose's head was entitled to the goose as his reward. But this custom, on account of its barbarity, has been long ago laid aside; and in place of the goose head, a mark of about an inch diameter is affixed upon each butt, and the archer who first hits this mark is captain of the butt shooters for a year. Archery || Archeus.

The affairs of the Company are managed by a preses and six counsellors, who are chosen annually by the whole members. The council are vested with the power of receiving or rejecting the candidates for admission, and of appointing the Company's officers civil and military.

The Royal Company now consists of above 1000 members, among whom are most of the Scottish nobility of the first distinction. A number of the Company meet weekly during the summer season at Edinburgh, in the Meadows, where they exercise themselves in shooting at butts or rovers: And in the adjoining ground they have a handsome building, erected within these 12 years, with suitable offices, whither they adjourn after their exercise, and where they hold their elections and other meetings relative to the business of the society.

The uniform of the Royal Company of Archers is tartan, lined with white, and trimmed with green and white fringes; a white sash with green tassels; and a blue bonnet, with a St Andrew's cross and feathers. The Company have two standards. The first of these bears on one side Mars and Venus encircled in a wreath of thistles, with this motto, "*In peace* and war." On the other, a yew tree, with two men dressed and equipped as archers, encircled as the former; motto, *Dat gloria vires*. The other standard displays, on one side, a lion rampant gules, on a field or, encircled with a wreath; on the top, a thistle and crown; motto, *Nemo me impune lacesset*. On the other, St Andrew on the cross, on a field argent; at the top, a crown; motto, *Dulce pro patria periculum*.

ARCHES COURT, in English ecclesiastical polity, is a court of appeal, belonging to the archbishop of each province; whereof the judge is called the *dean of the arches*, because he anciently held his court in the church of St Mary *le bow*, (*Sancta Maria de arcubus*), though all the principal spiritual courts are now holden at Doctors Commons. His proper jurisdiction is only over the 13 peculiar parishes belonging to the archbishop in London; but the office of dean of the arches having been for a long time united with that of the archbishop's principal office, he now, in right of the last-mentioned office, receives and determines appeals from the sentences of all inferior ecclesiastical courts within the province. And from him there lies an appeal to the king in chancery (that is, to a court of delegates appointed under the king's great seal), by statute 25th Hen. VIII. c. 19. as supreme head of the English church, in the place of the bishop of Rome, who formerly exercised this jurisdiction; which circumstance alone will furnish the reason why the Popish clergy were so anxious to separate the spiritual court from the temporal.

ARCHETYPE, the first model of a work, which is copied after to make another like it. Among minters, it is used for the standard weight by which the others are adjusted. The archetypal world, among Platonists, means the world as it existed in the idea of God before the visible creation.

ARCHEUS, from ἀρχή, the principal, chief, or first

Archeus ‖ Archil.

first mover); a sort of primum mobile set up by Helmont, to superintend the animal economy, and preserve it. It is akin to Plato's *anima mundi*. Hippocrates uses the words αρχαιη φυσις, to signify the former healthy state before the attack of the disease.

ARCHIACOLYTHUS (from αρχος, *chief*, and ακολυθος *minister*), an ancient dignity in cathedral churches: the ministers whereof were divided into four orders or degrees, viz. priests, deacons, subdeacons, and acolythi; each of which had their chiefs. The chief of the acolythi was called *archiacolythus*.

ARCHIATER, ARCHIATRUS, properly denotes chief physician of a prince who retains several. The word is formed of αρχη, *principium*, "chief;" and ιατρος, *medicus*, a "physician."

ARCHIDAPIFER, (from αρχος, and *dapifer*, "sewer,") or chief sewer, is a great officer of the empire. The elector of Bavaria is archidapifer. The palatine of the Rhine at one time pretended this office was annexed to his palatinate; but he has since desisted.

ARCHIEROSYNES, in the Grecian antiquity, a high priest vested with authority over the rest of the priests, and appointed to execute the more sacred and mysterious rites of religion.

ARCHIGALLUS, in antiquity, the high priest of Cybele, or the chief of the eunuch priests of that goddess, called *Galli*.

ARCHIGERONTES (from αρχος, and γερων, *old*), in antiquity, the chiefs or masters of the several companies of artificers at Alexandria. Some have mistaken the archigerontes for the arch-priests appointed to take the confession of those who were condemned to the mines.

ARCHIGUBERNUS, ARCHIGUBERNETA, or ARCHIGUBERNITES, in antiquity, the commander of the imperial ship, or that which the emperor was aboard of. Some have confounded the office of archigubernus with that of *præfectus classis*, or admiral, but the former was under the command of the latter. Potter takes the proper office of the archiguberneta to have been, to manage the marine affairs, to provide commodious harbours, and order all things relating to the sailing of the fleet, except what related to war.

ARCHIL, ARCHILLA, ROCELLA, ORSIELLE, is a whitish moss which grows upon rocks, in the Canary and Cape de Verd islands, and yields a rich purple tincture, fugitive, indeed, but extremely beautiful. This weed is imported to us as it is gathered. Those who prepare it for the use of the dyer, grind it betwixt stones, so as to thoroughly bruise, but not to reduce it into powder; and then moisten it occasionally with a strong spirit of urine, or urine itself mixed with quicklime: in a few days it acquires a purplish red, and at length a blue colour. In the first it is called *Archil*; in the latter, *Lacmus* or *Litmase*.

The dyers rarely employ this drug by itself, on account of its dearness and the perishableness of its beauty. The chief use they make of it is, for giving a bloom to other colours, as pinks, &c. This is effected by passing the dyed cloth or silk through hot water lightly impregnated with the archil. The bloom thus communicated soon decays upon exposure to the air. Mr Hellot informs us, that by the addition of a little solution of tin, the drug gives a durable dye; that its colour is at the same time changed towards a scarlet; and that it is the more permanent in proportion as it recedes the more from its natural colour.

Archil ‖ Archilochus.

Prepared archil very readily gives out its colour to water, to volatile spirits, and to spirit of wine; it is the substance principally made use of for colouring the spirits of thermometers. As exposure to the air destroys its colour upon cloth, the exclusion of the air produces a like effect in these hermetically sealed tubes, the spirits of large thermometers becoming in the compass of a few years colourless. M. l'Abbe Nollet observes (in the French Memoirs for the year 1742), that the colourless spirit, upon breaking the tube, soon resumes its colour, and this for a number of times successively; that a watery tincture of archil, included in the tubes of thermometers, lost its colour in three days; and that, in an open deep vessel, it became colourless at the bottom, while the upper part retained its colour. See COLOUR-*Making*.

A solution of archil in water, applied on cold marble, stains it of a beautiful violet or purplish blue colour, far more durable than the colour which it communicates to other bodies. M. du Fay says he has seen pieces of marble stained with it, which in two years had suffered no sensible change. It sinks deep into the marble, sometimes above an inch; and at the same time spreads upon the surface, unless the edges be bounded by wax or other like substances. It seems to make the marble somewhat more brittle.

Linnæus informs us, in the Swedish Transactions for the year 1742, that the true archil moss is to be found on the western coasts of England.

ARCHILOCHIAN, a term in poetry, applied to a sort of verses, of which Archilochus was the inventor, consisting of seven feet; the four first whereof are ordinarily dactyls, though sometimes spondees; the three last trochees, as in Horace,

Solvitur acris hyems, grata vice veris et Favoni.

ARCHILOCHUS, a famous Greek poet and musician, was, according to Herodotus, cotemporary with Candaules and Gyges, kings of Lydia, who flourished about the 14th Olympiad, 724 years before Christ. But he is placed much later by modern chronologists; viz. by Blair 686, and by Priestley 660 years, before Christ.

He was born at Paros, one of the Cyclades. His father Telesicles was of so high a rank, that he was chosen by his countrymen to consult the oracle at Delphos concerning the sending a colony to Thasos: a proof that he was of one of the most distinguished families upon the island. However, he is said to have sullied his birth by an ignoble marriage with a slave called *Enipo*, of which alliance our poet musician was the fruit.

Though Archilochus showed an early genius and attachment to poetry and music, these arts did not prevent his going into the army, like other young men of his birth; but in the first engagement at which he was present, the young poet, like Horace, and like our own Suckling, lost his buckler, though he saved his life by the help of his heels. *It is much easier*, said he, *to get a new buckler than a new existence.* This pleasantry, however, did not save his reputation; nor could his poetry or prayers prevail upon Lycambes, the father

of

rchilo-
chus.

of his mistress, to let him marry his daughter, though she had been long promised to him. After these mortifications, his life seems to have been one continued tissue of disgrace and resentment.

Archilochum proprio rabies armavit iambo.
HOR. Art. Poet. 79.

Archilochus, with fierce resentment warm'd,
Was with his own severe iambics arm'd. FRANCIS.

The *rage of Archilochus* was proverbial in antiquity; which compared the provoking this satirist to the treading upon a serpent: A comparison not very severe, if it be true that Lycambes, and, as some say, his three daughters, were so mortified by his satire, as to be driven to the consolation of a halter.

In this piece, many adventures are mentioned, full of defamation, and out of the knowledge of the public. There were likewise many loose passages in it; and it is said to have been on account of this satire that the Lacedæmonians laid a prohibition on his verses *.

'al.
x. lib.
c. 3.

However, according to Plutarch, there is no bard of antiquity by whom the two arts of poetry and music have been so much advanced as by Archilochus. To him is attributed particularly the sudden transition from one rhythm to another of a different kind, and the manner of accompanying those irregular measures upon the lyre. Heroic poetry, in hexameter verse, seems to have been solely in use among the more ancient poets and musicians; and the transition from one rhythm to another, which lyric poetry required, was unknown to them; so that if Archilochus was the first author of this mixture, he might with propriety be styled the *Inventor of Lyric Poetry*, which, after his time, became a species of versification wholly distinct from heroic.—To him is likewise ascribed the invention of *Epodes*. See EPODE.

Our poet-musician is generally ranked among the first victors at the Pythic games: and we learn from Pindar, that his muse was not always a termagant; for though no mortal escaped her rage, yet she was at times sufficiently tranquil and pious to dictate hymns in praise of the gods and heroes. One in particular, written in honour of Hercules, acquired him the acclamations of all Greece; for he sung it in full assembly at the Olympic games, and had the satisfaction of receiving from the judges the crown of victory consecrated to real merit. This hymn, or ode, was afterwards sung in honour of every victor at Olympia, who had no poet to celebrate his particular exploits.

Archilochus was at last slain by one Callondax Corax, of the island of Naxos; who, though he did it in fight, according to the laws of war, was driven out of the temple of Delphi, by command of the oracle, for having deprived of life a man consecrated to the Muses.

The names of Homer and Archilochus were equally revered and celebrated in Greece, as the two most excellent poets which the nation had ever produced. This appears from an epigram in the Anthologia; and from Cicero, who ranks him with poets of the first class, and in his Epistles tells us, that the grammarian Aristophanes, the most rigid and scrupulous critic of his time, used to say, that the longest poem of Archilochus always appeared to him the most excellent.

Archilochus ‖ Archimedes.

ARCHIMAGUS, the high priest of the Persian Magi or worshippers of fire. He resided in the highest fire temple; which was held in the same veneration with them as the temple of Mecca among the Mahometans. Zoroaster first settled it at Balch; but after the Mahometans had overrun Persia in the 7th century, the Archimagus was forced to remove from thence into Kerman, a province of Persia, lying on the southern ocean, where it hath continued to this day. Darius Hystaspes took upon himself the dignity of Archimagus: for Porphyry tells us, he ordered before his death, that, among the other titles, it should be engraven on his monument, that he had been *Master of the Magi;* which plainly implies that he had borne this office among them, for none but the Archimagus was master of the whole sect. From hence it seems to have proceeded, that the kings of Persia were ever after looked on to be of the sacerdotal tribe, and were always initiated into the sacred order of the Magi, before they took on them the crown, and were inaugurated into the kingdom.

ARCHIMANDRITE, in ecclesiastical history, was a name given by the ancient Christians to what we now call an *abbot*. Father Simon observes, that the word *mandrite* is Syriac, and signifies a solitary monk.

ARCHIMEDES, one of the most eminent of the ancient mathematicians, was born at Syracuse in Sicily, about the year 180 before the Christian era. Hiero, king of Syracuse, deemed it an honour to have this philosopher for his relative and friend. History does not inform us, to whom he was indebted for the rudiments of literature, but he flourished about 50 years after Euclid. It is reported, that he was indebted to Egypt for much of his knowledge; but other accounts indicate, that he conferred more knowledge than he received from that celebrated nation; and, in particular, Diodorus mentions, that Egypt was indebted to him for the invention of the screw-pump, for drawing off water. And the same author narrates, that he was the inventor of several other useful machines, which conveyed his fame to every quarter of the globe. The following passage from Livy, proves, that he was dexterous both for the inventing warlike machines, and also for his accurate observation of the heavenly bodies: "Unicus spectator cæli siderumque, mirabilior tamen inventor ac machinator bellicorum tormentorum," &c. lib. xxiv. It appears also, that in Cicero's time, he had become proverbial for his skill in solving problems. In a letter to Atticus, he informs him, that he is now freed from a difficulty, which he termed an Archimedian problem, lib. xiii. ep. 28.

It may perhaps be impossible distinctly to ascertain the different inventions of this great man; but from the following passage, it appears that he formed a *glass sphere*, or some kind of *planetarium*, which, with no small degree of accuracy, represented the phenomena of the heavenly bodies. Hence says Claudian

Jupiter, in parvo cum cerneret æthera vitro,
Risit, et ad superos talia dicta dedit:

Huccine

Archimedes.

Huccine mortalis progressa potentia curæ?
Jam meus in fragile ludetur orbe labor.
Jura poli, rerumque fidem, legesque deorum,
Ecce Syracosius transtulit arti senex.
Inclusus variis famulatur spiritus astris,
Et verum certis motibus urget opus.
Percurrit proprium mentitus signifer annum.
Et simulata novo Cynthia mense redit.
Jamque suum volvens audax industria mundum
Gaudet, et humana sidera mente regit.
Quid falso insontem tonitru Salmonea miror?
Emula naturæ parva reperta manus.

" When in a glass's narrow sphere confin'd,
Jove saw the fabric of th' Almighty mind;
He smil'd, and said, ' Can mortals art alone
Our heav'nly labours mimic with their own?
The Syracusan's brittle work contains
Th' eternal law that through all nature reigns.
Fram'd by his art, see stars unnumber'd burn,
And in their courses rolling orbs return;
His sun, through various signs describe the year,
And every month his mimic moons appear.
Our rival's laws his little planets bind,
And rule their motions by a human mind:
Salmoneus could our thunder imitate;
But Archimedes can a world create."

In the following lines the same machine is mentioned by Ovid.

Arte Syracosia suspensus in aëre clauso,
Stat globus, immensi parva figura poli.

Ovid, Fast. vi. 277.

Vitruvius mentions a fact, which proves Archimedes's knowledge in the doctrine of specific gravity. Hiero, the king, having given a certain quantity of gold wherewith to make a golden crown, and suspecting that the workmen had stolen part of the gold and substituted silver in its stead, he applied to Archimedes to employ his ingenuity in detecting the fraud. Ruminating upon this subject when he was bathing himself, he observed that he dislodged a quantity of water corresponding to the bulk of his own body; therefore, instantly quitting the bath with all the eagerness natural to an inventive mind upon a new discovery, he run into the streets naked, crying, Ευρηκα! Ευρηκα! *I have found it out! I have found it out!* Then taking one mass of gold and another of silver, each equal in weight to the crown; he carefully observed the quantity of fluid which they alternately displaced, when introduced in the same vessel full of water. Next he ascertained how much water was displaced by the crown when put into the same vessel full of water; and, upon comparing the three quantities together, he ascertained the exact proportions of gold and silver, of which the crown was composed.

Archimedes was well acquainted with the mechanical powers. His celebrated saying with regard to the power of the lever has been often repeated, " Give me a place to stand upon, and I will move the earth." In order to shew Hiero the effect of mechanical powers, it is said, that aided by ropes and pulleys, he drew towards him a galley, which lay on the shore manned and loaded: but the displays of his mechanical skill mentioned by Marcellus at the siege of Syracuse, were long deemed almost incredible; until the after improvements in mechanics have demonstrated them practicable. He harassed the vessels of the besiegers, both when they approached and kept at a distance from the city. When they approached, he sunk them by means of long and huge beams of wood; or, by means of grappling hooks placed at the extremity of levers, he hoisted up the vessels into the air, and dashed them to pieces either against the walls or the rocks. When the enemy kept at a distance, he employed machines which threw from the walls such a quantity of stones as shattered and destroyed their vessels. In short, his mechanical genius supplied strength and courage to the city, and filled the Romans with astonishment and terror. Until Buffon invented and framed a burning glass, composed of about 400 glass panes, capable of setting fire to wood at the distance of 200 feet, and of melting lead and tin at the distance of 120 feet, and silver at the distance of 50; the account of Archimedes's instrument for burning ships at a great distance by means of the rays of the sun, was deemed fabulous and impossible.

Archim des.

But, however eminent for mechanical invention, he was still more eminent for the investigation of abstract truths; and the formation of conclusive demonstrations in the branches of pure geometry. Plutarch also mentions, that Archimedes himself esteemed mechanical invention greatly inferior in value to those speculations which convey irresistible conviction to the mind. His geometrical works afford numerous proofs of his success in this field of science. It is reported, that he was often so deeply engaged in mathematical speculations, as both to neglect his food and the care of his person; and at the bath he would sometimes draw geometrical figures in the ashes, and sometimes upon his own body when it was anointed, according to the custom of that time. He valued himself so much upon the discovery of the ratio between the sphere and the containing cylinder, that, indifferent to all his other inventions, he ordered his friends to engrave upon his tomb a cylinder containing a sphere, with an inscription explanatory of its nature and use.

It must be extremely painful to every humane mind, but particularly to every lover of philosophic merit, to learn, that when Syracuse was taken by storm, he, being ignorant of that fact, was run through the body, when engaged in drawing a geometrical figure upon the sand. As Marcellus had given express orders that both his person and his house should be held sacred; this appears to have happened through ignorance, and therefore removes a great part of the odium from the Roman name. This mournful event happened in the 142d Olympiad, or 212 years before the Christian era. Marcellus, in the midst of his triumphant laurels, lamented the death of Archimedes, conferred upon him an honourable burial, and took his surviving relations under his protection; but greater honour was conferred upon him when the philosopher of Arpinum, 140 years after, went in search of his long-neglected tomb. Hence, says Cicero, " I diligently sought to discover the sepulchre of Archimedes, which the Syracusans had totally neglected, and suffered to be overgrown with thorns and briers. Recollecting some verses, said to be inscribed on the tomb, which mentioned, that on the top was placed a sphere with a cylinder,

Archimedes.

looked round me upon every object at the Agrigentine gate, the common receptacle of the dead. At last I observed a little column which just rose above the thorns, upon which was placed the figure of a sphere and cylinder. 'This,' said I to the Syracusan nobles who were with me, 'This must, I think, be what I am seeking.' Several persons were immediately employed to clear away the weeds, and lay open the spot. As soon as a passage was opened, we drew near, and found on the opposite base the inscription, with nearly half the latter part of the verses worn away. Thus would this most famous, and formerly most learned, city of Greece have remained a stranger to the tomb of one of its most ingenious citizens, had it not been discovered by a man of Arpinum."

Several works of this most celebrated mathematician have escaped the wreck of time. Of abstract geometry we have a treatise "on the Sphere and Cylinder," another "on the Dimension of the Circle, or the Proportion between the Diameter and the Circumference; on Obtuse Conoids and Spheroids; on Spiral Lines; and on the Quadrature of the Parabola." Of his mechanics Archimedes has left a "Treatise on Equiponderants, or Centres of Gravity; and in hydrostatics, a "Treatise concerning Bodies floating on Fluids;" and a geometrical piece, entitled *Assumpta* or *Lemmata*. His other works are either lost or remain unpublished. (*Gen. Biog.*).

ARCHIPELAGO, in *Geography*, a general term signifying a sea interrupted with islands; it is however more especially applied to that lying between Europe and Asia, which contains the islands anciently called *Cyclades* and *Sporades*. See these two words. Archipelago || Architect.

ARCHIPHERACITÆ, ministers in the Jewish synagogues appointed to read and interpret the Perakim, or titles and heads of the law and the prophets.

ARCHPRESBYTER, or ARCHPRIEST, a priest established in some dioceses with a superiority over the rest. He was anciently chosen out of the college of presbyters at the pleasure of the bishop. These archpresbyters were of much the same nature with deans in the cathedral churches, as the college of presbyters answers to the chapter. See PRESBYTER.

ARCHISYNAGOGUES, the chief of the synagogue; the title of an officer among the Jews, who presided in their synagogues and assemblies. The number of these officers was not fixed, nor the same in all places; there being 70 in some, and in others only one. They are sometimes called *princes* of the synagogue, and had a power of excommunicating such as deserved that punishment.

ARCHITECT, a person skilled in architecture, or the art of building; who forms plans and designs for edifices, conducts the work, and directs the several artificers employed in it. The word is derived from αρχος, *princeps*, and τεκτων, *faber*, "workman;" q. d. the principal workman.

ARCHITECTURE,

IN the utmost latitude of the word, signifies the art of building in general; but the term is most frequently applied only to the construction of such buildings as are necessary for the purposes of civil life, such as houses, churches, halls, bridges, porticoes, &c.

History of Architecture.

THE origin of this art, like that of most others, is totally unknown. We are assured, however, that it is as old as Cain: for Moses tells us that he built a city; though what were the materials, or how the buildings were constructed, we are entirely ignorant. It is commonly said, that the first materials employed in building were branches and twigs of trees, wherewith men constructed huts; such as the *wigwams* in use among the American Indians at present. This, however, appears disputable. The natural shelter afforded by hollows in the sides of mountains or rocks, it may be supposed, would much more readily suggest the idea of using stones and earth as materials for building houses. Indeed, considering that tents were not invented before the days of Jabal, Tubal Cain's brother, it is very probable that such temporary houses as the Indian wigwams were not originally known; otherwise the method of covering poles with the skins of beasts, instead of small branches or twigs, must very soon have taken place. These temporary houses seem to have come into use only when men began to lead an idle wandering life, like the Tartars, and could not be at the trouble of constructing durable habitations in every place where they were obliged to wander with their cattle; and Jabal perhaps from them took the hint of making portable houses or tents. Accordingly we see, that no nations, except those who are in a perpetually unsettled state, make use of such wretched materials. Even in America, where the human race has appeared in the rudest form, they were no sooner collected into great bodies under the emperors of Mexico and Peru, than stone buildings began to be erected. 1 Materials first used in building.

We are not, therefore, to look for the origin of architecture in any single nation; but in every nation, when the inhabitants began to leave off their savage way of life, and to become civilized: and if there is any nation to be found which hath been always in a civilized state, we may be assured that architecture hath always had an existence there. But whatever may be in this, the origin of regular buildings hath been deduced from the construction of the meanest huts in a very natural and plausible manner by several authors. "Anciently (says Vitruvius) men lived in woods, and inhabited caves; but in time, taking perhaps example from birds, who with great industry build their nests, they made themselves huts. At first they made these huts, very probably, of a conic figure; because that is a figure of the simplest structure; and, like the birds, whom they imitated, composed them of branches of trees, spreading them wide at the bottom, and join- 2 Primitive huts. Plate XXXVII. fig. 1.

ing them in a point at the top; covering the whole with reeds, leaves, and clay, to screen them from tempests and rain.

3 Their improvement.

"But finding the conic figure inconvenient on account of its inclined sides, they changed both the form and construction of their huts, giving them a cubical figure, and building them in the following manner: Having marked out the space to be occupied by the hut, they fixed in the ground several upright trunks of trees to form the sides, filling the intervals between them with branches closely interwoven and covered with clay. The sides being thus completed, four large beams were placed on the upright trunks; which, being well joined at the angles, kept the sides firm, and likewise served to support the covering or roof of the building, composed of many joists, on which were laid several beds of reeds, leaves, and clay.

Fig. 2.

"Insensibly mankind improved in the art of building, and invented methods to make their huts lasting and handsome as well as convenient. They took off the bark, and other unevennesses, from the trunks of the trees that formed the sides: raised them, probably above the dirt and humidity, on stones; and covered each of them with a flat stone or slate, to keep off the rain. The spaces between the ends of the joists were closed with clay, wax, or some other substance; and the ends of the joists covered with thin boards cut in the manner of triglyphs. The position of the roof was likewise altered: for being, on account of its flatness, unfit to throw off the rains that fell in great abundance during the winter season, they raised it in the middle; giving it the form of a gable roof, by placing rafters on the joists, to support the earth and other materials that composed the covering.

Fig. 3.

"From this simple construction the orders of architecture took their rise. For when buildings of wood were set aside, and men began to erect solid and stately edifices of stone, they imitated the parts which necessity had introduced into the primitive huts; insomuch that the upright trees, with the stones at each end of them, were the origin of columns, bases, and capitals, and the beams, joists, rafters, and strata of materials that formed the covering, gave birth to architraves, frizes, triglyphs, and cornices, with the corona, the mutules, the modillions, and the dentils.

"The first buildings were in all likelihood rough and uncouth; as the men of those times had neither experience nor tools: but when, by long experience and reasoning upon it, the artists had established certain rules, had invented many instruments, and by great practice had acquired a facility in executing their ideas, they made quick advances towards perfection, and at length discovered certain manners of building, which succeeding ages have regarded with the highest veneration."

4 State of architecture among the Egyptians.

Among the ancient Egyptians, Assyrians, and Persians, this art was carried to an incredible length. The pyramids of Egypt are such structures as would exceed the power of the most potent monarch on earth to raise at this day. The largest of these, according to the account of M. Goguet, is near 500 feet high, and contains 313,590 solid fathoms. It is composed of stones enormously large; many of them being 30 feet long, four feet high, and three in breadth; and all this huge mass of building was coated over with sqnare flags of marble.—The structure called the *labyrinth*, in the same country, according to Herodotus, who saw it, excelled every thing which he could have conceived from the imagination either of himself or others. Within the same circuit of walls they had enclosed 3000 halls, 12 of which were of a singular form and beauty; and of these, half were above, and half below ground; and the whole was terminated by a pyramid 40 fathoms high. All this prodigious mass of building was composed of white marble, and the walls were adorned with engravings.—The obelisks were not less astonishing; the largest of them being entire pieces of granite, no less than 180 feet high.—Near Andera, in Upper Egypt, are the ruins of a palace of gray granite, the ceilings of which are supported by columns of such thickness, that four men can scarcely fathom them. The ceilings themselves are composed of stones of the same kind, six or seven feet in breadth and 18 feet in length. The grand hall is 112 feet long, 60 high, and 58 broad. The roof of the whole edifice is a terrace, on which the Arabs formerly built a very large village, the ruins of which are still visible.

5 Among Babylonians and Persians

Among the Babylonians and Persians, too, such immense piles of building have been raised, as appear utterly inconceivable and incredible to many modern authors, where their former grandeur is not demonstrable by ruins visible at this day. The ruins of Persepolis, the ancient capital of Persia, were so stupendous in the time of Avicenna the Arab physician, that his countrymen could not believe such structures possible to be erected but by evil spirits. Of their extraordinary magnificence, indeed, we may have some idea from the account of the staircases belonging to the palace. The remains, some time ago, consisted of 95 steps of white marble, so broad and flat, that 12 horses might conveniently go up abreast.

6 Their buildings more remarkable for greatness than elegance

In these vast structures, however, the nations of whom we speak seem to have regarded the greatness, rather than the elegance or usefulness of their works. In the pyramids and obelisks of Egypt this is exceedingly conspicuous; but whether it was so in the labyrinth or in the palace at Thebes above mentioned, it is impossible to determine, unless the buildings were entire, and we knew for what purpose they had been designed. If the kings who built the pyramids designed to immortalize their memories by building, they certainly could not have fallen upon any thing more proper for this purpose; though even in this they have somehow or other failed, the names of those who erected them not being certainly known even in the time of Herodotus.

7 Ignorant the use of arches,

It is certain, however, that neither the ancient Assyriaus nor Babylonians knew the method of constructing arches. The roofs of all their halls were flat, and covered with prodigiously large stones, some of them so big as to cover a whole room singly. Their manner of building was also quite destitute of what is now called *taste;* the columns were ill proportioned, and their capitals executed in the poorest manner imaginable. This was observed by the Greeks, who improved upon the proportions formerly used, and were the inventors of three of the five orders of architecture, viz. the Doric, Ionic, and Corinthian. "Anciently (says Vitruvius) they were ignorant of the art of proportioning the various parts of a building: they used columns; but they cut them at hazard, without rules,

8 and of proportioning columns.

without

without principles, and without having any attention to the proportions which they ought to give them: they placed them likewise without any regard to the other parts of the edifice. Dorus, son of Helen and grandson of Deucalion, having caused a temple to be built at Argos in honour of Juno, that edifice was found by chance to be constructed according to the taste and proportions of the order which afterwards they called *Doric*. The form of this building having appeared agreeable, they conformed to it in the construction of edifices which they afterwards had to build.

9 Origin of the Doric order.

"About the same time, the Athenians sent into Asia a colony under the conduct of Ion, nephew of Dorus: this undertaking had very good success. Ion seized on Caria, and there founded many cities. These new inhabitants thought to build temples. They proposed for a model that of Juno at Argos: but, ignorant of the proportion which they ought to give to the columns, and in general to the whole edifice, they sought for rules capable of regulating their operation. These people wanted, in making their columns sufficiently strong to support the whole edifice, to render them at the same time agreeable to the sight. For this purpose, they thought to have given it the same proportion that they found between the foot of a man and the rest of his body. According to their ideas, the foot made a sixth part of the human height: in consequence, they gave at first to a Doric column, taking in its chapiter, six of its diameters; that is to say, they made it six times as high as it was thick: afterwards they added to it a seventh diameter.

10 the Io-

"This new order of architecture was not long in giving birth to a second: they would immediately go beyond the first invention. The Ionians tried to throw still more delicacy and elegance into their edifices. They employed the same method which they had before put in practice for the composition of the Doric order: but instead of taking for a model the body of a man, the Ionians were regulated by that of a woman. With a view to make the columns of this new order more agreeable and more pleasing, they gave them eight times as much height as they had diameter. They also made channellings all along the trunk, to imitate the folds of the robes of women: the volutes of the chapiter represented that part of the hair which hung in curls on each side of the face. The Ionians added, lastly, to these columns a base, which was not in use in the Doric order." According to Vitruvius, these bases were made in the manner of twisted cords, as a kind of case for the columns. This order of architecture was called *Ionic*, from the name of the people who had invented it.

Such is the account given by Vitruvius of the origin of improvements in the proportion of columns. Had these improvements, however, existed in such early times, Homer, who was greatly posterior to them, would certainly have made mention of something of that kind; but in all his writings he gives us no account of any thing like a column of stone, but uses a word which would rather incline us to think that his columns were nothing more than bare posts.

11 nts of improvement bably en from omon's ple.

It is remarkable, that improvements in architecture did not take place in any nation till after, or about, the time that Jerusalem was taken by Nebuchadnezzar. The grandest buildings erected among the Assyrians seem to have owed their existence to this monarch; and it can scarce be imagined that he would not endeavour to imitate the architecture of Solomon's temple, to which, by his conquest of Jerusalem, he had full access. It is also remarkable, that the dimensions of the two pillars, Jachin and Boaz, set up by Solomon, very nearly correspond with those of the Doric order, first invented by the Greeks, and which originally came from their colonies settled in Asia Minor. The height of Solomon's pillars, without the chapiter, was 18 cubits; that of the chapiter itself was five cubits; the circumference was 12 cubits; from whence, according to the Scripture language, we may reckon the diameter to have been exactly four cubits. Had they been a single cubit higher, they would have been precisely of the same height with columns of the original Doric order. We do not indeed mean to assert, that this famous temple gave a model of architecture to the whole world; although it is scarce conceivable but imitations of it, as far as it could be known, must have taken place among many nations.

12 Egyptian banqueting room described.

Notwithstanding all their defects, however, the Egyptian buildings undoubtedly had an air of vast grandeur and magnificence, if we may credit the description given of one of their banqueting rooms by Vitruvius. The usal size of one of these rooms was from 100 to 150 feet in length, and its breadth somewhat more than half its length. At the upper end, and along the two sides, they placed rows of pillars tolerably well proportioned to one another, though not of any regular order; and at the lower part they made a magnificent and spacious entrance: this, with its ornaments seems to have taken up one end of the building entire. We are not told that there were any pillars there; though perhaps they placed two or more toward the angles on each side, for uniformity, the central space being enough for an entrance in the grandest and most august manner. Those rows of columns were set at a distance from the wall, forming a noble portico along the two sides and upper end of the building. Upon the pillars was laid an architrave; and from this was carried up a continued wall with three quarter columns, answering directly to those below, and in proportion one-fourth smaller in all their parts. Between these three quarter columns were placed the windows for enlightening the building. From the tops of the lower pillars to the wall was laid a floor; this covered the portico overhead within, and made on the outside a platform, which was surrounded by a corridor with rails and ballusters. This was terraced, and served as a plain for people to walk on; and from this they could look through the windows down into the room. To this terrace there was no covering required, as the Egyptians were in no fear of rain. The Egyptians decorated this sort of building with statues; and no kind of ornament could answer it so well, as the light cannot fall upon statues to such advantage in any direction, as when it comes from above, in such a regular, proportioned, and uninterrupted manner.

13 Ancient architecture superior in grandeur to the modern.

We have already taken notice, that among the ancient Egyptians, Persians, and Babylonians, the vast strength and extent of their buildings seems to have been what they chiefly valued; and in this they certainly as much excelled the Greeks and modern nations,

as the latter excel them in the beautiful proportion and elegance of their structures. There are not wanting, however, some modern authors, who endeavour to deprive the ancients of what is justly their due, and will have every thing to be exaggerated which seems beyond the power of modern princes to accomplish. In this way M. Goguet remarkably distinguishes himself; and that without giving any reason at all, but merely that he takes it into his head. Speaking of the wonders of ancient Babylon, "All these works (says he), so marvellous in the judgment of antiquity, appear to me to have been extremely exaggerated by the authors who have spoken of them. How can we conceive, in effect, that the walls of Babylon could have been 318 feet high, and 81 in thickness, in a compass of near ten leagues?" To this we may easily reply, that the pyramids of Egypt, and the immense wall which divides China from Tartary, show us, that even such a work as the wall of ancient Babylon is said to have been is not altogether incredible. The lowest computation of the dimensions of the Chinese wall is, that it extends in length 1200 miles, is 18 feet high at a medium and as many thick; according to which computation, it must contain 9,504,000 solid fathoms; and yet, if we may credit the Chinese historians, this immense mass of building was finished in five years. If therefore we can suppose Nebuchadnezzar, or whoever fortified the city of Babylon, to have been capable of employing as many men for ten years as were employed in raising the Chinese wall, we may suppose him able to have fortified the city of Babylon as strongly as it is said to have been; for the mass of building is not quite double that of the Chinese wall, though nearly so, amounting to 18,189,600 solid fathoms. When our author afterwards gasconades about the works of the French king, it is difficult to avoid laughter at hearing him declare, that "infinitely more money has been expended, and much more genius required, as well as more power, taste, and time, to finish Versailles, with all its defects, than to construct a pyramid, or erect an obelisk." The genius, taste, and time, we shall not dispute; but as the same author confesses that 100,000 men were employed for 30 years together in the construction of the largest pyramid, we think the power may justly be doubted. This doubt will appear still the more reasonable, when we consider what time the above-mentioned number of men would have taken to accomplish some of the works of which M. Goguet boasts so much. The canal of Languedoc, he tells us, extends in length upwards of 70 leagues, and required the removal of two millions of cubic fathoms of earth. This was no doubt a great work; but had 100,000 men been employed upon it at once, they must have removed this quantity of earth in three weeks, supposing each to have removed only a single fathom a-day. Nor can we imagine, that any modern work will at all stand in competition with the works of the ancients as to greatness, whatever they may do in other respects.

14 Architecture improved by the Greeks.

As to the improvements in architecture, the Greeks were undoubtedly the first European nation who began to distinguish themselves in this way. Whence they took the first hint of improvement, we have no means of knowing; though, as we have already hinted, it is scarce credible but that Solomon's temple must have somewhat contributed thereto; especially as we learn from Scripture, that the capitals of the columns there were ornamented in the richest manner. The origin of the Doric and Ionic orders we have already given an account of from Vitruvius; to which we may add, that the volutes, which are the peculiar ornament of the Ionic capital, are by some said to represent the natural curling down of a piece of bark from the top of a beam, which is supposed to have been the first kind of column. The Corinthian order was not invented till long after the others, and is said to have taken its rise from the following accident: A basket had been set upon the ground, and covered with a square tile; there grew near it a plant of acanthus or bear's breech; the leaves shot up and covered the outer surface of the basket; and, as the stalks rose up among them, they soon reached the tile which overhung the edges of the basket at the top; this stopping their course upwards, they curled and twisted themselves into a kind of volutes. In this situation a sculptor, Callimachus, saw it; the twisted part of the stalk represented to him the volutes of the Ionic capital, which, as they were here smaller, and more numerous, appeared in a new form: he saw the beauty of raising them among leaves, and was struck with the representation of a noble and lofty capital; which being afterwards put into execution, has been universally admired.

15 Origin of the Corinthian order

In their private houses the Greeks had greater conveniences, but much less magnificence, than the Romans, as the former reserved the use of their grandest architecture for their temples and public buildings. The entrance to their private houses, however large they were, was always small, narrow and plain. The whole edifice usually consisted of two courts, and several ranges of buildings. The porter's lodge, if such a phrase may be allowed, was usually on the right hand of this narrow entrance, and opposite to this were the stables. From this entrance one came into the first or smaller court. This had piazzas on three sides; and on the fourth, which was usually the south side, there were butments of pilasters, which supported the more inward parts of the ceiling. A space being thus left between the one and the other, they had places for the lodgings of men and maid servants, and such as had the principal care of the house. Upon the same floor with these butments they had several regular apartments, consisting of an antichamber, a chamber, and closets; and about the piazzas, rooms for eating and other common purposes. Opposite to the entrance was a lobby, or vestibule, through which lay the passage into the several rooms; and through this, in front, one entered a large passage, which led into the larger or principal square. Round this they had four piazzas, which, in the common way of building, were all of one height; but in more magnificent houses, they made that which faced the great entrance loftier, and every way nobler, than the other three. A nobleman of Rhodes added this to the common method of building; and it was thence called the *Rhodian* manner. In this more noble part of the building were the apartments of the family. These were adorned with lofty galleries, and here were the best rooms: they were called the *men's apartments;* for, in rude times, the Greeks lodged their wives and female relations in the best rooms of the first court, where they had also their separate and detached place.

16 Private houses of the Greeks

The two sides of this larger court were kept for the reception of visitors; and servants were appointed to wait upon them. The master of the house entertained his guests the first day in his own apartments; but after this, how long soever they staid, they lived without restraint in one of those separate piazzas, and joined the family only when they chose it. Thus was the upper end and two sides of the great court disposed of; and its lower end, being the same range of building that was the upper end of the first court, held the lady of the house and her female friends.

17 the Romans.

The Romans borrowed their architecture from the Greeks, but did not imitate them in the modesty of their private dwellings. They placed the principal front of their house towards the south, and on this they bestowed all the decoration of expensive ornament. They had here lofty galleries and spacious rooms, and every thing carried an air of greatness and show. In their country houses, they preserved the same situation and the same front, but the inner distribution was different. At the entrance they placed the meaner and more offensive offices, after the manner of the Greeks. The first gallery, which received the stranger at his entrance, had on one side a passage to the kitchen, and on the other to the stalls where they kept cattle, that their noise or smell might not be offensive within, while yet they were in readiness for all services. These stalls were placed to the left, as in the Greek houses; on the right was the kitchen, which had its light from above, and its chimney in the middle. Farther within the building were placed on one side bathing rooms, and on the other family conveniences, in the manner of our butteries and store rooms; the bathing rooms were on the left, and the others on the right. Backwards, and full to the north, they placed their cellars, for fear of the sun, and over these were other store rooms. From this part of the structure one came into the court: for in these there generally was only one court: this was taken up by servants, and those who had the care of the cattle; and on each side there were stalls for the cattle. In front from the entrance, but very far from all these annoyances, stood the nobler apartments for the master of the family.

18 Decline of the art among the Romans.

How magnificent the Romans were in their temples and public buildings, is yet to be seen in what remains of them, and which are not only models for all moderm architects, but have never been surpassed or even equalled to this day. But though the art of architecture continued almost at its highest pitch among the Romans for two centuries, it declined exceedingly as the empire began to fail. Tacitus relates, that after the battle of Actium no men of genius appeared; and after the reign of Alexander Severus, a manner of building altogether confused and irregular was introduced, wherein nothing of the true graces and majesty of the former was preserved. When the empire was entirely overrun by the Goths, the conquerors naturally introduced their own method of building. Like the ancient Egyptians, the Goths seem to have been more studious to amaze people with the greatness of their buildings, than to please the eye with the regularity of their structure, or the propriety of their ornaments. They corrected themselves, however, a little by the models of the Roman edifices which they saw before them: but these models themselves were faulty; and the Goths being totally destitute of genius, neither architecture nor any other art could be improved by them.

19 Gothic manner of building.

Most writers who mention the ancient buildings in this island, particularly the religious ones, notwithstanding the striking difference in the styles of their construction, class them all under the common denomination of *Gothic;* a general appellation by them applied to buildings not exactly conformable to some one of the five orders of architecture. Our modern antiquaries, more accurately, divide them into Saxon, Norman, and Saracenic, or that species vulgarly, though improperly, called *modern Gothic.*

20 Of the Saxon and Norman styles.

It has been maintained by some, that the Saxon churches, after they began to be built with stone, consisted only of upright walls, without pillars or arches, the construction of which, it is alleged, they were entirely ignorant of. But this opinion is not only contradicted by the testimony of several cotemporary or very ancient writers, who expressly mention them both, but also by the remains of some edifices universally allowed to be of Saxon workmanship, one of them the ancient conventual church of Ely. Indeed, it is highly improbable that the Saxons could be ignorant of so useful a contrivance as the arch. Many of them, built by the Romans, they must have had before their eyes; some of which have reached our days: two particularly are now remaining in Canterbury only; one in the castle yard, the other at Riding gate. And it is not to be believed, that once knowing them and their convenience, they would neglect to make use of them; or having used, would relinquish them. Besides, as it appears from undoubted authorities they procured workmen from the continent to construct their capital buildings "according to the Roman manner," this alone would be sufficient to confute that ill-grounded opinion; and at the same time proves, that what we commonly call *Saxon*, is in reality Roman architecture.

This was the style of building practised all over Europe; and it continued to be used by the Normans, after their arrival here, till the introduction of what is called the *modern Gothic*, which was not till about the end of the reign of Henry II. so that there seems to be little or no grounds for a distinction between the Saxon and Norman architecture. Indeed it is said, the buildings of the latter were of larger dimensions both in height and area; and they were constructed with a stone brought from Caen in Normandy, of which their workmen were peculiarly fond: but this was simply an alteration in the scale and materials, and not in the manner of the building. The ancient parts of most of our cathedrals are of this early Norman work.—The characteristic marks of this style are these: the walls are very thick, generally without buttresses; the arches, both within and without, as well as those over the doors and windows, semicircular, and supported by very solid, or rather clumsy, columns, with a kind of regular base and capital: in short, plainness and solidity constitute the striking features of this method of building. Nevertheless, the architects of those days sometimes deviated from this rule: their capitals were adorned with carvings of foliage, and even animals; and their massive columns decorated with small half columns united to them, and their

their surfaces ornamented with spirals, squares, lozenge net-work, and other figures, either engraven or in relievo. Various instances of these may be seen in the cathedral of Canterbury, particularly the under croft, the monastery at Lindisfarn or Holy island, the cathedral at Durham, and the ruined choir at Orford in Suffolk. The columns 1, 1, 1, 1, (Plate XXXVIII.), are at the monastery of Lindisfarn or Holy island. Those 2, 2, 2, belong to the ruined chancel at Orford in Suffolk. N° 3 is at Christ church, Canterbury. N° 4, a column with two remarkable projections like claws, in the south aisle of Romney church, Hampshire.

21 Of the modern Gothic or Saracenic style.

To what country or people the *modern Gothic*, or the style of building with pointed arches so called, owes its origin, seems by no means satisfactorily determined. Some have imagined it may possibly have taken its rise from those arches we see in the early Norman or Saxon buildings or walls, where the wide semicircular arches cross and intersect each other, and form at their intersection a narrow and sharp-pointed arch: But it is more generally conjectured to be of Arabian extraction, and to have been introduced into Europe by some persons returning from the Crusades in the Holy Land. Sir Christopher Wren was of that opinion, and it has been subscribed to by most writers who have treated on this subject.

"Modern Gothic, as it is called (says Rious), is distinguished by the lightness of its work, by the excessive boldness of its elevations and of its sections; by the delicacy, profusion, and extravagant fancy of its ornaments. The pillars of this kind are as slender as those of the ancient Gothic are massive; such productions, so airy, cannot admit the heavy Goths for their author. How can be attributed to them a style of architecture, which was only introduced in the tenth century of our era, several years after the destruction of all those kingdoms which the Goths had raised upon the ruins of the Roman empire, and at a time when the very name of Goth was entirely forgotten? From all the marks of the new architecture, it can only be attributed to the Moors; or, what is the same thing, to the Arabians or Saracens, who have expressed, in their architecture, the same taste as in their poetry; both the one and the other falsely delicate, crowded with superfluous ornaments, and often very unnatural: the imagination is highly worked up in both; but it is an extravagant imagination; and this has rendered the edifices of the Arabians (we may include the other orientals) as extraordinary as their thoughts. If any one doubts of this assertion, let us appeal to any one who has seen the mosques and palaces of Fez, or some of the cathedrals in Spain built by the Moors; one model of this sort is the church at Burgos; and even in this island there are not wanting several examples of the same. Such buildings have been vulgarly called modern Gothic, but their true appellation is Arabic, Saracenic, or Moresque.—This manner was introduced into Europe through Spain. Learning flourished among the Arabians all the time that their dominion was in full power; they studied philosophy, mathematics, physic, and poetry. The love of learning was at once excited; in all places that were not at too great a distance from Spain, these authors were read: and such of the Greek authors as they had translated into Arabic, were from thence turned into Latin. The physic and philosophy of the Arabians spread themselves in Europe, and with these their architecture: many churches were built after the Saracenic mode; and others with a mixture of heavy and light proportions: the alteration that the difference of the climate might require, was little, if at all considered. In most southern parts of Europe, and in Africa, the windows (before the use of glass), made with narrow apertures, and placed very high in the walls of the building, occasioned a shade and darkness within side, and were well contrived to guard against the fierce rays of the sun; yet were ill suited to latitudes where that glorious luminary sheds its feebler influence, and is rarely seen but through a watery cloud."

Mr Grose, however, thinks the above opinion is not sufficiently favoured by the observations of several learned travellers who have accurately surveyed the ancient mode of building in those parts of the world. Thus Cornelius le Brun, an indefatigable and inquisitive traveller, has published many views of eastern buildings, particularly about the Holy Land: in all these, only one Gothic ruin, the church near Acre, and a few pointed arches, occur; and those built by the Christians when in possession of the country. Near Ispahan, in Persia, he gives several buildings with pointed arches: but these are bridges and caravanseras, whose age cannot be ascertained; consequently are as likely to have been built after, as before the introduction of this style into Europe. At Ispahan itself, the mey doen, or grand market place, is surrounded by divers magnificent Gothic buildings; particularly the royal mosque, and the Talael Ali-kapie, or theatre. The magnificent bridge of Alla-werdie-chan, over the river Zenderoet, 540 paces long and 17 broad, having 33 pointed arches, is also a Gothic structure; but no mention is made when or by whom these were built. The Chiaer Baeg, a royal garden, is decorated with Gothic buildings; but these were, it is said, built only in the reign of Schah Abbas, who died anno 1629. One building indeed, Mr Grose admits, seems at first as if it would corroborate this assertion, and that the time when it was erected might be in some degree fixed; it is the tomb of Abdallah, one of the apostles of Mahomet, probably him surnamed Abu Becr. "If this tomb (says he) is supposed to have been built soon after his death, estimating that even to have happened according to the common course of nature, it will place its erection about the middle of the seventh century: but this is by far too conjectural to be much depended on. It also seems as if this was not the common style of building at that time, from the temple of Mecca; where, if any credit is to be given to the print of it in Sale's Koran, the arches are semicircular. The tomb here mentioned has one evidence to prove its antiquity; that of being damaged by the injuries of time and weather. Its general appearance much resembles the east end of the chapel belonging to Ely House, London, except that which is filled up there by the great window, in the tomb is an open pointed arch, where also the columns or pinnacles on each side are higher in proportion.

As to the supposition that this kind of architecture was brought into Spain by the Moors (who possessed themselves

themselves of a great part of that country in the beginning of the eighth century, which they held till the latter end of the fifteenth), and that from thence, by way of France, it was introduced into Britain; this at first seems plausible; though, according to Mr Grose, the only instance which seems to corroborate this hypothesis, or at least the only one proved by authentic drawings, is the mosque at Cordova in Spain; where, if we may judge from the views published by Mr Swinburne, although most of the arches are circular or horse-shoe fashion, there are some pointed arches formed by the intersection of two segments of a circle. This mosque was, as it is there said, begun by Abdoulrahman I. who laid the foundation two years before his death, and was finished by his son Hissem or Iscan about the year 800. If these arches were part of the original structure, it would be much in favour of the supposition; but as it is also said that edifice has been more than once altered and enlarged by the Mahometans, before any well-grounded conclusion can be drawn, it is necessary to ascertain the date of the present building.

There are also several pointed arches in the Moorish palace at Granada, called the *Alhambra;* but as that was not built till the year 1273, long after the introduction of pointed arches into Europe, they are as likely to be borrowed by the Moors from the Christians, as by the Christians from the Moors. The greatest peculiarity in the Moorish architecture is the horse-shoe arch, which containing more than a semicircle, contracts towards its base, by which it is rendered unfit to bear any considerable weight, being solely calculated for ornament. In Romsey church, Hampshire, there are several arches of this form.

In the drawings of the Moorish buildings given in *Les Delices de l'Espagne*, said to be faithful representations, there are no traces of the style called Gothic architecture: there, as well as in the Moorish castle at Gibraltar, the arches are all represented circular. Perhaps a more general knolwedge of these buildings would throw some light on the subject; possibly the Moors may, like us, at different periods, have used different manners of building.

The marks which constitute the character of Gothic or Saracenical architecture, are its numerous and prominent buttresses, its lofty spires and pinnacles, its large and ramified windows, its ornamental niches or canopies, its sculptured saints, the delicate lace-work of its fretted roofs, and the profusion of ornaments lavished indiscriminately over the whole building: but its peculiar distinguishing characteristics are, the small clustered pillars and pointed arches formed by the segments of two intersecting circles; which arches, though last brought into use, are evidently of more simple and obvious construction than the semicircular ones; two flat stones, with their tops inclined to each other, and touching, form its rudiments; a number of boughs stuck into the ground opposite each other, and tied together at the top, in order to form a bower, exactly describe it: whereas a semicircular arch appears the result of deeper contrivance, as consisting of more parts; and it seems less probable chance, from whence all these inventions were first derived, should throw several wedge-like stones between two set perpendicular, so as exactly to fit and fill up the interval.

Bishop Warburton, in his notes on Pope's Epistles, in the octavo edition, has the following ingenious observations on this subject:—"Our Gothic ancestors had juster and manlier notions of magnificence, on Greek and Roman ideas, than these mimics of taste who profess to study only classic elegance; and because the thing does honour to the genius of those barbarians, I shall endeavour to explain it. All our ancient churches are called without distinction Gothic, but erroneously. They are of two sorts; the one built in the Saxon times, the other in the Norman. Several cathedral and collegiate churches of the first sort are yet remaining, either in whole or in part; of which this was the original: When the Saxon kings became Christians, their piety (which was the piety of the times), consisted chiefly in building churches at home, and performing pilgrimages abroad, especially to the Holy Land: and these spiritual exercises assisted and supported one another; for the most venerable as well as most elegant models of religious edifices were then in Palestine. From these the Saxon builders took the whole of their ideas, as may be seen by comparing the drawings which travellers have given us of the churches yet standing in that country, with the Saxon remains of what we find at home; and particularly in the sameness of style in the latter religious edifices of the knights templars (professedly built upon the model of the church of the Holy Sepulchre at Jerusalem), with the earlier remains of our Saxon edifices. Now the architecture of the Holy Land was Grecian, but greatly fallen from its ancient elegance. Our Saxon performance was indeed a bad copy of it, and as much inferior to the works of St Helena and Justinian, as theirs were to the Grecian models they had followed; yet still the footsteps of ancient art appeared in the circular arches, the entire columns, the division of the entablature into a sort of architrave, frize, and cornice, and a solidity equally diffused over the whole mass. This, by way of distinction, I would call the Saxon architecture. But our Norman works had a very different original. When the Goths had conquered Spain, and the genial warmth of the climate and the religion of the old inhabitants had ripened their wits and inflamed their mistaken piety, both kept in exercise by the neighbourhood of the Saracens, through emulation of their service, and aversion to their superstition, they struck out a new species of architecture, unknown to Greece and Rome, upon original principles, and ideas much nobler than what had given birth even to classical magnificence. For this northern people having been accustomed, during the gloom of Paganism, to worship the deity in groves (a practice common to all nations); when their new religion required covered edifices, they ingeniously projected to make them resemble groves, as nearly as the distance of architecture would permit; at once indulging their old prejudices, and providing for their present conveniences, by a cool receptacle in a sultry climate: and with what skill and success they executed the project by the assistance of Saracen architects, whose exotic style of building very luckily suited their purpose, appears from hence, that no attentive observer ever viewed a regular avenue of well-grown trees intermixing their branches overhead, but it presenly put him in mind of the long visto through the Gothic cathedral;

or ever entered one of the larger and more elegant edifices of this kind, but it presented to his imagination an avenue of trees; and this alone is what can be truly called the Gothic style of building. Under this idea of so extraordinary a species of architecture, all the irregular transgressions against art, all the monstrous offences against nature, disappear; every thing has its reason, every thing is in order, and an harmonious whole arises from the studious application of means proper and proportionate to the end. For could the arches be otherwise than pointed, when the workmen were to imitate that curve which branches of two opposite trees make by their insertion with one another? or could the columns be otherwise than split into distinct shafts, when they were to represent the stems of a clump of trees growing close together? On the same principles they formed the spreading ramification of the stone work in the windows, and the stained glass in the interstices; the one to represent the branches, and the other the leaves of an opening grove, and both concurred to preserve that gloomy light which inspires religious reverence and dread. Lastly, We see the reason of their studied aversion to apparent solidity in these stupendous masses, deemed so absurd by men accustomed to the apparent as well as real strength of Grecian architecture. Had it been only a wanton exercise of the artist's skill, to show he could give real strength without the appearance of any, we might indeed admire his superior science, but we must needs condemn his ill judgment. But when one considers, that this surprising lightness was necessary to complete the execution of his idea of a sylvan place of worship, one cannot sufficiently admire the ingenuity of the contrivance. This, too, will account for the contrary qualities in what I call the Saxon architecture. These artists copied, as has been said, from the churches in the Holy Land, which were built on the models of the Grecian architecture, but corrupted by prevailing barbarism; and still farther depraved by a religious idea. The first places of Christian worship were sepulchres and subterraneous caverns, low and heavy from necessity. When Christianity became the religion of the state, and sumptuous temples began to be erected, they yet, in regard to the first pious ages, preserved the massive style, made still more venerable by the church of the Holy Sepulchre; where this style was, on a double account, followed and aggravated."

22 Ancient rise and progress of architecture in Britain.

In Britain, before the Roman invasion, the natives appear to have had no better lodgings than thickets, dens, and caves. Some of these caves, which were their winter habitations, and places of retreat in time of war, were formed and rendered secure and warm by art, like those of the ancient Germans, which are thus described by Tacitus: "They are used to dig deep caves in the ground, and cover them with earth, where they lay up their provisions, and dwell in winter for the sake of warmth. Into these they retire also from their enemies, who plunder the open country, but cannot discover these subterranean recesses." Some of these subterraneous, or *earth houses*, as they are called, are still remaining in the Western isles of Scotland and in Cornwall. The summer habitations of the most ancient Britons were very slight; and, like those of the Finnians, consisted only of a few stakes driven into the ground, interwoven with wattles, and covered over with the boughs of trees."

When Julius Cæsar invaded Britain, the inhabitants of Cantium (Kent), and of some other parts in the south, had learned to build houses a little more substantial and convenient. "The country (says Cæsar) abounds in houses, which very much resemble those of Gaul." The first step towards this improvement seems to have been that of daubing the wattled walls of their houses with clay, to fill up the chinks and make them warmer. "The Germans used for this purpose a kind of pure resplendent earth of different colours, which had an appearance of painting at a distance;" but the Gauls and Britons chose rather to whitewash the clay after it was dry with chalk. Instead of the boughs of trees, they thatched these houses with straw, as a much better security against the weather. They next proceeded to form the walls of large beams of wood, instead of stakes and wattles. This seems to have been the mode of building in Britain, when it was first invaded by the Romans. "The Britons (says Diodorus Siculus, who was cotemporary with Cæsar) dwell in wretched cottages, which are constructed of wood, covered with straw." These wooden houses of the ancient Gauls and Britons were not square but circular, with high tapering roofs, at the top or centre of which was an aperture for the admission of light and emission of smoke. Those of Gaul are thus described by Strabo: "They build their houses of wood, in the form of a circle, with lofty tapering roofs." The foundations of some of the most magnificent of these circular houses were of stone, of which there are some vestiges still remaining in Anglesey and other places. It was probably in imitation of these wooden houses, that the most ancient stone edifices, of which there are still some remains in the Western islands of Scotland, were built circular, and have a large aperture at the top.

When the Britons were invaded by the Romans, they had nothing among them answering to our ideas of a city or town, consisting of a great number of contiguous houses disposed into regular streets, lanes, and courts. Their dwellings, like those of the ancient Germans, were scattered about the country, and generally situated on the brink of some rivulet for the sake of water, and on the skirt of some wood or forest for the convenience of hunting and pasture for their cattle. As these inviting circumstances were more conspicuous in some parts of the country than others, the princes and chiefs made choice of these places for their residence; and a number of their friends and followers, for various reasons, built their houses as near to them as they could with convenience. This naturally produced an ancient British town, which is described by Cæsar and Strabo in the following manner: "From the Cassi he learnt that the town of Cassivelaun was at no great distance; a place defended by woods and marshes, in which very great numbers of men and cattle were collected. For what the Britons call a town is a tract of woody country surrounded by a mound and ditch, for the security of themselves and their cattle against the incursions of their enemies." "The forests of the Britons are their cities; for when they have enclosed a very large circuit with felled trees, they build within it houses for themselves and hovels for their cattle. These buildings are very slight, and not

not designed for long duration." The palaces of the British princes were probably built of the same materials, and on the same plan, with the houses of their subjects, and differed from them only in solidity and magnitude.

Though the communication between this island and the continent was more free and open after the first Roman invasion than it had been before, and some of the British princes and chieftains even visited Rome, then in its greatest glory; it doth not appear that the people of Britain made any considerable improvements in their manner of building for at least a hundred years after that invasion. For when the renowned Caractacus was carried prisoner to Rome, A. D. 52, and observed the beauty and magnificence of the buildings in that proud metropolis of the world, he is said to have expressed great surprise, "That the Romans, who had such magnificent palaces of their own, should envy the wretched cabins of the Britons."

It must appear very surprising that the ancient Britons, when they were so ignorant of architecture, were capable of erecting (if indeed it was erected by them) so stupendous a fabric as that of Stonehenge on Salisbury plain: A fabric which hath been the admiration of all succeeding ages, and hath outlasted all the solid and noble structures which were erected by the Romans in this island. See the article STONEHENGE.

Of another very extraordinary species of building several remains are found in the Highlands of Scotland. They consist of ruins; the walls of which, instead of being cemented with lime or some other similar substance, or of being raised with dry stones as was the method before cement came into use, are described as having been vitrified, or the stones run and compacted together by the force of fire. Concerning the origin, use, &c. of these buildings, different opinions have been formed; and even the reality of them as works of contrivance has been called in question: of all which particulars the reader will find an account under the article *FORTS, Vitrified.*

But for whatever purposes, or by whatever means, the above and other similar structures of a peculiar nature were erected, we have sufficient evidence that the people of Britain, before they were subdued and instructed by the Romans, had but a rude knowledge of architecture, and were very meanly lodged. As soon, however, as the Romans began to form settlements and plant colonies in this island, a sudden and surprising change ensued in the state of architecture. For that wonderful people were as industrious as they were brave, and made haste to adorn every country that they conquered. The first Roman colony was planted at Camelodunum, A. D. 50; and when it was destroyed by the Britons in their great revolt under Boadicea, only eleven years after, it appears to have been a large and well-built town, adorned with statues, temples, theatres, and other public edifices.

The Romans not only built a prodigious number of solid, convenient, and magnificent structures for their own accommodation, but they exhorted, encouraged, and instructed the Britons to imitate their example. This was one of the arts which Agricola, the most excellent of the Roman governors, employed to civilize the Britons, and reconcile them to the Roman government. "The following winter (says Tacitus) was spent by Agricola in very salutary measures. That the Britons who led a roaming and unsettled life, and were easily instigated to war, might contract a love of peace and tranquillity, by being accustomed to a more pleasant way of living, he exhorted and assisted them to build houses, temples, courts, and market-places. By praising the diligent and reproaching the indolent, he excited so great an emulation among the Britons, that after they had erected all those necessary edifices in their towns, they proceeded to build others merely for ornament and pleasure, as porticoes, galleries, baths, banqueting houses, &c." From this time, which was A. D. 80, to the middle of the fourth century, architecture and all the arts immediately connected with it greatly flourished in this island; and the same taste for erecting solid, convenient, and beautiful buildings, which had long prevailed in Italy, was introduced into Britain. Every Roman colony and free city (of which there was a great number in this country) was a little Rome, encompassed with strong walls, adorned with temples, palaces, courts, halls, basilics, baths, markets, aqueducts, and many other fine buildings, both for use and ornament. The country everywhere abounded with well-built villages, towns, forts, and stations; and the whole was defended by that high and strong wall, with its many towers and castles, which reached from the mouth of the river Tyne on the east to the Solway frith on the west. This spirit of building, which was introduced and encouraged by the Romans, so much improved the taste and increased the number of the British builders, that in the third century this island was famous for the great number and excellence of its architects and artificers. When the emperor Constantius, father of Constantine the Great, rebuilt the city of Autun in Gaul, A. D. 296, he was chiefly furnished with workmen from Britain, "which (says Eumenius) very much abounded with the best artificers."

Not very long after this period, architecture and all the arts connected with it began to decline very sensibly in Britain, and in all the provinces of the western empire. This was partly owing to the building of Constantinople, which drew many of the most famous architects and other artificers into the east, and partly to the irruptions and depredations of the barbarous nations.

The final departure of the Romans was followed by the almost total destruction of architecture in this island. For the unhappy and unwarlike people whom they left behind, having neither skill nor courage to defend the numerous towns, forts, and cities which they possessed, they were seized by their ferocious invaders, who first plundered and then destroyed them. By this means, the many noble structures, with which Provincial Britain had been adorned by the art and industry of the Romans, were ruined or defaced in a very little time; and the unfortunate Britons were quite incapable of repairing them, or of building others in their room. That long succession of miseries in which they were involved by the Scots, Picts, and Saxons, deprived them of the many useful arts which they had learned from their former masters, and lodged them once more in forests, dens, and caves, like their savage ancestors.

The most wanton and extensive devastations were those committed by the Anglo-Saxons; among whom it

it seems to have been a maxim to destroy all the towns and castles which they took from their enemies, instead of preserving them for their own use.

It cannot be supposed that a people who wantonly demolished so many beautiful and useful structures had any taste for the arts by which they had been erected. The truth is, that the Anglo-Saxons at their arrival in this island were almost totally ignorant of these arts; and, like all the other nations in Germany, had been accustomed to live in wretched hovels, built of wood or earth, and covered with straw or the branches of trees: nor did they much improve in the knowledge of architecture for 200 years after their arrival. During that period, masonry was quite unknown and unpractised in this island; and the walls even of cathedral churches were built of wood. "There was a time (says venerable Bede) when there was not a stone church in all the land; but the custom was to build them all of wood. Finan, the second bishop of Lindisfarne, or Holy island, built a church in that island, A. D. 652, for a cathedral, which yet was not of stone, but of wood, and covered with reeds: and so it continued till Eadbert, the successor of St Cuthbert, and seventh bishop of Lindisfarne, took away the reeds, and covered it all over, both roof and walls, with sheets of lead." The first cathedral of York was built of the same materials; and a church of stone was esteemed a kind of prodigy in those times that merited a place in history. "Paulinus, the first bishop of York, built a church of stone in the city of Lincoln, whose walls (says Bede) are still standing, though the roof is fallen down; and some healing miracles are wrought in it every year, for the benefit of those who have the faith to seek them."

There does not seem to have been so much as one church of stone, nor any artists who could build one, in all Scotland, at the beginning of the eighth century. For Naitan king of the Picts, in his famous letter to Ceolfred abbot of Weremouth, A. D. 710, earnestly entreats him to send him some masons to build a church of stone in his kingdom, in imitation of the Romans; which he promises to dedicate to the honour of the apostle Peter, to whom the abbey of Weremouth was dedicated: and we are told by Bede, who was then living in that abbey, that the reverend abbot Ceolfred granted this pious request, and sent masons according to his desire.

Masonry was restored, and some other arts connected with it introduced into England, towards the end of the seventh century, by two clergymen, who were great travellers, and had often visited Rome, where they had acquired some taste for these arts. These were, the famous Wilfrid bishop of York, and afterwards of Hexham, and Benedict Biscop, founder of the abbey of Weremouth. Wilfrid, who was one of the most ingenious, active, and magnificent prelates of the seventh century, was a great builder, and erected several structures at York, Rippon, and Hexham, which were the admiration of the age in which he flourished. The cathedral of Hexham, which was one of these structures, is thus described by his biographer: "Having obtained a piece of ground at Hexham from Queen Etheldreda, he there founded a most magnificent church, which he dedicated to the blessed apostle St Andrew. As the plan of this sacred structure seems to have been inspired by the Spirit of God, it would require a genius much superior to mine to describe it properly. How large and strong were the subterraneous buildings, constructed of the finest polished stones! How magnificent the superstructure, with its lofty roof, supported by many pillars, its long and high walls, its sublime towers, and winding stairs! In one word, there is no church on this side of the Alps so great and beautiful." This admired edifice, of which some vestiges are still remaining, was built by masons and other artificers brought from Rome by the munificence of its generous founder. Benedict Biscop was the cotemporary and companion of Wilfrid in some of his journeys, and had the same taste for the arts. He made no fewer than six journeys to Rome, chiefly with a view of collecting books, pictures, statues, and other curiosities, and of persuading artificers of various kinds to come from Italy and France and settle in England. Having obtained a grant of a considerable estate from Egfrid king of Northumberland, near the mouth of the river Were, he there founded a monastery, A. D. 674. "About a year after the foundations of this monastery were laid, Benedict crossed the sea into France, where he collected a number of masons, and brought them over with him, in order to build the church of his monastery of stone after the Roman manner, of which he was a great admirer. His love to the apostle Peter, to whom he designed to dedicate his church, made him urge these workmen to labour so hard, that mass was celebrated in it about a year after it was founded. When the work was far advanced, he sent agents into France to procure if possible some glass-makers, a kind of artificers quite unknown in England, and to bring them over to glaze the windows of his church and monastery. These agents were successful, and brought several glass-makers with them; who not only performed the work required by Benedict, but instructed the English in the art of making glass for windows, lamps, drinking vessels, and other uses."

Eddi Vita Wilfridi, c. 22.

Bedæ Hist. Abbat.

But though these arts of building edifices of stone, with windows of glass and other ornaments, were thus introduced by these two prelates in the latter part of the seventh century, they do not seem to have flourished much for several centuries. It appears from many incidental hints in our ancient historians, that stone buildings were still very rare in the eighth and ninth ages; and that when any such buildings were erected, they were the objects of much admiration. When Alfred the Great, towards the end of the ninth century, formed the design of rebuilding his ruined cities, churches, and monasteries, and of adorning his dominions with more magnificent structures, he was obliged to bring many of his artificers from foreign countries. "Of these (as we are told by his friend and companion Asserius) he had an almost innumerable multitude collected from different nations; many of them the most excellent in their several arts."

In the other parts of this island architecture was, as might naturally be imagined, in a still less flourishing state. It appears indeed to have been almost entirely lost among the posterity of the ancient Britons after they retired to the mountains of Wales. The chief palace of the kings of Wales, where the nobility and wise men assembled for making laws, was called the *white palace*, because

because the walls of it were woven with white wands, which had the bark peeled off. By the laws of Wales, whoever burnt or destroyed the king's hall or palace was obliged to pay one pound and eighty pence, besides one hundred and twenty pence for each of the adjacent buildings, which were eight in number; viz. the dormitory, the kitchen, the chapel, the granary, the bakehouse, the storehouse, the stable, and the doghouse. From hence it appears, that a royal residence in Wales, with all its offices, when these laws were made, was valued at five pounds and eighty pence of the money of that age, equal in quantity of silver to sixteen pounds of our money, and in efficacy to one hundred and sixty. This is certainly a sufficient proof of the meanness of those buildings which were only of wood. Even the castles in Wales, in this period, that were built for the security of the country, appear to have been constructed of the same materials; for the laws required the king's vassals to come to the building of these castles with no other tools but an axe.

The arts of building do not seem to have been much better understood by the Scots and Picts than by the ancient Britons in the former part of this period. When Finan, the second bishop of Lindisfarne, built a church of wood in that island, A. D. 652, he is said to have done it *more Scotorum*, after the manner of his countrymen the Scots; and it hath been already observed, that Naitan king of the Picts was obliged to bring masons from Northumberland, when he resolved to build a church of stone in his dominions, A. D. 710. After this last period, it is probable that the Picts, and perhaps the Scots, began to learn and practise the art of masonry; because there are still some stone buildings of a very singular construction, and great antiquity, to be seen in Scotland. These buildings are all circular; though of two kinds so different from each other, that they seem to be the work of different ages and of different nations. The largest of these structures are in a very extraordinary taste of architecture; and are thus described by a modern antiquary, who viewed them with no little attention: "Having arrived at the barrack of Glenelg, I was conducted to the remains of those stupendous fabrics, seated about two miles from thence, in a valley called *Glenbeg*, in which four of them anciently stood. Two of these are now almost quite demolished, the third is half fallen down, the fourth is almost entire. The first I met with lies towards the north side of the valley, and is called *Castle Chalamine*, or *Malcolm's Castle*. It stands upon a considerable eminence, and affords us a fine prospect of the island of Skye, and a good part of the sea coast. The foundation of this only appears; as also of that other, on the east end of the valley, called *Castle Chonel*. About a quarter of a mile further, upon the bank of a rivulet which passes through the middle of the glen, stands the third fabric, called *Castle Tellve*. I found it composed of stones without cement; not laid in regular courses, after the manner of elegant buildings, but rudely and without order. Those toward the base were pretty large, but ascending higher they were thin and flat, some of them scarce exceeding the thickness of an ordinary brick. I was surprised to find no windows on the outside, nor any manner of entrance into the fabric, except a hole towards the west, at the base, so very low and narrow, that I was forced to creep in upon hands and knees, and found that it carried me down four or five steps below the surface of the ground. When I was got within I was environed betwixt two walls, having a cavity or void space which led me round the whole building. Opposite to the little entry, on the ontside, was a pretty large door in the second or inner wall, which led me into the area or inner court. When I was there, I perceived that one half of the building was fallen down, and thereby had the opportunity of seeing a complete section thereof. The two walls join together at the top, round about, and have formed a large void space or area in the middle. But to give a more complete idea of these buildings, I shall describe the fourth called *Castle Troddan*, which is by far the most entire of any in that country, and from whence I had a very clear notion how these fabrics were originally contrived. On the outside were no windows, nor were the materials of this castle anywise different from those of the other already described, only the entry on the ontside was somewhat larger; but this might be occasioned by the falling of the stones from above. The area of this makes a complete circle; and there are four doors in the inner wall, which face the four cardinal points of the compass. These doors are each eight feet and a half high, and five feet wide, and lead from the area into the cavity between the two walls, which runs round the whole building. The perpendicular height of this fabric is exactly 33 feet; the thickness of both walls, including the cavity between, no more than 12 feet; and the cavity itself is hardly wide enough for two men to walk abreast; the external circumference is 178 feet. The whole height of the fabric is divided into four parts or stories, separated from each other by thin floorings of flat stones, which knit the two walls together, and run quite round the building: and there have been winding stairs of the same flat stones ascending betwixt wall and wall up to the top. The undermost partition is somewhat below the surface of the ground, and is the widest; the others grow narrower by degrees till the walls close at the top. Over each door are nine square windows, in a direct line above each other, for the admission of light: and between every row of windows are three others in the uppermost story, rising above a cornice which projects out from the inner wall and runs round the fabric." From this description of these singular edifices it plainly appears that they were designed both for lodging and defence; and considering the state of the times in which they were built, they were certainly very well contrived for answering both these purposes.

ordon's Itinerarium ptentrionale, 165.

The stone edifices of the other kind which were probably erected in this period, and of which some few are still to be seen in Scotland, are not so large as the former, but more artificial. They are slender, lofty, circular towers, of cut stone, laid in regular rows, between 40 and 50 feet in external circumference, and from 70 to 100 feet high, with one door some feet from the ground. They are exactly similar to the round tower of Ardmore, and several others, in Ireland; and therefore were probably built about the same time, which was in the tenth century, and for the same purposes; which are believed by some to have been for the confinement of penitents while they were performing penance. On this account these towers are always

found in the neighbourhood of churches both in Scotland and Ireland; and are said to have been used in this manner: "The penitents were placed in the uppermost story of the tower (which commonly consisted of five or six stories); where having made probation, or done penance, such a limited time, according to the heinousness of their crime, they then were permitted to descend to the next floor, and so on by degrees, until they came to the door, which always faced the entrance of the church, where they stood to receive absolution from the clergy, and the blessings of the people. A tedious process, to which few penitents in the present age would willingly submit. Other writers are of opinion, that the design of these circular towers (of which one is still remaining at Abernethy and another at Brechin) was to be places from whence the people were called to public worship by the sound of a horn or trumpet, before the introduction of bells.

Archæologia, vol. i. p. 307.

This art received very great improvements in the 12th century; which indeed may be called *the age of architecture;* when the rage for building was more violent in England than at any other time. The great and general improvements that were made in the fabrics of houses and churches in the first years of this century, are thus described by a cotemporary writer. "The new cathedrals and innumerable churches that were built in all parts, together with the many magnificent cloisters and monasteries, and other apartments of monks, that were then erected, afford a suffieient proof of the great felicity of England in the reign of Henry I. The religious of every order, enjoying peace and prosperity, displayed the most astonishing ardour in every thing that might increase the splendour of divine worship. The fervent zeal of the faithful prompted them to pull down houses and churches everywhere, and rebuild them in a better manner. By this means the ancient edifices that had been raised in the days of Edgar, Edward, and other Christian kings, were demolished, and others of greater magnitude and magnificence, and of more elegant workmanship, were erected in their room, to the glory of God."

Orasrio Vital. Hist. Eccles. p. 878.

As the prodigious power of religious zeal, whatever turn it happens to take, when it is thoroughly heated, is well known, it may not be improper to give one example of the arts employed by the clergy and monks of this period, to inflame the pious ardour of the kings, nobles, and people, for building and adorning churches. When Joffred abbot of Croyland resolved to rebuild the church of his monastery in a most magnificent manner, A. D. 1106, he obtained from the archbishops of Canterbury and York, a bull dispensing with the third part of all penances for sin to those who contributed any thing towards the building of that church. This bull was directed not only to the king and people of England, but to the kings of France and Scotland, and to all other kings, earls, barons, archbishops, bishops, abbots, priors, rectors, presbyters, and clerks, and to all true believers in Christ, rich and poor, in all Christian kingdoms. To make the best use of this bull, he sent two of his most eloquent monks to proclaim it over all France and Flanders, two other monks into Scotland, two into Denmark and Norway, two into Wales, Cornwall, and Ireland, and others into different parts of England. "By this means (says the historian) the wonderful benefits granted to all the contributors to the building of this church were published to the very ends of the earth; and great heaps of treasure and masses of yellow metal flowed in from all countries upon the venerable Abbot Joffred, and encouraged him to lay the foundations of his church." Having spent about four years in collecting mountains of different kinds of marble from quarries both at home and abroad, together with great quantities of lime, iron, brass, and other materials for building, he fixed a day for the great ceremony of laying the foundation, which he contrived to make a very effectual mean of raising the superstructure! For on the long-expected day, the feast of the holy virgins Felicitas and Perpetua, an immense multitude of earls, barons, and knights, with their ladies and families, of abbots, priors, monks, nuns, clerks, and persons of all ranks, arrived at Croyland, to assist at this ceremony. The pious Abbot Joffred began by saying certain prayers, and shedding a flood of tears on the foundation. Then each of the earls, barons, knights, with their ladies, sons, and daughters, the abbots, clerks, and others, laid a stone, and upon it deposited a sum of money, a grant of lands, tithes, or patronages, or a promise of stone, lime, wood, labour, or carriages, for building the church. After this the abbot entertained the whole company, amounting to 5000 persons, at dinner. To this entertainment they were all entitled; for the money, and grants of different kinds, which they had deposted on the foundation stones, were alone sufficient to have raised a very noble fabric. By such arts as these the clergy inspired kings, nobles, and people of all ranks, with so ardent a spirit for these pious works, that in the course of this period almost all the sacred edifices in England were rebuilt, and many hundreds of new ones raised from the foundation. Nor was this spirit confined to England, but prevailed as much in Scotland in proportion to its extent and riches. King David I. alone, besides several cathedrals and other churches, built no fewer than thirteen abbeys and priories, some of which were very magnificent structures.

The sacred architecture of the Anglo-Normans in the beginning of this period did not differ much in its style and manner from that of the Anglo-Saxons; their churches being in general plain, low, strong, and dark; the arches both of the doors and windows semicircular, with few or no ornaments. By degrees, through much practice, our architects, who were all monks or clergymen, improved their taste and skill, and ventured to form plans of more noble, light, and elevated structures, with a great variety of ornaments; which led to that bold magnificent style of building, commonly, though perhaps not very properly, called *the later Gothic*. It is not improbable that our monkish architects were assisted in attaining this style of building by models from foreign countries, or by instructions from such of their own number as had visited Italy, France, Spain, or the East. But the origin of this style of architecture has been already considered, and the characters by which it is distinguished from the ancient Gothic have also been described: (See N° 21. *supra*). Its first appearance in England was towards the latter end of the reign of King Henry II. But it was not at once thoroughly adopted; some

some short solid columns and semicircular arches being retained and mixed with the pointed ones; as for example, in the west end of the Old Temple church; and at York, where, under the choir, there remains much of the ancient work, the arches of which are but just pointed, and rise on short round pillars. In the reign of Henry III. however, this manner of building seems to have gained a complete footing; the circular giving place to the pointed arch, and the massive column yielding to the slender pillar. Indeed, like all novelties, when once admitted, the rage of fashion made it become so prevalent, that many of the ancient and solid buildings, erected in former ages, were taken down in order to be re-edified in the new taste, or had additions patched to them, of this mode of architecture. The present cathedral church of Salisbury was begun early in this reign, and finished in the year 1258. It is entirely in the Saracenic style; and, according to Sir Christopher Wren, may be justly accounted one of the best patterns of architecture of the age in which it was built. Its excellency is undoubtedly in a great measure owing to its being constructed on one plan; whence arises that symmetry and agreement of parts, not to be met with in many of our other cathedral churches; which have mostly been built at different times, and in a variety of styles. From this time till the reign of Henry VIII. the fashionable pillars in churches were of Purbeck marble, very slender and round, encompassed with marble shafts a little detached, having each a capital adorned with foliage, which joining, formed one elegant capital for the whole pillar. The windows were long and narrow, with pointed arches and painted glass, which was introduced about that time, or at least became more common. In this century also they began to delight in lofty steeples, with spires and pinnacles. In the fourteenth century, the pillars consisted of an assemblage of shafts not detached, but united, forming one solid and elegant column; the windows, especially those in the east and west ends, were greatly enlarged, divided into several lights by stone mullions running into ramifications above, and forming numerous compartments in various fanciful shapes. Those windows, filled with stained glass of the most lively colours, representing kings, saints, and martyrs, and their histories, made a most solemn and glorious appearance. There were several other variations, especially in the taste of the carvings and other ornaments, which are too minute for general history.

As to the state of civil architecture during the same period: The houses of the common people in the country, and of the lower burgesses in towns and cities, were very little improved in their structure, that most numerous and useful order of men being much depressed in the times we are now delineating. Even in the capital city of London, all the houses of mechanics and common burgesses were built of wood, and covered with straw or reeds, towards the end of the twelfth century. But the palaces, or rather castles, of the Anglo-Norman kings, barons, and prelates, were very different from the residences of persons of the same rank in the Anglo-Saxon times. For this we have the testimony of a person of undoubted credit, who was well acquainted with them both. "The Anglo-Saxon nobles (says William of Malmsbury) squandered away their ample revenues in low and mean houses; but the French and Norman barons are very different from them, living at less expence, but in great and magnificent palaces." The truth is, that the rage of building fortified castles, was no less violent among the Norman princes, prelates, and barons, than that of building churches. To this they were prompted not only by the custom of their native country, but also by their dangerous situation in this island. Surrounded by multitudes, whom they had depressed and plundered, and by whom they were abhorred, they could not think themselves safe without the protection of deep ditches and strong walls. The Conqueror himself was sensible, that the want of fortified places in England had greatly facilitated his conquest, and might facilitate his expulsion; and therefore he made all possible haste to remedy this defect, by building very magnificent and strong castles in all the towns within the royal demesnes. "William (says Matthew Paris) excelled all his predecessors in building castles, and greatly harassed his subjects and vassals with these works." All his earls, barons, and even prelates, imitated his example; and it was the first care of every one who received the grant of an estate from the crown to build a castle upon it for his defence and residence. The disputes about the succession in the following reigns, kept up this spirit for building great and strong castles. William Rufus was still a greater builder than his father. "This William (says Henry Knyghton), was much addicted to building royal castles and palaces, as the castles of Dover, Windsor, Norwich, Exeter, the palace of Westminster, and many others, testify; nor was there any king of England before him that erected so many and such noble edifices." Henry I. was also a great builder both of castles and monasteries. But this rage for building never prevailed so much in any period of the English history as in the turbulent reign of King Stephen, from A. D. 1135 to A. D. 1154. "In this reign (as we are told by the author of the Saxon Chronicle) every one who was able built a castle; so that the poor people were worn out with the toil of these buildings, and the whole kingdom was covered with castles." This last expression will hardly appear too strong, when we are informed, that besides all the castles before that time in England, no fewer than 1115 were raised from the foundation in the short space of 19 years. See the article CASTLE.

The castles, monasteries, and greater churches of this period, were generally covered with lead, the windows glazed; and when the walls were not of ashler, they were neatly plastered and whitewashed on both sides. The doors, floors, and roof, were commonly made of oak planks and beams, exactly smoothed and jointed, and frequently carved. It is hardly necessary to observe, that the building one of these great and magnificent castles, monasteries, or churches, of which there were many in England, must have been a work of prodigious expence and labour; and that the architects and artificers, by whom that work was planned and executed, must have attained considerable dexterity in their respective arts. Several of these architects have obtained a place in history, and are highly celebrated for their superior skill. William of Sens, architect to Archbishop Lanfranc in building his cathedral, is said by Gervase of Canterbury, to have been a most exquisite artist both in stone and wood. He made

made not only a model of the whole cathedral, but of every particular piece of sculpture and carving, for the direction of the workmen; and invented many curious machines for loading and unloading ships, and conveying heavy weights by land, because all the stones were brought from Normandy. Matthew Paris speaks even in a higher strain of Walter of Coventry, who flourished towards the end of this period, when he says, that "so excellent an architect had never yet appeared, and probably never would appear, in the world." This encomium was undoubtedly too high; but it is impossible to view the remains of many magnificent fabrics, both sacred and civil, that were erected in this period, without admiring the genius of the architects by whom they were planned, and the dexterity of the workmen by whom they were executed.

In the beginning of the reign of Henry VIII. or rather towards the latter end of that of Henry VII. when brick building became common, a new kind of low pointed arch grew much in use; it was described from four centres, was very round at the haunches, and the angle at the top was very obtuse. This sort of arch is to be found in every one of Cardinal Wolsey's buildings; also at West Sheen; an ancient brick gate at Mile End, called *King John's Gate;* and in the great gate of the palace of Lambeth. From this time Gothic architecture began to decline; and was soon after supplanted by a mixed style, if one may venture to call it one; wherein the Grecian and Gothic, however discordant and irreconcileable, are jumbled together. Concerning this mode of building, Mr Warton, in his observations on Spencer's Faery Queene, has the following anecdotes and remarks:

"Although the Roman or Grecian architecture did not begin to prevail in England till the time of Inigo Jones, yet our communication with the Italians, and our imitation of their manners, produced some specimens of that style much earlier. Perhaps the earliest was Somerset House in the Strand, built about the year 1549, by the duke of Somerset, uncle to Edward VI. The monument of Bishop Gardiner, in Winchester cathedral, made in the reign of Mary, about 1555, is decorated with Ionic pillars. These verses of Spenser,

——————————— Did rise
On stately pillars, fram'd after the Doric guise—

bear an allusion to some of the fashionable improvements in building, which at this time were growing more and more into esteem. Thus also Bishop Hall, who wrote about the same time, viz. 1598:

There findest thou some stately Doric frame,
Or neat Ionicke work.———————

But these ornaments were often absurdly introduced into the old Gothic style: as in the magnificent portico of the schools at Oxford, erected about the year 1613; where the builder, in a Gothic edifice, has affectedly displayed his universal skill in the modern architecture, by giving us all the five orders together. However, most of the great buildings of Queen Elizabeth's reign have a style peculiar to themselves both in form and finishing; where, though much of the old Gothic is retained, and great part of the new taste is adopted, yet neither predominates; while both, thus distinctly blended, compose a fantastic species, hardly reducible to any class or name. One of its characteristics is the affectation of large and lofty windows: where, says Bacon, "you shall have sometimes fair houses so full of glass, that one cannot tell where to come to be out of the sun."

To return now to our general history, and to conclude: In the 15th and 16th centuries, when learning of all kinds began to revive, the chaste architecture of the Greeks and Romans seemed as it were to be recalled into life. The first improvements in it began in Italy, and owed their existence to the many ruins of the ancient Roman structures that were to be found in that country; from whence an improved method of building was gradually brought into the other countries of Europe; and though the Italians for a long time retained the superiority as architects over the other European nations; yet, as men of genius travelled from all quarters into Italy, where they had an opportunity of seeing the originals from whence the Italians copied, architects have arisen in other nations equal, if not superior, to any that ever appeared in Italy. Of this we have a recent instance in our own countryman Mr Mylne, who lately gained the prize in architecture at Rome, where it would no doubt be disputed by such natives of Italy as were best skilled in that art.

PART I. PRINCIPLES OF ARCHITECTURE.

MANY ages must have elapsed before architecture came to be considered as a fine art. Utility was its original destination, and still continues to be its principal end. Experience, however, has taught us, that architecture is capable of exciting a variety of agreeable feelings. Of these, utility, grandeur, regularity, order, and proportion are the chief.

13 Distinction of buildings.

Architecture, being an useful as well as a fine art, leads us to distinguish buildings, and parts of buildings, into three kinds, viz. what are intended for use solely, what for ornament solely, and what for both. Buildings intended for utility solely, ought in every part to correspond precisely to that intention: the least deviation from use, though contributing to ornament, will be disagreeable; for every work of use being considered as a mean to an end, its perfection as a mean is the capital circumstance, and every other beauty in opposition is neglected as improper. On the other hand, in such things as are intended solely for ornament, as columns, obelisks, triumphal arches, &c. beauty alone ought to be regarded. The principal difficulty in architecture lies in combining use and ornament. In order to accomplish these ends, different and even opposite means must be employed; which is the reason why they are so seldom united in perfection; and hence, in buildings of this kind, the only practicable method is,

Principles. to prefer utility to ornament according to the character of the building: in palaces, and such buildings as admit of a variety of useful contrivances, regularity ought to be preferred; but in dwelling houses that are too small for variety of contrivance, utility ought to prevail, neglecting regularity as far as it stands in opposition to convenience.

24 Intrinsic and relative beauty. In considering attentively the beauty of visible objects, we discover two kinds. The first may be termed *intrinsic* beauty, because it is discovered in a single object, without relation to any other. The second may be termed *relative* beauty, being founded on a combination of relative objects. Architecture admits of both kinds. We shall first give a few examples of *relative* beauty.

The proportions of a door are determined by the use to which it is destined. The door of a dwelling house, which ought to correspond to the human size, is confined to seven or eight feet in height and three or four in breadth. The proportions proper for a stable or coachhouse are different. The door of a church ought to be wide, in order to afford an easy passage for a multitude; and its height must be regulated by its wideness, that the proportion may please the eye. The size of the windows ought always to be proportioned to that of the room they are destined to illuminate; for if the apertures be not large enough to convey light to every corner, the room must be unequally lighted, which is a great deformity. Steps of stairs should likewise be accommodated to the human figure, without regarding any other proportion; they are accordingly the same in large and in small buildings, because both are inhabited by men of the same size.

We shall next consider *intrinsic* beauty blended with that which is *relative*. A cube itself is more agreeable than a parallelopipedon; this constantly holds in small figures: but a large building in the form of a cube is lumpish and heavy; while a parallelopipedon, set on its smaller base, is more agreeable on account of its elevation: Hence the beauty of Gothic towers. But if this figure were to be used in a dwelling house, to make way for relative beauty, we should immediately perceive that utility ought chiefly to be regarded; and this figure, inconvenient by its height, ought to be set on its larger base: the loftiness in this case would be lost; but that loss will be more than sufficiently compensated by the additional convenience. Hence the form of buildings spread more upon the ground than raised in height, is always preferred for a dwelling house.

25 Internal divisions of rooms. With regard to the internal divisions, utility requires that the rooms be rectangular, to avoid useless spaces. An hexagonal figure leaves no void spaces; but it determines the rooms to be all of one size, which is both inconvenient and disagreeable for want of variety. Though a cube be the most agreeable figure, and may answer for a room of a moderate size: yet, in a very large room, utility requires a different figure. Unconfined motion is the chief convenience of a great room; to obtain this the greatest length that can be had is necessary. But a square room of large size is inconvenient. It removes chairs, tables, &c. at too great a distance from the hand, which, when unemployed, must be ranged along the sides of the room. Utility, therefore, requires a large room to be a parallelogram. This figure is likewise best calculated for the admission of light; because, to avoid cross lights, all the windows ought to be in one wall; and if the opposite wall be at such a distance as not to be fully lighted, the room must be obscure. The height of a room exceeding nine or ten feet has little relation to utility; therefore proportion is the only rule for determining the height when above that number of feet. Principles.

26 Utility and beauty often incompatible. Artists who deal in the beautiful, love to entertain the eye: palaces and sumptuous buildings, in which intrinsic beauty may be fully displayed, give them an opportunity of exerting their taste. But such a propensity is peculiarly unhappy with regard to private dwelling houses; because, in these, relative beauty cannot be displayed to perfection without hurting intrinsic beauty. There is no opportunity for great variety of form in a small house; and in edifices of this kind, internal convenience has not hitherto been happily adjusted to external regularity. Perhaps an accurate coincidence in this respect is beyond the reach of art. Architects, however, constantly split upon this rock; for they never can be persuaded to give over attempting to reconcile these two incompatibles: how otherwise should it happen, that of the endless variety of private dwelling houses, there should not be one found that is generally agreed upon as a good pattern? the unwearied propensity to make a house regular as well as convenient obliges the architect, in some articles, to sacrifice convenience to regularity, and, in others regularity to convenience; and accordingly the house, which turns out neither regular nor convenient, never fails to displease.

Nothing can be more evident, than that the form of a dwelling house ought to be suited to the climate; yet no error is more common than to copy in Britain the form of Italian houses, not forgetting even those parts that are purposely contrived for collecting air, and for excluding the sun; witness our colonnades and logios, designed by the Italians to gather cool air, and exclude the beams of the sun, conveniences which the climate of this country does not require.

27 Architecture considered as a fine art. We shall next view architecture as one of the fine arts; which will lead us to the examination of such buildings, and parts of buildings, as are calculated solely to please the eye. Variety prevails in the works of nature; but art requires to be guided by rule and compass. Hence it is, that in such works of art as imitate nature, the great art is, to hide every appearance of art; which is done by avoiding regularity and indulging variety. But in works of art that are original and not imitative, such as architecture, strict regularity and uniformity ought to be studied, so far as consistent with utility.

28 Difference between proportions of number and quantity. Proportion is not less agreeable than regularity and uniformity; and therefore, in buildings intended to please the eye, they are all equally essential. It is taken for granted by many writers, that in all the parts of a building there are certain strict proportions which please the eye, in the same manner as in sound there are certain strict proportions which please the ear; and that, in both, the slightest deviation is equally disagreeable. Others seem to relish more a comparison between proportion in numbers and proportion in quantity; and maintain, that the same proportions are agreeable in both. The proportion, for example, of the numbers

Principles. bers 16, 24, and 36, are agreeable; and so, say they, are the proportions of a room, whose height is 16 feet, the breadth 24, and the length 36. But it ought to be considered, that there is no resemblance or relation between the objects of different senses. What pleases the ear in harmony, is not the proportion of the strings of the instrument, but of the sound which these strings produce. In architecture, on the contrary, it is the proportion of different quantities that pleases the eye, without the least relation to sound. The same thing may be said of numbers. Quantity is a real quality of every body; number is not a real quality, but merely an idea that arises upon viewing a plurality of things in succession. An arithmetical proportion is agreeable in numbers; but have we from this any reason to conclude, that it must also be agreeable in quantity? At this rate, a geometrical proportion, and many others, ought also to be agreeable in both. A certain proportion may coincide in quantity and number; and among an endless variety of proportions, it would be wonderful if there never should be a coincidence. One example is given of this coincidence in the numbers 16, 24, and 36; but to be convinced that it is merely accidental, we need but reflect, that the same proportions are not applicable to the external figure of a house, and far less to a column.

It is ludicrous to observe writers acknowledging the necessity of accurate proportions, and yet differing widely about them. Laying aside reasoning and philosophy, one fact universally agreed on ought to have undeceived them, that the same proportions which please in a model are not agreeable in a large building: a room 48 feet in length, and 24 in breadth and height, is well proportioned: but a room 12 feet wide and high, and 24 long, approaches to a gallery.

29 Beauty arising from proportion. Perrault, in his comparison of the ancients and moderns, goes to the opposite extreme; maintaining, that the different proportions assigned to each order of columns are arbitrary, and that the beauty of these proportions is entirely the effect of custom. But he should have considered, that if these proportions had not originally been agreeable, they could never have been established by custom.

For illustrating this point, we shall add a few examples of the agreeableness of different proportions. In a sumptuous edifice, the capital rooms ought to be large, otherwise they will not be proportioned to the size of the building; for the same reason, a very large room is improper in a small house. But in things thus related, the mind requires not a precise or single proportion, rejecting all others; on the contrary, many different proportions are equally agreeable. It is only when a proportion becomes loose and distant, that the agreeableness abates, and at last vanishes. Accordingly, in buildings, rooms of different proportions are found to be equally agreeable, even where the proportion is not influenced by utility. With regard to the proportion the height of a room should bear to the length and breadth, it must be extremely arbitrary, considering the uncertainty of the eye as to the height of a room when it exceeds 16 or 17 feet. In columns, again, every architect must confess, that the proportion of height and thickness varies betwixt eight diameters and 10, and that every proportion between these two extremes is agreeable. Besides, there must certainly be a further variation of proportion, depending on the size of the column. A row of columns 10 feet high, and a row twice that height, require different proportions: The intercolumniations must also differ in proportion according to the height of the row. Principl

Proportion of parts is not only itself a beauty, but is inseparably connected with a beauty of the highest relish, that of concord and harmony; which will be plain from what follows: A room, the parts of which are all finely adjusted to each other, strikes us not only with the beauty of proportion, but with a pleasure far superior. The length, the breadth, the height, the windows, raise each of them a separate emotion: These emotions are similar; and, though faint when separately felt, they produce in conjunction the emotion of concord or harmony, which is very pleasant. On the other hand, where the length of a room far exceeds the breadth, the mind, comparing together parts so intimately connected, immediately perceives a disagreement or disproportion which disgusts. Hence a long gallery, however convenient for exercise, is not an agreeable figure of a room.

30 Form of structure to be suited to the purposes for which they are intended. In buildings destined chiefly or solely to please the eye, regularity and proportion are essentially necessary, because they are the means of producing intrinsic beauty. But a skilful artist will not confine his view to regularity and proportion; he will also study congruity, which is perceived when the form and ornaments of a structure are suited to the purpose for which it is appointed. Hence every building ought to have an expression suited to its destination. A palace ought to be sumptuous and grand; a private dwelling, neat and modest; a playhouse, gay and splendid; and a monument gloomy and melancholy. A heathen temple has a double destination: It is considered as a house dedicated to some divinity; therefore it ought to be grand, elevated, and magnificent: It is also considered as a place of worship; and therefore ought to be somewhat dark and gloomy, because dimness or obscurity produces that tone of mind which is favourable to humility and devotion. Columns, besides their chief destination of being supports, contribute to that peculiar expression which the destination of a building requires. Columns of different proportions serve to express loftiness, lightness, &c. as well as strength. Situation may also contribute to expression: Conveniency regulates the situation of a private dwelling-house; and the situation of a palace ought to be lofty. This leads to a question, Whether the situation, where there happens to be no choice, ought, in any measure, to regulate the form of the edifice? The connection between a great house and a neighbouring field, though not extremely intimate, demands, however, some congruity. It would, for example, displease us to find an elegant building thrown away upon a wild uncultivated country: congruity requires a polished field for such a building. The old Gothic form of building was well suited to the rough uncultivated regions where it was invented; but was very ill adapted to the fine plains of France and Italy.

31 Internal divisions of houses. The external structure of a house leads naturally to its internal structure. A large and spacious room, which is the first that commonly receives us, is a bad contrivance in several respects. In the first place, when immediately from the open air we step into such

a

inciples. a room, its size in appearance is diminished by contrast; it looks little, compared with the great canopy of the sky. In the next place, when it recovers its grandeur, as it soon doth, it gives a diminutive appearance to the rest of the house; passing from it, every apartment looks little. In the third place, by its situation it serves only for a waiting room, and a passage to the principal apartments. Rejecting therefore this form, a hint may be taken from the climax in writing for another that appears more suitable: A handsome portico, proportioned to the size and fashion of the front, leads into a waiting room of a larger size, and this to the great room, all by a progression of small to great.

Grandeur is the principal emotion that architecture is capable of raising in the mind: it might therefore be the chief study of the artist, in great buildings destined to please the eye. But as grandeur depends partly on size, it is unlucky for architecture that it is governed by regularity and proportion, which never deceive the eye by making objects appear larger than they are in reality. But though regularity and proportion contribute nothing to grandeur, so far as that emotion depends on size; yet they contribute greatly to it by confining the size within such bounds that it can be taken in and examined at one view; for when objects are so large as not to be comprehended but in parts, they tend rather to distract than satisfy the mind.

We shall next pass to such ornaments as contribute to give buildings a peculiar expression. It has been doubted, whether a building can regularly admit any ornament but what is useful, or at least has that appearance. But, considering the double aim of architecture, as a fine as well as an useful art, there is no reason why ornaments may not be added to please the eye, without any relation to utility. A private dwelling house, it is true, and other edifices, where use is the chief aim, admit not regularly any ornament but what has at least the appearance of use; but temples, triumphal arches, and other buildings, intended chiefly or solely for show, may be highly ornamented.

32 ferent ds of or- nents. This suggests a division of ornaments into three kinds, viz. 1. Ornaments that are beautiful without relation to use; such as statues, vases, basso or alto relievo: 2. Things in themselves not beautiful, but possessing the beauty of utility, by imposing on the spectator, and appearing to be useful; such as blind windows: 3. Where things are beautiful in themselves, and at the same time take on the appearance of use; such as pilasters.

With regard to the *first*, we naturally require that a statue be so placed, as to be seen in every direction, and examined at different distances. Statues, therefore, are properly introduced to adorn the great stair that leads to the principal door of a palace, or to lessen the void between pillars. But a niche in the external front is an improper place for a statue. There is an additional reason against placing them upon the roof or top of the walls: their ticklish situation gives pain, as they have the appearance of being in danger of tumbling down; besides we are inclined to feel from their being too much exposed to the inclemencies of the weather. To adorn the top of the wall with a row of vases, is an unhappy conceit, by placing a thing whose natural destination is utility, where it cannot have even the appearance of use. As to carvings upon the external surface of a building, termed *basso relievo* when flat, and *alto relievo* when prominent, all contradictory expressions ought to be avoided. Now, firmness and solidity being the proper expressions of a pedestal, and, on the contrary, lightness and delicacy of carved work, the pedestal, whether of a column or of a statue, ought to be sparingly ornamented. The ancients never ventured any bolder ornament than the basso relievo. Principles.

With respect to ornaments of the *second* kind, it is a great blunder to contrive them so as to make them appear useless. A blind window, therefore, when necessary for regularity, ought to be so disguised as to appear a real window: when it appears without disguise, it is disgustful, as a vain attempt to supply the want of invention; it shows the irregularity in a stronger light, by signifying that a window ought to be there in point of regularity, but that the architect had not skill sufficient to connect external regularity with internal convenience.

As to the *third*, it is an error to sink pilasters so far into the wall, as to remove totally, or mostly, the appearance of use. They should always project so much from the wall, as to have the appearance of supporting the entablature over them.

From ornaments in general, we descend to a pillar, the chief ornament in great buildings. The destination of a pillar is to support, really, or in appearance, another part, termed the *entablature*. With regard to the form of a pillar, it must be observed, that a circle is a more agreeable figure than a square, a globe than a cube, and a cylinder than a parallelopipedon. This last, in the language of architecture, is saying, that a column is a more agreeable figure than a pilaster; and for that reason it ought to be preferred, when all other circumstances are equal. Another reason concurs, that a column annexed to a wall, which is a plain surface, makes a greater variety than a pilaster. Besides, pilasters at a distance are apt to be mistaken for pillars; and the spectator is disappointed, when, on a nearer approach, he discovers them to be only pilasters. 33 Columns.

As to the parts of a column, a bare uniform cylinder, without a capital, appears naked; and without a base, appears too ticklishly placed to stand firm; it ought therefore to have some finishing at the top and bottom: Hence the three chief parts of a column, the shaft, the base, and the capital. Nature undoubtedly requires proportion among these parts, but it admits of variety of proportion. Vitruvius and some of the elder writers seem to think, that the proportions of columns were derived from the human figure, the capital representing the head, the base the feet, and the shaft the body. The Tuscan has been accordingly denominated the *Gigantic;* the Doric, the *Herculean;* the Ionic, the *Matronal;* and the Corinthian, the *Virginal:*—The Composite is a mixture of the Corinthian and Ionic. As to the base, the principle of utility interposes to vary it from the human figure, and to proportion it so to the whole, as to give the column the appearance of stability.

34 Whether new orders can be invented.

Among the Greeks, we find only three orders of columns, the Doric, the Ionic, and the Corinthian, distinguished

Principles. stinguished from each other by their destination as well as by their ornaments. It has been disputed, whether any new order can be added to these: some hold the affirmative, and give for instances the Tuscan and Composite: others maintain, that these properly are not distinct orders, but only the original orders with some slight variation. The only circumstances that can serve to distinguish one order from another, are the form of the column, and its destination. To make the first a distinguishing mark, without regard to the other, would multiply orders without end. Destination is more limited; and it leads us to distinguish three kinds of orders; one plain and strong for the purpose of supporting plain and massy buildings; one delicate and graceful, for supporting buildings of that character; and between these, a third, for supporting buildings of a mixed nature. So that, if destination alone is to be regarded, the Tuscan is of the same order with the Doric, and the Composite with the Corinthian.

The ornaments of these three orders ought to be suited to the purposes for which they are intended. Plain and rustic ornaments would not be a little discordant with the elegance of the Corinthian order, and sweet and delicate ornaments not less with the strength of the Doric.

35 Rules regarding buildings in general. With respect to buildings of every kind, one rule, dictated by utility, is, that they be firm and stable. Another, dictated by beauty, is, that they also appear so to the eye: for every thing that appears tottering, and in hazard of tumbling down, produceth in the spectator the painful emotion of fear, instead of the pleasing emotion of beauty; and accordingly it should be the great care of the artist, that every part of his edifice appear to be well supported. Some have introduced a kind of conceit in architecture, by giving parts of buildings the appearance of falling; of this kind is the church of St Sophia in Constantinople: the round towers in the uppermost stories of Gothic buildings are in the same false taste.

The most considerable ornaments used in architecture are five orders of columns, pediments, arches, ballusters, &c. of which in the following chapters.

Chap. I. *Of the Orders of Architecture.*

An order consists of two principal members, the Column and the Entablature; each of which is composed of three principal parts. Those of the columns are, the *Base*, the *Shaft*, and the *Capital;* and those of the entablature are, the *Architrave*, the *Frize*, and the *Cornice*. All these are subdivided into many lesser parts, whose number, form, and dimensions, characterize each order, and express the degree of strength, delicacy, richness, or simplicity peculiar to it.

36 Parts of an order divided into two classes. The parts that compose an order may be distributed into two different classes. In the *first* may be ranged all that have any analogy to the primitive huts, and represent some part that was necessary in their construction. Such are the shaft of the column, with the plinth of its base, and the abacus of its capital; likewise the architrave and triglyphs, the mutules, modilions, or dentiles, which all of them represent the rafters, or some other pieces of timber used to support the covering; and the corona, representing the beds of materials that composed the covering. All these may properly be distinguished by the name of *essential members*. The subservient parts, contrived for the use or ornaments of the former, and commonly called *mouldings*, may constitute the *second* class. Princip

There are eight regular mouldings in ornamenting columns: the fillet, listel, or square; the astragal, or bead; the torus, or tore; the scotia, mouth, or casement; the echinus, ovolo, or quarter-round; the inverted cyma, talon, or ogee; the cyma, cyma recta, or cymation; the cavetto, or hollow. The names of these allude to their forms, and their forms are adapted to the purposes for which they are intended. See Plate XLII.

The ovolo and talon, as they are strong at the extremities, are fit for supports; the cyma and cavetto, though improper for supports, serve for coverings to shelter other members; the torus and astragal, being shaped like ropes, are intended to bind and fortify the parts with which they are connected: But the use of the scotia and fillet is only to separate and distingnish the other mouldings, to give a graceful turn to the profile, and to prevent the confusion which would arise from joining several curved members together.

There are various methods of describing the contours of mouldings; but the simplest and best is to form them of quadrants of circles.

37 Profile, what. An assemblage of what are called essential parts and mouldings is termed a *profile*. The most perfect profiles are such as are composed of few mouldings, varied in form and size; and so disposed, that the straight and curved ones succeed each other alternately. When ornaments are employed in mouldings, some of them should be left plain, in order to give a proper repose: For when all are ornamented, the figure of the profile is lost.

38 Diminution of columns. Columns, in imitation of trees, from which they drew their origin, are tapered in their shafts. In the antiques the diminution is variously performed: beginning sometimes from the foot of the shaft, and at others from one quarter, or one-third of its height; the lower part being perfectly cylindrical. The former of these was most in use among the ancients, and being the most natural and graceful, ought to have the preference, though the latter hath been more universally practised by modern artists.

The first architects, says M. Auzoult, probably made their columns in straight lines, in imitation of trees; so that their shaft was a frustum of a cone; but finding this form abrupt and disagreeable, they made use of some curve, which, springing from the extremities of the superior and inferior diameters of the column, swelled beyond the sides of the cone, and by that means gave a more pleasing figure to the contour.

Vitruvius, in the second chapter of his third book, mentions this practice, but in so obscure and cursory a manner, that his meaning hath not been understood; and several of the modern architects, intending to conform themselves to his doctrine, have made the diameters of their columns greater in the middle than at the foot of the shaft. Leon Baptista, Alberti, and others of the Florentine and Roman architects, have carried

inciples. carried this to a very great excess; for which they have been justly blamed, as it is neither natural, reasonable, nor beautiful.

Monsieur Auzoult observes, that a column, supposing its shaft to be the frustum of a cone, may have an additional thickness in the middle, without being swelled there beyond the bulk of its inferior parts; and supposes the addition mentioned by Vitruvius to signify nothing but the increase towards the middle of the column, occasioned by changing the straight line, which at first was in use, for a curve.

The supposition is extremely just, and founded on what is observed in the works of antiquity; where there is no instance of columns thicker in the middle than at the bottom, though all have the swelling hinted at by Vitruvius, all of them being terminated by curves; some granite columns excepted, which are bounded by straight lines; a proof, perhaps, of their antiquity, or of their having been wrought in the quarries of Egypt, by bungling and unskilful workmen.

Monsieur Blondel, in his book entitled *Resolution des quatre principaux problemes d'Architecture*, teaches various manners of diminishing columns; the best and simplest of which is by means of the instrument which Nicomedes invented to describe the first conchoid: for this, being applied at the bottom of the shaft, performs at one sweep both the swelling and the diminution; giving such a graceful form to the column, that it is universally allowed to be the most perfect practice hitherto discovered. The columns in the Pantheon, accounted the most beautiful among the antiques, are made in this manner; as appears by the exact measures of one of them, to be found in Desgodet's Antiquities of Rome.

39 gnola's thod. To give an accurate idea of the operation, it will be necessary first to describe Vignola's method of diminution, on which it is grounded. "As to this second method, says Vignola, it is a discovery of my own, and although it be less known than the former, it will be easily comprehended by the figure. Having therefore determined the measures of your column, (that is to say, the height of the shaft, and its inferior and superior diameters), draw a line indefinitely from C through D, perpendicular to the axis of the column: this done, set off the distance CD, which is the inferior semidiameter, from A, the extreme point of the superior semidiameter, to B, a point in the axis; then from A, through B, draw the line ABE, which will cut the indefinite line CD in E; and, from this point of intersection E, draw through the axis of the column any number of rays, as E b a, on each of which, from the axis towards the circumference, setting off the interval CD, you may find any number of points, a, a, a, a, through which if a curve be drawn, it will describe the swelling and diminution of the column."

Plate XXVII.

40 come- s's in- rument. Though this method be sufficiently accurate for practice, especially if a considerable number of points be found, yet, strictly speaking, it is defective; as the curve must either be drawn by hand, or by applying a flexible ruler to all the points; both of which are liable to variations. Blondel, therefore, to obviate this objection, (after having proved the curve passing from A to C through the points a, a, to be of the same nature with the first conchoid of the ancients), employed the instrument of Nicomedes to describe it; the construction of which is as follows:

Principles.

Having determined, as above, the length of the shaft, with the inferior and superior diameters of the column, and having likewise found the length of the line CDE, take three rulers, either of wood or metal, as FG, ID, and AH; of which let FG and ID be fastened together at right angles in G. Cut a dovetail groove in the middle of FG, from top to bottom; and at the point E on the ruler ID (whose distance, from the middle of the groove in FG, is the same as that of the point of intersection from the axis of the column) fix a pin: then on the ruler AH set off the distance AB, equal to CD the inferior semidiameter of the column, and at the point fix a button, whose head must exactly be fitted to the groove made in FG, in which it is to slide; and, at the other extremity of the ruler AH, cut a slit or canal from H to K, whose length must not be less than the difference of length between EB and ED, and whose breadth must be sufficient to admit the pin fixed at E, which must pass through the slit, that the ruler may slide thereon.

The instrument being thus completed, if the middle of the groove, in the ruler FG, be placed exactly over the axis of the column, it is evident that the ruler AH, in moving along the groove, will with the extremity A describe the curve A a a C; which curve is the same as that produced by Vignola's method of diminution, supposing it done with the utmost accuracy; for the interval AB, a b, is always the same; and the point E is the origin of an infinity of lines, of which the parts BA, b a, b a, extending from the axis to the circumference, are equal to each other and to DC. And if the rulers be of an indefinite size, and the pins at E and B be made to move along their respective rulers so that the intervals AB and DE may be augmented or diminished at pleasure, it is likewise evident that the same instrument may be thus applied to columns of any size.

41 Quantity of diminution. In the remains of antiquity the quantity of the diminution is various; but seldom less than one-eighth of the inferior diameter of the column, nor more than one-sixth of it. The last of these is by Vitruvius esteemed the most perfect.

Of the Tuscan Order.

42 Plate XXXIX. This is the most solid and simple of all the orders. It is composed of few parts, devoid of ornaments, and so massy, that it seems capable of supporting the heaviest burden. There are no remains of a regular Tuscan order among the antiques: the doctrine of Vitruvius concerning it is obscure; and the profiles of Palladio, Scamozzi, Serlio, de l'Orme and Vignola, are all imperfect.

The height of the Tuscan order is 14 modules, or semidiameters, each consisting of 30 minutes; and that of the whole entablature $3\frac{1}{2}$ modules; which being divided into ten equal parts, three of them are for the height of the architrave, three for the frize, and the remaining four for the cornice. The capital is one module; the base, including the lower cincture of the shaft is likewise one module; and the shaft, with its upper cincture and astragal, 12 modules.

These are the general dimensions of the order; the

Principles. particular dimensions may be learned by inspection of the plates.

In the remains of antiquity, the quantity of diminution at the top of the Tuscan column is various; but seldom less than one-eighth, nor more than one-sixth, of the inferior diameter of the column. The last of these is generally preferred; and Chalmers and others make the same diminution in all columns, without regard to their order.

Of the Doric Order.

43
Plate XL. This order is next in strength to the Tuscan; and being of a grave, robust, and masculine aspect, is, by Scamozzi, called the *Herculean*. As it is the most ancient of all the orders, it retains more of the structure of the primitive huts than any of the rest; the triglyphs in its frize representing the ends of the joists, and the mutules in its cornice representing the rafters.

The height of the Doric column, including its capital and base is 16 modules, and the height of the entablature 4; the latter of which being divided into eight parts, two of them are for the architrave, three for the frize, and three for the cornice.

In most of the antiques, the Doric column is executed without a base. Vitruvius likewise makes it without one; the base, according to him, having been first employed in the Ionic order, in imitation of the sandal of a woman's foot. Scamozzi blames this practice, and most of the modern architects are of his opinion.

44
Ornaments of the frize. In the profile of the theatre of Marcellus, the frize is enriched with husks and roses; the architrave consits only of one fascia and a fillet; the drops are conical; the metope is enriched with a bull's skull, adorned with a garland of beads, in imitation of those on the temple of Jupiter Tonans, at the foot of the Capitol. In some antique fragments, and in a great many modern buildings, the metopes are alternately adorned with ox skulls and pateras. But they may be filled with any other ornaments, according to the destination of the building.

The Ionic Order

45
Plate XLI. Is of a more slender make than the Doric or Tuscan; its appearance is simple, yet graceful and majestic; its ornaments are few; so that it has been compared to a sedate matron, in decent, rather than magnificent attire.

Among the ancients, the form of the Ionic profile appears to have been more positively determined than that of any other order: for in all the antiques at Rome (the temple of Concord excepted), it is exactly the same.

The modern artists have likewise been unanimous in their opinions; all of them, excepting Palladio and his imitators, having employed the dentil, cornice, and the other parts of the profile, nearly as they are found in the Coliseum, the temple of Fortune, and the theatre of Marcellus.

The height of the Ionic column is 18 modules, and that of the entablature $4\frac{1}{2}$, or one quarter of the height of the column, as in the other orders, which is a trifle less than in any of the antique Ionics. In all the antiques, the base is Attic; and the shaft of the column may either be plain, or fluted with 24 flutings, or 20 only, as in the temple of Fortune. The plan of the flutings may be a trifle more than a semicircle, as in the forum of Nerva, because they then appear more distinct. The fillets, or intervals between them, must not be broader than one-third of the breadth of a fluting, nor narrower than one-fourth. The ornaments of the capital must correspond with the flutings of the shaft; and there must be an ove above the middle of each fluting. The volutes ought to be traced according to Mr Goldman's method, which is as follows: Principle

46
Method of drawing volutes. Plate XLII. fig. 9. Draw the cathetus, FC, whose length must be 15 minutes, or one-fourth of a module: and from the point C, describe the eye of the volute AEBD, of which the diameter is to be $6\frac{2}{3}$ minutes; divide it into four equal sectors by the diameters AB, DE. Bisect the radii CA, CB, in 1 and 4; and on the line, 1, 4, construct a square, 1, 2, 3, 4. From the centre C, to the angles 2, 3, draw the diagonals C 2, C 3, and divide the side of the square 1, 4, into six equal parts, at 5, 9, C, 12, 8. Then through the points, 5, 9, 12, 8, draw the lines 5, 6, 9, 10, 12, 11, 8, 7, parallel to the diameter ED, which will cut the diagonals in 6, 7, 10, 11; and the points 1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, will be the centres of the volute. From the first centre 1, with the distance 1 F, describe the quadrant FG; from the second centre 2, with the distance 2 G, describe the quadrant GH; and continuing the same operation from all the 12 centres, the contour of the volute will be completed.

Fig. 10. The centres for describing the fillet are found in this manner. Construct a triangle, of which the side AF is equal to the part of the cathetus contained between AF, and the side FV equal to C 1; place the distance FS from F towards A, equal to FS the breadth of the fillet, and through the point S draw the line ST, which will be to C 1 in the same proportion as AS is to AF; place this line on the diameter of the eye AB: divide it into three equal parts; and through the points of division, draw lines parallel to the diameter ED, which will cut the diagonals C 2, C 3, and you will have twelve new centres, from whence the interior contour of the fillet may be described in the same manner as the exterior one was from the first centres.

Of the Corinthian Order.

47
Plate XLIII. The proportions of this order are extremely delicate. It is divided into a great variety of members, and enriched with a profusion of ornaments. Scamozzi calls it the *virginal order*; and indeed it has all the delicacy in its make, and all the delicacy in its dress, peculiar to young girls.

The most perfect model of the Corinthian order is generally allowed to be in the three columns in the Campo Vaccino at Rome, the remains, as it is thought, of the temple of Jupiter Stator.

The Corinthian column should be 20 modules high, and the entablature 5; which proportions are a medium between those of the Pantheon and the three columns. The base of the column may be either Attic or Corinthian: They are both beautiful. If the entablature be enriched, the shaft may be fluted. The flutings may be filled, to one-third of their height, with cabblings, as the inside of the Pantheon; which will strengthen

inciples. strengthen the lower part of the column, and make it less liable to injury.

In most of the antiques at Rome, the capital of this order is enriched with olive leaves; the acanthus being seldom employed but in the Composite. De Cordemoy, however, prefers the acanthus.

The divisions of the entablature bear the same proportions to each other, as the Tuscan, Ionic, and Composite orders.

The Composite

48 Plate XLIV. Is, strictly speaking, only a species of the Corinthian; and therefore retains, in a great measure, the same character.

49 ferent ds of or- nents. It does not appear that the ancients affected any particular form of entablature to this order. Sometimes the cornice is entirely plain, as in the temple of Bacchus; at others, as in the arch of Septimius Severus, it is enriched with dentiles differing very little from the Ionic; and in the arch of Titus, there are both dentils and modilions; the whole form of the profile being the same with the Corinthian, as executed in the antiques at Rome.

The modern architects have varied more in this than in any other order, each following the bent of his own fancy.

The height of the Composite column, and parts of the entablature, is the same with that of the Corinthian. The foot of the leaves of the capital ought not to project beyond the upper part of the shaft. The different bunches of leaves should be strongly marked; the sprigs which arise between the upper ones should be kept flat upon the vase; and the ornaments of the volutes must not project beyond the fillets that enclose them.

Chap. II. *Of Pilasters.*

50 These differ from columns only in their plan; which is a square, as that of columns is round. Their bases, capitals and entablatures, have the same parts, with the same heights and projections, as those of columns: they are also distinguished in the same manner, by the names of Tuscan, Doric, Ionic, Corinthian, and Composite.

The column is undoubtedly more perfect than the pilaster. However, they may be employed with great propriety on many occasions. Some authors declaim against pilasters, because, according to them, they do not admit of diminution. But this is a mistake; there are many instances in the remains of antiquity, of their being diminished. Scamozzi always gave his pilasters the same diminution as his columns: Palladio and Inigo Jones have likewise diminished them in many of their buildings.

51 asters re use. Pilasters are employed in churches, galleries, halls, and other interior decorations, to save room; for, as they seldom project beyond the solid wall above one quarter of their diameter, they do not occupy near so much space as columns. They are likewise used in exterior decorations; sometimes alone, instead of columns, on account of their being less expensive; and sometimes they accompany columns, being placed behind them to support the architraves where they enter the building, as in the Pantheon at Rome; or, in the same line with them, to fortify the angles, as in the portico of Septimius. Principles.

When pilasters are used alone, they should project one quarter of their diameter beyond the walls. When placed behind columns, especially if they be very near them, they need not project above one-eighth of their diameter. But, when placed on a line with columns, their projection must be regulated by that of the columns; and consequently, it can never be less than a semidiameter, even when the columns are engaged as much as possible.

The shafts of pilasters are frequently adorned with flutings, in the same manner as those of columns; the plan of which may be a trifle more than a semicircle; their number must be seven on each face, which makes them nearly of the same size with those of columns. The intervals, or fillets, must either be one-third or one-fourth of the fluting in breadth. 52 How ornamented.

The capitals of pilasters are profiled nearly in the same manner as those of columns. Plate XLV.

Chap. III. *Of Attics.*

53 These very properly follow the pilasters; being nothing more than square pillars with their cornices. They had their origin in Athens, where it was for many ages a rule in building to conceal the roof. For this purpose, nothing served so well as a kind of low or little order ranged in a continued line, singly, or with the interruption of ballusters; which, rising above the rest of the work and before the roof, hid it perfectly, and placed something agreeable in view. The place of attics, therefore, is at the uppermost extremity of a building, to which they serve as a crown, or very properly make a finishing for the other orders when they have been used in the structure. They must never stand under any thing except such ornaments as are placed at the very top. These attics should never exceed in height one-third of the height of the order on which they are placed, nor be less than one quarter of it. The base, dye, and cornice, of which they are composed, may bear the same proportions to each other as those of pedestals do; and the base and cornice may be composed of the same mouldings as those of pedestals. Sometimes the attic is continued throughout; at others, it projects, and forms a pilaster over each column of the order. The breadth of this pilaster is seldom made narrower than the upper diameter of the column below it, and never broader. Its projection may be equal to one quarter of its breadth.

Chap. IV. *Of Persians, Caryatides, and Termini.*

54 Besides columns and pilasters, it is sometimes customary to employ representations of the human figure, to support entablatures in buildings. The male figures are called *Persians;* and the female, *Carians* or *Caryatides.*

55 Origin of Persians. The *Persians* are so called from a victory gained over the Persians by Pausanias, who having brought home spoils and trophies to the Athenians, they fixed upon Persian figures for those which should support entablatures, and thus kept in mind that there were once Persian slaves in Athens. To represent these conquered

Principles.

quered people in the lowest state possible, they loaded them with the heaviest entablature, viz. that of the Doric order. In process of time, however, other figures besides those of Persians were introduced, and other entablatures put over them; but the name was still retained.

56 Of Caryatides.

The proper Caryatides are women dressed in long robes, after the Asiatic manner; and the origin of the device was as follows:—The Carians had been long at war with the Athenians; but being at length totally vanquished, their wives were led away captives; and, to perpetuate the memory of this event, trophies were erected, in which figures of women dressed in the Caryatic manner, were used to support entablatures like the Persians; and though other female figures were afterwards used in the same manner, the name of *Caryatides* was always retained.

57 Their proportions, &c.

The ancients made frequent use of Persians and Caryatides, and delighted in diversifying them a thousand ways. The modern artists have followed their examples; and there is a great variety of compositions of this kind to be met with in different parts of Enrope.

Indecent attitudes, distorted features, and all monstrous productions, ought to be avoided, of which there are many examples in Gothic buildings. On the contrary, the attitudes should be simple and graceful, the countenance always pleasing, though varied and strongly marked agreeable to the nature of the object represented.

The Caryatides, or female figures, should never much exceed the human size. But the Persians, or male figures, may be of any size; and the larger the better, as they will strike the beholder with the greater awe and astonishment. Persians may be used with propriety in arsenals, galleries of armeur, &c. under the figures of captives, heroic virtues, &c. Their entablature ought to be Doric, and bear the same proportion to them as to columns of the same height. The entablature for Caryatides ought to be either Ionic or Corinthian, according as the character of the figures is more or less delicate.

58 Termini.

Termini are sometimes employed, instead of Persians or Caryatides, to support the entablatures of monuments, chimney-pieces, and such like compositions. These figures owe their origin to the stones used by the ancients to mark the limits of particular possessions. Numa Pompilius, to render these inviolable, consecrated the terminus into a deity, and instituted festivals and sacrifices to his honour. In a short time, what were formerly only large upright stones, were represented in human shape; and afterwards introduced as ornaments to temples and other buildings. The termini are now principally used as ornaments for gardens and fields.

Chap. V. *Of Pedestals.*

59

Most writers consider the *pedestal* as a necessary part of the order, without which it is not complete. It is indeed a matter of little importance whether it be considered in that light, or as a distinct composition: we shall therefore treat of a pedestal as a distinct body, having no more connexion with the order than an attic, a basement, or any other part with which it may on some occasions be associated.

Princip

A pedestal consists of three principal parts: the base, the dye, and the cornice. The dye is always nearly of the same figure; being constantly either a cube or a parallelopipedon: but the base and cornice are varied and adorned with more or fewer mouldings, according to the simplicity or richness of the composition in which the pedestal is employed. Hence pedestals are, like columns, distinguished by the names of *Tuscan*, *Doric*, *Ionic*, *Corinthian*, and *Composite*.

60 Pedestal where pr per.

Some authors are averse to pedestals, and compare a column raised on a pedestal to a man mounted on stilts; imagining that they were introduced merely from necessity, and for want of columns of a sufficient length. It is indeed true, that the ancients often made use of artifices to lengthen their columns; as appears by some that are in the Baptistery of Constantine at Rome; the shafts of which, being too short for the building, were lengthened and joined to their bases by an undulated sweep, adorned with acanthus leaves. Nevertheless, there are many occasions where pedestals are evidently necessary; and some in which the order, were it not so raised, would lose much of its beautiful appearance. Thus, in the insides of churches, if the columns that support the vault were placed immediately on the ground, the seats would hide their bases and a good part of their shafts; and in the theatres of the ancients, if the columns of the scene had been placed immediately on the stage, the actors would have hid a part of them from the audience. In anterior decorations, a pedestal diminishes the parts of the order, which otherwise might perhaps appear too clumsy, and hath the advantage of placing the column in a more favourable view, by raising its base nearer the level of the spectator's eye. In a second order of arcades, there is no avoiding pedestals: as without them it is impossible to give the arches any tolerable proportion.

61 Their pr portions.

With regard to the proportion that pedestals ought to bear to that of the columns they support, it is by no means fixed. Both the ancients and moderns vary greatly on this head. Vignola's proportions are generally reckoned the best. He makes his pedestals in all the orders of the same height, viz. one-third of the column; and as their breadth of course increases or diminishes in the same degree as the diameters of their respective columns do, the character of the order is always preserved, which, according to any other method, is impossible.

As to the divisions of the pedestals; if the whole height be divided into nine parts, one of them may be given to the height of the cornice, two to the base, and the six remaining to the dye. The breadth of the dye is always made equal to that of the plinth of the column. The projection of the cornice may be made equal to its height; and the base being divided into three parts, two of them will be for the height of the plinth, and one for the mouldings, whose projection must be less than that of the cornice. These measures are common to all pedestals. See Plate XLV.

Chap. VI. *Of Intercolumniations.*

Columns are either engaged, or insulated; and, when insulated, are either very near the wall, or at a considerable distance from it. Engaged columns, or such as are near the walls of a building, are not limited

62

in

nciples. in their intercolumniations, as these depend on the breadths of the arches, windows, niches, or other decorations placed between the columns. But columns that are entirely detached, and perform alone the office of supporting the entablature, as in peristyles, porches and galleries, must be near each other, for the sake both of real and apparent solidity.

63 erent rco- nia- s used he an- ts.

The intercolumniations among the ancients were various. Those used in the Ionic and Corinthian orders were the pycnostyle, of which the interval was equal to one diameter and a half of the column; the systyle, whose interval was equal to two diameters: the eustyle, to two and a quarter; the diastyle to three, and the aræostyle to four. In the Doric order, they used other intercolumniations, regulating them by the triglyphs, one of which was always placed directly over the middle of each column; so that they were either systyle, monotriglyph, of one diameter and a half; diastyle, of two diameters and three quarters; or aræostyle, of four diameters; and the Tuscan intervals were very wide, some of them being above seven diameters, which was very practicable, as the architraves were of wood.

Among these different intercolumniations, the pycnostyle and systyle are too narrow; for although the ancients made frequent use of them, that ought rather to be ascribed to necessity than choice. For as the architraves were composed of single stones, extending from the middle of one column to the middle of another, it would have been difficult, especially in large buildings, to find blocks of a sufficient length for diastyle intervals. With regard to the aræostyle and Tuscan intercolumniations, they are by much too wide, and can only be used in rustic buildings, where the architraves are of wood; neither is the diastyle sufficiently solid in large compositions. The eustyle is a medium between the narrow and broad intervals; and being at the same time both spacious and solid, hath been preferred to any of the rest by the ancients as well as the moderns.

64 d by nola.

Vignola observed nearly the same proportion in all his intercolumniations: which practice, though condemned by several writers, is certainly preferable to any other; as it preserves the character of each order, and maintains in all of them an equal degree of real solidity. Setting aside therefore the pycnostyle and systyle dispositions on account of their want of space, and the aræostyle for its deficiency in point of strength, it may be established, that the diastyle and eustyle intercolumniations (the latter of which, on most occasions, ought to have the preference) may be employed in all the orders without distinction, excepting the Doric; in which the most perfect interval is ditriglyph; neither the monotriglyph, nor the aræostyle being to be suffered but in cases of necessity.

Sometimes, on account of the windows, doors, niches, and other decorations, which correspond with the intercolumniations of the peristyle, or gallery, it is not possible to make the interval so narrow as eustyle, or even as diastyle: wherefore the moderns, authorised by some few examples of the ancients, where grouped columns are employed, have invented a manner of disposing them, called by Perrault *aræostyle*, which admits of a larger interval, without any detriment to the apparent solidity of the building. This kind of composition is composed of two systyle intercolumniations; the column that separates them being approached towards one of those at the extremities, sufficient room only being left between them for the projection of the capitals; so that the great space is three diameters and a half wide, and the little one half a diameter. Principles.

In peristyles, galleries, or porticoes, all the intercolumniations must be equal; but in a logio, or porch, the middle interval may be broader than the others, by a triglyph or modilion, or three or four dentils; unless the columns at the angles be coupled or grouped with pilasters: in which case, all the intervals should be of the same dimensions.

When buildings are very small, as is frequently the case in temples and other inventions used for ornamenting gardens, the intercolumniations may be broader, in proportion to the diameter of the columns, than usual; because, when they are nearer each other than three feet, there is hardly room for a bulky person to pass between them.

Chap. VII. *Of Arches.*

65 Arches, where proper.

Arches are not so magnificent as colonnades; but they are more solid and less expensive. They are proper for triumphal entrances, gates of cities, of palaces, of gardens, and of parks, and, in general, for all openings that require an extraordinary breadth.

66 How adorned.

There are various manners of adorning arches. Sometimes their piers are rusticated; sometimes they are adorned with pilasters, termini, or caryatides; and sometimes they are made sufficiently broad to admit niches or windows. The circular part of the arch is either surrounded with rustic key-stones, or with an archivolt enriched with mouldings; which, in the middle, is sometimes interrupted by a console, a mask, serving at the same time as a key to the arch, and as a support to the architrave of the order. The archivolt is sometimes supported by an impost, at the head of the pier; and at others by columns placed on each side of it, with a regular entablature, or architrave and cornice. There are likewise instances of arcades without piers, the arches being turned on single columns, as in the temple of Faunus at Rome, &c. This practice, however, ought to be seldom imitated, as it is neither solid nor handsome.

When arches are large, the key-stone should never be omitted, but cut in the form of a console, and carried close under the soffit of the architrave, which on account of its extraordinary length, requires a support in the middle. The imposts of arches should never be omitted: at least, if they be, a platform ought to supply their place. If columns are employed without pedestals in arcades, they should always be raised on a plinth. In all arches, the circular part ought not to spring immediately from the impost, but take its rise at such a distance above it as is necessary in order to have the whole curve seen at the proper point of view.

67 Proportions.

The void or aperture of arches should never be higher nor much lower, than double their breadth; the breadth of the pier should seldom exceed two-thirds, nor be less than one-third, of the breadth of the arch; and the angular pier ought to be broader than

Principles. than the others, by one-half, one-third, or one-fourth; the impost should not be more than one-seventh, nor less than one-ninth of the aperture; and the archivolt must not be more than one-eighth, nor less than one-tenth of it. The breadth of the console must, at the bottom, be equal to that of the archivolt; and its sides must be drawn from the centre of the arch; the length of it must not be less than one and a half of its smallest breadth, nor more than double. The thickness of the pier depends on the breadth of the portico; for it must be strong enough to resist the pressure of its vault. But with regard to the beauty of the building, it should not be less than one quarter of the breadth of the arch, nor more than one-third. These are the general dimensions of arches.

Chap. VIII. *Of Orders above Orders.*

68 When, in a building, two or more orders are employed, one above another, the laws of solidity require the strongest should be placed lowermost. Hence the Tuscan must support the Doric, the Doric the Ionic, the Ionic the Composite or Corinthian, and the Composite the Corinthian.

This rule, however, is not always strictly adhered to. Most authors place the Composite above the Corinthian. There are likewise examples where the same order is repeated, as in the theatre of Statilius Taurus, and the Coliseum; and others, where an intermediate order is omitted, and the Ionic placed on the Tuscan, or the Corinthian on the Doric. But none of these practices ought to be imitated.

In placing columns above one another, the axis of all the columns ought to correspond, or be in the same perpendicular line, at least in front.

69 Proportions of columns placed above each other. With regard to the proportions of columns placed above each other, Scamozzi's rule, That the lower diameter of the superior column should constantly be equal to the upper diameter of the inferior one, is universally esteemed the best, and gives all the columns the appearance of one long tapering tree, cut into several pieces. According to this rule, the Doric column will be to the Tuscan, as $13\frac{1}{3}$ to 14; the Ionic to the Doric, as 15 to 16; the Composite or Corinthian to the Ionic, as $16\frac{2}{3}$ to 18; and the Corinthian to the Composite, as $16\frac{2}{3}$ to 20.

In Britain there are few examples of more than two stories of columns in the same aspect; and though in Italy, and other parts of Europe, we frequently meet with three, and sometimes more; yet it is a practice by no means to be imitated; for there is no possibility of avoiding many striking inconsistencies, or of preserving the character of each order in its intercolumnal decorations.

Chap. IX. *Of Basements.*

70 Instead of employing several orders one above the other in a composition, the ground floor is sometimes made in the form of a *basement*, on which the order that decorates the principal story is placed. The proportion of these basements is not fixed, but depends on the nature of the rooms on the ground floor. In the palace of the Porti in Vicenza, the height of the basement is equal to that of the order. In some buildings, its height exceeds two-thirds of that of the order; and, in others, only half the height of the order. It is not, however, advisable to make the basement higher than the order it supports; neither should it be lower than one half of the order. Principl

71 Decorations, & of basements. The usual method of decorating basements is with rustics of different kinds. The best, where neatness and finishing is aimed at, are such as have a smooth surface. Their height, including the joint, should never be less, nor much more, than half a module of the order placed on the basement. Their figure may be from a square to a sesquialtera; and their joints may be either square or chamfered. The square ones should not be broader than one-eighth of the height of the rustic, nor narrower than one-tenth; and their depth must be equal to their breadth; those that are chamfered must form a rectangle; and the breadth of the whole joint may be from one-fourth to one-third of the height of the flat surface of the rustic.

Chap. X. *Of Pediments.*

72 Pediments, among the Romans, were used only as coverings to their sacred buildings, till Cæsar obtained leave to cover his house with a pointed roof, after the manner of temples. In the remains of antiquity we meet with two kinds of pediments, the triangular and the circular. The former of these are promiscuously applied to cover small or large bodies: But the latter, being of a heavier figure, are never used but as coverings to doors, niches, windows, or gates.

As a pediment represents the roof, it should never be employed but as a finishing to the whole composition.

The ancients introduced but few pediments into their buildings, usually contenting themselves with a single one to adorn the middle or principal part. But some of the moderns, and particularly the Italians, have been so immoderately fond of them, that their buildings frequently consist of almost nothing else.

The girder being a necessary part in the construction of a roof, it is an impropriety to intermit the horizontal entablature of a pediment, by which it is represented, to make room for a niche, an arch, or a window.

73 Forms, & of pediments. In regular architecture, no other form of pediments can be admitted, besides the triangular and circular. Both of them are beautiful; and when a considerable number of pediments are introduced, as when a range of windows are adorned with them, these two figures may be used alternately, as in the niches of the Pantheon, and in those of the temple of Diana at Nismes.

The proportion of pediments depends upon their size; for the same proportions will not do in all cases.

When the base of the pediment is short, its height must be increased; and when the pediment is long, the height must be diminished. The best proportion for the height is from one-fifth to one-fourth of the base, according to the extent of the pediment, and the character of the body it covers. The materials of the roof must also be attended to; for if it be covered with tiles,

nciples. tiles, it will be necessary to raise it more than one quarter of the base, as was the custom of the ancients in their Tuscan temples.

The tympan is always on a line with the front of the frize; and when large, admits of various ornaments.

Chap. XI. *Of Ballustrades.*

74 Ballustrades are sometimes of real use in buildings; and at other times they are only ornamental. Such as are intended for use, as when they are employed in staircases, before windows, or to enclose terraces, &c. must always be nearly of the same height; never exceeding three feet and a half, nor ever less than three. But those that are principally designed for ornament, as when they finish a building, should be proportioned to the architecture they accompany: and their height ought never to exceed four-fifths of the height of the entablature on which they are placed; nor should it ever be less than two-thirds thereof, without counting the zocholo, or plinth, the height of which must be sufficient to leave the whole ballustrade exposed to view.

75 portion, of balers. The best proportion for ballustrades is to divide the whole given height into thirteen equal parts; eight of these for the height of the balluster, three for the base, and two for the cornice or rail; or into fourteen, (if it be required to make the balluster less), giving eight parts to the balluster, four to the base, and two to the rail. One of these parts may be called a *module;* and being divided into nine minutes, may serve to determine the dimensions of the particular members.

In ballustrades, the distance between two ballusters should not exceed half the diameter of the balluster measured in its thickest part, nor be less than one-third of it.

The breadth of the pedestals, when they are placed on columns or pilasters, is regulated by them; the dye never being made broader than the top of the shaft, nor much narrower; and when there are neither columns nor pilasters on the front, the dye should not be much lower than a square, and seldom higher. On stairs, or any other inclined planes, the same proportions are to be observed as on horizontal ones.

Chap. XII. *Of Gates, Doors, and Piers.*

76 rs and es. There are two kinds of entrances, viz. doors and gates. The former serve only for the passage of persons on foot; but the latter likewise admit horsemen and carriages. Doors are used as entrances to churches and other public buildings, to common dwelling-houses and apartments: And gates serve for inlets to cities, fortresses, parks, gardens, palaces, &c. The apertures of gates being always wide, they are generally made in the form of an arch, that figure being the strongest. But doors, which are generally of small dimensions, are commonly parallelograms, and closed horizontally.

The general proportion for the apertures, both of gates and doors, whether arched or square, is, that the height be about double the breadth.

The most common, and indeed almost the only ornaments for gates are the piers by which they are supported, and which were originally no more than bare posts into which the hinges of the gate were driven. Though this, however, is the only proper use of piers, it must be concealed as much as possible, and they must seem as if placed there only for ornament. As they are to be fixed to the wall before the house, so they must also be proportioned to it; and as they are to be seen in the same view with the front of the house, their correspondence with it is equally necessary. They are to be placed on a plinth, and something must be allowed by way of ornament and finishing at the top, All the luxuriance of fancy may be employed in the decoration of piers: but it will be proper to observe this general rule, that the pier being an inferior building, it must never be richer than the front of the house. If, for instance, the front of the house is ornamented with columns of the Doric order, the Ionic must not be used in the piers; and it will be found better to omit columns altogether, than to make use of the Tuscan order for piers in any case. If the Ionic or Corinthian orders are employed in the front of the house, the Doric or Ionic may be used with propriety in the piers. One piece of ornament is almost universal in piers, namely, a niche with its seat, made as if for the conveniency of weary travellers. On this account, it will be proper to raise the columns on pedestals, because the continued moulding from their cap will be a good ornament under the niche. The base of the columns ought always to be the Attic. Principles. 77 Piers.

Inside doors, however small the building may be, should never be narrower than two feet nine inches; nor should they ever, in private houses, exceed three feet six inches in breadth, which is more than sufficient to admit the bulkiest person. Their height should at least be six feet three or four inches; otherwise a tall person cannot pass without stooping. In churches, palaces, &c. where there is a constant ingress and egress of people, the apertures must be larger. The smallest breadth that can be given to a gate is eight and a half or nine feet, which is but just sufficient for the passage of a coach.

Plate XLVI. fig. 1. is a rustic door, composed by the celebrated Vignola, in which the aperture occupies two-thirds of the whole height, and one-half of the whole breadth; the figure of it being a double square. The rustics may be either smoothed or hatched; their joints must form a rectangle, and the breadth of each joint may be one-third, or two-sevenths, of the vertical surface of a rustic. The joints of the claveaux, or keystones, must be drawn to the summit of an equilateral triangle, whose base is the top of the aperture. The architrave surrounding the aperture may be composed either of a large ogee and fillet, or of a platband and fillet. Its whole breadth must be one-tenth of the breadth of the aperture: the remaining part of each pier being for the rustics. The entablature is Tuscan: the cornice is to be one-fifteenth of the whole height of the door; and what remains below it being divided into 21 equal parts, the two uppermost of them will be for the frize and architrave, and the remaining 19 for the rustics and plinth at the foot of the door.

Fig. 2. is a disposition of Michael Angelo's. The windows of the Capitol at Rome are of this kind; and Sir Christopher Wren has executed doors of the same kind

Principles. kind under the semicircular porches in the flanks of St Paul's. The figure of the aperture may be a double square; the architrave one-sixth of the breadth of the aperture; and the whole entablature one quarter of its height. The front of the pilasters or columns, on each side, must be on a line with the fascia of the architrave; and their breadth must be a semidiameter.

Fig. 3. is likewise a design of Vignola's. It is of the Corinthian order, and executed in the Cancellaria at Rome. The height is equal to double its breadth; and the whole ornament at the top is equal to one-third of the height of the aperture. The architrave is in breadth one-fifth of the breadth of the aperture; and the pilasters, that support the consoles, are half as broad as the architrave. The whole is well imagined, but rather heavy; and it will be best to reduce the architrave to one-sixth of the aperture, diminishing the entablature proportionally.

Fig. 4. is a design of Serlio's. The aperture may be either twice as high as broad, or a trifle less. The diameter of the columns may be equal to one quarter of the breadth of the aperture; and their height may be from eight diameters to eight and a half. The entablature must be somewhat less than one quarter of the height of the columns; and the height of the pediment may be one quarter of its base.

Fig. 5. is a door in the saloon of the Farnese in Rome designed by Vignola. The aperture forms a double square. The entablature is equal to three-elevenths of its height, the architrave being one of these elevenths; and the whole ornaments on the sides, consisting of the architrave and pilasters, are equal to two-sevenths of the breadth of the aperture: the cornice is Composite, enriched with mutules and dentils; and the frize is adorned with a festoon of laurel.

Fig. 6, is copied from a door at Florence, said to be a design of Cigoli's. The height of the aperture is a trifle more than twice its breadth. It is arched; and the impost is equal to half a diameter. The columns are Ionic, somewhat above nine diameters high; and their shafts are garnished each with five rustic cinctures. The entablature is less than one quarter of the column; and the breadth of the tablet, in which there is an inscription, is equal to the breadth of the aperture.

Plate LVI. fig. 1. is a pier invented by Mr Chambers. Its diameter may be one quarter of its height, exclusive of the plinth and vase; and the height of both these may be equal to one diameter of the pier, or a trifle less. The rustics may either be plain, hatched, or vermiculated: the height of each course may be one-eleventh part of the height of the pier, counting to the top of the entablature; the entablature two-elevenths; and the base of the pier one-eleventh part.

Fig. 2. is likewise a composition of Mr Chambers, imitated from M. Angelo Buonaroti's design for Cardinal Sermonetti. The height of the aperture is somewhat more than twice its breadth; which breadth occupies one-third of the breadth of the whole composition. The order is Composite; and the height of the entablature is equal to one quarter of the height of the column. He has made a break in it over each column: but, unless the column project considerably, it will be as well to carry the entablature on in a straight line. The dimensions of the particular parts may be measured on the design. Princi

Fig. 3. is also a composition of Mr Chambers, executed at Goodwood, the seat of his grace the duke of Richmond, in Sussex. The diameter is one quarter of the height, exclusive of the finishing, which is equal to one diameter; and the height of the pier, from the top of the entablature downwards, being divided into eleven and a half parts, one of these parts is given to the base, one to each rustic, and one and a half to the astragal, frize, and cornice.

Fig. 4. is a composition of the late earl of Burlington's, that great architect and patron of the fine arts, which is executed at Chiswick, and at Bedford-house in Bloomsbury square, with some little difference.

Fig. 5. is an invention of Mr Chambers.

Fig. 6. is one of Inigo Jones's; of which kind he hath executed a couple at Aimsbury in Wiltshire, the seat of his grace the duke of Queensberry.

Chap. XIII. *Of Windows.*

78 Propor of wind

The first consideration with regard to windows is their size, which varies according to the climate, the destination of the building, &c. In Britain, the windows of the smallest private houses are commonly from 3 to $3\frac{1}{2}$ feet broad: and being generally twice their breadth in height, or somewhat more, in the principal apartments, they generally rise to within a foot or two of the ceilings of the rooms, which are frequently no higher than 10 feet, and at most 12 or 13. But, in more considerable houses, the apartments are from 15 to 20 feet high, and sometimes more; and in these the windows are from 4 to 5 and $5\frac{1}{2}$ feet broad, and high in proportion. These dimensions are sufficient for dwelling houses of any size in this country; when they are larger, they admit too much of the cold air in winter. But churches, and other buildings of that kind, may have larger windows, proportioned to the size of the structures.

The proportions of the apertures of windows depend upon their situation. Their breadth in all the stories must be the same; but the different heights of the apartments make it necessary to vary the height of the windows likewise. In the principal floor, it may be from $2\frac{1}{8}$ of the breadth to $2\frac{1}{3}$, according as the rooms have more or less elevation. In the ground story, where the apartments are lower, the apertures of the windows seldom exceed a double square, and, when they are in a rustic basement, they are frequently made much lower. The height of the windows of the second floor may be from $1\frac{7}{8}$ of their breadth to $1\frac{4}{5}$; and attics and mezzanines may be either a perfect square, or somewhat lower.

79 How o mented

The windows of the principal floor are generally most enriched. The simplest method of adorning them is, with an architrave surrounding the aperture and crowned with a frize and cornice. The windows of the ground floor are sometimes left entirely plain, without any ornament: and at others they are surrounded with rustics, or a regular architrave with a frize and cornice. Those of the second floor have generally an architrave carried entirely round the aperture;

nciples. ture; and the same is the method of adorning attic and mezzanine windows, but the two last have seldom either frize or cornice; whereas the second floor windows are often crowned with both.

The breasts of all the windows on the same floor should be on the same level, and raised above the floor from two feet nine inches to three feet six inches at the very most. When the walls are thick, the breasts should be reduced under the apertures, for the conveniency of looking out. In France, the windows are frequently carried quite down to the floor. When the building is surrounded with gardens, or other beautiful objects, this method renders the rooms exceeding pleasant.

The interval between the apertures of windows depends in a great measure on their enrichments. The breadth of the aperture is the least distance that can be between them; and twice that breadth should be the largest in dwelling houses; otherwise the rooms will not be sufficiently lighted. The windows in all the stories of the same aspect must be placed exactly above one another.

Plate XLVII. fig. 1. is a design of P. Lescot, abbot of Clagny, executed in the old Louvre at Paris. The apertures may be a double square, or a trifle more; the architrave from one-sixth to one-seventh of the breadth of the aperture: the pilaster is equal to that breadth, when the architrave is narrow; or less by one quarter, or one-fifth, when it is broad. The whole entablature should not exceed one quarter of the height of the aperture, nor be much lower. The consoles may be equal in length to half the breadth of the aperture at most, and to one-third of it at least.

Fig. 2. is a design of Palladio's executed at the Chiericato in Vicenza: its proportions are not much different from the following. The plat-band that supports the window is equal to the breadth of the architrave.

Fig. 3. is likewise a design of Palladio's, executed by him in many of his buildings. The aperture is a double square. The breadth of the architrave is one-sixth of the breadth of the aperture; and the frize and cornice together are double the height of the architrave. The breadth of the consoles is two-thirds of the breadth of the architrave.

Fig. 4. is a design of Ludovico da Cigoli; and executed in the ground floor of the Ranunchini palace at Florence.

Fig. 5. is a design of Inigo Jones, executed at the Banqueting House. The aperture may be a double square; the architrave may be one-sixth of its breadth; the whole entablature one quarter of its height; and the breadth of the consoles two-thirds of the breadth of the architrave.

Fig. 6. is a design of M. Angelo Buonaroti, executed at the Farnese.

Chap. XIV. *Of Niches and Statues.*

80 It has been customary, in all ages, to enrich different parts of buildings with representations of the human body. Thus the ancients adorned their temples, baths, theatres, &c. with statues of their deities, heroes, and legislators. The moderns still preserve the same custom, placing in their churches, palaces, &c. statues of illustrious persons, and even groups composed of various figures, representing occurrences collected from history, fables, &c. Sometimes these statues or groups are detached, raised on pedestals, and placed contiguous to the walls of a building, or in the middle of a room, court, or public square. But they are most frequently placed in cavities made in the walls, called *niches*. Of these there are two sorts; the one formed like an arch in its elevation, and semicircular or semi-elliptical in its plan; the other is a parallelogram both in its plan and elevation. Principles. 81 Different kinds of niches;

The proportion of both these niches depends on the characters of the statues, or the general form of the groups placed in them. The lowest are at least a double square in height; and the highest never exceed $2\frac{1}{2}$ of their breadth.

With regard to the manner of decorating them when they are alone in a composition, they are generally enclosed in a pannel, formed and proportioned like the aperture of a window, and adorned in the same manner. In this case the niche is carried quite down to the bottom; but on the sides and at the top, a small space is left between the niche and the architrave of the pannel. And when niches are intermixed with windows, they may be adorned in the same manner with the windows, provided the ornaments be of the same figure and dimensions with those of the windows. 82 how decorated.

The size of the statues depends on the dimensions of the niches. They should be neither so large as to have the appearance of being rammed into the niches, as in Santa Maria Majora at Rome; nor so narrow as to seem lost in them, as in the Pantheon. The distance between the outline of the statue and side of the niche should never be less than one-third of a head, nor more than one-half, whether the niche be square or arched: and when it is square, the distance from the top of the head to the ceiling of the niche should not be greater than the distance on the sides. Statues are generally raised on a plinth, the height of which may be from one-third to one-half of a head; and sometimes, where the niches are large, the statues may be raised on small pedestals. 83 Statues.

The character of the statue should always correspond with the character of the architecture with which it is surrounded. Thus, if the order be Doric, Hercules, Jupiter, Mars, Æsculapius, and all male statues, representing beings of a robust and grave nature, may be introduced; if Ionic, then Apollo, Bacchus, &c.; and if Corinthian, Venus, Flora, and others of a delicate nature, should be employed.

Chap. XV. *Of Chimney-pieces.*

Among the ancients there are very few examples of chimney-pieces to be met with. Neither the Italians nor French have excelled in compositions of this kind. Britain, by being possessed of many able sculptors at different times, has surpassed all other nations, both in taste of design, and workmanship. 84

The size of the chimney must be regulated by the dimensions of the room where it is placed. In the smallest apartments, the breadth of the aperture should never be less than three feet, or three feet six inches. 85 Proportions and situations.

Principles. In rooms, from 20 to 24 feet square, or of equal superficial dimensions, it may be from 4 to $4\frac{1}{2}$ feet broad; in those of 24 to 27, from $4\frac{1}{2}$ to 5; and in such as exceed these dimensions, the aperture may even be extended to $5\frac{1}{2}$ or 6 feet.

The chimney should always be situated so as to be immediately seen by those who enter the room. The middle of the partition wall is the most proper place in halls, saloons, and other rooms of passage; but in drawing-rooms, dressing-rooms, and the like, the middle of the back wall is the best situation. In bed-rooms, the chimney is always in the middle of one of the partition walls; and in closets and other very small places, to save room, it is put in a corner. Wherever two chimneys are used in the same room, they should be placed either directly facing each other, if in different walls, or at equal distances from the centre of the wall in which both are.

The proportion of the apertures of chimney-pieces of a moderate size is generally a perfect square; in small ones, it is a trifle higher; and in large ones, a trifle lower. Their ornaments consist in architraves, frizes, cornices, columns, pilasters, termini, caryatides, consoles, and all kinds of ornaments of sculpture, representing animals, vegetables, &c. likewise vases, chalices, trophies of arms, &c. In designing them, regard must be had to the nature of the place where they are to be employed. Such as are intended for halls, saloons, guard-rooms, galleries, and other large places, must be composed of large parts, few in number, of distinct and simple forms, and having a bold relief; but chimney-pieces for drawing-rooms, dressing-rooms, &c. may be of a more delicate and complicated nature.

Chimney-pieces are composed of wood, stone, or marble; the last of which ought to be preferred, as figures or profiles are best represented in a pure white.

Plate XLVIII. exhibits different designs for chimney-pieces by Palladio and Inigo Jones. Their proportion may be gathered from the designs, which are accurately executed.

Chap. XVI. *Of the Proportions of Rooms.*

86 The proportions of rooms depend in a great measure on their use and actual dimensions; but, with regard to beauty, all figures, from a square to a sesquilateral, may be employed for the plan.

The height of rooms depends on their figure. Flat-ceiled ones may be lower than those that are coved. If their plan be a square, their height should not exceed five-sixths of the side, nor be less than four-fifths; and when it is oblong, their height may be equal to their breadth. But coved rooms, if square, must be as high as broad; and when oblong, they may have their height equal to their breadth, more one-fifth, one quarter, or even one-third of the difference between the length and breadth: and galleries should at least be in height one and one-third of their breadth, and at most one and a half, or one and three-fifths.

87 High rooms improper in Britain. The coldness of the British climate is a strong objection to high rooms; so that it is not uncommon to see the most magnificent apartments not above 15, 16, or at most 18 feet high; though the extent of the rooms would require a much more considerable elevation. But where beauty is aimed at, this practice ought not to be imitated. Princip

When rooms are adorned with an entire order, the entablature should never exceed one-sixth of the whole height in flat-ceiled rooms, and one-sixth of the upright part in coved ones; and when there are neither columns nor pilasters, but only an entablature, its height should not be above one-seventh of these heights. If the rooms be finished with a simple cornice, it should never exceed one-fourteenth, nor ever be less than one-fifteenth part of the above-mentioned height.

Chap. XVII. *Of Ceilings.*

88 Ceilings are either flat, or coved in different manners. The simplest of the flat kind are those adorned with large compartments, surrounded with one or several mouldings, either let into the ceiling, or projecting beyond its surface; and when the mouldings that form the compartments are enriched, and some of the compartments adorned with well executed ornaments, such ceilings have a good effect, and are very proper for common dwelling-houses, and all low apartments. Their ornaments and mouldings do not require a bold relief; but, being near the eye, they must be finished with taste and neatness. For higher rooms, a flat ceiling, which has the appearance of being composed of various joists framed into each other, and forming compartments of various geometrical figures, should be employed. The sides of the joists forming the compartments are generally adorned with mouldings, and represent either a simple architrave, or an architrave cornice, according to the size of the compartments and the height of the room.

Coved ceilings are more expensive; but they are likewise more beautiful. They are used promiscuously in large and small rooms, and occupy from one-fifth to one-third of the height of the room. If the room be low in proportion to its breadth, the cove must likewise be low; and when it is high, the cove must be so likewise; by which means the excess of the height will be rendered less perceptible. But where the architect is at liberty to proportion the height of the room to its superficial dimensions, the most eligible proportion for the cove is one-fourth of the whole height. In parallelogram-figured rooms, the middle of the ceiling is generally formed into a large flat pannel. This pannel, with the border that surrounds it, may occupy from one half to three-fifths of the breadth of the room. The figure of the cove is commonly either a quadrant of a circle or of an ellipse, taking its rise a little above the cornice, and finishing at the border round the great pannel in the centre. The border projects somewhat beyond the coves on the outside; and, on the side towards the pannel, it is generally made of sufficient depth to admit the ornaments of an architrave, or architrave and cornice.

In Britain circular rooms are not much in use; but they are very beautiful. Their height must be the same with that of square rooms; their ceilings may be flat; but they are handsomer when coved, or of a concave form.

Arcs doublaux, or soffits of arches, when narrow,

are

inciples. are ornamented with *guillochs*, or frets; but when broad, they may be adorned in a different manner.

When the profiles of the room are gilt, the ceilings ought likewise to be gilt. The usual method is to gild all the ornaments, and to leave the grounds white, pearl colour, light blue, or of any other tint proper to set off the gilding to advantage. Painted ceilings, so common in France and Italy, are but little used in Britain.

Chap. XVII. *Of Stairs and Staircases.*

89 There are many kinds of staircases: for, in some, the steps are made straight; in others winding; in others, mixed of both. Of straight stairs, some fly directly forward, others are square, others triangular. Others are called *French flights;* or *winding stairs*, (which in general are called *spiral*, or *cockle stairs*); of which some are square, some circular or round, and some elliptical or oval; and these again are various, some winding about a solid, others about an open newel. Stairs mixed of straight and winding steps are also of various kinds; some are called *dog-legged;* some there are that wind about a solid newel, and others that fly about a square open newel.

90 Staircases where to be placed. Great care ought to be taken in placing of the staircase in any building; and therefore staircases ought to be described and accounted for justly when the plan of a building is made. For want of this, sometimes unpardonable errors have been committed: such as having a little blind staircase to a large house, or, on the other hand, a large spacious staircase to a little one.

Palladio says, in placing staircases, the utmost care ought to be taken; it being difficult to find a place convenient for them, that will not at the same time prejudice the rest of the building. But commonly the stairs are placed in the angle, wing, or middle of the front.

To every staircase are required three openings.

First, The door leading thereto.

Secondly, The window, or windows, that give light to it:

And, Thirdly, The landing.

First, The door leading to the staircase should be so placed, that most of the building may be seen before you come at the stairs, and in such a manner that it may be easy for any person to find out.

Secondly, For the windows; if there be but one, it must be placed in the middle of the staircase, that thereby the whole may be enlightened.

Thirdly, The landing of stairs should be large and spacious, for the convenient entering into rooms; in a word, staircases should be spacious, light, and easy in ascent. The height of large steps must never be less than six inches, nor more than seven inches and a half.

The breadth of steps should never be less than 10 inches, nor more than 18 inches; and the length of them not less than three feet, nor more than 12.

91 Plate XLIX. fig. 1. A staircase of two flights.—*A* shows the manner of drawing the *ramp*, which is to rise equal to the height of the first step of the next flight, and as much as its *kneeling;* as is shown by the *ramp* intersecting the rail of the second flight.

Fig. 2. shows the straight rail intersecting a circular cap. Principles.

Fig. 3. section of two different hand rails.

Fig. 4. shows the manner of dove-tailing the riser into the step.

Plate L. fig. 1. represents a staircase, with flights, and its landing rail. 92

Fig. 2. shows the solid part of the step out of which the scroll is formed; where *a* represents the *oversail* of the step; *b*, The thickness of the bracket, with its *mitring* to the *riser;* and *c*, The *string board*.

Fig. 4. shows the scale for drawing the scroll of fig. 3.—To perform which, take the distance from 1 to the centre, in fig. 3. and set it from 1 to the centre in fig. 4.; divide that extent into three parts, then set four such parts on the upper side of the scale, and draw the line from 4 to 1; set one foot of your compasses at 4, and strike the circular line; let that be divided into 12 equal parts, and then draw lines from 4 through those divisions to the upright line.

The scale being thus made, draw the scroll of fig. 3. by it in the following manner.

Set one foot of your compasses in 1, and describe a stroke at *c;* take the same distance, and with one foot in 2, cross the stroke at *c;* then from *c*, turn the part from 1 to 2, and proceed in the same manner: for if the distance were taken in the scale from 1 to the centre, it would strike the circle too flat; and if taken from 2, it would strike the circle too quick.

When this is well understood, there will be little difficulty in drawing the scroll below fig. 2.; which throws itself out farther in proportion than that in fig. 3.; for this will always be the case when the upper line of the scale, which consists of four divisions in fig. 4. is made but with three divisions or less; whence it appears, that the upper line of the scale may be drawn at what length you please, according as you would bring in or keep out the scroll.

Plate LI. shows the manner of squaring twist rails. 93

Fig. 2. exhibits the pitch board, to show what part of the step the twisted part of the rails contains; the three doated lines drawn from the rail to the pitch board represent the width of the rail, which is to be kept level. The dotted lines *a* and *b* show how much half the width of the rail turns up from its first beginning to 3.

Fig. 3. shows the same pitch board, with the manner of the rail's turning up. If the sides of the twisted part of the rail be shaped by the rail mould, so that they direct down to its ground plan, that is, the upper side of the rail being first struck by the mould, then apply the mould to the under side, as much back as the level of the pitch board shows, by being struck on the side of the rail, and then fig. 3. being applied to the outside of the rail, from its first twisting part to 3, will show how much wood is to be taken off.

Fig. 5. exhibits the square of the rail, with the raking line of the pitch board drawn through the middle on the upper side; then draw the depths of the side of the rail parallel to this, and the dotted lines from the diagonal of the rail; these lines show what quantity of wood will be wanting on the upper and lower sides of the rail. Set your compasses at *c*, and draw the circular stroke from the raking part of the pitch board to *b;* take the distance *a b* and transfer it from *a* to

Practice.

a to *b*, in fig. 7. The several distances thus found may be set at any number of places, ranging with the straight part of the rail; and it then forms the width of the mould for the twisting part of the rail.

Fig. 7. shows the sweep of the rail. The rail cannot be fixed less than one-fourth part from the *nosing* or front of the step.

The remaining part of the pitch board may be divided into any number of parts, as here into four; from these divisions draw lines across the pitch board to the raking line; then take the distances from the ground line of the pitch board to the plan of the rail, and set them perpendicular from the raking line of the pitch board; and these divisions, when the rail is in its proper position, lie directly over the divisions on the ground plan.

In this figure *l*, *m*, and *n*, rise as much above *o* as the dotted line in fig. 5. does above the width of the rail: and they sink as much below *o* as the other dotted line in fig. 5. falls below the width of the rail; the same thicknesses must be glued upon *o*, though the greatest part will come off in squaring. The reason of placing the letters *l*, *m*, and *n*, where they are, is that they might not obstruct the small divisions of the rail mould.

Fig. 4. shows how to find the rail when it takes more than one step. The remaining part of the pitch board is divided into four parts, as before in fig. 7. and it takes in two such parts of the next step. Draw lines from these divisions to the diagonal of the pitch board as in fig. 7. then take the distance *a b*, and set it from *c* to *d*, and so proceed with the other divisions.

Another way to find the outside of the rail mould is, to draw all the divisions across the plan of the rail; then take the distance from the ground line of the pitch board to 4, transfer it from the diagonal of the pitch board to 4 on the rail; and so proceed with the other distances. Now, when the rail is put in its proper situation, *c* will be perpendicular to *b*, and all the divisions, as 1, 2, 3, 4, &c. in the rail, will be perpendicular to 1, 2, 3, 4, &c. in the ground plan.

Fig. 6. shows the plan of a rail of five steps.

To find the rail.—Set five divisions, as from *e* to *h*, which is the height of the five steps; draw the diagonal *h* to the plan of the rail; then take the distance *e f*, and transfer it to *g h*, and proceed in the same manner with the other seven distances. Practice.

To find the width of the rail mould.—Draw the lines across the plan of the rail, as at *k*; set that distance from the diagonal to *i*; and so proceed with the rest, as shown in fig. 4.

Having formed the sides of the rail perpendicular to its ground plan, and having squared the lower end of the rail, then take a thin lath, and bend it with the rail, as is represented by *m*, fig. 1.

This is the readiest method of squaring a solid rail; but if the rail be bent in the thicknesses, the nosing of the steps must be drawn upon a cylinder, or some other solid body of a sufficient width to contain the width of the rail or string board.

r Represents the depth of the rail, touching the nose of each step. Take a sufficient number of thicknesses of this width, to make the thickness of your rail, glue them altogether upon your cylinder or templet; confine them till they are dry, and the rail taken off is ready squared. Proceed in the same manner with the architrave, marked *a*.

Chap. XIX. *Of Roofs.*

Plate LII. fig. 1. shows the form of a trussed roof, 94
with three ring posts, that may carry 70 feet or upwards.

Fig. 2. exhibits an M roof, capable of carrying as great an extent as the former. Indeed both these designs are capable of carrying almost any extent.

Fig. 3. represents two different sorts of trusses.

Fig. 4. shows the manner of piecing timber. Sometimes the joint may be extended as far as *a*, with another bolt through it. To the right is shown a different sort of joint.

Fig. 5. shows the manner of trussing a girder. If the trusses are full long, with the pieces *b* and *c*, you may make them as light as you please.

Fig. 6. represents the manner of trussing partitions.

PART II. PRACTICE OF ARCHITECTURE.

HAVING thus described and given rules for the most generally received proportions of the different parts of buildings, both of the useful and ornamental kind, we must next give an account of the method of erecting different kinds of edifices; and here the judgement of the architect must necessarily be very much employed, as no fixed rules have been laid down by which he can be directed in all cases. As a necessary preliminary, however, to the construction, we must first consider,

Chap. I. *The Situations of Houses.*

95 Though it must be, in many cases, impossible to choose such a situation as might be agreeable either to the architect or the proprietor, yet where a choice can be made, there are certainly a great many circumstances that will determine one situation to be preferable to another. These circumstances depend entirely on the person who is to inhabit the house. A farmer, for instance, ought to dwell in the most centrical part of his farm; an independent gentleman must regard the healthiness, the neighbours with whom he can converse, the prospect from his house, and also the aspect of the ground near it. To answer these purposes of health and pleasure, an open elevated situation is the best, as the air is there pure, and the prospect extensive: but too elevated a situation is disagreeable, as being both difficult of access, and exposed to cold and bleak winds. To build in bottoms between hills is both unhealthful and unpleasant, the house being in a manner buried, and the ground near it generally marshy from the

ractice. the rain water which runs down from the hills, which renders the air unwholesome. As a garden also is a very necessary article to a country habitation, the soil is by no means a matter of indifference; and therefore it may be concluded, that an elevated situation on a gravelly loam, near some running water, is the best situation for a country house.

Chap. II. *Of the Construction of Edifices in general.*

The proper situation of a house, or any other building, being chosen, according to its intended nature, the next thing to be considered is to lay the foundation in a proper manner. The only security in a house or any other building whatever, is in having a good foundation, and no error is so dangerous as that which is committed here; as the shrinking of the foundation but the breadth of a straw may cause a rent of five or six inches wide in the superstructure. To guard against errors of this kind, the qualities of the ground for a considerable depth must be carefully observed.

96 ıalities of e ground cessary be ex- ined.

The best foundation is that which consists of gravel or stone; but, in order to know whether the inferior strata are sufficient for the support of the building, it will be advisable to sink wells at some little distance. By attending to what is thrown up in digging these, the architect will be acquainted with what lies under the stony or gravelly bed which on the surface promises so much security, and will know what measures to take.

97 ›cky ›und metimes ngerous.

But though a stony or gravelly bottom is undoubtedly the most sure and firm, where all is sound beneath, there is no kind of ground which may prove more fallacious, or occasion such terrible accidents. The reason of this is, that such kind of ground often contains absolute vacuities; nor is rock itself, though a foundation upon a rock is strong even to a proverb, free from dangers of the same kind. Caverns are very frequent in rocky places: and should a heavy building be erected over one of these, it might suddenly fall down altogether. To guard against accidents of this kind, Palladio advises the throwing down great weights forcibly on the ground, and observing whether it sounds hollow, or shakes; and the beating of a drum upon it, by the sound of which an accustomed ear will know whether the earth is hollow or not.

Where the foundation is gravel, it will be proper to examine the thickness of the stratum, and the qualities of those that lie under it, as they have appeared in digging. If the bed of gravel is thick, and the under strata of a sound and firm kind, there needs no assistance; if otherwise, we must have recourse to various methods in order to supply the defect.

98 ıdy or gy und how naged.

The other matters which may occur for a foundation are clay, sand, common earth, or rotten boggy ground. Clay will often both raise and sink a foundation; yet it has a solidity which, with proper management, is very useful. The marshy, rotten, or boggy ground is of all others the worst; yet even upon this great buildings may be raised with perfect safety, provided proper care be taken. In case of boggy earths, or unfirm sand, piling is one of the most common methods of securing a foundation; and, notwithstanding the natural disadvantage of the earth, piles, when properly executed, are one of the firmest and most secure foundations. Practice.

99 Foundations near waters dangerous.

In foundations near the edge of waters, we should always be careful to sound to the very bottom; as many terrible accidents have happened from the ground being undermined by rivers. The same method is to be followed when the ground on which we build has been dug or wrought before. It ought never to be trusted in the condition in which it is left: but we must dig through it into the solid and unmoved ground, and some way into that, according to the weight and bigness of the intended edifice. The church of St Peter's at Rome is an instance of the importance of this last observation. That church is in great part built upon the old circus of Nero; and the builders having neglected to dig through the old foundation, the structure is consequently so much the weaker. The walls were judged of strength enough to bear two steeples upon the corners of the frontispiece; but the foundation was found too weak, when it was impossible to remedy the defect perfectly.

100 Defect in St Peter's at Rome.

Before the architect, however, begins to lay the foundation of the building, it will be proper to construct such drains as may be necessary for carrying off the rain, or other refuse water that would otherwise be collected and lodged about the house. In making of drains for carrying off this water, it will be necessary to make large allowances for the different quantities that may be collected at different times. It must also be considered, that water of this kind is always loaded with a vast quantity of sediment, which, by its continual falling to the bottom will be very apt to choke up the drain, especially at those places where there happen to be angles or corners in its course. The only method of preventing this is by means of certain cavities disposed at proper distances from one another. In these the sediment will be collected, and they are for that reason called *sesspools*. With regard to these, the only directions necessary are, that they be placed at proper distances, be sufficiently large, and placed so as to be easily cleaned. It is a good rule to make a sesspool at each place where the water enters the drain: as by this means a considerable quantity of sediment will be prevented from entering the channel at all. Others are to be made at proper distances, especially where there are any angles. They must be made sufficiently large; the bigger, in moderation, the better; and they must also be covered in such a manner as to be easily got at in order to be cleaned. But, as putrid water is exceedingly noxious, it will be necessary to carry up a brick funnel over every sesspool, in order to prevent the collection of the putrid effluvia, which would otherwise occasion the death of the person who cleaned it.

101 Drains how made.

102 Sesspools.

All drains ought to be arched over at top, and may be most conveniently built of brick. According to their different sizes, the following proportions of height and thickness may be observed. If the drain is 18 inches wide, the height of the walls may be one foot, and their thickness nine inches; the bottom may be paved with brick, laid flatwise, and the arch turned four inches. If the drain is 22 inches wide, the side walls are then to be one foot three inches in height, and the rest constructed as before. If it is 14 inches wide,

103 Proportions of drains.

Practice. wide, the height of the walls may be nine inches, and the sweep of the arch four. A drain of a yard wide should have the same height, and the arch turned over it ought to be nine inches thick. Upon the same principles and proportions may other drains of any size be constructed.

104 Foundation of buildings how laid. The sewers and drains being constructed in a manner proportioned to the size of the intended building, the architect may next proceed to lay the foundation of the walls. Here the first care must be, that the floor of the foundation be perfectly smooth and level. The Italians begin with laying over it an even covering of strong oak plank; and upon that they lay, with the most exact care, the first course of the materials. Whether we take this method, or begin upon the naked floor, all must be laid with the most exact truth by rule and line. When the board plat is laid, a course of stone is the best first bed, and this is to be laid without mortar; for lime would make the wood decay, which otherwise, in a tolerably good soil, will last for ages. After this, all the courses should follow with the same perfect evenness and regularity. If the materials are brick, they should be laid on with an equal, and not too great quantity of mortar: if stone, they ought to be placed regularly, and in the same situation in which they lay in the quarry: for many stones which will bear any weight flatwise, and in their natural position, are of such a grain, that they will split otherwise. The joinings of the under course must be covered by the solid of the next course all the way up; and the utmost care must be taken that there be no vacuity left in the wall, for the weight will most certainly crush it in. The less mortar there is in a foundation, the better. Its use is to cement the bricks and stones together; and the evener they are, the less will be required for that purpose. Where mortar is used to fill up cavities, it becomes part of the wall; and not being of equal strength with the solid materials, it takes from the firmness of the building. For the same reason nothing can be more absurd than to fill up a foundation with loose stones or bricks thrown in at random; and where this is done, the ruin of the building is inevitable. Where the foundation of a principal wall is laid upon piles, it will be necessary also to pile the foundations of the partitions, though not so strongly.

105 Thickness and diminutions of walls, &c. The thickness of foundation walls in general ought to be double that of the walls which they are to support. The looser the ground, the thicker the foundation wall ought to be: and it will require the same addition also in proportion of what is to be raised upon it. The plane of the ground must be perfectly level, that the weight may press equally everywhere: for when it inclines more to one side than another, the wall will split. The foundations must diminish as they rise, but the perpendicular is to be exactly kept in the upper and lower parts of the wall; and this caution ought to be observed all the way up with the same strictness. In some ground, the foundation may be arched; which will save materials and labour, at the same time that the superstructure has an equal security. This practice is peculiarly serviceable where the foundation is piled.

As the foundation walls are to diminish in thickness, so are those which are built upon them. This is necessary in order to save expence, but is not absolutely so to strengthen the wall; for this would be no less strong though it was continued all the way to the top of an equal thickness, provided the perpendicular was exactly kept. In this the ancients were very expert; for we see, in the remains of their works, walls thus carried up to an exorbitant height. It is to be observed, however, that, besides perfect truth in their perpendiculars, they never grudged ironwork, which contributed greatly to the strength of their buildings. The thickness and diminution of walls is in a great measure arbitrary. In common houses built of brick, the general diminution from the bottom to the top is one half the thickness at the bottom; the beginning is two bricks, then a brick and a half, and lastly one brick thickness. In larger edifices, the walls must be made proportionally thicker; but the diminution is preserved much in the same manner. Where stones are used, regard must be had to their nature, and the propriety of their figures for holding one another. Where the wall is to be composed of two materials, as stone and brick, the heaviest ought always to be placed undermost.

Practice. 106 Diminution of the thickness of walls.

107 Angles how fortified. There is one farther particular regarding the strength of a plain wall, and that is, the fortifying its angles. This is best done with good stone on each side, which gives not only a great deal of strength, but a great deal of beauty. Pilasters properly applied are a great strengthening to walls. Their best distance is about every 20 feet, and they should rise five or six inches from the naked of the wall. A much slighter wall of brick with this assistance, is stronger than a heavier and massier one built plain. In brick walls of every kind, it is also a great addition to their strength to lay some chief courses of a larger and harder matter; for these serve like sinews to keep all the rest firmly together, and are of great use where a wall happens to sink more on one side than another.

108 Windows improperly near the corners. As the openings in a wall are all weakenings, and as the corners require to be the strongest parts, there should never be a window very near a corner. Properly, there should always be the breadth of the opening firm to the corner. In the most perfect way of forming the diminution of walls, the middle of the thinnest part being directly over the middle of the thickest, the whole is of a pyramidal form: but where one side of the wall must be perpendicular and plain, it ought to be the inner, for the sake of the floors and cross walls. The diminished side, in this case, may be covered with a fascia or cornice, which will at once be a strength and ornament.

109 Chimneys. Along with the construction of walls, that of the chimneys must also be considered; for errors in the construction of these, will render the most elegant building extremely disagreeable. The common causes of smoking are either that the wind is too much let in above at the mouth of the shaft, or the smoke is stifled below; and sometimes a higher building, or a great elevation of the ground behind, is the source of the mischief: or, lastly, the room in which the chimney is may be so small or close, that there is not a sufficient current of air to drive up the smoke. Almost all that can be done, while the walls are constructing, to prevent smoke, is, to make the chimney vent narrower at bottom than top: yet this must not be carried to an extreme;

Practice. extreme; because the smoke will then linger in the upper part, and all the force of the draught will not be able to send it up. As for the methods of curing smoky chimneys in houses already built, see the article CHIMNEY.

110 Roofs. After the walls are finished, the roof is the next consideration: but concerning it very little can be said; only that its weight must be proportioned to the strength of the walls. It must also be contrived so as to press equally upon the building; and the inner walls must bear their share of the load as well as the outer ones. A roof ought neither to be too massy nor too light; as being necessary for keeping the walls together by its pressure, which it is incapable of doing while too light; and if too heavy, it is in danger of throwing them down. Of these two extremes, however, the last is to be accounted the worst.

111 Floors. With regard to the floors, they are most commonly made of wood; in which case it will be necessary that it should be well seasoned by being kept a considerable time before it is used. The floors of the same story should be all perfectly on a level: not even a threshold rising above the rest; and if in any part there is a room or closet whose floor is not perfectly level, it ought not to be left so, but raised to an equality with the rest; what is wanting of the true floor being supplied by a false one.

In mean houses, the floors may be made of clay, ox blood, and a moderate portion of sharp sand. These three ingredients, beaten thoroughly together and well spread, make a firm good floor, and of a beautiful colour. In elegant houses, the floors of this kind are made of plaster of Paris, beaten and sifted, and mixed with other ingredients. This may be coloured to any hue by the addition of proper substances; and, when well worked and laid, makes a very beautiful floor. Besides these, halls, and some other ground rooms, are paved or floored with marble or stone; and this either plain or dotted, or of a variety of colours; but the universal practice of carpeting has, in a great measure, set aside the bestowing any ornamental workmanship upon floors. In country buildings, also, floors are frequently made of bricks and tiles. These, according to their shapes, may be laid in a variety of figures; and they are also capable of some variation in colour, according to the nature of the earth from which they were made. They may be laid at any time; but for those of earth or plaster, they are best made in the beginning of summer, for the sake of their drying.

CHAP. III. *Of the Distribution of the Apartments of Houses, with other conveniences.*

112 Plan of a house. As houses are built only for the sake of their inhabitants, the distribution of the apartments must of necessity be directed by the way of life in which the inhabitants are engaged. In the country, this is commonly farming; and here, besides the house for the family, there is also necessary a barn for the reception of the produce of the ground, a stable for cattle, a cart-house for keeping the utensils under cover, and sheds for other uses.—To accomplish these purposes, let a piece of ground be taken of five times the extent of the front of the house, and enclosed in the least expensive manner. Back in the centre of this let the house be placed, and in the front of the ground the barn and the stable, with the adjoining sheds. These are to be set one on each side, to the extreme measure of the enclosed ground; they will thus fill up a part of the entrance, and will leave all about the house some enclosed ground by way of yard. From the barn to the stable may be extended a fence with a gate in the middle, and this gate ought to front the door of the house. Practice.

This much being settled, the plan of the house and out buildings may be made as follows. The door may open into a plain brick passage, at the end of which may be carried up a small staircase. On one side of the passage may be a common kitchen; and on the other side a better or larger room, which will serve the family by way of parlour. Beyond this may stand on one side the pantry, and on the other the dairy room, the last being twice the size of the former. They are placed on the same side with the parlour, on account of the heat of the kitchen, which renders it improper to be near them. On the kitchen side, a brewhouse may very conveniently be placed. More rooms may be added on the ground floor as occasion requires; and the upper story is to be divided into bedchambers for the family, with garrets over them for the servants.—A house of this kind is represented Plate LIII. fig. 1.; and one of a somewhat better kind, fig. 2. where a private gentleman who has a small family may find conveniency.

113 Of an elegant country seat. On Plate LIV. is represented a gentleman's country-seat, built on a more elegant plan. Here the front may extend 65 feet in length, the depth in the centre being 40 feet, and in each of the wings 45. The offices may be disposed in wings; the kitchen in the one, and the stables in the other; both of which, however, may correspond in their front with the rest of the building, which they ought also to do with one another. These wings may have a projection of 13 feet from the dwelling house, to which they ought to be connected, not by straight lines, but by curves as represented fig. 2.

The best proportion of these offices to a house extending 65 feet in front, is 35 feet. If they are smaller, the house will look gigantic; if larger, they will lessen its aspect. To a front of 35 feet, a depth of 48 is a very good proportion. There ought also to be a covered communication between the dwelling house and offices, which must not appear only to be a plain blank wall, but must be ornamented with gates, as in the figure. The arch by which the offices are joined to the dwelling house must be proportioned to the extent of the buildings; and there cannot be a better proportion than five feet within the angles of the buildings. By this means the wings, which have only a projection of 13 feet, will appear to have one of 18, and the light will be agreeably broken.

With regard to the internal distribution of a house of this kind, the under story may be conveniently divided into three rooms. The hall, which is in the centre, will occupy the whole of the projecting part, having a room on each side. The length of the hall must be 24 feet and its breadth 12: the rooms on each side of it must be 16 feet long, and 11 wide. Of these two front rooms, that on the right hand may be conveniently

Practice. conveniently made a waiting room for persons of better rank, and that on the left hand a dressing room for the master of the house. Behind the hall may run a passage of four feet and a half, leading to the apartments in the hinder part of the house and the staircase. These may be disposed as follows: Directly behind the hall and this passage the space may be occupied by a saloon, whose length is 23 feet and its breadth 17. On the left hand of the passage, behind the hall, is to be placed the grand staircase; and as it will not fill the whole depth, a pleasant common parlour may terminate on that side of the house. On the other side, the passage is to lead to the door of the great dining parlour, which may occupy the whole space.

114 Another. A plan of a house of the same kind, but somewhat different in the distribution, is represented below in the same plate. The front here extends 68 feet, and the wings project 28 feet; their depth is 48, and their breadth 36. The hall may be 26 feet long and 17 broad. On the left hand of the hall may be a waiting room 16 feet long and 10 broad; behind which may be a handsome dining room. The passage into this waiting room should be at the lower end of the hall; and it must have another opening into the room behind it. On the right hand of the hall is the place of the great staircase, for which a breadth of 16 feet three inches is to be allowed. In the centre of the building, behind the hall, may be a drawing room 26 feet long and 16 broad; and behind the staircase will be room for a common parlour of 16 feet square. The passage of communication between the house and wings may be formed into colonnades in a cheap manner behind: a flight of steps, raised with a sweep, occupying the centre of each, and leading up to a door, and the covering being no more than a shed supported by the plainest and cheapest columns.

The two wings now remain to be disposed of. That on the right hand may contain the kitchen, and offices belonging to it, and the other the stables. The front of the right-hand wing may be occupied by a kitchen entirely, which will then be 30 feet long and $16\frac{1}{2}$ wide: or it may be made smaller by setting off a small room to the right. Twenty-two feet by 16 will then be a good bigness. The other room will then have the same depth of 16 feet, and the width to the front may be $7\frac{1}{2}$. Beyond the kitchen may stand the staircase, for which $7\frac{1}{2}$ feet will be a proper allowance; and to the right of this may be a scullery 12 feet 10 inches deep from the back front by seven in breadth. To the left of the stair may be a servants hall 16 feet square, and behind that a larder 12 feet 10 by 14 feet 6. In the centre of the other wing may be a double coach-house: for which there should be allowed the whole breadth of the wing, with 10 feet 6 inches in the clear; and on each side of this may be the stables. The external decorations of the front and wings will be better understood from the figure than they can be by any description.

115 Of the earl of Wemyss's house. Plate LV. shows the plan and elevation of the house of the earl of Wemyss at Newmills. The proportions of the rooms are marked in the plan; and the front, being decorated with columns of the Ionic order, will sufficiently show in what manner any of the five orders may be introduced with propriety and elegance. Practice

Chap. IV. *Of Aquatic Buildings.*

1. Of Bridges.

These are constructed either of wood or stone; of which the last are evidently the strongest and most durable, and therefore, in all cases, to be preferred where the expence of erecting them can be borne. The proper situation for them is easily known, and requires no explanation; the only thing to be observed is, to make them cross the stream at right angles, for the sake of boats that pass through the arches with the current of the river; and to prevent the continual striking of the stream against the piers, which in a long course may endanger their being damaged and destroyed in the end. 116

Bridges built for a communication of high roads, ought to be so strong and substantial as to be proof against all accidents that may happen, to have a free entrance for carriages, afford an easy passage to the waters, and be properly adapted for navigation, if the river admits of it. Therefore the bridge ought to be at least as long as the river is wide in the time of its greatest flood; because the stopping of the waters above may cause too great a fall, which may prove dangerous to the vessels, and occasion the under gravelling the foundation of the piers and abutments; or, by reducing the passage of the water too much in time of a great flood, it might break through the banks of the river, and overflow the adjacent country, which would cause very great damages; or if this should not happen, the water might rise above the arches, and endanger the bridge to be overset, as has happened in many places.

When the length of the bridge is equal to the breadth of the river, which is commonly the case, the current is lessened by the space taken up by the piers; for which reason this thickness should be no more than is necessary to support the arches; and it depends, as well as that of the abutments, on the width of the arches, their thickness, and the height of the piers.

117 Proper form of arches. The form of the arch is commonly semicircular; but when they are of any great width, they are made elliptical, because they would otherwise become too high. This has been done at the Pont Royal at Paris, where the middle arch is 75 feet, and its height would have been 37.5 feet, instead of which it is only 24 by being made elliptical.

Another advantage of much more importance arises from the oval figure, which is, that the quantity of masonry of the arches is reduced in the same proportion as the radius of the arch is to its height. That is, if the radius is 36 feet, and the height of the arch 24, or three-fourths of the radius, the quantity of masonry of the arches is likewise reduced to three-fourths; which must lessen the expence of the bridge considerably. Notwithstanding these advantages, however, the latest experiments have determined segments of circles to be preferable to curves of any other kind; and of these the semicircle is undoubtedly the best, as pressing most perpendicularly on the piers.

When

Practice.

When the height of the piers is about six feet, and the arches are circular, experience has shown, says Mr Belidor, that it is sufficient to make the thickness of the piers the sixth part of the width of the arch, and two feet more; that is, the thickness of the piers of an arch of 36 feet, ought to be eight feet; those of an arch of 48 feet, to be 10.

118 Thickness of the piers.

When the arches are of a great width, the thickness of the piers may be reduced to the sixth part of that width; but the depression of the two feet is not done at once; that is, in an arch of above 48 feet, 3 inches are taken off for every 6 feet of increase of the width of the arch. For instance, the thickness of the piers supporting an arch of 72 feet wide, should be 14 feet, according to the preceding rule; but by taking off 3 inches for every 6 feet, above an arch of 48 wide, the thickness of the piers is reduced to 13 feet; consequently, by following the same rule, the thickness of the piers supporting an arch of 16 fathoms wide, will be 16 feet; all the others above that width are the sixth part of the width.

After this, Mr Belidor gives a rule for finding the thickness of the piers which support elliptic arches, and makes them stronger than the former; the abutments he makes one-sixth part more than the piers of the largest arch. But it is plain that these rules are insufficient, being merely guess-work, determined from some works that have been executed.

119 The thickness of the arch-stones.

The thickness of the arch-stones is not to be determined by theory, nor do those authors who have written on the subject agree amongst themselves. Mr Gautier, an experienced engineer, in his works, makes the length of the arch-stones, of an arch 24 feet wide, two feet; of an arch 45, 60, 75, 90 wide, to be 3, 4, 5, 6, feet long respectively, when they are hard and durable, and something longer when they are of a soft nature: on the contrary, Mr Belidor says, they ought to be always one twenty-fourth part of the width of the arch, whether the stones be hard or soft; because, if they are soft, they weigh not so much.

But that the length of the arch-stones should be but a foot in an arch of 24 feet wide, 2, 3, 4, in arches of 48, 72, 96 feet, seems incredible; because the great weight of the arches would crush them to pieces, by the pressure against one another: and therefore Mr Gautier's rule appears preferable. As he made the length of the arch-stones to increase in a slower proportion, from 10 to 45 feet wide, than in those above that width, we imagine that the latter will be sufficient for all widths, whether they are great or little; therefore we shall suppose the length of the arch-stones of 30 feet in width to be two feet, and to increase one foot in 15; that is, 3 feet in an arch of 45 feet; 4, 5, 6, in an arch of 60, 75, and 90 feet; and so the rest in the same proportion.

Table containing the thickness of piers of bridges.

	6	9	12	15	18	21	24
20	4.574	4.918	5.165	5.350	5.492	5.610	5.698

95	17.184	17.826	18.772	19.438	20.036	20.577	21.068
100	17.991	18.848	19.610	20.293	20.908	21.466	21.976

120 Explanation of the table.

The first horizontal line expresses the height of the piers in feet, from 6 to 24 feet, each increasing by three; the first vertical column, the width of arches from 20 to 100 feet, for every five feet.

The other columns express the thickness of piers in feet and decimals, according to the respective height at the head of the column, and the width of the arch against it in the first column.

Thus, for example, let the width of the arch be 60 feet, and the height of the piers 12; then the number 12.718, under 12, and against 60, expresses the thickness of the piers, that is 12 feet and 8.6 inches: we must observe again, that the length of the key-stone is two feet in an arch of 30 feet wide; 3, 4, 5, 6, in an arch of 45, 60, 75, 90; that of 20 feet wide, one foot four inches; and the length of any other width is found by adding four inches for every five feet in width.

As this table contains the thicknesses of piers in respect to arches that are commonly used in practice, we imagined, that to carry it farther would be needless; because the difference between the thickness of the piers of any contiguous arches being but small, those between any two marked here, may be made equal to half the sum of the next below and above it: thus the thickness of the piers of an arch 52 or 53 feet wide is nearly equal to 10.222, half the sum of the thicknesses 9.085 and 10.64 of the arches 50 and 55 feet wide when the height of the piers is six feet.

121 Form of piers.

Rectangular piers are seldom used but in bridges over small rivers. In all others they project the bridge by a triangular prism, which presents an edge to the stream, in order to divide the water more easily, and to

Practice. prevent the ice from sheltering there, as well as vessels from running foul against them: the edge is terminated by the adjacent surfaces at right angles to each other at Westminster bridge, and makes an acute angle at the Pont Royal of about 60 degrees; but of late the French terminate this angle by two cylindric surfaces, whose bases are arcs of 60 degrees, in all their new bridges.

122 Slope of the bridge on each side. When the banks of the rivers are pretty high, the bridge is made quite level above, and all the arches of an equal width; but where they are low, or for the sake of navigation, a large arch is made in the middle of the stream, then the bridge is made higher in the middle than at the ends: in this case, the slope must be made easy and gradual on both sides, so as to form above one continued curve line, otherwise it appears disagreeable to the eye. Mr Belidor will have the descent of that slope to be one twenty-fourth part of the length; but this is undoubtedly too much, as one-fiftieth part of the length is quite sufficient for the descent.

123 Width, &c. The width commonly allowed to small bridges is 30 feet: but in large ones near great towns, these 30 feet are allowed clear for horses and carriages, besides a banquette at each side for foot passengers of 6 to 9 feet each, raised about a foot above the common road; the parapet walls on each side are about 18 inches thick, and 4 feet high; they generally project the bridge with a cornice underneath: sometimes ballustrades of stone or iron are placed upon the parapet, as at Westminster; but this is only practised where a bridge of a great length is made near the capital of a country.

The ends of bridges open from the middle of the two large arches with two wings, making an angle of 45 degrees with the rest, in order to make their entrance more free and easy: these wings are supported by the same arches of the bridge next to them, being continued in the manner of an arch, of which one pier is much longer than the other.

How the work is to be carried on.

124 Methods of laying the foundation. As the laying the foundation of the piers is the most difficult part of the whole work, it is necessary we should begin with an easy case, that is, when the depth of the water does not exceed 6 or 8 feet; and then proceed to those which may happen in a greater depth of water.

125 By batardeaus. One of the abutments, with the adjacent piers, is enclosed by a dyke called *batardeau* by the French, of a sufficient width for the work, and room for the workmen. This batardeau is made by driving a double row of piles, whose distance is equal to the depth of water, and the piles in each row are 3 feet from each other: they are fastened together on the outside by bonds of 6 by 4 inches: this being done, frames of about 9 feet wide are placed on the inside to receive the boards which are to form the enclosure: the two uprights of these frames are two boards of an inch and a half thick, sharpened below to be driven into the ground, and fastened together by double bonds, one below and the other above, each separated by the thickness of the uprights; these bonds serve to slide the boards between: after these frames have been driven into the ground as hard as can be, then the boards themselves are likewise driven in till they reach the firm ground underneath.

Between every two piles tie-beams are fastened to the bonds of the piles, to fasten the inside wall to the outside one; these tie-beams are let into the bonds and bolted to the adjacent piles: this being done, the bottom is cleared from the loose sand and gravel, by a machine like those used by ballast-heavers; and then well prepared clay is rammed into the coffer very tight and firm, to prevent the water from oozing through. Practic

Sometimes these enclosures are made with piles only driven close to each other; at others, the piles are notched or dove-tailed one into the other; but the most usual method is to drive piles with grooves in them, 5 or 6 feet distant from each other, and boards are let down between them.

This being done, pumps and other engines are used to draw the water out of the enclosures, so as to be quite dry; then the foundation is dug, and the stones are laid with the usual precautions, observing to keep some of the engines always standing, in order to draw out the water that may ooze through the batardeau.

The foundation being cleared, and every thing ready to begin the work, a course of stones is laid; the outside all round with the largest stretchers and headers that can be had, and the inside filled with ashlers well jointed, the whole laid in terrass mortar: the facings are crampt together, and set in lead; and some cramps are also used to fasten the facings with the inside. The same manner is to be observed throughout all the courses to the height of low water mark; after which the facings alone are laid in terrass mortar, and the inside with the best of the common sort. When the foundation is carried to the height of low water mark, or to the height where the arches begin, then the shaft or middle wall is to be carried up nearly to the height of the arches, and there left standing till all the piers are finished, in order that the masonry may be sufficiently dry and settled before the arches are begun.

126 Proper form of the base. As the piers end generally with an arch at each end, it is customary to lay the foundation in the same manner: which is not so well as to continue the base rectangular quite to the ends of the piers, and as high as low water mark; both because the foundation becomes then so much broader, and also because the water will not be able to get under it: for when the current sets against a flat surface, it drives the sand and mud against it so as to cover it entirely; whereas if a sharp edge be presented to the stream, it carries every thing away, and exposes the foundation to the continual action of the water, which in course of time must destroy it.

After the intervals between the arches are filled up with stones laid in a regular manner without mortar, and the gravel is laid over them; two drains or gutters are to be made lengthwise over the bridge, one on each side next to the footpath, about six feet wide and a foot deep; which being filled with small pebble stones, serve to carry off the rain water that falls on the bridge, and to prevent its filtering through the joints of the arches, as often happens.

127 Method of building with coffers, as we practised at Westminster bridge. The former method of laying the foundation by means of batardeaus is very expensive, and often meets with great difficulties: for when the depth of water is 8 feet or more, it is scarcely possible to make the batardeaus so tight as to prevent the water from oozing through them; and in that case the number of engines required, as well as the hands to work them, becomes very

Practice. very extensive; and if part of the batardeau should break by some extraordinary wind or tide, the workmen would be exposed to very great danger.

The next and best method therefore is to build with coffers, when it is practicable, such as were used at Westminster bridge. Here the height of water was 6 feet at a medium when lowest, and the tide rose about 10 feet at a medium also; so that the greatest depth of water was about 16 feet. At the place where one of the piers of the middle or great arch was to be, the workmen began to drive piles of about 13 or 14 inches square, and 34 feet long, shod with iron, so as to enter into the gravel with more ease, and hooped above to prevent their splitting in driving them: these piles were driven as deep as could be done, which was 13 or 14 feet below the surface of the bed of the river, and 7 feet distant from each other, parallel to the short ends of the pier, and about 30 feet distant from them: the number of these piles was 34, and their intent to prevent any vessels or barges from approaching the work; and in order to hinder boats from passing between them, booms were placed so as to rise and fall with the water.

This being done, the ballast-men began to dig the foundation under the water of about 6 feet deep, and 5 wider all round than the intended coffer was to be, with an easy slope to prevent the ground from falling in: in order to prevent the current from washing the sand into the pit, short-grooved piles were driven before the two ends and part of the sides, not above 4 feet higher than low water mark, and about 15 feet distant from the coffer: between these piles rows of boards were let into the grooves down to the bed of the river, and fixed there.

The bottom of the coffer was made of a strong grate, consisting of two rows of large timbers, the one longways, and the other crossways, bolted together with wooden trunnels ten feet wider than the intended foundation. The sides of the coffer were made with fir timbers laid horizontally close one over another, pinned with oaken trunnels, and framed together at the corners, excepting at the two salient angles, where they were secured with proper irons, so that the one half might be loosened from the other if it should be thought necessary; these sides were lined on the inside as well as on the outside with three inch planks placed vertically; the thickness of those sides was 18 inches at the bottom, reduced to 15 above, and they were 16 feet high; besides, knee timbers were bolted at the angles, in order to secure them in the strongest manner. The sides were fastened to the bottom by 20 pieces of timber on the outside, and 18 within, called *straps*, about 8 inches broad, and 3 or 4 inches thick, reaching and lapping over the ends of the sides: the lower part of these straps had one side cut dove-tail fashion, in order to fit the mortises made near the edge of the bottom to receive them, and were kept in their places by iron wedges; which being drawn out when the sides were to be taken away, gave liberty to clear the straps from the mortises.

Before the coffer was launched, the foundation was examined, in order to know whether it was level; for which purpose several gauges were made, each of which consisted of a stone of about 15 inches square and three thick, with a wooden pole in the middle of about 18 feet long. The foundation being levelled and the coffer fixed directly over the place with cables fastened to the adjacent piles, the masons laid the first course of the stones for the foundation within it; which being finished, a sluice made in the side was opened near the time of low water; on which the coffer sunk to the bottom; and if it did not set level, the sluice was shut, and the water pumped out, so as to make it float till such time as the foundation was levelled: then the masons crampt the stones of the first course, and laid a second; which being likewise crampt, a third course was laid: then the sluice being opened again, proper care was taken that the coffer should settle in its due place. The stone work being thus raised to within two feet of the common low water mark, about two hours before low water the sluice was shut, and the water pumped out so far as that the masons could lay the next course of stone, which they continued to do till the water was risen so high as to make it unsafe to proceed any further: then they left off the work, and opened the sluice to let in the water. Thus they continued to work night and day at low water till they had carried their work some feet higher than the low water mark: after this, the sides of the coffer were loosened from the bottom, which made them float; and then were carried ashore to be fixed to another bottom, in order to serve for the next pier. Practice.

It must be observed, that the coffer being no higher than 16 feet, which is equal to the greatest depth of water, and the foundation being 6 feet under the bed of the river; the coffer was therefore 6 feet under water when the tide was in; but being loaded with three courses of stones, and well secured with ropes fastened to the piles, it could not move from its place. By making it no higher, much labour and expence were saved; yet it answered the intent fully as well as if it had been high enough to reach above the highest flood.

The pier being this carried on above low water mark, the masons finished the rest of it during the intervals of the tides in the usual way; and after all the piers and abutments were finished in a like manner, the arches were begun and completed as mentioned before: the whole bridge was built in about seven years, without any accidents happening either in the work or to the workmen, which is seldom the case in works of this nature.

128 Materials employed.

It may be observed, that all the piers were built with solid Portland stone, some of which weighed four tons. The arch stones were likewise of the same sort: but the rest of the masonry was finished with Kentish *rag-stones*; and the paths for foot passengers were paved with *Purbec*, which is the hardest stone to be had in England, excepting Plymouth marble.

129 This method sometimes impracticable.

This method of building bridges is certainly the easiest and cheapest that can be thought of, but cannot be used in many cases: when the foundation is so bad as not to be depended upon without being piled, or the depth of water is very great, with a strong current and no tide, it cannot then be practised. For if piles are to be used, it will be next to impossible to cut them off in the same level five or six feet below the bed of the river, notwithstanding that saws have been invented for that purpose: because if they are cut off separately, it will be a hard matter to do it so nicely that the one shall not exceed the other in height; and if this is not done,

Practice. done, the grating or bottom of the coffer will not be equally supported, whereby the foundation becomes precarious: neither can they be cut off altogether; for piles are to be driven as far as the bottom of the coffer extends, which at Westminster bridge was 27 feet; the saw must have three feet play, which makes the total length of the saw 30 feet; now, if either the water is deeper than it is there, or the arches are wider, the saw must still be longer, so that this method is impracticable in any such cases.

In a great depth of water that has a strong current and no tide, the coffers must reach above the water, which makes them very expensive, and unwieldy to manage, as well as very difficult to be secured in their places, and kept steady: so that there is no probability of using them in such a case.

130 Russian method. In some cases, where there is a great depth of water, and the bed of the river is tolerably level, or where it can be made so by any contrivance, a very strong frame of timber, about four times as large as the base of the piers may be let down with stones upon it round the edges to make it sink: after fixing it level, piles must be driven about it to keep it in its place; and then the foundation may be laid in coffers as before, which are to be kept steady by means of ropes tied to the piles.

This method has frequently been used in Russia; and though the bed of the river is not very solid, yet such a grate, when once well settled with the weight of the pier upon it, will be as firm as if piles had been driven under the foundation, but to prevent the water from gulling under the foundation; and to secure it against all accidents, a row of dove-tail piles must be driven quite round the grating; this precaution being taken, the foundation will be as secure as any that can be made.

131 French method. The French engineers make use of another method in raising the foundations of masonry under water; which is, to drive a row of piles round the intended place, nearer to, or farther from, each other, according as the water is more deep or shallow: these piles being strongly bound together in several places with horizontal tie-beams, serve to support a row of dove-tail piles driven within them: when this is done, and all well secured according to the nature of the situation and circumstances, they dig the foundation by means of a machine with scoops, invented for that purpose, until they come to a solid bed of gravel or clay; or if the bed of the river is of a soft consistence to a great depth, it is dug only to about six feet, and a grate of timber is laid upon it, which is well secured with piles driven into the opposite corners of each square, not minding whether they exceed the upper surface of the grate much or little.

When the foundation is thus prepared, they make a kind of mortar called *beton*, which consists of twelve parts of pozolano or Dutch terrass, six of good sand, nine of unslaked lime, the best that can be had, thirteen of stone splinters not exceeding the bigness of an egg, and three parts of tile dust, or cinders, or else scales of iron out of a forge: this being well worked together must be left standing for about 24 hours, or till it becomes so hard as not to be separated without a pick-axe.

This mortar being thus prepared, they throw into the coffer a bed of ruble stones, not very large, and spread them all over the bottom as nearly level as they can; they then sink a box full of this hard mortar, broken into pieces, till it come within a little of the bottom; the box is so contrived as to be overset or turned upside down at any depth; which being done, the pieces of mortar soften, and so fill up the vacant spaces between the stones; by these means they sink as much of it as will form a bed of about 12 inches deep all over; then they throw in another bed of stone, and continue alternately to throw one of mortar and one of stone till the work approaches near the surface of the water, where it is levelled, and then the rest is finished with stones in the usual manner.

Practi

Mr Belidor says, in the second part of his Hydraulics, vol. ii. p. 188. that Mr Millet de Montville having filled a coffer containing 27 cubic feet, with masonry made of this mortar, and sunk it into the sea, it was there left standing for two months, and when it was taken out again it was harder than stone itself.

132 Impossibility of building bridges in some cases. We have hitherto mentioned such situations only where the ground is of a soft nature; but where it is rocky and uneven, all the former methods prove ineffectual; nor indeed has there yet been any one proposed which can be always used upon such occasions, especially in a great depth of water. When the water is not so deep but that the unevenness of the rock can be perceived by the eye, piles strongly shod with iron may be raised and let fall down, by means of a machine, upon the higher parts, so as to break them off piece by piece, till the foundation is tolerably even, especially when the rock is not very hard; which being done either this or any other way that can be thought of, a coffer is made without any bottom, which is let down and well secured, so as not to move from its place: to make it sink, heavy stones should be fixed on the outside; then strong mortar and stones must be thrown into it; and if the foundation is once brought to a level, large hewn stones may be let down so as to lie flat and even: by these means the work may be carried on quite up to the surface of the water. But when the water is so deep, or the rock so hard as not to be levelled, the foundation must be sounded, so as to get nearly the risings and fallings; then the lower part of the coffer must be cut nearly in the same manner, and the rest finished as before. It must however be observed, that we suppose a possibility of sinking a coffer; but where this cannot be done, no method that we know of will answer.

133 Trajan's bridge o the Dan described Among the aquatic buildings of the ancients none appears to have been more magnificent than Trajan's bridge. Dion Cassius gives the following account of it: "Trajan built a bridge over the Danube, which in truth one cannot sufficiently admire; for though all the works of Trajan are very magnificent, yet this far exceeds all the others: the piers were 20 in number, of square stone: each of them 150 feet high above the foundation, 60 feet in breadth, and distant from one another 170 feet. Though the expence of this work must have been exceeding great, yet it becomes more extraordinary by the river's being very rapid, and its bottom of a soft nature: where the bridge was built, was the narrowest part of the river thereabout, for in most others it is double or treble this breadth; and although on this account it became so much the deeper and the more rapid, yet no other place was so suitable for

Practice. for this undertaking. The arches were afterwards broken down by Adrian; but the piers are still remaining, which seems as it were to testify that there is nothing which human ingenuity is not able to effect." The whole length then of this bridge was 1590 yards.; some authors add, that it was built in one summer, and that Apollodorus of Damascus was the architect, who left behind him a description of this great work.

134 Wooden bridges. Where stone bridges cannot be erected on account of the expence, very strong and durable ones may be constructed of wood: in which case they ought to be so framed, as that all the parts may press upon one another like the arch of a stone bridge; and thus, instead of being weakened by great weights passing over them, they will become the stronger. How this is to be accomplished, will be better understood from the figure at bottom of Plate LIV. which represents a wooden bridge constructed after this manner, than it can be by any description.

2. Of Harbours.

135 Situation proper for harbours. In these, the first thing to be considered is the situation; which may be some large creek or bason of water, in or near the place where the harbour is intended to be made, or at the entrance of a large river, or near the sea: for a harbour should never be dug entirely out of dry land, unless upon some extraordinary occasions, where it is impossible to do otherwise, and yet a harbour is absolutely necessary. When a proper place is found, before it is fixed upon, it must be considered whether ships can lie there safe in stormy weather, especially when those winds blow which are most dangerous upon that coast; whether there be any hills, rising ground, or high buildings, that will cover it; in these cases, the situation is very proper: but if there be nothing already that will cover the ships, it must be observed whether any covering can be made at a moderate expence, otherwise it would be useless to build a harbour there.

The next thing to be considered is, whether there be a sufficient depth of water for large ships to enter with safety, and lie there without touching the ground; and if not, whether the entrance and inside might not be made deeper at a moderate expence: or, in case a sufficient depth of water is not to be had for large ships, whether the harbour would not be useful for small merchantmen; for such a one is often of great advantage, when situated upon a coast much frequented by small coasting vessels.

The form of the harbour must be determined in such a manner, that the ships which come in when it is stormy weather may lie safe, and so as there may be sufficient room for as many as pass that way: the depths of water where the piers are to be built must be taken at every 10, 15, or 20 feet distance, and marked upon piles driven here and there, in order that the workmen may be directed in laying the foundation.

136 Materials. This being done, it must be considered what kind of materials are to be used, whether stone, brick, or wood. When stones are to be had at a moderate price, they ought to be preferred, because the work will be much stronger, more lasting, and need fewer repairs, than if made with any other materials: but when stones are scarce, and the expence becomes greater than what is allowed for building the harbour, the foundation may be made of stone as high as low water mark, and the rest finished with brick. If this manner of building should still be too expensive, wood must be used; that is, piles are driven as close as it is thought necessary; which being fastened together by cross bars, and covered with strong oaken planks, form a kind of coffer, which is filled with all kinds of stones, chalk, and shingles. Practice.

137 French method of building. The manner of laying the foundation in different depths of water, and in various soils, requires particular methods to be followed. When the water is very deep, the French throw in a great quantity of stones at random, so as to form a much larger base than would be required upon dry land; this they continue to within 3 or 4 feet of the surface of the water, where they lay the stones in a regular manner, till the foundation is raised above the water: then they lay a great weight of stones upon it, and let it stand during the winter to settle; as likewise to see whether it is firm, and resists the force of waves and winds: after that, they finish the superstructure with large stones in the usual manner.

138 A preferable one. As this method requires a great quantity of stones, it can be practised only in places where stones are in plenty: and therefore the following one is much preferable. A coffer is made with dove-tail piles, of about 30 yards long, and as wide as the thickness of the foundation is to be; then the ground is dug and levelled, and the wall is built with the best mortar.

As soon as the mortar is tolerably dry, those piles at the end of the wall are drawn out, the side rows are continued to about 30 yards farther, and the end enclosed; then the foundation is cleared, and the stones laid as before. But it must be observed, that the end of the foundation finished is left rough, in order that the part next to it may incorporate with it in a proper manner; but if it is not very dry, it will incline that way of itself, and bind with the mortar that is thrown in next to it; this method is continued till the whole pier is entirely finished.

It must likewise be observed, that the piers are not made of one continued solid wall; because in deep water it would be too expensive: for which reason, two walls are built parallel to each other, and the interval between them is filled up with shingle, chalk, and stone As these walls are in danger of being thrust out or overset by the corps in the middle, together with the great weight laid at times on the pier, they are tied or bound together by cross walls at every 30 or 40 yards distance, by which they support each other in a firm and strong manner.

In a country where there is great plenty of stones, piles may be driven in as deep as they will go, at about two or three feet distance; and when the foundation is sunk and levelled, large stones may be let down, which will bed themselves: but care must be taken to lay them close, and so as to have no two joints over each other; and when the wall is come within reach, the stones must be crampt together.

139 Another method with coffers. Another method practised is to build in coffers much after the same manner as has been done in building the piers of Westminster bridge; but as in this case the ends of the coffers are left in the wall, and prevent their joining

Practice. joining so well as to be water tight, the water that penetrates through and enters into the corps may occasion the wall to burst and to tumble down. Another inconveniency arising from this manner of building is, that as there are but few places without worms, which will destroy wood wherever they can find it; by their means the water is let into the pier, and consequently makes the work liable to the same accident as has been mentioned above.

140 Russian method. To prevent these inconveniences, the best method is to take the wood away, and joggle the ends of the walls together with large stones, pouring terrass mortar into the joints; when this is done, the water between the two walls may be pumped out, and the void space filled up with stone and shingle as usual; or if these joggles cannot be made water tight, some dove-tail piles must be driven at each end as close to the wall as can be done, and a strong sailcloth put on the outside of them, which, when the water is pumped out, will stick so close to the piles and wall, that no water can come in. This method is commonly used in Russia.

141 Thickness of piers. The thickness of a pier depends on two considerations: it ought to be both such as may be able to resist the shock of the waves in stormy weather; and also to be of a sufficient breadth above, that ships may be laden or unladen whenever it is though necessary. Now, because the specific gravity of sea water is about one half that of brick, and as 2 to 5 in comparison of stone; and since the pressure of stagnated water against any surface is equal to the weight of a prism of water whose altitude is the length of that surface, and whose base is a right-angled isosceles triangle, each of the equal sides being equal to the depth of the water; therefore a pier built with bricks, whose thickness is equal to the depth of the water, will weigh about four times as much as the pressure of the water against it; and one of stone of the same breadth, about six times and a quarter as much. Now this is not the force to be considered, since this pressure is the same within as without the pier: but it is that force with which the waves strike against the piers, and that depends on the weight and velocity of the waves, which can hardly be determined; because they vary according to the different depths of water, the distance from the shore, and according to the tides, winds, and other causes. Consequently the proper thickness of the piers cannot be determined by any other means than by experience. Practi

Practitioners suppose, that if the thickness of a pier is equal to the depth of the water, it is sufficient; but for a greater security they allow 2, 3, or 4 feet more. This might probably do, if piers were built with solid stones crampt together; but as this is hardly ever the case, and on the contrary, as the inside is filled up with shingle, chalk, or other loose materials, their rule is not to be depended upon; besides it makes the space above too narrow for lading and unlading the ships, unless in a great depth of water; so that it does not appear that their method can be followed, excepting in a very few cases where the water has but very little motion.

When stone can be had, no other materials should be used, because they being of a larger bulk than brick, will better resist the waves by their own weight, till such time as the mortar is grown hard; for after this is effected, brick will resist better against the action of sea water than soft stones.

The wall must be built with terrass mortar from the bottom to the height of low water mark, and the rest finished with cinder or tile-dust mortar, which has been found sufficiently good in those places where the wall is wet and dry alternately. The upper part of the pier should be paved with flat hewn stones laid in strong mortar, in order to prevent any water from penetrating into it: iron rings ought also to be fixed here and there at proper distances, to fasten the ships, and prevent them from striking against the pier when agitated by the waves.

Wooden fenders or piles should be driven at the inside close to the wall, and crampt to it with iron, to prevent the ships from touching them, and from being worn by the continual motion. Where the sea breaks against the piers with great violence, breakers should be made at proper distances; that is, two rows of piles are driven nearly at right angles to the piers for the length of about 12 or 15 feet, and at about 8 or 10 feet distant from each other; and then another to join the two former: these piles being covered with planks, and the inside being filled with shingles and ruble stones, then the top is paved with stones of about a foot in length, set longwise to prevent the waves from tearing them up. This precaution is absolutely necessary where the water rushes in very strongly.

Architecture ‖ Architriclinus. *Military* ARCHITECTURE, the same with what is otherwise called *fortification*. See FORTIFICATION.

Naval ARCHITECTURE, the art of building ships. See *SHIP-Building*.

ARCHITRAVE, in *Architecture*, that part of a column which lies immediately upon the capital, being the lowest member of the entablature. See Plate XXXIX.

Over a chimney, this member is called the *mantle-piece*; and over doors or windows, the *hyperthyron*.

ARCHITRICLINUS, in antiquity, the master or director of a feast, charged with the order and economy of it, the covering and uncovering of the tables, the command of the servants, and the like.

The architriclinus was sometimes called *servus triclinarcha*, and by the Greeks προγευστης, i. e. *prægustator*, or *foretaster*. Potter also takes the architriclinus for the same with the symposiarcha.

ARCHIVAULT, in *Architecture*, implies the interior contour of an arch, or a band adorned with mouldings, running over the faces of the arch-stones, and bearing upon the imposts. It has only a single face in the Tuscan order, two faces crowned in the Doric and Ionic, and the same mouldings as the architrave in the Corinthian and Composite.

Archive ‖ Archons.

ARCHIVE, or ARCHIVES, a chamber or apartment wherein the records, charters, and other papers and evidences, of a state, house, or community, are preserved, to be consulted occasionally.

We say, the *archives* of a college, of a monastery, &c. The archives of ancient Rome were in the temple of Saturn; the archives of the court of chancery are in the rolls office.

ARCHIVIST, ARCHIVISTA, a keeper of an archive.

Under the emperors, the archivist was an officer of great dignity, held equal to the proconsuls, vested with the quality of a count, styled *clarissimus*, and exempted from all public offices and taxes. Among the ancient Greeks and Persians, the trust was committed to none but men of the first rank; among the Franks, the clergy being the only men of letters, kept the office among themselves. Since the erection of the electoral college, the archbishop of Mentz has had the direction of the archives of the empire.

ARCHMARSHAL, the grand marshal of the empire, a dignity belonging to the elector of Saxony.

ARCHONS, in Grecian antiquity, were magistrates appointed after the death of Codrus *. They were chosen from the most illustrious families till the time of Aristides, who got a law passed, by which it was enacted, that, in electing these magistrates, less regard should be paid to birth than to merit.

* See the article *Attica.*

The tribunal of the archons was composed of nine officers. The first was properly the *archon;* by whose name the year of his administration was distinguished. The title of the second was *king;* that of the third, *polemarchus;* to these were added six *thesmothetæ.* These magistrates, elected by the scrutiny of beans, were obliged to prove, before their respective tribes, that they had sprung, both in their father's and their mother's side, for three descents, from citizens of Athens. They were likewise to prove that they were attached to the worship of Apollo, the tutelary god of their country; that they had in their house an altar consecrated to Apollo; and that they had been respectfully obedient to their parents; an important and sacred part of their character, which promised that they would be faithful servants to their country. They were likewise to prove, that they had served in a military capacity the number of years which the republic required of every citizen: and this qualification gave the state experienced officers; for they were not allowed to quit the army till they were 40 years old. Their fortune too, of which they were to inform those before whom they were examined, was a warrant for their fidelity.

After the commissioners, who were appointed to inquire into their character and other requisites, had made a report of them, they were then to swear that they would maintain the laws; which obligation if they neglected, they engaged to send to Delphi a statue of the weight of their bodies. According to a law of Solon, if an archon got drunk, he was condemned to pay a heavy fine, and sometimes even punished with death. Such magistrates as the Athenian archons were well entitled to respect. Hence it was eternal infamy to insult them; and hence Demosthenes observed, that to treat the thesmothetæ with disrespect, was to show disrespect to the republic.

Archons ‖ Archpriest.

Another qualification indispensably required of the second officer of this tribunal, who was called the *king*, was, that he had married the daughter of an Athenian citizen, and that he had espoused her a virgin. This was exacted of him, says Demosthenes, because part of his duty was to sacrifice to the gods jointly with his wife, who instead of appeasing, would have irritated them, if she had not possessed both these honours.

The inquiry into the private title of the nine archons was very severe; and this attention was the more necessary, as they had a right to take a seat in the Areopagus, after they had quitted their office, and given an account of their administration.

When any obscurity occurred in the laws relative to religion and the worship of the gods, the interpretation was submitted to the tribunal of the archons.

Aristotle observes, that Solon, whose aim was to make his people happy, and who found their government in his time aristocratical, by the election of the nine archons, who were annual magistrates, tempered their power, by establishing the privilege of appealing from them to the people, called by lot to give their suffrage, after having taken the oath of the Heliastæ, in a place near the Panathenæum, where Hissus had formerly calmed a sedition of the people, and bound them to peace by an oath.

The archons were the principal officers, not only in civil, but likewise in sacred matters, and especially in the mysteries of Bacchus. The archons, however, who were surnamed *eponymi*, were chiefly employed in civil affairs; yet they presided at the great feasts, and held the first rank there. Hence they are sometimes styled *priests.*

ARCHON is also applied by some authors to divers officers, both civil and religious, under the eastern or Greek empire. Thus bishops are sometimes called *archontes;* and the same may be said of the lords of the emperor's court. We also read of the *archons of the antimensia, archon of archons, grand archon, archon of churches, archon of the gospel, archon of the walls,* &c.

ARCHONTICI, in church history, a branch of Valentinians who maintained that the world was not created by God, but by angels called *Archontes.*

ARCHPRIEST, ARCHPRESBYTER, a priest or presbyter established in some dioceses, with a pre-eminence over the rest. Anciently the archpriest was the first person after the bishop: he was seated in the church next after the bishop; and even acted as his vicar, in his absence, as to all spiritual concerns. In the sixth century, there were found several archpriests in the same diocese; from which time some will have them to have been called *deans.* In the ninth century, they distinguished two kinds of cures or parishes: the smaller governed by simple priests; and the baptismal churches by archpriests; who, besides the immediate concern of the cure, had the inspection of the other inferior priests, and gave an account of them to the bishop, who governed the chief or cathedral church, in person. There are archpresbyters still subsisting in the Greek church; vested with most of the functions and privileges of chorepiscopi or rural deans.

Archtreasurer || Archytas.

ARCHTREASURER, the great treasurer of the German empire. This office was created with the eighth electorate, in favour of the elector Palatine, who had lost his former electorate, which was given to the duke of Bavaria, by the emperor Ferdinand II. who took it away from Frederic V. elector Palatine, after the battle of Prague, where he was defeated in maintaining his election to the crown of Bohemia. The dignity of archtreasurer was contested between the elector of Brunswick, who claimed it in virtue of his descent from the elector Frederic, and the elector Palatine.

ARCHILUTE, ARCILEUTO, a long and large lute, having its bass strings lengthened after the manner of the theorbo, and each row doubled, either with a little octave or an unison. It is used by the Italians for playing a thorough bass.

ARCHYTAS of Tarentum, was a Pythagorean philosopher, and also well skilled in mathematics and geography. He lived in the time of Plato, and, according to report, interposed his influence with Dionysius the tyrant, in order to save the life of that renowned philosopher. According to this date, it would appear that Jamblichus is mistaken when he asserts, that he was a hearer of Pythagoras, and the testimony of a writer mentioned by Photius, would seem more worthy of credit, that he was the eighth successive preceptor of the Pythagorean school. But his fame was not confined to the circle of literature; for so eminent were his military talents, that, in opposition to an express law of his country, that no man should be chosen more than once the general of its armies, he was elevated to that important station no less than seven times. He adopted the sentiments of Pythagoras; in his dissertations on speculative philosophy. He taught in morality, that there is nothing so destructive to man as pleasure; that in every condition of society, virtue is to be pursued for its own merit, and that every extreme is incompatible with virtue. Aristotle was indebted to Archytas for his general heads of arrangement, entitled his "Ten Categories," and very probably for that principal idea in his Ethics, that virtue consists in avoiding excesses. By discovering the duplication of the cube by means of the conic sections, and the method of finding two mean proportionals between two given lines, he displayed his great knowledge in mathematics. He is reported to have invented several curious hydraulic machines, and to have made a kind of winged automaton; and his genius is likewise honoured with the invention of the screw and crane. In a beautiful ode, Horace records his sad fate, in being cast upon the Apulian shore, an unburied corpse; and mentions him as an excellent astronomer and geographer.

Te maris et terræ numeroque carentis arenæ
Mensorem cohibent, Archyta,
Pulveres exigui prope litus parva Matinum
Munera: nec quidquam tibi prodest
Aerias tentasse domos, animoque rotundum
Percurrisse polum, morituro.

Archytas, what avails thy nice survey
Of ocean's countless sands, of earth, and sea?
In vain thy mighty spirit once could soar
To orbs celestial, and their course explore,
If here, upon the tempest-beaten strand,
You lie confin'd, till some more liberal hand
Shall strew the pious dust in funeral rite,
And wing thee to the boundless realms of light.
FRANCIS.

Arcis-sur-Aube || Arctotis

A singular modesty, and a firm command of his passions, were the leading features in his moral character. In his anger he never chastised any of his servants. He said one day to a certain dependant who had disobliged him, "What should I have done to you if I had not been angry?" He maintained a uniform decency not often observed in ancient writings.

A small treatise, entitled Περὶ τῦ Παντος φυσεως, "On the Universe," and some other small fragments, "On Wisdom," and "On the Good and Happy Man," are the only pieces ascribed to this philosopher that are still extant.

ARCIS-SUR-AUBE, a small town of France, in Champagne, now the department of Aube, seated on the river Aube. E. Long. 4. 15. N. Lat. 48. 40.

ARCO, a strong town and castle in the Trentin, belonging to the house of Austria. It was taken by the French in 1703, and abandoned soon after. It stands on the river Sarca, near the north extremity of the lake Garda. E. Long. 10. 48. N. Lat. 45. 52.

ARCONA, a strong town situated on the island of Rugen in the Baltic. It stood on a high promontory, with the east, north, and south sides defended by steep and lofty precipices, and the west by a wall 50 feet high, proportionably thick, and secured by a deep and broad ditch. It was, however, taken and ruined, in 1168, by Valdemar king of Denmark. One of the conditions imposed by the conqueror was, that the inhabitants should destroy a temple they had erected to St Vitus, and deliver up the vast treasure belonging to this tutelary saint. Another was, that they should pay 40 silver yokes for oxen, by way of tribute, and enter as soldiers in the Danish service when called upon.

ARCOS, a strong city of Andalusia in Spain, seated on a high craggy rock, at the bottom of which runs the Guadeleto. Its strength lies not only in its situation, but in the works erected for its defence, and it is inaccessible on every side but one. The governor resides in an old castle, from whence there is a delightful prospect, which extends very far into the neighbouring country. W. Long. 5. 50. N. Lat. 36. 20.

ARCTIC, in *Astronomy*, an epithet given to the north pole, or the pole raised above our horizon. It is called the *arctic pole*, on occasion of the constellation of the little bear, in Greek called ἀρκτος; the last star in the tail whereof nearly points out the north pole.

ARCTIC Circle, is a lesser circle of the sphere, parallel to the equator, and 23° 30′ distant from the north pole; from whence its name. This, and its opposite, the *antarctic*, are called the two *polar circles*; and may be conceived to be described by the motion of the poles of the ecliptic, round the poles of the equator, or of the world.

ARCTIUM, BURDOCK. See BOTANY *Index*.

ARCTOPHYLAX, (from ἀρκτος, *bear*, and φυλαττω, *I guard*), in *Astronomy*, a constellation, otherwise called *Bootes*.

ARCTOPUS, See BOTANY *Index*.

ARCTOTIS. See BOTANY *Index*.

ARCTURUS,

Arcturus || Ardebil.

ARCTURUS, in *Astronomy*, a fixed star, of the first magnitude, in the constellation Arctophylax, or Bootes. The word is formed of ἀρκτος, bear, and ὀυρα, *tail*, q. d. *bear's tail*, as being very near it. This star was known to the ancients, as in the following verse of Virgil:

Arcturum, pluviasque Hyades, geminasque Triones.

See also Job ix. 9. xxxviii. 32.

ARCUATION, in *Gardening*, the method of raising trees by layers, which is done in the following manner. Strong mother plants or stools must be planted in a clear border, and in a straight line, about six feet asunder. When these have shot five or six main branches from the roots, and as many collateral branches, the former must be bent to the ground, and there fastened. The small branches must be covered three inches deep upon the joints, and have a large bason of earth made round them to hold the water. About the middle of September they may be opened, and if they have taken root, may be immediately removed into the nursery; but if they have not sufficiently extended their roots, they must be suffered to remain till the spring, and then transplanted.

ARCUCCIO, ARCUTIO, a machine made of a board, covered with pieces of hoops, like the tilt of a waggon: used in Italy to prevent children from being overlaid and smothered by nurses or others. Every nurse in Florence is obliged to lay her child in an arcutio, under pain of excommunication.

ARCY, PATRICK D', a writer on military affairs. See SUPPLEMENT.

ARDAMON, or ARDAMA, in antiquity, a vessel of water placed at the door of a person deceased, till the time of burial, as a token that the family was in mourning, and to serve to sprinkle and purify persons as they came out of the house.

ARDASSES, in *Commerce*, the coarsest of all the silks of Persia; and as it were the refuse of each kind. In this sense, they say, the *legis*, the *housets*, the *chouſs*, and the *payas ardasses*, to signify the worst of those four sorts of Persian silks.

ARDASSINES, in *Commerce*, called in France *ablaques;* a very fine sort of Persian silks, little inferior in fineness to the sourbastis, or rather cherbassis, and yet it is little used in the silk manufactures of Lyons and Tours, because that kind of silk will not bear hot water in the winding.

ARDEA, the crane. See ORNITHOLOGY *Index*.

ARDEA, in *Ancient Geography*, a town of Latium, the royal residence of Turnus king of the Rutuli, (Livy); so called, either from the augury of the heron, (Hyginus); or from the excessive heat of the country, (Martial). It was in a marshy, sickly situation, (Strabo, Seneca). It was built by Danaë, the mother of Perseus, (Virgil); above five miles distant from the sea, and 20 from Rome: now a hamlet. It was a Roman colony, (Livy); the inhabitants called *Ardeates*. E. Long. 17. 49. N. Lat. 41. 30.

ARDEBIL, or ARDEVIL, a town of Persia in the province of Aderbijan. It was taken and burnt by Jenghiz Khan, in 1222, when most of the inhabitants were destroyed: but it has been since rebuilt; and is still ranked for dignity among the best cities of the kingdom, on account of its having been the residence and burying-place of some of the Persian kings; particularly the sepulchre of Sheik Sefi is at this place, to which the people resort in pilgrimage. He founded a place, which they call his kitchen, with a revenue sufficient to maintain 1000 poor people, and to feed them three times a-day. Three or four of the largest principal streets have shops, and are planted on each side with elms and linden trees, to keep off the excessive heat of the sun; but the houses are poorly built, with bricks dried in the sun: yet most of them, that are not in the bazars or market places, have the pleasure and conveniency of a garden full of trees bearing fruit; and there are large spots in the out parts of the town, where the houses are at a distance from each other, and the spaces between planted with trees, which render the city of a large extent. Ardebil || Arden.

Through the city there pass two branches of a rivulet, which are sometimes enlarged by the melting of the snow on the mountains, so that they have been forced to make canals to divert the stream. In the reign of Shah Abbas, it broke down the dikes and carried away a great number of houses. The city is without walls, and is seated in the midst of a large plain encompassed with mountains, the highest of which lies westward, and is always covered with snow. These render the air sometimes extremely hot, and at others intolerably cold, which occasions epidemical distempers, that carry off great numbers of people. The soil produces no fruit near the city but apples, pears, and peaches; and yet is good both for corn and pasture. The sheep are so numerous, that 100,000 have passed over the city bridge in a day. There are here several sorts of mineral waters, which serve both for common bathing, and for the cure of various diseases; one of these is a sulphureous spring, whose exhalations render the circumambient air extremely disagreeable. There are three springs which produce water as hot as if it was boiling; and from which, waters are conveyed to the public baths in the city. About half a league from the city, on the right hand of the public road, there is a pool of standing water, which is covered all over with salt like ice. E. Long. 47. 30. N. Lat. 37. 55.

ARDECHE, a department in the south-east of France, which derives its name from a river, and comprehends part of Dauphiny. The eastern part is fertile, the western rather hilly. Besides the common species of grain, vines and silk are cultivated. There are some manufactures of silks, woollens, leather, &c. The department contains 550,004 hectares; and in 1816 it had a population of 284,743.

ARDEN, the common name of forests among the Celtæ, from the widely extensive one which ranged for 500 miles across the country of Gaul, or that which covered more than half the county of Warwick in Britain, and the sites of which still retain the appellation of *Arden*, to the much smaller one of the ancient Mancenion, that covered and surrounded the site of the present Manchester. It is written *Arduen* by Cæsar and Tacitus in speaking of the forest in Gaul, and *Ardven* by Ossian in mentioning the woods of Caledonia. It cannot (says Mr Whitaker) be compounded of *ar* the prepositive article in Celtic, and the substantive *den*, as Baxter and Camden assert it to be; but is formed of *ard* an adjective, and *ven* the same as *den*. The meaning of the name therefore is not, as Mr Baxter renders

Arden || Ardrah.

it, simply *the hills*, or even, as the ingenious translator of Ossian interprets it, the *high hill*. *Ard* signifies either *high* or *great*, and *ven* or *den* either a *hill* or *wood*. *Arduen*, *Ardven*, or *Arden*, then, means a considerable wood. Hence, only, the name became applicable to such very different sites, as the *plains* of Warwickshire and the *hills* of Scotland: and it was given, not only to the most extensive forests, to that which was the greatest in Gaul, or so considerable in Britain; but to many that were important only within their own contracted districts, as the wood of Mancenion above mentioned, and others.

ARDENBURG, a town of the Netherlands, in Dutch Flanders, and formerly the most considerable in that country; but it has been dismantled by the Dutch. E. Long. 3. 30. N. Lat. 51. 16.

ARDENNE, a forest in France, formerly of vast extent; but the trees are in many places grubbed up, and where they stood are built cities, towns, and abbeys. At present it extends from Thionville, near the country of Liege, to Doncherry and Sedan, on the confines of Champagne.

ARDENNES, a department of France, which comprehends part of Champagne, and takes its name from the forest. In the north it is covered in many parts with wood; in the south, vines are raised. The most common produce over the whole is rye. It has mines of iron, coal, slate, and quarries of marble. Its manufactures of cloth are much celebrated. It contains 1,029,189 acres, and 346,000 inhabitants.

ARDENTES, in middle-age writers, an appellation given to those afflicted with the ignis sacer, or erysipelas. They were thus called, as seeming to be scorched or burned with the disease. Hence also the abbey of St Genevieve at Paris is called *Domus Ardentium*, by reason, as it is said, that great numbers were cured of that distemper at the shrine of this saint, in the reign of Louis VI.

ARDES, a town of France, in Lower Auvergne, and now in the department of Puy de Dome. It serves as a mart for the commodities and trade between Upper and Lower Auvergne. E. Long. 3. 10. N. Lat. 45. 22.

ARDFERT, a town of Ireland, was the ancient capital of Kerry, with an university, which was held in the highest esteem. It is a bishop's see, and borough by ancient prescription, and has been held *in commendam* with the bishopric of Limeric ever since the Restoration. The bishops were anciently called Bishops of Kerry. St Brandon, to whom the cathedral is dedicated, had his first education in this county, under Bishop Ert; but he finished his studies in Connaught, St Jarlath bishop of Tuam being his preceptor. The ruins here are very extensive. Near the cathedral was an anchorite tower, the loftiest and finest in the kingdom, being 120 feet high: it fell suddenly in 1771. In the ruined churches there are several inscriptions round the mouldings of the tombstones; and over an arch, behind Lord Glandore's house, is an inscription in relief done in a masterly manner, but the characters unknown.

ARDRAH, a small territory or kingdom of Africa, in Guinea properly so called. It lies at the bottom of the gulf of St Thomas, and has a town called *Ardres*, supposed to be the capital. The inhabitants are very licentious, and have neither temple nor any place for religious worship. However they are very courageous; and their king was absolute, till lately that the king of Dahomy made war upon this and the neighbouring territories, brought them under subjection, and burnt the towns, particularly Ardres. The air is very unwholesome to Europeans: yet the natives live to a great age; but the smallpox makes great destruction among them. This country is fertile in Indian corn, palm wine, plants, and fruits, which last all the year; and they make a great deal of salt.

Ardra || Arela

ARDRES, a town of France, in Lower Picardy, now the department of the Straits of Calais. Here was an interview between Francis I. and Henry VIII. king of England in 1520. It is seated in the midst of a morass, eight miles south of Calais. E. Long 2. 0. N. Lat. 50. 35.

ARDS, Barony of, in the county of Down in Ireland: it is a narrow slip of land, in some places three and in none above six miles broad; but the soil is for the most part tolerably good. It lies between the lake of Strangford and the sea, and in the south part it is opposite to Lecale. Sir Thomas Smith obtained a patent for this barony from Queen Elizabeth, and sent his natural son with a colony to possess it; but he was intercepted and slain by an Irishman. After Sir Thomas's death, Ards was granted by James I. to some of the Scots nobility.

ARDUBA, an ancient city of the Pannonians. It was taken by Germanicus about the 7th year of the Christian æra; but its reduction was more owing to the disagreement that reigned among the inhabitants than to the valour of the Romans. The greater part of the citizens were for submitting; but the women, more fond of their ancient laws and liberties than the men, joined some Roman deserters, and falling upon their husbands, killed a great number of them: but being at last overcome by the men, who then submitted to the Romans, the women either threw themselves headlong from the tops of the walls, or, setting fire to their houses, burnt themselves and their children to death.

AREA, in general, denotes any plain surface, whereon we walk, &c. The word is Latin, importing more properly a threshing floor; and is derived from *arere* "to be dry."

Area, in *Architecture*, denotes the space or site of ground on which an edifice stands. It is also used for inner courts and those portions of ground.

Area, in *Geometry*, denotes the superficial content of any figure. Thus, if a figure, e. g. a field, be in form of a square, and its side be 40 feet long, its area is said to be 1600 square feet; or it contains 1600 little squares, each a foot every way.

AREB, a kind of imaginary money used in the dominions of the Great Mogul. Four arebs are equal to one crou, or 100 lacs; one lac to 100,000 roupees.

AREBO, or Arebon, a town on the Slave coast of Guinea, in Africa, seated at the mouth of the river Formosa. The English had once a factory there, as the Dutch have still. It is a large oblong place, indifferently well peopled, and furnished with houses built of reeds and leaves. E. Long. 5. 5. N. Lat. 5. 0.

ARECA, the Fausel-nut. See Botany *Index*.

ARELATE, or Arelatum, is a town of Gallia Narbonensis, situated on the Rhone, denoting a town on, or beyond, a marsh, according to the particular situation

situation of the speaker; called *Arelate Sextanorum* (Pliny, Mela, Coin), because it had a colony of the sixth legion. Writers of the lower age call it *Arelas, -atis*, (Prudentius, Ausonius). There was a double Arelas, one on each side of the river, and joined by a bridge, (Ausonius); that on the left side is thought to have been built by Constantine. Tiberius's father was sent by Julius Cæsar at the head of the colony, (Suetonius); and hence the appellation *Julia Paterna*, as appears from an inscription. It was a favourite place of the Romans, and greatly ornamented; and hence called *Gallula Roma*, (Ausonius). It is now called *Arles*. E. Long. 5. 5. N. Lat. 43. 40.

AREMBERG, a small town of Germany, in the circle of Westphalia, defended by a castle. It is the capital of a county of the same name, and was erected into a principality by the emperor Maximilian II. in favour of John de Ligne, lord of Barbazon, who took the name of *Aremberg*. It is seated on the river Aer. E. Long. 6. 44. N. Lat. 50. 27.

AREMORICA, or ARMORICA, a part of Gaul, between the Sequana and Ligeris, (Cæsar, Hirtius); denoting a country on, or beyond the sea, *ar moer*, or *are moer*, Celtic. Pliny indeed says, that *Aquitania* was formerly called *Aremorica*; but in this he stands alone. In the lower age, the term *Armorica* was confined to Bretagne in France.

ARENA, in Roman antiquity, a place where the gladiators fought; so called from its being always strewed with sand, to conceal from the view of the people the blood spilt in the combat. Nero is said to have strewed the arena with gold dust.

ARENARIA, or SANDWORT. See BOTANY *Index*.

ARENACUM, or ARENACUS, one of the four towns or larger villages in the island of the Batavi, (Tacitus). Now *Arnheim*, in Guelderland. E. Long. 5. 20. N. Lat. 52. 2.

ARENARII, in antiquity, gladiators who combated with beasts in the arena or amphitheatre. The arenarii were slaves of the lowest rank; so that, though manumitted, they were not capable of being Roman citizens. They were the same with what were otherwise called *Bestiarii*.

ARENARIUM, in ecclesiastical writers, denotes a cemetery or burying ground. The arenaria were properly a kind of pits, or holes, under ground, wherein the ancient Christians not only buried their dead, but held their religious assemblies in times of persecution.

ARENSBERG, a small town of Germany, in the circle of Westphalia, upon the river Roer. E. Long. 8. 20. N. Lat. 51. 25.

ARENSBURG, an episcopal and maritime town of Livonia in Sweden, seated in the isle of Osel, in the Baltic sea. E. Long. 22. 40. N. Lat. 58. 15.

AREOLA, among anatomists, the coloured circle surrounding the nipple of the breast.

AREOPAGUS, a sovereign tribunal at Athens, famous for the justice and impartiality of its decrees, to which the gods themselves are said to have submitted their differences. It was in the town, on a rock or hill opposite to the citadel. The word signifies strictly, *rock of Mars*.

Plutarch attributes the establishment of the Areopagus to Solon. Other authors think differently: and with good reason; for it appears undeniable, that this tribunal was instituted before Solon. But the best authorities allow him the honour of its restoration. The city of Athens, governed till this time by tribunals of a circumscribed jurisdiction, which were multiplied by the most trifling accidents and circumstances, took no fixed political or civil form, however closely united the members of those tribunals were by their general views towards the public good, and by the common love of their country. As each of those tribunals could only act in proportion to the power delegated to it, it was impossible that so many different and unequal impressions should give to the great machine of the state that uniform and regular movement which, by an impulse always the same, would keep each part in the situation it should maintain with relation to the whole. Areopagus.

To effect this universal and harmonious power, it was necessary to unite the different channels of public authority, which, by being too much distributed, lost its force. This authority Solon collected, and placed it all in the court of Areopagus, which consequently became the mainspring of the government. The judges of this court, who, under Draco, decided only in cases of murder, now took cognizance of crimes of every kind: and the same tribunal which inflicted capital punishment on murder, poisoning, burning of houses, theft, &c. struck at the roots of those crimes, by arraigning idleness, luxury, and debauchery. Equally attentive to stimulate the indolence of the young, and the languor of the old, these sage judges roused in the one the laudable ambition to serve the state, and restored to the others their former activity. Satisfied that extremes produce the same effects, they thought the republic had as much to fear from the excess of wealth as from the gripe of poverty. Hence they exacted a minute account of the effects of every individual. Hence their great severity to those idle citizens, who, instead of being useful members in a state, are its bane, and its dishonour. Isocrates draws a most beautiful and striking picture of those venerable and astonishing men, and of the order and harmony which flourished in Athens by their wise administration.

The judges of the Areopagus, says that author, were more industrious to prevent crimes, by representing them in an odious light, than to establish modes of punishment. It was their opinion, that the enemies of the state were the instruments destined by the gods to punish the wicked; but that it was their province to correct and reform public and private manners. They were vigilantly attentive to the conduct of all the citizens, but particularly to that of the youth. They well knew that the impetuosity of juvenile passion gave the most violent shocks to health and growing virtue; that it was the duty of inspectors of education to soften the austerity of moral discipline with innocent pleasure; and that no recreations were more eligible than bodily exercises, which enable a young man to give a good education its full play, which improve health, give a pleasurable and agreeable vivacity, and even fortify the mind. The fortunes of the Athenians were too unequal to admit the same mode of education; and therefore the youth were trained in a manner suitable to the rank and circumstances of their respective families.

Areopagus. lies. Those of the inferior classes were taught agriculture and commerce; from this principle, that idleness is followed by indigence, and that indigence excites to the most daring and atrocious crimes. Having thus endeavoured, by wise precautions, to preclude the entrance of moral evil, they thought they had little to fear.

Exercises of the body, such as horsemanship and hunting, were objects of education to the youth of liberal fortune. In this sage distribution, their great aim was to prevent the poor from committing crimes, and to facilitate to the rich the acquisition of virtue. Not satisfied with having established good laws, they were extremely careful to see that they were observed. With this view they had divided the city into quarters, and the country into cantons. Thus every thing passed under their eyes; nothing escaped them; they were acquainted with the private conduct of every citizen. Those who had been guilty of any irregularity, were cited before the magistrates, and were reprehended, or punished in proportion to their misdemeanour.

The same Areopagites obliged the rich to relieve the poor. They repressed the intemperance of the youth by a severe discipline. Corruption in magistrates was suppressed by the punishments denounced against it; and the old men, at the sight of the employments of the young, felt themselves animated with a degree of juvenile vigour and activity.

Religion came likewise under the cognizance of the Areopagites. Plato durst never, we are told by Justin Martyr, divulge his private opinion concerning the Deity. He had learned from the Egyptians the doctrine of Moses. It appeared to him the best, and he embraced it with ardour. But his dread of the Areopagites, who were attached to the prevailing system, would not permit him even to name the author of sentiments which opposed the common tradition.

The public edifices, the cleanness of the streets, the pay of the soldiers, the distribution of the public money; in a word, whatever interested the republic, was under the direction of the Areopagus. The people themselves, jealous as they were of their power, did nothing without consulting this assembly, and suffered it, without a murmur, to amend their precipitate decrees. Yet this authority, however great it may seem, was subject to the laws; by them rewards and punishments were determined; and those respectable judges gave an account of the exercise of their trust to public censors, who were placed betwixt them and the people to prevent the aristocracy from growing too powerful.

The most important qualifications were required in those who entered into the Areopagus. Solon made a law, by which they who had not been archons for a year should not be admitted members of the Areopagus. To give more force to his law, he subjected himself to it, and was only admitted on that title. This was but the first step; those annual magistrates, after having given law to the republic, were interrogated on their administration. If their conduct was found irreproachable, they were admitted Areopagites with eulogium; but the smallest misconduct excluded them from that honour for ever. What administration was not to be expected from a tribunal so well composed! what veneration was not due to men of such rare talents and virtue! Such respect was paid them, that people presumed not to laugh in their presence; and so well established was their reputation for equity, that those whom they condemned, or dismissed without granting their petition, never complained that they had been unjustly treated. Areopa s.

The edifice of the Areopagus was extremely simple; and its roof, which was at first of the most common materials, remained in that state till the time of Augustus. This we learn from Vitruvius. Orestes was the first who thought of embellishing it. He raised in it an altar to Minerva. He likewise adorned it with two seats of solid silver; on one of which the *accuser* sat, and the *accused* on the other. The one seat was consecrated to *Injury*, and the other to *Impudence*. This religious sketch was brought to perfection by Epimenides, who erected altars to those allegorical deities, and soon after a temple, which Cicero mentions in his second book of laws. This temple corresponded with that which Orestes had built to the Furies, who brought him to Athens, and procured him the protection of Minerva. Epimenides dedicated it a second time to the Furies, or *severe Goddesses*, as they were termed by the Athenians. A man was thought lost without resource, and a victim to every human ill, if he enforced a perjury by invoking the sacred name of those tremendous divinities.

Those who employed their thoughts in solving the mysteries of Paganism, imagined that the Eumenides had their temple so near the court of Areopagus, that they might enlighten the judges by their inspiration, and, by their continual assistance, prevent them from committing those errors to which human weakness is liable. To propitiate those terrible deities, and to procure their favour for the Areopagus, they were worshipped with great punctuality and devotion; and the senate itself appointed their priests. Demosthenes had been nominated to preside over their sacrifices; and he thought it very extraordinary, that he to whom the republic had confided so important an office, should be publicly impeached.

It was natural to associate with the Eumenides the other deities who shared with them the sovereign empire over the dead. Epimenides placed in their temples the statues of Pluto, of Mercury, and of Tellus. They were all, according to Pausanias, of an agreeable form. Each of them was placed upon an altar, on which the citizens, or strangers, who had been acquitted by the Areopagus, made their grateful offerings. But it was not to gratitude alone that these several deities owed all the incense that smoked upon their altars. They who had been accused before the senate, harassed with superstition, and uncertain how these deities would be affected towards them, were lavish of sacrifices to obtain their clemency, by which they hoped their judges would likewise be influenced.

The tomb of Oedipus was another of the ornaments of the Areopagus. It was in the outward court of the Areopagus, where a barge was likewise placed, which made a part of the pomp at the public games.

Whatever homage and implicit obedience the court of Areopagus might derive from all this religious parade, the public good was always dearer to them than

Areopagus. than any lower advantages they might have drawn from the altars and temples with which they were surrounded.

The senate assembled in a hall built on the summit of a hill, which was ascended with difficulty by the old men bent with age. However, as for some time they only assembled on the three last days of each month, they bore with patience this inconvenient situation. But public affairs multiplied to such a degree, that they were obliged to add to their three former sittings a fourth, which was held on the seventh day of the month, and which was soon succeeded by an assembly every day. Their meetings were so regular, that they were not interrupted by the most solemn festivals, till Cephisodorus was archon, who, in the third year of the 105th Olympiad, made a decree, which obliged the Areopagites to celebrate, after the example of the other courts, the Apaturian feasts, which lasted five days.

This assiduous and painful exercise of their office made the Areopagites feel all the inconvenience of the situation of their tribunal, and determined them to remove it to a part of the city called the *Royal Portico*. It was a square, exposed to all the inclemencies of the weather. When the judges, who assembled there in profound silence, had taken their places, they were enclosed by a thread, or rather a cord, drawn around them.

They held their assemblies in the night, that their attention to public affairs might not be diverted by external objects,—and (adds Lucian) that they might only be influenced by the arguments, and not by the presence and action, of the speakers. This circumstance explains a passage in Athenæus, who tells us, that none knew the numbers nor faces of the Areopagites. The custom of administering justice in the open air was not peculiar to them. It was followed by all the other tribunals when they tried for murder: for two reasons; —1st, That the judges, the sworn protectors of innocence, might not be hurt by being under cover with criminals, whose hands were polluted with blood. 2dly, That the accuser and the accused might not be under the same roof.

When all the members of the senate were convened, a herald enjoined silence, and ordered the people to retire. As soon as they had departed, the assembly proceeded to business; and as they deemed the least preference a flagrant injustice, the causes which they were to determine were drawn by a kind of lottery; and the same chance which brought them up, distributed them to different numbers of judges, small or great, according to the importance of the several causes.

In early times, the parties themselves stated their cause in a simple manner. The eloquence of advocates was thought a dangerous talent, fit only to varnish crimes. But afterwards the Areopagus, on this point, relaxed from their severity; at first the accused, and soon after the accusers, were permitted to engage those to make the attack and the defence, whose profession it was to exert the art of speaking for others with accuracy and elegance.

Sextus Empiricus seems not to have sufficiently distinguished times, where he says, that the court of Areopagus did not suffer those who are to be tried at Areopagus. their bar to avail themselves of the abilities of others.

What undoubtedly led him into that mistake, was an inviolable custom of that tribunal, which prohibited, in pleadings, all that warm and picturesque oratory which seduces the judgment and inflames the passions. When the suffrages were collected, each person gave his in silence. They voted with a small flint, which they held betwixt the thumb and the two next fingers, and which they put into one of the two urns that stood in a corner of the hall. One stood before the other. The first was called the *urn of death;* the second, the *urn of compassion*. That of death was of brass, and was termed *proper;* that of compassion was of wood, and was termed *improper*. The judges commonly brought their flint to the assembly, and put it into the urn; but, that all the suffrages might be collected, the herald took the two urns, and presented them, one after another, to every senator, commanding him, in the name of the republic, no longer to defer his acquittal or condemnation.

From this method of giving sentence, which was called κρυβδην ψηφος, because it kept the vote of each person undiscovered, the Thirty Tyrants, to make themselves masters of the decisions of the Areopagus, substituted another, by means of which they knew exactly the opinion of each of the judges; for they obliged them to bring their flints publicly, and lay them upon two tables placed before them, the situation of which was quite opposite to that of the urns; for the first of those tables was that of *life*, and the second that of *death*.

The first substances with which they gave their suffrages were not small pieces of the bones of a hog, as some authors assert, but sea-shells; for which pieces of brass, of the same form, termed *spondyla*, were afterwards substituted. The substances with which they voted were distinguished by their form and colour. Those which condemned were black, and perforated in the middle; the others were white, and not perforated. The precaution of piercing the black ones tends to prove, what we have already observed, that the court of Areopagus sat in the night: for what end did it serve to pierce the black shells, or flints, if the judges could have seen them and the white ones, and consequently have distinguished their colours by the assistance of the light? But as they passed sentence in the dark, it is evident that a difference besides that of colour was necessary, to know the black ones from the white. The judges were likewise permitted to multiply, at pleasure, the distinctions between signs, which essentially distinguished the fates of men.

After the suffrages were collected, they were taken out of the two urns, and put into a third vase of brass.

They were then counted; and as the number of white or of black flints was higher or inferior, one of the judges drew with his nail a shorter or a longer line on a tablet with a waxen surface, on which the result of each cause was marked. The short line expressed acquittal; the long, condemnation.

With regard to the emoluments of the judges, they were as moderate as those of the advocates. The length of the process did not enhance its expence; and when the decision of a cause was postponed till the next day, the committee were only paid an obolus on that day. Hence Mercury, in Lucian, is surprised that such

sensible

Areopagus. sensible old men as the senators of Areopagus were should sell at so low a price the trouble of ascending so high.

As to the number of the judges which composed the Areopagus, some authors, attentive only to a part of Solon's regulations, by which he enacted, that for the future, none but the nine archons should be admitted members of the Areopagus, have imagined, that this tribunal was filled anew every year, and that it never consisted of more than nine magistrates. This opinion, and some others, are refuted by the circumstantial account which Diogenes Laertius gives us of the condemnation of Socrates. This great man had wished to substitute a rational hypothesis for the fabulous and extravagant system of religion which prevailed in his time. His project, however laudable, appeared impious in the eye of superstition. Information was laid against him before the Areopagus, and he had as many accusers as fellow-citizens. After the charges and the answers were heard, they proceeded to suffrages. The opinions were divided, but not equally, for the number of those who condemned him exceeded by 281 the number of those who declared him innocent. He made an ironical reply to this iniquitous sentence, by telling his judges, that he took it for granted they would admit him to a maintenance in the Prytaneum. On this sarcasm, 80 of those who had voted in his favour forsook him, went over to the opposite party, and condemned him to die. Here then we have 361 judges who condemn; to whom if we add those who persist in acquitting him, the number must be very considerable.

Of all the judgments of the Areopagus, the most famous one, excepting that of Mars, was the sentence which they passed on Orestes. His trial, which happened under Demophoon the 12th king of Athens, in 375 of the Attic era, owed all its fame to a remarkable circumstance, that gave rise to a custom which was observed ever afterwards. Orestes had killed his mother. He was accused before the Areopagus, and cited to appear in that court. He would have lost his life in consequence of the equal division of the votes, had not Minerva, moved with his misfortunes, declared herself for those who had absolved him, and joined her suffrage to theirs. Thus Orestes was saved. In veneration to this miracle, the Areopagites, whenever the suffrages were equally divided, decided in favour of the accused, by granting him what they termed *the shell of Minerva.* Cephalus and Dedalus were condemned by the Areopagus long before the time of Orestes.

We find in ancient authors some decisions of this tribunal, which bear the strongest marks of justice, though their objects are not interesting. We shall here quote an anecdote from Aulus Gellius, and Valerius Maximus, of a woman who was accused of having poisoned her husband and her son. She was taken and brought before Dolabella, who was then proconsul of Asia. She was no sooner in his presence than she owned the fact: and added, that she had very good reasons for putting her husband and her son to death.—"I had (said she) to my first husband a son whom I tenderly loved, and whose virtues rendered him worthy of my affection. My second husband, and the son whom I bare to him, murdered my favourite child. I thought it would have been unjust to have suffered those two monsters of barbarity to live. If you think, Sir, that I have committed a crime, it is your province to punish it; I certainly never shall repent of it." This affair embarrassed Dolabella. She was afterwards sent to the Areopagus; and that court, when they had examined her a long time, ordered her and her accuser to appear before them again a hundred years after, from the first day of her trial. Areopa Arequi

We must not, however, suppose that the Areopagus always preserved its old reputation; for such is the constitution of human affairs, that perfection, with regard to them, is a violent, and consequently a transitory state. Pericles, who lived about 100 years after Solon, to flatter the people and win them to his party, used his utmost efforts to weaken the authority of the Areopagus, which was then disliked by the multitude. He took from it the cognizance of many affairs which had before come under its jurisdiction; and to forward his design of humbling it, employed the eloquence of Ephialtes, whose talents were formidable, and who was an avowed enemy to the great men of Athens.

The Areopagus itself seemed to second the endeavours of a man who projected its ruin, and by its misconduct hastened its fall. The old rules of the court, by which none were admitted its members but those whose unexceptionable conduct would support its majesty, seemed too severe. They grew less delicate in their choice; and presuming that the faults with which they dispensed, would soon be reformed in the society of so many good examples, vice imperceptibly crept among them: corruption, at first secret and timid, grew insensibly open and daring, and made such progress, that the most shameful crimes were soon exhibited on the stage; and they were not copied from the low and abandoned multitude, but from those senators, once the venerable and austere censors of idleness and of vice. Demetrius, the comic poet, wrote a piece which he entitled *The Areopagitæ*, where he strips the mask off those hypocritical legislators, who were now equally apt to be seduced by wealth and by beauty. So much had the Athenian senate degenerated in the days of Isocrates, cir. 340 years before the Christian era.

Before this tribunal St Paul was called to give an account of his doctrine, and converted Dionysius one of their number.

The end of this court of judicature is as obscure as its origin, which was derived from very remote antiquity. It existed, with the other magistracies, in the time of Pausanias, i. e. in the 2d century. The term of its subsequent duration is not ascertained; but a writer, who lived under the emperors Theodosius the Elder and Younger, in the 5th century, mentions it as extinct.

AREQUIBA, a city of Peru in South America, situated in W. Long. 73°, S. Lat. 17°. It is one of the most beautiful cities in all Peru, being delightfully situated in the valley of Quilca, 100 leagues from Lima, and 20 from the sea, with which it communicates by a fine river. The entrance into the harbour is rather shallow for ships of great burden; but when once they are entered, they may ride securely in 18 fathoms water. This city was founded in 1539, by order of Don Francisco Pizarro, in a place known likewise by the name of *Arequiba;* but its situation being found disadvantageous,

Arequiba || Arethusa.

disadvantageous, the inhabitants obtained leave to remove to the place where the city now stands. The houses are built with stone, and vaulted; and, contrary to what is usual in warm countries, they are lofty, neatly furnished within, and finely decorated on the outside. The inhabitants are also exempt from many diseases common in other parts of Peru; which perhaps is owing to their keeping the streets clean by means of canals which extend to the river. The temperature of the air is extremely good; and though sometimes a slight frost is perceivable, the cold is never excessive, nor the heat troublesome, so that the surrounding fields are clothed with perpetual verdure. These natural advantages, however, are considerably allayed by its being very subject to earthquakes, by which it has already been five times laid in ruins; notwithstanding which, it is populous, and has among its inhabitants some of the noblest families in America.

ARES, a word of Paracelsus's, by which he would express that power of nature in the whole material world, by which species are divided into individuals.

ARETÆUS of Cappadocia, a Greek physician of the sect of the Pneumatists, lived in the reign of Augustus, according to some; according to others, under Trajan or Adrian. He wrote several treatises in the Ionian dialect, on acute diseases, and other medicinal subjects; some of which are still extant. The best edition of his works is that of Boerhaave, in Greek and Latin, with notes, printed in 1731: that of Wigan, printed at Oxford in 1723, in folio, is also much esteemed.

ARETHUSA, in *Fabulous History*, the daughter of Nereus and Doris, and the companion of Diana, who changed her into a fountain to deliver her from the pursuit of her lover Alpheus.

ARETHUSA, a celebrated fountain near the city of Syracuse in Sicily, famous for the quantity of its waters, and the number of fishes it contained. Many fables were invented by the ancients concerning this fountain. They had also a notion that the river ALPHEUS ran under or through the waters of the sea, without mixing with them, from Peloponnesus to Sicily. Mr Brydone informs us, that it still continues to send forth an immense quantity of water, rising at once to the size of a river, but is entirely abandoned by the fishes it formerly contained in such plenty. At some distance from Arethusa is a fountain of fresh water, which boils up very strongly in the sea, insomuch that, after piercing the salt water, it may be sometimes taken up very little affected by it. This fountain Mr Brydone thinks the ancients were ignornant of, or they would not have failed to use it as an argument for the submarine journey of the Alpheus.

Mr Swinburne describes this once famous fountain as a large pool of water near the quay, defended from the sea by a wall, and almost hidden by houses on every other side. The water is not salt, but brackish, and fit for no purpose but washing linen. "This (says he) is the celebrated fountain of Arethusa, whose soft poetical name is known to every reader. The fable of the nymph and her constant lover Alpheus, the excellency of the spring, and the charms of its situation, are themes on which ancient and modern poets have indulged their fancy, and exercised their pens. Alas, how altered! rubbish chokes up its wholesome sources; the waves have found a passage through the rocks, which repeated earthquakes have split; and not a fish is to be seen in it. Sometimes, after an earthquake, it has been left dry; and, at other times, the whole mass of its waters has been tainted by subterranous effluvia. Its fountain head probably lies among the neighbouring hills."

Arethusa || Aretin.

ARETHUSA. See BOTANY *Index*.

ARETIA. See BOTANY *Index*.

ARETIN, GUIDO, famous for his musical improvements, lived in the 13th century. He was a native of Arezzo, a city in Tuscany; and having been taught the practice of music in his youth, and probably retained as a chorister in the service of the Benedictine monastery founded in that city, he became a monk professed, and a brother of the order of St Benedict.

In this retirement he seems to have devoted himself to the study of music, particularly the system of the ancients, and, above all, to reform their method of notation. The difficulties that attended the instruction of youth in the church offices were so great, that, as he himself says, ten years were generally consumed barely in acquiring the knowledge of the plain song; and this consideration induced him to labour after some amendment, some method that might facilitate instruction, and enable those employed in the choral office to perform the duties of it in a correct and decent manner. If we may credit those legendary accounts that are extant in old monkish manuscripts, we should believe he was assisted in his pious intention by immediate communications from heaven: some speak of the invention of the syllables as the effect of inspiration: and Guido himself seems to have been of the same opinion, by his saying it was revealed to him by the Lord; or, as some interpret his words, in a dream: but graver historians say, that being at vespers in the chapel of his monastery, it happened that one of the offices appointed for that day was the hymn * to St John.

UT queant laxis *REsonare fibris*
MIra gestorum *FAmuli tuorum*
SOLve pollutis *LAbiis reatum,*
Sancte Joannes.

* Composed by Paul, a deacon of the church of Aquileia about the year 770.

During the performance of the hymn, he remarked the iteration of the words, and the frequent returns of UT, RE, MI, FA, SOL, LA: he observed likewise a dissimilarity between the closeness of the syllable MI and the broad open sound of FA, which he thought could not fail to impress upon the mind a lasting idea of their congruity; and immediately conceived a thought of applying these six syllables to perfect an improvement either then actually made by him, or under consideration, viz. that of converting the ancient tetrachords into hexachords.

Struck with the discovery, he retired to his study, and having perfected his system, began to introduce it into practice; the persons to whom he communicated it were the brethren of his own monastery, from whom it met with but a cold reception, which in the epistle to his friend, he ascribes undoubtedly to its true cause, envy: however, his interest with the abbot, and his employment in the chapel, gave him an opportunity of trying the efficacy of his method on the boys who were training up for the choral service, and it exceeded the most sanguine expectation. "To the admiration of all (says Cardinal Baronius) a boy there-

Aretin.

by learnt, in a few months, what no man, though of great ingenuity, could before that attain in several years."

The fame of Guido's invention soon spread abroad, and his method of instruction was adopted by the clergy of other countries. We are told by Kircher, that Hermannus, bishop of Hamburgh, and Elviricus bishop of Osnaburg, made use of it; and by the authors of the *Histoire Literaire a la France*, that it was received in that country, and taught in all the monasteries in the kingdom. It is certain that the reputation of his great skill in music had excited in the pope a desire to see and converse with him; of which, and of his going to Rome for that purpose, and the reception he met with from the pontiff, he himself has given a circumstantial account in the epistle hereafter mentioned.

The particulars of this relation are very curious; and as we have his own authority, there is no room to doubt the truth of it. It seems that John XX. or as some writers compute, the 19th pope of that name, having heard of the fame of Guido's school, and conceiving a desire to see him, sent three messengers to invite him to Rome. Upon their arrival, it was resolved by the brethren of the monastery, that he should go thither attended by Grimaldo the abbot, and Peter the chief of the canons of the church of Arezzo. Arriving at Rome, he was presented to the holy father, and by him received with great kindness. The pope had several conversations with him, in all which he interrogated him as to his knowledge in music; and upon sight of an antiphonary which Guido had brought with him, marked with the syllables agreeable to his new invention, the pope looked upon it as a kind of prodigy; and ruminating on the doctrines delivered by Guido, would not stir from his seat till he had learned perfectly to sing off a verse: upon which he declared that he could not have believed the efficacy of the method, if he had not been convinced by the experiment he had himself made of it. The pope would have detained him at Rome; but labouring under a bodily disorder, and fearing an injury to his health from the air of the place, and the heats of the summer, which was then approaching, Guido left that city upon a promise to revisit it, and explain to his holiness the principles of his new system. On his return homewards, he made a visit to the abbot of Pomposa, a town in the duchy of Ferrara, who was very earnest to have Guido settle in the monastery of that place; to which invitation it seems he yielded, being, as he says, desirous of rendering so great a monastery still more famous by his studies there.

Here it was that he composed a tract on music, entitled *Micrologus*, i. e. "a short discourse;" which he dedicated to Theobald bishop of Arezzo; and finished, as he himself at the end of it tells us, under the pontificate of John XX. and in the 34th year of his age. Vossius speaks also of another musical treatise written by him, and dedicated to the same person.

Most of the authors who have taken occasion to mention Guido, speak of the Micrologus as containing the sum of his doctrine; but it is in a small tract, entitled *Argumentum novi Cantus inveniendi*, that his declaration of his use of the syllables, with their several mutations, and in short his whole doctrine of solmisation, is to be found. This tract makes part of an epistle to a very dear and intimate friend of Guido, whom he addresses thus, "Beatissimo atque dulcissimo fratri Michaeli;" at whose request the tract itself seems to have been composed.

Aretin

Whether Guido was the author of any other tracts, is not easy to determine. It nowhere appears that any of his works were ever printed, except that Baronius, in his *Annales Ecclesiastici*, tom. xi. p. 73. has given at length the epistle from him to his friend Michael of Pomposa, and that to Theobald bishop of Arezzo, prefixed to the Micrologus: and yet the writers on music speak of the Micrologus as of a book in the hands of every one. Martini cites several manuscripts of Guido; namely, two in the Ambrosian library at Milan, the one written about the twelfth century, the other less ancient; another among the archives of the chapter of Pistoja, a city in Tuscany; and a third in the Medico-Laurenziano library at Florence, of the 15th century; these are clearly the Micrologus. Of the epistle to Michael of Pomposa, together with the *Argumentum novi Cantus inveniendi*, he mentions only one, which he says is somewhere at Ratisbon. Of the several tracts above mentioned, the last excepted, a manuscript is extant in the library of Baliol college in Oxford. Several fragments of the two first, in one volume, are also among the Harleian manuscripts now in the British Museum, N° 3199; but so very much mutilated, that they afford but small satisfaction to a curious inquirer.

ARETIN, *Leonard*, one of the most learned men of the 15th century, was secretary to the republic of Florence, and translated from the Greek into Latin some of the Lives of Plutarch, and Aristotle's Ethics: he also composed three books of the Punic war, that may serve as a supplement to those wanting in Livy; the history of the transactions in Italy during his time; that of ancient Greece; that of the Goths; that of the republic of Florence; and many other books. He died in 1443, aged 74.

ARETIN, *Francis*, a man of great reading, and well acquainted with the Greek language. He translated into Latin the Commentaries of St Chrysostom upon St John, and about 20 homilies of the same father; he also translated the Letters of Phalaris into Latin, and wrote a treatise *De balneis Puteolanis*. He studied at Sienna, about the year 1443; and afterwards taught law there with such reputation, that they called him the *Prince of Subtleties*, and his wit became a proverb. He displayed his talents chiefly in disputes, in which nobody could withstand him. He gave his opinions in law with so much confidence, ss to assure those who consulted him that they should carry thair cause: nor did experience contradict him; for it was a common saying at the bar, such a cause has been condemned by Aretin, it must therefore be lost. He taught also in the university of Pisa, and in that of Ferrara. He was at Rome under the pontificate of Sixtus IV. but did not stay here long; for he soon perceived that the great hopes which he had built upon his reputation would come to nothing. This pope, however, declared he would have given him a cardinal's hat, had he not thought he should have done a public injury by depriving the youth of such an excellent professor. When old age would not permit him to go through the duties of his office, they dispensed with his reading

Aretin, Aretologi.

of lectures, and his salary was continued. He continued, however, sometimes to mount the chair; and although his lectures had now but little spirit in them, yet he had still many hearers on account of his reputation. One day when the students were gone to some public shows, there were but 40 persons in his auditory; which so mortified him, that he threw away his book: and crying out, "Aretin shall never explain law to a few persons," retired in a passion, and would teach no more. He was severe in his temper, and never kept a servant longer than a month or two; for it was a maxim of his, "that new-hired servants always served best." He was honoured with the title of *knight*, and spent all his life in celibacy; and his way of living was so parsimonious, that he was thereby enabled to amass a great deal of wealth. He had designed this wealth for the maintenance of a college; but he altered his resolution, and left it to his relations.

ARETIN, *Peter*, a native of Arezzo, who lived in the 16th century. He was famous for his satirical writings; and was so bold as to carry his invectives even against sovereigns, and from thence got the title of the *Scourge of Princes*. Francis I. the emperor Charles V. most of the princes of Italy, several cardinals, and many noblemen, courted his friendship by presents, either because they liked his compositions, or perhaps from an apprehension of falling under the lash of his satire. Aretin became thereupon so insolent, that he is said to have got a medal struck, on one side of which he is represented with these words, IL DIVINO ARETINO; and on the reverse, sitting upon a throne, receiving the presents of princes, with these words, I PRINCIPI TRIBUTATI DA POPOLI, TRIBUTANO IL SERVIDO LORO. Some imagine that he gave himself the title of *Divine*, signifying thereby that he performed the functions of a god upon earth, by the thunderbolts with which he struck the heads of the highest personages. He used to boast, that his lampoons did more service to the world than sermons; and it was said of him, that he had subjected more princes by his pen than the greatest had ever done by their arms. Aretin wrote many irreligious and obscene pieces; such are his dialogues, which were called *Ragionamenti*. There is likewise imputed to him another very obscene performance, *De omnibus Veneris schematibus*. "It was about the year 1525 (says Mr Chevillier*) that Julio Romano, the most famous painter of Italy, instigated by the enemy of the salvation of mankind, invented drawings to engrave 20 plates; the subjects are so immodest that I dare only name them. Peter Aretin composed sonnets for each figure. George Vasari, who relates this in his Lives of the Painters, says, he does not know which would be the greatest impurity, to cast one's eyes upon the drawings of Julio, or to dip into the verses of Aretin." Some say that Aretin changed his libertine principles; but however this may be, it is certain that he composed several pieces of devotion. He wrote a paraphrase on the penitential psalms, and another on Genesis; he wrote also the Life of the Virgin Mary, and that of St Catharine of Sienna, and of St Thomas Aquinas. He was author likewise of some comedies. He died in the year 1556, at the age of 65.

* *Origin de l'imprimerie de Paris*, p. 224.

ARETOLOGI, in antiquity, a sort of philosophers, chiefly of the Cynic or Stoic tribe, who having no school or disciples of their own, haunted the tables of great men, and entertained them in their banquets with disputations on virtue, vice, and other popular topics. These are sometimes also denominated *Circulatores Philosophi*. In this sense, the word is derived from the Greek αρετη, *virtue*, and λογος, *discourse*. Some authors choose to derive the word from αρετος, *gratus*, "agreeable;" and define Aretologi, by persons who strive to divert and entertain their audience with jokes and pleasant tales; which latter seems the more natural explication.

Aretologi || Argeia.

AREZZO, a city of Italy, in Tuscany, seated in the territory of Florence, on the declivity of a hill that overlooks the neighbouring plain, between the Citta di Castelli and Florence. It is an ancient city and a bishop's see; and was famous for a kind of earthen ware much esteemed by the Romans. It was greatly fallen to decay when Cosmo de Medicis took it under his protection; since which it has been recovering gradually. It is famed for being the birthplace of Mecænas. E. Long. 12. 2. N. Lat. 43. 27.

ARGEA, or ARGEI, in Roman antiquity, thirty human figures made of rushes, thrown annually by the priests or vestals into the Tiber, on the day of the ides of May.—Plutarch, in his Roman Questions, inquires why they are called *Argea*. There are two reasons assigned. The first, that the barbarous nations who first inhabited these parts cast all the Greeks they could meet with into the Tiber: for Argians was a common name for all Grecians: but that Hercules persuaded them to quit so inhuman a practice, and to purge themselves of the crime by instituting this solemnity. The second, that Evander, an Arcadian, and a sworn enemy of the Argians, to perpetuate that enmity to his posterity, ordered the figures of Argians to be thus cast into the river.

ARGEIA, or ARGOLIS, a district of Peloponnesus, situated between Arcadia to the west, the Egean sea to the east, Laconia and the Sinus Argolicus to the south, and to the north the territory of Corinth and the Sinus Saronicus (Livy, Ptolemy); so called from ARGOS, the capital: Now *Romania di Morea*.

By the Greeks the people were called *Argeii*, from *Argi* or *Argos*; by the Romans, *Argivi*, Argives. They were a colony who migrated, it is said, from Egypt, under the command of Inachus. Polemon and Ptolemy Mendesius, ancient Greek writers, inform us, that Inachus was contemporary with Amosis, who demolished Avaris, and expelled the shepherds out of Egypt. If, with some learned chronologers, we suppose Inachus to have begun to reform the Argives B. C. 1856, and to have died B. C. 1808, he must have been coeval with Amosis, who reigned in Upper Egypt 15 years before the expulsion of the shepherds, and 10 years after that event, which happened B. C. 1806. Inachus was styled the *Son of the Ocean*, because his origin was not known, or because he had come by sea into Greece. Before his arrival the inhabitants were rude and barbarous. These he united and civilized, and instructed in various arts. His son Phoroneus instituted the laws of government; and, on that account, has been called the *first king in Argos*, the *first of men*, and the *father of mortals*. The family of Inachus, after having kept possession of the

Argeia || Argentaria.

throne 347 years, were expelled by Danaus, who arrived B. C. 1509 with a colony from Canaan. Acrisius, the last king of Argos, died B. C. 1313; and was succeeded by Perseus, his grandson, who transferred the seat of government to Mycenæ, 544 years from the first year of Inachus, in the reign of Cecrops II. king of Athens, and about the time when Pelops the son of Tantalus king of Phrygia, having been compelled by Ilus to leave his native country, came into Greece with great wealth, and acquired supreme power in the region afterwards called by his name. In the 37th year of Eurystheus, grandson of Perseus, the Argonautic expedition happened, i. e. B. C. 1224. This unjust and tyrannical prince had assigned to Hercules his tasks; and, after the death of that hero, he banished all his children. These were the Heraclidæ who fled to Athens for protection, and who returned to Peloponnesus 50 years after the destruction of Troy. In the reign of Agamemnon, the Trojan war commenced, and it was carried on with vigour during the space of ten years. In the year B. C. 1184, Troy was taken, and the war was concluded. Scarcely had the Grecians settled in their own country after their return from this dangerous expedition, when the posterity of Hercules invaded Peloponnesus, took possession of it, and divided it among themselves. Here the kingdom of Mycenæ ended, and that of Sparta was established on its ruins. See SPARTA.

ARGEMONE, PRICKLY POPPY. See BOTANY *Index*.

ARGENCES, a town of France, in Lower Normandy, now the department of Calvados, on the river Meance. W. Long. 0. 10. N. Lat. 49. 15.

ARGENT, the common French word for *silver*, of which metal all white fields or charges are supposed to consist. Argent of itself is used in heraldry to signify purity, innocence, beauty, and gentleness; and, according to G. Leigh, if it is compounded with

Gul.	it signifies	boldness;
Azu.		courtesy;
Ver.		virtue;
Pur.		favour;
Sab.		religion;

ARGENTAC, a town of France, in the Limosin, on the river Dordogne. E. Long. 2. 3. N. Lat. 45. 5.

ARGENTAN, a town of France, in the department of Orne, and in the diocese of the Seez. It is seated on an eminence, in the middle of a fertile plain, on the banks of the river Orne, and has a considerable trade in lace. E. Long. 0. 5. N. Lat. 48. 54.

ARGENTARIA, a town of ancient Gaul, thought to stand in the place where the city Colmar now stands. It is remarkable for a great victory gained by the emperor Gratian over the Lentienses, in the month of May, A. D. 378. The Romans being but few in number, were at first overpowered, and obliged to give ground; but soon returning to the charge, they gained in the end a complete victory. Thirty thousand of the barbarians, and among the rest their king Triarius, were killed on the spot; and all the rest, except 5000, taken prisoners.

ARGENTARIA *Creta*, pure white earth, found in Prussia, and much esteemed for cleaning plate.

ARGENTARIUS is frequently used in Roman writers for a money-changer or banker. The argentarii were moneyed people, who made a profit either by the changing, or lending of money at interest. These had their *tabernæ*, or offices, in the *forum Romanum*, built there as early as the reign of L. Tarquinius Priscus. The argentarii and fœneratores were much hated on account of their covetousness and extortion.

Argentarius || Argenti

ARGENTATI MILITES, in antiquity. Livy, lib. vi. speaks of *argentati milites*, as distinguished from *aurati*. Aquinas supposes these to have been similar to the argyraspides and chrysaspides; but the descriptions do not quadrate. Livy only represents the argentati as clothed in white linen coats.

ARGENTEUIL, a town of the Isle of France, seated on the river Seine, five miles north-west of Paris. It is a very beautiful place, with fine vineyards. In the environs are quarries of stucco. In the Benedictine priory they pretend to have the seamless coat of Christ. E. Long. 2. 28. N. Lat. 48. 52.

ARGENTIERE, a small island in the Archipelago, near Milo. It is about 18 miles in compass; and is full of barren mountains, producing nothing but barley, cotton, and a few grapes fit only for eating. The barley and cotton are sown round the only village there is in the island. The ladies are handsome enough, have no other employment but making cotton stockings, and take up with the sailors, who put into the port. The men all use the sea, and in time become good pilots. They have very little religion, are very ignorant, and of very bad morals. Justice is administered by an itinerant cadi, who is sometimes the only Mussulman in the whole island. The only article relating to natural history is the terra cimolia so highly esteemed by the ancients; it is a kind of white chalk, which is very heavy, without taste, and crumbles easily: they use it in washing linen. E. Long. 23. 10. N. Lat. 36. 50.

ARGENTINA. See ICHTHYOLOGY *Index*.

ARGENTINUS, a deity worshipped by the ancients, as the god of silver coin; as Æsculanus, whom they made his father, was the god of brass money, which was in use before silver.

ARGENTON, a town and county of France, in the department of Indre, divided into two by the river Creuse. Here was formerly a castle; but it was demolished by Lewis XIV. E. Long. 1. 38. N. Lat. 40. 30.

ARGENTORA, *Argentina*, (Notitiæ); *Argentoratum*, (Ptolemy); *Argentoratus*, (Ammian); a city of the Tribocci; one of the fifty forts built by Drusus on the Rhine, (Florus): an appellation formed by the Romans from the German, *Argen Strassen* or *Straten*, "unsafe roads for travellers," from the marauding parties of the garrisons that infested the roads. Now *Strasburg*, in Lower Alsace, on the rivulet Ill, near the Rhine. E. Long. 7. 35. N. Lat. 48. 38.

ARGENTUM ALBUM, in our old customs, silver coin, or pieces of bullion that anciently passed for money. By Doomsday tenure, some rents to the king were paid in *argento albo*, common silver pieces of money; other rents in *libris ursis et pensatis*, in metal of full weight and purity: in the next age, that rent which was paid in money, was called *blanch fearm*,

and

Argentum || Argonautic.

and afterwards *white rent*; and what was paid in provisions, was termed *black mail*.

ARGENTUM *Dei*, *God's penny*, anciently signified earnest money, or money given to bind a bargain; in somes places called *erles*, or *arles*, and by the civilians and canonists, *arrhæ*. *Et cepit de prædicto Henrico tres denarios de argenti Dei præ manibus*.

ARGENTUM *Musivum* is a mass consisting of silver-like flakes, used for the colouring of plaster figures, and for other purposes, as pigment. It consists of an amalgam of equal parts of tin, bismuth, and mercury. It is to be mixed with white of eggs, or spirit varnish, and then applied to the intended work, which is afterwards to be burnished.

ARGENTUM *Vivum*, *Mercury* or *Quicksilver*. See MERCURY, and CHEMISTRY *Index*.

ARGESTES, is used by Vitruvius for the wind which blows from that quarter of the horizon, which is 75° from the south and westward. Ricciolus uses the term to denote the wind which blows at 22° 30′ from the west towards the north, coinciding with that which is otherwise called *west-north-west*.

ARGIL, in *Ornithology*, a species of ardea. See ARDEA, ORNITHOLOGY *Index*.

ARGILLA, CLAY, in *Natural History*. See CLAY.

ARGIVI, or ARGEII, the people of Argeia or Argolis. See ARGEIA.

ARGO, in antiquity, a ship or vessel celebrated among the poets; being that wherein the Argonauts, of whom Jason was the chief, made their expedition in quest of the golden fleece. Jason having happily accomplished his enterprise, consecrated the ship Argo to Neptune; or, as others say, to Minerva, in the isthmus of Corinth; where, they add, it did not remain long before it was translated into heaven, and made a constellation. The generality of authors represent the ship Argo as of a long make, resembling the modern galleys; and furnished with thirty benches of rowers. It could not, however, be of any great bulk, since the Argonauts were able to carry it on their backs from the Danube to the Adriatic sea.

ARGO *Navis*, the *Ship Argo*, in *Astronomy*, is a constellation in the southern hemisphere, whose stars in Ptolemy's catalogue, are 45; in Tycho's 11; in the Britannic catalogue, and Sharp's Appendix, 64.

ARGOB, in *Ancient Geography*, a canton lying beyond Jordan, in the half tribe of Manasseh, and in the country of Bashan, one of the most fruitful on the other side of Jordan. In the region of Argob there were sixty cities, called *Bashan-havoth-jair*, which had very high walls and strong gates, without reckoning many villages and hamlets which were not enclosed, Deut. iii. 4. 14. and 1 Kings iv. 13. But Argob was more particularly the name of the capital city of the region of Argob, which Eusebius says was 15 miles west from Gerasa.

ARGONAUTA. See CONCHOLOGY *Index*.

ARGONAUTIC, something belonging to the Argonauts.

The Argonautic expedition is one of the greatest epochas or periods of history which Sir Isaac Newton endeavours to settle, and from thence to rectify the ancient chronology. This he shows, by several authorities, to have been one generation or about 30 years earlier than the taking of Troy, and 43 years later than the death of Solomon. See CHRONOLOGY. Argonautic, Argonauts.

Dr Bryant, however, rejects the history of the Argonautic expedition as a Grecian fable, founded indeed on a tradition derived from Egypt, and ultimately referring to Noah's preservation, &c. in the ark. But although we are not to believe all the romantic stories which poets, and even some grave historians, have told us of these famous adventurers, yet it seems unreasonable to discredit entirely the Argonautic expedition. See ARGONAUTS.

ARGONAUTICA, in literary history, denotes poems on the subject and expeditions of the Argonauts. We have the *Argonautics* of Orpheus in epic verse, published by H. Stephens; the *Argonauticon* of Valerius Flaccus, in eight books of Latin heroics, in imitation of Apollonius, with respect to which Burman observes that the imitator has often surpassed the original; the *Argonautics* of Apollonius Rhodius, an heroic poem, consisting of four books, *opus*, as Quintilian calls it, *non contemnendum*.

ARGONAUTS, in antiquity, a company of illustrious Greeks, who embarked along with Jason, in the ship Argo, from Colchis, with a design to obtain the golden fleece.

The occasion of this expedition is thus represented by Greek writers. Phryxus, flying with his sister Helle from the rage of their stepmother Ino, the daughter of Cadmus, went on board a ship, whose ensign was a golden ram, and sailed to Colchis (now Mingrelia, part of Georgia). Helle was drowned by the way, in that sea which from her was called the *Hellespont*, now the *Dardanelles*. This, according to some, was the ground of the poetical fable, that a ram with a golden fleece swam away with them to Colchis; and that the Argonauts undertook their famed expedition, in order to find that fleece. But Strabo and Arrian inform us, that it was a practice of the Colchians to collect gold on Mount Caucasus by extending fleeces across the beds of the torrents; and as the water passed, the metallic particles remained entangled in the wool: hence, according to those historians, the adventure was named the *expedition of the golden fleece*. Sir Isaac Newton thinks that this expedition was really an embassy sent by the Greeks, during the intestine divisions of Egypt in the reign of Amenophis, to persuade the nations upon the coasts of the Euxine and the Mediterranean seas, to take that opportunity of shaking off the yoke of Egypt, which Sesostris had laid upon them; and that fetching the golden fleece, was only a pretence to cover their true design.

But the most judicious and satisfactory account of the Argonautic expedition seems to be that given by Dr Gillies in his History of Greece. "The northern districts of Thessaly being peculiarly exposed to the dangerous fury of invaders, the petty princes of that province entered into a confederacy for their mutual defence. They assembled in spring and autumn at Thermopylæ, a place afterwards so illustrious, and then governed by Amphictyon, a descendant of Deucalion, whose name is immortalized in the Amphictyonic council. The advantages which the confederates derived from this measure, were soon perceived by their neighbours. The central states gradually acced-

ed

ed to their alliance; and about the middle of the 14th century before Christ, Acrisius king of Argos, and other princes of Peloponnesus, were allowed to share the benefits and security of this useful association. See AMPHICTYONS.

"After this event, the Amphictyons appear to have long confined themselves to the original purpose of their institution. The states, whose measures were directed by this assembly, found sufficient occupation in defending their own territories; and near a century elapsed, before they undertook, by common consent, any distant expedition. But it was not to be expected that their restless activity could always be exhausted in defensive war. The establishment of the Amphictyons brought together the chiefs most distinguished by birth and bravery. Glory and emulation prompted them to arms, and revenge directed those arms against the barbarians. Jason, Admetus, and other chieftains of Thessaly, having equipped a small fleet in the neighbouring harbour of Iolcus, and particularly the ship Argo of superior size and construction to any before known, were animated with a desire to visit foreign lands, to plant colonies in those parts of them that appeared most delightful, and to retort on their inhabitants the injuries which Greece had suffered from strangers. The princes of the north having proclaimed this spirited design over the central and southern provinces, the standard of enterprise and glory was speedily surrounded by the flower of the Grecian youth, who eagerly embraced this honourable opportunity to signalize their manly valour. Peleus, Tydeus, Telamon, and in general the fathers of those heroic chiefs who in the succeeding age shone with distinguished lustre in the plains of Troy, are numbered among the leaders of the Argonauts. They were accompanied by the chosen warriors, and by the venerable prophets, of their respective tribes; by an Esculapius, the admired father of the healing art; and by the divine Orpheus, whose sublime genius was worthy to celebrate the amazing series of their adventures.

"These adventures, however, have been too much adorned by the graces of poetry, to be the proper subject of historical composition. The designs of the Argonauts are veiled under the allegorical, or at least doubtful, phrase, *of carrying off the golden fleece;* which, though easily explained, if we admit the report that the inhabitants of the eastern banks of the Euxine extended fleeces of wool, in order to collect the golden particles which were carried down by the torrents from Mount Caucasus, is yet described in such various language by ancient writers, that almost every modern who examines the subject, thinks himself entitled to offer, by way of explanation, some new conjecture of his own. But in opposition to the most approved of these conjectures, we may venture to affirm, that the voyage to Colchis was not undertaken with a view to establish extensive plans of commerce, or to search for mines of gold, far less to learn the imaginary art of converting other substances into that precious metal; all such motives expressing a degree of speculation and refinement unknown in that age to the gallant but uninstructed youth of Thessaly. The real object of the expedition may be discovered by its consequences. The Argonauts fought, conquered, and plundered; they settled a colony on the shores of the Euxine; and carried into Greece a daughter of the king of Colchis, the celebrated Medea, a princess of Egyptian extraction, whose crimes and enchantments are condemned to eternal infamy in the immortal lines of Euripides."

ARGONAUTS *of St Nicholas*, was the name of a military order instituted by Charles III. king of Naples, in the year 1382, for the advancement of navigation, or, as some say, merely for preserving amity among the nobles. They wore a collar of shells, enclosed in a silver crescent, whence hung a ship, with this device, *Non credo tempori*, "I do not trust time." Hence these Argonaut knights came to be called *knights of the shell.* They received the order of St Basil, archbishop of Naples; and held their assemblies in the church of St Nicholas, their patron.

ARGOPHYLLUM, WHITE-LEAF (*Forst. Nov. Gen.*); a genus of the monogynia order, belonging to the pentandria class of plants. The capsule is trilocular; the nectarium is pyramidal, pentagonous, and the length of the corolla. There is but one species, the nitidum or glossy, a native of New Caledonia. This genus has great affinity with the ivy; but differs in the nectarium, and perhaps in the fruit.

ARGOS, an ancient name of Peloponnesus; from Argos, one of the kings, (Homer, Strabo).

ARGOS, the capital, and an inland town, of Argolis or ARGEIA. It had different surnames; as *Achaicum*, from the country, or an ancient people, (Homer); *Hippium*, from its breed of horses; and *Inachium*, from the river Inachus, which runs by, or from Inachus the founder of the kingdom, whose name was also given to the river. The Argives related, that this was one of the river gods who adjudged the country to Juno, when she contended for it with Neptune, which deity in return made their water to vanish; the reason why the Inachus flowed only after rain, and was dry in summer. The source was a spring, not copious, on a mountain in Arcadia, and the river served there as a boundary between the Argives and Mantineans.

Ancient Argos stood chiefly on a flat. The springs were near the surface; and it abounded in wells, which were said to have been invented by the daughters of Danaus. This early personage lived in the acropolis or citadel, which was named *Larissa*, and accounted moderately strong. On the ascent was a temple of Apollo on the ridge, which in the second century continued the seat of an oracle. The woman who prophesied was debarred from commerce with the male sex. A lamb was sacrificed in the night monthly; when, on tasting of the blood, she became possessed with the divinity. Farther on was a stadium, where the Argives celebrated games in honour of Nemean Jupiter, and Juno. On the top was a temple of Jupiter, without a roof, the statue off the pedestal. In the temple of Minerva there, among other curious articles, was a wooden Jupiter, with an eye more than common, having one in the forehead. This statue, it was said, was once placed in a court of the palace of Priam, who fled as a suppliant to the altar before it, when Troy was sacked. In this city was also the brazen tower in which Danaë, being confined there by her father, was deflowered by Jupiter.

Argos retains its original name and situation, standing

Argos, Arguim.

ing near the mountains which are the boundary of the plain, with Napoli and the sea in view before it. The shining houses are whitened with lime or plaster. Churches, mud-built cottages and walls, with gardens and open areas, are interspersed, and the town is of considerable extent. Above the other buildings towers a very handsome mosque shaded with solemn cypresses; and behind is a lofty hill, brown and naked, of a conical form, the summit crowned with a neglected castle. The devastations of time and war have effaced the old city. We look in vain (says Mr Chandler) for vestiges of its numerous edifices, the theatre, the gymnasium, the temples, and monuments, which it once boasted, contending even with Athens in antiquity and in favours conferred by the gods.

ARGOS *Amphilochium*, (Thucydides), a city of Acarnania, (Scylax, Pliny); its territory Amphilochia: situated on the east side of the Sinus Ambracius, (Thucydides); distant an hundred and eighty stadia to the south-east of Ambracia, (Polybius). Also called *Argia Amphilochis*, (Mela); *Amphiloci* and *Amphilochici* the people. (Stephanus). The name is from Amphilochus, son of Amphiaraus; and from Argos, the name of his country, in Peloponnesus, (Thucydides).

ARGOS *Hippium*. See ARGOS in Peloponnesus, *supra*.

ARGOS *Hippium*, the ancient name of Arpi; but Lampe is a still more ancient; afterwards called *Argyrippa*, and *Argippa;* built by, and the residence of, Diomedes, on the Cerbalus, (Virgil); afterwards a large and populous city, (Livy): A town of Apulia; now in ruins, and the place called *Arpi*.

ARGOS *Pelasgicum*, (Homer); an appellation denoting Thessaly; so called from the Pelasgi.

ARGOS *Portus*, a port of Tuscany, (Strabo): now Porto Ferrajo, in the north of the island Elba. E. Long. 11. 30. N. Lat. 42. 35.

ARGUIM, an island on the coast of Africa, about sixteen miles distant from Cape Blanco, situated in W. Long. 16. 30. N. Lat. 20. 20. It is scarce two miles in length; notwithstanding which, it was a bone of contention for 87 years between the Portuguese, Dutch, English, and French; and, after a variety of fortune, has at last been totally abandoned.

This island was first discovered by the Portuguese in 1444, when a fleet bound to the east touched at Arguim, and from some little trade carried on with the natives, it was imagined that a settlement there might be of some advantage to Portugal. In consequence of this opinion, a fort was erected on the island, and the Portuguese enjoyed the peaceable possession of it till 1638. At this time, the Dutch having received a minute account of the condition of the island, resolved to attack it: and accordingly landed without molestation from the garrison, which was too weak to oppose them. The Portuguese, however, defended themselves with great intrepidity, and at last surrendered upon honourable terms. The Dutch immediately set about repairing the fortifications, and securing it in the best manner they could: however, in 1665, the fort was reduced almost to a heap of rubbish by an English squadron; but as the fortifications were totally destroyed, and only a small garrison left there, it was easily retaken by the Dutch the next year. They now redoubled their diligence in strengthening the island, entering into alliance with Moorish chiefs, procuring a number of families to settle under protection of the fort, and giving extravagant prices for gums, in order to monopolize the gum trade. By this means the gum trade of the French Senegal Company was almost entirely destroyed; upon which they fitted out a squadron, dispossessed the Dutch, and had the island finally ceded to them by the treaty of Nimeguen.

Arguim || Argus.

Though the Dutch now seemed to be finally expelled, they resolved not to part so easily with such a valuable settlement. Under pretence of being subjects of the elector of Brandenburg, therefore, they erected one of the forts which had been demolished, and there maintained themselves in spite of the utmost endeavours of the French Company to dispossess them. Numberless were the memorials, protests, rescripts, &c. which were published on this occasion, till a new war in 1701 put an end to them. In 1717, however, the French Company having found all their remonstrances ineffectual, fitted out a new squadron; but this armament did not arrive at Arguim before Feb. 26. 1721. The Dutch defended themselves with such intrepidity and conduct as had almost baffled the utmost efforts of the French; but the latter having found means to draw off a Moorish chief from his allegiance, the Dutch were obliged to evacuate Arguim, and retire to Portendic, where they fortified themselves, determining to watch a favourable opportunity for recovering their settlement at Arguim. This was not long wanting, by means of the weakness of the garrison and the imprudence of Duval the French director, who having quarrelled with the Moors, was surprised, defeated, and killed by them; in consequence of which, the settlement fell again into the hands of the Dutch on the 11th of January 1722. In 1723, the Dutch were attacked by another French squadron under the command of the Sieur Riguadiere. This gentleman boasted that the fort could not hold out one day; but though he prevailed so far as to get possession of the cisterns which contained the water of the besieged, he was at last shamefully repulsed, and forced to raise the siege with precipitation. The Dutch, however, did not long enjoy the possession which they had so bravely defended; for, in 1725, their fort was entirely demolished by the French under Du Casse, and has never since been rebuilt by any European nation.

ARGUMENT, in *Rhetoric* and *Logic*, an inference drawn from premises, the truth of which is indisputable, or at least highly probable. See LOGIC.

ARGUMENT, in matters of literature, denotes also the abridgement or heads of a book, history, comedy, chapter, &c. See SYLLABUS.

ARGUMENTATION, the act of inventing, or framing arguments, of making inductions, and drawing conclusions. See INDUCTION, &c.

Argumentation, according to Cicero, is the delivering or unfolding of an argument.—The matter of argumentations is propositions; the form, their due disposition, with regard to one another, so as a conclusion may be drawn from them. See ENTHYMEME, PROPOSITION, RATIOCINATION, SORITES, SYLLOGISM, &c.

ARGUS, in fabulous history, was the son of Aristor, and had 100 eyes, 50 of which were always open. Juno made choice of him to guard Io, whom Jupiter had

Argus || Argyll-shire.

had transformed into a white heifer; but Jupiter, pitying Io for being so closely confined, sent Mercury, who, with his flute, charmed Argos to sleep, sealed up his eyes with his caduceus, and then cut off his head; when Juno, to reward his fidelity, turned him into a peacock, and placed his eyes in his tail.

Argus-shell, a species of porcelain shell, beautifully variegated with spots, resemblimg in some measure those in a peacock's tail.

ARGUTIÆ, witty and acute sayings, which commonly signify something further than what their mere words at first sight seem to import. Writers on rhetoric speak of divers species of argutiæ, viz.

Argutiæ ab alieno, when something is said, which seems repugnant either to the nature and property of a thing, or to common custom, the laws, &c. which yet in reality is consistent therewith; or when something is given as a reason of another, which yet is not the reason of it. For instance, *Si Caius nihil didicisset, errasset minus*; again, *Aureum hoc sæculum est, quia plurimus jam auro honos venit.*

Argutiæ ab allusione, those wherein allusion is made to some history, fable, sentence, proverb or the like; e. g. *Multi umbram captant et carnem amittunt.*

Argutiæ à comparatis, when two things are compared together, which yet at first sight appear very different from each other, but so as to make a pretty kind of simile or dissimile; e. g. *Par est pauper nil cupiens principi omnia habenti.*

Argutiæ à repugnantibus, when two things meet in a subject, which yet regularly cannot be therein; or when two things are opposed to each other, yet the epithet of the one is attributed to the other, e. g. *Dum tacent clamant.*

ARGYLL, Dukes of. See Campbell.

ARGYLLSHIRE, one of the counties of Scotland, supposed to have formed the principal part of the Caledonian kingdom, when the eastern provinces of Scotland submitted to the irresistible power of the Roman empire. It is bounded on the east by the shires of Perth and Dunbarton; on the north by Inverness; on the west and south by the Irish sea and the frith of Clyde, which enter into various bays, sounds, and inlets, round the coast, and form both in the main land and the islands, many spacious and commodious harbours. This county is subdivided into the districts of Kintyre, Knapdale, Argyll Proper, Cowal, and Lorn. Within the same division are also comprehended several Hebudian islands, of which two or three are of considerable extent. Its length from south to north, between the mull of Kintyre and the point of Ardnamurchan, where it joins the shire of Inverness, is about 114 miles, and its breadth, in several places, including the isles, is 70. The total superficies is calculated at 3800 square miles, of which 1063 are insular, and 2735 on the main land.

Similar to the other parts of the Highlands of Scotland, this county presents a very wild and horrid prospect of hills, rocks, and huge mountains, piled upon each other in a stupendous and dreadful disorder, bare, bleak, and barren to the view; or, at best covered with shaggy heath, which appears black and dismal to the eye, except in the summer, when it is variegated with an agreeable bloom of a purple colour. Hence lofty mountains, deep glens, inlets of the sea entering far into the land, form the most striking features in the general aspect of this country. Cruacha-Ben in this county is one of the loftiest mountains in Scotland; and where this county meets the confines of Perth and Dunbarton, the mountains contiguous to Ben-Lomond are but little inferior in height to that mountain. The Loch Fine, Loch Etive, Linnhe Loch, are inlets of the sea. The district of Kintyre enters into the north channel, and is almost divided from the main land at the narrow isthmus of Tarbat. The district of Cowal is also nearly peninsulated by Loch Long on one side and Loch Fine on the other. The interior parts of the county are interspersed with a great number of small fresh-water lakes. A barrenness of soil and scanty vegetation prevail chiefly on the summits of the great mountains, which exhibit great masses of stratified rocks or groups in a columnar form. Even a number of the glens are barren, and afford little pasturage, and are covered in several places with large fragments, which have been separated and precipitated from the impending rocks. On the declivities of the hills and the banks of the lakes there are, however, numerous woods interspersed, which unite with the lofty mountains to form a most romantic scene. In a run of several miles, fertility, verdure, and cultivation, reign through the valley of Glenurchay. Remains of ancient forests are still very extensive in various places; and these consist chiefly of oakes, ashes, pines, and birches. The level of the country, towards the southern parts, descends the nearest to an equality with that of the sea. The elevation of the country is highest towards the interior parts of the counties of Perth and Inverness.

Argy shire

The mountains and forests abound with fallow-deer, roes, stags, and all kinds of wild game; and all over the sea coast, the moors, the heaths, and on the lakes, the wild fowl are numerous. The mountains feed an innumerable quantity of black cattle, which run wild among the hills in winter as well as summer. The circumambient sea, with its lochs, bays, and harbours, pours forth myriads of fish; and in several places of the county iron, copper, lead, and other metals and minerals, have been dug out. Yet, notwithstanding these numerous local advantages, Argyllshire, as well as many other parts of the Highlands, struggles with many great obstacles in the way of improvement. The want of long leases is one of the most material. What inducement can a person have to manure or cultivate a piece of land which he may have taken, when his first work is to erect a hut for himself; and after all the disagreeable inconveniencies attending it, he holds his farm year by year, dependant on the will of his landlord? When he also reflects, that by cultivating his ground in such a manner, the rent which he was this year scarcely able to pay, may be nearly doubled the next year, how can he be able to defray the expence necessarily attending such an improvement, when he is uncertain of a competent return for his labour? It is hoped that proprietors will at length see the manifest advantage that will arise from granting long leases, both to themselves and their tenants; and, by so doing, either to encourage the tenants to build houses, by paying any expence that may remain unpaid at the end of the lease, or build houses for the tenants themselves; and,

by

Argyll-shire.

by these means, they would have surer payment of their rents, which would be augmented; their grounds would be greatly improved, and their vassals would enjoy comfort and ease. Another great obstacle to the general improvement is the rugged face of this county, which renders the great roads few in number, and the intersected roads for the purpose of conveying manure to the grounds being still in their natural rudeness. The chief branch of husbandry followed over the greatest part of this county is the management of sheep, black cattle, and goats. In former times, the ordinary animal stock consisted mostly of black cattle: but within these last 20 years a more skilful method of managing flocks of sheep than was formerly practised, having been introduced by the farmers of the low country; these have been multiplied with great attention and assiduity. Cows and oxen now form only the second considerable branch of the animal stock.

Barley, oats, and potatoes, are the principal articles of crop; and, in some places, the proper manner of tillage has been made use of, excellent manures have been laid upon the ground, and the most suitable rotation of crops has been adopted. In years of ordinary plenty it would appear, that besides affording a considerable surplus to the breweries and distilleries, the grain commonly produced in this county is a sufficient sustenance for its inhabitants. Besides the great profits arising from the iron works and the salmon fisheries, the cutting down of woods has brought much money into Argyll, and still continues to be equally beneficial to the labourer and the landlord.

When the projected canal * shall be completed, and some villages and harbours erected, the populous county of Argyll (Mr Knox affirms) will become one of the most valuable provinces of the British empire. Washed on both sides by the sea; deeply indented by navigable lakes and bays; having an easy communication with the fishing grounds on the north Highlands, with Glasgow and the trading towns on the Clyde, with Ireland, Wales, Whitehaven, Liverpool, Bristol, and other marts on the west coast of England; we may easily conceive, that the period is at no great distance when Argyllshire will become a great commercial county. To corroborate this opinion, he observes, that after a vessel gets under sail from this coast, she enters at once into the Atlantic, where she meets with no interruption till she makes the coast of America or the West Indies. The line, therefore, which nature points out for the inhabitants is that of salt-making, fishing, ship-building, freight or the carrying trade, soap and glass-making, by means of the kelp upon their shores, and sand found upon the islands of Jura and Gigha, which is adapted for the latter.

* This is the Crinan canal, which is now navigable.

In this district the deeds of the celebrated Fingal, whose invincible arm gave a check to the progress of the conquerors of the world, were mostly achieved. Many of the scenes of the battles of that illustrious hero and his gallant followers, which are so beautifully described by Ossian, are still pointed out, and many very ancient monuments still display the warlike spirit of its former inhabitants. In the course of the eighth and ninth centuries, Argyll, along with the neighbouring isles, was conquered by the Danes and Norwegians. For five or six centuries it continued under the dominion of Norway, and during that period, was under the direct administration of feudal chieftains, generally of Norwegian extraction, who each maintained an almost independent government. Along with the Hebudean isles, all the western parts of Argyll became the conquest of the Scottish monarchs in the 14th century. Some time after, Macdonald, the representative of this region, obtained leave from the Scottish crown to hold his possessions as a feudatory to that kingdom; but the turbulent spirit of him and his family could not remain in quietude, and therefore their rebellions were punished with forfeiture. Their estates and titles were bestowed on the *Campbells;* and these have ever since retained them in peace and loyalty, beloved and honoured by their country. The county of Argyll gives the title of *duke* and *earl* to the chief of this family. He likewise enjoys several other important posts under the crown, and is the chief of the Scottish nobility. His vassals are so numerous, that in former times he could on occasion bring 3000 or 4000 fighting men into the field. Argyllshire is generally peopled by this clan, and affords a great number of castles and seats belonging to gentlemen who hold of the duke, and boast themselves descended from his family. Argyllshire sends one member to parliament: it is also the seat of a provincial synod. It contains two royal boroughs and 49 parishes; the population of which is as follows:

See ARGYLESHIRE, SUPPLEMENT.

ARGYRASPIDES, or ARGYROASPIDES, in antiquity, persons armed with silver bucklers, or bucklers silvered.

The argyraspides, according to Quintus Curtius, made the second corps of Alexander's army; the first was the phalanx.—According to Justin's account, lib. xii. cap. 7. Alexander having penetrated into India, and extended his empire as far as the ocean; for a monument of his glory, ordered the armour of his soldiers, and the housings of his horses, to be adorned with silver. And hence commanded them to be called *argyraspides*, from the Greek αργυρος, *silver*, and ασπις, *buckler*.

By this author it should seem, that Alexander's whole army were called *argyraspides*.—After that prince's death, the argyraspides despised all other chiefs of the army, disdaining to obey any other, having borne arms under Alexander.

ARGYRIPÆ, See *ARGOS Hippium*.

ARGYRUNTUM, a maritime town of Illyria (Ptolemy, Pliny). Now Novigrad, a town of Dalmatia. E. Long. 17. 30. N. Lat. 44. 30.

ARHUSEN, a diocese in North Jutland, in Denmark, to the south of Wilburg, about 60 miles in length and 30 in breadth. It contains two capital cities, called *Arhusen* and *Rander*; besides several market towns of less note, and upwards of 300 villages. Arhusen, one of the capitals, is advantageously situated on the coast of the Baltic sea, at the mouth of the river Guda, which runs through it; and it is surrounded with forests full of game. E. Long. 10. 0. N. Lat. 56. 12.

ARIA, one of the ancient names of Thrace, (Stephanus); that is, *martial*, from the character of the people, whose country Euripides calls the residence of Mars, and Sophocles his place of nativity.

ARIA, and *Ariana*, in *Ancient Geography*, whether the same or distinct countries authors are not agreed. Ptolemy has only Aria, and knows nothing about Ariana. Pliny mentions only Ariana, and says nothing about Aria; but distinguishes between the Arii and Ariani: Parthia, he says, has the Arii to the east, Caramania and the Ariani to the south; from which it is conjectured, the Ariani extended farther than the Arii, and comprised the Gedrosii and the Drangæ. Arrian has only Aria and Arii, and is silent about Ariana. But Strabo gives more extensive bounds to Ariana than to Aria, without particularly defining them; only in general he says, that Ariana begins from India, and quotes Eratosthenes; according to whom, Ariana is bounded by the Indus on the east; on the south by the Great sea; by Paropamisus on the north, and by the mountains, quite to the Portæ Caspiæ; on the west by the same boundaries by which Parthia is separated from Media, Caramania from Parætacene and Persia: and thus Ariana is extremely extensive.—Aria has its limits thus described by Ptolemy: On the north, some parts of Margiana and Bactriana; on the east, the Paropamisidæ; on the south the Drangianæ: and Strabo says, the Arii adjoin to the Paropamisidæ on the east.

ARIA, called *Ariapolis*, (Strabo): Now Herat, in Chorasan, set down in an ancient map as situated on the river Arias, which probably gave name to the country Aria. Arrian calls the river *Areios*; Pliny, *Arius*; Ammian, *Arias*: now Heri, which runs by Alexandria, also called *Alexandria Arion* or *Ariorum*.

ARIADNÆA, in Grecian antiquity, two festivals at Naxos, in honour of two women named *Ariadne*. One of them being the daughter of King Minos, they had, in the solemnity dedicated to her, a show of sorrow and mourning; and, in memory of her being left by Theseus near the time of child-birth, it was usual for a young man to lie down and counterfeit all the agonies of a woman in labour. This festival is said to have been first instituted by Theseus, to atone for his ingratitude to that princess.—The other Ariadne was thought to be of a gay and sprightly temper; and therefore her festival was observed with music and other expressions of mirth and joy.

ARIADNE, daughter of Minos king of Crete. Theseus being sent to destroy the Minotaur, Ariadne was so taken with him, that, as a testimony of her love, she gave Theseus a clue of thread to guide him out of the labyrinth. Theseus, having killed the Minotaur, carried off the Athenians he had relieved, together with Ariadne: whom, however, he afterwards forsook.

ARIADNIA, in antiquity. See ARIADNÆA.

ARIANA, in *Ancient Geography*, an extensive country, comprising Paropamisus, Arachosia, Drangiana, and Gedrosia, if we suppose it to reach to the sea. See ARIA.

ARIANNA, a small village six miles north-east from the city of Tunis. Here is a beautiful range of the ancient Carthaginian aqueduct, 74 feet high, supported by columns 16 feet square, and which still increased in grandeur the nearer it approached Carthage. The stones are all diamond cut. Near this spot several ancient mattamones, or subterraneous magazines for corn, have been discovered within these few years, capable of containing 100 bushels, strongly arched with large square stones. The Moors have already begun to demolish them, it being their custom to do so with every thing beautiful as soon as it comes to light.

ARIANO, a town of Italy, in the kingdom of Naples in the Ulterior Principality, with a bishop's see. Mr Swinburne describes it as an ugly city, built upon the uneven summit of a mountain, with an extensive look-out on all sides, but exposed to every blast that blows. It does not appear to be so old as the time of the Romans; therefore may be supposed to owe its rise to the demolition of some neighbouring town, and to the advantages its situation afforded for discovery and defence. It is but a poor place, without

Arianna, Arians.

out trade or manufactures; having declined ever since the desolation caused by an earthquake in 1456. It reckons about 14,000 inhabitants, and no less than 20 parishes and convents, besides an ill-endowed cathedral. The wine made here is pale, like red Champagne, which it also resembles in a certain tartness, exceedingly refreshing in hot weather. The soil lies upon a soft argillaceous stone. At a small distance to the east is a bank consisting of layers of volcanic earths, interspersed with thick strata of oyster shells.

Below the town is a convent of Dominicans, whose house, within these last hundred years, has been thrice rebuilt, having been as often thrown to the ground by earthquakes. The last and most destructive happened in 1732, fatal to all the country that lies along the eastern verge of the Apennines. In order to secure a retreat in case of future accidents, which from their situation they have every reason to expect, these fathers have constructed a small building of wood, the parts of which being joined together with strong iron chains, are contrived so as to have a proper play, and by yielding to the oscillatory motion of the earth, return easily to their equilibrium. E. Long. 15. 19. N. Lat. 41. 8.

ARIANS, followers of Arius, a presbyter of the church of Alexandria about the year 315; who maintained that the Son of God was totally and essentially distinct from the Father; that he was the first and noblest of those beings whom God had created, the instrument by whose subordinate operation he formed the universe; and therefore inferior to the Father both in nature and dignity: afso, that the Holy Ghost was not God, but created by the power of the Son.

The Arians owned that the Son was the Word, but denied that Word to have been eternal. They held, that Christ had nothing of man in him but the flesh, to which the Λογος or Word was joined, which was the same as the soul in us. See *Lardner's Credibility*, &c. vol. ix. book i. c. 69.

The Arians were first condemned and anathematized by a council at Alexandria in 320, under Alexander, bishop of that city; who accused Arius of impiety, and caused him to be expelled from the communion of the church; and afterwards by 380 fathers in the general council of Nice, assembled by Constantine in the year 325. But, notwithstanding that, it was not extinguished; on the contrary, it became the reigning religion, especially in the east, where it obtained much more than in the west. Arius was recalled from banishment by the emperor Constantine in two or three years after the council of Nice, and the laws that had been enacted against him were repealed. In the year 335, Athanasius, his zealous opponent, was deposed and banished into Gaul, and Arius and his followers were reinstated in their privileges, and received into the communion of the church. In little more than a year after this, he fell a victim to the resentment of his enemies, and died a tragical death, occasioned probably by poison, or some other violence. The Arian party found a protector in Constantius, who succeeded his father in the empire of the east; and the zeal with which he abetted them produced many animosities and tumults to the time of his death in the year 362. They underwent various revolutions, persecuting and oppressed, under succeeding emperors, according to the degree of interest they had in the civil power, till at length Theodosius the Great exerted every possible effort to suppress and disperse them. Arians.

The Arians were divided into various sects, of which ancient writers give an account under the names of *Semi-Arians*, *Eusebians*, *Aetians*, *Eunomians*, *Acacians*, *Psathyrians*, and others. But they have been commonly distributed into three classes, viz. the *Genuine Arians*, *Semi-Arians*, and *Eunomians*.

Arianism was carried in the fifth century into Africa under the Vandals; and into Asia under the Goths. Italy, the Gauls, and Spain, were also deeply infected with it; and towards the commencement of the sixth century, it was triumphant in many parts of Asia, Africa, and Europe. But it sunk almost all at once, when the Vandals were driven out of Africa, and the Goths out of Italy, by the arms of Justinian. However, it revived again in Italy under the protection of the Lombards in the seventh century.

Erasmus seems to have aimed in some measure to restore Arianism at the beginning of the sixteenth century, in his Commentaries on the New Testament. Accordingly, he was reproached by his adversaries with Arian interpretations and glosses, Arian tenets, &c. To which he made little answer, save that there was no heresy more thoroughly extinct than that of the Arians: *Nulla heresis magis extincta quam Arianorum.* But the face of things was soon changed. Servetus, a Spaniard by nation, published in 1531 a little treatise against the Trinity, which once more revived the opinions of the Arians in the west. Indeed he rather showed himself a Photinian than an Arian; only that he made use of the same passages of Scripture, and the same arguments against the divinity of our Saviour, with the proper Arians.

It is true, Servetus had not, properly speaking, any disciples; but he gave occasion after his death to the forming of a new system of Arianism in Geneva, much more subtle and artful than his own, and which did not a little perplex Calvin. From Geneva the new Arians removed to Poland, where they gained considerable ground; but at length became Socinians.

The appellation *Arian* has been indiscriminately applied, in more modern times, to all those who consider Jesus Christ as inferior and subordinate to the Father; and whose sentiments cannot be supposed to coincide exactly with those of the ancient Arians. Mr Whiston was one of the first divines who revived this controversy, in the beginning of the 18th century. He was followed by Dr Clarke, who published his famous book, entitled, "The Scripture Doctrine of the Trinity, &c. In consequence of which he was reproached with the title of *Semi-Arian*. He was also threatened by the convocation, and combated by argument. Dr Waterland, who has been charged with verging towards Tritheism, was one of his principal adversaries. The history of this controversy during the present century may be found in a pamphlet entitled, "An Account of all the considerable Books and Pamphlets that have been wrote on either side, in the Controversy concerning the Trinity, from the Year 1712; in which also is contained an Account of the Pamphlets written this last Year, on each side, by the Dissenters, to the End of the Year 1719." Published in London 1720.

Aricina || Arillus.

ARICINA, in *Mythology*, a surname of Diana; under which appellation she was honoured in the forest Aricine, so called from Aricia a princess of the blood royal of Athens. Hippolytus, to whom this princess was married, is said to have erected a temple to Diana in this forest, where he was concealed after his resurrection by Esculapius, and to have established a priest and festivals.

ARIUS MONTANUS, a learned Spanish divine, employed by Philip II. of Spain to publish another edition of the Bible, after that of Cardinal Ximenes; which he finished with applause, and died at Seville in 1589.

ARICA, a port town of South America, in the province of Los Charcas, in Peru. It was formerly a considerable place, but the earthquakes, which are frequent here, have almost entirely ruined it; for there are no more than 150 families, which are most of them blacks, mulattoes, and Indians. Most of the houses are made with canes or reeds, set upright and bound together with cords or thongs; and as it never rains here, they are covered only with mats, which makes the place look at a distance like a heap of ruins.

The vale of Arica is about a league wide, and six leagues long, next the sea, and is all a barren country, except the spot where the old town stood, which is divided into little meadows of clover grass, and plots for sugar canes, with a few olive and cotton trees intermixed. This vale grows narrower as it runs eastward: and a league up there is a village, where they begin to cultivate pimento or Jamaica pepper, which is planted throughout all the rest of the vale; and there are several farms, which produce nothing else, that bring in the value of 80,000 crowns yearly. The Spaniards of Peru are so used to this pepper, that they dress no provisions without it. W. Long. 70. 15. S. Lat. 18. 26.

ARICONIUM, a town of the Silures, (Antonine); now Hereford, (Camden). W. Long. 2. 42. Lat. 52. 6.

ARIDAS, a kind of taffety, manufactured in the East Indies from a shining thread which is got from certain herbs, whence they are styled *aridas of herbs*.

ARIDULLAM, in *Natural History*, a kind of zarnich found in the East Indies. See ZARNICH.

ARIES, in *Zoology*. See OVIS.

ARIES, the battering ram. See *BATTERING Ram*.

ARIES, in *Astronomy*, a constellation of fixed stars, drawn on the globe, in the figure of a ram. It is the first of the twelve signs of the zodiac, from which a twelfth part of the ecliptic takes its denomination.

ARILLUS, an improper term invented by Linnæus, and defined to be the proper exterior coat or covering of the seed which falls off spontaneously.

All seeds are not furnished with an arillus; in many, a dry covering, or scarf skin, supplies its place. In jasmine; hound's tongue, *cynoglossum*; cucumber; fraxinella; *dictamnus*; staff-tree, *celastrus*; spindle-tree, *euonymus*; African spiræa, *diosma*; and the coffee-tree, *coffea*; it is very conspicuous.

In the genus hound's tongue, four of these arilli or proper coats, each enfolding a single reed, are affixed to the stylus: and in this circumstance, says Linnæus, does the essence of the genus consist. In fraxinella, the arillus is common to two seeds. The staff tree has its seeds only half involved with this cover.

Aril || Arima

The arillus is either *baccatus*, succulent, and of the nature of a berry; as in the spindle tree, *euonymus*—*Cartilagineus*, cartilaginous, or gristly; as in the African spiræa, *diosma*—*Coloratus*, coloured; as in the staff-tree—*Elasticus*, endued with elasticity, for dispersing the seeds; as is remarkable in the African spiræa, *diosma*, and fraxinella—*Scaber*, rough and knotty; as in hound's tongue.

Although covered with an arillus or other dry coat, seeds are said to be naked (*semina nuda*) when they are not enclosed in any species of pericarpium or fruit vessel; as in the grasses, and the *labiati* or lipped flowers of Tournefort, which correspond to the *didynamia gymnospermia* of Linnæus. Seeds are said to be covered (*semina tecta*) when they are contained in a fruit vessel, whether capsule, pod, or pulpy pericarpium, of the apple, berry, or cherry kind: (See SEMEN). This exterior coat of the seed is, by some former writers, styled *calyptra*. See CALYPTRA.

The different skins or coverings of the seeds are adapted, say naturalists, for receiving the nutritive juices, and transmitting them within.

ARIMANIUS, the evil god of the ancient Persians. The Persian Magi held two principles; a good demon or god, and an evil one: the first the author of all good, and the other of all evil: the former they supposed to be represented by light, and the latter by darkness, as their truest symbols. The good principle they named *Yezad* or *Yesdan*, and *Ormozd* or *Hormizda*, which the Greeks wrote *Oromasdes*; and the evil demon they called *Ahriman*, and the Greeks *Arimanius*. Some of the Magians held both these principles to have been from all eternity; but this sect was reputed heterodox: the original doctrine being, that the good principle only was eternal, and the other created. —Plutarch (*De Iside et Osiride*, p. 369.) gives the following account of the Magian traditions in relation to these gods, and the introduction of evil into the world, viz. That Oromazes consisted of the most pure light, and Arimanius of darkness; and that they were at war with each other: That Oromazes created the gods; the first, the author of benevolence; the second, of truth; the third, of justice, riches, and the pleasure which attends good actions; and that Arimanius made as many, who were the authors of the opposite evils or vices: that then Oromazes, triplicating himself, removed as far from the sun as the sun is from the earth, and adorned the heaven with stars, appointing the dog star for their guardian and leader: that he also created 24 other gods, and enclosed them in an egg; but Arimanius having also made an equal number, these last perforated the egg, by which means evil and good became mixed together. However, the fatal time will come, when Arimanius, the introducer of plagues and famine, must be of necessity utterly destroyed by the former, and annihilated; then the earth being made plain and even, mankind shall live in a happy state, in the same manner, in the same political society, and using one and the same language. Theopompus writes, that, according to the Magians, the said two gods, during the space of 3000 years, alternately conquer, and are conquered; that for other 3000 years, they will

Arimaspi || Arion.

will wage perpetual war, fight and destroy the works of each other, till at last Hades (or the evil spirit) shall perish, and men become perfectly happy, their bodies needing no food, nor casting any shadow, i. e. being perfectly transparent.

ARIMASPI, (Pliny), a people of Sarmatia Europea, to the south of the Montes Riphæi, said by Mela to have but one eye; a fable broached by Aristeas Proconnesius, according to Herodotus.

ARIMATHEA, a town of Judea, (Evangelists); thought to be the same with *Ramatha*, 1 Sam. i. and thus in the tribe of Ephraim (Wells).—This place is now called *Ramla;* and is in a very ruinous state, containing nothing but rubbish within its boundaries. The aga of Gaza resides here in a serai, the floors and walls of which are tumbling down. He maintains about one hundred horsemen, and as many Barbary soldiers, who (says Mr Volney) are lodged in an old Christian church, the nave of which is used as a stable, and in an ancient khan, which is disputed with them by the scorpions. The adjacent country is planted with lofty olive trees, disposed in quincunces. The greatest part of them are as large as the walnut trees of France; but they are daily perishing through age, the ravages of contending factions, and even from secret mischief: for, in these countries, when a peasant would revenge himself of his enemy, he comes by night, and saws or cuts his trees close to the ground, and the wound, which he takes care to cover, draining off the sap like an issue, the olive tree languishes and dies. Amid the plantations, we meet, at every step, with dry wells, cisterns fallen in, and vast vaulted reservoirs, which prove that, in ancient times, this town must have been upwards of a league and a half in circumference. At present it scarcely contains two hundred families. The little land which is cultivated by a few of them, belongs to the mufti, and two or three persons related to him. The rest content themselves with spinning cotton, which is chiefly purchased by two French houses established there. The only remarkable antiquity at Ramla, is the minaret of a ruined mosque on the road to Yafa, which is very lofty; and by an Arabic inscription appears to have been built by the sultan Saladin.

ARIMINUM, a town of Umbria, or Romagna, at the mouth of the Ariminus, on the gulf of Venice. The seizing on it by Cæsar gave rise to the civil war. Now called *Rimini*. E. Long. 13. 30. Lat 44. 8.

ARIOLI, in antiquity, a kind of prophets, or religious conjurors, who by abominable prayers, and horrible sacrifices at the altars of idols, procured answers to their questions concerning future events. *Isid. Orig.* lib. viii. cap. 9. These are also called *harioli*, and the operation *hariolation*. Sometimes they were denominated *aruspices* or *haruspices*. The *arioli* were distinguished by a slovenly dress, disorderly and matted beards, hair, &c.

ARION, an excellent musician and poet, inventor of dithyrambics. Periander entertained him at his court, where getting an estate, and returning to Corinth, the sailors, for lucre of his money, threw him into the sea; when, according to the poets, a dolphin, charmed with his music, took him on her back and carried him safe to shore.

ARION, an admirable horse, much more famous in poetic history than Bucephalus in that of Alexander. Authors speak variously of his origin, though they agree in giving him a divine one. His production is most commonly ascribed to Neptune. This god, according to some, raised him out of the ground by a stroke of his trident: according to others, he begat him upon the body of the fury Erinnys; according to others, upon that of Ceres, whom he ravished in the form of a horse, she having previously assumed the form of a mare to elude his pursuit. This horse was nursed by the Nereids; and being sometimes yoked with the sea horses of Neptune to the chariot of this god, he drew him with incredible swiftness threw the sea. He had this singularity in him, that his right feet resembled those of a man. Neptune gave him to Capreus king of Haliartus. Capreus made a present of him to Hercules; who mounted him when he took the city of Elis, gained the prize with him in the race against Cygnus the son of Mars near Trœcena, and at last made a present of him to Adrastus. It is under this last master that Arion has signalized himself the most: he won the prize for racing at the Nemean games, which the princes who went to besiege Thebes instituted in honour of Archemorus; and was the cause that Adrastus did not perish in this famous expedition as all the other chiefs did.

Arion || Ariosto.

ARIOSTO, Lodovico, the famous Italian poet, and author of Orlando Furioso, was born at the castle of Reggio in Lombardy in 1474. His father, who was major domo to Duke Hercules, lived to the extent of his fortune, so left but little at his death. Ariosto, from his childhood, showed great marks of genius, especially in poetry; and wrote a comedy in verse on the story of Pyramus and Thisbe, which his brothers and sisters played. His father being utterly unlearned, and rather regarding profit than his son's inclination, compelled him to study the civil law, in which having plodded some years to no purpose, he quitted it for more pleasing studies; yet often lamented, as Ovid and Petrarch did before him, and our own Milton since *, that his father banished him from the Muses. At the age of 24, Ariosto lost his father, and found himself perplexed with family affairs. However, in about six years he was, for his good parts, taken into the service of Don Hippolito, cardinal of Este. At this time he had written nothing but a few sonnets; but now he resolved to make a poem, and chose Bayardo's *Orlando Inamorato* for a groundwork. However, he was prevented writing for a great many years, and was chosen as a fit person to go on an embassy to Pope Julius II. where he gave such satisfaction, that he was sent again, underwent many dangers and difficulties, and at his return was highly favoured. Then, at his leisure, he again applied himself to his poem: but soon after he incurred the cardinal's displeasure for refusing to accompany him into Hungary; by which he was so discouraged, that he deferred writing for 14 years, even till the cardinal's death. After that, he finished by degrees, in great perfection, that which he began with great expectation. Duke Astolfo offered him great promotions if he would serve him; but preferring liberty to grandeur, he refused this and other great offers from princes and cardinals, particularly from Leo X. from all whom he received notwithstanding great presents. The duke of Ferrara delighted

* See his Latin poem, *Ad Patrem.*

Ariosto. delighted so much in his comedies, of which he wrote five, that he built a stage on purpose to have them played in his court, and enabled our poet to build himself a house in Ferrara, with a pleasant garden, where he used to compose his poems, which were highly esteemed by all the princes in Italy, who sent him many presents; but he said, "he would not sell his liberty for the best cardinal's hat in Rome." It was but a small, though convenient house: being asked, why he had not built it in a more magnificent manner, since he had given such noble descriptions of sumptuous palaces, beautiful porticoes, and pleasant fountains, in his Orlando Furioso? he replied, That words were cheaper laid together than stones. Upon the door was the following inscription:

Parva, sed apta mihi, sed nulli obnoxia, sed non
Sordida, parta meo sed tamen ære, domus.

Which Mr Harrington thus translates:

This house is small, but fit for me, but hurtful unto none;
But yet not sluttish, as you see, yet paid for with mine own.

In his diet he was temperate, and so careless of dainties, that he was fit to have lived in the world when they fed upon acorns. Whether he was ever married, is uncertain. He kept company with one Alexandria, to whom, it was reported, he was married privately, and a lady Genevera, whom he slily mentions in the 24th book of his Orlando, as poets are apt to intermix with their fictions some real amours of their own. He was urged to go ambassador to Pope Clement, but would by no means accept this embassy. He translated the *Menecmi* of Plautus: and all his own comedies were so esteemed, that they were frequently acted by persons of the first quality; and when his Lena was first represented, Ferdinand of Este, afterwards marquis of Massa, so far honoured the piece as to speak the prologue. He began one of his comedies in his father's lifetime, when the following incident shows the remarkable talent he had for poetry. His father one day rebuked him sharply, charging him with some great fault; but all the while he returned him no answer. Soon after, his brother began on the same subject: but he easily refuted him, and with strong arguments justified his own behaviour. "Why then (said his brother) did you not satisfy my father?" "In truth (said Lodovico) I was thinking of a part in my comedy; and methought my father's speech to me was so suited to the part of an old man's chiding his son, that I forgot I was concerned in it myself, and considered it only to make it a part of my play." It is also reported of Ariosto, that coming by a potter's shop, he heard him singing a stave out of his Orlando, with so bad a grace, that, out of all patience, he broke with his stick several of his pots. The potter, in a pitiful tone, asking what he meant by wronging a poor man that had never injured him? "You rascal (he replied), I have not done thee half the wrong thou hast done me: for I have broken but two or three pots of thine, not worth so many halfpence; whereas thou has broken and mangled a stanza of mine worth a mark of gold."

Ariosto was tall, of a melancholy complexion, and so absorbed in study and meditation, that he often forgot himself. His picture was drawn by Titian in a masterly manner. He was honoured with the laurel by the hands of the emperor Charles V. He was naturally affable, always assuming less than was his due, yet never putting up a known injury, even from his superiors. He was so fearful on the water, that, whenever he went out of a ship, he would see others go before him; and, on land, he would alight from his horse on the least apprehension of danger. He was of an amorous disposition, and left two natural sons. He enjoyed the friendship of the most eminent men of learning of his time, most of whom he mentions with great respect in the last canto of his Orlando Furioso. His constitution was but weakly, so that he was obliged to have recourse to physicians the greatest part of his life. He bore his last sickness with great resolution and serenity; and died at Ferrara the 8th of July 1533, according to Sir John Harrington, being then 59 years of age. He was interred in the church of the Benedictine monks, who, contrary to their custom, attended his funeral. He had a bust erected to him, and the following epitaph, written by himself, inscribed upon his tomb:

Ariosto || Aristande

Ludovici Ariosti humantur ossa
Sub hoc marmore, seu sub hac humo, seu
Sub quidquid voluit benignus hæres,
Sive hærede benignior comes, seu
Opportunius incidens viator:
Nam scire haud potuit futura: sed nec
Tanti erat, vacuum sibi cadaver
Ut urnam cuperet parare,
Vivens ista tamen sibi paravit,
Quæ scribi voluit suo sepulchro,
Olim si quod haberet id sepulchrum:
Ne cum spiritus hoc brevi peracto
Prescripto spatio misellos artus,
Quos ægre ante reliquerat, reposcet,
Hac et hac cinerem huc et huc revellem
Dum noscat proprium, diu vagetur.

ARIPO, a town on the western coast of the island of Ceylon, at the mouth of the river Sarunda. To the east of this town, is a bank, where they fish for pearls. E. Long. 80. 25. N. Lat. 8. 42.

ARISBA, in *Ancient Geography*, a town of the island of Lesbos (Herodot.).—Another of Troas on the continent, in the territory and to the south-east of Abydos (Polyb.): the rendezvous of Alexander's army after the passage of the Hellespont (Arrian); a colony of the Mitylenians (Stephanus); taken and plundered by Achilles (Virgil.) The residence of Axylus, celebrated by Homer for his hospitality, which gained him the character of Friend of mankind.

ARISH, a Persian long measure, containing about 38 English inches.

ARISI, the Indian name for the plant which produces the rice. See ORYZA, BOTANY *Index*.

ARISTA, or AWN, among botanists, a long needle-like beard, which stands out from the husk of a grain of corn, grain, &c.

ARISTÆUS, son of Apollo and Cyrene, whom, for the many services he had rendered to mankind by his knowledge of all profitable arts, the gods placed among the stars; so that he is the Aquarius in the zodiac. The resemblance of his history to that of Moses has been curiously discussed by Huetius.

ARISTANDER, a famous soothsayer under Alexander the Great, over whom he gained a wonderful

Aristander of Aristides.

ful influence by the good success of his art. He had already had the same employment at the court of King Philip; and it was he who explained better than his brethren the dream that this prince had after having married Olympias.

ARISTARCHUS, a Grecian philosoper of Samos, one of the first that maintained that the earth turns upon its own centre. We are not sure of the age in which he lived; and have none of his works but a *Treatise of the greatness and distance of the Sun and Moon*, translated into Latin by Frederic Commandine, and published with Pappus's explanation in 1572.

ARISTARCHUS, a celebrated grammarian, much esteemed by Ptolemy Philometor, who committed to him the education of his son. He applied himself chiefly to criticism, and made a revisal of Homer's poems, but in too magisterial a way; for such verses as he did not like he treated as spurious. He commented on other poets. Cicero and Horace made use of his name to express a very rigid critic.

ARISTIDA. See BOTANY *Index*.

ARISTIDES, surnamed the *Just*, one of the most celebrated characters of his age for purity and integrity, and cotemporary with Themistocles, was the son of Lysimachus, a man of middle rank, and born at Athens. His dispositions and temper from his youth all conjoined in anticipating that greatness to which he afterwards arose. To a firm, resolute, and placid temper, he likewise added a great contempt of dissimulation, and an utter abhorrence of every thing dishonourable. He began very early to meditate on subjects of government, and applied to his studies with the greatest assiduity. He imbibed a strong predilection for oligarchy upon becoming acquainted with the laws of Lycurgus, which excited his admiration, and gave him a distaste of the unlimited democracy then established in his native city. On the other hand, Themistocles favoured democracy; and even when at school, he is said to have been his constant antagonist on that point. A perpetual opposition to one another in all political points, whether just or unjust, was the consequence of this difference of opinion, when their abilities raised them to several important stations in the state. Although it was deemed absolutely necessary at that time for a party leader to oppose all the acts of his antagonist whatsoever with the greatest vehemence, yet Aristides did not follow this practice without self-reproach. It is related, that one day having firmly opposed a proposal of Themistocles in the assembly, which in his own conscience he knew to be right, on coming out he exclaimed, "The affairs of the Athenians will never prosper, till they throw both of us into the *barathrum*," (the dungeon for condemned criminals). Aristides maintained a strict observance of justice, and when in his own opinion a friend was guilty, he would never screen him from the punishment due to his offence. Neither desirous of profit nor honour, he served his country from the purest principles of duty; and his character was so universally known, that once, when these verses of Æschylus, describing Amphiaraus were recited in the theatre,

"To be, and not to seem, is this man's maxim;
"His mind reposes on its conscious worth,
"And wants no other praise"—

Aristides.

the eyes of the whole assembly were immediately directed towards Aristides, as the true picture of the idea the poet wished to delineate. When in the office of public treasurer, by convicting Themistocles and several others of making free with the public property, he raised up a party against himself; and when he gave in his own account, they to retaliate the affront, accused him of embezzling the public stores: and it was only by the interposition of the court of Areopagus that he got himself cleared. He was, however, again elected to that office, and then, although he kept a secret account against those people concerned with him, he permitted them to plunder without reprehension. It consequently fell out that he was universally praised, his acquaintance cultivated with the greatest avidity, and interest made on all sides to continue him in office: But when the people were about to proceed to elect him again to that trust, he severely chided them, and said, "that while he had served them with fidelity he was treated with calumny, and incurred their displeasure; now that he had really violated his trust, he met with general applause, and was reckoned an excellent citizen." He then exhibited their deceits, and made all parties ashamed of the part they had acted.

Aristides was present at the battle of Marathon, fought B. C. 490, and was next in command among the Athenians to Miltiades; and there, upon that general's proposing to come to battle as soon as possible, he seconded his motion with the utmost vigour. In the field he distinguished himself with intrepidity, valour, and generosity; and being left after the battle to secure the spoils, he executed his trust with honour and fidelity, bringing all to the public account, reserving nothing for himself. He was elected to the important office of chief magistrate the year following; but by the art of Themistocles, the high authority he had attained by his merits was at length converted into an accusation against him; and he was accordingly banished by the ostracism, although a mild, often an unjust measure in the policy of the Athenian state, for getting a temporary relief from the presence of any political influence by which they thought their independence might be injured. A circumstance which occurred on this occasion gives a very high idea of his character. A rustic citizen coming up to vote against him, although not personally acquainted with Aristides, and being himself unable to write, ordered the first person whom he met, who accidentally happened to be Aristides himself, to inscribe his name upon the shell, signifying his acquiescence in the sentence of the state. The patriot said, "Did Aristides ever injure you?" The rustic replied, "I do not so much as know him, but I am tired with everywhere hearing him called *the Just*."—Aristides, taking the shell, wrote his own name upon it, and returned it in silence to the voter. Lifting up his hands to heaven, he supplicated that the Athenians might never behold the day which should induce them to remember Aristides; and then quitted the city.

As the Persians were meditating a new invasion of Greece, he employed himself in his exile in encouraging the Greeks to defend their liberties against the invaders. The Athenians immediately, upon the approach of Xerxes, recalled Aristides, whose absence they began sincerely to regret, along with their other exiles.

Aristides. exiles. At this critical moment, upon his return, he suspended all political animosities; and upon understanding that it was the design of Themistocles to fight the Persian navy in the straits of Salamis, he waited on him in private, proposed an oblivion of all past circumstances, extolled his intentions, and gave him his sincere promise to do the utmost in his power towards effecting his designs. Themistocles, some time after the battle of Salamis, acquainted the Athenians that he had formed a scheme which, although it was of such a nature as forbade his public avowal of it to them, was of inestimable advantage to the state. They immediately ordered that he should communicate it to Aristides. It was a project for consuming the whole confederate fleet of Greece by fire, except their own ships; and thus the entire sway of the sea would be left to the Athenian navy. Aristides reported that nothing could be more unjust, and at the same time, nothing more advantageous that the scheme of Themistocles. Upon this report, the people immediately determined to drop any further thought of it. It was equally to the honour of the Athenians that they made such a determination, and to Aristides that he was made the referree on this occasion. Aristides, before the battle of Platæa, was of considerable service in persuading his countrymen, who were elated with their former successes, to submit to the superior power of the Spartans, and in preserving peace and amity between the confederate forces. He acquitted himself with great valour and resolution in the engagement, and was appointed after the victory to determine a very dangerous dispute concerning the honour of the day, which he conferred upon the Platæans, giving up the claim of the Athenians, the Lacedemonians following his example. Upon the rebuilding of Athens, he was the first person to promote a law which divided the administration among the citizens at large, and enjoined that the archons, or chief magistrates, should be elected out of the whole body of the people, who had so deservedly merited the favour of the state.

Aristides, upon the continuation of the war with the Persians, was sent along with Cimon, the son of Miltiades, to take the command of the Athenian forces in the confederate army. Their humility and meekness, compared with the haughty domineering temper of Pausanias, so engaged the rest of the allies, that the superiority of rank was conferred upon Athens, with the joint concurrence of the other states. The nomination of Aristides to lay an equal assessment upon all the states for the purpose of defraying the expence of the war, was a signal proof of the high idea all Greece had of his integrity and justice. The wisdom and impartiality with which he performed this commission gave universal satisfaction. He obliged all the confederates, after this affair was terminated, solemnly to swear to all the articles of association. The advice which he afterwards gave the Athenians to extend their own territories beyond their proper limits, must certainly have proceeded from some very pressing necessity, when he thus drew down the consequences of the perjury upon his own head. Aristides, on Themistocles's falling under the displeasure of the ruling party, would not concur in a capital prosecution of him; and instead of triumphing over an old enemy, he always spoke of him after his banishment with the highest respect.

In that age it was common for men who had borne the highest public offices to make no increase to their private fortunes, but no man ever carried this disinterestedness to so high a pitch as Aristides. He was indeed so remarkably poor, that when a prosecution was raised against Callias, a rich relation of his, the orator pleading against him, in order to excite the indignation of his audience, made some remarks upon his ability to assist Aristides, and at the same time upon the extreme indigence in which he permitted him and his family to live. Callias, in his vindication, was forced to call Aristides to testify that he had frequently offered him considerable sums, which he would not accept, saying, "that it better became Aristides to glory in his poverty than Callias in his riches," which appear to have been acquired not very honourably.

This great man died about 407 years B. C. according to some at Athens, at an advanced age; others say at Pontus, where he was transacting public business. He was buried at the public expence, and his daughters received portions out of the public treasury; and a pension and an estate in land was bestowed on his son Lysimachus, in gratitude for the signal services Aristides had done his country. (*Gen. Biog.*).

ARISTIDES of Miletus, a famous Greek author, often cited by the ancients.

ARISTIDES, a very eloquent Athenian orator, who became a convert to the Christian religion, and about the year 124 presented to the emperor Adrian an apology for the Christians.

ARISTIDES, *Ælius*, a celebrated orator, born in Mysia, about 129 years before the Christian era. The best edition of his works is that of Oxford, printed in Greek and Latin, in two volumes quarto.

ARISTIDES, a painter cotemporary with Apelles, flourished at Thebes about the 122d Olympiad. He was the first, according to Pliny, who expressed character and passion, the human mind, and its several emotions; but he was not remarkable for softness of colouring. "His most celebrated picture was of an infant (on the taking of a town) at the mother's breast, who is wounded and expiring. The sensations of the mother were clearly marked, and her fear lest the child, upon failure of the milk, should suck her blood." "Alexander the Great (continues the same author) took this picture with him to Pella."

Junius (in his Treatise *de Pictura Veterum*) conjectures that the following beautiful epigram of Æmilianus was written on this exquisite picture:

Ελκε, ταλαν, παρα μητρος ον ωκ ετι μαζον αμελξεις
Ελκυσον υστατιον ναμα κατα φθιμενης.
Η δη γαρ ξιφεεσσι λιποπνοος αλλα τα μητρος
Φιλτρα και εν αιδη παιδοκομειν εμαθον.

Elegantly translated thus:

Suck, little wretch, while yet thy mother lives,
Suck the last drop her fainting bosom gives!
She dies! her tenderness survives her breath,
And her fond love is provident in death.
Webb's Inquiries, Dial. vii. p. 161.

ARISTIPPUS, the founder of the Cyrenaic sect of philosophy, was the son of Aretades, and born at Cyrene in Libya. He flourished about the 96th Olympiad. The great reputation of Socrates induced him to

Aristippus. to leave his own country, and remove to Athens, that he might have the satisfaction of hearing his discourses. He was chiefly delighted with those discourses of Socrates that related the most to pleasure: which he asserted to be the ultimate end in which all happiness consists. His manner of life was agreeable to his opinion: for he indulged himself extremely in all the luxuries of dress, wine, and women. Though he had a good estate, and three country seats, yet he was the only one of the disciples of Socrates who took money for teaching; which being discovered by the philosopher, he asked Aristippus, How he came to have so much? Who in reply asked him, How he came to have so little? Upon his leaving Socrates, he went to Ægina, as Athenæus informs us, where he lived with more freedom and luxury than before. Socrates sent frequent exhortations to him, in order to reclaim him; but all in vain; and with the same view he published that discourse which we find in Xenophon. Here Aristippus became acquainted with Laïs, the famous courtezan of Corinth; for whose sake he took a voyage to that city. He continued at Ægina till the death of Socrates, as appears from Plato's *Phædo*, and the epistle which he wrote upon that occasion. He returned at last into his own country Cyrene, where he professed philosophy, and instituted a sect which, as we observed above, was called the *Cyrenaic*, from the place, and by some writers the *Hedonic* or voluptuous, from its doctrines. During the height of the grandeur of Dionysius the Sicilian tyrant, a great many philosophers resorted to him; and among the rest Aristippus, who was tempted thither by the magnificence of that court. Dionysius asking him the reason of his coming, he replied, "That it was in order to give what he had, and to receive what he had not:" or, as others represent it, "That when he wanted wisdom, he went to Socrates; but now as he wanted money, he was come to him." He very soon insinuated himself into the favour of Dionysius; for being a man of a soft easy temper, he conformed himself exactly to every place, time, and person, and was a complete master of the most refined complaisance.

We have several remarkable passages concerning him during his residence at that court, mentioned by Diogenes Laertius. Dionysius, at a feast, commanded that all should put on women's purple habits, and dance in them. But Plato refused, repeating these lines:

> I cannot in this gay effeminate dress
> Disgrace my manhood or my sex betray.

But Aristippus readily submitted to the command, and made this reply immediately:

> ——At feasts, where mirth is free,
> A sober mind can never be corrupted.

At another time, interceding with Dionysius in behalf of a friend, but not prevailing, he cast himself at his feet: being reproved by one for that excess of humility, he replied, "That it was not he who was the cause of that submission; but Dionysius, whose ears were in his feet." Dionysius showed him three beautiful courtezans, and ordered him to take his choice. Upon which he took them all three away with him, alleging that Paris was punished for preferring one to the other two: but when he had brought them to his door, he dismissed them, in order to show that he could either enjoy or reject with the same indifference. Having desired money of Dionysius, the latter observed to him, that he had assured him a wise man wanted nothing. "Give me (says he) what I ask, and we will talk of that afterwards." When Dionysius had given it him, "Now (says he), you see I do not want." By his complaisance he gained so much upon Dionysius, that he had a greater regard for him than for all the rest of the philosophers, though he sometimes spoke with such freedom to the king, that he incurred his displeasure. When Dionysius asked, Why philosophers haunted the gates of rich men, but not rich men those of philosophers: he replied, "Because the latter know what they want, and the others not." Another time, Dionysius repeating (out of Sophocles, as Plutarch affirms, who ascribes this to Zeno) these verses,

Aristippus.

> He that with tyrants seeks for bare support,
> Enslaves himself, though free he came to court:

he immediately answered,

> He is no slave, if he be free to come.

Diocles, as Laertius informs us, related this in his *Lives of the Philosophers;* though others ascribe this saying to Plato. Aristippus had a contest with Antisthenes the Cynic philosopher; notwithstanding which, he was very ready to employ his interest at court for some friends of Antisthenes, to preserve them from death, as we find by a letter of his to that philosopher. Diogenes followed the example of his master Antisthenes in ridiculing Aristippus, and called him the *court spaniel.*

We have many apophthegms of his preserved.—To one who asked him what his son would be the better for being a scholar? "If for nothing else (said he), yet for this alone, that when he comes into the theatre, one stone will not sit upon another." When a certain person recommended his son to him, he demanded 500 drachmas; and upon the father's replying, that he could buy a slave for that sum, "Do so (said he), and then you will be master of a couple." Being reproached, because, having a suit of law depending, he fee'd a lawyer to plead for him, "Just so (said he), when I have a great supper to make, I always hire a cook." Being asked what was the difference between a wise man and a fool, he replied, "Send both of them together naked to those who are acquainted with neither of them, and then you will know." Being reproved by a certain person (who, according to Mr Stanley, was Plato) for his costly and voluptuous feasts, "I warrant you (said he), that you would not have bestowed three farthings upon such a dinner;" which the other confessing, "Why, then (said he), I find myself less indulgent to my palate than you are to your covetous humour;" or, as it is otherwise represented, "I find, that I love my belly and you love your money." When Simus, treasurer to Dionysius, showed him his house magnificently furnished, and paved with costly marble, (for he was a Phrygian, and consequently profuse); Aristippus spit in his face: upon which the other growing angry, "Why, truly (said he), I could not find a fitter place." His servant carrying after him a great weight of money, and being ready to sink upon the road under his burden,

burden, he bid him throw away all that was too much for him to carry. Horace mentions this fact in his third satire of the second book:

> ————————Quid simile isti
> *Græcus Aristippus? qui servos projicere aurum*
> *In media jussit Libya, quia tardius irent*
> *Propter onus segnes.*

Being asked, what things were most proper for children to be instructed in? he answered, "Those which might prove of the greatest advantage to them when they came to be men." Being reproached for going from Socrates to Dionysius, he replied, "That he went to Socrates when he wanted serious instruction, and to Dionysius for diversion." Having received money of Dionysius at the same time that Plato accepted a book only, and being reproached for it, "The reason is plain (says he), I want money, and Plato wants books." Having lost a considerable farm, he said to one who seemed excessively to compassionate his loss, "You have but one field; I have three left: why should not I rather grieve for you?" Plutarch, who relates this, in his book *De Tranquillitate Animi*, observes upon it, that it is very absurd to lament for what is lost, and not to rejoice for what is left. When a person told him, "That the land for his sake was lost," he replied, "That it was better so, than that he should be lost for the land." Being cast by shipwreck ashore on the island of Rhodes, and perceiving mathematical schemes and diagrams drawn upon the ground, he said, "Courage, friends; for I see the footsteps of men."

After he had lived a long time with Dionysius, his daughter Arete sent to him, to desire his presence at Cyrene, in order to take care of her affairs, since she was in danger of being oppressed by the magistrates. But he fell sick in his return home, and died at Lipara, an Eolian island. With regard to his principal opinions, like Socrates, he rejected the sciences as they were then taught, and pretended that logic alone was sufficient to teach truth and fix its bounds. He asserted, that pleasure and pain were the criterions by which we were to be determined; that these alone made up all our passions; that the first produced all the soft emotions, and the latter all the violent ones. The assemblage of all pleasure, he asserted, made true happiness, and that the best way to attain this was to enjoy the present moments. He wrote a great many books: particularly the history of Libya, dedicated to Dionysius; several Dialogues; and four books of the Luxury of the ancients. There are four epistles of his extant in the Socratic collection published by Leo Allatius.

Besides Arete his daughter, whom he educated in philosophy, Aristippus had also a son, whom he disinherited for his stupidity. Arete had a son who was named *Aristippus* from his grandfather, and had the surname of Μητροδιδακτος, from his mother's instructing him in philosophy. Among his auditors, besides his daughter Arete, we have an account of Æthiops of Ptolemais, and Antipater of Cyrene. Arete communicated the philosophy which she received from her father to her son Aristippus, who transmitted it to Theodorus *the Atheist*, who instituted the sect called *Theodorean.* Antipater communicated the philosophy of Aristippus to Epitimedes his disciple; Epitimedes to Paræbates; Paræbates to Hegesias and Anniceris: and these two last improving it by some additions of their own, obtained the honour each of them of giving a name to the *Hegesiac* and *Annicerian* sect.

ARISTO, a Stoic philosopher, the disciple of Zeno the chief of the Stoics, flourished about 290 years before the Christian era. He differed but little from his master Zeno. He rejected logic as of no use, and natural philosophy as being above the reach of the human understanding. It is said, that being bald, the sun burnt his head; and that this caused his death.—There is a saying of his recorded, which might render the doctrine of Aristippus less odious than it ordinarily is; (see ARISTIPPUS). He used to say, "That a philosopher might do those of his hearers a prejudice who put a wrong interpretation upon good meanings; as for example that the school of Aristippus might send out debauchees, and that of Zeno cynics:" which seems to imply, that the doctrine of this philosopher never produced this effect but when it was misunderstood. He should also have added, that every teacher is therefore obliged to forbear laying down ambiguous maxims, or to prevent false glosses being put upon them.

ARISTOCRACY, a form of government where the supreme power is vested in the principal persons of the state. The word is derived from αριστος, *optimus*, and κρατεω, *impero*, "I govern." The ancient writers of politics prefer the aristocratical form of government to all others. The republic of Venice is an aristocracy. Aristocracy seems to coincide with oligarchy; which, however, is more ordinarily used to signify a corruption of an aristocratical state, where the administration is in the hands of too few, or where some one or two usurp the whole power.

ARISTOGITON, a famous Athenian, who, with Harmodius, killed Hipparchus tyrant of Athens, about 513 years before the Christian era. The Athenians erected a statue to him.

ARISTOLACHIA, BIRTHWORT. See BOTANY *Index*.

ARISTOMENES, a general of the Messenians, renowned for his valour and virtue. See MESSENIA.

ARISTOPHANES, a celebrated comic poet of Athens. He was contemporary with Plato, Socrates, and Euripides; and most of his plays were written during the Peloponnesian war. His imagination was warm and lively, and his genius particularly turned to raillery. He had also great spirit and resolution; and was a declared enemy to slavery, and to all those who wanted to oppress their country. The Athenians suffered themselves in his time to be governed by men who had no other views than to make themselves masters of the commonwealth. Aristophanes exposed the designs of these men, with great wit and severity, upon the stage. Cleon was the first whom he attacked, in his comedy of the *Equites;* and as there was not one of the comedians who would venture to personate a man of his great authority, Aristophanes played the character himself, and with so much success, that the Athenians obliged Cleon to pay a fine of five talents, which were given to the poet. He described the affairs of the Athenians in so exact a manner, that his comedies are a faithful history of that people. For this reason, when Dionysius king of Syracuse desired to

Aristophanes.

to learn the state and language of Athens, Plato sent him the comedies of Aristophanes, telling him, these were the best representations thereof. He wrote above 50 comedies; but there are only 11 extant which are perfect: these are Plutus, the Clouds, the Frogs, Equites, the Acharnenses, the Wasps, Peace, the Birds, the Ecclesiazusæ or Female Orators, the Thesmophosiazusæ or Priestesses of Ceres, and Lysistrata. The Clouds, which he wrote in ridicule of Socrates *, is the most celebrated of all his comedies. Madam Dacier tells us, she was so much charmed with this performance, that after she had translated it, and read it over 200 times, it did not become the least tedious to her, which she could not say of any other piece; and that the pleasure which she received from it was so exquisite, that she forgot all the contempt and indignation which Aristophanes deserved for employing his wit to ruin a man who was wisdom itself, and the greatest ornament of the city of Athens. Aristophanes having conceived some aversion to the poet Euripides, satirizes him in several of his plays, particularly in his Frogs and his Thesmophosiazusæ. He wrote his Peace in the 10th year of the Peloponnesian war, when a treaty of 50 years was concluded between the Athenians and the Lacedæmonians, though it continued but seven years. The Acharnenses was written after the death of Pericles and the loss of the battle in Sicily, in order to dissuade the people from intrusting the safety of the commonwealth to such imprudent generals as Lamachus. Soon after, he represented his Aves or Birds; by which he admonished the Athenians to fortify Decelæa, which he calls by a fictitious name *Nephelococcygia*. The Vespæ, or Wasps, was written after another loss in Sicily, which the Athenians suffered from the misconduct of Chares. He wrote the Lysistrata when all Greece was involved in war; in which comedy the women are introduced debating upon the affairs of the commonwealth; when they come to a resolution, not to go to bed with their husbands till a peace should be concluded. His Plutus, and other comedies of that kind, were written after the magistrates had given orders that no person should be exposed by name upon the stage. He invented a peculiar kind of verse, which was called by his name, and is mentioned by Cicero in his Brutus; and Suidas says, that he also was the inventor of the tetrameter and octameter verse.

* See the article *Socrates*.

Aristophanes was greatly admired among the ancients, especially for the true Attic elegance of his style. The time of his death was unknown; but it is certain he was living after the expulsion of the tyrants by Thrasybulus, whom he mentions in his Plutus and other comedies. There have been several editions and translations of this poet. Nicodemus Frischin, a German, famous for his classical knowledge, in the 16th century, translated Plutus, the Clouds, the Frogs, the Equites, and the Acharnenses, into Latin verse. Quintus Septimus Florens rendered into Latin verse the Wasps, the Peace, and Lysistrata; but his translation is full of obsolete words and phrases. Madam Dacier published at Paris in 1692, a French version of Plutus and the Clouds, with critical notes, and an examination of them according to the rules of the theatre. Mr Lewis Theobald likewise translated these two comedies into the English, and published them with remarks. The most noble edition of this author is that published by Ludolphus Kuster, at Amsterdam, in folio, in 1710, and dedicated to Charles Montague earl of Halifax.

Aristophanes || Aristotle.

ARISTOTELIA, in antiquity, annual feasts celebrated by the citizens of Stagyra, in honour of Aristotle, who was born there; and in gratitude for his having procured from Alexander the rebuilding and repeopling of that city, which had been demolished by King Philip.

ARISTOTELIAN, something that relates to the philosopher Aristotle.

ARISTOTELIAN *Philosophy*, the philosophy taught by Aristotle, and maintained by his followers. The Aristotelian is otherwise called the *Peripatetic Philosophy*. See PERIPATETICS.

ARISTOTELIANS, a sect of philosophers, otherwise called *Peripatetics*.

The Aristotelians and their dogmata prevailed for a long while in the schools and universities; even in spite of all the efforts of the Cartesians, Newtonians, and other corpuscularians. But the systems of the latter have at length gained the pre-eminence; and the Newtonian philosophy in particular is now very generally received. The principles of Aristotle's philosophy, the learned agree, are chiefly laid down in the four books *de Cœlo;* the eight books of *Physical Auscultation*, φυσικης ακροασεως, belonging rather to logic, or metaphysics, than to physics. Instead of the more ancient systems, he introduced matter, form, and privation, as the principles of all things; but he does not seem to have derived much benefit from them in natural philosophy. His doctrines are, for the most part, so obscurely expressed, that it has not yet been satisfactorily ascertained what were his sentiments on some of the most important subjects. He attempted to refute the Pythagorean doctrine concerning the twofold motion of the earth; and pretended to demonstrate, that the matter of the heavens is ungenerated, incorruptible, and subject to no alteration: and he supposed that the stars were carried round the earth in solid orbs. The reader will find a distinct account of the logical part of his philosophy, by Dr Reid professor of moral philosophy in the university of Glasgow, and in the second volume of Lord Kames's Sketches of the History of Man. Mr Harris has published a commentary on his Categories, under the title of *Philosophical Arrangements*.

ARISTOTLE, the chief of the Peripatetic philosophers, born at Stagyra, a small city in Macedon, in the 99th Olympiad, about 384 years before the birth of Christ. He was the son of Nicomachus, physician to Amyntas the grandfather of Alexander the Great. He lost his parents in his infancy; and Proxenes, a friend of his father, who had the care of his education, taking but little notice of him, he quitted his studies, and gave himself up to the follies of youth. After he had spent most of his patrimony, he entered into the army; but not succeeding in this profession, he went to Delphos to consult the oracle what course of life he should follow; when he was advised to go to Athens and study philosophy. He accordingly went thither about 18 years of age, and studied under Plato till he was 37. By this time he had spent his whole fortune; and we are told that he got his living by selling powders, and some receipts in pharmacy. He

Aristotle. followed his studies with most extraordinary diligence, so that he soon surpassed all in Plato's school. He ate little, and slept less; and that he might not oversleep himself, Diogenes Laertius tells us, that he lay always with one hand out of the bed, having a ball of brass in it, which, by its falling into a bason of the same metal, awaked him. We are told that Aristotle had several conferences with a learned Jew at Athens, and that by this means he instructed himself in the sciences and religion of the Egyptians, and thereby saved himself the trouble of travelling into Egypt. When he had studied about 15 years under Plato, he began to form different tenets from those of his master, who became highly piqued at his behaviour. Upon the death of Plato, he quitted Athens; and retired to Atarnya, a little city of Mysia, where his old friend Hermias reigned. Here he married Pythias, the sister of this prince, whom he is said to have loved so passionately, that he offered sacrifice to her. Some time after, Hermias having been taken prisoner by Meranon, the king of Persia's general, Aristotle went to Mitylene the capital of Lesbos, where he remained till Philip king of Macedon having heard of his great reputation, sent for him to be tutor to his son Alexander, then about 14 years of age: Aristotle accepted the offer; and in eight years taught him rhetoric, natural philosophy, ethics, politics, with a certain sort of philosophy, according to Plutarch, which he taught nobody else. Philip erected statues in honour of Aristotle; and for his sake rebuilt Stagyra, which had been almost ruined by the wars.

The last fourteen years of his life he spent mostly at Athens, surrounded with every assistance which men and books could afford him for prosecuting his philosophical inquiries. The glory of Alexander's name, which then filled the world, ensured tranquillity and respect to the man whom he distinguished as his friend: but after the premature death of that illustrious protector, the invidious jealousy of priests and sophists inflamed the malignant and superstitious fury of the Athenian populace; and the same odious passions which proved fatal to the offensive virtue of Socrates, fiercely assailed the fame and merit of Aristotle. To avoid the cruelty of persecution, he secretly withdrew himself to Chalcis in Eubœa. This measure was sufficiently justified by a prudent regard to his personal safety; but lest his conduct should appear unmanly, when contrasted with the firmness of Socrates in a similar situation, he condescended to apologise for his flight, by saying, that he was unwilling to afford the Athenians a second opportunity "to sin against philosophy." He seems to have survived his retreat from Athens only a few months; vexation and regret probably ended his days.

Besides his treatises on philosophy, he wrote also on poetry, rhetoric, law, &c. to the number of 400 treatises, according to Diogenes Laertius; or more, according to Francis Patricius of Venice. An account of such as are extant, and of those said to be lost, may be seen in Fabricius's *Bibliotheca Græca*. He left his writings with Theophrastus, his beloved disciple and successor in the Lycæum; and forbade that they should ever be published. Theophrastus, at his death, trusted them to Neleus, his good friend and disciple: whose heirs buried them in the ground at Scepsis, a town of Troas, to secure them from the king of Pergamus, who made great search everywhere for books to adorn his library. Here they lay concealed 160 years, until, being almost spoiled, they were sold to one Apellicon, a rich citizen of Athens. Sylla found them at this man's house, and ordered them to be carried to Rome. They were some time after purchased by Tyrannion a grammarian: and Andronicus of Rhodes having bought them of his heirs, was in a manner the first restorer of the works of this great philosopher; for he not only repaired what had been decayed by time and ill keeping, but also put them in a better order, and got them copied. There were many who followed the doctrine of Aristotle in the reigns of the 12 Cæsars, and their numbers increased much under Adrian and Antoninus: Alexander Aphrodinus was the first professor of the Peripatetic philosophy at Rome, being appointed by the emperors Marcus Aurelius and Lucius Verus; and in succeeding ages the doctrine of Aristotle prevailed among almost all men of letters, and many commentaries were written upon his works.

Aristot Aristox nus.

The first doctors of the church disapproved of the doctrine of Aristotle, as allowing too much to reason and sense; but Antoninus bishop of Laodicea, Didymus of Alexandria, St Jerome, St Augustin, and several others, at length wrote and spoke in favour of it. In the sixth age Boethius made him known in the west, and translated some of his pieces into Latin. But from the time of Boethius to the eighth age, Joannes Damascenus was the only man who made an abridgement of his philosophy, or wrote any thing concerning him. The Grecians, who took great pains to restore learning in the 11th and following ages, applied much to the works of this philosopher, and many learned men wrote commentaries on his writings: amongst these were Alfarabius, Algazel, Avicenna, and Averroes. They taught his doctrine in Africa, and afterwards at Cordova in Spain. The Spaniards introduced his doctrine into France, with the commentaries of Averroes and Avicenna; and it was taught in the university of Paris, until Amauri having supported some particular tenets on the principles of this philosopher, was condemned for heresy, in a council held there in 1210, when all the works of Aristotle that could be found were burnt, and the reading of them forbidden under pain of excommunication. This prohibition was confirmed, as to the physics and metaphysics, in 1215, by the pope's legate; though at the same time he gave leave for his logic to be read, instead of St Augustin's, used at that time in the university. In the year 1265, Simon, cardinal of St Cecil, and legate from the holy see, prohibited the reading of the physics and metaphysics of Aristotle. All these prohibitions, however, were taken off in 1366; for the cardinals of St Mark and St Martin, who were deputed by Pope Urban V. to reform the university of Paris, permitted the reading of those books which had been prohibited: and in the year 1448, Pope Stephen approved of all his works, and took care to have a new translation of them into Latin.

ARISTOXENUS, one of the most ancient musical writers, was born at Tarentum, a city in *Magna Græcia*, now Calabria. He was the son of a musician, and it appears that he lived about the time of Alexander the Great and his successors. His *Harmonics*

Aristoxenus.

monics in three books, all that are come down to us, together with Ptolemy's Harmonics, were first published by Gogavinus, but not very correctly, at Venice, 1562, in 4to, with a Latin version. John Meursius next translated the three books of Aristoxenus into Latin, from the MS. of Jos. Scaliger; but according to Meibomius, very negligently. With these he printed at Leyden, 1616, 4to, Nicomachus and Alypius, two other Greek writers on music. After this, Meibomius collected these musical writers together; to which he added Euclid, Bacchius senior, Aristides Quintilianus; and published the whole with a Latin version and notes, from the elegant press of Elzevir, Amst. 1652. The learned editor dedicates these ancient musical treatises to Christina queen of Sweden. Aristoxenus is said by Suidas to have written 452 different works, among which those on music were the most esteemed; yet his writings on other subjects are very frequently quoted by ancient authors, notwithstanding Cicero and some others say that he was a bad philosopher, and had nothing in his head but music. The title of several of the lost works of Aristoxenus, quoted by Athenæus and others, have been collected by Meursius in his notes upon this author, by Tonsius and Menage, all which Fabricius has digested into alphabetical order.

Aristoxenus.

ARITHMETIC

IS a science which explains the properties of numbers, and shows the method or art of computing by them.

History of Arithmetic.

1 AT what time this science was first introduced into the world, we can by no means determine. That some part of it, however, was coeval with the human race is absolutely certain. We cannot conceive how any man endowed with reason can be without some knowledge of numbers. We are indeed told of nations in America who have no word in their language to express a greater number than three; and this they call *pœtarrarorincouroac:* but that such nations should have no idea of a greater number than this, is absolutely incredible. Perhaps they may compute by threes, as we compute by tens; and this may have occasioned the notion that they have no greater number than three.

But though we cannot suppose any nation, or indeed any single person, ever to have been without some knowledge of the difference between greater and smaller numbers, it is possible that mankind may have subsisted for a considerable time without bringing this science to any perfection, or computing by any regular scale, as 10, 60, &c. That this, however, was very early introduced into the world, even before the flood, we may gather from the following expression in Enoch's prophecy, as mentioned by the apostle Jude: "Behold, the Lord cometh with *ten thousands* of his saints." This shows, that even at that time men had ideas of numbers as high as we have at this day, and computed them also in the same manner, namely, by tens. The directions also given to Noah concerning the dimensions of the ark, leave us no room to doubt that he had a knowledge of numbers, and of measures likewise. When Rebekah was sent away to Isaac, Abraham's son, her relations wished she might be the mother of *thousands of millions;* and if they were totally unacquainted with the rule of multiplication, it is difficult to see how such a wish could have been formed.

It is probable, therefore, that the four fundamental rules of Arithmetic have always been known to some nation or other. No doubt, as some nations, like the Europeans formerly, and the Africans and Americans now, have been immersed in the most abject and deplorable state of ignorance, they might remain for some time unacquainted with numbers, except such as they had immediate occasion for; and, when they came afterwards to improve, either from their own industry, or hints given by others, might fancy that they themselves, or those from whom they got the hints, had invented what was known long before. The Greeks 2
were the first European nation among whom arithmetic arrived at any degree of perfection. M. Goguet is of opinion, that they first used pebbles in their calculations: a proof of which he imagines is, that the word ψηφιζω, which comes from ψηφος, a little stone, or flint, among other things, signifies *to calculate*. The same, he thinks, is probable of the Romans; and derives the word *calculation* from the use of little stones (*calculi*) in their first arithmetical operations.

If this method, however, was at all made use of, it must have been but for a short time, since we find the Greeks very early made use of the letters of the alphabet to represent their numbers. The 23 letters of their alphabet taken according to their order, at first denoted the numbers 1, 2, 3, 4, 5, 7, 8, 9, 10, 20, 30, 40, 50, 60, 70, 80, 100, 200, 300, 400, 500, 600, 700, and 800; to which they added the three following, ϛ, ϟ, Ϡ, to represent 6, 90, and 900. The difficulty of performing arithmetical operations by such marks as these may easily be imagined, and is very conspicuous from Archimedes's treatise concerning the dimensions of a circle.

The Romans followed a like method; and besides 3
characters for each rank of classes, they introduced others for five, fifty, and five hundred. Their method is still used for distinguishing the chapters of books, and some other purposes. Their numeral letters and values are the following:

I	V	X	L	C	D	M
One,	five,	ten,	fifty,	one hundred,	five hundred,	one thousand.

Any number, however great, may be represented by repeating and combining these according to the following rules:

1st, When the same letter is repeated twice, or oftener, its value is represented as often. Thus II signifies two; XXX thirty; CC two hundred.

2d, When a numeral letter of lesser value is placed after one of greater, their values are added: thus XI signifies

signifies eleven, LXV sixty-five, MDCXXVIII one thousand six hundred and twenty-eight.

3d, When a numeral letter of lesser value is placed before one of greater, the value of the lesser is taken from that of the greater: thus IV signifies four, XL forty, XC ninety, CD four hundred.

Sometimes IↃ is used instead of D for 500, and the value is increased ten times by annexing Ↄ to the right hand.

Thus IↃ signifies	500	Also CIↃ is used for	1000
IↃↃ	5000	CCIↃↃ for	10000
IↃↃↃ	50000	CCCIↃↃↃ for	100000

Sometimes thousands are represented by drawing a line over the top of the numeral; $\overline{V}$ being used for five thousand, $\overline{L}$ for fifty thousand, $\overline{CC}$ two hundred thousand.

4 Sexagesimal Arithmetic.

About the year of Christ 200, a new kind of arithmetic, called *sexagesimal*, was invented, as is supposed, by Claudius Ptolemæus. The design of it was to remedy the difficulties of the common method, especially with regard to fractions. In this kind of arithmetic, every unit was supposed to be divided into 60 parts, and each of these into 60 others, and so on: hence any number of such parts were called *sexagesimal fractions;* and to make the computation in whole numbers more easy, he made the progression in these also sexagesimal. Thus from one to 59 were marked in the common way: then 60 was called a *sexagesima prima*, or first sexagesimal integer, and had one single dash over it; so 60 was expressed thus I′; and so on to 59 times 60, or 3540, which was thus expressed LIX′. He now proceeded to 60 times 60, which he called a *sexagesima secunda*, and was thus expressed I″. In like manner, twice 60 times 60, or 7200, was expressed by II″; and so on till he came to 60 times 3600, which was a third sexagesimal, and expressed thus, I‴. If any number less than 60 was joined with these sexagesimals, it was added in its proper characters without any dash; thus I′XV represented 60 and 15, or 75; I′VXXV is four times 60 and 25, or 265; X″II′XV, is ten times 3600, twice 60 and 15, or 36, 135, &c. Sexagesimal fractions were marked by putting the dash at the foot, or on the left hand of the letter: thus $I_{,}$ or $'I$ denoted $\frac{1}{60}$; $I_{,,}$ or $''I$ $\frac{1}{3600}$, &c.

5 Indian characters, when brought into use.

The most perfect method of notation, which we now use, came into Europe from the Arabians, by the way of Spain. The Arabs, however, do not pretend to be the inventors of them, but acknowledge that they received them from the Indians. Some there are, indeed, who contend that neither the Arabs nor the Indians were the inventors, but that they were found out by the Greeks. But this is by no means probable; as Maximus Planudes, who lived towards the close of the 13th century, is the first Greek who makes use of them: and he is plainly not the inventor; for Dr Wallis mentions an inscription on a chimney in the parsonage house of Helendon in Northamptonshire, where the date is expressed by M° 133, instead of 1133. Mr Luffkin furnishes a still earlier instance of their use, in the window of a house, part of which is a Roman wall, near the market place in Colchester; where between two carved lions stands an escutcheon with the figures 1090. Dr Wallis is of opinion that these characters must have been used in England at least as long ago as the year 1050, if not in ordinary affairs, at least in mathematical ones, and in astronomical tables. How these characters came to be originally invented by the Indians we are entirely ignorant.

The introduction of the Arabian characters in notation did not immediately put an end to the sexagesimal arithmetic. As this had been used in all the astronomical tables, it was for their sakes retained for a considerable time. The sexagesimal integers went first out, but the fractions continued till the invention of decimals.

6 Treatises on arithmetic.

The oldest treatises extant, upon the theory of arithmetic, are the seventh, eighth, and ninth books of Euclid's Elements, where he treats of proportion and of prime and composite numbers; both of which have received improvements since his time, especially the former. The next, of whom we know any thing, is Nicomachus the Pythagorean, who wrote a treatise of the theory of arithmetic, consisting chiefly of the distinctions and divisions of numbers into classes, as plain, solid, triangular, quadrangular, and the rest of the figurate numbers as they are called, numbers odd and even, &c. with some of the more general properties of the several kinds. This author is, by some, said to have lived before the time of Euclid; by others, not long after. His arithmetic was published at Paris in 1538. The next remarkable writer on this subject is Boethius, who lived at Rome in the time of Theodoric the Goth. He is supposed to have copied most of his works from Nicomachus.

From this time no remarkable writer on arithmetic appeared till about the year 1200, when Jordanus of Namur wrote a treatise on this subject, which was published and demonstrated by Joannes Faber Stapulensis in the 15th century, soon after the invention of printing. The same author also wrote upon the new art of computation by the Arabic figures, and called this book *Algorismus Demonstratus*. Dr Wallis says, this manuscript is in the Savillian library at Oxford, but it hath never yet been printed. As learning advanced in Europe, so did the knowledge of numbers: and the writers on arithmetic soon became innumerable. About the year 1464, Regiomontanus, in his triangular tables, divided the radius into 10,000 parts, instead of 60,000; and thus tacitly expelled the sexagesimal arithmetic. Part of it, however, still remains in the division of time, as of an hour into 60 minutes, a minute into 60 seconds, &c. Ramus in his arithmetic, written about the year 1550, and published by Lazarus Schonerus in 1586, used decimal periods in carrying on the square and cube roots to fractions. The same had been done before by our countrymen Buckley and Record; but the first who published an express treatise on decimals was Simon Stevinius, about the year 1582. As to the circulating decimals, Dr Wallis is the first who took much notice of them. He is also the author of the *arithmetic of infinites*, which has been very usefully applied to geometry. The greatest improvement, however, which the art of computation ever received, is the invention of logarithms. The honour of this invention is unquestionably due to Baron Napier of Merchiston in Scotland, about the end of the 16th or beginning of

the

Notation and Numeration.

the 17th century. By these means arithmetic has advanced to a degree of perfection which the ancients could never have imagined possible, much less hoped to attain; and we believe it may now be reckoned one of those few sciences which have arrived at their utmost height, and which is in its nature capable of little further improvement.

Chap. I. NOTATION and NUMERATION.

7 The first elements of arithmetic are acquired during our infancy. The idea of one, though the simplest of any, and suggested by every single object, is perhaps rather of the negative kind, and consists partly in the exclusion of plurality, and is not attended to till that of number be acquired. Two is formed by placing one object near another; three, four, and every higher number, by adding one continually to the former collection. As we thus advance from lower numbers to higher, we soon perceive that there is no limit to this increasing operation; and that, whatever number of objects be collected together, more may be added, at least, in imagination; so that we can never reach the highest possible number, nor approach near it. As we are led to understand and add numbers by collecting objects, so we learn to diminish them by removing the objects collected; and if we remove them one by one, the number decreases through all the steps by which it advanced, till only one remain, or none at all. When a child gathers as many stones together as suits his fancy, and then throws them away, he acquires the first elements of the two capital operations in arithmetic. The idea of numbers, which is first acquired by the observation of sensible objects, is afterwards extended to measures of space and time, affections of the mind, and other immaterial qualities.

Small numbers are most easily apprehended: a child soon knows what two and what three is; but has not any distinct notion of seventeen. Experience removes this difficulty in some degree; as we become accustomed to handle larger collections, we apprehend clearly the number of a dozen or a score; but perhaps could hardly advance to a hundred without the aid of classical arrangement, which is the art of forming so many units into a class, and so many of these classes into one of a higher kind, and thus advancing through as many ranks of classes as occasion requires. If a boy arrange an hundred stones in one row, he would be tired before he could reckon them; but if he placed them in ten rows of ten stones each, he will reckon an hundred with ease; and if he collect ten such parcels, he will reckon a thousand. In this case, ten is the lowest class, a hundred is a class of the second rank, and a thousand is a class of the third rank.

There does not seem to be any number naturally adapted for constituting a class of the lowest, or any higher rank, to the exclusion of others. However, as ten has been universally used for this purpose by the Hebrews, Greeks, Romans, and Arabians, and by all nations who have cultivated this science, it is probably the most convenient for general use. Other scales, however, may be assumed, perhaps on some occasions, with superior advantage; and the principles of arithmetic will appear in their full extent, if the student can adapt them to any scale whatever: thus, if eight were the scale, 6 times 3 would be two classes, and two units, and the number 18 would then be represented by 22. If 12 were the scale, 5 times 9 would be three classes and nine units, and 45 would be represented by 39, &c.

Notation and Numeration.

It is proper, whatever number of units constitutes a class of the lower rank, that the same number of each class should make one of the next higher. This is observed in our arithmetic, ten being the universal scale: but it is not regarded in the various kinds of moneys, weights, and the like, which do not advance by any universal measure; and much of the difficulty in the practice of arithmetic arises from that irregularity.

As higher numbers are somewhat difficult to apprehend, we naturally fall on contrivances to fix them in our minds, and render them familiar: but notwithstanding all the expedients we can fall upon, our ideas of high numbers are still imperfect, and generally far short of the reality; and though we can perform any computation with exactness, the answer we obtain is often incompletely apprehended.

It may not be amiss to illustrate, by a few examples, the extent of numbers which are frequently named without being attended to. If a person employed in telling money reckon an hundred pieces in a minute, and continue at work ten hours each day, he will take seventeen days to reckon a million; a thousand men would take 45 years to reckon a billion. If we supposed the whole earth to be as well peopled as Britain, and to have been so from the creation, and that the whole race of mankind had constantly spent their time in telling from a heap consisting of a quadrillion of pieces, they would hardly have yet reckoned the thousandth part of that quantity.

All numbers are represented by the ten following characters.

1 2 3 4 5 6 7 8 9 0

One, two, three, four, five, six, seven, eight, nine, cypher.

The nine first are called *significant figures*, or *digits;* and sometimes represent units, sometimes tens, hundreds, or higher classes. When placed singly, they denote the simple numbers subjoined to the characters. When several are placed together, the first or right-hand figure only is to be taken for its simple value: the second signifies so many tens, the third so many hundreds, and the others so many higher classes, according to the order they stand in. And as it may sometimes be required to express a number consisting of tens, hundreds, or higher classes, without any units or classes of a lower rank annexed; and as this can only be done by figures standing in the second, third, or higher place, while there are none to fill up the lower ones; therefore an additional character or cypher (0) is necessary, which has no signification when placed by itself, but serves to supply the vacant places, and bring the figures to their proper station.

The following table shows the names and divisions of the classes.

8.

Notation and Numeration.

8.	4.	3.	7.	9.	8.	2.	5.	6.	4.	7.	3.	8.	9.	7.	2.	6.	4.	5.
TRILLIONS	Hundred thousand of billions	Ten thousand of billions	Thousand billions	Hundred billions	Ten billions	BILLIONS	Hundred thousand of millions	Ten thousand of millions	Thousand millions	Hundred millions	Ten millions	MILLIONS	Hundred thousands	Ten thousands	Thousands	Hundreds	Tens	Units

The first six figures from the right hand are called the *unit period*, the next five the *million period*, after which the *trillion*, *quadrillion*, *quintillion*, *sextillion*, *septillion*, *octillion*, and *nonillion* periods follow in their order.

It is proper to divide any number, before we reckon it, into periods and half periods, by different marks. We then begin at the left hand, and read the figures in their order, with the names of their places, from the table. In writing any number, we must be careful to mark the figures in their proper places, and supply the vacant places with cyphers.

As there are no possible ways of changing numbers, except by enlarging or diminishing them according to some given rule, it follows, that the whole art of arithmetic is comprehended in two operations, *Addition* and *Subtraction*. However, as it is frequently required to add several equal numbers together, or to subtract several equal ones from a greater, till it be exhausted, proper methods have been invented for facilitating the operation in these cases, and distinguished by the names of *Multiplication* and *Division*; and these four rules are the foundation of all arithmetical operations whatever.

As the idea of number is acquired by observing several objects collected, so is that of fractions by observing an object divided into several parts. As we sometimes meet with objects broken into two, three, or more parts, we may consider any or all of these divisions promiscuously, which is done in the doctrine of vulgar fractions, for which a chapter will be allotted. However, since the practice of collecting units into parcels of tens has prevailed universally, it has been found convenient to follow a like method in the consideration of fractions, by dividing each unit into ten equal parts, and each of these into ten smaller parts; and so on. Numbers divided in this manner are called *Decimal Fractions*.

CHAP. II. ADDITION.

3 ADDITION is that operation by which we find the amount of two or more numbers. The method of doing this in simple cases is obvious, as soon as the meaning of number is known, and admits of no illustration. A young learner will begin at one of the numbers, and reckon up as many units separately as there are in the other, and practice will enable him to do it at once. It is impossible, strictly speaking, to add more than two numbers at a time. We must first find the sum of the first and second; then we add the third to that number; and so on. However, as the several sums obtained are easily retained in the memory, it is neither necessary nor usual to mark them down. When the numbers consist of more figures than one, we add the units together, the tens together, and so on. But if the sum of the units exceed ten, or contain ten several times, we add the number of tens it contains to the next column, and only set down the number of units that are over. In like manner we carry the tens of every column to the next higher. And the reason of this is obvions from the value of the places; since an unit, in any higher place, signifies the same thing as ten in the place immediately lower.

Additi

RULE. "Write the numbers distinctly, units under units, tens under tens; and so on. Then reckon the amount of the right-hand column. If it be under ten, mark it down. If it exceed ten, mark the units only, and carry the tens to the next place. In like manner, carry the tens of each column to the next, and mark down the full sum of the left-hand column."

Example.

346863
876734
123467
314213
712316
438987
279654
———
3092234
24433

As it is of great consequence in business to perform addition readily and exactly, the learner ought to practise it till it become quite familiar. If the learner can readily add any two digits, he will soon add a digit to a higher number with equal ease. It is only to add the unit place of that number to the digit; and, if it exceed ten, it raises the amount accordingly. Thus, because 8 and 6 is 14, 48 and 6 is 54. It will be proper to mark down under the sums of each column, in a small hand, the figure that is carried to the next column. This prevents the trouble of going over the whole operation again, in case of interruption or mistake. If you want to keep the account clean, mark down the sum and figure you carry on a separate paper, and after revising them, transcribe the sum only. After some practice, we ought to acquire the habit of adding two or more figures at one glance. This is particularly useful when two figures which amount to 10, as 6 and 4, or 7 and 3, stand together in the column.

Every operation in arithmetic ought to be revised, to prevent mistakes; and as one is apt to fall into the same mistake, if he revise it in the same manner he performed it, it is proper either to alter the order, or else to trace back the steps by which the operation advanced, which will lead us at last to the number we began with. Every method of proving accounts may be referred to one or other of these heads.

1st, Addition may be proven by any of the following methods: Repeat the operation, beginning at the top of the column, if you began at the foot when you wrought it.

2d, Divide the account into several parts; add these separately, and then add the sums together. If their amount correspond with the sum of the account, when added at once, it may be presumed right. This method is particularly proper when you want to know the sums of the parts, as well as that of the whole.

3d, Subtract the number successively from the sum; if the account be right, you will exhaust it exactly, and find no remainder.

When

Addition.

When the given number consists of articles of different value, as pounds, shillings, and pence, or the like, which are called *different denominations*, the operations in arithmetic must be regulated by the value of the articles. We shall give here a few of the most useful tables for the learner's information.

I. *Sterling Money.*	II. *Avoirdupois Weight.*
4 Farthings = 1 penny, *marked* d.	16 Drams = 1 ounce, oz.
12 Pence = 1 shilling, s.	16 Ounces = 1 pound, lb.
20 Shillings = 1 pound, L.	28 Pounds = 1 quarter, qr.
Also, 6s. 8d. = 1 noble	4 Quart. = 1 hun. wght, C.
12s. = 1 angel	20 Hun. weight = 1 ton, T.
13s. 4d. or two-thirds of a pound = 1 merk.	

Scots money is divided in the same manner as sterling, and has one twelfth of its value. A pound Scots is equal to 1s. 8d. sterling, a shilling Scots to a penny sterling, and a penny Scots to a twelfth part of a penny sterling; a merk Scots is two-thirds of a pound Scots, or 13⅓d. Sterling.

III. *Troy Weight.*	IV. *Apothecaries Weight.*
20 Mites = 1 grain, gr.	20 Grains = 1 scruple, ℈
24 Grains = 1 pen. wt, dwt.	3 Scruples = 1 dram, ʒ
20 Penny wts = 1 ounce, oz.	8 Drams = 1 ounce, ℥
12 Ounces = 1 pound, lib.	12 Ounces = 1 pound, ℔

V. *English Dry Measure.*	VI. *Scots Dry Measure.*
2 Pints = 1 quart	4 Lippies = 1 peck
4 Quarts = 1 gallon	4 Pecks = 1 firlot
2 Gallons = 1 peck	4 Firlots = 1 boll
4 Pecks = 1 bushel	16 Bolls = 1 chalder
8 Bushels = 1 quarter	

VII. *English Land Measure.*	VIII. *Scots Land Measure.*
30¼ Square yards = 1 pole or perch	36 Square ells = 1 fall
40 Poles = 1 rood	40 Falls = 1 rood
4 Roods = 1 acre	4 Roods = 1 acre

IX. *Long Measure.*	X. *Time.*
12 Inches = 1 foot	60 Seconds = 1 minute
3 Feet = 1 yard	60 Minutes = 1 hour
5½ Yards = 1 pole	24 Hours = 1 day
40 Poles = 1 furlong	7 Days = 1 week
8 Furlongs = 1 mile	365 Days = 1 year
3 Miles = 1 league	52 Weeks & 1 day = 1 year

Rule *for Compound Addition.* "Arrange like quantities under like, and carry according to the value of "the higher place."

Note 1. When you add a denomination, which contains more columns than one, and from which you carry to the higher by 20, 30, or any even number of tens, first add the units of that column, and mark down their sum, carrying the tens to the next column; then add the tens, and carry to the higher denomination, by the number of tens that it contains of the lower. For example, in adding shillings, carry by 10 from the units to the tens, and by 2 from the tens to the pounds.

Note 2. If you do not carry by an even number of tens, first find the complete sum of the lower denomination, then inquire how many of the higher that sum contains, and carry accordingly, and mark the remainder, if, any, under the column. For example, if the sum of a column of pence be 43, which is three shillings and sevenpence, mark 7 under the pence column, and carry 3 to that of the shillings. Addition.

Note 3. Some add the lower denominations after the following method; when they have reckoned as many as amounts to one of the higher denomination, or upwards, they mark a dot, and begin again with the excess of the number reckoned above the value of the denomination. The number of dots shows how many are carried, and the last reckoned number is placed under the column.

Examples in Sterling Money.

L.			L.		
145	6	8	16	9	11½
215	3	9	169	16	10
172	18	4	36	12	9¾
645	7	7	54	7	6
737	2	2	30	–	1¼
35	3	9	7	19	6
9	–	7	707	19	11
1764	12	3	14	14	4
780	–	–	84	18	8¾
99	9	9	125	3	7
150	10	–	16	16	8¾
844	9	7	62	5	3

In Avoirdupois Weight.

T.	*C.*	*qr.*	*lb.*	*T.*	*C.*	*qr.*	*lb.*
1	19	3	26	3	15	2	24
–	14	1	16	6	3	–	19
2	18	1	16	5	7	3	26
–	1	2	27	3	2	2	–
3	1	–	10	4	3	1	10
–	17	2	24	–	18	1	12
–	15	3	18	1	1	1	1
4	6	–	5	5	3	–	7
–	6	3	9	6	4	–	9
6	4	–	4	4	6	–	5
5	5	–	5	2	1	3	4

When one page will not contain the whole account, we add the articles it contains, and write against their sum *Carried forward;* and we begin the next page with the sum of the foregoing, writing against it, *Brought forward.*

When the articles fill several pages, and their whole sum is known, which is the case in transcribing accounts, it is best to proceed in the following manner: Add the pages, placing the sums on a separate paper; then add the sums, and if the amount of the whole be right, it only remains to find what number should be placed at the foot and top of the pages. For this purpose, repeat the sum of the first page on the same line; add the sums of the first and second, placing the amount in a line with the second; to this add the sum of the third, placing the amount in a line with the third. Proceed in the like manner with the others; and if the last sum corresponds with the amount of the page, it is right. These sums are transcribed at the foot of the respective pages, and tops of the following ones.

Addition.

Examples.

L.	134	6	8											
	42	3	9	L.	170	5	4	L.	70	4	2	L.	15	3	9
	175	4	9		66	9	8		18	6	8		12	2	6
	42	5	7		73	8	6		12	13	2		7	5	4
	163	7	4		45	3	2		15	3	9		8	–	–
	148	5	8		78	7	9		17	5	4		–	9	6
	73	2	3		12	–	–		18	6	6		–	5	10

	L.			L.			L.			L.		
1st Page,	L.	778	16	–	L.	778	16	–				
2d,		445	14	5		1224	10	5				
3d,		151	19	9		1376	10	2				
4th,		43	6	11		1419	17	1				
	L.	1419	17	1								

Then we transcribe 778l. 16s. at the foot of the first and top of the second pages, 1224l. 10s. 5d. at the foot of the second and top of the third; and so on.

CHAP. III. SUBTRACTION.

SUBTRACTION is the operation by which we take a lesser number from a greater, and find their difference. It is exactly opposite to addition, and is performed by learners in a like manner, beginning at the greater, and reckoning downwards the units of the lesser. The greater is called the *minuend*, and the lesser the *subtrahend*.

If any figure of the subtrahend be greater than the corresponding figure of the minuend, we add ten to that of the minuend, and having found and marked the difference, we add one to the next place of the subtrahend. This is called *borrowing ten*. The reason will appear, if we consider that, when two numbers are equally increased by adding the same to both, their difference will not be altered. When we proceed as directed above, we add ten to the minuend, and we likewise add one to the higher place of the subtrahend, which is equal to ten of the lower place.

RULE. "Subtract units from units, tens from tens, "and so on. If any figure of the subtrahend be greater "than the correponding one of the minuend, borrow "ten."

Example.			
Minuend	173694	738641
Subtrahend	21453	379235
Remainder	152241	359406

To prove subtraction, add the subtrahend and remainder together; if their sum be equal to the minuend, the account is right.

Or subtract the remainder from the minuend. If the difference be equal to the subtrahend, the account is right.

RULE *for Compound Subtraction.* "Place like deno-"minations under like; and borrow, when necessary, "according to the value of the higher place."

Examples.

					C.	*qr.*	*lib.*		*A.*	*R.*	*F.*	*E.*
L.	146	3	3		12	3	19		15	2	24	18
	58	7	6		4	3	24		12	2	36	7
L.	87	15	9		7	3	23		2	3	28	11

Note 1. The reason for borrowing is the same as in simple subtraction. Thus, in subtracting pence, we add 12 pence when necessary to the minuend, and at the next step, we add one shilling to the subtrahend. Subtr-tion

Note 2. When there are two places in the same denomination, if the next higher contain exactly so many tens, it is best to subtract the units first, borrowing ten when necessary; and then subtract the tens, borrowing, if there is occasion, according to the number of tens in the higher denomination.

Note 3. If the value of the higher denomination be not an even number of tens, subtract the units and tens at once, borrowing according to the value of the higher denomination.

Note 4. Some choose to subtract the place in the subtrahend, when it exceeds that of the minuend, from the value of the higher denomination, and add the minuend to the difference. This is only a different order of proceeding, and gives the same answer.

Note 5. As custom has established the method of placing the subtrahend under the minuend, we follow it when there is no reason for doing otherwise; the minuend may be placed under the subtrahend with equal propriety; and the learner should be able to work it either way, with equal readiness, as this last is sometimes more convenient; of which instances will occur afterwards.

Note 6. The learner should also acquire the habit, when two numbers are marked down, of placing such a number under the lesser, that, when added together, the sum may be equal to the greater. The operation is the same as subtraction, though conceived in a different manner, and is useful in balancing accounts and on other occasions.

It is often necessary to place the sums in different columns, in order to exhibit a clear view of what is required. For instance, if the values of several parcels of goods are to be added, and each parcel consists of several articles, the particular articles should be placed in an inner column, and the sum of each parcel extended to the outer column, and the total added there.

If any person be owing an account, and has made some partial payments, the payments must be placed in an inner column, and their sum extended under that of the account in the outer column, and subtracted there.

An example or two will make this plain.

CHAP.

Multiplication.

Chap. IV. MULTIPLICATION.

10

In multiplication, two numbers are given, and it is required to find how much the first amounts to, when reckoned as many times as there are units in the second. Thus, 8 multiplied by 5, or 5 times 8, is 40. The given numbers (8 and 5) are called *factors;* the first (8) the *multiplicand;* the second (5) the *multiplier;* and the amount (40) the *product.*

This operation is nothing else than addition of the same number several times repeated. If we mark 8 five times under each other, and add them, the sum is 40. But, as this kind of addition is of frequent and extensive use, in order to shorten the operation, we mark down the number only once, and conceive it to be repeated as often as there are units in the multiplier.

For this purpose, the learner must be thoroughly acquainted with the following multiplication table, which is composed by adding each digit twelve times.

Twice	Thrice	Four times	Five times	Six times	Seven times
1 is 2	1 is 3	1 is 4	1 is 5	1 is 6	1 is 7
2 4	2 6	2 8	2 10	2 12	2 14
3 6	3 9	3 12	3 15	3 18	3 21
4 8	4 12	4 16	4 20	4 24	4 28
5 10	5 15	5 20	5 25	5 30	5 35
6 12	6 18	6 24	6 30	6 36	6 42
7 14	7 21	7 28	7 35	7 42	7 49
8 16	8 24	8 32	8 40	8 48	8 56
9 18	9 27	9 36	9 45	9 54	9 63
10 20	10 30	10 40	10 50	10 60	10 70
11 22	11 33	11 44	11 55	11 66	11 77
12 24	12 36	12 48	12 60	12 72	12 84

Eight times	Nine times	Ten times	Eleven times	Twelve times
1 is 8	1 is 9	1 is 10	1 is 11	1 is 12
2 16	2 18	2 20	2 22	2 24
3 24	3 27	3 30	3 33	3 36
4 32	4 36	4 40	4 44	4 48
5 40	5 45	5 50	5 55	5 60
6 48	6 54	6 60	6 66	6 72
7 56	7 63	7 70	7 77	7 84
8 64	8 72	8 80	8 88	8 96
9 72	9 81	9 90	9 99	9 108
10 80	10 90	10 100	10 110	10 120
11 88	11 99	11 110	11 121	11 132
12 96	12 108	12 120	12 132	12 144

If both factors be under 12, the table exhibits the product at once. If the multiplier only be under 12, we begin at the unit place, and multiply the figures in their order, carrying the tens to the higher place, as in addition.

Ex. 76859 multiplied by 4, or 76859 added 4 times.

4	76859
	76859
307436	76859
	307436

If the multiplier be 10, we annex a cypher to the multiplicand. If the multiplier be 100, we annex two cyphers; and so on. The reason is obvious, from the use of cyphers in notation.

If the multiplier be any digit, with one or more cyphers on the right hand, we multiply by the figure, and annex an equal number of cyphers to the product. Thus, if it be required to multiply by 50, we first multiply by 5, and then annex a cypher. It is the same thing as to add the multiplicand 50 times; and this might be done by writing the account at large, dividing the column into 10 parts of 5 lines, finding the sum of each part, and adding these ten sums together. Multiplication.

If the multiplier consists of several significant figures, we multiply separately by each, and add the products. It is the same as if we divided a long account of addition into parts corresponding to the figures of the multiplier.

Example. To multiply 7329 by 365

7329	7329	7329	36645= 5 times.
5	60	300	439740= 60 times.
36645	439740	2198700	2198700=300 times.
			2675085=365 times.

It is obvious that 5 times the multiplicand added to 60 times, and to 300 times, the same must amount to the product required. In practice, we place the products at once under each other; and as the cyphers arising from the higher places of the multiplier are lost in the addition, we omit them. Hence may be inferred the following

RULE. "Place the multiplier under the multiplicand, and multiply the latter successively by the significant figures of the former; placing the right-hand figure of each product under the figure of the multiplier from which it arises; then add the product."

Ex.				
	7329	42785	37846	93956
	365	91	235	8704
	36645	42785	189230	375824
	43974	385065	113538	657692
	21987		75692	751648
	2675085	3893435	8893810	817793024

A number which cannot be produced by the multiplication of two others is called a *prime number;* as 3, 5, 7, 11, and many others.

A number which may be produced by the multiplication of two or more smaller ones, is called a *composite number.* For example 27, which arises from the multiplication of 9 by 3; and these numbers (9 and 3) are called the *component parts* of 27.

Contractions and Varieties in Multiplication.

First, If the multiplier be a composite number, we may multiply successively by the component parts.

Ex. 7638 by 45 or 5 times 9

45	9	7638	1st, 5492 by 72
38190			2d, 13759 by 56
30552	5	68742	3d, 56417 by 144
342710		343710	4th, 73048 by 84
			5th, 166549 by 125
			6th, 378914 by 54
			7th, 520813 by 63

Because the second product is equal to five times the first, and the first is equal to nine times the multi-

Multiplication.

plicand, it is obvious that the second product must be five times nine, or forty-five times as great as the multiplicand.

Secondly, If the multiplier be 5, which is the half of 10, we may annex a cypher, and divide by 2. If it be 25, which is the fourth part of 100, we may annex two cyphers, and divide by 4. Other contractions of the like kind will readily occur to the learner.

Thirdly, To multiply by 9, which is one less than 10, we may annex a cypher; and subtract the multiplicand from the number it composes. To multiply by 99,999, or any number of 9's, annex as many cyphers, and subtract the multiplicand. The reason is obvious; and a like rule may be found, though the unite place be different from 9.

Fourthly, Sometimes a line of the product is more easily obtained from a former line of the same than from the multiplicand.

Ex. 1st.]	1372	2d.]	1348
	84		36
	5488		8088
	10976		4044
	115248		48528

In the first example, instead of multiplying by 5, we may multiply 5480 by 2; and, in the second, instead of multiplying by 3, we may divide 8088 by 2.

Fifthly, Sometimes the product of two or more figures may be obtained at once, from the product of a figure already found.

Ex. 1st.]	14356	2d.]	3462321
	648		96484
	114848		13849284
	918784		166191408
	9302688		332382816
			334058579364

In the second example, we multiply first by 4; then because 12 times 4 is 48, we multiply the first line of the product by 12, instead of multiplying separately by 8 and 4; lastly, because twice 48 is 96, we multiply the second line of the product by 12, instead of multiplying separately by 6 and 9.

When we follow this method, we must be careful to place the right-hand figure of each product under the right-hand figure of that part of the multiplier which it is derived from.

It would answer equally well in all cases, to begin the work at the highest place of the multiplier; and contractions are sometimes obtained by following that order.

Ex. 1st.]	3125	or	3125	2d.]	32452
	642		642		52575
	18750		18750		162260
	12500		131250		811300
	6250		2006250		2433900
	2006250				1706163900

It is a matter of indifference which of the factors be used as the multiplier; for 4 multiplied by 3 gives the same product as 3 multiplied by 4; and the like holds universally true. To illustrate this, we may make three rows of points, four in each . . . . row, placing the rows under each other; . . . . and we shall have also four rows, con- . . . . taining three points each, if we reckon the rows downwards.

Multiplication is proven by repeating the operation, using the multiplier for the multiplicand, and the multiplicand for the multiplier. It may also be proven by division, or by casting out the 9's; of which afterwards; and an account, wrought by any contraction, may be proven by performing the operation at large, or by a different contraction.

Compound Multiplication.

Rule I. "If the multiplier do not exceed 12, the "operation is performed at once, beginning at the "lowest place, and carrying according to the value of "the place."

[*Examples.*]	*Cwt. qr. lb.*	*A. R. P.*	*Lb.oz.dwt.*
L.	13 6 7	12 2 8	13 3 18	7 5 9
	9	5	6	12
L.	119 19 3	62 3 12	83 — 28	89 5 8

Rule II. "If the multiplier be a composite number, "whose component parts do not exceed 12, multiply "first by one of these parts, then multiply the product "by the other. Proceed in the same manner if there "be more than two."

Ex. 1st.] L. 15 3 8 by 32=8×4
8

L.121 9 4 = 8 times.
4

L.485 17 4 = 32 times.

2d.] L. 17 3 8 by 75=5×5×3
3

L. 51 11 – = 3 times.
5

L.257 15 – = 15 times.
5

L.1288 15 – = 75 times.

Note 1. Although the component parts will answer in any order, it is best, when it can be done, to take them in such order as may clear off some of the lower places at the first multiplication, as is done in Ex. 2d.

Note 2. The operation may be proved, by taking the component parts in a different order, or dividing the multiplier in a different manner.

Rule III. "If the multiplier be a prime number, "multiply first by the composite number next lower, "then by the difference, and add the products."

L.

Multiplication.

L. 35 17 9 by 67=64+3
8 64= 8×8

L. 287 2 -=8 times.
8

L.2296 16 -=64 times.
107 13 3= 3 times.

L.2404 9 3=67 times.

Here because 8 times 8 is 64, we multiply twice by 8, which gives 2296l. 16s. equal to 64 times the multiplicand; then we find the amount of 3 times the multiplicand, which is 107l. 13s. 3d.; and it is evident that these added, amount to 67, the multiplicand.

RULE IV. "If there be a composite number a little above the multiplier, we may multiply by that "number, and by the difference, and subtract the second product from the first."

L. 17 4 5 by 109=108— 2
12 108+ 9×12

L. 206 13 -
9

L.1859 17 —=108 times.
34 8 10= 2 times.

L.1825 8 2=206 times.

Here we multiply by 12 and 9, the component parts of 108, and obtain a product of 1860l. 6s. equal to 108 times the multiplicand; and, as this is twice oftener than was required, we subtract the multiplicand doubled, and the remainder is the number sought.

Example. 34l. 8s. 2½d. by 3465.

RULE. V. "If the multiplier be large, multiply by "10, and multiply the product again by 10; by "which means you obtain an hundred times the given "number. If the multiplier exceed 1000, multiply "by 10 again; and continue it farther, if the multiplier require it; then multiply the given number "by the unit place of the multiplier; the first product "by the ten-place, the second product by the hundred-place; and so on. Add the products thus obtained together."

L. 34 8 2½ by 5=L. 172 1 0½= 5 times
10

10 times L. 344 2 1 by 6= 2064 12 6 = 60 times
10

100 times L. 3441 — 10 by 4= 13764 3 4 = 400 times
10

1000 times L.34410 8 4 by 3=103231 5 — =3000 times

L.119232 9 10½=3465 times

The use of multiplication is to compute the amount of any number of equal articles, either in respect of measure, weight, value, or any other consideration. The multiplicand expresses how much is to be reckoned for each article; and the multiplier expresses how many times that is to be reckoned. As the multiplier points out the number of articles to be added, it is always an abstract number, and has no reference to any value or measnre whatever. It is therefore quite improper to attempt the multiplication of shillings by shillings, or to consider the multiplier as expressive of any denomination. The most uowuuoo instances in which the practice of this operation is required, are, to find the amount of any number of parcels, to find the value of any number of articles, to find the weight or measure of a number of articles, &c.

Division.

This computation, for changing any sum of money, weight, or measure, into a different kind, is called REDUCTION. When the quantity given is expressed in different denominations, we reduce the highest to the next lower, and add thereto the given number of that denomination; and proceed in like manner till we have reduced it to the lowest denomination.

Example. To reduce 46l. 13. 8¾d. to farthings.

L. 46
20

920 shillings in L.46
13

933 shillings in L.46 13
12

11196 pence in L.46 13
8

11204 pence in L.46 13 8
4

44186 farthings in L.46 13 8
3

44819 farthings in L.46 13 8¾

Or thus:

L. 46 13 4¾
20

933
12

11204
4

44819

It is easy to take in or add the higher denomination at the same time we multiply the lower.

CHAP. V. DIVISION.

IN division, two numbers are given; and it is required to find how often the former contains the latter. Thus, it may be asked how often 21 contains 7, and the answer is exactly 3 times. The former given number (21) is called the *Dividend;* the latter (7) the *Divisor;* and the number required (3) the *Quotient.* It frequently happens that the division cannot be completed exactly without fractions. Thus it may be asked, how often 8 is contained in 19? the answer is twice, and the remainder of 3.
