Encyclopædia Britannica.

BURKE, Edmund, a writer, orator, and statesman, was born in Dublin, on the first January, in the year 1730. His father was an attorney, first in Limerick, and afterwards in Dublin. Young Burke received the first rudiments of his education at Ballytore, in the county of Kildare, under the tuition of Abraham Shackleton, a Quaker of considerable celebrity. Committed to the care of a master so admirably qualified for the important business of instruction, young Burke applied to his studies with commendable assiduity, and became one of the numerous examples that might be adduced, to demonstrate the falsehood of that popular but dangerous maxim, *that young men of genius are always destitute of application*.

In this seminary he laid the foundation of his knowledge in the languages of antiquity; whence he was hereafter to borrow the elegance of his taste, and the models and imagery of his eloquence. From this source was also, most probably, derived that love of liberty, which, germinating at certain periods in his bosom, so often pointed his oratory, inflamed his passions, and animated his sentiments; and which in his best days acquired him a reputation almost unequalled in our times.

At this respectable school several years of his life were spent: and the attachment of the master, and the gratitude of the pupil, reflect honour on both. The former lived to see his scholar attain a considerable degree of reputation; and he on his part was accustomed to spend a portion of his annual visit to Ireland at Ballytore.

From a provincial seminary Edmund was sent to the university of Dublin. Here, however, he does not appear to have distinguished himself either by application or talents. His character, as a student, was merely negative. He exhibited no symptoms of early genius, obtained no palms in the academic race, and departed even without a degree. During this period, however, he commenced author. His first essays were of a political nature.

Mr Burke now addicted himself to other pursuits, particularly logic and metaphysics: and is said to have planned a refutation of the systems of Berkeley and Hume. While thus employed in treasuring up the means of attaining a species of celebrity, which far different avocations prevented him afterwards from aspiring to, he was not inattentive to the grand object of obtaining a suitable settlement in life; for his family was not opulent, and he already panted after independence. He accordingly became a candidate for a vacant chair at the university of Glasgow. The immediate reason of his failure is not directly known; but on this he repaired to the metropolis, and enrolled his name as a student of the Inner Temple.

It appears from his speeches, his writings, and his conversation, that he studied the grand outline of our municipal jurisprudence with particular attention; but it may be doubted whether he ever entered into the minutiæ. Indeed, the versatility of his talents, and his avocations, were but little calculated for that dull and plodding circuit which can alone lead to an intimate knowledge of our laws. Besides, if he had been gifted with the necessary application, both time and opportunity were wanting: for it is well known that at this period of his life the "*res angusta domi*" did not permit the student to dedicate his attention solely to this, or indeed to any other single object.

The exhausted state of his finances called frequently for a speedy supply; and, instead of perusing the pages of Bracton, Fleta, Littleton, and Coke, he was obliged to write essays, letters, and paragraphs, for the periodical publications of the day. But if these pursuits diverted his attention from graver studies, they acquired him a facility of composition, and a command of style and of language, which proved eminently serviceable in the course of his future life.

His health, however, became at length impaired, and a nervous fever ensued. This circumstance induced him to call in the aid of Dr Nugent, one of his own countrymen, a medical man, whose manners were more amiable than his practice was extensive. This gentleman, who had travelled on the continent, and was an author himself, readily discovered the source of his malady, and, by removing him from books and business to his own house, soon effected a cure. That event is said to have been hastened, if not entirely completed, by a physician of another kind; the accomplished daughter of his host. This lady was destined to become his wife; a circumstance particularly fortunate for him, as her disposition was mild and gentle, and she continued through a long series of years, and many vicissitudes of fortune, to soothe and tranquillize passions always violent, and often tumultuous.

Our student seems at length to have determined once more to endeavour to distinguish himself as an author,

thor, and he accordingly took advantage of the death of a celebrated peer to write a work after the manner of that nobleman; in which, by exaggerating his principles, he should be enabled to bring them into contempt: but this effort proved unsuccessful, for the treatise in question was for a long time consigned to oblivion, and would never have been heard of, had it not been resuscitated by his future fame. Another performance made ample amends: his "Essay on the Sublime and Beautiful" attracted a high degree of reputation, and acquired him considerable celebrity as a man of letters. In addition to the profits of the publication, he is said on this occasion to have received a present from his father of 100l. But his circumstances must have been greatly embarrassed about this time, as he was obliged to sell his books; and surely nothing but the extremity of distress could have forced a man of letters to such a measure.

The work we have just mentioned, having an immediate relation to taste, excited a desire in Sir Joshua Reynolds, even then at the head of his profession, to become acquainted with Mr Burke; and a friendship ensued which continued uninterrupted during the life of the painter, and was unequivocally testified by a handsome bequest in his will. Dr Johnson also sought and obtained an intimacy with him, and he now became the constant frequenter of two clubs, composed of some of the most celebrated men of that day. One of these met at the Turk's Head tavern in Gerrard-street, and consisted of the following members: Dr Johnson, Mr (afterwards Sir Joshua) Reynolds, Dr Goldsmith, Mr Topham Beauclerc, Dr Nugent, Sir John Hawkins, Mr Bennet Langton, Mr Chamier, Mr Garrick, and Mr Burke.

The other assembled at the St James's coffee-house, and besides many of the above, was composed of the following members: Mr Cumberland, Dr Douglas bishop of Salisbury, Dr Bernard dean of Derry, Mr Richard Burke, Mr William Burke, Mr Hickey, &c. Dr Goldsmith, who was Mr Burke's contemporary at Dublin College, was a member of both, and wrote the epitaphs of those who composed the latter. That on Mr Burke has often been praised.

Here lies our good Edmund whose genius was such,
We scarcely can praise it or blame it too much;
Who, born for the universe, narrowed his mind,
And to party gave up what was meant for mankind.
Though fraught with all learning, yet straining his throat
To persuade Tommy Townshend to lend him a vote;
Who, too deep for his hearers, still went on refining,
And thought of convincing while they thought of dining;
Though equal to all things, for all things unfit;
Too nice for a statesman, too proud for a wit;
For a patriot too cool, for a drudge disobedient;
And too fond of the *right*, to pursue the *expedient*.
In short, 'twas his fate, unemployed, or in place, Sir,
To eat mutton cold, and cut blocks with a razor.

A literary work on a new plan, first suggested in 1750, and by some attributed to the Dodsleys, and by others to Mr Burke, became, for some time, a considerable source of emolument to him. This was called the "Annual Register;" a publication that soon obtained considerable celebrity, and of which he had the superintendence for several years.

He was at length called off from his literary labours by avocations of a far different kind. A gentleman who afterwards derived the *cognomen* of "single-speech Hamilton," from a celebrated oration, having been appointed secretary to the lord-lieutenant of Ireland, invited his friend Mr Burke to accompany him thither; this offer he readily complied with, and although he acted in no public station, and performed no public service while he remained in that country, he was rewarded with a pension of 300l. per annum, which he soon after disposed of for a sum of money.

On his return to England he amused himself, as usual, with literary composition. A series of essays, written by him in a newspaper, which, at one time, obtained great celebrity, attracted the notice of the late Marquis of Rockingham; and Mr Fitzherbert, a member of parliament, and father of the present Lord St Helen's, in consequence of this circumstance, introduced him to that nobleman. From this moment he was destined to become a public man, and to dedicate his studies, his eloquence, and his pen, to politics.

Lord Rockingham having proved more compliant than the Earl of Chatham, the former nobleman was brought into power, and seated on the treasury bench. On this occasion he selected Mr Burke as his private secretary, an office of no power and very little emolument, but which naturally leads to both. As it was now necessary he should have a seat in parliament, although it cannot be supposed that he was legally qualified in respect to property, he applied to Lord Verney, who was patron of Wendover, a borough at that time dependent on him, and principally occupied by his tenants.

Having thus obtained a seat in 1765, he prepared to fit himself for his new situation. He was already provided with all the necessary talents, and was only deficient in the forms of business, and the facility of expressing his sentiments before a public audience. The first of these was mastered by sedulous attention; and as to the second, if we are to give credit to those who pretend to be intimately acquainted with this period of his life, he overcame all difficulties by a previous initiation elsewhere. In short he had acquired celebrity at the "Robinhood," before he attempted to speak in the British senate, and vanquished an eloquent "baker" ere he began to cope with the great orators of the nation.

Holding a confidential place under the Rockingham administration, he of course supported all its measures. A former ministry, anxious to increase its influence by means of increased imposts, had conceived the idea of taxing America through the medium of a parliament in which she was not represented. Having attempted to carry this into effect by means of the famous stamp act, the Americans, alarmed at what they conceived to be a flagrant violation of every principle of the English constitution, made such a spirited resistance to the measure that it was abandoned, and the Rockingham party readily consented to the repeal. Under the pretext, however, of vindicating the honour of the crown, they unfortunately proposed and carried the declaratory

Burke. claratory act, by means of which, although the original scheme had been abandoned, the principle on which it was built was asserted anew, and a foundation laid for all the miseries that afterwards ensued. But if this short-lived administration deserved no great credit on this occasion, it is entitled to considerable praise on account of other parts of its conduct; for it repealed the cyder act, procured a declaration of the house of commons, condemning the seizure of papers, and a resolution against general warrants. The first of these afforded great relief to such of the counties as cultivated orchard grounds, and the two last seemed to be called for by the conduct of their predecessors in respect to Mr Wilkes.

On retiring from office they, however, did not carry much popularity along with them, as Lord Chatham and his friends, who in some measure monopolized the public favour, were entrusted with the management of affairs for a short time; and it is extremely probable that they would have sunk into neglect, had not America been driven into resistance.

It now fell to the lot of Lord North to enforce the scheme which the Grenville party had projected, and wished to carry boldly into execution; which the Rockingham administration had by an unaccountable blunder at once annihilated and recognised, and which they afterwards manfully, and at length successfully opposed.

This forms the most brilliant epoch of Mr Burke's life. He was hostile to the expulsion of Mr Wilkes; an act which the house of commons afterwards rescinded from its records. On the application of the Dissenters for relief, he took up their cause, and expressed his resentment, in very animated terms, against that misguided policy, which permits all those not within the pale of establishment to enjoy liberty less by right than by connivance. But perhaps the noblest part of his conduct consisted in his steady and uniform opposition to the American war, and his marked and declared hostility to the abettors of it. His speech against the Boston Port bill was one of the most charming specimens of oratory that had ever been exhibited in the British senate; and on the 19th of April, 1774, on a motion for the repeal of the tea duty, he discovered such talents, that an old and respectable member exclaimed, "Good God! what a man is this!—How could he acquire such transcendent powers?" And when, in reply to another who had said, "That the Americans were our children, and it was horrible to revolt against their parent!" the orator uttered the following passage, the whole house was electrified: —"They are our children, it is true; but when children ask for bread, we are not to give them a stone. When those children of ours wish to assimilate with their parent, and to respect the beauteous countenance of British liberty, are we to turn to them the shameful parts of our constitution? Are we to give them our weakness for their strength; our opprobrium for their glory; and the slough of slavery, which we are not able to work off, to serve them for their freedom?"

The city of Bristol, the merchants of which had become rich by the commerce with America, were likely to suffer by its interdiction. This consideration alone rendered many of them hostile to the proceedings of the ministry; but nobler and more exalted motives actuated the bosoms of others, particularly the Quakers, Dissenters, and other sectarists who were moved by zeal against oppression, and a love of liberty imprinted on their minds by a constitution which had remained until then inviolate. Gratified by the exertions of Mr Burke in behalf of civil and religious freedom, they put him in nomination for their city, and sent into Yorkshire, to request his immediate personal attendance. After consulting with his patron concerning an offer so flattering and unexpected, accompanied at the same time with assurances most punctually fulfilled, *that he should be put to no expence whatever*, he immediately set out for the west of England, and found that no less than three candidates had started before him. The first was Lord Clare, afterwards Lord Nugent, one of the former representatives, whose unpopularity was such, that he soon discovered the necessity of resigning all his pretensions; two, therefore (Mr Cruger and Mr Brickdale), only remained in the field, and the former of these, like Mr Burke himself, was averse to a rupture with America.

The new candidate did not appear on the hustings until the afternoon of the sixth day's poll, on which occasion he addressed the electors in a very able speech, admirably calculated for the occasion. He began by expressing a modest diffidence of his own abilities, and a high opinion of the important trust they were assembled to confer. He then boldly declared himself hostile to a contest with America, and asserted, that England had been rendered flourishing by liberty and commerce, the first of which was dear to his heart, while the latter had been a favourite object of his studies, both in its principles and details.

This harangue was well received by the electors; the contest proved propitious to his wishes; and when the sheriffs had notified, at the close of the poll, that he was elected, he made the most brilliant address on the occasion that had ever been heard within the walls of a city celebrated rather for its opulence than its eloquence.

Mr Burke immediately returned from his new constituents to parliament, with increased vigour, reputation, and zeal. The Earl of Chatham, faving failed, notwithstanding his reputation for wisdom, in an attempt to adjust the troubles of the colonies by means of a conciliatory bill introduced by him into the house of peers for that purpose, the obstinacy of the ministry now became apparent to every one. This circumstance, which would have appalled an inferior man, did not, however, discourage the member for Bristol from a similar attempt in another place; and accordingly, March 22. 1775, he brought forward his thirteen celebrated propositions, which were intended to close the fatal breach, and heal all the differences between the mother country and her colonies.

His plan, on this occasion, embraced not only an immediate conciliation, by a repeal of the late coercive acts, but also the creation of an independent judicature, and the regulation of the courts of admiralty. The whole, however, was quashed by a large majority on the side of the minister, who moved the previous question.

Mr Burke had hitherto chiefly distinguished himself in opposition to the measures of others; but in 1780, he himself stood forth as the original author and proposer of a scheme which soon engaged the attention of the public, and actually appeared big with the most prosperous results. When he found ministers obstinately persisting in a disastrous war, and perceived that the people began to bend beneath the weight of the taxes for its support, it struck him as advantageous on one hand, and political on the other, to diminish the public burdens and the number of adherents to the court at the same time. Accordingly, on the 11th of February, he brought in a bill "for the regulation of his majesty's civil establishments, and of certain public offices; for the limitation of pensions, and the suppression of sundry useless, expensive, and inconvenient places, and for applying the monies saved thereby, to the public service."

This scheme was manifestly founded on the late reforms that had taken place in France; for by an edict of the king, registered in the parliament of Paris, it appeared that he had suppressed no less than 406 places in his household by one regulation. The orator, with great judgment, fastened upon this event, and endeavoured to make use of it as an incitement to a similar attempt here; nay, he called in national rivalship itself, by way of an inducement to consent to this sacrifice on the part of the crown.

To this bill the minority did not at first give much opposition. Indeed the mover of it contrived to soften those features that appeared harsh to them. Notwithstanding this, it did not prove successful during Lord North's administration; and when it was at length carried, it was much modified and altered.

Parliament was dissolved in 1780, but Mr Burke was not re-elected for Bristol, and this is said to have made a deep impression on the mind of the orator; but this must have been obliterated by the important events that speedily ensued; for the minister now tottered on the treasury bench, being abandoned by many of his staunchest supporters, and but little confident in his own schemes, all of which had proved eminently unsuccessful, The opposition, having by this time increased to a considerable degree, unceasingly assailed him, until at length, March 28. 1782, Lord North assured the house of commons that his administration was at an end.

The day had now arrived when the ministry and opposition were to change places, and the former to be arrayed in the spoils of the latter. Of this rich booty Mr Burke, whose services had been so conspicuous in hunting the enemy into the toils prepared for them, had his portion: for he was made a privy counsellor, and invested with the lucrative appointment of paymaster-general of the forces. He was at length now enabled to enforce his plan of political economy, tendered before in vain; and the board of trade, the board of works, the offices of third secretary of state, treasurer of the chamber, cofferer of the household, the lords of police in Scotland, the master of the harriers, the master of the stag hounds, the six clerks of the board of green cloth, and the paymaster of the pensions, were abolished.

At length the reins of government were confided to the hands of the Marquis of Lansdowne, then Earl Shelburne; and this event gave such offence to those who wished to place the duke of Portland at the head of affairs, that Mr Fox, Lord John Cavendish, and Mr. Burke, immediately resigned.

In the mean time, the critical state of the English East India Company had long agitated the public mind, and become occasionally a subject of discussion in parliament. The seizure, imprisonment, and confinement of Lord Pigot, by a faction in the council of Madras; the conduct of Mr Hastings, in respect to several of the native powers; the grand question of sovereignty, relative to the territorial possessions of the company in Asia: all these subjects had, at different times, excited the attention of the nation.

No sooner did Mr Fox behold himself and his friends in possession of power, than he brought in a bill, to remedy the various abuses in the government of British India. Of this bill Mr Burke is well known to have been the principal penman, and upon this occasion he defended its principles and provisions with all the zeal of a parent. In a speech of considerable length he exhibited an able retrospect of the system, both political and commercial, of the company. He then proceeded to state the benefit likely to result from the plan under contemplation, which he considered as calculated to effect "the rescue of the greatest number of the human race that ever were so grievously oppressed, from the greatest tyranny that ever was exercised." In short, he contemplated it as a measure that would "secure the rice in his pot to every man in India." "I carry my mind (adds he) to all the people, and all the names and descriptions that, relieved by this bill, will bless the labours of this parliament, and the confidence which the best house of commons has given to him who best deserves it."

This celebrated bill, notwithstanding much opposition both within and without, was carried triumphantly through the house of commons: but in the house of peers it experienced a far different fate, and with it fell the power and consequence of its authors, framers, and supporters.

In the course of the next year (February 28. 1785), he made a celebrated speech relative to the nabob of Arcot's debts; and depicted one of his creditors, who had taken an active share in the late elections, "as a criminal who long since ought to have fattened the region kites with his offal; the old betrayer, insulter, oppressor, and scourge of a country (Tanjore), which had for years been an object of an unremitted, but unhappily an unequal, struggle, between the bounties of Providence to renovate, and the wickedness of mankind to destroy."

But there appeared to Mr Burke to be a still greater delinquent, on whom he was determined to inflict all the wounds of his eloquence, and sacrifice, if possible, the powerful offender himself at the shrine of national vengeance. This was Mr Hastings; and soon after his arrival in England, the orator gave notice of his intentions. On the 17th of February, 1785, he opened the accusation by a most eloquent speech; in which he depicted the supposed crimes of the late governor-general, in the most glowing and animated colours. This trial, however, turned out in the event

far

Burke.

far different from his hopes and expectations; while the length of it failed not to involve both himself and party in reproach.

During the debate on the commercial treaty with France (January 23. 1787), the member for Malton exhibited an undiminished versatility of talents, and pointed his ridicule with no common success at Mr Pitt, who, according to him, contemplated the subject with a narrowness peculiar to limited minds:—"He seems to consider it (adds he) as an affair of two little compting-houses, and not of two great nations. He seems to consider it as a contention between the sign of the *fleur-de-lis* and the sign of the old *red lion*, for which should obtain the best custom."

The next public event of importance in which we find Mr Burke engaged, occurred in consequence of his majesty's indisposition. On this occasion he took an active part in the debates of the house of commons; and is supposed to have penned a letter for one, and a speech for another, branch of the royal family. When Mr Pitt moved his declaratory resolutions relative to the provisional exercise of the royal authority, he attacked him with much asperity of language, and was particularly severe on the manner in which the royal assent was to be given to all future acts of parliament. The men who held most of the high places under the government were treated as "jobbers, old hacks of the court, and the supporters and betrayers of all parties; and it was a mock crown, a tinsel robe, and a sceptre from the theatre, lackered over and unreal," which were about to be conferred on the prince of Wales.

The opposition, lessened indeed by a few occasional desertions, had hitherto acted as a great public body, supposed to be united in general principles, for the common welfare and prosperity of the state; but the French revolution thinned their ranks, dispelled their consequence, and, by sowing jealousy between the chiefs, spread consternation and dismay among their followers.

It was on the 2d of March 1790, when Mr Fox moved for leave to bring in a bill to repeal the corporation and test-acts, that this disunion became evident; and soon after this Mr Burke declared, "that his honourable friend and he were separated in their politics for ever."

The ministry now seemed anxious to provide for their new associate; and he, on his part, certainly appeared deserving of some remuneration at their hands, for he had abandoned all his old friends, and not a few of his old principles. In addition to this, his "Reflections on the Revolution in France," had afforded some degree of countenance, and even popularity, to the measures of administration; and, not content with his own exertions, he had enlisted his son on the same side, and even sent him to Coblentz. The royal munificence at length gratified his warmest wishes; for by a warrant, dated September 24. 1795, and made to commence January 5. 1793, he received a pension of 1200l. for his own life, and that of his wife, on the civil list; while two other pensions of 2500l. a-year for three lives, payable out of the four and a half per cent. fund, dated October 24. 1795, were made to commence from July 24. 1793. Honours as well as wealth now seemed to await him, for he was about to be ennobled, when the untimely death of an only child put an end to his dreams of ambition, and contributed not a little to hasten his own, which occurred at his house at Beaconsfield, July 8. 1797.

Thus died, in the 68th year of his age, Edmond Burke, one of the greatest orators, statesmen, and authors, of his age; one whose name will long continue to be celebrated; and who, had he fallen during the meridian of his fame and character, would have scarcely been considered as second to any man, either of ancient or modern times.

As a man of letters, he ranks high in point of genius, learning, and composition; and his works are attended with this peculiarity, that they are the production of almost the only orator of his day, who could wield his pen with as much fluency as his tongue, and shine equally in the senate and the closet. His dissertation on the "Sublime and Beautiful" acquired him the applause of all, and secured him the friendship and assistance of many men of taste in the nation. His political tracts betoken much reading, deep thought, uncommon sagacity; and even those who may be disposed to object to his doctrines, cannot but admire his various talents, his happy allusions, and his acute penetration. There is no species of composition which he has not attempted; no subject on which he has not occasionally treated: his first and his last days were equally dedicated to literature, and he disdained not any species of it, from the newspaper column, that supplied needful bread to his early youth, to the more elaborate performance that procured unnecessary opulence to his old age.

As an orator, notwithstanding some glaring defects, he stands almost unrivalled. His gesticulation was at times violent and repulsive, his manner harsh and overbearing, his epithets coarse and disgusting; on many occasions he made use of assertions which were not bottomed in fact, and on one in particular, toward the latter end of his life, had recourse to stage trick and pantomime, instead of sense and argument. But on the other hand, no man was better calculated to arouse the dormant passions, to call forth the glowing affections of the human heart, and to "harrow up" the inmost recesses of the soul. Venality and meanness stood appalled in his presence; he who was dead to the feelings of his own conscience, was still alive to his animated reproaches; and corruption for a while became alarmed at the terrors of his countenance. His powers were never more conspicuous than on that memorable day on which he exposed the enormities of a subaltern agent of oriental despotism—on which he depicted the tortures inflicted by his orders, the flagrant injustice committed by his authority, the pollution that ensued in consequence of his sanction—when he painted agonizing nature vibrating in horrid suspense between life and destruction—when he described, in the climax of crimes, "death introduced into the very sources of life," the bosoms of his auditors became convulsed with passion, and those of more delicate organs and weaker frame actually swooned away. Nay, after the storm of eloquence had spent its force, and the captivated ears no longer listened to his voice, his features still spoke the purpose of his heart, his hand still seemed to threaten punishment, and his brow to meditate vengeance.

"The

"The qualities of his heart (says one of his biographers) were not less amiable and estimable than his talents were astonishing:—benevolent, just, temperate, magnanimous. He loved his country, loved its constitution, because he believed it the best adapted for its happiness: at different times, from the same principle, he supported different members of it, when he thought the one or the other likely to be overbalanced. During the prevalence of the Bute plans, dreading the influence of the crown, he supported the people; and for the same reason, during the American war.

"After the overthrow of the French monarchy, the aristocracy, and the dissemination in Great Britain of the principles that had destroyed these powers, apprehending similar effects, if not vigorously opposed in England, he strenuously supported the monarchy and aristocracy. Thus discriminately patriotic in public life, in his private relations his conduct was highly meritorious. A fond and attentive husband, an affectionate and judiciously indulgent father, a sincere friend, at once fervid and active, a liberal and kind master, an agreeable neighbour, a zealous and bountiful patron, he diffused light and happiness. His principles were as strict, and habits as virtuous, as his dispositions were kind." (*Annual Necrology*).

BURKITT, William, a celebrated commentator on the New Testament, was born at Hitcham in Northamptonshire, July 25. 1650, and educated at Pembroke-hall, Cambridge. He entered young upon the ministry, being ordained by Bishop Reynolds: and the first employment which he had was at Milden in Suffolk, where he continued 21 years a constant preacher, first as a curate, and afterwards as rector of that church. In the year 1692, he had a call to the vicarage of Dedham in Essex, where he continued to the time of his death, which happened in the latter end of October 1703. He was a pious and charitable man. He made great collections for the French Protestants in the years 1687, &c. and by his great care, pains, and charges, procured a worthy minister to go and settle in Carolina. Among other charities, by his last will and testament, he bequeathed the house wherein he lived, with the lands thereunto belonging, to be a habitation for the lecturer that should be chosen from time to time to read the lecture at Dedham. Besides his commentary upon the New Testament, written in the same plain, practical, and affectionate manner in which he preached, he wrote a volume, entitled *The poor man's help, and the rich man's guide.*

BURLAW. See *By-Law*.

BURLEIGH. See Cecil.

BURLESQUE, a species of composition, which, though a great engine of ridicule, is not confined to that subject; for it is clearly distinguishable into burlesque that excites laughter merely, and burlesque that excites derision or ridicule. A grave subject, in which there is no impropriety, may be brought down by a certain colouring so as to be risible, as in Virgil travestie; the author first laughs at every turn in order to make his readers laugh. The Lutrin is a burlesque poem of the other sort, laying hold of a low and trifling incident to expose the luxury, indolence, and contentious spirit, of a set of monks. Boileau, the author, turns the subject into ridicule, by dressing it in the heroic style, and affecting to consider it as of the utmost dignity and importance. Though ridicule is the poet's aim, he always carries a grave face, and never once betrays a smile. The opposition between the subject and the manner of handling it, is what produces the ridicule; and therefore, in a composition of this kind, no image professedly ludicrous ought to have quarter, because such images destroy the contrast.

Though the burlesque that aims at ridicule produces its effects by elevating the style far above the subject, yet the poet ought to confine himself to such images as are lively, and readily apprehended. A strained elevation, soaring above the ordinary reach of fancy, makes not a pleasant impression. The mind is soon disgusted by being kept long on the stretch. Machinery may be employed in a burlesque poem, such as the Lutrin, Dispensary, or Hudibras, with more success and propriety than in any other species of poetry. For burlesque poems, though they assume the air of history, give entertainment chiefly by their pleasant and ludicrous pictures: It is not the aim of such a poem to raise sympathy; and, for that reason, a strict imitation of nature is not necessary. And hence, the more extravagant the machinery in a ludicrous poem, the more entertainment it affords.

BURLINGTON, a sea-port town in the east riding of Yorkshire, situated on the German ocean, about 37 miles north-east of York. E. Long. 0. 10. and N. Lat. 54. 15. It gave the title of earl to a branch of the noble family of Boyle, but the earldom is now extinct. Population 3741 in 1811.

New Burlington, the capital of New Jersey, in North America; situated in an island of Delaware river, about 20 miles north of Philadelphia. W. Long. 74. 0. N. Lat. 40. 40.

BURMAN, Francis, a Protestant minister, and learned professor of divinity at Utrecht, was born at Leyden in 1628; and died on the 10th of November 1679, after having published a course of divinity, and several other works.

He is not to be confounded with *Francis Burman*, his son; or with *Peter Burman*, a laborious commentator on Phædrus, Lucan, Petronius, and other profane authors, who died in 1741.

BURN, in *Medicine* and *Surgery*, an injury received in any part of the body by fire. See Surgery.

BURNET, Gilbert, bishop of Salisbury in the latter end of the 17th century, was born at Edinburgh, in 1643, of an ancient family in the shire of Aberdeen. His father being bred to the law, was, at the restoration of King Charles II. appointed one of the lords of session, with the title of *Lord Crimond*, in reward for his constant attachment to the royal party during the troubles of Great Britain. Our author, the youngest son of his father, was instructed by him in the Latin tongue; at ten years of age he was sent to continue his studies at Aberdeen, and was admitted M. A. before he was 14. His own inclination led him to the study of the civil and feudal law; and he used to say, that it was from this study he had received more just notions concerning the foundations of civil society and government, than those which some divines maintain. About the year after, he changed his mind, and began to apply to divinity, to the great satisfaction

Burnet.

satisfaction of his father. He was admitted preacher before he was 18; and Sir Alexander Burnet, his cousin-german, offered him a benefice; but he refused to accept of it.

In 1663, about two years after the death of his father, he came into England; and after six months stay at Oxford and Cambridge, returned to Scotland; which he soon left again to make a tour for some months, in 1664, in Holland and France. At Amsterdam, by the help of a Jewish rabbi, he perfected himself in the Hebrew language; and likewise became acquainted with the leading men of the different persuasions tolerated in that country; as Calvinists, Arminians, Lutherans, Anabaptists, Brownists, Papists, and Unitarians; amongst each of which he used frequently to declare, he met with men of such unfeigned piety and virtue, that he became fixed in a strong principle of universal charity, and an invincible abhorrence of all severities on account of religious dissensions.

Upon his return from his travels, he was admitted minister of Salton: in which station he served five years in the most exemplary manner. He drew up a memorial, in which he took notice of the principal errors in the conduct of the Scots bishops, which he observed not to be conformable to the primitive institution; and sent a copy of it to several of them. This exposed him to their resentments: but, to show he was not actuated with a spirit of ambition, he led a retired course of life for two years; which so endangered his health, that he was obliged to abate his excessive application to study. In 1669, he published his "Modest and free conference between a conformist and nonconformist." He became acquainted with the duchess of Hamilton, who communicated to him all the papers belonging to her father and her uncle; upon which he drew up the "Memoirs of the dukes of Hamilton." The duke of Lauderdale, hearing he was about this work, invited him to London, and introduced him to King Charles II. He returned to Scotland, and married the lady Margaret Kennedy, daughter of the earl of Cassilis; a lady of great piety and knowledge, highly esteemed by the Presbyterians, to whose sentiments she was strongly inclined. As there was some disparity in their ages, that it might remain past dispute that this match was wholly owing to inclination, and not to avarice or ambition, the day before their marriage our author delivered the lady a deed, whereby he renounced all pretensions to her fortune, which was very considerable, and must otherwise have fallen into his hand, she herself having no intention to secure it. The same year he published his "Vindication of the authority, constitution, and laws of the church and state of Scotland;" which at that juncture was looked upon as so great a service, that he was again offered a bishopric, and a promise of the next vacant archbishopric; but did not accept of it, because he could not approve of the measures of the court, the grand view of which he saw to be the advancement of Popery.

Mr Burnet's intimacy with the dukes of Hamilton and Lauderdale occasioned him to be frequently sent for by the king and the duke of York, who had conversations with him in private. But Lauderdale, conceiving a resentment against him on account of the freedom with which he spoke to him, represented at last to the king, that Dr Burnet was engaged in an opposition to his measures. Upon his return to London, he perceived that these suggestions had entirely thrown him out of the king's favour, though the duke of York treated him with greater civility than ever, and dissuaded him from going to Scotland. Upon this, he resigned his professorship at Glasgow, and staid at London. About this time the living at Cripplegate being vacant, the dean and chapter of St Paul's (in whose gift it was), hearing of his circumstances, and the hardships he had undergone, sent him an offer of the benefice; but, as he had been informed of their first intention of conferring it on Dr Fowler, he generously declined it. In 1675, at the recommendation of Lord Hollis, whom he had known in France, ambassador at that court, he was by Sir Herbottle Grimstone, master of the rolls, appointed preacher of the chapel there, notwithstanding the opposition of the court. He was soon after chosen a lecturer of St Clement's, and became one of the preachers that were most followed in town. In 1697, he published his *History of the Reformation*, for which he had the thanks of both houses of parliament. The first part of it was published in 1679, and the second in 1681. Next year, he published an abridgement of these two parts.

Mr Burnet about this time happened to be sent for to a woman in sickness, who had been engaged in an amour with the earl of Rochester. The manner in which he treated her during her illness, gave that lord a great curiosity for being acquainted with him. Whereupon, for a whole winter, he spent one evening in a week with Dr Burnet, who discoursed with him upon all those topics upon which sceptics and men of loose morals attack the Christian religon. The happy effects of these conferences occasioned the publication of his account of the life and death of that earl. In 1682, when the administration was changed in favour of the duke of York, being much resorted to by persons of all ranks and parties, in order to avoid returning visits, he built a laboratory, and went for above a year through a course of chemical experiments. Not long after, he refused a living of 300l. a-year offered him by the earl of Essex, on the terms of his not residing there, but in London. When the inquiry concerning the popish plot was on foot, he was frequently sent for and consulted by King Charles with relation to the state of the nation. His majesty offered him the bishopric of Chichester, then vacant, if he would engage in his interests; but he refused to accept it on these terms. He preached at the Rolls till 1684, when he was dismissed by order of the court. About this time he published several pieces.

On King James's accession to the throne, having obtained leave to go out of the kingdom, he first went to Paris, and lived in great retirement; till, contracting an acquaintance with Brigadier Stouppe, a Protestant gentleman in the French service, he made a tour with him into Italy. He met with an agreeable reception at Rome. Pope Innocent XI. hearing of our author's arrival, sent the captain of the Swiss guards to acquaint him he would give him a private audience in bed, to avoid the ceremony of kissing his holiness's slipper. But Dr Burnet excused himself as well as he could. Some disputes which our author had here concerning religion, Burnet. religion, beginning to be taken notice of, made it proper for him to quit the city, which, upon an intimation given him by Prince Borghese, he accordingly did.

He pursued his travels through Switzerland and Germany. In 1688, he came to Utrecht, with an intention to settle in some of the seven provinces. There he received an invitation from the prince and princess of Orange (to whom their party in England had recommended him) to come to the Hague, which he accepted. He was soon made acquainted with the secret of their councils, and advised the fitting out of a fleet in Holland sufficient to support their designs and encourage their friends. This, and the Account of his Travels, in which he endeavoured to blend Popery and tyranny together, and represent them as unseparable, with some papers reflecting on the proceedings of England, that came out in single sheets, and were dispersed in several parts of England, most of which Mr Burnet owned himself the author of, alarmed King James, and were the occasion of his writing twice against him to the princess of Orange, and insisting, by his ambassador, on his being forbid the court; which, after much importunity, was done, though he continued to be trusted and employed as before, the Dutch minister consulting him daily. To put an end to these frequent conferences with the ministers, a prosecution for high treason was set on foot against him both in England and Scotland. But Burnet receiving the news thereof before it arrived at the States, he avoided the storm, by petitioning for, and obtaining without any difficulty, a bill of naturalization, in order to his intended marriage with Mary Scott, a Dutch lady of considerable fortune, who, with the advantage of birth, had those of a fine person and understanding.

After his marriage with this lady, being legally under the protection of Holland, when Mr Burnet found King James plainly subverting the constitution, he omitted no method to support and promote the design the prince of Orange had formed of delivering Great Britain, and came over with him in quality of chaplain. He was soon advanced to the see of Salisbury. He declared for moderate measures with regard to the clergy who scrupled to take the oaths, and many were displeased with him for declaring for the toleration of nonconformists. His pastoral letter concerning the oaths of allegiance and supremacy to King William and Queen Mary, 1689, happening to touch upon the right of conquest, gave such offence to both houses of parliament, that it was ordered to be burnt by the hands of the common executioner. In 1698 he lost his wife by the smallpox; and as he was almost immediately after appointed preceptor to the duke of Gloucester, in whose education he took great care, this employment, and the tender age of his children, induced him the same year to supply her loss by a marriage with Mrs Berkely, eldest daughter of Sir Richard Blake, knight. In 1669 he published his Exposition of the 39 Articles; which occasioned a representation against him in the lower house of convocation in the year 1701; but he was vindicated in the upper house. His speech in the house of lords in 1704 against the bill to prevent occasional conformity was severely attacked. He died in 1715, and was interred in the church of St James, Clerkenwell, where he has a monument erected to him. Burnet. He formed a scheme for augmenting the poor livings; which he pressed forward with such success, that it ended in an act of parliament passed in the second year of Queen Anne, "for the augmentation of the livings of the poor clergy."

Burnet, *Thomas*, a polite and learned writer in the end of the 17th century, was born in Scotland, but educated in Cambridge, under the tuition of Mr John Tillotson, afterwards archbishop of Canterbury. In the beginning of 1685, he was made master of Sutton's hospital in London, after which he entered into holy orders. During the reign of King James, he made a noble stand in his post as master of the Charter-house against the encroachments of that monarch, who would have imposed one Andrew Popham, a Papist, as a pensioner upon the foundation of that house. In 1680 he published his *Telluris theoria sacra*, so universally admired for the purity of the style and beauty of the sentiments, that King Charles gave encouragement to a translation of it into English. This theory was, however, attacked by several writers. In 1692 he published his *Archæologia philosophica*, deditated to King William, to whom he was clerk of the closet. He did in 1715. Since his death, hath been published his book *De statu mortuorum et resurgentium*, and his treatise *De fide et officiis Christianorum.*

Burnet, the *Honourable James*, *Lord Monboddo*, a senator of the college of justice in Scotland, was born about the year 1714. He was the son of Mr Burnet of Monboddo in Kincardineshire. After passing through the usual course of school education, he prosecuted his studies at the universities of Aberdeen, Edinburgh, and Leyden, with distinguished reputation. He was admitted an advocate in 1737, and on the 12th of February 1767, he was raised to the bench by the title of Lord Monboddo, in the room of Lord Milton, appointed a judge the 4th of June 1742, and who had succeeded Sir John Lauder of Fountainhall, admitted November 1689; being the third on the bench in succession since the Revolution.

He married Miss Farquharson, a very amiable woman, by whom he had a son and two daughters.

His private life was spent in the practice of all the social virtues, and in the enjoyment of much domestic felicity. Although rigidly temperate in his habits of life, he, however, delighted much in the convivial society of his friends, and among these he could number almost all the most eminent of those who were distinguished in Scotland for virtue, literature, or genuine elegance of conversation and manners. One of those who esteemed him the most was the late Lord Gardenstone, a man who possessed no mean portion of the same overflowing benignity of disposition, the same unimpeachable integrity as a judge, the same partial fondness for literature and the fine arts. His son, a very promising boy, in whose education he took great delight, was, indeed, snatched away from his affections by a premature death. But, when it was too late for sorrow and anxiety to avail, the afflicted father stifled the emotions of nature in his breast, and wound up the energies of his soul to the firmest tone of stoical fortitude. He was, in like manner, bereaved of his excellent lady, the object of his dearest tenderness; and he endured the loss with a similar firmness, fitted to do honour

Burnet.

honour either to philosophy or to religion. In addition to his office as a judge in the court of session, an offer was made to him of a seat in the court of justiciary. But, though the emoluments of this would have made a convenient addition to his income, he refused to accept it, lest its business should too much detach him from the pursuit of his favourite studies. To these studies he continued through the whole of a long life to be greatly devoted. His admiration of the manners, literature, and philosophy of the ancients, was unbounded. Thus strongly prepossessed, it is not to be wondered at, that the comparison which he made between the ancients and moderns was little favourable to the latter. For among the former he supposed that he saw all that was elegant, manly, and virtuous, all that was praiseworthy and excellent; while the degenerate race of the moderns exhibited nothing but effeminacy and corruption.

The vacation of the court of session afforded him sufficient leisure to retire every year, in spring and in autumn, to the country; and he used then to dress in a style of simplicity, as if he had been only a plain farmer; and to live among the people upon his estate, with all the kind familiarity and attention of an aged father among his grown-up children. Although his estate, from the old leases, afforded comparatively but a moderate income, he would never raise the rents or displace an old tenant to make room for a new one who offered a higher rent. In imitation of the rural economy of some of the ancients, whom he chiefly admired, he accounted population the true wealth of an estate, and was desirous of no improvement so much as of increasing the number of souls upon his lands, so as to make it greater, in proportion to the extent, than that of those upon the estate of any neighbouring landholder. It was there he had the pleasure of receiving Dr Samuel Johnson, with his friend James Boswell, at the time when these two gentlemen were upon their well-known tour through the Highlands of Scotland. Johnson admired nothing in literature so much as the display of a keen discrimination of human character, a just apprehension of the principles of moral action, and that vigorous common sense which is the most happily applicable to the ordinary conduct of life. Monboddo delighted in the refinements, the subtleties, the abstractions, the affectations of literature; and in comparison with these, despised the grossness of modern taste and of common affairs. Johnson thought learning and science to be little valuable, except so far as they could be made subservient to the purposes of living usefully and happily with the world, upon his own terms. Monboddo's favourite science taught him to look down with contempt upon all sublunary, and especially upon all modern things; and to fit life to literature and philosophy, not literature and philosophy to life. James Boswell, therefore, in carrying Johnson to visit Monboddo, probably thought of pitting them one against another, as two game cocks, and promised himself much sport from the colloquial contest which he expected to ensue between them. But Monboddo was too hospitable and courteous to enter into keen contention with a stranger in his own house. There was much talk between them, but no angry controversy, no exasperation of that dislike for each other's well-known peculiarities with which they had met. Johnson it is true, still continued to think Lord Monboddo what he called *a prig* in literature.

Lord Monboddo used frequently to visit London, to which he was allured by the opportunity that great metropolis affords of enjoying the conversation of a vast number of men of profound erudition. A journey to the capital became a favourite amusement of his periods of vacation from the business of the court to which he belonged; and, for a time, he made this journey once a year. A carriage, a vehicle that was not in common use among the ancients, he considered as an engine of effeminacy and sloth, which it was disgraceful for a man to make use of in travelling. To be dragged at the tail of a horse, instead of mounting upon his back, seemed, in his eyes, to be a truly ludicrous degradation of the genuine dignity of human nature. In all his journeys, therefore, between Edinburgh and London, he was wont to ride on horseback, with a single servant attending him. He continued this practice, without finding it too fatiguing for his strength, till he was upwards of eighty years of age. Within these few years, on his return from a last visit, which he made on purpose to take leave, before his death, of all his old friends in London, he became exceedingly ill upon the road, and was unable to proceed; and had he not been overtaken by a Scotch friend, who prevailed upon him to travel the remainder of the way in a carriage, he might, perhaps, have actually perished by the way side, or breathed his last in some dirty inn. Since that time, he did not again attempt an equestrian journey to London.

In London, his visits were exceedingly acceptable to all his friends, whether of the literary or fashionable world. He delighted to shew himself at court; and the king is said to have taken a pleasure in conversing with the old man, with a distinguishing notice that could not but be very flattering to him.

A constitution of body, naturally framed to wear well and last long, was strengthened to Lord Monboddo by exercise, guarded by temperance, and by a tenor of mind too firm to be deeply broken in upon by those passions which consume the principles of life. In the country he always used much the exercises of walking in the open air, and of riding. The cold bath was a means of preserving the health, to which he had recourse in all seasons, amidst every severity of the weather, under every inconvenience of indisposition or business, with a perseverance invincible. He was accustomed, alike in winter and in summer, to rise at a very early hour in the morning, and, without loss of time, to betake himself to study or wholesome exercise. It is said, that he even found the use of what he called the air bath, or the practice of occasionally walking about, for some minutes, naked, in a room filled with fresh and cool air, to be highly salutary.

Lord Monboddo is well known to the world as a man of letters. His first publication was "a Dissertation on the Origin and Progress of Language," in 2 vols. 8vo. 1773; which were followed by four more vols. the last published not long before his death. In this work, intended chiefly to vindicate the honours of *Grecian literature*, he ascribes the origin of alphabetical writing to the Egyptians; and strenuously maintains, that the ouran-outang is a class of the human species, and that his want of speech is merely accidental. He also

Burnet.

so endeavours to establish the reality of the existence of mermaids, and other fictitious animals. He was induced to undertake another work, for the purpose of defending the cause of Grecian philosophy; and published, in five vols. 4to. a work entitled, "Ancient Metaphysics," which, like the other, is remarkable for a surprising mixture of erudition and genius, with the most absurd whim and conceit.

As a judge, his decisions were sound, upright, and learned, and marked with acute discrimination; and free from those paradoxes and partialities which appear in his writings. He attended his judicial duty with indefatigable diligence till within a few days of his death, which happened at his house in Edinburgh, May 26. 1799, at the advanced age of 85.

His eldest daughter married some years before his death. His second daughter, in personal loveliness one of the finest women of the age, was beheld in every public place with general admiration, and was sought in marriage by many suitors. Her mind was endowed with all her father's benevolence of temper, and with all his taste for elegant literature, without any portion of his whim and caprice. It was her chief delight to be the nurse and the companion of his declining age. Her presence contributed to draw around him, in his house, and at his table, all that was truly respectable among the youth of his country. She mingled in the world of fashion, without sharing its follies; and heard those flatteries which are addressed to youth and beauty, without being betrayed to that light and selfish vanity which is often the only sentiment that fills the heart of the high-praised beauty. She delighted in reading, in literary conversation, in poetry, and in the fine arts, without contracting from this taste, any of that pedantic self-conceit and affectation which usually characterize literary ladies, and whose presence often frightens away the domestic virtues, the graces, the delicacies, and all the more interesting charms of the sex. When Burns, the well-known Scotish poet, first arrived from the plough in Ayrshire to publish his poems in Edinburgh, there was none by whom he was more zealously patronized than by Lord Monboddo and his lovely daughter. No man's feelings were ever more powerfully or exquisitely alive than those of the rustic bard, to the emotions of gratitude, or to the admiration of the good and fair. In a poem which he at that time wrote, as a panegyrical address to Edinburgh, he took occasion to celebrate the beauty and excellence of Miss Burnet, in perhaps the finest stanza of the whole:

> "Thy daughters bright thy walks adorn,
> "Gay as the gilded summer sky,
> "Sweet as the dewy milk-white thorn,
> "Dear as the raptur'd thrill of joy!
> "Fair Burnet strikes th' adoring eye:
> "Heav'n's beauties on my fancy shine,
> "I see the *Sire of Love* on high,
> "And own his work, indeed, divine."

She was the ornament of the elegant society of the city in which she resided, her father's pride, and the comfort of his domestic life in his declining years. Every amiable and noble sentiment was familiar to her heart, every female virtue was exemplified in her life. Yet, this woman, thus lovely, thus elegant, thus wise and virtuous, was cut off in the flower of her age, and left her father bereft of the last tender tie which bound him to society and to life. She died about six years before him, of a consumption; a disease that, in Scotland, proves too often fatal to the loveliest and most promising among the fair and the young. Neither his philosophy, nor the necessary torpor of the feelings of extreme old age, were capable of preventing Lord Monboddo from being very deeply affected by so grievous a loss; and from that time he began to droop exceedingly in his health and spirits. *Edin. Mag.*

Burnet || Burning.

BURNET. See POTERIUM and SANGUISORBA, BOTANY *Index*.

BURNHAM, a market town of Norfolk in England, situated in E. Long. 0. 50. N. Lat. 53. 0.

BURNING, the action of fire on some pabulum or fuel, by which the minute parts thereof are put into a violent motion, and some of them assuming the nature of fire themselves, fly off *in orbem*, while the rest are dissipated in form of vapour, or reduced to ashes. See IGNITION.

Extraordinary Cases of BURNING. We have instances of persons burnt by fire kindled within their own bodies. A woman at Paris, who used to drink brandy to excess, was one night reduced to ashes by a fire from within, all but her head and the ends of her fingers. Signora Corn. Zangari, or, as others call her, *Corn. Bandi*, an aged lady, of an unblemished life, near Cesana in Romagna, underwent the same fate in March 1731. She had retired in the evening to her chamber somewhat indisposed; and in the morning was found in the middle of the room reduced to ashes, all except her face, legs, skull, and three fingers. The stockings and shoes she had on were not burnt in the least. The ashes were light; and, on pressing between the fingers, vanished, leaving behind a gross stinking moisture with which the floor was smeared; the walls and furniture of the room being covered with a moist cineritious soot, which had not only stained the linen in the chests, but had penetrated into the closet, as well as into the room overhead, the walls of which were moistened with the same viscous humour.—We have various other relations of persons burnt to death in this unaccountable manner.

Sig. Mondini, Bianchini, and Maffei, have written treatises express to account for the cause of so extraordinary an event: common fire it could not be, since this would likewise have burnt the bed and the room; besides that it would have required many hours, and a vast quantity of fuel, to reduce a human body to ashes; and, after all, a considerable part of the bones would have remained entire, as they were anciently found after the fiercest funeral fires. Some attribute the effect to a mine of sulphur under the house; others to a miracle; while others suspect that art or villany had a hand in it. A philosopher of Verona maintains, that such a conflagration might have arisen from the inflammable matters wherewith the human body naturally abounds. Sig. Bianchini accounts for the conflagration of the lady above mentioned, from her using a bath or lotion of camphorated spirit of wine when she found herself out of order. Maffei supposes it owing to lightning, but to lightning generated in her own body, agreeable to his doctrine, which is, That lightning does not proceed from the clouds, but is always produced in the place where it is seen and its effects perceived. We

have

have had a late attempt to establish the opinion, that these destroying internal fires are caused in the entrails of the body by inflamed effluvia of the blood; by juices and fermentation in the stomach; by the many combustible matters which abound in living bodies for the purposes of life; and, finally, by the fiery evaporations which exhale from the settlings of spirit of wine, brandies, and other hot liquors, in the tunica villosa of the stomach and other adipose or fat membranes; within which those spirits engender a kind of camphor, which in the night time, in sleep, by a full respiration, are put in a stronger motion, and are more apt to be set on fire. Others ascribe the cause of such persons being set on fire to lightning; and their burning so entirely, to the greater quantity of phosphorus and other combustible matters they contained.—For our own part, we can by no means pretend to explain the cause of such a phenomenon: but for the interests of humanity, we wish it could be derived from something external to the human body; for if, to the calamities of human life already known, we superadd a suspicion that we may unexpectedly, and without the least warning, be consumed by an *internal* fire, the thought is too dreadful to be borne.

Burning, or *Brenning*, in our old customs, denotes an infectious disease, got in the stews by conversing with lewd women, and supposed to be the same with what we now call the *venereal disease*.

In a manuscript of the vocation of John Bale to the bishopric of Ossory, written by himself, he speaks of Dr Hugh Weston, who was dean of Windsor in 1556, but deprived by Cardinal Pole for adultery, thus: "At this day is leacherous Weston, who is more practised in the arts of breech-burning, than all the whores of the stews. He not long ago brent a beggar of St Botolph's parish. See Stews.

Burning, in antiquity, a way of disposing of the dead, much practised by the ancient Greeks and Romans, and still retained by several nations in the East and West Indies. The antiquity of this custom rises as high as the Theban war, where we are told of the great solemnity accompanying this ceremony at the pyre of Menæacus and Archemorus, who were cotemporary with Jair, the eighth judge of Israel. Homer abounds with funeral obsequies of this nature. In the inward regions of Asia, the practice was of very ancient date, and the continuance long: for we are told, that in the reign of Julian, the king of Chionia burnt his son's body, and deposited the ashes in a silver urn. Coeval almost with the first instances of this kind in the east, was the practice in the western parts of the world. The Herulians, the Getes, and the Thracians, had all along observed it; and its antiquity was as great with the Celtæ, Sarmatians, and other neighbouring nations. The origin of this custom seems to have been out of friendship to the deceased: their ashes were preserved, as we preserve a lock of hair, a ring, or a seal, which had been the property of a deceased friend.

Kings were burnt in cloth made of the asbestos stone, that their ashes might be preserved pure from any mixture with the fuel and other matters thrown on the funeral pile. The same method is still observed with the princes of Tartary. Among the Greeks, the body was placed on the top of a pile, on which were thrown divers animals, and even slaves and captives, besides unguents and perfumes. In the funeral of Patroclus we find a number of sheep and oxen thrown in, then four horses, followed by two dogs, and lastly by 12 Trojan prisoners. The like is mentioned by Virgil in the funerals of his Trojans; where, besides oxen, swine, and all manner of cattle, we find eight youths condemned to the flames. The first thing was the fat of the beasts, wherewith the body was covered, that it might consume the sooner: it being reckoned great felicity to be quickly reduced to ashes. For the like reason, where numbers were to be burnt at the same time, care was taken to mix with the rest some of humid constitutions, and therefore more easily to be inflamed. Thus we are assured by Plutarch and Macrobius, that for every ten men it was customary to put in one woman. Soldiers usually had their arms burnt with them. The garments worn by the living were also thrown on the pile, with other ornaments and presents; a piece of extravagance which the Athenians carried to so great a height, that some of their lawgivers were forced to restrain them, by severe penalties, from defrauding the living by their liberality to the dead.—In some cases, burning was expressly forbidden among the Romans, and even looked upon as the highest impiety. Thus infants, who died before the breeding of teeth, were entombed unburnt in the ground, in a particular place set apart for this purpose, called *suggrundarium*. The like was practised with regard to those who had been struck dead with lightning, who were never to be burnt again. Some say that burning was denied to suicides.—The manner of burning among the Romans was not unlike that of the Greeks; the corpse, being brought out without the city, was carried directly to the place appointed for burning it; which, if it joined to the sepulchre, was called *bustum;* if separate from it, *ustrina;* and there laid on the *rogus* or *pyra*, a pile of wood prepared on which to burn it, built in shape of an altar, but of different height, according to the quality of the deceased. The wood used was commonly from such trees as contain most pitch or rosin; and if any other were used, they split it, for the more easy catching fire: round the pile they set cypress trees, probably to hinder the noisome smell of the corpse. The body was not placed on the bare pile, but on the couch or bed whereon it lay. This done, the next of blood performed the ceremony of lighting the pile; which they did with a torch, turning their faces all the while the other way, as if it were done with reluctance. During the ceremony, decursions and games were celebrated; after which came the *ossilegium*, or gathering of the bones and ashes; also washing and anointing them, and repositing them in urns.

Burning, among surgeons, denotes the application of an actual cautery, that is, a red hot iron instrument to the part affected; otherwise denominated *cauterization*. The whole art of physic among the Japanese lies in the choice of places proper to be burnt: which are varied according to the disease. In the country of the Mogul, the colic is cured by an iron ring applied red hot about the patient's navel. Certain it is, that some very extraordinary cures have been performed accidentally by burning. The following case is recorded in the Memoirs of the Academy of Sciences by M. Homberg. A woman of about 35 became subject to a head-

ach,

ach, which at times was so violent that it drove her out of her senses, making her sometimes stupid and foolish, at other times raving and furious. The seat of the pain was in the forehead, and over the eyes, which were inflamed, and looked violently red and sparkling; and the most violent fits of it were attended with nauseas and vomitings. In the times of the fits, she could take no food; but out of them, had a very good stomach. Mr Homberg had in vain attempted her cure for three years with all kinds of medicines; only opium succeeded; and that but little, all its effect being only the taking off the pain for a few hours. The redness of her eyes was always the sign of an approaching fit. One night, feeling a fit coming on, she went to lie down upon the bed; but first walked up to the glass with the candle in her hand, to see how her eyes looked: in observing this, the candle set fire to her cap: and as she was alone, her head was terribly burnt before the fire could be extinguished. Mr Homberg was sent for, and ordered bleeding and proper dressings: but it was perceived, that the expected fit this night never came on; the pain of the burning wore off by degrees; and the patient found herself from that hour cured of the headach, which had never returned in four years after, which was the time when the account was communicated. Another case, not less remarkable than the former, was communicated to Mr Homberg by a physician at Bruges. A woman, who for several years had her legs and thighs swelled in an extraordinary manner, found some relief from rubbing them before the fire with brandy every morning and evening. One evening the fire chanced to catch the brandy she had rubbed herself with, and slightly burnt her. She applied some brandy to her burn; and in the night all the water her legs and thighs were swelled with was entirely discharged by urine, and the swelling did not again return.

Burning-Bush. See Bush.

Burning-Glass, a convex glass, commonly spherical, which being exposed directly to the sun, collects all the rays falling thereon into a very small space called the *focus;* where wood or any other combustible matter being put, will be set on fire. The term *burning-glass* is also used to denote those concave mirrors, whether composed of glass quicksilvered, or of metalline matters, which burn by reflection, condensing the sun's rays into a focus similar to the former.

The use of burning-glasses appears to have been very ancient. Diodorus Siculus, Lucian, Dion, Zonaras, Galen, Anthemius, Eustathius, Tzetzes, and others, attest, that by means of them Archimedes set fire to the Roman fleet at the siege of Syracuse. Tzetzes is so particular in his account of this matter, that his description suggested to Kircher the method by which it was probably accomplished. That author says, that "Archimedes set fire to Marcellus's navy, by means of a burning-glass composed of small square mirrors moving every way upon hinges; which, when placed in the sun's rays, directed them upon the Roman fleet, so as to reduce it to ashes at the distance of a bow shot." A very particular testimony we have also from Anthemius of Lydia, who takes pains to prove the possibility of setting fire to a fleet, or any other combustible body, at such a distance.

That the ancients were also acquainted with the use of catoptric or refracting burning-glasses, appears from a passage in Aristophanes's comedy of The Clouds, which clearly treats of their effects. The author introduces Socrates as examining Strepsiades about the method he had discovered of getting clear of his debts. He replies, that "he thought of making use of a burning-glass which he had hitherto used in kindling his fire:" "for (says he) should they bring a writ against me, I'll immediately place my glass in the sun at some little distance from it, and set it on fire." Pliny and Lactantius have also spoken of glasses that burn by refraction. The former calls them *balls* or *globes of glass* or *crystal*, which, exposed to the sun, transmit a heat sufficient to set fire to cloth, or corrode the dead flesh of those patients who stand in need of caustics; and the latter, after Clemens Alexandrinus, takes notice that fire may be kindled by interposing glasses filled with water between the sun and the object, so as to transmit the rays to it.

It seems difficult to conceive how they should know such glasses would burn without knowing they would magnify, which it is granted they did not, till towards the close of the 13th century, when spectacles were first thought on. For as to those passages in Plautus which seem to intimate the knowledge of spectacles, M. de la Hire observes, they do not prove any such thing; and he solves this, by observing, that their burning-glasses being spheres, either solid or full of water, their foci would be one-fourth of their diameter distant from them. If then their diameter were supposed half a foot, which is the most we can allow, an object must be at an inch and a half distance to perceive it magnified; those at greater distances do not appear greater, but only more confused through the glass than out of it. It is no wonder, therefore, the magnifying property of convex glasses was unknown, and the burning one known. It is more wonderful there should be 300 years between the invention of spectacles and telescopes.

Among the ancients, the burning mirrors of Archimedes and Proclus are famous: the former we have already taken notice of; by the other, the navy of Vitellius besieging Byzantium, according to Zonaras, was burnt to ashes.

Among the moderns, the most remarkable burning mirrors are those of Settala, of Villette, of Tschirnhausen, of Buffon, of Trudaine, and of Parker.

Settala, canon of Padua, made a parabolic mirror, which, according to Shottus, burnt pieces of wood at the distance of 15 or 16 paces. The following things are noted of it in the *Acta Eruditorum.* 1. Green wood takes fire instantaneously, so as a strong wind cannot extinguish it. 2. Water boils immediately; and eggs in it are presently edible. 3. A mixture of tin and lead, three inches thick, drops presently, and iron and steel plate becomes red hot presently, and a little after burns into holes. 4. Things not capable of melting, as stones, bricks, &c. become soon red hot, like iron. 5. Slate becomes first white, then a black glass. 6. Tiles are converted into a yellow glass, and shells into a blackish yellow one. 7. A pumice stone, emitted from a volcano, melts into white glass; and, 8. A piece of crucible also vitrifies in eight minutes. 9. Bones are soon turned into an opaque glass, and earth into a black one. The breadth of this mirror is near three Leipsic ells, its focus two ells from it; it is made of copper, and

and its substance is not above double the thickness of the back of a knife.

Villette, a French artist of Lyons, made a large mirror, which was bought by Tavernier, and presented to the king of Persia; a second, bought by the king of Denmark; a third, presented by the French king to the Royal Academy; a fourth has been in England, where it was publicly exposed. The effects hereof, as found by Dr Harris, and Dr Desaguliers, are, that a silver sixpence is melted in $7\frac{1}{2}''$, a King George's halfpenny in $16''$, and runs with a hole in $34''$. Tin melts in $3''$, cast iron in $16''$, slate in $3''$; a fossil shell calcines in $7''$; a piece of Pompey's pillar at Alexandria vitrifies, the black part in $50''$, the white in $54''$; copper ore in $8''$; bone calcines in $4''$, vitrifies in $33''$. An emerald melts into a substance like a turquois stone; a diamond weighing four grains loses seven-eighths of its weight: the asbestos vitrifies; as all other bodies will do, if kept long enough in the focus; but when once vitrified, the mirror can go no farther with them. This mirror is 47 inches wide, and is ground to a sphere of 76 inches radius; so that its focus is about 38 inches from the vertex. Its substance is a composition of tin, copper, and tin-glass.

Every lens, whether convex, plano-convex, or convexo-convex, collects the sun's rays, dispersed over its convexity, into a point by refraction; and is therefore a burning-glass. The most considerable of this kind is that made by M. de Tschirnhausen: the diameters of his lenses are three and four feet, the focus at the distance of 12 feet, and its diameter an inch and a half. To make the focus the more vivid, it is collected a second time by a second lens parallel to the first, and placed in that point where the diameter of the cone of rays formed by the first lens is equal to the diameter of the second; so that it receives them all: and the focus, from an inch and a half, is contracted into the space of eight lines, and its force increased proportionably.

This glass vitrifies tiles, slate, pumice-stones, &c. in a moment. It melts sulphur, pitch, and all rosins, under water; the ashes of vegetables, woods, and other matters, are transmuted into glass; and every thing applied to its focus is either melted, turned into a calx, or into smoke. Tschirnhausen observes, that it succeeds best when the matter applied is laid on a hard charcoal well burnt.

Sir Isaac Newton presented a burning-glass to the Royal Society, consisting of seven concave glasses, so placed as that all their foci join in one physical point. Each glass is about 11 inches and a half in diameter: six of them are placed round the seventh, to which they are all contiguous; and they form a kind of segment of a sphere, whose subtense is about 34 inches and a half, and the central glass lies about an inch farther in than the rest. The common focus is about 22 inches and a half distant, and about an inch in diameter. This glass vitrifies brick or tile in $1''$, and melts gold in $30''$.

It would appear, however, that glass quicksilvered is a more proper material for burning-glasses than metals; for the effects of that speculum wherewith Mr Macquer melted the platina seem to have been superior to those above mentioned, though the mirror itself was much smaller. The diameter of this glass was only 22 inches, and its focal distance 28. Black flint, when exposed to the focus, being powdered to prevent its crackling and flying about, and secured in a large piece of charcoal, bubbled up and ran into transparent glass in less than half a minute. Hessian crucibles, and glass-house pots, vitrified completely in three or four seconds. Forged iron smoked, boiled, and changed into a vitrescent scoria as soon as it was exposed to the focus. The gypsum of Montmartre, when the flat sides of the plates or leaves of which it is composed were presented to the glass, did not show the least disposition to melt; but, on presenting a transverse section of it, or the edges of the plates, it melted in an instant, with a hissing noise, into a brownish yellow matter. Calcareous stones did not completely melt: but there was detached from them a circle more compact than the rest of the mass, and of the size of the focus; the separation of which seemed to be occasioned by the shrinking of the matter which had begun to enter into fusion. The white calx of antimony, commonly called *diaphoretic antimony*, melted better than the calcareous stones, and changed into an opaque pretty glossy substance like white enamel. It was observed, that the whiteness of the calcareous stones and the antimonial calx was of great disadvantage to their fusion, by reason of their reflecting great part of the sun's rays; so that the subject could not undergo the full activity of the heat thrown upon it by the burning-glass. The case was the same with metallic bodies; which melted so much the more difficultly as they were more white and polished; and this difference was so remarkable, that in the focus of this mirror, so fusible a metal as silver, when its surface was polished, did not melt at all.

Plate CXXXI. fig. 1. represents M. Buffon's burning mirror, which he with great reason supposes to be of the same nature with that of Archimedes. It consists of a number of small mirrors of glass quicksilvered, all of which are held together by an iron frame. Each of these small mirrors is also moveable by a contrivance on the back part of the frame, that so their reflections may all coincide in one point. By this means they are capable of being accommodated to various heights of the sun, and to different distances. The adjusting them in this manner takes up a considerable time; but after they are so adjusted, the focus will continue unaltered for an hour or more.

Fig. 2. represents a contrivance of M. Buffon's for diminishing the thickness of very large refracting lenses. He observes, that in the large lenses of this kind, and which are most convenient for many purposes, the thickness of the glass in the middle is so great as very much to diminish their force. For this reason he proposes to form a burning-glass of concentric circular pieces of glass, each resting upon the other, as represented in the figure. His method is to divide the convex arch of the lens into three equal parts. Thus, suppose the diameter to be 26 inches, and the thickness in the middle to be three inches: By dividing the lens into three concentric circles, and laying the one over the other, the thickness of the middle piece needs be only one inch; at the same time that the lens will have the same convexity, and almost the same focal distance, as

as in the other case; while the effects of it must be much greater, on account of the greater thinness of the glass.

M. Trudaine, a French gentleman, constructed a burning lens on a new principle. It was composed of two circular segments of glass spheres, each four feet in diameter, applied with their concave sides towards each other. The cavity was filled with spirit of wine, of which it contained 40 pints. It was presented by the maker to the Royal Academy of Sciences, but was, not long after, broken by accident. The expence of constructing it amounted to about 1000l. sterling. After all, it does not appear that the effects of this lens were very great. Mr Magellan informs us, that it could only coagulate the particles of platina in 20 minutes, while Mr Parker's lens entirely melted them in less than two.

A large burning lens, indeed, for the purpose of fusing and vitrifying such substances as resist the fires of ordinary furnaces, and especially for the application of heat in vacuo, and in other circumstances in which heat cannot be applied by any other means, has long been a desideratum among persons concerned in philosophical experiments: And it appears now to be in a great degree accomplished by Mr Parker. His lens is three feet in diameter, made of flint-glass, and which, when fixed in its frame, exposes a surface two feet eight inches and a half in the clear.

In the *Elevation* represented on Plate CXXXII, A is the lens of the diameter mentioned: thickness in the centre, three inches and one-fourth: weight, 212 pounds: length of the focus, six feet eight inches; diameter of ditto, one inch. B, a second lens, whose diameter in the frame is 16 inches, and shows in the clear 13 inches: thickness in the centre, one inch five-eighths: weight 21 pounds: length of focus 29 inches: diameter of ditto, three-eighths of an inch. When the two above lenses are compounded together, the length of the focus is five feet three inches: diameter of ditto, half an inch. C, a truncated cone, composed of 21 ribs of wood: at the larger end is fixed the great lens A; at the smaller extremity the lesser lens B: near the smaller end is also fixed a rack D, passing through the pillar L, moveable by a pinion turning in the said pillar, by means of the handle E, and thus giving a vertical motion to the machine. F, a bar of wood, fixed between the two lower ribs of the cone at G; having, within a chased mortice in which it moves, an apparatus H, with the iron plate, I, fixed thereto; and this part turning on a ball and socket, K, a method is thereby obtained of placing the matter under experiment, so as to be acted upon by the focal rays in the most direct and powerful manner. LL, a strong mahogany frame, moving on castors, MM. Immediately under the table N are three friction wheels, by which the machine moves horizontally. O, a strong iron bow, in which the lens and the cone hang.

Section.—a, The great lens marked A in the elevation. b, The frame which contains the lens. c, The small lens marked B. d, The frame which contains the small lens. e, The truncated cone, marked C. f, The bar on which the apparatus marked F moves. g, The iron plate marked I. h, The cone of rays formed by the refraction of the great lens a, and falling on the lens c. i, The cone of rays formed by the refraction of the lens c. *Front-view.*—k, The great lens. l, The frame containing it. m, The strong iron bow in which it hangs.

From a great number of experiments made with this lens, in the presence of many scientific persons, the following are selected as specimens of its powers.

Substances fused, with their weight and time of fusion.	Weight in Grains.	Time in Seconds.
Gold, pure,	20	3
Silver, do.	20	4
Copper, do.	33	20
Platina, do.	10	3
Nickel,	16	3
Bar iron, a cube,	10	12
Cast iron, a cube,	10	3
Steel, a cube,	10	12
Scoria of wrought iron,	12	2
Terra ponderosa, or barytes,	10	7
A topaz, or chrysolite,	3	45
An oriental emerald,	2	25
Crystal pebble,	7	6
White agate,	10	30
Flint, oriental,	10	30
Rough cornelian,	10	75
Jasper,	10	25
Onyx,	10	20
Garnet,	10	17
White rhomboidal spar,	10	60
Zeolites,	10	23
Rotten-stone,	10	80
Common slate,	10	2
Asbestos,	10	10
Common lime-stone,	10	55
Pumice-stone,	10	24
Lava,	10	7
Volcanic clay,	10	60
Cornish moor-stone,	10	60

Burning Mountains. See Ætna, Hecla, Vesuvius, and Volcano, with the plates accompanying them.

Burning Springs. Of these there are many in different parts of the world; particularly one in Dauphiny near Grenoble; another near Hermanstadt in Transylvania; a third at Chermay, a village near Switzerland; a fourth in the canton of Friburg; and a fifth not far from the city of Cracow in Poland. There also is, or was, a famous spring of the same kind at Wigan in Lancashire, which, upon the approach of a lighted candle, would take fire and burn like spirit of wine for a whole day. But the most remarkable one of this kind, or at least that of which we have the most particular description, was discovered in 1711 at Brosely in Shropshire. The following account of this remarkable spring was given by the reverend Mr Mason, Woodwardian professor at Cambridge, dated February 18. 1746. "The well for four or five feet deep is six or seven feet wide; within that is another less hole of like depth dug in the clay, in the bottom whereof is placed a cylindric earthen vessel, of about four or five inches diameter at the mouth, having the bottom taken off, and the sides well fixed in the clay

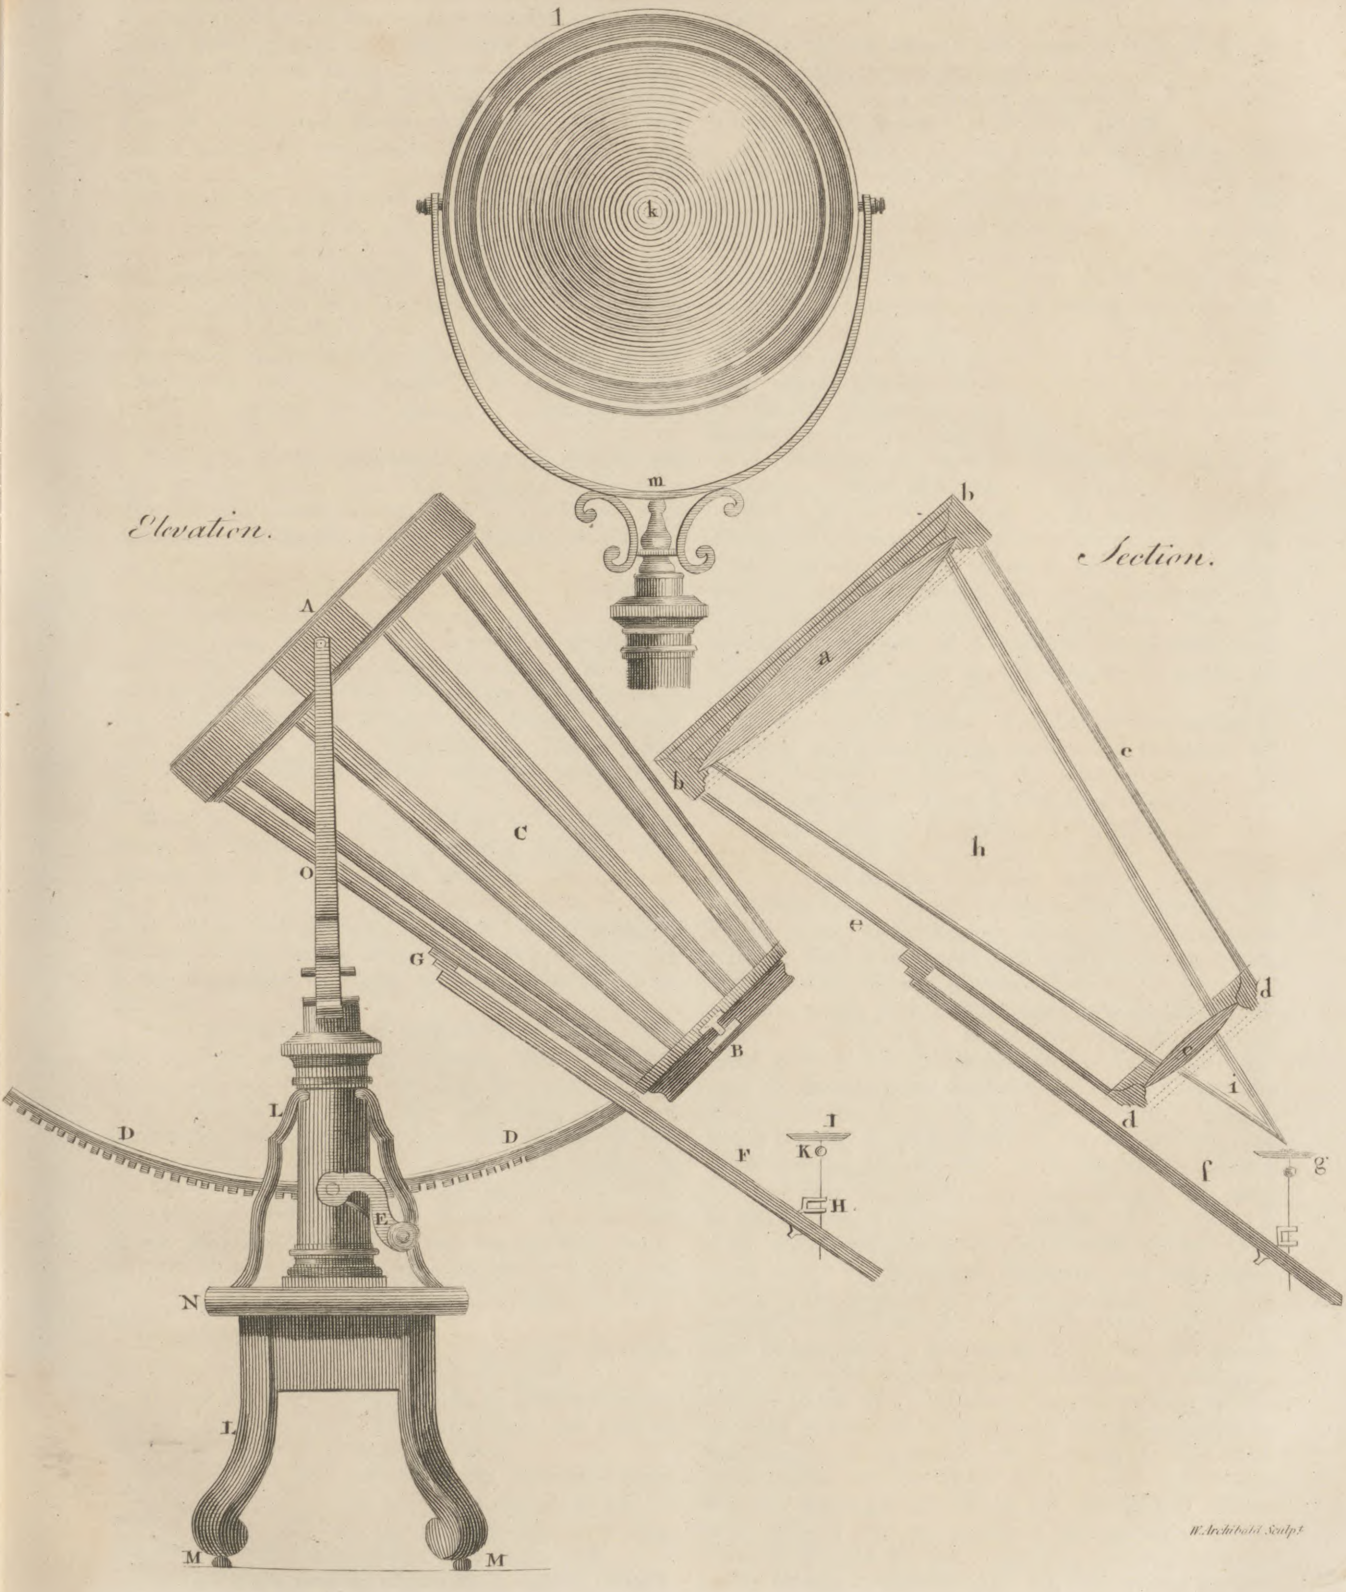
BURNING LENS. PLATE CXXXII.

Parker's.



rammed close about it. Within the pot is a brown water, thick as puddle, continually forced up with a violent motion beyond that of boiling water, and a rumbling hollow noise, rising or falling by fits five or six inches; but there was no appearance of any vapour rising, which perhaps might have been visible, had not the sun shone so bright. Upon putting a candle down at the end of a stick, at about a quarter of a yard distance, it took fire, darting and flashing after a very violent manner for about half a yard high, much in the manner of spirits in a lamp, but with great agitation. It was said that a tea-kettle had been made to boil in about nine minutes time, and that it had been left burning for 48 hours without any sensible diminution. It was extinguished by putting a wet mop upon it; which must be kept there for a little time, otherwise it would not go out. Upon the removal of the mop there arises a sulphureous smoke lasting about a minute, and yet the water is very cold to the touch." In 1755, this well totally disappeared by the sinking of a coal-pit in its neighbourhood.

The cause of the inflammable property of such waters is, with great probability, supposed to be their mixture with petroleum, which is a very inflammable substance, and has the property of burning on the surface of water.

Burning of Colours, among painters. There are several colours that require burning; as,

First, Lamp black, which is a colour of so greasy a nature, that, except it is burnt, it will require a long time to dry. The method of burning, or rather drying, lamp black, is as follows: Put it into a crucible over a clear fire, letting it remain till it be red hot, or so near it that no manner of smoke arises from it.

Secondly, Umber, which, if it be intended for colour for a horse, or to be a shadow for gold, then burning fits it for both these purposes. In order to burn umber, you must put it into the naked fire, in large lumps, and not take it out till it is thoroughly red hot; if you have a mind to be more curious, put it into a crucible, and keep it over the fire till it be red hot.

Ivory also must be burnt to make black, thus: Fill two crucibles with shavings of ivory, then clap their two mouths together, and bind them fast with an iron wire, and lute the joints close with clay, salt, and horse-dung, well beaten together; then set it over the fire, covering it all over with coals: let it remain in the fire till you are sure that the matter enclosed is thoroughly red hot: then take it out of the fire; but do not open the crucibles till they are perfectly cold; for were they opened while hot, the matter would turn to ashes; and so it will be, if the joints are not luted close.

BURNISHER, a round polished piece of steel, serving to smooth and give a lustre to metals.

Of these there are different kinds, of different figures, straight, crooked, &c. Half burnishers are used to solder silver, as well as to give a lustre.

Burnishers for gold and silver are commonly made of a dog's or wolf's tooth, set in the end of an iron or wooden handle. Of late, agates and pebbles have been introduced, which many prefer to the dog's tooth.

The burnishers used by engravers in copper, usually serve with one end to burnish, and with the other to scrape.

BURNISHING, the art of smoothing or polishing a metalline body, by a brisk rubbing of it with a burnisher.

Book-binders burnish the edges of their books, by rubbing them with a dog's tooth.

BURNLEY, a town of Lancashire in England, situated in W. Long. 2. 5. N. Lat. 51. 38.

BURNS, Robert, was a native of Ayrshire, one of the western counties of Scotland. He was the son of humble parents; and his father passed through life in the condition of a hired labourer, or of a small farmer. Even in this situation, however, it was not hard for him to send his children to the parish school, to receive the ordinary instruction in reading, writing, arithmetic, and the principles of religion. By this course of education young Robert profited to a degree that might have encouraged his friends to destine him to one of the liberal professions, had not his father's poverty made it necessary to remove him from school, as soon as he had grown up, to earn for himself the means of support as a hired ploughboy or shepherd.

The expence of education in the parish-schools of Scotland is so small, that hardly any parents who are able to labour want the means of giving to their children at least such education as young Burns received. From the spring labours of a ploughboy, from the summer employment of a shepherd, the peasant-youth often returns for a few months, eagerly to pursue his education at the parish-school.

It was so with Burns; he returned from labour to learning, and from learning went again to labour, till his mind began to open to the charms of taste and knowledge; till he began to feel a passion for books, and for the subjects of books, which was to give a colour to the whole thread of his future life. On nature he soon began to gaze with new discernment and with new enthusiasm: his mind's eye opened to perceive affecting beauty and sublimity, where, by the mere gross peasant, there was nought to be seen but water, earth, and sky—but animals, plants, and soil.

What might perhaps first contribute to dispose his mind to poetical efforts, is one particular in the devotional piety of the Scotish peasantry. It is still common for them to make their children get by heart the Psalms of David, in the version of homely rhymes which is used in their churches. In the morning and in the evening of every day, or at least on the evening of every Saturday and Sunday, these Psalms are sung in solemn family devotion, a chapter of the Bible is read, and extemporary prayer is fervently uttered. The whole books of the sacred Scriptures are thus continually in the hands of almost every peasant. And it is impossible that there should not be occasionally some souls among them, awakened to the divine emotions of genius by that rich assemblage which those books present, of almost all that is interesting in incidents, or picturesque in imagery, or affectingly sublime or tender in sentiments and character. It is impossible that those rude rhymes, and the simple artless music with which they are accompanied, should not occasionally excite some ear to a fond perception of the melody of verse. That Burns had felt these impulses, will appear undeniably certain to whoever shall carefully peruse his *Cottar's*

Burns.

tar's Saturday's Night; or shall remark, with nice observation, the various fragments of Scripture sentiment, of Scripture imagery, of Scripture language, which are scattered throughout his works.

Still more interesting to the young peasantry are those ancient ballads of love and war, of which a great number are, in the south of Scotland, yet popularly known, and often sung by the rustic maid or matron at her spinning-wheel. They are listened to with ravished ears by old and young. Their rude melody; that mingled curiosity and awe which are naturally excited by the very idea of their antiquity; the exquisitely tender and natural complaints sometimes poured forth in them; the gallant deeds of knightly heroism, which they sometimes celebrate; their wild tales of demons, ghosts, and fairies, in whose existence superstition alone has believed; the manners which they represent; the obsolete, yet picturesque and expressive, language in which they are often clothed—give them wonderful power to transport every imagination, and to agitate every heart. To the soul of Burns they were like a happy breeze touching the wires of an Æolian harp, and calling forth the most ravishing melody.

Beside all this, the Gentle Shepherd, and the other poems of Allan Ramsay, have long been highly popular in Scotland. They fell early into the hands of Burns; and while the fond applause which they received drew his emulation, they presented to him likewise treasures of phraseology and models of versification. He got acquainted at the same time with the poetry of Robert Ferguson, written chiefly in the Scotish dialect, and exhibiting many specimens of uncommon poetical excellence. The Seasons of Thomson, too, the Grave of Blair, the far-famed Elegy of Gray, the Paradise Lost of Milton, perhaps the Minstrel of Beattie, were so commonly read, even among those with whom Burns would naturally associate, that poetical curiosity, although even less ardent than his, could in such circumstances have little difficulty in procuring them.

With such means to give his imagination a poetical bias, and to favour the culture of his taste and genius, Burns gradually became a poet. He was not, however, one of those forward children who, from a mistaken impulse, begin prematurely to write and to rhyme, and hence never attain to excellence. Conversing familiarly for a long while with the works of those poets who were known to him; contemplating the aspect of nature in a district which exhibits an uncommon assemblage of the beautiful and the ruggedly grand, of the cultivated and the wild; looking upon human life with an eye quick and keen, to remark as well the stronger and leading, as the nicer and subordinate, features of character; to discriminate the generous, the honourable, the manly in conduct, from the ridiculous, the base, and the mean—he was distinguished among his fellows for extraordinary intelligence, good sense, and penetration, long before others, or perhaps even himself, suspected him to be capable of writing verses. His mind was mature, and well stored with such knowledge as lay within his search: he had made himself master of powers of language, superior to those of almost any former writer in the Scotish dialect, before he conceived the idea of surpassing Ramsay and Ferguson.

Hitherto he had conversed intimately only with peasants on his own level; but having got admission into the fraternity of free-masons, he had the fortune, whether good or bad, to attract in the lodges the notice of gentlemen better qualified than his more youthful companions to call forth the powers of his mind, and to show him that he was indeed a poet. A masonic song, a satirical epigram, a rhyming epistle to a friend, attempted with success, taught him to know his own powers, and gave him confidence to try tasks more arduous, and which should command still higher bursts of applause.

The annual celebration of the sacrament of the Lord's Supper, in the rural parishes of Scotland, has much in it of those old Popish festivals, in which superstition, traffic, and amusement, used to be strangely intermingled. Burns saw, and seized in it one of the happiest of all subjects, to afford scope for the display of that strong and piercing sagacity by which he could almost intuitively distinguish the reasonable from the absurd, and the becoming from the ridiculous; of that picturesque power of fancy, which enabled him to represent scenes, and persons, and groups, and looks, attitudes, and gestures, in a manner almost as lively and impressive, even in words, as if all the artifices and energies of the pencil had been employed; of that knowledge which he had necessarily acquired of the manners, passions, and prejudices of the rustics around him, of whatever was ridiculous, no less than of whatever was affectingly beautiful, in rural life.

A thousand prejudices of Popish, and perhaps too of ruder Pagan superstition, have from time immemorial been connected in the minds of the Scotish peasantry, with the annual recurrence of the Eve of the Festival of all the Saints, or Hallowe'en. These were all intimately known to Burns, and had made a powerful impression upon his imagination and feelings. He chose them for the subject of a poem, and produced a piece which is almost to frenzy the delight of those who are best acquainted with its subject; and which will not fail to preserve the memory of the prejudices and usages which it describes, when they shall perhaps have ceased to give one merry evening in the year to the cottage fire-side.

The simple joys, the honest love, the sincere friendship, the ardent devotion of the cottage; whatever in the more solemn part of the rustic's life is humble and artless, without being mean or unseemly—or tender and dignified, without aspiring to stilted grandeur, or to unnatural buskined pathos, had deeply impressed the imagination of the rising poet: had, in some sort, wrought itself into the very texture of the fibres of his soul. He tried to express in verse what he most tenderly felt, what he most enthusiastically imagined; and produced the *Cottar's Saturday's Night*.

These pieces, the true effusion of genius, informed by reading and observation, and prompted by its own native ardour, as well as by friendly applause, were soon handed about amongst the most discerning of Burns's acquaintance; and were by every new reader perused and reperused, with an eagerness of delight and approbation which would not suffer their author long to withhold them from the press. A subscription was proposed; was earnestly promoted by some gentlemen, who were glad to interest themselves in behalf of such signal poetical merit; was soon crowded with the names of a considerable number of the inhabitants of

Burns. of Ayrshire, who in the proffered purchase sought not less to gratify their own passion for Scotish poetry, than to encourage the wonderful ploughman. At Kilmarnock were the poems of Burns for the first time printed. The whole edition was quickly distributed over the country.

It is hardly possible to express with what eager admiration and delight they were everywhere received.—They eminently possessed all those qualities which the most invariably contribute to render any literary work quickly and permanently popular. They were written in a phraseology, of which all the powers were universally felt; and which being at once antique, familiar, and now rarely written, was hence fitted to serve all the dignified and picturesque uses of poetry, without making it unintelligible. The imagery, the sentiments, were at once faithfully natural, and irresistibly impressive and interesting. Those topics of satire and scandal in which the rustic delights; that humorous imitation of character, and that witty association of ideas familiar and striking, yet not naturally allied to one another, which has force to shake his sides with laughter; those fancies of superstition, at which he still wonders and trembles; those affecting sentiments and images of true religion, which are at once dear and awful to his heart, were all represented by Burns with all a poet's magic power. Old and young, high and low, grave and gay, learned or ignorant, all were alike delighted, agitated, transported.

In the mean time, some few copies of these fascinating poems found their way to Edinburgh; and having been read to Dr Blacklock, they obtained his warmest approbation. In the beginning of the winter 1786-7 Burns went to Edinburgh, where he was received by Dr Blacklock with the most flattering kindness, and introduced to every man of generosity and taste among that good man's friends. Multitudes now vied with each other in patronising the rustic poet. Those who possessed at once true taste and ardent philanthropy were soon earnestly united in his praise: they who were disposed to favour any good thing belonging to Scotland, purely because it was Scotch, gladly joined the cry; those who had hearts and understanding to be charmed, without knowing why, when they saw their native customs, manners, and language, made the subjects and the materials of poesy, could not suppress that voice of feeling which struggled to declare itself for Burns: for the dissipated, the licentious, the malignant wits, and the freethinkers, he was so unfortunate as to have satire and obscenity, and ridicule of things sacred, sufficient to captivate their fancies; even for the pious he had passages in which the inspired language of devotion might seem to come mended from his pen.

Thus did Burns, ere he had been many weeks in Edinburgh, find himself the object of universal curiosity, favour, admiration, and fondness. He was sought after, courted with attentions the most respectful and assiduous, feasted, flattered, caressed, treated by all ranks as the first boast of his country, whom it was scarcely possible to honour and reward to a degree equal to his merits. In comparison with the general favour which now promised to more than crown his most sanguine hopes, it could hardly be called praise at all which he had obtained in Ayrshire.

In this posture of our poet's affairs a new edition of his poems was earnestly called for. He sold the copy-right for 100l.; but his friends at the same time suggested, and actively promoted, a subscription for an edition, to be published for the benefit of the author, ere the bookseller's right should commence. Those gentlemen who had formerly entertained the public of Edinburgh with the periodical publication of the papers of the *Mirror*, having again combined their talents in producing the *Lounger*, were at this time about to conclude this last series of papers; yet before the Lounger relinquished his pen, he dedicated a number to a commendatory criticism of the poems of the Ayrshire bard.

The subscription papers were rapidly filled; and it was supposed that the poet might derive from the subscription and the sale of his copy-right, a clear profit of at least 700l.

The conversation of even the most eminent authors is often found to be so unequal to the fame of their writings, that he who reads with admiration can listen with none but sentiments of the most profound contempt. But the conversation of Burns was, in comparison with the formal and exterior circumstances of his education, perhaps even more wonderful than his poetry. He affected no soft air or graceful motions of politeness, which might have ill accorded with the rustic plainness of his native manners. Conscious superiority of mind taught him to associate with the great, the learned, and the gay, without being overawed into any such bashfulness as might have made him confused in thought, or hesitating in elocution. He possessed withal an extraordinary share of plain common sense or mother-wit, which prevented him from obtruding upon persons, of whatever rank, with whom he was admitted to converse, any of those effusions of vanity, envy, or self-conceit, in which authors are exceedingly apt to indulge, who have lived remote from the general practice of life, and whose minds have been almost exclusively confined to contemplate their own studies and their own works. In conversation he displayed a sort of intuitive quickness and rectitude of judgment upon every subject that arose. The sensibility of his heart, and the vivacity of his fancy, gave a rich colouring to whatever reasoning he was disposed to advance; and his language in conversation was not at all less happy than in his writings. For these reasons, those who had met and conversed with him once, were pleased to meet and to converse with him again and again.

For some time he conversed only with the virtuous, the learned, and the wise; and the purity of his morals remained uncontaminated. But, alas! he fell, as others have fallen in similar circumstances. He suffered himself to be surrounded by a race of miserable beings, who were proud to tell that they had been in company with Burns, and had seen Burns as loose and as foolish as themselves. He was not yet irrecoverably lost to temperance and moderation; but he was already almost too much captivated with their wanton rivals, to be ever more won back to a faithful attachment to their more sober charms. He now also began to contract something of new arrogance in conversation. Accustomed to be among his favourite associates what is vulgarly but expressively called *the cock of the company*, he could scarcely refrain from indulging in similar freedom

Burns.

dom and dictatorial decision of talk, even in the presence of persons who could less patiently endure his presumption.

The subscription edition of his poems, in the mean time, appeared; and although not enlarged beyond that which came from the Kilmarnock press by any new pieces of eminent merit, did not fail to give entire satisfaction to the subscribers. He was now to close accounts with his bookseller and his printer, to retire to the country with his profits in his pocket, and to fix upon a plan for his future life. He talked loudly of independence of spirit, and simplicity of manners, and boasted his resolution to return to the plough; yet still he lingered in Edinburgh, week after week, and month after month, perhaps expecting that one or other of his noble patrons might procure him some permanent and competent annual income, which should set him above all necessity of future exertions to earn for himself the means of subsistence; perhaps unconsciously reluctant to quit the pleasures of that voluptuous town life to which he had for some time too willingly accustomed himself. An accidental dislocation or fracture of an arm or leg confining him for some weeks to his apartment, left him, during this time, leisure for serious reflection; and he determined to retire from the town without longer delay. None of all his patrons interposed to divert him from his purpose of returning to the plough, by the offer of any small pension, or any sinecure place of moderate emolument, such as might have given him competence without withdrawing him from his poetical studies. It seemed to be forgotten that a ploughman thus exalted into a man of letters was unfitted for his former toils, without being regularly qualified to enter the career of any new profession; and that it became incumbent upon those patrons who had called him from the plough, not merely to make him their companion in the hour of riot, not simply to fill his purse with gold for a few transient expences, but to secure him, as far as was possible, from being ever overwhelmed in distress in consequence of the favour which they had shewn him, and of the habits of life into which they had seduced him. Perhaps indeed the same delusion of fancy betrayed both Burns and his patrons into the mistaken idea, that, after all which had passed, it was still possible for him to return in cheerful content to the homely joys and simple toils of undissipated rural life.

In this temper of Burns's mind, in this state of his fortune, a farm and the excise were the objects upon which his choice ultimately fixed for future employment and support. By the surgeon who attended him during his illness, he was recommended with effect to the commissioners of excise; and Patrick Miller, Esq. of Dalswinton, deceived, like Burns himself and Burns's other friends, into an idea that the poet and exciseman might yet be respectable and happy as a farmer, generously proposed to establish him in a farm, upon conditions of lease, which prudence and industry might easily render exceedingly advantageous. Burns eagerly accepted the offers of this benevolent patron. Two of the poet's friends from Ayrshire were invited to survey that farm in Dumfries-shire which Mr Miller offered. A lease was granted to the poetical farmer at that annual rent which his own friends declared that the due cultivation of his farm might easily enable him to pay. What yet remained of the profits of his publication was laid out in the purchase of farm stock; and Mr Miller might, for some short time, please himself with the persuasion that he had approved himself the liberal patron of genius; had acquired a good tenant upon his estate; and had placed a deserving man in the very situation in which alone he himself desired to be placed, in order to be happy to his wishes.

Burns, with his Jane, whom he now married, took up their residence upon his farm. The neighbouring farmers and gentlemen, pleased to obtain for an inmate among them the poet by whose works they had been delighted, kindly sought his company, and invited him to their houses. He found an inexpressible charm in sitting down beside his wife, at his own fireside; in wandering over his own grounds; in once more putting his hand to the spade and the plough; in forming his inclosures, and managing his cattle. For some months he felt almost all that felicity which fancy had taught him to expect in his new situation. He had been for a time idle; but his muscles were not yet unbraced for rural toil. He now seemed to find a joy in being the husband of the mistress of his affections, in seeing himself the father of her children, such as might promise to attach him for ever to that modest, humble, and domestic life, in which alone he could hope to be permanently happy. Even his engagements in the service of the excise did not, at the very first, threaten necessarily to debase him by association with the mean, the gross, and the profligate, to contaminate the poet, or to ruin the farmer.

But it could not be: it was not possible for Burns now to assume that soberness of fancy and passions, that sedateness of feeling, those habits of earnest attention to gross and vulgar cares, without which success in his new situation was not to be expected. A thousand difficulties were to be encountered and overcome, much money was to be expended, much weary toil was to be exercised, before his farm could be brought into a state of cultivation, in which its produce might enrich the occupier. This was not a prospect encouraging to a man who had never loved labour, and who was at this time certainly not at all disposed to enter into agriculture with the enthusiasm of a projector. The business of the excise too, as he began to be more and more employed in it, distracted his mind from the care of his farm, led him into gross and vulgar society, and exposed him to many unavoidable temptations to drunken excess, such as he had no longer sufficient fortitude to resist. Amidst the anxieties, distractions, and seducements which thus arose to him, home became insensibly less and less pleasing; even the endearments of his Jane's affection began to lose their hold on his heart; he became every day less and less unwilling to forget in riot those gathering sorrows which he knew not to subdue.

Mr Miller and some others of his friends would gladly have exerted an influence over his mind, which might have preserved him in this situation of his affairs, equally from despondency and from dissipation; but Burns's temper spurned all controul from his superiors in fortune. He resented, as an arrogant encroachment upon his independence, that tenor of conduct by which Mr Miller wished to turn him from dissolute conviviality, to that steady attention to the business of his farm, without which it was impossible to thrive in it.

His

Burns.

His crosses and disappointments drove him every day more and more into dissipation; and his dissipation tended to enhance whatever was disagreeable and perplexing in the state of his affairs. He sunk, by degrees, into the boon companion of mere excisemen; and almost every drunken fellow, who was willing to spend his money lavishly in the alehouse, could easily command the company of Burns. The care of his farm was thus neglected; waste and losses wholly consumed his little capital: he resigned his lease into the hands of his landlord; and retired, with his family, to the town of Dumfries, determining to depend entirely for the means of future support upon his income as an excise-officer.

Yet during this unfortunate period of his life, which passed between his departure from Edinburgh to settle in Dumfriesshire, and his leaving the country in order to take up his residence in the town of Dumfries, the energy and activity of his intellectual powers appeared not to have been at all impaired. In a collection of Scotish songs, which were published (the words with the music) by Mr Johnson, engraver in Edinburgh, in 4 vols. 8vo, Burns, in many instances, accommodated new verses to the old tunes with admirable felicity and skill. He assisted in the temporary institution of a small subscription library, for the use of a number of the well-disposed peasants in his neighbourhood. He readily aided, and by his knowledge of genuine Scotish phraseology and manners, greatly enlightened, the antiquarian researches of the late ingenious Captain Grose. He still carried on an epistolary correspondence, sometimes gay, sportive, humorous, but always enlivened by bright flashes of genius, with a number of his old friends, and on a very wide diversity of topics. At times, as it should seem from his writings of this period, he reflected, with inexpressible heart-bitterness, on the high hopes from which he had fallen; on the errors of moral conduct into which he had been hurried by the ardour of his soul, and in some measure by the very generosity of his nature; on the disgrace and wretchedness into which he saw himself rapidly sinking; on the sorrow with which his misconduct oppressed the heart of his Jane; on the want and destitute misery in which it seemed probable that he must leave her and their infants; nor amidst these agonizing reflections did he fail to look, with an indignation half invidious, half contemptuous, on those who, with moral habits not more excellent than his, with powers of intellect far inferior, yet basked in the sunshine of fortune, and were loaded with the wealth and honours of the world, while his follies could not obtain pardon, nor his wants an honourable supply. His wit became from this time more gloomily sarcastic; and his conversation and writings began to assume something of a tone of misanthropical malignity, by which they had not been before, in any eminent degree, distinguished. But with all these failings, he was still that exalted mind which had raised itself above the depression of its original condition; with all the energy of the lion, pawing to set free his hinder limbs from the yet encumbering earth, he still appeared *not less than archangel ruined!*

His morals were not mended by his removal from the country. In Dumfries his dissipation became still more deeply habitual; he was here more exposed than in the country to be solicited to share the riot of the dissolute and the idle; foolish young men flocked eagerly about him, and from time to time pressed him to drink with them, that they might enjoy his wicked wit. The Caledonian Club, too, and the Dumfriesshire and Galloway Hunt, had occasional meetings in Dumfries after Burns went to reside there, and the poet was of course invited to share their convivality, and hesitated not to accept the invitation.

In the intervals between his different fits of intemperance, he suffered still the keenest anguish of remorse, and horribly afflictive foresight. His Jane still behaved with a degree of maternal and conjugal tenderness and prudence, which made him feel more bitterly the evil of his misconduct, although they could not reclaim him. At last crippled, emaciated, having the very power of animation wasted by disease, quite broken-hearted by the sense of his errors, and of the hopeless miseries in which he saw himself and his family depressed; with his soul still tremblingly alive to the sense of shame, and to the love of virtue; yet even in the last feebleness and amid the last agonies of expiring life, yielding readily to any temptation that offered the semblance of intemperate enjoyment, he died at Dumfries, in the summer of 1796, while he was yet three or four years under the age of 40, furnishing a melancholy proof of the danger of *suddenly* elevating even the greatest mind above its original level.

After his death it quickly appeared that his failings had not effaced from the minds of his more respectable acquaintance either the regard which had once been won by his social qualities, or the reverence due to his intellectual talents. The circumstances of want in which he left his family were noticed by the gentlemen of Dumfries with earnest commiseration. His funeral was celebrated by the care of his friends with a decent solemnity, and with a numerous attendance of mourners, sufficiently honourable to his memory. Several copies of verses were inserted in different newspapers upon the occasion of his death. A contribution, by subscription, was proposed, for the purpose of raising a small fund, for the decent support of his widow, and the education of his infant children.

From the preceding detail of the particulars of this poet's life, the reader will naturally and justly infer him to have been an honest, proud, warm-hearted man; of high passions and sound understanding, and a vigorous and excursive imagination. He was never known to descend to any act of deliberate meanness. In Dumfries he retained many respectable friends, even to the last. It may be doubted whether he has not, by his writings, exercised a greater power over the minds of men, and, by consequence, on their conduct, upon their happiness and misery, and upon the general system of life, than has been exercised by any half dozen of the most eminent statesmen of the present age. The power of the statesman is but shadowy, so far as it acts upon externals alone: the power of the writer of genius subdues the heart and the understanding, and having thus made the very spring of action its own, through them moulds almost all life and nature at its pleasure. Burns has not failed to command one remarkable sort of homage, such as is never paid but to great original genius: a crowd of poetasters started up to imitate him, by writing verses as he had done,

in

in the Scotish dialect; but, *O imitatores! servum pecus!* To persons whom the Scotish dialect, and the customs and manners of rural life in Scotland, have no charm, too much may appear to have been said about Burns; by those who passionately admire him, a great deal more, perhaps, was expected.

A complete edition of his works, in 4 vols 8vo. was published under the superintendence of Dr Currie of Liverpool, who drew up an elaborate and valuable account of the life of the poet, which is prefixed. From the profits of this edition his widow and family have received a handsome sum. The following letter from Burns to the late Dr Moore, gives so interesting an account of the transactions of his early years, and affords so good a specimen of vigour of thought and force of expression in his prose composition, that we hope it will prove acceptable to our readers.

" *Mauchline*, August 2. 1787.—Sir, For some months past I have been rambling up and down the country, but I am now confined with some lingering complaints, originating, as I take it, in the stomach. To divert my spirits a little in this miserable fog of *ennui*, I have taken a whim to give you a history of myself. My name has made some little noise in this country; you have done me the honour to interest yourself very warmly in my behalf; and I think a faithful account of what character of a man I am, and how I came by that character, may perhaps amuse you in an idle moment. I will give you an honest narrative, though I know it will be often at my own expence; for I assure you, Sir, I have, like Solomon, whose character, excepting in the trifling affair of wisdom, I sometimes think I resemble, I have, I say, like him turned my eyes to behold madness and folly, and like him, too, frequently shaken hands with their intoxicating friendship. * * * After you have perused these pages, should you think them trifling and impertinent, I only beg leave to tell you, that the poor author wrote them under some twitching qualms of conscience, arising from a suspicion that he was doing what he ought not to do; a predicament he has more than once been in before.

" I have not the most distant pretensions to assume that character which the pye-coated guardians of escutcheons call, a gentleman. When at Edinburgh last winter, I got acquainted in the heralds office, and looking through that granary of honours, I there found almost every name of the kingdom; but for me,

——My ancient but ignoble blood
Has crept thro' scoundrels ever since the flood.

Gules, purpure, argent, &c. quite disowned me.

" My father was of the north of Scotland, the son of a farmer, and was thrown by early misfortunes on the world at large; where, after many years wanderings and sojournings, he picked up a pretty large quantity of observation and experience, to which I am indebted for most of my little pretensions to wisdom.—I have met with few who understood men, their manners, and their ways, equal to him; but stubborn ungainly integrity, and headlong ungovernable irascibility, are disqualifying circumstances; consequently I was born a very poor man's son. For the first six or seven years of my life, my father was a gardener to a worthy gentleman of a small estate in the neighbourhood of Ayr. Had he continued in that station, I must have marched off to be one of the little underlings about a farm-house; but it was his dearest wish and prayer to have it in his power to keep his children under his own eye, till they could discern between good and evil; so with the assistance of his generous master, my father ventured on a small farm on his estate. At these years I was by no means a favourite with any body. I was a good deal noted for a retentive memory, a stubborn sturdy something in my disposition, and an enthusiastic idiot piety. I say idiot piety, because I was then but a child. Though it cost the schoolmaster some thrashings, I made an excellent English scholar; and by the time I was 10 or 12 years of age, I was a critic in substantives, verbs, and particles. In my infant and boyish days too, I owed much to an old woman who resided in the family, remarkable for her ignorance, credulity, and superstition. She had, I suppose, the largest collection in the country, of tales and songs concerning devils, ghosts, fairies, brownies, witches, warlocks, spunkies, kelpies, elf-candles, dead-lights, wraiths, apparitions, cantraips, giants, enchanted towers, dragons, and other trumpery. This cultivated the latent seeds of poetry; but had so strong an effect on my imagination, that to this hour, in my nocturnal rambles, I sometimes keep a sharp look-out in suspicious places; and though nobody can be more sceptical than I am in such matters, yet it often takes an effort of philosophy to shake off these idle terrors. The earliest composition that I recollect taking pleasure in, was the Vision of Mirza, and a hymn of Addison's, beginning, 'How are thy servants blest, O Lord!' I particularly remember one half-stanza which was music to my boyish ear—

For though on dreadful whirls we hung
High on the broken wave.—

I met with these pieces in Mason's English Collection, one of my school-books. The two first books I ever read in private, and which gave me more pleasure than any two books I ever read since, were, The Life of Hannibal, and The History of Sir William Wallace. Hannibal gave my young ideas such a turn, that I used to strut in raptures up and down after the recruiting drum and bag-pipe, and wish myself tall enough to be a soldier; while the story of Wallace poured a Scotish prejudice into my veins, which will boil along there, till the flood-gates of life shut in eternal rest.

" Polemical divinity about this time was putting the country half mad, and I, ambitious of shining in conversation parties on Sundays between sermons, at funerals, &c. used a few years afterwards to puzzle Calvinism with so much heat and indiscretion, that I raised a hue and cry of heresy against me, which has not ceased to this hour.

" My vicinity to Ayr was of some advantage to me. My social disposition, when not checked by some modifications of spited pride, was, like our catechism definition of infinitude, without bounds or limits. I formed several connexions with other younkers who possessed superior advantages; the youngling actors who were busy in the rehearsal of parts in which they were shortly to appear on the stage of life, where, alas! I was destined to drudge behind the scenes. It is not commonly at this green age that our young gentry

gentry have a just sense of the immense distance between them and their ragged play-fellows. It takes a few dashes into the world, to give the young great man that proper, decent, unnoticing disregard for the poor, insignificant, stupid devils, the mechanics and peasantry around him, who were perhaps born in the same village. My young superiors never insulted the *clouterly* appearance of my plough-boy carcase, the two extremities of which were often exposed to all the inclemencies of all the seasons. They would give me stray volumes of books; among them, even then, I could pick up some observations, and one, whose heart I am sure not even the Munny Begum scenes have tainted, helped me to a little French. Parting with these my young friends and benefactors, as they occasionally went off for the East or West Indies, was often to me a sore affliction, but I was soon called to more serious evils. My father's generous master died; the farm proved a ruinous bargain; and to clench the misfortune, we fell into the hands of a factor, who sat for the picture I have drawn of one in my tale of Twa Dogs. My father was advanced in life when he married; I was the eldest of seven children, and he, worn out by early hardships, was unfit for labour. My father's spirit was soon irritated, but not easily broken. There was a freedom in his lease in two years more, and to weather these two years, we retrenched our expences. We lived very poorly: I was a dexterous ploughman for my age; and the next oldest to me was a brother (Gilbert) who could drive the plough very well, and help me to thrash the corn. A novel writer might perhaps have viewed these scenes with some satisfaction, but so did not I; my indignation yet boils at the recollection of the s——l factor's insolent threatening letters, which used to set us all in tears.

"This kind of life—the cheerless gloom of a hermit, with the unceasing moil of a galley-slave, brought me to my 16th year; a little before which period I first committed the sin of ryhme. You know our country custom of coupling a man and woman together as partners in the labours of harvest. In my 15th autumn, my partner was a bewitching creature, a year younger than myself. My scarcity of English denies me the power of doing her justice in that language, but you know the Scotish idiom; she was a bonnie, sweet, sonsie lass. In short, she altogether, unwittingly to herself, initiated me in that delicious passion, which, in spite of acid disappointment, gin-horse prudence, and book-worm philosophy, I hold to be the first of human joys, our dearest blessing here below! How she caught the contagion I cannot tell: you medical people talk much of infection from breathing the same air, the touch, &c. but I never expressly said I loved her.—Indeed I did not know myself why I liked so much to loiter behind with her, when returning in the evening from our labours; why the tones of her voice made my heart-strings thrill like an Æolian harp: and particularly why my pulse beat such a furious ratan when I looked and fingered over her little hand to pick out the cruel nettle-stings and thistles. Among her other love-inspiring qualities, she sung sweetly; and it was her favourite reel to which I attempted giving an embodied vehicle in rhyme. I was not so presumptuous as to imagine that I could make verses like printed ones, composed by men who had Greek and Latin; but my girl sung a song which was said to be composed by a small country laird's son, on one of his father's maids, with whom he was in love, and I saw no reason why I might not rhyme as well as he; for excepting that he could smear sheep, and cast peats, his father living in the moorlands, he had no more scholar-craft than myself.

"Thus with me began love and poetry; which at times have been my only, and, till within the last 12 months, have been my highest enjoyment. My father struggled on till he reached the freedom in his lease, when he entered on a larger farm, about ten miles farther in the country. The nature of the bargain he made was such as to throw a little ready money into his hands at the commencement of his lease, otherwise the affair would have been impracticable. For four years we lived comfortably here; but a difference commencing between him and his landlord as to terms, after three years tossing and whirling in the vortex of litigation, my father was just saved from the horrors of a jail, by a consumption, which, after two years promises, kindly stepped in, and carried him away, to 'where the wicked cease from troubling, and where the weary are at rest!'

"It is during the time that we lived on this farm, that my little story is most eventful. I was, at the beginning of this period, perhaps the most ungainly aukward boy in the parish—no solitaire was less acquainted with the ways of the world. What I knew of ancient story was gathered from Salmon's and Guthrie's Geographical Grammars; and the ideas I had formed of modern manners, of literature, and criticism, I got from the Spectator. These, with Pope's Works, some plays of Shakespeare, Tull and Dickson on Agriculture, the Pantheon, Locke's Essay on the Human Understanding, Stackhouse's History of the Bible, Justice's British Gardener's Directory, Bayle's Lectures, Allan Ramsay's Works, Taylor's Scripture Doctrine of Original Sin, a Select Collection of English Songs, and Hervey's Meditations, had formed the whole of my reading. The collection of songs was my *vade mecum*. I pored over them driving my cart, or walking to labour, song by song, verse by verse; carefully noting the true tender, or sublime, from affectation and fustian. I am convinced I owe to this practice much of my critic-craft, such as it is." (*Month Mag. and Currie's Life of Burns*).

BURNTISLAND. See Bruntisland.

BURNTWOOD, a town of Essex in England, situated on a hill, in E. Long. 0. 25. N. Lat. 51. 38.

BURR, the round knob of a horn next a deer's head.

BURRE, Bouree, or *Boree*, a kind of dance composed of three steps joined together in two motions, begun with a crotchet rising. The first couplet contains twice four measures, the second twice eight. It consists of a balance and coupee.

BURR-Pump, or *Bilge-Pump*, differs from the common pump, in having a staff, six, seven, or eight feet long, with a bar of wood, whereto the leather is nailed, and this serves instead of a box. So two men, standing over the pump, thrust down this staff, to the middle whereof is fastened a rope, for six, eight, or ten to hale by, thus pulling it up and down.

BURROCK, a small wier or dam, where weels are laid in a river, for the taking of fish.

Burroughs's Machine.

BURROUGHS's machine for grinding and polishing glass, invented by Mr Burroughs of Southwark; and for which he received from the society for the encouragement of arts a premium of 70l.

Plate CXXXI.

This machine consists of a cog-wheel A (fig. 3.), 12 feet in diameter, carrying 72 cogs; which turn a trundle-head B, one foot four inches in diameter, and furnished with eight rounds; and also a horizontal spur-wheel C, of 12 cogs; and one foot eight inches in diameter. The trundle-head B turns a spur-wheel D of 10 cogs, and two feet eight inches in diameter. This spur-wheel has two cranks, *a*, *b*, in its shaft; one of which, *a*, gives motion to a wooden frame, *c*, about 34 inches long and 19 broad. On the under side of this frame are fastened by screws 12 pieces of polished metal, each five inches and a half long, and three broad, covered with leather; and underneath these polishers a glass plate cemented in another frame is placed on the bench *d*, and polished with tripoli by the motion given to the upper frame by the crank *a*. The nuts of the screws which fasten the polishers to the upper frame are not screwed close to the wood, in order to give the frame room to play; by which contrivance the perpendicular rise of the crank is avoided, and the motion of the polishers is always parallel and equal. The under frame may be moved by the hand in any direction without stopping the machine; by which means the plate, when larger than the polishing frame can cover in its motion, will be equally polished in every part.

The other crank *b* gives motion to two other polishers marked *n*, *o*, which have an alternate motion by the bending of the crank; they move upon the same plate, and have an equal number of polishers as that already described.

The same crank also gives motion to a contrivance represented at *e* for polishing spectacle-glasses. It consists of two segments of the same sphere; one concave and the other convex. On the latter the glasses are cemented; and polished by the former, which is moved by the crank *b*. The convex segment may be moved round by the hand without stopping the machine, so that all the glasses on its superficies will be equally polished.

The other spur-wheel C, by means of a crank in its shaft, gives motion to another frame *g*, employed in grinding the glass plates. The rod *h*, extended from the crank *f* to the frame *g*, is fastened to the latter by means of a pivot, in order to admit of a rotatory motion, as well as that given it by the crank in a longitudinal direction. This rotatory motion is effected by means of a rod of iron *i*, called a *trigger*, sharp at the extremity next the frame, where it touches the teeth of a horizontal spur-wheel, or circular piece of wood, fixed on the grinding plate, while the other is extended three feet two inches to the centre of motion.

But this contrivance, in which the merit of the machine principally consists, will be much better conceived from a small delineation of it by itself (fig. 4.), where F is the crank marked *f* in fig. 3. and turned by the spur-wheel C in the same figure. G is the trigger, three feet two inches long. I, a roll fixed on the trigger for the rod to slide on. H, the horizontal spur-wheel, eleven inches in diameter, fixed on the grinding plate; the teeth of which are touched by the trigger; but with a very unequal force, as it will wholly depend upon the grinding-plate's being farther from, or nearer to, the centre of motion of the trigger. By this simple contrivance, the grinding-plate has a very compound motion, never moving exactly in the same track, and therefore must grind the plates equally in every part. Several attempts have been made by others for producing the same effect, but without success; the grinding-plate always follows the same track, and consequently the plates are ground equally.

Burroughs's Machine ‖ Bursars.

BURROW, Sir James, master of the crown office, was elected F. R. S. and F. A. S. 1751. On the death of Mr West in 1772, he was prevailed on to fill the president's chair at the Royal Society till the anniversary election, when he resigned it to Sir John Pringle; and August 10. 1773, when the society presented an address to his majesty, he received the honour of knighthood. He published two volumes of Reports in 1766; two others in 1771 and 1776; and a volume of Decisions of the Court of King's Bench upon settlement cases from 1732 to 1772 (to which was subjoined An Essay of Punctuation), in three parts, 4to, 1768, 1772, 1776. The Essay was also printed separately in 4to, 1773. He published, without his name, "A few Anecdotes and Observations relating to Oliver Cromwell and his family, serving to rectify several errors concerning him," published by Nicol. Comn. Papadopoli, in his *Historia Gymnasii Patavini*, 1763, 4to. He died in 1782.

BURROWS, holes in a warren, serving as a covert for rabbits, &c. A coney's coming out of her burrow is called *bolting*. To catch coneys, they sometimes lay purse-nets over the burrows, then put in a terrier close muzzled, which making the creature bolt, she is caught in the net.

BURSA, or Prusa, in *Geography*, the capital of Bithynia in Asia Minor, situated in a fine fruitful plain, at the foot of Mount Olympus, about 100 miles south of Constantinople. It is still a large town. E. Long. 29. 0. N. Lat. 40. 30.

Bursa-Pastoris, in *Botany*. See Thlaspi.

Bursa, *Burse*, originally signifies a purse. In middle-age writers it is more particularly used for a little college or hall in a university, for the residence of students, called *bursales* or *bursarii*. In the French universities it still denotes a foundation for the maintenance of poor scholars in their studies. The nomination to burses is in the hands of the patrons and founders thereof. The burses of colleges are not benefices, but mere places assigned to certain countries and persons. A burse becomes vacant by the burser's being promoted to a cure.

BURSÆ mucosæ. See Anatomy *Index*.

BURSAR, or Burser, (*Bursarius*), is used in middle-age writers for a treasurer or cash-keeper. In this sense we meet with bursars of colleges. Conventual bursars were officers in monasteries, who were to deliver up their account yearly on the day after Michaelmas. The word is formed from the Latin *bursa*, whence also the English word *purse*; hence also the officer, who in a college is called *bursar*, in a ship is called *purser*.

Bursars, or *Bursors*, (*Bursarii*), also denote those to whom stipends are paid out of a burse or fund appointed for that purpose.

BURSARIA,

BURSARIA, the bursary, or exchequer of collegiate and conventual bodies; or the place of receiving, paying, and accounting by the bursarii or bursers.

BURSE, in matters of commerce, denotes a public edifice in certain cities, for the meeting of merchants to negotiate bills, and confer on other matters relating to money and trade. In this sense, burse amounts to the same with what we otherwise call an *exchange*.

The first place of this kind to which the name *Burse* was given, Guiechardin assures us was at Bruges; and it took its denomination from a hotel adjoining to it, built by a lord of the family de la Bourse, whose arms, which are three purses, are still found on the crowning over the portal of the house. Catel's account is somewhat different, viz. that the merchants of Bruges bought a house or apartment to meet in, at which was the sign of the purse. From this city the name was afterwards transferred to the like places in others, as in Antwerp, Amsterdam, Bergen in Norway, and London. This last, anciently known by the name of the *common burse of merchants*, had the denomination since given it by Queen Elizabeth, of the *royal exchange*. The most considerable burse is that of Amsterdam, which is a large building, 230 feet long and 130 broad, round which runs a peristyle 20 feet wide. The columns of the peristyle, which are 46, are numbered, for the conveniency of finding people. It will hold 4500 persons.

In the times of the Romans there were public places for the meeting of merchants in most of the trading cities in the empire; that built at Rome, in the 259th year after its foundation, under the consulate of Appius Claudius and Publius Servilius, was denominated the *college of merchants*; some remains of it are still to be seen, and are known by the modern Romans under the name *loggia*. The Hans Towns, after the example of the Romans, gave the name of *colleges* to their burses.

BURSERA. See BOTANY *Index*.

BURSTEN, denotes a person who has a rupture. See RUPTURE

BURTHEN *of a* SHIP. See BURDEN.

BURTON *upon* TRENT, a town of Staffordshire, in England. It had formerly a large abbey; and over the river Trent it has now a famous bridge of free stone, about a quarter of a mile in length, supported by 37 arches. It consists chiefly of one long street, which runs from the place where the abbey stood to the bridge, and contained 3979 inhabitants in 1811. Burton ale is reckoned the best of any brought to London. W. Long. 1. 36. N. Lat. 52. 48.

BURTON, a town of Lincolnshire in England, seated on a hill near the river Trent. It is but a small place, and is situated in W. Long. 0. 30. N. Lat. 53. 40.

BURTON, a town of Westmoreland in England, seated in a valley near a large hill called *Farleton-knot-hill*. It is pretty well built, and lies on the great road from Lancaster to Carlisle. W. Long. 2. 35. N. Lat. 54. 10.

BURTON, *Robert*, known to the learned by the name of *Democritus junior*, was younger brother to William Burton, who wrote "The Antiquities of Leicestershire," and born of an ancient family at Lindley, in that county, upon the 8th of February 1576. He was educated in grammatical learning in the free school of Sutton Colefield in Warwickshire; in the year 1593 was sent to Brazen-nose college in Oxford; and in 1599 was elected student of Christ-church. In 1616, he had the vicarage of St Thomas, in the west suburb of Oxford, conferred upon him by the dean and canons of Christ-church, to the parishioners of which, it is said, that he always gave the sacrament in wafers; and this, with the rectory of Segrave in Leicestershire, given him some time after by George Lord Berkeley, he held to the day of his death, which happened in January 1639.

He was a man of general learning; a great philosopher; an exact mathematician; and (what makes the peculiarity of his character) a very curious calculator of nativities. He was extremely studious, and of a melancholy turn; yet an agreeable companion, and very humorous. *The anatomy of melancholy*, by *Democritus junior*, as he calls himself, shows, that these different qualities were mixed together in his composition. This book was printed first in 4to, afterwards in folio, in 1624, 1632, 1638, and 1652, to the great emolument of the bookseller, who, as Mr Wood tells us, got an estate by it. Some circumstances attending his death occasioned strange suspicions. He died in his chamber at or very near the time which, it seems, he had some years before predicted from the calculation of his nativity; and this exactness made it whispered about that for the glory of astrology, and rather than his calculation should fail, he became indeed a *felo de se*. This, however, was generally discredited; he was buried with due solemnity in the cathedral of Christ-church, and had a fair monument erected to his memory. He left behind him a very choice collection of books. He bequeathed many to the Bodleian library; and 100l. to Christ-church, the interest of which was to be laid out yearly in books for their library.

BURTON, *John*, D. D. a learned divine, was born in 1696, at Wembworth, in Devonshire, of which parish his father was rector. He was educated at Corpus Christi college, Oxford. In 1725, being then proproctor and master of the schools, he spoke a Latin oration before the determining bachelor, which is entitled "*Heli*; or, An Instance of a Magistrate's erring through unseasonable Lenity;" written and published with a view to encourage the salutary exercise of academical discipline; and afterwards treated the same subject still more fully in four Latin sermons before the university, and published them with appendixes. He also introduced into the schools, Locke, and other eminent modern philosophers, as suitable companions to Aristotle: and printed a double series of philosophical questions, for the use of the younger students; from which Mr Johnson of Magdalene college, Cambridge, took the hint of his larger work of the same kind, which has gone through several editions.

When the settling of Georgia was in agitation, Dr Bray, justly revered for his institution of parochial libraries, Dr Stephen Hales, Dr Berriman, and other learned divines, intreated Mr Burton's pious assistance in that undertaking. This he readily gave, by preaching before the society in 1732, and publishing his sermon, with an appendix on the state of that colony; and he he afterwards published an account of the designs of the associates of the late Dr Bray, with an account of their proceedings.

About the same time, on the death of Dr Edward Littleton, he was presented by Eton college to the vicarage of Maple-Derham, in Oxfordshire. Here a melancholy scene, which too often appears in the mansion of the clergy, presented itself to his view; a widow, with three infant daughters, without a home, without a fortune; from his compassion arose love, the consequence of which was marriage; for Mrs Littleton was handsome, elegant, accomplished, ingenious, and had great sweetness of temper. In 1760, he exchanged his vicarage of Maple-Derham for the rectory of Worplesdon in Surrey. In his advanced age, finding his eyes begin to fail him, he collected and published, in one volume, all his scattered pieces, under the title of *Opuscula miscellanea;* and soon after died, February 11th, 1771.

Burton, in the sea-language, a small tackle consisting of two single blocks, and may be made fast any where at pleasure, for hoisting small things in and out.

BURY, is sometimes used to denote the hole or den of some animal under ground. In this sense we say the *bury* of a mole, a tortoise, or the like. The grillotalpa, or mole-cricket, digs itself a bury with its forefeet, which are made broad and strong for that purpose. Naturalists speak of a kind of urchins in the island of Maraguan, which have two entries to their buries, one towards the north, the other to the south, which they open and shut alternately, as the wind happens to lie.

Bury, in *Geography*, a market town of Lancashire, about 80 miles south-east of Lancaster. It is a barony in the family of Albemarle. W. Long. 2. 20. N. Lat. 53. 36.

Bury *St Edmond's*, or *St Edmond's Bury*, the county town of Suffolk, about 12 miles east of Newmarket, and 70 north-east of London. Population 7986. E. Long. 0. 45. N. Lat. 52. 20.

BURYING, the same with interment or Burial.

Burying Alive was the punishment of a vestal who had violated her vow of virginity. The unhappy priestess was let down into a deep pit, with bread, water, milk, oil, a lamp burning, and a bed to lie on. But this was only for show; for the moment she was let down, they began to cast in the earth upon her till the pit was filled up.† Some middle-age writers seem to make burying alive *(defossio)* the punishment of a woman thief. Lord Bacon gives instances of the resurrection of persons who have been buried alive. The famous Duns Scotus is of the number; who, having been seized with a catalepsis, was thought dead, and laid to sleep among his fathers, but raised again by his servant, in whose absence he had been buried. Bartholin gives an account of a woman, who, on recovering from an apoplexy, could not be convinced but that she was dead, and solicited so long and so earnestly to be buried, that they were forced to comply; and performed the ceremonies, at least in appearance. The famous Emperor Charles V. after his abdication, took it into his head to have his burial celebrated in his lifetime, and assisted at it. See Charles V.

† See the article *Vestals*.

Burying-Place. The ancients buried out of cities and towns; an usage which we find equally among Jews, Greeks, and Romans. Among the last, burying within the walls was expressly prohibited by a law of the 12 tables. The usual places of interment were in the suburbs and fields, but especially by the way-sides. We have instances, however, of persons buried in the city; but it was a favour allowed only to a few of singular merit in the commonwealth. Plutarch says, those who had triumphed were indulged in it. Be this as it will, Val. Publicola, and C. Fabricius, are said to have had tombs in the forum: and Cicero adds Tubertus to the number. Lycurgus allowed his Lacedemonians to bury their dead within the city and round their temples, that the youth, being inured to such spectacles, might be the less terrified with the apprehension of death. Two reasons are alleged why the ancients buried out of cities: the first, an opinion that the sight, touch, or even neighbourhood, of a corpse, defiled a man, especially a priest; whence that rule in A. Gellius, that the *flamen dialis* might not on any account enter a place where there was a grave: the second, to prevent the air from being corrupted by the stench of putrified bodies, and the buildings from being endangered by the frequency of funeral fires.

Burying in churches was not allowed for the first 300 years after Christ; and the same was severely prohibited by the Christian emperors for many ages afterwards. The first step towards it appears to have been the practice of erecting churches over the graves of some martyrs in the country, and translating the relics of others into churches in the city; the next was, allowing kings and emperors to be buried in the atrium or church-porch. In the 6th century, the people began to be admitted into the church-yards; and some princes, founders, and bishops, into the church. From that time the matter seems to have been left to the discretion of the bishop.

BUSBEC, Auger Gislen, Lord of, a person illustrious on account of his embassies, was born at Commines in the year 1522; and educated at the most famous universities, at Louvain, at Paris, at Venice, at Bologna, and at Padua. He was engaged in several important employments and negotiations, and particularly was twice sent ambassador by the king of the Romans to the emperor Soliman. He collected inscriptions; bought manuscripts; searched after rare plants; inquired into the nature of animals; and in his second journey to Constantinople, carried with him a painter, that he might be able to communicate to the curious the figures, at least, of the plants and animals that were not well known in the west. He wrote a Discourse of the State of the Ottoman Empire, and a Relation of his two Journeys to Turkey, which are much esteemed. He died in 1592.

BUSBY, Dr Richard, son of a gentleman in Westminster, was born at Lutton in Lincolnshire, in 1606. He passed through the classes in Westminster school, as king's scholar; and completed his studies at Christ-church, Oxford. In 1640 he was appointed master of Westminster school; and by his skill and diligence in the discharge of this important and laborious office, for the space of 55 years, bred up the greatest number of eminent men, in church and state, that ever at one time adorned any age or nation. He was extremely severe in his school; though he applauded wit in

Bush.

in his scholars, even when it reflected on himself. He died in 1695, aged 89, and was buried in Westminster Abbey, where there is a fine monument erected for him, with a Latin inscription. He composed several books for the use of his school.

BUSCHING, A. F. a celebrated German geographer. See SUPPLEMENT.

BUSH, PAUL, the first bishop of Bristol, became a student in the university of Oxford about the year 1513, and in 1518 took the degree of bachelor of arts. He afterwards became a brother of the order called *bonhoms:* of which, after studying some time among the friars of St Austin (now Wadham college), he was elected provincial. In that station he lived many years; till at length King Henry VIII. being informed of his great knowledge in divinity and physic, made him his chaplain, and in 1542 appointed him to the new episcopal see of Bristol; but having in the reign of Edward VI. taken a wife, he was, on the accession of Mary, deprived of his dignity, and spent the remainder of his life in a private station at Bristol, where he died in the year 1558, aged 68, and was buried on the north side of the choir of the cathedral. Wood says, that while he was a student at Oxford, he was numbered among the celebrated poets of that university; and Pitt gives him the character of a faithful Catholic, his want of chastity notwithstanding. He wrote, 1. An Exhortation to Margaret Burgess, wife to John Burgess, clothier, of King's Wood, in the county of Wilts. London, printed in the reign of Edward VI. 8vo. 2. Notes on the Psalms. 3. Treatise in praise of the cross. 4. Answer to certain queries concerning the abuse of the mass. Records, No. 25. 5. Dialogues between Christ and the Virgin Mary. 6. Treatise of slaves and curing remedies. 7. A little treatise called *The Extirpation of Ignorancy.* 8. *Carmina diversa.*

BUSH, a term used for several shrubs of the same kind growing close together: thus we say, a *furze-bush*, *bramble-bush*, &c.

BUSH is sometimes used, in a more general sense, for any assemblage of thick branches interwoven and mixed together.

BUSH also denotes a coronated frame of wood hung out as a sign of taverns. It takes the denomination from hence, that, anciently, signs where wine was sold were *bushes* chiefly of ivy, cypress, or the like plant, which keeps its verdure long. And hence the English proverb, "Good wine needs no *bush*."

Burning-BUSH, that bush wherein the Lord appeared to Moses at the foot of Mount Horeb, as he was feeding his father-in-law's flocks.

As to the person that appeared in the bush, the text says, "That the angel of the Lord appeared unto him in a flame of fire, out of the middle of the bush:" but whether it was a created angel, speaking in the person of God, or God himself, or (as the most received opinion is) Christ the son of God, has been matter of some controversy among the learned. Those who suppose it no more than an angel, seem to imply that it would be a diminution of the majesty of God, to appear upon every occasion, especially when he has such a number of celestial ministers, who may do the business as well. But considering that God is present everywhere, the notification of his presence by some outward sign in one determinate place (which is all we mean by his appearance), is in our conception less laborious (if any thing laborious could be conceived of God) than a delegation of angels upon every turn from heaven, and seems in the main to illustrate rather than debase the glory of his nature and existence. But however this be, it is plain that the angel here spoken of was no created being, from the whole context, and especially from his saying, "I am the Lord God, the Jehovah," &c. since this is not the language of angels, who are always known to express themselves in such humble terms as these, "I am sent from God; I am thy fellow servant," &c. It is a vain pretext to say, that an angel, as God's ambassador, may speak in God's name and person; for what ambassador of any prince ever yet said, "I am the king?" Since therefore no angel, without the guilt of blasphemy, could assume these titles; and since neither God the Father nor the Holy Ghost, are ever called by the name of *angel*, i. e. "messenger, or person sent," whereas God the Son is called by the prophet Malachi (chap. iii. 1), "The angel of the covenant:" it hence seems to follow, that this angel of the Lord was God the Son, who might very properly be called an *angel*, because in the fulness of time he was sent into the world in our flesh, as a messenger from God, and might therefore make these his temporary apparitions presages and forerunners, as it were, of his more solemn mission. The emblem of the burning-bush is used as the seal of the church of Scotland, with this motto: *Nec tamen consumebatur;* i. e. "Though burning, is never consumed."

Bush, Bushel.

BUSHEL, a measure of capacity for things dry; as grains, pulse, dry fruits, &c. containing four pecks, or eight gallons, or one-eighth of a quarter.

Du Cange derives the word from *bussellus*, *bustellus*, or *bisellus*, a diminutive of *buz*, or *buza*, used in the corrupt Latin for the same thing; others derive it from *bussulus*, an *urn*, wherein lots were cast; which seems to be a corruption from *buxulus*. *Bussellus* appears to have been first used for a liquid measure of wine, equal to eight gallons. *Octo libræ faciunt galonem vini, et octo galones vini faciunt* bussellum *London, quæ est octava pars quarterii.* It was soon after transferred to the dry measure of corn of the same quantity.—*Pondus octo librorum frumenti facit* bussellum, *de quibus octo consistit quarterium.*

By 12 Henry VII. c. 5. a bushel is to contain 8 gallons of wheat; the gallon 8 pounds of wheat troy weight; the pound 12 ounces troy-weight; the ounce 20 shillings; and the sterling 32 grains or corns of wheat, growing in the midst of the ear. This standard bushel is kept in the Exchequer; when being filled with common spring-water, and the water measured before the house of commons in 1696, in a regular parallelopiped, it was found to contain 2145,6 solid inches; and the said water being weighed, amounted to 1131 ounces and 14 penny-weights troy. Besides the standard or legal bushel, we have several local bushels, of different dimensions in different places. At Abington and Andover, a bushel contains nine gallons; at Appleby and Penrith, a bushel of pease, rye, and wheat, contains 16 gallons; of barley, big, malt, mixt malt, and oats, 20 gallons. A bushel contains, at Carlisle, 24 gallons; at Chester, a bushel of wheat, rye, &c. contains 32 gallons, and of oats 40; at Dorchester, a bushel of malt and oats contains

tains 10 gallons; at Falmouth, the bushel of stricken coals is 16 gallons, of other things 20, and usually 21 gallons; at Kingston upon Thames, the bushel contains $8\frac{1}{4}$; at Newbury, 9; at Wycomb and Reading, $8\frac{1}{4}$; at Stamford, 15 gallons. *Houghton. Collect.* tom. i. n. 46. p. 42.

At Paris, the bushel is divided into 2 half-bushels; the half-bushel into 2 quarts; the quart into 2 half-quarts; the half-quart into 2 litrons; and the litron into 2 half-litrons. By a sentence of the provost of the merchants of Paris, the bushel is to be 8 inches $2\frac{1}{2}$ lines high, and 10 inches in diameter; the quart 4 inches 9 lines high, and 6 inches 9 lines wide; the half-quart 4 inches 3 lines high, and 5 inches diameter: the litron $3\frac{1}{2}$ inches high, and 3 inches 10 lines in diameter. Three bushels make a minot, 6 a mine, 12 a septier, and 144 a muid. In other parts of France the bushel varies: $14\frac{1}{8}$ bushels of Amboise and Tours make the Paris septier. Twenty bushels of Avignon make 3 Paris septiers. Twenty bushels of Blois make 1 Paris septier. Two bushels of Bourdeaux make 1 Paris septier. Thirty-two bushels of Rochel make 19 Paris septiers. Oats are measured in a double proportion to other grains; so that 24 bushels of oats make a septier, and 248 a muid. The bushel of oats is divided into 5 picotins, the picotin into 2 half-quarts, or 4 litrons. For salt, 4 bushels make a minot, and 6 a septier. For coals, 8 bushels make a minot, 16 a mine, and 320 a muid. For lime, 3 bushels make a minot, and 48 minots a muid. Such were the measures by bushel before the revolution: for the changes that have since taken place, see MEASURE and WEIGHT.

BUSIRIS, in *Ancient Geography*, a city of the Lower Egypt, to the south of Leontopolis, on that branch of the Nile called Busiriticus; built by Busiris, noted for his cruelty, and slain by Hercules, (Ovid, Virgil, Diodorus Siculus). Strabo denies such a tyrant ever existed; Isocrates has written his panegyric. In this city there stood a grand temple of Isis, which gave it the appellation of the city of Isis. It was destroyed on a revolt by Dioclesian.

BUSIRITICUS FLUVIUS, in *Ancient Geography*, that branch of the Nile which empties itself at the mouth called Ostium Pathmeticum, or Phatniticum, (Ptolemy); also a part according to an ancient map at the Ostium Mindesium; this river, or branch, dividing itself at Diospolis into two branches; called Busiriticus, from the city of Busiris, which stood on its left or west branch. It is the second branch of the Nile, reckoning from the east.

BUSIRITICUS Nomos, in *Ancient Geography*, a prefecture, or division of the Lower Egypt; so called from the city Busiris, (Herodotus, Pliny, Ptolemy).

BUSITIS, in *Ancient Geography*, a district of Arabia Deserta; so called from Bus, or Buz, Nahor's second son; the country of Elihu, the fourth interlocutor in Job; called *Buzetes*, by the Septuagint.

BUSKIN, a kind of shoe, somewhat in manner of a boot, and adapted to either foot, and worn by either sex. This part of dress, covering both the foot and mid-leg, was tied underneath the knee; it was very rich and fine, and principally used on the stage by actors in tragedy. It was of a quadrangular form; and the sole was so thick, as that, by means thereof, men of the ordinary stature might be raised to the pitch and

elevation of the heroes they personated. The colour was generally purple on the stage; herein it was distinguished from the sock worn in comedy, that being only a low common shoe. The buskin seems to have been worn not only by actors but by girls, to raise their height; travellers and hunters also made use of it, to defend themselves from the mire. In classic authors, we frequently find the buskin used to signify tragedy itself, in regard it was a mark of tragedy on the stage. It was also to be understood for a lofty strain or high style.

BUSS, in maritime affairs, a small sea vessel, used by us and the Dutch in the herring-fishery, commonly from 48 to 60 tons burden, and sometimes more: a buss has two small sheds or cabins, one at the prow and the other at the stern; that at the prow serves for a kitchen. Every buss has a master, an assistant, a mate, and seamen in proportion to the vessel's size; the master commands in chief, and without his express orders the nets cannot be cast or taken up; the assistant has the command after him; and the mate next, whose business is to see the seamen manage their rigging in a proper manner, to mind those who draw in their nets, and those who kill, gut, and cure the herrings as they are taken out of the sea: the seamen generally engage for a whole voyage in the lump. The provisions which they take on board the busses, consist commonly in biscuit, oatmeal, and dried or salt fish: the crew being content for the rest with what fresh fish they catch. See FISHERIES.

BUST, or BUSTO, in *Sculpture*, denotes the figure or portrait of a person in relievo, showing only the head, shoulders, and stomach, the arms being lopped off; ordinarily placed on a pedestal or console.

In speaking of an antique, we say the head is marble, and the bust porphyry, or bronze, that is, the stomach and shoulders. Felibien observes, that though in painting, one may say a figure appears in busto, yet it is not properly called a *bust*, that word being confined to things in relievo.

The bust is the same with what the Latins called *Herma*, from the Greek Hermes, Mercury, the image of that god being frequently represented in this manner amongst the Athenians.

BUST is also used, especially by the Italians, for the trunk of a human body, from the neck to the hips.

BUSTA Gallica, was a place in ancient Rome, wherein the bones of the Gauls, who first took the city, and were slain by Camillus, were deposited. It differed from

BUSTA Gallorum, a place on the Apennines, thus called by reason of many thousands of Gauls killed there by Fabius.

BUSTARD. See OTIS, ORNITHOLOGY *Index*.

BUSTUARIÆ MOECHÆ, according to some, women that were hired to accompany the funeral and lament the loss of the deceased; but others are of opinion, that they were rather the more common prostitutes, that stood among the tombs, graves, and other such lonely places.

BUSTUARII, in Roman antiquity, gladiators who fought about the bustum or funeral pile of a person of distinction, that the blood which was spilt might serve as a sacrifice to the infernal gods, and render them more propitious to the manes of the deceased. This custom was introduced in the room of the more inhuman

man one of sacrificing captives at the bustum, or on the tombs of warriors.

BUSTUM, in antiquity, denotes a pyramid or pile of wood, whereon were anciently placed the bodies of the deceased, in order to be burnt.

The Romans borrowed the custom of burning their dead from the Greeks. The deceased, crowned with flowers, and dressed in his richest habits, was laid on the bustum. Some authors say, it was only called *bustum* after the burning, *quasi bene ustum*: before the burning it was more properly called *pyra*; during it *rogus*; and afterwards *bustum*. When the body was only burnt there, and buried elsewhere, the place was not properly called *bustum*, but *ustrina*, or *ustrinum*.

BUSTUM, in the Campus Martius, was a structure whereon the emperor Augustus first, and after him the bodies of his successors, were burnt. It was built of white stone, surrounded with an iron pallisade, and planted withinside with alder trees.

BUSTUM was also figuratively applied to denote any tomb. Whence those phrases, *facere bustum*, *violare bustum*, &c.

BUSTUM of an Altar, was the hearth or place where the fire was kindled.

BUTCHER, a person who slaughters cattle for the use of the table, or who cuts up and retails the same.

Among the ancient Romans, there were three kinds of established butchers, whose office it was to furnish the city with the necessary cattle, and to take care of preparing and vending their flesh. The suarii provided hogs; the pecuarii or boarii, other cattle, especially oxen; and under these was a subordinate class, whose office was to kill, called *lanii* and *carnifices*.

To exercise the office of butcher among the Jews with dexterity, was of more reputation than to understand the liberal arts and sciences. They have a book concerning shamble-constitution; and in case of any difficulty, they apply to some learned rabbi for advice: nor was any allowed to practise this art, without a license in form; which gave the man, upon evidence of his abilities, a power to kill meat, and others to eat what he killed; provided he carefully read every week for one year, and every month the next year, and once a quarter during his life, the constitution above mentioned.

We have some very good laws for the better regulation and preventing the abuses committed by butchers. A butcher that sells swine's flesh measled, or dead of the murrain, for the first offence shall be amerced; for the second, have the pillory: for the third, be imprisoned, and make fine; and for the fourth, abjure the town. Butchers not selling meat at reasonable prices shall forfeit double the value, leviable by warrant of two justices of the peace. No butcher shall kill any flesh in his scalding-house, or within the walls of London, on pain to forfeit for every ox so killed 12d., and for every other beast 8d., to be divided betwixt the king and the prosecutor.

BUTCHER-Bird. See LANIUS, ORNITHOLOGY *Index*.

BUTCHER-Broom. See RUSCUS, BOTANY *Index*.

BUTCHER-Island, in the East Indies, a small island about two miles long and scarce one broad. It has its name from cattle being kept there for the use of Bombay, from which it is about three miles distant. It has a small fort, but of very little consequence.

BUTE, an island lying to the west of Scotland, being separated from Cowal, a district of Argyleshire, only by a narrow channel. In length it is about 18 miles; the broadest part from east to west is about five. Part of it is rocky and barren; but from the middle southwards, the ground is cultivated, and produces pease, oats, and barley. Here is a quarry of red stone, which the natives have used in building a fort and chapel in the neighbourhood of Rothsay, which is a very ancient royal borough, head town of the shire of Bute and Arran; but very thinly peopled, and maintained chiefly by the herring fishery, with the profits of which all the rents of this island are chiefly paid. On the north side of Rothsay, are the ruins of an ancient fort, with its drawbridge, chapel, and barracks. Here are likewise the remains of some Danish towers. The natives are healthy and industrious, speak the Erse and the dialect of the Lowlands indifferently, and profess the Protestant religion. The island is divided into two parishes, accommodated with four churches; and belongs chiefly to the earl of Bute, who possesses an elegant seat on the east side of the island. The name of this isle has by several authors, and in different periods, been very differently written, as *Bote*, *Both*, *Bothe*, *Boot*, but now generally *Bute*. Our ancient writers suppose that it derived its name from a cell erected therein by St Brendan, an Irish abbot who flourished in the 6th century, because in his language such a cell was called *Both*. It is however, probable, that this name was of great antiquity, since we find it denominated *Botis* by the anonymous geographer of Ravenna. It was from very early times part of the patrimony of the Stuarts: large possessions in it were granted to Sir John Stuart, son of Robert II. by his beloved mistress Elizabeth More; and it has continued in that line to the present time.

BUTESHIRE, comprehends the islands of Bute, Arran, the greater and lesser Cumbray, and *Inch-marnoc*. This shire and that of Caithness send a member to parliament alternately. The earl of Bute is admiral of the county, by commission from his majesty; but no way dependent on the lord high admiral of Scotland: so that if any maritime case occurs within this jurisdiction, (even crimes of as high a nature as murder or piracy), his lordship, by virtue of his powers as admiral, is sufficient judge, or he may delegate his authority to any deputies.

The following is a view of the population of this county at two different periods, taken from the Statistical history of Scotland.

	Parishes.	Population in 1795.	Population in 1790—1798.
Bute.	Rothsay,	2222	4032
	Kingarth,	998	727
Arran.	Kilbride,	1369	2545
	Kilmorie,	2127	3259
	Total,	6716	10,563
Population in 1811,		12,033	

See BUTESHIRE, SUPPLEMENT.

BUTEO, the trivial name of a species of FALCO. See ORNITHOLOGY *Index*.

BUTLER, CHARLES, a native of Wycomb in the county of Bucks, and a master of arts in Magdalen college, Oxford, published a book with this title: "The principles of music in singing and setting; with the twofold use thereof, ecclesiastical and civil." Quarto, London 1636. The author of this book was a person of singular learning and ingenuity, which he manifested in sundry other works enumerated by Wood in the *Athen. Oxon.* Among the rest is an English Grammar, published in 1633, in which he proposes a scheme of regular orthography, and makes use of characters, some borrowed from the Saxon, and others of his own invention, so singular, that we want types to exhibit them: and of this imagined improvement he appears to have been so fond, that all his tracts are printed in like manner with his grammar; the consequence whereof has been an almost general disgust to all that he has written. His Principles of Music is, however, a very learned, curious, and entertaining book; and, by the help of the advertisement from the printer to the reader, prefixed to it, explaining the powers of the several characters made use of by him, may be read to great advantage, and may be considered a judicious supplement to Morley's introduction.

BUTLER, *Samuel*, a celebrated poet, was the son of a reputable Worcestershire farmer, and was born in 1612. He passed some time at Cambridge, but was never matriculated in that university. Returning to his native country, he lived some years as clerk to a justice of peace; where he found sufficient time to apply himself to history, poetry, and painting. Being recommended to Elizabeth countess of Kent, he enjoyed in her house, not only the use of all kinds of books, but the conversation of the great Mr Selden, who often employed Butler to write letters, and translate for him. He lived also some time with Sir Samuel Luke, a gentleman of an ancient family in Bedfordshire, and a famous commander under Oliver Cromwell: and he is supposed at this time to have wrote, or at least to have planned, his celebrated *Hudibras*; and under that character to have ridiculed the knight. The poem itself furnishes this key; where, in the first canto, Hudibras says,

"'Tis sung, there is a valiant Mamaluke
"In foreign land yclep'd — —
"To whom we oft have been compar'd
"For person, parts, address, and beard."

After the Restoration, Mr Butler was made secretary to the earl of Carbury, lord president of Wales, who appointed him steward of Ludlow castle, when the court was revived there. No one was a more generous friend to him than the earl of Dorset and Middlesex, to whom it was owing that the court tasted his *Hudibras*. He had promises of a good place from the earl of Clarendon, but they were never accomplished; though the king was so much pleased with the poem, as often to quote it pleasantly in conversation. It is indeed said, that Charles ordered him the sum of 3000l.: but the sum being expressed in figures, somebody through whose hands the order passed, by cutting off a cypher reduced it to 300l. which, though it passed the offices without fees, proved not sufficient to pay what he then owed; so that Butler was not a shilling the better for the king's bounty. He died in 1680: and though he met with many disappointments, was never reduced to any thing like want, nor did he die in debt. Mr Granger observes, that Butler "stands without rival in burlesque poetry. His Hudibras (says he) is in its kind almost as great an effort of genius as the Paradise Lost itself. It abounds with uncommon learning, new rhymes, and original thoughts. Its images are truly and naturally ridiculous. There are many strokes of temporary satire, and some characters and allusions which cannot be discovered at this distance of time."

BUTLER, *Joseph*, late bishop of Durham, a prelate distinguished by his piety and learning, was the youngest son of Mr Thomas Butler, a reputable shopkeeper at Wantage in Berkshire, where he was born in the year 1692. His father, who was a Presbyterian, observing that he had a strong inclination to learning, after his being at a grammar-school, sent him to an academy in Gloucestershire, in order to qualify him for a dissenting minister; and while there, he wrote some remarks on Dr Clarke's first sermon at Boyle's lecture. Afterwards, resolving to conform to the established church, he studied at Oriel college, where he contracted an intimate friendship with Mr Edward Talbot, son of the bishop of Durham, and brother to the lord chancellor, who laid the foundation of his subsequent advancement. He was first appointed preacher at the Rolls, and rector of Haughton and Stanhope, two rich benefices in the bishopric of Durham. He quitted the Rolls in 1726; and published in 8vo, a volume of sermons, preached at the chapel. After this he constantly resided at Stanhope, in the regular discharge of all the duties of his office, till the year 1733, when he was called to attend the Lord Chancellor Talbot as his chaplain, who gave him a prebend in the church of Rochester. In the year 1736, he was appointed clerk of the closet to Queen Caroline, whom he attended every day, by her majesty's special command, from seven to nine in the evening. In 1738 he was appointed to the bishopric of Bristol; and not long afterwards to the deanery of St Paul's, London. He now resigned his living of Stanhope. In the year 1746, he was made clerk of the closet to the king; and in 1750, was translated to Durham. This rich preferment he enjoyed but a short time: for he died at Bath, June 16. 1752. His corpse was interred in the cathedral at Bristol; where there is a monument, with an inscription, erected to his memory. He died a bachelor. His deep learning and comprehensive mind appear sufficiently in his writings, particularly in that excellent treatise entitled, *The Analogy of Religion, natural and revealed, to the Constitution and Course of Nature*, published in 8vo, 1736.

BUTLER, the name anciently given to an officer in the court of France, being the same as the grand echanson, or great cupbearer of the present times.

BUTLER, in the common acceptation of the word, is an officer in the houses of princes and great men, whose principal business is to look after the wine, plate, &c.

BUTLERAGE of wine, is a duty of 2s. for every ton of wine imported by merchant strangers; being a composition in lieu of the liberties and freedoms granted ed to them by King John and Edward I. by a charter called *charta mercatoria*.

Butlerage was originally the only custom that was payable upon the importation of wines, and was taken and received by virtue of the regal prerogative, for the proper use of the crown. But for many years past, there having been granted by parliament subsidies to the kings of England, and the duty of butlerage not repealed, but confirmed, they have been pleased to grant the same way to some noblemen, who, by virtue of such grant, are to enjoy the full benefit and advantage thereof, and may cause the same to be collected in the same manner that the kings themselves were formerly wont to do.

BUTMENT. Butments of arches are the same with buttresses. They answer to what the Romans call *sublicas*, the French *culees* and *butees*.

BUTMENTS, or *Abutments*, of a bridge, denote the two massives at the end of a bridge, whereby the two extreme arches are sustained and joined with the shore on either side.

BUTOMUS, the FLOWERING-RUSH, or *Water-gladiole*. See BOTANY *Index*.

BUTRINTO, a port-town of Epirus, or Canina, in Turkey in Europe, situated opposite to the island of Corfu, at the entrance of the gulf of Venice. E. Long. 20. 40. N. Lat. 39. 45.

BUTT is used for a vessel, or measure of wine, containing two hogsheads, or 126 gallons; otherwise called *pipe*. A butt of currants is from 1500 to 2200 pounds weight.

BUTTS, or *Butt-ends*, in the sea-language, are the fore ends of all planks under water, as they rise, and are joined one end to another.—Butt-ends in great ships are most carefully bolted; for if any one of them should spring or give way, the leak would be very dangerous and difficult to stop.

BUTTS, the place where archers meet with their bows and arrows to shoot at a mark, which is called shooting at the *butts*: (See ARCHERY.)—Also *butts* are the short pieces of land in arable ridges and furrows.

BUTTER, a fat unctuous substance, prepared from milk by beating or churning.

It was late ere the Greeks appear to have had any notion of butter; their poets make no mention of it, and are yet frequently speaking of milk and cheese.

The Romans used butter no otherwise than as a medicine, never as a food.

According to Beckman, the invention of butter belongs neither to the Greeks nor the Romans. The former, he thinks, derived their knowledge of butter from the Scythians, the Thracians, and Phrygians; and the latter from the people of Germany.

The ancient Christians of Egypt burnt butter in their lamps instead of oil; and in the Roman churches, it was anciently allowed, during Christmas time, to burn butter instead of oil, on account of the great consumption of it otherwise.

Butter is the fat, oily, and inflammable part of the milk. This kind of oil is naturally distributed through all the substance of the milk in very small particles, which are interposed betwixt the caseous and serous parts, amongst which it is suspended by a slight adhesion, but without being dissolved. It is in the same state in which oil is in emulsions: hence the same whiteness of milk and emulsions; and hence, by rest, the oily parts separate from both these liquors to the surface, and form a cream. See EMULSION.

When butter is in the state of cream, its proper oily parts are not yet sufficiently united together to form a homogeneous mass. They are still half separated by the interposition of a pretty large quantity of serous and caseous particles. The butter is completely formed by pressing out these heterogeneous parts by means of continued percussion. It then becomes an uniform soft mass.

Fresh butter which has undergone no change has scarce any smell; its taste is mild and agreeable; it melts with a weak heat, and none of its principles are disengaged by the heat of boiling water. These properties prove, that the oily part of butter is of the nature of the fat, fixed, and mild oils, obtained from many vegetable substances by expression. See OILS.—The half fluid consistence of butter, as of most other concrete oily matters, is thought to be owing to a considerable quantity of acid united with the oily part; which acid is so well combined, that it is not perceptible while the butter is fresh and has undergone no change; but when it grows old, and undergoes some kind of fermentation, then the acid is disengaged more and more; and this is the cause that butter, like oils of the same kind, becomes rancid by age.

Butter is constantly used in food, from its agreeable taste: but to be wholesome, it must be very fresh and free from rancidity, and also not fried or burnt; otherwise its acrid and even caustic acid, being disengaged, disorders digestion, renders it difficult and painful, excites acrid empyreumatic belchings, and introduces much acrimony into the blood. Some persons have stomachs so delicate, that they are even affected with these inconveniences by fresh butter and milk. This observation is also applicable to oil, fat, chocolate, and in general to all oleaginous matters.

For the making of butter, see AGRICULTURE *Index*.

The trade in butter is very considerable. Some compute 50,000 tons annually consumed in London. It is chiefly made within 40 miles round the city. Fifty thousand firkins are said to be sent yearly from Cambridge and Suffolk alone: each firkin containing 56lbs. Utoxeter, in Staffordshire, is a market famous for good butter, insomuch that the London merchants have established a factory there for that article. It is bought by the pot, of a long cylindrical form, weighing 14lb.

Shower of BUTTER. Naturalists speak of showers and dews of a butyraceous substance. In 1695, there fell in Ireland, during the winter and ensuing spring, a thick yellow dew, which had the medicinal properties of butter.

BUTTER, among chemists, a name given to several preparations, on account of their consistence resembling that of butter; as butter of antimony, &c. See CHEMISTRY *Index*.

BUTTER-Bur. See TUSSILAGO, BOTANY *Index*.

BUTTER-Milk, the milk which remains after the butter is produced by churning. Butter-milk is esteemed an excellent food, in the spring especially, and is particularly

larly recommended in hectic fevers. Some make curds of butter-milk, by pouring into it a quantity of new milk hot.

Butter-Wort. See Pinguicula, Botany *Index.*

BUTTERFLY, the English name of a numerous genus of insects. See Papilio, Entomology *Index.*

Butterfly-Shell. See Voluta, Conchology *Index.*

Method of preserving Butterflies. See Insects.

Method of making Pictures of Butterflies. "Take butterflies or field moths, either those catched abroad, or such as are taken in caterpillars and nursed in the house till they be flies; clip off their wings very close to their bodies, and lay them on clean paper, in the form of a butterfly when flying; then have ready prepared gum arabic that hath been some time dissolved in water, and is pretty thick; if you put a drop of ox-gall into a spoonful of this, it will be better for the use; temper them well with your finger, and spread a little of it on a piece of thin white paper, big enough to take both sides of your fly; when it begins to be clammy under your finger, the paper is in proper order to take the feathers from the wings of the fly; then lay the gummed side on the wings, and it will take them up: then double your paper so as to have all the wings between the paper; then lay it on a table, pressing it close with your fingers; and you may rub it gently with some smooth hard thing; then open the paper and take out the wings, which will come forth transparent: the down of the upper and under side of the wings, sticking to the gummed paper, form a just likeness of both sides of the wing in their natural shapes and colours. The nicety of taking off flies depends on a just degree of moisture of the gummed paper: for if it be too wet, all will be blotted and confused; and if too dry, your paper will stick so fast together, that it will be torn in separation. When you have opened your gummed papers, and they are dry, you must draw the bodies from the natural ones, and paint them in water colours: you must take paper that will bear ink very well for this use; for sinking paper will separate with the rest, and spoil all."

Edwards's Hist. of Birds, vol. ii. p. 122.

BUTTERIS, in the manege, an instrument of steel, fitted to a wooden handle, wherewith they pare the foot, or cut off the hoof of a horse.

BUTTOCK *of a Ship*, is that part of her which is her breadth right astern, from the tack upwards; and a ship is said to have a broad or a narrow buttock, according as she is built broad or narrow at the transum.

BUTTON, an article in dress, whose form and use are too well known to need description. They are made of various materials, as mohair, silk, horse hair, metal, &c.

Method of making common Buttons. Common buttons are generally made of mohair; some indeed are made of silk, and others of thread; but the latter are of a very inferior sort. In order to make a button, the mohair must be previously wound on a bobbin; and the mould fixed to a board by means of a bodkin thrust through the hole in the middle of it. This being done, the workman wraps the mohair round the mould in three, four, or six columns, according to the button.

Horse-hair Buttons. The moulds of these buttons are covered with a kind of stuff composed of silk and hair; the warp being belladine silk, and the shoot horse hair. This stuff is wove with two selvages, in the same manner and in the same loom as ribbands. It is then cut into square pieces proportional to the size of the button, wrapped round the moulds, and the selvages stitched together, which form the under part of the button.

Cleansing of Buttons. A button is not finished when it comes from the maker's hands; the superfluous hair and hubs of silk must be taken off, and the button rendered glossy and beautiful before it can be sold. This is done in the following manner: A quantity of buttons are put into a kind of iron sieve, called by workmen a *singeing box.* Then a little spirit of wine being poured into a kind of shallow iron dish, and set on fire, the workman moves and shakes the singeing box, containing the buttons, briskly over the flame of the spirit, by which the superfluous hairs, hubs of silk, &c. are burnt off, without damaging the buttons. Great care, however, must be taken that the buttons in the singeing box be kept continually in motion; for if they are suffered to rest over the flame, they will immediately burn. When all these loose hairs, &c. are burnt off by the flame of the spirit, the buttons are taken out of the singeing box, and put, with a proper quantity of the crumbs of bread, into a leather bag, about three feet long, and of a conical shape; the mouth or smaller end of which being tied up, the workman takes one of the ends in one hand and the other in the other, and shakes the hand briskly with a particular jerk. This operation cleanses the buttons, renders them very glossy, and fit for sale.

Gold-twist Buttons. The mould of these buttons is first covered in the same manner with that of common buttons. This being done, the whole is covered with a thin plate of gold or silver, and then wrought over of different forms, with purple and gimp. The former is a kind of thread composed of silk and gold wire twisted together; and the latter, capillary tubes of gold or silver, about the tenth of an inch long. These are joined together by means of a fine needle, filled with silk, thrust through their apertures, in the same manner as beads or bugles.

The manner of making metal Buttons. The metal with which the moulds are intended to be covered is first cast into small ingots, and then flatted into thin plates or leaves, of the thickness intended, at the flatting mills; after which it is cut into small round pieces proportionable to the size of the mould they are intended to cover, by means of proper punches on a block of wood covered with a thick plate of lead. Each piece of metal thus cut out of the plate is reduced into the form of a button, by beating it successively in several cavities, or concave moulds, of a spherical form, with a convex puncheon of iron, always beginning with the shallowest cavity of the mould, and proceeding to the deeper, till the plate has acquired the intended form: and the better to manage so thin a plate, they form ten, twelve, and sometimes even twenty-four, to the cavities, or concave moulds, at once; often nealing the metal during the operation, to make it more ductile. This plate is generally called by workmen the *cap of the button.*

The form being thus given to the plates or caps, they

they strike the intended impression on the convex side, by means of a similar iron puncheon, in a kind of mould engraven *en creux*, either by the hammer or the press used in coining. The cavity or mould, wherein the impression is to be made, is of a diameter and depth suitable to the sort of button intended to be struck in it; each kind requiring a particular mould. Between the puncheon and the plate is placed a thin piece of lead, called by workmen a *hob*, which greatly contributes to the taking off all the strokes of the engraving; the lead, by reason of its softness, easily giving way to the parts that have relievo, and as easily insinuating itself into the traces or indentures.

The plate thus prepared makes the cap or shell of the button. The lower part is formed of another plate, in the same manner, but much flatter, and without any impression. To the last or under plate is soldered a small eye made of wire, by which the button is to be fastened.

The two plates being thus finished, they are soldered together with soft solder, and then turned in a lathe. Generally indeed they use a wooden mould, instead of the under plate; and in order to fasten it, they pass a thread or gut across, through the middle of the mould, and fill the cavity between the mould and the cap with cement, in order to render the button firm and solid; for the cement entering all the cavities formed by the relievo of the other side, sustains it, prevents its flattening, and preserves its bosse or design.

Button, in the manege. Button of the reins of a bridle, is a ring of leather, with the reins passed through it, which runs all along the length of the reins. To put a horse under the button, is when a horse is stopped without a rider upon his back, the reins being laid on his neck, and the button lowered so far down that the reins bring in the horse's head, and fix it to the true posture or carriage. It is not only the horses which are managed in the hand that must be put under the button; for the same method must be taken with such horses as are bred between two pillars, before they are backed.

Button-Wood. See Cephalanthus, Botany *Index.*

Button's-Bay, the name of the north part of Hudson's bay in North America, by which Sir Thomas Button attempted to find out a north-west passage to the East Indies. It lies between 80° and 100° west longitude, and between 60° and 66° north latitude.

Button-Stone, in *Natural History*, a kind of figured stone, so denominated from its resembling the button of a garment. Dr Hook gives the figure of three sorts of button-stones, which seem to have been nothing else but the filling up of three several sorts of shells. They are all of them very hard flints; and have this in common, that they consist of two bodies, which seem to have been the filling up of two holes or vents in the shell. Dr Plot describes a species finely striated from the top, after the manner of some hair buttons. This name is also given to a peculiar species of slate found in the marquisate of Bareith, in a mountain called *Fichtelberg;* which is extremely different from the common sorts of slate, in that it runs with great ease into glass in five or six hours time, without the addition of any salt or other foreign substance, to promote its vitrification, as other stones require. It contains in itself all the principles of glass, and really has mixed in its substance the things necessary to be added to promote the fusion of other stony bodies. The Swedes and Germans make buttons of the glass produced from it, which is very black and shining, and it has hence its name *button-stone.* They make several other things also of this glass, as the handles of knives and the like, and send a large quantity of it unwrought in round cakes, as it cools from the fusion, into Holland.

BUTTRESS, a kind of butment built archwise, or a mass of stone or brick, serving to prop or support the sides of a building, wall, &c. on the outside, where it is either very high, or has any considerable load to sustain on the other side, as a bank of earth, &c.—Buttresses are used against the angles of steeples and other buildings of stone, &c. on the outside, and along the walls of such buildings as have great and heavy roofs, which would be subject to thrust the walls out, unless very thick, if no buttresses were placed against them. They are also placed for a support and butment against the feet of some arches, that are turned across great halls in old palaces, abbeys, &c.

BUTUS, in *Ancient Geography*, a town of Lower Egypt, on the west side of the branch of the Nile, called *Thermuthiacus;* towards the mouth called *Ostium Sebennyticum:* in this town stood an oracle of Latona, (Strabo, Herodotus). Ptolemy places Butus in the Nomos Phthenotes: it is also called *Buto, -us,* (Herodotus, Stephanus.) It had temples of Apollo and Diana, but the largest was that of Latona, where the oracle stood.

BUTZAW, a town of Lower Saxony, in Germany; it stands upon the river Varnow, on the road from Schwerin to Rostock, lying in E. Long. 13. 12. N. Lat. 54. 50.

BUVETTE, or Beuvette, in the French laws, an established place in every court, where the lawyers and counsellors may retire, warm themselves, and take a glass of wine by way of refreshment, at the king's charge. There is one for each court of parliament, but these are only for persons belonging to that body; there are others in the *palais*, whither other persons also resort.

BUXENTUM, (Livy, Velleius, Ptolemy, Mela, Pliny); Pyxus, (Strabo, Pliny); a town of Lucania, first built by the people of Messina, but afterwards deserted, (Strabo). A Roman colony was sent thither, (Livy, Velleius): and when found still thin of inhabitants, a new colony was sent by a decree of the senate. Its name is from *buxus*, the box-tree, growing plentifully there. Strabo says, the name *Pyxus* includes a promontory, port, and river, under one. Now *Pulicastro*, in the Hither Principato of Naples. E. Long. 15. 40. N. Lat. 40. 20.

BUXTON, a place in the Peak of Derbyshire, celebrated for its medicinal waters, and lying in W. Long. 0. 20. N. Lat. 53. 20.

It has been always believed by our antiquaries, that the Romans were acquainted with these wells, and had frequented them much, as there is a military way still visible, called the *Bath-gate*, from Burgh to this place. This was verified about 50 years ago, when Sir Thomas Delves, of Cheshire, in memory of a cure he received here, caused an arch to be erected; in digging the foundation for which, they came to the remains of a

solid

Buxton. solid and magnificent structure of Roman workmanship; and in other places of the neighbourhood, very capacious leaden vessels, and other utensils of Roman workmanship, have been discovered. These waters have always been reckoned inferior to those in Somersetshire; but seem never to have been totally disused. They are mentioned by Leland, as well known 200 years ago; but it is certain they were brought into greater credit by Dr Jones in 1572, and by George earl of Shrewsbury, who erected a building over the bath, then composed of nine springs. This building was afterwards pulled down, and a more commodious one erected at the expence of the earl of Devonshire. In doing this, however, the ancient register of cures drawn up by the bath-warden, or physician attending the baths, and subscribed by the hands of the patients, was lost.

The warm waters of Buxton are, the bath, consisting of nine springs, as already mentioned, St Ann's well, and St Peter's, or Bingham well. St Ann's well rises at the distance of somewhat more than 32 yards north-east from the bath. It is chiefly supplied from a spring on the north side, out of a rock of black limestone or bastard marble. It formerly rose into a stone bason, shut up within an ancient Roman brick wall, a yard square within, a yard high on three sides, and open on the fourth. But, in 1709, Sir Thomas Delves, as already mentioned, erected an arch over it, which still continues. It is 12 feet long, and as many broad, set round with stone steps on the inside. In the midst of this dome the water now springs up into a stone bason two feet square. St Peter's or Bingham well rises about 20 yards south-east of St Ann's. It is also called *Leigh's well*, from a memorable cure received from it by a gentleman of that name. It rises out of a black limestone, in a very dry ground; and is not so warm as St Ann's well.

From the great resort of company to the waters, this place has grown into a large straggling town, which is daily increasing. The houses are chiefly, or rather solely, built for the reception of invalids; and many of them are not only commodious, but elegant. The duke of Devonshire has lately erected a most magnificent building in the form of a crescent, with piazzas, under which the company walk in wet or cold weather. It is divided into different hotels, shops, &c. with a public coffee-room, and a very elegant room for assemblies and concerts.

The hot water resembles that of Bristol. It has a sweet and pleasant taste. It contains the calcareous earth, together with a small quantity of sea salt, and an inconsiderable portion of a purging salt, but no iron can be discovered in it. This water taken inwardly is esteemed good in the diabetes; in bloody urine; in the bilious cholic; in loss of appetite, and coldness of the stomach; in inward bleedings; in atrophy; in contraction of the vessels and limbs, especially from age; in cramps and convulsions; in the dry asthma without a fever; and also in barrenness. Inwardly and outwardly, it is said to be good in rheumatic and scorbutic complaints; in the gout; in inflammation of the liver and kidneys, and in consumptions of the lungs; also in old strains; in hard callous tumours; in withered and contracted limbs; in the itch, scabs, nodes, chalky swellings, ring worms, and other similar complaints.—Besides the hot water, there is also a cold chalybeate water, with a rough irony taste: It resembles the Tunbridge water in virtues.

For the methods of composing artificial Buxton water, or of impregnating the original water with a greater quantity of its own gas or with other gases, see WATERS, *Medicinal*.

BUXTON, *Jedediah*, a prodigy with respect to skill in numbers. His father, William Buxton, was schoolmaster of the same parish where he was born in 1704: yet Jedediah's education was so much neglected, that he was never taught to write; and with respect to any other knowledge but that of numbers, seemed always as ignorant as a boy of ten years of age. How he came first to know the relative proportions of numbers, and their progressive denominations, he did not remember; but to this he applied the whole force of his mind, and upon this his attention was constantly fixed, so that he frequently took no cognizance of external objects, and when he did, it was only with respect to their numbers. If any space of time was mentioned, he would soon after say it was so many minutes; and if any distance of way, he would assign the number of hair-breadths, without any question being asked, or any calculation expected by the company. When he once understood a question, he began to work with amazing facility, after his own method, without the use of a pen, pencil, or chalk, or even understanding the common rules of arithmetic as taught in the schools. He would stride over a piece of land or a field, and tell you the contents of it almost as exact as if you had measured it by the chain. In this manner he measured the whole lordship of Elmton, of some thousand acres, belonging to Sir John Rhodes, and brought him the contents, not only in acres, roods, and perches, but even in square inches. After this, for his own amusement, he reduced them into square hair-breadths, computing 48 to each side of the inch. His memory was so great, that while resolving a question he could leave off, and resume the operation again where he left off the next morning, or at a week, a month, or at several months, and proceed regularly till it was completed. His memory would doubtless have been equally retentive with respect to other objects, if he had attended to other objects with equal diligence; but his perpetual application to figures prevented the smallest acquisition of any other knowledge. He was sometimes asked, on his return from church, whether he remembered the text, or any part of the sermon; but it never appeared that he brought away one sentence, his mind, upon a closer examination, being found to have been busied, even during divine service, in his favourite operation, either dividing some time, or some space, into the smallest known parts, or resolving some question that had been given him as a test of his abilities.

This extraordinary person living in laborious poverty, his life was uniform and obscure. Time, with respect to him, changed nothing but his age; nor did the seasons vary his employment, except that in winter he used a flail, and in summer a ling-hook. In the year 1754 he came to London, where he was introduced to the Royal Society, who, in order to prove his abilities, asked him several questions in arithmetic, and he gave them such satisfaction, that they dismissed him with a handsome gratuity. In this visit to the metropolis,

polis, the only object of his curiosity, except figures, was his desire to see the king and royal family; but they being just removed to Kensington, Jedediah was disappointed. During his residence in London, he was taken to see King Richard III. performed at Drury-lane playhouse; and it was expected, either that the novelty and the splendour of the show would have fixed him in astonishment, or kept his imagination in a continual hurry; or that his passions would, in some degree, have been touched by the power of action, if he had not perfectly understood the dialogue. But Jedediah's mind was employed in the playhouse just as it was employed in every other place. During the dance, he fixed his attention upon the number of steps; he declared, after a fine piece of music, that the innumerable sounds produced by the instruments had perplexed him beyond measure; and he attended even to Mr Garrick, only to count the words that he uttered, in which he said he perfectly succeeded. Jedediah returned to the place of his birth, where, if his enjoyments were few, his wishes did not seem to be more. He applied to his labour, by which he subsisted, with cheerfulness; he regretted nothing that he left behind him in London; and it continued to be his opinion, that a slice of rusty bacon afforded the most delicious repast.

BUXTORF, John, a learned professor of Hebrew at Basil, who, in the 17th century, acquired the highest reputation for his knowledge of the Hebrew and Chaldee languages. He died of the plague at Basil in 1629, aged 65. His principal works are, 1. A small but excellent Hebrew grammar; the best edition of which is that of Leyden in 1701, revised by Leusden. 2. A treasure of the Hebrew grammar. 3. A Hebrew concordance, and several Hebrew lexicons. 4. *Institutio epistolaris Hebraica.* 5. *De abbreviaturis Hebræorum*, &c.

Buxtorf, *John*, the son of the former, and a learned professor of the Oriental languages at Basil, distinguished himself, like his father, by his knowledge of the Hebrew language, and his rabbinical learning. He died in Basil in 1664, aged 65 years. His principal works are, 1. His translation of the *More Nevochim*, and the *Cozri.* 2. A Chaldee and Syriac lexicon. 3. An anticritic against Cappel. 4. A treatise on the Hebrew points and accents, against the same Cappel.

BUXUS, the Box-tree. See Botany *Index.*

BUYING, the act of making a purchase, or of acquiring the property of a thing for a certain price.

Buying stands opposed to selling, and differs from borrowing or hiring, as in the former the property of the thing is alienated for perpetuity, which in the latter it is not. By the civil law persons are allowed to buy hope, *spem precio emere*, that is, to purchase the event or expectation of any thing; e. gr. the fish or birds a person shall catch, or the money he shall win in gaming.

There are different species of buying in use among traders; as, buying on one's own account, opposed to buying on commission: buying for ready money, which is when the purchaser pays in actual specie on the spot; buying on credit, or for a time certain, is when the payment is not to be presently made, but in lieu thereof, an obligation given by the buyer for payment at a time future; buying on delivery, is when the goods purchased are only to be delivered at a certain time future.

Buying the Refusal, is giving money for the right or liberty of purchasing a thing at a fixed price in a certain time to come; chiefly used in dealing for shares in stock. This is sometimes also called by a cant name, *buying the bear.*

Buying the Smallpox, is an appellation given to a method of procuring that disease by an operation similar to inoculation; frequent in South Wales, where it has obtained time out of mind. It is performed either by rubbing some of the *pus* taken out of a pustule of a variolous person on the skin, or by making a puncture in the skin with a pin dipped in such pus.

BUYS, a town of Dauphiny in France, situated on the borders of Provence. E. Long. 5. 20. N. Lat. 44. 25.

BUZANCOIS, a small town of Berry in France, situated on the borders of Touraine, in E. Long. 1. 29. N. Lat. 46. 38.

BUZBACH, a town of Germany, in Westeravia, and the county of Holmes, on the confines of Hanau. E. Long. 10. 51. N. Lat. 50. 22.

BUZET, a small town of France, in Languedoc, seated on the river Torne, in E. Long. 1. 45. N. Lat. 43. 47.

BUZZARD, the name of several species of the hawk kind. See Falco, Ornithology *Index.*

BYBLUS, in *Ancient Geography*, a town of Phœnicia, situated between Berytus and Botrys; it was the royal residence of Cinyras; sacred to Adonis. Pompey delivered it from a tyrant, whom he caused to be beheaded. It stood at no great distance from the sea, on an eminence (Strabo); near it ran the Adonis into the Mediterranean. Now in ruins.

BYCHOW, a small town of Lithuania in Poland, situated on the river Nieper, in E. Long. 30. 2. N. Lat. 53. 57.

BY-LAWS, are laws made *obiter*, or by the by; such as orders and constitutions of corporations for the governing of their members, of court-leets, and courts baron, commoners, or inhabitants in vills, &c. made by common assent, for the good of those that made them, in particular cases whereunto the public law doth not extend; so that they bind further than the common or statute law; guilds and fraternities of trades, by letters patents of incorporation, may likewise make by-laws for the better regulation of trade among themselves or with others. In Scotland these laws are called laws of *birlaw* or *burlaw:* which are made by neighbours elected by common consent in the *birlaw-courts*, wherein knowledge is taken of complaints betwixt neighbour and neighbour; which men so chosen are judges and arbitrators, and styled *birlaw-men.* And birlaws, according to Skene, are *leges rusticorum*, laws made by husbandmen, or townships, concerning neighbourhood among them. All by-laws are to be reasonable, and for the common benefit, not private advantage of particular persons, and must be agreeable to the public laws in being.

BYNG, George, Lord Viscount Torrington, was the son of John Byng, Esq. and was born in 1663. At the age of 15, he went volunteer to sea with the king's warrant. His early engagement in this course of life gave him little opportunity of acquiring learning or cultivating the polite arts; but by his abilities and activity as a naval commander, he furnished abundant matter for the pens of others. After being several times advanced, he was in 1702 raised to the command of the Nassau, a third rate, and was at the taking and burning the French fleet at Vigo; and the next year he was made rear-admiral of the red. In 1704 he served in the grand fleet sent to the Mediterranean under Sir Cloudesly Shovel, as rear-admiral of the red; and it was he who commanded the squadron that attacked, cannonaded, and reduced Gibraltar. He was in the battle of Malaga, which followed soon after; and for his behaviour in that action Queen Anne conferred on him the honour of knighthood. In 1705, in about two months time, he took 12 of the enemies largest privateers, with the Thetis, a French man of war of 44 guns; and also several merchant ships, most of them richly laden. The number of men taken on board was 2070, and of guns 334. In 1718 he was made admiral and commander in chief of the fleet, and was sent with a squadron into the Mediterranean for the protection of Italy, according to the obligation England was under by treaty, against the invasion of the Spaniards: who had the year before surprised Sardinia, and had this year landed an army in Sicily. In this expedition he dispatched Captain Walton in the Canterbury with five more ships, in pursuit of six Spanish men of war, with galleys, fire-ships, bomb-vessels, and store-ships, who separated from the main fleet, and stood in for the Sicilian shore. The captain's laconic epistle on this occasion is worthy of notice; which shewed that fighting was his talent as well as his admiral's, and not writing.

"Sir,

"We have taken and destroyed all the Spanish ships and vessels which were upon the coast, as per margin.

Canterbury, off Syracuse, I am, &c.
August 16, 1718. G. Walton."

From the account referred to, it appeared that he had taken four Spanish men of war, with a bomb-vessel and a ship laden with arms: and burned four, with a fire-ship and bomb-vessel. The king made the admiral a handsome present, and sent him plenipotentiary powers to negotiate with the princes and states of Italy as there should be occasion. He procured the emperor's troops free access into the fortresses that still held out in Sicily, sailed afterwards to Malta, and brought out the Sicilian galleys, and a ship belonging to the Turkey company. Soon after he received a gracious letter from the emperor Charles VI. written with his own hand, accompanied with a picture of his imperial majesty, set round with very large diamonds, as a mark of the grateful sense he had of his services. It was entirely owing to his advice and assistance that the Germans retook the city of Messina in 1719, and destroyed the ships that lay in the bason; which completed the ruin of the naval power of Spain. The Spaniards being much distressed, offered to quit Sicily; but the admiral declared, that the troops should never be suffered to quit the island till the king of Spain had acceded to the quadruple alliance. And to his conduct it was entirely owing that Sicily was subdued, and his Catholic majesty forced to accept the terms prescribed him by the quadruple alliance. After performing so many signal services, the king received him with the most gracious expressions of favour and satisfaction; made him rear-admiral of England, and treasurer of the navy, one of his most honourable privy-council, Baron Byng of Southill in the county of Bedford, Viscount Torrington in Devonshire, and one of the knights companions of the Bath upon the revival of that order. In 1727, George II. on his accession to the crown, placed him at the head of his naval affairs, as first lord commissioner of the admiralty; in which high station he died January 15. 1733, in the 70th year of his age, and was buried at Southill in Bedfordshire.

BYNG, *the Honourable George*, the unhappy son of the former, was bred to sea, and rose to the rank of admiral of the blue. He gave many proofs of courage; but was at last shot, upon a dubious sentence, for neglect of duty, in 1757. See BRITAIN.

BYRLAW or *BURLAW Laws* in Scotland. See BY-LAWS.

BYROM, JOHN, an ingenious poet of Manchester, born in 1691. His first poetical essay appeared in the Spectator, No. 603, beginning, "My time, O ye Muses, was happily spent;" which, with two humorous letters on dreams, are to be found in the eighth volume. He was admitted a member of the Royal Society in 1724; and having originally entertained thoughts of practising physic, to which the title of *doctor* is incident, that was the appellation by which he was always known: but reducing himself to narrow circumstances by a precipitate marriage, he supported himself by teaching a new method of writing shorthand, of his own invention; until an estate devolved to him by the death of an elder brother. He was a man of lively wit; of which, whenever a favourable opportunity tempted him to indulge it, he gave many humorous specimens. He died in 1763; and a collection of his miscellaneous poems was printed at Manchester, in 2 vols 8vo. 1773.

BYRRHUS. See ENTOMOLOGY *Index*.

BYSSUS. See BOTANY *Index*.

BYSSUS, or *Byssum*, a fine thready matter produced in India, Egypt, and about Elis in Achaia, of which the richest apparel was anciently made, especially that worn by the priests both Jewish and Egyptian. Some interpreters render the Greek Βυσσος, which occurs both in the Old and New Testament, by *fine linen*. But other versions, as Calvin's, and the Spanish printed at Venice in 1556, explain the word by *silk*: and yet byssus must have been different from our silk, as appears from a multitude of ancient writers, and particularly from Jul. Pollux. M. Simon, who renders the word by fine linen, adds a note to explain it; viz. "that there was a fine kind of linen very dear, which the great lords alone wore in this country as well as in Egypt." This account agrees perfectly well with that given by Hesychius, as well as what is observed by Bochart, that the byssus was a finer kind of linen, which was frequently dyed of a purple colour. Some authors will have the byssus to be the same with our cotton; others take it for the *linum asbestinum;* and others for the lock or bunch of silky hair found adhering to the pinna marina, by which it fastens itself to the neighbouring bodies. Authors usually distinguish two sorts of byssus; that of Elis; and that of Judæa, which

Byssus, Byzantium.

which was the finest. Of this latter were the priestly ornaments made. Bonfrerius notes, that there must have been two sorts of byssus, one finer than ordinary, by reason there are two Hebrew words used in Scripture to denote byssus; one of which is always used in speaking of the habit of the priests, and the other of that of the Levites.

Byssus Asbestinus, a species of asbestus or incombustible flax, composed of fine flexible fibres, parallel to one another. It is found plentifully in Sweden, either white, or of different shades of green. At a copper mine in Westmanland it forms the greatest part of the vein out of which the ore is dug; and by the heat of the furnace which melts the metal is changed into a pure semitransparent slag or glass.

BYZANTIUM, an ancient city of Thrace, situated on the Bosphorus. It was founded, according to Eusebius, about the 30th Olympiad, while Tullus Hostilius reigned in Rome. But, according to Diodorus Siculus, the foundations of this metropolis were laid in the time of the Argonauts, by one Bysas, who then reigned in the neighbouring country, and from whom the city was called *Byzantium.* This Bysas, according to Eustathius, arrived in Thrace a little before the Argonauts came into those seas, and settled there with a colony of Megarenses. Velleius Paterculus ascribes the founding of Byzantium to the Milesians, and Ammianus Marcellinus to the inhabitants of Attica. Some ancient medals of Byzantium, which have reached our times, bear the name and head of Bysas, with the prow of a ship on the reverse. The year after the destruction of Jerusalem by Titus, Byzantium was reduced to the form of a Roman province. In the year 193 this city took part with Niger against Severus. It was strongly garrisoned by Niger, as being a place of the utmost importance. It was soon after invested by Severus; and as he was universally hated on account of his cruelty, the inhabitants defended themselves with the greatest resolution. They had been supplied with a great number of warlike machines, most of them invented and built by Periscus, a native of Nicæa, and the greatest engineer of his age. For a long time they baffled all the attempts of the assailants, killed great numbers of them, crushed such as approached the walls with large stones; and when stones began to fail, they used the statues of their gods and heroes. At last they were obliged to submit, through famine, after having been reduced to the necessity of devouring one another. The conqueror put all the magistrates and soldiers to the sword; but spared the engineer Periscus. Before this siege, Byzantium was the greatest, most populous, and wealthiest city of Thrace. It was surrounded by walls of an extraordinary height and breadth: and defended by a great number of towers, seven of which were built with such art, that the least noise heard in one of them was immediately conveyed to all the rest. Severus, however, no sooner became master of it, than he commanded it to be laid in ashes. The inhabitants were stripped of all their effects, publicly sold for slaves, and the walls levelled with the ground. But by the chronicle of Alexandria we are informed, that soon after this terrible catastrophe, Severus himself caused a great part of the city to be rebuilt, calling it *Antonina* from his son Caracalla, who assumed the surname of *Antoninus.* In 262, the tyrant Galienus wreaked his fury on the inhabitants of Byzantium. He intended to besiege it; but on his arrival despaired of being able to make himself master of such a strong place. He was admitted the next day, however, into the city; and without any regard to the terms he had agreed to, caused the soldiers and all the inhabitants to be put to the sword. Trebellius Pollio says, that not a single person was left alive. What the reason was for such an extraordinary massacre, we are nowhere informed. In the wars between the emperors Licinius and Maximin the city of Byzantium was obliged to submit to the latter, but was soon after recovered by Licinius. In the year 323, it was taken from Licinius by Constantine the Great, who in 330 enlarged and beautified it, with a design to make it the second, if not the first, city in the Roman empire. He began with extending the walls of the ancient city from sea to sea; and while some of the workmen were busied in rearing them, others were employed in raising within them a great number of stately buildings, and among others a palace no way inferior in magnificence and extent to that of Rome. He built a capitol and amphitheatre, made a circus maximus, several forums, porticoes, and public baths. He divided the whole city into 14 regions, and granted the inhabitants many privileges and immunities. By this means Byzantium became one of the most flourishing and populous cities of the empire. Vast numbers of people flocked thither from Pontus, Thrace, and Asia, Constantine having, by a law, enacted this year (330), decreed, that such as had lands in those countries should not be at liberty to dispose of them, nor even leave them to their proper heirs at their death, unless they had a house in this new city. But however desirous the emperor was that his city should be filled with people, he did not care that it should be inhabited by any but Christians. He therefore caused all the idols to be pulled down, and all their churches consecrated to the true God. He built besides an incredible number of churches, and caused crosses to be erected in all the squares and public places. Most of the buildings being finished, it was solemnly dedicated to the Virgin Mary, according to Cedrenus, but according to Eusebius, to the God of Martyrs. At the same time Byzantium was equalled to Rome. The same rights, immunities, and privileges, were granted to its inhabitants, as to those of the metropolis. He established a senate and other magistrates, with a power and authority equal to those of old Rome. He took up his residence in the new city; and changed its name to CONSTANTINOPLE.

Byzantium, Bzovius.

BZOVIUS, ABRAHAM, one of the most celebrated writers in the 17th century, with respect to the astonishing number of pieces composed by him. His chief work is the continuation of Baronius's Annals. He was a native of Poland, and a Dominican friar. Upon his coming to Rome, he was received with open arms by the Pope, and had an apartment assigned him in the Vatican. He merited that reception, for he has imitated Baronius to admiration, in his design of making all things conspire to the despotic power and glory of the Papal see. He died in 1630, aged 70.

C.

C, THE third letter, and second consonant, of the alphabet, is pronounced like *k* before the vowels *a*, *o*, and *u*; and like *s*, before *e*, *i*, and *y*. C is formed, according to Scaliger, from the κ of the Greeks, by retrenching the stem or upright line; though others derive it from the כ of the Hebrews, which has in effect the same form; allowing only for this, that the Hebrews reading backwards, and the Latins, &c. forwards, each have turned the letter their own way. However the C not being the same as to sound with the Hebrew *caph*, and it being certain the Romans did not borrow their letters immediately from the Hebrews or other orientals, but from the Greeks, the derivation from the Greek κ, is the more probable. Add, that F. Montfaucon, in his Palæographia, gives us some forms of the Greek κ, which come very near to that of our C: thus, for instance, ϲ: and Suidas calls the C the Roman kappa. The second sound of C resembles that of the Greek Σ: and many instances occur of ancient inscriptions, in which Σ has the same form with our C. All grammarians agree, that the Romans pronounced their Q like our C, and their C like our K. F. Mabillon adds, that Charles the Great was the first who wrote his name with a C; whereas all his predecessors of the same name wrote it with a K; and the same difference is observed in their coins.

As an abbreviature, C stands for Caius, Carolus, Cæsar, *condemno*, &c. and CC for *consulibus*.

As a numeral, C signifies 100, CC 200, &c.

C, in *Music*, placed after the cleff, intimates that the music is in common time, which is either quick or slow, as it is joined with allegro, or adagio; if alone, it is usually adagio. If the C be crossed or turned, the first requires the air to be played quick, and the last very quick.

CAABA, or CAABAH, properly signifies a square stone building: but is particularly applied by the Mahometans to the temple at Mecca, built, as they pretend, by Abraham and Ishmael his son.

Before the time of Mahomet, this temple was a place of worship for the idolatrous Arabs, and is said to have contained no less than 360 different images, equalling in number the days of the Arabian year. They were all destroyed by Mahomet, who sanctified the Caaba, and appointed it to be the chief place of worship for all true believers. The temple is in length from north to south about 24 cubits; its breadth from east to west is 23, and its height 27. The door, which is on the east side, stands about four cubits from the ground; the floor being level with the bottom of the door. In the corner next this door is the *black stone*, so much celebrated among the Mahometans. On the north side of the Caaba, within a semicircular enclosure 50 cubits long, lies the *white stone*, said to be the sepulchre of Ishmael, which receives the rain water from the Caaba by a spout formerly of wood, but now of gold. The black stone, according to the Mahometans, was brought down from heaven by Gabriel at the creation of the world, and was originally of a white colour; but contracted the blackness that now appears on it from the guilt of those sins committed by the sons of men. It is set in silver, and fixed in the south-east corner of the Caaba, looking towards Basra, about seven spans from the ground. This stone, upon which there is the figure of a human head, is held in the highest estimation among the Arabs; all the pilgrims kissing it with great devotion, and some even calling it the *right hand of God*. Its blackness, which is only superficial, is probably owing to the kisses and touches of so many people. After the Karmatians had taken Mecca, they carried away this precious stone, and could by no means be prevailed upon to restore it; but finding at last that they were unable to prevent the concourse of pilgrims to Mecca, they sent it back of their own accord, after having kept it 22 years.

The double roof of the Caaba is supported within by three octagonal pillars of aloes wood; between which, on a bar of iron, hang some silver lamps. The outside is covered with rich black damask, adorned with an embroidered band of gold, which is changed every year, and was formerly sent by the caliphs, afterwards by the sultans of Egypt, and is now provided by the Turkish emperors. The Caaba, at some distance, is almost surrounded by a circular enclosure of pillars, joined towards the bottom by a low ballustrade, and towards the top by bars of silver. Just without this inner enclosure, on the south, north, and west sides of the Caaba, are three buildings, which are the oratories or places where three of the orthodox sects assemble to perform their devotions. Towards the south-east stands an edifice which covers the well Zemzem, the treasury, and the cupola of Al Abbas. Formerly there was another cupola, that went under the name of the *hemicycle* or *cupola of Judea*; but whether or not any remains of that are now to be seen, is unknown; nor is it easy to obtain information in this respect, all Christians being denied access to this holy place. At a small distance from the Caaba, on the east side, is the *station* or *place* of Abraham; where is another stone much respected by the Mahometans; and where they pretend to shew the footsteps of the patriarch, telling us he stood on it when he built the Caaba. Here the fourth sect of Arabs, viz. that of Al Shafei, assemble for religious purposes.

The square colonnade, or great piazza, which at a considerable distance encloses these buildings, consists, according to Al Jannabi, of 488 pillars, and has no less than 38 gates. Mr Sale compares this piazza to that of the Royal Exchange at London, but allows it to be much larger. It is covered with small domes or cupolas, from the four corners of which rise as many minarets or steeples, with double galleries, and adorned with gilded spires and crescents after the Turkish manner, as are also the cupolas which cover the piazza and other buildings. Between the columns of both enclosures hang a great number of lamps, which are constantly lighted at night. The first foundation of this second enclosure was laid by Omar, the second caliph, who built no more than a low wall, to prevent the court of the Caaba from being encroached upon by private buildings; but by the liberality of succeeding princes the whole has been raised to that state of magnificence in which it appears at present.

This temple enjoys the privilege of an asylum for all sorts of criminals: but it is most remarkable for the pilgrimages made to it by the devout Mussulmans, who pay so great a veneration to it, that they believe a single sight of its sacred walls, without any particular act of devotion, is as meritorious in the sight of God, as the most careful discharge of one's duty, for the space of a whole year, in any other temple.

CAAMINI, in *Botany*, a name given by the Spaniards and others to the finest sort of Paraguayan tea. It is the leaf of a shrub which grows on the mountains of Maracaya, and is used in Chili and Peru as the tea is with us. The mountains where this shrub grows naturally are far from the inhabited parts of Paraguay: but the people of the place know so well the value and use of it, that they constantly furnish themselves with great quantities of it from the spot. They used to go out on these expeditions many thousands together; leaving their country, in the mean time, exposed to the insults of their enemies, and many of themselves perishing by fatigue. To avoid these inconveniences, they have of late planted these trees about their habitations; but the leaves of these cultivated ones have not the fine flavour of those that grow wild. The king of Spain has permitted the Indians of Paraguay to bring to the town of Saintfoy 12,000 arobes of the leaves of this tree every year, but they are not able to procure so much of the wild leaves annually: about half the quantity is the utmost they bring of this: the other half is made up of the leaves of the trees in their own plantations; and this sells at a lower price, and is called *pabos*. The arobe is about 25 pounds weight: the general price is four piastres; and the money is always divided equally among the people of the colony.

CAANA, or KAANA, a town in Upper Egypt, seated on the eastern bank of the river Nile, from whence they carry corn and pulse for the supply of Mecca in Arabia. E. Long. 32. 23. N. Lat. 24. 30.

Here are several monuments of antiquity yet remaining, adorned with hieroglyphics.

CAB, a Hebrew dry measure, being the sixth part of a seah or satum, and the 18th part of an ephah. A cab contained $2\frac{5}{6}$ pints of our corn-measure: a quarter cab was the measure of dove's dung, or more properly a sort of chick-pease called by this name, which was sold at Samaria, during the siege of that city, for five shekels.

CABAL, an apt name currently given to the infamous ministry of Charles II. composed of five persons, Clifford, Ashley, Buckingham, Arlington, and Lauderdale; the first letters of whose names, in this order, furnished the appellation by which they were distinguished.

CABALIST, in French commerce, a factor or person who is concerned in managing the trade of another.

CABALLARIA, in middle-age writers, lands held by the tenure of furnishing a horseman with suitable equipage in time of war, or when the lord had occasion for him.

CABALLEROS, or CAVALLEROS, are Spanish wools, of which there is a pretty considerable trade at Bayonne in France.

CABALLINE, denotes something belonging to horses; thus caballine aloes is so called, from its being chiefly used for purging horses; and common brimstone is called *sulphur caballinum*, for a like reason.

CABALLINUM, in *Ancient Geography*, a town of the Ædui in Gallia Celtica; now *Chalons sur Saone*.

CABALLINUS, in *Ancient Geography*, a very clear fountain in Mount Helicon in Bœotia; called *Hippocrene* by the Greeks, because opened by Pegasus on striking the rock with his hoof, and hence called *Pegasius*.

CABALLIO, or CABELLIO, in *Ancient Geography*, a town of the Cavares in Gallia Narbonensis, situated on the Druentia. One of the Latin colonies, in the Notitiæ called *Civitas Cabellicorum*. Now *Cavaillon* in Provence.

CABANIS, P. J. G. a celebrated French medical writer. See SUPPLEMENT.

CABBAGE, in *Botany*. See BRASSICA; and AGRICULTURE *Index*.

CABBAGE-*Tree*, or *True* CABBAGE-*Palm*. See ARECA, BOTANY *Index*.

CABBAGE-BARK *Tree*. See GEOFFRÆA, BOTANY *Index*.

CABBALA, according to the Hebrew style, has a very distinct signification from that wherein we understand it in our language. The Hebrew cabbala signifies tradition; and the rabbins, who are called *cabbalists*, study principally the combination of particular words, letters, and numbers, and by this means pretend to discover what is to come, and to see clearly into the sense of many difficult passages of Scripture. There are no sure principles of this knowledge, but it depends upon some particular traditions of the ancients; for which reason it is termed *cabbala*.

The cabbalists have abundance of names which they call *sacred*; these they make use of in invoking of spirits, and imagine they receive great light from them. They tell us, that the secrets of the Cabbala were discovered to Moses on Mount Sinai; and that these have been delivered to them down from father to son, without interruption, and without any use of letters; for to write them down, is what they are by no means permitted to do. This is likewise termed the *oral law*, because it passed from father to son, in order to distinguish it from the written laws.

There is another cabbala, called *artificial*, which consists in searching for abstruse and mysterious significations of a word in Scripture, from whence they borrow certain explanations, by combining the letters which compose it; this cabbala is divided into three kinds, the gematric, the notaricon, and the temura or themura. The first whereof consists in taking the letters of a Hebrew word for ciphers or arithmetical numbers, and explaining every word by the arithmetical value of the letters whereof it is composed. The second sort of cabbala, called *notaricon*, consists in taking every particular letter of a word for an entire diction; and the third, called *themura*, i. e. change, consists in making different transpositions or changes of letters, placing one for the other, or one before the other.

Among the Christians, likewise, a certain sort of magic is, by mistake, called *cabbala;* which consists in using improperly certain passages of Scripture for magic operations, or in forming magic characters or figures with stars and talismans.

Some visionaries among the Jews believe, that Jesus Christ wrought his miracles by virtue of the mysteries of the cabbala.

CABBALISTS, the Jewish doctors who profess the study of the cabbala.

In the opinion of these men, there is not a word, letter, or accent in the law, without some mystery in it. The Jews are divided into two general sects; the karaites, who refuse to receive either tradition or the talmud, or any thing but the pure texts of Scripture; and the rabbinists, or talmudists, who, besides this, receive the traditions of the ancients, and follow the talmud.

The latter are again divided into two other sects; pure rabbinists, who explain the Scripture in its natural sense, by grammar, history, and tradition; and cabbalists, who, to discover hidden mystical senses, which they suppose God to have couched therein, make use of the cabbala, and the mystical methods above mentioned.

CABECA, or CABESS, a name given to the finest silks in the East Indies, as those from 15 to 20 per cent. inferior to them are called *barina.* The Indian workmen endeavour to pass them off one with the other; for which reason, the more experienced European merchants take care to open the bales, and to examine all the skaines one after another. The Dutch distinguish two sorts of cabecas; namely, the moor cabeca, and the common cabeca. The former is sold at Amsterdam for about $21\frac{1}{2}$ schellinghen Flemish, and the other for about $18\frac{1}{2}$.

CABECA *de Vide*, a small sea port town of Alentejo, in Portugal, with good walls, and a strong castle. W. Long. 6. 43. N. Lat. 39. 0.

CABENDA, a sea port of Congo, in Africa, situated in E. Long. 12. 2. S. Lat. 4. 5.

CABES, or GABES, a town of Africa in the kingdom of Tunis, seated on a river near the gulf of the same name. E. Long. 10. 35. N. Lat. 33. 40.

CABEZZO, a province of the kingdom of Angola, in Africa; having Oacco on the north, Lubolo on the south, the Coanzo on the north-east, and the Reinba on the south-west. It is populous, and well stored with cattle, &c. and hath a mine of iron on a mountain, from thence called the *iron mountain*, which yields great quantities of that metal; and this the Portuguese have taught the natives to manufacture. This province is watered by a river called *Rio Longo*, and other small rivulets, lakes, &c. The trees here are vastly large; and they have one sort not unlike our apple trees, the bark of which being slashed with a knife, yields an odoriferous resin of the colour and consistency of wax, and very medicinal in its nature, only a little too hot for Europeans, unless qualified by some cooling drug.

CABIDOS, or CAVIDOS, a long measure used at Goa, and other places of the East Indies belonging to the Portuguese, to measure stuffs, linens, &c. and equal to $\frac{4}{7}$ths of the Paris ell.

CABIN, a room or apartment in a ship where any of the officers usually reside. There are many of these in a large ship; the principal of which is designed for the captain or commander. In ships of the line this chamber is furnished with an open gallery in the ship's stern, as also a little gallery on each quarter. The apartments where the inferior officers or common sailors sleep and mess are usually called BIRTHS; which see.

The bed places built up for the sailors at the ship's side in merchantmen are also called *cabins.*

CABINDA, the chief port of the kingdom of Angoy in Loango in Africa. It is situated at the mouth of a river of the same name, about five leagues north of Cape Palmerino, on the north side of the mouth of the river Zaire. The bay is very commodious for trade, wooding and watering.

CABINET, the most retired place in the finest part of a building, set apart for writing, studying, or preserving any thing that is precious.

A complete apartment consists of a hall, antichamber, chamber, and cabinet, with a gallery on one side. Hence we say, a cabinet of paintings, curiosities, &c.

CABINET also denotes a piece of joiners workmanship, being a kind of press or chest, with several doors and drawers.

There are common cabinets of oak or of chesnut varnished, cabinets of China and Japan, cabinets of inlaid-work, and some of ebony, or the like scarce and precious woods. Formerly the Dutch and German cabinets were much esteemed in France; but are now quite out of date, as well as the cabinets of ebony which came from Venice.

CABINET is also used in speaking of the more select and secret councils of a prince or administration. Thus we say, the secrets, the intrigues of the cabinet. To avoid the inconveniencies of a numerous council, the policy of Italy and practice of France first introduced cabinet councils. King Charles I. is charged with first establishing this usage in England. Besides his privy council, that prince erected a kind of cabinet council, or junto, under the denomination of a council of state; composed of Archbishop Laud, the earl of Strafford, and Lord Collington, with the secretaries of state. Yet some pretend to find the substance of a cabinet council of much greater antiquity, and even allowed by parliament, which anciently settled a quorum of persons most confided in, without whose presence no arduous matter was to be determined: giving them power to act without consulting the rest of the council. As long since as the 28th of Henry III. a charter passed in affirmance of the ancient rights of the kingdom; which provided, that four great men, chosen by common consent, who were to be conservators of the kingdom, among other things, should see to the disposing of moneys given by parliament, and appropriated to particular uses; and parliaments were to be summoned as they should advise. But even of these four, any two made a quorum: and generally the chief justice of England and chancellor were of the number of the conservators. Math. Par. 28. Henry III. In the first

of

of Henry VI. the parliament provides, that the quorum for the privy council be six, or four at least; and that in all weighty considerations, the dukes of Bedford and Gloucester, the king's uncles, should be present; which seems to be erecting a cabinet by law.

CABIRI, a term in the theology of the ancient Pagans, signifying great and powerful gods; being a name given to the gods of Samothracia. They were also worshipped in other parts of Greece, as Lemnos and Thebes, where the Cabiria were celebrated in honour of them: these gods are said to be in number four, viz. Axieros, Axiocersa, Axiocersus, and Casmilus.

CABIRIA, festivals in honour of the Cabiri, celebrated in Thebes and Lemnos, but especially in Samothracia, an island consecrated to the Cabiri. All who were initiated into the mysteries of these gods were thought to be secured thereby from storms at sea, and all other dangers. The ceremony of initiation was performed by placing the candidate, crowned with olive branches, and girded about the loins with a purple ribband, on a kind of throne, about which the priests and persons before initiated danced.

CABLE, a thick, large, strong rope, commonly of hemp, which serves to keep a ship at anchor.

There is no merchant ship, however weak, but has at least three cables; namely, the chief cable, or cable of the sheet anchor, a common cable, and a smaller one.

Cable is also said of ropes, which serve to raise heavy loads, by the help of cranes, pulleys, and other engines. The name of *cable* is usually given to such as are, at least, three inches in circumference; those that are less are only called *ropes*, of different names, according to their use.

Every cable, of whatsoever thickness it be, is composed of three strands; every strand of three ropes; and every rope of three twists: the twist is made of more or less threads, according as the cable is to be thicker or thinner.

In the manufacture of cables, after the ropes are made, they use sticks, which they pass first between the ropes of which they make the strands, and afterwards between the strands of which they make the cable, to the end that they may all twist the better, and be more regularly wound together; and also, to prevent them from entwining or entangling, they hang, at the end of each strand and of each rope, a weight of lead or of stone.

The number of threads each cable is composed of is always proportioned to its length and thickness; and it is by this number of threads that its weight and value are ascertained: thus, a cable of three inches circumference, or one inch diameter, ought to consist of 48 ordinary threads, and to weigh 192 pounds; and on this foundation is calculated the following table, very useful for all people engaged in marine commerce, who fit out merchantmen for their own account, or freight them for the account of others.

A table of the number of threads and weight of cables of different circumferences.

Circumf.	Threads.	Weight.
3 inches.	48	192 pounds.
4	77	308
5 inches.	121	484 pounds.
6	174	696
7	238	952
8	311	1244
9	393	1572
10	485	1940
11	598	2392
12	699	2796
13	821	3284
14	952	3808
15	1093	4372
16	1244	4976
17	1404	5616
18	1574	6296
19	1754	7016
20	1943	7772

Sheet-Anchor CABLE, is the greatest cable belonging to a ship.

Stream CABLE, a hawser or rope, something smaller than the bowers, and used to moor the ship in a river or haven, sheltered from the wind and sea, &c.

Serve or *Plate the* CABLE, is to bind it about with ropes, clouts, &c. to keep it from galling in the hawse.

To splice a CABLE, is to make two pieces fast together, by working the several threads of the rope the one into the other.

Pay more CABLE, is to let more out of the ship. *Pay cheap the* CABLE, is to hand it out apace. *Veer more* CABLE, is to let more out, &c.

CABLE's *Length*, a measure of 120 fathoms, or of the usual length of the cable.

CABLED, in *Heraldry*, a term applied to a cross formed of the two ends of a ship's cable; sometimes also to a cross covered over with rounds of rope; more properly called a *cross carded*.

CABLED *Flute*, in *Architecture*, such flutes as are filled up with pieces in the form of a cable.

CABO DE ISTRIA, the capital town of the province of Istria, in the Austro-Venetian territories; and the see of a bishop. It is seated on a small island in the gulf of Venice, and is joined to the mainland by drawbridges. E. Long. 14. 22. N. Lat. 45. 49.

CABOCHED, in *Heraldry*, is when the heads of beasts are borne without any part of the neck, full faced.

CABOLETTO, in commerce, a coin of the republic of Genoa, worth about 3d. of our money.

CABOT, SEBASTIAN, the first discoverer of the continent of America, was the son of John Cabot, a Venetian. He was born at Bristol in 1477; and was taught by his father, arithmetic, geometry, and cosmography. Before he was 20 years of age he made several voyages. The first of any consequence seems to have been made with his father, who had a commission from Henry VII. for the discovery of a north-west passage to India. They sailed in the spring of 1497; and proceeding to the north-west they discovered land, which for that reason they called *Primavista*, or *Newfoundland*. Another smaller island they called *St John*, from its being discovered on the feast of St John Baptist; after which, they sailed along the coast of America as far as Cape Florida, and then returned to England

land with a good cargo, and three Indians aboard. Stowe and Speed ascribe these discoveries wholly to Sebastian, without mentioning his father. It is probable that Sebastian, after his father's death, made several voyages to these parts, as a map of his discoveries, drawn by himself, was hung up in the privy garden at Whitehall. However, history gives but little account of his life for near 20 years: when he went to Spain, where he was made pilot-major, and intrusted with reviewing all projects for discoveries, which were then very numerous. His great capacity and approved integrity induced many eminent merchants to treat with him about a voyage by the new found straits of Magellan to the Moluccas. He therefore sailed in 1525, first to the Canaries; then to the Cape de Verd islands; thence to St Augustine and the island of Patos; when some of his people beginning to be mutinous, and refusing to pass through the straits, he laid aside the design of sailing to the Moluccas; left some of the principal mutineers upon a desert island; and, sailing up the rivers of Plate and Paraguay, discovered, and built forts in, a large tract of fine country, that produced gold, silver, and other rich commodities. He thence dispatched messengers to Spain for a supply of provisions, ammunition, goods for trade, and a recruit of men: but his request not being readily complied with, after staying five years in America, he returned home; where he met with a cold reception, the merchants being displeased at his not having pursued his voyage to the Moluccas, while his treatment of the mutineers had given umbrage at court. Hence he returned to England; and being introduced to the duke of Somerset, then lord protector, a new office was erected for him: he was made governor of the mystery and company of the merchant adventurers for the discovery of regions, dominions, islands, and places unknown; a pension was granted him, by letters-patent, of 166l. 13s. 4d. per annum; and he was consulted in all affairs relative to trade. In 1522, by his interest, the court fitted out some ships for the discovery of the northern parts of the world. This produced the first voyage the English made to Russia, and the beginning of that commerce which has ever since been carried on between the two nations. The Russia company was now founded by a charter granted by Philip and Mary; and of this company Sebastian was appointed governor for life. He is said to be the first who took notice of the variation of the needle, and who published a map of the world. The exact time of his death is not known, but he lived to be above 70 years of age.

CABRA, a town of the kingdom of Tombut in Africa. It is a large town, but without walls; and is seated on the river Niger, about 12 miles from Tombut. The houses are built in the shape of bells; and the walls are made with stakes or hurdles, plastered with clay, and covered with reeds after the manner of thatch. This place is very much frequented by negroes who come here by water to trade. The town is very unhealthy, which is probably owing to its low situation. The colour of the inhabitants is black, and their religion a sort of Mahometanism. They have plenty of corn, cattle, milk, and butter; but salt is very scarce. The judge who decides controversies is appointed by the king of Tombut. E. Long. 0. 50. N. Lat. 14. 21.

CABUL, or Gaboul, a city of Asia, and capital of the province of Cabulistan. It lies in E. Long. 68. 15. N. Lat. 33. 30. on the frontiers of Great Bukharia, on the south side of the mountains which divide the territories of Hindostan from that part of Great Tartary. It is one of the finest places in that part of the world; large, rich, and very populous. As it is considered as the key of the whole country on that side, great care is taken to keep its fortifications in repair, and a numerous garrison is maintained for its security. It lies on the road between Samarcand and Lahor: and is much frequented by the Tartars, Persians, and Indians. The Usbec Tartars drive there a great trade in slaves and horses, of which it is said that no fewer are sold than 60,000 annually. The Persians bring black cattle and sheep, which renders provisions very cheap. They have also wine, and plenty of all sorts of eatables. The city stands on a little river which falls into the Indus, and thereby affords a short and speedy passage for all the rich commodities in the country behind it, which when brought to Cabul, are there exchanged for slaves and horses, and then conveyed by merchants of different countries to all parts of the world. The inhabitants are most of them Indian pagans, though the officers of the prince and most of the garrisons are Mahometans.

CABULISTAN, a province of Asia, formerly belonging to the Great Mogul; but ceded in 1739 to Kouli Khan, who at that time governed Persia. It is bounded on the north by Bukharia, on the east by Caschmire, on the west by Zabulistan, and Candahar, and on the south by Moultan. It is 250 miles in length, 240 in breadth, and its chief town is Cabul. This country in general is not very fruitful; but in the vales they have good pasture lands. The roads are much infested with banditti; which obliges the natives to have guards for the security of travellers. The religion of the Cabulistans is pagan; and their extraordinary time of devotion is the full moon in February, and continues for two days. At this time they are clothed in red, make their offerings, dance to the sound of the trumpet, and make visits to their friends in masquerade dresses. They say, their god Crusman killed a giant who was his enemy, and that he appeared like a little child; in memory of which, they cause a child to shoot at the figure of a giant. Those of the same tribe make bonfires, and feast together in a jovial manner. The moral part of their religion consists in charity; for which reason, they dig wells and build houses for the accommodation of travellers. They have plenty of provisions, mines of iron, myrobolans, aromatic woods, and drugs of many kinds. They carry on a great trade with the neighbouring countries; by which means they are very rich, and are supplied with plenty of all things.

CABURNS, on ship board, are small lines made of spun yarn, to bind cables, seize tackles, or the like.

CACALIA. See Botany *Index*.

CACAO. See Theobroma, Botany *Index*.

CACOONS. See Flevillea, Botany *Index*.

CACERES, a town of Spain in the province of Estremadura, is seated on the river Saler, and noted for the exceeding fine wool which the sheep bear in the neighbourhood. Between this town and Brocos, there is a wood, where the allies defeated the rear-guard of the

the duke of Berwick, on the 7th of April 1706. E. Long. 6. 47. N. Lat. 39. 15.

CACHALOT. See PHYSETER, CETOLOGY *Index*.

CACHAN, or CASHAN, a considerable town of Persia, in Irac Agemi, where they carry on an extensive trade in silks, silver, and gold brocades, and fine earthen ware. It is situated in a vast plain, 55 miles from Ispahan. E. Long. 50. 2. N. Lat. 34. 10.

CACHAO, a province in the kingdom of Tonquin in Asia, situated in the heart of the kingdom, and surrounded by the other seven. Its soil is fertile, and in some places mountainous, abounding with a variety of trees, and particularly that of varnish. Most of these provinces carry on some branch of the silk manufacture, but this most of all. It takes its name from the capital, which is also the metropolis of the whole kingdom, though in other respects hardly comparable to a Chinese town of the third rank.

CACHAO, a city of the province of that name, in the kingdom of Tonquin in Asia, situated in E. Long. 105. 31. N. Lat. 22. 10. at about 80 leagues distance from the sea. It is prodigiously crowded with people, insomuch that the streets are hardly passable, especially on market days. These vast crowds, however, come mostly from the neighbouring villages; upon which account these villages have been allowed their halls in particular parts of the city, where they bring and dispose of their wares. The town itself, though the metropolis of the whole Tonquinese kingdom, hath neither walls nor fortifications. The principal streets are wide and airy, but the rest of them narrow and ill paved; and except the palace royal and arsenal, the town has little else worth notice. The houses are low and mean, mostly built of wood and clay, and not above one story high. The magazines and warehouses belonging to foreigners are the only edifices built of brick; and these, though plain, yet, by reason of their height and more elegant structure, make a considerable shew among those rows of wooden huts. From the combustibility of its edifices, this city suffers frequent and dreadful conflagrations. These spread with such surprising velocity, that some thousands of houses are often laid in ashes before the fire can be extinguished. To prevent these sad consequences, every house hath, either in its yard or even in its centre, some low building of brick, in form of an oven, into which the inhabitants, on the first alarm, convey their most valuable goods. Besides this precaution, which every family takes to secure their goods, the government obliges them to keep a cistern, or some other capacious vessel, always full of water, on the top of their house, to be ready on all occasions of this nature; as likewise a long pole and bucket, to throw water from the kennel upon the houses. If these two expedients fail of suppressing the flames, they immediately cut the straps which fasten the thatch to the walls, and let it fall in and waste itself on the ground. The king's palace stands in the centre of the city; and is surrounded with a stout wall, within whose cincture are seen a great number of apartments two stories high, whose fronts and portals have something of the grand taste. Those of the king and his wives are embellished with variety of carvings and gildings after the Indian manner, and all finely varnished. In the outer court are a vast number of sumptuous stables for the king's horses and elephants. The appearance of the inner courts can only be conjectured; for the avenues are not only shut to all strangers, but even to the king's subjects, except those of the privy council, and the chief ministers of state; yet we are told, that there are staircases by which people may mount up to the top of the wall, which are about 18 or 20 feet high; from whence they may have a distant view of the royal apartments, and of the fine parterres and fish ponds that are between the cincture and them. The front wall hath a large gate well ornamented, which is never opened but when the king goes in and out; but at some distance from it on each side there are two posterns, at which the courtiers and servants may go in and out. This cincture, which is of a vast circumference, is faced with brick within and without, and the whole structure is terminated by wide spacious gardens: which, though stored with great variety of proper ornaments, are destitute of the grandeur and elegance observed in the palaces of European princes. Besides this palace, the ruins of one still more magnificent are to be observed, and are called *Libatvia*. The circumference is said to have been betwixt six and seven miles; some arches, porticoes, and other ornaments, are still remaining; from which, and some of its courts paved with marble, it may be concluded to have been as magnificent a structure as any of the eastern parts can show. The arsenal is likewise a large and noble building, well stored with ammunition and artillery. The English factory is situated on the north side of the city, fronting the river *Song-koy*. It is a handsome low-built house, with a spacious dining-room in the centre; and on each side are the apartments of the merchants, factors, and servants. At each end of the building are smaller houses for other uses, as storehouses, kitchen, &c. which form two wings with the square in the middle, and parallel with the river, near the bank of which stands a long flag-staff, on which they commonly display the English colours on Sundays and all remarkable days. Adjoining to it, on the south side, is the Danish factory, which is neither so large nor so handsome. On the same side of the river runs a long dike, whose timber and stones are so firmly fastened together, that no part of it can be stirred without moving the whole. This work was raised on those banks to prevent the river, during the time of their vast rains, from overflowing the city; and it has hitherto answered its end; for, though the town stands high enough to be in no danger from land floods, it might yet have been otherwise frequently damaged, if not totally laid under water, by the overflowing of that river. Some curious observations have been communicated to the Royal Society concerning differences between the tides of those seas and those of Europe, viz. that on the Tonquinese coast ebbs and flows but once in 24 hours; that is, that the tide is rising during the space of 12 hours, and can be easily perceived during two of the moon's quarters, but can hardly be observed during the other two. In the springs tides, which last 14 days, the waters begin to rise at the rising of the moon; whereas, in the low tides, which continue the same number of days, the tide begins not till that planet has got below the horizon. Whilst it is passing through the six northern signs, the tides are observed to vary greatly, to rise sometimes very high, and sometimes to be very low; but when it once got into the southern part of the zodiac, they are then found to be more even and regular.

CACHECTIC, something partaking of the nature of, or belonging to, a cachexy.

CACHEO, a town of Negroland in Africa, seated on the river St Domingo. It is subject to the Portuguese, who have three forts there, and carry on a great trade in wax and slaves. W. Long. 14. 55. N. Lat. 12. 0.

CACHEXY, in *Medicine*, a vitious state of the humours and whole habit. See MEDICINE *Index*.

CACHRYS. See BOTANY *Index*.

CACHUNDE, the name of a medicine, highly celebrated among the Chinese and Indians, and made of several aromatic ingredients, the perfumes, medicinal earth, and precious stones; they make the whole into a stiff paste, and form out of it several figures according to their fancy, which are dried for use; these are principally used in the East Indies, but are sometimes brought over to Portugal. In China, the principal persons usually carry a small piece in their mouths, which is a continued cordial, and gives their breath a very sweet smell. It is a highly valuable medicine, also, in all nervous complaints; and is esteemed a prolonger of life, and a provocative to venery, the two great intentions of most of the medicines in use in the East.

CACOCHYLIA, or CACOCHYMIA, a vitious state of the vital humours, especially of the mass of blood; arising either from a disorder of the secretions or excretions, or from external contagion. The word is Greek, compounded of κακος *ill*, and χυμος *juice*.

CACOPHONIA, in *Grammar* and *Rhetoric*, the meeting of two letters, or syllables, which yield an uncouth and disagreeable sound. The word is compounded of κακος *evil*, and φωνη *voice*.

CACOPHONIA, in *Medicine*, denotes a vice or depravation of the voice or speech; of which there are two species, *aphonia* and *dysphonia*.

CACTUS. See BOTANY *Index*.

The cacti are plants of a singular structure, but especially the larger kinds of them; which appear like a large, fleshy, green melon, with deep ribs, set all over with strong sharp thorns, and, when the plants are cut through the middle, their inside is a soft, pale-green, fleshy substance, very full of moisture. The fruit of all the species is frequently eaten by the inhabitants of the West Indies. The fruits are about three quarters of an inch in length, of a taper form, drawing to a point at the bottom toward the plant, but blunt at the top where the empalment of the flower was situated. The taste is agreeably acid, which in a hot country must render the fruit more grateful.

The cochineal animals are supported on a species called *cactus cochenillifer*.—The flower of the cactus grandiflora (one of the creeping cereuses) is said to be as grand and beautiful as any in the vegetable system. It begins to open in the evening about seven o'clock, is in perfection about eleven, and fades about four in the morning; so that the same flower only continues in perfection about six hours. The calyx when expanded is about a foot in diameter, of a splendid yellow within, and a dark brown without; the petals are many, and of a pure white; and the great number of recurved stamina, surrounding the style in the centre of the flower, make a grand appearance, to which may be added the fine scent, which perfumes the air to a considerable distance. It flowers in July.

CACUS, in fabulous history, an Italian shepherd upon Mount Aventine. As Hercules was driving home the herd of King Geryon whom he had slain, Cacus robbed him of some of his oxen, which he drew backward into his den lest they should be discovered. Hercules at last finding them out by their lowing, or the robbery being discovered to him, killed Cacus with his club. He was Vulcan's son, of prodigious bulk, and half man half satyr.

CADAN, a town of Bohemia, in the circle of Zats, seated on the northern bank of the river Egra, in E. Long. 13. 34. N. Lat. 50. 20.

CADARI, or KADARI, a sect of Mahometans, who assert free will; attribute the actions of men to men alone, not to any secret power determining the will; and deny all absolute decrees, and predestination. The author of this sect was Mabeb ben Kaled al Gihoni, who suffered martyrdom for it. The word comes from the Arabic, קדר, *cadara*, "power." Ben Aun calls the Cadarians the Magi or Manichees of the Mussulmans.

CADE, a cag, cask, or barrel. A cade of herrings is a vessel containing the quantity of 500 red herrings, or 1000 sprats.

CADE Lamb, a young lamb weaned, and brought up by hand, in a house; called, in the North, *pet lamb*.

CADE Oil, in the *Materia Medica*, a name given to an oil much in use in some parts of France and Germany. The physicians call it *oleum cadæ*, or *oleum de cada*. This is supposed by some to be the pisselæum of the ancients, but improperly; it is made of the fruit of the oxycedrus, which is called by the people of these places *cada*.

CADE Worm, in *Zoology*, the maggot or worm of a fly called *phryganea*. It is used as a bait in angling. See PHRYGANEA, ENTOMOLOGY *Index*.

CADEA, or THE LEAGUE OF THE HOUSE OF GOD, is one of those that compose the republic of the Grisons, and the most powerful and extensive of them all. It contains the bishopric of Coire, the great valley of Engadine, and that of Bragail or Pregal. Of the 11 great or 21 small communities, there are but two that speak the German language; that of the rest is called the *Rhetic*, and is a dialect of the Italian. The Protestant religion is most prevalent in this league, which has been allied to the Swiss cantons ever since the year 1498. Coire is the capital town.

CADENAC, a town of France, in the department of Lot, seated on the river Lot, in E. Long. 2. 12. N. Lat. 44. 36.

CADENCE, or REPOSE, in *Music*, (from the Latin *cadere* "to fall or descend"); the termination of an harmonical phrase on a repose, or on a perfect chord. See MUSIC, Art. 73—76, and 132—137.

CADENCE, in *Reading*, is a falling of the voice below the key-note at the close of every period. In reading, whether prose or verse, a certain tone is assumed which is called the *key-note*: and in this tone the bulk of the words are sounded; but this note is generally lowered towards the close of every sentence.

CADENCE,

Cadence, in the manege, an equal measure or proportion, observed by a horse in all his motions; so that his times have an equal regard to one another, the one does not embrace or take in more ground than the other, and the horse observes his ground regularly.

CADENE, one of the sorts of carpets which the Europeans import from the Levant. They are the worst sort of all, and are sold by the piece, from one or two piastres per carpet.

CADENET, a town of France, in the department of Vaucluse, on the river Durance. E. Long. 5. 30. N. Lat. 43. 40.

CADES, or Kadesh, in *Ancient Geography*, a town in the wilderness of Zin, in Arabia Petræa; the first encampment of the Israelites, after their departure from Eziongeber; and from which the wilderness of Zin was called Cades; the burial place of Miriam, with the rock and water of Meribah in it. Another *Cades*, a town of the tribe of Judah, Joshua xv. 23. *Cadesbarnea*, called also *Cades*.

CADESBARNEA, in *Ancient Geography*, a town of the wilderness of Paran, on the confines of Canaan, from which the spies were sent out; sometimes simply called *Cades*, but distinct from the Cades in the wilderness of Zin.

CADET, the younger son of a family, is a term naturalized in our language from the French. At Paris, among the citizens, the cadets have an equal patrimony with the rest. At Caux, in Normandy, the custom, as with us, is to leave all to the eldest, except a small portion to the cadets. In Spain, it is usual for one of the cadets in great families to take the mother's name.

Cadet is also a military term, denoting a young gentleman who chooses to carry arms in a marching regiment as a private man. His views are, to acquire some knowledge in the art of war, and to obtain a commission in the army. Cadet differs from volunteer, as the former takes pay, whereas the latter serves without pay.

CADI, or Cadhi, a judge of civil affairs in the Turkish empire. It is generally taken for the judge of a town; judges of provinces being distinguished by the appellation of *moulas*.

We find numerous complaints of the avarice, iniquity, and extortion, of the Turkish cadis; all justice is here venal; the people bribe the cadis, the cadis bribe the moulas, the moulas the cadileschers, and the cadileschers the mufti. Each cadi has his serjeants, who are to summon persons to appear and answer complaints. If the party summoned fails to appear at the hour appointed, sentence is passed in favour of his adversary. It is usually in vain to appeal from the sentences of the cadi, since the affair is never heard anew, but judgment is passed on the case as stated by the cadi. But the cadis are often cashiered and punished for crying injustice with the bastinado and mulcts; the law, however, does not allow them to be put to death. Constantinople has had cadis ever since the year 1390, when Bajazet I. obliged John Paleologus, emperor of the Greeks, to receive cadis into the city to judge all controversies happening between the Greeks and the Turks settled there. In some countries of Africa, the cadis are also judges of religious matters. Among the Moors cadis is the denomination of their higher order of priests or doctors, answering to the rabbins among the Jews.

CADIACI, the Turkish name of Chalcedon. See Chalcedon.

CADILESCHER, a capital officer of justice among the Turks, answering to a chief justice among us.

It is said, that this authority was originally confined to the soldiery; but that at present it extends itself to the determination of all kinds of law-suits; yet is nevertheless subject to appeals.

There are but three cadileschers in all the grand signior's territories; the first is that of Europe; the second, of Natolia; and the third resides at Grand Cairo. This last is the most considerable: they have their seats in the divan next to the grand vizir.

CADILLAC, a town of France in Guienne, now in the department of Gironde, near the river Garonne, with a handsome castle, situated in W. Long. 0. 15. N. Lat. 44. 37.

CADIZ, a city and port town of Andalusia in Spain, situated on the island of Leon, opposite to Port St Mary on the continent, about 60 miles south-west of Seville, and 40 north-west of Gibraltar. W. Long. 6. 40. N. Lat. 36. 30.

It occupies the whole surface of the western extremity of the island, which is composed of two large circular parts, joined together by a very narrow bank of sand, forming altogether the figure of a chain-shot. At the south-east end, the ancient bridge of Suaco, thrown over a deep channel or river, affords a communication between the island and the continent; a strong line of works defends the city from all approaches along the isthmus; and, to render them still more difficult, all the gardens and little villas on the beach were in 1762 cleared away, and a dreary sandy glacis left in their room, so that now there is scarce a tree on the whole island.

Except the *Calle Ancha*, all the streets are narrow, ill paved, and insufferably stinking. They are all drawn in straight lines, and most of them intersect each other at right angles. The swarms of rats that in the nights run about the streets are innumerable; whole droves of them pass and repass continually, and these in their midnight revels are extremely troublesome to such as walk late. The houses are lofty, with each a vestibule, which being left open till night, serves passengers to retire to; this custom, which prevails throughout Spain, renders these places exceedingly offensive. In the middle of the house is a court like a deep well, under which is generally a cistern, the breeding place of gnats and mosquitoes; the ground floors are warehouses, the first stories compting-house or kitchen, and the principal apartment up two pair of stairs. The roofs are flat, covered with an impenetrable cement, and few are without a *mirador* or turret for the purpose of commanding a view of the sea. Round the parapet-wall at top are placed rows of square pillars, meant either for ornament according to some traditional mode of decoration, or to fix awnings to, that such as sit there for the benefit of the sea breeze may be sheltered from the rays of the sun; but the most common use made of them, is to fasten ropes for drying linen upon. High above all these pinnacles, which give Cadiz a most singular appearance, stands the

the tower of signals. Here flags are hung out on the first sight of a sail, marking the size of the ship, the nation it belongs to, and, if a Spanish Indiaman, the port of the Indies it comes from. The ships are acquainted with the proper signals to be made, and these are repeated by the watchmen of the tower: as painted lists are in every house, persons concerned in commerce soon learn the marks.

The city is divided into 24 quarters, under the inspection of as many commissioners of police; and its population is reckoned at 70,000 inhabitants, of which part are French, and part also Italians. The square of Saint Antonia is large, and tolerably handsome, and there are a few smaller openings of no great note. The public walk, or Alameda, is pleasant in the evening: it is fenced off the coach-road by a marble rail. The sea air prevents the trees from thriving, and destroys all hopes of future shade.

From the Alameda, continuing your walk westwards, you come to the Camposanto, a large esplanade, the only airing place for coaches; it turns round most part of the west and south sides of the island, but the buildings are straggling and ugly: the only edifice of any show is the new orphan house. Opposite to it is the fortress of St Sebastian, built on a neck of land running out into the sea. The round tower at the extremity is supposed to have saved the city, in the great earthquake of 1755, from being swept away by the fury of the waves. The building proved sufficiently solid to withstand the shock, and break the immense volume of water that threatened destruction to the whole island. In the narrow part of the isthmus the surge beat over with amazing impetuosity, and bore down all before it; among the rest, the grandson of the famous tragic poet Racine, who strove in vain to escape, by urging his horse to the utmost of his speed. On St Sebastian's feast, a kind of wake or fair is held in the fort; an astonishing number of people then passing and repassing, on a string of wooden bridges laid from rock to rock, makes a very lively moving picture.

From hence to the wooden circus where they exhibit the bull feasts, you keep turning to the left close above the sea, which on all this side dashes over large ledges of rock: the shore seems here absolutely inaccessible. On this shore stands the cathedral, a work of great expence, but carried on with so little vigour, that it is difficult to guess at the term of years it will require to bring it to perfection. The vaults are executed with great solidity. The arches, that spring from the clustered pilasters to support the roof of the church, are very bold; the minute sculpture bestowed upon them seems superfluous, as all the effect will be lost from their great height, and from the shade that will be thrown upon them by the filling up of the interstices. From the sea, the present top of the church resembles the carcase of some huge monster cast upon its side, rearing its gigantic blanched ribs high above the buildings of the city. The outward casings are to be of white marble, the bars of the windows of bronze.

Next, crossing before the land gate and barracks, a superb edifice for strength, convenience, and cleanliness, you come down to the ramparts that defend the city on the side of the bay. If the prospect to the ocean is solemn, that towards the main land is animated in the highest degree; the men of war ride in the eastern bosom of the bay; lower down the merchantmen are spread far and near; and close to the town an incredible number of barks, of various shapes and sizes, cover the surface of the water, some moored and some in motion, carrying goods to and fro. The opposite shore of Spain is studded with white houses, and enlivened by the town of St Mary's, Port-real, and others, behind which, eastward, on a ridge of hills, stands Medina Sidonia, and further back rise the mountains of Granada. Westward, Rota closes the horizon, near which was anciently the island and city of Tartessus, now covered by the sea, but at low water some part of the ruins are still to be discerned. In a large bastion, jutting out into the bay, they have built the customhouse, the first story of which is level with the walk upon the walls. When it was resolved to erect a building so necessary to this great emporium of trade, the marquis di Squillace gave orders that no expence should be spared, and the most intelligent architects employed, in order to erect a monument, which by its taste and magnificence might excite the admiration of posterity: the result of these precautions proved a piece of vile architecture, composed of the worst of materials.

The stir here is prodigious during the last months of the stay of the flota. The packers possess the art of pressing goods to great perfection; but, as they pay the freight according to the cubic palms of each bale, they are apt to squeeze down the cloths and linens so very close and hard, as sometimes to render them unfit for use. Every commercial nation has a consul resident at Cadiz; those of England and France are the only ones not allowed to have any concern in trade.

In 1596, Cadiz was taken, pillaged, and burnt by the English; but in 1702 it was attempted, in conjunction with the Dutch, without success. It was bombarded by the English in 1800; and was blockaded by the French while the Cortes held its sittings there in 1810, till the blockade was raised after the battle of Salamanca in 1812.

CADIZADELITES, a sect of Mahometans very like the ancient Stoics. They shun feasts and diversions, and affect an extraordinary gravity in all their actions; they are continually talking of God, and some of them make a jumble of Christianity and Mahometanism; they drink wine, even in the fast of the Ramazan; they love and protect the Christians; they believe that Mahomet is the Holy Ghost, practise circumcision, and justify it by the example of Jesus Christ.

CADMEAN LETTERS, the ancient Greek or Ionic characters, such as they were first brought by Cadmus from Phœnicia: whence Herodotus also calls them *Phœnician letters*. According to some writers, Cadmus was not the inventor, nor even importer of the Greek letters, but only the modeller and reformer thereof; and it was hence they acquired the appellation *Cadmean* or *Phœnician letters;* whereas before that time they had been called *Pelasgian letters*.

CADMIA. See CALAMINE.

CADMUS, in fabulous history, king of Thebes, the son of Agenor king of Phœnicia, and the brother of Phœnix, Cilix, and Europa. He carried into Greece the 16 simple letters of the Greek alphabet; and there built Thebes, in Bœotia. The poets say, that

that he left his native country in search of his sister Europa, whom Jupiter had carried away in the form of a bull: and that, inquiring of the Delphic oracle for a settlement, he was answered, that he should follow the direction of a cow, and build a city where she lay down. Having arrived among the Phocenses, he was met by a cow, who conducted him through Bœotia to the place where Thebes was afterwards built: but as he was about to sacrifice his guide to Pallas, he sent two of his company to the fountain Dirce for water; when they being devoured by a serpent or dragon, he slew the monster, and afterwards, by the advice of Pallas, sowed his teeth, when there sprung up a number of armed soldiers, who prepared to revenge the death of the serpent; but on his casting a stone among these upstart warriors, they turned their weapons against each other with such animosity, that only five survived the combast, and these assisted Cadmus in founding his new city. Afterwards, to recompense his labours, the gods gave him Harmonia, or Harmione, the daughter of Mars and Venus; and honoured his nuptials with presents and peculiar marks of favour. But at length resigning Thebes to Pentheus, Cadmus and Harmione went to govern the Ecclellenses: when grown old, they were transformed into serpents; or, as others say, sent to the Elysian fields, in a chariot drawn by serpents. See THEBES.

CADMUS of Miletus, a celebrated Greek historian, was, according to Pliny, the first of the Greeks who wrote history in prose. He flourished about 550 before Christ.

CADORE, or PIEVE DE CADORE, a town of Italy, in the territory of Venice, and capital of a district called *Cadorino;* famous for the birth of Titian the painter. E. Long. 13. 45. N. Lat. 46. 25.

CADORINO, a province of Italy, in the territory of Venice; bounded on the east by Friuli Proper, on the south and west by the Bellunese, and by the bishopric of Brixen on the north. It is a very mountainous country, but pretty populous. The only town is Pieve de Cadore.

CADRITES, a sort of Mahometan friars, who once a-week spend a great part of the night in turning round, holding each others hands, and repeating incessantly the word *hai*, which signifies *living*, and is one of the attributes of God; during which one of them plays on a flute. They never cut their hair, nor cover their heads; and always go bare-footed: they have liberty to quit their convent when they please, and to marry.

CADSAND, an island on the coast of Dutch Flanders, situated at the mouth of the Scheldt, whereby the Dutch command the navigation of that river.

CADUCEUS, in antiquity, Mercury's rod or sceptre, being a wand entwisted by two serpents, borne by that deity as the ensign of his quality and office, given him, according to the fable, by Apollo, for his seven-stringed harp. Wonderful properties are ascribed to this rod by the poets; as laying men asleep, raising the dead, &c.

It was also used by the ancients as a symbol of peace and concord: the Romans sent the Carthaginians a javelin and a caduceus, offering them their choice either of war or peace. Among that people, those who denounced war were called *feciales;* and those who went to demand peace, *caduceatores*, because they bore a caducens in their hand.

The caduceus found on medals is a common symbol, signifying good conduct, peace, and prosperity. The rod expresses power, the two serpents prudence, and the two wings diligence.

CADUCI, (from *cado*, "to fall"); the name of a class in Linnæus's *calycina*, consisting of plants whose calyx is a simple perianthium, supporting a single flower or fructification, and falling off either before or with the petals. It stands opposed to the *classes persistentes* in the same method, and is exemplified in mustard and ranunculus.

CADURCI, CADURCUM, *Cadurcus*, and *Cadurx*, in *Ancient Geography*, a town of the Cadurci, a people of Aquitania; situated between the rivers Oldus, running from the north, and the Tarnis from the south, and falling into the Garumna: Now *Cahors*, capital of the territory of the Querci, in Guienne. A part of the Cadurci, to the south next the Tarnis, were called *Eleutheri*.

CADUS, in antiquity, a wine vessel of a certain capacity, containing 80 amphoræ or firkins; each of which, according to the best accounts, held nine gallons.

CADUSII, in *Ancient Geography*, a people of Media Atropatene, situated to the west in the mountains, and reaching to the Caspian sea; between whom and the Medes perpetual war and enmity continued down to the time of Cyrus.

CÆCILIA, in *Zoology*, a genus of serpents belonging to the amphibia class. The cæcilia has no scales: it is smooth, and moves by means of lateral rugæ or prickles. The upper lip is prominent, and furnished with two tentacula. It has no tail. There are but two species of this serpent, viz. 1. The tentaculata, has 135 rugæ. It is about a foot long, and an inch in circumference, preserving an uniform cylindrical shape from the one end to the other. The teeth are very small. It has such a resemblance to an eel, that it may easily be mistaken for one; but as it has neither fins nor gills, it cannot be classed with the fishes. It is a native of America, and its bite is not poisonous. 2. The glutinosa, has 340 rugæ or prickles above, and 10 below, the anus. It is of a brownish colour, with a white line on the side, and is a native of the Indies.

CÆCUM, or COECUM, the blind gut. See ANATOMY *Index*.

CÆLIUM, in *Ancient Geography*, an inland town of Peucetia, a division of Apulia; a place four or five miles above Barium or Bari, and which still retains that name.

CÆLIUS MONS, (Itinerary); a town of Vindelicia, on the right or west side of the Ilargus. Now *Kelmuntz*, a small town of Suabia, on the Iller.

CÆLIUS MONS at Rome. See COELIUS.

CÆLIUS, *Aurelianus*, an ancient physician, and the only one of the sect of the Methodists of whom we have any remains. He was of Sicca, a town of Numidia; but in what age he lived, cannot be determined: it is probable, however, that he lived before Galen; since, though he carefully mentions all the physicians before him, he takes no notice of Galen. He had read over very diligently the ancient physicianscians of all sects; and we are indebted to him for the knowledge of many dogmas which are not to be found but in his books *de celeribus et tardis passionibus*. He wrote, as he himself tells us, several other works; but they are all perished.

CAEN, a handsome and considerable town of France, capital of Lower Normandy, and of the department of Calvados. It contains 60 streets, and 12 parishes, and in 1815 had 36,000 inhabitants. It has a castle with four towers, which were built by the English. The town-house is a large building with four great towers. The royal square is the handsomest in all Normandy, and has fine houses on three sides of it; and in the middle is the statue of Louis XIV. in a Roman habit, standing on a marble pedestal, and sursounded with an iron ballustrade. It is seated in a pleasant country on the river Orne, about eight miles from the sea. William the Conqueror was buried here, in the abbey of St Stephen, which he founded. W. Long. 0. 27. N. Lat. 49. 11.

CÆRE, in *Ancient Geography*, a town of Etruria, the royal residence of Mezentius. Its ancient name was *Argyllæ*. In Strabo's time not the least vestige of it remained, except the baths called *cæretana*. From this town the Roman censor's tables were called *cærites tabulæ*. In these were entered the names of such as for some misdemeanour forfeited their right of suffrage, or were degraded from a higher to a less honourable tribe. For the people of Cære hospitably receiving those Romans who, after the taking of Rome by the Gauls, fled with their gods and the sacred fire of Vesta, were, on the Romans recovering themselves from this disaster, honoured with the privilege of the city, but without a right of voting.

CÆRITES TABULÆ. See the preceding article.

CAERFILLY, a town of Glamorganshire in South Wales, seated between the rivers Taaff and Rumney, in a moorish ground among the hills. It is thought the walls, now in ruins, were built by the Romans; there being often Roman coins dug up there. W. Long. 3. 12. N. Lat. 51. 25.

CAERLEON, a town of Monmouthshire in England, and a place of great antiquity. It was a Roman town, as is evident from the many Roman antiquities found here. It is commodiously situated on the river Usk, over which there is a large wooden bridge. The houses are generally built of stone, and there are the ruins of a castle still to be seen. W. Long. 3. 0. N. Lat. 51. 40.

CAERMARTHENSHIRE, a county of Wales, bounded on the north by the Severn sea or St George's channel, Cardiganshire on the south, the shires of Brecknock and Glamorgan on the east, and Pembrokeshire on the west. Its greatest length is between 30 and 40 miles, and its breadth upwards of 20, and it contained 77,217 inhabitants in 1811. The soil is less rocky and mountainous than most other parts of Wales, and consequently is proportionally more fertile both in corn and pasture. It has also plenty of wood, coal, and limestone. The most considerable rivers are the Towey, the Cothy, and the Tave; of which, the first abounds with excellent salmon. The principal towns are Caermarthen the capital, Kidwely, Lanimdovery, &c. This county abounds with ancient forts, camps, and tumuli or barrows. Near to Caermarthen, towards the east, may be seen the ruins of Kastelk Karrey, which was situated on a steep and inaccessible rock; and also several vast caverns, supposed to have been copper mines of the Romans. Near this spot is a fountain which ebbs and flows twice in 24 hours like the sea. See CAERMARTHENSHIRE, SUPPLEMENT.

CAERMARTHEN, a town of Wales, and capital of the county of that name. It is situated on the river Towey, over which it has a fine stone bridge. It is of great antiquity, being the Maridunum of Ptolemy. It is a thriving place, and many of the neighbouring gentry reside there in the winter. It is a corporation and county of itself, with power to make by-laws. Here were held the courts of chancery and exchequer for South Wales, till the whole was united to England in the reign of Henry VIII. Here was born the famous conjuror Merlin; and near the town is a wood called *Merlin's Grove*, where he is said to have often retired for contemplation. Many of his pretended prophecies are still preserved in the country. The town gives the title of *marquis* to the duke of Leeds. It sends one member to parliament, and the county another. Population 7275.

CAERNARVONSHIRE, a county of Wales, bounded on the north and west by the sea, on the south by Merionethshire, and on the east divided from Denbighshire by the river Conway. It is about 40 miles in length, and 20 in breadth; and sends one member to parliament for the shire, and another for the borough of Caernarvon. The air is very piercing; owing partly to the snow, that lies seven or eight months of the year upon some of the mountains, which are so high that they are called the *British Alps*, and partly to the great number of lakes, which are said not to be fewer than 50 or 60. The soil in the valleys on the side next Ireland is pretty fertile, especially in barley; great numbers of black cattle, sheep, and goats, are fed on the mountains. The population in 1811 was 49,336. The highest mountains in the county are those called *Snowdon hills*, and *Pen-maen-mawr*, which last hangs over the sea. There is a road cut out of the rock on the side next the sea, guarded by a wall running along the edge of it on that side; but the traveller is sometimes in danger of being crushed by the fall of pieces of the rock from the precipices above. The river Conway, though its course from the lake out of which it issues to its mouth is only 12 miles, yet is so deep, in consequence of the many brooks it receives, that it is navigable by ships of good burden for eight miles. Pearls are found in large black muscles taken in this river. The principal towns are Bangor, Caernarvon the capital, and Conway. In this county is an ancient road said to have been made by Helena the mother of Constantine the Great: and Matthew of Westminster asserts, that the body of Constantius, father of Constantine, was found at Caernarvon in the year 1283, and interred in the parish church by order of Edward I. See CAERNARVONSHIRE, SUPPLEMENT.

CAERNARVON, a town of Wales, and capital of the county of that name. It was built by Edward I. near the site of the ancient Segontium, after his conquest of the country in 1282, the situation being well adapted to overawe his new subjects. It had natural requisites for strength; being bounded on one side by the arm of the sea called the *Menai*; by the estuary of the

Sciont on another, exactly where it receives the tide from the former; on a third side, and a part of the fourth, by a cheek of the Menai; and the remainder has the appearance of having the insulation completed by art. Edward undertook this great work immediately after his conquest of the country in 1282, and completed the fortifications and castle before 1284; for his queen, on April 25th in that year, brought forth within its walls Edward, first prince of Wales of the English line. It was built within the space of one year, by the labour of the peasants, and at the cost of the chieftains of the country, on whom the conqueror imposed the hateful task. The external state of the walls and castle, Mr Pennant informs us, are at present exactly as they were in the time of Edward. The walls are defended by numbers of round towers, and have two principal gates: the east, facing the mountains; the west, upon the Menai. The entrance into the castle is very august, beneath a great tower, on the front of which appears the statue of the founder, with a dagger in his hand, as if menacing his new-acquired unwilling subjects. The gate had four portcullises, and every requisite of strength. The towers are very beautiful. The eagle tower is remarkably fine, and has the addition of three slender angular turrets issuing from the top. Edward II. was born in a little dark room in this tower, not twelve feet long nor eight in breadth: so little did, in those days, a royal consort consult either pomp or conveniency. The gate through which the affectionate Eleanor entered, to give the Welsh a prince of their own, who could not speak a word of English, is at the farthest end, at a vast height above the outside ground; so could only be approached by a drawbridge. The quay is a most beautiful walk along the side of the Menai, and commands a most agreeable view.

Caernarvon is destitute of manufactures, but has a brisk trade with London, Bristol, Liverpool, and Ireland, for the several necessaries of life. It is the residence of numbers of genteel families, and contains several very good houses. Edward I. bestowed on this town its first royal charter, and made it a free borough. Among other privileges, none of the burgesses could be convicted of any crime committed between the rivers Conway and Dyfe, unless by a jury of their own townsmen. It is governed by a mayor, who, by patent, is created governor of the castle. It has one alderman, two bailiffs, a town clerk, and two serjeants at mace. The representative of the place is elected by its burgesses, and those of Conway, Pwllheli, Nesyn, and Crickaeth. The right of voting is in the freemen. The town gives title of *earl* and *marquis* to the duke of Chandos, and has a good tide harbour. Population 4595 in 1811.

CAERWIS, a market town of Flintshire, in North Wales, situated in W. Long. 3. 25. N. Lat. 53. 20.

CÆSALPINIA, BRASILETTO, or *Brasil wood.* See BOTANY *Index*. Of this there are three species, the most remarkable of which is the brasiliensis, commonly called *Brasiletto*. It grows naturally in the warmest parts of America, from whence the wood is imported for the dyers, who use it much. The demand has been so great, that none of the large trees are left in any of the British plantations; so that Mr Catesby owns himself ignorant of the dimensions to which they grow.

The largest remaining are not above two inches in thickness, and eight or nine feet in height. The branches are slender and full of small prickles; the leaves are pinnated; the lobes growing opposite to one another, broad at their ends, with one notch. The flowers are white, papilionaceous, with many stamina and yellow apices growing in a pyramidal spike, at the end of a long slender stalk: the pods enclose several small round seeds. The colour produced from this wood is greatly improved by solution of tin in aqua regia *. The second sort is a native of the same countries with the first, but is of a larger size. It sends out many weak irregular branches, armed with short, strong, upright thorns. The leaves branch out in the same manner as the first; but the lobes, or small leaves, are oval and entire. The flowers are produced in long spikes like those of the former, but are variegated with red. These plants may be propagated from seeds, which should be sown in small pots filled with light rich earth early in the spring, and plunged in a bed of tanner's bark. Being tender, they require to be always kept in the stove, and to be treated in the same manner as other exotics of that kind.

* See *Colour-making and Dyeing.*

CÆSALPINUS of Arezzo, professor at Pisa, and afterwards physician to Pope Clement VIII. one of the capital writers in botany. See SUPPLEMENT.

CÆSAR, JULIUS, the illustrious Roman general and historian, was of the family of the Julii, who pretended they were descended from Venus by Æneas. The descendants of Ascanius, son of Æneas and Creüsa, and surnamed *Julius*, lived in Alba till that city was ruined by Tullus Hostilius king of Rome, who carried them to Rome, where they flourished. We do not find that they produced more than two branches. The first bore the name of *Tullus*, the other that of *Cæsar*. The most ancient of the Cæsars were those who were in public employments in the 11th year of the first Punic war. After that time we find there was always some of that family who enjoyed public offices in the commonwealth, till the time of Caius Julius Cæsar, the subject of this article. He was born at Rome the 12th of the month Quintilis, year of the city 653, and lost his father An. 669. By his valour and eloquence he soon acquired the highest reputation in the field and in the senate. Beloved and respected by his fellow citizens, he enjoyed successively every magisterial and military honour the public could bestow consistent with its own free constitution. But at length having subdued Pompey, the great rival of his growing power, his boundless ambition effaced the glory of his former actions: for, pursuing his favourite maxim, "that he had rather be the first man in a village than the second in Rome," he procured himself to be chosen perpetual dictator; and, not content with this unconstitutional power, his faction had resolved to raise him to the imperial dignity; when the friends of the civil liberties of the republic rashly assassinated him in the senate-house, where they should only have seized him and brought him to a legal trial for usurpation. By this impolitic measure they defeated their own purpose, involving the city in consternation and terror, which produced general anarchy, and paved the way to the revolution they wanted to prevent: the monarchical government being absolutely founded on the murder of Julius Cæsar. He fell in the 56th year of his age, 43 years before

Cæsar.

before the Christian era. His commentaries contain a history of his principal voyages, battles, and victories. The London edition in 1712, in folio, is preferred.

The detail of Cæsar's transactions (so far as is consistent with the limits of this work) being given under the article ROME, we shall here only add a portrait of him as drawn by a philosopher *.

* From the *Melanges Philosophiques* of M. Ophellot.

"If, after the lapse of 18 centuries, the truth may be published without offence, a philosopher might, in the following terms, censure Cæsar without calumniating him, and applaud him without exciting his blushes.

"Cæsar had one predominant passion: it was the love of glory; and he passed 40 years of his life in seeking opportunities to foster and encourage it. His soul, entirely absorbed in ambition, did not open itself to other impulses. He cultivated letters; but he did not love them with enthusiasm, because he had not leisure to become the first orator of Rome. He corrupted the one half of the Roman ladies, but his heart had no concern in the fiery ardours of his senses. In the arms of Cleopatra, he thought of Pompey; and this singular man, who disdained to have a partner in the empire of the world, would have blushed to have been for one instant the slave of a woman.

"We must not imagine that Cæsar was born a warrior, as Sophocles and Milton were born poets. For, if nature had made him a citizen of Sybaris, he would have been the most voluptuous of men. If in our days he had been born in Pennsylvania, he would have been the most inoffensive of Quakers, and would not have disturbed the tranquillity of the new world.

"The moderation with which he conducted himself after his victories, has been highly extolled; but in this he showed his penetration, not the goodness of his heart. Is it not obvious, that the display of certain virtues is necessary to put in motion the political machine? It was requisite that he should have the appearance of clemency, if he inclined that Rome should forgive him his victories. But what greatness of mind is there in a generosity which follows on the usurpation of the supreme power?

"Nature, while it marked Cæsar with a sublime character, gave him also that spirit of perseverance which renders it useful. He had no sooner begun to reflect, than he admired Sylla; hated him, and yet wished to imitate him. At the age of 15, he formed the project of being dictator. It was thus that the president Montesquieu conceived, in his early youth, the idea of the Spirit of Laws.

"Physical qualities as, well as moral causes, contributed to give strength to his character. Nature, which had made him for command, had given him an air of dignity. He had acquired that soft and insinuating eloquence, which is perfectly suited to seduce vulgar minds, and has a powerful influence on the most cultivated. His love of pleasnre was a merit with the fair sex; and women, who even in a republic can draw to them the suffrages and attention of men, have the highest importance in degenerate times. The ladies of his age were charmed with the prospect of having a dictator whom they might subdue by their attractions.

"In vain did the genius of Cato watch for some time to sustain the liberty of his country. It was unequal to contend with that of Cæsar. Of what avail were the eloquence, the philosophy, and the virtue of this republican, when opposed by a man who had the address to debauch the wife of every citizen whose interest he meant to engage; who, possessing an enthusiasm for glory, wept, because, at the age of 30, he had not conquered the world like Alexander; and who, with the haughty temper of a despot, was more desirous to be the first man in a village than the second in Rome.

"Cæsar had the good fortune to exist in times of trouble and civil commotions, when the minds of men are put into a ferment; when opportunities of great actions are frequent; when talents are every thing, and those who can only boast of their virtues are nothing. If he had lived an hundred years sooner, he would have been no more than an obscure villain; and, instead of giving laws to the world, would not have been able to produce any confusion in it.

"I will here be bold enough to advance an idea, which may appear paradoxical to those who weakly judge of men from what they achieve, and not from the principle which leads them to act. Nature formed in the same mould Cæsar, Mahomet, Cromwell, and Kouli Khan. They all of them united to genius that profound policy which renders it so powerful. They all of them had an evident superiority over those with whom they were surrounded; they were conscious of this superiority, and they made others conscious of it. They were all of them born subjects, and became fortunate usurpers. Had Cæsar been placed in Persia, he would have made the conquest of India; in Arabia, he would have been the founder of a new religion; in London, he would have stabbed his sovereign, or have procured his assassination under the sanction of the laws. He reigned with glory over men whom he had reduced to be slaves; and, under one aspect, he is to be considered as a hero; under another, as a monster. But it would be unfortunate, indeed, for society, if the possession of superior talents gave individuals a right to trouble its repose. Usurpers accordingly have flatterers, but no friends; strangers respect them; their subjects complain and submit; it is in their own families that humanity finds her avengers. Cæsar was assassinated by his son, Mahomet was poisoned by his wife, Kouli Khan was massacred by his nephew, and Cromwell only died in his bed because his son Richard was a philosopher.

"Cæsar, the tyrant of his country; Cæsar, who destroyed the agents of his crimes, if they failed in address; Cæsar, in fine, the husband of every wife, and the wife of every husband, has been accounted a great man by the mob of writers. But it is only the philosopher who knows how to mark the barrier between celebrity and greatness. The talents of this singular man, and the good fortune which constantly attended him till the moment of his assassination, have concealed the enormity of his actions."

CÆSAR, in Roman antiquity, a title borne by all the emperors, from Julius Cæsar to the destruction of the empire. It was also used as a title of distinction for the intended or presumptive heir of the empire, as *King of the Romans* is now used for that of the German empire.

This

This title took its rise from the surname of the first emperor C. Julius Cæsar, which, by a decree of the senate, all the succeeding emperors were to bear. Under his successor, the appellation of *Augustus* being appropriated to the emperors, in compliment to that prince, the title *Cæsar* was given to the second person in the empire, though still it continued to be given to the first; and hence the difference betwixt Cæsar used simply, and Cæsar with the addition of Imperator Augustus.

The dignity of Cæsar remained to the second of the empire, till Alexius Comnenus having elected Nicephorus Melissenus Cæsar by contract; and it being necessary to confer some higher dignity on his own brother Isaacius, he created him Sebastocrator with the precedency over Melissenus; ordering, that in all acclamations, &c. Isaacius Sebastocrator should be named the second, and Melissenus Cæsar the third.

Cæsar, *Sir Julius*, a learned civilian, was descended by the female line from the duke de Cesarini in Italy; and was born near Tottenham in Middlesex, in the year 1557. He was educated at Oxford, and afterwards studied in the university of Paris, where, in the year 1581, he was created doctor of the civil law, and two years after was admitted to the same degree at Oxford, and also became doctor of the canon law. He was advanced to many honourable employments, and for the last 20 years of his life was master of the rolls. He was remarkable for his extensive bounty and charity to all persons of worth, so that he seemed to be the almoner-general of the nation. He died in 1639, in the 79th year of his age. It is very remarkable that the manuscripts of this lawyer were offered (by the executors of some of his descendants) to a cheesemonger for waste paper; but being timely inspected by Mr Samuel Paterson, this gentleman discovered their worth, and had the satisfaction to find his judgment confirmed by the profession, to whom they were sold in lots for upwards of 500l. in the year 1757.

Cæsar *Augusta*, or *Cæsarea Augusta*, in *Ancient Geography*, a Roman colony situated on the river Iberus in the Hither Spain, before called *Salduba*, in the territories of the Edetani. Now commonly thought to be Saragosa.

CÆSAREA, the name of several ancient cities, particularly one on the coast of Phœnicia. It was very conveniently situated for trade; but had a very dangerous harbour, so that no ships could be safe in it when the wind was at south-west. Herod the Great, king of Judea, remedied this inconveniency at an immense expence and labour, making it one of the most convenient havens on that coast. He also beautified it with many buildings, and bestowed 12 years on the finishing and adorning it.

CÆSAREAN operation. See Midwifery.

CÆSARIANS, *Cæsarienses*, in Roman antiquity, were officers or ministers of the Roman emperors: They kept the account of the revenues of the emperors; and took possession, in their name, of such things as devolved or were confiscated to them.

CÆSARODUNUM, in *Ancient Geography*, a town of the Turones in Celtic Gaul; now *Tours*, the capital of Touraine. See Tours.

CÆSAROMAGUS, in *Ancient Geography*, a town of the Trinobantes in Britain; by some supposed to be *Chelmsford*, by others *Brentford*, and by others *Purfleet*.

CÆSENA, in *Ancient Geography*, a town of Gallia Cispadana, situated on the rivers Isapis and Rubicon; naw Cecena, which see.

CÆSIA sylva, in *Ancient Geography*, a wood in Germany, part of the great Sylva Hercynia, situated partly in the duchy of Cleves, and partly in Westphalia, between Wesel and Kesfield.

CÆSONES, a denomination given to those cut out of their mothers wombs. Pliny ranks this as an auspicious kind of birth; the elder Scipio Africanus, and the first of the family of Cæsars, were brought into the world in this way.

CÆSTUS, in antiquity, a large gauntlet made of raw hide, which the wrestlers made use of when they fought at the public games.—This was a kind of leathern strap, strengthened with lead or plates of iron, which encompassed the hand, the wrist, and a part of the arm, as well to defend these parts as to enforce their blows.

Cæstus, or *Cæstum*, was also a kind of girdle, made of wool, which the husband untied for his spouse the first day of marriage, before they went to bed.

This relates to Venus's girdle, which Juno borrowed of her to entice Jupiter to love her. See Cestus.

CÆSURA, in the ancient poetry, is when, in the scanning of a verse, a word is divided so, as one part seems cut off, and goes to a different foot from the rest: as,

Menti|ri no|li, nun|quam men|dacia|prosunt.

where the syllables *ri*, *li*, *quam*, and *men*, are cæsuras.

Cæsura, in the modern poetry, denotes a rest or pause towards the middle of an Alexandrian verse, by which the voice and pronunciation are aided, and the verse, as it were, divided into two hemistichs. See Pause.

CÆTERIS paribus, a Latin term in frequent use among mathematical and physical writers. The words literally signify, *the rest* (or *other things*) *being alike or equal*. Thus we say the heavier the bullet, *cæteris paribus*, the greater the range; i. e. by how much the bullet is heavier, if the length and diameter of the piece and strength of the powder be the same, by so much will the utmost range or distance of a piece of ordnance be the greater. Thus also, in a physical way, we say, the velocity and quantity circulating in a given time through any section of an artery, will, *cæteris paribus*, be according to its diameter, and nearness to or distance from the heart.

CÆTOBRIX, in *Ancient Geography*, a town of Lusitania, near the mouth of the Tagus, on the east side; now extinct. It had its name from its fishery; and there are still extant fish ponds on the shore done with plaster of Paris, which illustrate the name of the ruined city.

CAFFA, in commerce, painted cotton cloths manufactured in the East Indies, and sold at Bengal.

Caffa, or *Kaffa*, a city and port town of Crim Tartary, situated on the south-east part of that peninsula. E. Long. 37. 0. N. Lat. 44. 55.

It is the most considerable town in the country, and gives

gives name to the straits of Caffa, which run from the Euxine or Black sea, to the Palus Mæotis, or sea of Asoph.

CAFFILA, a company of merchants or travellers, who join together in order to go with more security through the dominions of the Great Mogul, and through other countries on the continent of the East Indies.

The caffila differs from a caravan, at least in Persia; for the caffila properly belongs to some sovereign, or to some powerful company in Europe; whereas a caravan is a company of particular merchants, each trading upon his own account. The English and Dutch have each of them their caffila at Gambrow. There are also such caffilas, which cross some parts of the deserts of Africa, particularly that called the *sea of sand*, which lies between the kingdom of Morocco and those of Tombut and Giago. This is a journey of 400 leagues; and takes up two months in going, and as many in coming back; the caffila travelling only by night, on account of the excessive heat of that country, The chief merchandise they bring back consists in gold dust, which they call *atibar*, and the Europeans *tibir*.

CAFFILA, on the coast of Guzerat or Cambaya, signifies a small fleet of merchant ships.

CAFFRARIA, the country of the Caffres or Hottentots, in the most southerly parts of Africa, lying in the form of a crescent about the inland country of Monomotapa, between 35° south latitude and the tropic of Capricorn; and bounded on the east, south, and west, by the Indian and Atlantic oceans. See HOTTENTOTS.

Most of the sea coasts of this country are subject to the Dutch, who have built a fort near the most southern promontory called the *Cape of Good Hope*.

CAG, or KEG, a barrel or vessel that contains some four or five gallons.

CAGANUS, or CACANUS, an appellation anciently given by the Huns to their kings. The word appears also to have been formerly applied to the princes of Muscovy, now called *czar*. From the same also, probably, the Tartar title *cham* or *can*, had its origin.

CAGE, an enclosure made of wire, wieker, or the like, interwoven lattice-wise, for the confinement of birds or wild beasts. The word is French, *cage*, formed from the Italian *gaggia*, of the Latin *cavea*, which signifies the same: *à caveis theatralibus in quibus includebantur feræ.*

Beasts were usually brought to Rome shut up in oaken or beechen cages artfully formed, and covered or shaded with boughs, that the creatures, deceived with the appearance of a wood, might fancy themselves in their forest. The fiercer sorts were pent in iron cages, lest wooden prisons might be broke through. In some prisons there are iron cages for the closer confinement of criminals. The French laws distinguish two sorts of birds cages; viz. high or singing cages, and low or dumb cages; those who expose birds to sale are obliged to put the hens in the latter, and the cocks in the former, that persons may not be imposed on by buying a hen for a cock.

CAGES (*caveæ*), denote also places in the ancient amphitheatres, wherein wild beasts were kept, ready to be let out for sport. The *caveæ* were a sort of iron cages, different from dens, which were under ground and dark; whereas the *caveæ* being airy and light, the beasts rushed out of them with more alacrity and fierceness than if they had been pent under ground.

CAGE, in carpentry, signifies an outer work of timber, inclosing another within it. In this sense we say, *the cage of a wind-mill*, The cage of a staircase denotes the wooden sides or walls which enclose it.

CAGEAN, or CAGAYAN, a province of the island of Luzon, or Manilla, in the East Indies. It is the largest in the island, being 80 leagues in length and 40 in breadth. The principal city is called *New Segovia*, and 15 leagues eastward from this city lies Cape Bajador. Doubling that cape, and coasting along 20 leagues from north to south, the province of Cagean ends, and that of Illocos begins. The peaceable Cageans who pay tribute are about 9000; but there are a great many not subdued. The whole province is fruitful; the men apply themselves to agriculture, and are of a martial disposition; and the women apply to several works in cotton. The mountains afford food for a vast number of bees; in consequence of which wax is so plenty, that all the poor burn it instead of oil. They make their candles after the following manner; they leave a small hole at each end of a hollow stick for the wick to run through, and then, stopping the bottom, fill it with wax at the top; when cold, they break the mould and take out the candle. On the mountains there is abundance of brasil, ebony, and other valuable woods. In the woods are store of wild beasts, as boars; but not so good as those of Europe. There are also abundance of deer, which they kill for their skins and horns to sell to the Chinese.

CAGLI, an ancient episcopal town of Italy, in the duchy of Urbino, situated at the foot of the Apennine mountains. E. Long. 14. 12. N. Lat. 43. 30.

CAGLIARI, PAOLO, called *Paulo Veronese*, an excellent painter, was born at Verona in the year 1532. Gabriel Cagliari his father was a sculptor, and Antonio Badile his uncle was his master in painting. He was not only esteemed the best of all the Lombard painters, but for his extensive talents in the art was peculiarly styled *Il pittor felice*, "the happy painter;" and there is scarcely a church in Venice where some of his performances are not to be seen. De Pile says that "his picture of the marriage at Cana, in the church of St George, is to be distinguished from his other works, as being not only the triumph of Paul Veronese, but also the triumph of painting itself." When the senate sent Grimani, procurator of St Mark, to be their ambassador at Rome, Paul attended him, but did not stay long, having left some pieces at Venice unfinished. Philip II. king of Spain, sent for him to paint the Escurial, and made him great offers; but Paul excused himself from leaving his own country, where his reputation was so well established, that most of the princes of Europe ordered their several ambassadors to procure something of his hand at any rate. He was indeed highly esteemed by all the principal men in his time; and so much admired by the great masters, as well his contemporaries, as those who succeeded him, that Titian himself used to say, he was the ornament of his profession. And Guido Reni being asked which of the masters his predecessors he would

would choose to be, were it in his power, after Raphael and Corregio, named Paul Veronese; whom he always called his Paolino. He died of a fever at Venice in 1588, and had a tomb and a statue of brass erected to his memory in the church of St Sebastian. He left great wealth to his two sons Gabriel and Charles, who lived happily together, and joined in finishing several of their father's imperfect pieces with good success.

CAGLIARI, an ancient, large, and rich town, capital of the island of Sardinia in the Mediterranean. It is seated on the declivity of a hill; is an university, an archbishopric, and the residence of the viceroy. It has an excellent harbour, and a good trade; but is a place of no great strength. It was taken, with the whole island, by the English in 1708, who transferred it to the emperor Charles VI.; but it was retaken by the Spaniards in 1717, and about two years afterwards ceded to the duke of Savoy in lieu of Sicily, and hence he has the title of *King of Sardinia*. E. Long. 9. 14. N. Lat. 39. 12.

CAGUI, in *Zoology*, a synonyme of two species of monkeys, viz the jacchus and œdipus. See SIMIA, MAMMALIA *Index*.

CAHORS, a considerable town of France in Guienne, now in the department of Lot. It is seated on a peninsula made by the river Lot, and built partly on a craggy rock. The principal street is very narrow; and terminates in the market place, in which is the town house. The cathedral is a Gothic structure, and has a large square steeple. The fortifications are regular, and the town contained 10,136 inhabitants in 1815. E. Long. 1. 6. N. Lat. 44. 26.

CAHYS, a dry measure for corn, used in some parts of Spain, particularly at Seville and Cadiz. It is near a bushel of our measure.

CAJANABURG, the capital of the province of Cajania or East Bothnia in Sweden, situated on the north-east part of the lake Cajania, in E. Long. 27. 0. N. Lat. 63. 50.

CAIAPHAS, high priest of the Jews after Simon, condemned Christ to death; and was put out of his place by the emperor Vitellius, for which disgrace he made away with himself.

CAJAZZO, a town of the province of Lavoro in the kingdom of Naples, situated in E. Long. 15. 0. N. Lat. 41. 15.

CAICOS, the name of some American islands to the north of St Domingo, lying from W. Long. 112. 10. to 113. 16. N. Lat. 21. 40.

CAJEPUT, an oil brought from the East Indies, resembling that of cardamoms. See MELALEUCA.

CAIETA, in *Ancient Geography*, a port and town of Latium, so called from Æneas's nurse; now *Gaeta*, which see.

CAJETAN, CARDINAL, was born at Cajeta in the kingdom of Naples in the year 1469. His proper name was *Thomas de Vio*: but he adopted that of *Cajetan* from the place of his nativity. He defended the authority of the pope, which suffered greatly at the council of Nice, in a work entitled *Of the power of the Pope;* and for this work he obtained the bishopric of Cajeta. He was afterwards raised to the archiepiscopal see of Palermo, and in 1517 was made a cardinal by Pope Leo X. The year after, he was sent as legate into Germany, to quiet the commotions raised against indulgences by Martin Luther: but Luther, under protection of Frederic elector of Saxony, set him at defiance; for though he obeyed the cardinal's summons, in repairing to Augsburg, yet he rendered all his proceedings ineffectual. Cajetan was employed in several other negotiations and transactions, being as ready at business as at letters. He died in 1534. He wrote Commentaries upon Aristotle's philosophy, and upon Thomas Aquinas's theology; and made a literal translation of the Old and New Testaments.

CAIFONG, a large, populous, and rich town of Asia, in China, seated in the middle of a large and well cultivated plain. It stands in a bottom; and when besieged by the rebels in 1642, they ordered the dykes of the river Hoang-ho to be cut, which drowned the city and destroyed 300,000 of its inhabitants. E. Long. 113. 27. N. Lat. 35. 0.

CAILLE, NICHOLAS LOUIS DE LA, an eminent mathematician and astronomer, was born at a small town in the diocese of Rheims in 1713. His father had served in the army, which he quitted, and in his retirement studied mathematics; and amused himself with mechanic exercises, wherein he proved the happy author of several inventions of considerable use to the public. Nicholas, almost in his infancy, took a fancy to mechanics, which proved of signal service to him in his maturer years. He was sent young to school at Mantes-sur-Seine, where he discovered early tokens of genius. In 1729, he went to Paris; where he studied the classics, philosophy, and mathematics. Afterwards he went to study divinity at the college de Navarre, proposing to embrace an ecclesiastical life. At the end of three years he was ordained a deacon, and officiated as such in the church of the college de Mazarin several years; but he never entered into priests orders, apprehending that his astronomical studies, to which he became most assiduously devoted, might too much interfere with his religious duties. In 1739, he was conjoined with M. de Thury, son to M. Cassini, in verifying the meridian of the royal observatory through the whole extent of the kingdom of France. In the month of November the same year, whilst he was engaged day and night in the operations which this grand undertaking required, and at a great distance from Paris, he was, without any solicitation, elected into the vacant mathematical chair which the celebrated M. Varignon had so worthily filled. Here he began to teach about the end of 1740; and an observatory was ordered to be erected for his use in the college, and furnished with a suitable apparatus of the best instruments. In May 1741, M. de la Caille was admitted into the Royal Academy of Sciences as an adjoint member for astronomy. Besides the many excellent papers of his dispersed up and down in their Memoirs, he published Elements of Geometry, Mechanics, Optics, and Astronomy. Moreover, he carefully computed all the eclipses of the sun and moon that had happened since the Christian era, which were printed in a book published by two Benedictines, entitled *l' Art de Verifier les Dates*, &c. Paris, 1750, in 4to. Besides these he compiled a volume of astronomical ephemerides for the years 1745 to 1755; another for the years 1755 to 1765; a third for the years 1765 to 1775; an excellent work entitled *Astronomiæ Fundamenta*

 menta

Caille.

menta novissimis solis et stellarum observationibus stabilita: and the most correct solar tables that ever appeared. Having gone through a seven years series of astronomical observations in his own observatory, he formed a project of going to observe the southern stars at the Cape of Good Hope. This was highly approved by the academy, and by the prime minister Comte de Argenson, and very readily agreed to by the states of Holland. Upon this he drew up a plan of the method he proposed to pursue in his southern observations; setting forth, that, besides settling the places of the fixed stars, he proposed to determine the parallax of the moon, Mars, and Venus. But whereas this required correspondent observations to be made in the northern parts of the world, he sent to those of his correspondents who were expert in practical astronomy previous notice in print, what observations he designed to make at such and such times for the said purpose. At length, on the 21st of November 1750, he sailed for the Cape, and arrived there on the 19th of April 1751. He forthwith got his instruments on shore: and, with the assistance of some Dutch artificers, set about building an astronomical observatory, in which his apparatus of instruments was properly disposed of as soon as it was in a fit condition to receive them.

The sky at the Cape is generally pure and serene, unless when a south-east wind blows: But this is often the case, and when it is, it is attended with some strange and terrible effects. The stars look bigger, and seem to caper; the moon has an undulating tremor; and the planets have a sort of beard like comets. Two hundred and twenty-eight nights did our astronomer survey the face of the southern heavens: during which space, which is almost incredible, he observed more than 10,000 stars; and whereas the ancients filled the heavens with monsters and old wives tales, the Abbé de la Caille chose rather to adorn them with the instruments and machines which modern philosophy has made use of for the conquest of nature *. With no less success did he attend to the parallax of the moon, Mars, Venus, and the sun. Having thus executed the purpose of his voyage, and no present opportunity offering for his return, he thought of employing the vacant time in another arduous attempt; no less than that of taking the measure of the earth, as he had already done that of the heavens. This, indeed, had, through the munificence of the French king, been done before by different sets of learned men, both in Europe and America; some determining the quantity of a degree under the equator, and others under the arctic circles; but it had not as yet been decided whether in the southern parallels of latitude the same dimensions obtained as in the northern. His labours were rewarded with the satisfaction he wished for; having determined a distance of 410,814 feet from a place called *Klip Fontyn* to the Cape, by means of a base of 38,802 feet, three times actually measured: whence he discovered a new secret of nature, namely, that the radii of the parallels in south latitude are not the same as those of the corresponding parallels in north latitude. About the 23d degree of south latitude he found a degree on the meridian to contain 342,222 Paris feet. He returned to Paris the 27th of September 1754; having, in his almost four years absence, expended no more than 9144 livres on himself and his companion; and at his coming into port, he refused a bribe of 100,000 livres, offered by one who thirsted less after glory than gain, to be sharer in his immunity from customhouse searches.

* See the Planisphere in his *Cœlum australe stelliferum*.

Caille, Caimacan.

After receiving the congratulatory visits of his more intimate friends and the astronomers, he first of all thought fit to draw up a reply to some strictures which Professor Euler had published relative to the meridian, and then he settled the results of the comparison of his own with the observations of other astronomers for the parallaxes. That of the sun he fixed at $9\frac{1}{2}''$; of the moon at $56' 56''$; of Mars in his opposition, $36''$; of Venus, $38''$. He also settled the laws whereby astronomical refractions are varied by the different density or rarity of the air, by heat or cold, and dryness or moisture. And, lastly, he showed an easy, and by common navigators practicable, method of finding the longitude at sea by means of the moon, which he illustrated by examples selected from his own observations during his voyages. His fame being now established upon so firm a basis, the most celebrated academies of Europe claimed him as their own: and he was unanimously elected a member of the royal society at London; of the institute of Bologna; of the imperial academy at Petersburgh; and of the royal academies at Berlin, Stockholm, and Gottingen. In the year 1760, M. de la Caille was attacked with a severe fit of the gout; which, however, did not interrupt the course of his studies; for he then planned out a new and immense work; no less than the history of astronomy through all ages, with a comparison of the ancient and modern observations, and the construction and use of the instruments employed in making them. In order to pursue the task he had imposed upon himself in a suitable retirement, he obtained a grant of apartments in the royal palace of Vincennes; and whilst his astronomical apparatus was erected there, he began printing his Catalogue of the Southern Stars, and the third volume of his Ephemerides. The state of his health was, towards the end of the year 1763, greatly reduced. His blood grew inflamed; he had pains of the head, obstructions of the kidneys, loss of appetite, with a fulness of the whole habit. His mind remained unaffected, and he resolutely persisted in his studies as usual. In the month of March, medicines were administered to him, which rather aggravated than alleviated his symptoms; and he was now sensible, that the same distemper which in Africa, ten years before, yielded to a few simple remedies, did in his native country bid defiance to the best physicians. This induced him to settle his affairs: his manuscripts he committed to the care and discretion of his esteemed friend M. Maraldi. It was at last determined that a vein should be opened; but this brought on an obstinate lethargy, of which he died, aged 49.

CAIMACAN, or KAIMACAM, in the Turkish affairs, a dignity in the Ottoman empire, answering to lieutenant, or rather deputy, amongst us.

There are usually two caimacans; one residing at Constantinople, as governor thereof; the other attends the grand vizir in quality of his lieutenant, secretary of state, and first minister of his council, and gives audience to ambassadors. Sometimes there is a third

third caimacan, who attends the sultan; whom he acquaints with any public disturbances, and receives his orders concerning them.

CAIMAN or CAYMAN ISLANDS, certain American islands lying south of Cuba and north-west of Jamaica, between 81° and 86° of west longitude, and in 21° of north latitude. They are most remarkable on account of the fishery of tortoise, which the people of Jamaica catch here and carry home alive, keeping them in pens for food, and killing them as they want them.

CAIN, eldest son of Adam and Eve, killed his brother Abel; for which he was condemned by God to banishment and a vagabond state of life. Cain retired to the land of Nod, on the east of Eden; and built a city, to which he gave the name of his son Enoch.

CAINITES, a sect of heretics in the 2d century, so called on account of their great respect for Cain. They pretended that the virtue which produced Abel was of an order inferior to that which had produced Cain, and that this was the reason why Cain had the victory over Abel and killed him; for they admitted a great number of genii, which they called *virtues*, of different ranks and orders. They made profession of honouring those who carry in Scripture the most visible marks of reprobation; as the inhabitants of Sodom, Esau, Korah, Dathan, and Abiram. They had, in particular, a very great veneration for the traitor Judas, under pretence that the death of Jesus Christ had saved mankind. They had a forged gospel of Judas, to which they paid great respect.

CAIRNS, or CARNES, the vulgar name of those heaps of stones which are to be seen in many places of Britain, particularly Scotland and Wales.—They are composed of stones of all dimensions thrown together in a conical form, a flat stone crowning the apex; (see Plate CXXXV.).

Various causes have been assigned by the learned for these heaps of stones. They have supposed them to have been, in times of inauguration, the places where the chieftain elect stood to show himself to best advantage to the people; or the place from whence judgement was pronounced; or to have been erected on the road-side in honour of Mercury; or to have been formed in memory of some solemn compact, particularly where accompanied by standing pillars of stones; or for the celebration of certain religious ceremonies. Such might have been the reasons, in some instances, where the evidences of stone chests and urns are wanting: but these are so generally found that they seem to determine the most usual purpose of the piles in question to have been for sepulchral monuments. Even this destination might render them suitable to other purposes; particularly religious, to which by their nature they might be supposed to give additional solemnity.—According to Toland, fires were kindled on the tops of flat stones, at certain times of the year, particularly on the eves of the 1st of May and the 1st of November, for the purpose of sacrificing; at which time all the people having extinguished their domestic hearths, rekindled them from the sacred fires of the cairns. In general, therefore, these accumulations appear to have been designed for the sepulchral protection of heroes and great men. The stone chests, the repository of the urns and ashes, are lodged in the earth beneath: sometimes only one, sometimes more, are found thus deposited; and Mr Pennant mentions an instance of 17 being discovered under the same pile.

Cairns are of different sizes, some of them very large. Mr Pennant describes one in the island of Arran, 114 feet over, and of a vast height. They may justly be supposed to have been proportioned in size to the rank of the person, or to his popularity: the people of a whole district assembled to show their respect to the deceased; and, by an active honouring of his memory, soon accumulated heaps equal to those that astonish us at this time. But these honours were not merely those of the day; as long as the memory of the deceased endured, not a passenger went by without adding a stone to the heap: they supposed it would be an honour to the dead, and acceptable to his manes.

Quanquam festinas, non est mora longa: licebit
Injecta ter pulvera, curras.

To this moment there is a proverbial expression among the Highlanders allusive to the old practice; a suppliant will tell his patron, *Curri mi cloch er do charne*, "I will add a stone to your cairn;" meaning, when you are no more, I will do all possible honour to your memory.

Cairns are to be found in all parts of our islands, in Cornwall, Wales, and all parts of North Britain; they were in use among the northern nations; Dahlberg, in his 323d plate, has given the figure of one. In Wales they are called *carneddau;* but the proverb taken from them there, is not of the complimental kind: *Karn ar dy ben*, or, "A cairn on your head," is a token of imprecation.

CAIRO, or GRAND CAIRO, the capital of Egypt, situated in a plain at the foot of a mountain, in E. Long. 32. 0. N. Lat. 30. 0. It was founded by Jawhar, a Magrebian general, in the year of the Hegira 358. He had laid the foundation of it under the horoscope of Mars; and for that reason gave his new city the name of *Al Kahira*, or the *Victorious*, an epithet applied by the Arab astronomers to that planet. In 362 it became the residence of the caliphs of Egypt, and of consequence the capital of that country, and has ever since continued to be so. It is divided into the New and Old cities. Old Cairo is on the eastern side of the river Nile, and is now almost uninhabited. The new, which is properly Cairo, is seated in a sandy plain about two miles and a half from the old city. It stands on the western side of the Nile, from which it is not three quarters of a mile distant. It is extended along the mountain on which the castle is built, for the sake of which it was removed hither, in order, as some pretend, to be under its protection. However, the change is much for the worse, as well with regard to air as water, and the pleasantness of the prospect. Bulack may be called the port of Cairo; for it stands on the bank of the Nile, about a mile and a half from it, and all the corn and other commodities are landed there before they are brought to the city. Some travellers have made Cairo of a most enormous magnitude, by taking in the old city, Bulack, and the new; the real circumference of it, however, is not above ten miles, but it is extremely populous. The first thing that strikes a traveller is the narrowness of the

streets,

Cairo. streets, and the appearance of the houses. These are so daubed with mud on the outside, that you would think they were built with nothing else. Besides, as the streets are unpaved, and always full of people, the walking in them is very inconvenient, especially to strangers. To remedy this, there are a great number of asses, which always stand ready to be hired for a trifle, that is, a penny a mile. The owners drive them along, and give notice to the crowd to make way. And here it may be observed, that the Christians in this, as well as other parts of the Turkish dominions, are not permitted to ride upon horses. The number of the inhabitants can only be guessed at. Volney thinks it may amount to 200,000; but some later travellers estimate it as high as 300,000 or 400,000. The houses are from one to two or three stories high, and flat at the top; where they take the air, and often sleep all night. The better sort of these have a court on the inside like a college. The common run of houses have very little room, and even among great people it is usual for 20 or 30 to lie in a small hall. Some houses will hold 300 persons of both sexes, among whom are 20 or 30 slaves; and those of ordinary rank have generally three or four.

There is a canal, called *khalis*, which runs along the city from one end to the other, with houses on each side, which makes a large straight street. Besides this, there are several lakes, which are called *birks* in the language of the country. The principal of these, which is near the castle, is 500 paces in diameter. The most elegant houses in the city are built on its banks; but what is extraordinary, eight months in the year it contains water, and the other four it appears with a charming verdure. When there is water sufficient, it is always full of gilded boats, barges, and barks, in which people of condition take their pleasure towards night, at which time there are curious fire-works, and variety of music.

New Cairo is surrounded with walls built with stone, on which are handsome battlements, and at the distance of every hundred paces there are very fine towers, which have room for a great number of people. The walls were never very high, and are in many places gone to ruin. The basha lives in the castle, which was built by Saladine 700 years ago. It stands in the middle of the famous mountain Moketan, which terminates in this place, after it had accompanied the Nile from Ethiopia hither. This castle is the only place of defence in Egypt; and yet the Turks take no notice of its falling, insomuch that in process of time it will become a heap of rubbish. The principal part in it is a magnificent hall, environed with 12 columns of granite, of a prodigious height and thickness, which sustain an open dome, under which Saladine distributed justice to his subjects. Round this dome there is an inscription in relievo, which determines the date and by whom it was built. From this place the whole city of Cairo may be seen, and above 30 miles along the Nile, with the fruitful plains that lie near it, as well as the mosques, pyramids, villages, and gardens, with which these fields are covered. These granite pillars were the work of antiquity, for they were got out of the ruins of Alexandria. There are likewise in the mosques and in the principal houses no less than 40,000 more, besides great magazines, where all kinds are to be had at very low rates. A janizary happened to find five in his garden, as large as those in the castle; but could not find any machine of strength sufficient to move them, and therefore had them sawed in pieces to make millstones. It is believed that there have been 30 or 40,000 of these pillars brought from Alexandria, where there are yet many more to be had. The gates of Cairo are three, which are very fine and magnificent.

There are about 300 public mosques in this city, some of which have six minarets. The mosqne of Asher hath several buildings adjoining, which were once a famous university, and 14,000 scholars and students were maintained on the foundation; but it has now not above 1400, and those are only taught to read and write. All the mosques are built upon the same plan, and differ only in magnitude. The entrance is through the principal gate into a large square, open on the top, but well paved. Round this are covered galleries, supported by pillars, under which they say their prayers, in the shade. On one side of the square there are particular places with basons of water for the conveniency of performing the ablutions enjoined by the Koran. The most remarkable part of the mosque, besides the minaret, is the dome. This is often bold, well proportioned, and of an astonishing magnitude. The inside stones are carved like lace, flowers, and melons. They are built so firm, and with such art, that they will last 600 or 700 years. About the outward circumference there are large Arabic inscriptions in relievo, which may be read by those who stand below, though they are sometimes of a wonderful height.

The khanes or caravanseras are numerons and large, with a court in the middle, like their houses. Some are several stories high, and are always full of people and merchandise. The Nubians, the Abyssinians, and other African nations, which come to Cairo, have one to themselves, where they always meet with lodging. Here they are secure from insults, and their effects are all safe. Besides these, there is a bazar, or market, where all sorts of goods are to be sold. This is in a long broad street; and yet the crowd is so great, you can hardly pass along. At the end of this street is another short one, but pretty broad, with shops full of the best sort of goods and precious merchandise. At the end of this short street there is a great khane, where all sorts of white slaves are to be sold. Farther than this is another khane, where a great number of blacks, of both sexes, are exposed to sale. Not far from the best market place is a mosque, and an hospital for mad people. They also receive and maintain sick people in this hospital, but they are poorly looked after.

Old Cairo has scarce any thing remarkable but the granaries of Joseph; which are nothing but a high wall, lately built, which includes a square spot of ground where they deposit wheat, barley, and other grain, which is a tribute to the basha, paid by the owners of land. This has no other covering but the heavens, and therefore the birds are always sure to have their share. There is likewise a tolerably handsome church, which is made use of by the Copts, who are Christians, and the original inhabitants of Egypt.

Joseph's

Cairo || Caisson.

Joseph's well is in the castle, and was made by King Mohammed about 700 years ago. It is called *Joseph's well*, because they attribute every thing extraordinary to that remarkable person. It is cut in a rock, and is 280 feet in depth. The water is drawn up to the top by means of oxen, placed on platforms, at proper distances, which turn about the machines that raise it. The descent is so sloping, that, though there are no steps, the oxen can descend and ascend with ease.

The river Nile, to which not only Cairo, but all Egypt is so much indebted, is now known to have its rise in Abyssinia. The increase of the Nile generally begins in May, and in June they commonly proclaim about the city how much it is risen. Over against old Cairo the basha has a house, wherein the water enters to a column, which has lines at the distance of every inch, and marks at every two feet as far as 30. When the water rises to 22 feet, it is thought to be of a sufficient height; when it rises much higher, it does a great deal of mischief. There is much pomp and ceremony used in letting the water into the canal above mentioned. See EGYPT.

The inhabitants of Cairo are a mixture of Moors, Turks, Jews, Greeks, and Copts or Coptis. The only difference between the habit of the Moors and Copts is their turbans; those of the Moors being white, and of the Copts white striped with blue. The common people generally wear a long black loose frock, sewed together all down before. The Jews wear a frock of the same fashion, made of cloth; and their caps are like a high-crowned hat, without brims, covered with the same cloth, but not so taper. The Jewish women's are not very unlike the men's, but more light and long. The Greeks are habited like the Turks, only their turbans differ.

Provisions of all kinds are exceedingly plenty; for 20 eggs may be bought for a parah or penny, and bread is six times as cheap as with us. They have almost all sorts of flesh and fish; and in particular have tame buffaloes which are very useful. They bring goats into the streets in great numbers to sell their milk. Their gardens are well stocked with fruit trees of various kinds, as well as roots, herbs, melons, and cucumbers. The most common flesh meat is mutton. The goats are very beautiful, and have ears two feet in length; but their flesh is in no great esteem. See farther the article EGYPT.

CAIROAN, or CAIRWAN, a city of Africa, in the kingdom of Tunis, seated in a sandy barren soil, about five miles from the gulf of Capres. It has neither spring, well, nor river; for which reason they are obliged to preserve rain water in tanks and cisterns. It was built by the Aglabites; and is the ancient Cyrene *, but hath now lost its splendour. There is still, however, s very superb mosque, and the tombs of the kings of Tunis are yet to be seen. E. Long. 9. 12. N. Lat. 35. 40.

* See *Barbary*.

CAISSON, in the military art, a wooden chest, into which several bombs are put, and sometimes filled only with gunpowder: this is buried under some work whereof the enemy intend to possess themselves, and, when they are masters of it, is fired, in order to blow them up.

CAISSON is also used for a wooden frame or chest used in laying the foundations of the piers of a bridge.

Caisson, Caithness.

CAITHNESS, otherwise called the *shire of Wick*, is the most northern county of all Scotland; bounded on the east by the ocean, and by Strathnaver and Sutherland on the south and south-west: from these it is divided by the mountain of Orde, and a continued ridge of hills as far as Knockfin, then by the whole course of the river Hallowdale. On the north it is washed by the Pentland or Pictland frith, which flows between this county and the Orkneys. It extends 35 miles from north to south, and about 20 from east to west. The coast is rocky, and remarkable for a number of bays and promontories. Of these, the principal are Sandside-head to the west, pointing to the opening of Pentland frith; Orcas, now Holborn-head, and Dunnet-head, both pointing northward to the frith. Dunnet-head is a peninsula about a mile broad, and seven in compass; affording several lakes, good pasture, excellent mill-stones, and a lead mine. Scribister bay, on the north-west, is a good harbour, where ships may ride securely. Rice-bay, on the east side, extends three miles in breadth; but it is of dangerous access, on account of some sunk rocks at the entrance. At the bottom of this bay appear the ruins of two strong castles, the seat of the earl of Caithness, called *Castle Sinclair*, and Gernego, joined to each other by a draw-bridge. Duncan's bay, otherwise called *Dunsby-head*, is the north-east point of Caithness, and the extremest promontory in Britain. At this place, the breadth of the frith does not exceed 12 miles, and in the neighbourhood is the ordinary ferry to the Orkneys. Here is likewise Clytheness pointing east, and Noshead pointing north-east. The sea in this place is very impetuous, being in continual agitation from violent counter tides, currents, and vortices. The only island belonging to this county is that of Stroma, in the Pentland frith, at the distance of two miles from the main land, extending about a mile in length, and producing good corn. The navigation is here rendered very difficult by conflicting tides and currents, which at both ends of the island produce a great agitation in the sea. At the south end, the waves dance so impetuously, that the sailors term them the *merry men of May*, from the name of a gentleman's seat on the opposite shore of Caithness, which served them as a land mark, in the dangerous passage between the island and the continent. The property of this island was once disputed between the earls of Orkney and Caithness; but adjudged to the latter, in consequence of an experiment, by which it appeared, that venomous creatures will live in Stroma, whereas they die immediately if transported to the Orkneys. The county of Caithness, though chiefly mountainous, flattens towards the sea coast, where the ground is arable, and produces good harvests of oats and barley, sufficient for the natives, and yielding a surplus for exportation. Caithness is well watered with small rivers, brooks, lakes, and fountains, and affords a few woods of birch, but is in general bare of trees; and even those the inhabitants plant are stunted in their growth. Lead is found at Dunnet, copper at Old Urk, and iron ore at several places; but these advantages are not improved. The air of Caithness is temperate, though in the latitude of 58°, where the longest day in summer is computed at 18 hours; and when the sun sets he makes

Caithness. so small an arch of a circle below the horizon, that the people enjoy a twilight until he rises again. The fuel used by the inhabitants of Caithness consists of peat and turf, which the ground yields in great plenty. The forests of Morravins and Berridale afford abundance of red deer and roe-bucks; the county is well stored with hares, rabbits, grouse, heathcocks, plover, and all sorts of game, comprehending a bird called *snow-fleet*, about the size of a sparrow, exceedingly fat and delicious, that comes hither in large flights about the middle of February, and takes its departure in April. The hills are covered with sheep and black cattle; so numerous, that a fat cow has been sold at market for 4s. sterling. The rocks along the coasts are frequented by eagles, hawks, and all manner of sea fowl, whose eggs and young are taken in vast quantities by the natives. The rivers and lakes abound with trout, salmon, and eels; and the sea affords a very advantageous fishery. Divers obelisks and ancient monuments appear in this district, and several Romish chapels are still standing. Caithness is well peopled with a race of hardy inhabitants, who employ themselves chiefly in fishing, and breeding sheep and black cattle: they are even remarkably industrious; for between Wick and Dunbeath, one continued tract of rugged rocks, extending 12 miles, they have formed several little harbours for their fishing boats, and cut artificial steps from the beach to the top of the rocks, where they have erected houses, in which they cure and dry the fish for market.

According to Mr Pennant, this county is supposed to send out in some years about 20,000 head of black cattle, but in bad seasons the farmer kills and salts great numbers for sale. Great numbers of swine are also reared here. These are short, high-backed, long-bristled, sharp, slender, and long-nosed; have long erect ears, and most savage looks. Here are neither barns nor granaries; the corn is threshed out, and preserved in the chaff in byks; which are stacks, in the shape of bee-hives, thatched quite round, where it will keep good for two years. Vast numbers of salmon are taken at Castle-hill, Dunnet, Wick, and Thurso. A miraculous draught at this last place is still talked of, not less than 2500 being taken at one tide within the memory of man; and Mr Smollet informs us, that, in the neighbourhood, above 300 good salmon have been taken at one draught of the net. In the month of November, great numbers of seals are taken in the caverns that open into the sea, and run some hundreds of yards under ground. The entrance of these caverns is narrow, but the inside lofty and spacious. The seal hunters enter these in small boats with torches, which they light as soon as they land, and then with loud shouts alarm the animals, which they kill with clubs as they attempt to pass. This is a hazardous employment; for, should the wind blow hard from sea, these adventurers are inevitably lost. Sometimes a large species of seals, 12 feet long, have been killed on this coast; and it is said the same kind are found on the rock Hiskir, one of the Western islands. During the spring, great quantities of lump fish resort to this coast, and are the prey of the seals, as appears from the number of skins of those fishes which at that season float ashore. At certain times also the seals seem to be visited by a great mortality; for, at those times, multitudes of them are seen dead in the water. Much limestone is found in this county, which when burnt is made into a compost with turf and sea plants.

The discovery of coal has long been an object of great importance in this part of Scotland. In the years 1801 and 1802 some attempts were made for this purpose at the expence of government. But although the business was conducted by persons well skilled in such matters, and long persevered in, it has entirely failed, which leaves little hope of future success.

The following is the population of the county of Caithness, according to the parishes, taken at two different periods, namely in 1755 and in 1798, and extracted from the Statistical History of Scotland.

Parishes.	Population in 1755.	Population in 1790—98.
Bower	1287	1592
Canisby	1481	1950
Dunnet	1235	1399
Halkirk	3075	3180
Latheron	3675	4006
Olrick	875	1001
Reay	2262	2298
Thurso	2963	3146
Wattin	1424	1230
Wick	3938	5000
Total	22,215	24,802
Population in 1811,	23,419	

See CAITHNESS, SUPPLEMENT.

CAIUS, KAYE, or *Keye*, Dr JOHN, the founder of Caius College in Cambridge, was born at Norwich in 1510. He was admitted very young a student in Gonville Hall in the above-mentioned university; and at the age of 21 translated from Greek into Latin some pieces of divinity, and into English Erasmus's paraphrase on Jude, &c. From these his juvenile labours, it seems probable that he first intended to prosecute the study of divinity. Be that as it may, he travelled to Italy, and at Padua studied physic under the celebrated Montanus. In that university he continued some time, where we are told he read Greek lectures with great applause. In 1543, he travelled through part of Italy, Germany, and France; and returning to England commenced doctor of physic at Cambridge. He practised first at Shrewsbury, and afterwards at Norwich; but removing to London, in 1547, he was admitted fellow of the college of physicians, to which he was several years president. In 1557, being then physician to Queen Mary, and in great favour, he obtained a licence to advance Gonville-hall, where he had been educated, into a college; which he endowed with several considerable estates, adding an entire new square at the expence of 1834l. Of this college he accepted the mastership, which he kept till within a short time of his death. He was physician to Edward VI. Queen Mary, and Queen Elizabeth. Towards the latter end of his life he retired to his own college at Cambridge; where, having resigned the mastership to Dr Legge of Norwich, he spent the remainder of his life as a fellow commoner. He did in July 1573, aged 63; and was buried in the chapel of his own college. Dr Caius was a a learned, active, benevolent man. In 1557, he erected a monument in St Paul's to the memory of the famous Linacre. In 1563, he obtained a grant for the college of physicians to take the bodies of two malefactors annually for dissection; and he was the inventor of the *insignia* which distinguish the president from the rest of the fellows. He wrote, 1. Annals of the college from 1555 to 1572. 2. Translation of several of Galen's works; printed at different times abroad. 3. *Hippocrates de Medicamentis;* first discovered and published by our author; also *De ratione victus*, Lov. 1556, 8vo. 4. *De Medendi Methodo.* Basil, 1554. Lond. 1556, 8vo. 5. Account of the sweating sickness in England. Lond. 1556, 1721. It is entitled *De ephemera Britannica.* 6. History of the university of Cambridge. Lond. 1568, 8vo. 1574, 4to. in Latin. 7. *De thermis Britannicis.* Doubtful whether ever printed. 8. Of some rare plants and animals. Lond. 1570. 9. *De canibus Britannicis*, 1570, 1729. 10. *De pronunciatione Græcæ et Latinæ Linguæ.* Lond. 1574. 11. *De libris propriis.* Lond. 1570. Besides many other works which never were printed.

CAKE, a finer sort of bread, denominated from its flat round figure.

We meet with different compositions under the name of *cakes;* as *seed-cakes*, made of flour, butter, cream, sugar, coriander, and caraway seeds, mace, and other spices and perfumes, baked in the oven; *plum-cake*, made much after the same manner, only with fewer seeds, and the addition of currants: *pan-cakes*, made of a mixture of flour, eggs, &c. fried; *cheese-cakes*, made of cream, eggs, and flour, with or without cheese-curd, butter, almonds, &c.; *oat-cakes*, made of fine oaten flour, mixed with yeast and sometimes without, rolled thin, and laid on an iron or stone to bake over a slow fire; *sugar-cakes*, made of fine sugar beaten and searced with the finest flour, adding butter, rose-water, and spices; *rose-cakes*, (*placentæ rosaceæ*), are leaves of roses dried and pressed into a mass, sold in the shops for epithems.

The Hebrews had several sorts of cakes, which they offered in the temple. They were made of the meal either of wheat or barley; they were kneaded sometimes with oil and sometimes with honey. Sometimes they only rubbed them over with oil when they were baked, or fried them with oil in a frying-pan upon the fire. In the ceremony of Aaron's consecration, they sacrificed a calf and two rams, and offered unleavened bread, and cakes unleavened, tempered with oil, and wafers unleavened, anointed with oil; the whole made of fine wheaten flour. Ex. xxix. 1, 2.

CAKET, a town of Asia, in Persia, in the province of Curdistan near Mount Caucasus. Its trade consists chiefly in silks. E. Long. 46. 15. N. Lat. 43. 32.

CALABASH, in *Commerce*, a light kind of vessel formed of the shell of a gourd, emptied and dried, serving to put divers kinds of goods in, as pitch, rosin, and the like. The word in Spanish, *Calabacca*, which signifies the same. The Indians also, both of the North and South sea, put the pearls they have fished in calabashes, and the negroes on the coast of Africa do the same by their gold dust. The smaller calabashes are also frequently used by these people as a measure, by which they sell these precious commodities to the Europeans. The same vessels likewise serve for putting liquors in; and do the office of cups, as well as bottles, for soldiers, pilgrims, &c.

Calabash-Tree. See Crescentia, Botany *Index.*

African Calabash-Tree. See Adansonia, Botany *Index.*

CALABRIA, a country of Italy, in the kingdom of Naples, divided into Calabria Ultra and Calabria Citra, commonly called *Ulterior* and *Citerior*, or Farther and Hither Calabria. Calabria Citerior is one of the 12 provinces of the kingdom of Naples; and bounded on the south by Calabria Ultra, on the north by Basilicata, and on the west and east by the sea: Cosensa is the capital. Calabria Ultra is washed by the Mediterranean sea on the east, south, and west, and bounded by Calabria Citra on the north. Reggio is the capital town.

This country has been almost entirely desolated by the earthquakes of 1783. The reiterated shocks extended from Cape Spartivento to Amantea above the gulf of St Eufemia, and also affected that part of Sicily which lies opposite to the southern extremity of Italy. Those of the 5th and 7th of February, and of the 28th of March, were the most violent, and completed the destruction of every building throughout the above-mentioned space. Not one stone was left upon another south of the narrow isthmus of Squillace: and what is more disastrous, a very large proportion of the inhabitants was killed by the falling of their houses, near 40,000 lives being lost. Some persons were dug out alive after remaining a surprising length of time buried among the rubbish. Messina became a mass of ruins; its beautiful palazzata was thrown in upon the town, and its quay cracked into ditches full of water. Reggio was almost destroyed; Tropea greatly damaged; and every other place in the province levelled to the ground.

Before and during the concussion the clouds gathered, and then hung immoveable and heavy over the earth. At Palmi the atmosphere wore so fiery an aspect, that many people thought part of the town was burning. It was afterwards remembered that an unusual heat had affected the skins of several persons just before the shock; the rivers assumed a muddy ash-coloured tinge, and a sulphureous smell was almost general. A frigate passing between Calabria and Lipari felt so severe a shock, that the steersman was thrown from the helm, and the cannons were raised upon their carriages, while, all around, the sea exhaled a strong smell of brimstone.

Stupendous alterations were occasioned in the face of the country; rivers, choked up by the falling in of the hills, were converted into lakes, which if not speedily drained by some future convulsion, or opened by human labour, will fill the air with pestilential vapours, and destroy the remnants of population. Whole acres of ground, with houses and trees upon them, were broken off from the plains, and washed many furlongs down the deep hollows which the course of the rivers had worn; there, to the astonishment and terror of beholders, they found a new foundation to fix upon, either in an upright or an inclining position. In short, every species of phenomenon, incident to these destructive commotions of the earth, was to be seen in its utmost extent and variety in this desolated country. Their Sicilian majesties, with the utmost expedition, dispatched vessels loaded with every thing that could be thought of on the occasion for the relief and accommodation of the distressed Calabrians; a general officer went from Naples with engineers and troops to direct the operations of the persons employed in clearing away and rebuilding the houses, and to defend the property of the sufferers. The king ordered this officer to take all the money the royal treasures could supply or borrow; for, rather than it should be wanting on this pressing call, he was determined to part with his plate, nay the very furniture of his palace. A messenger sent off from a town near Reggio, on the 8th of February, travelled four days without shelter, and without being able to procure a morsel of bread; he supported nature with a piece of cheese which he had brought in his pocket, and the vegetables he was lucky enough to find near the road. To add to all their other sufferings, the Calabrians found themselves and the miserable wreck of their fortunes exposed to the depredations of robbers and pirates. Villains landed from boats and plundered several places, and thieves went even from Naples in search of booty: In order to strike a greater terror, they dressed themselves like Algerines; but were discovered and driven off. To this accumulated distress succeeded a most inclement season, which obstructed every effort made to alleviate it; and almost daily earthquakes kept the inhabitants in continual dread, not of being destroyed by the fall of houses, for none were left, but of being swallowed up by the splitting of the earth, or buried in the waves by some sudden inundation.

The two Calabrias in 1815 contained 750,000 inhabitants.

CALADE, in the manege, the descent or sloping declivity of a rising manege ground, being a small eminence upon which we ride down a horse several times, putting him to a short gallop, with his fore hams in the air, to learn him to ply or bend his haunches, and form his stop upon the aides of the calves of the legs, the stay of the bridle, and the caveson seasonably given.

CALAGORINA, or CALAGURIS, distinguished by the surname *Nasica*, in *Ancient Geography*, a city of the Vascones in the Hither Spain: now *Calahorra*.

CALAHORRA, an episcopal town of Spain, in Old Castile, seated on a fertile soil, on the side of a hill which extends to the banks of the river Ebro. W. Long. 2. 7. N. Lat. 42. 12.

CALAIS, a strong town of France, in Lower Picardy, now called the department of the Straits of Calais, which has a citadel and a fortified harbour. It is built in the form of a triangle, one side of which is towards the sea. The citadel is as large as the town, and has but one entrance. It is a trading place, with handsome streets, and several churches and monasteries; the number of inhabitants in 1813 was 7600.

Calais was taken by Edward III. in 1347. Hither he marched his victorious army from Cressy, and invested the town on the 8th of September. But finding that it could not be taken by force without the destruction of great multitudes of his men, he turned the siege into a blockade; and having made strong intrenchments to secure his army from the enemy, huts to protect them from the inclemency of the weather, and stationed a fleet before the harbour to prevent the introduction of provisions, he resolved to wait with patience till the place fell into his hands by famine. The besieged, discovering his intention, turned seventeen hundred women, children, and old people, out of the town, to save their provisions; and Edward had the goodness, after entertaining them with a dinner, and giving them two-pence a piece, to suffer them to pass. The garrison and inhabitants of Calais having at length consumed all their provisions, and even eaten all the horses, dogs, cats, and vermin in the place, the governor John de Vienne appeared upon the walls, and offered to capitulate. Edward greatly incensed at their obstinate resistance, which had detained him eleven months under their walls, at an immense expence both of men and money, sent Sir Walter Mauny, an illustrious knight, to acquaint the governor that he would grant them no terms; but that they must surrender at discretion. At length, however, at the spirited remonstrances of the governor, and the persuasions of Sir Walter Mauny, Edward consented to grant their lives to all the garrison and inhabitants, except six of the principal burgesses, who should deliver to him the keys of the city, with ropes about their necks. When these terms were made known to the people of Calais, they were plunged into the deepest distress; and after all the miseries they had suffered, they could not think without horror of giving up six of their fellow citizens to certain death. In this extremity, when the whole people were drowned in tears, and uncertain what to do, Eustace de St Pierre, one of the richest merchants in the place, stepped forth, and voluntarily offered himself to be one of these six devoted victims. His noble example was soon imitated by other five of the most wealthy citizens. These true patriots, barefooted and bareheaded, with ropes about their necks, were attended to the gates by the whole inhabitants with tears, blessings, and prayers for their safety. When they were brought into Edward's presence, they laid the keys of the city at his feet, and falling on their knees, implored his mercy in such moving strains, that all the noble spectators melted into tears. The king's resentment was so strong for the many toils and losses he had suffered in this tedious siege, that he was in some danger of forgetting his usual humanity; when the queen, falling upon her knees before him, earnestly begged and obtained their lives. This great and good princess conducted these virtuous citizens, whose lives she had saved, to her own apartment, entertained them honourably, and dismissed them with presents. Edward took possession of Calais, August 4.; and in order to secure a conquest of so great importance, and which had cost him so dear, he found it necessary to turn out all the ancient inhabitants, who had discovered so strong an attachment to their native prince, and to people it with English.

Calais remained in subjection to England till the reign of Queen Mary, when it was retaken by the duke of Guise. This general began the enterprise by ordering the privateers of Normandy and Bretagne to cruise in the Channel, more especially in the very straits of Calais; he then detached the duke of Nevers with a a considerable army towards the country of Luxemburg; a motion which drew the attention of the Spaniards that way: when all things were ready, he procured an application from the people of Boulogne, for a body of troops to secure them against the incursions of the Spaniards; he sent a strong detachment at their request, which was followed by another, under colour of supporting them; then repaired thither in person, secure that his officers would follow his instructions: and thus, on the first day of the new year, 1557, Calais was invested. He immediately attacked Fort St Agatha, which the garrison quitted and retired into the fort of Nicolai, which, together with the Risbank, the besiegers attacked at the same time, granted good terms to the officer who commanded in the former, but obliged the garrison of the latter to surrender prisoners of war. By these means he opened a communication with the sea: and having received from on board the ships an immense quantity of hurdles, his infantry, by the help of them, passed the morasses that lie round the town. He then made a false attack at the water-gate, which drew the attention of the garrison, who fatigued themselves exceedingly in making intrenchments behind the breach; but when they had finished their work, he began to fire upon the castle, where the walls were very old, and had been neglected on account of the breadth of the ditch, which was also very deep when the tide was in; but a great breach being made, the duke caused it to be attacked in the night, and during the ebb, the soldiers passing almost up to the shoulders. The place was easily carried, though the governor made three vigorous attacks before the break of day, in order to dislodge them; but the French, though they lost a considerable number of men, kept their posts. The governor then saw that it was impracticable to defend the place any longer, and therefore made the best terms for himself that he could obtain, which, however, were not very good: and thus, in eight days, the duke of Guise recovered a fortress which cost the victorious Edward III. a whole year's siege, and which had been now 210 years in the possession of the English, without so much as a single attempt to retake it. There are very different accounts given of this matter. Some English historians say, that King Philip penetrated the design of the French upon this fortress, gave notice of it in England, and offered to take the defence of it upon himself; but that this, out of jealousy, was refused, it being believed to be only an artifice to get a place of such consequence into his own hands. The truth of the matter seems to be this: The strength of Calais consisted in its situation and outworks, which required a very numerous garrison; but this being attended with a very large expence, the best part of the troops had been sent to join Philip's army, so that the governor had not above 500 men, and there were no more than 250 of the townsmen able to bear arms. As to ammunition, artillery, and provisions, the French found there abundance: but with so slender a garrison, it was impossible to make a better defence; and therefore when the Lord Wentworth, who was governor, and whom the French call Lord Dumfort, was tried by his peers for the loss of this place, he was acquitted. The duke obliged all the English inhabitants to quit Calais; and bestowed the government of it upon Des Tormes, who was soon after made a marshal of France.

The fortifications of Calais are good; but its greatest strength is its situation among the marshes, which may be overflowed at the approach of an enemy. The harbour is not so good as formerly, nor will it admit vessels of any great burden. In times of peace, there are packet boats going backward and forward twice a week from Dover to Calais, which is 21 miles distant. E. Long. 2. 6. N. Lat. 50. 58.

Calais *and Zetes*, in fabulous history, sons of Boreas and Orythia, to whom the poets attributed wings: they went on the voyage to Colchis with the Argonauts; delivered Phineus from the harpies; and were slain by Hercules.

CALAMANCO, a sort of woollen stuff manufactured in England and Brabant. It has a fine gloss; and is checkered in the warp, whence the checks appear only on the right side. Some calamancoes are quite plain, others have broad stripes adorned with flowers, some with plain broad stripes, some with narrow stripes, and others watered.

CALAMARIÆ, in *Botany*, an order of plants in the *Fragmenta methodi naturalis* of Linnæus; in which he has the following genera, viz. bobartia, scirpus, cyperus, eriophorum, carex, schœnus, flagellaria, juncus. See Botany.

CALAMATA, a considerable town of Turkey in Europe, in the Morea, and province of Belvedera. It was taken by the Venetians in 1685: but the Turks retook it afterwards with all the Morea. It stands on the river Spinarza, eight miles from the sea. E. Long. 22. 15. N. Lat. 37. 8.

CALAMINE, Calamy, *Lapis Calaminaris* or *Cadmia Fossilis*, a sort of stone or mineral containing zinc, iron, and sometimes other substances. It is considerably heavy; moderately hard and brittle, or of a consistence betwixt stone and earth: the colour sometimes whitish or grey; sometimes yellowish, or of a deep yellow; sometimes red; sometimes brown or blackish. It is plentiful in several places of Europe, as Hungary, Transylvania, Poland, Spain, Sweden, Bohemia, Saxony, Goslar, France, and England, particularly in Derbyshire, Gloucestershire, Nottinghamshire, and Somersetshire, as also in Wales. The calamine of England, however, is by the best judges allowed to be superior in quality to that of most other countries. It seldom lies very deep, being chiefly found in clayey grounds near the surface. In some places it is mixed with lead ores. It is a true ore of zinc, and is used as an ingredient in making of brass.—Newman relates various experiments with this mineral, the only result of which was to show that it contained iron as well as zinc. The most remarkable are the following: A saturated solution of calamine in the marine acid, concentrated by evaporating part of the liquor, exhibits in the cold an appearance of fine crystals, which on the application of warmth dissolve and disappear. A little of this concentrated solution tinges a large quantity of water of a bright yellow colour; and at the same time deposites by degrees a fine, spongy, brownish precipitate. Blue dissolved in this solution, and afterwards inspissated, forms an extremely slippery tenacious mass, which does not become dry, and, were it not too expensive, might be of use for entangling flies, caterpillars, &c. Sulphur boiled in this solution seems to acquire some degree of transparency.

transparency.—This mineral is an article in the materia medica: but before it comes to the shops is usually roasted or calcined, in order to separate some arsenical or sulphureous matter which in its crude state it is supposed to contain, and to render it more easily reducible into a fine powder. In this state it is employed in collyria against defluxions of thin acrid humours upon the eyes, for drying up moist running ulcers, and healing excoriations. It is the basis of an officinal epulotic CERATE.

There is another substance from which this semi-metal is also obtained. This is called *cadmia fornacum* or *cadmia of the furnaces*, to distinguish it from the other. This is a matter sublimed when ores containing zinc, like those of Rammelsberg, are smelted. This cadmia consists of the flowers of the semi-metal sublimed during the fusion, and adhering to the inner surfaces of the walls of furnaces, where they suffer a semi-fusion, and therefore acquire some solidity. So great a quantity of these is collected, that they form very thick incrustations, which must be frequently taken off.

CALAMINT. See MELISSA and MENTHA, BOTANY *Index*.

CALAMUS. See BOTANY *Index*. There is but one species, the rotang. The stem is without branches, has a crown at top, and is everywhere beset with straight spines. This is the true Indian cane, which is not visible on the outside; but the bark being taken off discovers the smooth stick, which has no marks of spine on the bark, and is exactly like those which the Dutch sell to us; keeping this matter very secret, lest travellers going by should take as many canes out of the woods as they please. Sumatra is said to be the place where most of these sticks grow. Such are to be chosen as are of proper growth between two joints suitable to the fashionable length of canes as they are then worn; but such are scarce. The calamus rotang is one of several plants from which the drug called *dragons blood* is obtained.

CALAMUS, in the ancient poets, denotes a simple kind of pipe or fistula, the musical instrument of the shepherds and herdsmen; usually made either of an oaten stalk or a reed.

CALAMUS *Aromaticus*, or *Sweet-scented Flag*, in the materia medica, a species of flag called *acorus* by Linnæus. See ACORUS, BOTANY *Index*.

CALAMUS *Scriptorius*, in antiquity, a reed or rush to write with. The ancients made use of styles to write on tables covered with wax; and of reed or rush, to write on parchment, or Egyptian paper.

CALAMY, EDMUND, an eminent Presbyterian divine, born at London in the year 1600, and educated at Pembroke-hall, Cambridge, where his attachment to the Arminian party excluded him from a fellowship. Dr Felton, bishop of Ely, however, made him his chaplain; and in 1639, he was chosen minister of St Mary Aldermary, in the city of London. Upon the opening of the long parliament, he distinguished himself in defence of the presbyterian cause; and had a principal hand in writing the famous *Smectymnus*, which, himself says, gave the first deadly blow to Episcopacy. The authors of this tract were five, the initials of whose names formed the name under which it was published; viz. Stephen Marshal, Edmund Calamy, Thomas Young, Mathew Newcomen, and William Sparstow.

He was after that an active member in the assembly of divines, was a strenuous opposer of sectaries, and used his utmost endeavours to prevent those violences committed after the king was brought from the isle of Wight. In Cromwell's time he lived privately, but was assiduous in promoting the king's return; for which he was afterwards offered a bishopric, but refused it. He was ejected for nonconformity in 1662; and died of grief at the sight of the great fire of London.

CALAMY, *Edmund*, grandson to the preceding, (by his eldest son, Mr Edmund Calamy, who was ejected from the living of Moxton in Essex on St Bartholomew's day 1662) was born in London, April 5. 1671. After having learned the languages, and gone through a course of natural philosophy and logic at a private academy in England, he studied philosophy and civil law at the university of Utrecht, and attended the lectures of the learned Grævius. Whilst he resided here, an offer of a professor's chair in the university of Edinburgh was made him by Mr Carstairs, principal of that university, sent over on purpose to find a person properly qualified for such an office. This he declined; and returned to England in 1691, bringing with him letters from Grævius to Dr Pococke, canon of Christchurch, and regius professor of Hebrew, and to Dr Bernard, Savilian professor of astronomy, who obtained leave for him to prosecute his studies in the Bodleian library. Having resolved to make divinity his principal study, he entered into an examination of the controversy between the conformists and nonconformists; which determined him to join the latter; and coming to London in 1692, he was unanimously chosen assistant to Mr Matthew Sylvester at Blackfriars: and in 1694, he was ordained at Mr Annesley's meeting-house in Little St Helena, and soon after was invited to become assistant to Mr Daniel Williams in Hand-Alley. In 1702, he was chosen to be one of the lecturers in Salters-hall; and in 1703, succeeded Mr Vincent Alsop as pastor of a great congregation in Westminster. He drew up the table of contents to Mr Baxter's history of his life and times, which was sent to the press in 1696; made some remarks on the work itself, and added to it an index; and, reflecting on the usefulness of the book, he saw the expediency of continuing it, for Mr Baxter's history came no lower than the year 1684. Accordingly he composed an abridgement of it, with an account of many other ministers who were ejected after the restoration of Charles II.; their apology, containing the grounds of their nonconformity and practice as to stated and occasional communion with the church of England; and a continuation of their history till the year 1691. This work was published in 1702. He afterwards published a moderate defence of nonconformity, in three tracts, in answer to some tracts of Dr Hoadley. In 1709 Mr Calamy made a tour to Scotland; and had the degree of doctor of divinity conferred on him by the universities of Edinburgh, Aberdeen, and Glasgow. In 1713, he published a second edition of his Abridgement of Mr Baxter's history of his life and times; in which, among other additions, there is a continuation of the history through King William's reign, and Queen Anne's, down to the passing of the occasional bill; and in the close is subjoined the reformed liturgy, which was drawn

drawn up and presented to the bishops in 1661, "that the world may judge (he says in his preface) how fairly the ejected ministers have been often represented as irreconcileable enemies to all liturgies." In 1718, he wrote a vindication of his grandfather, and several other persons, against certain reflections cast upon them by Mr Archdeacon Echard in his History of England; and in 1728 appeared his Continuation of the account of the ministers, lecturers, masters, and fellows of colleges, and schoolmasters, who were ejected, after the Restoration in 1660, by or before the act of uniformity. He died June 3. 1732, greatly regretted not only by the dissenters, but also by the moderate members of the established church, both clergy and laity, with many of whom he lived in great intimacy. Besides the pieces already mentioned, he published a great many sermons on several subjects and occasions. He was twice married, and had 13 children.

CALANDRE, a name given by the French writers to an insect that does vast mischief in granaries. It is properly of the scarab or beetle class; it has two antennæ or horns formed of a great number of round joints, and covered with a soft and short down; from the anterior part of the head there is thrust out a trunk, which is so formed at the end, that the creature easily makes way with it through the coat or skin that covers the grain, and gets at the meal or farina on which it feeds; the inside of the grains is also the place where the female deposites her eggs, that the young progeny may be born with provision about them. When the female has pierced a grain of corn for this purpose, she deposites in it one egg, or at the utmost two, but she most frequently lays them single: these eggs hatch into small worms, which are usually found with their bodies rolled up in a spiral form, and after eating till they arrive at their full growth, they are changed into chrysales, and from these in about a fortnight comes out the perfect calandre. The female lays a considerable number of eggs; and the increase of these creatures would be very great, but nature has so ordered it, that while in the egg state, and even while in that of the worm, they are subject to be eaten by mites: these little vermin are always very plentiful in granaries, and they destroy the far greater number of these larger animals.

CALAS, John, the name of a most unfortunate Protestant merchant at Thoulouse, inhumanly butchered under forms of law cruelly prostituted to shelter the sanguinary dictates of ignorant Popish zeal. He had lived 40 years at Thoulouse. His wife was an English woman of French extraction; and they had five sons; one of whom, Lewis, had turned Catholic through the persuasions of a Catholic maid who had lived 30 years in the family. In October 1761, the family consisted of Calas, his wife, Mark Antony their son, Peter their second son, and this maid. Antony was educated for the bar; but being of a melancholy turn of mind, was continually dwelling on passages from authors on the subject of suicide, and one night in that month hanged himself on a bar laid across two folding doors in their shop. The crowd collected by the confusion of the family on so shocking a discovery, took it into their heads that he had been strangled by the family to prevent his changing his religion, and that this was a common practice among Protestants. The officers of justice adopted the popular tale, and were supplied by the mob with what they accepted as evidences of the fact. The fraternity of White Penitents got the body, buried it with great ceremony, and performed a solemn service for him as a martyr: the Franciscans did the same; and after these formalities no one doubted the guilt of the devoted heretical family. They were all condemned to the torture, to bring them to confession: they appealed to the parliament; who, as weak and as wicked as the subordinate magistrates, sentenced the father to the torture, ordinary and extraordinary, to be broken alive upon the wheel, and then to be burnt to ashes. A diabolical decree! which, to the shame of humanity, was actually carried into execution. Peter Calas, the other son was banished for life; and the rest were acquitted. The distracted widow found some friends, and among the rest M. Voltaire, who laid her case before the council of state at Versailles, and the parliament of Thoulouse was ordered to transmit the proceedings. These the king and council unanimously agreed to annul; the capitoul or chief magistrate of Thoulouse was degraded and fined; old Calas was declared to have been innocent; and every imputation of guilt was removed from the family, who also received from the king and clergy considerable gratuities.

CALASH, or Calesh, a small light kind of chariot or chair, with very low wheels, used chiefly for taking the air in parks and gardens. The calash is for the most part richly decorated, and open on all sides for the conveniency of the air and prospect, or at most enclosed with light mantlets of wax-cloth to be opened and shut at pleasure. In the Philosophical Transactions we have a description of a new sort of calash going on two wheels, not hung on traces, yet easier than the common coaches, over which it has this further advantage, that whereas a common coach will overturn if one wheel go on a surface a foot and a half higher than the other, this will admit of a difference of $3\frac{1}{2}$ feet without danger of overturning. Add, that it would turn over and over; that is, after the spokes being so turned as that they are parallel to the horizon, and one wheel flat over the head of him that rides in it, and the other flat under him, it will turn once more, by which the wheels are placed *in statu quo*, without any disorder to the horse or rider

CALASIO, Marius, a Franciscan, and professor of the Hebrew language at Rome, of whom there is very little to be said, but that he published there, in the year 1621, a Concordance of the Bible, which consisted of four great volumes in folio. This work has been highly approved and commended both by Protestants and Papists, and is indeed a most admirable work. For besides the Hebrew words in the Bible, which are in the body of the book, with the Latin version over against them; there are, in the margin, the differences between the Septuagint version and the Vulgate; so that at one view may be seen wherein the three Bibles agree, and wherein they differ. Moreover, at the beginning of every article there is a kind of dictionary, which gives the signification of each Hebrew word; affords an opportunity of comparing it with other oriental languages, viz. with the Syriac, Arabic, and Chaldee; and is extremely useful for

for determining more exactly the true meaning of the Hebrew words.

CALASIRIS, in antiquity, a linen tunic fringed at the bottom, and worn by the Egyptians under a white woollen garment: but this last they were obliged to pull off when they entered the temples, being only allowed to appear there in linen garments.

CALATAJUD, a large and handsome town of Spain, in the kingdom of Arragon; situated at the confluence of the rivers Xalon and Xiloca, at the end of a very fertile valley, with a good castle on a rock. W. Long. 2. 9. N. Lat. 41. 22.

CALATHUS, in antiquity, a kind of hand basket made of light wood or rushes; used by the women sometimes to gather flowers, but chiefly after the example of Minerva to put their work in. The figure of the calathus, as represented on ancient monuments, is narrow at the bottom, and widening upwards like that of a top. Pliny compares it to that of a lily. The calathus or work basket of Minerva is no less celebrated among the poets than her distaff.

Calathus was also the name of a cup for wine used in sacrifices.

CALATOR, in antiquity, a crier, or officer appointed to publish something aloud, or call the people together. The word is formed from καλεω, *voco*, "I call." Such ministers the pontifices had, whom they used to send before them when they went to sacrifice on *feriæ* or holidays, to advertise the people to leave off work. The magistrates also used *calatores*, to call the people to the comitia, both *curiata* and *centuriata*. The officers in the army also had *calatores*; as had likewise many private families, to invite their guests to entertainments.

CALATRAVA, a city of New Castile, in Spain, situated on the river Guadiana, 45 miles south of Toledo. W. Long. 4. 20. N. Lat. 39. 0.

Knights of Calatrava, a military order in Spain, instituted by Sancho III. king of Castile, upon the following occasion: When that prince took the strong fort of Calatrava from the Moors of Andalusia, he gave it to the Templars, who, wanting courage to defend it, returned it him again. Then Don Reymond of the order of the Cistercians, accompanied with several persons of quality, made an offer to defend the place, which the king thereupon delivered up to them, and instituted that order. It increased so much under the reign of Alphonsus, that the knights desired they might have a grand master, which was granted. Ferdinand and Isabella afterwards, with the consent of Pope Innocent VIII. reunited the grand mastership of Calatrava to the Spanish crown; so that the kings of Spain are now become perpetual administrators thereof.

The knights of Calatrava bear a cross gules, fleurdelised with green, &c. Their rule and habit was originally that of the Cistercians.

CALAURIA, in *Ancient Geography*, an island of Greece in the Saronic bay, over against the port of Troezen, at the distance of 40 stadia. Hither Demosthenes went twice into banishment; and here he died. Neptune was said to have accepted this island from Apollo, in exchange for Delos. The city stood on a high ridge nearly in the middle of the island, commanding an extensive view of the gulf and its coasts. There was his holy temple. The priestess was a virgin, who was dismissed when marriageable. Seven of the cities near the island held a congress at it, and sacrificed jointly to the deity. Athens, Ægina, and Epidaurus, were of this number, with Nauplias, for which place Argos contributed. The Macedonians, when they had reduced Greece, were afraid to violate the sanctuary, by forcing from it the fugitives, his suppliants. Antipater commanded his general to bring away the orators, who had offended him, alive; but Demosthenes could not be prevailed on to surrender. His monument remained in the second century, within the enclosure of the temple. The city of Calauria has been long abandoned. Traces of buildings and of ancient walls appear nearly level with the ground; and some stones, in their places, each with a seat and back forming a little circle, once perhaps a bath. The temple, which was of the Doric order, and not large, as may be inferred from the fragments, is reduced to an inconsiderable heap of ruins. The island is now called *Poro*. It stretches along before the coast of the Morea in a lower ridge, and is separated from it by a canal only four stadia, or half a mile wide. This, which is called Poro or the Ferry, in still weather may be passed on foot, as the water is not deep. It has given its name to the island; and also to the town, which consists of about 200 houses, mean and low, with flat roofs; rising on the slope of a bare disagreeable rock.

CALCADA or *St Domingo* Calcalda, a town of Spain, situated in W. Long. 3. 5. N. Lat. 42. 36.

CALCAR, a very strong town of Germany, in the circle of Westphalia, and duchy of Cleves. It belongs to the king of Prussia, and is seated near the Rhine, in E. Long. 5. 51. N. Lat. 41. 45.

Calcar, in glass-making, the name of a small oven or reverberatory furnace, in which the first calcination of sand and salt of potashes is made for the turning them into what is called *frit*. This furnace is made in the fashion of an oven, ten feet long, seven broad in the widest part, and two feet deep. On one side of it is a trench six inches square, the upper part of which is level with the calcar, and separated only from it at the mouth by bricks nine inches wide. Into this trench they put sea-coal, the flame of which is carried into every part of the furnace, and is reverberated from the roof upon the frit, over the furnace of which the smoke flies very black, and goes out at the mouth of the calcar; the coals burn on iron grates, and the ashes fall through.

Calcar, *John de*, a celebrated painter, was the disciple of Titian, and perfected himself by studying Raphael. Among other pieces he drew a Nativity, representing the angels around the infant Christ; and so ordered the disposition of his picture, that the light all proceeds from the child. He died at Naples, in 1546, in the flower of his age. It was he who designed the anatomical figures of Vesal, and the portraits of the painters of Vesari.

CALCAREOUS, something that partakes of the nature and qualities of calx, or lime. We say, a *calcareous* earth, *calcareous* stone. See Chemistry *Index*.

CALCEARIUM, in antiquity, a donative or largess

gess bestowed on Roman soldiers for buying shoes. In monasteries, *calcearium* denoted the daily service of cleaning the shoes of the religious.

CALCEOLARIA. See BOTANY *Index*.

CALCHAS, in fabulous history, a famous diviner, followed the Greek army to Troy. He foretold that the siege would last ten years; and that the fleet, which was detained in the port of Aulis by contrary winds, would not sail till Agamemnon's daughter had been sacrificed to Diana. After the taking of Troy, he retired to Colophon; where, it is said, he died of grief, because he could not divine what another of his profession, called *Mopsus*, had discovered.

CALCINATION, in *Chemistry*, the reducing of substances to a calx, or powder, by fire. Limestone is said to be calcined or burned by being deprived of its carbonic acid, and thus brought to the caustic state. But when a metallic substance is calcined by being exposed to strong heat, it assumes the form of powder or calx, by combining with oxygen. See CHEMISTRY *Index*.

CALCINATO, a town of Italy, in the duchy of Mantua, remarkable for a victory gained over the Imperialists by the French in 1706. E. Long. 9. 55. N. Lat. 45. 25.

CALCULARY *of a* PEAR, a congeries of little strong knots dispersed through the whole parenchyma of the fruit. The calculary is most observed in rough-tasted or choke pears. The knots lie more continuous and compact together towards the part where they surround the ACETARY. About the stalk they stand more distant; but towards the cork, or stool of the flower, they still grow closer, and there at last gather into the firmness of a plum stone. The calculary is no vital or essential part of the fruit; the several knots whereof it consists being only so many concretions or precipitations out of the sap, as we see in urines, wines, and other liquors.

CALCULATION, the act of computing several sums, by adding, subtracting, multiplying, or dividing. See ARITHMETIC.

CALCULATION is more particularly used to signify the computations in astronomy and geometry, for making tables of logarithms, ephemerides, finding the time of eclipses, &c. See ASTRONOMY, GEOMETRY, and LOGARITHMS.

CALCULUS, primarily denotes a little stone or pebble, anciently used in making computations, taking of suffrages, playing at tables, and the like. In after times, pieces of ivory, and counters struck of silver, gold, and other matters, were used in lieu thereof, but still retaining the ancient names. Computists were by the lawyers called *calculones*, when they were either slaves, or newly freed men; those of a better condition were named *calculatores* or *numerarii;* ordinarily there was one of these in each family of distinction. The Roman judges anciently gave their opinions by calculi, which were white for absolution, and black for condemnation. Hence *calculus albus*, in ancient writers, denotes a favourable vote, either in a person to be absolved and acquitted of a charge, or elected to some dignity or post; as *calculus niger* did the contrary. This usage is said to have been borrowed from the Thracians, who marked their happy or prosperous days by *white*, and their unhappy by *black*, pebbles, put each night into an urn.

Besides the diversity of colour, there were some calculi also which had figures or characters engraven on them, as those which were in use in taking the suffrages both in the senate and at assemblies of the people. These calculi were made of thin wood, polished and covered over with wax. Their form is still seen in some medals of the Cassian family; and the manner of casting them into the urns, in the medals of the Licinian family. The letters marked upon these calculi were U. R. for *uti rogas*, and A. for *antiquo;* the first of which expressed an approbation of the law, the latter a rejection of it. Afterwards the judges who sat in capital causes used calculi marked with the letter A. for *absolvo;* C. for *condemno;* and N. L. for *non liquet*, signifying that a more full information was required.

CALCULUS is also used in ancient geometric writers for a kind of weight equal to two grains of cicer. Some make it equivalent to the siliqua, which is equal to three grains of barley. Two calculi made the ceratium.

CALCULUS, in *Mathematics*, is a certain method of performing investigations and resolutions, particularly in mechanical philosophy. Thus there is the *Differential* calculus, the *Exponential*, the *Integral*, the *Literal*, and the *Antecedental*.

CALCULUS *Differentialis*, is a method of differencing quantities, or of finding an infinitely small quantity, which being taken infinite times, shall be equal to a given quantity; or, it is the arithmetic of the infinitely small differences of variable quantities.

The foundation of this calculus is an infinitely small quantity, or an infinitesimal, which is a portion of a quantity incomparable to that quantity, or that is less than any assignable one, and therefore accounted as nothing; the error accruing by omitting it being less than any assignable one. Hence two quantities, only differing by an infinitesimal, are reputed equal. Thus, in astronomy, the diameter of the earth is an infinitesimal, in respect of the distance of the fixed stars; and the same holds in abstract quantities. The term, infinitesimal, therefore, is merely respective, and involves a relation to another quantity; and does not denote any real ens or being. Now infinitesimals are called *differentials*, or *differential quantities*, when they are considered as the differences of two quantities. Sir Isaac Newton calls them *moments;* considering them as the momentary increments of quantities, v. g. of a line generated by the flux of a point, or of a surface by the flux of a line. The differential calculus, therefore, and the doctrine of fluxions, are the same thing under different names; the former given by M. Leibnitz, and the latter by Sir Isaac Newton: each of whom lays claim to the discovery. There is, indeed, a difference in the manner of expressing the quantities resulting from the different views wherein the two authors consider the infinitesimals: the one as moments, the other as differences. Leibnitz, and most foreigners, express the differentials of quantities by the same letters as variable ones, only prefixing the letter d: thus the differential of x is called dx: and that of y, dy: now dx is a positive quantity, if x continually increase; negative, if it decrease. The English, with Sir Isaac Newton,

Newton, instead of $d x$ write $\dot{x}$ (with a dot over it), for $d y$, $\dot{y}$, &c. which foreigners object against, on account of that confusion of points, which they imagine arises when differentials are again differenced; besides, that the printers are more apt to overlook a point than a letter. Stable quantities being always expressed by the first letters of the alphabet $d a = o$, $d b = o$, $d c = o$; wherefore $d\ (x + y - a) = d x + d y$, and $d\ (x - y + a = d x + d y$. So that the differencing of quantities is easily performed by the addition or subtraction of their compounds.

To difference quantities that multiply each other; the rule is, first, multiply the differential of one factor into the other factor, the sum of the two factors is the differential sought: thus, the quantities being x, y, the differential will be $x\, d y + y\, d x$, i. e. $d\,(x y) = x\, d y + y\, d x$. Secondly, If there be three quantities mutually multiplying each other, the factum of the two must then be multiplied into the differential of the third; thus suppose $v x y$, let $v x = t$, then $v x y = t y$; consequently $d\,(v x y) = t\, d y + y\, d t$: but $d t = v\, d x + x\, d v$. These values, therefore, being substituted in the antecedent differential, $t\, d y + y\, d t$, the result is, $d\,(v x y) = v x\, d y + v y\, d x + x y\, d v$. Hence it is easy to apprehend how to proceed where the quantities are more than three. If one variable quantity increase, while the other y decreases, it is evident $y\, d x - x\, d y$ will be the differential of $x y$.

To difference quantities that mutually divide each other; the rule is, first, multiply the differential of the divisor into the dividend; and, on the contrary, the differential of the dividend into the divisor: subtract the last product from the first, and divide the remainder by the square of the divisor, the quotient is the differential of the quantities mutually dividing each other. See Fluxions.

Calculus *Exponentialis*, is a method of differencing exponential quantities, or of finding and summing up the differentials or moments of exponential quantities; or at least bringing them to geometrical constructions.

By exponential quantity, is here understood a power, whose exponent is variable; v. g. x^x. a^x. x^y. where the exponent x does not denote the same in all the points of a curve, but in some stands for 2, in others for 3, in others for 5, &c.

To difference an exponential quantity; there is nothing required but to reduce the exponential quantities to logarithmic ones; which done, the differencing is managed as in logarithmic quantities. Thus, suppose the differential of the exponential quantity x^y required, let

$$x^y = z$$

Then will $y\, l x = l z$

$$l x\, d y + \frac{y\, d x}{x} = \frac{d z}{z}$$

$$l x\, d y + \frac{z y\, d x}{x} = d z$$

That is, $x^y\, l x\, d y + x^{y-1} d x = d z$.

Calculus *Integralis*, or *Summatorius*, is a method of integrating, or summing up moments, or differential quantities; i. e. from a differential quantity given, to find the quantity from whose differencing the given differential results.

The integral calculus, therefore, is the inverse of the differential one; whence the English, who usually call the differential method *fluxions*, give this *calculus*, which ascends from the fluxions, to the flowing or variable quantities; or, as foreigners express it, from the differences to the sums, by the name of the *inverse method of fluxions*.

Hence, the integration is known to be justly performed, if the quantity found, according to the rules of the differential calculus, being differenced, produce that proposed to be summed.

Suppose s the sign of the sum, or integral quantity, then $s\, y\, d x$ will denote the sum, or integral of the differential $y\, d x$.

To integrate, or sum up a differential quantity: it is demonstrated, first, that $s\, d x = x$: secondly, $s\,(dx + dy) = x + y$: thirdly, $s\,(x\, d y + y\, d x) - x y$: fourthly, $s\,(m x^{m-1} d x) = x^m$: fifthly, $s\,(n : m)\ x^{\frac{n-m}{m}} dx = x^{\frac{n}{m}}$: sixthly, $s(y dx - x dy) : y^2 = x : y$. Of these, the fourth and fifth cases are the most frequent, wherein the differential quantity is integrated, by adding a variable unity to the exponent, and dividing the sum by the new exponent multiplied into the differential of the root; v. g. the fourth case, by $m - (1 + 1)\ d x$, i. e. by $m\, d x$.

If the differential quantity to be integrated doth not come under any of these formulas, it must either be reduced to an integral finite, or an infinite series, each of whose terms may be summed.

It may be here observed, that, as in the analysis of finites, any quantity may be raised to any degree of power: but *vice versa*, the root cannot be extracted out of any number required; so in the analysis of infinites, any variable or flowing quantity may be differenced; but *vice versa*, any differential cannot be integrated. And as, in the analysis of finites, we are not yet arrived at a method of extracting the roots of all equations, so neither has the integral calculus arrived at its perfection; and as in the former we are obliged to have recourse to approximation, so in the latter we have recourse to infinite series, where we cannot attain to a perfect integration.

Calculus *Literalis*, or *Literal* Calculus, is the same with specious arithmetic, or algebra, so called from its using the letters of the alphabet, in contradistinction to numeral arithmetic, which uses figures. In the literal calculus given quantities are expressed by the first letters, a, b, c, d; and quantities sought by the last, z, y, x, &c. Equal quantities are denoted by the same letters.

Calculus, *Antecedental*, a geometrical method of reasoning invented by Mr Glenie, which, without any consideration of notion or velocity, is applicable to all the purposes of fluxions. In this method, says Mr Glenie, "every expression is truly and strictly geometrical, is founded on principles frequently made use of by the ancient geometers, principles admitted into the very first elements of geometry, and repeatedly used by Euclid himself. As it is a branch of general geometrical proportion, or universal comparison, and is derived from an examination of the antecedents of ratios, having

Calculus.

ing given consequents and a given standard of comparison in various degrees of augmentation and diminution they undergo by composition and decomposition, I have called it the antecedental calculus. As it is purely geometrical, and perfectly scientific, I have, since it first occurred to me in 1779, always made use of it instead of the fluxionary and differential calculi, which are merely arithmetical. Its principles are totally unconnected with the ideas of motion and time, which, strictly speaking, are foreign to pure geometry and abstract science, though, in mixed mathematics and natural philosophy, they are equally applicable to every investigation, involving the consideration of either with the two numerical methods just mentioned. And as many such investigations require compositions and decompositions of ratios, extending greatly beyond the triplicate and subtriplicate, this calculus in all of them furnishes every expression in a strictly geometrical form. The standards of comparison in it may be any magnitudes whatever, and are of course indefinite and innumerable; and the consequents of the ratios, compounded or decompounded, may be either equal or unequal, homogeneous or heterogeneous. In the fluxionary and differential methods, on the other hand, 1, or unit, is not only the standard of comparison, but also the consequent of every ratio compounded or decompounded." See Phil. Trans. Edin. vol. iv.

Some mathematicians, however, are of opinion that the advantage to be derived from the employment of this calculus is not so great as the author seems to promise from it.

Calculus *Minervæ*, among the ancient lawyers, denoted the decision of a cause, wherein the judges were equally divided. The expression is taken from the history of Orestes, represented by Æschylus and Euripides; at whose trial, before the Areopagites, for the murder of his mother, the votes being equally divided for and against him, Minerva interposed, and gave the casting vote or calculus in his behalf.

M. Cramer, professor at Marpurg, has a discourse express, *De Calculo Minervæ;* wherein he maintains, that all the effect an entire equality of voices can have, is to leave the cause in *statu quo*.

Calculus *Tiburtinus*, a sort of figured stone, formed in great plenty about the cataracts of the Anio, and other rivers in Italy; of a white colour, and in shape oblong, round, or echinated. They are a species of the *striæ lapideæ*, or *stalactites*, and generated like them; and so like sugar plums, that it is a common jest at Rome to deceive the unexperienced by serving them up as deserts.

Calculus, in *Medicine*, the disease of the stone in the bladder or kidneys. The term is Latin, and signifies a *little pebble*. The calculus in the bladder is called *lithiasis;* and in the kidneys *nephritis*. See Medicine and Surgery.

Human calculi are commonly formed of different strata or incrustations; sometimes smooth and heavy like mineral stones; but often rough, spongy, light, and full of inequalities or protuberances; chemically analyzed, or distilled in an open fire, they yield nearly the same principles as urine itself, or at least an empyreumatic volatile urinous matter, together with a great deal of air. They never have, nor can have, naturally, any foreign matter for a basis; but they may by accident: an instance of which is related by Dr Percival *. A bougie had unfortunately slipped into the bladder, and upon it a stone of considerable size was formed in less than a year. This stone had so much the appearance of chalk, that the doctor was induced to try whether it could be converted into quicklime. His experiment succeeded, both with that and some other calculi; from which he conjectures, that hard waters which contain calcareous earth may contribute towards the formation of these calculi.

Calculus, Calcutta.

* *Essays*, vol. iii. p. 165.

CALCUTTA, the capital of the province of Bengal, and of all the British possessions in the East Indies, is situated on the river Hooghly, a branch of the Ganges, about 100 miles from the sea, in N. Lat. 23. and Long. 88. 28. E. from Greenwich. It is but a modern city, built on the site of a village called *Govindpour*. The English first obtained the Mogul's permission to settle in this place in the year 1690; and Mr Job Charnock, the company's agent, made choice of the spot on which the city stands, on account of a large shady grove which grew there; though in other respects it was the worst he could have pitched upon; for three miles to the north coast, there is a salt water lake, which overflows in September, and when the flood retires in December leaves behind such a quantity of fish and other putrescent matter, as renders the air very unhealthy. The custom of the Gentoos throwing the dead bodies of their poor people into the river is also very disgustful, and undoubtedly contributes to render the place unhealthy, as well as the cause already mentioned.

Calcutta is now become a large and populous city, being supposed at present to contain 500,000 inhabitants. It is elegantly built, at least the part inhabited by the English; but the rest, and that the greatest part, is built after the fashion of the cities of India in general. The plan of all these is nearly the same; their streets are exceedingly confined, narrow, and crooked, with a vast number of ponds, reservoirs, and gardens interspersed. A few of the streets are paved with brick. The houses are built, some with brick, others with mud, and a still greater number with bamboos and mats; all which different kinds of fabrics standing intermixed with one another, form a very uncouth appearance. The brick houses are seldom above two stories high, but those of mud and bamboos are only one, and are covered with thatch. The roofs of the brick houses are flat and terraced. These, however, are much fewer in number than the other two kinds; so that fires, which often happen, do not sometimes meet with a brick house to obstruct their progress in a whole street. Within these 20 or 25 years Calcutta has been greatly improved both in appearance and in the salubrity of its air; the streets have been properly drained, and the ponds filled; thereby removing a vast surface of stagnant water, the exhalations of which were particularly hurtful. The citadel is named Fort William, and is superior as a fortress to any in India; but is now on too extensive a scale to answer the purpose for which it was intended, viz. the holding a post in case of extremity. It was begun on this extended plan by Lord Clive immediately after the battle of Plassey. The expence attending it was supposed to amount two millions sterling.

Calcutta is the emporium of Bengal, and the residence

Calcutta. dence of the governor-general of India. Its flourishing state may in a great measure be supposed owing to the unlimited toleration of all religions allowed here; the Pagans being suffered to carry their idols in procession, the Mahomedans not being discountenanced, and the Roman Catholics being allowed a church.—At about a mile's distance from the town is a plain where the natives annually undergo a very strange kind of penance on the 9th of April; some for the sins they have committed, others for those they may commit, and others in consequence of a vow made by their parents. This ceremony is performed in the following manner: Thirty bamboos, each about the height of 20 feet, are erected in the plain above mentioned. On the top of these they contrive to fix a swivel, and another bamboo of 30 feet or more crosses it, at each end of which hangs a rope. The people pull down one end of this rope, and the devotee placing himself under it, the bramin pinches up a large piece of skin under both the shoulder-blades, sometimes in the breasts, and thrusts a strong iron hook through each. These hooks have lines of Indian grass hanging to them, which the priest makes fast to the rope at the end of the cross bamboo, and at the same time puts a sash round the body of the devotee, laying it loosely in the hollow of the hooks, lest, by the skin's giving way, he should fall to the ground. When this is done, the people haul down the other end of the bamboo; by which means the devotee is immediately lifted up 30 feet or more from the ground, and they run round as fast as their legs can carry them. Thus the devotee is thrown out the whole length of the rope, where, as he swings, he plays a thousand antic tricks; being painted and dressed in a very particular manner, on purpose to make him look more ridiculous. Some of them continue swinging half an hour, others less. The devotees undergo a preparation of four days for this ceremony. On the first and third they abstain from all kinds of food; but eat fruit on the other two. During this time of preparation they walk about the streets in their fantastical dresses, dancing to the sound of drums and horns; and some to express the greater ardour of devotion, run a rod of iron quite through their tongues, and sometimes through their cheeks also.

Before the war of 1755, Calcutta was commonly garrisoned by 300 Europeans, who were frequently employed in conveying the company's vessels from Patna, loaded with saltpetre, piece goods, opium, and raw silk. The trade of Bengal alone supplied rich cargoes for 50 or 60 ships annually, besides what was carried on in small vessels to the adjacent countries. It was this flourishing state of Calcutta that probably was one motive for the nabob Surajah Dowla to attack it in the year 1756. Having had the fort of Cossimbuzar delivered up to him, he marched against Calcutta with all his forces, amounting to 70,000 horse and foot, with 400 elephants, and invested the place on the 15th of June. Previous to any hostilities, however, he wrote a letter to Mr Drake the governor, offering to withdraw his troops, on condition that he would pay him his duty on the trade for 15 years past, defray the expence of his army, and deliver up the black merchants who were in the fort. This being refused, he attacked one of the redoubts at the entrance of the town; but was repulsed with great slaughter. On the 16th he attacked another advanced post, but was likewise repulsed with great loss. Notwithstanding this disappointment, however, the attempt was renewed on the 18th, when the troops abandoned these posts, and retreated into the fort; on which the nabob's troops entered the town, and plundered it for 24 hours. An order was then given for attacking the fort; for which purpose a small breastwork was thrown up, and two twelve pounders mounted upon it; but without firing oftener than two or three times an hour. The governor then called a council of war, when the captain of the train informed them, that there was not ammunition in the fort to serve three days; in consequence of which the principal ladies were sent on board the ships lying before the fort. They were followed by the governor, who declared himself a Quaker, and left the place to be defended by Mr Holwell the second in council. Besides the governor, four of the council, eight gentlemen of the company's service, four officers, and 100 soldiers, with 52 free merchants, captains of ships, and other gentlemen, escaped on board the ships, where were also 59 ladies, with 33 of their children. The whole number left in the fort was about 250 effective men, with Mr Holwell, four captains, five lieutenants, six ensigns, and five serjeants; as also 14 sea captains, and 29 gentlemen of the factory. Mr Holwell then having held a council of war, divided three chests of treasure among the discontented soldiers, making them large promises also, if they behaved with courage and fidelity; after which he boldly stood on the defence of the place, notwithstanding the immense force which opposed him. The attack was very vigorous; the enemy having got possession of the houses, galled the English from thence, and drove them from the bastions; but they themselves were several times dislodged by the fire from the fort, which killed an incredible number, with the loss of only five English soldiers the first day. The attack, however, was continued till the afternoon of the 20th; when many of the garrison being killed and wounded, and their ammunition almost exhausted, a flag of truce was hung out. Mr Holwell intended to have availed himself of this opportunity to make his escape on board the ships, but they had fallen several miles down from the fort, without leaving even a single boat to facilitate the escape of those who remained. In the mean time, however, the back-gate was betrayed by the Dutch guard, and the enemy, entering the fort, killed all they first met, and took the rest prisoners.

The fort was taken before six in the evening; and, in an hour after, Mr Holwell had three audiences of the nabob, the last being in the durbar or council. In all of these the governor had the most positive assurances that no harm should happen to any of the prisoners; but he was surprised and enraged at finding only 5000l. in the fort instead of the immense treasures he expected; and to this, as well as perhaps to the resentment of the jemmidaars or officers, of whom many were killed in the siege, we may impute the catastrophe that followed.

As soon as it was dark, the English prisoners, to the number of 146, were directed by the jemmidaars who guarded them, to collect themselves into one body, and sit down quietly under the arched veranda, or

Calcutta.

or piazza, to the westward of the Black Hole prison. Besides the guard over them, another was placed at the south end of this veranda, to prevent the escape of any of them. About 500 gunmen, with lighted matches, were drawn up on the parade; and soon after the factory was in flames to the right and left of the prisoners, who had various conjectures on this appearance. The fire advanced with rapidity on both sides; and it was the prevailing opinion of the English, that they were to be suffocated between the two fires. On this they soon came to a resolution of rushing on the guard, seizing their scimitars, and attacking the troops upon the parade, rather than be thus tamely roasted to death: but Mr Holwell advanced, and found the Moors were only searching for a place to confine them in. At this time Mr Holwell might have made his escape, by the assistance of Mr Leech, the company's smith, who had escaped when the Moors entered the fort, and returned just as it was dark, to tell Mr Holwell he had provided a boat, and would ensure his escape, if he would follow him through a passage few were acquainted with, and by which he then entered. This might easily have been accomplished, as the guard took little notice of it; but Mr Holwell told Mr Leech, he was resolved to share the fate of the gentlemen and the garrison; to which Mr Leech gallantly replied, that "then he was resolved to share Mr Holwell's fate, and would not leave him."

The guard on the parade advanced, and ordered them all to rise and go into the barracks. Then, with their muskets presented, they ordered them to go into the Black Hole prison; while others, with clubs and scimitars pressed upon them so strong, that there was no resisting it; but, like one agitated wave impelling another, they were obliged to give way and enter: the rest following like a torrent. Few among them, the soldiers excepted, had the least idea of the dimensions or nature of a place they had never seen; for if they had, they should at all events have rushed upon the guard, and been cut to pieces by their own choice as the lesser evil.

It was about eight o'clock when these 146 unhappy persons, exhausted by continual action and fatigue, were thus crammed together into a dungeon about eighteen feet square, in a close sultry night in Bengal; shut up to the east and south, the only quarters from whence air could reach them, by dead walls, and by a wall and door to the north; open only to the west by two windows, strongly barred with iron, from which they could receive scarce any circulation of fresh air.

They had been but few minutes confined before every one fell into a perspiration so profuse, that no idea can be formed of it. This brought on a raging thirst, which increased in proportion as the body was drained of its moisture. Various expedients were thought of to give more room and air. Every man was stripped, and every hat put in motion: they several times sat down on their hams; but at each time several of the poor creatures fell, and were instantly suffocated or trode to death.

Before nine o'clock every man's thirst grew intolerable, and respiration difficult. Efforts were again made to force the door; but still in vain. Many insults were used to the guards, to provoke them to fire in upon the prisoners, who grew outrageous, and many delirious. "Water, water," became the general cry. Some water was brought: but these supplies, like sprinkling water on fire, only served to raise and feed the flames. The confusion became general and horrid from the cries and ravings for water; and some were trampled to death. This scene of misery proved entertainment to the brutal wretches without, who supplied them with water, that they might have the satisfaction of seeing them fight for it, as they phrased it; and held up lights to the bars, that they might lose no part of the inhuman diversion.

Before eleven o'clock, most of the gentlemen were dead, and one-third of the whole. Thirst grew intolerable: but Mr Holwell kept his mouth moist by sucking the perspiration out of his shirt sleeves, and catching the drops as they fell, like heavy rain, from his head and face. By half an hour after eleven, most of the living were in an outrageous delirium. They found that water heightened their uneasiness; and "Air, air," was the general cry. Every insult that could be devised against the guard; all the opprobrious names that the viceroy and his officers could be loaded with, were repeated, to provoke the guard to fire upon them. Every man had eager hopes of meeting the first shot. Then a general prayer to heaven, to hasten the approach of the flames to the right and left of them, and put a period to their misery. Some expired on others; while a steam arose as well from the living as the dead, which was very offensive.

About two in the morning, they crowded so much to the windows, that many died standing, unable to fall by the throng and equal pressure round. When the day broke, the stench arising from the dead bodies was insufferable. At that juncture, the soubah, who had received an account of the havock death had made among them, sent one of his officers to enquire if the chief survived. Mr Holwell was shown to him; and near six an order came for their release.

Thus they had remained in this infernal prison from eight at night until six in the morning, when the poor remains of 146 souls, being only 23, came out alive; but most of them in a high putrid fever. The dead bodies were dragged out of the hole by the soldiers, and thrown promiscuously into the ditch of an unfinished ravelin, which was afterwards filled with earth.

The injuries which Calcutta suffered at this time, however, were soon repaired. The place was retaken by Admiral Watson and Colonel Clive, early in 1757; Surajah Dowla was defeated, deposed, and put to death; and Meer Jaffier, who succeeded him in the nabobship, engaged to pay an immense sum for the indemnification of the inhabitants. Since that time, the immense acquisition of territory by the British in this part of the world, with the constant state of security enjoyed by this city, have given an opportunity of embellishing and improving it greatly beyond what it was before.—Among these improvements we may reckon that of Sir William Jones, who on the 15th of January, 1784, instituted a society for inquiring into the history, civil and natural, the antiquities, arts, sciences, and literature of Asia; and thus the literature of Europe, and along with it, it is to be hoped, the arts of humanity, beneficence, and peace, have at length obtained a footing in the rich empire of Indostan, so long a prey to the rapine and violence of tyrants. See CALCUTTA, SUPPLEMENT.

CALDARIUM, in the ancient baths, denoted a brazen vessel or cistern, placed in the hypocaustum, full of hot water, to be drawn thence into the *piscina* or bath, to give it the necessary degree of heat. In this sense the *caldarium* stood contradistinguished from the *tepidarium* and *frigidarium*,

CALDARIUM, also denoted the stove, or sudatory, being a close vaulted room, wherein, by hot dry fumes, without water, people were brought to a profuse sweat. In which sense, *caldarium* was the same with what was otherwise denominated *vaporarium*, *sudatorium*, and *laconium;* in the Greek baths, *hypocaustum*, ὑποκαυϛον.

CALDERINUS, DOMITIUS, a learned critic, born at Calderia near Verona. He read lectures upon polite literature at Rome with great reputation; and was the first who ventnred to write upon the most difficult of the ancient poets. He died very young in 1477.

CALDERON, DE LA BARCA, DON PEDRO, a Spanish officer, who after having signalized himself in the military profession, quitted it for the ecclesiastical, and then commenced dramatic writer. His dramatic works make 9 vols. in 4to. and some Spanish authors have compared him to Shakespeare. He flourished about the year 1640.

CALDERWOOD, DAVID, a famous divine of the church of Scotland, and a distinguished writer in behalf of the Presbyterians, was descended of a good family in that kingdom; and being early designed for the ministry, he applied with great diligence to the study of the Scriptures in their original tongues, the works of the fathers, the councils, and the best writers on church history. He was settled about the year 1604 at Crelling near Jedburgh. King James I. of Great Britain, being desirous of bringing the church of Scotland nearer to a conformity with that of England, laboured earnestly to restore the episcopal authority, and enlarge the powers of the bishops who were then in Scotland. This design was very warmly opposed by many of the ministers, and particularly by Mr David Calderwood; who, when Mr James Law, bishop of Orkney, came to visit the presbyteries of Merse and Tiviotdale, declined his jurisdiction by a paper under his hand, dated May 5. 1608. But the king having its success much at heart, sent the earl of Dunbar, the high-treasurer of Scotland, with Dr Abbot, afterward archbishop of Canterbury, and two other divines, into that kingdom, with instructions to employ every method to persuade both the clergy and laity of his majesty's sincere desire to promote the good of the church, and of his zeal for the Protestant religion. Mr Calderwood did not assist at the general assembly held at Glasgow, June 8. 1610, in which Lord Dunbar presided as commissioner; and it appears from his writings, that he looked upon every thing transacted in it as null and void. In May following, King James went to Scotland; and on the 17th of June held a parliament at Edinburgh. At that time the clergy met in one of the churches, to hear and advise with the bishops, which kind of assembly, it seems, was contrived in order to resemble the English convocation. Mr Calderwood was present at it, but declared publicly that he did not take any such meetings to resemble a convocation; and being opposed by Dr Whitford and Dr Hamilton, who were friends to the bishops, he took his leave of them in these words: "It is absurd to see men sitting in silks and satins, and to cry poverty in the kirk, when purity is departing." The parliament proceeded in the meanwhile in the dispatch of business; and Mr Calderwood, with several other ministers, being informed that a bill was depending to empower the king, with the advice of the archbishops, bishops, and such a number of the ministry as his majesty should think proper, to consider and conclude as to matters decent for the external policy of the church, not repugnant to the word of God; and that such conclusions should have the strength and power of ecclesiastical laws; against this they protested, for four reasons: 1. Because their church was so perfect, that, instead of needing reformation, it might be a pattern to others. 2. General assemblies, as now established by law, and which ought always to continue, might by this means be overthrown. 3. Because it might be a means of creating schism, and disturb the tranquillity of the church. 4. Because they had received assurances, that no attempts should be made to bring them to a conformity with the church of England. They desired, therefore, that, for these and other reasons, all thoughts of passing such a law might be laid aside: but in case this be not done, they protest for themselves and their brethren who shall adhere to them, that they can yield no obedience to this law, when it shall be enacted, because it is destructive of the liberty of the church; and therefore shall submit to such penalties, and think themselves obliged to undergo such punishments, as may be inflicted on them for disobeying that law. This protest was signed by Mr Archibald Simson on behalf of the members, who subscribed another separate roll, which he kept for his justification. This protest was presented to the clerk register, who refused to read it before the states in parliament. However, though not read, it had its effect; for although the bill had the consent of parliament, yet the king thought fit to cause it to be laid aside, and not long after called a general assembly at St Andrew's. Soon after the parliament was dissolved, and Mr Calderwood was summoned to appear before the high commission court at St Andrew's, on the 8th of July following, to answer for his mutinous and seditious behaviour. July 10th, the king came to that city in person; when Mr Calderwood, being called upon, and refusing to comply with what the king in person required of him, was committed to prison. Afterwards the privy council, according to the power exercised by them at that time, directed him to banish himself out of the king's dominions before Michaelmas next; and not to return without licence. Having applied to the king for a prorogation of his sentence without success, because he would neither acknowledge his offence, nor promise conformity for the future, he retired to Holland, where, in 1623, he published his celebrated piece entitled *Altare Damascenum*. Mr Calderwood having in the year 1624 been afflicted with a long fit of sickness, and nothing having been heard of him for some time, one Mr Patrick Scott, as Calderwood himself informs us, took it for granted that he he was dead; and thereupon wrote a recantation in his name, as if, before his decease, he had changed his sentiments. This imposture being detected, Scott went over to Holland, and staid three weeks at Amsterdam, where he made a diligent search for the author of Altare Damascenum, with a design to have dispatched him. But Calderwood had privately retired into his own country, where he lived several years. Scott gave out that the king had furnished him with the matter for the pretended recantation, and that he only put it in order. During his retirement, Mr Calderwood collected all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the reformation there down to the death of King James, which collection is still preserved in the university library of Glasgow; that which was published under the title of "The True History of Scotland," is only an extract from it. In the advertisement prefixed to the last edition of his Altare Damascenum, mention is made of his being minister of Pencaitland near Edinburgh in 1638, but we find nothing said there, or anywhere else, of his death.

CALDRON, a large kitchen utensil, commonly made of copper; having a moveable iron handle, whereby to hang it on the chimney hook. The word is formed from the French *chaudron*, or rather the Latin *caldarium*.

Boiling in CALDRONS (*caldariis decoquere*), is a capital punishment spoken of in the middle-age writers, decreed to divers sort of criminals, but chiefly to debasers of the coin. One of the torments inflicted on the ancient Christian martyrs, was boiling in caldrons of water, oil, &c.

CALDWALL, RICHARD, a learned English physician, born in Staffordshire about the year 1513. He studied physic in Brazen-nose College, Oxford; and was examined, admitted into, and made censor of, the College of Physicians at London, all in one day. Six weeks after he was chosen one of the elects; and in the year 1570, he was made president of that college. Mr Wood tells us, that he wrote several pieces in his profession; but he does not tell us what they were, only that he translated a book on the art of surgery, written by one Horatio More, a Florentine physician. We learn from Camden, that Caldwall founded a chirurgical lecture in the College of Physicians, and endowed it with a handsome salary. He died in 1585.

CALEA. See BOTANY *Index*.

CALEB, one of the deputies sent by the Israelites to take a view of the land of Canaan. He made a good report of the country, and by this means revived the spirits of the dejected people; on which account, he and Joshua were the only persons who, after their leaving Egypt, settled in the land of Canaan. Caleb had for his share the mountains and the city of Hebron, from which he drove three kings. Othniel his nephew having taken the city of Debir, Caleb gave him his daughter Achsah in marriage; and died, aged 114.

CALEDONIA, the ancient name of Scotland. From the testimonies of Tacitus, Dio, and Solinus, we find, that the ancient Caledonia comprehended all that country lying to the north of the rivers Forth and Clyde. In proportion as the Silures or Cimbri advanced towards the north, the Caledonians being circumscribed within narrower limits, were forced to transmigrate into the islands which crowd the western coasts of Scotland. It is in this period, probably, we ought to place the first great migration of the British Gaël into Ireland; that kingdom being much nearer to the promontory of Galloway and Cantire than many of the Scotish isles are to the continent of North Britain.

To the country which the Caledonians possessed, they gave the name of *Caël-doch;* which is the only appellation the Scots, who speak the Gaelic language, know for their own division of Britain. *Caël-doch* is a compound, made up of *Gaël* or *Caël*, the first colony of the ancient Gauls who transmigrated into Britain, and *doch*, a district or division of a country. The Romans, by transposing the letter *l* in *Cael*, and by softening into a Latin termination the *ch* of *doch*, formed the well-known name of Caledonia.

When the tribes of North Britain were attacked by the Romans, they entered into associations, that, by uniting their strength, they might be more able to repel the common enemy. The particular name of that tribe, which either its superior power or military reputation placed at the head of the association, was the general name given by the Romans to all the confederates. Hence it is that the *Mœatæ*, who with other tribes inhabited the districts of Scotland lying southward of the frith, and the *Caledonians*, who inhabited the west and north-west parts, have engrossed all the glory which belonged in common, though in an inferior degree, to all the other nations settled of old in North Britain. It was for the same reason that the name of *Mœatæ* was entirely forgotten by foreign writers after the third century, and that of the *Caledonians* themselves but seldom mentioned after the fourth.

Britons, *Caledonians*, *Mœatæ*, *Barbarians*, are the names constantly given to the old inhabitants of North Britain, by Tacitus, Herodian, Dio, Spartian, Vopiscus, and other ancient writers. The successors of these Britons, Caledonians, Mœats, and barbarians, are called Picts, Scots, and Attacots, by some Roman writers of the fourth century.

The origin of the appellations *Scoti* and *Picti*, introduced by later Roman authors, has occasioned much controversy among the antiquarians of these days. The dispute seems now to be fully decided by some learned critics of the present century, whose knowledge of the Gaelic language assisted their investigation. See SCOTLAND, PICTS, and HIGHLANDERS.

CALEDONIA, the name of a settlement made by the Scots on the west side of the gulf of Darien, in 1698; out of which they were starved at the request of the East India Company; for the English government prohibited the other colonies sending them any provisions; so they were obliged to leave it in 1700.

New CALEDONIA, an island in the South sea, lately discovered by Captain Cook, and next to New Holland and New Zealand, is the largest island that hath yet been discovered in that sea. It extends from 19. 37. to 22. 30. S. Lat. and from 163. 37. to 167. 14. E. Long. Its length from north-west to south-east is about 80 leagues: but its greatest breadth does not exceed ten leagues. This island is diversified with hills and valleys of various size and extent. From the hills issue abundance of rivulets, which contribute to fertilize the plains.

Caledonia. plains. Along its north-east shore the land is flat; and being well watered, and cultivated by the inhabitants after their manner, appeared to great advantage to Captain Cook's people. Was it not, indeed, for those fertile spots on the plains, the whole country might be called a *dreary waste:* the mountains and higher parts of the land are in general incapable of cultivation. They consist chiefly of rocks, many of which are full of mundic; the little soil that is upon them is scorched and burnt up by the sun: it is, however, covered with coarse grass and other plants, and here and there covered with trees and shrubs. The country in general bears a great resemblance to those parts of New South Wales which lie under the same parallel of latitude. Several of its natural productions are the same, and the woods are without underwood as well as in that country. The whole coast seems to be surrounded by reefs and shoals, which render all access to it extremely dangerous; but at the same time guard the coasts against the attacks of the wind and sea; rendering it easily navigable along the coast by canoes, and causing it abound with fish. Every part of the coast seems to be inhabited; the plantations in the plains are laid out with great judgment, and cultivated with much labour. They begin their cultivation by setting fire to the grass, &c. with which the ground is covered, but have no notion of preserving its vigour by manure; they, however, recruit it by letting it lie for some years untouched. On the beach was found a large irregular mass of rock, not less than a cube of ten feet, consisting of a close grained stone speckled full of granites somewhat bigger than pins heads, from whence it seems probable that some valuable minerals may be found on this island. It differs from all the other islands yet discovered in the South sea, by being entirely destitute of volcanic productions. Several plants of a new species were found here; and a few young bread fruit trees, not then sufficiently grown to bear fruit, seemed to have come up without culture; plantains and sugar canes are here in small quantity, and the cocoa-nut trees are small and thinly planted. A new species of passion flower was likewise met with, which was never known to grow wild anywhere but in America. Several *Caputi* (MELALEUCA) trees were also found in flower. Musquetos here are very numerous. A great variety of birds was seen of different classes, which were for the most part entirely new; particularly a beautiful species of parrot before unknown to zoologists. A new species of fish, of the genus called by Linnæus *tetraodon*, was caught here; and its liver, which was very large, presented at supper Several species of this genus being reckoned poisonous, and the present species being remarkably ugly, Messrs Fosters hinted their suspicions of its quality; but the temptations of a fresh meal, and the assurances of Captain Cook that he had formerly eaten this identical sort of fish without harm, got the better of their scruples, and they ate of it. Its oiliness, however, though it had no other bad taste than what proceeded from this, prevented them from taking more than a morsel or two. In a few hours after they had retired to rest they were awaked by very alarming symptoms, being all seized with an extreme giddiness; their hands and feet were numbed, so that they were scarcely able to crawl; and a violent languor and oppression seized them. Emetics were administered with some success, but sudorifics gave the greatest relief. Some dogs who had eaten the remainder of the liver were likewise taken ill; and a pig which had eaten the entrails died soon after, having swelled to an unusual size. The effects of this poison on the gentlemen did not entirely go off in less than six weeks.—Abundance of turtle was seen here. The natives had not the least notion of goats, hogs, dogs, or cats, and had not even a name for any of them.

The inhabitants are very stout, tall, and in general well proportioned; their features mild; their beards and hair black, and strongly frizzled, so as to be somewhat woolly in some individuals: their colour is swarthy, or a dark chesnut brown. A few were seen who measured six feet four inches. They are remarkably courteous, not at all addicted to pilfering and stealing: in which character of honesty they are singular, all the other nations in the South sea being remarkably thievish. Some wear their hair long, and tie it up to the crown of their heads: others suffer only a large lock to grow on each side, which they tie up in clubs; many others, as well as all the women, wear it cropt short. They make use of a kind of comb made of sticks or hard wood, from seven to nine or ten inches long, and about the thickness of knitting needles; a number of these, seldom exceeding 20, but generally fewer, are fastened together at one end, parallel to and near one-tenth of an inch from each other: the ends, which are a little pointed, will spread out or open like the sticks of a fan. These combs they always wear in their hair on one side of their head. Some had a kind of concave cylindrical stiff black cap, which appeared to be a great ornament among them, and was supposed to be worn only by the chiefs and warriors. A large sheet of strong paper, whenever they got one in exchange, was commonly applied to this purpose. The men go naked; only tying a string round their middle, and another round their neck. A little piece of a brown cloth made of the bark of a fig tree, sometimes tucked up to the belt, and sometimes pendulous, scarcely deserves the name of a covering; nor indeed does it seem at all intended for that purpose. This piece of cloth is sometimes of such a length, that the extremity is fastened to a string round the neck; to this string they likewise hang small round beads of a pale green nephritic stone. Coarse garments were seen among them made of a sort of matting; but they seemed never to wear them, except when in their canoes and unemployed. The women seemed to be in a servile state: they were the only persons of the family who had any employment, and several of them brought bundles of sticks and fuel on their backs: those who had children carried them on their backs in a kind of satchel. The women also were seen to dig up the earth in order to plant it. They are in general of a dark chesnut, and sometimes mahogany brown; their stature middle-sized, some being rather tall, and their whole form rather stout and somewhat clumsy. Their dress is the most disfiguring that can be imagined, and gives them a thick squat shape; it is a short petticoat or fringe, consisting of filaments or little cords, about eight inches long, which are fastened to a very long string, which they have tied several times round their waist. The filaments, or little ropes, therefore, lie above each other in several layers, forming a kind of thick

thick thatch all round the body, but which does not near cover the thigh; these filaments were sometimes dyed black; but frequently those on the outside only were of that colour, the rest being of a dirty grey. There was not a single instance, during the ship's stay in this island, of the women permitting any indecent familiarity with an European; they took pleasure in practising the arts of a jilting coquette, but never became absolute wantons. The general ornaments of both sexes are ear-rings of tortoise shells; necklaces, or amulets, made of both shells and stones; and bracelets made of large shells, which they wear above the elbows.

The houses, or huts, in New Caledonia, are circular, something like a bee-hive, and full as close and warm; the entrance is by a small door, or long square hole, just big enough to admit a man bent double: the side walls are about four feet and a half high; but the roof is lofty, and peaked to a point at the top, above which is a post or stick of wood, which is generally ornamented either with carving or shells, or both. The framing is of small spars, reeds, &c. and both sides and roof are thick, and close covered with thatch made of coarse long grass. In the inside of the house are set up posts, to which cross spars are fastened, and platforms made for the conveniency of laying any thing on. Some houses have two floors, one above another; the floor is laid with dried grass, and here and there mats are spread for the principal people to sit or sleep on. In these houses there was no passage for the smoke but through the door: they were intolerably smoky, and so hot as to be insupportable to those unaccustomed to them: probably the smoke is intended to drive out the musquetos which swarm here. They commonly erect two or three of these huts near each other under a cluster of lofty fig trees, whose leaves are impervious to the rays of the sun.

The canoes used here are very heavy clumsy vessels; they are made of two trees hollowed out, having a raised gunnel about two inches high, and closed at each end with a bulk head of the same height; so that the whole is like a long square trough about three feet shorter than the body of the canoe. Two canoes thus fitted are fastened to each other about three feet asunder, by means of cross spars, which project about a foot over each side. Over these is laid a deck or heavy platform made of plank and small round spars, on which they have a fire-hearth, and generally a fire burning; they are navigated by one or two latteen sails, extended to a small latteen yard, the end of which is fixed in a notch or hole in the deck.

Notwithstanding the inoffensive disposition of the inhabitants of New Caledonia, they are well provided with offensive weapons; as clubs, spears, darts, and slings for throwing stones. Their clubs are about two feet and a half long, and variously formed; some like a scythe, others like a pick-axe; some have a head like a hawk, and others have round heads; but all are neatly made; many of their darts and spears are no less neat, and ornamented with carvings. The slings are as simple as possible; but they take some pains to form the stones that they use into a proper shape, which is something like an egg, supposing both ends to be like the small one. They drive the dart by the assistance of short cords, knobbed at one end and looped at the other, called by the seamen *beckets*. These contain a quantity of red wool taken from the vampyre, or great Indian bat. Bows and arrows are wholly unknown among them.

Their language bears no affinity to that spoken in the other South sea islands, the word *arrekee* and one or two more excepted. This is the more extraordinary, as different dialects of one language were spoken not only in the easterly islands, but at New Zealand.

A musical instrument, a kind of whistle, was procured here. It was a little polished piece of brown wood about two inches long, shaped like a kind of bell, though apparently solid, with a rope fixed at the small end; two holes were made in it near the base, and another near the insertion of the rope, all which communicated with each other; and by blowing in the uppermost, a shrill sound like whistling was produced: no other instrument was seen among them that had the least relation to music.

Many of the New Caledonians were seen with prodigiously thick legs and arms, which seemed to be affected with a kind of leprosy; the swelling was found to be extremely hard, but the skin was not alike harsh and scaly in all those who were afflicted with the disorder. The preternatural expansion of the arm or leg did not appear to be a great inconvenience; and they seemed to intimate that they very rarely felt any pain in it; but in some the disorder began to form blotches, which are marks of a great degree of virulence. This disease is probably *elephantiasis*.

Here they bury their dead in the ground. The grave of a chief who had been slain in battle here resembled a large mole-hill, and was decorated with spears, darts, paddles, &c. all stuck upright in the ground round about it.

CALEDONIAN Canal, a canal extending across the Highlands of Scotland, in a north-east and south-west direction, from Fort William to Inverness. It was begun in 1803, and is expected to be completed in 1821. See Caledonian Canal, Supplement.

CALEFACTION, the production of heat in a body from the action of fire, or that impulse impressed by a hot body on others around it. This word is used in pharmacy, by way of distinction from *coction*, which implies boiling; whereas calefaction is only heating a thing.

CALENBERG, a castle of Germany, in the duchy of Brunswick and principality of Calenberg. It is seated on the river Leine, and is 15 miles south of Hanover. It is subject to the duke of Brunswick Lunenburg, elector of Hanover, and king of Great Britain. E. Long. 9. 43. N. Lat. 52. 20.

Calenberg, a principality of Lower Saxony, and one of the three parts of the duchy of Brunswick, is bounded on the north by the duchy of Verden, on the east by the principality of Zell, on the south by the principalities of Grubenhagen and Wolfenbuttle, and on the west by Westphalia. It belongs to the elector of Hanover.

CALENDAR, in *Astronomy* and *Chronology*. See Kalendar.

Calendar of prisoners, in *Law*, a list of all the prisoners names in the custody of each respective sheriff*.

* See the article *Execution*.

CALENDARIUM floræ, in *Botany*, a calendar containing

containing an exact register of the respective times in which the plants of any given province or climate germinate, expand, and shed their leaves and flowers, or ripen and disperse their seeds. For particulars on this curious subject, see the articles DEFOLIATIO, EFFLORESCENTIA, FRONDESCENTIA, FRUCTESCENTIA, and GERMINATIO.

CALENDER, a machine used in manufactories to press certain woollen and silken stuffs and linens, to make them smooth, even, and glossy, or to give them waves, or water them, as may be seen in mohairs and tabbies. This instrument is composed of two thick cylinders, or rollers, of very hard and well polished wood, round which the stuffs to be calendered are wound: these rollers are placed cross-wise between two very thick boards, the lower serving as a fixed base, and the upper moveable by means of a thick screw with a rope fastened to a spindle, which makes its axis: the uppermost board is loaded with large stones weighing 20,000lb. or more. At Paris they have an extraordinary machine of this kind, called the *royal calender*, made by order of M. Colbert. The lower table or plank is made of a block of smooth marble, and the upper is lined with a plate of polished copper. The alternate motion of the upper board sometimes one way and sometimes another, together with the prodigious weight laid upon it, gives the stuffs their gloss and smoothness; or gives them the waves, by making the cylinders on which they are put roll with great force over the undermost board. When they would put a roller from under the calender, they only incline the undermost board of the machine. The dressing alone, with the many turns they make the stuffs and linens undergo in the calender, gives the waves, or waters them, as the workmen call it. It is a mistake to think, as some have asserted, that they use rollers with a shallow indenture or engraving cut in them. See CALENDERING, SUPPLEMENT.

CALENDER *of Monteith*, a district in the south-west corner of Perthshire in Scotland, from which a branch of the ancient family of Livingstone had the title of earl. The chief seat of the family near Falkirk is also called *Calender*. Both estate and title were forfeited in consequence of the possessor being engaged in the rebellion 1715.

CALENDERS, a sort of Mahometan friars, so called from Santon Calenderi their founder. This Santon went bareheaded, without a shirt, and with the skin of a wild beast thrown over his shoulders. He wore a kind of apron before, the strings of which were adorned with counterfeit precious stones. His disciples are rather a sect of epicures than a society of religious. They honour a tavern as much as they do a mosque; and think they pay as acceptable worship to God by the free use of his creatures, as others do by the greatest austerities and acts of devotion. They are called, in Persia and Arabia, *Abdals*, or *Abdallat*, i. e. persons consecrated to the honour and service of God. Their garment is a single coat, made up of a variety of pieces, and quilted like a rug. They preach in the market places, and live upon what their auditors bestow on them. They are generally very vicious persons: for which reason they are not admitted into any houses.

CALENDS, in Roman antiquity. See KALENDS.

CALENDULA, the MARIGOLD. See BOTANY *Index*.

CALENTIUS, ELISIUS, a Neapolitan poet and prose author. He was preceptor to Frederick the son of Ferdinand king of Naples, and the earliest writer on the illegality of putting criminals to death, except for murder. He died in 1503.

CALENTURE, a feverish disorder incident to sailors in hot countries; the principal symptom of which is their imagining the sea to be green fields: hence, attempting to walk abroad in these imaginary places of delight, they are frequently lost. Vomiting, bleeding, a spare diet, and the neutral salts, are recommended in this disorder; a single vomit commonly removing the delirium, and the cooling medicines completing the cure.

CALEPIN, AMBROSIUS, an Augustine monk of Calepio, whence he took his name, in the 16th century. He is author of a dictionary of eight languages, since augmented by Passerat and others.

CALES, in *Ancient Geography*, a municipal city of some note in Campania, at no great distance from Casilinum. The epithet *Calenus* is by Horace and Juvenal applied to a generous wine which the territory produced.

CALETES, in *Ancient Geography*, a people of Gallia Celtica, on the confines of Belgica, situated between the sea and the Sequana. Now called *le Paix de Caux*, in Normandy.

CALETURE, a fort on the island of Ceylon, at the mouth of a river of the same name. The Dutch became masters of it in 1655; but were afterwards obliged to leave it. E. Long. 80. 51. N. Lat. 6. 38.

CALF, in *Zoology*, the young of the ox kind.

There are two ways of breeding calves that are intended to be reared. The one is to let the calf run about with its dam all the year round; which is the method in the cheap breeding countries, and is generally allowed to make the best cattle. The other is to take them from the dam after they have sucked about a fortnight: they are then to be taught to drink flat milk, which is to be made but just warm for them, it being very dangerous to give it them too hot. The best time of weaning calves is from January to May: they should have milk for 12 weeks after; and a fortnight before that is left off, water should be mixed with the milk in larger and larger quantities. When the calf has been fed on milk for about a month, little wisps of hay should be placed all about him in cleft sticks to induce him to eat. In the beginning of April they should be turned out to grass; only for a few days they should be taken in for the night, and have milk and water given them: the same may also be given them in a pail sometimes in the field, till they are so able to feed themselves that they do not regard it. The grass they are turned into must not be too rank, but short and sweet, that they may like it, and yet get it with some labour. Calves should always be weaned at grass; for if it be done with hay and water, they often grow big-bellied on it, and are apt to rot. When those among the males are selected which are to be kept as bulls, the rest should be gelt for oxen: the sooner the better. Between 10 and 20 days is a proper

Calf.

per age. About London almost all the calves are fatted for the butcher. The reason of this is, that there is a good market for them: and the lands there are not so profitable to breed upon as in cheaper countries. The way to make calves fat and fine, is the keeping them very clean; giving them fresh litter every day; and the hanging a large chalk stone in some corner where they can easily get at it to lick it, but where it is out of the way of being fouled by their dung and urine. The coops are to be placed so as not to have too much sun upon them, and so high above the ground that the urine may run off. They also bleed them once when they are a month old, and a second time before they kill them; which is a great addition to the beauty and whiteness of their flesh; the bleeding is by some repeated much oftener, but this is sufficient. Calves are very apt to be loose in their bowels; which wastes and very much injures them. The remedy is to give them chalk scraped among milk, pouring it down with a horn. If this does not succeed, they give them bole armenic in large doses, and use the cold bath every morning. If a cow will not let a strange calf suck her, the common method is to rub both her nose and the calf's with a little brandy; this generally reconciles them after a few smellings.

Golden CALF, an idol set up and worshipped by the Israelites at the foot of Mount Sinai, in their passage through the wilderness to the land of Canaan. Our version makes Aaron fashion this calf with a graving tool after he had cast it in a mould; the Geneva translation makes him engrave it first, and cast it afterwards. Others, with more probability, render the whole verse thus: "And Aaron received them (the golden earrings), and tied them up in a bag, and got them cast into a molten calf:" which version is authorised by the different senses of the word *tzur*, which signifies to tie up or bind, as well as to shape or form; and of the word *cherret*, which is used both for a graving tool and a bag. Some of the ancient fathers have been of opinion that this idol had only the face of a calf, and the shape of a man from the neck downwards, in imitation of the Egyptian Isis. Others have thought it was only the head of an ox without a body. But the most general opinion is, that it was an entire calf in imitation of the Apis worshipped by the Egyptians; among whom, no doubt, the Israelites had acquired their propensity to idolatry. This calf Moses is said to have *burnt with fire*, reduced to powder, and strewed upon the water which the people were to drink. How this could be accomplished hath been a question. Most people have thought that as gold is indestructible, it could only be burnt by the miraculous power of God; but M. Stahl conjectures that Moses dissolved it by means of liver of sulphur *. The Rabbins tell us that the people were made to drink of this water in order to distinguish the idolaters from the rest; for that as soon as they had drunk of it, the beards of the former turned red. The Cabbalists add, that the calf weighed 125 quintals; which they gather from the Hebrew word *massekah*, whose numerical letters make 125.

* See CHEMISTRY *Index*.

CALF-*Skins*, in the leather manufacture, are prepared and dressed by the tanners, skinners, and curriers, who sell them for the use of the shoemakers, saddlers, bookbinders, and other artificers, who employ them in their several manufactures.

CALF-*Skin dressed in sumach*, denotes the skin of this animal curried black on the hair side, and dyed of an orange colour on the flesh side, by means of sumach, chiefly used in the making of belts.

The English calf-skin is much valued abroad, and the commerce thereof very considerable in France and other countries; where divers attempts have been made to imitate it, but hitherto in vain. What is like to baffle all endeavours for imitating the English calf in France is, the smallness and weakness of the calves about Paris; which at 15 days old are not so big as the English ones when they come into the world.

Sea-CALF. See PHOCA, MAMMALIA *Index*.

CALI, a town of Popayan in South America, seated in a valley of the same name on the river Cauca. The governor of the province usually resides there. W. Long. 78. 5. N. Lat. 3. 15.

CALIBER, or CALLIPER, properly denotes the diameter of any body; thus we say, two columns of the same caliber, the caliber of the bore of a gun, the caliber of a bullet, &c.

CALIBER *compasses*, a sort of compasses made with arched legs to take the diameter of round or swelling bodies. See COMPASSES.

Caliber compasses are chiefly used by gunners for taking the diameters of the several parts of a piece of ordnance, or of bombs, bullets, &c. Their legs are therefore circular, and move on an arch of brass, whereon is marked the inches and half inches, to show how far the points of the compasses are opened asunder.

Some are also made for taking the diameter of the bore of a gun or mortar.

The gaugers also sometimes use calibers, to embrace the two heads of any cask, in order to find its length.

The caliber used by carpenters and joiners, is a piece of board notched triangular-wise in the middle for the taking of measure.

CALIBER *Rule*, or *Gunners* CALLIPERS, is an instrument wherein a right line is so divided as that the first part being equal to the diameter of an iron or leaden ball of one pound weight, the other parts are to the first as the diameters of balls of two, three, four, &c. pounds are to the diameter of a ball of one pound. The caliber is used by engineers, from the weight of the ball given, to determine its diameter or caliber, or *vice versa*.

The gunners callipers consist of two thin plates of brass joined by a rivet, so as to move quite round each other: its length from the centre of the joint is between six inches and a foot, and its breadth from one to two inches; that of the most convenient size is about nine inches long. Many scales, tables, and proportions, &c. may be introduced on this instrument; but none are essential to it, except those for taking the caliber of shot and cannon, and for measuring the magnitude of salient and entering angles. The most complete callipers is exhibited Plate CXXXIII. the furniture and use of which we shall now briefly describe. Let the four faces of this instrument be distinguished by the letters A, B, C, D: A and D consist of

Caliber. of a circular head and leg; B and C consist only of a leg.

On the circular head adjoining to the leg of the face A are divisions denominated *shot diameters:* which show the distance in inches and tenths of an inch of the points of the callipers when they are opened; so that if a ball not exceeding ten inches be introduced between them, the bevil edge E marks its diameter among these divisions.

On the circular bevil part E of the face B is a scale of divisions distinguished by *lb. weight of iron shot.* When the diameter of any shot is taken between the points of the callipers, the inner edge of the leg A shows its weight in avoirdupois pounds, provided it be lib. $\frac{1}{2}$, 1, $1\frac{1}{2}$, 2, 3, 4, $5\frac{1}{4}$, 6, 8, 9, 12, 16, 18, 24, 26, 32, 36, or 42; the figures nearest the bevil edge answering to the short lines in the scale, and those behind them to the longer strokes. This scale is constructed on the following geometrical theorem, viz. that the weights of spheres are as the cubes of their diameters.

On the lower part of the circular head of the face A is a scale of divisions marked *bores of guns;* for the use of which, the legs of the callipers are slipped across each other, till the steel points touch the concave surface of the gun in its greatest breadth; then the bevil edge F of the face B will cut a division in the scale showing the diameter of the bore in inches and tenths.

Within the scales of *shot* and *bore* diameters on the circular part of A, are divisions marked *pounders:* the inner figures $\frac{1}{2}$, $1\frac{1}{2}$, 3, $5\frac{1}{4}$, 8, 12, 18, 26, 36, correspond to the longest lines; and the figures, 1, 2, 4, 6, 9, 16, 24, 32, 42, to the short strokes. When the bore of a gun is taken between the points of the callipers, the bevil edge F will either cut or be near one of these divisions, and show the weight of iron shot proper for that gun.

On the upper half of the circular head of the face A are three concentric scales of degrees; the outer scale consisting of 180 degrees numbered from right to left, 10, 20, &c. the middle numbered the contrary way, and the outer scale beginning at the middle, with 0, and numbered on each side to 90 degrees. These scales serve to take the quantity of an angle, either entering or salient. For an entering or internal angle, apply the legs of the callipers so that its outward edges coincide with the legs of the given angle, the degree cut by the bevil edge F in the outer scale shows the measure of the angle sought: for a salient or external angle, slip the legs of the callipers across each other, so that their outward edges may coincide with the legs forming the angle, and the degree marked on the middle scale by the bevil edge E will show the measure of the angle required. The inner scale will serve to determine the elevation of cannon and mortars, or of any oblique plane. Let one end of a thread be fixed into the notch on the plate B, and any weight tied to the other end: apply the straight side of the plate A to the side of the body whose inclination is sought; hold it in this position, and move the plate B, till the thread falls upon the line near the centre marked *perp.* Then will the bevil edge F cut the degrees on the inner scale, showing the inclination of that body to the horizon.

On the face C near the point of the callipers is a little table showing the proportion of troy and avoirdupois weights, by which one kind of weight may be easily reduced into another. Caliber.

Near the extreme of the face D of the callipers are two tables showing the proportion between the pounds weight of London and Paris, and also between the lengths of the foot measure of England and France.

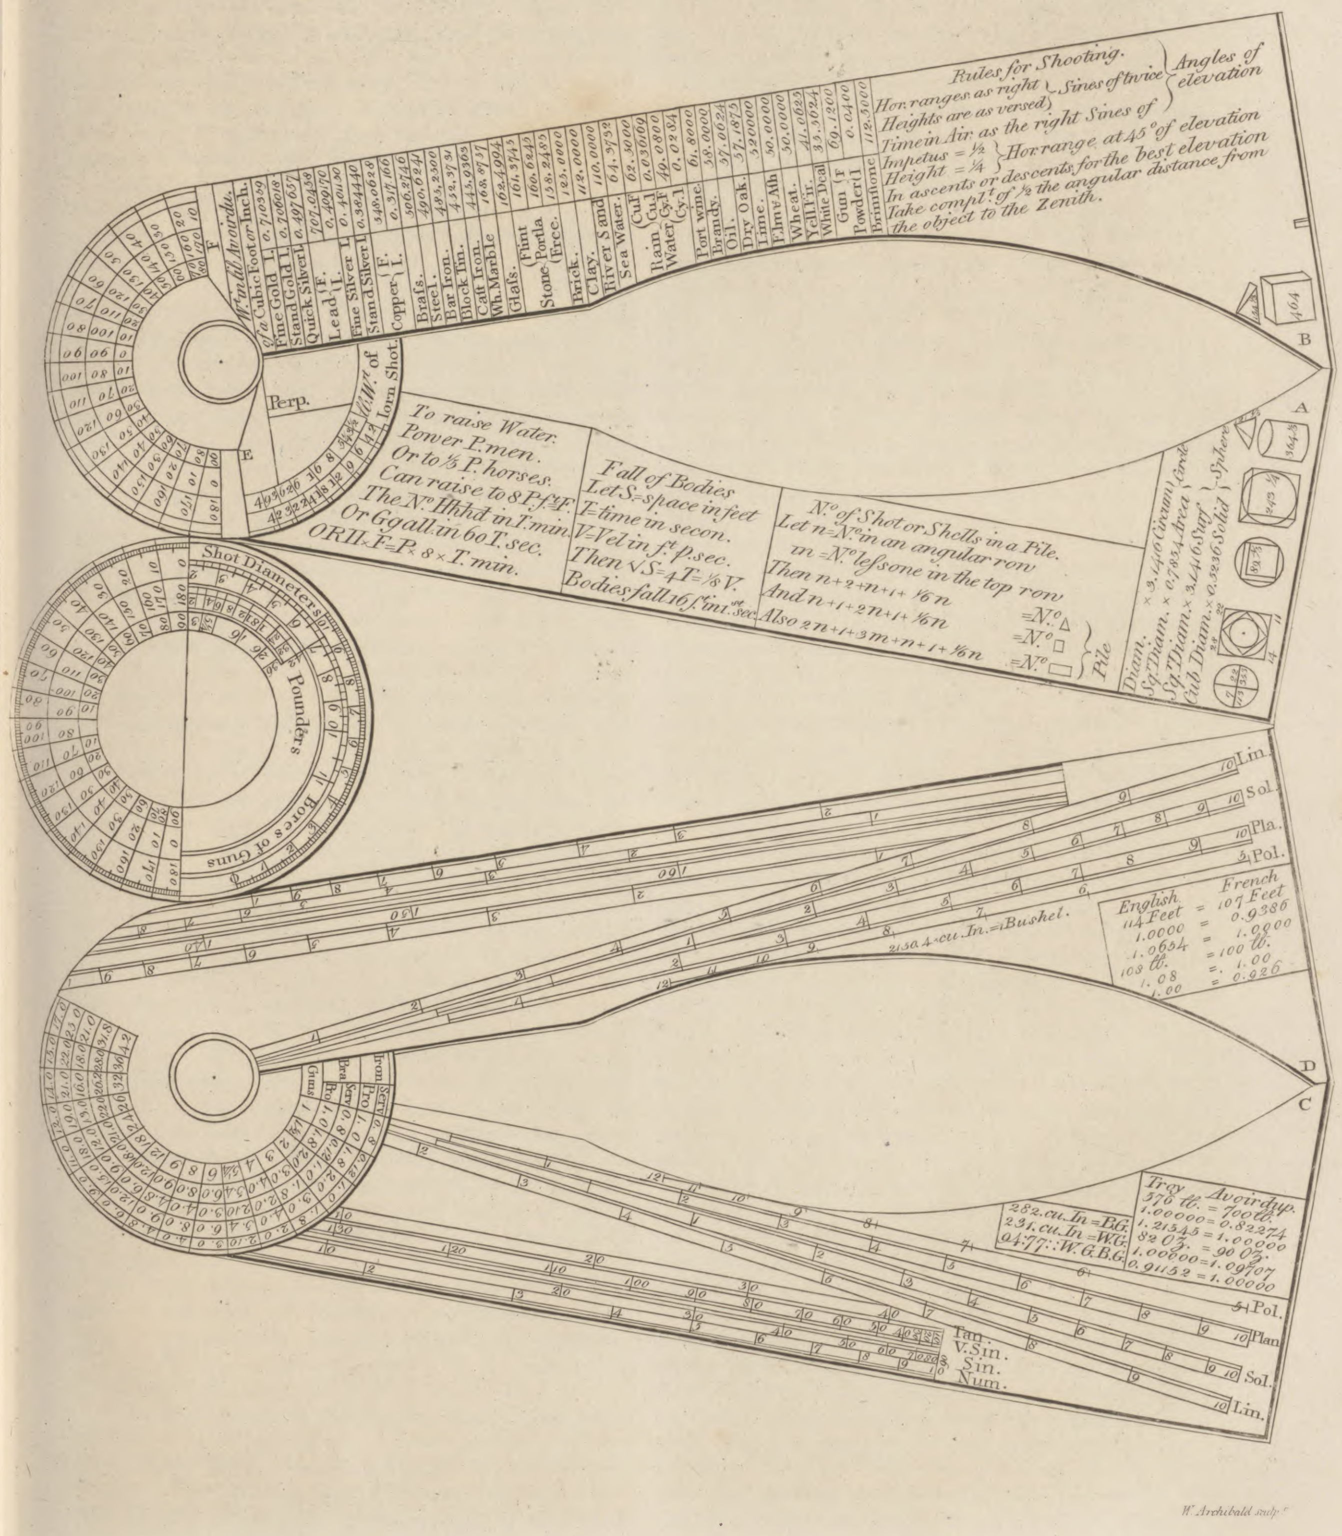
Near the extreme on the face A is a table containing four rules of the circle and sphere; and geometrical figures with numbers annexed to them: the first is a circle including the proportion in round numbers of the diameter to its circumference; the second is a circle, inscribed in a square, and a square within that circle, and another circle in the inner square: the numbers 28, 22, above this figure, exhibit the proportion of the outward square to the area of the inscribed circle: and the numbers 14, 11, below it, show the proportion between the area of the inscribed square and the area of its inscribed circle. The third is a cube inscribed in a sphere; and the number $89\frac{1}{7}$ shows that a cube of iron, inscribed in a sphere of 12 inches in diameter, weighs $89\frac{1}{7}$lb. The fourth is a sphere in a cube, and the number 243 expresses the weight in pounds, of a sphere inscribed in a cube whose side is 12 inches: the fifth represents a cylinder and cone of one foot diameter and height: the number in the cylinder shows, that an iron cylinder of that diameter and height weighs 364.5lb. and the number 121.5 in the cone expresses the weight of a cone, the diameter of whose base is 12 inches, and of the same height: the sixth figure shows that an iron cube, whose side is 12 inches, weighs 464lb. and that a square pyramid of iron, whose base is a square foot, and height 12 inches, weighs $154\frac{2}{3}$lb. The numbers which have been hitherto fixed to the four last figures were not strictly true; and therefore they have been corrected in the figure here referred to; and by these the figures on any instrument of this kind should be corrected likewise.

On the leg B of the callipers, is a table showing the weights of a cubic inch or foot of various bodies in pounds avoirdupois.

On the face D of the circular head of the callipers is a table contained between five concentric segments of rings: the inner one marked *Guns* shows the nature of the gun, or the weight of ball it carries; the two next rings contain the quantity of powder used for proof and service to brass guns, and the two outermost rings show the quantity for proof and service in iron cannon.

On the face A is a table exhibiting the method of computing the *number of shot or shells* in a triangular, square, or rectangular pile. Near this is placed a table containing the principal rules relative to the *fall of bodies*, expressed in an algebraic manner; nearer the centre we have another table of rules for raising water, calculated on the supposition, that one horse is equal in this kind of labour to five men, and that one man will raise a hogshead of water to eight feet of height in one minnte, and work at that rate for some hours. N. B. Hogsheads are reckoned at 60 gallons.

Some of the leading principles in gunnery, relating to *shooting* in cannon and mortars, are expressed on the face B of the callipers. Besides the articles already enumerated,



W. Archibald sculp.t

enumerated, the scales usually marked on this sector are laid down on this instrument: thus the line of inches is placed on the edge of the callipers, or on the straight borders of the faces C, D; the logarithmic scales of numbers, sines, versed sines, and tangents, are placed along these faces near the straight edges: the line of lines is placed on the same faces in an angular position, and marked *Lin.* The lines of planes or superfices are also exhibited on the faces C and D, tending towards the centre, and marked *Plan.* Finally, The lines of solids are laid on the same faces tending towards the centre, and distinguished by *Sol.*

CALICOULAN, or QUILLON, a town of Asia, in the East Indies, on the coast of Malabar, and in the peninsula on this side the Ganges, where the Dutch have a factory. E. Long. 75. 21. N. Lat. 9. 5.

CALICUT, a kingdom of India, on this side the Ganges, upon the coast of Malabar. It is about 63 miles long, and as much broad. It has many woods, rivers, and marshes, and is very populous; but does not produce much corn, abundance of rice being imported from Canara. The land along the sea-coast is low and sandy, and produces a number of cocoa trees. The higher grounds produce pepper and cardamoms of a very good quality. They have likewise timber for building, white and yellow sanders, cassia lignea, cassia fistula, nux vomica, and cocculus indicus. The woods abound with parrots and monkeys, as well as different kinds of game. They have also plenty of fish, several sorts of medicinal drugs, and their mountains produce iron. The *samorin*, or king, of Calicut, was once master of all the coast of Malabar; but at his death, he left it by will among four of his nephews. He who governs Calicut has a palace of stone, and there is some appearance of grandeur about his court. He carries on a considerable trade, which makes the people of Calicut richer than their neighbours. In former times they had several strange customs, some of which are still kept up; particularly the samorin's wife must be first enjoyed by the high priest, who may have her three nights if he pleases. The nobles permit the other priests to take the same liberty, but the lower people cannot have that honour. A woman may marry a number of husbands; each of whom has her ten days or more, by turns, as they agree among themselves; and provide her all things necessary during that time. When she proves with child she names the father; who, after the child is weaned, takes care of its education. These people have no pens, ink, or paper; but write with a bodkin on flags that grow by the sides of the rivers. By this means the letters are in some sense engraved; and so tough are the flags, that they will last for a great number of years. This was the first land discovered by the Portuguese in 1498.

CALICUT, a town of Asia, in the kingdom of that name on the coast of Malabar. It contains a great number of mean low houses, each of which has a garden. The English had a factory here, but it is removed to Tellichery. E. Long. 76. 4. N. Lat. 11. 21.

CALIDÆ PLANTÆ (from *calor*, heat); plants that are natives of warm climates. Such are those of the East Indies, South America, Egypt, and the Canary islands. These plants, says Linnæus, will bear a degree of heat which is as 40 on a scale in which the freezing point is 0, and 100 the heat of boiling water. In the 10th degree of cold they cease to grow, lose their leaves, become barren, are suffocated, and perish.

CALIDUCT, in antiquity, a kind of pipes or canal disposed along the walls of houses or apartments, used by the ancients for conveying heat to several remote parts of the house from one common furnace.

CALIFORNIA, the most northerly of all the Spanish dominions on the continent of America, is sometimes distinguished by the name of *New Albion*, and the *Islas Carrabiras:* but the most ancient appellation is *California;* a word probably owing to some accident, or to some words spoken by the Indians and misunderstood by the Spaniards. For a long time California was thought to be an island; but Father Caino, a Geman Jesuit, discovered it to be a peninusla joining to the coast of New Mexico and the southern parts of America. The peninsula extends from Cape St Sebastian, lying in north latitude 43. 30. to Cape St Lucar, which lies in north latitude 22. 32. It is divided from New Mexico by the gulf, or as some call it the *lake*, of California, or *Vermilion sea*, on the east; on the north, by that part of the continent of North America which is least known; and on the west and south, by the Pacific ocean or great South sea. The coasts, especially towards the Vermilion sea, are covered with inhabited islands, on some of which the Jesuits have established settlements, such as St Clement, Paxaros, St Anne, Cedars (so called from the great number of these trees it produces), St Joseph, and a multitude of others. But the islands best known are three lying off Cape St Lucar towards the Mexican coast. These are called *Les Tres Marias*, " the three Maries." They are small, but have good wood and water, salt pits, and abundance of game; therefore the English and French pirates have sometimes wintered there, when bound on cruises in the South seas.

As California lies altogether within the temperate zone, the natives are neither chilled with cold nor scorched with heat; and indeed the improvements in agriculture made by the Jesuits afford strong proofs of the excellency of the climate. In some places the air is extremely hot and dry; and the earth wild, rugged, and barren. In a country stretching about 800 miles in length, there must be considerable variations of soil and climate; and indeed we find, from good authority, that California produces some of the most beautiful lawns, as well as many of the most inhospitable deserts, in the universe. Upon the whole, although California is rather rough and craggy, we are assured by the Jesuit Vinegas, and other good writers, that with due culture it furnishes every necesssary and conveniency of life; and that, even where the atmosphere is hottest, vapours rising from the sea, and dispersed by pleasant breezes, render it of a moderate temperature.

The peninsula of California is now stocked with all sorts of domestic animals known in Spain and Mexico. Horses, mules, asses, oxen, sheep, hogs, goats, and all other quadrupeds imported, thrive and increase in this country. Among the native animals is a species of deer of the size of a young heifer, and greatly resembling it in shape; the head is like that of a deer, and the horns thick and crooked like those of a ram. The hoof of the animal is large, round, and cloven, the skin spotted, but

California. the hair thinner, and the tail sharper than those of a deer. Its flesh is greatly esteemed. There is another animal peculiar to this country, larger and more bulky than a sheep, but greatly resembling it in figure, and, like it, covered with a fine black or white wool. The flesh of this animal is nourishing and delicious; and, happily for the natives, it is so abundant, that nothing more is required than the trouble of hunting, as these animals wander about in droves in the forests and on the mountains. Father Torquemado describes a creature, which he calls a *species of large bear*, something like a buffalo, of the size of a steer, and nearly of the figure of a stag. Its hair is a quarter of a yard in length, its neck long and awkward, and on its forehead are horns branched like those of a stag. The tail is a yard in length, and half a yard in breadth; and the hoofs cloven like those of an ox. With regard to birds we have but an imperfect account; only, in general, Father Vinegas tells us that the coast is plentifully stored with peacocks, bustards, geese, cranes, and most of the birds common in other parts of the world. The quantity of fish which resort to these coasts is incredible. Salmon, turbot, barbel, skate, mackerel, &c. are caught here with very little trouble; together with pearl oysters, common oysters, lobsters, and a variety of exquisite shell fish. Plenty of turtle are also caught on the coasts. On the South sea coasts are some shell fish peculiar to it, and perhaps the most beautiful in the world; their lustre surpassing that of the finest pearl, and darting their rays through a transparent varnish of an elegant vivid blue, like the lapis lazuli. The fame of California for pearls soon drew forth great numbers of adventurers, who searched every part of the gulf, and are still employed in that work, notwithstanding fashion has greatly diminished the value of this elegant natural production. Father Torquemado observes that the sea of California affords very rich pearl fisheries; and that the *hostias*, or beds of oysters, may be seen in three or four fathom water, almost as plain as if they were on the surface.

The extremity of the peninsula towards Cape St Lucar is more level, temperate, and fertile, than the other parts, and consequently more woody. In the more distant parts, even to the farthest missions on the east coast, no large timber hath yet been discovered. A species of manna is found in this country, which, according to the accounts of the Jesuits, has all the sweetness of refined sugar, without its whiteness. The natives firmly believe that this juice drops from heaven.

The Californians are well made, and very strong. They are extremely pusillanimous, inconstant, stupid, and even insensible, and seem extremely deserving of the character given to the Indians in general, under the article America. Before the Europeans penetrated into California, the natives had no form of religion. The missionaries indeed tell us many tales concerning them, but they so evidently bear the marks of forgery, as not to be worth repeating. Each nation was then an assemblage of several cottages more or less numerous, that were all mutually confederated by alliances, but without any chief. They were strangers even to filial obedience. No kind of dress was used by the men; but the women made use of some coverings, and were even fond of ornamenting themselves with pearls, and such other trinkets as the country afforded. What most displayed their ingenuity was the construction of their fishing nets, which are said by the Jesuits to have even exceeded in goodness those made in Europe. They were made by the women, of a coarse kind of flax procured from some plants which grow there. Their houses were built of branches and leaves of trees; nay, many of them were only enclosures of earth and stone, raised half a yard high, without any covering; and even these were so small, that they could not stretch themselves at length in them. In winter they dwelt under ground, in caves either natural or artificial.

In 1526 Ferdinand Cortez having reduced and settled Mexico, attempted the conquest of California; but was obliged to return, without even taking a survey of the country, a report of his death having disposed the Mexicans to a general insurrection. Some other attempts were made by the officers of Cortez, but these were also unsuccessful; and this valuable coast was long neglected by the Spaniards, who, to this day, have but one settlement upon it. In 1595 a galleon was sent to make discoveries on the Californian shore; but the vessel was unfortunately lost. Seven years after, the Count de Monteroy, then viceroy of New Spain, sent Sebastian Biscayno on the same design with two ships and a tender; but he made no discovery of importance. In 1684 the Marquis de Laguna, also viceroy of New Spain, dispatched two ships with a tender to make discoveries on the lake of California. He returned with an indifferent account, but was among the first who asserted that California was not an island; which was afterwards confirmed by Father Caino, as already related. In 1697, the Spaniards being discouraged by their losses and disappointments, the Jesuits solicited and obtained permission to undertake the conquest of California. They arrived among the savages with curiosities that might amuse them, corn for their food, and clothes for which they could not but perceive the necessity. The hatred these people bore the Spanish name could not support itself against these demonstrations of benevolence. They testified their acknowledgments as much as their want of sensibility and their inconstancy would permit them. These faults were partly overcome by the religious institutors, who pursued their project with a degree of warmth and resolution peculiar to the society. They made themselves carpenters, masons, weavers, and husbandmen; and by these means succeeded in imparting knowledge, and in some measure a taste for the useful arts, to this savage people, who have been all successively formed into one body. In 1745 they composed 43 villages, separated from each other by the barrenness of the soil and the want of water. The inhabitants of these small villages subsist principally on corn and pulse, which they cultivate; and on the fruits and domestic animals of Europe, the breeding of which last is an object of continual attention. The Indians have each their field, and the property of what they reap; but such is their want of foresight, that they would squander in a day what they had gathered, if the missionary did not take upon himself to distribute it to them as they stand in need of it. They manufacture some coarse stuffs; and the necessaries they are in in want of are purchased with pearls, and with wine nearly resembling that of Madeira, which they sell to the Mexicans and to the galleons, and which experience hath shown the necessity of prohibiting in California. A few laws, which are very simple, are sufficient to regulate this rising state. In order to enforce them, the missionary chooses the most intelligent person of the village; who is empowered to whip and imprison; the only punishments of which they have any knowledge. In all California there are only two garrisons, each consisting of 30 men, and a soldier with every missionary. These troops were chosen by the legislators, though they are paid by the government. Were the court of Madrid to push their interest with half the zeal of the Jesuits, California might become one of the most valuable of their acquisitions, on account of the pearls and other valuable articles of commerce which the country contains. At present the little Spanish town near Cape St Lucar is made use of for no other purpose than as a place of refreshment for the Manilla ships, and the head residence of the missionaries.

CALIGA, in Roman antiquity, was the proper soldier's shoe, made in the sandal fashion, without upper leather to cover the superior part of the foot, though otherwise reaching to the middle of the leg, and fastened with thongs. The sole of the caliga was of wood, like the sabot of the French peasants, and its bottom stuck full of nails; which clavi are supposed to have been very long in the shoes of the scouts and sentinels; whence these were called by way of distinction, *caligæ speculatoriæ;* as if, by mounting the wearer to a higher pitch, they gave a greater advantage to the sight: though others will have the *caligæ speculatoriæ* to have been made soft and woolly, to prevent their making a noise. From these *caligæ* it was that the emperor Caligula took his name, as having been born in the army, and afterwards bred up in the habit of a common soldier.

According to Du Cange, a sort of *caliga* was also worn by monks and bishops, when they celebrated mass pontifically.

CALIGATI, an appellation given by some ancient writers to the common soldiers in the Roman armies, by reason of the caliga which they wore. The caliga was the badge or symbol of a soldier; whence to take away the caliga and belt, imported a dismissing or cashiering.

CALIGO, or CALIGATIO, in *Medicine*, an opacity, or cloudiness of the anterior surface of the crystalline lens of the eye, causing a dimness or suffusion of sight.

CALIGULA, the Roman emperor and tyrant, A. D. 37, began his reign with every promising appearance of becoming the real father of his people; but at the end of eight months he was seized with a fever, which it is thought left a frenzy on his mind: for his disposition totally changed, and he committed the most atrocious acts of impiety, cruelty, and folly; such as proclaiming his horse consul, feeding it at his table, introducing it to the temple in the vestments of the priests of Jupiter, &c. and causing sacrifices to be offered to himself, his wife, and the horse. After having murdered many of his subjects with his own hand, and caused others to be put to death without any just cause, he was assassinated by a tribune of the people as he came out of the amphitheatre, A. D. 41, in the 29th year of his age, and 4th of his reign.

CALIN, a compound metal, whereof the Chinese make tea canisters, and the like. The ingredients seem to be lead and tin.

CALIPH, or KHALIF, the supreme ecclesiastical dignity among the Saracens: or, as it is otherwise defined, sovereign dignity among the Mahometans, vested with absolute authority in all matters relating both to religion and policy. In the Arabic it signifies *successor* or *vicar;* the caliphs bearing the same relation to Mahomet that the popes pretend they do to Jesus Christ or St Peter. It is at this day one of the Grand Signior's titles, as successor of Mahomet; and of the Sophi of Persia, as successor of Ali. One of the chief functions of the caliph, in quality of imam or chief priest of Mussulmanism, was to begin the public prayers every Friday in the chief mosque, and to deliver the *khothbak* or sermon. In after times, they had assistants for this latter office; but the former the caliphs always performed in person. The caliph was also obliged to lead the pilgrims to Mecca in person, and to march at the head of the armies of his empire. He granted investiture to princes; and sent swords, standards, gowns, and the like, as presents to princes of the Mahometan religion; who, though they had thrown off the yoke of the caliphate, nevertheless held of it as vassals. The caliphs usually went to the mosque mounted on mules; and the sultans Selgiucides, though masters of Bagdad, held their stirrups, and led their mule by the bridle some distance on foot, till such time as the caliph gave them the sign to mount on horseback. At one of the windows of the caliph's palace there always hung a piece of black velvet 20 cubits long, which reached to the ground, and was called the *caliph's sleeve:* which the grandees of his court never failed to kiss every day, with great respect. After the destruction of the caliphate by Hulaku, the Mahometan princes appointed a particular officer, in their respective dominions, who sustains the sacred authority of caliph. In Turkey, he goes under the denomination of *mufti*, and in Persia under that of *sadne*.

CALIPHATE, the office or dignity of Caliph: See the preceding article. The successions of caliphs continued from the death of Mahomet till the 655th year of the Hegira, when the city of Bagdad was taken by the Tartars. After this, however, there were persons who claimed the caliphate, as pretending to be of the family of the Abassides, and to whom the sultans of Egypt rendered great honours at Cairo, as the true successors of Mahomet: but this honour was merely titular, and the rights allowed them only in matters relating to religion; and though they bore the sovereign title of *caliphs*, they were nevertheless subjects and dependents of the sultans. In the year of the Hegira 361, a kind of caliphate was erected by the Fatemites in Africa, and lasted till it was suppressed by Saladin. Historians also speak of a third caliphate in Yemen or Arabia Felix, erected by some princes of the family of the Jobites. The emperors of Morocco assume the title of *grand cherifs;* and pretend to be the true caliphs, or successors of Mahomet, though under another name.

CALIPPIC PERIOD, in *Chronology*, a series of seventy-six seventy-six years, perpetually recurring; which elapsed, the middle of the new and full moons, as its inventor Calippus, an Athenian, imagined, return to the same day of the solar year. Meton, a hundred years before, had invented the period, or cycle, of nineteen years; assuming the quantity of the solar year $365d.\ 6h.\ 18' 56'' 50^{3} 41^{4} 34^{5}$: and the lunar month, $29d.\ 12h.\ 45' 47'' 26^{3} 48^{4} 30^{5}$: but Calippus, considering that the Metonic quantity of the solar year was not exact, multiplied Meton's period by 4, and thence arose a period of 76 years, called the *Calippic*. The Calippic period, therefore, contains 27,759 days: and since the lunar cycle contains 235 lunations, and the *Calippic period* is quadruple of this, it contains 940 lunations. This period began in the third year of the 112th Olympiad, or the 4384th of the Julian period. It is demonstrated, however, that the Calippic period itself is not accurate; that it does not bring the new and full moons precisely to their places; $8h.\ 5' 52'' 60'''$, being the excess of 940 lunations, above 76 solar years; but brings them too late, by a whole day in 225 years.

CALISTA, in fabulous history, the daughter of Lycaon king of Arcadia, and one of the nymphs of Diana. Being beloved by Jupiter, that god assumed the form of the goddess of chastity, by which means he debauched her: but her disgrace being revealed, as she was bathing with her patroness, the incensed deity turned her and the son with which she was pregnant into bears; when Jupiter, in compassion to her sufferings, took them up into the heavens, and made them the constellations Ursa Major and Ursa Minor.

CALIX. See CALYX.

CALIXTINS, a name given to those, among the Lutherans, who follow the sentiments of George Calixtus, a celebrated divine, and professor at Helmstadt in the duchy of Brunswick, who died in 1656: he opposed the opinion of St Augustin, on predestination, grace, and free will, and endeavoured to form an union among the various members of the Romish, Lutheran, and reformed churches; or rather, to join them in the bonds of mutual forbearance and charity.

CALIXTINS also denote a sect in Bohemia, derived from the Hussites, about the middle of the 15th century, who asserted the use of the cup as essential to the eucharist. And hence their name; which is formed from the Latin *calyx*, a cup.

The Calixtins are not ranked by Romanists in the list of heretics, since in the main they still adhered to the doctrine of Rome. The reformation they aimed at terminated in the four following articles. 1. In restoring the cup to the laity. 2. In subjecting the criminal clerks to the punishment of the civil magistrate. 3. In stripping the clergy of their lands, lordships, and all temporal jurisdiction. 4. In granting liberty to all capable priests to preach the word of God.

CALKA, a kingdom of Tartary, in Asia, to the east of Siberia.

CALKING. See CAULKING.

CALKINS, the prominent parts at the extremities of a horse shoe, bent downwards, and forged to a sort of point.

Calkins are apt to make horses trip: they also occasion bleymes, and ruin the back sinews. If fashioned in form of a hare's ear, and the horn of a horse's heel be pared a little low, they do little damage; whereas the great square calkins quite spoil the foot.

Calkins are either single or double, that is, at one end of the shoe, or at both: these last are deemed less hurtful, as the horses can tread more even.

CALL, among hunters, a lesson blown upon the horn, to comfort the hounds.

CALL, an English name for the mineral called tungsten or wolfram by the Germans.

CALL, among sailors, a sort of whistle or pipe, of silver or brass, used by the boatswain and his mates to summon the sailors to their duty, and direct them in the different employments in the ship. As the call can be sounded to various strains, each of them is appropriated to some particular exercise; such as hoisting, heaving, lowering, veering away, belaying, letting go a tackle, &c. The act of winding this instrument is called piping, which is as attentively observed by sailors as the beat of the drum to march, retreat, rally, charge, &c. is obeyed by soldiers.

CALL, among fowlers, the noise or cry of a bird, especially to its young, or to its mate in coupling time. One method of catching partridges is by the natural call of a hen trained for the purpose, which drawing the cocks to her, they are entangled in a net. Different birds require different sorts of calls; but they are most of them composed of a pipe or reed, with a little leathern bag or purse, somewhat in form of a bellows; which, by the motion given thereto, yields a noise like that of the species of bird to be taken. The call for partridges is formed like a boat bored through, and fitted with a pipe or swan's quill, &c. to be blown with the mouth, to make the noise of the cock partridge, which is very different from the call of the hen. Calls for quails, &c. are made of a leathern purse in shape like a pear, stuffed with horse hair, and fitted at the end with the bone of a cat's, hare's, or coney's leg, formed like a flageolet. They are played, by squeezing the purse in the palm of the hand, at the same time striking on the flageolet part with the thumb, to counterfeit the call of the hen quail.

CALL of the House. See CALLING.

CALLA, WAKE-ROBIN, or *Ethiopian Arum*. See BOTANY *Index*.

CALLA Susung, a town of Asia, in the island of Bouton in the East Indies. It is seated about a mile from the sea, on the top of a small hill surrounded with cocoa-nut trees. See BOUTON.

CALLAO, a strong town of South America, in Peru. It is the port of Lima, from which it is distant about five miles. The town is built on a low flat point of land on the sea shore. It is fortified; but the fortifications were much damaged by the last great earthquake, and have not since been repaired. The town is not above nine or ten feet above the level of high water mark; but the tide does not commonly rise or fall above five feet. The streets are drawn in a line; but are full of dust, which is very troublesome. In a square near the sea side are the governor's house, the viceroy's palace, the parish church, and a battery of three pieces of cannon. On the north side are the warehouses for the merchandise brought from Chili, Mexico, and other parts of Peru. The other churches are built with reeds, and covered with timber or clay, but they look tolerably neat. There are five monasteries

ries and an hospital, though the number of families does not exceed 400. The trade of Callao is considerable. From Chili they bring cordage, leather, tallow, dried fish, and corn; from Chiloe, cedar planks, woollen manufactures, and carpets; from Peru, sugars, wines, brandy, masts, cordage, timber for shipping, cacao, tobacco, and melasses; from Mexico, pitch, tar, woods for dyeing, sulphur, balsam of Peru, both white and brown, as well as commodities from China. At the port of Callao the watering is easy, but the wood is a mile or two distant. Earthquakes are very frequent in these parts, which have done vast mischief to Lima and Callao. W. Long. 76. 15. S. Lat. 12. 29.

CALLE, in *Ancient Geography*, a town of Hither Spain, situated on an eminence which hangs over the river Durius; whose port was at the mouth of the river. Now *Porto*, *Oporto*, or *Port a Port*.

CALLEN, a town of Ireland, in the county of Kilkenny and province of Leinster, about ten miles south-west of Kilkenny. W. Long. 7. 22. N. Lat. 52. 25.

CALLICARPA. See JOHNSONIA.

CALLICO, in commerce, a sort of cloth resembling linens made of cotton. The name is taken from that of Calicut, a city on the coast of Malabar, being the first place at which the Portuguese landed when they discovered the India trade. The Spaniards still call it *callicu*.

Callicoes are of different kinds, plain, printed, painted, stained, dyed, chintz, muslins, and the like, all included under the general denomination of *callicoes*. Some of them are painted with various flowers of different colours; others are not stained, but have a stripe of gold and silver quite through the piece, and at each end is fixed a tissue of gold, silver, and silk, intermixed with flowers. The printing of callicoes was first set on foot in London about the year 1676.

CALLICRATES, an ancient sculptor, who engraved some of Homer's verses on a grain of millet, made an ivory chariot that might be concealed under the wing of a fly, and an ant of ivory in which all the members were distinct: but Ælian justly blames him for exerting his genius and talents in things so useless, and at the same time so difficult. He flourished about the year 472 before Christ.

CALLIGONUM. See BOTANY *Index*.

CALLIGRAPHUS, anciently denoted a copyist, or scrivener, who transcribed fair, and at length, what the notaries had taken down in notes or minutes. The ward is compounded of καλλος, *beauty*, and γραφω, I *write*. The minutes of acts, &c. were always taken in a kind of cypher, or short hand; such as the notes of Tyro in Gruter: by which means the notaries, as the Latins called them, or the σημειογραφοι and ταχυγραφοι, as the Greeks called them, were enabled to keep pace with a speaker or person who dictated. These notes, being understood by few, were copied over fair, and at length, by persons who had a good hand, for sale, &c. These persons were called *calligraphi*; a name frequently met with in the ancient writers.

CALLIGRAPHY, the art of fair writing. Callicrates is said to have written an elegant distich on a sesamum seed. Junius speaks of a person, as very extraordinary, who wrote the apostles creed, and beginning of St John's Gospel, in the compass of a farthing. What would he have said of our famous Peter Bale, who in 1575 wrote the Lord's prayer, creed, ten commandments, and two short prayers in Latin, with his own name, motto, day of the month, year of the Lord, and reign of the queen, in the compass of a single penny, enchased in a ring and border of gold, and covered with a crystal, all so accurately wrought as to be very legible?

CALLIMACHUS, a celebrated architect, painter, and sculptor, born at Corinth, having seen by accident a vessel about which the plant called *acanthus* had raised its leaves, conceived the idea of forming the Corinthian capital; hence the Corinthian order of architecture. The ancients assure us, that he worked in marble with wonderful delicacy. He flourished about 540 B. C.

CALLIMACHUS, a celebrated Greek poet, native of Cyrene in Libya, flourished under Ptolemy Philadelphus and Ptolemy Euergetes, kings of Egypt, about 280 years before Christ. He passed, according to Quintilian, for the prince of the Greek elegiac poets. His style is elegant, delicate, and nervous. He wrote a great number of small poems, of which we have only some hymns and epigrams remaining. Catullus has closely imitated him, and translated into Latin verse his small poem on the locks of Berenice. Callimachus was also a good grammarian and a learned critic. There is an edition of his remains, by Mes. le Fevre, quarto; and another in two volumes 8vo. with notes by Spanheim, Grævius, Bentley, &c.

CALLING the HOUSE, in the British Parliament, is the calling over the members names, every one answering to his own, and going out of the house, in the order in which he is called: this they do in order to discover whether there be any person there not returned by the clerk of the crown, or if any member be absent without the leave of the house.

CALLINICUS of Heliopolis, inventor of a composition to burn in the water, called the *Greek*, and since *Wild-fire*, See *Grecian* FIRE.

CALLINUS of Ephesus, a very ancient Greek poet, inventor of elegiac verse; some specimens of which are to be found in the collection of Stobeus. He flourished about 776 years before Christ.

CALLIONYMUS, the DRAGONET. See ICHTHYOLOGY *Index*.

CALLIOPE, in the Pagan mythology, the Muse who presides over eloquence and heroic poetry. She was thus called from the sweetness of her voice, and was reckoned the first of the nine sisters. Her distinguishing office was to record the worthy actions of the living; and accordingly she is represented with tablets in her hand.

CALLIPÆDIA, the art of getting or breeding fine and beautiful children. We find divers rules and practices relating to this art, in ancient and modern writers. Among the Magi, a sort of medicine called *ermesia* was administered to pregnant women, as a means of producing a beautiful issue. Of this kind were the kernels of pine nuts ground with honey, myrrh, saffron, palm wine, and milk. The Jews are said to have been so solicitous about the beauty of their children, that care was taken to have some very beautiful child placed at the door of the public baths, that the women at going out being struck with his appearance, and retaining the idea, might all have children as fine as he. The Chinese take still greater care of their breeding women, to prevent uncouth objects of any kind from striking their imagination. Musicians are employed at night to entertain them with agreeable songs and odes, in which are set forth all the duties and comforts of a conjugal and domestic life; that the infant may receive good impressions even before it is born, and not only come forth agreeably formed in body, but well disposed in mind. Callipædia, nevertheless, seems to have been first erected into a just art by Claude Quillet de Chinon, a French abbot, who, under the fictitious name of *Calvides Lætus*, has published a fine Latin poem in four books, under the title of *Callipædia, seu de pulchræ prolis habendæ ratione*; wherein are contained all the precepts of that new art. There is a translation of it into English verse by Mr Rowe.

CALLIPOLIS, in *Ancient Geography*, the name of several cities of antiquity, particularly one upon the Hellespont, next the Propontis, and opposite to Lampsacus in Asia. Now GALLIPOLI.

CALLIPPIC PERIOD. See CALIPPIC.

CALLIRRHOE, in *Ancient Geography*, surnamed *Enneacrunos*, from its nine springs or channels; a fountain not far from Athens, greatly adorned by Pisistratus, where there were several wells, but this the only running spring. Callirrhoe was also the name of a very fine spring of hot water beyond Jordan near the Dead sea, into which it empties itself.

CALLISIA. See BOTANY *Index*.

CALLISTEA, in Grecian antiquity, a Lesbian festival, wherein the women presented themselves in Juno's temple, and the prize was assigned to the fairest. There was another of these contentions at the festival of Ceres Eleusinia among the Parrhasians, and another among the Eleans, where the most beautiful man was presented with a complete suit of armour, which he consecrated to Minerva, to whose temple he walked in procession, being accompanied by his friends, who adorned him with ribbons, and crowned him with a garland of myrtle.

CALLISTHENES the philosopher, disciple and relation of Aristotle, by whose desire he accompanied Alexander the Great in his expeditions; but proving too severe a censurer of that hero's conduct, he was by him put to the torture (on a suspicion of a treasonable conspiracy), and died under it, 328 years before Christ.

CALLISTRATUS, an excellent Athenian orator, was banished for having obtained too great an authority in the government. Demosthenes was so struck with the force of his eloquence, and the glory it procured him, that he abandoned Plato, and resolved from thenceforward to apply himself to oratory.

CALLITRICHE, or STAR-GRASS, in *Botany*, a genus of the digynia order, belonging to the monandria class of plants; and in the natural method ranking under the 12th order, *Holoraceæ*. There is no calyx, but two petals, and the capsule is bilocular and tetraspermous.

CALLOO, a fortress in the Netherlands, in the territory of Waes, on the river Scheldt, subject to the house of Austria. The Dutch were defeated here by the Spaniards in 1638. E. Long. 4. 10. N. Lat. 51. 15.

CALLOSUM CORPUS, in *Anatomy*, a whitish hard substance, joining the two hemispheres of the brain, and appearing in view when the two hemispheres are drawn back. See ANATOMY *Index*.

CALLOT, JAMES, a celebrated engraver, born at Nancy in 1593. In his youth he travelled to Rome to learn designing and engraving: and from thence went to Florence, where the grand duke took him into his service. After the death of that prince, Callot returned to his native country; when he was very favourably received by Henry duke of Lorrain, who settled a considerable pension upon him. His reputation being soon after spread all over Europe, the infanta of the Netherlands drew him to Brussels, where he engraved the siege of Breda. Louis XIII. made him design the siege of Rochelle, and that of the isle of Rhé. The French king, having taken Nancy in 1631, made Callot the proposal of representing that new conquest, as he had already done the taking of Rochelle: but Callot begged to be excused; and some courtiers resolving to oblige him to do it, he answered, that he would sooner cut off his thumb than do any thing against the honour of his prince and country. This excuse the king accepted; and said, that the duke of Lorrain was happy in having such faithful and affectionate subjects. Callot followed his business so closely, that, though he died at 43 years of age, he is said to have left of his own execution about 1500 pieces. The following are a few of the principal. 1. The *murder of the innocents*, a small oval plate, engraved at Florence. Callot engraved the same subject at Nancy, with some difference in the figures on the back ground. The former is the most rare; a fine impression of it is very difficult to be found. 2. The *marriage of Cana in Galilee*, from Paolo Veronese, a middling sized plate lengthwise. 3. The *passion of Christ*, on 12 very small upright plates: first impressions very scarce. 4. *St John in the island of Patmos*, a small plate, nearly square. 5. The *temptation of St Anthony*, a middling sized plate lengthwise. He also engraved the same subject larger; which, though not the best, is notwithstanding the scarcest print. There is a considerable difference in the treatment of the subject in the two prints. 6. The *punishments*, wherein is seen the execution of several criminals. The marks of the best impressions of this plate are, a small square tower which appears above the houses, towards the left, and a very small image of the Virgin placed in an angle of the wall, near the middle of the print. 7. The *miseries of war*, 18 small plates, lengthwise. There is another set on the same subject, consisting of seven plates less than the former. 8. The *great fair of Florence*, so called because it was engraved at Florence. As several parts of this plate were not equally bitten by the aquafortis, it is difficult to meet with a fine impression. Callot, on his return to Nancy, re-engraved this plate without any alteration. The copy, however, is by no means equal to the original. The first is distinguished from the second by the words *in Firenza*, which appear below at the right-hand corner of the plate. The second has these words in the same place, *Fe. Florientis, excudit Nancei*. There is also a large copy of this print, reversed, published by Savery; but the difference is easily distinguished between it and the true print. 9. The *little fair*, otherwise called the *players at bowls*; where also some peasants are represented

presented dancing. This is one of the scarcest of Callot's prints; and it is very difficult to meet with a fine impression of it, for the distances and other parts of the plate failed in the biting it with the aquafortis. 10. The *tilting, or the new street at Nancy*, a middling sized plate, lengthwise. 11. The *Garden of Nancy*, where young men are playing with a balloon, the same. 12. *View of the Pont Neuf*, a small plate, lengthwise. 13. *View of the Louvre*, the same. 14. *Four landscapes*, small plates, lengthwise.

CALLUS, or CALLOSITY, in a general sense, any cutaneous, corneous, or osseous hardness, whether natural or preternatural; but most frequently it means the callus generated about the edges of a fracture, provided by nature to preserve the fractured bones, or divided parts, in the situation in which they are replaced by the surgeon. A callus, in this last sense, is a sort of jelly, or liquid viscous matter, that sweats out from the small arteries and bony fibres of the divided parts, and fills up the chinks or cavities between them. It first appears of a cartilaginous substance; but at length becomes quite bony, and joins the fractured part so firmly together, that the limb will often make greater resistance to any external violence, with this part than with those which were never broken.

CALLUS is also a hard, dense, insensible knob, rising on the hands, feet, &c. by much friction and pressure against hard bodies.

CALM, the state of rest which appears in the air and sea when there is no wind stirring. A calm is more dreaded by a seafaring man than a storm, if he has a strong ship and sea room enough; for under the line excessive heat sometimes produces such dead calms, that ships are obliged to stay two or three months without being able to stir one way or other. Two opposite winds will sometimes make a calm. This is frequently observed in the gulf of Mexico, at no great distance from the shore, where some gust or land wind will so poise the general easterly wind, as to produce a perfect calm.

Calms are never so great on the ocean as on the Mediterranean, because the flux and reflux of the former keep the water in a continual agitation, even where there is no wind; whereas there being no tides in the latter, the calm is sometimes so dead, that the face of the water is as clear as a looking glass; but such calms are almost constant presages of an approaching storm. On the coasts about Smyrna, a long calm is reputed a prognostic of an earthquake.

It is not uncommon for the vessels to be calmed, or becalmed, as the sailors express it, in the road of the constant Levantine winds, in places where they ride near the land. Thus between the two capes of Cartooche towards the main, and Cape Antonio in Cuba, the sea is narrow, and there is often a calm produced by some gust of a land wind, that poises the Levantine wind, and renders the whole perfectly still for two or three days. In this case, the current that runs here is of use to the vessels, if it sets right; when it sets easterly, a ship will have a passage in three or four days to the Havannah; but if otherwise, it is often a fortnight or three weeks sail, the ship being embayed in the gulf of Mexico.

When the weather is perfectly calm, no wind at all stirring, the sailors try which way the current sets, by means of a boat which they send out, and which will ride at anchor, though there is no bottom to be found, as regularly and well as if fastened by the strongest anchor to the bottom. The method is this: they row the boat to a little distance from the ship, and then throw over their plummet, which is about forty pounds weight; they let this sink to about two hundred fathoms; and then, though it never reaches the bottom, the boat will turn head against the current, and ride as firmly as can be.

CALM Latitudes, in sea language, are situated in the Atlantic ocean, between the tropic of Cancer and the latitude of 29° N. or they denote the space that lies between the trade and variable winds, because it is frequently subject to calms of long duration.

CALMAR, a strong sea port of Sweden, in the province of Smaland, divided into two towns, the old and the new; but of the former there remains only the church and a few houses. The new town is built a little way from the other, and has large handsome houses. E. Long. 16. 15. N. Lat. 56. 48.

CALMET, AUGUSTINE, one of the most learned and laborious writers of the 18th century, was born at Mesnil le Horgne, a village in the diocese of Toul in France, in the year 1672, and took the habit of the Benedictines in 1688. Among the many works he published are, 1. A literal exposition, in French, of all the books in the Old Testament, in nine volumes folio. 2. An historical, critical, chronological, geographical, and literal dictionary of the Bible, in four vols folio, enriched with a great number of figures of Jewish antiquities. 3. A civil and ecclesiastical history of Lorrain, three vols folio. 4. A history of the Old and New Testament, and of the Jews, in two volumes folio, and seven volumes duodecimo. 5. An universal sacred and profane history, in several volumes quarto. He died in 1757.

CALMUCKS. See KALMUCKS.

CALNE, a town of Wiltshire in England, seated on a river of the same name. It has a handsome church, and sends two members to parliament. W. Long. 1. 59. N. Lat. 51. 30. Population in 1811, 3457.

CALNEH, in *Ancient Geography*, a city in the land of Shinar, built by Nimrod, and the last city mentioned (Gen. x. 10.) as belonging to his kingdom. It is believed to be the same with Calno, mentioned in Isaiah (x. 9.) and with Canneh in Ezekiel (xxvii. 23.) with still greater variation. It is observed, that it must have been situated in Mesopotamia, since these prophets join it with Haran, Eden Assyrian, and Chilmad, which carried on a trade with Tyre. It is said by the Chaldee interpreters, as also by Eusebius and Jerome, to be the same with Ctesiphon, standing upon the Tigris, about three miles distant from Seleucia, and that for some time it was the capital city of the Parthians.

CALOGERI, in church history, monks of the Greek church, divided into three degrees: the novices, called *archari*; the ordinary professed, called *microchemi*; and the more perfect, called *megalochemi*: they are likewise divided into cœnobites, anchorites, and recluses. The cœnobites are employed in reciting their offices from midnight to sunset, they are obliged to make three genuflexions at the door of the choir, and, returning, to bow to the right and to the left, to their brethren.

thren. The anchorets retire from the conversation of the world, and live in hermitages in the neighbourhood of the monasteries; they cultivate a little spot of ground, and never go out but on Sundays and holidays to perform their devotions at the next monastery. As for the recluses, they shut themselves up in grottoes and caverns on the tops of mountains, which they never go out off, abandoning themselves entirely to Providence: they live on the alms sent them by the neighbouring monasteries.

CALOMEL, or dulcified sublimate of mercury, is a combination of mercury with the muriatic acid, in the present nomenclature called a *sub-muriate of mercury*. See PHARMACY and CHEMISTRY *Index*.

CALOPHYLLUM. See BOTANY *Index*.

CALOTTE, a cap or coif of hair, satin, or other stuff; an ecclesiastical ornament in most Popish countries. See CAP.

CALOTTE, in *Architecture*, a round cavity or depressure, in form of a cap or cup, lathed and plastered, used to diminish the rise or elevation of a moderate chapel, cabinet, alcove, &c. which without such an expedient would be too high for other pieces of the apartment.

CALPE, a mountain of Andalusia in Spain; at the foot of which, towards the sea, stands the town of Gibraltar. It is half a league in height towards the land, and so steep that there is no approaching it on that side.

CALPURNIUS, TITUS, a Latin Sicilian poet, lived under the emperor Carus and his son. We have seven of his eclogues remaining.

CALQUING, or CALKING, a term used in painting, &c. where the back side of any thing is covered over with a black or red colour, and the strokes or lines traced through on a waxed plate, wall, or other matter, by passing lightly over each stroke of the design with a point, which leaves an impression of the colour on the plate or wall.

CALTHA. See BOTANY *Index*.—There is only one species known, which grows naturally in moist boggy lands in many parts of England and Scotland. The flowers gathered before they expand, and preserved in salted vinegar, are a good substitute for capers. The juice of the petals, boiled with a little alum, stains paper yellow. The remarkable yellowness of the butter in spring is supposed to be caused by this plant: but cows will not eat it, unless compelled by extreme hunger; and then, Boerhaave says, it occasions such an inflammation, that they generally die. Upon May-day, the country people strew the flowers upon the pavement before their doors. Goats and sheep eat this plant; horses, cows, and swine, refuse it.

CALTROP. See TRIBULUS, BOTANY *Index*.

CALTROP, in military affairs, an instrument with four iron points, disposed in a triangular form, so that three of them are always on the ground, and the fourth in the air. They are scattered over the ground where the enemy's cavalry is to pass, in order to embarrass them.

CALVARIA, in *Anatomy*, the hairy scalp or upper part of the head, which, either by disease or old age, grows bald first.

CALVART, DENIS, a celebrated painter, was born at Antwerp in 1552; and had for his masters Prospero Fontana and Lorenzo Sabbatini. He opened a school at Bologna, which became celebrated; and from which proceeded Guido, Albani, and other great masters. Calvart was well skilled in architecture, perspective, and anatomy, which he considered as necessary to a painter, and taught them to his pupils. His principal works are at Bologna, Rome, and Reggio. He died at Bologna in 1619.

CALVARY, a term used in Catholic countries for a kind of chapel of devotion raised on a hillock near a city, in memory of the place where Jesus Christ was crucified near the city of Jerusalem. The word comes from the Latin *calvarium;* and that from *calvus*, bald, in regard the top of that hillock was bare and destitute of verdure; which is also signified by the Hebrew word *golgotha*. Such is the Calvary of St Valerian near Paris; which is accompanied with several little chapels, in each of which is represented in sculpture one of the mysteries of the Passion.

CALVARY, in *Heraldry*, a cross so called, because it resembles the cross on which our Saviour suffered. It is always set upon steps.

CALVERT, GEORGE, afterwards Lord Baltimore, was born at Kipling in Yorkshire about the year 1582, and educated at Oxford, where he took the degree of bachelor of arts, and afterwards travelled. At his return, he was made secretary to Sir Robert Cecil: he was afterwards knighted, and in 1618 appointed one of the principal secretaries of state. But after he had enjoyed that post about five years, he willingly resigned it; freely owning to his majesty that he was become a Roman Catholic, so that he must either be wanting to his trust, or violate his conscience in discharging his office. This ingenuous confession so affected King James, that he continued him privy counsellor all his reign, and the same year created him baron of Baltimore in the kingdom of Ireland. He had before obtained a patent for him and his heirs, for the province of Avelon in Newfoundland: but that being exposed to the insults of the French, he abandoned it, and afterwards obtained the grant of a country on the north part of Virginia from Charles I. who called it *Maryland*, in honour of his queen: but he died in April 1632 (aged 50), before the patent was made out. It was, however, filled up to his son Cecil Calvert Lord Baltimore; and bears date June 20. 1632. It is held from the crown as part of the manor of Windsor, on one very singular condition, viz. to present two Indian arrows yearly, on Easter Tuesday, at the castle, where they are kept and shown to visitors.—His lordship wrote, 1. A Latin poem on the death of Sir Henry Upton. 2. Speeches in parliament. 3. Various letters of state. 4. The answer of Tom Tell-truth. 5. The Practice of Princes. And, 6. The Lamentation of the Kirk.

CALVI, a town of the province of Lavoro, in the kingdom of Naples, situated near the sea, about fifteen miles north of the city of Naples. E. Long. 14. 45. N. Lat. 41. 15.

CALVI is also the name of a sea port in the island of Corsica, situated on a bay, on the west side of the island, about 40 miles south-west of Bastia. E. Long. 9. 5. N. Lat. 42. 16.

CALVIN, JOHN, the celebrated reformer of the Christian church from Romish superstitions and doctrinal

nal errors, and founder of the sect since called *Calvinists*, was born in 1509. He was the son of a cooper of Noyon in Picardy; and his real name was *Chauvin*, which he chose to latinize into *Calvinus*, styling himself in the title page to his first work (a Commentary on *Seneca de Clementia*), "Lucius Calvinus, Civis Romanus;" an early proof of his pride, at about 24 years of age. In 1529, he was rector of Pont l'Eveque; and in 1534 he threw up this benefice, separating himself entirely from the Romish church. The persecution against the Protestants in France (with whom he was now associated) obliged him to retire to Basle in Switzerland: here he published his famous Institutes of the Christian religion in 1535. The following year he was chosen professor of divinity, and one of the ministers of the church at Geneva. The next year, viz. 1537, he made all the people solemnly swear to a body of doctrines; but finding that religion had not yet had any great influence on the morals of the people, he, assisted by other ministers, declared, that since all their admonitions and warnings had proved unsuccessful, they could not celebrate the holy sacrament as long as these disorders reigned; he also declared, that he could not submit to some regulations made by the synod of Berne. Upon which the syndics having summoned the people, it was ordered that Calvin and two other ministers should leave the city within two days. Upon this Calvin retired to Strasburg, where he established a French church, of which he was the first minister, and was also chosen professor of divinity there. Two years after he was chosen to assist at the diet appointed by the emperor to meet at Worms and at Ratisbon in order to appease the troubles occasioned by the difference of religion. He went with Beucer, and entered into a conference with Melancthon. The people of Geneva now entreated him to return; to which he consented, and arrived at Geneva, September 13. 1541. He began with establishing a form of ecclesiastical discipline, and a consistorial jurisdiction, with the power of inflicting all kinds of canonical punishments. This was greatly disliked by many persons, who imagined that the papal tyranny would soon be revived. Calvin, however, asserted on all occasions the rights of his consistory with inflexible strictness; and he caused Michael Servetus to be burnt at the stake for writing against the doctrine of the Trinity. But though the rigour of his proceedings sometimes occasioned great tumults in the city, yet nothing could shake his steadiness and inflexibility. Amongst all the disturbances of the commonwealth, he took care of the foreign churches in England, France, Germany, and in Poland; and did more by his pen than his presence, sending his advice and instructions by letter, and writing a greater number of books. This great reformer died on the 27th of May 1564, aged 55. His works were printed together at Amsterdam in 1671, in nine volumes folio; the principal of which are his Institutions, in Latin, the best edition of which is that of Robert Stephens in 1553, in folio; and his Commentaries on the Holy Scriptures.—Calvin is universally allowed to have had great talents, an excellent genius and profound learning. His style is grave and polite. Independent of his spiritual pride, his morals were exemplary; for he was pious, sober, chaste, laborious, and disinterested. But his memory can never be purified from the stain of burning Servetus; it ill became a reformer, to adopt the most odious practice of the corrupt church of Rome.

CALVINISM, the doctrine and sentiments of Calvin and his followers. Calvinism subsists in its greatest purity in the city of Geneva: and from thence it was first propagated into Germany, France, the United Provinces, and England. In France it was abolished by the revocation of the edict of Nantz in 1685. It has been the prevailing religion in the United Provinces ever since the year 1571. The theological system of Calvin was adopted, and made the public rule of faith in England, under the reign of Edward VI. and the church of Scotland was modelled by John Knox, the disciple of Calvin, agreeably to the doctrine, rites, and form of ecclesiastical government, established at Geneva. In England, it has declined since the time of Queen Elizabeth; though it still subsists, some say a little allayed, in the articles of the etablished church; and in its rigour in Scotland.

The distinguishing theological tenets of Calvinism, as the term is now generally applied, respect the doctrines of PREDESTINATION, or particular ELECTION and REPROBATION, original SIN, particular REDEMPTION, effectual, or, as some have called it, irresistible GRACE in regeneration, JUSTIFICATION by faith, PERSEVERANCE, and the TRINITY. See each of these articles.

Besides the doctrinal part of Calvin's system, which, so far as it differs from that of other reformers of the same period, principally regarded the absolute decree of God, whereby the future and eternal condition of the human race was determined out of mere sovereign pleasure and free will; it extended likewise to the discipline and government of the Christian church, the nature of the Eucharist, and the qualification of those who were entitled to the participation of it. Calvin considered every church as a separate and independent body, invested with the power of legislation for itself. He proposed that it should be governed by presbyteries and synods, composed of clergy and laity, without bishops, or any clerical subordination; and maintained, that the province of the civil magistrate extended only to its protection and outward accommodation. In order to facilitate an union with the Lutheran church, he acknowledged a real, though spiritual, presence of Christ, in the Eucharist, that true Christians were united to the man Christ in this ordinance, and that divine grace was conferred upon them, and sealed to them, in the celebration of it; and he confined the privilege of communion to pious and regenerate believers. In France the Calvinists are distinguished by the name of *Huguenots;* and, among the common people, hy that of *Parpaillots.* In Germany they are confounded with the Lutherans, under the general title *Protestants;* only sometimes distinguished by the name *Reformed.*

CALVINISTS, in church history, those who follow the opinions of CALVIN. See the two preceding articles.

Crypto-CALVINISTS, a name given to the favourers of Calvinism in Saxony, on account of their secret attachment to the Genevan doctrine and discipline. Many of them suffered by the decrees of the convocation of Torgaw, held in 1576. The Calvinists in their progress have divided into various branches, or lesser sects.

CALVISIUS, Seth, a celebrated German chronologer in the beginning of the 17th century. He wrote *Elenchus calendarii Gregoriani, et duplex calendarii melioris forma*, and other learned works, together with some excellent treatises on music. He died in 1617, aged 61.

CALVITIES, or Calvitium, in *Medicine*, baldness, or a want of hair, particularly on the sinciput, occasioned by the moisture of the head, which should feed it, being dried up, by some disease, old age, or the immoderate use of powder, &c. See Alopecia.

CALUMET, a symbolical instrument of great importance among the American Indians.—It is nothing more than a pipe, whose bowl is generally made of a soft red marble: the tube of a very long reed, ornamented with the wings and feathers of birds. No affair of consequence is transacted without the calumet. It ever appears in meetings of commerce or exchanges; in congresses for determining of peace or war; and even in the very fury of a battle. The acceptance of the calumet is a mark of concurrence with the terms proposed; as the refusal is a certain mark of rejection. Even in the rage of a conflict this pipe is sometimes offered; and if accepted, the weapons of destruction instantly drop from their hands, and a truce ensues. It seems the sacrament of the savages; for no compact is ever violated which is confirmed by a whiff from this holy reed. When they treat of war, the pipe and all its ornaments are usually red, or sometimes red only on one side. The size and decorations of the calumet are for the most part proportioned to the quality of the persons to whom they are presented, and to the importance of the occasion. The calumet of peace is different from that of war. They make use of the former to seal their alliances and treaties, to travel with safety, and to receive strangers; but of the latter to proclaim war. It consists of a red stone, like marble, formed into a cavity resembling the head of a tobacco pipe, and fixed to a hollow reed. They adorn it with feathers of various colours; and name it the calumet of the sun, to which luminary they present it, in expectation of thereby obtaining a change of weather as often as they desire. From the winged ornaments of the calumet, and its conciliating uses, writers compare it to the caduceus of Mercury, which was carried by the caduceatores, or messengers of peace, with terms to the hostile states. It is singular, that the most remote nations, and the most opposite in their other customs and manners, should in some things have, as it were, a certain consent of thought. The Greeks and the Americans had the same idea, in the invention of the caduceus of the one, and the calumet of the other.

Dance of the Calumet, is a solemn rite among the Indians on various occasions. They dare not wash themselves in rivers in the beginning of summer, nor taste of the new fruits, without performing it; and the same ceremony always confirms a peace or precedes a war. It is performed in the winter time in their cabins, and in summer in the open fields. For this purpose they choose a spot among trees to shade them from the heat of the sun, and lay in the middle a large mat, as a carpet, setting upon it the monitor, or god, of the chief of the company. On the right hand of this image, they place the calumet, as their great deity, erecting around it a kind of trophy with their arms. Things being thus disposed, and the hour of dancing come, those who are to sing take the most honourable seats under the shade of the trees. The company is then ranged round, every one, before he sits down, saluting the monitor, which is done by blowing upon it the smoke of their tobacco. Each person next receives the calumet in rotation, and holding it with both hands, dances to the cadence of the vocal music, which is accompanied with the beating of a sort of drum. During this exercise, he gives a signal to one of their warriors, who takes a bow, arrow, and axe, from the trophies already mentioned, and fights him; the former defending himself with the calumet only, and both of them dancing all the while. This mock engagement being over, he who holds the calumet makes a speech, in which he gives an account of the battles he has fought, and the prisoners he has taken, and then receives a cloak, or some other present, from the chief of the ball. He then resigns the calumet to another, who, having acted a similar part, delivers it to a third, who afterwards gives it to his neighbour, till at last the instrument returns to the person that began the ceremony, who presents it to the nation invited to the feast, as a mark of their friendship, and a confirmation of their alliance, when this is the occasion of the entertainment.

CALUMNY, the crime of accusing another falsely, and knowingly so, of some heinous offence.

Oath of Calumny, Juramentum (or rather *Jusjurandum*) *Calumniæ*, among civilians and canonists, was an oath which both parties in a cause were obliged to take; the plaintiff that he did not bring his charge, and the defendant that he did not deny it, with a design to abuse each other, but because they believed their cause was just and good; that they would not deny the truth, nor create unnecessary delays, nor offer the judge or evidence any gifts or bribes. If the plaintiff refused this oath, the complaint or libel was dismissed; if the defendant, it was taken *pro confesso*. This custom was taken from the ancient athletæ; who, before they engaged, were to swear that they had no malice, nor would use any unfair means for overcoming each other. The *juramentum calumniæ* is much disused, as a great occasion of perjury. Anciently the advocates and proctors also took this oath; but of late it is dispensed with, and thought sufficient that they take it once for all at their first admission to practice. See also Law, Part III. N° clxxxiv. 7.

CALVUS, Cornelius Licinius, a celebrated Roman orator, was the friend of Catullus; and flourished 64 B. C. Catullus, Ovid, and Horace, speak of him.

CALX properly signifies *lime*, but has been used by chemists and physicians for a fine powder remaining after the calcination of metals. All metallic calces are found to weigh more than the metal from which they were originally produced. This arises from the metal having combined with oxygen during the process of calcination or burning; and hence in the present chemical nomenclature they are called *oxides*.

Calx Nativa, in *Natural History*, a kind of marly earth, of a dead whitish colour, which, if thrown into water,

water, makes a considerable bubbling and hissing noise, and has, without previous burning, the quality of making a cement like lime or plaster of Paris.

Calx *Viva*, or *Quicklime*, that whereon no water has been cast; in contradiction to lime which has been slaked by pouring water on it.

CALYBITES, the inhabitants of a cottage, an appellation given to divers saints on account of their long residence in some hut by way of mortification.

The word is formed from καλυπτω, *tego*, *I cover;* whence καλυβη, *a little cot.* The Romish church commemorates St John the Calybite on the 15th of December.

CALYCANTHEMÆ, in *Botany*, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, in which are the following genera, viz. epilobium, œnothera, jussiæa, ludivigia, oldenlandia, isnarda, &c. See Botany, *Natural Orders.*

CALYCANTHUS. See Botany *Index.*

CALYCIFLORÆ, in *Botany*, the 16th order in Linnæus's *Fragmenta methodi naturalis*, consisting of plants which, as the title imports, have the stamina (the flower) inserted into the calyx. This order contains the following genera, viz. eleagnus, hippophae, osyris, and trophis. See Botany.

CALYCISTÆ, (from *calyx*, the flower-cup), systematic botanists, so named by Linnæus, who have arranged all vegetables from the different species, structure, and other circumstances, of the calyx or flower-cup. The only systems of this kind are the *Character Plantarum Novus*, a posthumous work of Magnolius, professor of botany at Montpelier, published in 1720; and Linnæus's *Methodus Calycina*, published in his *Classes Plantarum*, at Leyden, in 1738. See Botany, *History.*

CALYDON, in *Ancient Geography*, a town of Ætolia, situated seven miles and a half from the sea, and divided by the river Evenus; the country was anciently called *Æolis*, from the Æolians its inhabitants. This country was famous for the story of Meleager and the Calydonian boar.

CALYPSO, in fabulous history, a goddess who was the daughter of Oceanus and Tethys, or, as others say, of Atlas. She was queen of the island of Ogygia, which from her was called the island of *Calypso.* According to Homer, Ulysses suffered shipwreck on her coast, and staid with her several years.

CALYPTRA, among botanists, a thin membranaceous involucrum, usually of a conic figure, which covers the parts of fructification. The capsules of most of the mosses have calyptræ.

CALYX, among botanists, a general term, expressing the cup of a flower, or that part of a plant which surrounds and supports the other parts of the flower.

The cups of flowers are very various in their structure, and on that account distinguished by several names, as *perianthium*, *involucrum*, *spatha*, *gluma*, &c. See Botany.

CALZADA, a town of Old Castile in Spain, seated on the river Leglera. W. Long. 2. 47. N. Lat. 42. 12.

CAMÆA, in *Natural History*, a genus of the semipellucid gems, approaching to the onyx structure, being composed of zones, and formed on a crystalline basis: but having their zones very broad and thick, and laid alternately one on another, with no common matter between; usually less transparent, and more debased with earth, than the onyxes.

1. One species of the camæa is the dull-looking onyx, with broad, black, and white zones; and is the camæa of the moderns, and the Arabian onyx. This species is found in Egypt, Arabia, Persia, and the East Indies. 2. Another species of the camæa is the dull broad-zoned, green and white camæa, or the jaspicamæo of the Italians: it is found in the East Indies, and in some parts of America. 3. The third is the hard camæa, with broad white and chesnut-coloured veins. 4. The hard camæa, with bluish, white, and flesh-coloured broad veins, being the sardonyx of Pliny's time, only brought from the East Indies.

CAMAIEU, or Camayeu, a word used to express a peculiar sort of onyx: also by some to express a stone, whereon are found various figures, and representations of landscapes, &c. formed by a kind of *lusus naturæ*, so as to exhibit pictures without painting. The word comes from *camahuia*, a name the Orientals give to the onyx, when they find, in preparing it, another colour; as who should say, *a second stone.* It is of these *camaieux* Pliny is to be understood when he speaks of the manifold picture of gems, and the party-coloured spots of precious stones: *Gemmarum pictura tam multiplex lapidumque tam discolores maculæ.*

Camaieu is also applied by others to those precious stones, as onyxes, cornelians, and agates, whereon the lapidaries employ their art to aid nature, and perfect these representations. See Camæa.

Camaieu is also frequently applied to any kind of gem, whereon figures may be engraved either indentedly or in relievo. In this sense the lapidaries of Paris are called in their statutes, *cutters of camayeux.*

A society of learned men at Florence undertook to procure all the *cameos* or *camayeux* and intaglios in the great duke's gallery to be engraven; and began to draw the heads of divers emperors in *cameos.*

Camaieu is also used for a painting, wherein there is only one colour; and where the lights and shadows are of gold, wrought on a golden or azure ground. When the ground is yellow, the French call it *cirage;* when gray, *grissaile.* This kind of work is chiefly used to represent basso relievos: the Greeks call pieces of this sort μονοχρωματα.

CAMALDULIANS, Camaldunians, or Camaldolites, an order of religious, founded by Romuald, an Italian fanatic, in 1023, in the horrible desert of Camaldoli, otherwise called Campo Malduli, situated in the state of Florence, on the Apennines. Their rule is that of St Benedict; and their houses, by the statutes, are never to be less than five leagues from cities. The *Camaldulians* have not borne that title from the beginning of their order; till the close of the eleventh century they were called *Romualdins*, from the name of their founder. Till that time, *Camaldulian* was a particular name for those of the desert Camaldoli; and D. Grandi observes, was not given to the whole order in regard it was in this monastery that the order commenced, but because the regulation was best maintained here.

Guido Grandi, mathematician of the grand duke of Tuscany,

Tuscany, and a monk of this order, has published *Camaldulian* Dissertations, on the origin and establishment of it.

The *Camaldulites* were distinguished into two classes, of which the one were Coenobites, and the other Eremites.

CAMALODUNUM, in *Ancient Geography*, a town of the Trinobantes, the first Roman colony in Britain, of veterans under the emperor. From the Itineraries it appears to have stood where now Malden stands. It continued to be an open place under the Romans; a place of pleasure rather than strength; yet not unadorned with splendid works, as a theatre and a temple of Claudius: which the Britons considered as badges of slavery, and which gave rise to several seditions and commotions. It stands on a bay of the sea, at the mouth of the Chelmer, in the county of Essex: the modern name is curtailed from the ancient.

CAMARANA, an island of Arabia, in the Red sea, whose inhabitants are little and black. It is the best of all the islands in this sea, and here they fish for coral and pearls. N. Lat. 15. 0.

CAMASSEI, or Camace, Andrea, painter of history and landscape, was born at Bevagna, and at first learned the principles of design and colouring from Domenichino; but afterwards he studied in the school of Andrea Sacchi, and proved a very great painter. He was employed in St Peter's at Rome, as also at St John Lateran; and his works are extremely admired, for the sweetness of his colouring, the elegance of his thoughts and design, and likewise for the delicacy of his pencil. Sandrart laments that the world was deprived of so promising a genius, in the very bloom of life, when his reputation was daily advancing. He died in 1657. At St John Lateran are to be seen, the Battle of Constantine and Maxentius; and the Triumph of Constantine; which are noble and grand compositions; and they afford sufficient proofs of the happiness of his invention, and the correctness of his execution. Also at Wilton, the seat of the earl of Pembroke, there is a picture of Venus with the Graces, said to be by the hand of Camassei.

CAMARCUM, in *Ancient Geography*, the capital of the Nervii, a people of Gallia Belgica, (Antonine, Peutinger); before whose time no mention was made of it. Now Cambray, capital of the Cambresis, in French Flanders. E. Long. 3. 15. Lat. 50. 15.

CAMARINA, in *Ancient Geography*, a city of Sicily, built by the Syracusans on an eminence near the sea, in the south of Sicily, to the west of the promontory Pachynum, between two rivers, the Hipparis and Oanus. Of so famous a city nothing now remains but its name and ancient walls, a mile and a half in compass, with the slight remains of houses: now called *Camarana*.

Camarina Palus, a marsh or lake near the city Camarina, and from which it took its name. In a time of drought, the stench of the lake produced a pestilence; upon which the inhabitants consulted the oracle, whether they should not quite drain it. The oracle dissuaded them: they notwithstanding drained it, and opened a way for their enemies to come and plunder their city: hence the proverb *Ne moveas Camarinam*, that is, not to remove one evil to bring on a greater. *Lago di Camarana*, situated in a beautiful plain, under the very walls of Camarina, and of a triangular form.

CAMAYEU. See Camaieu.

CAMBAIA, or Campay, a town of Asia, in India, and in the peninsula on this side the Ganges; capital of a province of the same name; but more commonly called *Guzerat*. It is seated at the bottom of a gulf of the same name, on a small river; is a large place with high walls, and has a pretty good trade. The product and manufactures are inferior to few towns in India, for it abounds in corn, cattle, and silk; and cornelian and agate stones are found in its rivers. The inhabitants are noted for embroidery; and some of their quilts have been valued at 40l. It came into the possession of the British in 1803. E. Long. 72. 15. N. Lat. 22. 30.

CAMBAYES, in commerce, cotton cloths made at Bengal, Madras, and some other places on the coast of Coromandel. They are proper for the trade of Marseilles, whither the English at Madras send great numbers of them. Many are also imported into Holland.

CAMBER, according to our monkish historians, one of the three sons of Brute, who, upon his father's death, had that part of Britain assigned him for his share, called from him *Cambria*, now Wales.

Camber-Beam, among builders, a piece of timber in an edifice cut archwise, or with an obtuse angle in the middle, commonly used in platforms, as church leads, and on other occasions where long and strong beams are required.

CAMBERED decks, among ship-builders. The deck or flooring of a ship is said to be cambered, or to lie cambering, when it is higher in the middle of the ship's length, and droops towards the stem and stern, or the two ends. Also when it lies irregular; a circumstance which renders the ship very unfit for war.

CAMBERT, a French musician in the 17th century, was at first admired for the manner in which he touched the organ, and became superintendant of the music to Anne of Austria the queen-mother. The Abbé Perin associated him in the privilege he obtained of his majesty, of setting up an opera in 1669. Cambert set to music two pastorals, one entitled *Pomona*, the other *Ariadne*, which were the first operas given in France. He also wrote a piece entitled *The pains and pleasures of love*. These pieces pleased the public; yet in 1672, Lully obtaining the privilege of the opera, Cambert was obliged to come to England, where he became superintendant of the music to King Charles II. and died there in 1677.

CAMBIO, an Italian word which signifies *exchange*, commonly used in Provence, and in some other countries, particularly Holland.

CAMBIST, a name given in France to those who trade in notes and bills of exchange. The word *cambist*, though a term of antiquity, is even now a technical word, of some use among merchants, traders, and bankers. Some derive it from the Latin *cambium*, or rather *cambio*.

CAMBLET, or Chamblet, a stuff sometimes of wool, sometimes silk, and sometimes hair, especially that of goats, with wool or silk: in some, the warp

warp is silk and wool twisted together, and the woof hair.

The true or oriental camblet is made of the pure hair of a sort of goat, frequent about Angora, and which makes the riches of that city, all the inhabitants whereof are employed in the manufacture and commerce of camblets. It is certain we find mentioned in middle-age writers stuffs made of camels hair, under the denominations of *cameletum* and *camelinum*, whence probably the origin of the term; but these are represented as strangely coarse, rough, and prickly, and seem to have been chiefly used among the monks by way of mortification, as the hair shirt of latter times.

We have no camblets made in Europe of the goats hair alone; even at Brussels, they find it necessary to add a mixture of woollen thread.

England, France, Holland, and Flanders, are the chief places of this manufacture. Brussels exceeds them all in the beauty and quality of its camblets; those of England are reputed the second.

Figured CAMBLETS, are those of one colour, whereon are stamped various figures, flowers, foliage, &c. by means of hot irons, which are a kind of moulds, passed together with the stuff under a press. These are chiefly brought from Amiens and Flanders; the commerce of these was anciently much more considerable than at present.

Watered CAMBLETS, those which, after weaving, receive a certain preparation with water; and are afterwards passed under a hot press, which gives them a smoothness and lustre.

Waved CAMBLETS, are those whereon waves are impressed, as on tabbies; by means of a calender, under which they are passed and repassed several times.

The manufacturers, &c. of camblets are to take care they do not acquire any false and needless plaits; it being almost impossible to get them out again. This is notorious even to a proverb; we say a person is like camblet he has taken his plait.

CAMBODIA, a kingdom of Asia, in the East Indies, bounded on the north by the kingdom of Laos, on the east by Cochin-China and Chiapa, and on the south and west by the gulf and kingdom of Siam; divided by a large river called *Mecon*. The capital town is of the same name, seated on the western shore of the said river, about 150 miles north of its mouth. This country is annually overflowed in the rainy season, between June and October; and its productions and fruits are much the same with those usually found between the tropics. E. Long. 104. 15. N. Lat. 12. 40.

CAMBODUNUM, (Itinerary); a town of the Brigantes in Britain; now in ruins, near Almonbury in Yorkshire. Westchester, (Talbot.) Also a town of Vindelicia, on the Cambus; now Kempten in Suabia.

CAMBOGIA, in *Botany*, a genus of the monogynia order, belonging to the polyandria class of plants; and in the natural method ranking under the 38th order, *Tricoccæ*. The corolla is tetrapetalous; the calyx tetraphyllous; and the fruit is a pome with eight cells, and solitary seeds. There is but one species, the gutta, a native of India, which yields the gum-resin known by the name of *gamboge* in the shops. See GAMBOGE.

CAMBRASINES, in commerce, fine linen made in Egypt, of which there is a considerable trade at Cairo, Alexandria, and Rosetta, or Raschit. They are called *cambrasines* from their resemblance to cambrics.

CAMBRAY, an archiepiscopal city, the capital of the Cambresis, in the Low Countries, seated on the Scheldt. It is defended by good fortifications, and has a fort on the side of the river; and as the land is low on that side, they can lay the adjacent parts under water by means of sluices. Its ditches are large and deep, and those of the citadel are cut into a rock. Clodion became master of Cambray in 445. The Danes burnt it afterwards; since which time it became a free imperial city. It has been the subject of contest between the emperors, the kings of France, and the earls of Flanders. Francis I. let it remain neutral during the war with Charles V. but this last took possession of it in 1543. After this it was given to John of Montluc by Henry III. of France, whom he created prince of Cambray; but the Spaniards took it from Montluc in 1593, which broke his heart. It continued under the dominion of the house of Austria till 1677, when the king of France became master of it, in whose hands it has continued ever since.

The buildings of Cambray are tolerably handsome, and the streets fine and spacious. The place or square for arms is of an extraordinary largeness, and capable of receiving the whole garrison in order of battle. The cathedral dedicated to the Virgin Mary is one of the finest in Europe. The body of the church is very large, and there are rich chapels, the pillars of which are adorned with marble tombs that are of exquisite workmanship, and add greatly to the beauty of the place.

There are two galleries, one of which is of copper, finely wrought. The door of the choir is of the same metal, and well carved. The steeple of this church is very high, and built in the form of a pyramid; and from its top you have a view of the city, which is one of the finest and most agreeable in the Low Countries. There are nine parishes, four abbeys, and several convents for both sexes. The citadel is very advantageously situated on the high ground, and commands the whole city. Cambray is one of the most opulent and commercial cities in the Low Countries; and makes every year a great number of pieces of cambric, with which the inhabitants drive a great trade. E. Long. 3. 20. N. Lat. 50. 11.

CAMBRAY, *M. de Fenelon, archbishop of.* See FENELON.

CAMBRESIS, a province of France, in the Netherlands, about 25 miles in length. It is bounded on the north and east by Hainault, on the south by Picardy, and on the west by Artois. It is a very fertile and populous country; and the inhabitants are industrious, active, and ingenious. The trade consists principally in corn, sheep, very fine wool, and fine linen cloth. Cambray is the capital town.

CAMBRIA, a name for the principality of Wales.

CAMBRIC, in commerce, a species of linen made of flax, very fine and white; the name of which was originally derived from the city of Cambray, where they were first manufactured. They are now made at other places in France.

The

Cambric, Cambridge.

The manufacture of cambrics hath long since proved of extraordinary advantage to France. For many years it appeared that England did not in this article contribute less than 200,000l. per annum to the interest of France. This proved motive sufficient to induce the parliament of Great Britain to enact many salutary laws to prevent this great loss of our wealth. See 18 Geo. II. c. 38. and 21 Geo. II. c. 26. See also stat. 32 Geo. II. c. 32. and 4 Geo. III. c. 37. which regulates the cambric manufactory, not long since introduced into Winchelsea in Sussex; but very soon abolished. The cambrics now allowed in this country are manufactured in Scotlaud and Ireland. Any persons convicted of wearing, selling (except for exportation), or making up for hire any cambric or French lawns, are liable to a penalty of 5l. by the two first statutes cited above.

CAMBRIDGE, a town of England, and capital of the county of that name. It takes the name of Cambridge from the bridge over the Cam, which divides the town into two parts. Either it or a place in the neighbourhood was styled *Camboritum*, in the time of the Romans. It suffered much during the wars with the Danes. Here was a castle built by William the Conqueror, of which the gatehouse yet remains, and is now the county gaol. By Doomsday-book it appears that it then had ten wards, containing 387 houses. In William Rufus's reign it was quite destroyed by Roger de Montgomery; but Henry I. bestowed many privileges upon it to encourage its restoration, particularly an exemption from the power of the sheriff, on condition of its paying yearly into the exchequer 100 merks (equivalent to 1000 pounds now), and from tolls, lastage, pontage, passage, and stallage, in all fairs of his dominions. It was afterwards often plundered in the barons wars by the outlaws from the isle of Ely, till Henry III. secured it by a deep ditch. In 1388, Richard II. held a parliament there. In the rebellion of Wat Tyler and Jack Straw against that prince, the university records were taken and burnt in the market place.

The modern town is about one mile long from south to north, and about half a mile broad in the middle, diminishing at the extremities. It has 14 parish churches, of which two are without any towers. It contained 11,108 inhabitants in 1811; but the private buildings are neither elegant nor large, owing chiefly to their being held on college leases. It is governed by a mayor, high steward, recorder, 13 aldermen and 24 common council men, a town clerk, &c. Its chief trade is water carriage from hence to Downham, Lynn, Ely, &c. The Jews, being encouraged to settle in England by William I. and II. were very populous here for several generations, and inhabited that street now called the *Jewry*. They had a synagogue, since converted to a parish church, called from the shape of its tower *Round Church;* though others are of opinion that it was built by the Knights Templars, it bearing a resemblance to the Temple church in London. The market place is situated in the middle of the town, and consists of two spacious oblong squares united together; at the top of the angle stands the shire hall, lately erected at the expence of the county. At the back of the shire hall is the town hall and gaol. In the market place, fronting the shire hall, is a remarkably handsome stone conduit, to which water is conveyed by an aqueduct, which was the benefaction of the celebrated Hobson, a carrier in the reign of James I. who was a native of this town. A fine road for the benefit of the inhabitants and students was made a few years since for four miles, from this town to Gogmagog hills, pursuant to the will of Mr Worts. The late Dr Addenbroke also left it 4000l. towards building and furnishing an hospital for the cure of poor diseased people gratis; of which charity the master of Catharine hall is a trustee; which hospital has been erected at the south-east end of the town. At a little distance from Bennet college is the botanic garden of five acres, and a large house for the use of the governors and the residence of the curator, given to the university by the late Dr Walker, who settled an estate on it towards its support, to which the late Mr Edward Betham added a very considerable benefaction. The town has fairs on June 24. and August 14.

Cambridge.

The glory of Cambridge is its university; but when it had its beginning is uncertain. At first there was no public provision for the accommodation or maintenance of the scholars; but afterwards inns began to be erected by pious persons for their reception, and in the time of Edward I. colleges began to be built and endowed. This university, not inferior to any in Christendom, consists of 12 colleges and 4 halls, which have the same privileges as the colleges. The whole body, which is commonly about 1500, enjoys very great privileges granted by several of our sovereigns; but it was James I. who empowered it to send two members to parliament, as the town had done from the first. The university is governed, 1. By a chancellor, who is always some nobleman, and may be changed every three years, or continued longer by the tacit consent of the university. 2. By a high steward, chosen by the senate, and holding his place by patent from the university. 3. By a vice-chancellor, who is the head of some college or hall, and chosen yearly by the body of the university, the heads of the colleges naming two. 4. By two proctors chosen every year, according to the cycle of colleges and halls; as are two taxors, who with the proctors regulate the weights and measures, as clerks of markets. The proctors also inspect the behaviour of the scholars, who must not be out of their colleges after nine at night. Here are also 2 moderators, 2 scrutators, a commissary, public orator, 2 librarians, a register, a school-keeper, 3 esquire beadles and a yeoman beadle, 18 professors, and the caput, consisting of the vice-chancellor, a doctor of divinity, a doctor of laws, a doctor of physic, a regent and a non-regent master of arts. Henry VI. granted it the power to print all books of any kind within itself, a privilege which Oxford had not. The senate house of the university is an elegant building of the Corinthian order, cost near 16,000l. building; in which on the north side is a fine statue of George I. erected in 1739 at the expence of the late Lord Townshend; opposite to this on the south side is another of George II. erected in 1765 at the expence of the late duke of Newcastle: at the east end, on each side of the entrance, are two others; one, the late duke of Somerset, after the Vandyke taste; the other, an Italian emblematical figure of Gloria. This is allowed to be the most superb room in England, being 101 feet long,

long, 42 broad, and 32 high; and it has a gallery which can contain 1000 persons. This building forms the north side of the quadrangle, as the schools and public library do the west, the schools being the ground floor, and the library over them surrounding a small court. North of the philosophy school is the repository of Dr Woodward's fossils, ores, shells, &c. The doctor, together with that collection, and a part of his library, left a sum of money to this university for erecting a professorship for natural philosophy, with a provision of 150l. a-year for ever. At the south-east corner of this building is an elegant geometrical stone staircase which leads to the old library, and consists of 18 classes; at the end of which is an elegant square room, in which are deposited the MSS. and a valuable cabinet of oriental books and curiosities, &c. This room opens to two other rooms, containing 26 large classes, consisting of 30,000 volumes presented to the university by George I. being the entire collection of Dr Moore, bishop of Ely, and purchased of the doctor's executors by his majesty for 6000 guineas; before which his majesty gave the university 2000l. to defray the expence of fitting up the apartments, and erecting classes for their reception; they consist of the first editions of the Greek and Latin classics and historians, and the greatest part of the works of the first printers; large collections of prints by the greatest masters; and a valuable MS. of the Gospels and Acts of the Apostles, on vellum, in Greek and Latin capitals, given to the university by Theodore Beza, and supposed to be as old as any MS. extant. The other part of the library has been rebuilt in an elegant manner, and forms the west side of the intended quadrangle. The books which are contained in the last room are part of the old library, augmented with a considerable number of the best modern books, several of which are presents from foreign sovereigns and eminent men. The south side of the quadrangle is designed for a building to contain the printing-office, &c. of the university, for which preparations began lately to be made by pulling down the old buildings on the spot. St Mary's church forms the east side of this quadrangle; here the university have their public sermons; and the pulpit, which stands in the centre of the church, and faces the chancel, has no soundingboard. In a grand gallery over part of the chancel is a seat for the chancellor, vice-chancellor, &c. George I. when he gave the books, also established a professor of modern history and modern languages in this university, with a salary of 400l. for himself and two persons under him, qualified to instruct in that branch 20 scholars, to be nominated by the king, each of whom is obliged to learn at least two of the languages. A fellowship is founded at Magdalen college, appropriated to the gentlemen of Norfolk, and called *the travelling Norfolk fellowship*. All the libraries in Cambridge, except that of King's college, are lending libraries: and those at Oxford are studying libraries. The different colleges are as follow:

1. St Peter's, the most ancient, and the first on entering the town from London, consisting of two courts, separated by a cloister and gallery. The largest is 144 feet long, and 84 broad. The buildings in this court have been lately repaired in an elegant manner. The lesser court is divided by the chapel, which is a fine old building, 54 feet long, 27 broad, and 27 high. This college was founded in 1257. There are three colleges in Oxford, which dispute the antiquity with this. Cambridge and Oxford were universities long before they were possessed of any colleges in their own right, the students then lodging and boarding with the townsmen, and they then hired hotels for their exercises and disputations. A hotel or hall, now denominated *Pythagoras's school*, situated on the west side of the river, is one of the ancient hotels that remain undemolished, and in which Erasmus read his first Greek lectures in England. 2. Clare hall, on the brink of the river, over which it has an elegant stone bridge, was founded in 1326, consisting of one grand court, 150 feet long, and 111 broad. The front of this building that faces the fields has the appearance of a palace. To this college a new chapel has been added. 3. Pembroke hall is near St Peter's college, and was founded in 1343; it consists of two courts. It has an elegant chapel, built by Sir Christ. Wren. 4. Corpus Christi or Bennet college, founded in 1350, has but a mean appearance, but is possessed of a remarkably large collection of valuable and curious ancient manuscripts. 5. Trinity hall, on the north of Clare hall, near the river, was founded in 1351; it is a small but remarkably neat building. 6. Gonvil and Caius college is near the middle of the town, north of the senate house, and has three courts. It was founded in 1348, and augmented in 1557. 7. King's college, the most noble foundation in Europe, was first endowed by Henry VI. The old court resembles a decayed castle, more than a college. The new building is very magnificent, near 300 feet long. The chapel is one of the finest pieces of Gothic architecture now remaining in the world. It is 304 feet long, 73 broad on the outside, and 40 within, and 91 high; and yet not a single pillar to sustain its ponderous roofs, of which it has two: the first is of stone, most curiously carved; the other of wood, covered with lead, between which is a vacancy of 10 feet. There is such a profusion of carvings, both within and without, as is nowhere to be equalled. Henry VII. enlarged it 188 feet in length, and Henry VIII. gave the elegant stalls and organ gallery, with its inimitable carvings, where are the coats of arms of that king and those of Anne Boleyn quartered. He gave also the elegant painted glass windows, which are in fine preservation, and were permitted by Cromwell to be preserved when almost every other in England was destroyed, as he had a particular regard for this university, where he had his education, and for the town which he had represented in parliament. A new altar has been lately erected, which corresponds with the architecture of the building, embellished with an antique painting of Christ taken down from the cross, purchased in Italy, and presented to the college by the earl of Carlisle. In this chapel are put up the Spanish colours taken at the reduction of Manilla by Colonel Draper, a member of this college. This college has an ancient stone bridge over the Cam. 8. Queen's college, near the river, south of King's, was founded in 1448, and consists of two courts, with a fine grove, and gardens on both sides of the river, connected with each other and the college by two wooden bridges, one of which is of a curious structure. 9. Catharine hall is east of Queen's, and its principal front on the west,

Cambridge, Cambridge-shire. west, the most extensive and regular in the university. It contains only one court, 180 feet long, and 120 broad. and was founded in 1475. 10. Jesus college is at the east end of the town, surrounded by groves and gardens. The principal front faces the south, 180 feet long, regularly built and sashed: it was originally a Benedictine convent, and converted to the present use in 1576. 11. Christ's college is opposite to St Andrew's church, on the east side of the town; and was founded by Henry VIIth's mother, in 1505. It has lately had a thorough repair, and is now a neat and beautiful structure. 12. St John's college was founded by the same lady, in 1509, on the site of a dissolved priory. It consists of three courts, and has a large library filled with scarce and valuable books. To this college belongs a fine stone bridge over the river, which leads to their grand walks. 13. Magdalen college, the only one that stands on the north side of the river, near the great bridge, consists of two courts, and was founded in 1519. 14. Trinity college is east of the river, having St John's college on the north, and Caius's college and Trinity hall on the south. It contains two large quadrangles, the first of which is 344 feet long, and 280 broad. It has two noble entrances; and on the north side of it is the chapel, 204 feet long, 34 broad, and 44 high. It has every grand ornament, and the much admired statue of Sir Isaac Newton, who was a student in this college. The hall is above 100 feet long, 40 broad, and 50 high. The inner court is esteemed the finest in the university, and surpasses any in Oxford. It is very spacious, and has an elegant cloister of stone pillars, supporting grand apartments: on the west is the library, the most elegant structure of the kind in the kingdom, 190 feet long, 40 broad, and 38 high within. Its entrance is by a staircase, the steps black marble, and the walls incrusted with ancient Roman monuments. The entrance into the library is by folding doors at the north end. Its inside appearance is inexpressibly grand, having at the south end (lately erected) a beautiful painted glass window of his present majesty in his robes; and the classes are large, beautiful, and noble, well stocked with books, manuscripts, &c. Its outside has every suitable embellishment, and was erected by Sir Christopher Wren, at the expence of near 20,000l. Under this building is a spacious piazza of equal dimensions; out of which open three gates to a lawn that leads to the river, over which is a new elegant cycloidal bridge of three arches, leading to extensive walks. In the middle is a remarkable vista. This college was founded on the site of two other colleges and a hall in 1546, by Henry VIII. 15. Emanuel college is at the south-east end of the town; consists of two courts, the principal of which is very neat; and was built on the site of a Dominican convent. It has been lately in great part rebuilt and elegantly embellished. 16. Sidney-Sussex college is in Bridge-street. Its hall is elegant, but the chapel remarkable only for standing north and south, as others do east and west. The number of inhabitants in the town of Cambridge in 1801, was 10,087.

CAMBRIDGESHIRE, an inland county of England, bounded on the east by Norfolk and Suffolk, on the south by Essex and Hertfordshire, on the west by Bedfordshire and Huntingdonshire, and on the north by Lincolnshire. Prior to the arrival of the Romans it was included in the ancient division of the Iceni; and after their conquest, in the third province of Flavia Cæsariensis, which reached from the Thames to the Humber. During the Heptarchy it belonged to the kingdom of the East Angles, the sixth kingdom, which began in 575, and ended in 792, having had 14 kings; and it is now included in the Norfolk circuit, the diocese of Ely, and province of Canterbury, except a small part which is in the diocese of Norwich. It is about 40 miles in length from north to south, and 25 in breadth from east to west, and is 130 miles in circumference, containing near 570,000 acres. It has about 17,400 houses, 140,000 inhabitants: is divided into 17 hundreds, in which are one city, Ely; 8 market towns, viz. Cambridge, which is the shire town, and a celebrated university, Caxton, Linton, Merch, Newmarket, Soham, Wisbeach, Thorney, and part of Royston; 220 villages, 64 parishes: sends 2 members to parliament (exclusive of 2 for the town, and 2 for the university), pays one part of the land tax, and provides 480 men in the militia. Its only rivers are the Cam, the Nene, and the Ouse. A considerable tract of land in this county is distinguished by the name of the Isle of Ely. It consists of fenny ground, divided by innumerable channels and drains: and is part of a very spacious level, containing 300,000 acres of land, extending into Norfolk, Suffolk, Huntingdonshire, and Lincolnshire. The Isle of Ely is the north division of the county, and extends south almost as far as Cambridge. The whole level of which this is part, is bounded on one side by the sea, and on the others by uplands; which, taken together, form a rude kind of semicircle, resembling a horse shoe. The air is very different in different parts of the county. In the fens it is moist and foggy, and therefore not so wholesome; but in the south and east parts it is very good, these being much drier than the other; but both, by late improvements, have been rendered very fruitful, the former by draining, and the latter by cinquefoil: so that it produces plenty of corn, especially barley, saffron, and hemp, and affords the richest pastures. The rivers abound with fish, and the fens with wild fowl. The principal manufactures of the county are malt, paper, and baskets. As the above tract appears to have been dry land formerly, the great change it has undergone must have been owing either to a violent breach and inundation of the sea, or to earthquakes. As the towns in and about the fens were great sufferers by the stagnation of the waters in summer, and want of provisions in winter, many attempts were made to drain them, but without success, until the time of Charles I. in which, and that of his son, the work was happily completed, and an act of parliament passed, by which a corporation was established for its preservation and government. By the same act, 83,000 acres were vested in the corporation, and 10,000 in the king. In these fens are a great many DECOYS, in which incredible numbers of ducks, and other wild fowl, are caught during the season. The population of Cambridgeshire in 1811 amounted to 100,109 persons. See CAMBRIDGESHIRE, SUPPLEMENT.

Cambridgeshire, New Cambridge. *New* CAMBRIDGE, a town of New England, about three

three miles from Boston, remarkable for an university consisting of three colleges. W. Long. 70. 4. N. Lat. 42. 0.

CAMBRIDGE *Manuscript*, a copy of the Gospels and Acts of the Apostles, in Greek and Latin. Beza found it in the monastery of Irenæus at Lyons in the year 1562, and gave it to the university of Cambridge in 1582. It is a quarto size, and written on vellum; 66 leaves of it are much torn and mutilated, ten of which are supplied by a later transcriber. Beza conjectures, that this manuscript might have existed so early as the time of Irenæus: Wetstein apprehends that it either returned or was first brought from Egypt into France: that it is the same copy which Druthmar, an ancient expositor who lived about the year 840, had seen, and which, he observes, was ascribed to St Hilary: and that R. Stephens had given a particular account of it in his edition of the New Testament in 1550. It is usually called *Stephen's second Manuscript*. Mill agrees with F. Simon in opinion, that it was written in the western part of the world by a Latin scribe, and that it is to a great degree interpolated and corrupted: he observes that it agrees so much with the Latin Vulgate, as to afford reason for concluding, that it was corrected or formed upon a corrupt and faulty copy of that translation. From this and the Clermont copy of St Paul's Epistles, Beza published his larger Annotations in 1582.

CAMBYSES. See *(History of)* PERSIA.

CAMDEN, WILLIAM, the great antiquarian, was born in London in the year 1551. His father was a native of Lichfield in Staffordshire, who settling in London, became a member of the company of paper-stainers, and lived in the Old Bailey. His mother was of the ancient family of Curwen, of Workington, in Cumberland. He was educated first at Christ's hospital, and afterwards at St Paul's school: from thence he was sent, in 1566, to Oxford, and entered servitor of Magdalen college; but being disappointed of a demy's place, he removed to Broadgate hall, and somewhat more than two years after to Christ-church, where he was supported by his kind friend and patron Dr Thornton. About this time he was a candidate for a fellowship of All-souls college, but lost it by the intrigues of the Popish party. In 1570, he supplicated the regents of the university to be admitted bachelor of arts; but in this also he miscarried. The following year Mr Camden came to London, where he prosecuted his favourite study of antiquity, under the patronage of Dr Goodman, dean of Westminster, by whose interest he was made second master of Westminster school in 1575. From the time of his leaving the university to this period, he took several journeys to different parts of England, with a view to make observations and collect materials for his *Britannia*, in which he was now deeply engaged. In 1581 he became intimately acquainted with the learned President Brisson, who was then in England; and in 1586 he published the first edition of his Britannia; a work which, though much enlarged and improved in future editions, was even then esteemed an honour to its author, and the glory of its country. In 1593 he succeeded to the head mastership of Westminster school on the resignation of Dr Grant. In this office he continued till 1597, when he was promoted to be Clarencieux king at arms. In the year 1600 Mr Camden made a tour to the north, as far as Carlisle, accompanied by his friend Mr (afterwards Sir Robert) Cotton. In 1606 he began his correspondence with the celebrated President de Thou, which continued to the death of that faithful historian. In the following year he published his last edition of the Britannia, which is that from which the several English translations have been made; and in 1608, he began to digest his materials for a history of the reign of Queen Elizabeth. In 1609, after recovering from a dangerous illness, he retired to Chislehurst in Kent, where he continued to spend the summer months during the remainder of his life. The first part of his annals of the queen did not appear till the year 1615, and he determined that the second volume should not appear till after his death (A). The work was entirely finished in 1617; and from that time he was principally employed in collecting more materials for the further improvement of his Britannia. In 1622, being now upwards of 70, and finding his health decline apace, he determined to lose no time in executing his design of founding a history lecture in the university of Oxford. His deed of gift was accordingly transmitted by his friend Mr Heather to Mr Gregory Wheare, who was, by himself, appointed his first professor. He died at Chislehurst in 1623, in the 73d year of his age; and was buried with great solemnity in Westminster Abbey, in the south aisle, where a monument of white marble was erected to his memory. Camden was a man of singular modesty and integrity; profoundly learned in the history and antiquities of this kingdom, and a judicious and conscientious historian. He was reverenced and esteemed by the literati of all nations, and will be ever remembered as an honour to the age and country wherein he lived. Besides the works already mentioned, he was author of an excellent Greek grammar, and of several tracts in Hearne's collection. But his great and most useful work, the *Britannia*, is that upon which his fame is chiefly built. The edition above mentioned, to which he put his last hand, was correctly printed in folio, much augmented, amended where it was necessary, and adorned with maps. It was first translated into English, and published in folio at London, in 1611, by the laborious Dr Philemon Holland, a physician of Coventry, who is thought to have consulted our author himself; and therefore great respect has been paid to the additions and explanations that occur

(A) The reign of Queen Elizabeth was so recent when the first volume of the Annals was published, that many of the persons concerned, or their dependents, were still living. It is no wonder, therefore, that the honest historian should offend those whose actions would not bear inquiry. Some of his enemies were clamorous and troublesome; which determined him not to publish the second volume during his life; but, that posterity might be in no danger of disappointment, he deposited one copy in the Cotton library, and transmitted another to his friend Dupuy at Paris. It was first printed at Leyden in 1625.

occur therein, on a supposition that they may belong to Camden. But in a later edition of the same translation, published in 1636, the doctor has taken liberties which cannot either be defended or excused. A new translation, made with the utmost fidelity from the last edition of our author's work, was published in 1695, by Edmund Gibson of Queen's college in Oxford, afterwards bishop of London; in which, besides the addition of notes, and of all that deserved to be taken notice of in Dr Holland's first edition, which, though thrown out of the text, is preserved at the bottom of the page, there are many other augmentations and improvements, all properly distinguished from the genuine work of the author, as they ought to be: and the same judicious method obtained in the next edition of the same performance, which was justly considered as the very best book of its kind that had been hitherto published. But the public has been recently put in possession of a new translation, and still more improved edition, by that learned and industrious topographer Mr Gough, under whose hands it has been enlarged to near double the size of the last of the preceding editions.

CAMEL, in *Zoology*. See CAMELUS.

CAMEL, in *Mechanics*, a kind of machine used in Holland for raising or lifting ships, in order to bring them over the Pampus, which is at the mouth of the river Y, where the shallowness of the water hinders large ships from passing. It is also used in other places, particularly at the dock of Petersburgh, the vessels built here being in their passage to Cronstadt lifted over the bar by means of camels. These machines were originally invented by the celebrated De Wit, for the purpose above mentioned; and were introduced into Russia by Peter the Great, who obtained the model of them when he worked in Holland as a common shipwright. A camel is composed of two separate parts, whose outsides are perpendicular, and whose insides are concave, shaped so as to embrace the hull of a ship on both sides. Each part has a small cabin with sixteen pumps and ten plugs, and contains 20 men. They are braced to a ship underneath by means of cables, and entirely enclose its sides and bottom; being then towed to the bar, the plugs are opened, and the water admitted until the camel sinks with the ship and runs aground. Then, the water being pumped out, the camel rises, lifts up the vessel, and the whole is towed over the bar. This machine can raise the ship eleven feet, or, in other words, make it draw eleven feet less water.

CAMELFORD, a borough town of Cornwall in England, consisting of about 100 houses, badly built; but the streets are broad and well paved. W. Long. 5. 4. N. Lat. 50. 40. It sends two members to parliament; and gives title of baron to Thomas Pitt, elder brother of the great earl of Chatham.

CAMELIA. See BOTANY *Index*.

CAMELODUNUM. See CAMALODUNUM.

CAMELOPARDALIS, in *Zoology*, the trivial name of a species of CERVUS. See MAMMALIA *Index*.

CAMELUS, or CAMEL, in *Zoology*, a genus of quadrupeds belonging to the order of pecora. See MAMMALIA *Index*.

CAMEO. See CAMAIEU.

CAMERA ÆOLIA, a contrivance for blowing the fire, for the fusion of ores, without bellows, by means of water falling through a funnel into a close vessel, which sends from it so much air or vapour as continually blows the fire: if there be the space of another vessel for it to expatiate in by the way, it there lets fall its humidity, which otherwise might hinder the work. This contrivance was named *camera æolia* by Kircher.

CAMERA *Lucida*, a contrivance of Dr Hook for making the image of any thing appear on a wall in a light room, either by day or night. Opposite to the place or wall where the appearance is to be, make a hole of at least a foot in diameter, or if there be a high window with a casement of this dimension in it, this will do much better without such hole or casement opened.

At a convenient distance, to prevent its being perceived by the company in the room, place the object or picture intended to be represented, but in an inverted situation. If the picture be transparent, reflect the sun's rays by means of a looking glass, so as that they may pass through it towards the place of representation; and, to prevent any rays from passing aside it, let the picture be encompassed with some board or cloth. If the object be a statue, or a living creature, it must be much enlightened by casting the sun's rays on it, either by reflection, refraction, or both. Between this object and the place of representation, put a broad convex glass, ground to such a convexity as that it may represent the object distinctly in such place. The nearer this is situated to the object, the more will the image be magnified on the wall, and the further the less: such diversity depending on the difference of the spheres of the glasses. If the object cannot be conveniently inverted, there must be two large glasses of proper spheres, situated at suitable distances, easily found by trial, to make the representations erect. This whole apparatus of object, glasses, &c. with the persons employed in the management of them, are to be placed without the window or hole, so that they may not be perceived by the spectators in the room. Phil. Trans. No. 38. p. 741. seq. See CAMERA LUCIDA, SUPPLEMENT.

CAMERA *Obscura*, or *Dark Chamber*, in *Optics*, a machine, or apparatus, representing an artificial eye; whereon the images of external objects, received through a double convex glass, are exhibited distinctly, and in their native colours, on a white matter placed within the machine, in the focus of the glass.

The first invention of this instrument is ascribed to Baptista Porta. See his *Magia Naturalis*, lib. xvii. cap. 6. first published at Frankfort about the year 1589 or 1591; the first four books of this work were published at Antwerp in 1560.

The *camera obscura* affords very diverting spectacles; both by exhibiting images perfectly like their objects, and each clothed in their native colours; and by expressing, at the same time, all their motions; which latter no other art can imitate. By means of this instrument, a person unacquainted with designing will be able to delineate objects with the greatest accuracy and justness, and another well versed in painting will find many things herein to perfect his art. See the construction under DIOPTRICS.

CAMERARIA. See BOTANY *Index*.

CAMERARIUS, JOACHIM, one of the most learned writers of his time, was born in 1500, at Bamberg, a city of Franconia; and obtained great reputation by his writings. He translated into Latin Herodotus, Demosthenes, Xenophon, Euclid, Homer, Theocritus, Sophocles, Lucian, Theodoret, Nicephorus, &c. He published a catalogue of the bishops of the principal sees; Greek epistles; Accounts of his journeys, in Latin verse; a Commentary on Plautus; the Lives of Helius Eobanus Hessus, and Philip Melancthon, &c. He died in 1574.

CAMERARIUS, *Joachim*, son of the former, and a learned physician, was born at Nuremberg in 1534. After having finished his studies in Germany, he went into Italy, where he obtained the esteem of the learned. At his return he was courted by several princes to live with them; but he was too much devoted to books, and the study of chemistry and botany, to comply. He wrote a Hortus Medicus, and several other works. He died in 1598.

CAMERATED, among builders, the same with vaulted or arched.

CAMERET BAY, in the province of Brittany in France, forms the harbour of Brest. See BREST.

CAMERINO, a town of the Ecclesiastical State in Italy, situated in E. Long. 13. 7. N. Lat. 45. 5.

CAMERLINGO, according to Du Cange, signified formerly the pope's or emperor's treasurer: at present, camerlingo is nowhere used but at Rome, where it denotes the cardinal who governs the Ecclesiastical State, and administers justice. It is the most eminent office at the court of Rome, because he is at the head of the treasury. During a vacation of the papal chair, the cardinal camerlingo publishes edicts, coins money, and exerts every other prerogative of a sovereign prince; he has under him a treasurer-general, auditor-general, and 12 prelates called *clerks of the chamber*.

CAMERON, JOHN, one of the most famous divines among the Protestants of France in the 17th century, was born at Glasgow in Scotland, where he taught the Greek tongue; and having read lectures upon that language for about a year, travelled, and became professor at several universities, and minister at Bourdeaux. He published, 1. Theological lectures; 2. *Icon Johannis Cameronis*; and some miscellaneous pieces. He died in 1625, aged 60.

CAMERONIANS, a sect or party in Scotland, who separated from the Presbyterians in 1666, and continued to hold their religious assemblies in the fields.

The Cameronians took their denomination from Richard Cameron, a famous field preacher, who refusing to accept the indulgences to tender consciences, granted by King Charles II. as such an acceptance seemed an acknowledgment of the king's supremacy, and that he had before a right to silence them, made a defection from his brethren, and even headed a rebellion, in which he was killed. His followers were never entirely reduced till the Revolution, when they voluntarily submitted to King William.

The Cameronians adhered rigidly to the form of government established in 1648.

CAMERONIANS, or *Cameronites*, is also the denomination of a party of Calvinists in France, who asserted that the will of a man is only determined by the practical judgment of the mind; that the cause of men's doing good or evil proceeds from the knowledge which God infuses into them; and that God does not move the will physically, but only morally, in virtue of its dependence on the judgment of the mind. They had this name from John Cameron, a famous professor, first at Glasgow, where he was born, in 1580, and afterwards at Bourdeaux, Sedan, and Saumur; at which last place he broached his new doctrine of grace and free will, which was formed by Amyraut, Cappel, Bochart, Daille, and others of the more learned among the reformed ministers, who judged Calvin's doctrines on these points too harsh. The Cameronians are a sort of mitigated Calvinists, and approach to the opinion of the Arminians. They are also called *Universalists*, as holding the universality of Christ's death; and sometimes *Amyraldists*. The rigid adherents to the synod of Dort accused them of Pelagianism, and even of Manicheism. The controversy between the parties was carried on with a zeal and subtlety scarce conceivable; yet all the question between them was only, Whether the will of man is determined by the immediate action of God upon it, or by the intervention of a knowledge which God impresses into the mind? The synod of Dort had defined that God not only illuminates the understanding, but gives motion to the will by making an internal change therein. Cameron only admitted the illumination, whereby the mind is morally moved; and explained the sentiment of the synod of Dort so as to make the two opinions consistent.

CAMES, a name given to the small slender rods of cast lead of which the glaziers make their turned lead.

Their lead being cast into slender rods of twelve or fourteen inches long each, is called the *came*: sometimes also they call each of these rods a *came*, which being afterwards drawn through their vice, makes their turned lead.

CAMILLUS, MARCUS FURIUS, was the first who rendered the family of *Furius* illustrious. He triumphed four times, was five times dictator, and was honoured with the title of the *second founder of Rome*. In a word, he acquired all the glory a man can gain in his own country. Lucius Apuleius, one of the tribunes, prosecuted him to make him give an account of the spoils taken at Veii. Camillus anticipated judgment, and banished himself voluntarily. During his banishment, instead of rejoicing at the devastation of Rome by the Gauls, he exerted all his wisdom and bravery to drive away the enemy; and yet kept with the utmost strictness the sacred law of Rome, in refusing to accept the command, which several private persons offered him. The Romans who were besieged in the capitol, created him dictator in the year 363; in which office he acted with so much bravery and conduct, that he entirely drove the army of the Gauls out of the territories of the commonwealth. He died in the 81st year of his age, 365 years before the Christian era.

CAMILLI and CAMILLÆ, in antiquity, boys and girls of ingenuous birth, who ministered in the sacrifices of the gods; and especially those who attended the *flamen dialis*, or priest of Jupiter. The word seems borrowed

borrowed from the language of the ancient Hetrurians, where it signified minister, and was changed from *casmillus*. The Tuscans also gave the appellation *Camillus* to Mercury, in quality of minister of the gods.

CAMINHA, a maritime town of Portugal, in the province of Entre-Duero-e-Minho, with the title of a duchy. It is situated at the mouth of the river Minho, in W. Long. 9. 15. N. Lat. 41. 14.

CAMIS, or KAMIS, in the Japanese theology, denote deified souls of ancient heroes, who are supposed still to interest themselves in the welfare of the people whom they anciently commanded.

The camis answer to the heroes in the ancient Greek and Roman theology, and are venerated like the saints in the modern Roman church.

Besides the heroes or camis beatified by the consent of antiquity, the *mikaddos*, or pontiffs, have deified many others, and continue still to grant the apotheosis to new worthies; so that they swarm with *camis*: the principal one is *Tensio Dai Sin*, the common father of Japan, to whom are paid devotions and pilgrimages extraordinary.

CAMISADE, in the art of war, an attack by surprise in the night, or at the break of day, when the enemy is supposed to be a-bed. The word is said to have taken its rise from an attack of this kind; wherein, as a badge or signal to know one another by, they bore a shift, in French called *chemise*, or *chamise*, over their arms.

CAMISARDS, a name given by the French to the Calvinists of the Cevennes, who formed a league, and took up arms in their own defence, in 1688.

CAMLETINÆ, a slight stuff, made of hair and coarse silk, in the manner of camblet. It is now out of fashion.

CAMMA, and GOBBI, two provinces of the kingdom of Loango in Africa. The inhabitants are continually at war with each other. The weapons they formerly used in their wars were the short pike, bows and arrows, sword and dagger; but since the Europeans have become acquainted with that coast, they have supplied them with fire-arms. The chief town of Gobbi lies about a day's journey from the sea.—Their rivers abound with a variety of fish; but are infested with sea-horses, which do great mischief both by land and water. The principal commerce with the natives is in logwood, elephants teeth and tails, the hair of which is highly valued, and used for several curious purposes.

CAMMIN, a maritime town of Germany, in Brandenburg Pomerania, situated in E. Long. 15°. N. Lat. 54°.

CAMOENS, LOUIS DE, a famous Portuguese poet, the honour of whose birth is claimed by different cities. But according to N. Antonio, and Manual Correa, his intimate friend, this event happened at Lisbon in 1517. His family was of considerable note, and originally Spanish. In 1370, Vasco Perez de Caamans, disgusted at the court of Castile, fled to that of Lisbon, where King Ferdinand immediately admitted him into his council, and gave him the lordships of Sardoal, Punnete, Marano, Amendo, and other considerable lands; a certain proof of the eminence of his rank and abilities. In the war for the succession, which broke out on the death of Ferdinand, Camoens sided with the king of Castile, and was killed in the battle of Aljabarota. But though John I. the victor, seized a great part of his estate, his widow, the daughter of Gonsalo Tereyro, grand master of the order of Christ, and general of the Portuguese army, was not reduced beneath her rank. She had three sons, who took the name of *Camoens*. The family of the eldest intermarried with the first nobility of Portugal; and even, according to Castera, with the blood royal. But the family of the second brother, whose fortune was slender, had the superior honour to produce the author of the Lusiad.

Early in his life the misfortunes of the poet began. In his infancy, Simon Vaz de Camoens, his father, commander of a vessel, was shipwrecked at Goa, where, with his life, the greatest part of his fortune was lost. His mother, however, Anne de Macedo of Santarene, provided for the education of her son Louis at the university of Coimbra. What he acquired there, his works discover; an intimacy with the classics, equal to that of a Scaliger, but directed by the taste of a Milton or a Pope.

When he left the university, he appeared at court. He was handsome; had speaking eyes, it is said, and the finest complexion. Certain it is, however, he was a polished scholar, which, added to the natural ardour and gay vivacity of his disposition, rendered him an accomplished gentleman. Courts are the scenes of intrigue; and intrigue was fashionable at Lisbon. But the particulars of the amours of Camoens rest unknown. This only appears; he had aspired above his rank, for he was banished from the court; and in several of his sonnets he ascribes this misfortune to love.

He now retired to his mother's friends at Santarene. Here he renewed his studies, and began his poem on the discovery of India. John III. at this time prepared an armament against Africa. Camoens, tired of his inactive obscure life, went to Ceuta in this expedition, and greatly distinguished his valour in several rencounters. In a naval engagement with the Moors in the straits of Gibraltar, in the conflict of boarding, he was among the foremost, and lost his right eye. Yet neither hurry of actual service nor the dissipation of the camp could stifle his genius. He continued his *Lusiadas*, and several of his most beautiful sonnets were written in Africa, while, as he expressed it,

One hand the pen, and one the sword, employ'd.

The fame of his valour had now reached the court, and he obtained permission to return to Lisbon. But, while he solicited an establishment which he had merited in the ranks of battle, the malignity of evil tongues, as he calls it in one of his letters, was injuriously poured upon him. Though the bloom of his early youth was effaced by several years residence under the scorching heavens of Africa, and though altered by the loss of an eye, his presence gave uneasiness to the gentlemen of some families of the first rank where he had formerly visited. Jealousy is the characteristic of the Spaniards and Portuguese; its resentment knows no bounds, and Camoens now found it prudent to banish himself from his native country. Accordingly, in 1553, he sailed for India, with a resolution never to return. As the ship left the Tagus, he exclaimed, in the words of the sepulchral monument of Scipio Africanus, Camoens.

canus, *Ingrata patria, non possidebis ossa mea!* "Ungrateful country, thou shalt not possess my bones!" But he knew not what evils in the east would awake the remembrance of his native fields.

When Camoens arrived in India, an expedition was ready to sail to revenge the king of Cochin on the king of Pimenta. Without any rest on shore after his long voyage, he joined this armament, and in the conquest of the Alagada islands displayed his usual bravery.

In the year following, he attended Manuel de Vasconcello in an expedition to the Red sea. Here, says Faria, as Camoens had no use for his sword, he employed his pen. Nor was his activity confined to the fleet or camp. He visited Mount Felix and the adjacent inhospitable regions of Africa, which he so strongly pictures in the Lusiad, and in one of his little pieces where he laments the absence of his mistress.

When he returned to Goa, he enjoyed a tranquillity which enabled him to bestow his attention on his epic poem. But this serenity was interrupted perhaps by his own imprudence. He wrote some satires which gave offence: and by order of the viceroy Francisco Barreto, he was banished to China.

The accomplishments and manners of Camoens soon found him friends, though under the disgrace of banishment. He was appointed commissary of the defunct in the island of Macao, a Portuguese settlement in the bay of Canton. Here he continued his Lusiad; and here also, after five years residence, he acquired a fortune, though small, yet equal to his wishes. Don Constantine de Braganza was now viceroy of India; and Camoens, desirous to return to Goa, resigned his charge. In a ship, freighted by himself, he set sail; but was shipwrecked in the gulf near the mouth of the river Mehon, on the coast of China. All he had acquired was lost in the waves; his poems, which he held in one hand, while he swimmed with the other, were all he found himself possessed of when he stood friendless on the unknown shore. But the natives gave him a most humane reception: this he has immortalized in the prophetic song in the tenth Lusiad; and in the seventh, he tells us, that here he lost the wealth which satisfied his wishes.

Agora da esparança ja adquirida, &c.

Now blest with all the wealth fond hope could crave,
Soon I beheld that wealth beneath the wave
For ever lost;———
My life, like Judah's heaven-doomed king of yore,
By miracle prolong'd———

On the banks of the Mehon he wrote his beautiful paraphrase of the psalm, where the Jews, in the finest strain of poetry, are represented as hanging their harps on the willows, by the rivers of Babylon, and weeping their exile from their native country. Here Camoens continued some time, till an opportunity offered to carry him to Goa. When he arrived at that city, Don Constantine de Braganza, the viceroy, whose characteristic was politeness, admitted him into intimate friendship, and Camoens was happy till Count Redondo assumed the government. Those who had formerly procured the banishment of the satirist, were silent while Constantine was in power; but now they exerted all their arts against him. Redondo, when he entered on office, pretended to be the friend of Camoens; yet, with all that unfeeling indifference with which he made his most horrible witticism on the Zamorin, he suffered the innocent man to be thrown into the common prison. After all the delay of bringing witnesses, Camoens, in a public trial, fully refuted every accusation of his conduct while commissary at Macao, and his enemies were loaded with ignominy and reproach. But Camoens had some creditors, and these detained him in prison a considerable time, till the gentlemen of Goa began to be ashamed that a man of his singular merit should experience such treatment among them. He was set at liberty; and again he assumed the profession of arms, and received the allowance of a gentleman volunteer, a character at this time common in Portuguese India. Soon after, Pedro Barreto, appointed governor of the fort at Sofala, by high promises, allured the poet to attend him thither. The governor of a distant fort, in a barbarous country, shares in some measure the fate of an exile. Yet, though the only motive of Barreto was, in this unpleasant situation, to retain the conversation of Camoens at his table, it was his least care to render the life of his guest agreeable. Chagrined with his treatment, and a considerable time having elapsed in vain dependence upon Barreto, Camoens resolved to return to his native country. A ship, on the homeward voyage, at this time touched at Sofala, and several gentlemen who were on board were desirous that Camoens should accompany them. But this the governor ungenerously endeavoured to prevent, and charged him with a debt for board. Anthony de Cabra, however, and Hector de Sylveyra, paid the demand; and Camoens, says Faria, and the honour of Barreto, were sold together.

After an absence of 16 years, Camoens, in 1569, returned to Lisbon, unhappy even in his arrival, for the pestilence then raged in that city, and prevented his publication for three years. At last, in 1572, he printed his Lusiad, which, in the opening of the first book, in a most elegant turn of compliment, he addressed to his prince, King Sebastian, then in his 18th year. The king, says the French translator, was so pleased with his merit, that he gave the author a pension of 4000 reals, on condition that he should reside at court. But this salary, says the same writer, was withdrawn by Cardinal Henry, who succeeded to the crown of Portugal, lost by Sebastian at the battle of Alcazar.

Though the great patron of one species of literature, a species the reverse of that of Camoens, certain it is, that the author of the Lusiad was utterly neglected by Henry, under whose inglorious reign he died in all the misery of poverty. By some, it is said, he died in an alms-house. It appears, however, that he had not even the certainty of subsistence which these houses provide. He had a black servant, who had grown old with him, and who had long experienced his master's humanity. This grateful Indian, a native of Java, who, according to some writers, saved his master's life in the unhappy shipwreck where he lost his effects, begged in the streets of Lisbon for the only man in Portugal on whom God had bestowed those talents which have a tendency to erect the spirit of a downward age. To the eye of a faithful observer, the fate of Camoens throws

Camoens || Camp.

throws great light on that of his country, and will appear strictly connected with it. The same ignorance, the same degenerated spirit, which suffered Camoens to depend on his share of the alms begged in the streets by his old hoary servant, the same spirit which caused this, sunk the kingdom of Portugal into the most abject vassalage ever experienced by a conquered nation. While the grandees of Portngal were blind to the ruin which impended over them, Camoens beheld it with a pungency of grief which hastened his exit. In one of his letters he has these remarkable words: *Em fim accaberey à vida, e verram todos que fuy efeicoada a minho patria, &c.* "I am ending the course of my life; the world will witness how I have loved my country. I haye returned, not only to die in her bosom, but to die with her."

In this unhappy situation, in 1579, in his 62d year, the year after the fatal defeat of Don Sebastian, died Louis de Camoens, the greatest literary genius ever produced by Portugal; in martial courage and spirit of honour nothing inferior to her greatest heroes. And in a manner suitable to the poverty in which he died, was he buried.

CAMOMILE. See ANTHEMIS, BOTANY *Index*.

CAMP, the ground on which an army pitch their tents. It is marked out by the quartermaster general, who appoints every regiment their gronnd.

The chief advantages to be minded in choosing a camp for an army, are to have it near the water, in a country of forage, where the soldiers may find wood for dressing their victuals; that it have a free communication with garrisons, and with a country from whence it may be supplied with provisions; and, if possible, that it be situated on a rising ground, in a dry gravelly soil. Besides, the advantages of the ground ought to be considered, as marshes, woods, rivers, and enclosure; and if the camp be near the enemy, with no river or marsh to cover it, the army ought to be intrenched. An army always encamps fronting the enemy; and generally in two lines, running parallel, about 500 yards distance; the horse and dragoons, on the wings; and the foot, in the centre; sometimes a body of two, three, or four brigades, is encamped behind the two lines, and is called the *body of reserve*. The artillery and bread-waggons are generally encamped in the rear of the two lines. A battalion of foot is allowed 80 or 100 paces for its camp; and 30 or 40 for an interval betwixt one battalion and another. A squadron of horse is allowed 30 for its camp, and 30 for an interval, and more if the ground will allow it.

Where the grounds are equally dry, those camps are always the most healthful that are pitched on the banks of large rivers; becanse, in the hot season, situations of this kind have a stream of fresh air from the water, serving to carry off the moist and putrid exhalations. On the other hand, next to marshes, the worst encampments are on low grounds close beset with trees; for then the air is not only moist and hurtful in itself, but by stagnating becomes more susceptible of corruption. However, let the situation of camps be ever so good, they are frequently rendered infectious by the putrid effluvia of rotten straw, and the privies of the army, more especially if the bloody flux prevails; in which case, the best method of preventing a general infection, is to leave the ground with the privies, foul straw, and other filth of the camp, behind. This must be frequently done, if consistent with the military operations: but when these render it improper to change the ground often, the privies should be made deeper than usual, and once a-day a thick layer of earth thrown into them till the pits are near fnll; and then they are to be well covered, and supplied by others. It may also be a proper caution to order the pits to be made either in the front or the rear, as the then stationary winds may best carry off their effluvia from the camp. Moreover, it will be necessary to change the straw frequently, as being not only apt to rot, but to retain the infectious steams of the sick. But if fresh straw cannot be procured, more care must be taken in airing the tents, as well as the old straw.

Camp.

The disposition of the Hebrew encampment was at first laid out by God himself. Their camp was of a quadrangular form, surrounded with an enclosure of the height of 10 hands-breadth. It made a square of 12 miles in compass about the tabernacle; and within this was another called the *Levites camp*.

The Greeks had also their camps, fortified with gates and ditches. The Lacedemonians made their camp of a round figure, looking upon that as the most perfect and defensible of any form: we are not, however, to imagine, that they thought this form so essential to a camp, as never to be dispensed with when the circumstances of the place required it. Of the rest of the Grecian camps, it may be observed, that the most valiant of the soldiers were placed at the extremities, the rest in the middle. Thus we learn from Homer, that Achilles and Ajax were posted at the ends of the camp before Troy, as bulwarks on each side of the rest of the princes.

The figure of the Roman camp was a square divided into two principal parts: in the upper part were the general's pavilion, or prætorium, and the tents of the chief officers; in the lower, those of inferior degree were placed. On one side of the prætorium stood the quæstorium, or apartment of the treasurer of the army: and near this the forum, both for a market place and the assembling of councils. On the other side of the prætorium were lodged the legati; and below it the tribunes had their quarters, opposite to their respective legions. Aside of the tribunes were the præfecti of the foreign troops, over against their respective wings; and behind these were the lodgments of the evocati, then those of the extraordinarii and ablecti equites, which concluded the higher part of the camp. Between the two partitions was a spot of ground called *principia*, for the altars and images of the gods, and probably also for the chief ensigns. The middle of the lower partition was assigned to the Roman horse: next to them were quartered the triarii; then the principes, and close by them the hastati; afterwards the foreign horse, and lastly, the foreign foot. They fortified their camp with a ditch and parapet, which they termed *fossa* and *vallum*: in the latter some distinguish two parts, viz. the *agger* or earth, and the *sudes* or wooden stakes driven in to secure it. The camps were sometimes surrounded by walls made of hewn stone; and the tents themselves formed of the same matter.

In the front of the Turkish camp are quartered the janizaries and other foot, whose tents encompass their aga: in the rear are the quarters of the spahis and other

other horsemen. The body of the camp is possessed by the stately tents or pavilions of the vizier or general, rais effendi or chancellor, khaija or steward, the testerdar bashaw or lord treasurer, and kapislar kahiaseer or master of the ceremonies. In the middle of these tents is a spacious field, wherein are erected a building for the divan, and a hafna or treasury. When the ground is marked out for a camp, all wait for the pitching of the tent *lailac*, the place where the courts of justice are held; it being the disposition of this that is to regulate all the rest.

The Arabs still live in camps, as the ancient Scenites did. The camp of the Assyne Emir, or king of the country about Tadmor, is described, by a traveller who viewed it, as spread over a very large plain, and possessing so vast a space, that though he had the advantage of a rising ground, he could not see the utmost extent of it. His own tent was near the middle; scarce distinguishable from the rest, except that it was bigger, being made, like the others, of a sort of haircloth.

Camp, is also used by the Siamese, and some other nations in the East Indies, as the name of the quarters which they assign to foreigners who come to trade with them. In these camps, every nation forms, as it were, a particular town, where they carry on all their trade, not only keeping all their warehouses and shops there, but also living in these camps with their whole families. The Europeans, however, are so far indulged, that at Siam, and almost everywhere else, they may live either in the cities or suburbs, as they shall judge most convenient.

Camp-fight, or *Kamp-fight*, in law writers, denotes the trial of a cause by duel, or a legal combat of two champions in the field, for decision of some controversy.

In the trial by camp-fight, the accuser was, with the peril of his own body, to prove the accused guilty; and, by offering him his glove, to challenge him to this trial, which the other must either accept of, or acknowledge himself guilty of the crime whereof he was accused.

If it were a crime deserving death, the camp-fight was for life and death: if the offence deserved only imprisonment, the camp-fight was accomplished when one combatant had subdued the other, so as either to make him yield or take him prisoner. The accused had liberty to choose another to fight in his stead, but the accuser was obliged to perform it in his own person, and with equality of weapons. No women were permitted to be spectators, nor men under the age of thirteen. The priest and the people who looked on were engaged silently in prayer, that the victory might fall to him who had right. None might cry, shriek, or give the least sign; which in some places was executed with so much strictness, that the executioner stood ready with an axe to cut off the right hand or foot of the party that should offend herein.

He that, being wounded, yielded himself, was at the other's mercy either to be killed or suffered to live. But if life were granted him, he was declared infamous by the judge, and disabled from ever bearing arms, or riding on horseback.

CAMPAGNA. See Campania.

CAMPAIGN, in the art of war, denotes the space of time that an army keeps the field, or is encamped. The beginning of every campaign is considerably more unhealthy than if the men were to remain in quarters. After the first fortnight or three weeks encampment, the sickness decreases daily; the most infirm being by that time in the hospitals, and the weather daily growing warmer. This healthy state continues throughout the summer, unless the men get wet clothes or wet beds; in which case, a greater or less degree of the dysentery will appear in proportion to the preceding heats. But the most sickly part of the campaign begins about the middle or end of August, whilst the days are still hot, but the nights cool and damp, with fogs and dews: then, and not sooner, the dysentery prevails: and though its violence is over by the beginning of October, yet the remitting fever gaining ground, continues throughout the rest of the campaign, and never entirely ceases, even in winter-quarters, till the frost begin. At the beginning of a campaign the sickness is so uniform, that the number may be nearly predicted; but for the rest of the season, as the diseases are then of a contagious nature, and depend so much upon the heats of summer, it is impossible to foresee how many may fall sick from the beginning to the end of autumn. It is also observed, that the last fortnight of a campaign, if protracted till the beginning of winter, is attended with more sickness than the first two months encampment; so that it is better to take the field a fortnight sooner, in order to return into winter-quarters so much the earlier. As to winter expeditions, though severe in appearance, they are attended with little sickness, if the men have strong shoes, quarters, fuel, and provisions. Long marches in summer are not without danger, unless made in the night, or so early in the morning as to be over before the heat of the day.

CAMPANACEÆ, in *Botany*, an order of plants in the *Fragmenta methodi naturalis* of Linnæus, in which are the following genera, viz. convolvulus, ipomæa, polemonium, campanula, roella, viola, &c.*

* See Botany, Natural Orders.

CAMPANELLA, Thomas, a famous Italian philosopher, born at Stilo in Calabria, in 1568. He distinguished himself by his early proficiency in learning: for at the age of 13 he was a perfect master of the ancient orators and poets. His peculiar inclination was to philosophy, to which he at last confined his whole time and study. In order to arrive at truth, he shook off the yoke of authority: by which means the novelty of some of his opinions exposed him to many inconveniences; for at Naples he was thrown into prison, in which he remained 27 years, and during this confinement wrote his famous work entitled *Atheismus triumphatus*. Being at length set at liberty, he went to Paris, where he was graciously received by Louis XIII. and Cardinal Richelieu; the latter procured him a pension of 2000 livres, and often consulted him on the affairs of Italy. Campanella passed the remainder of his days in a monastery of Dominicans at Paris, and died in 1639.

CAMPANI, Matthew, of Spoletto, curate at Rome, wrote a curious treatise on the art of cutting glasses for spectacles, and made several improvements in optics, assisted by his brother and pupil Joseph. He died after 1678.

CAMPANIA, a town of Italy, in the kingdom of Naples, Campania. Naples, and in the Farther Principato, with a bishop's see. E. Long. 15. 30. N. Lat. 40. 40.

Campania, or *Campagna di Roma*, anciently Latium, a province of Italy, bounded on the west by the Tiber and the sea, on the south-west by the sea, on the south by Terra di Lavoro, on the east by Abruzzo, and on the north by Sabina. Though the soil is good, it produces little or nothing, on account of the heavy duties on corn; and though the waters are good, the air is unwholesome. It is subject to the Pope, and is about 60 miles in length, on the Mediterranean sea.

It has been generally thought that the air of this country hath something in it peculiarly noxious during the summer time; but Mr Condamine is of opinion that it is not more unhealthy than any other marshy country. His account follows. "It was after the invasion of the Goths in the fifth and sixth centuries that this corruption of the air began to manifest itself. The bed of the Tiber being covered by the accumulated ruins of the edifices of ancient Rome, could not but raise itself considerably. But what permits us not to doubt of this fact is, that the ancient and well-preserved pavement of the Pantheon and its portico is overflowed every winter; that the water even rises there sometimes to the height of eight or ten feet: and that it is not possible to suppose that the ancient Romans should have built a temple in a place so low as to be covered with the waters of the Tiber on the least inundation. It is evident, then, that the level of the bed of this river is raised several feet; which could not have happened without forming there a kind of dikes or bars. The choking up of its canal necessarily occasioned the overflow and reflux of its waters in such places as till then had not been subject to inundations: to these overflowings of the Tiber were added all the waters that escaped out of the ancient aqueducts, the ruins of which are still to be seen, and which were entirely broken and destroyed by Totila. What need, therefore, of any thing more to infect the air, in a hot climate, than the exhalations of such a mass of stagnating waters deprived of any discharge, and become the receptacle of a thousand impurities, as well as the grave of several millions both of men and animals? The evil could not but increase from the same causes while Rome was exposed to the incursions and devastations of the Lombards, the Normans, and the Saracens, which lasted for several centuries. The air was become so infectious there at the beginning of the 13th century, that Pope Innocent III. wrote, that few people at Rome arrived at the age of forty years, and that nothing was more uncommon there than to see a person of sixty. A very short time after the popes transferred the seat of their residence to Avignon: during the seventy-two years they remained there, Rome became a desert; the monasteries in it were converted into stables; and Gregory XI. on his return to Rome, in 1376, hardly counted there 30,000 inhabitants. At his death began the troubles of the great schism in the west, which continued for upwards of 50 years. Martin V. in whom this schism ended in the year 1429, and his first successors, were able to make but feeble efforts against so inveterate an evil. It was not till the beginning of the 16th century, that Leo X. under whom Rome began to resume her wonted splendour, gave himself some trouble about re-establishing the salubrity of the air: but the city being shortly after besieged twice successively by the emperor Charles V. saw itself plunged again into all its old calamities; and from 85,000 inhabitants, which it contained under Leo X. it was reduced under Clement VIII. to 32,000. In short, it is only since the time of Pius V. and Sextus V. at the end of the 16th century, that the popes have constantly employed the necessary methods for purifying the air of Rome and its environs, by procuring proper discharges for the waters, drying up the humid and marshy grounds, and covering the banks of the Tiber and other places reputed uninhabitable with superb edifices. Since that time a person may dwell at Rome, and go in or out of it at all seasons of the year. At the beginning, however, of the present century, they were still afraid to lie out of the city in summer, when they had resided there; as they were also to return to it, when once they had quitted it. They never ventured to sleep at Rome, even in broad day, in any other house than their own. They are greatly relaxed at present from these ancient scruples: I have seen cardinals, in the months of July and August, go from Rome to lie at Frascati, Tivoli, Albano, &c. and return the next or the following days to the city, without any detriment to their health: I have myself tried all these experiments, without suffering the least inconvenience from them; we have even seen, in the last war in Italy, two armies encamped under the walls of Rome at the time when the heats were most violent. Yet, notwithstanding all this, the greater part of the country people dare not still venture to lie during that season of the year, nor even so much as sleep in a carriage, in any part of the territory comprehended under the name of the *Campagna of Rome*."

Campania || Campbell

CAMPANIFORM, or Campanulated, an appellation given to flowers resembling a bell.

CAMPANINI, a name given to an Italian marble dug out of the mountains of Carrara, because, when it is worked, it sounds like a bell.

CAMPANULA, or Bell-flower. See Botany *Index*.

CAMPBELL, Archibald, Earl and Marquis of Argyle, was the son of Archibald earl of Argyle, by the Lady Anne Douglas, daughter of William earl of Morton. He was born in the year 1598; and educated in the profession of the Protestant religion, according to the strictest rules of the church of Scotland, as it was established immediately after the Reformation. During the commonwealth he was induced to submit to its authority. Upon the Restoration, he was tried for his compliance; a crime common to him with the whole nation, and such a one as the most loyal and affectionate subject might frequently by violence be induced to commit. To make this compliance appear the more voluntary and hearty, there were produced in court letters which he had wrote to Albemarle, while that general governed Scotland, and which contained expressions of the most cordial attachment to the established government. But, besides the general indignation excited by Albemarle's discovery of this private correspondence, men thought, that even the highest demonstrations of affection might, during jealous times, be exacted as a necessary mark of compliance from a person of such distinction as Argyle; and could not, by any equitable construction, imply the crime of treason.

Campbell. son. The parliament, however, scrupled not to pass sentence upon him, and he suffered with great constancy and courage.

Campbell, *Archibald*, earl of Argyle, son to the former, had from his youth distinguished himself by his loyalty and his attachment to the royal family. Though his father was head of the covenanters, he himself refused to concur in any of their measures; and when a commission of colonel was given him by the convention of states, he forbore to act upon it till it should be ratified by the king. By his respectful behaviour, as well as by his services, he made himself acceptable to Charles when that prince was in Scotland; and even after the battle of Worcester, all the misfortunes which attended the royal cause could not engage him to desert it. Under Middleton he obstinately persevered to harass and infest the victorious English; and it was not till he received orders from that general, that he would submit to accept of a capitulation. Such jealousy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was soon after fallen upon to commit him to prison; and his confinement was rigorously continued till the Restoration. The king, sensible of his services, had remitted to him his father's forfeiture, and created him earl of Argyle; and when a most unjust sentence was passed upon him by the Scots parliament, Charles had anew remitted it. In the subsequent part of this reign Argyle behaved himself dutifully; and though he seemed not disposed to go all lengths with the court, he always appeared, even in his opposition, a man of mild dispositions and peaceable deportment.

A parliament was summoned at Edinburgh in summer 1681, and the duke was appointed commissioner. Besides granting money to the king, and voting the indefeasible right of succession, this parliament enacted a test, which all persons possessed of offices, civil, military, or ecclesiastical, were bound to take. In this test the king's supremacy was asserted, the covenant renounced, passive obedience assented to, and all obligations disclaimed of endeavouring any alteration in civil or ecclesiastical establishments. This was the state of the test as proposed by the courtiers; but the country party proposed also a clause of adherence to the Protestant religion, which could not with decency be rejected. The whole was of an enormous length, considered as an oath; and, what was worse, a confession of faith was there ratified which had been imposed a little after the Reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of resistance was inculcated; so that the test being voted in a hurry, was found on examination to be a medley of absurdity and contradiction. Though the courtiers could not reject the clause of adhering to the Protestant religion, they proposed, as a requisite mark of respect, that all princes of the blood should be exempted from taking that oath. This exception was zealously opposed by Argyle: who observed that the sole danger to be dreaded for the Protestant religion must proceed from the perversion of the royal family. By insisting on such topics, he drew on himself the secret indignation of the duke of York, of which he soon felt the fatal consequences.

When Argyle took the test as a privy counsellor, he subjoined, in the duke's presence, an explanation which he had beforehand communicated to that prince, and which he believed to have been approved by him. It was in these words. "I have considered the test, and am very desirous of giving obedience as far as I can. I am confident that the parliament never intended to impose contradictory oaths: therefore I think no man can explain it but for himself. Accordingly I take it as far as it is consistent with itself and the Protestant religion. And I do declare that I mean not to bind myself, in my station, and in a lawful way, from wishing and endeavouring any alteration, which I think to the advantage of church or state, and not repugnant to the Protestant religion and my loyalty; and this I understand as a part of my oath." The duke, as was natural, heard it with great tranquillity: no one took the least offence: Argyle was admitted to sit that day in council; and it was impossible to imagine that a capital offence had been committed where occasion seemed not to have been given so much as for a frown or reprimand.

Argyle was much surprised a few days after, to find that a warrant was issued for committing him to prison; that he was indicted for high treason, leasing-making, and perjury; and that from the innocent words above mentioned an accusation was extracted, by which he was to forfeit life, honours, and fortune. It is needless to enter into particulars, where the iniquity of the whole is so evidently apparent. Though the sword of justice was displayed, even her semblance was not put on; and the forms of law were preserved to sanctify, or rather aggravate, the oppression. Of five judges, three did not scruple to find the guilt of treason and leasing-making to be incurred by the prisoner: a jury of 15 noblemen gave verdict against him; and the king being consulted, ordered the sentence to be pronounced, but the execution of it to be suspended till further orders. Argyle, however, saw no reason to trust to the justice or mercy of such enemies: He made his escape from prison, and till he could find a ship for Holland he concealed himself during some time in London. The king heard of his lurking place, but would not suffer him to be arrested. All the parts, however, of his sentence, so far as the government in Scotland had power, were rigorously executed; his estate confiscated, his arms reversed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himself at liberty, before the coronation of James II. to exert himself in order to recover the constitution by force of arms, he concerted measures with the duke of Monmouth, and went into Scotland, to assemble his friends: but not meeting with the success he expected, he was taken prisoner; and being carried to Edinburgh, was beheaded upon his former unjust sentence, June 30. 1685. He showed great constancy and courage under his misfortunes; on the day of his death he ate his dinner very cheerfully; and, according to custom, slept after it a quarter of an hour or more, very soundly. At the place of execution, he made a short, grave, and religious speech; and, after solemnly declaring that he forgave all his enemies, submitted to death with great firmness.

Campbell, *Archibald*, first duke of Argyle, son to the preceding, was an active promoter of the revolution.

Campbell. lution. He came over with the prince of Orange; was admitted into the convention as earl of Argyle, though his father's attainder was not reversed; and in the claim of rights the sentence against him was declared to be, what most certainly it was, a reproach upon the nation. The establishment of the crown upon the prince and princess of Orange being carried by a great majority in the Scotish convention, the earl was sent from the nobility, with Sir James Montgomery and Sir John Dalrymple from the barons and boroughs, to offer the crown, in the name of the convention, to their majesties, and tendered them the coronation oath; for which, and many other eminent services, he was admitted a member of the privy council, and, in 1690, made one of the lords of the treasury. He was afterwards made a colonel of the Scots horse guards; and, in 1694, one of the extraordinary lords of session. He was likewise created duke of Argyle, marquis of Kintyre and Lorn, earl of Campbell and Cowall, viscount of Lochow and Glenila, Lord Inverary, Mull, Morvern, and Terrey, by letters-patent, bearing date at Kensington the 23d of June, 1701. He sent over a regiment to Flanders for King William's service, the officers of which were chiefly of his own name and family, who bravely distinguished themselves through the whole course of the war. He married Elizabeth, daughter of Sir Lionel Talmash of Helmingham in the county of Suffolk, by Elizabeth, duchess of Lauderdale, his wife, daughter and heiress of William Murray, earl of Dysart, by whom he left issue two sons and a daughter; namely, John, duke of Argyle, the subject of the next article; Archibald, who succeeded his brother as duke of Argyle; and Lady Anne, married to James Stuart, second earl of Bute, by whom she had a son, afterwards earl of Bute.

CAMPBELL, *John*, second duke of Argyle, and also duke of Greenwich and baron of Chatham, son to the subject of the preceding article, was born on the 10th of October, 1680; and, on the very day when his grandfather suffered at Edinburgh, fell out of a window three pair of stairs high without receiving any hurt. At the age of 15, he had made a considerable progress in classical learning. His father then perceived and encouraged his military disposition, and introduced him to King William, who appointed him to the command of a regiment. In this situation he remained till the death of his father in 1703; when becoming duke of Argyle, he was soon after sworn of Qneen Anne's privy council, made captain of the Scots horse guards, and appointed one of the extraordinary lords of session. In 1704, her majesty reviving the Scotish order of the Thistle, his grace was installed one of the knights of that order, and was soon after appointed high-commissioner to the Scotch parliament; where, being of great service in promoting the intended union, he was on his return created a peer of England, by the titles of *baron of Chatham* and *earl of Greenwich*, and in 1710 was made knight of the Garter. His grace first distinguished himself in his military capacity at the battle of Oudenarde; where he commanded as brigadier-general, with all the bravery of youth and the conduct of a veteran officer. He was present under the duke of Marlborough at the siege of Ghent, and took possession of the town. He had also a considerable share in the victory obtained over the French at the battle of Malplaquet, by dislodging them from the wood of Sart, and gaining a post of great consequence. In this sharp engagement, several musket-balls passed through the duke's clothes, hat, and peruke. Soon after this hot action, he was sent to take the command in Spain; and after the reduction of Port Mahon he returned to England. His grace having now a seat in the house of lords, he censured the measures of the ministry with such freedom, that all his places were disposed of to other noblemen: but at the accession of George I. he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander-in-chief of his majesty's forces in North Britain; and was the principal means and cause of the total extinction, at that time, of the rebellion in Scotland, without much bloodshed. In direct opposition to him, or that part of the army he commanded, at the head of all his Campbells was placed Campbell, earl of Braidalbin, of the same family and kindred, by some fatal error that ever misguided and misled that unhappy family of the Stuarts and all its adherents. The consequence was, that both sets of Campbells, from family affection, refused to strike a stroke, and retired out of the battle. He arrived at London March 6th, 1716, and was in high favour: but, to the surprise of people of all ranks, he was in a few months divested of all his employments; and from this period to the year 1718, he signalized himself in a civil capacity, by his uncorrupted patriotism and manly eloquence. In the beginning of the year 1719, he was again admitted into favour, appointed lord-steward of the household, and in April following was created duke of Greenwich. He continued in the administration during all the remaining part of that reign; and, after his late majesty's accession, till April 1740; when he delivered a speech with such warmth, that the ministry being highly offended, he was again dismissed from his employments. To these, however, on the change of the ministry, he was soon restored; but not approving of the measures of the new ministry more than those of the old, he gave up all his posts for the last time, and never after engaged in affairs of state. He now enjoyed privacy and retirement; and died of a paralytic disorder on the 4th of October 1743. To the memory of his grace a very noble monument was erected in Westminster Abbey, executed by the ingenious Roubilliac.

The duke of Argyle, though never first minister, was a very able statesman and politician, most steadily fixed in those principles he believed to be right, and not to be shaken or changed. His delicacy and honour were so great, that it hurt him to be even suspected; witness that application said to be made to him by one of the adherents of the Stuart family before the last rebellion in order to gain his interest, which was considerable both in Scotland and England. He immediately sent the letter to the secretary of state; and it vexed him much even to have an application made him, lest any person should think him capable of acting a double part. When he thought measures wrong or corrupt, he cared not who was the author, however great or powerful he might be; witness his boldly attacking the great duke of Marlborough in the house of lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity, Campbell. popularity, though in all other respects he was the most able general of his time. The duke of Argyle on all occasions spoke well, with a firm, manly, and noble eloquence; and seems to deserve the character given of him by Pope:

> Argyle the state's whole thunder born to wield,
> And shake alike the senate and the field.

In private life, the duke's conduct was highly exemplary. He was an affectionate husband and an indulgent master. He seldom parted with his servants till age had rendered them incapable of their employments; and then he made provision for their subsistence. He was liberal to the poor, and particularly to persons of merit in distress: but though he was ready to patronise deserving persons, he was extremely cautious not to deceive any by lavish promises or leading them to form vain expectations. He was a strict economist, and paid his tradesmen punctually every month; and though he maintained the dignity of his rank, he took care that no part of his income should be wasted in empty pomp or unnecessary expences. He was twice married, and left five daughters, but no male issue. The titles of duke and earl of Greenwich and baron of Chatham became extinct at his death; but in his other titles he was succeeded by his brother Archibald earl of Isla, the subject of the next article.

Campbell, *Archibald*, third duke of Argyle, brother to the subject of the preceding article, was born at Hamhouse, in England, in June 1682, and was educated at the university of Glasgow. He afterwards applied himself to the study of the law at Utrecht; but, upon his father's being created a duke, he betook himself to a military life, and served some time under the duke of Marlborough. Upon quitting the army, in which he did not long remain, he applied to the acquisition of that knowledge which would enable him to make a figure in the political world. In 1705, he was constituted treasurer of Scotland, and made a considerable figure in parliament, though he was not more than 23 years of age. In 1706, he was appointed one of the commissioners for treating of the Union; and the same year was created Lord Oronsay, Dunoon, and Arrois, viscount and earl of Isla. In 1708, he was made an extraordinary lord of session; and when the Union was effected, he was chosen one of the Sixteen Peers for Scotland, in the first parliament of Great Britain; and was constantly elected to every future parliament till his death, except the fourth. In 1710, he was made justice-general of Scotland. In 1711, he was called to the privy council; and upon the accession of George I. he was nominated lord register of Scotland. When the rebellion broke out in 1715, he again betook himself to arms, in defence of the house of Hanover, and by his prudent conduct in the West Highlands, he prevented General Gordon, at the head of three thousand men, from penetrating into the country and raising levies. He afterwards joined his brother at Stirling, and was wounded at the battle of Dumblain. In 1725, he was appointed keeper of the privy seal; and from this time, he was entrusted with the management of Scotish affairs. In 1734, upon his resigning the privy seal, he was made keeper of the great seal, which office he enjoyed till his death. Upon the decease of his brother, he became duke of Argyle, hereditary justice-general, lieutenant, sheriff, and commissary of Argyleshire and the Western Isles, hereditary great master of the household, hereditary keeper of Dunstaffnage, Carrick, and several other castles. He was also chancellor of the university of Aberdeen; and laboured to promote the interest of that, as well as of the other universities of Scotland. He particularly encouraged the school of physic at Edinburgh, which has now acquired so high a reputation. Having the chief management of Scotch affairs, he was also extremely attentive to promote the trade, manufactures, and improvements of his country. It was by his advice that, after the rebellion in 1745, the Highlanders were employed in the royal army. He was a man of great endowments, both natural and acquired, well versed in the laws of his country, and possessed considerable parliamentary abilities. He was likewise eminent for his skill in human nature, had great talents for conversation, and had collected one of the most valuable private libraries in Great Britain. He built himself a very magnificent seat at Inverary. The faculties of his mind continued sound and vigorous till his death, which happened suddenly on the 15th of April 1761, in the 79th year of his age. He was married, but had no issue; and was succeeded in his titles and the estates of the family by John Campbell, fourth duke of Argyle, son of the honourable John Campbell of Mammore, who was the second son of Archibald the ninth earl of Argyle.

The family of Argyle were heritable justice generals for Scotland till abolished by the jurisdiction act. They are still heritable masters of the king's household in Scotland, and keepers of Dunstaffnage and Carrick.

Campbell, *John*, an eminent historical, biographical, and political writer, was born at Edinburgh, March 8. 1707-8. His father, Robert Campbell of Glenlyon, Esq. was captain of horse in a regiment commanded by the then earl of Hyndford; and his mother, Elizabeth, daughter of ——— Smith, Esq. of Windsor in Berkshire, had the honour of claiming a descent from the poet Waller. Our author, their fourth son, was at the age of five years carried from Scotland to Windsor, where he received the first principles of his education; and at a proper age, he was placed out as clerk to an attorney, being intended for the law. This profession, however, he never followed; but by a close application to the acquisition of knowledge of various kinds, became qualified to appear with great advantage in the literary world. In 1736, before he had completed his 30th year, he gave to the public, in two volumes folio, "the Military History of Prince Eugene and the duke of Marlborough," enriched with maps, plans, and cuts. The reputation hence acquired, occasioned him soon after to be solicited to take a part in the "Ancient Universal History." Whilst employed in this capital work, Mr Campbell found leisure to entertain the world with other productions. In 1739, he published the "Travels and Adventures of Edward Brown, Esq." 8vo. In the same year appeared his "Memoirs of the Bashaw Duke de Ripperda," 8vo. reprinted, with improvements, in 1740. These memoirs were followed, Campbell. followed, in 1741, by the "Concise History of Spanish America," 8vo. In 1742, he was the author of "A Letter to a friend in the Country, on the Publication of Thurloe's State Papers;" giving an account of their discovery, importance, and utility. The same year was distinguished by the appearance of the 1st and 2d volumes of his "Lives of the English Admirals, and other eminent British Seamen." The two remaining volumes were completed in 1744; and the whole, not long after, was translated into German. This was the first of Mr Campbell's works to which he prefixed his name; and it is a performance of great and acknowledged merit. In 1743, he published "Hermippus revived;" a second edition of which, much improved and enlarged, came out in 1749, under the following title: "Hermippus Redivivus: or, the Sage's Triumph over Old Age and the Grave. Wherein a method is laid down for prolonging the life and vigour of man. Including a Commentary upon an ancient inscription, in which this great secret is revealed; supported by numerous authorities. The whole interspersed with a great variety of remarkable and well attested relations." This extraordinary tract had its origin in a foreign publication; but it was wrought up to perfection by the additional ingenuity and learning of Mr Campbell. In 1744 he gave to the public, in two volumes folio, his "Voyages and Travels," on Dr Harris's plan, being a very distinguished improvement of that collection which had appeared in 1705. The time and care employed by Mr Campbell in this important undertaking did not prevent his engaging in another great work, the "Biographia Britannica," which began to be published in weekly numbers in 1745, and extended to seven volumes folio: but our author's articles were only in the first four volumes; of which Dr Kippis observes, they constitute the prime merit.

When the late Mr Dodsley formed the design of "The Preceptor," which appeared in 1748, Mr Campbell was to assist in the undertaking; and the parts written by him were the Introduction to Chronology, and the Discourse on Trade and Commerce, both of which displayed an extensive fund of knowledge upon these subjects. In 1750 he published the first separate edition of his "Present State of Europe;" a work which had been originally begun in 1746, in the "Museum," a very valuable periodical performance, printed for Dodsley. There is no production of our author's that hath met with a better reception. It has gone through six editions, and fully deserved this encouragement. The next great undertaking which called for the exertion of our author's abilities and learning, was "The Modern Universal History." This extensive work was published, from time to time, in detached parts, till it amounted to 16 volumes folio; and a second edition of it, in 8vo. began to make its appearance in 1759. The parts of it written by Mr Campbell were, the histories of the Portuguese, Dutch, Spanish, French, Swedish, Danish, and Ostend Settlements in the East Indies; and the histories of the Kingdoms of Spain, Portugal, Algarve, Navarre, and that of France, from Clovis to 1656. As our author had thus distinguished himself in the literary world, the degree of LL.D. was very properly and honourably conferred upon him, June 18. 1754, by the university of Glasgow.

His principal and favourite work was, "A Political Survey of Great Britain," 2 vol. 4to, published a short time before his death; in which the extent of his knowledge, and his patriotic spirit, are equally conspicuous. Dr Campbell's reputation was not confined to his own country, but extended to the remotest parts of Europe. As a striking instance of this, it may be mentioned, that in the spring of 1774, the empress of Russia was pleased to honour him with the present of her picture, drawn in the robes worn in that country in the days of John Bassiliowitz, grand duke of Muscovy, who was contemporary with Queen Elizabeth. To manifest the doctor's sense of her imperial majesty's goodness, a set of the "Political Survey of Britain," bound in Morocco, highly ornamented, and accompanied with a letter descriptive of the triumphs and felicities of her reign, was forwarded to St Petersburgh, and conveyed into her hands by Prince Orloff, who had resided some months in this kingdom.

Dr Campbell in 1736 married Elizabeth, daughter of Benjamin Vobe, of Leominster, in the county of Hereford, gentleman, with whom he lived nearly 40 years in the greatest conjugal harmony and happiness. So wholly did he dedicate his time to books, that he seldom went abroad: but to relieve himself as much as possible from the inconveniences incident to a sedentary life, it was his custom, when the weather would admit, to walk in his garden; or otherwise in some room of his house, by way of exercise. By this method, united with the strictest temperance in eating, and an equal abstemiousness in drinking, he enjoyed a good state of health, though his constitution was delicate. His domestic manner of living did not preclude him from a very extensive and honourable acquaintance. His house, especially on a Sunday evening, was the resort of the most distinguished persons of all ranks, and particularly of such as had rendered themselves eminent by their knowledge or love of literature. He received foreigners, who were fond of learning, with an affability and kindness which excited in them the highest respect and veneration; and his instructive and cheerful conversation made him the delight of his friends in general. He was, during the latter part of his life, agent for the province of Georgia in North America; and died at the close of the year 1775, in the 67th year of his age. The doctor's literary knowledge was by no means confined to the subjects on which he more particularly treated as an author; he was well acquainted with the mathematics, and had read much in medicine. It hath been with great reason believed, that if he had dedicated his studies to this last science, he would have made a very conspicuous figure in the medical profession. He was eminently versed in the different parts of sacred literature; and his acquaintance with the languages extended not only to the Hebrew, Greek, and Latin, among the ancient, and to the French, Italian, Spanish, Portuguese, and Dutch, among the modern; but likewise to the oriental tongues. He was particularly fond of the Greek language. His attainment of such a variety of knowledge was exceedingly assisted by a memory surprisingly retentive, and which indeed astonished

nished every person with whom he was conversant. In communicating his ideas, he had an uncommon readiness and facility; and the style of his works, which had been formed upon the model of that of the celebrated Bishop Sprat, was perspicuous, easy, flowing, and harmonious. To all these accomplishments of the understanding, Dr Campbell joined the more important virtues of a moral and pious character. His disposition was gentle and humane, and his manners kind and obliging. He was the tenderest of husbands, a most indulgent parent, a kind master, a firm and sincere friend. To his great Creator he paid the constant and ardent tribute of devotion, duty, and reverence; and in his correspondences he showed that a sense of piety was always nearest his heart.

Campbell, *George*, D. D. was born at Aberdeen in December 1719. He was educated at the grammar school in the same town, and intended for the employment of signet-writer, an occupation similar to that of an English attorney, in which he was bound an apprentice. The love of study, however, prevailed over every opposition: in 1741 he attended divinity lectures at Edinburgh before the term of his apprenticeship was fully completed, and soon after became a regular student in the university of Aberdeen, attending the lectures of Professor Lumsden in King's, and Professor Chalmers in Marischal college. In 1746 he was licensed to preach by the presbytery of Aberdeen. In 1748 he obtained the living of Banchory Ternan, in which situation he became a married man, and was fortunate in possessing a lady "remarkable for the sagacity of her understanding, the integrity of her heart, the general propriety of her conduct, and her skill in the management of domestic economy." Mutual happiness was the consequence of this union, which was not terminated till her death in 1792. In 1757 he was translated to Aberdeen, to be one of the ministers of that town, and in 1759 was presented to the office of principal of Marischal college.

Mr Hume's Treatise on Miracles gave the new principal an opportunity of evincing that he was not unworthy of his office. He opposed it in a sermon preached before the provincial synod of Aberdeen, in 1760, which he was requested to publish; but he preferred the form of a dissertation, and in that state sent the manuscript to Dr Blair, to be by him communicated to the metaphysician. Availing himself then of the remarks of his friends, and his opponent, he gave it to the world in 1763, with a dedication to Lord Bute: but however desirable the patronage of the minister might be in other respects, it was of very little assistance in giving circulation, in the literary world, to an essay which, from the favourable impressions of Blair and Hume, was eagerly read, and universally admired.

In 1771 he was elected professor of divinity in Marischal college, on which he resigned his office as one of the ministers of Aberdeen: but as "minister of Gray Friars, an office conjoined to the professorship about a century ago, he was obliged to preach once every Sunday in one of the established churches." Few persons seem to have entertained truer notions of the office of a teacher in an university than our new professor; and the plan he had in view, on entering upon his lectures, though expressed in rather too strong language, may be recommended to every one who undertakes a similar employment.

"Gentlemen (he thus addresses his pupils), the nature of my office has been much misunderstood. It is supposed, that I am to teach you every thing connected with the study of divinity. I tell you honestly, that I am to teach you nothing. Ye are not school-boys. Ye are young men, who have finished your courses of philosophy, and ye are no longer to be treated as if ye were at school. Therefore, I repeat it, I am to teach you nothing; but, by the grace of God, I will assist you to teach yourselves every thing." In 1771 he published his excellent sermon on the Spirit of the Gospel; and, in 1776, his Philosophy of Rhetoric. In this latter year, also, he acquired the friendship of Dr Tucker by a sermon, then much admired, and very generally read, on the Duty of Allegiance, in which he endeavours to show "that the British colonies in America had no right, either from reason or from Scripture, to throw off their allegiance;" and he uses those vulgar arguments, which, as being purely political, and more especially adapted to the sentiments of the majority of that day, were very improper topics for the pulpit. It is so much the fashion for divines to make the varying politics of the hour the subject of their discourses, and in them to follow the sentiments of those whose patronage is deemed most advantageous, that we must not be very severe in our animadversions on the present occasion. In 1777 he chose a better subject for a discourse, which he published at the request of the Society for propagating Christian Knowledge, and in which the success of the first publishers of the Gospel is ably treated as a proof of its truth. In 1779, when many of his countrymen, led away by the madness of enthusiasm and fanaticism, were rushing headlong into the most antichristian practice of persecution, he published a very seasonable address to the people of Scotland, on the alarms which had been raised by the bill in favour of the Roman Catholics.

In the same year, also, he published a sermon on the Happy Influence of Religion on Civil Society. The last work which he lived to bring before the public was his Translation of the Four Gospels, with preliminary dissertations, and explanatory notes, of which it is unnecessary to say any thing further in this place than that it is worthy of his talents and character.

In 1795 he resigned his professorship, in a letter to the moderator of the presbytery of Aberdeen, which they voted to be inserted in their records. Soon after the resignation of his professorship, he resigned also the principalship, on a pension of 300l. a-year being conferred on him by government; but this pension he possessed for a very short time; for, on the 31st of March, 1796, his last illness seized him, and on the next morning it was followed by a paroxysm of the palsy, which destroyed his faculty of speech, and under which he languished till he died. His funeral sermon was preached on the 17th of April by Dr Brown, who had succeeded him in the offices of principal and professor.

His character, very justly drawn by the same gentleman, we shall now lay before our readers. "Dr Campbell, as a public teacher, was long admired for the clearness and copiousness with which he illustrated

Campbell. ed the great doctrines and precepts of religion, and the strength and energy with which he enforced them. Intimately persuaded of the truth and infinite consequence of what revelation teaches, he was strongly desirous of carrying the same conviction to the minds of his hearers, and delivered his discourses with that zeal which flows from strong impressions, and that power of persuasion which is the result of sincerity of heart, combined with clearness of understanding. He was satisfied, that the more the pure dictates of the gospel were studied, the more they would approve themselves to the mind, and bring forth, in the affections and conduct, all the peaceable fruits of righteousness. The unadulterated dictates of Christianity, he was, therefore, only studious to recommend and inculcate; and knew perfectly to discriminate them from the inventions and traditions of men. His chief study ever was, to direct belief to the great objects of practice; and, without these, he viewed the most orthodox profession as "a sounding brass, and a tinkling cymbal." But, besides the character of a preacher of righteousness, he had also that of a teacher of the science of divinity to sustain. How admirably he discharged this duty, and with what effect he conveyed the soundest and most profitable instruction to the minds of his scholars, let those declare who are now in various congregations of this country, communicating to their fellow Christians the fruits of their studies under so able and judicious a teacher. Discarding all attachment to human systems, merely considered as such, he tied his faith to the Word of God alone, possessed the happiest talent in investigating its meaning, and communicated to his hearers the result of his own inquiries, with a precision and perspicuity which brought light out of obscurity, and rendered clear and simple what appeared intricate and perplexed. He exposed, without reserve, the corruptions which ignorance, craft, and hypocrisy had introduced into religion, and applied his talent for ridicule to the best of all purposes, to hold up to contempt the absurdities with which the purest and sublimest truths had been loaded.

"Placed at the head of a public seminary of learning, he felt all the importance of such a situation, and uniformly directed his influence to public utility. His enlarged and enlightened mind justly appreciated the extensive consequence of the education of youth. He anticipated all the effects resulting to the great community of mankind, from numbers of young men issuing, in regular succession, from the university over which he presided, and occupying the different departments of social life.

"His benevolent heart delighted to represent to itself the students under his direction usefully and honourably discharging the respective duties of their different professions, and some of them, perhaps, filling the most distinguished stations of civil society. With these prospects before him, he constantly directed his public conduct to their attainment. He never suffered his judgment to be warped by prejudice or partiality, or his heart to be seduced by passion or private interest. Those mean and ignoble motives by which many are actuated in the discharge of important trusts, approached not his mind. A certain honourable pride, if pride it may be called, diffused an uniform dignity over the whole of his behaviour. He felt the man degraded by the perversion of public character. His understanding also clearly shewed him even personal advantage attached to such principles and practice, as he adopted from a sense of obligation, and those elevated conceptions of real worth which were so congenial to his soul. He saw, he experienced, esteem, respect, and influence, following in the train of integrity and beneficence; but contempt, disgrace, aversion, and complete insignificance, closely linked to corruption and selfishness. Little minds are seduced and overpowered by selfish considerations, because they have not the capacity to look beyond the present advantage, and to extend to the misery that stands on the other side of it. The same circumstance that betrays the perversity of their hearts, also evinces the weakness of their judgments.

"His reputation as a writer is as extensive as the present intercourse of letters; not confined to his own country, but spread through every civilized nation. In his literary pursuits, he aimed not, as is very often the case, with men of distinguished literary abilities, merely at establishing his own celebrity, or increasing his fortune; but had chiefly at heart the defence of the great cause of Religion, or the elucidation of her dictates.

"At an early period he entered the lists as a champion for Christianity against one of its acutest opponents. He not only triumphantly refuted his arguments, but even conciliated his respect by the handsome and dexterous manner in which his defence was conducted. While he refuted the infidel, he spared the man, and exhibited the uncommon spectacle of a polemical writer possessing all the moderation of a Christian. But while he defended Christianity against its enemies, he was desirous of contributing his endeavours to increase, among its professors, the knowledge of the sacred writings. Accordingly, in the latter part of his life, he favoured the world with a work, the fruit of copious erudition, of unwearied application for almost thirty years, and of a clear and comprehensive judgment. We have only to regret, that the other writings of the New Testament have not been elucidated by the same pen that translated the Gospels. Nor were his literary merits confined to theology, and the studies more immediately connected with it. Philosophy, and the fine arts, are also indebted to his genius and labours; and in him the polite scholar was eminently joined to the deep and liberal divine.

"Political principles will always be much affected by general character. This was also the case with Dr Campbell. In politics, he maintained that moderation which is the surest criterion of truth and rectitude, and was equally distant from those extremes into which men are so apt to run in great political questions. He cherished that patriotism which consists in wishing and endeavouring to promote, the greatest happiness of his country, and is always subordinate to universal benevolence. Firmly attached to the British constitution, he was animated with that genuine love of liberty which it inspires and invigorates. He was equally averse to despotism and to popular anarchy; the two evils into which political parties are so frequently hurried, to the destruction of all that is valuable to government. Party-spirit, of whatever description, he considered as having an unhappy tendency to pervert, to the most pernicious purposes, the best principles of the human mind, and

and to clothe the most iniquitous actions with the most specious appearances. Although tenacious of those sentiments, whether in religion or politics, which he was convinced to be rational and just, he never suffered mere difference of opinion to impair his good will, to obstruct his good offices, or to cloud the cheerfulness of conversation. His own conversation was enlivened by a vein of the most agreeable pleasantry."

CAMPBELTOWN, a parliament town of Argyleshire in Scotland, seated on the eastern shore of the peninsula of Kintyre or Cantyre, of which it is the capital. It hath a good harbour; and is now a very considerable place, though within these 50 years only a petty fishing town. It has in fact been created by the fishery: for it was appointed the place of rendezvous for the busses; and above 260 have been seen in the harbour at once. The inhabitants amounted to 6000 in 1811. W. Long. 5. 10. N. Lat. 54.

CAMPDEN, a small town of Gloucestershire in England, containing 1214 inhabitants in 1811. It gives title of Viscount, by courtesy, to the earl of Gainsborough, his son. W. Long. 1. 50. N. Lat. 52.

CAMPEACHY, a town of Mexico in South America, seated on the east coast of a bay of the same name, on the west of the province of Yucatan. It is defended by a good wall and strong forts; but is neither so rich, nor carries on such a trade, as formerly; it having been the port for the sale of logwood, the place where it is cut being about 30 miles distant. It was taken by the English in 1596; by the Bucaneers in 1678; and by the Flibusters of St Domingo in 1685, who set it on fire and blew up the citadel. W. Long. 93. 7. N. Lat. 19. 20.

Campeachy-Wood. See Hæmatoxylum, Botany *Index.*

CAMPEN, a strong town in Overyssel in the United Provinces. It hath a citadel and a harbour; but the latter is almost choked up with sand. It was taken by the Dutch in 1578, and by the French in 1672. E. Long. 5. 35. N. Lat. 52. 38.

CAMPER, Peter, an eminent Dutch writer on medicine and physiology. See Supplement.

CAMPESTRE, in antiquity, a sort of cover for the privities, worn by the Roman soldiers in their field exercises; being girt under the navel, and hanging down to the knees. The name is supposed to be formed from *campus*, the field or place where the Roman soldiers performed their exercises.

CAMPHORA, or Camphire, a solid concrete substance extracted from the wood of the laurus camphora. See Chemistry, and Materia Medica *Index.*

Pure camphire is very white, pellucid, somewhat unctuous to the touch; of a bitterish aromatic taste, yet accompanied with a sense of coolness; of a very fragrant smell, somewhat like that of rosemary, but much stronger. It has been very long esteemed one of the most efficacious diaphoretics; and has been celebrated in fevers, malignant and epidemical distempers. In deliria, also, where opiates could not procure sleep, but rather aggravated the symptoms, this medicine has often been observed to procure it. All these effects, however, Dr Cullen attributes to its sedative property, and denies that camphire has any other medicinal vir-

tues than those of an antispasmodic and sedative. He allows it to be very powerful, and capable of doing much good or much harm. From experiments made on different brute creatures, camphire appears to be poisonous to every one of them. In some it produced sleep followed by death, without any other symptom. In others, before death, they were awakened into convulsions and rage. It seems, too, to act chiefly on the stomach; for an entire piece swallowed, produced the above-mentioned effects with very little diminution of weight.

CAMPHUYSEN, Dirk Theodore Raphael, an eminent painter, was born at Gorcum in 1586. He learned the art of painting from Diederic Govertze; and by a studious application to it, he very soon not only equalled, but far surpassed his master. He had an uncommon genius, and studied nature with care, judgment, and assiduity. His subjects were landscapes, mostly small, with ruinous buildings, huts of peasants, or views of villages on the banks of rivers, with boats and hoys, and generally he represented them by moonlight. His pencil is remarkably tender and soft, his colouring true nature and very transparent, and his expertness in perspective is seen in the proportional distances of his objects, which are excellently contrived, and have a surprising degree of nature and truth. As he left off painting at an age when others are scarcely qualified to commence artists, few of his works are to be met with, and they bring considerable prices: as they cannot but give pleasure to the eye of every observer. He painted his pictures with a thin body of colour, but they are handled with singular neatness and spirit. He practised in his profession only till he was 18 years of age, and being then recommended as a tutor to the sons of the Lord of Nieuport, he undertook the employment, and discharged it with so much credit, that he was appointed secretary to that nobleman. He excelled in drawing with a pen; and the designs which he finished in that manner are exceedingly valued.

CAMPIAN, Edmund, an English Jesuit, was born at London, of indigent parents, in the year 1540, and educated at Christ's hospital, where he had the honour to speak an oration before Queen Mary on her accession to the throne. He was admitted a scholar of St John's college in Oxford at its foundation, and took the degree of master of arts in 1564. About the same time he was ordained by a bishop of the church of England, and became an eloquent Protestant preacher. In 1566, when Queen Elizabeth was entertained by the university of Oxford, he spoke an elegant oration before her majesty, and was also respondent in the philosophy act in St Mary's church. In 1568, he was junior proctor of the university. In the following year, he went over to Ireland, where he wrote a history of that kingdom, and turned Papist; but being found rather too assiduous in persuading others to follow his example, he was committed to prison. He soon, however, found means to make his escape. He landed in England in 1571; and thence proceeded to Douay in Flanders, where he publicly recanted his former heresy, and was created bachelor of divinity. He went soon after to Rome, where, in 1573, he was admitted of the society of Jesus, and was sent by the general of that order to Vienna, where he wrote his tragedy called *Nectar et Ambrosia*, which was acted before the emperor with great applause.

From Vienna he went to Prague in Bohemia, where he resided in the Jesuits college about six years, and then returned to Rome. From thence, in 1580, he was sent by Pope Gregory XIII. with the celebrated Father Parsons, to convert the people of England. From Pitts we learn, that, some time before, several English priests, inspired by the Holy Ghost, had undertaken to convert their countrymen; that 80 of these from foreign seminaries, besides several others who, by God's grace, had been converted in England, were actually engaged in the pious work with great success; that some of them had suffered imprisonment, chains, tortures, and ignominious death, with becoming constancy and resolution; but seeing at last that the labour was abundant, and the labourers few, they solicited the assistance of the Jesuits, requesting, that though not early in the morning, they would at least in the third, sixth, or ninth hour, send labourers into the Lord's vineyard. In consequence of this solicitation, the above two were sent to England. They arrived in an evil hour for Campian, at Dover; and were next day joyfully received by their friends at London. He had not been long in England, before Walsingham, the secretary of state, being informed of his uncommon assiduity, in the cause of the church of Rome, used every means in his power to have him apprehended, but for a long time without success. However, he was at last taken by one Elliot, a noted *priest-taker*, who found him in the house of Edward Yates, Esq. at Lyford, in Berkshire, and conducted him in triumph to London, with a paper on his hat, on which was written *Campian the Jesuit*. He was imprisoned in the Tower, where Wood says, "he did undergo many examinations, abuses, wrackings, tortures:" *exquisitissimis cruciatibus tortus*, says Pitts. It is hoped, for the credit of our reformers, this torturing part of the story is not true. The poor wretch, however, was condemned on the statute 25 Ed. III. for high treason; and butchered at Tyburn, with two or three of his fraternity. Howsoever criminal in the eye of the law, or of the English gospel, might be the zeal of this Jesuit for the salvation of the poor heretics of this kingdom, biographers of each persuasion unite in giving him a great and amiable character. "All writers (says the Oxford antiquary), whether Protestants or Popish, say, that he was a man of admirable parts; an elegant orator, a subtile philosopher and disputant, and an exact preacher whether in English or the Latin tongue; of a sweet disposition, and a well-polished man." Fuller, in his church history, says, "he was of a sweet nature, constantly carrying about him the charms of a plausible behaviour, of a fluent tongue, and good parts." His History of Ireland, in two books, was written in 1570; and published, by Sir James Ware, from a manuscript in the Cotton library, Dublin, 1633, folio. He wrote also *Chronologia Universalis*, a very learned work, and various other tracts.

CAMPICURSIO, in the ancient military art, a march of armed men for several miles, from and back again to the camp, to instruct them in the military pace. This exercise was nearly akin to the *decursio*, from which it only differed, in that the latter was performed by horsemen, the former also by foot.

CAMPIDOCTORES, or CAMPIDUCTORES, in the Roman army, were officers who instructed the soldiery in the discipline and exercises of war, and the art of handling their weapons to advantage. These are also sometimes called *campigeni* and *armidoctores*.

CAMPIDUCTOR, in middle-age writers, signifies the leader or commander of an army, or party.

CAMPION, in *Botany*, the English name of the LYCHNIS.

CAMPION, a town of the kingdom of Tangut in Tartary. It was formerly remarkable for being a place through which the caravans passed in the road from Bukharia to China. E. Long. 104. 53. N. Lat. 40. 25.

CAMPISTRON, a celebrated French dramatic author, was born in 1656. Racine directed his poetical talents to the theatre, and assisted him in his first pieces. He died in 1723.

CAMPITÆ, in church history, an appellation given to the Donatists, on account of their assembling in the fields for want of churches. For a similar reason, they were also denominated *Montenses* and *Rupitani*.

CAMPLI, or CAMPOLI, a town of Italy, in the kingdom of Naples, and in the farther Abruzzo, situated in E. Long. 13. 55. N. Lat. 42. 38.

CAMPOMANES, D. P. R. COMTE DE, a Spanish political writer. See SUPPLEMENT.

CAMPREDON, a town of Catalonia in Spain, seated at the foot of the Pyrenean mountains. The fortifications were demolished by the French in 1691. W. Long. 1. 56. N. Lat. 42. 20.

CAMPS, FRANCIS DE, abbot of Notre Dame at Sigi, was born at Amiens in 1643; and distinguished himself by his knowledge of medals, by writing a history of France, and several other works. He died at Paris in 1723.

CAMPVERE. See VEER.

CAMPUS, in antiquity, a field or vacant plain in a city, not built upon, left vacant on account of shows, combats, exercises, or other uses of the citizens.

CAMPUS Maii, in ancient customs, an anniversary assembly of our ancestors held on May-day, when they confederated together for the defence of the kingdom against all its enemies.

CAMPUS Martius, a large plain in the suburbs of ancient Rome, lying between the Quirinal and Capitoline mounts and the Tiber; thus called because consecrated to the god Mars, and set apart for military sports and exercises to which the Roman youth were trained, as the use and handling of arms, and all manner of feats of activity. Here were the races run, either with chariots or single horses; here also stood the villa publica, or palace for the reception of ambassadors, who were not permitted to enter the city. Many of the public comitia were held in the same field, part of which was for that purpose cantoned out. The place was also nobly decorated with statues, arches, columns, porticoes, and the like structures.

CAMPUS Sceleratus, a place without the walls of ancient Rome, where the Vestals who had violated their vows of virginity were buried alive.

CAMUL, a town of Asia, on the eastern extremity of the kingdom of Cialus, on the frontiers of Tangut. E. Long. 98. 5. N. Lat. 37. 15.

CAMUS, a person with a low flat nose, hollowed in the middle.

The

The Tartars are great admirers of camus beauties. Rubruquis observes, that the wife of the great Jenghiz Khan, a celebrated beauty, had only two holes for a nose.

Camus, *John Peter*, a French prelate, born in 1582. He was author of a number of pious romances (the taste of his time), and other theological works, to the amount of 200 vols. His definition of politics is remarkable; *Ars non tam regendi, quam fallendi, homines*: "The art not so much of governing, as of deceiving mankind." He died in 1652.

CAN, in the sea-language, as can-pump, a vessel wherewith seamen pour water into the pump to make it go.

Can-Buoy. See Buoy.

Can-Hook, an instrument used to sling a cask by the end of the staves: it is formed by fixing a broad and flat hook at each end of a short rope; and the tackle by which the cask so slung may be hoisted or lowered, is hooked to the middle of the rope.

CANA, in *Ancient Geography*, a town on the confines of the Upper and Lower Galilee: memorable for the turning water into wine (John). The birthplace of Simeon, called the *Canaanite* from this place, and of Nathanael.

CANAAN, the fourth son of Ham. The irreverence of Ham towards his father Noah is recorded in Gen. ix. Upon that occasion the patriarch cursed him in a branch of his posterity: "Cursed," says he, "be Canaan; a servant of servants shall he be unto his brethren." This curse being pronounced, not against Ham the immediate transgressor, but against his son, who does not appear, from the words of Moses, to have been anywise concerned in the crime, hath occasioned several conjectures. Some have believed that Noah cursed Canaan, because he could not well have cursed Ham himself, whom God had not long before blessed. Others think Moses's chief intent in recording this prediction was to raise the spirits of the Israelites, then entering on a terrible war with the children of Canaan, by the assurance, that, in consequence of the curse, that people were destined by God to be subdued by them. For the opinion of those who imagine all Ham's race were here accursed, seems repugnant to the plain words of Scripture, which confines the malediction to Canaan and his posterity: and is also contrary to fact. Indeed the prophecy of Noah that "Canaan should be a servant of servants to his brethren," seems to have been wholly completed in him. It was completed with regard to Shem, not only in that a considerable part of the seven nations of the Canaanites were made slaves to the Israelites, when they took possession of their land, as part of the remainder of them were afterwards enslaved by Solomon; but also by the subsequent expeditions of the Assyrians and Persians, who were both descended from Shem; and under whom the Canaanites suffered subjection, as well as the Israelites; not to mention the conquest of part of Canaan by the Elamites, or Persians, under Chedorlaomer, prior to them all. With regard to Japhet, we find a completion of the prophecy, in the successive conquests of the Greeks and Romans in Palestine and Phœnicia, where the Canaanites were settled; but especially in the total subversion of the Carthaginian power by the Romans; besides some invasions of the northern nations, as the posterity of Thogarma and Magog; wherein many of them, probably, were carried away captive.

The posterity of Canaan were very numerous. His eldest son was Sidon, who at least founded and peopled the city of Sidon, and was the father of the Sidonians and Phœnicians. Canaan had besides ten sons, who were the fathers of so many peoples, dwelling in Palestine, and in part of Syria; namely, the Hittites, the Jebusites, the Amorites, the Girgasites, the Hivites, the Arkites, the Sinites, the Arvadites, the Zemarites, and Hamathites.

Land of Canaan, the country so named from Canaan the son of Ham. It lies between the Mediterranean sea and the mountains of Arabia, and extends from Egypt to Phœnicia. It is bounded to the east by the mountains of Arabia; to the south by the wilderness of Paran, Idumea, and Egypt; to the west by the Mediterranean, called in Hebrew the Great Sea; to the north by the mountains of Libanus. Its length from the city of Dan (since called Cæsarea Philippi, or Paneadis, which stands at the foot of these mountains) to Beersheba, is about 70 leagues; and its breadth from the Mediterranean sea to the eastern borders, is in some places 30. This country, which was first called Canaan, from Canaan the son of Ham, whose posterity possessed it, was afterwards called Palestine, from the people which the Hebrews call Philistines, and the Greeks and Romans corruptly Palestines, who inhabited the sea coasts, and were first known to them. It likewise had the name of the *Land of Promise*, from the promise God made to Abraham of giving it to him; that of the *Land of Israel*, from the Israelites having made themselves masters of it; that of *Judah*, from the tribe of Judah, which was the most considerable of the twelve; and lastly, the happiness it had of being sanctified by the presence, actions, miracles, and death of Jesus Christ, has given it the name of the *Holy Land*, which it retains to this day.

The first inhabitants of this land therefore were the Canaanites, who were descended from Canaan, and the eleven sons of that patriarch. Here they multiplied extremely: trade and war were their first occupations; these gave rise to their riches, and the several colonies scattered by them over almost all the islands and maritime provinces of the Mediterranean. The measure of their idolatry and abominations was completed, when God delivered their country into the hands of the Israelites. In St Athanasius's time, the Africans still said they were descended from the Canaanites; and it is said, that the Punic tongue was almost entirely the same with the Canaanitish and Hebrew language. The colonies which Cadmus carried into Thebes in Bœotia, and his brother Cilix into Cilicia, came from the stock of Canaan. The isles of Sicily, Sardinia, Malta, Cyprus, Corfu, Majorca and Minorca, Gades and Ebusus, are thought to have been peopled by the Canaanites. Bochart, in his large work entitled *Canaan*, has set all this matter in a good light.

Many of the old inhabitants of the north-west of the land of Canaan, however, particularly on the coast or territories of Tyre and Sidon, were not driven out by the children of Israel, whence this tract seems to have retained the name of Canaan a great while after those

Canaan || Canada.

those other parts of the country, which were better inhabited by the Israelites, had lost the said name. The Greeks called this tract, inhabited by the old Canaanites along the Mediterranean sea, Phœnicia; the more inland parts, as being inhabited partly by Canaanites, and partly by Syrians, Syrophœnicia: and hence the woman said by St Matthew (xv. 22.) to be a woman of Canaan, whose daughter Jesus cured, is said by St Mark (vii. 26.) to be a Syrophœnician by nation as she was a Greek by religion and language.

CANABAC, an island which lies contiguous to BULAM on the western coast of Africa, and is inhabited by a fierce people, governed by two kings or chiefs. It would appear that the Canabacs had been very troublesome to their neighbours; for the inhabitants of some other islands in that cluster rejoiced at the settlement of the English in Bulam, hoping to find in them a defence against the usurpations of this people.

CANADA, an extensive country of North America, bounded on the north-east by the gulf of St Lawrence, and St John's river; on the south-west, by the great line of lakes, Erie, Huron, and Superior; on the south, by the province of Nova Scotia, and the territories of the United States; and on the north-west, by Indian nations. Under the name of *Canada*, the French comprehended a very large territory; taking into their claim part of New Scotland, New England, and New York on the east; and extending it on the west as far as the Pacific ocean. That part, however, which is occupied or claimed by the British at present lies between 61 and 92 of west longitude, and 42 and 52 of north latitude, and is divided into Upper and Lower Canada. The climate is not very different from that of the United States; but as it is much further from the sea, and more to the northward, than most of those provinces, it has a much severer winter, though the air is generally clear; and, like most of those American tracts that do not lie too far to the northward, the summers are very hot, and exceeding pleasant. The soil in general is very good, and in many parts extremely fertile; producing many different sorts of grains, fruits, and vegetables. The meadow grounds, which are well watered, yield excellent grass, and breed vast numbers of great and small cattle. The uncultivated parts are a continued wood, composed of prodigiously large and lofty tress, of which there is such a variety of species, that even of those who have taken most pains to know them, there is not perhaps one that can tell half the number. Canada produces, among others, two sorts of pines, the white and the red; four sorts of firs; two sorts of cedar and oak, the white and the red; the male and female maple; three sorts of ash trees, the free, the mungrel, and the bastard; three sorts of walnut-trees, the hard, the soft, and the smooth; vast numbers of beech-trees and white wood; white and red elms, and poplars. The Indians hollow the red elms into canoes, some of which made out of one piece will contain 20 persons: others are made of the bark; the different pieces of which they sew together with the inner rind, and daub over the seams with pitch, or rather a bituminous matter resembling pitch, to prevent their leaking; the ribs of these canoes are made of boughs of trees. In the hollow elms, the bears and wild cats take up their lodging from November to April. The country produces also a vast variety of other vegetables, particularly tobacco, which thrives well. Near Quebec is a fine lead mine, and many excellent ones of iron have been discovered. It hath also been reported that silver is found in some of the mountains. The rivers are extremely numerous, and many of them very large and deep. The principal are, the Ouattauais, St John's, Seguinay, Despaires, and Trois Rivieres; but all these are swallowed up by the great river St Lawrence. This river issues from Lake Ontario; and, taking its course north-east, washes Montreal, where it receives the Ouattauais, and forms many fertile islands. It continues the same course, and meets the tide upwards of 400 miles from the sea, where it is navigable for large vessels; and below Quebec, 320 miles from the sea, it becomes so broad and so deep, that ships of the line contributed in the last war to reduce that city. After receiving in its progress innumerable streams, it at last falls into the ocean at Cape Rosiers, where it is 90 miles broad, and where the cold is intense and the sea boisterous. The most considerable settlements are upon the river and its smaller branches, and upon Lake Ontario, though a few settlers have fixed themselves also on Lake Erie, and the fur traders have stations far beyond Lake Superior. Here are five lakes, the least of which is of greater extent than the fresh-water lakes to be found in any other part of the world: these are Lake Ontario, which is not less than 200 leagues in circumference; Erie, or Oswego, longer, but not so broad, is about the same extent. That of the Huron spreads greatly in width, and is about 300 leagues in circuit; as also is that of Michigan, though, like Lake Erie, it is rather long, and comparatively narrow. But Lake Superior is larger than any of these, being not less than 500 leagues in circumference. All these are navigable by any vessels, and they all communicate with each other; but the passage between Erie and Ontario is interrupted by a most stupendous fall or cataract, called the *falls of Niagara* *. The river St Lawrence, as already observed, is the outlet of these lakes, by which they discharge themselves into the ocean. The French built forts at these several straits, by which the lakes communicate with one another, and on that where the last of them communicates with the river. By these, while the country was in their possession, they effectually secured to themselves the trade of the lakes, and preserved an influence over all the Indian nations that lie near them.

* See Niagara.

The most curious and interesting part of the natural history of Canada is the animals there produced. These are stags, elks, deer, bears, foxes, martens, wild cats, ferrets, weasels, large squirrels of a grayish hue, hares and rabbits. The southern parts, in particular, breed great numbers of wild bulls, divers sorts of roebucks, goats, wolves, &c. The marshes, lakes, and pools, with which this country abounds, swarm with otters and beavers, of which the white are highly valued, as well as the right black kind. A vast variety of birds are also to be found in the woods; and the river St Lawrence abounds with such quantities of fish, that it is affirmed by some writers, this would be a more profitable article than even the fur-trade.—There are

in

in Canada a multitude of different Indian tribes: but these are observed to decrease in number where the Europeans are most numerous; owing chiefly to the immoderate use of spirituous liquors, of which they are excessively fond. Their manners and way of living we have already particularly described*. The principal towns are Quebec, Trois Rivieres, Montreal, and York. The commodities required by the Canadians from Europe are, wine, or rather rum; cloths, chiefly coarse; linens, and wrought iron. The Indian trade requires rum, tobacco, a sort of duffle blankets, guns, powder, balls, and flints, kettles, hatchets, toys, and trinkets of all kinds. While the country was in possession of the French, the Indians supplied them with poultry; and the French had traders, who, like the original inhabitants, traversed the vast lakes and rivers in canoes, with incredible industry and patience, carrying their goods into the remotest parts of America, and among nations entirely unknown to us. These again brought the furs, &c. home to them, as the Indians were thereby habituated to trade with them. For this purpose, people from all parts, even from the distance of 1000 miles, came to the French fair at Montreal, which began in June, and sometimes lasted three months. Since Canada came into the possession of Great Britain, its progress has been extremely rapid. Its population in 1759, when the French lost it, amounted to 70,000. In 1814 the inhabitants of Lower Canada amounted to 335,000, and those of Upper Canada to 95,000; but a part of this increase may be attributed to the great influx of emigrants from Britain. The agriculture and commerce of Canada have also been vastly extended. In 1769 the value of the produce exported amounted to 163,105l. and it employed 70 vessels belonging to Britain and the colonies. But in 1812 the value of the goods imported into Britain, from Canada, Nova Scotia, and Newfoundland, amounted to 1,909,689l. Since heavy duties were laid on Baltic timber, a vast quantity has been imported from Canada; but its quality is found to be very inferior to what is procured from Norway.

* [See] America.

The greatest obstruction to the trade of Canada arises from the rigour of the climate. This is so excessive from December to April, that the broadest rivers are frozen over, and the snow lies commonly from four to six feet deep on the ground, even in those parts of the country which lie three degrees south of London, and in the temperate latitude of Paris. Our communication therefore with Canada, and the immense regions beyond it, will always be interrupted during the winter season, until roads are formed that can be travelled without danger from the Indians. For these savage people often commit hostilities against us without any previous notice; and frequently, without any provocation, they commit the most horrid ravages for a long time with impunity.

Canada was undoubtedly discovered by Sebastian Cabot, the famous Italian adventurer, who sailed under a commission from Henry VII. But though the English monarch did not think proper to make any use of this discovery, the French quickly attempted it; we have an account of their fishing for cod on the banks of Newfoundland, and along the sea-coast of Canada, in the beginning of the 16th century. About the year 1506, one Denys, a Frenchman, drew a map of the gulf of St Lawrence; and two years after, one Aubort, a shipmaster of Dieppe, carried over to France some of the natives of Canada. As the new country, however, did not promise the same amazing quantities of gold and silver produced by Mexico and Peru, the French for some years neglected the discovery. At last, in the year 1523, Francis I. a sensible and enterprising prince, sent four ships, under the command of Verazani, a Florentine, to prosecute discoveries in that country. The particulars of this man's first expedition are not known. All we can learn is, that he returned to France, and next year he undertook a second. As he approached the coast, he met with a violent storm; however, he came so near as to perceive the natives on the shore, making friendly signs to him to land. This being found impracticable by reason of the surf upon the coast, one of the sailors threw himself into the sea; but, endeavouring to swim back to the ship, a surge threw him on shore without signs of life. He was, however, treated by the natives with such care and humanity, that he recovered his strength, and was allowed to swim back to the ship, which immediately returned to France. This is all we know of Verazani's second expedition. He undertook a third, but was no more heard of, and it is thought that he and all his company perished before he could form any colony. In 1534, one Jaques Cartier of St Maloes set sail under a commission from the French king, and on the 10th of May arrived at Cape Bonavista in Newfoundland. He had with him two small ships besides the one in which he sailed. He cruised along the coast of that island, on which he discovered inhabitants, probably the Eskimaux. He landed in several places along the coast of the gulf, and took possession of the country in the king's name. On his return, he was again sent out with a commission, and a pretty large force; he returned in 1535, and passed the winter at St Croix; but the season proved so severe, that he and his companions must have died of the scurvy, had they not, by the advice of the natives, made use of the decoction of the tops and bark of the white pines. As Cartier, however, could produce neither gold nor silver, all that he could say about the utility of the settlement was disregarded; and in 1540, he was obliged to become pilot to one M. Roberval, who was by the French king appointed viceroy of Canada, and who sailed from France with five vessels. Arriving at the gulf of St Lawrence, they built a fort; and Cartier was left to command the garrison in it, while Roberval returned to France for additional recruits to his new settlement. At last, having embarked in 1549, with a great number of adventurers, neither he nor any of his followers were heard of more.

This fatal accident so greatly discouraged the court of France, that for 50 years, no measures were taken for supplying with necessaries the settlers that were left. At last, Henry IV. appointed the marquis de la Roche lieutenant-general of Canada and the neighbouring countries. In 1598, he landed on the isle of Sable, which he absurdly thought to be a proper place for a settlement, though it was without any port, and without product except briars. Here he left about 40 malefactors, the refuse of the French jails. After cruizing for

Canada, Canal.

for some time on the coast of Nova Scotia, without being able to relieve these poor wretches, he returned to France, where he died of a broken heart. His colony must have perished, had not a French ship been wrecked on the island, and a few sheep driven upon it at the same time. With the boards of the ship they erected huts; and while the sheep lasted they lived on them, feeding afterwards on fish. Their clothes wearing out, they made coats of seal-skin; and in this miserable condition they spent seven years, when Henry ordered them to be brought to France. The king had the curiosity to see them in their seal-skin dresses, and was so moved with their appearance, that he forgave them all their offences, and gave each of them 50 crowns to begin the world anew.

In 1600, one Chauvin, a commander in the French navy, attended by a merchant of St Malo, called *Pontgrave*, made a voyage to Canada, from whence he returned with a very profitable quantity of furs. Next year he repeated the voyage with the same good fortune, but died while he was preparing for a third. The many specimens of profit to be made by the Canadian trade, at last induced the public to think favourably of it. An armament was equipped, and the command of it given to Pontgrave, with powers to extend his discoveries up the river St Laurence. He sailed in 1603, having in his company Samuel Champlain, who had been a captain in the navy, and was a man of parts and spirit. It was not, however, till the year 1608, that the colony was fully established. This was accomplished by founding the city of Quebec, which from that time commenced the capital of all the settlements in Canada. The colony, however, for many years continued in a low way, and was often in danger of being totally exterminated by the Indians. As the particulars of these wars, however, could neither be entertaining, nor indeed intelligible to many of our readers, we choose to omit them, and in general observe, that the French not only concluded a permanent peace with the Indians, but so much ingratiated themselves with them, that they could with the greatest ease prevail upon them at any time to murder and scalp the English in their settlements. These practices had a considerable share in bringing about the last war with France, when the whole country was conquered by the British in 1761. The most remarkable transaction in this conquest was the siege of Quebec. See QUEBEC; see also CANADA, SUPPLEMENT. And for the transactions here during the late American war, see AMERICA (*United States of*).

CANAL *of* COMMUNICATION, an artifical cut in the ground, supplied with water from rivers, springs, &c. in order to make a navigable communication betwixt one place and another.

The particular operations necessary for making artificial navigations depend upon a number of circumstances. The situation of the ground; the vicinity or connection with rivers; the ease or difficulty with which a proper quantity of water can be obtained: these and many other circumstances necessarily produce great variety in the structure of artificial navigations, and augment or diminish the labour and expence of executing them. When the ground is naturally level, and unconnected with rivers, the execution is easy, and the navigation is not liable to be disturbed with floods; but, when the ground rises and falls, and cannot be reduced to a level, artificial methods of raising and lowering vessels must be employed; which likewise vary according to circumstances.

A kind of temporary sluices are sometimes employed for raising boats over falls or shoals in rivers by a very simple operation. Two posts or pillars of mason-work, with grooves, are fixed, one on each bank of the river, at some distance below the shoal. The boat having passed these posts, planks are let down across the river by pulleys into the grooves, by which the water is dammed up to a proper height for allowing the boat to pass up the river over the shoal.

The Dutch and Flemings at this day sometimes, when obstructed by cascades, form an inclined plane or rolling-bridge upon dry land, alongst which their vessels are drawn from the river below the cascade into the river above it. This, it is said, was the only method employed by the ancients, and is still used by the Chinese, who are said to be entirely ignorant of the nature and utility of locks. These rolling-bridges consist of a number of cylindrical rollers which turn easily on pivots, and a mill is commonly built near by, so that the same machinery may serve the double purpose of working the mill and drawing up vessels.

A LOCK is a bason placed lengthwise in a river or canal, lined with walls of masonry on each side, and terminated by two gates, placed where there is a cascade or natural fall of the country; and so constructed, that the bason being filled with water by an upper sluice to the level of the waters above, a vessel may ascend through the upper gate; or the water in the lock being reduced to the level of the water at the bottom of the cascade, the vessel may descend through the lower gate; for when the waters are brought to a level on either side, the gate on that side may be easily opened. But, as the lower gate is strained in proportion to the depth of water it supports, when the perpendicular height of the water exceeds 12 or 13 feet, more locks than one become necessary. Thus, if the fall be 17 feet, two locks are required, each having $8\frac{1}{2}$ feet fall; and if the fall be 26 feet, three locks are necessary, each having 8 feet 8 inches fall. The side walls of a lock ought to be very strong. Where the natural foundation is bad, they should be founded on piles and platforms of wood: they should likewise slope outwards, in order to resist the pressure of the earth from behind.

Plate CXXXIV. fig. 1. A perspective view of part of a canal: the vessel L, within the lock AC.—Fig. 2. Section of an open lock; the vessel L about to enter.—Fig. 3. Section of a lock full of water; the vessel L raised to a level with the water in the superior canal.—Fig. 4. Ground section of a lock. L, a vessel in the inferior canal. C, the under gate. A, the upper gate. GH, a subterraneous passage for letting water from the superior canal run into the lock. KF, a subterraneous passage for water from the lock to the inferior canal.

X and Y, (fig. 1.) are the two floodgates, each of which consists of two leaves, resting upon one another, so as to form an obtuse angle, in order the better to resist the pressure of the water. The first (X) prevents the water of the superior canal from falling into the lock; and the second (Y) dams up and sustains

Canal.

stains the water in the lock. These flood-gates ought to be very strong, and to turn freely upon their hinges. In order to make them open and shut with ease, each leaf is furnished with a long lever A *b*, A *b*; C *b*, C *b*. They should be made very tight and close, that as little water as possible may be lost.

By the subterraneous passage GH (fig. 2, 3, and 4.) which descends obliquely, by opening the sluice G, the water is let down from the superior canal D into the lock, where it is stopt and retained by the gate C when shut, till the water in the lock comes to be on a level with the water in the superior canal D; as represented, fig. 3. When, on the other hand, the water contained by the lock is to be let out, the passage GH must be shut by letting down the sluice G; the gate A must be also shut, and the passage KF opened by raising the sluice K: a free passage being thus given to the water, it descends through KF, into the inferior canal, until the water in the lock is on a level with the water in the inferior canal B; as represented, fig. 2.

Now, let it be required to raise the vessel L (fig. 2.) from the inferior canal B to the superior one D; if the lock happens to be full of water, the sluice G must be shut, and also the gate A, and the sluice K opened, so that the water in the lock may run out till it is on a level with the water in the inferior canal B. When the water in the lock comes to be on a level with the water at B, the leaves of the gate C are opened by the levers C *b*, which is easily performed, the water on each side of the gate being in eqnilibrio; the vessel then sails into the lock. After this the gate C and the sluice K are shut, and the sluice G opened, in order to fill the lock, till the water in the lock, and consequently the vessel, be upon a level with the water in the superior canal D; as is represented in fig. 3. The gate A is then opened, and the vessel passes into the canal D.

Again let it be required to make a vessel descend from the canal D into the inferior canal B. If the lock is empty, as in fig. 2. the gate C and sluice K must be shut, and the upper sluice G opened, so that the water in the lock may rise to a level with the water in the upper canal D. Then open the gate A, and let the vessel pass through into the lock. Shut the gate A and the sluice G; then open the slnice K, till the water in the lock be on a level with the water in the inferior canal; then the gate C is opened, and the vessel passes along into the canal B, as was required.

Scarcity of water becomes a very serious inconvenience to navigation in those places where locks are necessary, as without a sufficient supply, it must be frequently interrnpted. To save water, therefore, has been an important consideration in the construction of locks. Varions attempts have been made for this purpose. We shall here give an account of one which has been proposed by Mr Playfair, architect in London. "The nature and principle of this manner of saving water (says the inventor), consists in letting the water which has served to raise or fall a boat or barge from the lock, pass into reservoirs or cisterns, whose apertures of communication with the lock are upon different levels, and which may be placed or constructed at the side or sides of the lock with much they communicate, or in any other contiguous situation that circumstances may render eligible; which apertures may be opened or shut at plesure, so that the water may pass from the lock to each reservoir of the canal, or from each reservoir to the lock, in the following manner: The water which fills the lock, when a boat is to ascend or descend, instead of being passed immediately into the lower part of the canal, is let pass into these cisterns or reservoirs, upon different levels; then their communications with the lock being shut, they remain full until another vessel is wanted to pass; then, again, the cisterns are emptied into the lock, which is thereby nearly filled, so that only the remainder which is not filled is supplied from the higher part of the canal. Each of these cisterns must have a surface not less than that of the lock, and must contain half as much water as is meant to be expended for the passing of each vessel. The cistern the most elevated is placed twice its own depth (measuring by the aperture, or communicating opening of the cisterns) under the level of the water in the higher part of the canal. The second cistern is placed once its own depth under the first, and so on are the others, to the lowest; which last is placed once its own depth above the level of the water in the lower part of the canal. The apertures of the intermediate cisterns, whatever their number may be, must all be equally divided into different levels; the snrface of the water in the one being always on the level of the bottom of the apertnre of the çistern which is immediately above. As an example of the manner and rule for constructing these cisterns, suppose that a lock is to be constructed twelve feet deep, that is, that the vessel may ascend or descend twelve feet in passing. Suppose the lock sixty feet long and six feet wide, the quantity of water required to fill the lock, and to pass a boat, is 4320 cubic feet; and suppose that, in calculating the quantity of water that can be procured for supplying the canal, after allowing for waste, it is found (according to the number of boats that may be expected to pass) that there will not be above 800 cubic feet for each; then it will be necessary to save five sixths of the whole quantity that in the common case would be necessary: to do which ten cisterns must be made (the mode of placing which is expressed in the drawing, fig. 5. Plate CXXXIV.) each of which must be one foot deep, or deeper at pleasure, and each must have a surface of 360 feet square, equal to the surface of the lock. The bottom of the aperture of the lowest cistern must be placed one foot above the level of the water in the lower part of the canal, or eleven feet under the level of the high water; the second cistern must be two feet above the level of the low water; the third three feet, and so on of the others; the bottom of the tenth, or uppermost cistern, being ten feet above the low water, and two feet lower than the high water; and, as each cistern mnst be twelve inches in depth, the surface of the water in the higher cistern will be one foot under the level of the water in the upper part of the canal. The cisterns being thus constructed, when the lock is full, and the boat to be let down, the communications between the lock and the cisterns, which until then have all been shut, are to be opened in the following manner; first, the communication with the higher cistern is opened, which, being at bottom two feet under the level of the water in the lock,

Canal.

lock, is filled to the depth of one foot, the water in the lock descending one foot also at the same time: that communication is then shut, and the communication between the lock and the second cistern is opened; one foot more of the water then passes into that cistern from the lock, and fills it; the opening is then shut: the same is done with the third, fourth, fifth, sixth, seventh, eighth, ninth, and tenth cisterns, one by one, until they are all filled; and, when the tenth, or lowermost cistern, is filled, there remains but two feet depth of water in the lock. The communication between the lock and the lower part of the canal is then opened, and the last two feet depth of water is emptied into the lower part of the canal. By this means, it is evident, that, instead of twelve feet depth of water being let descend into the lower part of the canal, there is only two feet depth that descends, or one-sixth of the whole; therefore, instead of 4320 cubic feet being used, there are only 720 cubic feet used: the remainder of the water in the cisterns being used as follows. When another boat is to mount, the sluices being then shut, and the boat in the lock, the tenth or lowermost cistern is emptied into the lock, which it fills one foot; the communication being then shut, the next lower cistern, or the ninth, is emptied into the lock, which is thereby filled another foot; and so in like manner, all the other cisterns are emptied, one after another, until the higher cistern being emptied, which fills the tenth foot of water in the lock, there remains but two feet of water to fill, which is done from the upper part of the canal, by opening the higher sluice to pass the boat; by that means the same quantity of water descends from the upper part of the canal into the lock, that in the other case descended from the lock into the lower part of the canal; so that, in both cases, the same quantity of water is saved, that is, five-sixths of what would be necessary were there no cisterns. Suppose again that, upon the same canal, and immediately after the twelve feet lock, it would be advantageous to construct one of eighteen feet; then, in order not to use any greater quantity of water, it will be necessary to have sixteen cisterns, upon different levels, communicating with the lock in the same manner. Should, again, a lock of only six feet be wanted, after that of eighteen, then it will only be necessary to have four cisterns on different levels, and so of any other height of lock. The rule is this: for finding the number and size of the cisterns, each cistern being the same in superficies with the lock, its depth must be such as to contain one half the quantity of water meant to be used in the passing of one boat. The depth of the lock, divided by the depth necessary for such a cistern, will give, in all cases, the whole number of cisterns, and two more: deduct the number two, therefore, from the number which you find by dividing the depth of the lock by the depth of one cistern, and you have always the number of cisterns required; which are to be placed upon different levels, according to the rule already given. The above is the principle and manner of using the lock, for saving water in canals, and for enabling engineers to construct locks of different depths upon the same canal, without using more water for the deep locks than for the shallow ones. With regard to the manner of disposing the cisterns, the circumstance of the ground, the declivity, &c. will be the best guide for the engineer."

But even when water is abundant, if the declivity of a country be such as to require numerous locks, navigation suffers great interruption from them. A method by which boats could be raised and lowered with greater facility, or in a shorter time than can be done by means of locks, is still a very desirable object of improvement in inland navigation. For this purpose the inclined plane has been often resorted to, and particularly in China, where water carriage is more generally employed than in any country of Europe. But this method requires very powerful machinery or a great number of hands, which has prevented it from being much practised in this country. Other contrivances to obviate the use of locks have been proposed. Dr Anderson, in his Agricultural Survey of the County of Aberdeen, has described one, of which we shall give an account in his own words. This contrivance, he observes, "in the opinion of very good judges of matters of this sort, to whom the plan has been shewn, has been deemed fully adequate to the purpose of raising and lowering boats of a moderate size, that is, of 20 tons, or downwards; and it is the opinion of most men with whom I have conversed, who are best acquainted with the inland navigations, that a boat of from 10 to 15 tons is better than those of a larger size. When several are wanted to be sent at once, they may be affixed to one another, as many as the towing-horse can conveniently draw. Were boats of this size adopted, and were all the boats on one canal to be of the same dimensions, it would prove a great convenience to a country in a state of beginning improvements; because the expence of such a boat would be so trifling, that every farmer could have one for himself, and might of course make use of it when he pleased, by the aid of his own horse, without being obliged to have any dependence on the time that might suit the convenience of his neighbour; and if two or more boats were going from the same neighbourhood, one horse could serve the whole.

"You are to suppose that fig. 6. Plate CXXXIV. represents a bird's eye view of this simple apparatus, as seen from above. A is supposed to be the upper reach of the canal, and B the lower reach, with the apparatus between the two. This consists of three divisions; the middle one, extending from C to D, is a solid piece of masonry, raised from a firm foundation below the level of the bottom of the second reach; this is again divided into five parts, viz. *d d d*, where the wall rises only to the height of the water in the upper reach, and *e e*, two pillars, raised high enough to support the pivots of a wheel or pulley *g*, placed in the position there marked.

"The second division *h* consists of a wooden coffer, of the same depth nearly as the water in the upper reach, and of a size exactly fitted to contain one of the boats. This communicates directly with the upper reach, and being upon the same plane with it, and so connected with it as to be water-tight, it is evident, from inspection, that nothing can be more easy than to float a boat into this coffer from the upper reach, the part of the wheel that projects over it being at a sufficient height above it, so as to occasion no sort of interruption.

"Third

"Third division. At *i* is represented another coffer, precisely of the same dimensions with the first. But here two sluices, which were open in the former, and only represented by dotted lines, are supposed to be shut, so as to cut off all communication between the water in the canal and that in the coffer. As it was impossible to represent this part of the apparatus on so small a scale, for the sake of illustration it is represented more at large in fig. 9. where A, as before, represents the upper reach of the canal, and *h* one of the coffers. The sluice *k* goes into two cheeks of wood, joined to the masonry of the dam of the canal, so as to fit perfectly close; and the sluice *f* fits, equally close, into cheeks made in the side of the coffer for that purpose; between these two sluices is a small space *o*. The coffer, and this division *o*, are to be snpposed full of water, and it will be easy to see that these sluices may be let down, or drawn up at pleasure, with much facility.

"Fig. 10. represents a perpendicular section of these parts in the same direction as in fig. 9. and in which the same letters represent the same parts.

"Things being thus arranged, you are to suppose the coffer *h* to be suspended, by means of a chain passed over the pulley, and balanced by a weight that is sufficient to counterpoise it, suspended at the opposite end of the chain. Suppose, then, that the counterpoise be made somewhat lighter than the coffer with its contents, and that the line *m n* (fig. 10.) represents a division between the solid sides of the dam of separation, which terminates the upper reach and the wooden coffer, which had been closed only by the pressure of its own weight (being pushed a very little from A towards B, beyond its precise perpendicular swing), and that the joining all round is covered with lists of cloth put upon it for that purpose; it is evident that, so long as the coffer is suspended to this height, the joining must be water-tight; but no sooner is it lowered down a little than this joining opens, the water in the small division *o* is allowed to run out, and an entire separation is made between the fixed dam and this moveable coffer, which may be lowered down at pleasure without losing any part of the water it contained.

"Suppose the coffer now perfectly detached, turn to fig. 7. which represents a perpendicular section of this apparatus, in the direction of the dotted line *pp* (fig. 6.). In fig. 7. *h* represents an end view of the coffer, indicated by the same letter as in fig. 6. suspended by its chain, and now perfectly detached from all other objects, and balanced by a counterpoise *i*, which is another coffer exactly of the same size, as low down as the level of the lower reach. From inspection only it is evident, that, in proportion as the one of these weights rises, the other must descend. For the present, then, suppose that the coffer *h* is by some means rendered more weighty than *i*, it is plain it will descend while the other rises; and they will thus continue till *h* comes down to the level of the lower reach, and *i* rises to the level of the higher one.

"Fig. 8. represents a section in the direction AB (fig. 6.), in which the coffer *i* (seen in both situations) is supposed to have been gradually raised from the level of the lower reach B to that of the higher one where it now remains stationary; while the coffer *h* (which is concealed behind the masonry) has descended in the mean time to the level of the lower reach, where it closes by means of the juncture *r s*, fig. 10. (which juncture is covered with lists of cloth, as before explained at *m n*, and is of course become water-tight), when, by lifting the sluice *t*, and the corresponding sluice at the end of the canal, a perfect communication by water is established between them. If then, instead of water only, this coffer had contained a boat, floated into it from the upper reach, and then lowered down, it is very plain, that when these sluices were removed, after it had reached the level of the lower reach, that boat might have been floated out of the coffer with as much facility as it was let into it above. Here then we have a boat taken from the higher into the lower canal; and, by reversing this movement, it is very obvious that it might be, with equal ease, raised from the lower into the higher one. It now only remains that I should explain by what means the equilibrium between these counter-balancing weights can be destroyed at pleasure, and the motion, of course, produced.

"It is very evident, that if the two corresponding coffers be precisely of the same dimensions, their weight will be exactly the same when they are both filled to the same depth of water. It is equally plain, that should a boat be floated into either or both of them, whatever its dimensions or weight may be, so that it can be contained afloat in the coffer, the weight of the coffer and its contents will continue precisely the same as when it was filled with water only: hence, then, supposing one boat is to be lowered, or one to be raised at a time, or supposing one to be raised and another lowered at the same time—they remain perfectly in equilibrium in either place, till it is your pleasure to destroy that equilibrium. Suppose, then, for the present, that both coffers are loaded with a boat in each, the double sluices both above and below closed; and suppose also that a stop-cock *u*, in the under edge of the side of the lower coffer (fig. 8. and 10). is opened, some of the water which served to float the boat in the coffer will flow out of it, and consequently that coffer will become lighter than the higher one; the upper coffer will of course descend, while the other mounts upwards. When a gentle motion has been thus communicated, it may be prevented from accelerating, merely by turning the stop-cock so as to prevent the loss of more water, and thus one coffer will continue to ascend, and the other to descend, till they have assumed their stations respectively; when, in consequence of a stop below, and another above, they are rendered stationary at the level of the respective canals (A).

"Precisely the same effect will be produced when the coffers are filled entirely with water.

"It is unnecessary to add more to this explanation, except to observe, that the space for the coffer to descend into must be deeper than the bottom of the lower canal,

(A) "It does not seem necessary to adopt any other contrivance than the above for regulating the motions; but if it should be found necessary, it would be easy to put a ratch-wheel on the same axle."

Canal.

canal, in order to allow a free descent for the coffer to the requisite depth; and of course it will be necessary to have a small conduit to allow the water to get out of it. Two or three inches free, below the bottom of the canal, is all that would be necessary.

"Where the height is inconsiderable, there will be no occasion for providing any counterpoise for the chain, as that will give only a small addition to the weight of the undermost coffer, so as to make it preponderate, in circumstances where the two coffers would otherwise be in perfect equilibrium; but, where the height is considerable, there will be a necessity for providing such a counterpoise; as, without it, the chain, by becoming more weighty every foot it descended, would tend to destroy the equilibrium too much, and accelerate the motion to an inconvenient degree. To guard against this inconvenience, let a chain of the same weight per foot, be appended at the bottom of each coffer, of such a length as to reach within a few yards of the ground where the coffer is at its greatest height (see fig. 7.); it will act with its whole weight upon the highest coffer while in this position; but, as that gradually descended, the chain would reach the gronnd, and, being there supported, its weight would be diminished in proportion to its descent; while the weight of the chain on the opposite side would be augmented in the same proportion, so as to counterpoise each other exactly, in every situation, until the uppermost chain was raised from the ground. After which it would increase its weight no more; and, of course, would then give the under coffer that preponderance which is necessary for preserving the machine steady. The under coffer, when it reached its lowest position, would touch the bottom on its edges, which would then support it, and keep every thing in the same position, till it was made lighter for the purpose of ascending.

"What constitutes one particular excellence of the apparatus here proposed is, that it is not only unlimited as to the system of the rise or depression of which it is susceptible (for it would not require the expenditure of one drop more water to lower it 100 feet than one foot); but it would also be easy so to augment the number of pulleys at any one place as to admit of two, three, four, or any greater number of boats being lowered or elevated at the same time; so that let the succession of boats on such a canal be nearly as rapid as that of carriages upon a highway, none of them need be delayed one moment to wait an opportunity of passing: a thing that is totally impracticable where water-locks are employed; for the intercourse, on every canal constructed with water-locks, is necessarily limited to a certain degree, beyond which it is impossible to force it.

"For example: suppose a hundred boats are following each other, in such a rapid succession as to be only half a minute behind each other. By the apparatus here proposed, they would all be elevated precisely as they came; in the other, let it be supposed that the lock is so well constructed as that it takes no more than five minntes to close and open it; that is, ten minutes in the whole to each boat (for the lock, being once filled, mnst be again emptied before it can receive another in the same direction); at this rate, six boats only could be passed in an hour, and of course it would take sixteen hours and forty minutes to pass the whole hundred; and as the last boat would reach the lock in the space of fifty minutes after the first, it would be detained fifteen hours and fifty minutes before its turn would come to be raised. This is an immense detention; but if a succession of boats, at the same rate, were to follow continually, they never could pass at all. In short, in a canal constructed with water-locks, not more than six boats, on an average, can be passed in an hour, so that beyond that extent all commerce must be stopped; but, on the plan here proposed, sixty, or six hundred, might be passed in an hour, if necessary, so as to occasion no sort of interruption whatever. These are advantages of a very important nature, and ought not to be overlooked in a commercial country.

"This apparatus might be employed for innumerable other uses as a moving power, which it would be foreign to our present purpose here to specify. Nor does its power admit of any limitation, but that of the strength of the chain, and of the coffers which are to support the weights. All the other parts admit of being made so immoveably firm as to be capable of supporting almost any assignable weight.

"I will not enlarge on the benefits that may be derived from this very simple apparatus: its cheapness, when compared with any other mode of raising and lowering vessels that has ever yet been practised, is very obvious; the waste of water it would occasion is next to nothing; and when it is considered that a boat might be raised or lowered fifty feet nearly with the same ease as five, it is evident that the interruptions which arise from frequent locks would be avoided, and an immense saving be made in the original expence of the canal, and in the annual repairs.

"It is also evident, that an apparatus, on the same principle, might be easily applied for raising coals or metals from a great depth in mines, wherever a very small stream of water could be commanded, and where the mine was level-free."

It is almost needless to spend time in enumerating the many advantages which necessarily result from artificial navigations. Their utility is now so apparent, that most nations in Europe give the highest encouragement to undertakings of this kind wherever they are practicable. The advantages of navigable canals did not escape the observation of the ancients. From the most early accounts of society we read of attempts to cut through large isthmuses, in order to make a communication by water, either between different nations, or distant parts of the same nation, where land-carriage was long and expensive. Herodotus relates, that the Cnidians, a people of Caria in Asia Minor, designed to cut the isthmus which joins that peninsula to the continent; but were superstitious enough to give up the undertaking, because they were interdicted by an oracle. Several kings of Egypt attempted to join the Red sea to the Mediterranean by a canal. It was begun by Necos the son of Psammeticus, and completed by Ptolemy II. After his reign it was neglected, till it was opened in 635 under the caliphate of Omar, but was again allowed to fall into disrepair: so that it is now difficult to discover any traces of it. Both the Greeks and Romans intended to make a canal across the isthmus of Corinth, which joins the Morea and Achaia, in order to make a navigable passage by the Ionian sea into the Archipelago. Demetrius,

Canal.

metrius, Julius Cæsar, Caligula, and Nero, made several unsuccessful efforts to open this passage. But, as the ancients were entirely ignorant of the use of water-locks, their whole attention was employed in making level cuts, which is probably the principal reason why they so often failed in their attempts. Charlemagne formed a design of joining the Rhine and the Danube, in order to make a communication between the ocean and the Black sea, by a canal from the river Almutz which discharges itself into the Danube, to the Reditz, which falls into the Main, and this last falls into the Rhine near Mayence; for this purpose he employed a prodigious number of workmen; but he met with so many obstacles from different quarters, that he was obliged to give up the attempt.

The French at present have many fine canals: that of Briare was begun under Henry IV. and finished under the direction of Cardinal Richelieu in the reign of Louis XIII. This canal makes a communication betwixt the Loire and the Seine by the river Loing. It extends 11 French great leagues from Briare to Montargis. It enters the Loire a little above Briare, and terminates in the Loing at Cepoi. There are 42 locks on this canal.

The canal of Orleans, for making another communication between the Seine and the Loire, was begun in 1675, and finished by Philip of Orleans, regent of France, during the minority of Louis XV. and is furnished with 20 locks. It goes by the name of the *canal of Orleans;* but it begins at the village of Combleux, which is a short French league from the town of Orleans.

But the greatest and most useful work of this kind is the junction of the ocean with the Mediterranean by the canal of Languedoc. It was proposed in the reigns of Francis I. and Henry IV. and was undertaken and finished under Lonis XIV. It begins with a large reservoir 4000 paces in circumference, and 24 feet deep, which receives many springs from the mountain Noire. This canal is about 64 leagues in length, is supplied by a number of rivulets, and is furnished with 104 locks, of about eight feet rise each. In some places it passes over bridges of vast height; and in others it cuts through solid rocks for 1000 paces. At one end it joins the river Garonne near Thoulouse, and terminates at the other in the lake Tau, which extends to the port of Cette. It was planned by Francis Riquet in the 1666, and finished before his death, which happened in the 1680.

In the Dutch, Austrian, and French Netherlands, there is a very great number of canals; that from Bruges to Ostend carries vessels of 200 tons.

The Chinese have also a great number of canals; that which runs from Canton to Pekin extends about 825 miles in length, and was executed about 800 years ago.

It would be an endless task to describe the numberless canals in Holland, Russia, Germany, &c. We shall therefore confine ourselves to some of the more important in our own country.

As the promoting of commerce is the principal intention of making canals, it is natural to expect that their frequency in any nation should bear some proportion to the trade carried on in it, providing the situation of the country will admit of them. The present state of England and Scotland confirms this observation. Though the Romans made a canal between the Nyne, a little below Peterborough, and the Witham, three miles below Lincoln, which is now almost entirely filled up, yet it is not long since canals were revived in England. They are now however become very numerous, particularly in the counties of York, Lincoln, and Cheshire. Most of the counties betwixt the mouth of the Thames and the Bristol channel are connected together either by natural or artificial navigation; those upon the Thames and Isis being now connected with those upon the Severn. The duke of Bridgewater's canal in Cheshire runs 27 miles on a perfect level; but at Barton it is carried by a very high aqueduct bridge over the Irwell, a navigable river; so that it is common for vessels to be passing at the same time both under and above the bridge. It is likewise cut some miles into the hills, where the duke's coal-mines are wrought.

A navigable canal betwixt the Forth and Clyde in Scotland, and which divides the kingdom in two parts, was first thought of by Charles II. for transports and small ships of war; the expence of which was to have been 500,000l. a sum far beyond the abilities of his reign. It was again projected in the year 1722, and a survey made; but nothing more done till 1761, when the then Lord Napier, at his own expence, caused a survey, plan, and estimate, on a small scale, to be made. In 1764, the trustees for fisheries, &c. in Scotland, caused make another survey, plan, and estimate, of a canal five feet deep, which was to cost 79,000l. In 1766, a subscription was obtained by a number of the most respectable merchants in Glasgow, for making a canal four feet deep and twenty four feet in breadth; but when the bill was nearly obtained in parliament, it was given up on account of the smallness of the scale, and a new subscription set on foot for a canal seven feet deep, estimated at 150,000l. This obtained the sanction of parliament; and the work was begun in 1768 by Mr Smeaton the engineer. The extreme length of the canal from the Forth to the Clyde is 35 miles, beginning at the mouth of the Carron, and ending at Dalmuir Burnfoot on the Clyde, six miles below Glasgow, rising and falling 160 feet by means of 39 locks, 20 on the east side of the summit, and 19 on the west, as the tide does not ebb so low in Clyde as in the Forth by nine feet. Vessels drawing eight feet water, not exceeding nineteen feet beam and seventy-three feet in length, pass with ease, the canal having afterwards been deepened to upwards of eight feet. The whole enterprise displays the art of man in a high degree. The carrying the canal through moss, quicksand, gravel, and rocks, up precipices and over valleys, was attended with inconceivable difficulties. There are eighteen draw-bridges and fifteen aqueduct bridges of note, besides small ones and tunnels. In the first three miles there are only six locks: but in the fourth mile there are no less than ten locks, and a very fine aqueduct bridge over the great road to the west of Falkirk. In the next six miles there are only four locks which carry you to the summit. The canal then runs eighteen miles on a level, and terminates by one branch about a mile from Glasgow. In this course, for a considerable way, the ground is banked about twenty feet high, and the water is sixteen feet deep,

 and

and two miles of it is made through a deep moss. At Kirkintilloch, the canal is carried over the water of Logie on an aqueduct arch of ninety feet broad. This arch was thrown over in three stretches, having only a centre of thirty feet, which was shifted on small rollers from one stretch to another: a thing new, and never attempted before with an arch of this size; yet the joinings are as fairly equal as any other part, and admired as a very fine piece of masonry. On each side there is a very considerable banking over the valley. This work was carried on till it came within six miles of its junction with the Clyde; when the subscription and a subsequent loan being exhausted, the work was stopt in 1775. The city of Glasgow, however, by means of a collateral branch, opened a communication with the Forth, which has produced a revenue of about 6000l. annually; and, in order to finish the remaining six miles, the government in 1784 gave 50,000l. out of the forfeited estates, the dividends arising from this sum to be applied to making and repairing roads in the Highlands of Scotland. The work was accordingly resumed; and by contract, under a high penalty, was to be entirely completed in November 1789. The aqueduct bridge over the Kelvin, which is supposed the greatest of the kind in the world, consists of four arches, and carries the canal over a valley 65 feet high, and 420 in length, exhibiting a very singular effort of human ingenuity and labour. To supply the canal with water was of itself a very great work. There is one reservoir of 50 acres 24 feet deep, and another of 70 acres 22 feet deep, in which many rivers and springs terminate, which it is thought will afford a sufficient supply of water at all times. This whole undertaking when finished cost about 200,000l. It is the greatest of the kind in Britain, and of great national utility; though it is to be regretted that it had not been executed on a still larger scale, the locks being too short for transporting large masts.

This canal was completed in July 1790. On the 28th of this month, a tract barge, belonging to the company of proprietors, sailed from the bason, near the city of Glasgow, to Bowling bay, where the canal joins the river Clyde. The committee of management, accompanied by the magistrates of Glasgow, were the first voyagers on the new canal. On the arrival of the vessel at Bowling bay, after descending from the last lock into the Clyde, the ceremony of the junction of the Forth and Clyde was performed by discharging into the river Clyde a hogshead of water taken up from the river Forth, as a symbol of joining the western and eastern seas together.

About the year 1801, a canal was finished between Loch Gilp to Loch Crinan in Argyleshire. The distance is about nine miles. This canal, which is called the Crinan canal, is intended to accommodate the trade of the Western islands and fisheries. The vessels employed in this trade will, by means of this canal, avoid the circuitous and dangerous navigation round the Mull of Cantire.

Another canal was begun in 1803, which is intended to open a communication between the Western sea, and the Murray frith, through Loch Ness. This canal, which is by far the most magnificent work of the kind in Britain, is expected to be finished in 1821. See Caledonian Canal, Supplement.

Canal, in *Anatomy*, a duct or passage through which any of the juices flow.

CANANORE, a maritime town of Hindostan, on the coast of Malabar, in a district of the same name, with a large and safe harbour. It formerly belonged to the Portuguese, and had a strong fort to guard it; but in 1683, the Dutch, together with the natives, drove them away; and after they became masters of the town, enlarged the fortifications. The Dutch sold the place to a native family, now represented by a female, and also sovereign of the Lacadive islands, but paying an annual tribute of 14,000 rupees to the English East India Company. The town was taken by the British in 1790 from Tippo Saib, who had previously made himself master of it. E. Long. 78. 10. N. Lat. 12. 0.

Cananore, a small district of Hindostan, on the coast of Malabar, now subject to the British. The natives are generally Mahometans; and the country produces pepper, cardamoms, ginger, mirobolans, and tamarinds, in which they drive a considerable trade, their vessels sailing to Arabia and Sumatra.

CANARA, a province of Hindostan, on the coast of Malabar. The inhabitants are Gentoos, or Pagans; and there is a pagod or temple, called *Ramtrut*, which is visited every year by a great number of pilgrims. Here the custom of burning the wives with their husbands had its beginning, and is practised to this day. The country, before it fell into the hands of the British, was generally governed by a woman, who kept her court at a town called *Baydor*, two days journey from the sea. She might marry whom she pleased; and was not obliged to burn with her husband, like her female subjects. They are so good observers of their laws, that a robbery or murder is scarce ever heard of among them. The lower grounds yield every year two crops of corn or rice; and the higher produce pepper, betel-nuts, sanders wood, iron, and steel. The climate is fine, though subject to heavy rains during a great portion of the year. The surface is rocky and uneven, but produces a great abundance of vegetables. The inhabitants live in ease and comfort, though they are subjected to an enormous land tax of 60 per cent.

CANARIA, in *Ancient Geography*, one of the Fortunate islands, a proof that these were what are now called the *Canaries*. Canaria had its name from its abounding with dogs of an enormous size, two of which were brought to Juba, king of Mauritania. See the following article.

Canaria, or the *Grand Canary*, an island in the Atlantic ocean, about 180 miles from the coast of Africa. It is about 100 miles in circumference, and 33 in diameter. It is a fruitful island, and famous for the wine that bears its name. It also abounds with apples, melons, oranges, citrons, pomegranates, figs, olives, peaches, and plantains. The fir and palm trees are the most common. The towns are, Canary the capital, Gualdera, and Geria.

CANARY, or Cividad de Palmas, is the capital of the island of Canaria, with an indifferent castle, and a bishop's see. It has also a court of inquisition, and the supreme council of the rest of the Canary islands; as also four convents, two for men and two for women. The town is about three miles in compass, and contains

Canary. contains 12,000 inhabitants. The houses are only one story high, and flat at the top; but they are well built. The cathedral is a handsome structure. W. Long. 15. 20. N. Lat. 28. 4.

Canary Islands, are situated in the Atlantic ocean, over against the empire of Morocco in Africa. They were formerly called the *Fortunate Islands*, on account of the temperate healthy air, and excellent fruits. The land is very fruitful, for both wheat and barley produce 130 for one. The cattle thrive well, and the woods are full of all sorts of game. The Canary singing birds are well known all over Europe. There are here sugar-canes in great abundance; but the Spaniards first planted vines here, from whence we have the wine called *Canary* or *Sack*.

These islands were not entirely unknown to the ancients; but they were a long while forgot, till John de Batencourt discovered them in 1402. It is said they were first inhabited by the Phœnicians, or Carthaginians, but on no certain foundation; nor could the inhabitants themselves tell from whence they were derived; on the contrary, they did not know there was any other country in the world. Their language, manners, and customs, had no resemblance to those of their neighbours. However, they were like the people on the coast of Barbary in complexion. They had no iron. After the discovery, the Spaniards soon got possession of them all, under whose dominion they are to this day, except Madeira, which belongs to the Portuguese. The inhabitants are chiefly Spaniards; though there are some of the first people remaining, whom they call *Guanches*, who are somewhat civilized by their intercourse with the Spaniards. Their chief food is goat's milk. Their complexion is tawny, and their noses flat. The population, according to Humboldt, in 1790, was 174,000. The Spanish vessels, when they sail for the West Indies, always rendezvous at these islands, going and coming. Their number is 12. 1. Alegranza; 2. Canaria; 3. Ferro; 4. Fuerteventura; 5. Gomera; 6. Gratiosa; 7. Lancerotta; 8. Madeira; 9. Palma; 10. Rocca; 11. Salvages; 12. Teneriff. West longitude from 12. to 21. north latitude from 27. 30. to 29. 30. See Canary Islands, Supplement.

Canary-Bird. See Fringilla. These birds are much admired for their singing, and take their name from the place from whence they originally came, viz. the Canary islands; but of late years there is a sort of birds brought from Germany, and especially from Tirol, and therefore called *German birds*, which are much better than the others; though both are supposed to have originally come from the same place. The cocks never grow fat, and by some country people cannot be distinguished from common green-birds; though the Canary-birds are much lustier, have a longer tail, and differ much in the heaving of the passages in the throat when they sing. These birds being so much esteemed for their song, are sometimes sold at a high price, according to the goodness and excellency of their notes; so that it will always be advisable to hear one sing before he is bought. In order to know whether he is in good health, take him out of the store-cage, and put him in a clean cage by himself; if he stand up boldly, without crouching or shrinking in his feathers, look with a brisk eye, and is not subject to clap his head under his wing, it is a sign that he is in good health; but the greatest matter is to observe his dunging: if he bolts his tail like a nightingale, after he has dunged, it is a sign he is not in good health, or at least that he will soon be sick; but if his dung be very thin like water, or of a slimy white without any blackness in it, it is a sign of approaching death. When in perfect health, his dung lies round and hard, with a fine white on the outside, dark within, and dries quickly; though a seed-bird seldom dungs so hard, unless he is very young.

Canary. Canary-birds are subject to many diseases, particularly imposthumes, which affect the head, cause them to fall suddenly from the perch, and die in a short time, if not speedily cured. The most approved medicine is an ointment made of fresh butter and capon's grease melted together. With this the top of the bird's head is to be anointed for two or three days, and it will dissolve the imposthume: but if the medicine has been too long delayed, then, after three or four times anointing, see whether the place of his head be soft; and if so, open it gently, and let out the matter, which will be like the yolk of an egg; when this is done, anoint the place, and the bird will be cured. At the same time he must have figs with his other food, and in his water a slice or two of liquorice, with white sugar-candy.

Canary-birds are distinguished by different names at different times and ages: such as are about three years old are called *runts*; those above two are named *eriffs*; those of the first year under the care of the old ones, are termed *branchers*; those that are new-flown, and cannot feed themselves, *pushers*; and those brought up by hand, *nestlings*.

The Canary-birds may be bred with us; and, if treated with proper care, they will become as vigorous and healthful as in the country from whence they have their name. The cages in which these birds are kept are to be made either of walnut-tree or oak, with bars of wire; because these, being woods of strength, do not require to be used in large pieces. The common shape of cages, which is cylindric, is very improper for these birds; for this allows little room to walk, and without that the birds usually become melancholy. The most proper of all shapes is the high and long, but narrow.

If these birds eat too much, they grow over-fat, lose their shape, and their singing is spoiled; or at least they become so idle, that they will scarce ever sing. In this case their victuals are to be given them in a much smaller quantity, and they will by this means be recovered by degrees to all their beauty, and will sing as at first.

At the time that they are about to build their nests, there must be put into their cages some hay, dried thoroughly in the sun; with this must be mixed some moss dried in the same manner, and some stag's hair; and great care is to be taken of breeding the young, in the article of food. As soon as the young birds are eight days old, or somewhat more, and are able to eat and pick up food of themselves, they are to be taken out of the cage in which they were hatched, and each put separately into another cage, and hung up in a room where it may never have an opportunity of hearing the voice of any other bird. After they have keen kept thus about eight days, they are to be excited

cited to sing by a bird-pipe; but this is not to be blowed too much, or in too shrill a manner, lest they sing themselves to death.

For the first fifteen days the cages are to be covered with a black cloth, and for the fifteen days following with a green one. Five lessons in a day from the pipe are sufficient for these young creatures; and they must not be disturbed with several sounds at the same time, lest they confound and puzzle them; two lessons should be given them early in the morning, one about the middle of the day, and two more at night.

The genius and temper of the several birds of this kind are very different. The males are almost always melancholy, and will not sing unless they are excited to it by hearing others continually singing about them. The male bird of this kind will often kill the female put to him for breeding; and when there are several females together with the males, they will often do the same to one another from jealousy. It is therefore not easy to manage the article of their breeding well in this particular, unless in this manner: let two female birds be put into one cage, and when they have lived together some time, they will have contracted a sort of love for one another, which will not easily be dissolved. Put a male bird into the cage with these two, and every thing will go well; their friendship will keep them from quarrelling about his favours, and from danger of his mischievous disposition; for if he attacks one of them, in order to kill her, the other will immediately take her part; and after a few of these battles, the male will find that they are together an overmatch for him at fighting, and will then distribute his favours to them, and there will not fail of being a young breed or two, which are to be taken away from their parents, and educated as before directed. Some males watch the time of the females laying, and devour the eggs as fast as she deposits them; and others take the young ones in their beak as soon as hatched, and crush them to death against the sides of the cage, or some other way destroy them. When a male has been known once to have been guilty of this, he is to be shut up in a small cage, in the middle of the large one in which the female is breeding her young, and thus he will often comfort her with singing all day long, while she sits upon the eggs or takes care of the young ones; and when the time of taking away, to put them into separate cages, is come, the male is to be let out, and he will always after this live in friendship with the female.

If the male become sick during the time of the female's sitting or bringing up her young, he must be removed immediately, and only brought to the side of her cage at certain times that she may see him, till he is perfectly cured; and then he is to be shut up again in his cage in the middle.

Canary-birds are various in their notes; some having a sweet song, others a lowish note, others a long song, which is best, as having the greatest variety of notes; but they sing chiefly either the titlark or nightingale notes. See *Song of Birds*.

CANCALLE, a town of France, in the department of Ille and Vilaine, by the sea-side, where there is a road. Here the British landed in 1758, in their way to St Maloes, where they burnt a great number of ships in the harbour, and then retired without loss. This town was in their power; but they acted like generous enemies, and did no hurt to this nor any other on the coast. W. Long. 0. 13. N. Lat. 48. 41.

CANCELIER, in falconry, is when a light brown hawk, in her stooping, turns two or three times upon the wing, to recover herself before she seizes.

CANCELLI, a term used to denote lattice windows, or those made of cross bars disposed latticewise; it is also used for rails or ballusters inclosing the communion-table, a court of justice, or the like, and for the network in the inside of hollow bones.

CANCELLING, in the civil law, an act whereby a person consents that some former deed be rendered null and void. This is otherwise called *rescision*. The word comes from the Latin *cancellare*, to encompass or pale a thing round. In the proper sense of the word, *to cancel*, is to deface an obligation, by passing the pen from top to bottom, or across it; which makes a kind of chequer lattice, which the Latins call *cancelli*.

CANCER, in *Zoology*, a genus of insects belonging to the order of insecta aptera. This genus includes the lobster, the crab, the prawn, the shrimp, and the craw-fish. See Entomology *Index*.

Cancer, in *Medicine*, a roundish, unequal, hard, and livid tumour, generally seated in the glandulous parts of the body, supposed to be so called, because it appears at length with turgid veins shooting out from it, so as to resemble, as it is thought, the figure of a crab-fish, or others say, because, like that fish, where it has once got, it is scarce possible to drive it away. See Medicine *Index*.

Cancer, in *Astronomy*, one of the twelve signs, represented on the globe in the form of a crab, and thus marked (♋) in books. It is the fourth constellation in the starry zodiac, and that from which one quadrant of the ecliptic takes its denomination. The reason generally assigned for its name as well as figure, is a supposed resemblance which the sun's motion in this sign bears to the crab-fish. As the latter walks backwards, so the former, in this part of his course, begins to go backwards, or recede from us; though the disposition of stars in this sign is by others supposed to have given the first hint to the representation of a crab.

Tropic of Cancer, in *Astronomy*, a lesser circle of the sphere parallel to the equator, and passing through the beginning of the sign Cancer.

CANCHERIZANTE, or Cancherizato, in the Italian music, a term signifying a piece of music that begins at the end, being the retrograde motion from the end of a song, &c. to the beginning.

CANCROMA, or Boat-bill. See Ornithology *Index*.

CANDAHAR, a province of Afghanistan, bounded on the north by the province of Balk; on the east, by that of Cabul; on the south, by Buchor and Sablestan; and on the west, by Sigestan. There have been bloody wars between the Indians and Persians on account of this province. In 1650 it fell to the Persians, but is now independent. The inhabitants, who are known by the name of *Aghuans*, or *Afghans*, are chiefly a migratory race of shepherds. The country is fertile. See Persia.

Candahar, the capital of the above province, is seated on a mountain; and being a place of great trade

trade has a considerable fortress. The caravans that travel from Persia and the parts about the Caspian sea to the East Indies, choose to pass through Candahar, because there is no danger of being robbed on this road, and provisions are very reasonable. The religion is Mahometanism, but there are many Banians and Guebres. E. Long. 65. 45. N. Lat. 32. 40.

CANDAULES, the last king of Lydia, of the family of the Heraclidæ. See LYDIA.

CANDELARES, (from *candela*, a candle), the name of an order in the former editions of Linnæus's Fragments of a Natural Method, consisting of these three genera, *rhizophora*, *nyssa*, and *mimusops*. They are removed, in the later editions, into the order HOLORACEÆ.

CANDIA, the modern name of the island of Crete (see CRETE). The word is a variation of *Khunda*, which was originally the Arabian name of the metropolis only, but in time came to be applied to the whole island.

Candia came into the possession of the Venetians, by purchase, in the year 1194, as related under the article CRETE; and soon began to flourish under the laws of that wise republic. The inhabitants, living under the protection of a moderate government, and being encouraged by their masters, engaged in commerce and agriculture. The Venetian commandants readily afforded to those travellers who visited the island, that assistance which is necessary to enable them to extend and improve useful knowledge. Belon, the naturalist, is lavish in praise of their good offices, and describes, in an interesting manner, the flourishing state of that part of the island which he visited.

The seat of government was established at Candia. The magistrates and officers, who composed the council, resided there. The provisor-general was president. He possessed the chief authority; and his power extended over the whole principality. It continued in the possession of the Venetians for five centuries and a half. Cornaro held the chief command at the time when it was threatened with a storm, on the side of Constantinople. The Turks, for the space of a year, had been employed in preparing a vast armament. They deceived the Venetian, by assuring him that it was intended against Malta. In the year 1645, in the midst of a solemn peace, they appeared unexpectedly before Crete with a fleet of 400 sail, having on board 60,000 land forces, under the command of four pachas. The emperor Ibrahim, under whom this expedition was undertaken, had no fair pretext to offer in justification of his enterprise. He made use of all that perfidy which characterizes the people of the east, to impose on the Venetian senate. He loaded their ambassador with presents, directed his fleet to bear for Cape Matapan, as if they had been going beyond the Archipelago; and caused the governors of Tina and Cerigna to be solemnly assured that the republic had nothing to fear for her possessions. At the very instant when he was making those assurances, his naval armament entered the gulf of Canea; and, passing between that city and St Theodore, anchored at the mouth of Platania.

The Venetians, not expecting this sudden attack, had made no preparations to repel it. The Turks landed without opposition. The isle of St Theodore is but a league and a half from Canea. It is only three quarters of a league in compass. The Venetians had erected two forts there; one of which, standing on the summit of the highest eminence, on the coast of that little isle, was called Turluru; the other, on a lower situation, was named St Theodore. It was an important object to the Mussulmans to make themselves masters of that rock, which might annoy their ships. They immediately attacked it with ardour. The first of these fortresses, being destitute of soldiers and cannon, was taken without striking a blow. The garrison of the other consisted of no more than 60 men. They made a gallant defence, and stood out till the last extremity; and when the Turks at last prevailed, their number was diminished to ten, whom the captain-pacha cruelly caused to be beheaded.

Being now masters of that important post, as well as of Lazaret, an elevated rock, standing about half a league from Canea, the Turks invested the city by sea and land. General Cornaro was struck, as with a thunder-clap, when he learned the descent of the enemy. In the whole island there were no more than a body of 3500 infantry, and a small number of cavalry. The besieged city was defended only by 1000 regular troops, and a few citizens, who were able to bear arms. He made haste to give the republic notice of his distress; and posted himself off the road, that he might the more readily succour the besieged city. He threw a body of 250 men into the town before the lines of the enemy were completed. He afterwards made several attempts to strengthen the besieged with other reinforcements; but in vain. The Turks had advanced in bodies close to the town, had carried a half-moon battery, which covered the gate of Retimo; and were battering the walls night and day with their numerous artillery. The besieged defended themselves with resolute valour, and the smallest advantage which the besiegers gained cost them dear. General Cornaro made an attempt to arm the Greeks, particularly the Spachlots, who boasted loudly of their valour. He formed a battalion of these. But the æra of their valour was long past. When they beheld the enemy, and heard the thunder of the cannon, they took to flight; not one of them would stand fire.

When the senate of Venice were deliberating on the means to be used for relieving Canea, and endeavouring to equip a fleet, the Mahometan generals were sacrificing the lives of their soldiers to bring their enterprise to a glorious termination. In different engagements they had already lost 20,000 warriors; but, descending into the ditches, they had undermined the walls, and blown up the most impregnable forts with explosions of powder. They sprung one of those mines beneath the bastion of St Demetri. It overturned a considerable part of the wall, which crushed all the defenders of the bastion. That instant the besiegers sprung up with their sabres in their hands, and taking advantage of the general consternation of the besieged on that quarter, made themselves masters of the post. The besieged, recovering from their terror, attacked them with unequalled intrepidity. About 400 men assailed 2000 Turks already firmly posted on the wall, and pressed upon them with such obstinate and dauntless valour, that they killed a great number, and drove the rest down into the ditch. In this extremity, every

person

Candia.

person in the city was in arms. The Greek monks took up muskets; and the women, forgetting the delicacy of their sex, appeared on the walls among the defenders, either supplying the men with ammunition and arms, or fighting themselves; and several of those daring heroines lost their lives.

For 50 days the city held out against all the forces of the Turks. If, even at the end of that time, the Venetians had sent a naval armament to its relief, the kingdom of Candia might have been saved. Doubtless, they were not ignorant of this well-known fact. The north wind blows straight into the harbour of Canea. When it blows a little briskly, the sea rages. It is then impossible for any squadron of ships, however numerous, to form in line of battle in the harbour, and to meet an enemy. If the Venetians had set out from Cerigo with a fair wind, they might have reached Canea in five hours, and might have entered the harbour with full sails without being exposed to one cannon-shot; while none of the Turkish ships would have dared to appear before them; or if they had ventured, must have been driven back on the shore, and dashed in pieces among the rocks. But, instead of thus taking advantage of the natural circumstances of the place, they sent a few galleys, which, not daring to double Cape Spada, coasted along the southern shore of the island, and failed of accomplishing the design of their expedition.

At last, the Caneans, despairing of relief from Venice, seeing three breaches made in their walls, through which the infidels might easily advance upon them, exhausted with fatigue, and covered with wounds, and reduced to the number of 500 men, who were obliged to scatter themselves round the walls, which were half a league in extent, and undermined in all quarters, demanded a parley, and offered to capitulate. They obtained very honourable conditions; and after a glorious defence of two months, which cost the Turks 20,000 men, marched out of the city with the honours of war. Those citizens who did not choose to continue in the city were permitted to remove; and the Ottomans, contrary to their usual practice, faithfully observed their stipulations.

The Venetians, after the loss of Canea, retired to Retimo. The captain-pacha laid siege to the citadel of the Sude, situated in the entrance of the bay, on a high rock, of about a quarter of a league in circumference. He raised earthen batteries, and made an ineffectual attempt to level the ramparts. At last, despairing of taking it by assault, he left some forces to block it up from all communication, and advanced towards Retimo. That city, being unwalled, was defended by a citadel, standing on an eminence which overlooks the harbour. General Cornaro had retired thither. At the approach of the enemy, he advanced from the city, and waited for them in the open field. In the action, inattentive to his own safety, he encouraged the soldiers, by fighting in the ranks. A glorious death was the reward of his valour; but his fall determined the fate of Retimo.

The Turks having landed additional forces on the island, they introduced the plague, which was almost a constant attendant on their armies. This dreadful pest rapidly advanced, and, like a devouring fire, wasting all before it, destroyed most part of the inhabitants. The rest, flying in terror before its ravages, escaped into the Venetian territories, and the island was left almost desolate.

The siege of the capital commenced in 1646, and was protracted much longer than that of Troy. Till the year 1648, the Turks scarce gained any advantages before that city. They were often routed by the Venetians, and sometimes compelled to retire to Retime. At that period Ibrahim was solemnly deposed, and his eldest son, at the age of nine years, was raised to the throne, under the name of Mahomet IV. Not satisfied with confining the sultan to the horrors and obscurity of a dungeon, the partizans of his son strangled him on the 19th of August, in the same year. That young prince, who mounted the throne by the death of his father, was afterwards expelled from it, and condemned to pass the remainder of his life in confinement.

In the year 1649, Ussein Pacha, who blockaded Candia, receiving no supplies from the Porte, was compelled to raise the siege, and retreat to Canea. The Venetians were then on the sea with a strong squadron. They attacked the Turkish fleet in the bay of Smyrna, burnt 12 of their ships and two galleys, and killed 6000 of their men. Some time after, the Mahometans having found means to land an army on Candia, renewed the siege of the city with great vigour, and made themselves masters of an advanced fort that was very troublesome to the besieged; which obliged them to blow it up.

From the year 1650 till 1658, the Venetians, continuing masters of the sea, intercepted the Ottomans every year in the straits of the Dardanelles, and fought them in four naval engagements; in which they defeated their numerous fleets, sunk a number of their caravels, took others, and extended the terror of their arms even to the walls of Constantinople. That capital became a scene of tumult and disorder. The Grand Signior, alarmed, and trembling for his safety, left the city with precipitation.

Such glorious success revived the hopes of the Venetians, and depressed the courage of the Turks. They converted the siege of Candia into a blockade, and suffered considerable losses. The sultan, in order to exclude the Venetian fleet from the Dardanelles, and to open to his own navy a free and safe passage, caused two fortresses to be built at the entrance of the straits. He gave orders to the pacha of Canea to appear again before the walls of Candia, and to make every possible effort to gain the city. In the mean time, the republic of Venice, to improve the advantages which they had gained, made several attempts on Canea. In 1660, that city was about to surrender to their arms, when the pacha of Rhodes, hastening to its relief, reinforced the defenders with a body of 2000 men. He happily doubled the extremity of Cape Melec, though within sight of the Venetian fleet, which was becalmed off Cape Spada, and could not advance one fathom to oppose an enemy considerably weaker than themselves.

Kiopruli, son and successor to the vizier of that name, who had long been the support of the Ottoman empire, knowing that the murmurs of the people against the long continuance of the siege of Candia were rising to a height, and fearing a general revolt, which would

Candia. would be fatal to himself and his master, set out from Byzantium about the end of the year 1666 at the head of a formidable army. Having escaped the Venetian fleet, which was lying off Canea with a view to intercept him, he landed at *Palio Castro*, and formed his lines around Candia. Under his command were four pachas, and the flower of the Ottoman forces. Those troops, being encouraged by the presence and the promises of their chiefs, and supported by a great quantity of artillery, performed prodigies of valour. All the exterior forts were destroyed. Nothing now remained to the besieged but the bare line of the walls, unprotected by fortresses; and these being battered by an incessant discharge of artillery, soon gave way on all quarters. Still, however, what posterity may perhaps regard as incredible, the Candians held out three years against all the force of the Ottoman empire. At last they were going to capitulate, when the hope of assistance from France re-animated their valour, and rendered them invincible. The expected succours arrived on the 26th of June 1669. They were conducted by the duke of Noailles. Under his command were a great number of French noblemen, who came to make trial of their skill in arms against the Turks.

Next day after their arrival, the ardour of the French prompted them to make a general sally. The duke of Beaufort, admiral of France, assumed the command of the forlorn hope. He was the first to advance against the Mussulmans, and was followed by a numerous body of infantry and cavalry. They advanced furiously upon the enemy, attacked them within their trenches, forced the trenches, and would have compelled them to abandon their lines and artillery, had not an unforeseen accident damped their courage. In the midst of the engagement a magazine of powder was set on fire; the foremost of the combatants lost their lives; the French ranks were broken; several of their leaders, among whom was the duke of Beaufort, disappeared for ever; the soldiers fled in disorder; and the duke of Noailles, with difficulty, effected a retreat within the walls of Candia. The French accused the Italians of having betrayed them; and on that pretext prepared to set off sooner than the time agreed upon. No intreaties of the commandant could prevail with them to delay their departure; so they re-embarked. Their departure determined the fate of the city. There were now no more than five hundred men to defend it. Morosini capitulated with Kiopruli, to whom he surrendered the kingdom of Crete, excepting only the Sude, Grabusa, and Spina-Longua. The grand-vizier made his entrance into Candia on the 4th of October 1670, and staid eight months in that city, inspecting the reparation of its walls and fortresses.

The three fortresses left in the hands of the Venetians by the treaty of capitulation remained long after in their possession. At last they were all taken, one after another. In short, after a war of 30 years continuance, in the course of which more than 200,000 men fell in the island, and it was deluged with streams of Christian and Mahometan blood, Candia was entirely subdued by the Turks, in whose hands it still continues.

Of the climate of Candia travellers speak with rapture. The heat is never excessive; and in the plains violent cold is never felt. In the warmest days of summer the atmosphere is cooled by breezes from the sea. Winter properly begins here with December and ends with January; and during that short period snow never falls on the lower grounds, and the surface of the water is rarely frozen over. Most frequently the weather is as fine then as it is in Britain at the beginning of June. These two months have received the name of *winter*, because in them there is a copious fall of rain, the sky is obscured with clouds, and the north winds blow violently; but the rains are favourable to agriculture, the winds chase the clouds towards the summits of the mountains, where a repository is formed for those waters which are to fertilize the fields; and the inhabitants of the plain suffer no inconvenience from these transient blasts. In the month of February, the ground is overspread with flowers and rising crops. The rest of the year is almost one continued fine day. The inhabitants of Crete never experience any of those mortifying returns of piercing cold, which are so frequently felt in Britain and even more southern countries; and which, succeeding suddenly after the cherishing heats of spring, nip the blossoming flowers, wither the open buds, destroy half the fruits of the year, and are fatal to delicate constitutions. The sky is always unclouded and serene; the winds are mild and refreshing breezes. The radiant sun proceeds in smiling majesty along the azure vault, and ripens the fruits on the lofty mountains, the rising hills, and the plains. The nights are no less beautiful; their coolness is delicious. The atmosphere not being overloaded with vapours, the sky unfolds to the observer's view a countless profusion of stars; those numerous stars sparkle with the most vivid rays, and strew the azure vault in which they appear fixed, with gold, with diamonds, and with rubies. Nothing can be more magnificent than this sight, and the Cretans enjoy it for six months in the year.

To the charms of the climate other advantages are joined which augment their value: There are scarce any morasses in the island; the waters here are never in a state of stagnation; they flow in numberless streams from the tops of the mountains, and form here and there large fountains or small rivers that empty themselves into the sea; the elevated situation of their springs causes them to dash down with such rapidity, that they never lose themselves in pools or lakes; consequently insects cannot deposit their eggs upon them, as they would be immediately hurried down into the sea; and Crete is not infested like Egypt with those clouds of insects which swarm in the houses, and whose sting is insufferably painful; nor is the atmosphere here loaded with those noxious vapours which rise from marshy grounds.

The mountains and hills are overspread with various kinds of thyme, savoury, wild thyme, and with a multitude of odoriferous and balsamic plants; the rivulets which flow down the valleys are overhung with myrtles, laurel, and roses; clumps of orange, citron, and almond trees, are plentifully scattered over the fields; the gardens are adorned with tufts of Arabian jasmine. In spring, they are bestrewed with beds of violets; some extensive plains are arrayed in saffron; the cavities of the rocks are fringed with sweet smelling dittany. In a word, from the hills, the vales, and the plains, Candia. plains, on all hands, there arise clouds of exquisite perfumes, which embalm the air, and render it a luxury to breathe it.

As to the inhabitants, the Mahometan men are generally from five feet and a half to six feet tall. They bear a strong resemblance to ancient statues; and it must have been after such models that the ancient artists wrought. The women also are generally beautiful. Their dress does not restrain the growth of any part of their bodies, and their shape therefore assumes those admirable proportions with which the hand of the Creator has graced his fairest workmanship on earth. They are not all handsome or charming; but some of them are beautiful, particularly the Turkish ladies. In general, the Cretan women have a rising throat, a neck gracefully rounded, black eyes sparkling with animation, a small mouth, a fine nose, and cheeks delicately coloured with the fresh vermilion of health. But the oval of their form is different from that of Europeans, and the character of their beauty is peculiar to their own nation.

The quadrupeds belonging to the island are not of a ferocious temper. There are no lions, tigers, bears, wolves, foxes, or indeed any dangerous animal here. Wild goats are the only inhabitants of the forests that overspread the lofty mountains; and these have nothing to fear but the ball of the hunter: hares inhabit the hills and the plain; sheep graze in security on the thyme and the heath; they are folded every night, and the shepherd sleeps soundly without being disturbed with the fear that wild animals may invade and ravage his folds.

The Cretans are very happy in not being exposed to the troublesome bite of noxious insects, the poison of serpents, or the rapacity of the wild beasts of the desert. The ancients believed that the island enjoyed these singular advantages, on account of its having been the birth-place of Jupiter. "The Cretans (says Ælian) celebrate in their songs the beneficence of Jupiter, and the favour which he conferred on their island, which was the place of his birth and education, by freeing it from every noxious animal, and even rendering it unfit for nourishing those noxious animals that are introduced into it from foreign countries."

Dittany holds the first rank among the medicinal plants which are produced in Crete. The praises bestowed on the virtues of this plant by the ancients are altogether extravagant; yet we perhaps treat the medicinal virtues of this plant with too much contempt. Its leaf is very balsamic, and its flower diffuses around it a delicious odour. At present the inhabitants of the island apply it with success on various occasions. The leaf, when dried and taken in an infusion with a little sugar, makes a very pleasant drink, of a finer flavour than tea. It is there an immediate cure for a weak stomach, and enables it to recover its tone after a bad digestion.

Diseases are very rare in a country whose atmosphere is exceedingly pure; and in Candia, epidemical diseases are unknown. Fevers prevail here in summer, but are not dangerous; and the plague would be wholly unknown, had not the Turks destroyed the lazarets that were established by the Venetians, for strangers to do quarantine in. Since the period when these were demolished, it is occasionally introduced by ships from Smyrna and Constantinople. As no precautions are taken against it, it gains ground, and spreads over the island from one province to another; and as the colds and heats are never intemperate, it sometimes continues its ravages for six months at a time.

This fine country is infested with a disease somewhat less dangerous than the plague, but whose symptoms are somewhat more hideous; that disease is the leprosy. In ancient times, Syria was the focus in which it raged with most fury: and from Syria it was carried into several of the islands of the Archipelago. It is infectious, and is instantaneously communicated by contact. The victims who are attacked by it, are driven from society, and confined to little ruinous houses on the highway. They are strictly forbidden to leave these miserable dwellings, or hold intercourse with any person. Those poor wretches have generally beside their huts a small garden producing pulse, and feeding poultry; and with that support, and what they obtain from passengers, they find means to drag out a painful life in circumstances of shocking bodily distress. Their bloated skin is covered with a scaly crust, speckled with red and white spots: which afflict them with intolerable itchings. A hoarse and tremulous voice issues from the bottom of their breasts. Their words are scarce articulated; because their distemper inwardly preys upon the organs of speech. These frightful spectres gradually lose the use of their limbs. They continue to breathe till such time as the whole mass of their blood is corrupted, and their bodies entirely in a state of putrefaction: The rich are not attacked by this distemper: it confines itself to the poor, chiefly to the Greeks. But those Greeks observe strictly their four lents; and eat nothing during that time but salt fish, botargo salted and smoked, pickled olives, and cheese. They drink plentifully of the hot and muddy wines of the island. The natural tendency of such a regimen must be, to fire the blood, to thicken the fluid part of it, and thus at length to bring on a leprosy.

Candia is at present governed by three pachas, who reside respectively at Candia, Canea, and Retimo. The first, who is always a pacha of three tails, may be considered as viceroy of the island. He enjoys more extensive powers than the others. To him the inspection of the forts and arsenals is intrusted. He nominates to such military employments as fall vacant, as well as to the governments of the Sude, Grabusa, Spina Longua, and Gira-petra. The governors of these forts are denominated *beys*. Each of them has a constable and three general officers under him; one of whom is commander of the artillery, another of the cavalry, and the third of the janissaries.

The council of the pacha consists of a kyaia, who is the channel through which all orders are issued, and all favours bestowed; an aga of the janissaries, colonel-general of the troops, who has the chief care of the regulation of the police; two topigi bachi; a defterdar, who is treasurer-general for the imperial revenues; a keeper of the imperial treasury; and the chief officers of the army. This government is entirely military, and the power of the pacha serasquier is absolute. The justice of his sentences is never called in question; they are instantly carried into execution.

The

Candia.

The people of the law are the mufti, who is the religious head, and the cadi. The first interprets those laws which regard the division of the patrimony among the children of a family, successions, and marriages,—in a word, all that are contained in the Koran; and he also decides on every thing that relates to the ceremonies of the Mussulman religion. The cadi cannot pronounce sentence on affairs connected with these laws, without first taking the opinion of the mufti in writing, which is named *Faitfa*. It is his business to receive the declarations, complaints, and donations of private persons; and to decide on such differences as arise among them. The pacha is obliged to consult those judges when he puts a Turk legally to death; but the pacha, who is dignified with three tails, sets himself above all laws, condemns to death, and sees his sentence executed, of his own proper authority. All the mosques have their itam, a kind of curate, whose duty is to perform the service. There are schoolmasters in the different quarters of the city. These persons are much respected in Turkey, and are honoured with the title of *effendi*.

The garrison of Candia consists of 46 companies, composing a military force of about ten thousand men. All these forces do not reside constantly in the city, but they may be mustered in a very short time. They are all regularly paid every three months, excepting the janissaries, none of whom but the officers receive pay. The different gradations of this military body do not depend on the pacha. The council of each company, consisting of veterans, and of officers in actual service, has the power of naming to them. A person can occupy the same post for no longer than two years; but the post of *sorbagi*, or captain, which is purchased at Constantinople, is held for life. The *ousta*, or cook, is also continued in his employment as long as the company to which he belongs is satisfied with him. Each company has its almoner, denominated *imam*.

The garrisons of Canea and Retimo, formed on a similar plan, are much less numerous. The first consists of about 3000 men, the other of 500; but as all the male children of the Turks are enrolled among the janissaries as soon as born, the number of these troops might be greatly augmented in time of war: but, to say the truth, they are far from formidable. Most of them have never seen fire, nor are they ever exercised in military evolutions.

The pachas of Canea and Retimo are no less absolute, within the bounds of their respective provinces, than the pacha of Candia. They enjoy the same privileges with him, and their council consists of the same officers. These governors chief object is to get rich as speedily as possible; and in order to accomplish that end, they practise all the arts and cruelties of oppression, to squeeze money from the Greeks. In truth, those poor wretches run to meet the chains with which they are loaded. Envy, which always preys upon them, continually prompts them to take up arms. If some one among them happen to enjoy a decent fortune, the rest assiduously seek some pretence for accusing him before the pacha, who takes advantage of these dissensions, to seize the property of both the parties. It is by no means astonishing, that under so barbarous a government, the number of the Greeks is daily diminished.

Candia.

There are scarcely in the island, 65,000 of whom pay the carach.	150,000 Greeks
The Turks have not possessed the island for more than 120 years; yet as they are not exposed to the same oppression, they have multiplied in it, and raised themselves upon the ruin of the ancient inhabitants. Their number amounts to	200,000 Turks.
The Jews, of whom there are not many in the island, amount only to	200
Total is	350,200 souls.

This fertile country is in want of nothing but industrious husbandmen, secure of enjoying the fruit of their labours. It might maintain four times its present number of inhabitants.

Antiquity has celebrated the island of Crete as containing 100 populous cities; and the industry of geographers has preserved their names and situations. Many of these cities contained no fewer than 30,000 inhabitants; and by reckoning them, on an average, at 6000 each, we shall in all probability be rather within than beyond the truth. This calculation gives for 100 cities 600,000

By allowing the same number as inhabitants of the towns, villages, and all the rest of the island, 600,000

the whole number of the inhabitants of ancient Crete will amount to 1,200,000

This number cannot be exaggerated. When Candia was in the hands of the Venetians, it was reckoned to contain nine hundred fourscore and sixteen villages.

It appears, therefore, that when the island of Crete enjoyed the blessing of liberty, it maintained to the number of 849,800 more inhabitants than it does at present. But since those happier times, she has been deprived of her laws by the tyranny of the Romans; has groaned under the destructive sway of the monarchs of the lower empire; has been exposed for a period of 120 years to the ravages of the Arabians; has next passed under the dominion of the Venetians; and has at last been subjected to the despotism of the Turks, who have produced a dreadful depopulation in all the countries which have been subdued by their arms.

The Turks allow the Greeks the free exercise of their religion, but forbid them to repair their churches or monasteries; and accordingly they cannot obtain permission to repair their places of worship, or religious houses, but by the powerful influence of gold. From this article the pachas derive very considerable sums. They have 12 bishops as formerly, the first of whom assumes the title of archbishop of Gortynia. He resides at Candia; in which city the metropolitan church of the island stanes. He is appointed by the patriarch of Constantinople; and has the right of nominating to all the other bishoprics of the island; the names of which are, Gortynia, Cnossou, Mirabella, Hyera, Gira-petra, Arcadia, Cherronese, Lambis, Milopotamo, Retimo, Canea, Cisamo. These bishoprics are nearly the same as under the reign of the Greek emperors.

 The

The patriarch wears a triple tiara, writes his signature in red ink, and answers for all the debts of the clergy. To enable him to fulfil his engagements, he lays impositions on the rest of the bishops, and particularly on the monasteries, from which he draws very handsome contributions. He is considered as the head of the Greeks, whom he protects, as far as his slender credit goes. The orders of government are directed to him on important occasions; and he is the only one of all the Greeks in the island who enjoys the privilege of entering the city on horseback.

CANDIA, is the capital of the above island, situated on its northern coast, in E. Long. 25. 0. N. Lat. 35. 30. It stands on the same situation which was formerly occupied by Heraclea, and is the seat of government under the Turks. Its walls, which are more than a league in compass, are in good repair, and defended by deep ditches, but not protected by any exterior fort. Towards the sea, it has no attacks to fear; because the shallowness of the harbour renders it inaccessible to ships of war.

The Porte generally commits the government of this island to a pacha of three tails. The principal officers, and several bodies of the Ottoman soldiery, are stationed here. This city, when under the Venetians, was opulent, commercial, and populous; but it has now lost much of its former strength and grandeur. The harbour, naturally a fine bason, in which ships were securely sheltered from every storm, is every day becoming narrower and shallower. At present it admits only boats, and small ships after they have discharged a part of their freight. Those vessels, which the Turks freight at Candia, are obliged to go almost empty to the port of Standie, whither their cargoes are conveyed to them in barks. Such inconveniences are highly unfavourable to commerce; and as government never thinks of removing them, the trade of Candia is therefore considerably decayed.

Candia, which was embellished by the Venetians with regular streets, handsome houses, a fine square, and a magnificent cistern, contains at present but a small number of inhabitants, notwithstanding the vast extent of the area enclosed within its walls. Several divisions of the city are void of inhabitants. That in which the market-place stands is the only one which discovers any stir of business, or show of affluence. The Mahometans have converted most of the Christian temples into mosques; yet they have left two churches to the Greeks, one to the Armenians, and a synagogue to the Jews. The Capuchins possess a small convent, with a chapel in which the vice-consul of France hears mass. At present he is the only Frenchman who attends it, as the French merchants have taken up their residence at Canea.

West of the city of Candia is an extensive range of hills, which are a continuation of Mount Ida, and of which the extremity forms the promontory of Dion. On the way to Dion, we find Palio Castro, on the shore; a name which the modern Greeks give indifferently to all remains of ancient cities. Its situation corresponds to that of the ancient Panormus, which stood north-west from Heraclea.

The river which runs west of Candia was anciently known by the name of Triton; near the source of which Minerva sprung from the brain of Jove. Loaxus is a little farther distant. About a league east of that city, the river Ceratus flows through a delightful vale. According to Strabo, in one part of its course it runs near by Gnossus. A little beyond that, is another river supposed to be Therenus, on the banks of which, fable relates that Jupiter consummated his marriage with Juno. For the space of more than half a league round the walls of Candia there is not a single tree to be seen. The Turks cut them all down in the time of the siege, and laid waste the gardens and orchards. Beyond that extent, the country is plentifully covered with corn and fruit trees. The neighbouring hills are overspread with vineyards, which produce the malmsey of Mount Ida,—worthy of preference at the table of the most exquisite connoisseur in wines. That species of wine, though little known, has a fine flavour, a very pleasant relish, and is highly esteemed in the island.

CANDIAC, John Lewis, a premature genius, born at Candiac in the diocese of Nismes in France, in 1719. In the cradle he distinguished his letters: at 13 months, he knew them perfectly: at three years of age, he read Latin, either printed or in manuscript: at four, he translated from that tongue: at six, he read Greek and Hebrew; was master of the principles of arithmetic, history, geography, heraldry, and the science of medals; and had read the best authors on almost every branch of literature. He died of a complication of disorders, at Paris, in 1726.

CANDIDATE, a person who aspires to some public office.

In the Roman commonwealth, they were obliged to wear a white gown during the two years of their soliciting a place. This garment, according to Plutarch, they wore without any other clothes, that the people might not suspect they concealed money for purchasing votes, and also that they might more easily show to the people the scars of those wounds they had received in fighting for the defence of the commonwealth. The candidates usually declared their pretensions a year before the time of election, which they spent in making interest and gaining friends. Various arts of popularity were practised for this purpose, and frequent circuits made round the city, and visits and compliments to all sorts of persons, the process of which was called *ambitus*. See Ambitus.

CANDIDATI milites, an order of soldiers, among the Romans, who served as the emperor's bodyguards to defend him in battle. They were the tallest and strongest of the whole troops, and most proper to inspire terror. They were called *candidati*, because clothed in white, either that they might be more conspicuous, or because they were considered in the way of preferment.

CANDISH, a considerable province of Asia, in the dominions of the Great Mogul, bounded by Chytor and Malva on the north, Orixa on the east, Decan on the south, and Guzerat on the west. It is populous and rich; and abounds in cotton, rice, and indigo. Brampore is the capital town.

CANDLE, a small taper of tallow, wax, or spermaceti; the wick of which is commonly of several threads of cotton, spun and twisted together.

A tallow-candle, to be good, must be half sheep's and half bullock's tallow; for hog's tallow makes the candle

Candle. candle gutter, and always gives an offensive smell, with a thick black smoke. The wick ought to be pure, sufficiently dry, and properly twisted; otherwise the candle will emit an inconstant vibratory flame, which is both prejudicial to the eyes and insufficient for the distinct illumination of objects.

There are two sorts of tallow-candles; the one dipped, the other moulded: the former are the common candles; the others are the invention of the Sieur le Brege at Paris.

As to the method of making candles in general: After the tallow has been weighed, and mixed in the due proportions, it is cut into very small pieces, that it may melt the sooner; for the tallow in lumps, as it comes from the butchers, would be in danger of burning or turning black, if it were left too long over the fire. Being perfectly melted and skimmed, they pour a certain quantity of water into it, proportionable to the quantity of tallow. This serves to precipitate to the bottom of the vessel the impurities of the tallow which may have escaped the skimmer. No water, however, must be thrown into the tallow designed for the three first dips; because the wick, being still quite dry, would imbibe the water, which makes the candles crackle in burning, and renders them of bad use. The tallow, thus melted, is poured into a tub, through a coarse sieve of horse-hair, to purify it still more, and may be used after having stood three hours. It will continue fit for use 24 hours in summer and 15 in winter. The wicks are made of spun cotton, which the tallow-chandlers buy in skains, and which they wind up into bottoms or clues; whence they are cut out, with an instrument contrived on purpose, into pieces of the length of the candle required: then put on the sticks or broaches, or else placed in the moulds, as the candles are intended to be either dipped or moulded.

Wax-candles are made of a cotton or flaxen wick, slightly twisted, and covered with white or yellow wax. Of these, there are several kinds: some of a conical figure, used to illuminate churches, and in processions, funeral ceremonies, &c. (see TAPER); others of a cylindrical form, used on ordinary occasions. The first are either made with a ladle or the hand. 1. To make wax-candles with the ladle. The wicks being prepared, a dozen of them are tied by the neck, at equal distances, round an iron circle, suspended over a large bason of copper tinned, and full of melted wax: a large ladle full of this wax is poured gently on the tops of the wicks one after another, and this operation continued till the candle arrive at its destined bigness; with this precaution that the three first ladles be poured on at the top of the wick, the fourth at the height of $\frac{3}{4}$, the fifth at $\frac{1}{2}$, and the sixth at $\frac{1}{4}$, in order to give the candle its pyramidal form. Then the candles are taken down, kept warm, and rolled and smoothed upon a walnut-tree table, with a long square instrument of box, smooth at the bottom. 2. As to the manner of making wax-candles by the hand, they begin to soften the wax, by working it several times in hot water, contained in a narrow but deep caldron. A piece of the wax is then taken out, and disposed by little and little around the wick, which is hung on a hook in the wall, by the extremity opposite to the neck; so that they begin with the big end, diminishing still as they descend towards the neck. In other respects the method is nearly the same as in the former case. However, it must be observed, that, in the former case, water is always used to moisten the several instruments, to prevent the wax from sticking; and in the latter, oil of olives, or lard, for the hands, &c. The cylindrical wax-candles are either made as the former, with a ladle, or drawn. Wax-candles drawn, are so called, because actually drawn in the manner of wire, by means of two large rollers of wood, turned by a handle, which turning backwards and forwards several times, pass the wick through melted wax contained in a brass bason, and at the same time through the holes of an instrument like that used for drawing wire fastened at one side of the bason.

If any chandlers mix with their wares any thing deceitfully, &c. the candles shall be forfeited, by stat. 23 Eliz.; and a tax or duty is granted on candles, by 8 and 9 Anne, cap. 6. made for sale, of one penny a pound, besides the duty upon tallow, by 8 Anne, cap. 9. And by 24 Geo. III. cap. 11. an additional duty of a halfpenny a pound: and by the same an additional duty of a halfpenny a pound is laid upon all candles imported (except those of wax and spermaceti, for which see *WAX-Candles*), subject also to the two additional 5 per cents. imposed by 19 and 22 Geo. III. besides the duty of $2\frac{1}{4}$d. formerly imposed by 2 W. sess. 2. cap. 4. 8 Anne, cap. 9. and 9 Anne, cap. 6. And every maker of candles, other than wax-candles, for sale, shall annually take out a licence at 1l. The maker of candles shall, in four weeks within the bills, and elsewhere in six weeks, after entry, clear off the duties on pain of double duty; nor sell any after default in payment, on pain of double value; 8 Anne, cap. 9. The makers of candles are not to use melting houses, without making a true entry, on pain of 100l. and to give notice of making candles to the excise officer for the duties; and of the number, &c. or shall forfeit 50l. stat. 11. Geo. I. cap. 30. See also 23 Geo. II. cap. 21. and 26 Geo. II. cap. 32. No maker of candles for sale shall begin to make candles, without notice first given to the officers, unless, from September 29. to March 25. yearly, between seven in the morning and five in the evening, and from March 25. to September 29. between five in the morning and seven in the evening, on pain of 10l. 10 Anne, cap. 26. The penalty of obstructing the officer is 20l. and of removing candles before they are surveyed 20l. 8 Anne, cap. 9. The penalty of privately making candles is the forfeiture of the same and utensils, and 100l. 5 Geo. III. cap. 43. And the penalty of mingling weighed with unweighed candles, of removing them before they are weighed, or of concealing them, is the forfeiture of 100l. 11 Geo. cap. 30. Candles, for which the duty hath been paid, may be exported, and the duty drawn back; but no drawback shall be allowed on the exportation of any foreign candles imported. 8 Anne, cap. 9. 23 Geo. II. cap. 21.

The Roman candles were at first little strings dipt in pitch, or surrounded with wax; though afterwards they made them of the papyrus, covered likewise with wax; and sometimes also of rushes, by stripping off the outer rind, and only retaining the pith.—For religious offices, wax-candles were used; for vulgar uses, those

Candle.

those of tallow. Lord Bacon proposes candles of divers compositions and ingredients, as also of different sorts of wicks; with experiments of the degrees of duration, and light of each. Good housewives bury their candles in flour or bran, which it is said increases their lasting almost half.

Experiments to determine the real and comparative value of burning CANDLES *of different sorts and sizes.*

	Num. of candles in one pound.	Weight of one candle.		The time one candle lasted.		The time that one pound will last		The expence in 12 hours when candles are at 6d per dozen, which also shews the proportion of the expence at any price per dozen.

N. B. The time that one candle lasted was taken from an average of several trials in each size.

It is observable, in opics, that the flame of two candles joined, gives a much stronger light than both of them separate. The observation was suggested by Dr Franklin. Probably the union of the two flames produces a greater degree of heat, whereby the vapour is attenuated, and the particles of which light consists are more copiously emitted.

Mr Nicholson has made some interesting observations on the light afforded by lamps and candles, which we shall lay before our readers in his own words *. "We are acquainted with no means (says he), unless we may except electricity, of producing light, but by combustion, and this is most probably of the same nature. The rude method of illumination consists in successively burning certain masses of such in the solid state. Common fires answer this purpose in the apartments of houses, and in some lighthouses; small pieces of resinous wood, and the bituminous coal called *kannel-coal*, are in some countries applied to the same use; but the most general and useful method is that in which fat oil, of an animal or vegetable kind, is burned by means of a wick. These instruments of illumination are either lamps or candles. In the lamp, the oil must be one of those which retains its fluidity in the ordinary temperature of the atmosphere. The candle is formed of an oil, or other material, which is not fusible but at a temperature considerably elevated.

* *Phil. Jour.* vol. i.

"The method of measuring the comparative intensities of light is one of the first requisites in an inquiry concerning the art of illumination. Two methods of considerable accuracy are described in the *Traité d'Optique* of Bouguer, of which an abridged account is given by Dr Priestley in his Optics. The first of these two methods has been used by others since that time, and probably before, from its very obvious nature, but particularly by Count Rumford, who has given a description and drawings of an instrument called the *photometer*, in the Philosophical Transactions for 1794. The principle it is grounded upon is, that if two lights shine upon the same surface at equal obliquities, and an opaque body be interposed, the two shadows it will produce must differ in blackness or intensity in the same degree. For the shadow formed by intercepting the greater light will be illuminated by the smaller light only, and reversely the other shadow will be illuminated by the greater light. That is to say, in short, the stronger light will be attended with a deeper shadow. But it is easy, by removing the greater light to a greater distance, to render the illumination it produces at the common surface equal to that afforded by the less. Experiments of this kind may be conveniently made by fastening a sheet of white paper against the wall of a room. The two lights or candles intended to be compared, must then be placed so that the ray of light from each shall fall with nearly the same angle of incidence upon the middle of the paper. By some experiments made in this way in the year 1785, I was satisfied that the degree of illumination could be thus ascertained to the 80th or 90th part of the whole.

"By experiments of this kind many useful particulars may be shewn. Thus, for example, the light of a candle, which is so exceedingly brilliant when first snuffed, is very speedily diminished to one-half, and is usually not more than one-fifth or one-sixth before the uneasiness of the eye induces us to snuff it. Whence it follows, that if candles could be made so as not to require snuffing, the average quantity of light afforded by the same quantity of combustible matter would be more than doubled. In the same way, likewise, since the cost and duration of candles, and the consumption of oil in lamps, are easily ascertainable, it may be shewn whether more or less of light is obtained at the same expence during a given time, by burning a number of small candles instead of one of greater thickness. From a few experiments already made out of the numerous and useful series that presents itself, I have reason to think that there is very much waste in this expensive article of accommodation.

"In the lamp there are three articles which demand our attention, the oil, the wick, and the supply of air. It is required that the oil should be readily inflammable, without containing any fetid substance which may prove offensive, or mucilage, or other matter, to obtruct the channels of the wick. I do not know of any process for ameliorating oils for this purpose, excepting that of washing with water containing acid or alkali. Either of these is said to render the mucilage of animal oils more soluble in the water; but acid is preferred, because it is less disposed to combine with the oil itself. The office of the wick appears to be chiefly, if not solely, to convey the oil by capillary attraction to the place of combustion. As the oil is consumed and flies off, other oil succeeds, and in this way a continued current of oil and maintenance of the flame are effected. But as the wicks of lamps are commonly formed of of combustible matter, it appears to be of some consequence what the nature and structure of this material may be. It is certain that the flame afforded by a wick of rush differs very considerably from that afforded by cotton; though perhaps this difference may, in a great measure, depend on the relative dimensions of each. And if we may judge from the different odour in blowing out a candle of each sort, there is some reason to suspect that the decomposition of the oil is not effected precisely in the same manner in each. We have also some obscure accounts of prepared wicks for lamps, which are stated to possess the property of facilitating the combustion of very impure oils, so that they shall burn for many hours without smoke or smell.

"The access of air is of the last importance in every process of combustion. When a lamp is fitted up with a very slender wick, the flame is small, and of a brilliant white colour: if the wick be larger, the combustion is less perfect, and the flame is brown: a still larger wick not only exhibits a brown flame, but the lower internal part appears dark, and is occupied by a portion of volatilized matter, which does not become ignited until it has ascended towards the point. When the wick is either very large or very long, part of this matter escapes combustion, and shews itself in the form of coal or smoke. The different intensity of the ignition of flame, according to the greater or less supply of air, is remarkably seen by placing a lamp with a small wick beneath a shade of glass not perfectly closed below, and more or less covered above. While the current of air through the glass shade is perfectly free, the flame is white; but in proportion as the aperture above is diminished, the flame becomes brown, long, wavering, and smoky; it instantly recovers its original whiteness when the opening is again enlarged. The inconvenience of a thick wick has been long since observed, and attempts made to remove it: in some instances by substituting a number of small wicks instead of a larger; and in others, by making the wick flat instead of cylindrical. The most scientific improvement of this kind, though perhaps less simple than the ordinary purposes of life demand, is the well-known lamp of Argand. In this the wick forms a hollow cylinder or tube, which slides over another tube of metal, so as to afford an adjustment with regard to its length. When this wick is lighted, the flame itself has the figure of a thin tube, to the inner as well as the outer surface of which the air has access from below. And a cylindrical shade of glass serves to keep the flame steady, and in a certain degree to accelerate the current of air. In this very ingenious apparatus many experiments may be made with the greatest facility. The inconvenience of a long wick, which supplies more oil than the volume of flame is capable of burning, and which consequently emits smoke, is seen at once by raising the wick; and on the other hand, the effect of a short wick, which affords a diminutive flame merely for want of a sufficient supply of combustible matter, is observable by the contrary process.

"The most obvious inconvenience of lamps in general, arises from the fluidity of the combustible material, which requires a vessel adapted to contain it, and even in the best constructed lamps is more or less liable to be spilled. When the wick of a lamp is once adjusted as to its length, the flame continues nearly in the same state for a very considerable time.

"It is almost unnecessary to describe a thing so universally known as a candle. The article is formed of a consistent oil, which envelopes a porous wick of fibrous vegetable matter. The cylindrical form and dimensions of the oil are given, either by casting it in a mould, or by repeatedly dipping the wick into the fused ingredient. Upon comparing a candle with a lamp, two very remarkable particulars are immediately seen. In the first place, the tallow itself, which remains in the unfused state, affords a cup or cavity to hold that portion of melted tallow which is ready to flow into the lighted part of the wick. In the second place, the combustion, instead of being confined, as in the lamp, to a certain determinate portion of the fibrous matter, is carried by a slow succession, through the whole length. Hence arises the greater necessity for frequent snuffing the candle; and hence also the station of the freezing point of the fat oil becomes of great consequence. For it has been shown that the brilliancy of the flame depends very much on the diameter of the wick being as small as possible; and this requisite will be most attainable in candles formed of a material that requires a higher degree of heat to fuse it. The wick of a tallow candle must be made thicker in proportion to the greater fusibility of the material, which would otherwise melt the sides of the cup, and run over in streams. The flame will therefore be yellow, smoky, and obscure, excepting for a short time immediately after snuffing. Tallow melts at the 92d degree of Fahrenheit's thermometer; spermaceti at the 133d degree; the fatty matter formed of flesh after long immersion in water melts at 127°; the *pela* of the Chinese, at 145°; bees wax at 142°; and bleached wax at 155°. Two of these materials are well known in the fabrication of candles. Wax in particular does not afford so brilliant a flame as tallow: but, on account of its fusibility, the wick can be made smaller; which not only affords the advantage of a clear perfect flame, but from its flexibility it is disposed to turn on one side, and come in contact with the external air which completely burns the extremity of the wick to white ashes, and thus performs the office of snuffing. We see, therefore, that the important object to society of rendering tallow candles equal to those of wax, does not at all depend on the combustibility of the respective materials, but upon a mechanical advantage in the cup, which is afforded by the inferior degree of fusibility in the wax; and that to obtain this valuable object, one of the following effects must be produced: Either the tallow must be burned in a lamp, to avoid the gradual progression of the flame along the wick; or some means must be devised to enable the candle to snuff itself, as the wax candle does; or, lastly, the tallow itself must be rendered less fusible by some chemical process. I have no great reason to boast of success in the endeavour to effect these; but my hope is, that the facts and observations here presented may considerably abridge the labour of others in the same pursuit.

"The makers of thermometers and other small articles with the blow-pipe and lamp, give the preference to tallow instead of oil, because its combustion is more complete, Candle. complete, and does not blacken the glass. In this operation, the heat of the lamp melts the tallow which is occasionally brought into its vicinity by the workman. But for the usual purposes of illumination, it cannot be supposed that a person can attend to supply the combustible matter. Considerable difficulties arise in the project for affording this gradual supply as it may be wanted. A cylindrical piece of tallow was inserted into a metallic tube, the upper aperture of which was partly closed by a ring, and the central part occupied by a metallic piece nearly resembling that part of the common lamp which carries the wick. In this apparatus the piece last described was intended to answer the same purpose, and was provided with a short wick. The cylinder of tallow was supported beneath in such a manner that the metallic tube and other part of this lamp were left to rest with their whole weight upon the tallow at the ring or contraction of the upper aperture. In this situation the lamp was lighted. It burned for some time with a very bright clear flame, which, when compared with that of a candle, possessed the advantages of uniform intensity, and was much superior to the ordinary flame of a lamp in its colour, and the perfect absence of smell. After some minutes it began to decay, and very soon afterwards went out. Upon examination it was found, that the metallic piece which carried the wick had fused a sufficient quantity of tallow for the supply during the combustion; that part of this tallow had flowed beneath the ring, and to other remote parts of the apparatus, beyond the influence of the flame; in consequence of which, the tube, and the cylinder of tallow, were fastened together, and the expected progression of supply prevented. It seems probable, that in every lamp for burning consistent oils, the material ought to be so disposed that it may descend to the flame upon the principle of the fountain reservoir. I shall not here state the obstacles which present themselves in the prospect of this construction, but shall dismiss the subject by remarking, that a contrivance of this nature would be of the greatest public utility.

"The wick of a candle, being surrounded by the flame, is nearly in the situation of a body exposed to destructive distillation in a close vessel. After losing its volatile products, the carbonaceous residue retains its figure, until, by the descent of the flame, the external air can have access to its upper extremity. But, in this case, the requisite combustion, which might snuff it, is not effected. For the portion of oil emitted by the long wick is not only too large to be perfectly burned, but also carries off much of the heat of the flame while it assumes the elastic state. By this diminished combustion and increased efflux of half-decomposed oil, a portion of coal or soot is deposited on the upper part of the wick, which gradually accumulates, and at length assumes the appearance of a fungus. The candle does not then give more than one-tenth of the light emitted in its best state. Hence it is that a candle of tallow cannot spontaneously snuff itself. It was not probable that the addition of a substance containing vital air or oxygene would supply that principle at the precise period of time required; but, as experiment is the test of every probability of this nature, I soaked a wick of cotton in a solution of nitre, then dried it, and made a candle. When this came to be lighted, nothing remarkable happened for a short time; at the expiration of which a decrepitation followed at the lower extremity of the flame, which completely divided the wick where the blackened part commences. The whole of the matter in combustion therefore fell off, and the candle was of course instantly extinguished. Whether this would have happened in all proportions of the salt or constructions of the candle, I did not try, because the smell of azote was sufficiently strong and unpleasant to forbid the use of nitre in the pursuit. From various considerations I am disposed to think that the spontaneous snuffing of candles made of tallow, or other fusible materials, will scarcely be effected but by the discovery of some material for the wick which shall be voluminous enough to absorb the tallow, and at the same time sufficiently flexible to bend on one side.

"The most promising speculation respecting this most useful article, seems to direct itself to the cup which contains the melted tallow. The imperfection of this part has already been noticed, namely, that it breaks down by fusion, and suffers its fluid contents to escape. The Chinese have a kind of candle about half an inch in diameter, which, in the harbour of Canton, is called *lobchock;* but whether the name be Chinese, or the corruption of some European word, I am ignorant. The wick is of cotton, wrapt round a small stick or match of the bamboo cane. The body of the candle is white tallow; but the external part, to the thickness of perhaps one-thirtieth of an inch, consists of a waxy matter coloured red. This covering gives a considerable degree of solidity to the candle, and prevents its guttering, because less fusible than the tallow itself. I did not observe that the stick in the middle was either advantageous or the contrary; and, as I now write from the recollection of this object at so remote a period as 25 years ago, I can only conjecture that it might be of advantage in throwing up a less quantity of oil into the flame than would have been conveyed by a wick of cotton sufficiently stout to have occupied its place unsupported in the axis of the candle.

"Many years ago I made a candle in imitation of the lobchock. The expedient to which I had recourse consisted in adapting the wick in the usual pewter mould: wax was then poured in, and immediately afterwards poured out: the film of wax which adhered to the inner surface of the mould soon became cool; and the candle was completed by filling the mould with tallow. When it was drawn out, it was found to be cracked longitudinally on its surface, which I attributed to the contraction of the wax, by cooling, being greater than that of the tallow. At present I think it equally probable that the cracking might have been occasioned by too sudden cooling of the wax before the tallow was poured in; but other avocations prevented the experiments from being varied and repeated. It is probable that the Chinese external coating may not be formed of pure hard bleached wax.

"But the most decisive remedy for the imperfection of this cheapest, and in other respects best material for candles, would undoubtedly be to diminish its fusibility. Various substances may be combined with tallow. either in the direct or indirect method. In the latter way, by the decomposition of soap, a number of experiments were made by Berthollet, of which an account

Candle.

count is inserted in the memoirs of the academy at Paris for the year 1780, and copied into the 26th volume of the Journal de Physique. None of these point directly to the present object; besides which, it is probable that the soap made use of by that eminent chemist was formed not of tallow, but oil. I am not aware of any regular series of experiments concerning the mutual action of fat oils and other chemical agents, more especially such as may be directed to this important object of diminishing its solubility; for which reason I shall mention a few experiments made with this view.

"1. Tallow was melted in a small silver vessel. Solid tallow sinks in the fluid, and dissolves without any remarkable appearance. 2. Gum sandarach in tears was not dissolved, but emitted bubbles, swelled up, became brown, emitted fumes, and became crisp or friable. No solution nor improvement of the tallow. 3. Shell-lac swelled up with bubbles, and was more perfectly fused than the gum sandarach in the former experiment. When the tallow was poured off, it was thought to congeal rather more speedily. The lac did not appear to be altered. 4. Benzoin bubbled without much swelling, was fused, and emitted fumes of an agreeable smell, though not resembling the flowers of benzoin. A slight or partial solution seemed to take place. The benzoin was softer and of a darker colour than before, and the tallow less consistent. 5. Common resin unites very readily with melted tallow, and forms a more fusible compound than the tallow itself. 6. Camphor melts easily in tallow, without altering its appearance. When the tallow is near boiling, camphoric fumes fly off. The compound appeared more fusible than tallow. 7. The acid or flowers of benzoin dissolves in great quantities without any ebullition or commotion. Much smoke arises from the compound, which does not smell like the acid of benzoin. Tallow alone does not fume at a low heat, though it emits a smell something like that of oil-olive. When the proportion of the acid was considerable, small needled crystals appeared as the temperature diminished. The appearances of separation are different according to the quantity of acid. The compound has the hardness and consistence of firm soap, and is partially transparent. 8. Vitriolated tartar, nitre, white sugar, cream of tartar, crystallized borax, and the salt sold in the markets under the name of salt of lemons, but which is supposed to be the essential salt of sorrel, or vegetable alkali supersaturated with acid of sugar, were respectively tried without any obvious mutual action or change of properties in the tallow. 9. Calcined magnesia rendered tallow opake and turbid, but did not seem to dissolve. Its effect resembled that of lime.

"It is proposed to try the oxigenated acetous acid, or radical vinegar; the acid of ants, of sugar, of borax, of galls, the tanning principle, the serous and gelatinous animal matter, the fecula of vegetables, vegetable gluten, bird lime, and other principles, either by direct or indirect application. The object, in a commercial point of view, is entitled to an extensive and assiduous investigation. Chemists in general suppose the hardness or less fusibility of wax to arise from oxygen, and to this object it may perhaps be advantageous to direct a certain portion of the inquiry. The metallic salts and calces are the combinations from which this principle is most commonly obtained; but the combinations of these with fat oils have hitherto afforded little promise of the improvement here sought. The subject is however so little known, that experiments of the loosest and most conjectural kind are by no means to be despised."

Lighting a CANDLE *by a small spark of electricity.* This method, which is an invention of Dr Ingenhousz, is recorded in the Phil. Trans. vol. lxviii. It is done by a small phial, having eight or ten inches of metallic coating, or even less, charged with electricity, which may be done at any time of the night by a person who has an electric machine in his room. "When I have occasion to light a candle," says he, "I charge a small coated phial, whose knob is bent outwards, so as to hang a little over the body of the phial; then I wrap some loose cotton over the extremity of a long brass pin or a wire, so as to stick moderately fast to its substance. I next roll this extremity of the pin wrapped up with cotton in some fine powder of resin, (which I always keep in readiness upon the table for this purpose, either in a wide-mouthed phial or in a loose paper); this being done, I apply the extremity of the pin or wire to the external coating of the charged phial, and bring as quickly as possible the other extremity wrapped round with cotton to the knob; the powder of resin takes fire, and communicates its flame to the cotton, and both together burn long enough to light a candle. As I do not want more than half a minute to light my candle in this way, I find it a readier method than kindling it by a flint and steel, or calling a servant. I have found that powder of white or yellow resin lights easier than that of brown. The *farina lycopodii* may be used for the same purpose; but it is not so good as the powder of resin, because it does not take fire quite so readily, requiring a stronger spark not to miss: besides, it is soon burnt away. By dipping the cotton in oil of turpentine, the same effect may be as readily obtained, if you take a jar somewhat greater in size. This oil will inflame so much the readier if you strew a few fine particles of brass upon it. The pin dust is the best for this purpose: but as this oil is scattered about by the explosion, and when kindled fills the room with much more smoke than the powder of resin, I prefer the last."

CANDLE-*Bombs*, a name given to small glass bubbles, having a neck about an inch long, with a very slender bore, by means of which a small quantity of water is introduced into them, and the orifice afterwards closed up. This stalk being put through the wick of a burning candle, the vicinity of the flame soon rarefies the water into steam, by the elasticity of which the glass is broken with a loud crack.

CANDLE is also a term of medicine, and is reckoned among the instruments of surgery. Thus the *candela fumalis*, or the *candela pro suffitu odorata*, is a mass of an oblong form, consisting of odoriferous powders mixed up with a third or more of the charcoal of willow or lime tree, and reduced to a proper consistence with a mucilage of gum tragacanth, labdanum, or turpentine. It is intended to excite a grateful smell without any flame, to correct the air, to fortify the brain, and to excite the spirits.

Medicated CANDLE, the same with BOUGIE.

CANDLE. Sale or auction by inch of candle, is when a

Candle ‖ Candle-stick.

a small piece of candle, being lighted, the bystanders are allowed to bid for the merchandise that is selling; but the moment the candle is out, the commodity is adjudged to the last bidder.

There is also an excommunication by inch of candle; when the sinner is allowed to come to repentance while a candle continues burning; but after it is consumed, he remains excommunicated to all intents and purposes.

Rush CANDLES, used in different parts of England, are made of the pith of a sort of rushes, peeled or stripped of the skin, except on one side, and dipped in melted grease.

CANDLE-*Wood*, slips of pine about the thickness of a finger, used in New England and other colonies to burn instead of candles, giving a very good light. The French inhabitants of Tortuga use slips of yellow santal-wood for the same purpose, and under the same denomination, which yields a clear flame, though of a green colour.

CANDLEBERRY TREE. See MYRICA, BOTANY *Index*.

CANDLEMAS, a feast of the church held on the second day of February, in honour of the purification of the Virgin Mary. It is borrowed from the practice of the ancient Christians, who on that day used abundance of lights both in their churches and processions, in memory, as is supposed, of our Saviour's being on that day declared by Simon "to be a light to lighten the Gentiles." In imitation of this custom, the Roman Catholics on this day consecrate all the tapers and candles which they use in their churches during the whole year. At Rome, the pope performs that ceremony himself; and distributes wax-candles to the cardinals and others, who carry them in procession through the great hall of the pope's palace. This ceremony was prohibited in England by an order of council in 1548.

CANDLEMAS, (2d Feb.) is made one of the four terms of the year for paying or receiving rents or borrowed money, &c.—In the courts of law, Candlemas term begins 15th January, and ends 3d February.

CANDLESTICK, an instrument to hold a candle, made in different forms, and all sorts of matter.

The golden candlestick was one of the sacred utensils made by Moses to be placed in the Jewish tabernacle. It was made of hammered gold, a talent in weight. It consisted of seven branches supported by a base or foot. These branches were adorned at equal distances with six flowers like lilies, and with as many bowls and knobs placed alternately. Upon the stock and six branches of the candlestick were the golden lamps, which were immoveable, wherein were put oil and cotton.

These seven lamps were lighted every evening, and extinguished every morning. The lamps had their tongs or snuffers to draw the cotton in or out, and dishes underneath them to receive the sparks or droppings of the oil. This candlestick wss placed in the antichamber of the sanctuary on the south side, and served to illuminate the altar of perfume and the tabernacle of the shew-bread. When Solomon had built the temple of the Lord, he placed in it ten golden candlesticks of the same form as that described by Moses, five on the north and five on the south side of the holy: But after the Babylonish captivity, the golden candlestick was again placed in the temple, as it had been before in the tabernacle by Moses. This sacred utensil, upon the destruction of the temple by the Romans, was lodged in the temple of Peace built by Vespasian: and the representation of it is still to be seen on the triumphal arch at the foot of Mount Palatine, on which Vespasian's triumph is delineated.

Candlestick, Candy.

CANDY, a large kingdom of Asia, in the island of Ceylon. It contains about a quarter of the island; and as it is encompassed with high mountains, and covered with thick forests, through which the roads and paths are narrow and difficult, the king had them guarded to prevent his subjects from going into other countries. It is full of hills, from whence rivulets proceed which are full of fish; but as they run among the rocks, they are not fit for boats: however, the inhabitants are very dexterous in turning them to water their land, which is fruitful in rice, pulse, and hemp.

Since the island of Ceylon fell into the hands of the English, we have obtained fuller information respecting it. Mr Percival, who has published an account of this island, mentions the jealousy, both of the Dutch and of the natives, as difficulties which could not have been easily surmounted by travellers while it remained subject to Holland *. "The interior of the island (he says), owing to the jealousy of the Dutch, has been little explored by Europeans; and any traveller who might have obtained the permission of the Dutch to visit it, could not have executed his purpose from the jealousy of the natives. Since the Candians have been driven by their invaders into the mountains of the interior, it has been their policy carefully to prevent any European from seeing those objects which might tempt the avarice of his countrymen, or from observing the approaches by which an army could penetrate their mountains. If an European by any accident was carried into their territories, they took every precaution to prevent him from escaping; and the guards, stationed everywhere at the approaches, joined to the wide and pathless woods which divide the interior from the coast, rendered such an attempt almost completely desperate. When an ambassador was sent from any European government to the king of Candy, he was watched with all that strictness and jealousy which the suspicious temper of uncivilized nations dictates. In an embassy which I attended to the court of that monarch, I had an opportunity of observing how careful the natives were to prevent strangers from making any observations. Mr Boyd, who about twenty years ago went on a similar embassy, was watched with the same particular circumspection; and has therefore been able to add little to our stock of knowledge concerning the interior.

* *Account of Ceylon*, p. 23.

"The dominions of the native prince are completely cut off on all sides from those of the Europeans, by almost impenetrable woods and mountains. The passes which lead through these to the coasts are extremely steep and difficult, and scarcely known even by the natives themselves. As soon as we advance from ten to twenty miles from the coasts, a country presents itself greatly differing from the sea-coast, both in soil, climate, and appearance. After ascending the mountains and passing the woods, we find ourselves in the midst of a country not advanced many stages beyond the

the first state of improvement, and which we are astonished to find in the neighbourhood of the highly cultivated fields which surround Columbo. As we advance towards the centre of the island, the country gradually rises, and the woods and mountains which separate the several parts of the country become more steep and impervious.

"It is in the midst of these fastnesses that the native prince still preserves those remains of territory and power which have been left him by successive invaders. His dominions are now much reduced in size: for besides the whole of the sea-coasts which were of any value, the Dutch, in their various attacks during the last century, have contrived to get into their power every tract from which they could derive either emolument or security. Those provinces which still remain to him, are Nourecalva and Hotcourly towards the north and north-west; while Matuly, comprehending the districts of Bintana, Velas, and Panoa, with a few others, occupy those parts more to the eastward. To the south-east lies Ouvvah, a province of some note, and giving the king one of his titles. The western parts are chiefly included in the provinces of Cotemal and Hotteracorley. These different provinces are subdivided into corles or districts, and entirely belong to the native prince. It is needless to recount the names of those divisions which stretch towards the sea-coast, and are now chiefly in our possession.

"In the highest and most central part of the native king's dominions, lie the corles or counties of Oudanor and Tatanour, in which are situated the two principal cities. These countries take the pre-eminence of all the rest, and are both better cultivated, and more populous, than any of the other districts, and are distinguished by the general name of Condé Udda; *condé* or *candé* in the native language signifying a mountain, and *udda* the greatest or highest.

Ceylon fell into the hands of the British in 1796; and in 1802 a war originated with the Candians. The British took possession of the capital, and placed a new prince on the throne; but the military force being reduced by the climate, and the Candians being in arms, the place was given up by capitulation, in defiance of which, however, the British were massacred. Another British force again reduced the chief town in 1815, and in 1816 the kingdom was annexed to the British dominions. The Candians revolted in 1818, but were subdued after a considerable struggle.

Candy, a town of Asia, and capital of a kingdom of the same name, in the island of Ceylon. It has been often burnt by the Portuguese when they were masters of these coasts. It is situated in E. Long. 79. 12. N. Lat. 7. 35.

We have the following description of Candy by Mr Percival, whom we have already quoted, and who attended an embassy to the king.

"In the district of Tatanour lies Candy, the royal residence and the capital of the native prince's dominions. It is situated at the distance of 80 miles from Columbo, and twice as far from Trincomalec, in the midst of lofty and steep hills covered with thick jungle. The narrow and difficult passes by which it is approached are intersected with thick hedges of thorn; and hedges of the same sort are drawn round the hills in the vicinity of Candy like lines of circumvallation. Through them the only passage is by gates of the same thorny materials, so contrived as to be drawn up and let down by ropes. When the Candians are obliged to retreat within these barriers, they cut the ropes, and then it is impossible to force a passage except by burning down the gates, which, from their green state, and the constant annoyance of the enemy sheltered behind them, would prove an enterprise of time and difficulty. These hedge-rows form the chief fortifications of Candy. The Malivagonga also nearly surrounds the hill on which it stands: that river is here broad, rocky, and rapid; a very strict guard is kept on it, and every one who passes or repasses is closely watched and examined.

"The city itself is a poor miserable-looking place, surrounded by a mud wall of no strength whatever. It has been several times burnt by Europeans, and was once deserted by the king, who retired to a more inaccessible part of his dominions. It is upon occasion of the embassy of General Macdowall, that any information concerning the present state of Candy has been obtained; and even then it could be little more than guessed at, as the ambassador and his suite were admitted only by torch-light, and always retired before break of day. From what could then be observed, the city consists of a long straggling street built on the declivity of a hill; the houses mean and low, but with their foundations raised in such a manner above the level of the street, that they appear quite lofty to passengers. The reason of this extraordinary taste is to enable the king to hold his assemblies of the people, and to have his elephant and buffalo fights in the street, without interfering with the houses. When the king passes along the street, none of the inhabitants are allowed to appear before their houses, or the paths on a level with them, as that would be attended with the heinous indecorum of placing a subject higher than the prince descended of the sun.

"At the upper end of this street, stands the palace, a poor mansion for the abode of a king. It is surrounded with high stone walls, and consists of two squares, one within the other. In the inner of these are the royal apartments, and it is there that the court is held and audiences given. The exterior of the palace and the rest of the city could be but very partially observed by those who attended General Macdowal, owing to the pressure of the crowd, and the dazzling glare of the torches. By every account indeed which I have heard, Candy contains nothing worthy of notice, and from the want of either wealth or industry among the inhabitants, it is not indeed to be expected that any thing could be met with in this straggling village to attract the attention of the traveller."

Candy, or *Sugar-Candy*, a preparation of sugar made by melting and crystallizing it six or seven times over, to render it hard or transparent. It is of three kinds, white, yellow, and red. The white comes from the loaf-sugar, the yellow from the casonado, and the red from the muscovado.

CANDYING, the act of preserving simples in substance, by boiling them in sugar. The perfor-

mance

mance of this originally belonged to the apothecaries, but is now become a part of the business of the confectioner.

CANE. See Arundo and Calamus, Botany *Index*.

Cane, denotes also a walking stick. It is customary to adorn it with a head of gold, silver, agate, &c. Some are without knots, and very smooth and even; others are full of knots about two inches distance from one another. These last have very little elasticity, and will not bend so well as the others.

Canes of Bengal are the most beautiful which the Europeans bring into Europe. Some of them are so fine, that people work them into bowls or vessels, which being varnished over in the inside, with black or yellow lacca, will hold liquors as well as glass or China ware does; and the Indians use them for that purpose.

Cane is also the name of a long measure, which differs according to the several countries where it is used. At Naples the cane is equal to 7 feet $3\frac{1}{2}$ inches English measure: The cane of Thoulouse and the Upper Languedoc, is equal to the varre of Arragon, and contains 5 feet $8\frac{1}{2}$ inches; at Montpellier, Provence, Dauphiny, and the Lower Languedoc, to 6 English feet $5\frac{1}{2}$ inches.

CANEA, a considerable town of the island of Candia, where a bashaw resides. It was built by the Venetians, and occupies part of the site of the ancient Cydonia. It is but about two miles in compass; encircled on the land side with a single wall, extremely thick; and defended by a broad and deep ditch, cut through a bed of rock, which extends all around the wall. By cutting it still deeper, they might cause the sea to flow round its ramparts; on which they have raised high platforms, that their great guns might command a wider extent of the adjacent plain. The city has only one gate, the gate of Retimo, protected by a half-moon battery, which is the only exterior fort. The side which faces the sea is the best fortified. On the left of the harbour are four batteries, rising one above another, and planted with a number of large cannons of cast metal, marked with the arms of Venice. The first of these batteries stands close on the brink of the sea. The right side of the harbour is defended only by a strong wall, extending along a chain of pointed rocks which it is dangerous for ships to approach. At the extremity of this wall, there is an old castle, falling into ruins. Beneath that castle, the Venetians had immense arsenals, vaulted with stone. Each of these vaults was of sufficient length, breadth, and height, to serve as a work-shop for building a ship of the line. The ground is sloping, and the outermost part of these capacious arsenals is on a level with the sea; so that it was very easy to launch the ships built there into the water. The Turks are suffering that magnificent work to fall into ruins.

The city of Canea is laid out on a fine plan. The streets are large and straight; and the squares adorned with fountains. There are no remarkable buildings in it. Most of the houses are flat-roofed, and have only one story. Those contiguous to the harbour are adorned with galleries, from which you enjoy a delightful prospect. From the windows you discover the large bay formed between Cape Spada and Cape Melec, and all the ships that are entering in or passing out. The harbour, at present, receives ships of 200 tons burden: and it might be enlarged so as to admit the largest frigates. Its mouth is exposed to the violence of the north winds, which sometimes swell the billows above the ramparts. But, as it is narrow, and the bottom is good, ships that are well moored run no danger. At the time when Tournefort visited Crete, Canea did not contain more than five or six thousand inhabitants. But, at present, when the gates of Gira-Petra, Candi, and Retimo, are choaked up, the merchants have retired to Canea; and it is reckoned to contain 16,000 souls. The environs of the town are admirable; being adorned with forests of olive-trees mixed with fields, vineyards, gardens, and brooks bordered with myrtle-trees and laurel-roses. The chief revenue of this town consists in oil-olive. E. Long. 24. 15. N. Lat. 35. 28.

CANELLA. See Botany *Index*.

CANELLE, or Cane Land, a large country in the island of Ceylon, called formerly the *kingdom of Cota*. It contains a great number of cantons, now occupied by the English. The chief riches of this country consist in cinnamon, of which there are large forests. There are five towns on the coast, some forts, and a great number of harbours. The rest of the country is inhabited by the natives; and there are several rich mines, from whence they get rubies, sapphires, topazes, cats eyes, and several other precious stones.

CANEPHORÆ, in Grecian antiquity, virgins who when they become marriageable, presented certain baskets full of little curiosities to Diana, in order to get leave to depart out of her train, and change their state of life.

CANEPHORIA, in Grecian antiquity, a ceremony which made part of a feast celebrated by the Athenian virgins on the eve of their marriage-day. At Athens the canephoria consisted in this, that the maid, conducted by her father and mother, went to the temple of Minerva, carrying with her a basket full of presents to engage the goddess to make the marriage state happy; or, as the scholiast of Theocritus has it, the basket was intended as a kind of honourable amends made to that goddess, the protectrix of virginity, for abandoning her party: or as a ceremony to appease her wrath. Suidas calls it a festival in honour of Diana.

Canephoria is also the name of a festival in honour of Bacchus, celebrated particularly by the Athenians, on which the young maids carried golden baskets full of fruit, which baskets were covered, to conceal the mystery from the uninitiated.

CANES, in Egypt, and other eastern countries, a poor sort of buildings for the reception of strangers and travellers. People are accommodated in these with a room at a small price, but with no other necessaries; so that, excepting the room, there are no greater accommodations in these houses than in the deserts, only that there is a market near.

Canes Venatici, in *Astronomy*, the Greyhounds, two new constellations, first established by Hevelius, between the tail of the Great Bear and Bootes's arms, above the Coma Berenices. The first is called *asterion*, being that next the Bear's tail; the other *chara*. They comprehend 23 stars, of which Tycho only observed two. The longitudes and latitudes of each are given by Hevelius. In the British Catalogue they are 25.

CANETO, a strong town in Italy in the duchy of Mantua, seated on the river Oglio, which was taken by the Imperialists in 1701, by the French in 1702, afterwards by the Imperialists, and then by the French in 1705. E. Long. 10. 45. N. Lat. 45. 10.

CANGA, in the Chinese affairs, a wooden clog borne on the neck, by way of punishment for divers offences. The canga is composed of two pieces of wood notched, to receive the criminal's neck; the load lies on his shoulders, and is more or less heavy according to the quality of his offence. Some cangas weigh 200lb.; the generality from 50 to 60. The mandarins condemn to the punishment of the canga. Sentence of death is sometimes changed for this kind of punishment.

CANGE, Charles du Fresne, Sieur du, one of the most learned writers of his time, was born at Amiens in 1601, and studied at the Jesuits college in that city. Afterwards he applied himself to the study of the law at Orleans, and gained great reputation by his works; among which are, 1. The history of the empire of Constantinople under the French emperors. 2. John Cinnamus's six books of the history of the affairs of John and Manuel Comnenus, in Greek and Latin, with historical and philological notes. 3. *Glossarium ad Scriptores mediæ et infimæ Latinitatis.*

CANGI, Ceangi, or *Cangani*, anciently a people of Britain, concerning whose situations antiquaries have been much perplexed. They are all the same people. Camden discovered some traces of them in many different and distant places, as in Somersetshire, Wales, Derbyshire, and Cheshire; and he might have found as plain vestiges of them in Devonshire, Dorsetshire, Essex, Wiltshire, &c. Mr Horsley and others are no less perplexed and undetermined in their opinions on this subject. But Mr Baxter seems to have discovered the true cause of all this perplexity, by observing that the Cangi or Ceangi were not a distinct nation seated in one particular place, but such of the youth of many different nations as were employed in pasturage, in feeding the flocks and herds of their respective tribes. Almost all the ancient nations of Britain had their ceangi, their pastoritia pubes, the keepers of their flocks and herds, who ranged about the country in great numbers, as they were invited by the season and plenty of pasture for their cattle. This is the reason that vestiges of their name are to be found in so many different parts of Britain; but chiefly in those parts which are most fit for pasturage. These ceangi of the different British nations, naturally brave, and rendered still more hardy by their way of life, were constantly armed for the protection of their flocks from wild beasts; and these arms they occasionally employed in the defence of their country and their liberty.

CANGIAGIO, or Cambiasi Ludovico, one of the most eminent of the Genoese painters, was born in 1527. His works at Genoa are very numerous; and he was employed by the king of Spain to adorn part of the Escurial. It is remarked of him, that he was not only a most expeditious and rapid painter, but also that he worked equally well with both hands; and by that unusual power he executed more designs, and finished more grand works with his own pencils, in a much shorter time, than most other artists could do with several assistants. He died in 1585.

In the royal collection at Paris there is a Sleeping Cupid, as large as life, and likewise Judith with her attendant, which are painted by Cangiagio, and are an honour to that master. And in the Pembroke collection at Wilton is a picture, reputed the work of Cangiagio, representing Christ bearing his cross.

CANICULA, is a name proper to one of the stars of the constellation *canis major*, called also simply the *dog star*; by the Greeks Σειριος, *Sirius.* Canicula is the tenth in order in the Britannic catalogue; in Tycho's and Ptolemy's it is the second. It is situated in the mouth of the constellation; and is of the first magnitude, being the largest and brightest of all the stars in the heavens. From the rising of this star not cosmically, or with the sun, but heliacally, that is, its emersion from the sun's rays, which now happens about the 15th day of August, the ancients reckoned their *dies caniculares*, or dog days. The Egyptians and Ethiopians began their year at the rising of the Canicula, reckoning to its rise again the next year, which is called *annus canarius*, or canicular year. This year consisted ordinarily of 365 days, and every fourth year of 366, by which it was accommodated to the civil year. The reason of their choice of the Canicula before the other stars, to compute their time by, was not only the superior brightness of that star, but because its heliacal rising was in Egypt a time of singular note, as falling on the greatest augmentation of the Nile, the reputed father of Egypt. Ephestion adds, that, from the aspect and colour of Canicula, the Egyptians drew prognostics concerning the rise of the Nile; and, according to Florus, predicted the future state of the year; so that the first rising of this star was annually observed with great attention.

CANICULUM, or Caniculus, in the Byzantine antiquities, a golden standish or ink vessel, decorated with precious stones, wherein was kept the sacred *encaustum*, or red ink, wherewith the emperors signed their decrees, letters, &c. The word is by some derived from *canis*, or *caniculus;* alluding to the figure of a dog, which it represented, or rather because it was supported by the figures of dogs. The caniculum was under the care of a particular officer of state.

CANINA, the north part of the ancient Epirus, a province of Greece, which now belongs to the Turks, and lies off the entrance of the gulf of Venice. The principal town is of the same name, and is seated on the sea coast, at the foot of the mountains of Chimera. E. Long. 19. 25. N. Lat. 40. 55.

CANINANA, in *Zoology*, the name of a species of serpent found in America, and esteemed one of the less poisonous kinds. It grows to about two feet long; and is green on the back, and yellow on the belly. It feeds on eggs and small birds; the natives cut off the head and tail, and eat the body as a delicate dish.

CANINE, whatever partakes of, or has any relation to, the nature of a dog.

Canine Appetite, amounts to much the same with Bulimy.

Canine Madness. See Medicine *Index.*

Canine

Canine Teeth, are two sharp-edged teeth in each jaw; one on each side, placed between the incisores and molares.

CANINI, John Angelo and Marc Anthony, brothers and Romans, celebrated for their love of antiquities. John excelled in designs for engraving on stones, particularly heads: Marc engraved them. They were encouraged by Colbert to publish a succession of heads of the heroes and great men of antiquity, designed from medals, antique stones, and other ancient remains; but John died at Rome soon after the work was begun: Marc Anthony, however, procured assistance, finished and published it in Italian in 1669. The cuts of this edition were engraved by Canini, Picard, and Valet; and a curious explanation is given, which discovers the skill of the Caninis in history and mythology. The French edition of Amsterdam, in 1731, is spurious.

CANIS, or Dog. See Mammalia *Index*.

Canis Major, the Great Dog, in *Astronomy*, a constellation of the southern hemisphere, below Orion's feet, though somewhat to the westward of him; whose stars Ptolemy makes 29; Tycho observed only 13; Hevelius 21; in the Britannic catalogue they are 31.

Canis Minor, the Little Dog, in *Astronomy*, a constellation of the northern hemisphere; called also by the Greeks *Procyon*, and by the Latins *Antecanis* and *Canicula*. The stars in the constellation Canis Minor, are in Ptolemy's catalogue, 2; in Tycho's 5; in Hevelius's, 13; and in the British catalogue, 14.

CANISIUS, Henry, a native of Nimeguen, and one of the most learned men of his time, was professor of canon law at Ingoldstadt; and wrote a great number of books; the principal of which are, 1. *Summa Juris Canonici*. 2. *Antiquæ Lectiones*, a very valuable work. He died in 1609.

CANITZ, the Baron of, a German poet and statesman, was of an ancient and illustrious family in Brandenburg, and born at Berlin in 1654, five months after his father's death. After his early studies, he travelled to France, Italy, Holland, and England; and upon his return to his country, was charged with important negotiations by Frederic II. Frederic III. employed him also. Canitz united the statesman with the poet; and was conversant in many languages, dead as well as living. His German poems were published for the tenth time, 1750, in 8vo. He is said to have taken Horace for his model, and to have written purely and delicately. But he did not content himself with barely cultivating the fine arts in himself; he gave all the encouragement he could to them in others. He died at Berlin, in 1699, privy counsellor of state, aged 45.

CANKER, a disease incident to trees, proceeding chiefly from the nature of the soil. It makes the bark rot and fall. If the canker be in a bough, cut it off; in a large bough, at some distance from the stem; in a small one, close to it: but for over hot strong ground, the ground is to be cooled about the roots with pond mud and cow dung.

Canker, among farriers. See Farriery *Index*.

CANNA, Indian reed. See Botany *Index*.

CANNABIS, Hemp. See Botany *Index*.

From the leaves of hemp pounded and boiled in water, the natives of the East Indies prepare an intoxicating liquor of which they are very fond. The plant, when fresh, has a rank narcotic smell; the water in which the stalks are soaked, in order to separate the tough rind for mechanic uses, is said to be violently poisonous, and to produce its effects almost as soon as drank. The seeds also have some smell of the herb, and their taste is unctuous and sweetish: they are recommended, boiled in milk, or triturated with water into an emulsion, against coughs, heat of urine, and the like. They are also said to be useful in incontinence of urine, and for restraining venereal appetites; but experience does not warrant their having any virtues of that kind.

CANNÆ, in *Ancient Geography*, a town of Apulia on the Adriatic, at the mouth of the river Aufidus, rendered famous by a terrible overthrow which the Romans here received from the Carthaginians under Hannibal. The Roman consuls, Æmilius Paulus and Terentius Varro, being authorised by the senate to quit the defensive plan, and stake the fortunes of the republic on the chance of a battle, marched from Canusium, and encamped a few miles east, in two unequal divisions, with the Aufidus between them. In this position they meant to wait for an opportunity of engaging to advantage; but Hannibal, whose critical situation in a desolated country, without refuge or allies, could admit of no delay, found means to inflame the vanity of Varro by some trivial advantages in skirmishes between the light horse. The Romans, elated with this success, determined to bring matters to a speedy conclusion; but, finding the ground on the south side too confined for the operations of so large an army, crossed the river; and Varro resting his right wing upon the Aufidus, drew out his forces in the plain. Hannibal, whose head-quarters were at Cannæ, no sooner perceived the enemy in motion, than he forded the water below, and marshalled his troops in a line opposite to that of his adversaries.

The Romans were vastly superior in number to the Carthaginians; but the latter were superior in cavalry. The army of the former, consisting of 87,000 men, was drawn up in the usual manner; the *hastati* in the first line, the *principes* in the second, and the *triarii* in the third. The cavalry were posted on the wings.—On the right, the Roman knights flanked the legionaries; on the left, the cavalry of the allies covered their own infantry. The two consuls commanded the two wings, Æmilius the right, and Terentius the left; and the two proconsuls, Servilius and Attilius, the main body. On the other hand, Hannibal, whose army consisted of 40,000 foot and 10,000 horse, placed his Gaulish and Spanish cavalry in his left wing, to face the Roman knights; and the Numidian horse in his right, over against the cavalry of the allies of Rome. As to his infantry, he divided the African battalions into two bodies; one of which he posted near the Gaulish and Spanish horse, the other near the Numidian. Between these two bodies were placed on one side the Gaulish, on the other the Spanish infantry, drawn up in such a manner as to form an obtuse angle, projecting a considerable way beyond the two wings. Behind this line he drew up a second which had no projection. Asdrubal commanded the left wing; Maherbal the right; and Hannibal himself, with his brother Mago,

Mago, the main body. He had also taken care to post himself in such a manner, that the wind *Vulturnus*, which rises at certain stated times, should blow directly in the faces of the Romans during the fight, and cover them with dust. The onset was begun by the light-armed infantry; the Romans discharging their javelins, and the *baleares* their stones, with pretty equal success; nevertheless, the consul Æmilius was wounded. —Then the Roman cavalry in the right wing advanced against the Gaulish and Spanish in Hannibal's left. As they were shut in by the river Aufidus on one side, and by their infantry on the other, they did not fight, as usual, by charging and wheeling off, and then returning to the charge; but continued fighting each man against his adversary, till one of them was killed or retired. After they had made prodigious efforts on both sides to overbear each other, they all on a sudden dismounted, and fought on foot with great fury. In this attack the Gauls and Spaniards soon prevailed, put the Romans to the route, and, pursuing them along the river, strewed the ground with their dead bodies, Asdrubal giving no quarter. This action was scarce over, when the infantry on both sides advanced. The Romans first fell upon the Spaniards and Gauls, who, as already observed, formed a kind of triangle projecting beyond the two wings. These gave ground, and, pursuant to Hannibal's directions, sunk into the void space in their rear, by which means they insensibly brought the Romans into the centre of the African infantry; and then the fugitives rallying, attacked them in front, while the Africans charged them in both flanks. The Romans being, by this artful retreat, drawn into the snare and surrounded, no longer kept their ranks, but formed several platoons in order to face every way. Æmilius, who was on the right wing, seeing the danger of the main body, at the head of his legionaries acted the part both of a soldier and general, penetrating into the heart of the enemy's battalions, and cutting great numbers of them in pieces. All the Roman cavalry that were left attended the brave consul on foot; and, encouraged by his example, fought like men in despair. But, in the mean time, Asdrubal, at the head of a detachment of Gaulish and Spanish infantry brought from the centre, attacked Æmilius's legionaries with such fury, that they were forced to give ground and fly; the consul, being all covered with wounds, was at last killed by some of the enemy who did not know him. In the main body, the Romans, though invested on all sides, continued to sell their lives dear; fighting in platoons, and making a great slaughter of the enemy. But being at length overpowered, and disheartened by the death of the two proconsuls, Servilius and Attilius, who headed them, they dispersed and fled, some to the right, and others to the left, as they could find opportunity; but the Numidian horse cut most of them in pieces; the whole plain was covered with heaps of dead bodies, insomuch that Hannibal himself, thinking the butchery too terrible, ordered his men to put a stop to it.—There is a great disagreement among authors as to the number of Romans killed and taken at the battle of Cannæ. According to Livy, the republic lost 50,000 men, including the auxiliaries. According to Polybius, of 6000 Roman horse, only 70 escaped to Venusia with Terentius Varro, and 300 of the auxiliary horse. As to the infantry, that writer tells us, that 70,000 of the Roman foot died in the field of battle fighting like brave men; and that 13,000 were made prisoners. According to Dionysius of Halicarnassus, of 6000 horse, only 370 escaped the general slaughter, and of 80,000 foot, 3000 only were left. The most moderate computation makes the number of Romans killed to amount to 45,000. The scene of action is marked out to posterity, by the name of *Pezzo di Sangue*, "Field of Blood."

These plains have more than once, since the Punic war, afforded room for men to accomplish their mutual destruction. Melo of Bari, after raising the standard of revolt against the Greek emperors, and defeating their generals in several engagements, was at last routed here in 1019, by the Catapan Bolanus. Out of 250 Norman adventurers, the flower of Melo's army, only ten escaped the slaughter of that day. In 1201, the archbishop of Palermo and his rebellious associates, who had taken advantage of the nonage of Frederick of Swabia, were cut to pieces at Cannæ by Walter de Brienne, sent by the Pope to defend the young king's dominions.

The traces of the town of Cannæ are very faint, consisting of fragments of altars, cornices, gates, walls, vaults, and under-ground granaries. It was destroyed the year before the battle: but, being rebuilt, became an episcopal see in the infancy of Christianity. It was again ruined in the sixth century, but seems to have subsisted in a humble state many ages later; for we read of its contending with Barletta for the territory which till then had been enjoyed in common by them; and in 1284, Charles I. issued an edict for dividing the lands, to prevent all future litigation. The prosperity of the towns along the coast, which, increased in wealth and population by embarkations of the crusades and by traffic, proved the annihilation of the great inland cities; and Cannæ was probably abandoned entirely before the end of the thirteenth century.

CANNEQUINS, in commerce, white cotton cloths brought from the East Indies. They are a proper commodity for trading on the coast of Guinea, particularly about the rivers Senegal and Gambia. These linens are folded square-wise, and are about eight ells long.

CANNEL COAL. See MINERALOGY *Index*.

CANNES, a sea-port of France, in Provence, seated on the coast of the Mediterranean sea, with a castle. Bonaparte landed here on his return from Elba, 1. March 1815. E. Long. 7. 7. N. Lat. 43. 34.

CANNIBAL, a modern term for an anthropophagus or man-eater, more especially in the West Indies. See ANTHROPOPHAGI.

CANNON, a military engine for throwing balls, &c. by the help of GUNPOWDER.

The invention of brass cannon is by Laney ascribed to J. Owen: he says, that they were first known in England in the year 1535; but yet acknowledges, that, in 1346, there were four pieces of cannon in the English army at the battle of Cressy, and that these were the first that were known in France. And Mezeray relates, that King Edward, by five or six pieces of cannon, struck terror into the French army, it being the first time they had seen any of these thunder-ing machines; though others affirm that cannon were known also in France at the same time; but that the French king, in his hurry to attack the English, and in confidence of victory, left all his cannon behind him as useless incumbrances (see ARTILLERY). The Germans carry the invention farther back, and attribute it to Albertus Magnus, a Dominican monk, about the year 1250. Vossius rejects all these opinions, and finds cannon in China almost 1700 years ago. According to him, they were invented by the emperor Kitey in the year of Christ 85. See GUN and GUNNERY.

For the casting of cannon, see FOUNDERY. For their different parts, proportions, management, operation, and effect, see GUNNERY. See also CANNON, SUPPLEMENT.

CANNON, with letter-founders and printers, the name of the largest size of letters they use.

CANNONADE, the application of artillery to the purposes of war, or the direction of its efforts against some distant object intended to be seized or destroyed, as a ship, battery, or fortress. See GUNNERY.

Since a large ship of war may be considered as a combination of floating batteries, it is evident that the efforts of her artillery must be greatly superior to those of a fortress on the sea coast; that is to say, in general; because, on some particular occasions, her situation may be extremely dangerous, and her cannonading ineffectual. Her superiority consists in several circumstances, as the power of bringing her different batteries to converge to one point; of shifting the line of her attack so as to do the greatest possible execution against the enemy, or to lie where she will be the least exposed to his shot; and chiefly because, by employing a much greater number of cannon against a fort than it can possibly return, the impression of her artillery against stone walls soon becomes decisive and irresistible. Besides these advantages in the attack, she is also greatly superior in point of defence; because the cannon shot, passing with rapidity through her sides, seldom do any execution out of the line of their flight, or occasion much mischief by their splinters; whereas they very soon shatter and destroy the faces of a parapet, and produce incredible havock among the men by the fragments of the stones, &c. A ship may also retreat when she finds it too dangerous to remain longer exposed to the enemy's fire, or when her own fire cannot produce the desired effect. Finally, The fluctuating situation of a ship, and of the element on which she rests, renders the effects of bombs very uncertain, and altogether destroys the effect of the *ricochet*, or rolling and bounding shot, which is so pernicious and destructive in a fortress or land engagement. The chief inconveniency to which a ship is exposed, on the contrary, is, that the low-laid cannon in a fort near the brink of the sea, may strike her repeatedly on or under the surface of the water, so as to sink her before her cannonade can have any considerable efficacy.

CANO, a kingdom of Africa, in Negroland, with a town of the same name. It is bounded by Zaara on the north, by the river Niger on the south, the kingdom of Agades on the west, and that of Cashna on the east. Some of the inhabitants are herdsmen, and others till the ground and dwell in villages. It produces corn, rice, and cotton. Here are also many deserts, and mountains covered with woods, in which are wild citrons and lemon trees. The walls and houses of the town are made of clay, and the principal inhabitants are merchants. E. Long. 16. 18. N. Lat. 21. 5.

CANOBIA, a town of Italy, in the duchy of Milan, seated on the western bank of Lago Maggiore, or the Greater Lake. E. Long. 8. 47. N. Lat. 45. 55.

CANOE, a sort of Indian boat or vessel, formed of the trunk of a tree hollowed, and sometimes of several pieces of the bark put together.

Canoes are of various sizes, according to the uses for which they may be designed, or the countries wherein they are formed. The largest are made of the cotton tree; some of them will carry between 20 and 30 hogsheads of sugar or molasses. Some are made to carry sail; and for this purpose are steeped in water till they become pliant; after which their sides are extended, and strong beams placed between them, on which a deck is afterwards laid that serves to support their sides. The other sorts very rarely carry sail, unless when going before the wind; their sails are made of a sort of short silk grass or rushes. They are commonly rowed with paddles, which are pieces of light wood somewhat resembling a corn shovel; and, instead of rowing with it horizontally like an oar, they manage it perpendicularly. The small canoes are very narrow, having only room for one person in breadth, and seven or eight lengthwise. The rowers, who are generally American savages, are very expert in managing their paddles uniformly, and in balancing the canoes with their bodies; which would be difficult for a stranger to do, how well accustomed soever to the conducting of European boats, because the canoes are extremely light, and liable to be overturned. The American Indians, when they are under the necessity of landing to avoid a water-fall, or of crossing the land from one river to another, carry their canoes on their heads, till they arrive at a place where they can launch them again. This is the general construction of canoes, and method of managing them; but some nations have vessels going under the name of canoes, which differ considerably from the above; as the inhabitants of Greenland, Hudson's Bay, Otaheite, &c.

CANON, a person who possesses a prebend, or revenue allotted for the performance of divine service, in a cathedral or collegiate church.

Canons are of no great antiquity. Paschier observes, that the name canon was not known before Charlemagne; at least the first we hear of are in Gregory de Tours, who mentions a college of canons instituted by Baldwin XVI. archbishop of that city, in the time of Clotharius I. The common opinion attributes the institution of this order to Chrodegangus, bishop of Metz, about the middle of the eighth century.

Originally canons were only priests, or inferior ecclesiastics, who lived in community; residing by the cathedral church, to assist the bishop; depending entirely on his will; supported by the revenues of the bishopric; and living in the same house, as his domestics, or counsellors, &c. They even inherited his moveables, till the year 817, when this was prohibited by the council of Aix-la-Chapelle, and a new rule substituted

stituted in the place of that which had been appointed by Chrodegangus, and which was observed for the most part in the west till the 12th century. By degrees, these communities of priests, shaking off their dependence, formed separate bodies; whereof the bishops, however, were still heads. In the tenth century, there were communities or congregations of the same kind, established even in cities where there were no bishops: these were called collegiates, as they used the terms congregation and college indifferently: the name chapter, now given to these bodies, being much more modern. Under the second race of the French kings, the canonical or collegiate life had spread itself all over the country; and each cathedral had its chapter, distinct from the rest of the clergy. They had the name canon from the Greek κανων, which signifies three different things; a rule, a pension or fixed revenue to live on, and a catalogue or matricula; all which are applicable to them.

In time, the canons freed themselves from their rules, the observance relaxed, and, at length, they ceased to live in community: yet they still formed bodies; pretending to other functions besides the celebration of the common office in the church; yet assuming the rights of the rest of the clergy: making themselves as a necessary council of the bishop; taking upon them the administration of a see during a vacancy, and the election of a bishop to supply it. There are even some chapters exempt from the jurisdiction of the bishop, and owning no head but their dean. After the example of cathedral chapters, collegiate ones also continued to form bodies, after they had abandoned living in community.

CANONS are of various kinds; as,

Cardinal CANONS, which are those attached, and, as the Latins call it, *incardinati*, to a church, as a priest is to a parish.

Domicellary CANONS, were young canons, who, not being in orders, had no right in any particular chapters.

Expectative CANONS, were such as, without having any revenue or prebend, had the title and dignities of canons, a voice in the chapter, and a place in the choir; till such time as a prebend should fall.

Foreign CANONS, were such as did not officiate in the canonries to which they belonged. To these were opposed mansionary canons, or canons residentiary.

Lay or *honorary* CANONS, are such among the laity as have been admitted, out of honour and respect, into some chapter of canons.

Regular CANONS, are canons that still live in community; and who, like religious, have, in process of time, to the practice of their rules, added the solemn profession of vows. They are called regulars, to distinguish them from those secular canons who abandon living in community, and at the same time the observance of the canons made as the rule of the clergy, for the maintenance of the ancient discipline. The canons subsisted in their simplicity till the eleventh, some say the twelfth century, when some of them, separating from the community, took with them the name of canons, or acephalous priests, because they declined to live in community with the bishop; and those who were left thenceforth acquired the denomination of canons regular, and adopted most of the professions of the rule of St Augustine. This order of regular canons of St Augustine was brought into England by Adelwald, confessor to Henry I. who erected a priory at Nostel in Yorkshire; and obtained for them the church of Carlisle as an episcopal see, with the privilege of choosing their own bishop. They were singularly protected and encouraged by Henry I. who gave them the priory of Dunstable in 1107, and by Queen Maud, who, in the following year, gave them the priory of the Holy Trinity in London. It appears, that under the reign of Edward I. they had fifty-three priories.

Tertiary CANONS, those who had only the third part of the revenues of the canonicate.

CANON, in an ecclesiastical sense, is a law or rule, either of doctrine or discipline, enacted especially by a council, and confirmed by the authority of the sovereign.

Canons are properly decisions of matters of religion; or regulations of the policy and discipline of a church, made by councils, either general, national, or provincial. Such are the canons of the council of Nice, or Trent, &c.

There have been various collections of the canons of the eastern councils; but four principal ones, each ampler than the preceding. The first, according to Usher, A. D. 380, containing only those of the first ecumenical council, and the first provincial ones: they were but 164 in number. To these, Dionysius Exiguus, in the year 520, added the 50 canons of the apostles, and those of the other general councils. The Greek canons in this second collection end with those of the council of Chalcedon; to which are subjoined those of the council of Sardica, and the African councils. The fourth and last collection comes down as low as the second council of Nice; and it is on this that Balsamon and Zonaras have commented.

Apostolical CANONS, are those which have been usually ascribed to St Clement, Bellarmin, Baronius, &c. will have them to be genuine canons of the apostles; Catelerius observes, that they cannot be ascribed to the apostles or Clement, because they are not received with other books of Scripture, are not quoted by the writers of the first ages, and contain many things not agreeable to the apostolical times: Hincmar, De Marca, Beveridge, &c. take them to be framed by the bishops who were the apostles disciples in the second or third century; S. Basnage is of opinion that they were collected by an anonymous writer in the fifth century; but Daille, &c. maintain them to have been forged by some heretic in the sixth century; and S. Basnage conjectures that some of them are ancient, and others not older than the seventh century. The Greek church allows only 85 of them, and the Latins only 50; though there are 84 in the edition given of them in the Corpus Juris Canonici.

CANON is also used for the authorized catalogue of the sacred writings. See BIBLE.

The ancient canon, or catalogue of the books of the Old Testament, was made by the Jews, and is ordinarily attributed to Ezra; who is said to have distributed them into the law, the prophets, and the hagiographa, to which our Saviour refers, Luke, chap. xxiv. ver. 44. The same division is also mentioned by Josephus, cont. Appion.

Canon.

This is the canon allowed to have been followed by the primitive church, till the council of Carthage; and, according to St Jerome, this consisted of no more than 22 books; answering to the number of the Hebrew alphabet; though at present they are classed into 24 divisions, containing Genesis, Exodus, Leviticus, Numbers, Deuteronomy, Joshua, Judges, Samuel, Kings, Isaiah, Jeremiah, Ezekiel, the twelve minor prophets, the Psalms, the Proverbs, Job, Canticles, Ruth, Lamentations, Ecclesiastes, Esther, Daniel, Ezra, comprehending the book of Nehemiah and the Chronicles. However, this order is not universally observed either among Jews or Christians; nor were all the books above enumerated admitted into the canon in Ezra's time. It is most likely, says Dr Prideaux, that the two books of Chronicles, Ezra, Nehemiah, Esther, and Malachi, were added in the time of Simon the Just, when the canon was completed. But that council enlarged the canon very considerably, taking into it the books which we call apocryphal; which the council of Trent has further enforced, enjoining all these to be received as books of Holy Scripture, upon pain of anathema, and being attainted of heresy. The Romanists, in defence of this canon, say, that it is the same with that of the council of Hippo, held in 393; and with that of the third council of Carthage, in 397, at which were present 46 bishops, and, among the rest, St Augustine: who declared that they received it from their fathers.

Their canon of the New Testament perfectly agrees with ours. It consists of books that are well known; some of which have been universally acknowledged; such are the four Gospels, and acts of the Apostles, thirteen Epistles of St Paul, one Epistle of St Peter, and one Epistle of St John; and others, concerning which doubts were entertained, but which were afterwards received as genuine; such are the epistle to the Hebrews, that of James, the second of Peter, the second and third of John, that of Jude, and the Revelation. These books were written at different times; and they are authenticated, not by the decress of councils, or infallible authority, but by such kind of evidence as is thought sufficient in the case of any other ancient writings. They were very extensively diffused; they were read in every Christian society; they were valued and preserved with care by the first Christians; they were cited by Christian writers of the second, third, and fourth century, as by Irenæus, Clement the Alexandrian, Tertullian, Origen, Eusebius, &c. and their genuineness is proved by the testimony of those who were contemporary with the apostles themselves, and by tradition. The four Gospels, and most of the other books of the New Testament, were collected either by one of the apostles, or some of their disciples and successors, before the end of the first century. The catalogue of canonical books furnished by the more ancient Christian writers, as Origen about the year 210, Eusebius and Athanasius in 315, Epiphanius in 370, Jerome in 382, Austin in 394, and many others, agrees with that which is now received among Christians. For the time of writing the several books of the New Testament, see the titles of the books themselves; as the Gospel of St MATTHEW, MARK, &c.

Some of the fathers distinguish the inspired writings into three classes; proto-canonical, deutero-canonical, and apocryphal.

Paschal CANON, a table of the moveable feasts, showing the day of Easter, and the other feasts depending on it, for a cycle of 19 years.

The paschal canon is supposed to be the calculation of Eusebius of Cæsarea, and to have been done by order of the council of Nice.

CANON, in monastic orders, a book wherein the religious of every convent have a fair transcript of the rules of their order, frequently read among them as their local statutes. This is also called *regula*, as containing the rule and institution of their order.

The canon differs from the missale, martyrologium, and necrologium.

CANON, again, is used for the catalogue of saints acknowledged and canonized in the Romizh church.

CANON is also used, by way of excellence, in the Romish church, for the secret words of the mass, from the preface to the *Pater*; in the middle of which the priest consecrates the host. The common opinion is, that the canon of the mass commences with *Te igitur*, &c. The people are to be on their knees, hearing the canon; and are to rehearse it to themselves, so as not to be heard.

CANON, in the ancient music, is a rule or method of determining the intervals of notes.

Ptolemy, rejecting the Aristoxenian way of measuring the intervals in music, by the magnitude of a tone (which was supposed to be formed by the difference between a diapente and a diatessaron), thought that musical intervals should be distinguished, according to the ratios or proportions which the sounds terminating those intervals bear to one another, when considered according to their degree of acuteness or gravity; which, before Aristoxenus, was the old Pythagorean way. He therefore made the diapason consist in a double ratio; the diapente, in a sesquialterate; the diatessaron, in a sesquitertian; and the tone itself, in a sesquioctave; and all the other intervals, according to the proportion of the sounds that terminate them: wherefore taking the canon (as it is called) for a determinate line of any length, he shows how this canon is to be cut accordingly, so that it may represent the respective intervals: and this method answers exactly to experiment, in the different lengths of musical chords. From this canon, Ptolemy and his followers have been called *Canonici;* as those of Aristoxenus were called *Musici.*

CANON, in modern music, is a kind of fugue, which they call a *perpetual fugue*, because the different parts beginning one after another, repeat incessantly the same air.

Formerly, says Zarlino, they placed, at the head of perpetual fugues, particular directions which showed how this kind of fugues was to be sung; and these directions, being properly the rules by which perpetual fugues were composed, were called *canoni*, *rules* or *canons*. From this custom, others taking the title for the thing signified, by a metonymy, termed this kind of composition *canon*. Such canons as are composed with the greatest facility, and of consequence most generally used, begin the fugue either with the octave or the unison; that is to say, that every part repeats in the same tone the melody of the preceding. In order to form

form a canon of this kind, it is only necessary for the composer to make an air according to his taste: to add in score as many parts as he chooses, where the voices in octave or unison repeat the same melody; then forming a single air from all these parts successively executed, to try whether this succession may form an entire piece, which will give pleasure as well in the harmony as the melody.

In order to execute such a *canon*, he who sings the first part begins alone, and continues till the air is finished; then recommences immediately, without any suspense of sound or interruption of time; as soon as he has ended the first couplet, which ought to serve for the perpetual subject upon which the whole *canon* has been composed, the second part begins and repeats the same couplet, whilst the first who had begun pursues the second: others in succession begin and proceed the same way, as soon as he who precedes has reached the end of the first couplet. Thus, by incessantly recommencing, an universal close can never be found, and the *canon* may be repeated as long as the singers please.

A perpetual fugue may likewise consist of parts which begin with the intervals of a fourth or fifth; or, in other words, every part may repeat the melody of the first, a fourth or a fifth higher or lower. It is then necessary that the whole *canon* should be invented *di prima intenzione*, as the Italians say; and that sharps or flats should be added to the notes, whose natural gradations do not answer exactly, by a fourth or fifth, to the melody of the preceding part, and produce the same intervals with itself. Here the composer cannot pay the least regard to modulation; his only care is, that the melody may be the same, which renders the formation of a *canon* more difficult; for at every time when any part resumes the fugue, it takes a new key; it changes the tone almost at every note, and, what is still worse, no part is at the same time found in the same tone with another; hence it is that this kind of *canons*, in other respects far from being easy to be perused, never produce a pleasing effect, however good the harmony may be, and however properly it may be sung.

There is a third kind of *canon*, but very scarce, as well because it is extremely difficult, as because it is for the most part incapable of giving pleasure, and can boast no other merit but the pains which have been thrown away in its composition. This may be called a *double canon inverted*, as well by the inversions which are practised in it with respect to the melody of the parts, as by those which are found among the parts themselves in singing. There is such an artifice in this kind of *canon*, that, whether the parts be sung in their natural order, or whether the paper in which they are set be turned the contrary way, to sing them backward from the end to the beginning, in such a manner that the bass becomes the upper part, and the rest undergo a similar change, still you have pretty harmony and still a regular *canon*. The reader may consult Rousseau's Dictionary in this article, where he is referred to Plate D. fig. 11. for two examples of canons of this sort extracted from Bontempi, who likewise gives rules for their composition. But he adds, that the true principle from which the rule is deduced will be found at the word *systeme*, in his account of the system of Tartini, to which we must likewise once more refer the reader; as a quotation of such length must have protracted our article to an enormous extent.

To form a *canon*, in which the harmony may be a little varied, it is necessary that the parts should not follow each other in a succession too rapid, and that the one should only begin a considerable time after the other. When they follow one another so immediately as at a distance of a semibreve or a minim, the duration is not sufficient to admit a great number of chords, and the canon must of necessity exhibit a disagreeable monotony; but it is a method of composing, without much difficulty, a canon in as many parts as the composer chooses. For a *canon* of four bars only will consist of eight parts, if they follow each other at the distance of half a bar: and by each bar which is added, two parts will constantly be gained.

The emperor Charles VI. who was a great musician, and composed extremely well, took much pleasure in composing and singing *canons*. Italy is still replete with most beautiful *canons* composed for this prince, by the best masters in that country. To what has been said by Rousseau, we need only subjoin, that the English *catch* and the Italian *canon* are much the same; as any intelligent reader may perceive, from comparing the structure and execution of the English *catch* with the account of *canons* which has now been given.

CANON, in *Geometry* and *Algebra*, a general rule for the solution of all cases of a like nature with the present inquiry. Thus every last step of an equation is a canon; and, if turned into words, becomes a rule to solve all questions of the same nature with that proposed.

CANON Law, a collection of ecclesiastical laws, serving as the rule and measure of church-government.

The power of making laws was exercised by the church before the Roman empire became Christian. The canon law that obtained throughout the west, till the 12th century, was the collection of canons made by Dionysius Exiguus in 520, the capitularics of Charlemagne, and the decrees of the popes from Sircius to Anastasius.

The canon law, even when papal authority was at its height in England, was of no force when it was found to contradict the prerogative of the king, the laws, statutes and customs of the realm, or the doctrine of the established church.

The ecclesiastical jurisdiction of the see of Rome in England was founded on the canon law; and this created quarrels between kings and several archbishops and prelates who adhered to the papal usurpation.

Besides the foreign canons, there were several laws and constitutions made here for the government of the church: but all these received their force from the royal assent; and if, at any time, the ecclesiastical courts did, by their sentence, endeavour to enforce obedience to such canons, the courts at common law, upon complaints made, would grant prohibition. The authority vested in the church of England of making canons, was ascertained by a statute of Henry VIII. commonly called the *act of the clergy's submission*; by which they acknowledged, that the convocation had always been assembled by the king's writ; so that, though

Canon ‖ Canonical punishments.

though the power of making canons resided in the clergy met in convocation, their force was derived from the authority of the king's assenting to and confirming them.

The old canons continued in full force till the reign of James I. when the clergy being assembled in convocation, the king gave them leave to treat and consult upon canons; which they did, and presented them to the king, who gave them the royal assent: these were a collection out of several preceding canons, and injunctions. Some of these canons are now obsolete. In the reign of Charles I. several canons were passed by the clergy in convocation.

CANONESS, in the Romish church, a woman who enjoys a prebend, affixed, by the foundation, to maids, without their being obliged to renounce the world, or make any vows.

CANONICA, in philosophical history, an appellation given by Epicurus to his doctrine of logic. It was called *canonica*, as consisting of a few canons or rules for directing the understanding in the pursuit and knowledge of truth. Epicurus's *canonica* is represented as a very slight and insufficient logic by several of the ancients, who put a great value on his ethics and physics. Laertius even assures us, that the Epicureans rejected logic as a superfluous science; and Plutarch complains that Epicurus made an unskilful and preposterous use of syllogisms. But these censures seem too severe. Epicurus was not averse to the study of logic, but even gave better rules in this art than those philosophers who aimed at no glory but that of logics. He only seems to have rejected the dialectics of the Stoics, as full of vain subtleties and deceits, and fitted rather for parade and disputation than real use. The stress of Epicurus's *canonica* consists in his doctrine of the criteria of truth. All questions in philosophy are either concerning words or things: concerning things, we seek their truth; concerning words, their signification; things are either natural or moral; and the former are either perceived by sense or by the understanding. Hence, according to Epicurus, arise three criterions of truth, viz. sense, anticipation or prænotion, and passion. The great canon or principle of Epicurus's logic is, that the senses are never deceived; and therefore, that every sensation or perception of an appearance is true.

CANONICAL, something that belongs to, or partakes of, the nature of a rule or canon.

Canonical Hours, are certain stated times of the day, consigned, more especially by the Romish church, to the offices of prayer and devotion. Such are *matins, lauds, sixth, ninth vespers*. In our country the canonical hours are from eight to twelve in the forenoon, before or after which marriage cannot be legally performed in any parish church.

Canonical Obedience, is that submission which, by the ecclesiastical laws, the inferior clergy are to pay to their bishops, and religious to their superiors.

Canonical Sins, in the ancient church, those which were capital or mortal. Such especially were idolatry, murder, adultery, heresy, and schism.

Canonical Punishments, are those which the church may inflict; such as excommunication, degradation, and penance, in Roman Catholic countries; also fasting, alms, whipping, &c.

Canonical life ‖ Canonist.

Canonical Life, the method or rule of living prescribed by the ancient clergy who lived in community. The canonical life was a kind of medium between the monastic and clerical lives. Originally the orders of monks and clerks were entirely distinct; but pious persons, in process of time, instituted colleges of priests and canons, where clerks, brought up for the ministry, as well as others already engaged therein, might live under a fixed rule, which, though somewhat more easy than the monastic, was yet more restrained, than the secular. This was called the *canonical life*, and those who embraced it *canons*. Authors are divided about the founder of the canonical life. Some will have it to be founded by the apostles; others ascribe it to Pope Urban I. about the year 1230, who is said to have ordered bishops to provide such of their clergy as were willing to live in community, with necessaries out of the revenues of their churches. The generality attribute it to St Augustine; who, having gathered a number of clerks to devote themselves to religion, instituted a monastery within the episcopal palace, where he lived in community with them. Onuphrius Panvinus, brings the institution somewhat lower; according to him, Pope Gelasius I. about the year 495, placed the first regular canons of St Augustine in the Lateran church.

Canonical Letters, in the ancient church, were a sort of testimonials of the orthodox faith, which the bishops and clergy sent each other to keep up the Catholic communion, and distinguish orthodox Christians from Arians and other heretics. They were denominated *canonical*, either as being composed according to a certain rule or form, or because they were given to the *canonici*, that is, those comprehended in the canon or catalogue of their church. When they had occasion to travel into other dioceses or countries, dimissory and recommendatory letters, also letters of peace, &c. were so many species of canonical letters.

Canonical is also an appellation given to those epistles in the New Testament, more frequently called *catholic* or *general* epistles.

CANONICUM, in a general sense, denotes a tax or tribute.

Canonicum is more particularly used in the Greek church for a fee paid by the clergy to bishops, archbishops, and metropolitans, for degrees and promotions.

Canonicum also denotes a due of first fruits, paid by the Greek laity to their bishops, or, according to Du Cange, to their priests. The *canonicum* is affected according to the number of houses or chimneys in a place.

The emperor Isaac Comnenus made a constitution for regulating the *canonicum* of bishops, which was confirmed by another made in 1086, by his nephew Alexis Comnenus. A village containing thirty fires, was to pay for its *canonicum* one piece of gold, two of silver, one sheep, six bushels of barley, six of wheat flour, six measures of wine, and thirty hens.

CANONIST, a person skilled in or who makes profession of the study and practice of the canon law. Canonists and civilians are usually combined in the same persons: and hence the title of *doctor juris utriusque*, or *legum doctor*, usually expressed in abbreviature, LL. D. or J. U. D.

Canonization || Canopus.

CANONIZATION, a ceremony in the Romish church, by which persons deceased are ranked in the catalogue of the saints. It succeeds beatification.

Before a beatified person is canonized, the qualifications of the candidate are strictly examined into, in some consistories held for that purpose; after which, one of the consistorial advocates, in the presence of the pope and cardinals, makes the panegyric of the person who is to be proclaimed a saint, and gives a particular detail of his life and miracles; which done, the holy father decrees his canonization, and appoints the day.

On the day of canonization the pope officiates in white, and their eminences are drest in the same colour. St Peter's church is hung with rich tapestry, upon which the arms of the pope, and of the prince or state requiring the canonization, are embroidered in gold and silver. An infinite number of lights blaze all round the church, which is crowded with pious souls, who wait with devout impatience till the new saint has made his public entry as it were into paradise, that they may offer up their petitions to him without danger of being rejected.

The following maxim with regard to canonization is now observed, though it has not been followed above a century, viz. not to enter into the inquiries prior to canonization, till 50 years at least after the death of the person to be canonized. By the ceremony of canonization, it appears that this rite of the modern Romans has something in it very like the apotheosis or deification of the ancient Romans, and, in all probability, takes its rise from it; at least several ceremonies of the same nature are conspicuous in both.

CANONRY, the benefice filled by a canon. It differs from a prebend, in that the prebend may subsist without the canonicate, whereas the canonicate is inseparable from the prebend; again, the right of suffrages, and other privileges, are annexed to the canonicate, and not to the prebend.

CANOPUS, in *Astronomy*, a star of the first magnitude in the rudder of Argo, a constellation of the southern hemisphere.

CANOPUS, in Pagan mythology, one of the deities of the ancient Egyptians, and, according to some the god of water. It is said, that the Chaldeans, who worshipped fire, carried their fancied deity through other countries to try its powers, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worship; and it having easily subdued the gods of wood, stone, brass, silver and gold, its priests declared that all gods did it homage. This the priest of Canopus hearing, and finding that the Chaldeans had brought their god to contend with Canopus, they took a large earthen vessel, in which they bored several holes, which they afterwards stopped with wax, and having filled the vessel with water, painted it of several colours, and fitting the head of an idol to it, brought it ont in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all round it; but the heat having melted the wax, the water gushed out through the holes, and extinguished the fire; and thus Canopus conquered the god of the Chaldeans.

CANOPUS, or *Canobus*, according to Strabo, had been Menelaus's pilot, and had a temple erected to him in a town called *Canopus*, near one of the mouths of the Nile. Dionysins mentions it:

Canopus || Canosa.

Και τεμενος περιπυστον Αμυκλαιου Κανωβου.

There stands Canobus' temple known to fame:
The pilot who from fair Amycla came.

Vossius remarks, on this occasion, the vanity of the Greeks, who, as he conjectures, hearing of an Egyptian deity named *Canopus*, took from thence an opportunity of deifying the pilot of Menelaus who bore the same name, and giving out that the Egyptian god Canopus had been a Greek. F. Montfaucon gives several representations of this deity. One, in allusion to the victory above-mentioned, throws out water on every side through little holes.

CANOPUS, or *Canobus*, in *Ancient Geography*, a town of the Lower Egypt, on the Mediterranean, a hundred and twenty stadia, or fifteen miles, to the east of Alexandria; as old as the war of Troy, Canopus, or Canobus, Menelaus's steersman, being there buried. *Canopæi* the gentilitious name; famous for their luxury and debauchery (Strabo, Juvenal). See ABOUKIR.

CANOPY, in *Architecture* and *Sculpture*, a magnificent kind of decoration, serving to cover and crown an altar, throne, tribunal, pulpit, chair, or the like. The word is formed from the barbarous Latin *canopeum*, of κωνωπειον, *a net spread over a bed to keep off the gnats*, from κωνωψ, *a gnat*.

Canopies are also borne over the head in processions of state, after the manner of umbrellas. The canopy of an altar is more peculiarly called *ciborium*.

The Roman grandees had their canopies, or spread veils, called *thensæ*, over their chairs; the like were also in temples over the statues of their gods. The modern cardinals still retain the use of canopies.

CANOSA, a town of Puglia in Italy, occupying part of the site of the ancient Canusium. The old city was founded by Diomedes, according to Strabo. It afterwards became a Roman colony, and one of the most considerable cities of this part of Italy for extent, population, and magnificence of building. The era of Trajan seems to have been that of its greatest splendour; but this pomp only served to mark it as a capital object for the avarice and fury of the Barbarians. Genseric, Totila, and Autharis, treated it with extreme cruelty. The deplorable state to which this province was reduced in 590 is concisely but strongly painted by Gregory the Great in these terms: "On every side we hear groans; on every side we behold crowds of mourners, cities burnt, castles razed to the ground, countries become waste, provinces become deserts, some citizens led away captives, and others inhumanly massacred." No town in Puglia suffered more than Canosa from the outrages of the Saracens; the contests between the Greeks and Normans increased the measure of its woes, which was filled by a conflagration that happened when it was stormed by duke Robert. In 1090, it was assigned, by agreement, to Bohemund prince of Antioch, who died here in 1111. Under the reign of Ferdinand the Third, this estate belonged to the Grimaldis. On their forfeiture, the Affaititi acquired it, and still retain the title of marquis, though the Capeci are the proprietors of the fief.

Swinburne's Travels in Sicily, p. 408.

The

Canosa || Cantabria.

The ancient city stood in a plain between the hills and the river Ofanto, and covered a large tract of ground. Many brick monuments, though degraded and stripped of their marble casing, still attest its ancient grandeur. Among them may be traced the fragments of aqueducts, tombs, amphitheatres, baths, military columns, and two triumphal arches, which, by their position, seem to have been two city gates. The present town stands above, on the foundations of the old citadel, and is a most pitiful remnant of so great a city, not containing above three hundred houses. The church of Sabinus, built, as is said, in the sixth century, is now without the enclosure. It is astonishing that any part of this ancient cathedral should have withstood so many calamities. Its altars and pavements are rich in marble; and in a small court adjoining, under an octagonal cupola, is the mausoleum of Bohemund, adorned in a minute Gothic style.

CANSO, a sea-port town of Nova Scotia, in North America, seated on a narrow strait which separates Nova Scotia from Cape Breton. It has two bays which afford safe anchorage. Near this town is a fine fishery for cod. W. Long. 62. N. Lat. 46.

CANSTAT, a town of Swabia, in Germany, in the kingdom of Wirtemberg, situated on the river Neckar, in E. Long. 9. 9. N. Lat. 48. 51.

CANT, a quaint affected manner of speaking, adapted chiefly to the lower sort. Skinner racks his invention for the origin of this word; which he successively deduces from the German, Flemish, and Saxon tongues. According to the general opinion, Cant is originally the proper name of a Cameronian preacher in Scotland, who by exercise had attained the faculty of talking in the pulpit in such a tone and dialect as was understood by none but his own congregation: since Andrew Cant's time, the word has been extended to signify all sudden exclamations, and whining unmusical tones, especially in praying and preaching. But this origin of the word has been disputed by others: and perhaps the true derivation is from the Latin *cantare* "to sing."

Cant is also applied to words and phrases affected by particular persons or professions for low ends, and not authorized by the established language *. The difference between *cant* and *technical* seems to be this: the former is restrained to words introduced out of folly, affectation, or imposture: the latter is applied to such as are introduced for the sake of clearness, precision, and significancy.

* See *Canting Language.*

Cant is also used to denote a sale by auction. The origin of the word in this sense is dubious; it may come, according to some, from *quantum*, how much; according to others, from *cantare*, to sing or cry aloud; agreeably to which, we sometimes also call it an *outcry*.

Cant-*Timbers*, in ship-building, those timbers which are situated at the two ends of a ship. They derive their name from being *canted*, or raised obliquely from the keel; in contradistinction from those whose planes are perpendicular to it. The upper ends of those on the bow, or fore part of the ship, are inclined to the stern; as those in the after or hind part, incline to the stern post above. See *Ship-Building*.

CANTABRIA, in *Ancient Geography*, a district of Tarraconensis, on the Oceanus Cantabricus, or bay of Biscay; now Biscay. The inhabitants were famous for their warlike character. In conjunction with the Asturians †, they carried on desperate wars with the Romans; but were subdued by them about 25 years before Christ. Being impatient, however, of a foreign yoke, they in a few years revolted. Most of their youth had been already taken prisoners by the Romans, and sold for slaves to the neighbouring nations: but having found means to break their chains, they cut the throats of their masters; and returning into their own country, attacked the Roman garrisons with incredible fury. Agrippa marched against them with great expedition; but on his arrival, met with so vigorous a resistance, that his soldiers began to despair of ever being able to reduce them. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become desperate; well knowing, that if they were conquered, after having so often attempted to recover their liberty, they must expect the most severe usage, and cruel slavery. Animated with this reflection, they fell upon the Romans with a fury hardly to be expressed, routed them in several engagements, and defended themselves when attacked by the enemy with such intrepidity, that Agrippa afterwards owned that he had never, either by sea or land, been engaged in a more dangerous enterprise. That brave commander was obliged to use entreaties, menaces, and to brand some of his legionaries with ignominy, before he could bring them to enter the lists with such a formidable enemy. But having at last, with much ado, prevailed upon them to try the chance of an engagement in the open field, he so animated them by his example, that after a most obstinate dispute, he gained a complete victory, which indeed cost him dear, but put an end to that destructive war. All the Cantabrians fit to bear arms were cut in pieces, their castles and strong holds taken and razed; and their women, children, and old men (none else being left alive,) were obliged to abandon the mountainous places, and settle in the plain.

† See *Asturias.*

Dr Wallis seems to make the Cantabrian the ancient language of all Spain: which, according to him, like the Gaulish, gave way to a kind of broken Latin called *romance*, *romansh;* which by degrees was refined into the Castilian or present Spanish. But we can hardly suppose that so large a country, inhabited by such a variety of people, spoke all the same language. The ancient Cantabrian, in effect, is still found to subsist in the more barren and mountainous parts of the provinces of Biscay, Asturias, and Navarre, as far as Bayonne, much as the British does in Wales; but the people only talk it: for writing, they use either the Spanish or French, as they happen to live under the one or the other nation. Some attribute this to a jealousy of foreigners learning the mysteries of their language; others to a poverty of words and expressions. The Cantabrian does not appear to have any affinity with any other known language, abating that some Spanish words have been adopted in it for things whose use the Biscayans were anciently unacquainted with. Its pronunciation is not disagreeable. The Lord's prayer, in the Cantabrian tongue, runs thus: *Gure aita cervetan aicena, santifica bedi hire icena, ethor ledi hire resuma, eguin*

eguin bedi hire vorandatea cervan becala lurrean ere, &c.

CANTABRICA, in *Botany*, a synonyme of a species of CONVOLVULUS.

CANTABRUM, in antiquity, a large kind of flag used by the Roman emperors, distinguished by its peculiar colour, and bearing on it some word or motto of good omen, to encourage the soldiers.

CANTACUZENUS, JOHANNES, of Constantinople, a celebrated statesman, general, and historian, was born in that city, of a very ancient and noble family. He was bred to letters and to arms, and admitted to the highest offices in the state. The emperor Andronicus loaded him with wealth and honour; made him generalissimo of his forces; and was desirous of having him join him in the government, but this he refused. Andronicus dying in 1341, left to Cantacuzenus the care of the empire, till his son John Paleologus, who was then but nine years of age, should be fit to take it upon himself. This trust he faithfully discharged; till the empress-dowager and her faction forming a party against him, declared him a traitor. On this the principal nobility and the army besought him to ascend the throne; and accordingly he was crowned on the 21st of May 1342. This was followed by a civil war, which lasted five years; when he admitted John a partner with him in the empire, and their union was confirmed by his giving him his daughter in marriage. Suspicions and enmities, however, soon arising, the war broke out again, and continued till John took Constantinople in 1355. A few days after, Cantacuzenus, unwilling to continue the effusion of blood, abdicated his share of the empire, and retiring to a monastery, took the habit of a monk, and the name of *Joasaphas*. His wife also retired to a nunnery, and changed her name of *Irene* for that of *Eugenia*. In this retirement he lived till the year 1411, when he was upwards of 100 years of age. Here he wrote a history of his own times, a Latin translation of which, from the Greek manuscript, was published by Pontanus at Ingolstadt, in 1603; and a splendid edition was printed at Paris in 1645, in three volumes folio, of the original Greek, and Pontanus's Latin version. He also wrote an apology for the Christian religion against that of Mahomet, under the name of *Christodulus*.

CANTAL, a department of France, forming part of the ancient Auvergne. It contains 2300 square miles, and had 252,000 inhabitants in 1815. Aurillac is the chief town.

CANTALIVERS, in *Architecture*, pieces of wood framed into the front or sides of a house, to suspend the mouldings and eyes over it.

CANTAR, or CANTARO, an eastern weight, of different value in different places, equal at Acra in Turkey to 603 pounds, at Tunis and Tripoli to 114 pounds.

CANTAR is also an Egyptian weight, which is denominated a *quintal*, and consists of a hundred or of an hundred and fifty rotolos, according to the goods they are to weigh.

CANTARO is also an Egyptian weight, which at Naples is equivalent to 25 pounds, at Genoa to 150 pounds. At Leghorn there are three kinds of *cantaros*, one weighing 150 pounds, another 151, and a third 160 pounds.

CANTARO is also a Spanish liquid measure, in use especially at Alicant, containing three gallons.

CANTARO is also a measure of capacity, used at Cochin, containing four rubis, the rubi 32 rotolos.

CANTARINI, SIMON, a famous painter, called the *Peserese*, from his being born at Pesaro, was the disciple of Guido; and copied the manner of his master so happily that it is often difficult to distinguish between their works. He died at Verona in 1648.

CANTATA, in *Music*, a song or composition, intermixed with recitatives, airs, and different movements, chiefly intended for a single voice, with a thorough bass, though sometimes for other instruments. It was first used in Italy, then in France, whence it passed to us.

CANTAZARO, an episcopal city of Italy, in the kingdom of Naples, and in the territory of Calabria Ulterior. It is the residence of the governor of the province, and is seated near the sea, in E. Long. 17. 0. N. Lat. 38. 59.

CANTECROIX, a small territory of the Netherlands in Brabant, and in the quarter of Antwerp, with the title of a principality; there is a small town of the same name, but Lire is the capital.

CANTEMIR, DEMETRIUS, son of a prince of Moldavia. Disappointed by not succeeding his father in that dignity, held under the Ottoman Porte, he went over with his army to the Czar Peter the Great, against whom he had been sent by the Grand Signior: He signalized himself in the czar's service; and in the republic of letters, by a Latin history of the origin and decline of the Ottoman empire, &c. He died in 1723.

CANTEMIR, *Antiochus*, esteemed the founder of the Russian poetry, was the youngest son of the preceding. Under the most ingenious professors, whom the czar had invited to Petersburgh, he learned mathematics, physic, history, moral philosophy, and polite literature; without neglecting the study of the Holy Scriptures, to which he had a great inclination. Scarce had he finished his academic course, when he printed a Concordance of the Psalms in the Russian language, and was elected member of the academy. The affairs of state in which he was soon after engaged, did not make him neglect his literary pursuits. In order to make himself useful to his fellow citizens, he composed his satires, to ridicule certain prejudices which had got footing among them. When but 24 years of age, he was nominated minister at the court of Great Britain; and his dexterity in the management of public affairs was as much admired as his taste for the sciences. He had the same reputation in France, whither he went in 1738 in quality of minister plenipotentiary, and soon after was invested with the character of ambassador extraordinary. The wise and prudent manner in which he conducted himself during the different revolutions which happened in Russia during his absence, gained him the confidence and esteem of three successive princes. He died of a dropsy, at Paris, in 1744, aged 44. Besides the pieces already mentioned, he wrote, 1. Some Fables and Odes. 2. A translation of Horace's Epistles in Russian verse. 3. A prose

Cantemir, Canterbury. prose translation of Fontenelle's Plurality of Worlds; and, 4. Algarotti's Dialogues on Sight. The Abbè Guasco has written his life in French, and translated his satires into that language.

CANTERBURY, a city of England, and capital of the county of Kent, situated in E. Long. 1. 15. N. Lat. 51. 16. It has the names of *Durovernum* and *Darvernum* given it by the Romans, and *Durobernia* by Bede, which are thought to be derived from *Durwhem*, signifying a rapid stream, such as the Stour, on which it stands, is. The Britons call it *Caer Kent*, i. e. the city of Kent; and its present English name is of the same import, derived from the Saxon. Modern writers in Latin call it *Cantuaria*. Its great antiquity appears not only from Antoninus's Itinerary, but from the military way which has been discovered here, and the causeways leading to Dover and Lymme, besides the coins and other curiosities found about it. The archiepiscopal and metropolitan dignity seems to have been settled here very early; and to prevent its being removed, an anathema was decreed against any who should attempt it. After that, the city flourished greatly; though it suffered in common with other towns during the Danish invasions, and at other times by the casualties of fire. The city was given entirely to the bishops by William Rufus, and was held in the utmost veneration in the Popish times, especially after the murder of Becket in the reign of Henry II. to whose shrine so great was the resort, and so rich were the offerings, that Erasmus, who was an eye-witness of its wealth, says the whole church and chapel in which he was interred glittered with jewels; and at the dissolution, the plate and jewels filled two great chests, each of which required eight strong men to carry out. The cathedral was granted by Ethelbert, king of Kent, upon his conversion, to Austin the Monk, together with his palace, and the royalty of the city and its territories. This Austin founded a monastery for monks, called from him *Augustine*. After the cathedral had been several times destroyed by fire and rebuilt, the present was begun about the year 1174, and augmented and embellished by the succeeding archbishops, till it was completed in the reign of Henry V. It is a noble Gothic pile, and before the Reformation had 37 altars. A great many kings, princes, cardinals, and archbishops, are buried in it. At the dissolution, Henry VIII, seized all the revenues both of the church and monastery, except what he allotted for the maintenance of a dean, 12 prebendaries, and six preachers, whom he established in place of the monks. During the grand rebellion, it suffered much; the usurper Cromwell having made a stable of it for his dragoons. After the Restoration, it was repaired, and made what it now appears.

Besides the cathedral and other churches, as well as a monastery, the city had anciently a castle on the south side, and strong walls, with towers, a ditch, and rampart; it had also a mint and an exchange. As to its government, it seems to have been entirely subject to the archbishop, both in spirituals and temporals; at least from the time that William Rufus gave it solely to Bishop Anselm, till the Reformation. It is now a county of itself: and the corporation consists of a mayor, recorder, 12 aldermen, a sheriff, 24 common council men, a mace-bearer, a sword-bearer, and four serjeants at mace. Every Monday a court is held at Guildhall for civil and criminal causes; and every other Tuesday for the government of the city. Here were formerly 2000 or 3000 French Protestants employed in the silk manufacture; but this branch is now greatly decayed in the place, since Spittalfields became so flourishing. Besides the cathedral, it contains 15 parish churches, seven hospitals, a free school, a house of correction, a gaol for criminals, and sumptuous conduit for supplying the inhabitants with water. It consists of four streets, disposed in the form of a cross, and divided into six wards, which are about three miles in circumference. It is surrounded on all hands with hop grounds much to its advantage, and is famed for its excellent brawn. The population in 1811 was 10,200.

The diocese of Canterbury contains 257 parishes, besides chapels, in Kent, and about 100 more in other dioceses. These are called *Peculiars*; it being an ancient privilege of this see, that, wheresoever the archbishops had either manors or advowsons, the place was exempted from the jurisdiction of the ordinary of the diocese where it was situated, and was deemed in the diocese of Canterbury. This see is valued in the king's books at 2816l. 17s. 9¼d. but is reckoned to produce a clear revenue of 8000l. a year. The clergy's tenths come to 615l. 18s. 2¼d. This see had many great privileges in the time of Popery, some of which it still retains. The archbishop is accounted primate and metropolitan of all England, and is the first peer in the realm; having the precedence of all dukes not of the blood-royal, and of all the great officers of state. In common speech he is styled *His Grace*, and he writes himself *Divina Providentia;* whereas other bishops style themselves *Divina Permissione*. At coronations, he places the crown on the king's head; and, wherever the court may be, the king and queen are the proper domestic parishioners of the archbishop of Canterbury. The bishop of London is accounted his provincial dean, the bishop of Winchester his sub-dean, the bishop of Lincoln his chancellor, and the bishop of Rochester his chaplain. This see hath yielded to the church 18 saints; to the church of Rome, 9 cardinals; to the civil state of England, 12 lord chancellors, 4 lord treasurers, and 1 lord chief justice; and 9 chancellors to the university of Oxford. To this see belongs only one archdeacon, viz. of Canterbury. To the cathedral belong an archbishop, a dean, a chancellor, an archdeacon, 12 prebends, 6 preachers, 6 minor canons, 6 substitutes, 12 lay clerks, 10 choristers, 2 masters, 50 scholars, and 12 almsmen.

CANTERBURY *Bell*, the English name of a species of CAMPANULA. See BOTANY *Index*.

CANTERUS, WILLIAM, an eminent linguist and philologer, was born at Utrecht, in 1541. He studied at Louvain and Paris; and gave surprising proofs of his progress in Greek and Latin literature. He afterwards visited the several universities of Germany and Italy; and died at Louvain, in 1575, aged 33. He understood six languages, besides that of his native country; and, notwithstanding his dying so young, wrote several philological and critical works, among which are, *Notæ, Scholæ, Emendationes, et Explicationes, in Euripidem, Sophoclem, Eschylum, Ciceronem, Propertium, Ausonium*, &c. and many translations of Greek authors.

CANTHARIDES,

Cantharides ‖ Canticles.

CANTHARIDES, in the *Materia Medica*, flies which are employed to produce blisters on the skin.

CANTHARIS, in *Zoology*, a genus of insects belonging to the order of insecta coleoptera. Linnæus enumerates 27 species of the cantharis, most of them to be found in different parts of Europe. The cantharis used in making blistering plasters is ranked under the genus MELOE. See ENTOMOLOGY *Index*.

CANTHI, in *Anatomy*, cavities at the extremities of the eye-lids, commonly called the *corners of the eye*: the greater of them, or the great canthus, is next the nose; the lesser of them, or the little canthus, lies towards the temple.

CANTICLES, a canonical book of the Old Testament, otherwise called the *Song of Solomon*; by the Jews the *Song of Songs, Canticum Canticorum*. The book of Canticles is usually supposed to be an epithalamium composed by Solomon, on occasion of his marriage with the king of Egypt's daughter. But those who penetrate further into the mystery, find in it the marriage of Jesus Christ with human nature, the church, and good men. On this principle the Canticles is held to be a continued allegory, wherein, under the terms of a common wedding, a divine and spiritual marriage is expressed. This song contains the adventures of seven days and seven nights; the exact time allowed for the celebration of marriage among the Hebrews. The Jews themselves, apprehending the book liable to be understood in a gross and carnal manner, prohibited the reading of it before the age of 30, and the same usage anciently obtained in the Christian church. Among the ancients, Theodore Mopsuetanus rejected the book of Canticles as not divine. Divers rabbins have also questioned its being written by inspiration. It is alleged, that the name of God is not once found in it. Mr Whiston has a discourse express to prove that the Canticles is not a sacred book of the Old Testament. He alleges it indeed to have been written by King Solomon the son of David; but asserts that it was composed at the time when that prince, blinded by his concubines, was sunk in lust and idolatry. This he chiefly infers from the general character of vanity and dissoluteness which reigns through the Canticles: in which there is not, according to Whiston, one thought that leads the mind towards religion, but all is worldly and carnal, to say no worse. For the mystic sense, he asserts it to be without foundation; and that the book is not cited as canonical by any writer before the destruction of Jerusalem. Mr Whiston will have it to have been taken into the canon between the years 77 and 128, when allegories came into vogue, and the rabbins began to corrupt the text of Scripture. Grotius, Nierembergius, the Dutch divines who criticised F. Simon, Menetrier, Basnage, and some others, seem also to take the Canticles for a profane composition, on a footing with the love pieces of Catullus or Ovid. But this opinion is refuted by Michaelis, Majus, Witsius, Nat. Alexander, Outrein, Francius, and others. Mr Whiston's arguments have been particularly considered by Itchener, and also by Dr Gill. R. Akiba finds the book of Canticles more divine than the rest; the whole world, according to this rabbin, is not worth that day when the Canticles was given to Israel; for, whereas all the hagiographers are holy, the Canticles is the holy of holies.

Cantimarons ‖ Cantium.

CANTIMARONS, or CATIMARONS, a kind of floats or rafts, used by the inhabitants of the coast of Coromandel to go a fishing in, and to trade along the coast. They are made of three or four small canoes, or trunks of trees dug hollow, and tied together with cacao ropes, with a triangular sail in the middle, made of mats. The persons who manage them are almost half in the water, there being only a place in the middle a little raised to hold their merchandise: which last particular is only to be understood of the trading cantimarons, and not of those that go a fishing.

CANTIN, CAPE, a promontory of the coast of Morocco, in Africa, situated in W. Long. 10. 2. N. Lat. 33. 9.

CANTING, a sea phrase, denotes the act of turning any thing about.

CANTING Language or *Dialect*, is a mysterious sort of jargon used by gypsies, thieves, and strolling beggars, to express their sentiments to each other, without being understood by the rest of mankind. This dialect is not founded on any rules; yet even out of that irregularity many words seem to retain something of scholarship; as *togeman*, a gown, from *toga* in the Latin; *pannam*, bread, from *panis*; *casan*, cheese, from *caseus*, &c. It is observable, that, even unknown to ourselves, we have adopted some of their terms into our vulgar language; as *bite* and *bilk*, to cheat; *bounce*, to vapour; *bowse*, strong drink; *filch*, to steal; *flog*, to whip; *rig*, game or ridicule; *roast*, to rally; *rhino*, money. From the same source proceed the words *sham*, *banter*, *bubble*, *bully*, *sharper*, *cutting*, *shuffling*, *palming*, &c. An anonymous author has given a canting dictionary, comprehending all the terms used by the several tribes of gypsies, beggars, shoplifters, highwaymen, foot-pads, and other clans of cheats and villains, with a collection of songs in the canting dialect: London, 1725, 8vo.

CANTIUM, in *Ancient Geography*, a promontory of Britain, literally denoting a headland: giving name to a territory called *Cantium*, now Kent; and to a people called *Cantii* (Cæsar), commended for their great humanity and politeness. The promontory now the North *Foreland*. It is supposed that this was the first district in Britain which received a colony from the continent; and that it had frequently changed its masters, by new colonies coming over from time to time, and driving the inhabitants further north. In the midst of all these revolutions it still retained its ancient name (which was so agreeable to its shape and situation), and gave the same name to all the successive tribes by which it was inhabited. Those who possessed it at the time of the first Roman invasion were evidently of Belgic origin, and had come over so lately, that they differed in nothing from their countrymen on the continent. "The inhabitants of Kent (says Cæsar) are the most civilized of all the Britons, and differ but very little in their manners from the Gauls." This great resemblance between the people of Kent and their neighbours on the continent, might be partly owing to the situation of their country, which being nearest to the continent, was most frequented by strangers from thence. It was this situation also which exposed them to the first assaults of the Romans. For Cæsar, in both his expeditions into this island, landed in Kent; and therefore we may conclude,

that

that the Cantii had a great share in the vigorous opposition that was made to his landing, and in the several battles and skirmishes which were fought against him after his landing; particularly, they made a very bold, but unsuccessful attempt, upon his naval camp. The Cantii did not make the same vigorous resistance to the Romans on their next invasion in the reign of Claudius. For Aulus Plautius, the Roman general in that expedition, traversed their country without seeing an enemy; and as they now submitted to the power of Rome without a struggle, so they continued in a state of quiet submission to it to the very last. The situation of Cantium occasioned its being much frequented by the Romans, who generally took their way through it in their marches to and from the continent. Few places in Britain are more frequently mentioned by the Roman writers than Rutupium and Portus Rutupensis, most probably Richborough and Stonar. Rutupium was the same in those times that Dover is in ours; the usual place of embarking for, and landing from, the continent. Before the final departure of the Romans out of Britain, Portus Dubris, now Dover, had become a considerable place, and a well frequented harbour, where the third iter of Antoninus ends, and from whence they often embarked for Gaul. Portus Lemanus, supposed to be Lime near West Hythe, was also a noted sea-port in these times, and the termination of the fourth iter of Antoninus. Durobrivæ and Durovernum, now Rochester and Canterbury, were both Roman towns and stations, and are often mentioned in the Itinerary and other books. Besides these, there were several other Roman stations, towns, and ports in Cantium, which need not be particularly enumerated here. Cantium, in the most perfect state of the Roman government, made a part of the province which was called *Flavia Cæsariensis.*

CANTO, denotes a part or division of a poem, answering to what is otherwise called a *book*. The word is Italian, where it properly signifies *song*. Tasso, Ariosto, and several other Italians, have divided their longer or heroic poems into cantos. In imitation of them, Scarron has also divided his *Gigantomachia*, and Boileau his *Lutrin*, into chants or songs. The like usage has been adopted by some English writers, as Butler, who divides his Hudibras, and Dr Garth his Dispensary, into cantos. A late translator of part of Virgil's Æneid has even subdivided a book of Virgil into several cantos.

CANTO, in the Italian music, signifies a *song*: hence *canto simplice* is where all the notes or figures are equal, and called also *canto sermo*; *canto figurato*, that where the figures are unequal, and express different motions.

CANTO also signifies the treble part of a song; hence *canto concertante*, the treble of the little chorus; *canto repieno*, the treble of the grand chorus, or that which sings only now and then in particular places. *Canto* signifies the first treble, unless some other word be added to it, as *secondo*; in which case it denotes the second treble.

CANTON, in *Geography*, denotes a small district or country constituting a distinct government: such are the cantons of Switzerland.

CANTON, *Quang-tong*, or Koanton, one of the southern provinces of China; bounded on the north-east by Fokien, on the north by Kiang-si, on the west by

Quang-si and the kingdom of Tonking, and everywhere else by the sea. The country is diversified with hills and plains, and the soil in general so fertile that it produces two crops annually. Besides many of the fruits of Europe, and those common in other parts of the Indies, the province of Canton produces some peculiar to itself. Abundance of valuable aromatic woods is also to be met with in this province, as well as eagle wood, ebony, &c. and in the mineral kingdom the province furnishes gold, precious stones, tin, quicksilver, and copper. Silk and sugar are also cultivated here, and pearls are fished upon the coasts; so that every thing which can contribute to the pleasure or convenience of life is to be met with in Canton. "One begins (says F. Premare) to have an idea of China, on entering the river Canton. Both sides of it present large fields of rice which resemble green meadows, and extend beyond the reach of sight. They are intersected by an infinite number of small canals, in such a manner that the barks which pass and repass in them seem at a distance, while the water which carries them is concealed, to glide along the grass. Farther inland the country appears covered with trees, and cultivated along the valleys; and the whole scene is interspersed with villages, rural seats, and such a variety of delightful prospects, that one is never tired of viewing them, and regrets to be obliged to pass them so quickly.

All the coasts of this province abound with fish, and furnish vast numbers of crabs, oysters, and tortoises of an immense size. The inhabitants keep a prodigious number of tame ducks, which they hatch in ovens or dunghills, though it does not appear that they borrowed this custom from the Egyptians. The docility of these creatures exceeds what we should be apt at first to imagine. The inhabitants load a number of small barks with them, and carry them in flocks to feed on the sea shore, where they find shrimps and other animals proper for their nourishment. But though the ducks from the different barks are thus unavoidably mixed together in the day time, they are easily collected by only beating on a bason, on which they immediately collect themselves into different flocks, and each returns to its proper bark.

In this province the Chinese have also a method of preserving, not only the flesh of the ducks, in such a manner that it loses nothing of its original flavour, but their eggs also. The latter operation is performed by covering the eggs with a coat of clay mixed with salt. When mixed in this manner, it seems that the salt has the property of penetrating through the pores of the shell, and thus impregnating the substance in the egg, which it could not do by simple solution in water.

Canton, though it suffered much in the Chinese wars, is at present one of the most flourishing provinces of the empire; and being at a great distance from court, its government is one of the most important. A great number of fortresses, many of which are cities, provided with numerous garrisons, have been built along the coasts for the suppression of pirates and robbers; for which purpose also a certain number of troops are kept properly posted, in different parts of the province. It is divided into ten districts, which contain as many cities of the first class, and 84 of the second and third. The air in general is warm but healthy,

healthy, and the people are very industrious. They possess in an eminent degree the talent of imitation; so that if they are only shown any European work, they can execute others like it with surprising exactness. The most remarkable cities in the province besides Canton the capital are, 1. Chao-tcheou-fou, chiefly noted for a monastery of bonzes in its neighbourhood, to which the adjacent country belongs, and the origin of which is traced back for 800 or 900 years. It has under its jurisdiction six cities of the third class; near one of these grows a reed of which several instruments are made, which cannot be distinguished from real ebony. The air of Chao-tcheou-fou, however, is unhealthy; and great numbers of the inhabitants are carried off annually by contagious distempers, which prevail from the middle of October to the beginning of December. 2. Kao-tcheou-fou, situated in a delightful and plentiful country. In the neighbourhood is found a singular kind of stone much resembling marble, on which are natural representations of rivers, mountains, landscapes, and trees. These stones are cut into slabs, and made into tables, &c. Crabs are also caught on the coasts here, which very much resemble those of Europe; but, says Mr Grosier, they have this singularity, that when taken out of the water, they become petrified, without losing any thing of their natural figure. 3. Kiun-tcheou-fou, the capital of the island of Hai-nan. See Hai-nan.

Canton, a large, populous, and wealthy city of China, capital of the province of that name, stands on the banks of the river Taa, or great river, which, near the city, is wide and spacious. The wall of the city is pretty high, and about six or seven miles in circumference, though not more than one third of the ground is occupied by buildings, the other parts being appropriated to pleasure grounds or to fish ponds. The country is extremely pleasant, and towards the east hilly, so as to command a beautiful prospect of the city and suburbs, the compass of which, together, is about ten miles.

The buildings of Canton are in general low, consisting of one story and a ground floor, which is covered with earth or red tiles in order to keep it cool; but the houses of the most respectable merchants and mandarins are comparatively lofty and well built. In different parts of the city and suburbs are joss houses or temples, in which are placed the images worshipped by the Chinese: before whom are placed, at particular seasons, a vast variety of sweetmeats, oranges, great plenty of food ready dressed, and also incense, which is kept perpetually burning.

The streets of Canton are long and narrow, paved with flat stones, adorned at intervals with triumphal arches, which have a pleasing effect, and much crowded with people. On both sides are shops as in London, appropriated to the sale of different commodities; and a kind of awning is extended from house to house, which prevents the sun's rays from incommoding either inhabitants or passengers. At the end of every street is a barrier, which, with the gates of the city, is shut in the evening. In China street, which is pretty long and considerably wider than the rest, reside merchants, whose trade, so far as respects china, lackered ware, fans, &c. is wholly confined to Europeans. Most of them speak the foreign languages tolerably well, or at least sufficiently intelligible to transact business. Besides these merchants there is a company of twelve or thirteen, called the *Cohong*; who have an exclusive right by appointment from authority to purchase the cargoes from the different ships, and also to supply them with teas, raw silks, &c. in return. The establishment of the Cohong, though injurious to private trade, is admirably well adapted for the security of the different companies with which they traffic; because each individual becomes a guarantee for the whole; so that if one fail, the others consider themselves as responsible.

In Canton there are no carriages; all burdens are carried by porters across their shoulders on bamboos; as are also the principal people in sedan chairs, and the ladies always. The streets of Canton may be traversed from morning till evening without seeing a woman, those excepted who are Tartars, and even these but very seldom.

On the wharf of the river, which is commodious and pleasant, stand the factories of the different European nations, viz. the Dutch, French, Swedes, Danes, English, &c. In those reside the supercargoes belonging to their respective companies, who are appointed to dispose of the cargoes brought to market; to supply the ships with others from Europe in return; and, during their absence, to contract with the merchants for such articles as may be judged necessary for the next fleet. Between the residents of the factories the most perfect cordiality subsists; in each a common and splendid table is kept at the company's expence, and visits are reciprocally exchanged; so that nothing is wanting to make residence at Canton agreeable to an European, but the pleasure naturally resulting from the society of women.

The side of the river next the city is covered with boats, which form a kind of town, or streets, in which live the poorer sort of the Chinese, or rather the descendants of the Tartars. Some of the men come on shore in the morning to their respective employments, and in those sampans, or boats which are not stationary, the women and also the men carry passengers from place to place in the same manner as is done by wherries on the Thames. On this river live many thousand souls who never were permitted to come on shore; whose only habitation is their boat; in which they eat, drink, sleep, carry on many occupations, keep ducks, &c. and occasionally a hog.

The manufactures of Canton are principally carried on in the suburbs; though it has been frequently supposed that they were confined to the city; and this, by some writers, has been given as a reason why Europeans are not permitted to enter within the gates. But this is a mistake; and perhaps the true reason for this very singular restraint is, that the houses in which they keep their women are chiefly within the city.

At Wampoa, a large commodious place for anchorage, and which is about 12 or 14 miles from Canton, the European vessels lie and unload their cargoes, which are transmitted by lighters to the factories; and by the same conveyance receive their respective freights. Between this place and the city are three hoppo, or customhouses, at which the boats passing and repassing are obliged to stop, and undergo, with their passengers, an examination, in order to prevent smuggling.

Canton. gling. The lighters just mentioned, and also the captain's pinnace, are, however, excepted; the former having proper officers on board for the purpose, and the latter being narrowly watched and examined at the landing.

The weather at Canton is, in summer, extremely hot, and in the months of December, January, and February, cold: the country is nevertheless pleasant and healthful, abounding with all the necessaries and delicacies of life, which may be procured on terms much cheaper than in Europe. The number of inhabitants has been estimated at one million; but later calculations have made the number considerably less. N. Lat. 23. 30. E. Long. 113. 20.

Canton, *John*, an ingenious natural philosopher, was born in Stroud, in Gloucestershire, in 1718; and was placed, when young, under the care of a Mr Davis of the same place, a very able mathematician, with whom, before he had attained the age of nine years, he had gone through both vulgar and decimal arithmetic. He then proceeded to the mathematics, and particularly to algebra and astronomy, wherein he had made a considerable progress, when his father took him from school, and put him to learn his own business, which was that of a broad-cloth weaver. This circumstance was not able to damp his zeal for the acquisition of knowledge. All his leisure time was devoted to the assiduous cultivation of astronomical science; and, by the help of the Caroline tables annexed to "Wing's Astronomy," he computed eclipses of the moon and other phenomena. His acquaintance with that science he applied likewise to the constructing of several kinds of dials. But the studies of our young philosopher being frequently pursued to very late hours, his father, fearing that they would injure his health, forbade him the use of a candle in his chamber any longer than for the purpose of going to bed, and would himself often see that his injunction was obeyed. The son's thirst of knowledge was, however, so great, that it made him attempt to evade the prohibition, and to find means of secreting his light till the family had retired to rest, when he rose to prosecute undisturbed his favourite pursuits. It was during this prohibition, and at these hours, that he computed, and cut upon stone, with no better an instrument than a common knife, the lines of a large upright sun dial, on which, besides the hour of the day, was shown the rising of the sun, his place in the ecliptic, and some other particulars. When this was finished, and made known to his father, he permitted it to be placed before the front of his house, where it excited the admiration of several gentlemen in the neighbourhood, and introduced young Mr Canton to their acquaintance, which was followed by the offer of the use of their libraries. In the library of one of these gentlemen, he found "Martin's Philosophical Grammar," which was the first book that gave him a taste for natural philosophy. In the possession of another gentleman, a few miles from Stroud, he first saw a pair of globes: an object that afforded him uncommon pleasure, from the great ease with which he could solve those problems he had hitherto been accustomed to compute. The dial was beautified a few years ago at the expence of the gentlemen at Stroud, several of whom had been his schoolfellows, and who continued still to regard it as a very distinguished performance. Among other persons with whom he became acquainted in early life, was the late reverend and ingenious Dr Henry Miles of Tooting, a learned and respectable member of the Royal Society, and of approved eminence in natural knowledge. This gentleman perceiving that Mr Canton possessed abilities too promising to be confined within the narrow limits of a country town, prevailed on his father to permit him to come to London. Accordingly he arrived at the metropolis, March 4. 1737, and resided with Dr Miles at Tooting till the 6th of May following; when he articled himself for the term of five years, as a clerk to Mr Samuel Watkins, master of the Academy in Spital-square. In this situation, his ingenuity, diligence, and good conduct, were so well displayed, that on the expiration of his clerkship in May 1742, he was taken into partnership with Mr Watkins for three years; which gentleman he afterwards succeeded in Spital-square, and there continued during his whole life. In 1744, he married Penelope, the eldest daughter of Mr Thomas Colbrooke, and niece to James Colbrooke, Esq. banker in London.

Towards the end of 1745, electricity, which seems early to have engaged Mr Canton's notice, received a very capital improvement by the discovery of the famous Leyden Phial. This event turned the thoughts of most of the philosophers of Europe to that branch of natural philosophy; and our author, who was one of the first to repeat and to pursue the experiment, found his assiduity and attention rewarded by many capital discoveries. Towards the end of 1749, he was concerned with his friend, the late Mr Benjamin Robins, in making experiments in order to determine to what height rockets may be made to ascend, and at what distance their light may be seen. In 1750 was read at the Royal Society Mr Canton's "Method of making artificial magnets, without the use of, and yet far superior to, any natural ones." This paper procured him the honour of being elected a member of the society, and the present of their gold medal. The same year he was complimented with the degree of M. A. by the University of Aberdeen; and, in 1751, was chosen one of the council of the Royal Society.

In 1752, our philosopher was so fortunate as to be the first person in England who, by attracting the electric fire from the clouds during a thunder storm, verified Dr Franklin's hypothesis of the similarity of lightning and electricity. Next year, his paper entitled, "Electrical Experiments, with an attempt to account for their several Phenomena," was read at the Royal Society. In the same paper Mr Canton mentioned his having discovered, by a great number of experiments, that some clouds were in a positive, and some in a negative, state of electricity. Dr Franklin, much about the same time, made the like discovery in America. This circumstance, together with our author's constant defence of the doctor's hypothesis, induced that excellent philosopher, immediately on his arrival in England, to pay Mr Canton a visit, and gave rise to a friendship which ever after continued without interruption or diminution. In the "Lady's Diary for 1756," our author answered the prize question that had been proposed in the preceding year. The question

tion was, "How can what we call the shooting of stars be best accounted for; what is the substance of this phenomenon; and in what state of the atmosphere doth it most frequently shew itself?" The solution, though anonymous, was so satisfactory to his friend, Mr Thomas Simpson, who then conducted that work, that he sent Mr Canton the prize, accompanied with a note, in which he said, he was sure that he was not mistaken in the author of it, as no one besides, that he knew of, could have answered the question. Our philosopher's next communication to the public, was a letter in the "Gentleman's Magazine, for September 1759," on the electrical properties of the tourmalin, in which the laws of that wonderful stone are laid down in a very concise and elegant manner. On December 13. in the same year, was read at the Royal Society, "An attempt to account for the regular diurnal variation of the Horizontal Magnetic Needle; and also for its irregular variation at the time of an Aurora Borealis." A complete year's observations of the diurnal variations of the needle are annexed to the paper. On November 5. 1761, our author communicated to the Royal Society an account of the Transit of Venus, June 6. 1761, observed in Spital-square. M. Canton's next communication to the Society, was a letter addressed to Dr Benjamin Franklin, and read Feb. 4. 1762; containing some remarks on Mr Delaval's electrical experiments. On Dec. 16. in the same year, another curious addition was made by him to philosophical knowledge, in a paper entitled, "Experiments to prove that water is not incompressible." These experiments are a complete refutation of the famous Florentine experiments, which so many philosophers have mentioned as a proof of the incompressibility of water. On St Andrew's day, 1763, our author was the third time elected one of the council of the Royal Society: and on Nov. 8. in the following year, were read before that learned body, his farther "Experiments and observations on the compressibility of water, and some other fluids." The establishment of this fact, in opposition to the received opinion, formed on the hasty decision of the Florentine Academy, was thought to be deserving of the Society's gold medal. It was accordingly moved for in the council of 1764; and after several invidious delays, which terminated much to the honour of Mr Canton, it was presented to him Nov. 30. 1766.

The next communication of our ingenious author to the Royal Society, which we shall take notice of in this place, was on Dec. 22. 1763, being "An easy method of making a Phosphorus that will imbibe and emit light like the Bolognian stone; with experiments and observations." When he first showed to Dr Franklin the instantaneous light acquired by some of this phosphorus from the near discharge of an electrified bottle, the doctor immediately exclaimed, "And God said, Let there be light, and there was light." The dean and chapter of St Paul's having, in a letter to the president, dated March 5. 1769, requested the opinion of the Royal Society relative to the best and most effectual method of fixing electrical conductors to preserve that cathedral from damage by lightning, Mr Canton was one of the committee appointed to take the letter into consideration, and to report their opinion upon it. The gentlemen joined with him in this business were, Dr Watson, Dr Franklin, Mr Delaval, and Mr Wilson. Their report was made on the 8th of June following; and the mode recommended by them has been carried into execution. The last paper of our author's, which was read before the Royal Society, was on Dec. 21. 1769; and contained "Experiments to prove that the Luminousness of the Sea arises from the putrefaction of its animal substances." In the account now given of his communications to the public, we have chiefly confined ourselves to such as were the most important, and which threw new and distinguished light on various objects in the philosophical world. Besides these he wrote a number of papers both in earlier and in later life, which appeared in several different publications, and particularly in the Gentleman's Magazine.

The close and sedentary life of Mr Canton, arising from an unremitted attention to the duties of his profession, and to the prosecution of his philosophical inquiries and experiments, probably contributed to shorten his days. The disorder into which he fell, and which carried him off, was a dropsy. His death happened on March 22. 1772, in the 54th year of his age.

CANTONING, in the military art, is the allotting distinct and separate quarters to each regiment: the town where they are quartered being divided into as many cantons as there are regiments.

CANTRED, or CANTRETH, signifies a hundred villages. It is a British word, compounded of the adjective *cant*, i. e. hundred; and *tref*, a town or village. In Wales some of the counties are divided into cantreds, as in England into hundreds.

CANTYRE, from *Cantierre*, signifying a "headland;" the southern division of the shire of Argyle in Scotland. It is a peninsula, stretching 27 miles from north to south, and seven miles in breath. It is mostly plain, arable, and populous; inhabited promiscuously by Highlanders and Lowlanders, the latter being invited to settle in this place by the Argyle family, that the lands might be the better cultivated. It gives the title of *marquis* to the duke, and is by Lochfyn divided from Argyle Proper. This loch is an inlet from the sea, about 60 miles in length and four in breadth, celebrated for its herring fishery. There are many paltry villages in this country, but no town of any consequence except Campbelltown.

Cantyre was granted to the house of Argyle after the suppression of a rebellion of the Macdonalds of the Isles (and it is supposed of this peninsula) in the beginning of the last century, and the grant was afterwards ratified by parliament. The ancient inhabitants were the Mac-donalds, Mac-eachrans, Mac-kays, and Mac-maths.

Mull of CANTYRE, the south cape or promontory of the peninsula. There is here a lighthouse 235 feet above the sea at high water, situated on the rocks called the *Merchants*. Lat. 55. 22. Long. 5. 42. west of London. The sound of Isla from the lighthouse bearing, by the compass, N. by E. distant 27 miles; the south end of Isla N. N. W. distant 25 miles; the north end of Rathlin island, N. W. by W. one half W.; the Maiden Rocks, S. by W. one half W. distant 14 miles; Copland light, S. by W. one half W. distant

distant 31 miles. The lanthorn is seen from N. N. E. 1-4th E. from S. by W. 1-4th W. and intermediate points of the compass N. of these two points.

CANTZ, a town of Silesia in Germany. E. Long. 16. 36. N. Lat. 51. 6.

CANVAS, in *Commerce*, a very clear unbleached cloth of hemp, or flax, wove regularly in little squares. It is used for working tapestry with the needle, by passing the threads of gold, silver, silk, or wool, through the intervals or squares.

CANVAS is also a coarse cloth of hemp, unbleached, somewhat clear, which serves to cover women's stays, also to stiffen men's clothes, and to make some other of their wearing apparel, &c.

CANVAS is also used among the French for the model or first words whereon an air or piece of music is composed, and given to a poet to regulate and finish. The canvas of a song contains certain notes of the composer, which shew the poet the measure of the verses he is to make. Thus Du Lot says, he has canvas for ten sonnets against the Muses.

CANVAS is also the name of a cloth made of hemp, and used for ship sails.

CANVAS, among painters, is the cloth on which they usually draw their pictures; the canvas being smoothed over with a slick stone, then sized, and afterwards whited over, makes what the painters called their *primeo cloth*, on which they draw their first sketches with coal or chalk, and afterwards finish with colours.

CANULA, in *Surgery*, a tube made of different metals, principally of silver and lead, but sometimes of iron.

They are introduced into hollow ulcers, in order to facilitate a discharge of pus or any other substance: or into wounds, either accidental or artificial, of the large cavities, as the thorax or abdomen: they are used in the operation of bronchotomy; and by some, after the cutting for the stone, as a drain for urine.

Other canulas are used for introducing cauteries, either actual or potential, into hollow parts, in order to guard the parts adjacent to that to be cauterized, from injury. They are of various figures; some being oval, some round, and some crooked.

CANUSIUM, in *Ancient Geography*, a town of Apulia, on the right or south side of the Aufidus, to the west of Cannæ, whither the Romans fled after the defeat sustained there. It was famous for its red shining wool; whence those who wore clothes made of it were called *Canusinati*. Now called CANOSA; which see.

CANUTE, the first Danish king of England after Ironside. He married Emma, widow of King Ethelred; and put to death several persons of quality who stood in his way to the crown. Having thus settled his power in England, he made a voyage to his other kingdom of Denmark, in order to resist the attacks of the king of Sweden; and he carried along with him a great body of the English under the command of the earl of Godwin. This nobleman had there an opportunity of performing a service by which he both reconciled the king's mind to the English nation, and gaining to himself the friendship of his sovereign, laid the foundation of that immense fortune which he acquired to his family. He was stationed next the Swedish camp; and observing a favourable opportunity which he was obliged suddenly to seize, he attacked the enemy in the night, drove them suddenly from their trenches, threw them into disorder, pursued his advantage, and obtained a decisive victory over them. Next morning, Canute, seeing the English camp entirely abandoned, imagined that these disaffected troops had deserted to the enemy; and he was agreeably surprised to find that they were at that time engaged in pursuit of the discomfited Swedes. He was so pleased with this success, and the manner of obtaining it, that he bestowed his daughter in marriage upon Godwin, and treated him ever after with the most entire confidence and regard.

In another voyage which he afterwards made to Denmark, Canute attacked Norway, and expelled the just but unwarlike Olaus from his kingdom, of which he kept possession till the death of that prince. He had now by his conquests and valour attained the utmost height of his ambition, and having leisure from wars and intrigues, he felt the unsatisfactory nature of all human enjoyments: and equally weary of the glory and turmoils of this life, he began to cast his view towards that future existence, which it is so natural for the human mind, whether satiated by prosperity, or disgusted with adversity, to make the object of its attention. Unfortunately the spirit which prevailed in that age gave a wrong direction to his devotion; and, instead of making atonement to those whom he had formerly injured by his acts of violence, he entirely employed himself in those exercises of piety, which the monks represented as most meritorious. He built churches; he endowed monasteries; he enriched ecclesiastics; and he bestowed revenues for the support of chantries at Assington and other places, where he appointed prayers to be said for the souls of those who had there fallen in battle against him. He even undertook a pilgrimage to Rome, where he sojourned a considerable time; and, besides obtaining from the pope some privileges for the English school erected there, he engaged all the princes through whose dominions he was obliged to pass, to desist from those heavy impositions and tolls which they were accustomed to exact from the English pilgrims. By this spirit of devotion, no less than by his equitable and politic administration, he gained in a good measure the affections of his subjects.

Canute, who was the greatest and most powerful prince of his time, sovereign of Denmark and Norway as well as of England, could not fail to meet with adulation from his courtiers; a tribute which is liberally paid even to the meanest and weakest of princes. Some of his flatterers breaking out one day in admiration of his grandeur, exclaimed that every thing was possible for him: upon which the monarch, it is said, ordered a chair to be set on the sea shore while the tide was making; and as the waters approached, he commanded them to retire, and obey the voice of him who was lord of the ocean. He feigned to sit some time in expectation of their submission; but when the sea still advanced towards him, and began to wash him with its billows, he turned to his courtiers, and remarked to them, That every creature in the universe was feeble and impotent, and that power resided with one Being alone, in whose hands were all the elements of nature, who could say to the ocean, "Thus far shalt thou go, and no farther," and who could level with his nod the most towering piles of human pride and

and ambition. From that time, it is said, he never would wear a crown. He died in the 20th year of his reign, and was interred at Winchester, in the old monastery.

CANZONE, in *Music*, signifies, in general, a song, where some little fugues are introduced; but it is sometimes used for a sort of Italian poem, usually pretty long, to which music may be composed in the style of a cantata. If this term be added to a piece of instrumental music, it signifies much the same as cantata; if placed in any part of a sonata, it implies the same meaning as *allegro*, and only denotes that the part to which it is prefixed is to be played or sung in a brisk and lively manner.

CANZONETTA, a diminutive of canzone, denoting a little short song. The canzonette Neapolitane has two strains, each whereof is sung twice over, as the vaudevilles of the French. The canzonette Siciliane is a species of jig, the measure whereof is usually twelve eighths, and six eighths, and sometimes both, as rondeaus.

CAORLO, a small island in the gulf of Venice, on the coast of Friuli, 20 miles south-west of Aquileia, subject to Venice. It has a town of the same name, with a bishop's see.

CAOUTCHOUC, Elastic Resin, or *India rubber*, a substance produced from the syringe tree of Cayenne and other parts of South America, and possessed of the most singular properties. No substance is yet known which is so pliable, and at the same time so elastic; and it is farther a matter of curiosity, as being capable of resisting the action of very powerful menstrua. From the account of M. de la Condamine, we learn that this substance oozes out, under the form of a vegetable milk, from incisions made in the tree; and that it is gathered chiefly in time of rain, because, though it may be collected at all times, it flows then most abundantly. The means employed to inspissate and indurate it, M. de la Borde says, are kept a profound secret. M. Bomare, and others, affirm, that it thickens and hardens gradually by being exposed to the air; and as soon as it acquires a solid consistence it manifests a very extraordinary degree of flexibility and elasticity. Accordingly the Indians make boots of it which water cannot penetrate, and which, when smoked, have the appearance of real leather. Bottles are also made of it, to the necks of which are fastened hollow reeds, so that the liquor contained in them may be squirted through the reeds or pipes by pressure. One of these filled with water is always presented to each of the guests at their entertainments, who never fail to make use of it before eating. This whimsical custom led the Portuguese in that country to call the tree that produced the resin *pao di xirringa;* and hence the name of *seringat* is given both to the tree and to its resinous production. Flambeaux, an inch and a half in diameter, and two feet long, are likewise made of this resin, which give a beautiful light, have no bad smell, and burn twelve hours. A kind of cloth is also prepared from it, which the inhabitants of Quito apply to the same purpose as our oil cloth and sail cloth. It is formed, in fine, by means of moulds, into a variety of figures for use and ornament; and the process is said to be thus:—The juice, which is obtained by incision, is spread over pieces of clay formed into the desired shape; and as fast as one layer is dry, another is added, till the vessel be of the proper thickness; the whole is then held over a strong smoke of vegetables on fire, whereby it hardens into the texture and appearance of leather; and before the finishing, while yet soft, is capable of having any impression made on the outside, which remains for ever after. When the whole is done, the inside mould is picked out.

Since this resin has been known in Europe, its chemical qualities and other interesting properties have been very diligently investigated. In particular, it has been endeavoured to discover some method of dissolving it in such a manner that it would assume different figures, with equal ease as when in its original fluid state. In the memoirs of the Academy of Sciences for 1768, we have an account of several attempts for this purpose, and how it may be effected.—The state of vegetable milk in which the caoutchouc resin is found when it comes from the tree, led M. Macquer to imagine that it was composed of an oil and a watery matter. From its wanting aromatic flavour, from its little volatility, and from its being incapable of solution in spirit of wine, he concluded that the oil which entered its composition was not an essential, but a fatty one. Hence he thought it probable that it passed from a fluid to a solid form by the evaporation of the watery part, and that the oily solvents would reduce it to a soft state. The first trials he made for dissolving it were with linseed oil, essence of turpentine, and several others. But all he could obtain by means of these menstrua was a viscid substance, incapable of being hardened, and totally void of elasticity. The rectified essential oil of turpentine was employed seemingly with greater success. To separate from this menstruum the caoutchouc which it had dissolved, M. Macquer added spirit of wine; but the consequence was, that part only of the oil united with the spirit; the rest remaining obstinately attached to the resin which it had dissolved, and thus preventing it from assuming a solid consistence. The author next endeavoured to dissolve it by means of heat in Papin's digester. But neither water, nor spirit of wine, although in this way capable of dissolving the hardest bones, could produce any other effect upon it than to render it more firm than before. After this, he tried what effect the milky juice of other vegetables would have upon it. He used several kinds, particularly that of the fig. But, in this way, he could obtain no solution. From the great volatility of ether, he was next induced to try it as a menstruum; and, for this purpose, he prepared some with great attention. The caoutchouc, cut into little bits, and put into a proper vessel with so much ether as was sufficient to cover it, was perfectly dissolved without any other heat than that of the atmosphere. This solution was transparent and of an amber colour. It still preserved the smell of ether, but mixed with the disagreeable odour of the caoutchouc, and it is a little less fluid than pure ether. Upon its being thrown into water, no milky liquor was produced; but there arose to the surface a solid membrane, which possessed the great elasticity and other peculiar properties of the caoutchouc. He observes, however, that two pints of the best ether, obtained by rectifying eight or ten pints of the common ether by a gentle heat, must be used, in order to the success of the operation.—

Caoutchouc.

ration.—The distinguishing properties of this substance, viz. its solidity, flexibility, and elasticity, and its quality of resisting the action of aqueous, spirituous, saline, oily, and other common solvents, render it extremely fit for the construction of tubes, catheters, and other instruments, in which these properties are wanted. In order to form this resin into small tubes, M. Macquer prepared a solid cylindrical mould of wax, of the desired size and shape; and then dipping a pencil into the ethereal solution of the resin, daubed the mould over with it, till he had covered it with a coat of resin of a sufficient thickness. The whole piece is then thrown into boiling water; by the heat of which the wax is soon melted, and rises to the surface, leaving the resinous tube completely formed behind.

Grossart informs us, that he has succeeded very well in employing the essential oils of turpentine and lavender as a solvent for the elastic gum, and thus forming it into tubes or giving it any shape that is wanted. When the elastic tube is prepared with oil of lavender, the latter may be separated by immersing the tube in alcohol, which charges itself with the oil, and becomes a good lavender water. Alcohol serves another purpose beside taking up the essential oil. It accelerates very much the drying of caoutchouc instruments which are thus formed. Oil of turpentine appeared always to have a kind of stickiness; and the smell which could not be got rid of, by any means yet discovered, was another inconvenience.

Grossart proposes another solvent, which is easily procured, and is not liable to the inconvenience just mentioned. This solvent is *water*. "I conceive (says he) it will appear strange to mention water as a solvent of elastic gum, that liquid having been always supposed to have no action upon it. I myself resisted the idea; but reflecting that ether, by being saturated with water, is the better enabled to act on caoutchouc, and that this gum when plunged into boiling water becomes more transparent at the edges, I presumed that this effect was not due simply to the dilatation of its volume by the heat. I thought that, at that temperature, some action might take place, and that a long continued ebullition might produce more sensible effects. I was not disappointed in my expectations, and one of those tubes was prepared without any other solvent than water and heat. I proceeded in the same manner as with ether: the elastic gum dilates but very little in boiling water; it becomes whitish, but recovers its colour again by drying it in the air and light. It is sufficiently prepared for use when it has been a quarter of an hour in boiling water: by this time its edges are somewhat transparent. It is to be turned spirally round the mould, in the manner we described before, and replunged frequently into the boiling water, during the time that is employed in forming the tube, to the end that the edges may be disposed to unite together. When the whole is bound with packthread, it is to be kept some hours in boiling water; after which it is to be dried, still keeping on the binding.

"If we wish to be more certain that the connexion is perfect, the spiral may be doubled; but we must always avoid placing the exterior surfaces of the slips one upon the other, as those surfaces are the parts which most resist the action of solvents. This precaution is less necessary when ether is employed, on account of its great action upon the caoutchouc.

"It might be feared that the action of water upon caoutchouc would deprive us of the advantages which might otherwise be expected: but these fears will be removed, if we consider that the affinities differ according to the temperatures; that it is only at a very high temperature that water exercises any sensible action upon caoutchouc. I can affirm, that at 120° of Reaumur's thermometer (302° of Fahrenheit) this affinity is not such as that the water can give a liquid form to caoutchouc; and it does not appear that we have any thing to fear in practice from a combination between these two bodies, which, though it really is a true solution, does not take place in any sensible degree but at a high temperature. It is therefore at present easy to make of caoutchouc whatever instruments it may be advantageous to have of a flexible, supple, and elastic substance, which is impermeable to water at the temperature of our atmosphere, and resists the action of acids as well as that of most other solvents. As to the durability of these instruments, few substances promise more than this, because it may be soldered afresh in a damaged part. Any woven substance may be covered with it; it is only required that the substance should be of a nature not to be acted upon during the preparation, either by ether or by boiling water; for these two agents are those which appear to me to merit the preference. Artists will frequently find an advantage in employing ether, as it requires less time; so that a person may make, in a single day, any tube he may have occasion for. The expence of ether is very little, since it is needful only to dispose the caoutchouc to adhere; and being brought into that state, the caoutchouc may be kept in a vessel perfectly well closed. It would also diminish the expence of the ether, if, instead of washing it with a large quantity of water, there should be added to it only as much water as it can take up." *Annales de Chimie*, vol. xi. p. 149.

A resin similar to this was some years ago discovered by M. Poivre, in the isle of France; and there are various milky juices extracted from trees in America and elsewhere, which by previous mixtures and preparations are formed into an elastic resin, but of an inferior quality to that of Cayenne; such, for instance, are the juices obtained from the *Cecropia peltata*, the *Ficus religiosa* and *Indica*, &c.

Of the genuine trees, those growing along the banks of the river of the Amazons are described by M. Condamine as attaining a very great height, being at the same time perfectly straight, and having no branches except at top, which is but small, covering no more than a circumference of ten feet. Its leaves bear some resemblance to those of the *manioc*: they are green on the upper part, and white beneath. The seeds are three in number, and contained in a pod consisting of three cells, not unlike those of the *ricinus* or *palma Christi*; and in each of them there is a kernel, which being stripped and boiled in water, produces a thick oil or fat, answering the purpose of butter in the cookery of that country.

A method of dissolving this elastic gum without ether, for the purposes of a varnish or the like, is as follows: Take one pound of the spirit of turpentine, and a pound of the gum cut into very small pieces; pour the turpentine into a long-necked matrass, which must be placed in a sand-bath; throw in the gum, not all at once, but by little and little according as it is perceived to dissolve: When it is entirely dissolved, pour into the matrass a pint of nut or linseed oil, or oil of poppies, rendered desiccative in the usual manner with litharge: Then let the whole boil for a quarter of an hour, and the preparation is finished. This would make an excellent varnish for air balloons, were it not so expensive on account of the price of the gum. —Another method, invented by Mr Baldwin, is as follows. Take any quantity of the caoutchouc, as two ounces avoirdupois: cut it into small bits with a pair of scissars. Put a strong iron ladle (such as plumbers and glaziers melt their lead in) over a common pitcoal or other fire. The fire must be gentle, glowing, and without smoke. When the ladle is hot, much below a red heat, put a single bit into the ladle. If black smoke issues, it will presently flame and disappear; or it will evaporate without flame: the ladle is then too hot. When the ladle is less hot, put in a second bit, which will produce a white smoke. This white smoke will continue during the operation, and evaporate the caoutchouc: therefore no time is to be lost; but little bits are to be put in, a few at a time, till the whole are melted. It should be continually and gently stirred with an iron or brass spoon. Two pounds, or one quart, of the best drying oil (or of raw linseed oil, which, together with a few drops of neats foot oil, has stood a month, or not so long, on a lump of quicklime, to make it more or less drying) is to be put into the melted caoutchouc, and stirred till hot: and the whole poured into a glazed vessel, through a coarse gauze, or fine sieve. When settled and clear, which will be in a few minutes, it is fit for use, either hot or cold.

The Abbé Clavigero informs us, that the elastic gum is called by the Mexicans *Ollin* or *Olli*, and by the Spaniards of that kingdom *Ule*: That it distils from the olquahuitl, which is a tree of moderate size; the trunk of which is smooth and yellowish, the leaves pretty large, the flowers white, and the fruit yellow and rather round, but angular; within which there are kernels as large as filberts, and white, but covered with a yellowish pellicle: That the kernel has a bitter taste, and the fruit always grows attached to the bark of the tree: That when the trunk is cut, the ule which distils from it is white, liquid, and viscous; afterwards it becomes yellow; and lastly of a leaden colour, though rather blacker, which it always retains. The tree, he adds, is very common in the kingdom of Guatimala.

Different trees, it would appear, yield the elastic gum. Aublet, in his *Histoire des Plantes de la Guiane* (p. 871.), describes the tree, the fruit, and manner of collecting the juice; but never saw the flower: he calls it, however, *Hevea Guianensis*. In Jacquin's America, it is called *Echites Corymbosa*. The younger Linnæus, in his *Supplementum Plantarum* (p. 422), names it *Jatropha Elastica*; but acknowledges that he only gives it this name from the structure of the fruit having most resemblance to that genus, his dry species wanting the flowers.

Of the above gum, it is said, the Chinese make elastic rings for lascivious purposes.—Among us it is used by surgeons for injecting liquids, and by painters for rubbing out black lead pencil marks, &c.

CAP, a part of dress made to cover the head, much in the figure thereof.

The use of caps and hats is referred to the year 1449, the first seen in these parts of the world being at the entry of Charles VII. into Rouen: from that time they began to take place of the hoods, or chaperoons, that had been used till then. When the cap was of velvet, they called it *mortier;* when of wool, simply *bonnet*. None but kings, princes, and knights, were allowed the use of the mortier. The cap was the head-dress of the clergy and graduates. Pasquier says, that it was anciently a part of the hood worn by the people of the robe; the skirts whereof being cut off as an encumbrance, left the round cap an easy commodious cover for the head; which round cap being afterwards assumed by the people, those of the gown changed it for a square one, first invented by a Frenchman, called Patrouillet: he adds, that the giving of the cap to the students in the universities, was to denote, that they had acquired full liberty, and were no longer subject to the rod of their superiors; in imitation of the ancient Romans, who gave a *pileus*, or cap, to their slaves, in the ceremony of making them free: whence the proverb, *Vocare servos ad pileum*. Hence, also, on medals, the cap is the symbol of Liberty, whom they represent holding a cap in her right hand, by the point.

The Romans were many ages without any regular covering for the head: when either the rain or sun was troublesome, the lappet of the gown was thrown over the head; and hence it is that all the ancient statues appear bareheaded, excepting sometimes a wreath, or the like. And the same usage obtained among the Greeks, where, at least during the heroic age, no caps were known. The sort of caps or covers of the head in use among the Romans, on divers occasions, were the *pitra*, *pileus*, *cucullus*, *galerus*, and *palliolum;* the differences between which are often confounded by ancient as well as modern writers.

The French clergy wear a shallow kind of cap, called *calotte*, which only covers the top of the head, made of leather, satin, worsted, or other stuff. The red cap is a mark of dignity, allowed only to those who are raised to the cardinalate. The secular clergy are distinguished by black leathern caps, the regulars by knit and worsted ones.

Churchmen, and the members of universities, students in law, physic, &c. as well as graduates, wear square caps. In most universities doctors are distinguished by peculiar caps, given them in assuming the doctorate. Wickliff calls the canons of his time *bifurcati*, from their caps. Pasquier observes, that, in his time, the caps worn by the churchmen, &c. were called square caps; though, in effect, they were round yellow caps.

The Chinese have not the use of the hat, like us; but wear a cap of a peculiar structure, which the laws of civility will not allow them to put off: it is different for the different seasons of the year: that used in summer is in form of a cone, ending at top in a point. It is made of a very beautiful kind of mat, much valued in that country, and lined with satin; to this is added, Cap.

added, at top, a large lock of red silk, which falls all round as low as the bottom; so that, in walking, the silk fluctuating regularly on all sides, makes a graceful appearance: sometimes, instead of silk, they use a kind of bright red hair, the lustre whereof no weather effaces. In winter they wear a plush cap, bordered with martlet's or fox's skin: as to the rest, like those for the summer. These caps are frequently sold for eight or ten crowns; but they are so short, that the ears are exposed.

The cap is sometimes used as a mark of infamy; in Italy the Jews are distinguished by a yellow cap; at Lucca by an orange one. In France, those who had been bankrupts were obliged ever after to wear a green cap, to prevent people from being imposed on in any future commerce. By several arrets in 1584, 1622, 1628, 1688, it was decreed, that if they were at any time found without their green cap, their protection should be null, and their creditors empowered to cast them into prison: but the sentence is not now executed.

Cap of Maintenance, one of the regalia, or ornaments of state, belonging to the kings of England, before whom it was carried at the coronation and other great solemnities. Caps of maintenance are also carried before the mayors of the several cities in England.

Cap and Button, are two small islands, lying in longitude 105° 48′ 30″ east; and in latitude, the former 5° 58′ 30″, the latter 5° 49′ south. They are thus described by Sir George Staunton:

"At a little distance they might be mistaken for the remains of old castles, mouldering into heaps of ruins, with tall trees already growing upon the tops; but at a nearer view, they betrayed evident marks of a volcanic origin. Explosions from subterraneous fires, produce, for the most part, hills of a regular shape, and terminating in truncated cones; but when from a subaqueous volcano eruptions are thrown up above the surface of the sea, the materials, falling back into the water, are more irregularly dispersed, and generally leave the sides of the new creation naked and mishapen, as in the instance of Amsterdam, and of those smaller spots called, from some resemblance in shape, the Cap and Button.

"In the Cap were found two caverns, running horizontally into the side of the rock; and in these were a number of those birds nests so much prized by the Chinese epicures. They seemed to be composed of fine filaments cemented together by a transparent viscous matter, not unlike what is left by the foam of the sea upon stones alternately covered by the tide, or those gelatinous animal substances found floating on every coast. The nests adhere to each other, and to the sides of the cavern, mostly in rows, without any break or interruption. The birds that build these nests are small grey swallows, with bellies of a dirty white. They were flying about in considerable numbers; but they were so small and their flight so quick, that they escaped the shot fired at them. The same nests are said also to be found in deep caverns, at the foot of the highest mountains in the middle of Java, and at a distance from the sea, from which the birds, it is thought, derive no materials, either for their food or the construction of their nests; as it does not appear probable they should fly, in search of either, over the intermediate mountains, which are very high, or against the boisterous winds prevailing thereabouts. They feed on insects, which they find hovering over stagnated pools between the mountains, and for catching which their wide-opening beaks are particularly adapted. They prepare their nests from the best remnants of their food. Their greatest enemy is the kite, who often intercepts them in their passage to and from the caverns, which are generally surrounded with rocks of gray limestone or white marble. The nests are placed in horizontal rows at different depths, from 50 to 500 feet. The colour and value of the nests depend on the quantity and quality of the insects caught, and perhaps also on the situation where they are built. Their value is chiefly determined by the uniform fineness and delicacy of their texture; those that are white and transparent being most esteemed, and fetching often in China their weight in silver. These nests are a considerable object of traffic among the Javanese, and many are employed in it from their infancy. The birds having spent near two months in preparing their nests, lay each two eggs, which are hatched in about fifteen days. When the young birds become fledged, it is thought time to seize upon their nests, which is done regularly thrice a-year, and is effected by means of ladders of bamboo and reeds, by which the people descend into the cavern; but when it is very deep, rope ladders are preferred. This operation is attended with much danger; and several break their necks in the attempt. The inhabitants of the mountains generally employed in it begin always by sacrificing a buffalo; which custom is constantly observed by the Javanese on the eve of every extraordinary enterprise. They also pronounce some prayers, anoint themselves with sweet-scented oil, and smoke the entrance of the cavern with gum-benjamin. Near some of those caverns a tutelar goddess is worshipped, whose priest burns incense, and lays his protecting hands on every person preparing to descend into the cavern. A flambeau is carefully prepared at the same time, with a gum which exudes from a tree growing in the vicinity, and is not easily extinguished by fixed air or subterraneous vapours. The swallow, which builds those nests, is described as not having its tail feathers marked with white spots, which is a character attributed to it by Linnæus; and it is possible that there are two species or varieties of the swallow, whose nests are alike valuable *."

Cap, in ship-building, a strong thick block of wood, used to confine two masts together, when one is erected at the head of the other in order to lengthen it. It is for this purpose furnished with two holes perpendicular to its length and breadth, and parallel to its thickness: one of these is square, and the other round: the former being solidly fixed upon the upper end of the lower mast, whilst the latter receives the mast employed to lengthen it, and secures it in this position.

CAPACIO, an episcopal town of Italy in the kingdom of Naples, and in the Hither Principato. E. Long. 15. 18. N. Lat. 40. 40.

CAPACITY, in a general sense, an aptitude or disposition to hold or retain any thing.

Capacity, in *Geometry*, is the solid contents of any body;

Cap ‖ Capacit

* Em to Chi

body; also our hollow measures for wine, beer, corn, salt, &c. are called *measures of Capacity*.

Capacity, in *Law*, the ability of a man, or body politic to give or take lands or other things, or sue actions.

Our law allows the king two capacities; a natural, and a political: in the first, he may purchase lands to him and his heirs; in the second, to him and his successors. The clergy of the church of England have the like.

CAPARASON, or Caparison, the covering or clothing laid over a horse; especially a sumpter horse, or horse of state. The word is Spanish, being an augmentative of *cape*, *caput*, *head*.

Anciently the caparasons were a kind of iron armour, wherewith horses were covered in battle.

CAPE, in *Geography*, a high land running out with a point into the sea, as Cape Nord, Cape Horn, the Cape of Good Hope, &c.

Cape *Elk*. See Cervus, Mammalia *Index*.

Cape *Breton*. See Breton.

Cape *Coast Castle*. See Coast.

Cape *of Good Hope*. See Good Hope.

Cape *Verd*. See Verd.

CAPELL, Edward, a gentleman well known by his indefatigable attention to the works of Shakespeare, was a native of the county of Suffolk, and received his education at the school of St Edmund's Bury. In the dedication of his edition of Shakespeare, in 1768, to the duke of Grafton, he observes, that "his father and the grandfather of his grace were friends, and to the patronage of the deceased nobleman he owed the leisure which enabled him to bestow the attention of 20 years on that work." The office which his grace bestowed on Mr Capell was that of deputy-inspector of the plays, to which a salary is annexed of 200l. a-year. So early as the year 1745, as Mr Capell himself informs us, shocked at the licentiousness of Hanmer's plan, he first projected an edition of Shakespeare, of the strictest accuracy, to be collated and published in due time, *ex fide codicum*. He immediately proceeded to collect and compare the oldest and scarcest copies; noting the original excellencies and defects of the rarest quartos, and distinguishing the improvements or variations of the first, second, and third folios: and after many years labour produced a very beautiful small octavo, in 10 volumes, with an "Introduction." There is not, the authors of the Monthly Review observe, among the various publications of the present literary era, a more singular composition than that "Introduction." In style and manner it is more obsolete and antique than the age of which he treats. It is Lord Herbert of Cherbury, walking the new pavement in all the trappings of romance; but, like Lord Herbert, it displays many valuable qualities accompanying this air of extravagance, much sound sense, and appropriate erudition. In the title-page of "Mr William Shakespeare, his Comedies, Histories, and Tragedies," it was also announced and promulgated, "Whereunto will be added, in some other volumes, notes critical and explanatory, and a body of various readings entire." "The Introduction" likewise declared, that these "notes and various readings" would be accompanied with another work, disclosing the sources from which Shakespeare "drew the greater part of his knowledge in mythological and classical matters, his fable, his history, and even the seeming peculiarities of his language—to which," says Mr Capell, "we have given for title, The School of Shakespeare." Nothing surely could be more properly conceived than such designs; nor have we ever met with any thing better grounded on the subject of "the learning of Shakespeare," than what may be found in the long note to this part of Mr Capell's Introduction. It is more solid than even the popular "Essay" on this topic. Certain quaintnesses of style, and peculiarities of printing and punctuation, attended the whole of this publication. The outline, however, was correct; and the critic, with unremitting toil, succeeded in his undertaking. But while he was diving into the classics of Caxton (to continue the Reviewer's account), and working his way under ground, like the river Mole, in order to emerge with all his glories; while he was looking forward to his triumphs, certain other active spirits went to work upon his plan; and, digging out the promised treasures, laid them prematurely before the public, defeating the effect of our critic's discoveries by anticipation. Steevens, Malone, Farmer, Percy, Reed, and a whole host of literary ferrets, burrowed into every hole and corner of the warren of modern antiquity, and overran all the country, whose map had been delineated by Edward Capell. Such a contingency nearly staggered the steady and unshaken perseverance of our critic, at the very eve of the completion of his labours, and as his editor informs us—for, alas! at the end of near 40 years, the publication was posthumous, and the critic himself no more!—he was almost determined to lay the work wholly aside. He persevered, however, by the encouragement of some noble and worthy persons; and to such their encouragement, and his perseverance, the public was, in 1783, indebted for three large volumes in 4to. under the title of "Notes and various readings of Shakespeare; together with the School of Shakespeare, or Extracts from divers English Books that were in print in the Author's time; evidently showing from whence his several Fables were taken, and some parcel of his Dialogue. Also farther extracts, which contribute to a due understanding of his Writings, or give a light to the History of his Life, or to the Dramatic History of his Time. By Edward Capell."—Besides the works already mentioned, Mr Capell was the editor of a volume of ancient poems called "Prolusions;" and the alteration of "Anthony and Cleopatra," as acted at Drury Lane in 1758. He died January 24. 1781.

CAPELLA, in *Astronomy*, a bright fixed star in the left shoulder of the constellation Auriga.

CAPELLE, a town of France, in Picardy, in the department of Aisne, eight miles from Guise. It was taken by the Spaniards in 1636; but retaken the year after. E. Long. 3. 59. N. Lat. 49. 58.

CAPELLETS. See Farriery *Index*.

CAPELLUS, Lewis, an eminent French Protestant divine, born at Sedan in Champagne about the year 1579. He was the author of some learned works, but is chiefly known from the controversy he engaged in with the younger Buxtorf concerning the antiquity of Hebrew points, which Capellus undertook to disprove. His *Critica Sacra* was also an elaborate work, and

and excited some disputes. He died in 1658, having made an abridgement of his life in his work *De Gente Capellori*.

CAPER. See CAPPARIS, BOTANY *Index*.

CAPER also denotes a vessel used by the Dutch for cruising and taking prizes from the enemy; in which sense, caper amounts to the same with privateer. Capers are commonly double officered, and crowded with hands even beyond the rates of ships of war, because the thing chiefly in view is boarding the enemies.

CAPERNAUM, a city celebrated in the Gospels, being the place where Jesus usually resided during the time of his ministry. This city is nowhere mentioned in the Old Testament under this or any other name like it; and therefore it is not improbable that it was one of those towns which the Jews built after their return from the Babylonish captivity. It stood on the sea coast, i. e. on the coast of the sea of Galilee, in the borders of Zebulon and Nephtalim (Mat. iv. 15.), and consequently towards the upper part therof. It took its name no doubt from an adjacent spring, of great repute for its clear and limpid water; and which, according to Josephus, was by the natives called *Capernaum*. As this spring might be some inducement to the building the town in the place where it stood, so its being a convenient wafting place from Galilee to any part on the other side of the sea, might be some motive to our Lord for his moving from Nazareth, and making this the place of his most constant residence. Upon this account Capernaum was highly honoured, and said by our Lord himself to be *exalted unto heaven*; but because it made no right use of this signal favour, it drew from him the severe denunciation, that it should *be brought down to hell* (Matt. xi. 23.), which has certainly been verified: for, as Dr Wells observes, so far is it from being the metropolis of all Galilee, as it once was, that it consisted long since of no more than six poor fishermen's cottages, and may perhaps be now totally desolate.

CAPEROLANS, a congregation of religious in Italy, so called from Peter Caperole their founder, in the 15th century.

The Milanese and Venetians being at war, the enmity occasioned thereby spread itself to the very cloisters. The superiors of the province of Milan, of minor brothers, which extended itself as far as the territories of the republic of Venice, carried it so haughtily over the Venetians, that those of the convent of Brescia resolved to shake off a yoke which was grown insupportable to them. The superiors, informed of this, expelled out of the province those whom they considered as the authors of this design; the principal of whom were Peter Caperole, Matthew de Tharvillo, and Bonaventure of Brescia. Peter Caperole, a man of an enterprising genius, found means to separate the convents of Brescia, Bergamo, and Cremona, from the province of Milan, and subject them to the conventuals. This occasioned a law-suit between the vicar-general and these convents, which was determined in favour of the latter; and these convents, in 1475, by the authority of Pope Sextus IV. were erected into a distinct vicarate, under the title of that of *Brescia*. This not satisfying the ambition of Caperole, he obtained, by the interposition of the doge of Venice, that this vicarate might be erected into a congregation, which was called from him *Caperolans*. This congregation still subsists in Italy, and is composed of 24 convents, situated in Brescia, Bergamo, and Cremasco.

CAPEQUIN, a town of Ireland, in the county of Waterford, and province of Munster, situated on the river Blackwater. W. Long. 7. 50. N. Lat. 52. 5.

CAPESTAN, a town of France, in Lower Languedoc, in the diocese of Narbonne, and near the royal canal. E. Long. 3. 5. N. Lat. 43. 35.

CAPH, a Jewish measure of capacity for things, estimated by Kimchi at the 30th part of the log, by Arbuthnot at the 16th part of the hin or 32d of the seah, amounting to five-eighths of an English pint. The caph does not occur in Scripture, as the name of any measure.

CAPHAR, a duty which the Turks raised on the Christians who carry or send merchandises from Aleppo to Jerusalem and other places in Syria.

The duty of caphar was first imposed by the Christians themselves, when they were in possession of the Holy Land, for the maintenance of the troops which were planted in difficult passes to observe the Arabs and prevent their incursions. It is still continued, and much increased by the Turks, under pretence of defending the Christians against the Arabs; with whom, nevertheless, they keep a secret intelligence, favouring their excursions and plunders.

CAPHTOR, in *Ancient Geography*, a town or district of Higher Egypt; and hence the people called *Caphtorim* or *Caphtorei*.—Caphtor is an island of Egypt, Ai Caphtor (Jeremiah): probably one of those in the Nile. Dr Wells supposes it to be Coptos, which stood in a small island. Thence came the *Caphtorim* or *Caphtoræi*, in Palestine; who with the Philistines conspired to extirpate the Hevæi; and whose name was swallowed up in that of the Philistines.

CAPI-AGA, or CAPI-*Agassi*, a Turkish officer who is governor of the gates of the seraglio, or grand-master of the seraglio.

The capi-aga is the first dignity among the white eunuchs: he is always near the person of the grand signior: he introduces ambassadors to their audience: nobody enters or goes out of the grand signior's apartment but by his means. His office gives him the privilege of wearing the turban in the seraglio, and of going everywhere on horseback. He accompanies the grand signior to the apartment of the sultanas, but stops at the door without entering. His appointment is very moderate; the grand signior bears the expence of his table, and allows him at the rate of about sixty French livres per day; but his office brings him in abundance of presents; no affair of consequence coming to the emperor's knowledge without passing through his hand. The capi-aga cannot be bashaw when he quits his post.

CAPIAS, in *Law*, a writ of two sorts; one before judgment in an action, and the other after. That before judgment is called *capias ad respondendum*, where an original is issued out, to take the defendant, and make him answer the plaintiff. That after judgment is of divers kinds; as,

CAPIAS *ad Satisfaciendum*, a writ of execution, that issues on a judgment obtained, and lies where any person recovers in a personal action, as for debt, damages, &c.

&c. in which cases this writ issues to the sheriff, commanding him to take the body of him against whom the debt is recovered, who is to be kept in prison till he makes satisfaction.

Capias Pro Fine is a writ lying where a person is fined to the king, for some offence committed against a statute, and he does not discharge the fine according to the judgment; therefore his body shall be taken by this writ, and committed to gaol till the fine is paid.

Capias Utlegatum, a writ which lies against any one outlawed, upon any action personal or criminal, by which the sheriff is ordered to apprehend the party outlawed, for not appearing on the exigent, and keep him in safe custody till the day of return, when he is ordered to present him to the court, to be there farther ordered for his contempt.

Capias in Withernam, a writ that lies for cattle *in withernam*: that is, where a distress taken is driven out of the county, so that the sheriff cannot make deliverance upon a replevin; then this writ issues, commanding the sheriff to take as many beasts of the distrainer, &c.

CAPIGI, a porter or doorkeeper of the Turkish seraglio. There are about five hundred *capigis* or porters in the seraglio, divided into two companies: one consisting of three hundred, under a chief called *Capigi-Bassa*, who has a stipend of three ducats per day; the other consists of two hundred, distinguished by the name of *Cuccicapigi*, and their chief *Cuccicapigi-Bassa*, who has two ducats. The capigis have from seven to fifteen aspers per day; some more, others less. Their business is to assist the janizaries in the guard of the first and second gates of the seraglio; sometimes all together; as when the Turk holds a general council, receives an ambassador, or goes to the mosque; and sometimes only in part: being ranged on either side to prevent people entering with arms, any tumults being made, &c. The word, in its original, signifies *gate*.

CAPILLAMENT, in a general sense, signifies a hair: whence the word is applied to several things, which on account of their length or their fineness resemble hairs: as,

Capillaments of the Nerves, in *Anatomy*, the fine fibres or filaments, whereof the nerves are composed.

CAPILLARY, in a general sense, an appellation given to things on account of their extreme fineness, or resembling hair.

Capillary Tubes in *Physics*, are small pipes of glass, whose canals are extremely narrow, their diameter being only a half, a third, or a fourth of a line.

The ascent of water, &c. in capillary tubes, is a phenomenon that has long embarrassed the philosophers; for let one end of a glass tube open at both extremities be immerged in water, the liquor within the tube will rise to a considerable height above the external surface: or if two or more tubes are immerged in the same fluid, one a capillary tube, and the other of a larger bore, the fluid will ascend higher in the former than in the latter; and this will be in a reciprocal ratio of the diameters of the tubes.

In order to account for this phenomenon, it will be necessary first to premise, that the attraction between the particles of glass and water is greater than the attraction between the particles of water themselves: for if a glass tube be placed in a position parallel to the horizon, and a drop of water be applied to the under side of the tube, it will adhere to it: nor will it fall from the glass till its bulk and gravity are so far increased, as to overcome the attraction of the glass. Hence it is easy to conceive how sensibly such a power must act on the surface of a fluid, not viscid, as water, contained within the small cavity or bore of a glass tube; as also that it will be proportionably stronger as the diameter of the bore is smaller; for it will be evident that the efficacy of the power is in the inverse proportion of the diameter, when it is considered that such particles only as are in contact with the fluid, and those immediately above the surface, can effect it.

Now these particles form a periphery contiguous to the surface, the upper part of which attracts and raises the surface, while the lower part, which is in contact with it, supports it: so that neither the thickness nor length of the tube is of any consequence here; the periphery of particles only, which is always proportionable to the diameter of the bore, is the only acting power. The quantity of the fluid raised will therefore be as the surface of the bore which it fills, that is, as the diameter; for otherwise the effect would not be proportional to the cause, since the quantities are always as the ratio of the diameters; the heights therefore to which the fluids will rise in different tubes, will be inversely as the diameters.

Some doubt whether the law holds throughout, of the ascent of the fluid being always higher as the tube is smaller: Dr Hook's experiments, with tubes almost as fine as cobwebs, seem to show the contrary. The water in these, he observes, did not rise so high as one would have expected. The highest he ever found it, was at 21 inches above the level of the water in the bason; which is much short of what it ought to have been by the law above mentioned. See Cohesion.

Capillary Vessels. Many small vessels of animal bodies have been discovered by the modern invention of injecting the vessels of animals, with a coloured fluid, which upon cooling grows hard. But though most anatomists know the manner of filling the large trunks, few are acquainted with the art of filling the capillaries. Dr Monro, in the Medical Essays, has given what, after many trials, he has found most successful. See Injection.

CAPILLUS veneris. See Adiantum, Botany *Index*.

CAPILUPI, or Capilupus, Camillus, a native of Mantua, in the 16th century. He wrote a book, entitled *The Stratagem*; in which he relates not only what was perpetrated at Paris during the massacre on St Bartholomew's day, but also the artful preparations which preceded that horrid massacre. It is, however, blended with a great number of falsities.

Capilupi, *Lælius*, an Italian poet, brother to the former, made himself famous by some Centos of Virgil. The manner in which he applied Virgil's expressions to represent things which the poet never dreamt of, is admired. His Cento against women is very ingenious, but too satirical. The poems of Capilupi are inserted in the *Deliciæ Poetarum Italorum*.

CAPISCOLUS, or CAPISCHOLUS, in ecclesiastical writers, denotes a dignitary in certain cathedrals, who had the superintendency of the choir, or band of music, answering to what in other churches is called *chanter* or *precentor*. The word is also written *cabiscolus*, and *caputscholæ*, q. d. the head of the school, or band of music.

The capiscolus is also called *scholasticus*, as having the instruction of the young clerks and choristers, how to perform their duty.

CAPITA, DISTRIBUTION BY, in *Law*, signifies the appointing to every man an equal share of a personal estate; when all the claimants claim in their own rights, as in eqnal degrees of kindred, and not *jure representationis*.

CAPITAL, of the Latin *caput* "the head," is used, on various occasions, to express the relation of a head, chief or principal: thus,

CAPITAL City, in *Geography*, denotes the principal city of a kingdom, state, or province.

CAPITAL Stock, among merchants, bankers, and traders, signifies the sum of money which individuals bring to make up the common stock of a partnership when it is first formed. It is also said of the stock which a merchant at first puts into trade for his account. It likewise signifies the fund of a trading company or corporation, in which sense the word stock is generally added to it. Thus we say, the capital stock of the bank, &c. The word capital is opposed to that of profit or gain, though the profit often increases the capital, and becomes of itself part of the capital, when joined with the former.

CAPITAL Crime, such a one as subjects the criminal to capital punishment, that is, to loss of life. *

*See *Crime* and *Punishment*.

CAPITAL Picture in *Painting*, denotes one of the finest and most excellent pieces of any celebrated master.

CAPITAL Letters, in *Printing*, large or initial letters, wherein titles, &c. are composed; with which all periods, verses, &c. commence; and wherewith also all proper names of men, kingdoms, nations, &c. begin. The practice which, for some time, obtained among our printers, of beginning every substantive with a capital, is now justly fallen into disrepute; being a manifest perversion of the design of capitals, as well as an offence against beauty and distinctness.

CAPITAL, *Succession by*, where the claimants are next in degree to the ancestor, in their own right, and not by right of representation.

CAPITAL, in *Architecture*, the uppermost part of a column, or pilaster, serving as the head or crowning, and placed immediately over the shaft, and under the entablature. See ARCHITECTURE.

CAPITANA, or CAPTAIN *Galley*, the chief or principally galley of a state, not dignified with the title of a kingdom. The capitana was anciently the denomination of the chief galley of France, which the commander went on board of. But since the suppression of the office of captain general of the galleys in 1669, they have no capitana, but the first galley is called *reale*, and the second *parone*.

CAPITANATA, one of the 12 provinces of the kingdom of Naples, in Italy, bounded on the north by the gulf of Venice, on the east by the Terra de Bari, on the south by the Basilicata and the Farther Principato, and on the west by the county di Molise and a small part of Hither Abruzzo. It is a level country, without trees, the soil sandy, the air hot: the land, however, near the rivers, is fertile in pastures. The capital town is Manfredonia.

CAPITANEATE, in a general sense, the same with capitania. Capitaneates, in Prussia, are a kind of noble feuds or estates, which, besides their revenue, raise their owners to the rank of nobility. They are otherwise called *starosties*.

CAPITANEI, or CATANEI, in Italy, was a denomination given to all the dukes, marquises, and counts, who were called *capitanei regis*. The same appellation was also given to persons of inferior rank who were invested with fees, formerly distinguished by the appellation *valasores majores*.

CAPITANEUS, in ancient law writers, denotes a tenant in capite or chief.

CAPITANEUS *Ecclesiæ*, the same with advocate.

CAPITANIA, in *Geography*, an appellation given to the 12 governments established by the Portuguese in the Brasils.

CAPITATION, a tax or imposition raised on each person, in proportion to his labour, industry, office, rank, &c. It is a very ancient kind of tribute. The Latins call it *tributum*, by which taxes on persons are distinguished from taxes on merchandise, which were called *vectigalia*.

Capitations are never practised among us but in exigencies of state. In France the capitation was introduced by Louis XIV. in 1695; and is a tax very different from the *taille*, being levied from all persons, whether they be subject to the taille or not. The clergy pay no capitation, but the princes of the blood are not exempted from it.

CAPITE, in *Law*, (from *caput*, i. e. *rex*; whence *tenere in capite* is to hold of the *king*, the *head* or lord paramount of all the lands in the kingdom): An ancient tenure of land, held immediately of the king, as of the crown, either by knight's service or by soccage. It is now abolished. See TENURE.

CAPITE Censi, in antiquity, the lowest rank of Roman citizens, who in public taxes were rated the least of all, being such as never were worth above 365 asses. They were supposed to have been thus called, because they were rather counted and marshalled by their heads than by their estates. The *capite censi* made part of the sixth class of citizens, being below the *proletarii*, who formed the other moiety of that class. They were not enrolled in the army, as being judged not able to support the expence of war; for in those days the soldiers maintained themselves. It does not appear that before Caius Marius any of the Roman generals listed the *capite censi* in their armies.

CAPITOL, CAPITOLIUM, in antiquity, a famous fort or castle, on the Mons Capitolinus at Rome, wherein was a temple dedicated to Jupiter, thence also denominated *Capitolinus*, in which the senate anciently assembled; and which still serves as the city-hall, or townhouse, for the meeting of the conservators of the Roman people.—It had its name *capitol*, from *caput*, "a man's head," said to have been found fresh, and yet bleeding, upon digging the foundation of the temple built in honour of Jupiter. Arnobius adds, that the man's name was *Tolus*, whence *caput tolium*. The first foundations

foundations of the capitol were laid by Tarquin the Elder, in the year of Rome 139. His successor Servius raised the walls; and Tarquin the Proud finished it in the year 221. But it was not consecrated till the third year after the expulsion of the kings, and establishment of the consulate. The ceremony of the dedication of the temple was performed by the consul Horatius in 246.

The capitol consisted of three parts; a nave sacred to Jupiter, and two wings, the one consecrated to Juno, the other to Minerva; it was ascended to by stairs; the frontispiece and sides were surrounded with galleries, in which those who were honoured with triumphs entertained the senate at a magnificent banquet, after the sacrifice had been offered to the gods.

Both the inside and outside were enriched with an infinity of ornaments, the most distinguished of which was the statue of Jupiter with his golden thunderbolt, his sceptre, and crown. In the capitol also were a temple to Jupiter the Guardian, and another to Juno, with the mint; and on the descent of the hill was the temple of Concord. This beautiful edifice contained the most sacred deposits of religion, such as the ancilia, the books of the Sibyls, &c.

The capitol was burnt under Vitellius, and rebuilt under Vespasian. It was burnt a second time by lightning under Titus, and restored by Domitian.

Anciently the name *capitol* was likewise applied to all the principal temples in most of the colonies throughout the Roman empire; as at Constantinople, Jerusalem, Carthage, Ravenna, Capua, &c.—That of Thoulouse has given the name of *capitouls* to the echevins or sheriffs.

CAPITOLINE GAMES, annual games instituted by Camillus, in honour of Jupiter Capitolinus, and in commemoration of the capitol's not being taken by the Gauls. Plutarch tells us that a part of the ceremony consisted in the public criers putting up the Hetrurians to sale by auction; they also took an old man, and tying a golden bulla about his neck, exposed him to the public derision. Festus says they also dressed him in a pretexta.—There was another kind of Capitoline games, instituted by Domitian, wherein there were rewards and crowns bestowed on the poets, champions, orators, historians, and musicians. These last Capitoline games were celebrated every five years, and became so famous, that, instead of calculating time by lustra, they began to count by Capitoline games, as the Greeks did by Olympiads. It appears, however, that this custom was not of long continuance.

CAPITOLINUS, JULIUS, an historian in the beginning of the fourth age, under Dioclesian, to whom he inscribed the Lives of Verus, Antoninus Pius, Clodius Balbinus, Macrinus, the Maximins, and the Gordians. He wrote other lives, which are most of them lost.

CAPITOUL, or CAPITOL, an appellation given to the chief magistrates of Thoulouse, who have the administration of justice and policy both civil and mercantile in the city. The capitouls at Thoulouse are much the same with the echevins at Paris, and with the consuls, bailiffs, burgomasters, mayors, and aldermen, &c. in other cities. In ancient acts they are called *consules*, *capitularii*, or *capitolini*, and their body *capitulum*. From this last come the words *capitularii* and *capitouls*. The appellative *capitolini* arose hence, that they have the charge and custody of the townhouse, which was anciently called *capitol*.

The office lasts only one year, and ennobles the bearers. In some ancient acts they are called *capitulum nobilium Tolosæ*. Those who have borne it style themselves afterwards burgesses. They are called to all general councils, and have the *jus imaginum;* that is, when the year of their administration is expired, their pictures are drawn in the townhouse; a custom which they have retained from the ancient Romans, as may be seen in Sigonius.

CAPITULATE, an appellation given to the several quarters or districts of the city of Thoulouse, each under the direction of a capitoul: much like the wards of London, under their aldermen. Thoulouse is now divided into eight *capitoulates*, or quarters, which are subdivided into *moulans*, each of which has its tithingman, whose business is to inform the capitoul of what passes in his tithing, and to inform the inhabitants of the tithing of the orders of the capitoul.

CAPITULAR, or CAPITULARE, denotes an act passed in a chapter, either of knights, canons, or religious.

The capitularia or capitulars of Charlemagne, Charles the Bald, &c. are the laws, both ecclesiastical and civil, made by those emperors in the general councils or assemblies of the people; which was the way in which the constitutions of most of the ancient princes were made; each person present, though a plebeian, setting his hand to them.

Some distinguish these from laws; and say, they were only supplements to laws. They had their name, *capitulars*, because divided into capitula, chapters, or sections. In these capitulars did the whole French jurisprudence anciently consist. In process of time, the name was changed for that of ordinances.

Some distinguish three kinds of capitulars, according to the difference of their subject-matter; those on ecclesiastical affairs are really canons, extracted from councils; those on secular affairs, real laws; those relating to particular persons, or occasions, private regulations.

CAPITULATION, in military affairs, a treaty made between the inhabitants or garrison of a place besieged and the besiegers, for the delivering up the place on certain conditions. The most honourable and ordinary terms of capitulation are to march out at the breach with arms and baggage, drums beating, colours flying, a match lighted at both ends, and some pieces of cannon, waggons, and convoys for their baggage, and for their sick and wounded.

CAPITULATION, in the German polity, a contract which the emperor makes with the electors, in the name of all the princes and states of the empire, before he is declared emperor, and which he ratifies before he is raised to that sovereign dignity. The principal points which the emperor undertakes to observe are, 1. To defend the church and empire. 2. To observe the fundamental laws of the empire. And, 3. To maintain and preserve the rights, privileges, and immunities of the electors, princes, and other states of the empire, specified in the capitulation. These articles and capitulations are presented to the emperor by the electors only, without the concurrence of the other states,

states, who have complained from time to time of such proceedings; and in the time of the Westphalian treaty, in 1648, it was proposed to deliberate in the following diet, upon a way of making a perpetual capitulation; but the electors have always found means of eluding the execution of this article. In order, however, to give some satisfaction to their adversaries, they have inserted in the capitulation of the emperors, and in that of Francis I. in particular, a promise to use all their influence to bring the affair of a perpetual capitulation to a conclusion. Some German authors own, that this capitulation limits the emperor's power; but maintain that it does not weaken his sovereignty: though the most part maintain that he is not absolute, because he receives the empire under conditions which set bounds to absolute authority.

CAPITULUM, in the ancient military art, was a transverse beam, wherein were holes through which passed the strings whereby the arms of huge engines, as balistæ, catapultæ, and scorpions, were played or worked.

CAPITULUM, in ecclesiastical writers, denoted part of a chapter of the Bible read and explained. In which sense they said, *ire ad capitulum*, "to go to such a lecture." Afterwards the place or apartment where such theological exercises were performed was denominated *domus capituli*.

CAPNICON, in antiquity, chimney money, or a tax which the Roman emperors levied for smoke, and which of consequence was due from all, even the poorest, who kept a fire. This was first invented by Nicephorus.

CAPNOMANCY, a kind of divination by means of smoke, used by the ancients in their sacrifices. The words come from καπνος, *smoke*, and μαντεια, *divination*. The general rule was, when the smoke was thin and light, and rose straight up, it was a good omen; if the contrary, it was an ill one. There was also another species of capnomancy, consisting in the observation of the smoke rising from poppy and jasmine seed cast upon lighted coals.

CAPO FINO, a large barren rock in the territory of the Genoese, which has a castle on its eastern peak. Near it is a small harbour of the same name, 13 miles east by south of Genoa.

CAPO d'Istria, a considerable town of Italy, in Istria, on the gulf of Trieste, with a bishop's see, and subject to the Venetians. The air is wholesome and temperate; its principal revenue consists in wine and salt. E. Long. 14. 0. N. Lat. 45. 48.

CAPON, a cock chicken, gelded as soon as left by the dam, or as soon as he begins to crow. They are of use either to lead chickens, ducklings, pheasants, &c. and defend them from the kites and buzzards; or to feed for the table, they being reckoned more delicate than either a cock or a hen.

CAPONIERE, or CAPPONIERE, in *Fortification*, a covered lodgment sunk four or five feet into the ground, encompassed with a little parapet about two feet high, serving to support several planks covered with earth. The caponiere is large enough to contain 15 or 20 soldiers; and is usually placed in the glacis on the extremity of the counterscarp, and in dry moats; having little embrasures for the soldiers to fire through

CAPPADOCIA, an ancient kingdom of Asia, comprehending all that country which lies between Mount Taurus and the Euxine sea. It was divided by the Persians into two satrapies or governments; by the Macedonians into two kingdoms, the one called *Cappadocia ad Taurum;* the other *Cappadocia ad Pontum*, and commonly *Pontus;* for the history, &c. of which last, see the article PONTUS.

CAPPADOCIA *Magna*, or *Cappadocia* properly so called, lies between the 38th and 41st degrees of north latitude. It was bounded by Pontus on the north, Lycaonia and part of Armenia Major on the south, Galatia on the west, and by the Euphrates and part of Armenia Minor on the east. The first king of Cappadocia we read of in history was Pharnaces, who was preferred to the crown by Cyrus king of Persia, who gave him his sister Atossa in marriage. This is all we find recorded of him, except that he was killed in a war with the Hyrcanians. After him came a succession of eight kings, of whom we know scarce any thing but that they continued faithful to the Persian interest. In the time of Alexander the Great, Cappadocia was governed by Ariarathes II. who, notwithstanding the vast conquests and fame of the Macedonian monarchy, continued unshaken in his fidelity to the Persians. Alexander was prevented by death from invading his dominions; but Perdiccas, marching against him with a powerful and well-disciplined army, dispersed his forces, and having taken Ariarathes himself prisoner, crucified him with all those of the royal blood whom he could get into his power. Diodorus tells us that he was killed in the battle. He is said to have reigned 82 years. His son Ariarathes III. having escaped the general slaughter of the royal family, fled into Armenia, where he lay concealed till the civil dissensions which rose among the Macedonians gave him a fair opportunity of recovering his paternal kingdom. Amyntas, at that time the governor of Cappadocia, opposed him; but being defeated in a pitched battle, the Macedonians were obliged to abandon all the strong holds. Ariarathes, after a long and peaceable reign, left his kingdom to his son Ariaramnes II. He applied himself more to the arts of peace than war, in consequence of which Cappadocia flourished greatly during his reign. He was succeeded by his son Ariarathes IV. who proved a very warlike prince, and, having overcome Arsaces, founder of the Parthian monarchy, considerably enlarged his own dominions.

He was succeeded by Ariarathes V. who, marrying the daughter of Antiochus the Great, entered into an alliance with that prince against the Romans; but Antiochus being defeated, the king of Cappadocia was obliged to sue for peace, which he obtained, after having paid 200 talents by way of fine, for taking up arms against the people of Rome. He afterwards assisted the republic with men and money against Perseus king of Macedon, on which account he was by the senate honoured with the title of *the friend and ally of the Roman people*. He left the kingdom in a very flourishing condition to his son Mithridates, who, on his accession, took the name of Ariarathes VI.

This prince (surnamed *Philopater*, from the filial respect and love he showed his father from his very infancy) immediately renewed the alliance with Rome. Out of mere good nature, he restored Mithrobarzanes, son

Cappadocia.

son to Ladriades, king of the Lesser Armenia, to his father's kingdom, though he foresaw that the Armenians would lay hold of that opportunity to join Artaxias, who was then on the point of invading Cappadocia. These differences, however, were settled before they came to an open rupture by the Roman legates; and Ariarathes seeing himself thus delivered from an impending war by the mediation of the republic, presented the senate with a golden crown; and offered his service in whatever they thought proper to employ him. The senate in return sent him a staff, and chair of ivory; which were presents usually bestowed on those only whom they looked upon as attached to their interest. Not long before this, Demetrius Soter, king of Syria, had offered Ariarathes his sister in marriage, the widow of Perseus king of Macedon: but this offer the king of Cappadocia was obliged to decline for fear of offending the Romans; and his so doing was in the highest degree acceptable to the republic, who reckoned him among the chief of her allies. Demetrius, however, being greatly incensed at the slight put upon his sister, set up a pretender to the throne, one Orophernes, a supposititious, or, as others call him, a natural son of the deceased king. The Romans ordered Eumenes, king of Pergamus, to assist Ariarathes with all his forces: which he did, but to no purpose; for the confederates were overthrown by Demetrius, and Ariarathes was obliged to abandon the kingdom to his rival. This happened about 159 years before Christ, and the usurper immediately dispatched ambassadors to Rome with a golden crown. The senate declined accepting the present, till they heard his pretensions to the kingdom; and this Orophernes, by suborned witnesses, made appear so plain, that the senate decreed that Ariarathes and he should reign as partners; but next year Orophernes was driven out by Attalus, brother to Eumenes, and his successor to the kingdom of Pergamus.

Ariarathes, being thus restored, immediately demanded of the Priennians 400 talents of gold which Orophernes had deposited with them. They honestly replied, that as they had been trusted with the money by Orophernes, they could deliver it to none but himself, or such as came in his name. Upon this, the king entered their territories with an army, destroying all with fire and sword. The Priennians, however, still persevered in their integrity; and though their city was besieged by the united forces of Ariarathes and Attalus, not only made an obstinate defence, but found means to restore the sum to Orophernes. At last they applied to the Romans for assistance, who enjoined the two kings to raise the seige, under pain of being declared enemies to the republic. Ariarathes immediately obeyed; and marching his army into Assyria, joined Alexander Epiphanes against Demetrius Soter, by whom he had been formerly driven out of his kingdom. In the very first engagement Demetrius was slain, and his army entirely dispersed, Ariarathes having on that occasion given uncommon proofs of his courage and conduct. Some years after, a war breaking out between the Romans and Aristonicus, who claimed the kingdom of Pergamus in right of his father, Ariarathes joined the former, and was slain in the same battle in which P. Crassus proconsul of Asia was taken, and the Roman army cut in pieces. He left six sons by his wife Laodice, on whom the Romans bestowed Lycaonia and Cilicia. But Laodice, fearing lest her children, when they came to age, should take the government out of her hands, poisoned five of them, the youngest only having escaped her cruelty by being conveyed out of the kingdom. The queen herself was soon after put to death by her subjects, who could not bear her cruel and tyrannical government.

Laodice was succeeded by Ariarathes VII. who, soon after his accession, married another Laodice, daughter to Mithridates the Great, hoping to find in that prince a powerful friend to support him against Nicomedes king of Bithynia, who laid claim to part of Cappadocia. But Mithridates, instead of assisting, procured one Gordius to poison his unhappy son-in-law, and on his death, seized the kingdom, under pretence of maintaining the rights of the Cappadocians against Nicomedes, till the children of Ariarathes were in a condition to govern the kingdom, The Cappadocians at first fancied themselves obliged to their new protector: but, finding him unwilling to resign the kingdom to the lawful heir, they rose up in arms, and driving out all the garrisons placed by Mithridates, placed on the throne Ariarathes VIII. eldest son of their deceased king.

The new prince found himself immediately engaged in a war with Nicomedes; but, being assisted by Mithridates, not only drove him ont of Cappadocia, but stripped him of a great part of his hereditary dominions. On the conclusion of the peace, Mithridates, seeking for some pretence to quarrel with Ariarathes, insisted upon his recalling Gordius, who had murdered his father; which being rejected with abhorrence, a war ensued. Mithridates took the field first, in hopes of overrunning Cappadocia before Ariarathes could be in a condition to make head against him; but, contrary to his expectation, he was met on the frontiers by the king of Cappadocia with an army no way inferior to his own. Hereupon he invited Ariarathes to a conference; and, in sight of both armies, stabbed him with a dagger, which he had concealed under his garment. This struck such terror into the Cappadocians, that they immediately dispersed, and gave Mithridates an opportnnity of possessing himself of the kingdom without the least opposition. The Cappadocians, however, not able to endure the tyranny of his prefects, soon shook off the yoke; and recalling the king's brother who had fled into the province of Asia, proclaimed him king. He was scarce seated on the throne, however, before Mithridates invaded the kingdom at the head of a very numerous army, and having drawn Ariarathes to a battle, defeated his army with great slaughter, and obliged him to abandon the kingdom. The unhappy prince soon after died of grief; and Mithridates bestowed the kingdom on his son, who was then but eight years old, giving him also the name of *Ariarathes*. But Nicomedes Philopater, king of Bithynia, fearing lest Mithridates, having now got possession of the whole kingdom of Cappadocia, should invade his territories, suborned a youth to pass himself for the third son of Ariarathes, and to present to them a petition in order to be restored to his father's kingdom. With him he sent to Rome Laodice, sister of Mithridates, whom he had married after the death of her former husband Ariarathes. Laodice declared before the senate, Cappadocia.

senate, that she had three sons by Ariarathes, and that the petitioner was one of them; but that she had been obliged to keep him concealed, lest he should undergo the same fate with his brothers. The senate assured him that they would at all events reinstate him in his kingdom. But in the mean time, Mithridates, having notice of these transactions, dispatched Gordius to Rome, to undeceive the senate, and to persuade them that the youth to whom he had resigned the kingdom of Cappadocia was the lawful son of the late king, and grandson to Ariarathes who had lost his life in the service of the Romans against Aristonicus. This unexpected embassy put the senate upon inquiring more narrowly into the matter, whereby the whole plot was discovered; upon which Mithridates was ordered to resign Cappadocia, and the kingdom was declared free. The Cappadocians, however, in a short time sent ambassadors to Rome, acquainting the senate that they could not live without a king. This greatly surprised the Romans, who had such an aversion to royal authority; but they gave them leave to elect a king of their own nation. As the family of Pharnaces was now extinct, the Cappadocians chose Ariobarzanes; and their choice was approved by the senate, he having on all occasions shown himself a steady friend to the Romans.

Ariobarzanes had scarce taken possession of his kingdom when he was driven out by Tigranes king of Armenia; who resigned Cappadocia to the son of Mithridates, in pursuance of an alliance previously concluded between the two parties. Ariobarzanes fled to Rome; and having engaged the senate in his cause, he returned into Asia with Sylla, who was enjoined to restore him to his kingdom. This was easily performed by Sylla, who, with a small body of troops, routed Gordius, who came to meet him on the borders of Cappadocia at the head of a numerous army. Sylla, however, had scarce turned his back, when Ariobarzanes was again driven out by Ariarathes the son of Mithridates, on whom Tigranes had bestowed the kingdom of Cappadocia. This obliged Sylla to return into Asia, where he was attended with his usual success, and Ariobarzanes was again placed on the throne. After the death of Sylla, he was the third time forced by Mithridates to abandon his kingdom; but Pompey, having entirely defeated Mithridates near Mount Stella, restored Ariobarzanes to his throne, and rewarded him for his services during the war, with the provinces of Sophene, Gordiene, and great part of Cilicia. The king, however, being now advanced in years, and desirous of spending the remainder of his life in ease, resigned the crown to his son Ariobarzanes, in presence of Pompey; and never afterwards troubled himself with affairs of state.

Ariobarzanes II. proved no less faithful to the Romans than his father had been. On the breaking out of the civil war between Cæsar and Pompey, he sided with the latter; but, after the death of Pompey, he was received into favour by Cæsar, who even bestowed upon him great part of Armenia. While Cæsar was engaged in a war with the Egyptians, Pharnaces king of Pontus invaded Cappadocia, and stripped Ariobarzanes of all his dominions; but Cæsar, having defeated Pharnaces, restored the king of Cappadocia, and honoured him with new titles of friendship. After the murder of Cæsar, Ariobarzanes, having refused to join Brutus and Cassius, was by them declared an enemy to the republic, and soon after taken prisoner and put to death. He was succeeded by his brother Ariobarzanes III. who was by Mark Antony deprived both of his kingdom and his life; and in him ended the family of Ariobarzanes.

Archelaus, the grandson of that general of the same name who commanded against Sylla in the Mithridatic war, was by Mark Antony placed on the throne of Cappadocia, though nowise related either to the family of Pharnaces or Ariobarzanes. His preferment was entirely owing to his mother Glaphyra, a woman of great beauty, but of loose behaviour, who, in return for her compliance with the desires of Antony, obtained the kingdom of Cappadocia for her son. In the war between Augustus and Antony, he joined the latter; but, at the intercession of the Cappadocians, was pardoned by the emperor. He afterwards received from him Armenia the Lesser, and Cilicia Trachæa, for having assisted the Romans in clearing the seas of pirates, who greatly infested the coasts of Asia. He contracted a strict friendship with Herod the Great, king of Judæa; and even married his daughter Glaphyra to Alexander, Herod's son. In the reign of Tiberius, Archelaus was summoned to appear before the senate; for he had always been hated by that emperor, because in his retirement at Rhodes he had paid him no sort of respect. This had proceeded from no aversion in him to Tiberius, but from the warning given by Archelaus to his friends at Rome. For Caius Cæsar, the presumptive heir to the empire, was then alive, and had been sent to compose the differences of the east; whence the friendship of Tiberius was then looked upon as dangerous. But when he came to the empire, Tiberius, remembering the disrespect shewn him by Archelaus, enticed the latter to Rome by means of letters from Livia, who promised him her son Tiberius's pardon, provided he came in person to implore it. Archelaus obeyed the summons, and hastened to Rome; where he was received by the emperor with great wrath and contempt, and soon after accused as a criminal in the senate. The crimes of which he were accused were mere fictions; but his concern at seeing himself treated as a malefactor was so great, that he died soon after of grief, or, as others say, laid violent hands on himself. He is said to have reigned 50 years.

On the death of Archelaus, the kingdom of Cappadocia was reduced to a Roman province, and governed by those of the equestrian order. It continued subject to the Romans till the invasion of the eastern empire by the Turks, to whom it is now subject, but has no distinguishing modern name. In what was anciently called *Cappadocia*, however, the Turks have four beglerbeglics, called *Siwas*, *Trebizond*, *Maraisch*, and *Cogni*.

In the time of the Romans, the inhabitants of Cappadocia bore so bad a character, and were reputed so vicious and lewd, that, among the neighbouring nations, a wicked man was emphatically called a *Cappadocian*. In after ages, however, their lewd disposition was so corrected and restrained by the pure doctrines of of Christianity, that no country whatever has produced greater champions of the Christian religion, or given to the church prelates of more unblemished characters.

We have now no system of the Cappadocian laws, and scarce wherewithal to form any particular idea of them. As to their commerce, they carried on a considerable trade in horses, great numbers of which were produced in their country; and we read of them in Scripture as frequenting the fairs of Tyre with this commodity. As Cappadocia abounded with mines of silver, brass, iron, and alum, and afforded great store of alabaster, crystal, and jasper, it is probable that they might supply the neighbouring countries with these commodities.

The religion of the ancient Cappadocians was much the same with that of the Persians. At Comana there was a rich and stately temple dedicated to Bellona; whose battles the priests and their attendants used to represent on stated days, cutting and wounding each other as if seized with an enthusiastic fury. No less famous and magnificent were the temples of Apollo Catanius, and of Jupiter; the last of which had 3000 sacred servants, or religious votaries. The chief priest was next in rank to that of Comana; and, according to Strabo, had a yearly revenue of 15 talents. Diana Persica was worshipped in a city called *Castaballa*, where women, devoted to the worship of that goddess, were reported to tread barefooted on burning coals, without receiving any hurt. The temples of Diana at Diospolis, and of Anias at Zela, were likewise held in great veneration both by the Cappadocians and Armenians, who flocked to them from all parts. In the latter were tendered all oaths in matters of consequence; and the chief among the priests was no way inferior in dignity, power, and wealth, to any in the kingdom; having a royal attendance, and an unlimited authority over all the inferior servants and officers of the temple. The Romans, who willingly adopted all the superstitions and superstitious rites of the nations they conquered, greatly increased the revenues of this and other temples; conferring the priesthood on such as they thought most fit for carrying on their designs.—We are told that human sacrifices were offered at Comana; and that this barbarous custom was brought by Orestes and his sister Iphigenia from Taurica Scythica, where men and women were immolated to Diana. But this custom, if ever it obtained in Cappadocia, was abolished in the times of the Romans.

CAPPANUS, a name given by some authors to a worm that adheres to and gnaws the bottoms of ships; to which it is extremely pernicious, especially in the East and West Indies; to prevent this, several ships have lately been sheathed with copper; the first trial of which was made on his majesty's frigate the Alarm.

CAPPARIS. See BOTANY *Index*.

The buds of this plant, pickled with vinegar, &c. are brought to Britain annually from Italy and the Mediterranean. They are supposed to excite appetite and assist digestion; and to be particularly useful as detergents and aperients in obstructions of the liver and spleen.

CAPRA, or GOAT. See MAMMALIA *Index*.

CAPRA *Saltans*, in *Meteorology*, a fiery meteor or exhalation sometimes seen in the atmosphere. It forms an inflected line, resembling in some measure the caperings of a goat; whence it has its name.

CAPRALA, an isle of Italy, in the Tuscan sea, to the north-east of Corsica, on which it depends. It is pretty populous, and has a strong castle for its defence. It is about 15 miles in circumference. E. Long. 11. 5. N. Lat. 43. 15.

CAPRARIA. See BOTANY *Index*.

CAPRAROLA, one of the most magnificent palaces in Italy, seated on a hill, in Ronciglione, whose foot is watered by the river Tircia. It was built by Cardinal Farnese; and has five fronts, in the middle of which is a round court, though all the rooms are square, and well proportioned. It is 27 miles north-west of Rome.

CAPRÆ. See CAPRI.

CAPREOLUS, ELIAS, an excellent civilian, and learned historian, born at Brescia in Italy, wrote a history of Brescia, and other works: died in 1519.

CAPRI, (anciently *Capreæ*), a city and island at the entrance of the gulf of Naples, E. Long. 14. 50. N. Lat. 40. 45.—The island is only four miles long and one broad; the city is a bishop's see, and situated on a high rock at the west end of the island. Capreæ was anciently famous for the retreat of the emperor Tiberius for seven years, during which he indulged himself in the most scandalous debaucheries*. Before Tiberius came hither, Capri had attracted the notice of Augustus, as a most eligible retreat, though in sight of populous cities, and almost in the centre of the empire. His successor preferred it to every other residence; and in order to vary his pleasure, and enjoy the advantages as well as avoid the inconveniences of each revolving season, built 12 villas in different situations, dedicated to the 12 greater gods: the ruins of some of them are still to be seen: at Santa Maria are extensive vaults and reservoirs; and on an adjoining brow are the remains of a lighthouse; two broken columns indicate the entrance of the principal court. According to Dion Cassius, this island was wild and barren before the Cæsars took it under their immediate protection: at this day a large portion of its surface is uncultivated and impracticable; but every spot that will admit the hoe is industriously tilled, and richly laden with the choicest productions of agriculture. The odium attached to the memory of Tiberius proved fatal to his favourite abode; scarce was his death proclaimed at Rome, when the senate issued orders for the demolition of every fabric he had raised on the island, which by way of punishment was thenceforward destined to be a state prison. The wife and sister of Commodus were banished to its inhospitable rocks, which were soon stained with their blood. In the middle ages Capri became an appendage of the Amalfitan republic, and after the downfal of that state, belonged to the duchy of Naples. There stood a pharos on this island, which, a few days before the death of Tiberius, was overthrown by an earthquake.

* See *Tiberius*.

CAPRIATA, PETER JOHN, a civilian and historian, was born at Genoa. He wrote, in Italian, the history of the wars of Italy; an English translation of which was printed in London in 1663.

CAPRICORN, in *Astronomy*, one of the 12 signs of the zodiac. See ASTRONOMY *Index*.

Capricorn, Caprification.

The ancients accounted Capricorn the tenth sign; and when the sun arrived thereat, it made the winter solstice with regard to our hemisphere: but the stars having advanced a whole sign towards the east, Capricorn is now rather the 11th sign; and it is at the sun's entry into Sagittary that the solstice happens, though the ancient manner of speaking is still retained.

The sign is represented on ancient monuments, medals, &c. as having the forepart of a goat and the hindpart of a fish, which is the form of an Ægipan; sometimes simply under the form of a goat.

Tropic of CAPRICORN, a lesser circle of the sphere, which is parallel to the equinoctial, and at 23° 30′ distance from it southwards; passing through the beginning of Capricorn.

CAPRIFICATION, a method used in the Levant, for ripening the fruit of the domestic fig tree, by means of insects bred in that of the wild fig tree.

The most ample and satisfactory accounts of this curious operation in gardening, are those of Tournefort and Pontedra: the former, in his Voyage to the Levant, and in a Memoir delivered to the Academy of Sciences at Paris in 1705; the latter, in his *Anthologia*. The substance of Tournefort's account follows: "Of the thirty species or varieties of the domestic fig tree which are cultivated in France, Spain, and Italy, there are but two cultivated in the Archipelago. The first species is called *ornos*, from the old Greek *erinos*, which answers to *caprificus* in Latin, and signifies a wild fig tree. The second is the domestic or garden fig tree. The former bears successively, in the same year, three sorts of fruit, called *fornites*, *cratitires*, and *orni*; which, though not good to eat, are found absolutely necessary towards ripening those of the garden fig. These fruits have a sleek even skin; are of a deep green colour; and contain in their dry and mealy inside several male and female flowers placed upon distinct footstalks, the former above the latter. The *fornites* appear in August, and continue to November without ripening: in these are bred small worms, which turn to a sort of gnats, nowhere to be seen but about these trees. In October and November, these gnats of themselves make a puncture into the second fruit, which is called *cratitires*. These do not show themselves till towards the end of September. The *fornites* gradually fall away after the gnats are gone; the *cratitires*, on the contrary, remain on the tree till May, and enclose the eggs deposited by the gnats when they pricked them. In May, the third sort of fruit, called *orni*, begins to be produced by the wild fig trees. This is much bigger than the other two; and when it grows to a certain size, and its bud begins to open, it is pricked in that part by the gnats of the *cratitires*, which are strong enough to go from one fruit to another to deposite their eggs. It sometimes happens that the gnats of the *cratitires* are slow to come forth in certain parts, while the *orni* in those very parts are disposed to receive them. In this case, the husbandman is obliged to look for the *cratitires* in another part, and fix them at the ends of the branches of those fig trees whose *orni* are in a fit disposition to be pricked by the gnats. If they miss the opportunity, the *orni* fall, and the gnats of the *cratitires* fly away. None but those that are well acquainted with the culture know the critical moment of doing this; and in order to know it, their eye is perpetually fixed on the bud of the fig; for that part not only indicates the time that the prickers are to issue forth, but also when the fig is to be successfully pricked; if the bud is too hard and compact the gnat cannot lay its eggs; and the fig drops when the bud is too open.

"The use of all these three sorts of fruit is to ripen the fruit of the garden fig tree, in the following manner: During the months of June and July, the peasants take the *orni*, at the time their gnats are ready to break out, and carry them to the garden fig trees; if they do not nick the moment, the *orni* fall; and the fruit of the domestic fig tree, not ripening, will in a very little time fall in like manner. The peasants are so well acquainted with these precious moments, that, every morning, in making their inspection, they only transfer to their garden fig trees such *orni* as are well conditioned, otherwise they lose their crop. In this case, however, they have one remedy, though an indifferent one; which is, to strew over the garden fig trees another plant in whose fruit there is also a species of gnats which answer the purpose in some measure."

The caprification of the ancient Greeks and Romans, described by Theophrastus, Plutarch, Pliny, and other authors of antiquity, corresponds in every circumstance with what is practised at this day in the Archipelago and in Italy. These all agree in declaring, that the wild fig tree, *caprificus*, never ripened its fruit, but was absolutely necessary for ripening that of the garden or domestic fig, over which the husbandmen suspended its branches. The reason of this success has been supposed to be, that by the punctures of these insects the vessels of the fruit are lacerated, and thereby a greater quantity of nutritious juice derived thither. Perhaps, too, in depositing their eggs, the gnats leave behind them some sort of liquor proper to ferment gently with the milk of the figs, and to make their flesh tender. The figs in Provence, and even at Paris, ripen much sooner for having their buds pricked with a straw dipped in olive oil. Plums and pears likewise, pricked by some insects, ripen much the faster for it; and the flesh round such puncture is better tasted than the rest. It is not to be disputed, that considerable changes happen to the contexture of fruits so pricked, just the same as to parts of animals pierced with any sharp instrument. Others have supposed that these insects penetrated the fruit of the tree to which they were brought, and gave a more free admission to the air and to the sun. Linnæus explained the operation, by supposing that the insects brought the farina from the wild fig, which contained male flowers only, to the domestic fig, which contained the female ones. Hasselquist, from what he saw in Palestine, seemed to doubt of this mode of fructification. M. Bernard, in the Memoirs of the Society of Agriculture, opposes it more decidedly. He could never find the insect in the cultivated fig; and, in reality, it appeared to leave the wild fig, after the stamina were mature, and their pollen dissipated; besides, he adds, what they may have brought on their wings must be rubbed away, in the little aperature which they would form for themselves. At Malta, where there are seven or eight varieties of the domestic fig, this operation is only performed on those which ripen latest; the former are of a proper size, fine flavour, and in great abundance without it; so that he thinks the caprification only hastens the ripening.

ripening. He examined the parts of fructification of the fig; and he observes, if this examination be made previous to the ripening, that round the eye of the fig, and in the substance of its covering, may be seen triangular dentated leaves, pressed one against another; and under these leaves are the stamina, whose pollen is destined for the impregnation of the grains, which fill the rest of the fruit. These male organs are much more numerous in the wild fig than in the domestic; and the stamina are found to contain a yellow dust, which may be collected when it is ripe. The wild figs, when ripe, are not succulent, and have no taste, though the grains are disposed in the same manner as in the other kind. The pith of the grain of the wild fruit serves as food to a species of the cynips, whose larva is white, till the moment of its transformation; and it is by an opening, in the direction of the pistil, that the insect penetrates the grain. From this account it is thought probable that the insect is only communicated by accident to the domestic fig, and that the flowers of this genus are sometimes hermaphrodites. But the number of hermaphrodite flowers being fewer on the cultivated than on the wild fig, the seeds are fecundated more certainly and quickly by the caprification; and every botanist knows, that when the impregnation is completed, the flower soon withers: while, if by any accident it is delayed, it continues in bloom much longer. This view of the subject, therefore, explains very completely the reason why, in Malta, the caprification is practised on the late kind of figs, because it hastens the formation and maturity of the fruit.

CAPRIMULGUS, Goatsucker, or *Fern-owl.* See Ornithology *Index.*

CAPRIOLES, in the manege, leaps that a horse makes in the same place without advancing, in such a manner, that, when he is at the height of the leap, he jerks out with his hinder legs even and near. It is the most difficult of all the high manege. It differs from a croupade, in this, that in a croupade, a horse does not show his shoes; and from a ballotade, because in this he does not jerk out. To make a horse work well at caprioles, he must be put between two pillars, and taught to raise first his fore quarters, and then his hind quarters while his fore ones are yet in the air; for which reason you must give him the whip and the poinson.

CAPSA, in *Ancient Geography*, a large and strong town of Numidia, situated amidst vast deserts, waste, uncultivated, and full of serpents, where Jugurtha kept his treasure. In his time it was taken and razed by Marius the Roman general, who put to death all the citizens capable of bearing arms, and sold the rest for slaves. It was, however, afterwards rebuilt by the Romans, and strongly fortified; but, on the decline of their empire, was taken and demolished a second time, by Occuba a famous Arab general. The walls of the citadel are still remaining, and are monuments of the ancient glory and strength of Capsa. They are 24 fathoms in height, and five in thickness, built of large square stones, and have now acquired the solidity and firmness of a rock. The walls of the town were rebuilt by the inhabitants since their first demolition; but were afterwards destroyed by Jacob Almanzor, who sent a governor and troops into the province. In Marmol's time Capsa was very populous, and abounded with stately mosques and other structures of superb and elegant workmanship: but at present it is occupied by a poor and indigent people, fleeced and oppressed by the Tunisian government. In the very centre of the city stands an enclosed fountain, which both supplies the people with drink, and affords them an agreeable bath. The adjacent country is now cultivated, and produces several kinds of fruits; but the climate is unhealthy. The inhabitants are remarkable for their peevishness of temper. Both men and women dress handsomely, except their feet, which they cover with coarse shoes of bungling workmanship, and made of the rough skins of wild beasts, equally inconvenient and unbecoming. E. Long. 9. 3. N. Lat. 33. 15.

CAPSARIUS, (from *capsa*, satchel), in antiquity, a servant who attended the Roman youth to school, carrying a satchel with their books in it, sometimes also called librarius.

Capsarius was also an attendant at the baths, to whom persons committed the keeping of their clothes.

Capsarius (from *capsa*, " a chest,") among the Roman bankers, was he who had the care of the money chest or coffer.

CAPSICUM, or Guinea-pepper. See Botany *Index.*

The bell-pepper produces fruit for pickling; for which purpose they must be gathered before they arrive at their full size, while their rind is tender. They must be slit down on one side to get out the seeds, after which they should be soaked two or three days in salt and water; when they are taken out of this and drained, boiling vinegar must be poured on them in a sufficient quantity to cover them, and closely stopped down for two months; then they should be boiled in the vinegar to make them green; but they want no addition of any spice, and are the wholesomest and best pickle in the world. Another species is used for making what is called *cayan-butter* or *pepper-pots*, by the inhabitants of America, and which they esteem the best of all the spices. The following is a receipt for making of a pepper-pot: " Take of the ripe seeds of this sort of capsicum, and dry them well in the sun; then put them into an earthen or stone pot, mixing flour between every stratum of pods; and put them into an oven after the baking of bread, that they may be thoroughly dried: after which they must be well cleansed from the flour; and if any of the stalks remain adhering to the pods, they should be taken off, and the pods reduced to a fine powder; to every ounce of this add a pound of wheat flour, and as much leaven as is sufficient for the quantity intended. After this has been properly mixed and wrought, it should be made into small cakes, and baked in the same manner as common cakes of the same size; then cut them into small parts, and bake them again, that they may be as dry and hard as biscuit; which being powdered and sifted, is to be kept for use." This is prodigiously hot and acrimonious, setting the mouth as it were on fire. It is by some recommended as a medicine for flatulencies; but it is greatly to be doubted whether all those hot irritating medicines are not productive of more harm than good, in this country at least. If the ripe pods of capsicum are thrown into the fire, they will raise strong and noisome vapours, which occasion vehement sneezing,

ing, coughing, and often vomiting, in those who are near the place, or in the room where they are burnt. Some persons have mixed the powder of the pods with snuff, to give to others for diversion: but where it is in quantity, there may be danger in using it; for it will occasion such violent fits of sneezing, as may break the blood-vessels of the head.

CAPSQUARES, strong plates of iron which come over the trunnions of a gun, and keep it in the carriage. They are fastened by a hinge to the prize-plate, that they may lift up and down, and form a part of an arch in the middle to receive a third part of the thickness of the trunnions: for two-thirds are let into the carriage, and the other end is fastened by two iron wedges called the *forelocks* and *keys*.

CAPSTAN, or Capstern, a strong massy column of timber, formed like a truncated cone, and having its upper extremity pierced with a number of holes to receive the bars or levers. It is let perpendicularly down through the decks of a ship; and is fixed in such a manner, that the men, by turning it horizontally with their bars, may perform any work which requires any extraordinary effort.

Plate CXXXV. A capstern is composed of several parts, where A is the barrel, *b* the whelps, *c* the drumhead, and *d* the spindle. The whelps rise out from the main body of the capstern like buttresses, to enlarge the sweep, so that a greater quantity of cable, or whatever rope encircles the barrel, may be wound about it at one turn, without adding much to the weight of the capstern. The whelps reach downwards from the lower part of the drumhead to the deck. The drumhead is a broad cylindrical piece of wood resembling a millstone, and fixed immediately above the barrel and whelps. On the outside of this piece are cut a number of square holes parallel to the deck, to receive the bars. The spindle or pivot *d*, which is shod with iron, is the axis or foot upon which the capstern rests, and turns round in the saucer, which is a sort of iron socket let into a wooden stock or standard called the *step*, resting upon and bolted to the beams.

Besides the different parts of the capstern above explained, it is furnished with several appurtenances, as the *bars*, the *pins*, the *pawls*, the *swifter*, and the *saucer*, already described. The bars are long pieces of wood, or arms, thrust into a number of square holes in the drumhead all round, in which they are the radii of a circle, or the spokes in the nave of a wheel. They are used to heave the capstern round, which is done by the men setting their breasts against them, and walking about, like the machinery of a horse mill, till the operation is finished.—The pins *e*, are little bolts of iron thrust perpendicularly through the holes of the drumhead, and through a corresponding hole in the end of the bar, made to receive the pins when the bars are fixed. They are used to confine the bars, and to prevent them from working out as the men heave, or when the ship labours. Every pin is fastened to the drumhead with a small iron chain; and that the bars may exactly fit their respective holes, they are all numbered. The pawls *f*, No. 1. are situated on each side the capstern, being two short bars of iron, bolted at one end through the deck to the beams close to the lower part of the whelps; the other end, which occasionally turns round on the deck, being placed in the intervals of the

whelps, as the capstern turns round, prevents it from recoiling or turning back by any sudden jerk of the cable, as the ship rises on the sea, which might greatly endanger the men who heave. There are also hanging pawls *g g*, No. 3. used for the same purposes, reaching from the deck above to the drumhead immediately below it. The swifter is a rope passed horizontally through holes in the outer end of the bars, and drawn very tight; the intent of this is to keep the men steady as they walk round when the ship rocks, and to give room for a greater number to assist by pulling upon the swifter itself.

The most frequent use of the capstern is to heave in the cable, and thereby remove the ship or draw up the anchor. It is also used to wind up any weighty body, as the masts, artillery, &c. In merchant ships it is likewise frequently employed to discharge or take in the cargo, particularly when consisting of weighty materials that require a great exertion of mechanical powers to be removed.

There are commonly two capsterns in a man of war, the *main* and the *gear* capstern; the former of which has two drumheads, and may be called a *double one*. This is represented in No. 3. The latter is represented in No. 2.

Formerly the bars of the capstern went entirely through the head of it, and consequently were more than double the length of the present ones; the holes were therefore formed at different heights, as represented in No. 1. But this machine had several inconveniences, and has long been entirely disused in the navy. Some of these sort of capsterns, however, are still retained in merchant ships, and are usually denominated *crabs*. The situation of the bars in a crab, as ready for heaving, is represented in No. 4.

To rig the Capstern, is to fix the bars in their respective holes, and thrust in the pins, in order to confine them.—*Surge the Capstern*, is the order to slacken the rope heaved round upon it, of which there are generally two turns and a half about the barrel at once, and sometimes three turns.—*To heave the Capstern*, is to go round with it heaving on the bars, and drawing in any rope of which the purchase is created.—*To come-up the Capstern*, is to let go the rope upon which they had been heaving.—*To Pawl the Capstern*, is to fix the pawls to prevent it from recoiling during any pause of heaving.

CAPSULE, in a general sense, denotes a receptacle or cover in form of a bag.

Capsule, among botanists, a dry hollow seed-vessel or pericarpium, that cleaves or splits in some determinate manner. See Pericarpium, Botany *Index*.

This species of seed-vessel is frequently fleshy and succulent, like a berry, before it has attained maturity; but, in ripening, becomes dry, and often so elastic as to dart the seeds from their departments with considerable velocity. This elasticity is remarkably conspicuous in wood sorrel; balsam, *impatiens;* African spiræa, *diosma; fraxinella; justicia; ruellia; barleria; lathræa;* and many others.—The general aptitude or disposition of this species of seed-vessel to cleave or separate for the purpose of dispersing its seeds, distinguishes it not less remarkably than its texture from the pulpy or succulent fruits of the apple, berry, and cherry kind. This opening of the capsule for discharging

ing its seeds when the fruit is ripe, is either at the top, as in most plants; at the bottom, as in triglochin; at the side, through a pore or small hole, as in campanula and orchis; horizontally, as in plantain, amaranthus, and anagallis; or longitudinally, as in convolvulus. All fruit that is jointed, opens at every one of the joints, each of which contains a single seed. Capsules, in splitting, are divided, externally, into one or more pieces, called by Linnæus *valves*. The internal divisions of the capsules are called *cells*, *loculamenta*: these, in point of number, are exceedingly diversified; some having only one cell, as the primrose; and others many, as the water lily. Hence a capsule is termed *unilocular*, *bilocular*, *trilocular*, &c. according as it has one, two, three, &c. cells or cavities.

CAPSULÆ *Atrabiliariæ*, called also *glandulæ renales*, and *renes succenturiati*. See ANATOMY *Index*.

CAPTAIN, a military officer whereof there are several kinds, according to their commands.

CAPTAIN *of a Troop or Company*, an inferior officer who commands a troop of horse or a company of foot, under a colonel. The duty of this officer is to be careful to keep his company full of able-bodied soldiers; to visit their tents and lodgings, to see what is wanting; to pay them well; to cause them keep themselves neat and clean in their clothes, and their arms bright. He has power in his own company of making serjeants, corporals, and lanspesades.

In the horse and foot guards, the captains have the rank of colonels.

CAPTAIN-*General*, he who commands in chief.

CAPTAIN-*Lieutenant*, he who, with the rank of captain, but the pay of lieutenant, commands a troop or company in the name and place of some other person who is dispensed with, on account of his quality, from performing the functions of his post.

Thus the colonel being usually captain of the first company of his regiment, that company is commanded by his deputy under the title of *Captain-Lieutenant*.

So in England, as well as in France, the king, queen, dauphin, princes, &c. have usually the title of captain of the guards, *gens d'armes*, &c. the real duty of which offices is performed by captain-lieutenants.

CAPTAIN *Reformed*, one who, upon the reduction of the forces, has his commission and company suppressed; yet is continued captain, either as second to another, or without any post or command at all.

CAPTAIN *of a Ship of War*, the officer who commands a ship of the line of battle, or a frigate carrying 20 or more cannon. The charge of a captain in his majesty's navy is very comprehensive, in as much as he is not only answerable for any bad conduct in the military government, navigation, and equipment of the ship he commands, but also for any neglect of duty or ill management in his inferior officers, whose several charges he is appointed to superintend and regulate.

On his first receiving information of the condition and quality of the ship he is appointed to command, he must attend her constantly, and hasten the necessary preparations to fit her for sea. So strict, indeed, are the injunctions laid on him by the lord high admiral, or commissioners of the admiralty, that he is forbid to lie out of his ship, from his arrival on board to the day of his discharge, unless by particular leave from the admiralty or from his commander in chief. He is enjoined to show a laudable example of honour and virtue to the officers and men; and to discountenance all dissolute, immoral, and disorderly practices, and such as are contrary to the rules of subordination and discipline; as well as to correct those who are guilty of such offences as are punishable according to the usage of the sea. He is ordered particularly to survey all the military stores which are sent on board, and to return whatever is deemed unfit for service. His diligence and application are required to procure his complement of men; observing carefully to enter only such as are fit for the necessary duty, that the government may not be put to unnecessary expence. When his ship is fully manned, he is expected to keep the established number of men complete, and superintend the muster himself, if there is no clerk of the check at the port. When his ship is employed on a cruising station, he is expected to keep the sea the whole length of time previously appointed; but if he is compelled by some unexpected accident to return to port sooner than the time limited, he ought to be very cautious in the choice of a good situation for anchoring, ordering the master or other careful officers to sound and discover the depths of water and dangers of the coast. Previous to any possibility of an engagement with the enemy, he is to quarter the officers and men to the necessary stations according to their office and abilities, and to exercise them in the management of the artillery, that they may be more expert in time of battle. His station in the time of an engagement is on the quarter-deck; at which time he is expected to take all opportunities of annoying his enemy, and improving every advantage over him; to exhibit an example of courage and fortitude to his officers and crew; and to place his ship opposite to his adversary in such a position as that every cannon shall do effectual execution. At the time of his arrival in port, after his return from abroad, he is to assemble his officers, and draw up a detail of the observations that have been made during the voyage, of the qualities of the ship as to her trim, ballast, stowage, manner of sailing, for the information and direction of those who may succeed him in the command; and this account is to be signed by himself and officers, and to be returned to the resident commissioner of the navy at the port where the ship is discharged.

CAPTAIN *of a Merchant-ship*, he who has the direction of the ship, her crew, and lading, &c. In small ships and short voyages, he is more ordinarily called the *master*. In the Mediterranean, he is called the *patroon*.—The proprietor of the vessel appoints the captain or master; and he is to form the crew, and choose and hire the pilots, mates, and seamen; though, when the proprietor and master reside on the same spot, they generally act in concert together.

CAPTAIN *Bashaw*, or *Capondan Bashaw*, in the polity of the Turks, signifies the Turkish high admiral. He possesses the third office of the empire, and is invested with the same power at sea that the vizier has on shore. Soliman II. instituted this office in favour of the famous Barbarossa, with absolute authority over the officers of the marine and arsenal, whom he may punish, cashier, or put to death, as soon as he is without

out the Dardanelles. He commands in chief in all the maritime countries, cities, castles, &c.; and, at Constantinople, is the first magistrate of police in the villages on the side of the Porte, and the canal of the Black sea. The mark of his authority is a large Indian cane, which he carries in his hand, both in the arsenal and with the army.—The captain bashaw enjoys two sorts of revenues; the one fixed, the other casual. The first arises from a capitation of the islands in the Archipelago, and certain governments in Natolia and Galipoli. The latter consists in the pay of the men who die during a campaign; in a fifth of all prizes made by the begs; in the profits accruing from the labour of the slaves, whom he hires as rowers to the grand signior; and in the contributions he exacts in all places where he passes.

CAPTION, in *Scots Law*, a writ issuing under his majesty's signet, in his majesty's name, obtained at the instance of a creditor in a civil debt, commanding messengers at arms and other officers of the law to apprehend and imprison the person of the debtor until he pay the debt.—It is also the name of a writ issued by the court of session against the agents of the court, to return papers belonging to processes or law suits, or otherwise to go to prison.

CAPTIVE, a slave, or a person taken from the enemy.

Formerly captives in war became the slaves of those who took them; and though slavery, such as obtained among the ancients, is now abolished, some shadow of it still remains in respect of prisoners of war, who are accounted the property of their captors, and have no right to liberty but by concession from them. —The Romans used their captives with great severity; their necks were exposed to the soldiers to be trampled on, and their persons afterwards sold by public auction. Captives were frequently burnt in the funeral piles of the ancient warriors, as a sacrifice to the infernal gods. Those of royal or noble blood had their heads shaven, and their hair sent to Rome to serve as decorations for female toys, &c. They were led in triumph loaded with chains through Rome, in the emperor's train, at least as far as the foot of the Capitoline mount, for they were not permitted to ascend the sacred hill, but carried thence to prison. Those of the prime quality were honoured with golden chains on their hands and feet, and golden collars on their necks. If they made their escape, or killed themselves, to avoid the ignominy of being carried in triumph, their images or effigies were frequently carried in their place.

CAPTIVITY, in a general sense, the state or condition of a captive.

Captivity, in sacred history, a punishment which God inflicted upon his people for their vices and infidelities. The first of these captivities is that of Egypt, from which Moses delivered them; after which, are reckoned six during the government of the judges; but the greatest and most remarkable were those of Judah and Israel, which happened under the kings of each of these kingdoms. It is generally believed, that the ten tribes of Israel never came back again after their dispersion; and Josephus and St Jerome are of this opinion: nevertheless, when we examine the writings of the prophets, we find the return of Israel from captivity pointed out in a manner almost as clear as that of the tribes of Benjamin and Judah: see Hosea, i. 10. 11. Amos, ix. 14. The captivities of Judah are generally reckoned four; the fourth and last of which fell in the year of the world 3416, under Zedekiah; and from this period begins the 70 years captivity foretold by Jeremiah.

Since the destruction of the temple by the Romans, the Hebrews boast that they have always had their heads, or particular princes, whom they call *princes of the captivity*, in the east and west. The princes of the captivity in the east governed the Jews that dwelt in Babylon, Assyria, and Persia; and the princes of the captivity in the west governed those who dwelt in Judæa, Egypt, Italy, and in other parts of the Roman empire. He who resided in Judæa commonly took up his abode at Tiberias, and assumed the name of *Roschabboth* "head of the fathers or patriarchs." He presided in assemblies, decided in cases of conscience, levied taxes for the expences of his visits, and had officers under him who were dispatched through the provinces for the execution of his orders. As to the princes of the captivity of Babylon, or the east, we know neither the original nor succession of them. It only appears that they were not in being before the end of the second century.

CAPTURE, a prize, or prey; particularly that of a ship taken at sea. Captures made at sea were formerly held to be the property of the captors after a possession of twenty-four hours; but the modern authorities require, that before the property can be changed, the goods must have been brought into port, and have continued a night *intra præsidia*, in a place of safe custody, so that all hope of recovering them was lost.

Capture also denotes an arrest or seizure of a criminal, debtor, &c. at land.

CAPUA, in *Ancient Geography*, a very ancient city of Italy, in Campania, and capital of that district. It is famous for the abode of Hannibal the Carthaginian general after the battle of Cannæ, and where Livy accuses him, but unjustly, of having enervated himself with pleasures *. It still retains the name, and is the see of an archbishop. It is seated on the river Volturno, in E. Long. 15. 5. N. Lat. 41. 7. The history of Capua is thus shortly deduced by Mr Swinburne. "It was a settlement of the Osci long before the foundation of Rome. As the amazing fertility of the land and a lucrative commerce poured immense wealth upon its inhabitants, it became one of the most extensive and magnificent cities in the world. With riches excessive luxury crept in, and the Capuans grew insolent; but by their effeminacy they soon lost the power of repelling those neighbouring nations which their insolence had exasperated. For this reason Capua was continually exposed to the necessity of calling in foreign aid, and endangering its safety by the uncommon temptations it offered to needy auxiliaries. The Roman soldiers sent to defend Capua were on the point of making it their prey, and often the voice of the Roman people was loud for a removal from the barren unwholesome banks of the Tiber to the garden of Italy, near those of the Volturno. Through well-founded jealousy of the ambition of Rome, or, as Livy and other partial writers term it, natural inconstancy, the

* See Carthage.

the Capuans warmly espoused the quarrel of Carthage: Hannibal made Capua his winter quarters after the campaign of Cannæ; and there, if we are to believe historians, his rough and hitherto invincible soldiers were enervated by pleasure and indolence.

"When through a failure of supplies from Carthage Hannibal was under a necessity of remaining in Bruttium, and leaving the Capuans to defend themselves, this city, which had been long invested, was surrendered at discretion to the consuls Appius Claudius and Q. Fulvius Flaccus. The senators were put to death, the nobles imprisoned for life, and all the citizens sold and dispersed. Vibius, the chief of Hannibal's friends, avoided this ignominious fate, and escaped from the cruel vengeance of the Romans, by a voluntary death. —When the mob insisted upon the gates being thrown open to the enemy, Vibius assembled his steady associates, and sat down with them to a superb banquet, after which each of the guests swallowed a poisonous draught, and expired in full possession of their freedom. The buildings were spared by the victor; and Capua was left to be merely a harbour for the husbandmen of the plain, a warehouse for goods, and a granary for corn; but so advantageous a situation could not long be neglected; colonies were sent to inhabit it, and in process of time it regained a degree of importance.

"Genseric the Vandal was more cruel than the Roman conquerors had been; for he massacred the inhabitants, and burnt the town to the ground. Narses rebuilt it; but in 841 it was totally destroyed by an army of Saracens, and the inhabitants driven into the mountains. Some time after the retreat of these savage invaders, the Lombards ventured down again into the plain; but not deeming their force adequate to the defence of so large a circuit as the old city, they built themselves a smaller one on the river, and called it Capua.—They chose the site of Casilinum, famous in the second Punic war, for the resistance made by its garrison against Hannibal. Since the foundation of the new city, Old Capua has remained in ruins.

"In 856, Landulph formed here an independent earldom dismembered from the duchy of Benevento, and in the course of a few generations Capua acquired the title of a principality. In the 11th century, the Normans of Aversa expelled the Lombard race of princes, and Richard their chief became prince of Capua; the grandson of Tancred of Hauteville drove out the descendants of Richard, and united this state to the rest of his possessions.

"Capua is at present a neat little city, fortified according to the rules of modern art, and may be considered as the key of the kingdom; though far removed from the frontier, it is the only fortification that really covers the approach to Naples."

CAPUCHINS, religious of the order of St Francis in its strictest observance; deriving their name from *capuce*, or *capuchon*, a stuff cap, or cowl, wherewith they cover their heads. They are clothed with brown or gray; always barefooted; and never to go in a coach, nor ever shave their beard.—The Capuchins are a reform made from the order of Minors, commonly called *Cordeliers*, set on foot in the 16th century by Matthew Baschi, a religious observant of the monastery of Montefiascone; who, being at Rome, was advertised several times from heaven, to practise the rule of St Francis to the letter. Upon this he made application to Pope Clement in 1525; who gave him permission to retire into a solitude, with as many others as chose to embrace the strict observance. In 1528, they obtained the pope's bull. In 1529, the order was brought into complete form: Matthew was elected general, and the chapter made constitutions. In 1543, the right of preaching was taken from the Capuchins by the pope: but in 1545 it was restored to them again with honour. In 1578, there were already 17 general chapters in the order of Capuchins.

CAPUT, the head. See HEAD.

CAPUT *baroniæ*, the head of the barony, in ancient customs, denotes the ancient or chief seat or castle of a nobleman, where he made his usual residence, and held his court; sometimes also called *caput honoris*, or the head of the honour. The caput baroniæ could not be settled in dowry; nor could it be divided among the daughters, in case there was no son to inherit; but was to descend entire to the eldest daughter, *cæteris filiabus aliunde satisfactis*.

CAPUT *Gallinaginis*, in *Anatomy*, is a kind of septum, or spongy border, at the extremities or apertures of each of the *vesiculæ seminales*; serving to prevent the seed coming from one side, from rushing upon, and so stopping, the discharge of the other.

CAPUT *Lupinum*. Anciently an outlawed felon was said to have *caput lupinum*, and might be knocked on the head like a *wolf*, by any one that should meet him; because, having renounced all law, he was to be dealt with as in a state of nature, when every one that should find him might slay him; yet now, to avoid such inhumanity, it is holden that no man is entitled to kill him wantonly and wilfully; but in so doing he is guilty of murder, unless it is done in the endeavour to apprehend him.

CAPUT *Mortuum*, a Latin name given to fixed and exhausted residuums remaining in retorts after distillations. As these residuums are very different, according to the substances distilled, and the degree of heat employed, they are by the more accurate modern chemists particularly specified by adding a term denoting their qualities; as *earthy residuum*, *charry residuum*, *saline residuum*, &c.

CARABINE, a fire arm shorter than a musket, carrying a ball of 24 in the pound, borne by the light horse, hanging at a belt over the left shoulder. The barrel is two feet and a half long; and is sometimes furrowed spirally within, which is said to add to the range of the piece.

CARABINEERS, regiments of light horse, carrying longer carabines than the rest, and sometimes used on foot.

CARABUS. See ENTOMOLOGY *Index*.

CARACALLA, M. ANTONINUS BASSIANUS, emperor after his father Severus in 211, put the physicians to death for not despatching his father, as he would have had them. He killed his brother Geta; and put Papinianus to death, because he would not defend nor excuse his parricide. In short, it is said that 20,000 persons were massacred by his order. He married Julia, his father's widow. Going to Alexandria, he slew the inhabitants, and applied to the magicians and astrologers. At last, going from Edessa to Mesopotamia, one

Caracalla ‖ Caracci.

one of his captains slew him, by order of Macrinus, who succeeded him. He died after he had reigned somewhat more than six years.

Caracalla, in antiquity, a long garment, having a sort of capuchin, or hood a-top, and reaching to the heels; worn equally among the Romans by the men and the women, in the city and the camp. Spartian and Xiphilian represent the emperor Caracalla as the inventor of this garment, and hence suppose the appellation *Caracalla* was first given him. Others, with more probability, make the caracalla originally a Gallic habit, and only brought to Rome by the emperor above mentioned, who first enjoined the soldiery to wear it. The people call it *antoninian*, from the same prince, who had borrowed the name of Antoninus. The caracalla was a sort of cassock, or surtout. Salmasius, Scaliger, and after them Du Cange, even take the name *casaque* to have been formed from that of *caraque*, for *caracalla*. This is certain from St Jerome, that the caracalla, with a retrenchment of the capuchin, became an ecclesiastical garment. It is described as made of several pieces cut and sewed together, and hanging down to the feet; but it is more than probable there were some made shorter, especially out of Rome, otherwise we do not see how it could have fitted the soldiers purposes.

CARACCAS, a district of Terra Firma in South America, belonging to the Spaniards. The coast is rocky and mountainous, interspersed with small fertile valleys; subjected at certain seasons of the year to dry north-west winds, but blessed in general with a clear air and wholesome climate. A very great illicit trade is carried on by the English and Dutch with this province, notwithstanding all the vigilance of the Spaniards, who have scouts perpetually employed, and breastworks raised in all the valleys. A vast number of cacao trees are cultivated in this province; and it is reckoned that the crop of cacao produced here amounts to more than 100,000 fanegas of 110 pounds each. The country of Santa Fe consumes 20,000; Mexico a little more; the Canaries a small cargo; and Europe from 50 to 60,000. The cultivation of the plant employs 10 or 12,000 negroes. Such of them as have obtained their liberty have built a little town called *Nirva*, into which they will not admit any white people. The chief town is likewise called *Caraccas*, and is situated in N. Lat. 10. 10. It stands at a considerable distance from the sea; contains 34,000 inhabitants, and is extremely difficult of access, by reason of the steep and craggy hills over which an enemy must take his route. The commerce of this town, to which the bay of Guaira at two leagues distance serves for a harbour, was for a long time open to all the subjects of the Spanish monarchy, and is still so to the Americans; but the Europeans are not so well treated. The Caraccas contain altogether, according to Depons, 728,000 inhabitants, of whom the whites form two-tenths, the slaves three-tenths, the descendants of freedmen four, and the Indians the remainder. An insurrection began in this country in 1810, which it is probable will end in its separation from Old Spain. See Caraccas, Supplement.

CARACCI, Lewis, Augustine, and Hannibal, three celebrated painters of the Lombard school, all of Bologna. Lewis was born in 1555; and was cousin-german to Augustine and Hannibal, who were brothers, the sons of a tailor, who was yet careful to give them

2

a liberal education. They were both disciples of their cousin Lewis. Augustine gained a knowledge of mathematics, natural philosophy, music, poetry, and most of the liberal arts; but, though painting was his principal pursuit, he learned the art of engraving from Cornelius Cort, and surpassed all the masters of his time. Hannibal, again, never deviated from his pencil. —These three painters, at length, having reaped all the advantages they could by contemplation and practice, formed a plan of association, continued always together, and laid the foundation of that celebrated school which has ever since been known by the name of *Caracci's academy*. Hitherto all the young students, who had a view of becoming masters, resorted to be instructed in the rudiments of painting; and here the Caracci taught freely, and without reserve, all that came. Lewis's charge was to make a collection of antique statues and bas reliefs. They had designs of the best masters, and a collection of curious books on all subjects relating to their art; and they had a skilful anatomist always ready to teach what belonged to the knitting and motions of the muscles, &c. There were often disputations in the academy; and not only painters, but men of learned professions, proposed questions, which were always decided by Lewis. Every body was well received; and though stated hours were allotted to treat of different matters, yet improvements might be made at all hours by the antiquities and the designs which were to be seen.

The fame of the Caracci reaching Rome, the cardinal Farnese sent for Hannibal thither, to paint the gallery of his palace. Hannibal was the more willing to go, because he had a great desire to see Raphael's works, with the antique statues and bass reliefs. The gusto which he took there from the ancient sculpture, made him change his Bolognian manner for one more learned but less natural in the design and in the colouring.—Augustine followed Hannibal, to assist him in his undertaking of the Farnese gallery; but the brothers not rightly agreeing, Farnese sent Augustine to the court of the duke of Parma, where he died in the year 1602, being only 45 years of age. His most celebrated piece of painting is that of the Communion of St Jerome, in Bologna.

In the mean while, Hannibal continued working in the Farnese gallery at Rome; and, after inconceivable pains and care, finished the paintings in the perfection in which they are now to be seen. He hoped that the cardinal would have rewarded him in some proportion to the excellence of his work, and the time it took him up, which was eight years; but he was disappointed. The cardinal, influenced by an ignorant Spaniard, his domestic, gave him but a little above 200l. though it is certain he deserved more than twice as many thousands. When the money was brought him, he was so surprised at the injustice done him, that he could not speak a word to the person who brought it. This confirmed him in a melancholy to which his temper naturally inclined, and made him resolve never more to touch his pencil; which resolution he had undoubtedly kept, if his necessities had not compelled him to break it. It is said, that his melancholy gained so much upon him, that at certain times it deprived him of the use of his senses. It did not, however, put a stop to his amours; and his debauches at Naples, whither he had retired for the

the recovery of his health, brought a distemper upon him of which he died in 1609, when he was 49 years of age. His veneration for Raphael was so great, that it was his deathbed request to be buried in the same tomb with him; which was accordingly done, in the Pantheon or Rotunda at Rome. There are extant several prints of the blessed Virgin, and some other subjects, etched by the hand of this incomparable artist. He is said to have been a friendly, plain, honest, and open-hearted man; very communicative to his scholars, and so extremely kind to them, that he generally kept his money in the same box with his colours, where they might have recourse to either as they had occasion.

While Hannibal Caracci worked at Rome, Lewis was courted from all parts of Lombardy, especially by the clergy, to make pictures in their churches: and we may judge of his capacity and facility, by the great number of pictures he made, and by the preference that was given him to other painters. In the midst of these employments Hannibal solicited him to come and assist him in the Farnese gallery; and so earnestly, that he could not avoid complying with his request. He went to Rome; corrected several things in that gallery; painted a figure or two himself; and then returned to Bologna, where he died in 1619, aged 64.

CARACOL, in the manege, the half turn which a horseman makes, either to the right or left.—In the army, the horse always makes a caracol after each discharge, in order to pass the rear of the squadron.

Caracol, in *Architecture*, denotes a staircase in a helix or spiral form.

CARACOLI, a kind of metal of which the Caribbees, or natives of the Lesser Antilles, make a sort of ornament in the form of a crescent, which they also call *caracoli*.—This metal comes from the main land; and the common opinion is, that it is a compound of silver, copper, and gold, something like the Corinthian brass among the ancients. These metals are so perfectly mixed and incorporated together, that the compound which results from them, it is said, has a colour that never alters, how long soever it remains in the sea or under ground. It is somewhat brittle; and they who work at it are obliged to mix a large proportion of gold with it, to make the compound more tough and malleable.

CARACT, or Carat, the name of that weight which expresses the degree of fineness that gold is of. The word is also written *carract*, *carrat*, *karract*, and *karrat*. Its origin is contested: but the most probable opinion is that of Kennet, who derives it from *carecta*, a term which anciently denoted any weight, and came not till of later days to be appropriated to that which expresses the fineness of gold, and the gravity of diamonds.

These carats are not real determinate weights, but only imaginary. The whole mass, be the weight what it will, is conceived to be divided into 24 carats; and as many 24th parts as it contains of pure gold, it is called *gold of so many carats*, or *so many carats fine*. Thus, gold of 18 carats is a mixture, of which 18 parts are pure gold, and the other six an inferior metal, &c. This is the common way of reckoning in Europe, and at the gold mines in the Spanish West Indies, but with some variation in the subdivision of the carat; among us, it is divided into four grains; among the Germans, into 12 parts; and by the French, according to Mr Helot, into 32. The Chinese reckon by a different division called *touches*, of which the highest number, or that which denotes pure gold, is 100; so that 100 touches correspond to our 24 carats, &c.

Caract is also a certain weight which goldsmiths and jewellers use wherewith to weigh precious stones and pearls.—In this sense, the word is by some supposed to be derived from the Greek κεϱατιον, a fruit which the Latins call *siliqua*, and we *carob bean*; each of which may weigh above four grains of wheat, whence the Latin *siliqua* has been used for a weight of four grains. This caract weighs four grains, but they are sometimes lighter than the grains of other weights. Each of these grains is subdivided into $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$ $\frac{1}{16}$, &c.

CARACTACUS, a renowned king of the ancient British people called *Silures*, inhabiting South Wales. Having valiantly defended his country seven years against the Romans, he was at length defeated; and flying to Cartismunda, queen of the Brigantes (inhabitants of Yorkshire), was by her treacherously delivered up to the Romans, and led in triumph to the emperor Claudius then at York; where his noble behaviour, and heroic but pathetic speech, obtained him not only his liberty, but the esteem of the emperor, A. D. 52.

CARAGROUTH, in commerce, a silver coin of the empire, weighing nine drachms. It goes at Constantinople for 120 aspers. There are four sorts of them, which are all equally current and of the same value.

CARAITES, in the ecclesiastical history of the Jews, a religious sect among that people, whereof there are still some subsisting in Poland, Russia, Constantinople, Cairo, and other places of the Levant, whose distinguishing tenet and practice it is, to adhere closely to the words and letter of the Scripture, exclusive of allegories, traditions, and the like.

Leo of Modena, a rabbin of Venice, observes, that of all the heresies among that people, before the destruction of the temple, there is none now left but that of the *Caraim*, a name derived from *Micra*, which signifies the pure text of the Bible, because of their keeping to the Pentateuch, observing it to the letter, and rejecting all interpretations, paraphrases, and constitutions of the rabbins. Aben Ezra, and some other rabbins, treat the Caraites as Sadducees; but Leo de Juda calls them, more accurately, Saducees reformed; because they believe the immortality of the soul, paradise, hell, resurrection, &c. which the ancient Sadducees denied. He adds, however, that they were doubtless originally real Sadducees, and sprung from among them.

M. Simon, with more probability, supposes them to have risen hence; that the more knowing among the Jews opposing the dreams and reveries of the rabbins, and using the pure texts of Scripture to refute their groundless traditions, had the name of *Caraim* given them; which signifies as much as the barbarous Latin *Scripturarii*; i. e. people attached to the text of Scripture. The other Jews gave them the odious name Sadducees, from their agreement with those sectaries on the head of traditions. Scaliger, Vossius, and Spanheim,

heim, rank the Caraites among the Sabeans, Magi, Manichees, and Mussulmans, but by mistake: Wolfgang, Fabricius, &c. say the Sadducees and Esseni were called Caraites, in opposition to the Pharisees; others take them for the doctors of the law so often mentioned in the Gospel: but these are all conjectures, Josephus and Philo make no mention of them; which shows them to be more modern than either of those authors. In all probability, this sect was not formed till after the collection of the second part of the Talmud, or the Gemera; perhaps not till after the compiling of the Mischna in the third century. The Caraites themselves pretend to be the remains of the ten tribes led captive by Shalmaneser. Wolfius, from the Memoirs of Mardacheus, a Caraite, refers their origin to a massacre among the Jewish doctors under Alexander Jannæus, their king, about 100 years before Christ: because Simon, son of Schetach, and the queen's brother, making his escape into Egypt, there forged his pretended traditions; and, at his return to Jerusalem, published his visions; interpolating the law after his own fancy, and supporting his novelties on the notices which God, he said, had communicated by the mouth of Moses, whose depositary he was: he gained many followers; and was opposed by others, who maintained, that all which God had revealed to Moses was written. Hence the Jews became divided into two sects, the Caraites and Traditioners: among the first Juda, son of Tabbai, distinguished himself; among the latter, Hillel. Wolfius reckons not only the Sadducees, but also the Scribes, in the number of Caraites. But the address of the Pharisees prevailed against them all; and the number of Caraites decreased: Anan, indeed, in the eighth century, retrieved their credit a little; and Rabbi Schalomon in the ninth. They succeeded pretty well till the fourteenth; but since that time they have been declining.

The Caraites are but little known; their works coming only into very few hands, even among the greatest Hebraists. Buxtorf never saw more than one; Selden two; but Mr Trigland says, he has recovered enough to speak of them with assurance. He asserts, that soon after the prophets had ceased, the Jews became divided on the subject of works, and supererogation: some maintaining their necessity from tradition; whilst others, keeping close to the written law, set them aside; and it was from these last that Caraitism commenced. He adds, that after the return from the Babylonish captivity, the observation of the law being to be re-established, there were several practices found proper for that end; and these once introduced, were looked upon as essential, and appointed by Moses; which was the origin of Pharisaism: as a contrary party, continuing to keep close to the letter, founded Caraitism.

The modern Caraites, Leo of Modena observes, have their synagognes and ceremonies; they pretend to be the sole proper Jews, or observers of the laws of Moses; calling the rest by the term *Rabbanim*, or *followers of the Rabbins:* these hate the Caraites mortally; refusing to ally or even to converse with them, and treating them as *mamzeim*, bastards; because of their rejecting the constitutions of the rabbins relating to marriages, repudiations, purifications of women, &c. This aversion is so great, that if a Caraite should become a Rabbinist, he would never be received by the other Jews.

The Caraites, however, do not absolutely reject all kinds of traditions; but only such as do not appear well grounded. Selden, who is very express on this point, in his Uxor Hebraica, observes, that, besides the mere text, they have certain interpretations, which they call hereditary, and which are proper traditions. Their theology only seems to differ from that of the other Jews, in that it is purer, and clearer of superstition; they give no credit to the explications of the Cabbalists, chimerical allegories, nor to any constitutions of the Talmud, but what are conformable to the Scripture, and may be drawn from it by just and necessary consequences.

Peringer observes of the Caraites in Lithuania, that they are very different, both in aspect, language, and manners, from the Rabbinists, wherewith the country abounds. Their mother tongue is the Turkish; and this they use in their schools and synagogues. In visage they resemble the Mahometan Tartars. Their synagognes are placed north and south; and the reason they give for it is, that Shalmaneser brought them northward: so that, in praying, to look to Jerusalem, they must turn to the south. He adds, that they admit all the books of the Old Testament; contrary to the opinion of many of the learned, who hold that they reject all but the Pentateuch.

Caleb, a Caraite, reduces the difference betwen them and the Rabbinists to three points: 1. In that they deny the oral law to have come from Moses, and reject the Cabbala. 2. In that they abhor the Talmud. 3. In that they observe the feasts, as the sabbaths, &c. much more rigorously than the Rabbins do. To this may be added, that they extend the degrees of affinity, wherein marriage is prohibited, almost to infinity.

CARAMANIA, a considerable province of Turkey in Asia, in the south part of Natolia. Bajazet united this province to his empire about the year 1488, and since that time it has continued in the possession of the Turks. Satalia was the capital city, but is now much decayed.

CARAMANTA, a town of South America, and capital of the province of the same name in Terra Firma, and in the audience of Santa Fe. W. Long. 72. 35. N. Lat. 5. 18. The province of Caramanta is extended on both sides the river Cauca; and is bounded on the north by the district of Carthagena, on the east by New Grenada, on the south by Popayan, and on the west by Popayan and by the audience of Panama. It is a valley surrounded on every side by very high mountains.

CARANGA, an inconsiderable island near Bombay in the East Indies. It affords nothing but some rice, fowls, and goats, for that market.

CARANNA, or KARANNA, a very scarce gum which comes from New Spain. It is said to possess many extraordinary medical virtues, but the present practice takes no notice of it.

CARANUS, the first king of Macedon, and the seventh of the race of the Heraclidæ. See MACEDONIA.

CARARA, a weight at Leghorn, and in other parts of Italy, used in the sale of wool and cod fish, equivalent to 60 pounds of that country.

CARAT.

CARAT. See CARACT.

CARAVAGGIO, MICHAEL ANGELO. See ANGELO.

CARAVAN, or KARAVANNE, in the east, signifies a company or assembly of travellers and pilgrims, and more particularly of merchants, who, for their greater security, and in order to assist each other, march in a body through the deserts, and other dangerous places, which are infested with Arabs or robbers.

There are four regular caravans which go yearly to Mecca; the first from Damascus, composed of the pilgrims from Europe and Asia; the second from Cairo, from the Mahomedans of Barbary; the third from Zibith, a place near the mouth of the Red sea, where those of Arabia and India meet; the fourth from Babylon, where the Persians assemble. Most of the inland commerce of the east is carried on by caravans. The late Czar Peter the Great established a trade between Russia and China by means of a caravan. M. Bougnon, geographer to the duke of Lorrain, has given a treatise of the caravans of merchants in Asia; wherein he shows of what they are composed, how many sorts there are; the several uses of the different sorts of animals in them; the prices given for them; the officers and men appointed to conduct them, and the pay of each, with their manner of marching, halting, fighting, retreating, &c. Caravans of this kind are large convoys of armed men, merchants, and travellers, with divers sorts of animals for the carriage of their provisions. There are commonly four chief officers of a caravan, viz. the caravan bachi, or chief; the captain guide; captain of rest; and captain of distribution. The first has absolute command over all the rest: the second is absolute in the march: the office of the third only commences when the caravan stops and makes a stay: to the fourth it belongs to dispose of every part of the corps, in case of an attack or battle; he has also the inspection over the distribution of provisions, which is made under him by several distributors, who give security to the master of the caravan, and have each of them a certain number of persons, elephants, dromedaries, &c. to take care of at their own peril. The treasurer of the caravan makes a fifth officer, who has under him several agents and interpreters, who keep journals of all that passes, for the satisfaction of those concerned in fitting out the caravan.

Any dealer is at liberty to form a company, in order to make a caravan. He in whose name it is raised, is considered as the caravan bachi, or chief of the caravan, unless he appoint some other in his place. If there are several merchants equally concerned, they elect a caravan bachi; after which, they appoint officers to conduct the caravan, and decide all controversies that may arise during the journey.

There are also sea caravans; established on the same footing, and for the same purpose: such is the caravan of vessels from Constantinople to Alexandria.

CARAVANSERA, or KARAVANSERA, a place appointed for receiving and loading the caravans.

It is commonly a large square building, in the middle of which there is a very spacious court; and under the arches or piazzas that surround it there runs a bank, raised some feet above the ground, where the merchants, and those who travel with them in any capacity, take up their lodgings as well as they can; the beasts of burden being tied to the foot of the bank. Over the gates that lead into the court, there are sometimes little rooms, which the keepers of the caravanseras let out at a very high price to such as have a mind to be private.

The caravanseras in the east are something of the nature of the inns in Europe; only that you meet with little accommodation either for man or beast, but are obliged to carry almost every thing with you: there is never a caravansera without a well, or spring of water. These buildings are chiefly owing to the charity of the Mahometans: they are esteemed sacred dwellings, where it is not permitted to insult any person, or to pillage any of the effects that are deposited there. There are also caravanseras where most things may be had for money; and as the profits of these are considerable, the magistrates of the cities to whose jurisdiction they belong take care to store them well. There is an inspector, who, at the departure of each caravan, fixes the price of the night's lodging, from which there is no appeal.

CARAVANSERASKIER, the stewart or keeper of a CARAVANSERA. He keeps an account of all the merchandises that are sold upon trust, and demands the payments of the sums due to the merchants for what has been sold in the caravansera, on the seller's paying two per cent.

CARAVEL; thus they call a small vessel on the coast of France, which goes to fish for herring on the banks. They are commonly from 25 to 30 tons burden. Those which are designed for the same fishery in the British channel are called by the French *trinquarts*; these are from 12 to 15 tons burden.

CARAWAY. See CARUM, BOTANY *Index*.

CARBONADE, or CARBONADO, in cookery; flesh, fowl, or the like, seasoned and broiled on the coals.

CARBUNCLE, in *Natural History*, a very elegant gem, whose colour is deep red, with an admixture of scarlet.

This gem was known among the ancients by the name of *anthrax*. It is usually found pure and faultless, and is of the same degree of hardness with the sapphire: it is naturally of an angular figure; and is found adhering by its base, to a heavy and ferruginous stone of the emery kind: its usual size is near a quarter of an inch in length, and two-thirds of that in diameter in its thickest parts. when held up against the sun, it loses its deep tinge, and becomes exactly of the colour of a burning charcoal, whence the propriety of the name which the ancients gave it. It bears the fire unaltered, not parting with its colour, nor becoming at all the paler by it. It is found only in the East Indies, so far as is yet known; and there but very rarely.

CARBUNCLE, or *Anthrax*, in *Medicine*, an inflammation which arises, in time of the plague, with a vesicle or blister almost like that produced by burning.

CARBUNCLE, in *Heraldry*, a charge or bearing, consisting of eight radii, four whereof make a common cross, and the other four a saltier.

Some call these radii *buttons*, or staves, because round, and enriched with buttons, or pearled like pilgrims staves, and frequently tipped or terminated with flower-de-luces;

de-luces; others blazon them, royal sceptres, placed in saltier, pale and fesse.

CARCASSE, or CARCUS, in the art of war, an iron case, or hollow capacity, about the bigness of a bomb, of an oval figure, made of ribs of iron, filled with combustible matters, as meal powder, saltpetre, sulphur, broken glass, shavings of horn, turpentine, tallow, &c. It has two or three apertures out of which the fire is to blaze, and the design of it is to be thrown out of a mortar, to set houses on fire, and do other execution. It has the name *carcasse*, because the circles which pass from one ring or plate to the other seem to represent the ribs of a human carcase.

CARCASSONE, an ancient city of France, in Lower Languedoc, with a bishop's see. It is divided into the upper and lower town. They are both surrounded with walls; and though their situations are different, they are both watered by the river Aude. The upper town is seated on a hill, with a castle that commands it as well as the lower town. It is strong, not only by its situation on a craggy rock, but also by several large towers which are joined to its walls, and which render it of difficult access. The cathedral church is remarkable for nothing but its antiquity. The lower town is large, and built after the modern taste. The streets are very straight, and lead to a large square in the middle, from whence may be seen the four gates of the town. It contained 15,200 inhabitants in 1815. The neighbouring country is full of olive-trees; and in the mountains there is a fine marble, commonly called *marble of Languedoc*. E. Long. 2. 25. N. Lat. 43. 11.

This place bore a considerable share in that celebrated crusade undertaken against the Albigenses in the beginning of the 13th century, and which forms one of the most astonishing instances of superstition and of atrocious barbarity to be found in the annals of the world. When the royal power was nearly annihilated, during the reigns of the last kings of the Carlovingian race in France, most of the cities of Languedoc erected themselves into little independent states, governed by their own princes. Carcassone was then under the dominion of viscounts. At the time when Pope Innocent III. patronised and commanded the prosecution of hostilities against the Albigenses for the crime of heresy, Raymond the reigning viscount was included in that proscription. Simon de Montfort, general of the army of the church, invested the city of Carcassone in 1209. The inhabitants, terrified at the fate of several other places where the most dreadful massacres had been committed, demanded leave to capitulate; but this act of mercy was only extended to them under a condition equally cruel, incredible, and unparalleled in history, if we are not compelled to believe it by the unanimous testimony of all the contemporary writers. The people found in the place were all obliged, without distinction of rank or sex, to evacuate it in a state of nudity; and Agnes the viscountess was not exempted, though young and beautiful, from this ignominious and shocking punishment. "On les fit sortir tout nuds de la ville de Carcassone (says an ancient author) afin qu'ils receussent de la honte, en montrant ces parties du corps que la puretè de la langue n'exprime point, desquelles ils avoient abuse, et s'en etoient servis dans des crimes execrables." It seems by this imputation that the Albigeois were accused by their enemies of some enormities, probably unjust, and similar to those which religious enmity and prejudice have attributed to the followers of Zinzendorf in the last century.

CARCERES, in the ancient Circensian games, were inclosures in the circus, wherein the horses were restrained till the signal was given for starting, when by an admirable contrivance, they all at once flew open.

CARCHEMISH, in *Ancient Geography*, a town lying upon the Euphrates, and belonging to the Assyrians. Necho king of Egypt took it from the king of Assyria, 2 Chron. xxxv. 20. Necho left a garrison in it, which was taken and cut to pieces, in the fourth year of Jechoiachin king of Judah, by Nebuchadnezzar king of Babylon, 2 Kings xxiii. 29. Isaiah (x. 9.) speaks of Carchemish, and seems to say, that Tiglath-Pileser made a conquest of it, perhaps from the Egyptians. This is thought to be the same city with that called Circesium by the Greeks and Latins.

CARCINOMA, in *Medicine;* the same with CANCER. See MEDICINE and SURGERY *Index*.

CARD, among artificers, an instrument consisting of a block of wood, beset with sharp teeth, serving to arrange the hairs of wool, flax, hemp, and the like; there are different kinds of them, as hand-cards, stock-cards, &c. They are made as follows:

A piece of thick leather, of the size intended for the card, is strained in a frame for that purpose; and then pricked full of holes, into which the teeth or pieces of iron wire are inserted. After which the leather is nailed by the edges to a flat piece of wood, in the form of an oblong square, about a foot in length, and half a foot in breadth, with a handle placed in the middle of one of the longer sides.

The teeth are made in the following manner. The wire being drawn of the size intended, a skain or number of wires are cut into proper lengths by means of a gauge, and then doubled in a tool contrived for that purpose; after which they are bent into the proper direction by means of another tool; and then placed in the leather, as mentioned above.

CARDS, among gamesters, little pieces of fine thin pasteboard of an oblong figure, of several sizes; but most commonly in Britain, three inches and a half long and two and a half broad, on which are painted several points and figures.

The moulds and blocks for making cards are exactly like those that were used for the first printed books. They lay a sheet of wet or moist paper on the block, which is very slightly done over with a sort of ink made of lamp-black diluted in water, and mixed with some starch to give it a body. They afterwards rub it off with a round list. The court-cards are coloured by means of several patterns, styled *stane-files*. These consist of papers cut through with a penknife; and in these apertures they apply severally the various colours, as red, black, &c. These patterns are painted with oil-colours, that the brushes may not wear them out; and when the pattern is laid on the pasteboard, they slightly pass over it a brush full of colour, which leaving it within the openings, forms the face or figure of the card.

Among sharpers, divers sorts of false and fraudulent cards have been contrived; as, 1. *Marked* cards, where the

the aces, kings, queens, knaves, are marked on the corners of the backs with spots of different number and order, either with clear water or water tinged with pale Indian ink, that those in the secret may distinguish them. Aces are marked with single spots on two corners opposite diagonally: kings with two spots at the same corners: knaves with the same number transversed. 2. *Breef* cards, those which are longer or broader than the rest; chiefly used at whist and piquet. The broad cards are usually for kings, queens, knaves, and aces; the long for the rest. Their design is to direct the cuttings, to enable him in the secret to cut the cards disadvantageously to his adversary, and draw the person unacquainted with the fraud to cut them favourably for the sharper. As the pack is placed either endwise or sidewise to him that is to cut, the long or broad cards naturally lead him to cut them. Breef cards are sometimes made thus by the manufacturer; but, in defect of these, sharpers pare all but the breefs with a penknife or razor. 3. *Corner bend*, denotes four cards turned down finely at one corner, to serve as a signal to cut by. 4. *Middle bend*, or Kingston-bridge, is where the tricks are bent two different ways, which causes an opening or arch in the middle, to direct likewise the cutting.

Cards were invented about the year 1390, to divert Charles VI. of France, who had fallen into a melancholy disposition. The inventor proposed, by the figures of the four suits or colours, as the French call them, to represent the four classes of men in the kingdom. By the *cœurs* (hearts) are meant the *gens de choeur*, choir-men, or ecclesiastics; and therefore the Spaniards, who certainly received the use of cards from the French, have *copas*, or chalices, instead of hearts. The nobility, or prime military part of the kingdom, are represented by the ends or points of lances or pikes; and our ignorance of the meaning or the resemblance of the figure induced us to call them *spades:* The Spaniards have *espadas*, swords, in lieu of pikes, which are of similar import. By diamonds are designed the order of citizens, merchants, or tradesmen, *carreaux*, (square stones, tiles, or the like): The Spaniards have a coin, *dincros*, which answers to it: and the Dutch call the French word *carreaux*, " *streneen*," stones and diamonds, from the form. *Trefle*, the trefoil-leaf, or clover-grass (corruptly called *clubs*), alludes to the husbandmen and peasants. But how this suit came to be called *clubs* is not easily explained; unless borrowing the game from the Spaniards, who have *bastos* (staves or clubs) instead of the trefoil, we give the Spanish signification to the French figure.

The history of the four kings, which the French, in drollery, sometimes call the cards, are David, Alexander, Cæsar, and Charles; which names were then, and still are on the French *cards*. Those respectable names represent the four celebrated monarchies of the Jews, Greeks, Romans, and Franks under Charlemagne. By the queens are intended Argine, Esther, Judith, and Pallas (names retained in the French cards), typical of birth, piety, fortitude, and wisdom, the qualifications residing in each person. *Argine* is an anagram for *regina*, queen by descent. By the knaves were designed the servants to knights (for *knave* originally meant only *servant); but* French pages and valets, now indiscriminately used by various orders of persons, were formerly only allowed to persons of quality, esquires *(escuires)*, shield or armour bearers. Others fancy that the knights themselves were designed by those cards; because Hogier and Labire, two names on the French cards, were famous knights at the time cards were supposed to have been invented.

Deceptions with CARDS. See LEGERDEMAIN, sect. i.

CARDAMINE, in *Botany*, a genus of the siliquosa order, belonging to the tetradynamia class of plants; and in the natural method ranking under the 39th order *Siliquosæ*. The siliqua parts asunder with a spring, and the valves roll spirally backward; the stigma is entire, and the calyx a little gaping. Of this there are 15 species; but the most remarkable is the pratensis, with a large purplish flower. This grows naturally in many parts of Britain, and is also called *cuckow flower*. There are four varieties, viz. the single, with purple and white flowers, which are frequently intermixed in the meadows; and the double, of both colours. The single sorts are not admitted into gardens; but the double deserve a place, as making a pretty appearance during the time they are in flower. They will thrive in a moist shady border; and are propagated by parting their roots, which is best performed in autumn. They delight in a soft loamy soil, not too stiff. By some the plant is reckoned antiscorbutic.

CARDAMOM, in the *Materia Medica*. See AMOMUM.

CARDAN, JEROM, one of the most extraordinary geniuses of his age, was born at Pavia on the 24th of September 1501. As his mother was not married, she tried every method to procure an abortion, but without effect. She was three days in labour, and they were at last obliged to cut the child from her. He was born with his head covered with black curled hair. When he was four years old, he was carried to Milan, his father being an advocate in that city. At the age of 20, he went to study at the university of that city; and two years afterwards he explained Euclid. In 1524, he went to Padua, and the same year he was admitted to the degree of master of arts: in the end of the following year, he took the degree of doctor of physic. He married about the year 1531. For ten years before, his impotency had hindered him from having knowledge of a woman, which was a great mortification to him. He attributed it to the evil influences of his planet under which he was born. When he enumerates, as he frequently does, the greatest misfortunes of his life, this ten years impotency is always one. At the age of 32, he became professor of mathematics at Milan. In 1539, he was admitted a member of the college of physicians at Milan; in 1543, he read public lectures of medicine in that city, and at Pavia the year following; but discontinued them because he could not get payment of his salary, and returned to Milan. In 1552, he went into Scotland, having been sent for by the archbishop of St Andrew's who had in vain applied to the French king's physicians, and afterwards to those of the emperor of Germany. This prelate, then 40 years old, had for ten years been afflicted with a shortness of breath, which returned every eight days for the last two years. He began to recover from the moment that Cardan prescribed for him. Cardan took his leave of him at the end of six weeks and

Cardan.

and three days, leaving him prescriptions which in two years wrought a complete cure.

Cardan's journey to Scotland gave him an opportunity of visiting several countries. He crossed France in going thither; and returned through Germany, and the Low Countries, along the banks of the Rhine. It was on this occasion he went to London, and calculated King Edward's nativity. This tour took up about four months; after which, coming back to Milan, he continued there till the beginning of October 1552; and then went to Pavia, from whence he was invited to Bologna in 1562. He taught in this last city till the year 1570; at which time he was thrown into prison; but some months after he was sent home to his own house. He left Bologna in 1571, and went to Rome, where he lived for some time without any public employment. He was, however, admitted a member of the college of physicians, and received a pension from the pope. He died at Rome on the 21st of September, 1575, according to Thuanus. This account might be sufficient to shew the reader that Cardan was of a very fickle temper; but he will have a much better idea of his singular and odd turn of mind by examining what he himself has written concerning his own good and bad qualities. He paid himself congratulatory compliments for not having a friend in this world; but that in requittal, he was attended by an aerial spirit, emaned partly from Saturn and partly from Mercury, who was the constant guide of his actions, and teacher of every duty to which he was bound. He declared, too, that he was so irregular in his manner of walking the streets, as induced all beholders to point at him as a fool. Sometimes he walked very slowly, like a man absorbed in profound meditation; then all on a sudden quickened his steps, accompanying them with very absurd attitudes. In Bologna his delight was to be drawn about in a mean vehicle with three wheels. When nature did not visit him with any pain, he would procure to himself that disagreeable sensation by biting his lips so wantonly, or pulling his fingers to such a vehement degree, as sometimes to force the tears from his eyes: and the reason he assigned for so doing, was to moderate certain impetuous sallies of the mind, the violence of which was to him by far more insupportable than pain itself; and that the sure consequence of such a severe discipline was the enjoying the pleasure of health. He says elsewhere, that, in the greatest tortures of soul, he used to whip his legs with rods, and bite his left arm; that it was a great relief to him to weep, but that very often he could not; that nothing gave him more pleasure than to talk of things which made the whole company uneasy; that he spoke on all subjects, in season and out of season; and he was so fond of games of chance, as to spend whole days in them, to the great prejudice of his family and reputation, for he even staked his furniture and his wife's jewels.

Cardanus makes no scruple of owning that he was revengeful, envious, treacherous, a dealer in the black-art, a backbiter, a calumniator, and addicted to all the foul and detestable excesses that can be imagined; yet notwithstanding (as one would think) so humbling a declaration, there was never perhaps a vainer mortal, or one that with less ceremony expressed the high opinion he had of himself, than Cardanus was known to do, as will appear by the following proofs. "I have been admired by many nations: an infinite number of panegyrics, both in prose and verse, have been composed to celebrate my fame. I was born to release the world from the manifold errors under which it groaned. What I have found out could not be discovered either by my predecessors or my cotemporaries; and that is the reason why those authors who write any thing worthy of being remembered, scruple not to own that they are indebted to me for it. I have composed a book on the dialectic art, in which there is neither one superfluous letter nor one deficient. I finished it in seven days, which seems a prodigy. Yet where is there a person to be found, that can boast of his having become master of its doctrine in a year? And he that shall have comprehended it in that time, must appear to have been instructed by a familiar demon."

Cardan
Cardass

The same capriciousness observable in his outward conduct is to be observed in the composition of his works. We have a multitude of his treatises in which the reader is stopped almost every moment by the obscurity of his text, or his digressions from the point in hand. In his arithmetical performances there are several discourses on the motions of the planets, on the creation, and on the tower of Babel. In his dialectic work, we find his judgment on the historians and the writers of epistles. The only apology which he makes for the frequency of his digressions is, that they were purposely done for the sooner filling up of his sheet, his bargain with the bookseller being at so much per sheet: and that he worked as much for his daily support as for the acquisition of glory. The Lyons edition of his works, printed in 1663, consists of ten volumes in folio.

It was Cardanus who revived in latter times all the secret philosophy of the Cabbala or Cabbalists, which filled the world with spirits; a likeness to whom, he asserted, we might attain by purifying ourselves with philosophy. He chose for himself, however, notwithstanding such reveries, this fine device, *Tempus mea possessio, tempus meus ager*: "Time is my sole possession, and the only fund I have to improve."

In fact, when we consider the transcendent qualities of Cardan's mind, we cannot deny his having cultivated it with every species of knowledge, and his having made a greater progress in philosophy, in the medical art, in astronomy, in mathematics, &c. than the greatest part of his cotemporaries who had applied their minds but to one of those sciences.

Scaliger affirms, that Cardan, having fixed the time of his death, abstained froom food, that this prediction might be filfilled, and that his continuance to live might not discredit his art. Cardan's father, who was a doctor of medicine, and a professor of civil and canon law, died in the same manner in the year 1524, having abstained from all sustenance for nine days. His son tells us that he had white eyes, and could see in the night time.

CARDASS, a sort of card proper for carding flocks of silk, to make cappadine of it. It is also the name which the French give to those flocks of silk.

CARDASS is also the name which, in the cloth manufactories of Languedoc, they give to a sort of large card, which is used for carding the dyed wool, designed for making cloth of mixed colours.

CARDERS,

CARDERS, in the woollen manufactory, are persons who prepare wool, &c. for spinning, &c.

Carders, spinners, weavers, fullers, sheermen, and dyers, not performing their duty in their occupations, shall yield to the party grieved double damages; to be committed until payment. One justice to hear and determine complaints.

Carders, combers, sorters, spinners, or weavers, conveying away, embezzling, or detaining any wool or yarn, delivered by the clothier, or any other person, shall give the party grieved such satisfaction, as two justices, mayor, &c. shall think fit: if not able or willing to make satisfaction, for the first offence to be whipped, or set in the stocks in some market town, or in any other town where the offence is committed: the second offence to incur the like, or such further punishment by whipping, &c. as justices shall think proper. Conviction by one witness on oath, or confession.

CARDI, LUDOVICO. See CIVOLI.

CARDIAC, in a general sense, signifies all medicines beneficial to the heart, whether internally or externally applied. The word comes from the Greek word καρδια, *cor;* the heart being reputed the immediate seat of their operation.

CARDIACS, in a more particular sense, denote medicines which raise the spirits and give present strength and cheerfulness; these amount to the same with what are properly called *cordials.* Cardiacs are medicines anciently supposed to exert themselves immediately in comforting and strengthening the heart: but the modern physicians rather suppose them to produce the effect by putting the blood into a gentle fermentation, whereby the springs, before decayed, are repaired and invigorated, and the tone and elasticity of the fibres of the vessels restored; the consequence of which is a more easy and brisk circulation.

CARDIALGIA, in *Medicine*, a violent sensation of heat or acrimony felt towards the upper or left orifice of the stomach, though seemingly at the heart; sometimes accompanied with palpitations of the heart, fainting, and a propensity to vomit: better known by the name of *cardiac passion*, or *heart-burn*. See MEDICINE *Index*.

CARDIFF, a town of Glamorganshire, in South Wales, seated on the river Tave, in a rich and fruitful soil. It is a large, compact, well built town, having a castle, a wall, and four gates, built by Robert Fitz-Hamon, a Norman, about the year 1100. It is governed by the constable of the castle, 12 aldermen, 12 burgesses, &c. and sends one member to parliament. Here the assizes and sessions are held, besides several courts. There is a handsome bridge over the river, to which small vessels come to take in their lading. It has now only one church; St Mary's having been long since thrown down by the undermining of the river. The castle, though much decayed, makes a grand appearance even at this time; and the walls of the town are very strong and thick. The church has a fine tower-steeple, and the town-hall is a good structure. The magistrates are elected every year by the majority of the burgesses. W. Long. 3. 20. N. Lat. 51. 30. Cardiff gives the title of a British baron to the family of Bute in Scotland. Population 2457 in 1811.

CARDIGAN, the capital town of Cardiganshire, in South Wales, is seated near the mouth of the river Teivy, on the Irish channel. It contains three wards, one church, and the county gaol, and had 2129 inhabitants in 1811. It is governed by a mayor, 13 aldermen, 13 common council men, &c. Here are the ruins of a castle which was built by Gilbert de Clare, about the year 1100. It sends one member to parliament; and has two markets, held on Tuesdays and Saturdays. W. Long. 4. 38. N. Lat. 52. 15.

CARDIGANSHIRE, a county of South Wales, bounded on the north by Merionethshire and Montgomeryshire, on the east by Radnorshire and Brecknockshire, on the west by the Irish sea, and on the south by Caermarthenshire. Its length from north-west to south-east is about 44 miles, and its breadth near 20. The air, as in other parts of Wales, varies with the soil, which in the southern and western parts is more upon a level than this principality generally is, which renders the air mild and temperate. But as the northern and eastern parts are mountainous, they are consequently more barren and bleak. However, there are cattle bred in all parts; but they have neither wood nor coal. They have rich lead mines, and fish in plenty. The principal rivers are the Teivy, the Ridol, and the Istwith. This county has five market-towns, viz. Cardigan, Aberistwith, Llanbadarnvawn, Llanbedar, and Tregaron, with 77 parishes; and was computed to have upwards of 520,000 acres of land. It sends two members to parliament; one for the county, and one for Cardigan, and contained 50,260 inhabitants in 1811. See CARDIGANSHIRE, SUPPLEMENT.

CARDINAL, in a general sense, an appellation given to things on account of their pre-eminence. The word is formed of the Latin *cardo, a hinge;* it being on these fundamental points that all the rest of the same kind are supposed to turn. Thus, justice, prudence, temperance, and fortitude, are called the four *cardinal virtues*, as being the basis of all the rest.

CARDINAL Flower. See LOBELIA, BOTANY *Index.*

CARDINAL Points, in *Cosmography*, are the four intersections of the horizon with the meridian, and the prime vertical circle. Of these, two, viz. the intersections of the horizon and meridian, are called *North* and *South*, with regard to the poles they are directed to. The other two, viz. the intersections of the horizon and first vertical, are called *East* and *West*.

The cardinal points, therefore, coincide with the four cardinal regions of the heavens; and are 90° distant from each other. The intermediate points are called *collateral points*.

CARDINAL Points, in *Astrology*, are the rising and setting of the sun, the zenith, and nadir.

CARDINAL Signs, in *Astronomy*, are Aries, Libra, Cancer, and Capricorn.

CARDINAL Winds are those that blow from the cardinal points.

CARDINAL Numbers, in *Grammar*, are the numbers one, two, three, &c. which are indeclinable; in opposition to the ordinal numbers, first, second, third, fourth, &c.

CARDINAL, an ecclesiastical prince in the Romish church, being one who has a voice in the conclave at the election of a pope. Some say the cardinals were so called from the Latin *incardinatio*, which signifies the

Cardinal. the adoption in any church made of a priest of a foreign church, driven thence by misfortune: and add, that the use of the word commenced at Rome and Ravenna; the revenues of the church of which cities being very great, they became the common refuge of the unhappy priests of all other churches.

The cardinals compose the pope's council or senate. In the Vatican is a constitution of Pope John, which regulates the rights and titles of the *cardinals;* and which declares, that as the pope represents Moses, so the cardinals represent the seventy elders, who, under the pontifical authority, decide private and particular differences.

Cardinals, in their first institution, were only the principal priests, or incumbents, of the parishes of Rome. In the primitive church, the chief priest of a parish, who immediately followed the bishop, was called *presbyter cardinalis,* to distinguish him from the other petty priests, who had no church nor preferment; the term was first applied to them in the year 150; others say, under Pope Silvester, in the year 300. These cardinal priests were alone allowed to baptize, and administer the eucharist. When the cardinal priests became bishops, their cardinalate became vacant; they being then supposed to be raised to a higher dignity.—Under Pope Gregory, cardinal priests, and cardinal deacons, were only such priests and deacons as had a church or chapel under their particular care: and this was the original use of the word. Leo IV. in the council of Rome, held in 853, calls them *presbyteros sui cardinis;* and their churches, *parochias cardinales.*

The cardinals continued on this footing till the eleventh century; but as the grandeur and state of his holiness became then exceedingly augmented, he would have his council of cardinals make a better figure than the ancient priests had done. It is true, they still preserved their ancient title; but the thing expressed by it was no more. It was a good while, however, before they had the precedence over the bishops, or got the election of the pope into their hands: but when they were once possessed of those privileges, they soon had the red hat and purple; and growing still in authority, they became at length superior to the bishops, by the sole quality of being cardinals.

Du Cange observes, that originally there were three kinds of churches: the first or genuine churches were properly called *parishes;* the second *deaconries,* which were chapels joined to hospitals, and served by deacons; the third were simple *oratories,* where private masses were said, and were discharged by local and resident chaplains. He adds, that to distinguish the principal or parish churches from the chapels and oratories, the name *cardinales* was given to them. Accordingly, parish churches gave titles to cardinal priests; and some chapels also, at length, gave the the title of *cardinal deacons.*

Others observe, that the term *cardinal* was given not only to priests, but also to bishops and deacons who were attached to certain churches, to distinguish them from those who only served them *en passant,* and by commission. Titular churches, or benefices, were a kind of parishes, *i. e.* churches, assigned each to a cardinal priest; with some stated district depending on it, and a font for administering of baptism, in cases where the bishop himself could not administer it. These cardinals were subordinate to the bishops; and accordingly, in councils, particularly that held at Rome in 868, subscribed after them.

It was not, however, only at Rome, that priests bore this name; for we find there were cardinal priests in France: thus, the curate of the parish of St John de Vignes is called in old charters the *cardinal priest* of that parish.

The title of *cardinal* is also given to some bishops, *quatenus* bishops, *e. g.* to those of Mentz and Milan: the archbishop of Bourges is also, in ancient writings, called *cardinal;* and the church of Bourges, a *cardinal church.* The abbot of Vendome calls himself *cardinalis natus.*

The cardinals are divided into three classes or orders; containing six bishops, fifty priests, and fourteen deacons; making in all seventy; which constitute what they call the *sacred college.* The cardinal bishops, who are, as it were, the pope's vicars, bear the titles of the bishoprics assigned to them; the rest take such titles as are given them: the number of cardinal bishops has been fixed; but that of cardinal priests and deacons, and consequently the sacred college itself, is always fluctuating. Till the year 1125, the college only consisted of fifty-two or fifty-three: the council of Constance reduced them to twenty-four; but Sixtus IV. without any regard to that restriction, raised them again to fifty-three, and Leo to sixty-five. Thus, as the number of cardinal priests was anciently fixed to twenty-eight, new titles were to be established, in proportion as new cardinals were created. As for the cardinal deacons, they were originally no more than seven for the fourteen quarters of Rome; but they were afterwards increased to nineteen, and after that were again diminished.

According to Onuphrius, it was Pope Pius IV. who first enacted, in 1562, that the pope should be chosen only by the senate of cardinals; whereas, till that time, the election was by all the clergy of Rome. Some say, the election of the pope rested in the cardinals, exclusive of the clergy, in the time of Alexander III. in 1160. Others go higher still, and say, that Nicholas II. having been elected at Sienna, in 1058, by the cardinals alone, occasioned the right of election to be taken from the clergy and people of Rome; only leaving them that of confirming him by their consent; which was at length, however, taken from them. See his decree for this purpose, issued in the Roman council of 1059, in Hardouin's Acta Conciliorum, tom. vi. pt. i. p. 1165. Whence it appears, that the cardinals who had the right of suffrage in the election of his successors, were divided by this pontiff into *cardinal bishops,* and *cardinal clerks;* meaning by the former the seven bishops who belonged to the city and territory of Rome; and by the latter, the *cardinal presbyters,* or ministers of the twenty-eight Roman parishes, or principal churches. To these were added, in process of time, under Alexander III. and other pontiffs, new members, in order to appease the tumults occasioned by the edict of Nicholas II.

At the creation of a new cardinal, the pope performs the ceremony of opening and shutting his mouth; which is done in a private consistory. The shutting his mouth implies the depriving him of the liberty of giving his opinion in congregations; and the opening his

his mouth, which is performed 15 days after, signifies the taking off his restraint. However, if the pope happens to die during the time a cardinal's mouth is shut, he can neither give his voice in the election of a new pope, nor be himself advanced to that dignity.

The dress of a cardinal is a red soutanne, a rocket, a short purple mantle, and a red hat.

The cardinals began to wear the red hat at the council of Lyons, in 1243. The decree of Pope Urban VIII. whereby it is appointed, that the cardinals be addressed under the title of *eminence*, is of the year 1630; till then, they were called *illustrissimi.*

When cardinals are sent to the courts of princes, it is in quality of legates *à latere;* and when they are appointed governors of towns, their government is called by the name of *legation.*

Cardinal has also been applied to secular officers. Thus, the prime ministers in the court of the emperor Theodosius, are called *cardinales.* Cassiodorus, lib. vii. formul. 31. makes mention of the cardinal prince of the city of Rome; and in the list of officers of the duke of Bretagne, in 1447, we meet with one Raoul de Thorel, cardinal of Quillart, chancellor, and servant of the viscount de Rohan: which shows it to have been an inferior quality.

CARDIOID, in the higher geometry, an algebraical curve, so called from its resemblance to a heart.

CARDIOSPERMUM. See Botany *Index.*

CARDIUM, or Cockle, in *Zoology*, a genus of insects belonging to the order of *vermes testacea.* The shell consists of two equal valves, and the sides are equal. There are 21 species of this genus. Common on all sandy coasts, lodged a little beneath the sand; their place is marked by a depressed spot. They are wholesome and delicious food.

CARDONA, a handsome town of Spain, in Catalonia, with a strong castle, and the title of a duchy, and containing 2800 inhabitants. Near it is an inexhaustible mountain of salt of several colours, as red, white, carnation, and green: but when washed, it becomes white. There are also vineyards which produce excellent wine. It is seated on an eminence, near the river Cardenero. E. Long. 1. 26. N. Lat. 41. 42.

CARDUUS. See Botany *Index.*

Carduus Benedictus, Blessed thistle. See Cnicus, Botany *Index.*

CAREENING, in the sea-language, the bringing a ship to lie down on one side, in order to trim and caulk the other side.

A ship is said to be brought to the careen, when the most of her lading being taken not, she is hulled down on one side, by a small vessel, as low as necessary; and there kept by the weight of the ballast, ordnance, &c. as well as by ropes, lest her masts should be strained too much; in order that her sides and bottom may be trimmed, seams caulked, or any thing that is faulty under water mended. Hence, when a ship lies on one side when she sails, she is said to sail on the careen.

CAREER, in the manege, a place inclosed with a barrier, wherein they run the ring.

The word is also used for the race or course of the horse itself, provided it do not exceed 200 paces.

In the ancient circus, the career was the space the bigæ, or quadrigæ, were to run at full speed, to gain the prize. See Circus.

Career, in falconry, is a flight or tour of the bird, about 120 yards. If she mount more, it is called a *double career:* if less, a *semi-career.*

CARELIA, the eastern province of Finland; divided into Swedish Carelia, and Muscovite Carelia. The capital of the latter is Povenza, and of the former Weiburg.

CARENTAN, a town of France in Lower Normandy, with an ancient castle. Population 2860 in 1815. W. Long. 1. 14. N. Lat. 49. 20.

CARET, among grammarians, a character marked thus ʌ, signifying that something is added on the margin, or interlined, which ought to come in where the caret stands.

CAREW, a small village or parish of Wales, in the county of Pembroke, with the remains of a fine castle. Here a tournament was held about the beginning of the sixteenth century, or earlier, by the owner Sir Keil of Thomas, which lasted five days. A cross 14 feet high, formed of a single stone, stands by the side of the road. Population 911. Distant five miles from Pembroke.

Carew, *George*, born in Devonshire in 1557, an eminent commander in Ireland, was made president of Munster by Queen Elizabeth; when, joining his forces with the earl of Thomond, he reduced the Irish insurgens, and brought the earl of Desmond to his trial. King James made him governor of Guernsey, and created him a baron. As he was a valiant commander, he was no less a polite scholar; and wrote *Pacata Hibernia*, a history of the late wars in Ireland, printed after his death, in 1633. He made several collections for a History of Henry V. which are digested into Speed's History of Great Britain. Besides these, he collected materials of Irish history in four large MSS. volumes, now in the Bodleian library, Oxford.

Carew, *Thomas*, descended from the family of Carew in Gloucestershire, was gentleman of the privy chamber to Charles I. who always esteemed him one of the most celebrated wits of his court. He was much respected by the poets of his time, particularly by Ben Johnson and Sir William Davenant; and left behind him several poems, and a masque called *Cœlum Britannicum*, performed at Whitehall on Shrove Tuesday night, 1633, by the king, and several of his nobles with their sons. Carew was assisted in the contrivance by Inigo Jones, and the music was set by Mr Henry Lawes of the king's chapel. He died in the prime of life, about the year 1639.

Carew, *Richard*, author of the "Survey of Cornwall," was the eldest son of Thomas Carew of East Anthony, and was born in 1555. When very young, he became a gentleman commoner of Christ-church college, Oxford; and at 14 years of age had the honour of disputing, extempore, with the afterwards famous Sir Philip Sydney, in the presence of the earls of Leicester, Warwick, and other nobility. After spending three years at the university, he removed to the Middle Temple, where he resided the same length of time, and then travelled into foreign parts. Not long after his return to England, he married, in 1577, Juliana Arundel, of Trerice. In 1581, Mr Carew was made justice of the peace, and in 1586 was appointed high sheriff of the county of Cornwall; about which time he was likewise queen's deputy for the militia.

In 1589, he was elected a member of the college of Antiquaries, a distinction to which he was entitled by his literary abilities and pursuits. What particularly engaged his attention was his native county, his "Survey" of which was published, in 4to at London, in 1602. It hath been twice reprinted, first in 1723, and next in 1769. Of this work Camden hath spoken in high terms, and acknowledges his obligations to the author. In the present improved state of topographical knowledge, and since Dr Borlase's excellent publications relative to the county of Cornwall, the value of Carew's "Survey" must have been greatly diminished. Mr Gough remarks, that the history and monuments of this country were faintly touched by Carew; but it is added, that he was a person extremely capable of describing them, if the infancy of those studies at that time had afforded light and materials. Another work of our author was a translation from the Italian, entitled, "The Examination of Men's Wits. In which, by discovering the variety of natures, is showed for what profession each one is apt, and how far he shall profit therein." This was published at London in 1594, and afterwards in 1604; and though Richard Carew's name is prefixed to it, hath been principally ascribed by some persons to his father. According to Wood, Carew wrote also, "The true and ready way to learn the Latin tongue," in answer to a query, whether the ordinary method of teaching the Latin by the rules of grammar be the best mode of instructing youths in that language? This tract is involved in Mr Hartlib's book upon the same subject, and with the same title. It is certain that Carew was a gentleman of considerable abilities and literature, and that he was held in great estimation by some of the most eminent scholars of his time. He was particularly intimate with Sir Henry Spelman, who extols him for his ingenuity, virtue, and learning.

Carew, *George*, brother to the subject of the last article, was educated in the university of Oxford, after which he studied the law in the inns of court, and then travelled to foreign countries for farther improvement. On his return to his native country, he was called to the bar, and after some time was appointed secretary to Sir Christopher Hatton, lord chancellor of England. This was by the special recommendation of Queen Elizabeth herself, who gave him a prothonotaryship in the chancery, and conferred upon him the honour of knighthood. In 1597, Sir George Carew, who was then a master in chancery, was sent ambassador to the king of Poland. In the next reign, he was one of the commissioners for treating with the Scotch concerning an union between the two kingdoms; after which he was appointed ambassador to the court of France, where he continued from the latter end of the year 1605 till 1609. During his residence in that country, he formed an intimacy with Thuanus, to whom he communicated an account of the transactions in Poland whilst he was employed there, which was of great service to that admirable author in drawing up the 121st book of his history. After Sir George Carew's return from France, he was advanced to the important post of master of the court of wards, which honourable situation he did not long live to enjoy; for it appears from a letter written by Thuanus to Camden in the spring 1613, that he was then lately deceased. Sir George Carew married Thomasine, daughter of Sir Francis Godolphin, great grandfather of the lord treasurer Godolphin, and had by her two sons and three daughters. When Sir George Carew returned, in 1609, from his French embassy, he drew up, and addressed to James I. "A Relation of the State of France, with the characters of Henry IV. and the principal persons of that Court." The characters are drawn from personal knowledge and close observation, and might be of service to a general historian of that period. The composition is perspicuous and manly, and entirely free from the pedantry which prevailed in the reign of James I.; but this is the less surprising, as Sir George Carew's taste had been formed in a better era, that of Queen Elizabeth. The valuable tract we are speaking of lay for a long time in MS.; till happily falling into the hands of the earl of Hardwicke, it was communicated by him to Dr Birch, who published it, in 1749, at the end of his "Historical View of the Negotiations between the Courts of England, France, and Brussels, from 1592 to 1617." That intelligent and industrious writer justly observes, that it is a model upon which ambassadors may form and digest their notions and representations; and the late celebrated poet Mr Gray hath spoken of it as an excellent performance.

CAREX, Sedge-grass. See Botany *Index*.

CAREY, Harry, a man distinguished by both poetry and music, but perhaps more so by a certain facetiousness, which made him agreeable to every body. He published in 1720 a little collection of poems; and in 1732, six cantatas, written and composed by himself. He also composed sundry songs for modern comedies, particularly those in the "Provoked Husband:" he wrote a farce called "The Contrivances," in which were several little songs to very pretty airs of his own composition; he also made two or three little dramas for Goodman's-fields theatre, which were very favourably received. In 1729, he published by subscription his poems much enlarged: with the addition of one entitled "Namby Pamby," in which Ambrose Philips is ridiculed. Carey's talent, says his historian, lay in humour and unmalevolent satire: to ridicule the rant and bombast of modern tragedies he wrote one, to which he gave the strange title of "Chrononhotonthologos," acted in 1734. He also wrote a farce called "The Honest Yorkshireman." Carey was a thorough Englishman, and had an unsurmountable aversion to the Italian opera and the singers in it: he wrote a burlesque opera on the subject of the "Dragon of Wantley;" and afterwards a sequel to it, entitled, "The Dragoness;" both which were esteemed a true burlesque upon the Italian opera. His qualities being of the entertaining kind, he was led into more expences than his finances could bear, and thus was frequently in distress. His friends, however, were always ready to assist him by their little subscriptions to his works: and encouraged by these, he republished, in 1740, all the songs he had ever composed, in a collection, entitled, "The Musical Century, in 100 English Ballads, &c." and, in 1743, his dramatic works, in a small volume, 4to. With all his mirth and good humour, he seems to have been at times deeply affected with the malevolence of some of his own profession, who, for reasons that no one can guess at, were

were his enemies, and this, with the pressure of his circumstances, is supposed to have occasioned his untimely end; for, about 1744, in a fit of desperation, he laid violent hands on himself, and, at his house in Warner-street, Cold-Bath Fields, put a period to a life, which, says Sir John Hawkins, had been led without reproach. It is to be noted, and it is somewhat singular in such a character, that in all his songs and poems on wine, love, and such kind of subjects, he seems to have manifested an inviolable regard for decency and good manners.

CARGADORS, a name which the Dutch give to those brokers whose business is to find freight for ships outward bound, and to give notice to the merchants, who have commodities to send by sea, of the ships that are ready to sail, and of the places for which they are bound.

CARGAPOL, or KARGAPOL, the capital of a territory of the same name, in the province of Dwina, in Muscovy. E. Long. 36. N. Lat. 63.

CARGO denotes all the merchandises and effects which are laden on board a ship.

Super-Cargo, a person employed by merchants to go a voyage, oversee the cargo, and dispose of it to the best advantage.

CARIA, in *Ancient Geography*, a country of the Hither Asia; whose limits are extended by some, while they are contracted by others. Mela and Pliny extend the maritime Caria from Jasus and Halicarnassus, to Calynda, and the borders of Lycia. The inland Caria Ptolemy extends to the Meander and beyond. *Car*, *Cariates*, *Cariatis*, *Carissa* and *Caris*, and *Caira*, are the gentilitious names; *Carius* and *Caricus* the epithets. *In Care periculum*, was a proverbial saying on a thing exposed to danger, but of no great value. The *Cares* being the Swiss of those days, were hired and placed in the front of the battle, (Cicero). *Cum Care Carissa*, denoted the behaviour of clowns. The Cares came originally from the islands to the continent, being formerly subject to Minos, and called *Leleges*: this the Cretans affirm, and the Cares deny, making themselves aborigines. They are of a common original with the Mysi and Lydi, having a common temple, of a very ancient standing, at Melassa, a town of Caria, called *Jovis Carii Delubrum*, (Herodotus). Homer calls the Carians, barbarians in language.

CARIATI, a town of Italy, in the kingdom of Naples, and province of Hither Calabria, with a bishop's see, and the title of a principality. It is two miles from the gulf of Taranto, and 37 north-east of Cosenza. E. Long. 17. 19. N. Lat. 30. 38.

CARIBBEE ISLANDS, a cluster of islands situated in the Atlantic ocean between 59 and 63 degrees of west longitude, and between 11 and 18 degrees of north latitude. They lie in the form of a bow or semicircle, stretching almost from the coast of Florida north, to near the river Oroonoque. Those that lie nearest the east have been called the *Windward Islands*, the others the *Leeward*, on account of the winds blowing generally from the eastern point in those quarters. Abbé Raynal conjectures them to be the tops of very high mountains formerly belonging to the continent, which have been changed into islands by some revolution that has laid the flat country under water. The direction of the Caribbee islands, beginning from Tobago, is nearly north and N. N. W. This direction is continued, forming a line somewhat curved towards the north-west, and ending at Antigua. In this place the line becomes at once curved; and extending itself in a straight direction to the west and north-west, meets in its course with Porto-Rico, St Domingo, and Cuba, known by the name of the *Leeward Islands*, which are separated from each other by channels of various breadths. Some of these are 6, others 15 or 20 leagues broad, but in all of them the soundings are from 100 to 120 or 150 fathoms. Between Grenada and St Vincent's there is also a small archipelago of 30 leagues, in which the soundings are not above ten fathoms. The mountains in the Caribbee islands run in the same direction as the islands themselves. The direction is so regular, that if we were to consider the tops of these mountains only, independent of their bases, they might be looked upon as a chain of hills belonging to the continent, of which Martinico would be the most northwesterly promontory. The springs of water which flow from the mountains in the Windward islands, run all in the western parts of these islands. The whole eastern coast is without any running water. No springs come down there from the mountains; and indeed they would have there been useless; for after having run over a very short tract of land, and with great rapidity, they would have fallen into the sea. In Porto Rico, St Domingo, and Cuba, there are a few rivers that discharge themselves on the northern side, and whose sources rise in the mountains running from east to west, that is, through the whole length of these islands. From the other side of the mountains facing the south, where the sea, flowing with great impetuosity, leaves behind it marks of its inundations, several rivers flow down, the mouths of which are capable of receiving the largest ships. The soil of the Caribbees consists mostly of a layer of clay or gravel of different thickness; under which is a bed of stone or rock. The nature of some of those soils is better adapted to vegetables than others. In those places where the clay is drier and more friable, and mixes with the leaves and remains of plants, a layer of earth is formed of greater depth than where the clay is moister. The sand or gravel has different properties according to its peculiar nature; wherever it is less hard, less compact, and less porous, small pieces separate themselves from it, which, though dry, preserve a certain degree of coolness useful to vegetation. This soil is called in America a *pumice-stone* soil. Wherever the clay and gravel do not go through such modifications, the soil becomes barren, as soon as the layer formed by the decomposition of the original plants is destroyed.—By a treaty concluded in January 1660, between the French and English, the Caribs were confined to the islands of St Vincent's and Dominica, where all the scattered body of this people were united, and at that time did not exceed in number 6000 men. See ST VINCENT's and DOMINICA.

As the Caribbee islands are all between the tropics, their inhabitants are exposed, allowing for the varieties resulting from difference of situation and soil, to a perpetual heat, which generally increases from the rising of the sun till an hour after noon, and then declines in proportion as the sun declines. The variations of the temperature of the air seem to depend rather on the wind than on the changes of the seasons. In those places

places where the wind does not blow, the air is excessively hot, and none but the easterly winds contribute to temper and refresh it; those that blow from the south and west afford little relief; but they are much less frequent and less regular than that which blows from the east. The branches of the trees exposed to the influence of the latter are forced round towards the west; but their roots are stronger, and more extended under the ground, towards the east than towards the west, and hence they are easily thrown down by strong west winds or hurricanes from that quarter. The easterly wind is scarce felt in the Caribbee islands before nine or ten o'clock in the morning, increases in proportion as the sun rises above the horizon, and decreases as it declines. Towards the evening it ceases entirely to blow on the coasts, but not on the open sea. It has also been observed, that it blows with more force and more regularity in the dog-days than at any other time of the year.

The rain also contributes to the temperature of the Caribbee islands, though not equally in them all. In those places where the easterly wind meets with nothing to oppose its progress, it dispels the clouds as they begin to rise, and causes them to break either in the woods or upon the mountains. But whenever the storms are too violent, or the blowing of the easterly wind is interrupted by the changeable and temporary effect of the southerly or westerly ones, it then begins to rain. In the other Caribbee islands, where this wind does not generally blow, the rains are so frequent and plentiful, especially in the winter season, which lasts from the middle of July to the middle of October, that, according to the most accurate observations, as much rain falls in one week as in our climates in a year. Instead of those mild refreshing showers which fall in the European climates, the rains of the Caribbee islands are torrents, the sound of which might be mistaken for hail, were not that almost totally unknown under so burning a sky. These showers indeed refresh the air; but they occasion a dampness, the effects of which are not less disagreeable than fatal. The dead must be interred within a few hours after they have expired. Meat will not keep sweet above 24 hours. The fruits decay, whether they are gathered ripe or before their maturity. The bread must be made up into biscuits, to prevent its growing mouldy. Common wines turn sour, and iron turns rusty, in a day's time. The seeds can only be preserved by constant attention and care, till the proper season returns for sowing them. When the Caribbee islands were first discovered, the corn that was conveyed there for the support of the Europeans, was so soon damaged that it became necessary to send it out in the ears. This necessary precaution so much enhanced the price of it, that few were able to purchase it. Flour was then substituted in lieu of corn; which lowered indeed the expences of transport, but had this inconvenience, that it was sooner damaged. It was imagined by a merchant, that if the flour were entirely separated from the bran, it would have the double advantage of being cheaper and keeping longer. He caused it therefore to be sifted, and put the finest flour into strong casks, and beat it close together with iron hammers, till it became so close a body that the air could scarcely penetrate it. This method was found to answer the purpose; and if, by it, the flour cannot be preserved as long as in our dry and temperate climates, it may be kept for six months, a year, or longer, according to the degree of care taken in the preparation.

However troublesome these effects of the rain may be, it is attended with some others still more formidable; namely, frequent and dreadful earthquakes.—These happening generally during the time or towards the end of the rainy season, and when the tides are highest, some ingenious naturalists have supposed that there might be a connexion between them. The waters of the sky and of the sea undermine, dig up, and ravage the earth in several different ways. Among the various shocks to which the Caribbee islands are exposed from the fury of the boisterous ocean, there is one distinguished by the name of *raz de maree*, or *whirlpool*. It constantly happens once, twice, or thrice, from July to October, and always on the western coasts, because it takes place after the time of the westerly or southerly winds, or while they blow. The waves, which at a distance seem to advance gently within 400 or 500 yards, suddenly swell against the shore, as if acted upon in an oblique direction by some superior force, and break with the greatest impetuosity. The ships which are then upon the coast, or in the roads beyond it, unable either to keep their anchors or to put out to sea, are dashed to pieces against the land, and all on board most commonly perish. The hurricane is another terrible phenomenon in these islands, by which incredible damage is occasioned; but happily it occurs not often.

The produce of the Caribbee islands is exceedingly valuable to the Europeans, consisting of sugar, rum, molasses, indigo, &c. a particular account of which is given under the name of the respective islands as they occur in the order of the alphabet.

CARIBBIANA, or CARIBIANA, the north-east coast of Terra Firma, in South America, otherwise called *New* ANDALUSIA.

CARICA, the PAPAW. See BOTANY *Index*.

The fruit of one species is by the inhabitants of the Caribbee islands eaten with pepper and sugar as melons, but is much inferior to a melon in its native country; but those which have ripened in Britain were detestable: the only use to which Mr Miller says he has known them put was, when they were about half grown, to soak them in salt water to get out the acrid juice, and then pickle them for onangos, to which they are a good substitute.

CARICATURA, in *Painting*, denotes the concealment of real beauties, and the exaggeration of blemishes, but still so as to preserve a resemblance of the object. The word is Italian; formed of *carica*, a load, burden, or the like.

CARICOUS, an epithet given to such tumours as resemble the figure of a fig. They are frequently found in the piles.

CARIES, the corruption or mortification of a bone. See MEDICINE and SURGERY *Index*.

CARIGNANO, a fortified town of Piedmont, situated on the river Po, about seven miles south of Turin. E. Long. 7. 25. N. Lat. 44. 30. It was taken in 1544 by the French; who demolished the fortifications, but spared the castle. It was also taken, and retaken, in 1691.

CARILLONS, a species of chimes frequent in the Low Countries, particularly at Ghent, and Antwerp, and played on a number of bells in a belfrey, forming a complete series or scale of tones and semitones, like those on the harpsichord and organ. There are pedals communicating with the great bells, upon which the *carilloneur* with his feet plays the bass to sprightly airs, performed with the two hands upon the upper species of keys. These keys are projecting sticks, wide enough asunder to be struck with violence and velocity by either of the hands edgewise, without the danger of hitting the neighbouring key. The player is provided with a thick leather covering for the little finger of each hand, to guard against the violence of the stroke. These carillons are heard through a large town.

CARINA, a Latin term, properly signifying the *keel* of a ship; or that long piece of timber running along the bottom of the ship from head to stern, upon which the whole structure is built or framed.

CARINA is also frequently used for the whole capacity or bulk of a ship; containing the hull or all the space below the deck. Hence the word is also sometimes used by a figure for the whole ship.

CARINA is also used in the ancient architecture. The Romans gave the name *carina* to all buildings in form of a ship, as we still give the name *nave* to the middle or principal vault of our Gothic churches; because it has that figure.

CARINA, among anatomists, is used to denote the *spina dorsi;* as likewise for the fibrous rudiments or embryo of a chick appearing in an incubated egg. The carina consists of the entire *vertebræ*, as they appear after ten or twelve days incubation. It is thus called, because crooked in form of the keel of a ship.—Botanists also, for the like reason, use the word *carina* to express the lower petalum of a papilionaceous flower.

CARINÆ were also weepers, or women hired among the ancient Romans, to weep at funerals: they were thus called from *Caria*, the country whence most of them came.

CARINOLA, an episcopal town of Italy, in the kingdom of Naples, and Terra di Lavoro. E. Long. 15. 5. N. Lat. 41. 15.

CARINTHIA, a duchy of Germany, in the circle of Austria, bounded by the archbishopric of Saltzburg on the north, and by Carniola and the Venetian territories on the south, on the west by Tyrol, and on the east by Stiria. A part of this country was anciently called *Carnia*, and the inhabitants *Carni;* but the former afterwards obtained the name of *Carinthia*, and the latter *Carantani* or *Carinthi.* The air of this country is cold, and the soil in general mountainous and barren; but there are some fruitful dales and valleys in it, which produce wheat and other grain. The lakes, brooks, and rivers, which are very numerous, abound with fish; and the mountains yield lead and iron, and in many places are covered with woods. The river Drave, which runs across the country, is the most considerable in Carinthia. The inhabitants are partly descendants of the ancient Germans, and partly of the Sclavonians or Wends. The states are constituted as in Austria, and their assemblies are held at Clagenfurt. The archbishop of Saltzburg and the bishop of Bamberg have considerable territories in this country. Christianity was planted here in the 7th century. The only profession tolerated at present is the Roman Catholic. The bishops are those of Gurk and Lavant, who are subject to the archbishop of Saltzburg. This duchy was formerly a part of Bavaria. In the year 1282, the emperor Rodolph I. gave it to Maynard count of Tyrol, on condition that when his male issue failed, it should revert to the house of Austria; which happened in 1331. The population of Carinthia in 1812 amounted to 282,454, or about 70 persons to the square mile, Of these 138,000 were males, of whom 500 were nobles, 5000 citizens, 21,500 mechanics, and 76,500 were tenants and peasantry.

CARIPI, a kind of cavalry in the Turkish army. The caripi to the number of about 1000 are not slaves, nor bred up in the seraglio, like the rest; but are generally Moors or renegado Christians, who having followed adventures, being poor, and having their fortune to seek by their dexterity and courage, have arrived at the rank of horse guards to the Grand Signior.

CARISSA. See BOTANY *Index*.

CARITAS.—The *poculum caritatis*, or grace cup, was an extraordinary allowance of wine or other liquors, wherein the religious at festivals drank in commemoration of their founders and benefactors.

CARISBROOK CASTLE, a castle situated in the middle of the isle of Wight, where King Charles I. was imprisoned. W. Long. 1. 30. N. Lat. 50. 40.

CARISTO, an episcopal city of Greece, in the eastern part of the island of Negropont, near Cape Loro. E. Long. 24. 15. N. Lat. 38. 6.

CARKE, denotes the 30th part of a SARPLAR of wool.

CARLE. See CHURL.

CARLETON, SIR DUDLEY, was born in Oxfordshire, 1573, and bred in Christ-church college. He went as secretary to Sir Ralph Winwood into the Low Countries, when King James resigned the cautionary towns to the States; and was afterwards employed for 29 years as ambassador to Venice, Savoy, and the United Provinces. King Charles created him Viscount Dorchester, and appointed him one of his principal secretaries of state; in which office he died in 1651. He was esteemed a good statesman, though an honest man; and published several political works.

CARLINA, the CARLINE THISTLE. See BOTANY *Index*.

CARLINE, or CAROLINE THISTLE. See CARLINA. It is said to have been discovered by an angel to Charlemagne, to cure his army of the plague; whence its denomination.

CARLINE, or *Caroline*, a silver coin current in the Neapolitan dominions, and worth about 4d. of our money.

CARLINES, or CARLINGS, in a ship, two pieces of timber lying fore and aft, along from one beam to another, directly over the keel; serving as a foundation for the whole body of the ship. On these the ledges rest, whereon the planks of the deck and other matters of carpentry are made fast. The carlines have their ends let into the beams called *culver-tail-ways*.

CARLINE *Trees*, are timbers going athwart the ship, from the sides to the hatchway, serving to sustain the deck on both sides.

CARLINGFORD, a port town of Ireland, seated on on Carlington bay, in the county of Louth, and province of Leinster, 22 miles north of Drogheda. W. Long. 6. 24. N. Lat. 24. 5.

CARLISLE, the capital city of the county of Cumberland, seated on the south of the river Eden, and between the Petteral on the east, and the Caude on the west. It is surrounded by a strong stone wall, and has a pretty large castle in the western part of it, as also a citadel in the eastern part, built by Henry VIII. It flourished in the time of the Romans, as appears from the antiquities that are to be met with here, and the Roman coins that have been dug up. At the departure of the Romans this city was ruined by the Scots and Picts; and was not rebuilt till the year 680, by Egfrid, who encompassed it with a wall, and repaired the church. In the 8th and 9th centuries, the whole country was again ruined, and the city laid desolate by the incursions of the Norwegians and Danes. In this condition it remained till the time of William Rufus; who repaired the walls and the castle, and caused the houses to be rebuilt. It was fortified by Henry I. as a barrier against Scotland; he also placed a garrison in it, and made it an episcopal see. It was twice taken by the Scots, and afterwards burnt accidentally in the reign of Richard II. The cathedral, the suburbs, and 1500 houses, were destroyed at that time. It is at present in a good condition; and has three gates, the English on the south, the Scotch on the north, and the Irish on the west. It has two parishes, and as many churches, St Cuthbert's and St Mary's, the last of which is the cathedral, and is separated from the town by a wall of its own. The eastern part, which is the newest, is a curious piece of workmanship. The choir with the aisles is 71 feet broad; and has a stately east window 48 feet high and 30 broad, adorned with curious pillars. The roof is elegantly vaulted with wood; and is embellished with the arms of England and France quartered; as also with Percy's, Lucy's, Warren's, Mowbray's, and many others. In the choir are the monuments of the bishops who were buried there. This see was erected in 1133 by King Henry I. and made suffragan to the archbishop of York. The cathedral church here had been founded a short time before by Walter, deputy in these parts for King William Rufus, and by him dedicated to the Virgin Mary. He likewise built a monastery, and filled it with canons regular of St Augustine. This foundation continued till the dissolution of monasteries, when its lands were added to the see, and the maintenance of a dean, &c. placed here in their room. The church was almost ruined by the usurper Cromwell and his soldiers; and has never since recovered its former beauty, although repaired after the Restoration. This diocese contains the greatest part of the counties of Cumberland and Westmoreland, in which are only 93 parishes; but these (as all the northern are) exceeding large; and of them 18 are impropriations. Here is one archdeacon, viz. of Carlisle. The see is valued in the king's books at 530l. 4s. 11½d. but is computed to be worth annually 2800l. The clergy's tenth amounts only to 161l. 1s. 7½d. To this cathedral belong a bishop, a dean, a chancellor, an archdeacon, four prebendaries, eight minor canons, &c. and other inferior officers and servants.

The Picts wall, which was built across the country from Newcastle, terminates near this place. Carlisle was a fortified place, and still has its governor and lieutenant-governor, but no garrison. It was taken by the rebels, Nov. 15. 1745; and was retaken by the duke of Cumberland on the 10th of December following, and deprived of its gates. It is governed by a mayor, twelve aldermen, two bailiffs, &c. and has a considerable market on Saturdays. The manufactures of Carlisle are chiefly of printed linens, for which near 3000l. per annum is paid in duties. It is also noted for a great manufacture of whips, in which a great number of children are employed.—Salmons appear in the Eden in numbers, so early as the months of December and January; and the London and even Newcastle markets are supplied with early fish from this river: but it is remarkable, that they do not visit the Esk in any quantity till April; notwithstanding the mouths of the two rivers are at a small distance from each other.—Carlisle sends two members to parliament, and gives title of earl to a branch of the Howard family.

CARLOCK, in commerce, a sort of isinglass, made with the sturgeon's bladder, imported from Archangel. The chief use of it is for clarifying wine, but is also used by the dyers. The best carlock comes from Astracan, where a great quantity of sturgeon is caught.

CARLOSTAD, or CARLSTAD, a town of Sweden in Wermeland, seated on the lake Wermer, in E. Long. 14. 4. N. Lat. 59. 16.

CARLOSTAD, or *Carlstadt*, a town of Hungary, capital of Croatia, and the usual residence of the governors of the province. It is seated on the river Kulph, in E. Long. 16. 5. N. Lat. 45. 34.

CARLOWITZ, a small town of Hungary, in Sclavonia, remarkable for a peace concluded here between the Turks and Christians in 1669. It is seated on the west side of the Danube, and contains 5600 inhabitants. E. Long. 19. 5. N. Lat. 45. 25.

CARLSCRONA, or CARLSCROON, a seaport town in the Baltic, belonging to Sweden. It derives its origin and name from Charles XI. who first laid the foundation of a new town in 1680, and removed the fleet from Stockholm to this place, on account of its advantageous situation in the centre of the Swedish seas, and the superior security of its harbour. The greatest part of Carlscrona stands upon a small rocky island, which rises gently in a bay of the Baltic; the suburbs extend over another small rock, and along the mole close to the bason where the fleet is moored. The way into the town, from the mainland, is carried over a dyke to an island, and from thence along two long wooden bridges joined by a barren rock. The town is spacious, and contains about 18,000 inhabitants. It is adorned with one or two handsome churches, and a few tolerable houses of brick; but the generality of the buildings are of wood. The suburbs are fortified towards the land by a stone wall. The entrance into the harbour, which by nature is extremely difficult from a number of shoals and rocky islands, is still further secured from the attack of an enemy's fleet by two strong forts built on two islands, under the batteries of which all vessels must pass.

Formerly vessels in this port when careened and repaired, were laid upon their sides in the open harbour,

bour, until a dock, according to a plan given by Polheim, was hollowed in the solid rock; it was begun in 1714, and finished in 1724; but as it was too small for the admission of men of war, it has lately been enlarged, and is now capable of receiving a ship of the first rate. But new docks have been begun upon a stupendous plan, worthy of the ancient Romans. According to the original scheme, it was intended to construct 30 docks, for building and laying up the largest ships, at the extremity of the harbour. A large bason, capable of admitting two men of war, is designed to communicate, by sluices, with two smaller basons, from each of which are to extend, like the radii of a circle, five rows of covered docks; each row is to be separated by walls of stone; and each dock to be provided with sluice gates, so as to be filled or emptied by means of pumps. Close to the docks, magazines for naval stores are to be constructed, and the whole to be inclosed with a stone-wall. The project was begun in 1757, but was much neglected until the accession of his present majesty, who warmly patronized the arduous undertaking. At the commencement of the works, 25,000l. were annually expended upon them; which sum has been lessened to about 6000l. per annum, and the number of docks reduced to 20. The first dock was completed in 1779, and it was computed that the whole number would be executed in 20 years; but they are yet unfinished.

CARLSTADT, a town of Germany, in Bavaria, seated on the river Maine. It has a strong castle. E. Long. 9. 51. N. Lat. 50. 0.

CARLTON, a town in Norfolk, held by this tenure, that they shall present 1000 herrings baked in 14 pies to the king, wherever he shall be when they first come in season.

CARLYLE, Joseph Dacre, an eminent orientalist. See Supplement.

CARMAGNOLA, a fortified town of Italy, in Piedmont, with a good castle. It is seated in a country abounding in corn, flax, and silk, near the river Po, in E. Long. 7. 32. N. Lat. 44. 43.

CARMANIA, in *Ancient Geography*, a country of Asia, to the east of Persia, having Parthia to the north, Gedrosia to the east, to the south the Persian gulf or sea in part, and in part the Indian, called the *Carmanian Sea*; distinguished into *Carmania Deserta*, and *Carmania Propria*, the former lying to the south of Parthia, and to the south of that, the *Propria*, quite to the sea. Its name is from the Syriac, *Carma*, signifying a "vine," for which that country was famous, yielding clusters three feet long. Now Kerman, or Carimania, a province of modern Persia.

CARMEL, a high mountain of Palestine, standing on the skirts of the sea, and forming the most remarkable headland on all that coast. It extends eastward from the sea as far as the plain of Jezreel, and from the city of that name quite to Cæsarea on the south. It seems to have had the name of *Carmel* from its great fertility; this word, according to the Hebrew import, signifying the *vine of God*, and is used in Scripture to denote any fruitful spot, or any place planted with fruit trees. This mountain, we are assured, was very fertile. Mr Sandys acquaints us, that, when well cultivated, it abounds with olives, vines, and variety of fruits and herbs, both medicinal and aromatic. Others, however, represent it as rather dry and barren; which perhaps may have happened from the neglect of agriculture so common in all parts of the Turkish empire, especially where they are exposed to the incursions of the Arabs. Carmel is the name of the mountain, and of a city built on it; as well as of a heathen deity worshipped in it, but without either temple or statue; though anciently there must have been a temple, as we are told that this mountain was a favourite retreat of Pythagoras, who spent a good deal of time in the temple, without any person with him. But what hath rendered Mount Carmel most celebrated and revered both by Jews and Christians, is its having been the residence of the prophet Elijah, who is supposed to have lived there in a cave (which is there shewn), before he was taken up into heaven.

CARMELITES, an order of religious, making one of the four tribes of mendicants or begging friars; and taking its name from Mount Carmel, formerly inhabited by Elias, Elisha, and the children of the prophets; from whom this order pretends to descend in an uninterrupted succession. The manner in which they make out their antiquity has something in it too ridiculous to be rehearsed. Some among them pretend they are descendants of Jesus Christ; others go further, and make Pythagoras a Carmelite, and the ancient druids regular branches of their order. Phocos, a Greek monk, speaks the most reasonably. He says, that in his time, 1185, Elias's cave was still extant on the mountain; near which were the remains of a building which intimated that there had been anciently a monastery; that, some years before, an old monk, a priest of Calabria, by revelation, as he pretended, from the prophet Elias, fixed there, and assembled ten brothers. In 1209, Albert, patriarch of Jerusalem, gave the solitaries a rigid rule, which Papebroch has since printed. In 1217, or, according to others, 1226, Pope Honorius III. approved and confirmed it. This rule contained 16 articles; one of which confined them to their cells, and enjoined them to continue day and night in prayer; another prohibited the brethren having any property; another enjoined fasting from the feast of the holy cross till Easter, except on Sundays; abstinence at all times from flesh was enjoined by another article; one obliged them to manual labour; another imposed a strict silence on them from vespers till the tierce the next day.

The peace concluded by the emperor Frederic II. with the Saracens, in the year 1229, so disadvantageous to Christendom, and so beneficial to the infidels, occasioned the Carmelites to quit the Holy Land, under Alan the fifth general of the Order. He first sent some of the religious to Cyprus, who landed there in the year 1328, and founded a monastery in the forest of Fortania. Some Sicilians, at the same time, leaving Mount Carmel, returned to their own country, where they founded a monastery in the suburbs of Messina. Some English departed out of Syria, in the year 1240, to found others in England. Others of Provence, in the year 1244, founded a monastery in the desert of Aigualates, a league from Marseilles; and thus, the number of their monasteries increasing, they held their European general chapter in the year 1245, at their monastery of Aylesford in England.—This order is so much increased, that it has, at present, 38 provinces, besides the congregation of Mantua, in which are 54 monasteries, under a vicar-general; and the congregations of Barefooted Carmelites in Italy and Spain, which have their peculiar general.

After the establishment of the Carmelites in Europe, their rule was in some respects altered; the first time, by Pope Innocent IV. who added to the first article a precept of chastity, and relaxed the 11th, which enjoins abstinence at all times from flesh, permitting them, when they travelled, to eat boiled flesh; this pope likewise gave them leave to eat in a common refectory, and to keep asses or mules for their use. Their rule was again mitigated by the popes Eugenius IV. and Pius II. Hence the order is divided into two branches, viz. *the Carmelites of the ancient observance*, called the *moderate*, or *mitigated;* and those *of the strict observance*, who are the *barefooted Carmelites;* a reform set on foot in 1548, by S. Theresa, a nun of the convent of Avila, in Castile: these last are divided into two congregations, that of Spain and that of Italy.

The habit of the Carmelites was at first white, and the cloak laced at the bottom with several lists. But Pope Honorius IV. commanded them to change it for that of the Minims. Their scapulary is a small woollen habit of a brown colour, thrown over their shoulders. They wear no linen shirts, but instead of them linsey-woolsey, which they change twice a-week in the summer, and once a-week in the winter.

If a monk of this order lies with a woman, he is prohibited saying mass for three or four years, is declared infamous, and obliged to discipline himself publicly once a-week. If he is again guilty of the same fault, his penance is doubled; and if a third time, he is expelled the order.

CARMEN, an ancient term among the Latins, used in a general sense to signify a verse; but more particularly to signify a spell, charm, form of expiation, or execration, couched in a few words placed in a mystic order, on which its efficacy depended. Pezron derives the word *carmen* from the Celtic *carm*, the shout of joy, or the verses which the ancient bards sung to encourage the soldiers before the combat.—*Carmen* was anciently a denomination given also to precepts, laws, prayers, imprecations, and all solemn formulæ couched in a few words placed in a certain order, though written in prose. In which sense it was that the elder Cato wrote a *Carmen de moribus*, which was not in verse but in prose.

CARMENTALIA, a feast among the ancient Romans, celebrated annually upon the 11th of January, in honour of Carmenta, or Carmentis, a prophetess of Arcadia, mother of Evander, with whom she came into Italy 60 years before the Trojan war. The solemnity was also repeated on the 15th of January, which is marked in the old calendar of *Carmentalia relata*. This feast was established on occasion of a great fecundity among the Roman dames, after a general reconciliation with their husbands, with whom they had been at variance, in regard of the use of coaches being prohibited them by an edict of the senate. This feast was celebrated by the women; he who offered the sacrifices was called *sacerdos carmentalis*.

CARMINATIVES, medicines used in colics, or other flatulent disorders, to dispel the wind.

The word comes from the Latin *carminare*, to card or teaze wool, and figuratively to attenuate and discuss wind or vapours, and promote their discharge by perspiration. Though Dr Quincy makes it more mysterious: He says it comes from the word *carmen*, taking it in the sense of an invocation or charm; and makes it to have been a general name for all medicines which operated like charms, *i. e.* in an extraordinary manner. Hence, as the most violent pains were frequently those arising from pent-up wind, which immediately cease upon dispersion, the term *carminative* became in a peculiar sense applied to medicines which gave relief in windy cases, as if they cured by enchantment: but this interpretation seems a little too far strained.

CARMINE, a powder of a very beautiful red colour bordering upon purple; and used by painters in miniature, though rarely, on account of its great price. The manner of preparing it is kept a secret by the colour-makers; neither do any of those receipts which have for a long time been published concerning the preparation of this and other colours, at all answer the purpose. See COLOUR-*making*.

CARMONA, a town of Italy in Friuli, and in the county of Goritz, seated on a mountain near the river Indri. It belongs to the house of Austria. E. Long. 5. 37. N. Lat. 46. 15.

CARMONA, an ancient town of Spain, in Andalusia. It is seated in a fertile country, 15 miles east of Seville. W. Long. 5. 37. N. Lat. 37. 34.

CARNATIC, a province of Hindostan. See SUPPLEMENT.

CARNATION. See DIANTHUS, BOTANY *Index*.

CARNATION *Colour*, among painters, is understood of all the parts of a picture, in general, which represent flesh, or which are naked and without drapery. Titian and Correggio in Italy, and Rubens and Vandyke in Flanders, excelled in carnations.—In colouring for flesh, there is so great a variety, that it is hard to lay down any general rules for instructions therein: neither are there any regarded by those who have acquired a skill this way; the various colouring for carnations may be easily produced, by taking more or less red, blue, yellow, or bistre, whether for the first colouring or for the finishing; the colour for women should be bluish, for children a little red, both fresh and gay; and for men it should incline to yellow, especially if they are old.

CARNATION, among dyers. To dye a carnation, or red rose colour, it is directed to take liquor of wheat bran a sufficient quantity, alum three pounds, tartar two ounces; boil them, and enter 20 yards of broad cloth; after it has boiled three hours, cool and wash it: take fresh clear bran liquor a sufficient quantity, madder five pounds; boil and sodden according to art. —The Bow dyers know that the solution of tin, being put in a kettle to the alum and tartar, in another process, makes the cloth, &c. attract the colour into it, so that none of the cochineal is left, but the whole is absorbed by the cloth.

CARNEADES, a celebrated Greek philosopher, was a native of Cyrene in Africa, and founder of the third academy. He was so fond of study, that he not only avoided all entertainments, but forgot even to eat at his own table; his maid servant Melissa was oblig-

ed

ed to put the victuals into his hand. He was an antagonist of the Stoics; and applied himself with great eagerness to refute the works of Chrysippus, one of the most celebrated philosophers of their sect. The power of his eloquence was dreaded even by a Roman senate. The Athenians being condemned by the Romans to pay a fine of 500 talents for plundering the city of Oropus, sent ambassadors to Rome, who got the fine mitigated to 100 talents. Carneades the Academic, Diogenes the Stoic, and Critolaus the Peripatetic, were charged with this embassy. Before they had an audience of the senate, they harangued to great multitudes in different parts of the city. Carneades's eloquence was distinguished from that of the others by its strength and rapidity. Cato the Elder made a motion in the senate that these ambassadors should be immediately sent back, because it was very difficult to discern the truth through the arguments of Carneades. The Athenian ambassadors (said many of the senators) were sent rather to force us to comply with their demands, than to solicit them by persuasion; meaning, that it was impossible to resist the power of that eloquence with which Carneades addressed himself to them. According to Plutarch, the youth at Rome were so charmed by the orations of this philosopher, that they forsook their exercises and other diversions, and were carried with a kind of madness to philosophy; the humour of philosophising spreading like enthusiasm. This grieved Cato, who was particularly afraid of the subtility of wit and strength of argument with which Carneades maintained either side of a question. Carneades harangued in favour of justice one day, and the next day against it, to the admiration of all who heard him, among whom were Galba and Cato, the greatest orators of Rome. This was his element; he delighted in demolishing his own work; because it served in the end to confirm his grand principle, that there are only probabilities or resemblances of truth in the mind of man; so that of two things directly opposite, either may be chosen indifferently. Quintilian remarks, that though Carneades argued in favour of injustice, yet he himself acted according to the strict rules of justice. The following was a maxim of Carneades: "If a man privately knew that his enemy, or any other person whose death might be of advantage to him, would come to sit down on grass in which there lurked an asp, he ought to give him notice of it, though it were in the power of no person whatever to blame him for being silent." Carneades, according to some, lived to be 85 years old: others make him to be 90: his death is placed in the 4th year of the 162d Olympiad.

CARNEDDE, in British antiquity, denotes heaps of stones, supposed to be druidical remains, and thrown together on occasion of confirming and commemorating a covenant, Gen. xxxi. 46. They are very common in the isle of Anglesey, and were also used as sepulchral monuments, in the manner of *tumuli*; for Mr Rowland found a curious urn in one of these carnedde. Whence it may be inferred, that the Britons had the custom of throwing stones on the deceased. From this custom is derived the Welsh proverb, *Karn ardyben* "Ill betide thee."

CARNEIA, in antiquity, a festival in honour of Apollo, surnamed Carneus, held in most cities of Greece, but especially at Sparta, where it was first instituted.

The reason of the name, as well as the occasion of the institution, is controverted. It lasted nine days, beginning on the 13th of the month Carneus. The ceremonies were an imitation of the method of living and discipline used in camps.

CARNEL.—The building of ships first with their timber and beams, and after bringing on their planks, is called *carnel work*, to distinguish it from clinch work.

Vessels also which go with mizen sails instead of main sails are by some called carnels.

CARNELIAN, in *Natural History*, a precious stone, of which there are three kinds, distinguished by three colours, a red, a yellow, and a white. The red is very well known among us; is found in roundish or oval masses, much like our common pebbles; and is generally met with between an inch and two or three inches in diameter; it is of a fine, compact, and close texture; of a glossy surface; and, in the several specimens, is of all the degrees of red, from the palest flesh-colour to the deepest blood-red. It is generally free from spots, clouds, or variegations: but sometimes it is veined very beautifully with an extremely pale red, or with white; the veins forming concentric circles, or other less regular figures, about a nucleus, in the manner of those of agates. The pieces of carnelian, which are all one colour, and perfectly free from veins, are those which our jewellers generally make use of for seals, though the variegated ones are much more beautiful. The carnelian is tolerably hard, and capable of a very good polish: it is not at all affected by acid menstruums: the fire divests it of a part of its colour, and leaves it of a pale red; and a strong and long-continued heat will reduce it to a pale dirty gray.

The finest carnelians are those of the East Indies; but there are very beautiful ones found in the rivers of Silesia and Bohemia; and we have some not despicable ones in Engand.

Though the ancients have recommended the carnelian as astringent, and attributed a number of fanciful virtues to it, we know of no other use of the stone than the cutting seals on it; to which purpose it is excellently adapted, as being not too hard for cutting, and yet hard enough not to be liable to accidents, to take a good polish, and to separate easily from the wax.

CARNERO, in *Geography*, a name given to that part of the gulf of Venice which extends from the western coast of Istria to the islands of Grossa and the coast of Morlachia.

CARNERO is likewise the name of the cape to the west of the mouth of the bay of Gibraltar.

CARNIFEX, among the Romans, the common executioner. By reason of the odiousness of his office, the carnifex was expressly prohibited by the laws from having his dwelling house within the city. In middle-ages writers carnifex also denotes a butcher.

Under the Anglo-Danish kings, the carnifex was an officer of great dignity; being ranked with the archbishop of York, Earl Goodwin, and the lord steward. Flor. Wigorn. ann. 1040, *Rex Hardecanutus, Alfricum Ebor. Archiep. Goodwinum comitem, Edricum dispensatorem,*

torem, Thrond suum carnificem, *et alios magnæ dignitatis victor Londinum misit.*

CARNIOLA, a duchy of Germany, bounded on the south by the Adriatic sea, and that part of Istria possessed by the republic of Venice; on the north, by Carinthia and Stiria; on the east, by Sclavonia and Croatia; on the west, by Friuli, the county of Gorz or Goritz, and a part of the gulf of Venice; extending in length about 110 miles, and in breadth about 100. Its area is about 4700 square miles, and it contained 409,504 inhabitants in 1807. It had its ancient name *Carnia*, as well as the modern one *Carniola*, from its ancient inhabitants, the *Carni*, a tribe of Scythians, otherwise called *Japides*, whence this and the adjacent countries were also called *Japidia*.

Carniola is full of mountains, some of which are cultivated and inhabited, some covered with wood, others naked and barren, and others continually buried in snow. The valleys are very fruitful. Here are likewise mines of iron, lead, copper, and cinnabar; salt must be had from the sovereign's magazines. There are several rivers, besides many medicinal springs and inland lakes. The common people are very hardy, going barefooted in winter through the snow, with open breasts, and sleeping on a hard bench without bed or bolster. Their food is also very coarse and mean. In winter, when the snow lies deep on the ground, the mountaineers bind either small baskets, or long thin narrow boards, like the Laplanders, to their feet, on which, with the help of a stout staff or pole, they descend with great velocity from the mountains. When the snow is frozen, they make use of a sort of irons or skaits. In different parts of the country the inhabitants, especially the common sort, differ greatly in their dress, language, and manner of living. In Upper and Lower Carniola they wear long beards. The languages chiefly in use are the Sclavonian or Wendish, and German; the first by the commonalty, and the latter by people of fashion. The duchy is divided into the Upper, Lower, Middle, and Inner Carniola. The principal commodities exported hence are, iron, steel, lead, quicksilver, white and red wine, oil of olives, cattle, sheep, cheese, linen, and a kind of woollen stuff called *mahalan*, Spanish leather, honey, walnuts, and timber; together with all manner of wood work, as boxes, dishes, &c. Christianity was first planted here in the eighth century. Lutheranism made a considerable progress in it; but, excepting the Walachians or Uskokes, who are of the Greek church, and style themselves *Staraverzi*, i. e. old believers, all the inhabitants at present are Roman Catholics. Carniola was long a marquisate or margravate; but in the year 1231 was erected into a duchy. Carniola was ceded to France in 1809, but was restored to Austria in 1814.

CARNIVAL, or CARNAVAL, a time of rejoicing, a season of mirth, observed with great solemnity by the Italians, particularly at Venice, holding from the twelfth day till Lent.

The word is formed from the Italian *Carnavalle;* which M. Du Cange derives from *Carn-a-val*, by reason the flesh then goes to pot, to make amends for the season of abstinence then ensuing. Accordingly, in the corrupt Latin, he observes, it was called *Carnelevamen* and *Carnisprivium;* as the Spaniards still denominate it *carnes tollendas.*

Feasts, balls, operas, concerts of music, intrigues, marriages, &c. are chiefly held in carnival time. The carnival begins at Venice the second holiday in Christmas: Then it is they begin to wear masks, and open their playhouses and gaming houses; the place of St Mark is filled with mountebanks, jack-puddings, pedlars, whores, and such like mobs, who flock thither from all parts. There have been no less than seven sovereign princes and 30,000 foreigners here to partake of these diversions.

CARNIVOROUS, an epithet applied to those animals which naturally seek and feed on flesh.

It has been a dispute among naturalists, whether man is naturally carnivorous. Those who take the negative side of the question, insist chiefly on the structure of our teeth, which are mostly incisores or molares; not such as *carnivorous* animals are furnished with, and which are proper to tear flesh in pieces: to which it may be added, that, even when we do feed on flesh, it is not without a preparatory alteration by boiling, roasting, &c. and even then that it is the hardest of digestion of all foods. To these arguments Dr Wallis subjoins another, which is, that all quadrupeds which feed on herbs or plants have a long colon, with a cæcum at the upper end of it, or somewhat equivalent, which conveys the food by a long and large progress, from the stomach downwards, in order to its slower passage and longer stay in the intestines; but that, in *carnivorous* animals, such cæcum is wanting, and instead thereof there is a more short and slender gut, and a quicker passage through the intestines. Now in man, the cæcum is very visible: a strong presumption that nature, who is still consistent with herself, did not intend him for a *carnivorous* animal.—It is true, the cæcum is but small in adults, and seems of little or no use; but in a fœtus it is much larger in proportion: And it is probable, our customary change of diet, as we grow up, may occasion this shrinking. But to these arguments Dr Tyson replies, that if man had been by nature designed not to be *carnivorous*, there would doubtless have been found, somewhere on the globe, people who do not feed on flesh; which is not the case. Neither are carnivorous animals always without a colon and cæcum; nor are all animals carnivorous which have these parts; the opossum, for instance, hath both a colon and cæcum, and yet feeds on poultry and other flesh; whereas the hedgehog, which has neither colon nor cæcum, and so ought to be carnivorous, feeds only on vegetables. Add to this, that hogs which have both, will feed upon flesh when they can get it; and rats and mice, which have large cæcums, will feed on bacon as well as bread and cheese. Lastly, the human race are furnished with teeth necessary for the preparation of all kinds of foods; from whence it would seem that nature intended we should live on all. And as the alimentary duct in the human body is fitted for digesting all kinds of foods, ought we not rather to conclude that nature did not intend to deny us any?

It is not less disputed whether mankind were *carnivorous* before the flood. St Jerome, Chrysostome, Theodore, and other ancients, maintain, that all animal

food

food was then forbidden; which opinion is also strenuously supported among the moderns by Curcellæus, and refuted by Heidegger, Danzius, Bochart, &c. See ANTEDILUVIANS.

CARNOSITY is used by some authors for a little fleshy excrescence, tubercle, or wen, formed in the urethra, the neck of the bladder, or yard, which stops the passage of the urine.—Carnosities are very difficult of cure: they are not easily known but by introducing a probe into the passage, which there meets with resistance. They usually arise from some venereal malady ill managed.

CARO, ANNIBAL, a celebrated Italian poet, was born at Civita Nuovo in 1507. He became secretary to the duke of Parma, and afterwards to Cardinal Farnese. He was also made a knight of Malta. He translated Virgil's Æneid into his own language, with such propriety and elegance of expression, that he was allowed by the best judges to have equalled the original. He also translated Aristotle's rhetoric, two oratories of Gregory Nazianzen, with a discourse of Cyprian. He wrote a comedy; and a miscellany of his poems was printed at Venice in 1584. He died at Rome in 1566.

CAROLINA, a province of North America, between 31 and $36\frac{1}{2}$ degrees of N. Lat. It is bounded on the east by the Atlantic, on the west by Tennessee, on the north by Virginia, and on the south by Georgia. It is divided into two states, North Carolina and South Carolina.

North CAROLINA is about 430 miles long, and in general about 100 broad; but its sea coast is about 300 miles in extent. Its area is 50,500 square miles.

To the distance of 60 miles from the sea, the country is perfectly level, with a sandy or marshy soil, except along the banks of rivers, where a vegetable mould, three or four feet deep, affords fine pasture and good crops. Beyond this level country, there is a tract 40 miles in breadth, consisting of small sand hills, interspersed with pitch pine, which is of little value for agricultural purposes. The western parts of the state are generally mountainous; but between the mountains, and at their feet, lies much fertile land fit for any species of cultivation. There are several large swamps near the sea coast.

The winter in North Carolina is mild; the summer hot and sultry; the autumn is pleasant. The changes of temperature are sudden and frequent, and vegetation is sometimes hurt by the frost. In the upper country the climate is healthy; but in the low country, along the coast, the miasms are injurious, particularly in autumn.

The principal rivers are the Roanoke, which is navigable for boats 70 miles; the Pamlico, navigable for boats 80 miles; the Neuse, navigable 160 miles for small boats, and 50 miles for sea vessels; and Cape Fear river. A line of sand banks stretching along the coast, renders it difficult to approach it except at some points. The minerals are iron ore, which is abundant, but little worked; and gold, which is found in some of the rivers, but only in trifling quantities. Of animals there are the deer, bear, cougouar, wild cat, fox, squirrel, the wild turkey, and various species of snakes. The bison and the beaver, which were formerly numerous, have now disappeared.

The population of North Carolina in 1810 was 555,500, including 168,824 slaves, and 10,266 free blacks. It is one of the most thinly peopled of the old states, having only about 11 persons to the square mile. The inhabitants are chiefly planters, who live on their plantations at a distance of two or three miles from each other. Marriages are made among them at an early age. They are hospitable and indolent in their habits, and are accused of being addicted to gambling, drinking, and horse racing. In the upper country, however, where few slaves are kept, the people are laborious, sober, and plain in their manners. The government is vested in a senate and house of commons. The former consists of a member for each county, chosen annually by persons who possess 50l. freeholds. The house of commons consists of two representatives for each county, and one for each of six towns, chosen by all the freemen of mature age. There is no established church; the prevailing denominations are Presbyterians, Moravians, Quakers, Methodists, and Baptists. A public provision is made by the state for the support of schools and a university. The agricultural products are cotton, tobacco, rice, indigo, maize, wheat, barley, &c. The wheat harvest is early in June. The manufactures are chiefly domestic, and are but inconsiderable. The commerce of the state is also but small, the whole amount of the exports in 1817 being 956,580 dollars. The value of lands and houses in the state, as ascertained by a fiscal census in 1814, was 92,157,487 dollars, being three times as great as in 1799. Newbern, the largest town in the state, contained only 2467 inhabitants in 1810.

South CAROLINA is of a triangular form, and extends along the sea coast 170 miles. Its greatest length is 340 miles, and its area is 24,080 miles. In its general appearance, soil, climate, and productions, it resembles North Carolina, but has less mountain land. Snow seldom falls, and during seven years the thermometer never rose above 93° nor fell below 17°. The annual average of rain is about 49 inches. The chief rivers are the Savannah, which is navigable for sloops 250 miles; the Santee, navigable 150 miles; the Pedee, also navigable to a considerable distance; Ashley river, Cooper river, &c. The population of South Carolina in 1810 was 415,115, including 196,365 slaves, and 4554 free blacks. The whites are distinguished by politeness, hospitality, and a nice sense of honour. They are at the same time profuse in their habits, fond of gaming, and not free from the imputation of drunkenness. Horse races, hunting, dancing, and ball-playing, are favourite amusements. The legislative power is vested in a senate and house of representatives. The senate consists of 43 members elected for four years, and renewed by halves. The representatives, 124 in number, are chosen for two years. The electors consist of all the free white males of 21 years of age. The value of lands, houses, and slaves in this state in 1814 was 123,416,512 dollars. The exports in 1817 amounted to 10,372,613 dollars; but a great proportion of the trade is in the hands of the New Englanders, the shipping belonging to the state in 1815, amounting only to 37,168 tons. There is no established church; the most numerous sects are the Presbyterians, Baptists, Methodists, Episcopalians, and Independents. Till a late period education was but little attended to. But since

Carolina.

since 1795 two colleges, and a considerable number of academies and grammar schools have been established. In Charlestown, and some of the other towns, there are a number of societies of a philosophical, literary, or economical nature. The judges are appointed by the legislatnre during good behaviour, and are removable by impeachment. The judges of the different circuits, four in number, form the highest, or constitutional court, and meet once a year at Columbia, and at Charlestown, for the purpose of hearing and determining all motions for new trials, &c. The common and statute law of Great Britain is in force, and has been adapted by various modifications to the principles of the constitution.

Carolina was discovered by Sebastian Cabot about the year 1500, in the reign of Henry VII. but the settling of it being neglected by the English, a colony of French Protestants, by the encouragement of Admiral Coligni, were transported thither; and named the place of their first settlement *Arx Carolina*, in honour of their prince, Charles IX. of France: but in a short time that colony was destroyed by the Spaniards; and no other attempt was made by any European power to settle there till the year 1664, when 800 English landed at Cape Fear in North Carolina, and took possession of the country. In 1670, Cha. II. of Britain granted Carolina to the lords Berkeley, Clarendon, Albemarle, Craven, and Ashly, Sir George Carteret, Sir William Berkeley, and Sir John Colliton. The plan of government for this new colony was drawn up by the famous Mr Locke, who very wisely proposed a universal toleration in religious matters. The only restriction in this respect was, that every person claiming the protection of that settlement, should, at the age of 17, register himself in some particular communion. To civil liberty, however, our philosopher was not so favourable; the code of Carolina gave to the eight proprietors who founded the colony, and to their heirs, not only all the rights of a monarch, but all the powers of legislation. The court, which was composed of this sovereign body, and called the *Palatinate Court*, was invested with the right of nominating to all employments and dignities, and even of conferring nobility; but with new and nnprecedented titles. They were, for instance, to create in each connty two *caciques*, each of whom was to be possessed of 24,000 acres of land; and a *landgrave*, who was to have 80,000. The persons on whom these honours should be bestowed were to compose the upper house, and their possessions were made unalienable. They had only the right of farming or letting out a third part of them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than about a shilling per acre, and even this rent was redeemable. All the inhabitants, however, both slaves and freemen, were under an obligation to take up arms upon the first order from the Palatine court.

It was not long before the defects of this constitution became apparent. The proprietory lords used every endeavour to establish an arbitrary government; and, on the other hand, the colonists exerted themselves with great zeal to avoid servitude. In consequence of this struggle, the whole province, distracted with tumults and dissensions, became incapable of making any progress, though great things had been expected from its particular advantages of situation. Though a toleration in religious matters was a part of the original constitution, dissensions arose likewise on that account. In 1705, Carteret, now Lord Granville, who, as the oldest of the proprietors, was sole governor of the colony, formed a design of obliging all the non-conformists to embrace the ceremonies of the church of England; and this act of violence, though disavowed and rejected by the mother country, inflamed the minds of the people. In 1720, while this animosity was still subsisting, the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword: but, in 1728, the lords proprietors having refused to contribute towards the expences of an expedition, of which they were to share the immediate benefits, were deprived of their prerogative, except Lord Granville, who still retained his eighth part. The rest received a recompense of about 24,000l. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The division into North and South Carolina now took place, and the settlement of Georgia commenced in 1732. See GEORGIA.

Caroli || Carp

CAROLINE. See CARLINE.

CAROLINE-books, the name of four books, composed by order of Charlemagne, to refute the second council of Nice. These books are couched in very harsh and severe terms, containing 120 heads of accusation against the council of Nice, and condemning the worship of images.

CAROLOSTADIANS, or CARLOSTADIANS, an ancient sect or branch of Lutherans, who denied the real presence of Christ in the eucharist.

They were thus denominated from their leader Andrew Carolostadius, who having originally been archdeacon of Wittemberg, was converted by Luther, and was the first of all the reformed clergy who took a wife; but disagreeing afterwards with Luther, chiefly in the point of the sacrament, founded a sect apart. The Carolostadians are the same with what are otherwise denominated Sacramentarians, and agree in most things with the Zuinglians.

CAROLUS, an ancient English broad piece of gold struck under Charles I. Its value has of late been at 23s. sterling, though at the time it was coined it is said to have been rated at 20s.

CAROLUS, a small copper coin, with a little silver mixed with it, struck under Charles VIII. of France. The Carolus was worth 12 deniers when it ceased to be current. Those which are still current in trade in Lorrain, or in some neighbouring provinces, go under the name of French sols.

CAROTIDS, in *Anatomy*, two arteries of the neck, which convey the blood from the aorta to the brain; one called the right, and the other the left, carotid.

CARP, in *Ichthyology*, the English name of a species of cyprinus. See CYPRINUS, ICHTHYOLOGY *Index*.

The carp is the most valuable of all kinds of fish for stocking of ponds. It is very quick in its growth, and brings forth the spawn three times a year, so that the increase is very great. The female does not begin to to breed till eight or nine years old; so that in breeding-ponds a supply must be kept of carp of that age. The best judges allow, that, in stocking a breed-pond, four males should be allowed to twelve females. The usual growth of a carp is two or three inches in length in a year; but, in ponds which receive the fattening of common-sewers, they have been known to grow from five inches to 18 in one year. A feeding-pond of one acre extent will very well feed 300 carp of three years old, 300 of two years, and 400 of one year old. Carp delight greatly in ponds that have marly sides; they love also clay-ponds well sheltered from the winds and grown with weeds and long grass at the edges, which they feed on in the hot months. Carp and tench thrive very fast in ponds and rivers near the sea, where the water is a little brackish; but they are not so well tasted as those which live in fresh water.

CARPATES, or ALPES BASTARNICÆ, in *Ancient Geography*, a range of mountains, running out between Poland, Hungary, and Transylvania. Now called the Carpathian mountains.

CARPATHIUM MARE, (Horace, Ovid); the sea that washes the island Carpathus.

CARPATHUS, an island on the coast of Asia, two hundred stadia in compass, and an hundred in length. Its name is said to be from its situation on the coast of Caria. It lies between Rhodes and Crete, in the sea which, from this island, is called the Carpathian sea, and has to the north the Ionian, to the south the Egyptian, to the west the Cretan and African seas. It is two hundred furlongs in compass, and a hundred in length. It had anciently, according to Strabo, four cities; according to Scylax, only three. Ptolemy mentions but one, which he calls Posidium. This island is now called Scarpanto.

CARPÆA, a kind of dance anciently in use among the Athenians and Magnesians, performed by two persons, the one acting a labourer, the other a robber. The labourer, laying by his arms, goes to ploughing and sowing, still looking warily about him as if afraid of being surprised: the robber at length appears; and the labourer, quitting his plough, betakes himself to his arms, and fights in defence of his oxen. The whole was performed to the sound of flutes, and in cadence. Sometimes the robber was overcome and sometimes the labourer; the victor's reward being the oxen and plough. The design of the exercise was to teach and accustom the peasants to defend themselves against the attacks of ruffians.

CARPENTER, a person who practises CARPENTRY. The word is formed from the French *charpentier*, which signifies the same, formed of *charpente*, which denotes timber; or rather from the Latin *carpentarius*, a maker of *carpenta*, or carriages.

CARPENTER of a Ship, an officer appointed to examine and keep in order the frame of a ship, together with her masts, yards, boats, and all other wooden machinery. It is his duty in particular to keep the ship *tight;* for which purpose he ought frequently to review the decks and sides, and to caulk them when it is necessary. In the time of battle, he is to examine up and down, with all possible attention, in the lower apartments of the ship, to stop any holes that may have been made by shot, with wooden plugs provided of several sizes.

CARPENTRAS, an episcopal town of France, in the department of Vaucluse, and capital of Venaissin. It is subject to the pope; and is seated on the river Auson, at the foot of a mountain. E. Long. 5. 6. N. Lat. 44. 4.

CARPENTRY, the art of cutting, framing, and joining large pieces of wood, for the uses of building. It is one of the arts subservient to architecture, and is divided into house-carpentry and ship carpentry: the first is employed in raising, roofing, flooring of houses, &c. and the second in the building of ships †, barges, &c. The rules in carpentry are much the same with those of JOINERY: only carpentry is used in the larger and coarser work, and joinery in the smaller and curious. See CENTRE, ROOF, and *STRENGTH of Materials*. See also CARPENTRY, SUPPLEMENT.

† See *Ship-building*.

CARPENTUM, in *Antiquity*, a name common to divers sorts of vehicles, answering to coaches as well as waggons, or even carts, among us. The carpentum was originally a kind of car or vehicle in which the Roman ladies were carried; though in after times it was also used in war. Some derive the word from *carro;* others from *Carmenta* the mother of Evander, by a conversion of the *m* into *p*.

CARPET, a sort of covering of stuff, or other materials, wrought with the needle or on a loom, which is part of the furniture of a house, and commonly spread over tables, or laid on the floor.

Persian and Turkey carpets are those most esteemed; though at Paris there is a manufactory after the manner of Persia, where they make them little inferior, not to say finer, than the true Persian carpets. They are velvety, and perfectly imitate the carpets which come from the Levant. There are also carpets of Germany, some of which are made of woollen stuffs, as serges, &c. and called square carpets: others are made of wool also, but wrought with the needle, and pretty often embellished with silk; and, lastly, there are some made of dog's hair. We have likewise carpets made in Britain, which are used either as floor-carpets, or to cover chairs, &c. It is true, we are not arrived at the like perfection in this manufacture with our neighbours the French; but may not this be owing to the want of a like public encouragement?

CARPET-Knights, a denomination given to gown-men and others, of peaceable professions, who, on account of their birth, office, or merits to the public, or the like, are, by the prince, raised to the dignity of knighthood.

They take the appellation *carpet*, because they usually receive their honours from the king's hands in the court, kneeling on a carpet. By which they are distinguished from knights created in the camp, or field of battle, on account of their military prowess. Carpet knights possess a medium between those called *truck* or *dunghill knights*, who only purchase or merit the honour by their wealth, and *knights-bachelors*, who are created for their services in the war.

CARPI, a principality of Modena in Italy, lying about four leagues from that city. It formerly belonged to the house of Pio; the elder sons of which bore the title of *princes of St Gregory*. In the beginning of the 14th century, *Manfroy* was the first prince of Carpi; but in the 16th, the emperor Charles V. gave the principality to Alfonzo duke of Ferrara.

This nobleman, in recompense, gave to Albert Pio, to whom the principality of Carpi belonged of right, the town of Sassuola and some other lands. Albert was, however, at last obliged to retire to Paris; where, being stripped of all his estates, he died in 1338, with the reputation of being one of the best and bravest men of his age. The family of Pio is yet in being, and continues attached to the French court. Some of them have even been raised to the purple, and still make a figure in Europe.

CARPI, a town of Italy in the duchy of Modena, and capital of the last-mentioned principality. It has a strong castle, and is situated in E. Long. 11. 12. N. Lat. 44. 45.

CARPI, a town of the Veronese in Italy, memorable for a victory gained by the Imperialists over the French in 1701. It is subject to the Venetians; and is situated on the river Adige, in E. Long. 11. 39. N. Lat. 45. 10.

CARPI, *Ugo da*, an Italian painter, of no very considerable talents in that art, but remarkable for being the inventor of that species of engraving on wood, distinguished by the name of chiaro-scuro, in imitation of drawing. This is performed by using more blocks than one; and Ugo da Carpi usually had three; the first for the outline and dark shadows, the second for the lighter shadows, and the third for the half tint. In that manner he struck off prints after several designs, and cartoons of Raphael; particularly one of the Sibyl, a Descent from the Cross, and the History of Simon the Sorcerer. He died in 1500. This art was brought to a still higher degree of perfection by Balthazar Peruzzi of Siena, and Parmigiano, who published several excellent designs in that manner.

CARPI, *Girolamo da*, history and portrait painter, was born at Ferrara in 1501, and became a disciple of Garofala. When he quitted that master, he devoted his whole time, thoughts, and attention, to study the works of Correggio, and to copy them with a most critical care and observation: in which labour he spent several years at Parma, Modena, and other cities of Italy, where the best works of that exquisite painter were preserved. He acquired such an excellence in the imitation of Correggio's style, and copying his pictures, that many paintings finished by him were taken for originals, and not only admired, but were eagerly purchased by the connoisseurs of that time. Nor is it improbable that several of the paintings of Girolamo de Carpi pass at this day for the genuine work of Correggio himself. He died in 1556.

CARPINUS, the HORNBEAM. See BOTANY *Index*.

CARPOBALSAM, in the *Materia Medica*, the fruit of the tree which yields the true oriental balsam. The carpobalsam is used in Egypt, according to Prosper Alpinus, in all the intentions in which the balsam itself is applied: but the only use the Europeans make of it is in Venice treacle and mithridate: and in these not a great deal, for cubebs and juniper-berries are generally substituted in its place.

CARPOCRATIANS, a branch of the ancient Gnostics, so called from *Carpocrates*, who in the second century revived and improved upon the errors of Simon Magus, Menander, Saturinos, and other Gnostics. He owned, with them, one sole principle and father of all things, whose name as well as nature

was unknown. The word, he taught, was created by angels, vastly inferior to the first principle. He opposed the divinity of Jesus Christ; making him a mere man, begotten carnally on the body of Mary by Joseph, though possessed of uncommon gifts which set him above other creatures. He inculcated a community of women; and taught, that the soul could not be purified, till it had committed all kinds of abominations, making that a necessary condition of perfection.

CARPOLITI, or FRUIT-STONE ROCKS of the Germans, are composed of a kind of jasper, of the nature of the amygdaloides, or almond-stones. Bertrand asserts that the latter are those which appear to be composed of elliptical pieces like petrified almonds, though, in truth, they are only small oblong pieces of calcareous stone rounded by attrition, and sometimes small mussel-shells connected by a stony concretion. The name of Carpolithi, however, is given in general by writers on fossils to all sorts of stony concretions that have any resemblance to fruit of whatever kind.

CARPUS, the WRIST. See ANATOMY *Index*.

CARR, a kind of rolling throne, used in triumphs, and at the splendid entries of princes. See CHARIOT.

The word is from the ancient Gaulish, or Celtic, *Carr;* mentioned by Cæsar, in his Commentaries, under the name *Carrus*. Plutarch relates, that Camillus having entered Rome in triumph, mounted on a carr drawn by four white horses, it was looked on as too haughty an innovation.

CARR is also used for a kind of light open chariot. The carr, on medals, drawn either by horses, lions, or elephants, usually signifies either a triumph or an apotheosis: sometimes a procession of the images of the gods at solemn supplication, and sometimes of those of some illustrious family at a funeral. The carr covered, and drawn by mules, only signifies a consecration, and the honour done any one of having his image carried at the gates of the circus. See CONSECRATION, &c.

CARRAC, or CARRACA, a name given by the Portuguese to the vessels they send to Brasil and the East Indies, being very large, round built, and fitted for fight as well as burden. Their capacity lies in their depth, which is very extraordinary. They are narrower above than underneath, and have sometimes seven or eight floors; they carry about 2000 tons, and are capable of lodging 2000 men; but of late they are little used. Formerly they were also in use among the knights of Rhodes, as well as among the Genoese, and other Italians. It is a custom among the Portuguese, when the carracs return from India, not to bring any boat or sloop for the service of the ship beyond the island of St Helena; at which place they sink them on purpose, in order to take from the crew all hopes or possibility of saving themselves, in case of shipwreck.

CARRARA MARBLE, among our artificers, the name of a species of white marble, which is called *marmor lunense*, and *ligustrium* by the ancients; it is distinguished from the Parian, now called the statuary marble, by being harder and less bright.

CARRAVEIRA, a town of Turkey in Europe, with

with a Greek archbishop's see. E. Long. 22. 25. N. Lat. 40. 27.

CARRIAGE, a vehicle serving to convey persons, goods, merchandises, and other things, from one place to another.

For the construction and mechanical principles of wheel-carriages, see MECHANICS.

CARRIAGE of a Cannon, the frame or timber-work on which it is mounted, serving to point it for shooting, or to carry it from one place to another. It is made of two planks of wood, commonly of one-half the length of the gun, called the *cheeks*, and joined by three wooden transums, strengthened with three bolts of iron. It is mounted on two wheels, but on a march has two fore-wheels with limbers added. The principal parts of a carriage are the cheeks, transum, bolts, plates, trainbands, bridges, bed, hooks, trunnion holes, and capsquare.

Block-CARRIAGE, a cart made on purpose for carrying mortars and their beds from place to place.

Truck-CARRIAGE, two short planks of wood, supported on two axletrees, having four trucks of solid wood for carrying mortars or guns upon battery, where their own carriages cannot go. They are drawn by men.

CARRICK, the southern division of the shire of Ayr in Scotland. It borders on Galloway; stretches 32 miles in length; and is a hilly country fit for pasturage. The chief rivers are the Stinchar and Girvan, both abounding with salmon. Here are also several lakes and forests, and the people on the coast employ themselves in the herring-fishery, though they have no harbour of any consequence. The only towns of this district are Girvan and Ballantrae; the former at the mouth of the river of the same name, and the latter at the mouth of the Stinchar; and Maybole, an inland town. The Prince of Wales, as Prince of Scotland, is Earl of Carrick.

CARRICK on the Sure, a town of Ireland, in the county of Tipperary and province of Munster. W. Long. 7. 14. N. Lat. 52. 16.

CARRICK-Fergus, a town of Ireland, in the county of Antrim and province of Ulster. It is a town and county in itself, and sends one member to parliament. It contains 3400 inhabitants; has a good harbour; and is governed by a mayor, recorder, and sheriffs.—It has, however, been of far greater consequence than at present, as appears from the mayor having been admiral of a considerable extent of coast in the counties of Down and Antrim, and the corporation enjoying the customs paid by all vessels within these bounds, the creeks of Belfast and Bangor excepted. This grant was repurchased, and the customhouse transferred to Belfast.—Here is the skeleton of a fine house built by Lord Chichester in the reign of James I. an old Gothic church with many family monuments, and a very large old castle. The town was formerly walled round, and some part of the wall still remains entire.—Carrick-Fergus is seated on a bay of the same name in the Irish Channel; and is noted for being the landing place of King William in 1690. Here also Thurot made a descent in 1759, took possession of the castle, and carried away hostages for the ransom of the town; but being soon after pursued by Commodore Elliot, his three ships were taken, and he himself was killed.

CARRIER, is a person that carries goods for others for hire. A common carrier, having the charge and carriage of goods, is to answer for the same, or the value, to the owner. And where goods are delivered to a carrier, and he is robbed of them, he shall be charged and answer for them, because of the hire. If a common carrier, who is offered his hire, and who has convenience, refuses to carry goods, he is liable to an action, in the same manner as an innkeeper who refuses to entertain a guest. See ASSUMPSIT.

One brought a box to a carrier, with a large sum of money, and the carrier demanded of the owner what was in it; he answered, that it was filled with silks, and such like goods; upon which the carrier took it, and was robbed, and adjudged to make it good; but a special acceptance, as, *provided there is no charge of money*, would have excused the carrier.—A person delivered to a carrier's book-keeper two bags of money sealed up, to be carried from London to Exeter, and told him that it was 200l. and took his receipt for the same, with promise of delivery for 10s. per cent. carriage and risk; though it be proved that there was 400l. in the bags, if the carrier be robbed, he shall answer only for 200l. because there was a particular undertaking for that sum and no more; and his reward, which makes him answerable, extends no farther. If a common carrier loses goods which he is intrusted to carry, a special action on the case lies against him, on the custom of the realm, and not trover; and so of a common carrier by boat. An action will lie against a porter, carrier, or barge-man, upon his bare receipt of the goods, if they are lost through negligence. Also a lighter-man spoiling goods he is to carry, by letting water come to them, action of the case lies against him, on the common custom.

Jacob's Law Dict.

CARRIER-Pigeon, or *Courier-pigeon*, a sort of pigeon used, when properly trained, to be sent with letters from one place to another. See COLUMBA.

Though you carry these birds hood-winked, 20, 30, nay, 60 or 100 miles, they will find their way in a very little time to the place where they were bred. They are trained to this service in Turkey and Persia; and are carried first, while young, short flights of half a mile, afterwards more, till at length they will return from the farthest part of the kingdom. Every bashaw has a basket of these pigeons bred in the seraglio, which, upon any emergent occasion, as an insurrection, or the like, he dispatches, with letters braced under the wings, to the seraglio; which proves a more speedy method, as well as a more safe one, than any other; he sends out more than one pigeon, however, for fear of accidents. Lithgow assures us, that one of these birds will carry a letter from Babylon to Aleppo, which is 30 days journey, in 48 hours. This is also a very ancient practice. Hirtius and Brutus, at the siege of Modena, held a correspondence with one another by means of pigeons. And Ovid tells us, that Taurosthenes, by a pigeon stained with purple, gave notice to his father of his victory at the Olympic games, sending it to him at Ægina.

In modern times, the most noted were the pigeons of Aleppo, which served as couriers at Alexandretta and Bagdad. But this use of them has been laid aside for the last 30 or 40 years, because the Curd robbers killed

killed the pigeons. The manner of sending advice by them was this: they took pairs which had young ones, and carried them on horseback to the place from whence they wished them to return, taking care to let them have a full view. When the news arrived, the correspondent tied a billet to the pigeon's foot, and let her loose. The bird, impatient to see its young, flew off like lightning, and arrived at Aleppo in ten hours from Alexandretta, and in two days from Bagdad. It was not difficult for them to find their way back, since Aleppo may be discovered at an immense distance. This pigeon has nothing peculiar in its form, except its nostrils, which, instead of being smooth and even, are swelled and rough.

CARRON, a small but remarkable river in Scotland, rising about the middle of the isthmus between the friths of Forth and Clyde. Both its source, and the place where it emptieth itself into the sea, are within the shire of Stirling, which it divides into two nearly equal parts. The whole length of its course, which is from west to east, is not above 14 miles. It falls into the frith of Forth about three miles to the north-east of Falkirk. The stream thereof is but small, and scarcely deserves the notice of a traveller; yet there is no river in Scotland, and few in the whole island of Britain, whose banks have been the scene of so many memorable transactions. When the Roman empire was in all its glory, and had its eastern frontiers upon the Euphrates, the banks of Carron were its boundaries upon the north-west; for the wall of Antoninus *, which was raised to mark the limits of that mighty empire, stood in the neighbourhood of this river, and ran parallel to it for several miles.

* See *Antoninus's Wall.*

Near the middle of its course, in a pleasant valley, stand two beautiful mounts, called the *Hills of Dunipace*, which are taken notice of by most of the Scotish historians as monuments of great antiquity. The whole structure of these mounts is of earth; but they are not both of the same form and dimensions. The most easterly one is perfectly round, resembling an oven, and about fifty feet in height; and that this is an artificial work does not admit of the least doubt; but we cannot affirm the same, with equal certainty, of the other, though it has been generally supposed to be so too. It bears no resemblance to the eastern one either in shape or size. At the foundation it is nearly of a triangular form; but the superstructure is quite irregular; nor does the height thereof bear any proportion to the extent of its base. These mounts are now planted with firs, which, with the parish-church of Dunipace standing in the middle between them, and the river running hard by, give this valley a very romantic appearance. The common account given of those mounts is, that they were erected as monuments of a peace concluded in that place between the Romans and the Caledonians, and that their name partakes of the language of both people; *Dun* signifying a hill in the old language of this island, and *Pax* "peace," in the language of Rome. The compound word, *Dunipace*, signifies "the hills of peace." And we find in history, that no less than three treaties of peace were at different periods entered into between the Romans and Caledonians; the first by Severus about the year 210; the second soon after, by his son Caracalla; and the third, by the usurper Carausius about the year 280; but of which of these treaties Dunipace is a monument, we do not pretend to determine. If the concurring testimony of historians and antiquaries did not agree in giving this original to these mounts, we would be tempted to conjecture that they are sepulchral monuments. Human bones and urns have been discovered in earthen fabrics of this kind in many parts of this island, and the little mounts or barrows which are scattered in great numbers about Stonhenge in Salisbury plain are generally supposed to have been the sepulchres of the ancient Britons. See BARROWS.

From the valley of Dunipace, the river runs for some time in a deep and hollow channel, with steep banks on both sides; here it passes by the foundations of the ancient Roman bridge; not far from which, as is generally thought, was the scene of the memorable conference betwixt the Scotish patriot William Wallace and Robert Bruce, father to the king of that name, which first opened the eyes of the latter to a just view both of his own true interest and that of his country.

After the river has left the village and bridge of Larbert, it soon comes up to another smaller valley, through the midst of which it has now worn out to itself a straight channel, whereas, in former ages, it had taken a considerable compass, as appears by the track of the old bed which is still visible. The high and circling banks upon the south side give to this valley the appearance of a spacious bay; and, according to the tradition of the country, there was once an harbour here; nor does the tradition seem altogether groundless, pieces of broken anchors having been found here, and some of them within the memory of people yet alive. The stream tides would still flow near the place, if they were not kept back by the dam-head built across the river at Stenhouse; and there is reason to believe, that the frith flowed considerably higher in former ages than it does at present. In the near neighbourhood of this valley, upon the south, stand the ruins of ancient Camelon: which, after it was abandoned by the Romans, was probably inhabited, for some ages, by the natives of the country.

Another ancient monument, called *Arthur's Oven*, once stood upon the banks of the Carron: but was, with a spirit truly Gothic, entirely demolished about 40 years ago. The corner of a small inclosure between Stenhouse and the Carron iron-works, is pointed out as the place of its situation. This is generally supposed to have been a Roman work: though it is not easy to conceive what could be their motive for erecting such a fabric, at so great a distance from any other of their works, and in a spot which at that time must have been very remote and unfrequented. The form of it is said to have been perfectly round, and rising perpendicular for some yards at first, but afterwards gradually contracted, till it terminated in a narrow orifice at the top. Antiquaries are not agreed whether it had been a temple, or a trophy, or a mausoleum; but the most common opinion is, that it had been a temple, and Buchanan thinks, a temple of Terminus. Hector Boetius says, that there were benches of stone all around it upon the inside; and that there had been a large stone for sacrificing upon, or an altar, upon the south side.

As the Carron extends over the half of the isthmus, and runs so near the ancient boundaries of the Roman empire, the adjacent country fell naturally to be the scene of many battles and rencounters. Historians mention a bloody battle fought near the river between the Romans and the confederate army of the Scots and Picts in the beginning of the 5th century. The scenes of some of Ossian's poems were, in the opinion of the translator, upon the banks of this river. Here Fingal fought with Caracal, the son of the king of the world, supposed to have been the same with Caracalla, the son of the Roman emperor Severus. Here also young Oscar, the son of Ossian, performed some of his heroic exploits. Hereabout was the stream of Crona, celebrated in the ancient compositions of the Gaelic bard; possibly that now called the water of Bonny, which runs in the neighbourhood of the Roman wall, and dischargeth itself into the Carron at Dunipace. In those poems, mention is made of a green vale upon the banks of this river, with a tomb standing in the middle of it, where young Oscar's party and the warriors of Caros met. We only take notice of this as it strengthens the conjecture hazarded above, that the mounts of Dunipace, especially the more easterly of them, were sepulchral monuments.—About the distance of half a mile from the river, and near the town of Falkirk, lies the field of that battle which was fought by William Wallace and the English in the beginning of the 14th century. It goes by the name of *Graham's muir*, from the valiant John Graham, who fell there, and whose grave-stone is still to be seen in the church-yard of Falkirk.

The river Carron, though it has long since ceased to roll its stream amidst the din of arms, still preserves its fame, by lending its aid to trade and manufactures; (see the next article.)—The river is navigable for some miles near its mouth, and a considerable trade is carried on upon it by small craft; for the convenience of which, its channel has of late years been straightened and much shortened, and the great Canal * has its entrance from it.

* the art e Ca- nal

Carron-Works, a large iron-foundery, two miles north from Falkirk in Scotland. They are conveniently situated on the banks of the Carron, three miles above its entry into the frith of Forth. Above 100 acres of land have been converted into reservoirs and pools, for water diverted from the river, by magnificent dams built above two miles above the works, which after turning 18 large wheels for the several purposes of the manufacture, falls into a tide-navigation that conveys their castings to the sea.

These works are among the greatest of the kind in Europe, and were established in 1760. At present, the buildings are of vast extent; and the machinery, constructed by Mr Smeaton, is the first in Britain, both in elegance and correctness: there are 2000 men employed, and there are about twenty furnaces which consume 200 tons of coals a-week; 6500 tons of iron are smelted annually from the mineral with pit-coal, and cast into cannon, cylinders, &c.—In the founding of cannon, those works have lately arrived at such perfection, that they make above 5000 pieces a year, many of which are exported to foreign states; and their guns of *new construction* are the lightest and neatest now in use, not excepting brass guns; the 32 pounder ship-gun weighing 42 hundred weight, the 6 pounder 8 hundred-weight and one-half, and the other calibers in proportion.

The present proprietors are a chartered company, with a capital of 150,000l. sterling, a common seal, &c. but their stock is confined to a very few individuals.

CARRONADE, a short kind of ordnance, capable of carrying a large ball, and useful in close engagements at sea. It takes its name from Carron, the place where this sort of ordnance was first made, or the principle applied to an improved construction. See the article GUNNERY.

CARROT. See DAUCUS, BOTANY *Index*.

Deadly CARROT. See THAPSIA, BOTANY *Index*.

CARROUSAL, a course of horses and chariots, or a magnificent entertainment exhibited by princes on some public rejoicing. It consists in a cavalcade of several gentlemen, richly dressed and equipped after the manner of ancient cavaliers, divided into squadrons, meeting in some public place, and practising justs, tournaments, &c.—The last carrousals were in the reign of Louis XIV.—The word comes from the Italian word *carosello*, a diminutive of *carro*, "chariot." Tertullian ascribes the invention of carrousals to Circe; and will have them instituted in honour of the Sun, her father; whence some derive the word from *carrus*, or *carrus solis*. The Moors introduced ciphers, liveries, and other ornaments of their arms, with trappings, &c. for their horses. The Goths added crests, plumes, &c.

CARRUCA, in *Antiquity*, a splendid kind of carr, or chariot, mounted on four wheels, richly decorated with gold, silver, ivory, &c. in which the emperors, senators, and people of condition, were carried. The word comes from the Latin *carrus*, or British *carr*, which is still the Irish name for any wheel-carriage.

CARRUCA, or *Caruca*, is also used in middle-age writers for a plough.

CARRUCA, or *Caruca*, also was sometimes used for *carrucata*. See CARRUCATE.

CARRUCAGE (*carucagium*), a kind of tax anciently imposed on every plough, for the public service, See CARRUCATE and HIDAGE.

CARRUCAGE, *Carucage*, or *Caruage*, in husbandry, denotes the ploughing of ground, either ordinary, as for grain, hemp, and flax; or extraordinary, as for woad, dyers weed, rape, and the like.

CARRUCATE, (*carrucata*), in our ancient laws and history, denotes a plough land, or as much arable gronnd as can be tilled in one year with one plough.

In Doomsday Inquisition, the arable land is estimated in carrucates, the pasture in hides, and meadow in acres. Skene makes the *carrucata* the same with *hilda*, or *hida terræ;* Littleton the same with soc.

The measure of a carrucate appears to have differed in respect of place as well as time. In the reign of Richard I. it was estimated at 60 acres, and in another charter of the same reign at 100 acres: in the time of Edward I. at 180 acres; and in the 23d of Edward III. a carrucate of land in Burcester contained 112 acres, and in Middleton 150 acres.

By a statute under William III. for charging persons to the repair of the highways, a plough-land is rated at fifty pounds per annum, and may contain houses, mills, wood, pasture, &c.

CARRYING, in falconry, signifies a hawk's flying away with the quarry. Carrying is one of the ill qualities of a hawk, which she acquires either by dislike of the falconer, or not being sufficiently broke to the lure.

CARRYING, among huntsmen. When a hare runs on rotten ground (or even sometimes in a frost), and it sticks to her feet, they say she carries.

CARRYING, among riding-masters. A horse is said to carry low, when having naturally an ill-shaped neck, he lowers his head too much. All horses that arm themselves carry low, but a horse may carry low without arming. A French branch or gigot is prescribed as a remedy against carrying low.

A horse is said to carry well, when his neck is raised or arched, and he holds his head high and firm, without constraint.

Carrying Wind, a term used by our dealers in horses to express such a one as frequently tosses his nose as high as his ears, and does not carry handsomely. This is called *carrying wind;* and the difference between carrying in the wind, and beating upon the hand, is this: that the horse who beats upon the hand, shakes the bridle and resists it, while he shakes his head; but the horse that carries in the wind puts up his head without shaking, and sometimes beats upon the hand. The opposite to carrying in the wind, is arming and carrying low: and even between these two there is a difference in wind.

CARS, or KARS, a considerable and strong town of Asia, in Armenia, seated on a river of the same name, with a castle almost impregnable. E. Long. 43. 50. N. Lat. 41. 30.

CARSE, or *Carse of Gowry*, a district of Perthshire in Scotland. It lies on the north side of the Tay, and extends 14 miles in length from Dundee to Perth, and is from two to four in breadth. It is a rich plain country, cultivated like a garden, and producing as good harvests of wheat as any in Great Britain. It abounds with all the necessaries of life: but, from its low damp situation, the inhabitants are subject to agues, and the commonalty are in great want of firing. In this district, not far from the Tay, stands the house of Errol, which formerly belonged to the earls of that name, the chiefs of the ancient family of Hay, hereditary constables of Scotland.

CARSTAIRS, WILLIAM, an eminent Scots divine, whose merit and good fortune called him to act in great scenes, and to associate with men to whose society and intercourse his birth gave him few pretensions to aspire. A small village in the neighbourhood of Glasgow was the place of his nativity. His father, of whom little is known, exercised the functions of a clergyman.

Young Carstairs turned his thoughts to the profession of theology; and the persecutions and oppressions of government, both in regard to civil and religious liberty, having excited his strongest indignation, it became a matter of prudence that he should prosecute his studies in a foreign university. He went accordingly to Utrecht; and his industry and attention being directed with skill, opened up and unfolded those faculties which he was about to employ with equal honour to his country and himself.

During his residence abroad, he became acquainted with Pensionary Fagel, and entered with warmth into the interest of the Prince of Orange. On his return to Scotland to produce a licence to teach doctrines which he had studied with the greatest care, he became disgusted with the proud and insolent conduct of Archbishop Sharp, and prepared to revisit Holland; where he knew that religious liberty was respected, and where he hoped he might better his condition by the connections he had formed.

His expectations were not vain. His prudence, his reserve, and his political address, were strong recommendations of him to the Prince of Orange; and he was employed in personal negotiations in Holland, England, and Scotland. Upon the elevation of his master to the English throne, he was appointed the king's chaplain for Scotland, and employed in settling the affairs of that kingdom. William, who carried politics into religion, was solicitous that episcopacy should prevail there as universally as in England. Carstairs, more versant in the affairs of his native country, saw all the impropriety of this project, and the danger that would arise from the enforcing of it. His reasonings, his remonstrances, his entreaties, overcame the firmness of King William. He yielded to considerations founded alike in policy and in prudence; and to Carstairs Scotland is indebted for the full establishment of its church in the Presbyterian form of government.

The death of King William was a severe affliction to him; and it happened before the prince had provided for him with the liberality he deserved. He was continued, however, in the office of chaplain for Scotland by Queen Anne; and he was invited to accept the principality of the university of Edinburgh. He was one of the ministers of the city, and four times moderator of the General Assembly. Placed at the head of the church, he prosecuted its interest with zeal and with integrity. Nor were his influence and activity confined to matters of religion. They were exerted with success in promoting the culture of the arts and sciences. The universities of Scotland owe him obligations of the highest kind. He procured, in particular, an augmentation of the salaries of their professors; a circumstance to which may be ascribed their reputation, as it enabled them to cultivate with spirit the different branches of knowledge.

A zeal for truth, a love of moderation and order, prudence, and humility, distinguished Principal Carstairs in an uncommon degree. His religion had no mixture of austerity; his secular transactions were attended with no imputation of artifice; and the versatility of his talents made him pass with ease from a court to a college. He was among the last who suffered torture before the privy council, in order to make him divulge the secrets entrusted to him, which he firmly resisted; and after the Revolution, that inhuman instrument the thumb-screw was given to him in a present by the council.—This excellent person died in 1715; and in 1744 his *State papers and Letters*, with an account of his life, were published in one vol. 4to. by the Rev. Dr M'Cormick.

CARSUCAI, Rainier, a Jesuit, born at Citerna in Tuscany, in 1647, was the author of a Latin poem, entitled *Ars bene scribendi*, which is esteemed both for the elegance of the style and for the excellent precepts it contains. He also wrote some good epigrams. He died in 1709.

CARTAMA, a town of Spain in the kingdom of Grenada, formerly very considerable. It is seated at the foot of a mountain, near the river Guadala-Medina, in W. Long. 4. 28. N. Lat. 36. 40.

CART, a land carriage with two wheels, drawn commonly by horses, to carry heavy goods, &c. from once place to another. The word seems formed from the French *charrette*, which signifies the same, or rather the Latin *carreta*, a diminutive of *carrus*. See Carr.

In London and Westminster carts shall not carry more than twelve sacks of meal, seven hundred and fifty bricks, one chaldron of coals, &c. on pain of forfeiting one of the horses. (6 Geo. I. cap. 6.) By the laws of the city, carr-men are forbidden to ride either on their carts or horses. They are to lead or drive them on foot through the streets, on the forfeiture of ten shillings. (Stat. 1. Geo. I. cap. 57.) Criminals used to be drawn to execution on a cart. Bawds and other malefactors are whipped at the cart's tail.

Scripture makes mention of a sort of carts or drags used by the Jews to do the office of threshing. They were supported on low thick wheels, bound with iron, which were rolled up and down on the sheaves, to break them, and force out the corn. Something of the like kind also obtained among the Romans, under the denomination of *plaustra*, of which Virgil makes mention. (Georg. I.)

Tardaque Eleusinæ matris volventia plaustra,
Tribulaque, traheæque.——

On which Servius observes, that *trahea* denotes a cart without wheels, and *tribula* a sort of cart armed on all sides with teeth, chiefly used in Africa for threshing corn. The Septuagint and St Jerome represent these carts as furnished with saws, insomuch that their surface was beset with teeth. David having taken Rabbah, the capital of the Ammonites, ordered all the inhabitants to be crushed to pieces under such carts, moving on wheels set with iron teeth; and the king of Damascus is said to have treated the Israelites of the land of Gilead in the same manner.

Cart-Bote, in *Law*, signifies wood to be employed in making and repairing instruments of husbandry.

Carts of War, a peculiar kind of artillery anciently in use among the Scots. They are thus described in an act of parliament, A. D. 1456: "It is thought speidfull, that the king may requiest to certain of the great burrous of the land that are of ony myght, to mak carts of weir, and in ilk cart two gunnis, and ilk ane to have two chalmers, with the remnant of the graith that effeirs thereto, and an cunnand man to shut thame." By another act, A. D. 1471, the prelates and barons are commanded to provide such carts of war against their old enemies the English.

CARTE, Thomas, the historian, was the son of Mr Samuel Carte, prebendary of Lichfield, and born in 1686. When he was reader in the abbey-church at Bath, he took occasion in a 30th of January sermon, 1714, to vindicate Charles I. with respect to the Irish massacre, which drew him into a controversy with Mr Chandler the dissenting minister; and on the accession of the present royal family he refused to take the oaths to government, and put on a lay habit. He is said to have acted as a kind of secretary to Bishop Atterbury before his troubles: and in the year 1722, being accused of high treason, a reward of 1000l. was offered for apprehending him: but Queen Caroline, the great patroness of learned men, obtained leave for him to return home in security. He published, 1. An edition of Thuanus, in seven volumes, folio. 2. The life of the first duke of Ormond, three volnmes, folio. 3. The History of England, four volumes, folio. 4. A Collection of Original Letters and Papers concerning the affairs of England, two volumes octavo; and some other works. He died in April 1754. His History of England ends in 1654. His design was to have brought it down to the Revolution; for which purpose he had taken great pains in copying every thing valuable that could be met with in England, Scotland, France, Ireland, &c.—He had (as he himself says, p. 43. of his Vindication of a full answer to a letter from a bystander), "read abundance of collections relating to the time of King Charles II. and had in his power a series of memoirs from the beginning to the end of that reign, in which all those intrigues and turns at court, at the latter end of that king's life, which Bishop Burnet, with all his *gout* for tales of secret history, and all his genius for conjectures, does not pretend to account for, are laid open in the clearest and most convincing manner by the person who was most affected by them, and had the best reason to know them."—At his death, all his papers came into the hands of his widow, who afterwards married Mr Jernegan, a member of the church of Rome. They are now deposited in the Bodleian library, having been delivered by Mr Jernegan to the university, 1778, for a valuable consideration. Whilst they were in this gentleman's possession, the earl of Hardwick paid 200l. for the perusal of them. For a consideration of 300l. Mr Macpherson had the use of them; and from these and other materials, compiled his history and state papers. Mr Carte was a man of a strong constitution and indefatigable application. When the studies of the day were over, he would eat heartily; and in conversation was cheerful and entertaining.

Carte Blanche, a sort of white paper signed at the bottom with a person's name, and sometimes also sealed with his seal, giving another person power to superscribe what conditions he pleases. Much like this is the French *blanc signe*, a paper without writing, except a signature at the bottom, given by contending parties to arbitrators or friends, to fill up with the conditions they judge reasonable, in order to end the difference.

CARTEL, an agreement between two states for the exchange of their prisoners of war.

Cartel signifies also a letter of defiance or a challenge to decide a controversy either in a tournament or in a single combat. See Duel.

Cartel Ship, a ship commissioned in time of war to exchange the prisoners of any two hostile powers; also to carry any particular request or proposal from one to another:

Cartel Ship, Cartes.

another: for this reason the officer who commands her is particularly ordered to carry no cargo, ammunition, or implements of war, except a single gun for the purpose of firing signals.

CARTES, Rene des, descended of an ancient family in Touraine in France, was one of the most eminent philosophers and mathematicians in the 17th century. At the Jesuits College at La Fleche, he made a very great progress in the learned languages and polite literature, and became acquainted with Father Marsenne. His father designed him for the army; but his tender constitution then not permitting him to expose himself to such fatigues, he was sent to Paris, where he launched into gaming, in which he had prodigious success. Here Marsenne persuaded him to return to study; which he pursued till he went to Holland, in May 1616, where he engaged as a volunteer among the Prince of Orange's troops. While he lay in garrison at Breda, he wrote a *treatise on music*, and laid the foundation of several of his works. He was at the siege of Rochelle in 1628; returned to Paris; and, a few days after his return, at an assembly of men of learning in the house of Monsignor Bagni, the pope's nuncio, was prevailed upon to explain his sentiments with regard to philosophy, when the nuncio urged him to publish his system. Upon this he went to Amsterdam, and from thence to Franeker, where he began his *metaphysical meditations*, and drew up his *discourse on meteors*. He made a short tour to England; and not far from London, made some observations concerning the declination of the magnet. He returned to Holland, where finished his *treatise on the world*.

His books made a great noise in France; and Holland thought of nothing but discarding the old philosophy, and following his. Voetius being chosen rector of the university of Utrecht, procured his philosophy to be prohibited, and wrote against him; but he immediately published a vindication of himself. In 1647, he took a journey into France, where the king settled a pension of 3000 livres upon him. Christina, queen of Sweden, having invited him into that kingdom, he went thither, where he was received with the greatest civility by her majesty, who engaged him to attend her every morning at five o'clock, to instruct her in philosophy, and desired him to revise and digest all his writings which were unpublished, and to form a complete body of philosophy from them. She likewise proposed to allow him a revenue, and to form an academy, of which he was to be the director. But these designs were broken off by his death in 1650. His body was interred at Stockholm, and 17 years afterwards removed to Paris, where a magnificent monument was erected to him in the church of St Genevive du Mont. The great Dr Halley, in a paper concerning optics observes, that though some of the ancients mention refraction as an effect of transparent mediums, Des Cartes was the first who discovered the laws of refraction, and reduced dioptrics to a science. As to his philosophy, Dr Keill, in his introduction to his examination of Dr Burnet's theory of the earth, says, that Des Cartes was so far from applying geometry to natural philosophy, that his whole system is one continued blunder on account of his negligence in that point; the laws observed by the planets in their revolutions round the sun not agreeing with his theory of vortices. His philosophy has accordingly given way to the more acurate discoveries and demonstrations of the Newtonian system.

Cartes || Carthage.

CARTESIANS, a sect of philosophers, who adhered to the system of Des Cartes, founded on the two following principles, the one metaphysical, the other physical. The metaphysical one is, *I think, therefore I am*: the physical principle is, that *nothing exists but substance*. Substances he makes of two kinds; the one a substance that thinks, the other a substance extended; whence actual thought, and actual extension, are the essence of substance.

The essence of matter being thus fixed in extension, the Cartesians conclude that there is no vacuum nor any possibility thereof in nature; but that the universe is absolutely full: mere space is excluded by this principle; because extension being implied in the idea of space, matter is so too. Upon these principles the Cartesians explained mechanically how the world was formed, and how the present celestial phenomena came to take place. See Astronomy *Index*.

CARTHAGE, a famed city of antiquity, the capital of Africa Propria; and which for many years disputed with Rome the sovereignty of the world. According to Velleius Paterculus, this city was built 65, according to Justin and Trogus 72, according to others 100 or 140 years, before the foundations of Rome were laid. It is on all hands agreed that the Phœnicians were the founders.

1 When founded.

The beginning of the Carthaginian history, like that of all other nations, is obscure and uncertain. In the 7th year of Pygmalion king of Tyre, his sister Elisa, or Dido, is said to have fled, with some of her companions and vassals, from the cruelty and avarice of her brother, who had put to death her husband Sichæus in order to get possession of his wealth.

2 Elisa or Dido escapes from her brother.

She first touched at the island of Cyprus, where she met with a priest of Jupiter, who was desirous of attending her; to which she readily consented, and fixed the priesthood in his family. At that time it was a custom in the island of Cyprus, for the young women to go on certain stated days, before marriage, to the sea side, there to look for strangers, that might possibly arrive on their coasts, in order to prostitute themselves for gain, that they might thereby acquire a dowry. Out of these the Tyrians selected 80, whom they carried along with them. From Cyprus they sailed directly for the coast of Africa: and at last safely landed in the province called *Africa Propria*, not far from Utica, a Phœnician city of great antiquity. The inhabitants received their countrymen with great demonstrations of joy, and invited them to settle among them. The common fable is, that the Phœnicians imposed upon the Africans in the following manner: They desired, for their intended settlement, only as much ground as an ox's hide would encompass. This request the Africans laughed at: but were surprised, when, upon their granting it, they saw Elisha cut the hide into the smallest shreds, by which means it surrounded a large territory; in which she built the citadel called *Byrsa*. The learned, however, are now unanimous in exploding this fable: and it is certain that the Carthaginians for many years paid an annual tribute to the Africans for the ground they possessed.

3 Builds the citadel Byrsa.

The new city soon became populous and flourishing, by by the accession of the neighbouring Africans, who came thither at first with a view of traffic. In a short time it became so considerable, that *Jarbas*, a neighbouring prince, thought of making himself master of it without any effusion of blood. In order to this, he desired that an embassy of ten of the most noble Carthaginians might be sent him; and, upon their arrival, proposed to them a marriage with Dido, threatening war in case of a refusal. The ambassadors, being afraid to deliver this message, told the queen that Jarbas desired some person might be sent him who was capable of civilizing his Africans; but that there was no possibility of finding any of her subjects who would leave his relations for the conversation of such barbarians. For this they were reprimanded by the queen: who told them that they ought to be ashamed of refusing to live in any manner for the benefit of their country. Upon this, they informed her of the true nature of their message from Jarbas: and that, according to her own decision, she ought to sacrifice herself for the good of her country. The unhappy queen, rather than submit to be the wife of such a barbarian, caused a funeral pile to be erected, and put an end to her life with a dagger.

This is Justin's account of the death of Queen Dido, and is the most probable; Virgil's story of her amour with Æneas being looked upon as fabulous, even in the days of Macrobius, as we are informed by that historian. How long monarchical government continued in Carthage, or what happened to this state in its infancy, we are altogether ignorant, by reason of the Punic archives being destroyed by the Romans; so that there is a chasm in the Carthaginian history for above 300 years. It however appears, that from the very beginning the Carthaginians applied themselves to maritime affairs, and were formidable by sea in the time of Cyrus and Cambyses. From Diodorus Siculus and Justin, it appears that the principal support of the Carthaginians were the mines of Spain, in which country they seem to have established themselves very early. By means of the riches drawn from these mines, they were enabled to equip such formidable fleets as we are told they fitted out in the time of Cyrus or Cambyses. Justin insinuates, that the first Carthaginian settlement in Spain happened when the city of Gades, now Cadiz, was but of late standing, or even its infancy. The Spaniards finding this new colony begin to flourish, attacked it with a numerous army, insomuch that the inhabitants were obliged to call in the Carthaginians to their aid. The latter very readily granted their request, and not only repulsed the Spaniards, but made themselves masters of almost the whole province in which their new city stood. By this success, they were encouraged to attempt the conquest of the whole country: but having to do with very warlike nations, they could not push their conquests to any great length at first; and it appears, from the accounts of Livy and Polybius, that the greatest part of Spain remained unsubdued till the time of Hamilcar, Asdrubal, and Hannibal.

About 503 years before the birth of Christ, the Carthaginians entered into a treaty with the Romans. It related chiefly to matters of navigation and commerce. From it we learn that the whole island of Sardinia, and part of Sicily, were then subject to Carthage; that they were very well acquainted with the coasts of Italy, and had made some attempts upon them before this time: and that, even at this early period, a spirit of jealousy had taken place between the two republics. Some time near this period, the Carthaginians had a mind to discontinue the tribute they had hitherto paid the Africans for the ground on which their city stood. But, notwithstanding all their power, they were at present unsuccessful; and at last were obliged to conclude a peace, one of the articles of which was, that the tribute should be continued.

7 Sicily invaded by the Carthaginians.

By degrees the Carthaginians extended their power over all the islands in the Mediterranean, Sicily excepted; and for the entire conquest of this, they made vast preparations, about 480 years before Christ. Their army consisted of 300,000 men; their fleet was composed of upwards of 2000 men of war, and 3000 transports; and with such an immense armament, they made no doubt of conquering the whole island in a single campaign. In this, however, they found themselves miserably deceived. Hamilcar their general having landed his numerous forces, invested Himera, a city of considerable importance. He carried on his attacks with the greatest assiduity; but was at last attacked in his trenches by Gelon and Theron, the tyrants of Syracuse and Agrigentum, who gave the Carthaginians one of the greatest overthrows mentioned in history. An hundred and fifty thousand were killed in the battle and pursuit, and all the rest taken prisoners; so that of so mighty an army not a single person escaped. Of the 2000 ships of war and 3000 transports, of which the Carthaginian fleet consisted, eight ships only, which then happened to be out at sea, made their escape: these immediately set sail for Carthage; but were all cast away, and every soul perished, except a few who were saved in a small boat, and at last reached Carthage with the dismal news of the total loss of the fleet and army. No words can express the consternation of the Carthaginians upon receiving the news of so terrible a disaster. Ambassadors were immediately dispatched to Sicily, with orders to conclude a peace upon any terms. They put to sea without delay; and landing at Syracuse, threw themselves at the conqueror's feet. They begged Gelon, with many tears, to receive their city into favour, and grant them a peace on whatever terms he should choose to prescribe. He granted their request, upon condition that Carthage should pay him 2000 talents of silver to defray the expences of the war; that they should build two temples, where the articles of the treaty should be lodged and kept as sacred; and that for the future they should abstain from human sacrifices. This was not thought a dear purchase of a peace for which there was such occasion; and to show their gratitude for Gelon's moderation, the Carthaginians complimented his wife Demerata with a crown of gold worth 100 talents.

8 They are utterly destroyed.

9 Peace concluded.

From this time we find little mention of the Carthaginians for 70 years. Some time during this period, however, they had greatly extended their dominions in Africa, and likewise shaken off the tribute which gave them so much uneasiness. They had warm disputes with the inhabitants of Cyrene, the capital of Cyrenaica, about a regulation of the limits of

10 Dispute with the Cyreneans.

Carthage. of their respective territories. The consequence of these disputes was a war, which reduced both nations so low, that they agreed first to a cessation of arms, and then to a peace. At last it was agreed, that each state should appoint two commissaries, who should set out from their respective cities on the same day, and that the spot on which they met should be the boundary of both states. In consequence of this, two brothers called *Philæni* were sent out from Carthage, who advanced with great celerity, while those from Cyrene were much more slow in their motions. Whether this proceeded from accident or design, or perfidy, we are not certainly informed; but be this as it will, the Cyreneans, finding themselves greatly outstripped by the Philæni, accused them of breach of faith, asserting that they had set out before the time appointed, and consequently that the convention between their principals was broken. The Philæni desired them to propose some expedient whereby their differences might be accommodated; promising to submit to it whatever it might be. The Cyreneans then proposed, either that the Philæni should retire from the place where they were, or that they should be buried alive upon the spot. With this last condition the brothers immediately complied, and by their death gained a large extent of territory to their country. The Carthaginians ever after celebrated this as a most brave and heroic action; paid them divine honours; and endeavoured to immortalize their names by erecting two altars there, with suitable inscriptions upon them.

11 Story of the *Philæni.*

12 Sicily invaded anew.

About the year before Christ 412, some disputes happening between the Egestines and Selinuntines, inhabitants of two cities in Sicily, the former called in the Carthaginians to their assistance; and occasioned a new invasion of Sicily by that nation. Great preparations were made for this war: Hannibal, whom they had appointed general, was empowered to raise an army equal to the undertaking, and equip a suitable fleet. They also appointed certain funds for defraying all the expences of the war, intending to exert their whole force to reduce the island under their subjection.

13 Emporium and Selinis taken;

The Carthaginian general having landed his forces, immediately marched for Selinis. In his way he took Emporium, a town situated on the river Mazara; and having arrived at Selinis, he immediately invested it. The besieged made a very vigorous defence: but at last the city was taken by storm, and the inhabitants were treated with the utmost cruelty. All were massacred by the savage conqueror, except the women who fled to the temples; and these escaped, not through the merciful disposition of the Carthaginians, but because they were afraid, that if driven to despair they would set fire to the temples, and by that means consume the treasure they expected to find in those places. Sixteen thousand were massacred; 2250 escaped to Agrigentum; and the women and children, about 5000 in number, were carried away captives. At the same time the temples were plundered, and the city razed to the ground.

14 as likewise Himera.

After the reduction of Selinis, Hannibal laid siege to Himera: that city he desired above all things to become master of, that he might revenge the death of his grandfather Hamilcar, who had been slain before it by Gelon. His troops, flushed with their late success, behaved with undaunted courage: but finding his battering engines not to answer his purposes sufficiently, he undermined the wall, supporting it with large beams of timber, to which he afterwards set fire, and thus laid part of it flat on the ground. Notwithstanding this advantage, however, the Carthaginians were several times repulsed with great slaughter; but at last they became masters of the place, and treated it in the same manner as they had done Selinis. After this, Hannibal, dismissing his Sicilian and Italian allies, returned to Africa.

The Carthaginians were now so much elated, that they meditated the reduction of the whole island. But as the age and infirmities of Hannibal rendered him incapable of commanding the forces alone, they joined in commission with him Imilcar, the son of Hanno, one of the same family. On the landing of the Carthaginian army, all Sicily was alarmed, and the principal cities put themselves into the best state of defence they were able. The Carthaginians immediately marched to Agrigentum, and began to batter the walls with great fury. The besieged, however, defended themselves with incredible resolution, in a sally burnt all the machines raised against their city, and repulsed the enemy with great slaughter. The Syracusans, in the mean time, being alarmed at the danger of Agrigentum, sent an army to its relief. On their approach they were immediately attacked by the Carthaginians; but after a sharp dispute the latter were defeated, and forced to fly to the very walls of Agrigentum, with the loss of 6000 men. Had the Agrigentine commanders now sallied out, and fallen upon the fugitives, in all probability the Carthaginian army must have been destroyed; but, either through fear or corruption, they refused to stir out of the place, and this occasioned the loss of it. Immense booty was found in the city; and the Carthaginians behaved with their usual cruelty, putting all the inhabitants to the sword, not excepting even those who had fled to the temples.

15 Agrigentum besieged;

16 and taken.

The next attempt of the Carthaginians was designed against the city of Gela; but the Geleans, being greatly alarmed, implored the protection of Syracuse; and, at their request, Dionysius was sent to assist them with 2000 foot and 400 horse. The Geleans were so well satisfied with his conduct, that they treated him with the highest marks of distinction; they even sent ambassadors to Syracuse to return thanks for the important services done them by sending him thither; and soon after he was appointed generalissimo of the Syracusan forces and those of their allies against the Carthaginians. In the mean time Imilcar, having razed the city of Agrigentum, made an incursion into the territories of Gela and Comarina; which having ravaged in a dreadful manner, he carried off such immense quantity of plunder, as filled his whole camp. He then marched against the city; but though it was but indifferently fortified, he met with a very vigorous resistance; and the place held out for a long time without receiving any assistance from its allies. At last Dionysius came to its assistance with an army of 50,000 foot and 1000 horse. With these he attacked the Carthaginian camp, but was repulsed with great loss; after which he called a council of war, the result of whose deliberations was, that since the enemy was

17 Gela besieged.

Carthage. was so much superior to them in strength, it would be highly imprudent to put all to the issue of a battle; and therefore that the inhabitants should be persuaded to abandon the country, as the only means of saving their lives. In consequence of this, a trumpet was sent to Imilcar to desire a cessation of arms till the next day, in order, as was pretended, to bury the dead, but

18 in reality to give the people of Gela an opportunity of

At doned by inhabits. making their escape. Towards the beginning of the night the bulk of the citizens left the place; and he himself with the army followed them about midnight. To amuse the enemy, he left 2000 of his light-armed troops behind him, commanding them to make fires all night, and set up loud shouts, as though the army still remained in the town. At day-break these took the same route as their companions, and pursued their march with great celerity. The Carthaginians, finding the city deserted by the greatest part of its inhabitants, immediately entered it, putting to death all who had remained; after which, Imilcar having thoroughly plundered it, moved towards Camarina. The inhabitants of this city had been likewise drawn off by Dionysius, and it underwent the same fate with Gela.

19

Pe con. cl d. Notwithstanding these successes, however, Imilcar finding his army greatly weakened, partly by the casualties of war, and partly by a plague, which broke out in it, sent a herald to Syracuse to offer terms of peace. His unexpected arrival was very agreeable to the Syracusans, and a peace was immediately concluded upon the following terms, viz. That the Carthaginians, besides their ancient acquisitions in Sicily, should still possess the countries of the Silicani, the Selinuntines, the Himereans, and Agrigentines; that the people of Gela and Camarina should be permitted to reside in their respective cities, which yet should be dismantled, upon their paying un annual tribute to the Carthaginians; that all the other Sicilians should preserve their independency except the Syracusans, who should continue in subjection to Dionysius.

20

D ysius br is the tr y. The tyrant of Syracuse, however, had concluded this peace with no other view than to gain time, and to put himself in condition to attack the Carthaginian territories with greater force. Having accomplished this, he acquainted the Syracusans with his design, and they immediately approved of it: upon which he gave up to the fury of the populace the persons and possessions of the Carthaginians who resided in Syracuse, and traded there on the faith of treaties. As there were many of their ships at that time in the harbour, laden with cargoes of great value, the people immediately plundered them; and, not content with this, ransacked all their houses in a most outrageous manner. This example was followed throughout the whole island; and in the mean time Dionysius dispatched a herald to Carthage, with a letter to the senate and people, telling them, that if they did not immediately withdraw their garrisons from all the Greek cities in Sicily, the people of Syracuse would treat them as enemies. With this demand, however, he did not allow them to comply; for without waiting for any answer from Carthage, he advanced with his army to Mount Eryx, near which stood the city of Motya, a Carthaginian colony of great importance; and this he immediately invested. But soon after, leaving his brother Leptines to carry on the attack, he himself went with the greatest part of his forces to reduce the cities in alliance with the Carthaginians. He destroyed their territories with fire and sword, cut down all their trees; and then sat down before Egesta and Entella, most of the other towns having opened their gates at his approach: but these baffling his utmost efforts, he returned to Motya, and pushed on the siege of that place with the utmost vigour.

The Carthaginians, in the mean time, though alarmed at the message sent them by Dionysius, and though reduced to a miserable situation by the plague which had broke out in their city, did not despond, but sent officers to Europe, with considerable sums, to raise troops with the utmost diligence. Ten galleys were also sent from Carthage to destroy all the ships that were found in the harbour of Syracuse. The admiral, according to his orders, entered the harbour in the night, without being discerned by the enemy; and having sunk most of the ships he found there, returned without the loss of a man.

21 Syracusan ships destroyed.

22 Motya taken by the Greeks.

All this while the Motyans defended themselves with incredible vigour; while their enemies, desirous of revenging the crueltics exercised upon their countrymen by the Carthaginians, fought like lions. At last the place was taken by storm, and the Greek soldiers began a general massacre. For some time Dionysius was not able to restrain their fury: but at last he proclaimed that the Motyans should fly to the Greek temples; which they accordingly did, and a stop was put to the slaughter; but the soldiers took care thoroughly to plunder the town, in which they found a great treasure.

The following spring, Dionysius invaded the Carthaginian territories, and made an attempt upon Egesta: but here he was again disappointed. The Carthaginians were greatly alarmed at his progress; but, next year, notwithstanding a considerable loss sustained in a sea-fight with Leptines, Himilco their general landed a powerful army at Panormus, seized upon Eryx, and then advancing towards Motya, made himself master of it before Dionysius could send any forces to its relief. He next advanced to Messana, which he likewise besieged and took; after which most of the Siculi revolted from Dionysius.

23 Greeks defeated at sea by the Carthaginians.

Notwithstanding this defection, Dionysius, finding his forces still amount to 30,000 foot and 3000 horse, advanced against the enemy. At the same time Leptines was sent with the Syracusan fleet against that of the Carthaginians, but with positive orders not to break the line of battle upon any account whatever. But, notwithstanding these orders, he thought proper to divide his fleet, and the consequence of this was a total defeat; above 100 of the Syracusan galleys being sunk or taken, and 20,000 of their men killed in the battle or in the pursuit. Dionysius, disheartened by this misfortune, returned with his army to Syracuse, being afraid that the Carthaginian fleet might become masters of that city, if he should advance to fight the land army. Himilco did not fail immediately to invest the capital; and had certainly become master of it, and consequently of the whole island, had not a most malignant pestilence obliged him to desist from all further operations. This dreadful malady made great havock among his forces both by sea and land; and, to complete

24 Syracuse besieged by the Carthaginians.

Carthage. plete his misfortunes, Dionysius attacked him unexpectedly, totally ruined his fleet, and made himself master of his camp.

25 Himilco obliged to return.

Himilco, finding himself altogether unable to sustain another attack, was obliged to come to a private agreement with Dionysius; who for 300 talents consented to let him escape to Africa with the shattered remains of his fleet and army. The unfortunate general arrived at Carthage, clad in mean and sordid attire, where he was met by a great number of people bewailing their sad and inauspicious fortune. Himilco joined them in their lamentations; and, being unable to survive his misfortunes, put an end to his own life. He had left Mago in Sicily, to take care of the Carthaginian interests in the best manner he could. In order to this, Mago treated all the Sicilians subject to Carthage with the greatest humanity; and, having received a considerable number of soldiers from Africa, he at last formed an army with which he ventured a battle; in this he was defeated, and driven out of the field, with the loss of 800 men; which obliged him to desist from farther attempts of that nature.

26 Another invasion of Sicily.

Notwithstanding all these terrible disasters, the Carthaginians could not forbear making new attempts upon the island of Sicily; and about the year before Christ 392, Mago landed in it with an army of 80,000 men. This attempt, however, was attended with no better success than before: Dionysius found means to reduce him to such straits for want of provisions, that he was obliged to sue for peace. This continued for nine years, at the end of which the war was renewed with various success. It continued with little interruption till the year before Christ 376, when the Syracusan state being rent by civil dissensions, the Carthaginians thought it a proper time to exert themselves, in order to become masters of the whole island. They fitted out a great fleet, and entered into alliance with Icetas, tyrant of Leontini, who pretended to have taken Syracuse under his protection. By this treaty, the two powers engaged to assist each other, in order to expel Dionysius II. after which they were to divide

27 Syracusans assisted by the Corinthians.

the island between them. The Syracusans applied for succours to the Corinthians: and they readily sent them a body of troops under the command of Timoleon, an experienced general. By a stratagem, he got his forces landed at Taurominium. The whole of them did not exceed 1200 in number; yet with these he marched against Icetas, who was at the head of 5000 men: his army he surprised at supper, put 300 of them to the sword, and took 600 prisoners. He then marched to Syracuse, and broke into one part of the town before the enemy had any notice of his approach: here he took post, and defended himself with such resolution, that he could not be dislodged by the united power of Icetas and the Carthaginians.

28 Foolish conduct of the Carthaginian admiral.

In this place he remained for some time, in expectation of a reinforcement from Corinth; till the arrival of which he did not judge it practicable to extend his conquests.—The Carthaginians, being apprised that the Corinthian succours were detained by tempestuous weather at Thurium, posted a strong squadron, under Hanno their admiral, to intercept them in their passage to Sicily. But that commander, not imagining the Corinthians would attempt a passage to Sicily in such a stormy season, left his station at Thurium, and ordering his seamen to crown themselves with garlands, and adorn their vessels with bucklers both of the Greek and Carthaginian form, sailed to Syracuse in a triumphant manner. Upon his arrival there, he gave the troops in the citadel to understand that he had taken the succours Timoleon expected, thinking by this means to intimidate them to surrender. But, while he thus trifled away his time, the Corinthians marched with great expedition to Rhegium, and, taking the advantage of a gentle breeze, were easily wafted over into Sicily. Mago, the Carthaginian general, was no sooner informed of the arrival of this reinforcement, than he was struck with terror, though the whole Corinthian army did not exceed 4000 men; and soon after, fearing a revolt of his mercenaries, he weighed anchor, in spite of all the remonstrances of Icetas, and set sail for Africa. Here he no sooner arrived, than, overcome with grief and shame for his unparalleled cowardice, he laid violent hands on himself. His body was hung upon a gallows or cross, in order to deter succeeding generals from forfeiting their honour in so flagrant a manner.

29 Cowardice of Mago.

30 Exploits of Timoleon.

After the flight of Mago, Timoleon carried all before him. He obliged Icetas to renounce his alliance with the state of Carthage, and even deposed him, and continued his military preparations with the greatest vigour. On the other hand, the Carthaginians prepared for the ensuing campaign with the greatest alacrity. An army of 70,000 men was sent over with a fleet of 200 ships of war, and 1000 transports laden with warlike engines, armed chariots, horses, and all other sorts of provisions. This immense multitude, however, was overthrown on the banks of the Crimesus by Timoleon: 10,000 were left dead on the field of battle; and of these above 3000 were native Carthaginians of the best families in the city. Above 15,000 were taken prisoners; all their baggage and provisions, with 200 chariots, 1000 coats of mail, and 10,000 shields, fell into Timoleon's hands. The spoil, which consisted chiefly of gold and silver, was so immense, that the whole Sicilian army was three days in collecting it and stripping the slain. After this signal victory, he left his mercenary forces upon the frontiers of the enemy, to plunder and ravage the country; while he himself returned to Syracuse with the rest of his army, where he was received with the greatest demonstrations of joy. Soon after, Icetas, grown weary of his private station, concluded a new peace with the Carthaginians; and, having assembled an army, ventured an engagement with Timoleon: but in this he was utterly defeated; and himself, with Eupolemus his son, and Euthymus general of his horse, were brought bound to Timoleon by their own soldiers. The two first were immediately executed as tyrants and traitors, and the last murdered in cold blood; Icetas's wives and daughters were likewise cruelly put to death after a public trial. In a short time after, Mamercus, another of the Carthaginian confederates, was overthrown by Timoleon, with the loss of 2000 men.

31 Peace concluded.

These misfortunes induced the Carthaginians to conclude a peace on the following terms: That all the Greek cities should be set free; that the river Halycus should be the boundary between the territories of both parties; that the natives of cities subject to the Carthaginians

Carthaginians should be allowed to withdraw, if they pleased, to Syracuse or its dependencies, with their families and effects; and, lastly, that Carthage should not, for the future, give any assistance to the remaining tyrants against Syracuse.

32 War renewed. About 316 years before Christ, we find the Carthaginians engaged in another bloody war with the Sicilians, on the following occasion; Sosistratus, who had usurped the supreme authority at Syracuse, having been forced by Agathocles to raise the siege of Rhegium, returned with his shattered troops to Sicily. But soon after this unsuccessful expedition he was obliged to abdicate the sovereignty and quit Syracuse. With him were expelled above 600 of the principal citizens, who were suspected of having formed a design to overturn the plan of government which then prevailed in the city. As Sosistratus and the exiles thought themselves ill treated, they had recourse to the Carthaginians, who readily espoused their cause. Hereupon the Syracusans, having recalled Agathocles, who had before been banished by Sosistratus, appointed him commander in chief of all their forces, principally on account of the known aversion he bore that tyrant. The war, however, did not then continue long; for Sosistratus and the exiles were quickly received again into the city, and peace was concluded with Carthage:

33 Agathocles raises himself to the throne of Syracuse. The people of Syracuse, however, finding that Agathocles wanted to make himself absolute, exacted an oath from him, that he would do nothing to the prejudice of the democracy. But, notwithstanding this oath, Agathocles pursued his purpose, and by a general massacre of the principal citizens of Syracuse, raised himself to the throne. For some time he was obliged to keep the peace he had concluded with Carthage; but at last, finding his authority established, and that his subjects were ready to second his ambitious designs, he paid no regard to his treaties, but immediately made war on the neighbouring states, which he had expressly agreed not to do, and then carried his arms into the very heart of the island. In these expeditions he was attended with such success, that in two years time he brought into subjection all the Greek part of Sicily. This being accomplished, he committed great devastations in the Carthaginian territories, their general Hamilcar not offering to give him the least disturbance. This perfidious conduct greatly incensed the people of those districts against Hamilcar, whom they accused before the senate. He died, however, in Sicily; and Hamilcar the son of Gisco was appointed to succeed him in the command of the forces. The last place that held out against Agathocles was Messana, whither all the Syracusan exiles had retired. Pasiphilus, Agathocles's general, found means to cajole the inhabitants into a treaty: which Agathocles, according to custom, paid no regard to, but, as soon as he was in possession of the town, cut off all those who had opposed his government. For, as he intended to prosecute the war with the utmost vigour against Carthage, he thought it a point of good policy to destroy as many of his Sicilian enemies as possible.

34 Defeated by the Carthaginians, and besieged in Syracuse. The Carthaginians in the mean time having landed a powerful army in Sicily, an engagement soon ensued, in which Agathocles was defeated with the loss of 7000 men. After this defeat he was obliged to shut himself up in Syracuse, which the Carthaginians immediately invested, and most of the Greek states in the island submitted to them.

Agathocles, seeing himself stripped of almost all his dominions, and his capital itself in danger of falling into the hands of the enemy, formed a design, which, were it not attested by writers of undoubted authority, would seem absolutely incredible. This was no less than to transfer the war into Africa, and lay siege to the enemy's capital, at a time when he himself was besieged, and only one city left to him in all Sicily. 35 He invades Africa. Before he departed, however, he made all the necessary preparations for the defence of the place, and appointed his brother Antandrus governor of it. He also gave permission to all who were not willing to stand the fatigues of a siege to retire out of the city. Many of the principal citizens, Justin says 1600, accepted of this offer: but they were no sooner got out of the place, than they were cut off by parties posted on the road for that purpose. Having seized upon their estates, Agathocles raised a considerable sum, which was intended in some measure to defray the expence of the expedition: however, he carried with him only 50 talents to supply his present wants, being well assured that he should find in the enemy's country whatever was necessary for his subsistence. As the Carthaginians had a much superior fleet, they for some time kept the mouth of the harbour blocked up; but at last a fair opportunity offered; and Agathocles hoisting sail, by the activity of his rowers soon got clear both of the port and city of Syracuse. The Carthaginians pursued him with all possible expedition; but notwithstanding their utmost efforts, Agathocles got his troops landed with very little opposition.

Soon after his forces were landed, Agathocles burnt his fleet, probably that his soldiers might behave with the greater resolution, as they saw no possibility of flying from their danger. 36 He burns his fleet. He first advanced to a place called the Great City. This, after a feeble resistance, he took and plundered. From hence he marched to Tunis, which surrendered on the first summons; and Agathocles levelled both places with the ground.

The Carthaginians were at first thrown into the greatest consternation; but, soon recovering themselves, the citizens took up arms with so much alacrity, that in a few days they had on foot an army of 40,000 foot and 1000 horse, with 2000 armed chariots. The command of this army they entrusted to Hanno and Bomilcar, two generals between whom there subsisted a great animosity. This occasioned the defeat of their whole army, with the loss of their camp, though all the forces of Agathocles did not exceed 14,000 in number. 37 Carthaginians defeated. Among other rich spoils the conqueror found many chariots of curious workmanship, which carried 20,000 pair of fetters and manacles that the enemy had provided for the Sicilian prisoners. After this defeat, the Carthaginians, supposing themselves to have fallen under the displeasure of their deities on account of their neglecting to sacrifice children of noble families to them, resolved to expiate this guilt. 38 Their method of appeasing their deities. Accordingly 200 children of the first rank were sacrificed to their bloody gods, besides 300 other persons who voluntarily offered themselves to pacify the wrath of these deities.

After these expiations, Hamilcar was recalled from Sicily.

Carthage. Sicily. When the messengers arrived, Hamilcar commanded them not once to mention the victory of Agathocles; but, on the contrary, to give out among the troops that he had been entirely defeated, his forces all cut off, and his fleet destroyed by the Carthaginians. This threw the Syracusans into the utmost despair; however, one Eurymnon, an Etolian, prevailed upon Antandrus not to consent to a capitulation, but to stand a general assault. Hamilcar being informed of this, prepared his battering engines, and made all the necessary preparations to storm the town without delay. But while matters remained in this situation, a galley, which Agathocles had caused to be built immediately after the battle, got into the harbour of Syracuse, and acquainted the inhabitants with the certainty of Agathocles's victory. Hamilcar, observing that the garrison flocked down to the port on this occasion, and expecting to find the walls unguarded, ordered his soldiers to erect scaling ladders, and begin the intended assault. The enemy having left the ramparts quite exposed, the Carthaginians mounted them without being discerned, and had almost possessed themselves of an entire part lying between two towers, when the patrole discovered them. Upon this, a warm dispute ensued; but at last the Carthaginians were repulsed with loss. Hamilcar, therefore, finding it in vain to continue the siege after such glad tidings had restored life and soul to the Syracusans, drew off his forces, and sent a detachment of 5000 men to reinforce the troops in Africa. He still entertained hopes, however, that he might oblige Agathocles to quit Africa, and return to the defence of his own dominions. He spent some time in making himself master of such cities as sided with the Syracusans; and, after having brought all their allies under subjection, returned again to Syracuse, hoping to surprise it by an attack in the night-time. But being attacked while advancing through narrow passes, where his numerous army had not room to act, he was defeated with great slaughter, and himself taken prisoner, carried into Syracuse, and put to death.

39 Hamilcar makes an assault on Syracuse.

40 He raises the siege.

41 Is defeated, and taken prisoner, and put to death.

42 Agrigentines attempt the sovereignty of Sicily.

In the mean time the Agrigentines, finding that the Carthaginians and Syracusans had greatly weakened each other by this war, thought it a proper opportunity to attempt the sovereignty of the whole island. They therefore commenced a war against both parties; and prosecuted it with such success, that in a short time they wrested many places of note both out of the hands of the Syracusans and Carthaginians.

43 Success of Agathocles in Africa.

In Africa the tyrant carried every thing before him. He reduced most of the places of any note in the territory of Carthage; and hearing that Elymas king of Libya had declared against him, he immediately entered Libya Superior, and in a great battle overthrew that prince, putting to the sword a good part of his troops, and the general who commanded them; after which he advanced against the Carthaginians with such expedition, that he surprised and defeated them with the loss of 2000 killed, and a great number taken prisoners. He next prepared for the siege of Carthage itself; and in order thereto advanced to a post within five miles of that city. On the other hand, notwithstanding the great losses they had already sustained, the Carthaginians, with a powerful army, encamped between him and their capital. In this situation Agathocles received advice of the defeat of the Carthaginian forces before Syracuse, and the head of Hamilcar their general. Upon this he immediately rode up to the enemy's camp, and showing them the head, gave them an account of the total destruction of their army before Syracuse. This threw them into such consternation, that in all human probability Agathocles would have made himself master of Carthage, had not an unexpected mutiny arisen in his camp, which gave the Carthaginians an opportunity of recovering from their terror.

The year following an engagement happened, in which neither party gained any great advantage: but soon after, the tyrant, notwithstanding all his victories, found himself unable to carry on the war alone: and therefore endeavoured to gain over to his interest Ophellas, one of the captains of Alexander the Great. In this he perfectly succeeded; and to succour his new ally the more effectually, Ophellas sent to Athens for a body of troops. Having finished his military preparations, Ophellas found his army to consist of 10,000 foot and 600 horse, all regular troops, besides 100 chariots, and a body of 10,000 men, attended by their wives and children, as though he had been going to plant a new colony. At the head of these forces he continued his march towards Agathocles for 18 days; and then encamped at Automale, a city about 3000 stadia distant from the capital of his dominions. From thence he advanced through the Regio Syrtica; but found himself reduced to such extremities, that his army was in danger of perishing for want of bread, water, and other provisions. They were also greatly annoyed by serpents and wild beasts, with which that desert region abounded. The serpents made the greatest havock among the troops; for, being of the same colour with the earth, and extremely venomous, many soldiers, who trod upon them without seeing them, were stung to death. At last, after a very fatiguing march of two months, he approached Agathocles, and encamped at a small distance from him, to the no small terror of the Carthaginians, who apprehended the most fatal consequences from this junction. Agathocles at first caressed him, and advised him to take all possible care of his troops that had undergone so many fatigues; but soon after cut him off by treachery, and then by fair words and promises persuaded his troops to serve under himself.

44 He makes an alliance with Ophellas;

45 whom he treacherously murders.

Agathocles, now finding himself at the head of a numerous army, assumed the title of king of Africa, intending soon to complete his conquests by the reduction of Carthage. He began with the siege of Utica, which was taken by assault. After this he marched against Hippo Diarrhytus, the Biserta of the moderns, which was also taken by storm; and after this most of the people bordering upon the sea coasts, and even those who inhabited the inland parts of the country, submitted to him. But in the midst of this career of success, the Sicilians formed an association in favour of liberty; which obliged the tyrant to return home, leaving his son Archagathus to carry on the war in Africa.

46 Is obliged to return home.

Archagathus, after his father's departure, greatly extended the African conquests. He sent Eumachus at the head of a large detachment to invade some of the neighbouring provinces, while he himself, with the

47 Success of Archagathus.

Cart ge.

the greatest part of his army, observed the motions of the Carthaginians. Eumachus falling into Numidia, first took the great city of Tocas, and conquered several of the Numidian cantons. Afterwards he besieged and took Phillina; which was attended with the submission of the Asphodelodians, a nation, according to Diodorus, as black as the Ethiopians. He then reduced several cities; and being at last elated with such a run of good fortune, resolved to penetrate into the most remote parts of Africa. Here he at first met with success; but hearing that the barbarous nations were advancing in a formidable body to give him battle, he abandoned his conquests, and retreated with the utmost precipitation towards the sea coasts, after having lost abundance of men.

He i edu- ced the utmc dis- tress

This unfortunate expedition made a great alteration for the worse in the affairs of Archagathus. The Carthaginians being informed of Eumachus's bad success, resolved to exert themselves in an extraordinary manner to repair their former losses. They divided their forces into three bodies: one of these they sent to the sea coasts, to keep the towns there in awe; another they dispatched into the mediterranean parts, to preserve the allegiance of the inhabitants there; and the last body they ordered to the Upper Africa, to support their confederates in that country. Archagathus, being apprised of the motions of the Carthaginians, divided his forces likewise into three bodies. One of these he sent to observe the Carthaginian troops on the sea coasts, with orders to advance afterwards into the Upper Africa; another under the command of Æschrion, one of his generals, he posted at a proper distance in the heart of the country, to have an eye both on the enemy there and the barbarous nations; and with the last, which he led in person, he kept near Carthage, preserving a communication with the other two, in order to send them succours, or recal them, as the exigency of affairs should require.—The Carthaginian troops sent into the heart of the country, were commanded by Hanno, a general of great experience, who being informed of the approach of Æschrion, laid an ambuscade for him, into which he was drawn, and cut off with 4000 foot and 200 horse. Himilco, who commanded the Carthaginian forces in Upper Africa, having advice of Eumachus's march, immediately advanced against him. An engagement ensued, in which the Greeks were almost totally cut off, or perished with thirst after the battle; out of 8000 foot only 30, and of 800 horse only 40, having the good fortune to make their escape.

Archagathus receiving the melancholy news of these two defeats, immediately called in the detachments he had sent out to harass the enemy, which would otherwise have been instantly cut off. He was, however, in a short time hemmed in on all sides, in such a manner as to be reduced to the last extremity for want of provisions, and ready every moment to be swallowed up by the numerous forces which surrounded him. In this deplorable situation Agathocles received an express from Archagathus, acquainting him of the losses he had sustained, and the scarcity of provisions he laboured under. Upon this the tyrant, leaving the care of the Sicilian war to one Leptines, by a stratagem got 18 Etruscan ships that came to his assistance out of the harbour; and then engaging the Carthaginian squadron which lay in its neighbourhood, took five of their ships, and made all their men prisoners. By this means he became master of the port, and secured a passage into it for the merchants of all nations, which soon restored plenty to that city, where the famine before had begun to make great havock. Supplying himself, therefore, with a sufficient quantity of necessaries for the voyage he was going to undertake, he immediately set sail for Africa.

49 Agathocles arrives in Africa.

Upon his arrival in this country, Agathocles reviewed his forces, and found them to consist of 6000 Greeks, as many Samnites, Celtes, and Etruscans; besides 10,000 Africans, and 1500 horse. As he found his troops almost in a state of despair, he thought this a proper time for offering the enemy battle. The Carthaginians, however, did not think proper to accept the challenge; especially as, by keeping close in their camp, where they had plenty of every thing, they could starve the Greeks to a surrender without striking a stroke. Upon this Agathocles attacked the Carthaginian camp with great bravery, made a considerable impression upon it, and might perhaps have carried it, had not his mercenaries deserted him almost at the first onset. By this piece of cowardice he was forced to retire with precipitation to his camp, whither the Carthaginians pursued him very closely, doing great execution in the pursuit.

50 Attacks the enemy without success.

51 Disaster in the Carthaginian camp.

The next night, the Carthaginians sacrificed all the prisoners of distinction as a grateful acknowledgment to the gods for the victory they had gained. While they were employed in this inhuman work, the wind, suddenly rising, carried the flames to the sacred tabernacle near the altar, which was entirely consumed, as well as the general's tent, and those of the principal officers adjoining to it. A dreadful alarm took place through the whole camp, which was heightened by the great progress the fire made. For the soldiers tents consisting of very combustible materials, and the wind blowing in a most violent manner, the whole camp was almost entirely reduced to ashes; and many of the soldiers, endeavouring to carry off their arms, and the rich baggage of their officers, perished in the flames. Some of those who made their escape met with a fate equally unhappy; for, after Agathocles had received the last blow, the Africans deserted him, and were in that instant coming over in a body to the Carthaginians. These, the persons who were flying from the flames took to be the whole Syracusan army advancing in order of battle to attack their camp. Upon this a dreadful confusion ensued. Some took to their heels; others fell down in heaps one upon another; and others engaged their comrades, mistaking them for the enemy. Five thousand men lost their lives in this tumult, and the rest thought proper to take refuge within the walls of Carthage; nor could the appearance of daylight, for some time, dissipate their terrible apprehensions. In the mean time the African deserters, observing the great confusion the Carthaginians were in, and not knowing the meaning of it, were so terrified, that they thought proper to return to the place from whence they came. The Syracusans, seeing a body of troops advancing towards them in good order, concluded that the enemy were

52 Another in that of Agathocles.

Carthage. were marching to attack them, and therefore immediately cried out, "To arms." The flames ascending out of the Carthaginian camp into the air, and the lamentable outcries proceeding from thence, confirmed them in this opinion, and greatly heightened their confusion. The consequence was much the same as in the Carthaginian camp; for coming to blows with one another instead of the enemy, they scarce recovered their senses upon the return of light, and the intestine fray was so bloody that it cost Agathocles 4000 men.

53 He esapes privately.

The last disaster so disheartened the tyrant, that he immediately set about contriving means for making his escape privately; and this he at last, though with great difficulty, effected. After his departure, his two sons were immediately put to death by the soldiers, who, choosing a leader from among themselves, made peace with the Carthaginians upon the following conditions: 1. That the Greeks should deliver up all the places they held in Africa, receiving from them 300 talents: 2. That such of them as were willing to serve in the Carthaginian army should be kindly treated, and receive the usual pay; and, 3. That the rest should be transported to Sicily, and have the city of Selinus for their habitation.

54 Causes of the first Punic war.

From this time to that of their first war with the Romans, we find nothing remarkable in the history of the Carthaginians. The first Punic war, as it is commonly called, happened about 255 years before Christ. At that time the Carthaginians were possessed of extensive dominions in Africa; they had made considerable progress in Spain; were masters of Sardinia, Corsica, and all the islands on the coast of Italy; and had extended their conquests to a great part of Sicily. The occasion of the first rupture between the two republics was as follows: The Mamertines being vanquished in battle, and reduced to great straits by Hiero king of Syracuse, had resolved to deliver up Messina, the only city they now possessed, to that prince, with whose mild government and strict probity they were well acquainted. Accordingly, Hiero was advancing at the head of his troops to take possession of the city, when Hannibal, who at that time commanded the Carthaginian army in Sicily, prevented him by a stratagem. He came to meet Hiero, as it were, to congratulate him on his victory; and amused him, while some of the Carthaginian troops filed off towards Messina. Hereupon the Mamertines, seeing their city supported by a new reinforcement, were divided into several opinions. Some were for accepting the protection of Carthage; others were for surrendering to the king of Syracuse; but the greater part were for calling in the Romans to their assistance. Deputies were accordingly dispatched to Rome, offering the possession of the city to the Romans, and in the most moving terms imploring protection. This, after some debate, was agreed to; and the consul Appius Claudius received orders to attempt a passage to Sicily at the head of a powerful army. Being obliged to stay some time at Rome, however, one Caius Claudius, a person of great intrepidity and resolution, was dispatched with a few vessels to Rhegium. On his arrival there, he observed the Carthaginian squadron to be so much superior to his own, that he thought it would be little better than madness to attempt at that time to transport forces to Sicily. He crossed the straits, however, and had a conference with the Mamertines, in which he prevailed upon them all to accept of the protection of Rome; and on this he made the necessary preparations for transporting his forces. The Carthaginians, being informed of the resolution of the Romans, sent a strong squadron of galleys under the command of Hanno to intercept the Roman fleet; and accordingly the Carthaginian admiral, coming up with them near the coast of Sicily, attacked them with great fury. During the engagement, a violent storm arose, which dashed many of the Roman vessels against the rocks, and did a vast deal of damage to their squadron; by which means Claudius was forced to retire to Rhegium, and this he accomplished with great difficulty. Hanno restored all the vessels he had taken; but ordered the deputies sent with them to expostulate with the Roman general upon the infraction of the treaties subsisting between the two republics. This expostulation, however just, produced an open rupture: Claudius soon after possessing himself of Messina.

55 Hanno intercepts the Roman fleet.

56 Carthaginians and Syracusans defeated by the Romans.

Such was the beginning of the first Punic war, which is said to have lasted 24 years. The first year, the Carthaginians and Syracusans laid siege to Messina; but not acting in concert, as they ought to have done, were overthrown by the consul Appius Claudius; and this defeat so much disgusted Hiero with the Carthaginians, that he soon after concluded an alliance with the Romans. After this treaty, having no enemy to contend with but the Carthaginians, the Romans made themselves masters of all the cities on the western coast of Sicily, and at the end of the campaign carried back most of their troops with them to take up their winter quarters in Italy.

57 Agrigentum taken by the Romans.

The second year, Hanno the Carthaginian general fixed his principal magazine at Agrigentum. This place was very strong by nature, had been rendered almost impregnable by the new fortification raised by the Carthaginians during the preceding winter, and was defended by a numerous garrison, commanded by one Hannibal, a general of great experience in war. For five months the Romans attempted to reduce the place by famine, and had actually brought the inhabitants to great distress, when a Carthaginian army of 50,000 foot, 6000 horse, and 60 elephants, landed at Lilybæum, and from thence marched to Heraclea, within 20 miles of Agrigentum. There the general received a deputation from some of the inhabitants of Erbessa, where the Romans had their magazines, offering to put the town into his hands. It was accordingly delivered up; and by this means the Romans became so much distressed, that they had certainly been obliged to abandon their enterprise, had not Hiero supplied them with provisions. But all the assistance he was able to give could not long have supported them, as their army was so much weakened by disorders occasioned by famine, that out of 100,000 men, of whom it originally consisted, scarce a fourth part remained fit for service, and could no longer subsist on such parsimonious supplies. But in the mean time Hannibal acquainted Hanno that the city was reduced to the utmost distress; upon which he resolved to venture an engagement, which he had before declined. In this the Romans were victorious, and the city surrendered

Carthage. rendered at discretion, though Hannibal with the greatest part of the garrison, made their escape. This ended the campaign; and the Carthaginians being greatly chagrined at their bad success, fined Hanno of an immense sum of money, and deprived him of his command, appointing Hamilcar to succeed him in the command of the land army, and Hannibal in that of the fleet.

58
The third year, Hannibal received orders to ravage the coast of Italy; but the Romans had taken care to post detachments in such places as were most proper to prevent his landing, so that the Carthaginian found it impossible to execute his orders. At the same time, the Romans, perceiving the advantages of being masters of the sea, set about building 120 galleys. While this was doing, they made themselves masters of most of the inland cities, but the Carthaginians reduced or kept steady in their interest most of the maritime ones; so that both parties were equally successful during this campaign.

The fourth year, Hannibal by a stratagem made himself master of 17 Roman galleys; after which he committed great ravages on the coast of Italy, whither he had advanced to take a view of the Roman fleet.

59
But he was afterwards attacked in his turn, lost the greatest part of his ships, and with great difficulty made his own escape. Soon after he was totally defeated by the consul Duillius, with the loss of 80 ships taken, 13 sunk, 7000 men killed, and as many taken prisoners. After this victory Duillius landed in Sicily, put himself at the head of the land forces, relieved Segesta, besieged by Hamilcar, and made himself master of Macella, though defended by a numerous garrison.

60
The fifth year a difference arose between the Romans and their Sicilian allies, which came to such a height that they encamped separately. Of this Hamilcar availed himself, and attacking the Sicilians in their entrenchments, put 4000 of them to the sword. He then drove the Romans from their posts, took several cities from them, and overran the greatest part of the country. In the mean time, Hannibal, after his defeat, sailed with the shattered remains of his fleet to Carthage: but, in order to secure himself from punishment, he sent one of his friends with all speed, before the event of the battle was known there, to acquaint the senate, that the Romans had put to sea with a good number of heavy ill-built vessels, each of them carrying some machine, the use of which the Carthaginians did not understand; and asked whether it was the opinion of the senate that Hannibal should attack them? These machines were the *corvi*, which were then newly invented, and by means of which, chiefly, Duillius had gained the victory. The senate were unanimous in their opinion that the Romans should be attacked; upon which the messenger acquainted them with the unfortunate event of the battles. As the senators had already declared themselves for the engagement, they spared their general's life, and, according to Polybius, even continued him in the command of the fleet. In a short time, being reinforced by a good number of galleys, and attended by some officers of great merit, he sailed for the coast of Sardinia. He had not been long here before he was surprised by the Romans, who carried off many of his ships, and took great numbers of his men prisoners. This so incensed the rest, that they seized their unfortunate admiral, and crucified him; but who was his immediate successor does not appear.

61 Corsica and Sardinia reduced by the Romans.
The sixth year, the Romans made themselves masters of the islands of Corsica and Sardinia. Hanno, who commanded the Carthaginian forces in the latter, defended himself at a city called Olbia with incredible bravery; but being at last killed in one of the attacks, the place was surrendered, and the Romans soon became masters of the whole island.

62 The Roman army in great danger.
The seventh year, the Romans took the town of Mytestratum, in Sicily, from whence they marched towards Camarina, but in their way were surrounded in a deep valley, and in the most imminent danger of being cut off by the Carthaginian army.

63 Rescued by the bravery of a legionary tribune.
In this extremity, a legionary tribune, by name *M. Calpurnius Flamma*, desired the general to give him 300 chosen men, promising, with this small company, to find the enemy such employment as should oblige them to leave a passage open for the Roman army. He performed his promise with a bravery truly heroic; for having seized, in spite of all opposition, an eminence, and intrenched himself on it, the Carthaginians, jealous of his design, flocked from all quarters to drive him from his post. But the brave tribune kept their whole army in play, till the consul, taking advantage of the diversion, drew his army out of the bad situation into which he had imprudently brought it. The legions were no sooner out of danger, than they hastened to the relief of their brave companions: but all they could do was to save their bodies from the insults of their enemies; for they found them all dead on the spot, except Calpurnius, who lay under a heap of dead bodies all covered with wounds, but still breathing. His wounds were immediately dressed, and it fortunately happened that none of them proved mortal; and for this glorious enterprise he received a crown of *gramen*. After this the Romans reduced several cities, and drove the enemy quite out of the territory of the Agrigentines; but were repulsed with great loss before Lipara.

64 Carthaginians defeated at sea by the Romans.
The eighth year, Regulus, who commanded the Roman fleet, observing that of the Carthaginians lying along the coast in disorder, sailed with a squadron of ten galleys, to observe their number and strength, ordering the rest of the fleet to follow him with all expedition. But as he drew too near the enemy, he was surrounded by a great number of Carthaginian galleys. The Romans fought with their usual bravery; but being overpowered with numbers, were obliged to yield. The consul, however, found means to make his escape, and join the rest of the fleet; and then had his full revenge of the enemy, 18 of their ships being taken, and eight sunk.

65 Regulus invades Africa.
The ninth year, the Romans made preparations for invading Africa. Their fleet for this purpose consisted of 330 galleys, each of them having on board 120 soldiers and 300 rowers. The Carthaginian fleet consisted of 360 sail, and was much better manned than that of the Romans. The two fleets met near Ecnomus, a promontory in Sicily; where, after a bloody engagement, which lasted the greater part of the day, the Carthaginians were entirely defeated, with the loss of 30 galleys sunk, and 63 taken, with all their men.

Carthage. men. The Romans lost only 24 galleys, which were all sunk.—After this victory, the Romans having refitted their fleet, set sail for the coast of Africa with all expedition. The first land they got sight of was Cape Hermea, where the fleet lay at anchor for some time, waiting till the galleys and transports came up. From thence they coasted along till they arrived before Clupea, a city to the east of Carthage, where they made their first descent.

66 Carthaginians in great consternation.

No words can express the consternation of the Carthaginians on the arrival of the Romans in Africa. The inhabitants of Clupea were so terrified, that, according to Zonaras, they abandoned the place, which the Romans immediately took possession of. Having left there a strong garrison to secure their shipping, and keep the adjacent territory in awe, they moved nearer Carthage, taking a great number of towns; they likewise plundered a prodigious number of villages, laid vast numbers of noblemen's seats in ashes, and took above 20,000 prisoners. In short, having plundered and ravaged the whole country, almost to the gates of Carthage, they returned to Clupea loaded with the immense booty they had acquired in the expedition.

67 Success of Regulus.

The tenth year, Regulus pushed on his conquests with great rapidity. To oppose his progress, Hamilcar was recalled from Sicily, and with him Bostar and Asdrubal were joined in command. Hamilcar commanded an army just equal to that of Regulus. The other two commanded separate bodies, which were to join him or act apart as occasion required. But, before they were in a condition to take the field, Regulus, pursuing his conquests, arrived on the banks of the *Bagrada*, a river which empties itself into the sea at a small distance from Carthage. Here he had a monstrous serpent to contend with, which, according to the accounts of those days, infected the waters of the river, poisoned the air, and killed all other animals with its breath alone. When the Romans went to draw water, this huge dragon attacked them; and twisting itself round their bodies, either squeezed them to death, or swallowed them alive. As its hard and thick scales were proof against their darts and arrows, they were forced to have recourse to the balistæ, which they made use of in sieges to throw great stones, and to beat down the walls of besieged cities. With these they discharged showers of huge stones against this new enemy, and had the good luck with one of them, to break his back-bone; which disabled him from twisting and winding his immense body, and by that means gave the Romans an opportunity of approaching and dispatching him with their darts. But his dead body corrupted the air and the water of the river; and spread so great an infection over the whole country, that the Romans were obliged to decamp. We are told that Regulus sent to Rome the skin of this monster, which was 120 feet long; and that it was hung up in a temple, where it was preserved to the time of the Numantine war.

68 He kills a monstrous serpent.

69 Defeats the Carthaginians;

Having passed this river, he besieged *Adis*, or *Adda*, not far from Carthage, which the enemy attempted to relieve; but as they lay encamped among hills and rocks, where their elephants, in which the main strength of their army consisted, could be of no use, Regulus attacked them in their camp, killed 17,000 of them, and took 5000 prisoners, and 18 elephants. Upon the fame of this victory, deputations came from all quarters, insomuch that the conqueror in a few days became master of 80 towns: among which were the city and port of Utica. This increased the alarm at Carthage; which was reduced to despair, when Regulus laid siege to Tunis, a great city about nine miles from the capital. The place was taken in sight of the Carthaginians, who, from their walls, beheld all the operations of the siege, without making the least attempt to relieve it. And to complete their misfortunes, the Numidians, their neighbours, and implacable enemies, entered their territories, committing every where the most dreadful devastations, which soon occasioned a great scarcity of provisions in the city. The public magazines were soon exhausted; and, as the city was full of selfish merchants, who took advantage of the public distress, to sell provisions at an exorbitant price, a famine ensued, with all the evils which attend it.

70 and reduces them to the utmost despair.

71 His proposals of peace rejected.

In this extremity Regulus advanced to the very gates of Carthage; and, having encamped under the walls, sent deputies to treat of a peace with the senate. The deputies were received with inexpressible joy; but the conditions they proposed were such that the senate could not hear them without the greatest indignation. They were, 1. That the Carthaginians should relinquish all claims to Sardinia, Corsica, and Sicily. 2. That they should restore to the Romans all the prisoners they had taken from them since the beginning of the war. 3. That if they cared to redeem any of their own prisoners, they should pay so much a head for them as Rome should judge reasonable. 4. That they should for ever pay the Romans an annual tribute. 5. That for the future they should fit out but one man of war for their own use, and 50 triremes to serve in the Roman fleet, at the expence of Carthage, when required by any of the future consuls. These extravagant demands provoked the senators, who loudly and unanimously rejected them; the Roman deputies, however, told them that Regulus would not alter a single letter of the proposals, and that they must either conquer the Romans or obey them.

72 Xanthippus appointed to command the Carthaginian army.

In this extreme distress, some mercenaries arrived from Greece, among whom was a Lacedemonian, by name Xanthippus, a man of great valour and experience in war. This man having informed himself of the circumstances of the late battle, declared publicly, that their overthrow was more owing to their own misconduct than to the superiority of the enemy. This discourse being spread abroad, came at last to the knowledge of the senate; and by them, and even by the desire of the Carthaginian generals themselves, Xanthippus was appointed commander in chief of their forces. His first care was to discipline his troops in a proper manner. He taught them how to march, encamp, widen and close their ranks, and rally after the Lacedemonian manner under their proper colours. He then took the field with 12,000 foot, 4000 horse, and 100 elephants. The Romans were surprised at the sudden alteration they observed in the enemy's conduct; but Regulus, elated with his last success, came and encamped at a small distance from the Carthaginian army in a vast plain, where their elephants and

Ca age.

and horse had room to act. The two armies were parted by a river, which Regulus boldly passed, by which means he left no room for a retreat in case of any misfortune. The engagement began with great fury; but ended in the total defeat of the Romans, who, except 2000 that escaped to Clupea, were all killed or taken prisoners, and among the latter was Regulus himself. The loss of the Carthaginians scarce exceeded 800 men.

3 Th to- ma ut- ter le- fea , and Re lus tak .

The Carthaginians remained on the field of battle till they had stripped the slain; and then entered their metropolis, which was almost the only place left them, in great triumph. They treated all their prisoners with great humanity, except Regulus; but as for him, he had so insulted them in his prosperity, that they could not forbear showing the highest marks of their resentment. According to Zonaras and others, he was thrown into a dungeon, where he had only sustenance allowed him barely sufficient to keep him alive. Nay, his cruel masters, to heighten his other torments, ordered a huge elephant (at the sight of which animal, it seems, he was greatly terrified) to be constantly placed near him; which prevented him from enjoying any tranquillity or repose.

4 He cruel- ly d.

The eleventh year of this war, the Carthaginians, elated with their victory over Regulus, began to talk in a very high strain, threatening Italy itself with an invasion. To prevent this, the Romans took care to garrison all their maritime towns, and fitted out a new fleet. In the mean time, the Carthaginians besieged Clupea and Utica in vain, being obliged to abandon their enterprise upon hearing that the Romans were equipping a fleet of 350 sail. The Carthaginians having with incredible expedition refitted their old vessels, and built a good number of new ones, met the Roman fleet off Cape Hermea. An engagement ensued, in which the Carthaginians were utterly defeated; 104 of their ships being sunk, 30 taken, and 15,000 of their soldiers and rowers killed in the action. The Romans pursued their course to Clupea, where they were no sooner landed, than they found themselves attacked by the Carthaginian army, under the two Hannos, father and son. But, as the brave Xanthippus no longer commanded their army, notwithstanding the Lacedemonian discipline he had introduced among them, they were routed at the very first onset, with the loss of 9000 men, and among them many of their chief lords.

5 Ca agini- an efeat- ed sea an and.

Notwithstanding all their victories, however, the Romans found themselves now obliged, for want of provisions, to evacuate both Clupea and Utica, and abandon Africa altogether. Being desirous of signalizing the end of their consulate by some important conquest in Sicily, the consuls steered for that island, contrary to the advice of their pilots, who represented their danger, on account of the season being so far advanced. Their obstinacy proved the destruction of the whole fleet; for a violent storm arising, out of 370 vessels only 80 escaped shipwreck, the rest being swallowed up by the sea, or dashed against the rocks. This was by far the greatest loss that Rome had ever sustained; for besides the ships that were cast away with their crews, a numerous army was destroyed, with all the riches of Africa, which had been by Regulus amassed and deposited in Clupea, and were now from thence transporting to Rome. The whole coast from Pachinum to Camerina was covered with dead bodies and wrecks of ships; so that history can scarce afford an example of such a dreadful disaster.

6 Ro ans ob ed to ab don Af a.

7 Th fleet to y de- st ed by a rm.

The twelfth year, the Carthaginians hearing of this misfortune of the Romans, renewed the war in Sicily with fresh fury, hoping the whole island, which was now left defenceless, would fall into their hands. Carthalo, a Carthaginian commander, besieged and took Agrigentum. The town he laid in ashes, and demolished the walls, obliging the inhabitants to fly to Olympium. Upon the news of this success, Asdrubal was sent to Sicily with a large reinforcement of troops, and 150 elephants. They likewise fitted out a squadron, with which they retook the island of Corcyra, and marched a strong body of forces into Mauritania and Numidia, to punish the people of those countries for showing a disposition to join the Romans. In Sicily the Romans possessed themselves of Cephalodium and Panormus, but were obliged by Carthalo to raise the siege of Drepanum with great loss.

78 Agrigentum taken and destroyed by the Carthaginians.

The 13th year, the Romans sent out a fleet of 260 galleys, which appeared off Lilybæum in Sicily; but finding this place too strong, they steered from thence to the eastern coast of Africa, where they made several descents, surprised some cities, and plundered several towns and villages. They arrived safe at Panormus, and in a few days set sail for Italy, having a fair wind till they came off Cape Palinurus, where so violent a storm overtook them, that 160 of their galleys and a great number of their transports were lost; upon which the Roman senate made a decree, that for the future no more than 50 vessels should be equipped; and that these should be employed only in guarding the coast of Italy, and transporting the troops into Sicily.

79 The Romans fit out a new fleet.

80 Which is again destroyed.

The 14th year, the Romans made themselves masters of Himera and Lipara in Sicily; and the Carthaginians conceiving new hopes of conquering that island, began to make fresh levies in Gaul and Spain, and to equip a new fleet. But their treasures being exhausted, they applied to Ptolemy king of Egypt, intreating him to lend them 2000 talents: but he, being resolved to stand neuter, refused to comply with their request; telling them that he could not, without breach of fidelity, assist one friend against another. However, the republic of Carthage making an effort, equipped a fleet of 200 sail, and raised an army of 30,000 men, horse and foot, and 140 elephants, appointing Asdrubal commander in chief both of the fleet and army. The Romans, then, finding the great advantages of a fleet, resolved to equip one, notwithstanding all former disasters; and while the vessels were building, two consuls were chosen, men of valour and experience, to supersede the acting ones in Sicily. Metellus, however, one of the former consuls, being continued with the title of proconsul, found means to draw Asdrubal into a battle on disadvantageous terms near Panormus, and then sallying out upon him, gave him a most terrible overthrow. Twenty thousand of the enemy were killed, and many elephants. A hundred and four elephants were taken with their leaders, and sent to Rome, where they were hunted and put to death in the circus.

81 They fit out another.

82 Carthaginians utterly defeated.

The 15th year, the Romans besieged Lilybæum; and

Carthage.

and the siege continued during the rest of the first Punic war, and was the only thing remarkable that happened during that time *. The Carthaginians, on the first news of its being besieged, sent Regulus with some deputies to Rome to treat of a peace; but, instead of forwarding the negotiation, he hindered it: and notwithstanding he knew the torments prepared for him at Carthage, could not be prevailed upon to stay at Rome, but returning to his enemies country, was put to a most cruel death.

83 Lilybæum besieged by the Romans.

* See *Lilybæum.*

84 They are defeated at sea by the Carthaginians.

During this siege, the Roman fleet under Claudius Pulcher was utterly defeated by Adherbal the Carthaginian admiral. Ninety of the Roman galleys were lost in the action, 8000 of their men either killed or drowned, and 20,000 taken and sent prisoners to Carthage; and the Carthaginians gained this signal victory without the loss of a single ship, or even a single man.

85 A Roman fleet utterly destroyed by a storm.

Another Roman fleet met with a still severer fate. It consisted of 120 galleys, 800 transports, and was laden with all sorts of military stores and provisions. Every one of these vessels was lost by a storm, with all they contained, not a single plank being saved that could be used again; so that the Romans found themselves once more deprived of their whole naval force.

86 Hamilcar Barcas sent into Sicily.

In the mean time, the Carthaginian soldiery having shown a disposition to mutiny, the senate sent over Hamilcar Barcas, father of the famous Hannibal, to Sicily. He received a charte blanch from the senate to act as he thought proper; and, by his excellent conduct and resolution, showed himself the greatest general of his age. He defended Eryx, which he had taken by surprise, with such vigour, that the Romans would never have been able to make themselves masters of it, had they not fitted out a new fleet at the expence of private citizens, which, having utterly defeated that of the Carthaginians, Hamilcar, notwithstanding all his valour, was obliged to yield up the place which he had so long and so bravely defended.

87 Peace with the Romans.

The following articles of peace were immediately drawn up between the two commanders. 1. The Carthaginians shall evacuate all the places which they have in Sicily, and entirely quit that island. 2. They shall, in 20 years, pay the Romans, at equal payments every year, 2200 talents of silver, that is, 437,250l. sterling. 3. They shall restore the Roman captives and deserters without ransom, and redeem their own prisoners with money. 4. They shall not make war upon Hiero king of Syracuse, or his allies. These articles being agreed to, Hamilcar surrendered Eryx upon condition that all his soldiers should march out with him, upon his paying for each of them 18 *Roman denarii.* Hostages were given on both sides, and deputies were sent to Rome to procure a ratification of the treaty by the senate. After the senators had thoroughly informed themselves of the state of affairs, two more articles were added, viz. 1. That 1000 talents should be paid immediately, and the 2200 in the space of 10 years at equal payments. 2. That the Carthaginians should quit all the little islands about Italy and Sicily, and never more come near them with ships of war, or raise mercenaries in those places. Necessity obliged Hamilcar to consent to these terms; but he returned to Carthage with a hatred to the Romans which he did not even suffer to die with him, but transmitted to his son the great Hannibal.

Carthag

88 Causes o the war with the mercena ries.

The Carthaginians were no sooner got out of this bloody and expensive war than they found themselves engaged in another, which was like to have proved fatal to them. It is called by ancient historians the *Libyan war*, or the *war with the mercenaries.* The principal occasion of it was, that when Hamilcar returned to Carthage, he found the republic so much impoverished, that, far from being able to give these troops the largesses and rewards promised them, it could not pay them their arrears. He had committed the care of transporting them to one *Gisco*, who, being an officer of great penetration, as though he had foreseen what would happen, did not ship them off all at once, but in small and separate parties, that those who came first might be paid off and sent home before the arrival of the rest. The Carthaginians at home, however, did not act with the same prudence. As the state was almost entirely exhausted by the late war, and the immense sum of money, in consequence of the peace, paid to the Romans, they judged it would be a laudable action to save something to the public. They did not therefore pay off the mercenaries in proportion as they arrived, thinking it more proper to wait till they all came together, with a view of obtaining some remission of their arrears. But, being soon made sensible of their wrong conduct on this occasion, by the frequent disorders these barbarians committed in the city, they with some difficulty prevailed upon the officers to take up their quarters at Sicca, and canton their troops in that neighbourhood. To induce them to this, however, they gave them a sum of money for their present subsistence, and promised to comply with their pretensions when the remainder of their troops arrived from Sicily. Here, being wholly immersed in idleness, to which they had long been strangers, a neglect of discipline ensued, and of course a petulant and licentious spirit immediately took place. They were now determined not to acquiesce in receiving their bare pay, but to insist upon the rewards Hamilcar had promised them, and even to compel the state of Carthage to comply with their demands by force of arms.

89 Imprude conduct Hanno.

The senate being informed of the mutinous disposition of the soldiery, dispatched Hanno, one of the suffetes, to pacify them. Upon his arrival at Sicca, he expatiated largely upon the poverty of the state, and the heavy taxes with which the citizens of Carthage were loaded; and therefore, instead of answering their high expectations, he desired them to be satisfied with receiving part of their pay, and remit the remainder to serve the pressing exigencies of the republic. The mercenaries being highly provoked, that neither Hamilcar, nor any other of the principal officers, who commanded them in Sicily, and were the best judges of their merit, made their appearance on this occasion, but only Hanno, a person utterly unknown, and above all others utterly disagreeable to them, immediately had recourse to arms. Assembling therefore in a body, to the number of 20,000, they advanced to Tunis, and immediately encamped before that city.

The Carthaginians, being greatly alarmed at the approach of so formidable a body to Tunis, made large concessions to the mercenaries, in order to bring them back to their duty; but, far from being softened, they grew more insolent upon these concessions, taking

Carthage.

taking them for the effects of fear; and therefore were altogether averse to thoughts of accommodation. The Carthaginians, making a virtue of necessity, showed a disposition to satisfy them in all points, and agreed to refer themselves to the opinion of some general in Sicily, which they had all along desired; leaving the choice of such commander entirely to them. Gisco was accordingly pitched upon to mediate this affair, the mercenaries believing Hamilcar to have been a principal cause of the ill treatment they met with, since he never appeared amongst them, and, according to the general opinion, had voluntarily resigned his commission. Gisco soon arrived at Tunis with money to pay the troops; and, after conferring with the officers of the several nations, apart, he harangued them in such a manner, that a treaty was upon the point of being concluded, when Spendius and Mathos, two of the principal mutineers, occasioned a tumult in every part of the camp. Spendius was by nation a Campanian, who had been a slave at Rome, and had fled to the Carthaginians. The apprehensions he was under of being delivered to his old master, by whom he was sure to be hanged or crucified, prompted him to break off the accommodation. Mathos was an African, and free born; but as he had been active in raising the rebellion, and was well acquainted with the implacable disposition of the Carthaginians, he knew that a peace must infallibly prove his ruin. He therefore joined with Spendius, and insinuated to the Africans the danger of concluding a treaty at that juncture, which could not but leave them singly exposed to the rage of the Carthaginians. This so incensed the Africans, who were much more numerous than the troops of any other nation, that they immediately assembled in a tumultuous manner. The foreigners soon joined them, being inspired by Spendius with an equal degree of fury. Nothing was now to be heard but the most horrid oaths and imprecations against Gisco and the Carthaginians. Whoever offered to make any remonstrance, or lend an ear to temperate counsels, was stoned to death by the enraged multitude. Nay, many persons lost their lives barely for attempting to speak, before it could be known whether they were in the interest of Spendius or the Carthaginians.

In the midst of these commotions, Gisco behaved with great firmness and intrepidity. He left no methods untried to soften the officers and calm the minds of the soldiery; but the torrent of sedition was now so strong, that there was no possibility of keeping it within bounds. They therefore seized upon the military chest, dividing the money among themselves in part of their arrears, put the person of Gisco under an arrest, and treated him as well as his attendants with the utmost indignity. Mathos and Spendius, to destroy the remotest hopes of an accommodation with Carthage, applauded the courage and resolution of their men, loaded the unhappy Gisco and his followers with irons, and formally declared war against the Carthaginians. All the cities of Africa, to whom they had sent deputies to exhort them to recover their liberty, soon came over to them, except Utica and Hippo Diarrhytus. By this means, their army being greatly increased, they divided it into two parts, with one of which they moved towards Utica, whilst the other marched to Hippo, in order to besiege both places. The Carthaginians, in the mean time, found themselves ready to sink under the pressure of their misfortunes. After they had been harassed 24 years by a most cruel and destructive foreign war, they entertained some hopes of enjoying repose. The citizens of Carthage drew their particular subsistence from the rents or revenues of their lands, and the public expences from the tribute paid from Africa; all which they were not only deprived of at once, but, what was worse, had it directly turned against them. They were destitute of arms and forces either by sea or land; had made no preparations for the sustaining of a siege, or the equipping of a fleet. They suffered all the calamities incident to the most ruinous civil war; and, to complete their misery, had not the least prospect of receiving assistance from any foreign friend or ally. Notwithstanding their deplorable situation, however, they did not despond, but pursued all the measures necessary to put themselves into a posture of defence. Hanno was appointed commander in chief of all their forces; and the most strenuous efforts were made, not only to repel all the attempts of the mutineers, but even to reduce them by force of arms.

90 [The] merce[nari]es de[clar]e war.

In the mean time Mathos and Spendius laid siege to Utica and Hippacra at once; but as they were carried on by detachments drawn from the army for that purpose, they remained with the main body of their forces at Tunis, and thereby cut off all communication betwixt Carthage and the continent of Africa. By this means the capital was kept in a kind of blockade. The Africans likewise harassed them by perpetual alarms, advancing to the very walls of Carthage by day as well as by night, and treating with the utmost cruelty every Carthaginian that fell into their hands.

91 They are defeated by Hanno.

Hanno was dispatched to the relief of Utica with a good body of forces, 100 elephants, and a large train of battering engines. Having taken a view of the enemy, he immediately attacked their intrenchments, and after an obstinate dispute forced them. The mercenaries lost a vast number of men; and consequently the advantages gained by Hanno were so great, that they might have proved decisive, had he made a proper use of them: but becoming secure after his victory, and his troops being everywhere off their duty, the mercenaries, having rallied their forces, fell upon him, cut off many of his men, forced the rest to fly into the town, retook and plundered the camp, and seized all the provisions, military stores, &c. brought to the relief of the besieged. Nor was this the only instance of Hanno's military incapacity. Notwithstanding he lay encamped in the most advantageous manner near a town called *Gorza*, at which place he twice overthrew the enemy, and had it in his power to have totally ruined them, he yet neglected to improve those advantages, and even suffered the mercenaries to possess themselves of the isthmus which joined the peninsula on which Carthage stood, to the continent of Africa.

92 He is in his turn defeated.

93 Hamilcar Barcas appointed to command against them.

These repeated mistakes induced the Carthaginians once more to place Hamilcar Barcas at the head of their forces. He marched against the enemy with 10,000 men, horse and foot, being all the troops the Carthaginians

Carthage.

Carthaginians could then assemble for their defence; a full proof of the low state to which they were at that time reduced. As Mathos, after he had possessed himself of the isthmus, had posted proper detachments in two passes on two hills facing the continent, and guarded the bridge over the Bagrada, which through Hanno's neglect he had taken, Hamilcar saw little probability of engaging him upon equal terms, or indeed of coming at him. Observing, however, that on the blowing of certain winds, the mouth of the river was choked up with sand, so as to become passable, though with no small difficulty, as long as these winds continued; he halted for some time at the river's mouth, without communicating his design to any person. As soon as the wind favoured his intended project, he passed the river privately by night, and immediately after his passage, he drew up the troops in order of battle; and advancing into the plain where his elephants were capable of acting, moved towards Mathos who was posted at the village near the bridge. This daring action greatly surprised and intimidated the Africans. However, Spendius receiving intelligence of the enemy's motions, drew a body of 10,000 men out of Mathos's camp, with which he attended Hamilcar on one side, and ordered 15,000 from Utica to observe him on the other, thinking by this means to surround the Carthaginians, and cut them all off at one stroke. By feigning a retreat, Hamilcar found means to engage them at a disadvantage, and gave them a total overthrow, with the loss of 6000 killed and 2000 taken prisoners. The rest fled, some to the town at the bridge, and others to the camp at Utica. He did not give them time to recover from their defeat, but pursued them to the town near the bridge before mentioned; which he entered without opposition, the mercenaries flying in great confusion to Tunis; and upon this many towns submitted of their own accord to the Carthaginians, whilst others were reduced by force.

94 He defeats them.

Notwithstanding these disasters, Mathos pushed on the siege of Hippo with great vigour, and appointed Spendius and Autaritus, commanders of the Gauls, with a strong body to observe the motions of Hamilcar. These two commanders, therefore, at the head of a choice detachment of 6000 men drawn out of the camp at Tunis, and 2000 Gallic horse, attended the Carthaginian general, approaching him as near as they could with safety, and keeping close to the skirts of the mountains. At last Spendius, having received a strong reinforcement of Africans and Numidians, and possessing himself of all the heights surrounding the plain in which Hamilcar lay encamped, resolved not to let slip so favourable an opportunity of attacking him. Had a battle now ensued, Hamilcar and his army must in all probability have been cut off; but, by the desertion of one Naravasus, a young Numidian nobleman, with 2000 men, he found himself enabled to offer his enemies battle. The fight was obstinate and bloody; but at last the mercenaries were entirely overthrown, with the loss of 10,000 men killed and 4000 taken prisoners. All the prisoners that were willing to enlist in the Carthaginian service Hamilcar received among his troops, supplying them with the arms of the soldiers who had fallen in the engagement. To the rest he gave full liberty to go where they pleased, upon condition that they should never for the future bear arms against the Carthaginians; informing them, at the same time, however, that as many violators of this agreement as fell into his hands must expect to find no mercy.

95 Mercenaries again defeated.

Mathos and his associates, fearing that this affected lenity of Hamilcar might occasion a defection among the troops, thought that the best expedient would be to put them upon some action, so execrable in its nature that no hopes of reconciliation might remain. By their advice, therefore, Gisco, and all the Carthaginian prisoners were put to death; and when Hamilcar sent to demand the remains of his countrymen, he received for answer, that whoever presumed hereafter to come upon that errand, should meet with Gisco's fate: after which they came to a resolution to treat with the same barbarity all such Carthaginians as should fall into their hands. In return for this enormity, Hamilcar threw all the prisoners that fell into his hands to be devoured by wild beasts; being convinced that compassion served only to make his enemies more fierce and untractable.

96 They put to death the Carthaginian prisoners.

The war was now carried on generally to the advantage of the Carthaginians; nevertheless, the malecontents still found themselves in a capacity to take the field with an army of 50,000 men. They watched Hamilcar's motions, but kept on the hills, carefully avoiding to come down into the plains, on account of the Numidian horse and Carthaginian elephants. Hamilcar, being much superior in skill to any of their generals, at last shut them up in a post, so situated, that it was impossible to get out of it. Here he kept them strictly besieged: and the mercenaries, not daring to venture a battle, began to fortify their camp, and surrounded it with ditches and intrenchments. They were soon pressed by famine so sorely, that they were obliged to eat one another: but they were driven desperate by the consciousness of their guilt, and therefore did not desire any terms of accommodation. At last being reduced to the utmost extremity of misery, they insisted that Spendius, Autaritus, and Zarxas, their leaders, should in person have a conference with Hamilcar, and make proposals to him. Peace was accordingly concluded upon the following terms, viz. That ten of the ringleaders of the malecontents should be left entirely to the mercy of the Carthaginians, and that the troops should all be disarmed, every man retiring only in a single coat. The treaty was no sooner concluded, than Hamilcar, by virtue of the first article, seized upon the negotiators themselves; and the army being informed that their chiefs were under arrest, had immediately recourse to arms, as suspecting they were betrayed; but Hamilcar, drawing out his army in order of battle, surrounded them, and either cut them to pieces, or trod them to death with his elephants. The number of wretches who perished on this occasion amounted to above 40,000.

97 They are besieged by Hamilcar.

98 40,000 of them destroyed.

After the destruction of the army, Hamilcar invested Tunis, whither Mathos had retired with all his remaining forces. Hamilcar had another general, named *Hannibal*, joined in the command with him. Hannibal's quarters was on the road leading to Carthage, and Hamilcar on the opposite side. The army was no sooner encamped, than Hamilcar caused Spendius, and the rest of the prisoners, to be led out in

Ca age.

in the view of the besieged, and crucified near the walls. Mathos, however, observing that Hannibal did not keep so good a guard as he ought to have done, made a sally, attacked his quarters, killed many of his men, took several prisoners, among whom was Hannibal himself, and plundered his camp. Taking the body of Spendius from the cross, Mathos immediately substituted Hannibal in its room; and 30 Carthaginian prisoners of distinction were crucified around him. Upon this disaster, Hamilcar immediately decamped, and posted himself along the sea coast, near the mouth of the river Bagrada.

9
Ha ibal tak and cru ed by Ma os.

The senate, though greatly terrified by this unexpected blow, omitted no means necessary for their preservation. They sent 30 senators, with Hanno at their head, to consult with Hamilcar about the proper measures for putting an end to this unnatural war, conjuring, in the most pressing manner, Hanno to be reconciled to Hamilcar, and to sacrifice his private resentment to the public benefit. This, with some difficulty, was effected; and the two generals came to a full resolution to act in concert for the good of the public. The senate, at the same time, ordered all the youth capable of bearing arms to be pressed into the service: by which means a strong reinforcement being sent to Hamilcar, he soon found himself in a condition to act offensively. He now defeated the enemy in all rencounters, drew Mathos into frequent ambuscades, and gave him one notable overthrow near Leptis. This reduced the rebels to the necessity of hazarding a decisive battle, which proved fatal to them. The mercenaries fled almost at the first onset; most of their army fell in the field of battle, and in the pursuit. Mathos, with a few, escaped to a neighbouring town, where he was taken alive, carried to Carthage, and executed; and then by the reduction of the revolted cities an end was put to this war, which, from the excesses of cruelty committed in it, according to Polybius, went among the Greeks by the name of the *inexpiable war*.

00
M os entir de-fe d and ta pri-so .

During the Libyan war, the Romans, upon some absurd pretences, wrested the island of Sardinia from the Carthaginians; which the latter, not being able to resist, were obliged to submit to. Hamilcar, finding his country not in a condition to enter into an immediate war with Rome, formed a scheme to put it on a level with that haughty republic. This was by making an entire conquest of Spain, by which means the Carthaginians might have troops capable of coping with the Romans. In order to facilitate the execution of this scheme, he inspired both his son-in-law Asdrubal, and his son Hannibal with an implacable aversion to the Romans, as the great opposers of his country's grandeur. Having completed all the necessary preparations, Hamilcar, after having greatly enlarged the Carthaginian dominions in Africa, entered Spain, where he commanded nine years, during which time he subdued many warlike nations, and amassed an immense quantity of treasure, which he distributed partly amongst his troops, and partly amongst the great men at Carthage; by which means he supported his interests with these two powerful bodies. At last, he was killed in a battle, and was succeeded by his son-in-law Asdrubal. This general fully answered the expectations of his countrymen; greatly enlarged their dominions in Spain; and built the city of New Carthage, now Carthagena. He made such progress in his conquests that the Romans began to grow jealous. They did not, however, choose at present to come to an open rupture, on account of the apprehensions they were under of an invasion from the Gauls. They judged it most proper, therefore, to have recourse to milder methods; and prevailed upon Asdrubal to conclude a new treaty with them. The articles of it were, 1. That the Carthaginians should not pass the Iberus. 2. That the Saguntines, a colony of Zacynthians, and a city situated between the Iberus and that part of Spain subject to the Carthaginians, as well as the other Greek colonies there, should enjoy their ancient rights and privileges.

103
Asdrubal's treaty with the Romans.

Asdrubal, after having governed the Carthaginian dominions in Spain for eight years, was treacherously murdered by a Gaul, whose master he had put to death. Three years before this happened, he had written to Carthage, to desire that young Hannibal, then twenty-two years of age, might be sent to him. This request was complied with, notwithstanding the opposition of Hanno: and, from the first arrival of the young man in the camp, he became the darling of the whole army. The great resemblance he bore to Hamilcar rendered him extremely agreeable to the troops. Every talent and qualification he seemed to possess, that contribute towards forming a great man. After the death of Asdrubal, he was saluted general by the army with the highest demonstration of joy. He immediately put himself in motion; and in the first campaign conquered the Olcades, a nation seated near the Iberus. The next year he subdued the Vaccæi, another nation in that neighbourhood. Soon after, the Carpætani, one of the most powerful nations in Spain, declared against the Carthaginians. Their army consisted of 100,000 men, with which they proposed to attack Hannibal on his return from the Vaccæi; but by a stratagem they were utterly defeated, and the whole nation obliged to submit.

104
He is murdered.

105
Succeeded by Hannibal, who makes vast conquests in Spain.

Nothing now remained to oppose the progress of the Carthaginian arms but the city of Saguntum. Hannibal, however, for some time, did not think proper to come to a rupture with the Romans by attacking that place. At last he found means to embroil some of the neighbouring cantons, especially the Turdetani, or, as Appian calls them, the *Torboletæ*, with the Saguntines, and thus furnished himself with a pretence to attack their city. Upon the commencement of the siege, the Roman senate dispatched two ambassadors to Hannibal, with orders to proceed to Carthage, in case the general refused to give them satisfaction. They were scarcely landed, when Hannibal, who was carrying on the siege of Saguntum with great vigour, sent them word that he had something else to do than to give audience to ambassadors. At last, however, he admitted them: and, in answer to their remonstrances, told them, that the Saguntines had drawn their misfortunes upon themselves, by committing hostilities against the allies of Carthage; and at the same time desired the deputies, if they had any complaints to make of him, to carry them to the senate of Carthage. On their arrival in that capital, they demanded that Hannibal might be delivered up to the Romans to be punished according to his deserts; and.

106
He attacks Saguntum.

Carthage. and this not being complied with, war was immediately declared between the two nations.

107 and takes it. The Saguntines are said to have defended themselves for eight months with incredible bravery. At last, however, the city was taken, and the inhabitants were treated with the utmost cruelty. After this conquest, Hannibal put his African troops into winter quarters at New Carthage; but, in order to gain their affection, he permitted the Spaniards to retire to their respective homes.

108 He sets out for Italy. The next campaign, having taken the necessary measures for securing Africa and Spain, he passed the Iberus, subdued all the nations betwixt that river and the Pyrenees, appointed Hanno commander of all the new conquered district, and immediately began his march for Italy. Upon mustering his forces, after they had been weakened by sieges, desertion, mortality, and a detachment of 10,000 foot and 1000 horse, left with Hanno to support him in his new post, he found them to amount to 50,000 foot and 9000 horse, all veteran troops, and the best in the world. As they had left their heavy baggage with Hanno, and were all light-armed, Hannibal easily crossed the Pyrenees; passed by Ruscino, a frontier town of the Gauls, and arrived on the banks of the Rhone without opposition. This river he passed, notwithstanding of some opposition from the Gauls; and was for some time in doubt whether he should advance to engage the Romans, who, under Scipio, were bending their march that way, or continue his march for Italy. But to the latter he was soon determined by the arrival of Magilus, prince of the Boii, who brought rich presents with him, and offered to conduct the Carthaginian army over the Alps. Nothing could have happened more favourable to Hannibal's affairs than the arrival of this prince, since there was no room to doubt the sincerity of his intentions. For the Boii bore an implacable enmity to the Romans, and had even come to an open rupture with them, upon the first news that Italy was threatened with an invasion from the Carthaginians.

109 He crosses the Alps. It is not known with certainty where Hannibal began to ascend the Alps. As soon as he began his march, the petty kings of the country assembled their forces in great numbers; and, taking possession of the eminences over which the Carthaginians must necessarily pass, they continued harassing them, and were no sooner driven from one eminence than they seized on another, disputing every foot of land with the enemy, and destroyed great numbers of them by the advantage they had of the ground. Hannibal, however, having found means to possess himself of an advantageous post, defeated and dispersed the enemy, and soon after took their capital city; where he found the prisoners, horses, &c. that had before fallen into the hands of the enemy, and likewise corn sufficient to serve the army for three days. At last, after a most fatiguing march of nine days, he arrived at the top of the mountains. Here he encamped, and halted two days, to give his wearied troops some repose, and to wait for the stragglers. As the snow had lately fallen in great plenty, and covered the ground, this sight terrified the Africans and Spaniards, who were much affected with the cold. In order, therefore, to encourage them, the Carthaginian general led them to the top of the highest rock on the side of Italy, and thence gave them a view of the large and fruitful plains of Insubria, acquainting them that the Gauls, whose country they saw, were ready to join them. He also pointed out to them the place whereabout Rome stood, telling them, that by climbing the Alps they had scaled the walls of that rich metropolis; and, having thus animated his troops, he decamped, and began to descend the mountains. The difficulties they met with in their descent were much greater than those that had occurred while they ascended. They had indeed no enemy to contend with, except some scattered parties that came to steal rather than to fight; but the deep snows, the mountains of ice, craggy rocks, and frightful precipices, proved more terrible than any enemy. After they had for some days marched through narrow, steep, and slippery ways, they came at last to a place which neither elephants, horses, nor men could pass. The way, which lay between two precipices, was exceeding narrow; and the declivity, which was very steep, had become more dangerous by the falling away of the earth. Here the guides stopped; and the whole army being terrified, Hannibal proposed at first to march round about, and attempt some other way; but all places round him being covered with snow, he found himself reduced to the necessity of cutting a way into the rock itself, through which his men, horses, and elephants, might descend. This work was accomplished with incredible labour; and then Hannibal, having spent nine days in ascending, and six in descending the Alps, gained at length Insubria; and, notwithstanding all the disasters he had met with by the way, entered the country with all the boldness of a conqueror.

Hannibal, on his entry into Insubria, reviewed his army; when he found that of the 50,000 foot, with whom he set out from New Carthage five months and 15 days before, he had now but 20,000, and that his 9000 horse were reduced to 6000. His first care, after he entered Italy, was to refresh his troops; who, after so long a march, and such inexpressible hardships, looked like as many skeletons raised from the dead, or savages born in a desert. He did not, however, suffer them to languish long in idleness; but, joining the Insubrians, who were at war with the Taurinians, laid siege to Taurinum, the only city in the country, and in three days time became master of it, putting all who resisted to the sword. This struck the neighbouring barbarians with such terror, that of their own accord they submitted to the conqueror, and supplied his army with all sorts of provisions. 110 Taurinum taken.

Scipio, the Roman general, in the mean time, who had gone in quest of Hannibal on the banks of the Rhone, was surprised to find his antagonist had crossed the Alps, and entered Italy. He therefore returned with the utmost expedition. An engagement ensued near the river Ticinus, in which the Romans were defeated. The immediate consequence was, that Scipio repassed that river, and Hannibal continued his march to the banks of the Po. Here he staid two days, before he could cross that river over a bridge of boats. He then sent Mago in pursuit of the enemy, who, having rallied their scattered forces, and repassed the Po, were encamped at Placentia. Afterwards having concluded a treaty with several of the Gallic cantons, 111 The Romans defeated near the Ticinus.

cantons, he joined his brother with the rest of the army, and again offered battle to the Romans: but this they thought proper to decline; and at last the consul being intimidated by the desertion of a body of Gauls, abandoned his camp, passed the Trebia, and posted himself on an eminence near that river. Here he drew lines round his camp, and waited the arrival of his colleague with the forces from Sicily.

Hannibal being apprised of the consul's departure, sent out the Numidian horse to harass him on his march; himself moving with the main body to support them in case of need. The Numidians arriving before the rear of the Roman army had quite passed the Trebia, put to the sword or made prisoners all the stragglers they found there. Soon after Hannibal coming up, encamped in sight of the Roman army on the opposite bank. Here having learned the character of the consul Sempronius, lately arrived, he soon brought him to an engagement, and entirely defeated him. Ten thousand of the enemy retired to Placentia; but the rest were either killed or taken prisoners. The Carthaginians pursued the flying Romans as far as the Trebia, but did not think proper to repass that river on account of the excessive cold.

112 They are again defeated.

Hannibal, after this action upon the Trebia, ordered the Numidians, Celtiberians, and Lusitanians, to make incursions into the Roman territories, where they committed great devastations. During his state of inaction, he endeavoured to win the affections of the Gauls, and likewise of the allies of the Romans; declaring to the Gallic and Italian prisoners, that he had no intention of making war upon them, being determined to restore them to their liberty, and protect them against the Romans: and to confirm them in their good opinion of him, he dismissed them all without ransom.

113 They are utterly defeated near the lake Thrasymenus.

Next year having crossed the Apennines, and penetrated into Etruria, Hannibal received intelligence that the new consul Flaminius lay encamped with the Roman army under the walls of Aretium. Having learned the true character of this general, that he was of a haughty, fierce, and rash disposition, he doubted not of being soon able to bring him to a battle. To inflame the impetuous spirit of Flaminius, the Carthaginian general took the road to Rome, and, leaving the Roman army behind him, destroyed all the country through which he passed with fire and sword; and as that part of Italy abounded with all the elegancies as well as necessaries of life, the Romans and their allies suffered an incredible loss on this occasion. The rash consul was inflamed with the utmost rage on seeing the ravages committed by the Carthaginians; and therefore immediately approached them with great temerity, as if certain of victory. Hannibal in the mean time kept on, still advancing towards Rome, having Crotona on the left hand, and the lake Thrasymenus on the right; and at last, having drawn Flaminius into an ambuscade, entirely defeated him. The general himself, with 15,000 of his men, fell on the field of battle. A great number was likewise taken prisoners; and a body of 6000 men, who had fled to a town in Etruria, surrendered to Maherbal the next day. Hannibal lost only 1500 men on this occasion, most of whom were Gauls; though great numbers, both of his soldiers and of the Romans, died of their wounds. Being soon after informed that the consul Servilius had detached a body of 4000, or, according to Appian, 8000 horse from Ariminum, to reinforce his colleague in Etruria, Hannibal sent out Maherbal, with all the cavalry, and some of the infantry, to attack him.—The Roman detachment consisted of chosen men, and was commanded by Centenius a patrician. Maherbal had the good fortune to meet with him, and after a short dispute entirely defeated him. Two thousand of the Romans were laid dead on the spot; the rest, retiring to a neighbouring eminence, were surrounded by Maherbal's forces, and obliged next day to surrender at discretion; and this disaster, happening within a few days after the defeat at the lake Thrasymenus, almost gave the finishing stroke to the Roman affairs.

114 A Roman detachment cut to pieces or taken.

The Carthaginian army was now so much troubled with a scorbutic disorder, owing to the unwholesome encampments they had been obliged to make, and the morasses they had passed through, that Hannibal found it absolutely necessary to repose them for some time in the territory of Adria, a most pleasant and fertile country. In his various engagements with the Romans he had taken a great number of their arms, with which he now armed his men after the Roman manner. Being now likewise master of that part of the country bordering on the sea, he found means to send an express to Carthage with the news of the glorious progress of his arms. The citizens received this news with the most joyful acclamations, at the same time coming to a resolution to reinforce their armies both in Italy and Spain, with a proper number of troops.

115 Fabius Maximus named dictator.

The Romans being now in the utmost consternation, named a dictator, as was their custom in times of great danger. The person they chose to this office was Fabius Maximus, surnamed *Verruscosus;* a man as cool and cautious as Sempronius and Flaminius were warm and impetuous. He set out with a design not to engage Hannibal, but only to watch his motions and cut off his provisions, which he knew was the most proper way to destroy him in a country so far from his own. Accordingly he followed him through Umbria and Picenum, into the territory of Adria, and then through the territories of the Marucini and Frentani into Apulia. When the enemy marched he followed them: when they encamped, he did the same; but for the most part on eminences, and at some distance from their camp, watching all their motions, cutting off their stragglers, and keeping them in a continual alarm. This cautious method of proceeding greatly distressed the Carthaginians, but at the same time raised discontents in his own army. But neither these discontents, nor the ravages committed by Hannibal, could prevail upon Fabius to alter his measures. The former, therefore, entered Campania, one of the finest countries of Italy. The ravages he committed there raised such complaints in the Roman army, that the dictator, for fear of irritating his soldiers, was obliged to pretend a desire of coming to an engagement. Accordingly he followed Hannibal with more expedition than usual; but at the same time avoided, under various pretences, an engagement, with more care than the enemy sought it. Hannibal, finding he could not by any means bring the dictator to a battle, resolved

Carthage.

resolved to quit Campania, which he found abounding more with fruit and wine than corn, and to return to Samnium through the pass called Eribanus. Fabius concluding from his march that this was his design, got there before him, and encamped on Mount Callicula, which commanded the pass, after having placed several bodies in all the avenues leading to it.

116 He is outwitted by Hannibal.

Hannibal was for some time at a loss what to do; but at last contrived the following stratagem, which Fabius could not foresee nor guard against. Being encamped at the foot of Mount Callicula, he ordered Asdrubal to pick out of the cattle taken in the country 2000 of the strongest and nimblest oxen, to tie faggots to their horns, and to have them and the herdsmen ready without the camp. After supper, when all was quiet, the cattle were brought in good order to the hill, where Fabius had placed some Roman parties in ambush to stop up the pass. Upon a signal given, the faggots on the horns of the oxen were set on fire; and the herdsmen, supported by some battalions armed with small javelins, drove them on quietly. The Romans, seeing the light of the fires, imagined that the Carthaginians were marching by torch light. However, Fabius kept close in his camp, depending on the troops he had placed in ambuscade; but when the oxen, feeling the fire on their heads, began to run up and down the hills, the Romans in ambush thinking themselves surrounded on all sides, and climbing the ways where they saw least light, returned to their camp, leaving the pass open to Hannibal. Fabius, though rallied by his soldiers for being thus overreached by the Carthaginian, still continued to pursue the same plan, marched directly after Hannibal, and encamped on some eminences near him.

Soon after this, the dictator was recalled to Rome; and as Hannibal, notwithstanding the terrible ravages he had committed, had all along spared the lands of Fabius, the latter was suspected of holding a secret correspondence with the enemy. In his absence, Minucius, the general of the horse, gained some advantages, which greatly tended to increase the discontent with the dictator, insomuch that before his return Minucius was put upon an equal footing with himself. The general of the horse proposed that each should command his day; but the dictator chose rather to divide the army, hoping by that means to save at least a part of it.

117 Minucius in great danger is relieved by Fabius.

Hannibal soon found means to draw Minucius to an engagement, and by his masterly skill in laying ambushes, the Roman general was surrounded on every side, and would have been cut off with all his troops, had not Fabius hastened to his assistance, and relieved him. Then the two armies uniting, advanced in good order to renew the fight; but Hannibal, not caring to venture a second action, sounded a retreat, and retired to his camp; and Minucius, being ashamed of his rashness, resigned the command of the army to Fabius.

118 The Romans utterly defeated at Cannæ.

The year following the Romans augmented their army to 87,000 men, horse and foot, under the command of Æmilius Paulus and Terentius Varro, the consuls for the year; and Hannibal being reduced to the greatest straits for want of provisions, resolved to leave Samnium, and penetrate into the heart of Apulia. Accordingly he decamped in the night; and by leaving fires burning, and tents standing in his camp, made the Romans believe for some time that his retreat was only feigned. When the truth was discovered, Æmilius was against pursuing him; but in this he was seconded by few besides Servilius, one of the consuls of the preceding year; Terentius and all the other officers being obstinately bent on pursuing the enemy. They accordingly overtook them at Cannæ, till this time an obscure village in Apulia.* A battle ensued at this place, as memorable as any mentioned in history; in which the Romans, though almost double in number to the Carthaginians, were put to flight with most terrible slaughter; at least 45,000 of them being left dead on the field of battle, and 10,000 taken prisoners in the action or pursuit. The night was spent in Hannibal's camp in feasting and rejoicings, and next day in stripping the dead bodies of the unhappy Romans; after which the victorious general invested their two camps, where he found 4000 men.

* See Cannæ.

119 Consequences of this victory.

The immediate consequences of this victory, as Hannibal had foreseen, was a disposition of that part of Italy called the Old Province, Magna Grecia, Tarentum, and part of the territory of Capua, to submit to him. The neighbouring provinces likewise discovered an inclination to shake off the Roman yoke, but wanted first to see whether Hannibal was able to protect them. His first march was into Samnium, being informed that the Hirpini and other neighbouring nations were disposed to enter into an alliance with the Carthaginians. He advanced to Compsa, which opened its gates to him. In this place he left his heavy baggage, as well as the immense plunder he had acquired. After which he ordered his brother Mago, with a body of troops destined for that purpose, to possess himself of all the fortresses in Campania, the most delicious province of Italy. The humanity Hannibal had all along shown the Italian prisoners, as well as the fame of the complete victory he had lately obtained, wrought so powerfully upon the Lucani, Bruttii, and Apulians, that they expressed an eager desire of being taken under his protection. Nay, even the Campanians themselves, a nation more obliged to the Romans than any in Italy, except the Latins, discovered an inclination to abandon their natural friends.

120 Capua submits to Hannibal.

Of this the Carthaginian general receiving intelligence, he bent his march towards Capua, not doubting but that, by means of the popular faction there, he should easily make himself master of it; which accordingly happened. Soon after this place had made its submission, many cities of the Bruttii opened their gates to Hannibal, who ordered his brother Mago to take possession of them. Mago was then dispatched to Carthage, with the important news of the victory at Cannæ, and the consequences attending it.

121 Mago's account of Hannibal's success.

Upon his arrival there, he acquainted the senate, that Hannibal had defeated six Roman generals, four of whom were consuls, one dictator, and the other general of horse to the dictator: that he had engaged six consular armies, killed two consuls, wounded one, and driven another out of the field, with scarce 50 men to attend him: that he had routed the general of the horse, who was of equal power with the consuls; and that the dictator was esteemed the only general fit to command an army, merely because he had not the courage to engage him; and as a demonstrative proof of what he advanced, he produced, according to some authors, Ca .age.

authors, three bushels and a half of gold rings, taken from knights and senators who had been killed in the various engagements.

.2 Ha .bal sup or to eve other ger al me oned in l tory.

Hitherto we have seen Hannibal surprisingly victorious; and, indeed, if we consider what he had already done, we shall find his exploits superior to those of any other general, either ancient or modern. Other commanders have been celebrated for victories gained over barbarous and uncivilized nations. Alexander the Great invaded and overran the empire of Persia; but that kingdom was then sunk in sloth and effeminacy, so as to be an easy conquest: but had that great commander turned his arms against the western nations, who were of a more martial disposition, it is more than probable he had not conquered so easily. Hannibal, on the other hand, lived at a time when the Romans were not only the most powerful, but the most warlike nation in the whole world. That nation he attacked with an army of only 26,000 men, without resources either for recruits, money, or provisions, except what he could procure in the enemy's country. With these he had for three years resisted the Roman armies; which had been hitherto invincible by all other nations. Their armies had been commanded by generals of different tempers, dispositions, and abilities: the losses they sustained are by the Roman writers imputed to the faults of the generals themselves; but experience had abundantly shown, that these commanders, with all their faults, were able to conquer the most warlike nations, when commanded by another than Hannibal. In the battles fought with the Romans he had destroyed 200,000 of their men, and taken 50,000 prisoners; yet from the time of the battle of Cannæ, the affairs of this great man totally declined. The reason of this is, by the Roman historians, said to be, that when he put his army into winter quarters in Capua, he so enervated himself and his army by debaucheries in that place, that he became no longer capable of coping with the Roman forces. But this seems by no means to have been the case; for the Roman historians themselves own, that, after the battle of Cannæ, he gave their armies many and terrible defeats, and took a great number of towns in their sight.

.23 Ca : of th ecline of af- fai

The true reason of that reverse of fortune which Hannibal now experienced, was his not having sufficient resources for recruiting his army. On the first news, indeed, of his success at Carthage, a body of 4000 Numidian cavalry, 40 elephants, and 1000 talents of silver, were granted by the senate. A large detachment of Spanish forces was also appointed to follow them; and that these last might be ready in due time, Mago set out immediately for Spain to raise 20,000 foot and 4000 horse there. Had this ample supply been sent with proper expedition, it is by no means probable that the Romans would have had any occasion to reflect upon Hannibal's conduct at Capua. That general would undoubtedly have obliged the haughty republic to submit to the superior force of his arms the next campaign. But, notwithstanding the influence of the Barcinian faction at Carthage, Hanno and his adherents found means not only to retard the march of the supplies intended, but even to diminish their number. Mago, through the artifices of that infatuated party, could obtain an order for only 12,000 foot and 2500 horse; and even with this inconsiderable body of troops he was sent into Spain. Hannibal being thus deserted by his country, found himself obliged to act on the defensive; his army amounting to no more now than 26,000 foot and 9000 horse. But though obliged to act in this manner, he was only hindered from conquering; the utmost efforts of the whole Roman power not being able to drive this small army out of Italy for more than 14 years.

Carthage.

124 Measures taken by the Romans.

The Romans, though greatly reduced, were not yet exhausted. They were able still to send two consular armies into the field, fully recruited and in good order; and as neither the Gauls nor Italians were natural allies of the Carthaginians, they did not fail to abandon them on the first reverse of fortune. After the Romans had recovered from the consternation into which they were thrown by the defeat at Cannæ, they chose a dictator, and recalled Marcellus, the conqueror of Syracuse, from Sicily. All the young Romans, above 17 years of age, of what rank soever, were obliged to enlist themselves; as were also those who had already served their legal time. By this means four legions and 10,000 horse were soon raised in the city. The allies of Rome, the colonies, and the municipia, furnished their contingents as usual. To these were added 8000 of the youngest and strongest slaves in the city. The republic purchased them of their masters, but did not oblige them to serve without their own consent, which they gave, by answering *Volo*, "I am willing;" whence they were called *volones*, to distinguish them from the other troops. As the Romans, after the loss of so many battles, had no swords, darts, or bucklers, left in their magazines, the *volones* were supplied with the arms which had been formerly taken from the enemy, and hung up in the public temples and porticoes. The finances of Rome were no less exhausted: but this defect was supplied by the liberality of her citizens. The senators shewing the example, were followed first by the knights, and afterwards by all the tribes; who stripping themselves of all the gold they had, brought it to the public treasury. The senators only reserved their rings, and the *bullæ* about their children's necks. As for the silver coin, it was now, for the first time, alloyed with copper, and increased in its value. Thus the finances were put into a good condition, and a competent army raised.

This was plainly the last effort the Romans could make; and could Hannibal have procured a sufficient supply of men and money to enable him to cope with this army, and to break it as he had done the others before, there could have been no more resistance made on their part. He began, however, to be in want of money; and, to procure it, gave the Roman prisoners leave to redeem themselves. These unhappy men agreed to send ten of their body to Rome to negotiate their redemption; and Hannibal required no other security for their return but their oath. Carthalo was sent at the head of them to make proposals of peace; but upon the first news of his arrival, the dictator sent a lictor to him, commanding him immediately to depart the Roman territory; and it was resolved not to redeem the captives. Upon this Hannibal sent the most considerable of them to Carthage; and of the rest he made gladiators, obliging them to fight with one another,

125 They refuse to treat of peace.

Carthage. another, even relations with relations, for the entertainment of the troops.

126 Asdrubal defeated by the Romans in Spain. All this time Cneius and Publius Scipio had carried on the war in Spain with great success against the Carthaginians. Asdrubal had been ordered to enter Italy with his army to assist Hannibal; but being defeated by the Romans, was prevented. The dictator and senate of Rome, encouraged by this news, carried on the preparations for the next campaign with the greatest vigour, whilst Hannibal remained inactive at Capua. This inaction, however, seems to have proceeded from his expectation of succours from Africa, which never came, and which delay occasioned his ruin. The Roman dictator now released from prison all criminals, and persons confined for debt, who were willing to enlist themselves. Of these he formed a body of 6000 foot, armed with the broadswords and bucklers formerly taken from the Gauls. Then the Roman army, to the number of about 25,000 men, marched out of the city under the command of the dictator; while Marcellus kept the remains of Varro's army, amounting to about 15,000 men, at Casilinum, in readiness to march whenever there should be occasion.

Thus the Roman forces were still superior to those of Hannibal; and as they now saw the necessity of following the example of Fabius Maximus, no engagement of any consequence happened the first year after

127 Marcellus gains an advantage over Hannibal. the battle of Cannæ. Hannibal made a fruitless attempt upon Nola, expecting it would be delivered up to him; but this was prevented by Marcellus, who had entered that city, and sallying unexpectedly from three gates upon the Carthaginians, obliged them to retire in great confusion, with the loss of 5000 men. This was the first advantage that had been gained by the Romans where Hannibal had commanded in person, and raised the spirits of the former not a little. They were, however, greatly dejected, on hearing that the consul Posthumius Albinus, with his whole army, had been cut off by the Boii, as he was crossing a forest. Upon this it was resolved to draw all the Roman forces out of Gaul and other countries, and turn them against Hannibal; so that the Carthaginian stood daily more and more in need of those supplies, which yet

128 Hannibal takes several cities. never arrived from Carthage. He reduced, however, the cities of Nuceria, Casilinum, Petelia, Consentia, Crotona, Locri, and several others in Great Greece, before the Romans gained any advantage over him, except that before Nola, already mentioned. The Campanians, who had espoused the Carthaginian interest, raised an army of 14,000 of their own nation in favour of Hannibal, and put one Marius Alsius at the head of it; but he was surprised by the consul Sempronius, who defeated and killed him, with 2000 of his men. It was now found that Hannibal had concluded a treaty of alliance, offensive and defensive, with Philip king of Macedon: but, to prevent any disturbance from that quarter, a Roman army was sent to

129 He is defeated by Marcellus. Macedon. Soon after this Marcellus defeated Hannibal in a pitched battle, having armed his men with long pikes used generally at sea, and chiefly in boarding of ships; by which means the Carthaginians were pierced through, while they were totally unable to hurt their adversaries with the short javelins they carried. Marcellus pursued them close; and before they got to their camp, killed 5000, and took 600 prisoners; losing himself about 1000 men, who were trod down by the Numidian horse, commanded by Hannibal in person. After this defeat the Carthaginian general found himself deserted by 1200 of his best horse, partly Spaniards, and partly Numidians, who had crossed the Alps with him. This touched him so sensibly, that he left Campania, and retired into Apulia. 130 He is deserted by a party of horse.

The Romans still continued to increase their forces; and Hannibal, not having the same resources, found it impossible to act against so many armies at once. Fabius Maximus advanced into Campania, whither Hannibal was obliged to return, in order to save Capua. He ordered Hanno, however, at the head of 17,000 foot and 1700 horse, to seize Beneventum; but he was utterly defeated, scarce 2000 of his men being left alive. Hannibal himself, in the mean time, advanced to Nola, where he was again defeated by Marcellus. He now began to lose ground: the Romans retook Casilinum, Accua in Apulia, Arpi, and Aternum; but the city of Tarentum was delivered up to him by its inhabitants. The Romans then entered Campania, and ravaged the whole country, threatening Capua with a siege. The inhabitants immediately acquainted Hannibal with their danger; but he was so intent upon reducing the citadel of Tarentum, that he could not be prevailed upon to come to their assistance. In the mean time Hanno was again utterly defeated by Fulvius, his camp taken, and he himself forced to fly into Bruttium, with a small body of horse. The consuls then advanced with a design to besiege Capua in form. But, in their way, Sempronius Gracchus, a man of great bravery, and an excellent general, was betrayed by a Lucanian and killed, which proved a very great detriment to the republic. Capua, however, was soon after invested on all sides; and the besieged once more sent to Hannibal, who now came to their assistance with his horse, his light-armed infantry, and 33 elephants. He found means to inform the besieged of the time he designed to attack the Romans, ordering them to make a vigorous sally at the same time. The Roman generals, Appius and Fulvius, upon the first news of the enemy's approach, divided their troops. Appius taking upon him to make head against the garrison, and Fulvius to defend the intrenchments against Hannibal. The former found no difficulty in repulsing the garrison, and would have entered the city with them, had he not been wounded at the very gate, which prevented him from pursuing his design. Fulvius found it more difficult to withstand Hannibal, whose troops behaved themselves with extraordinary resolution. A body of Spaniards and Numidians had even the boldness to pass the ditch, and, in spite of all opposition, climbing the ramparts, penetrated into the Roman camp: but, not being properly seconded by the rest, they were all to a man cut in pieces. The Carthaginian general was so disheartened at this, especially after the garrison was repulsed, that he sounded a retreat, which was made in good order. His next attempt for the relief of Capua was to march to Rome, where he hoped his approach would strike so much terror, that the armies would be called from before Capua; and that the Capuans might not be disheartened by his sudden departure, he found means

131 He is again defeated, and begins to lose ground.

132 Capua besieged by the Romans.

133 Hannibal in vain attempts to relieve it.

134 He marches to Rome.

Carthage. means to acquaint them with his design. The news of his approach caused great consternation in the metropolis. Some of the senators were for calling all the armies in Italy into the neighbourhood of Rome, as thinking nothing less was able to resist the terrible Carthaginian. But Fabius told them that Hannibal's design was not to take Rome, but relieve Capua; upon which Fulvius was recalled to Rome with 15,000 foot and 1000 horse; and this obliged Hannibal again to retire. He then returned before Capua so suddenly that he surprised Appius in his camp, drove him out of it with the loss of a great number of men, and obliged him to intrench himself on some eminences, where he expected to be soon joined by his colleague Fulvius. As Hannibal, however, now expected to have all the Roman forces upon him, he could do nothing more for the relief of Capua; which was of consequence obliged to submit to the Romans.

A little before the surrender of Capua, Hannibal came up with a Roman army commanded by one M. Centenius Penula, who had signalized himself on many occasions as a centurion. This rash man, being introduced to the senate, had the assurance to tell them, that if they would trust him with a body of only 5000 men, he would give a good account of Hannibal. They gave him 8000, and his army was soon increased to double that number. He engaged the Carthaginians on Hannibal's first offering him battle; but, after an engagement of two hours, was defeated, himself and all his men being slain except about 1000. Soon after, having found means to draw the prætor Cneius Fulvius into an ambuscade, Hannibal cut in pieces almost his whole army, consisting of 18,000 men. In the mean time Marcellus was making great progress in Samnium. The city of Salapia was betrayed to him; but he took other two by assault. In the last of these he found 3000 Carthaginians, whom he put to the sword; and carried off 240,000 bushels of wheat, and 110,000 of barley. This, however, was by no means a compensation for the defeat which Hannibal soon after gave the proconsul Fulvius Centumalus, whom he surprised and cut off, with 13,000 of his men.

After this defeat the great Marcellus advanced with his army to oppose Hannibal. Various engagements happened without any thing decisive. In one of them the Romans are said to have been defeated, and in another Hannibal; but notwithstanding these, it was neither in the power of Marcellus, nor any other Roman general, totally to defeat or disperse the army commanded by Hannibal in person. Nay, in the eleventh year of the war, Hannibal found means to decoy into an ambuscade and cut off the great Marcellus himself; the consequence of which was, that the Romans were obliged to raise the siege of Locri, with the loss of all their military engines.

Hitherto the Carthaginians, though no longer the favourites of fortune, had lost but little ground; but now they met with a blow which totally ruined their affairs. This was the defeat of Asdrubal, Hannibal's brother, who had left Spain, and was marching to his assistance. He crossed the Pyrenees, without any difficulty; and, as the silver mines had supplied him with a very considerable quantity of treasure, he not only prevailed upon the Gauls to grant him a passage through their territories, but likewise to furnish him with a considerable number of recruits. Meeting with many favourable circumstances to expedite his march, he arrived at Placentia sooner than the Romans or even his brother Hannibal expected. Had he continued to use the same expedition with which he set out, and hastened to join his brother, it would have been utterly impossible to have saved Rome; but, sitting down before Placentia, he gave the Romans an opportunity of assembling all their forces to attack him. At last he was obliged to raise the siege, and began his march for Umbria. He sent a letter to acquaint his brother of his intended motion; but the messenger was intercepted: and the two consuls, joining their armies, with united forces fell upon the Carthaginians. As the latter were inferior both in numbers and resolution, they were utterly defeated, and Asdrubal was killed. About the same time, Hannibal himself is said to have suffered several defeats, and was retired to Canusium; but, on the fatal news of his brother's defeat and death, he was filled with despair, and retired to the extremity of Bruttium; where, assembling all his forces, he remained for a considerable time in a state of inaction, the Romans not daring to disturb him; so formidable did they esteem him alone, though every thing about him went to wreck, and the Carthaginian affairs seemed not far from the verge of destruction. Livy tells us, that it was difficult to determine whether his conduct was more wonderful in prosperity or in adversity. Notwithstanding which, Bruttium being but a small province, and many of its inhabitants being either forced into the service, or forming themselves into parties of banditti, so that a great part of it remained uncultivated, he found it a difficult matter to subsist there, especially as no manner of supplies were sent him from Carthage. The people there were as solicitous about preserving their possessions in Spain, and as little concerned about the situation of affairs in Italy, as if Hannibal had met with an uninterrupted course of success, and no disaster befallen him since he first entered that country.

All their solicitude, however, about the affairs of Spain, was to no purpose; their generals, one after another, were defeated by the Romans. They had indeed cut off the two Scipios; but found a much more formidable enemy in the young Scipio, afterwards surnamed *Africanus*. He overthrew them in conjunction with Masinissa king of Numidia; and the latter thereafter abandoned their interest. Soon after, Syphax king of the Masæsylii, was likewise persuaded to abandon their party. Scipio also gave the Spanish reguli a great overthrow, and reduced the cities of New Carthage, Gades, and many other important places. At last the Carthaginians began to open their eyes when it was too late. Mago was ordered to abandon Spain, and sail with all expedition to Italy. He landed on the coast of Liguria with an army of 12,000 foot and 2000 horse; where he surprised Genoa, and also seized upon the town and port of Savo. A reinforcement was sent him to this place, and new levies went on very briskly in Liguria; but the opportunity was past, and could not be recalled. Scipio having carried all before him in Spain, passed over into Africa, where he met with no enemy capable of

142 The great progress of Scipio Africanus.

143 Mago lands in Italy.

144 Scipio lands in Africa.

Carthage. of opposing his progress. The Carthaginians, then, seeing themselves on the brink of destruction, were obliged to recal their armies from Italy, in order to save their city. Mago, who had entered Insubria, was defeated by the Roman forces there; and having re-

145 Mago and Hannibal recalled.

treated into the maritime parts of Liguria, met a courier who brought him orders to return directly to Carthage. At the same time, Hannibal was likewise recalled. When the messengers acquainted him with the senate's pleasure, he expressed the utmost indignation and concern, groaning, gnashing his teeth, and scarce refraining from tears. Never banished man, according to Livy, showed so much regret in quitting his native country as Hannibal did at going out of that of the enemy.

146 Hannibal's proceedings after his arrival in Africa.

The Carthaginian general was no sooner landed in Africa than he sent out parties to get provisions for the army, and buy horses to remount the cavalry. He entered into a league with the regulus of the Arcacidæ, one of the Numidian tribes. Four thousand of Syphax's horse came over in a body to him; but as he did not think proper to repose any confidence in them, he put them all to the sword, and distributed their horses among his troops. Vermina, one of Syphax's sons, and Macetulus, another Numidian prince, likewise joined him with a considerable body of horse. Most of the fortresses in Masinissa's kingdom either surrendered to him upon the first summons, or were taken by force. Narce, a city of considerable note there, he made himself master of by stratagem. Tychæus, a Numidian regulus, and faithful ally of Syphax, whose territories were famous for an excellent breed of horses, reinforcing him also with 2000 of his best cavalry, Hannibal advanced to Zama, a town about five days journey distant from Carthage, where he encamped. He thence sent out spies to observe the posture of the Romans. These being brought to Scipio, he was so far from inflicting any punishment upon them, which he might have done by the laws of war, that he commanded them to be led about the camp, in order to take an exact survey of it, and then

147 He has an interview with Scipio.

dismissed them. Hannibal, admiring the noble assurance of his rival, sent a messenger to desire an interview with him; which, by means of Masinissa, he obtained. The two generals, therefore, escorted by equal detachments of horse, met at Nadagara, where, by the assistance of two interpreters, they held a private conference. Hannibal flattered Scipio in the most refined and artful manner, and expatiated upon all those topics which he thought could influence that general to grant his nation a peace upon tolerable terms; amongst other things, that the Carthaginians would willingly confine themselves to Africa, since such was the will of the gods, in order to procure a lasting peace, whilst the Romans would be at liberty to extend their conquests to the remotest nations. Scipio answered, that the Romans were not prompted by ambition, or any sinister views, to undertake either the former or present war against the Carthaginians, but by justice and a proper regard for their allies. He also observed, that the Carthaginians had, before his arrival in Africa, not only made him the same proposals, but likewise agreed to pay the Romans 5000 talents of silver, restore all the Roman prisoners without ransom, and deliver up all their galleys. He insisted on the perfidious conduct of the Carthaginians, who had broke a truce concluded with them; and told him, that, so far from granting them more favourable terms, they ought to expect more rigorous ones; which if Hannibal would submit to, a peace would ensue; if not, the decision of the dispute must be left to the sword.

148 The battle of Zama.

This conference betwixt two of the greatest generals the world ever produced, ending without success, they both retired to their respective camps; where they informed their troops, that not only the fate of Rome and Carthage, but that of the whole world, was to be determined by them the next day. An engagement ensued*, in which, as Polybius informs us, the surprising military genius of Hannibal displayed itself in an extraordinary manner. Scipio likewise, according to Livy, passed a high encomium upon him, on account of his uncommon capacity in taking advantages, the excellent arrangement of his forces, and the manner in which he gave his orders during the engagement. The Roman general, indeed, not only approved his conduct, but openly declared that it was superior to his own. Nevertheless, being vastly inferior to the enemy in horse, and the state of Carthage obliging him to hazard a battle with

149 Hannibal totally routed.

the Romans at no small disadvantage, Hannibal was utterly routed, and his camp taken. He fled first to Thon, and afterwards to Adrumentum, from whence he was recalled to Carthage; where being arrived, he advised his countrymen to conclude a peace with Scipio on whatever terms he thought proper to prescribe.

* See Zama.

150 Peace concluded.

Thus was the second war of the Carthaginians with the Romans concluded. The conditions of peace were very humiliating to the Carthaginians. They were obliged to deliver up all the Roman deserters, fugitive slaves, prisoners of war, and all the Italians whom Hannibal had obliged to follow him. They also delivered up all their ships of war, except ten triremes, all their tame elephants, and were to train up no more of these animals for the service. They were not to engage in any war without the consent of the Romans. They engaged to pay to the Romans, in 50 years, 10,000 Euboic talents, at equal payments. They were to restore to Masinissa all they had usurped from him or his ancestors, and to enter into an alliance with him. They were also to assist the Romans both by sea and land, whenever they were called upon so to do, and never to make any levies either in Gaul or Liguria. These terms appeared so intolerable to the populace, that they threatened to plunder and burn the houses of the nobility; but Hannibal having assembled a body of 6000 foot and 500 horse at Marthama, prevented an insurrection, and by his influence completed the accommodation.

151 Carthaginians oppressed by Masinissa.

The peace between Carthage and Rome was scarcely signed, when Masinissa unjustly made himself master of part of the Carthaginian dominions in Africa, under pretence that these formerly belonged to his family. The Carthaginians, through the villanous mediation of the Romans, found themselves under a necessity of ceding these countries to that ambitious prince, and of entering into an alliance with him. The good understanding between the two powers continued for many years afterwards; but at last Masinissa violated the treaties subsisting betwixt him and the Carthaginian

thaginian republic, and not a little contributed to its subversion.

After the conclusion of the peace, Hannibal still kept up his credit among his countrymen. He was intrusted with the command of an army against some neighbouring nations in Africa: but this being disagreeable to the Romans, he was removed from it, and raised to the dignity of prætor in Carthage. Here he

2 Ha ibal flie) Antio s.

continued for some time, reforming abuses, and putting the affairs of the republic into a better condition: but this likewise being disagreeable to the Romans, he was obliged to fly to Antiochus king of Syria. After his flight, the Romans began to look upon the Carthaginians with a suspicious eye; though to prevent every thing of this kind, the latter had ordered two ships to pursue Hannibal, had confiscated his effects, razed his house, and by a public decree

3 Ini tous pro ed- ing f Ma- sin and the o- ma

declared him an exile. Soon after, disputes arising between the Carthaginians and Masinissa, the latter, notwithstanding the manifest iniquity of his proceedings, was supported by the Romans. That prince, grasping at further conquest, endeavoured to embroil the Carthaginians with the Romans, by asserting that the former had received ambassadors from Perseus king of Macedon; that the senate assembled in the temple of Æsculapius in the night time, in order to confer with them; and that ambassadors had been dispatched from Carthage to Perseus, in order to conclude an alliance with him. Not long after this, Masinissa made an irruption into the province of Tysca, where he soon possessed himself of 70, or, as Appian will have it, 50 towns and castles. This obliged the Carthaginians to apply with great importunity to the Roman senate for redress, their hands being so tied up by an article in the last treaty, that they could not repel force by force, in case of an invasion, without their consent. Their ambassadors begged, that the Roman senate would settle once for all what dominions they were to have, that they might from thenceforth know what they had to depend upon; or, if their state had any way offended the Romans, they begged that they would punish them themselves, rather than leave them exposed to the insults and vexations of so merciless a tyrant. Then prostrating themselves on the earth, they burst out into tears. But, notwithstanding the impression their speech made, the matter was left undecided; so that Masinissa had liberty to pursue his rapines, as much as he pleased. But whatever villanous designs the Romans might have with regard to the republic of Carthage, they affected to show a great regard to the principles of justice and honour. They therefore sent Cato, a man famous for committing enormities under the specious pretence of public spirit, into Africa, to accommodate all differences betwixt Masinissa and the Carthaginians. The latter very well knew their fate, had they submitted to such a mediation; and therefore appealed to the treaty concluded with Scipio, as the only rule by which their conduct and that of their adversary ought to be examined. This *unreasonable* appeal so incensed the righteous Cato, that he pronounced them a devoted people, and from that time resolved upon their destruction. For some time he was opposed by Scipio Nasica; but the people of Carthage, knowing the Romans to be their inveterate enemies, and reflecting upon the iniquitous treatment they had met with from them ever since the commencement of their disputes with Masinissa, were under great apprehensions of a visit from them. To prevent a rupture as much as possible, by a decree of the senate, they impeached Asdrubal, general of the army, and Carthalo, commander of the auxiliary forces, together with their accomplices, as guilty of high treason, for being the authors of the war against the king of Numidia. They sent a deputation to Rome, to discover what sentiments were entertained there of their late conduct, and to know what satisfaction the Romans required. These messengers meeting with a cold reception, others were dispatched, who returned with the same success. This made the unhappy citizens of Carthage believe that their destruction was resolved upon; which threw them into the utmost despair. And indeed they had but too just grounds for such a melancholy apprehension, the Roman senate now discovering an inclination to fall in with Cato's measures. About the same time, the city of Utica, being the second in Africa, and famous for its immense riches, as well as its equally commodious and capacious port, submitted to the Romans. Upon the possession of so important a fortress, which, by reason of its vicinity to Carthage, might serve as a place of arms in 154

the attack of that city, the Romans declared war against the Carthaginians without the least hesitation. In consequence of this declaration, the consuls M. Manlius, Nepos, and L. Marcius Censorinus, were dispatched with an army and fleet to begin hostilities with the utmost expedition.

War declared by the Romans against Carthage.

The land forces consisted of 80,000 foot and 4000 chosen horse; and the fleet of 50 quinqueremes, besides a vast number of transports. The consuls had secret orders from the senate not to conclude the operations but by the destruction of Carthage, without which, it was pretended, the republic could not but look upon all her possessions as insecure. Pursuant to the plan they had formed, the troops were first landed at Lilybæum in Sicily, from whence, after receiving a proper refreshment, it was proposed to transport them to Utica. 155

Ambassadors sent to Rome.

The answer brought by the last ambassadors to Carthage had not a little alarmed the inhabitants of that city. But they were not yet acquainted with the resolutions taken at Rome. They therefore sent fresh ambassadors thither, whom they invested with full powers to act as they thought proper for the good of the republic, and even to submit themselves without reserve to the pleasure of the Romans. But the most sensible persons among them did not expect any great success from this condescension, since the early submission of the Uticans had rendered it infinitely less meritorious than it would have been before. However the Romans seemed to be in some measure satisfied with it, since they promised them their liberty, the enjoyment of their laws, and, in short, every thing that was dear and valuable to them. This threw them into a transport of joy, and they wanted words to extol the moderation of the Romans. 156

The Romans demand 300 hostages.

But the senate immediately dashed all their hopes, by acquainting them that this favour was granted upon condition that they would send 300 young Carthaginian noblemen of the first distinction to the prætor Fabius at Lilybæum, within the space of 30 days, and comply with all the orders of the consuls. These hard terms filled

Carthage.

filled the whole city with inexpressible grief: but the hostages were delivered; and as they arrived at Lilybæum before the 30 days were expired, the ambassadors were not without hopes of softening their hard-hearted enemy. But the consuls only told them, that upon their arrival at Utica they should learn the further orders of the republic.

The ministers no sooner received intelligence of the Roman fleet appearing off Utica, than they repaired thither, in order to know the fate of their city. The consuls however did not judge it expedient to communicate all the commands of the republic at once, lest they should appear so harsh and severe, that the
157 Carthaginians would have refused to comply with them. They first, therefore, demanded a sufficient supply of corn for the subsistence of their troops. Secondly, That they should deliver up into their hands all the triremes they were then masters of. Thirdly, That they should put them in possession of all their military machines. And, fourthly, That they should immediately convey all their arms into the Roman camp.

and all the Carthaginian arms, military machines, &c.

As care was taken that there should be a convenient interval of time betwixt every one of these demands, the Carthaginians found themselves ensnared, and could not reject any one of them, though they
158 submitted to the last with the utmost reluctance and concern. Censorinus, now imagining them incapable of sustaining a siege, commanded them to abandon their city, or, as Zonaras will have it, to demolish it; permitting them to build another 80 stadia from the sea, but without walls or fortifications. This terrible decree threw the senate and every one else into despair; and the whole city became a scene of horror, madness, and confusion. The citizens cursed their ancestors for not dying gloriously in the defence of their country, rather than concluding such ignominious treaties of peace, that had been the cause of the deplorable condition to which their posterity was then reduced. At length, when the first commotion was a little
159 abated, the senators assembled, and resolved to sustain a siege. They were stripped of their arms and destitute of provisions; but despair raised their courage, and made them find out expedients. They took care to shut the gates of the city; and gathered together on the ramparts great heaps of stones, to serve them instead of arms in case of a surprise. They took the malefactors out of prison, gave the slaves their liberty, and incorporated them in the militia. Asdrubal was recalled who had been sentenced to die only to please the Romans; and he was invited to employ 20,000 men he had raised against his country in defence of it. Another Asdrubal was appointed to command in Car-
160 thage; and all seemed resolute, either to save their city or perish in its ruins. They wanted arms; but, by order of the senate, the temples, porticoes, and all public buildings, were turned into workhouses, where men and women were continually employed in making arms. As they encouraged one another in their work, and lost no time in procuring to themselves the necessaries of life, which were brought to them at stated hours, they every day made 144 bucklers, 300 swords, 1000 darts, and 500 lances and javelins. As to balistæ and catapultæ, they wanted proper materials for them; but their industry supplied that defect. Where iron and brass were wanting, they made use of silver and gold, melting down the statues, vases, and even the utensils of private families; for, on this occasion, even the most covetous became liberal. As tow and flax were wanting to make cords for working the machines, the women, even those of the first rank, freely cut off their hair and dedicated it to that use. Without the walls, Asdrubal employed the troops in getting together provisions, and conveying them safe into Carthage; so that there was as great plenty there as in the Roman camp.

They command them to destroy their city.

The Carthaginians resolve to sustain a siege.

They make new arms.

In the mean time the consuls delayed drawing near to Carthage, not doubting but the inhabitants, whom they imagined destitute of necessaries to sustain a siege, would, upon cool reflection, submit; but at length, finding themselves deceived in their expectation, they came before the place and invested it. As they were still persuaded that the Carthaginians had no arms, they flattered themselves that they should easily carry 16[1] the city by assault. Accordingly they approached the walls in order to plant their scaling ladders; but to their great surprise they discovered a prodigious multitude of men on the ramparts, shining in the armour they had newly made. The legionaries were so terrified at this unexpected sight, that they drew back, and would have retired, if the consuls had not led them on to the attack; which, however, proved unsuccessful; the Romans, in spite of their utmost efforts, being obliged to give over the enterprise, and lay aside all thoughts of taking Carthage by assault. In the mean time, Asdrubal, having collected from all places subject to Carthage a prodigious number of troops, came and encamped within reach of the Romans, and soon reduced them to great straits for want of provisions. As Marcius, one of the Roman consuls, was posted near a marsh, the exhalations of the stagnating waters, and the heat of the season, infected the air, and caused a general sickness among his men. Marcius, therefore, ordered his fleet to draw as near the shore as possible, in order to transport his troops 1[62] to a healthier place. Asdrubal being informed of this motion, ordered all the old barks in the harbour to be filled with faggots, tow, sulphur, bitumen, and other combustible materials; and then, taking advantage of the wind, which blew towards the enemy, let them drive upon their ships, which were for the most part consumed. After this disaster, Marcius was called home to preside at the elections; and the Carthaginians looking upon the absence of one of the consuls to be a good omen, made a brisk sally in the night; and would have surprised the consul's camp, had not Æmilianus, with some squadrons, marched out of the gate opposite to the place where the attack was made, and, coming round, fell unexpectedly on their rear, and obliged them to return in disorder to the city.

The ci[tizens] attack[ed] the Ro[mans], are rep[ul]sed.

Part [of the] Roma[n] fleet [de]stroye[d].

Asdrubal had posted himself under the walls of a city named Nepheris, 24 miles distant from Carthage, and situated on a high mountain, which seemed inaccessible on all sides. From thence he made incursions into the neighbouring country, intercepted the Roman convoys, fell upon their detachments sent out to forage, and even ordered parties to insult the consular army in their camp. Hereupon the consul resolved to drive the Carthaginian from this advantageous post, and set out for Nepheris. As he drew near the hills, Asdrubal

Cart ge.

bal suddenly appeared at the head of his army in order of battle, and fell upon the Romans with incredible fury. The consular army sustained the attack with great resolution; and Asdrubal retired in good order to his post, hoping the Romans would attack him there. But the consul, being now convinced of his danger, resolved to retire. This Asdrubal no sooner perceived, than he rushed down the hill, and falling upon the enemy's rear, cut a great number of them in pieces. The whole Roman army was now saved by the bravery of Scipio Æmilianns. At the head of 300 horse, he sustained the attack of all the forces commanded by Asdrubal, and covered the legions, while they passed a river in their retreat before the enemy. Then he and his companions threw themselves into the stream, and swam across it. When the army had crossed the river, it was perceived that four manipuli were wanting; and soon after they were informed that they had retired to an eminence, where they resolved to sell their lives as dear as possible. Upon this news Æmilianus, taking with him a chosen body of horse, and provisions for two days, crossed the river, and flew to the assistance of his countrymen. He seized a hill over against that on which the four manipuli were posted; and, after some hours repose, marched against the Carthaginians who kept them invested; fell upon them at the head of his squadron with the boldness of a man determined to conquer or die; and, in spite of all opposition, opened a way for his fellow-soldiers to escape. On his return to the army, his companions, who had given him over for lost, carried him to his quarters in a kind of triumph; and the manipuli he had saved gave him a crown of *gramen*. By these and some other exploits, Æmilianus gained such reputation, that Cato, who is said never to have commended any body before, could not refuse him the praises he deserved; and is said to have foretold that Carthage would never be reduced till Scipio Æmilianus was employed in that expedition.

The ... my in g t dang is save y! Scip Æ- milia s.

The next year, the war in Africa fell by lot to the consul L. Calpurnius Piso; and he continued to employ Æmilianus in several important enterprises, in which he was attended with uncommon success. He took several castles; and in one of his excursions, found means to have a private conference with Phameas, general, under Asdrubal, of the Carthaginian cavalry, and brought him over, together with 2200 of his horse, to the Roman interest. Under the consul Calpurnius Piso himself, however, the Roman arms were unsuccessful. He invested Clupea; but was obliged to abandon the enterprise, with the loss of a great number of men killed by the enemy in their sallies. From this place he went to vent his rage on a city newly built, and thence called *Neapolis*, which professed a strict neutrality, and had even a safeguard from the Romans. The consul, however, plundered the place, and stripped the inhabitants of all their effects. After this he laid siege to *Hippagretta*, which employed the Roman fleet and army the whole summer; and, on the approach of winter, the consul retired to Utica, without performing a single action worth notice during the whole campaign.

54 H ains ov the C agini- ar eneral of rse.

165 H s cho- s consul.

The next year Scipio Æmilianus was chosen consul, and ordered to pass into Africa; and, upon his arrival, the face of affairs was greatly changed. At the time of his entering the port of Utica, 3500 Romans were in great danger of being cut in pieces before Carthage. These had seized Megalia, one of the snburbs of the city; but, as they had not furnished themselves with provisions to subsist there, and could not retire, being closely invested on all sides by the enemy's troops, the prætor Mancinus, who commanded this detachment, seeing the danger into which he had brought himself, dispatched a light boat to Utica, to acquaint the Romans there with his sitnation. Æmilianus received this letter a few hours after his landing; and immediately flew to the relief of the besieged Romans, obliged the Carthaginians to retire within their walls, and safely conveyed his countrymen to Utica. Having then drawn together all the troops, Æmilianus applied himself wholly to the siege of the capital.

Carthage.

166 Cruelties of Asdrubal.

His first attack was upon Megalia; which he carried by assault, the Carthaginian garrison retiring into the citadel of Byrsa. Asdrubal, who had commanded the Carthaginian forces in the field, and was now governor of the city, was so enraged at the loss of Megalia, that he caused all the Roman captives taken in the two years the war lasted to be brought upon the ramparts, and thrown headlong, in the sight of the Roman army, from the top of the wall; after having, with an excess of cruelty, commanded their hands and feet to be cut off, and their eyes and tongues to be torn out. He was of a temper remarkably inhuman; and it is said that he even took pleasure in seeing some of these unhappy men flayed alive. Æmilianus, in the mean time, was busy in drawing lines of circumvallation and contravallation across the neck of land which joined the isthmus on which Carthage stood to the continent. By this means, all the avenues on the land side of Carthage being shut up, the city could receive no provisions that way. His next care was to raise a mole in the sea, in order to block up the old port, the new one being already shut up by the Roman fleet; and this great work he effected with immense labour. The mole reached from the western neck of land, of which the Romans were masters, to the entrance of the port, and was 90 feet broad at the bottom, and 80 at the top. The besieged, when the Romans first began this surprising work, laughed at the attempt; but were no less alarmed than surprised, when they beheld a vast mole appearing above water, and by that means the port rendered inaccessible to ships, and quite useless. Prompted by despair, however, the Carthaginians, with incredible and almost miraculous industry, dug a new bason, and cut a passage into the sea, by which they could receive the provisions that were sent them by the troops in the field. With the same diligence and expedition they fitted out a fleet of 50 triremes; which, to the great surprise of the Romans, appeared suddenly advancing into the sea through this new canal, and even ventured to give the enemy battle. The action lasted the whole day, with little advantage on either side. The day after, the consul endeavoured to make himself master of a terrace which covered the city on the side next the sea; and on this occasion the besieged signalized themselves in a most remarkable manner. Great numbers of them, naked and unarmed, went into the water in the dead of the night, with unlighted torches in their hands; and having, partly by swimming, partly by wading, got within reach of the Roman

167 Carthage blocked up by sea and land.

168 The besieged dig a wide bason.

169 They set fire to the Roman machines.

Carthage.

Roman engines, they struck fire, lighted their torches, and threw them with fury against the machines. The sudden appearance of these naked men, who looked like so many monsters started up out of the sea, so terrified the Romans who guarded the machines, that they began to retire with the utmost confusion. The consul, who commanded the detachment in person, and had continued all night at the foot of the terrace, endeavoured to stop his men, and even ordered those who fled to be killed. But the Carthaginians, perceiving the confusion the Romans were in, threw themselves upon them like so many wild beasts; and having put them to flight only with their torches, they set fire to the machines, and entirely consumed them.—This, however, did not discourage the consul; he renewed the attack a few days after, carried the terrace by assault, and lodged 4000 men upon it. As this was an important post, because it pent in Carthage on the sea side, Æmilianus took care to fortify and secure it against the sallies of the enemy; and then, winter approaching, he suspended all further attacks upon the place till the return of good weather. During the winter season, however, the consul was not inactive. The Carthaginians had a very numerous army under the command of one Diogenes, strongly encamped near Nepheris, whence convoys of provisions were sent by sea to the besieged, and brought into

170 Vast slaughter of the Carthaginians.

the new bason. To take Nepheris, therefore, was to deprive Carthage of her chief magazine. This Æmilianus undertook, and succeeded in the attempt. He first forced the enemy's intrenchments, put 70,000 of them to the sword, and made 10,000 prisoners; all the inhabitants of the country, who could not retire to Carthage, having taken refuge in this camp. After this he laid siege to Nepheris, which was reduced in 22 days. Asdrubal being disheartened by the defeat of the army, and touched with the misery of the besieged, now reduced to the utmost extremity for want of provisions, offered to submit to what conditions the Romans pleased, provided the city was spared; but this was absolutely refused.

171 Cotho taken.

Early in the spring, Æmilianus renewed the siege of Carthage; and in order to open himself a way into the city, he ordered Lælius to attempt the reduction of Cotho, a small island which divided the two ports. Æmilianus himself made a false attack on the citadel, in order to draw the enemy thither. This stratagem had the desired effect: for the citadel being a place of the greatest importance, most of the Carthaginians hastened thither, and made the utmost efforts to repulse the aggressors; but in the mean time Lælius having, with incredible expedition, built a wooden bridge over the channel which divided Cotho from the isthmus, entered the island, scaled the walls of the fortress which the Carthaginians had built there, and made himself master of that important post. The proconsul, who was engaged before Byrsa, no sooner understood, by the loud shouts of the troops of Lælius, that he had made himself master of Cotho, than he

172 Romans enter the city.

abandoned the false attack, and unexpectedly fell on the neighbouring gate of the city, which he broke down, notwithstanding the showers of darts that were incessantly discharged upon his men from the ramparts. As night coming on prevented him from proceeding farther, he made a lodgment within the gate, and waited there for the return of day, with a design to advance through the city to the citadel, and attack it on that side, which was but indifferently fortified. Pursuant to this design, at daybreak, he ordered 4000 fresh troops to be sent from his camp; and having solemnly devoted to the infernal gods the unhappy Carthaginians, he began to advance at the head of his men through the streets of the city, in order to attack the citadel. Having advanced to the market place, he found that the way to the citadel lay through three exceeding steep streets. The houses on both sides were very high, and filled with the Carthaginians, who overwhelmed the Romans as they advanced with darts and stones; so that they could not proceed till they had cleared them. To this end Æmilianus in person, at the head of a detachment, attacked the first house and made himself master of it, sword in hand. His example was followed by the officers and soldiers, who went on from house to house, putting all they met with to the sword. As fast as the houses were cleared on both sides, the Romans advanced in order of battle towards the citadel; but met with a vigorous resistance from the Carthaginians, who on this occasion behaved with uncommon resolution. From the market place to the citadel, two bodies of men fought their way every step, one above on the roofs of the houses, the other below in the streets. The slaughter was inexpressibly great and dreadful. The air rung with shrieks and lamentations. Some were cut in pieces, others threw themselves down from the tops of the houses; so that the streets were filled with dead and 173

173 Which is set on fire.

mangled bodies. But the destruction was yet greater when the proconsul commanded fire to be set to that quarter of the town which lay next to the citadel. Incredible multitudes, who had escaped the swords of the enemy, perished in the flames, or by the fall of the houses. After the fire, which lasted six days, had demolished a sufficient number of houses, Æmilianus ordered the rubbish to be removed, and a large area to be made, where all the troops might have room to act. Then he appeared with his whole army before Byrsa; which so terrified the Carthaginians, who had fled thither for refuge, that first of all 25,000 women, and then 30,000 men, came out of the gates in such a condition as moved pity. They threw themselves prostrate before the Roman general, asking no favour but life. This was readily granted, not only to them but to all that were in Byrsa except the Roman deserters, whose number amounted to 900. Asdrubal's wife earnestly entreated her husband to suffer her to join the suppliants, and carry with her to the proconsul her two sons who were as yet very young; but the barbarian denied her request, and rejected her remonstrances with menaces. The Roman deserters, seeing themselves excluded from mercy, resolved to die sword in hand, rather than deliver themselves up to the vengeance of their countrymen. Then Asdrubal, finding them all resolved to defend themselves to the last breath, committed to their care his wife and children; after which, he in a most cowardly and mean-spirited manner, came and privately threw himself at the conqueror's feet. The Carthaginians in the citadel no sooner understood that their commander had abandoned the place, than they threw open the gates, and put the Romans in possession of Byrsa. They had now no

174 Cruelty and cowardice of Asdrubal.

Carthage.

no enemy to contend with but the 900 deserters, who, being reduced to despair, retreated into the temple of Æsculapius, which was as a second citadel within the first. There the proconsul attacked them; and these unhappy wretches, finding there was no way to escape, set fire to the temple. As the flames spread, they retreated from one part of the building to another, till they got to the roof. There Asdrubal's wife appeared

175 Asdrubal's wife destroys herself and two children.

in her best apparel, and having uttered the most bitter imprecations against her husband, whom she saw standing below with Æmilianus, "Base coward! (said she) the mean things thou hast done to save thy life shall not avail thee: thou shalt die this instant, at least in thy two children." Having thus spoken, she stabbed both the infants with a dagger; and while they were yet struggling for life, threw them both from the top of the temple, and then leaped down after them into the flames.

176 Carthage plundered,

Æmilianus delivered up the city to be plundered, but in the manner prescribed by the Roman military law. The soldiers were allowed to appropriate to themselves all the furniture, utensils, and brass money, they should find in private houses; but all the gold and silver, the statues, pictures, &c. were reserved to be put into the hands of the quæstors. On this occasion the cities of Sicily, which had been often plundered by the Carthaginian armies, recovered a number of statues, pictures, and other valuable monuments; among the rest the famous brazen bull, which Phalaris had ordered to be cast, and used as the chief instrument of his cruelty, was restored to the inhabitants of Agrigentum. As Æmilianus was greatly inclined to spare what remained of this stately metropolis, he wrote to the senate on the subject, from whom he received the following orders: 1. The city of Carthage, with Byrsa and Megalia, shall be entirely destroyed, and no traces of them left. 2. All the cities that have lent Carthage any assistance shall be dismantled. 3. The territories of those cities which have declared for the Romans shall be enlarged with lands taken from the enemy. 4. All the lands between Hippo and Carthage shall be divided among the inhabitants of Utica. 5. All the Africans of the Carthaginian state, both men and women, shall pay an annual tribute to the Romans at so much per head. 6. The whole country, which was subject to the Carthaginian state, shall be turned into a Roman province, and be governed by a prætor, in the same manner as Sicily. Lastly, Rome shall send commissioners into Africa, there to settle jointly with the proconsul the state of the new province. Before Æmilianus destroyed the city, he performed those religious ceremonies which were required on such occasions: he first sacrificed to the gods, and then caused a plough to be drawn round the

177 and utterly destroyed.

walls of the city. After this the towers, ramparts, walls, and all the works which the Carthaginians had raised in the course of many ages, and at a vast expence, were levelled with the ground; and lastly, fire was set to the edifices of the proud metropolis, which consumed them all, not a single house escaping the flames. Though the fire began in all quarters at the same time, and burnt with incredible fury, it continued for 17 days before all the buildings were consumed.

Thus fell Carthage, about 146 years before the birth of Christ; a city whose destruction ought to be attributed more to the intrigues of an abandoned faction, composed of the most profligate part of its citizens, than to the power of its rival. The treasure which Æmilianus carried off, even after the city had been delivered up to be plundered by the soldiers, was immense, Pliny making it to amount to 4,470,000 pounds weight of silver. The Romans ordered Carthage never to be inhabited again, denouncing dreadful imprecations against those who, contrary to this prohibition, should attempt to rebuild any part of it, especially Byrsa and Megalia. Notwithstanding this, however, about 24 years after, C. Gracchus, tribune 178 Rebuilt.

of the people, in order to ingratiate himself with them, undertook to rebuild it; and to that end conducted thither a colony of 6000 Roman citizens. The workmen, according to Plutarch, were terrified by many unlucky omens at the time they were tracing the limits and laying the foundations of the new city; which the senate being informed of, would have suspended the attempt. But the tribune, little affected with such presages, continued to carry on the work, and finished it in a few days. From hence it is probable that only a slight kind of huts were erected; but whether Gracchus executed his design, or the work was entirely discontinued, it is certain that Carthage was the first Roman colony ever sent out of Italy. According to some authors, Carthage was rebuilt by Julius Cæsar; and Strabo, who flourished in the reign of Tiberius, affirms it in his time to have been equal, if not superior, to any other city in Africa. It was looked upon as the capital of Africa for several centuries after the commencement of the Christian era. Maxentius laid it in ashes about the sixth or seventh year of Constantine's reign. Genseric, king of the Vandals, took it A. D. 439; but about a century afterwards it was reannexed to the Roman empire by the renowned Belisarius. At last the Saracens, under Mohammed's successors, towards the close of the seventh century, so completely destroyed it, that there are now scarce any traces remaining. 179 Utterly destroyed by the Saracens.

At the commencement of the third Punic war, Carthage appears to have been one of the first cities in the world. It was seated on a peninsula 360 stadia or 45 miles in circumference, joined to the continent by an isthmus 25 stadia or three miles and a furlong in breadth. On the west side there projected from it a long tract of land half a stadium broad; which shooting out into the sea, separated it from a lake or morass, and was strongly fortified on all sides by rocks and a single wall. In the middle of the city stood the citadel of Byrsa, having on the top of it a temple sacred to Æsculapius, seated upon rocks on a very high hill, to which the ascent was by 60 steps. On the south side the city was surrounded by a triple wall, 30 cubits high, flanked all round by parapets and towers, placed at equal distances of 480 feet. Every tower had its foundation sunk 32 feet deep, and was four stories high, though the walls were but two: they were arched; and, in the lower part, corresponding in depth with the foundation above mentioned, were stalls large enough to hold 300 elephants, with their fodder, &c. Over these were stalls and other conveniences for 4000 horses; and there was likewise room for lodging 20,000 foot and 4000 cavalry, without in 180 Its ancient grandeur.

in the least incommoding the inhabitants. There were two harbours, so disposed as to have a communication with one another. They had one common entrance 70 feet broad, and shut up with chains. The first was appropriated to the merchants; and included in it a vast number of places of refreshment, and all kinds of accommodation for seamen. The second, as well as the island of Cothon, in the midst of it, was lined with large quays, in which were distinct receptacles for securing and sheltering from the weather 220 ships of war. Over these were magazines of all sorts of naval stores. The entrance into each of these receptacles was adorned with two marble pillars of the Ionic order; so that both the harbour and island represented on each side two magnificent galleries. Near this island was a temple of Apollo, in which was a statue of the god all of massy gold; and the inside of the temple all lined with plates of the same metal, weighing 1000 talents. The city was 23 miles in circumference, and at the time we speak of contained 700,000 inhabitants. Of their power we may have some idea, by the quantity of arms they delivered up to the Roman consuls. The whole army was astonished at the long train of carts loaded with them, which were thought sufficient to have armed all Africa. At least it is certain, that on this occasion were put into the hands of the Romans 2000 catapultæ, 200,000 complete suits of armour, with an innumerable quantity of swords, darts, javelins, arrows, and beams armed with iron, which were thrown from the ramparts by the balistæ.

The character transmitted of the Carthaginians is extremely bad; but we have it only on the authority of the Romans, who, being their implacable enemies, cannot be much relied upon. As to their religion, manners, &c. being much the same with the Phœnicians, of which they were a colony, the reader is referred for an account of these things to the article PHŒNICIA.

On the ruins of Carthage there now stands only a small village called *Melcha*. The few remains of Carthage consist only of some fragments of walls, and 17 cisterns for the reception of rain water.

There are three eminences, which are so many masses of fine marbles pounded together, and were in all probability the sites of temples and other distinguished buildings. The present ruins are by no means the remains of the ancient city destroyed by the Romans; who, after taking it, entirely erased it, and ploughed up the very foundations; so truly they adhered to the well-known advice perpetually inculcated by Cato the Elder, *Delenda est Carthago*. It was again rebuilt by the Gracchi family, who conducted a colony to repeople it: and continually increasing in splendour, it became at length the capital of Africa under the Roman emperors. It subsisted near 700 years after its first demolition, until it was entirely destroyed by the Saracens in the beginning of the 7th century.

It is a singular circumstance that the two cities of Carthage and Rome should have been built just opposite one to the other; the bay of Tunis and the mouth of the Tiber being in a direct line.

Littora littoribus contraria, fluctibus undas,
Arma armis. VIRG. Æn. iv. 627.

New CARTHAGE, a considerable town of Mexico, in the province of Costa Rica. It is a very rich trading place. W. Long. 86. 7. N. Lat. 9. 5.

CARTHAGENA, a province of South America, in the new kingdom of Grenada, bounded on the north by the Carribbean sea, on the south by the province of Antioquia, on the east by Santa Martha, and on the west by Darien. The capital city, called likewise *Carthagena*, is situated in W. Long. 77. N. Lat. 11. on a sandy island, by most writers called a peninsula; which, forming a narrow passage on the south-west, opens a communication with that called *Tierra Bomba*, as far as *Bocca Chica*. The little island which now joins them was formerly the entrance of the bay; but it having been filled up by orders of the court, Bocca Chica became the only entrance: this, however, has been filled up since the attempt of Vernon and Wentworth, and the old passage again opened. On the north side the land is so narrow, that before the wall was begun, the distance from sea to sea was only 35 toises; but afterwards enlarging, it forms another island on this side; so that, excepting these two places, the whole city is entirely surrounded by salt water. To the eastward it has a communication, by means of a wooden bridge, with a large suburb called *Xemani*, built on another island, which is also joined to the continent by a bridge of the same materials. The fortifications both of the city and suburbs are built after the modern manner, and lined with freestone; and, in time of peace, the garrison consists of ten companies of 77 men each, besides militia. The city and suburbs are well laid out, the streets straight, broad, uniform, and well paved. All the houses are built of stone or brick, only one story high, well contrived, neat, and furnished with balconies and lattices of wood, which is more durable in that climate than iron, the latter being soon corroded by the acrimonious quality of the atmosphere. The climate is exceedingly unhealthy. The Europeans are particularly subject to the terrible disease called the *black vomit*, which sweeps off multitudes annually on the arrival of the galleons. It seldom continues above three or four days, in which time the patient is either dead or out of danger, and if he recovers, is never subject to a return of the same distemper. —This disease has hitherto foiled all the art of the Spanish physicians; as has also the leprosy, which is very common here. At Carthagena, likewise, that painful tumour in the legs, occasioned by the entrance of the *dracunculus* or Guinea-worm, is very common and troublesome. Another disorder peculiar to this country, and to Peru, is occasioned by a little insect called *nigua*, so extremely minute as scarce to be visible to the naked eye. This insect breeds in the dust, insinuates itself into the soles of the feet and the legs, piercing the skin with such subtility, that there is no being aware of it, before it has made its way to the flesh. If it is perceived in the beginning, it is extracted with little pain; but having once lodged its head, and pierced the skin, the patient must undergo the pain of an incision, without which a nidus would be formed, and a multitude of insects ingendered, which would soon overspread the foot and leg. The province contains about 60,000 whites, 13,000 Indians, and 7000 negro slaves. It has not been much concerned in the revolutionary movements which began in 1810, and still continue.

Carthagena || Cartilaginous.

CARTHAGENA, a seaport town of Spain, in the kingdom of Murcia, and capital of a territory of the same name, built by Asdrubal, a Carthaginian general, and named after Carthage. It has the best harbour in all Spain, but nothing else very considerable; the bishop's see being transferred to Toledo. In 1706 it was taken by Sir John Leake: but the duke of Berwick retook it afterwards. Population 25,000. W. Long. 0. 58. N. Lat. 37. 36.

CARTHAMUS. See BOTANY *Index*. The carthamus tinctorius is at present cultivated in many parts of Europe, and also in the Levant, from whence great quantities of it are annually imported into Britain for the purposes of dyeing and painting. The good quality of this commodity is in the colour, which is of a bright saffron hue: and in this the British carthamus very often fails; for if there happens much rain during the time the plants are in flower, the flowers change to a dark or dirty yellow, as they likewise do if the flowers are gathered with any moisture remaining upon them.—The seeds of carthamus have been celebrated as a cathartic; but they operate very slowly, and for the most part disorder the stomach and bowels, especially when given in substance: triturated with distilled aromatic waters, they form an emulsion less offensive, yet inferior in efficacy to the more common purgatives. They are eaten by a species of Egyptian parrot, which is very fond of them; to other birds or beasts they would prove a mortal poison.

CARTHUSIANS, a religious order, founded in the year 1080, by one Brudo. The Carthusians, so called from the desert of *Chartreux*, the place of their institution, are remarkable for the austerity of their rule. They are not to go out of their cells, except to church, without leave of their superior, nor speak to any person without leave. They must not keep any portion of their meat or drink till next day; their beds are of straw, covered with a felt; their clothing two haircloths, two cowls, two pair of hose, and a cloak, all coarse. In the refectory, they are to keep their eyes on the dish, their hands on the table, their attention on the reader, and their hearts fixed on God. Women are not allowed to come into their churches. It is computed that there are 172 houses of Carthusians; whereof five are of *nuns*, who practise the same austerities as the monks. They are divided into 16 provinces, each of which has two visitors. There have been several canonized saints of this order, 4 cardinals, 70 archbishops and bishops, and a great many very learned writers.

CARTHUSIAN *Powder*, the same with kermes mineral. See KERMES.

CARTILAGE, in *Anatomy*, a body approaching to the nature of bones; but lubricous, flexible, and elastic. See ANATOMY *Index*.

Pl. Zool. fig. 75.

CARTILAGINOUS, in *Ichthyology*, a title given to all fishes whose muscles are supported by cartilages instead of bones: and comprehends the same genera of fish to which Linnæus has given the name of *amphibia nantes*: but the word *amphibia* ought properly to be confined to such animals as inhabit both elements; and can live, without any inconvenience, for a considerable time, either on land or in water; such as tortoises, frogs, and several species of lizards; and among the quadrupeds, hippopotami, &c. &c.

Cartilaginous || Carton.

Many of the cartilaginous fish are viviparous, being excluded from an egg, which is hatched within them. The egg consists of a white and yolk; and is lodged in a case formed of a thick tough substance, not unlike softened horn; such are the eggs of the *ray* and *shark* kinds. Some again differ in this respect, and are oviparous; such is the *sturgeon*, and others.

They breathe either through certain apertures beneath, as in the *rays;* on their sides, as in the *sharks*, &c.; or on the top of the head, as in the *pipe-fish:* for they have not covers to their gills like bony fish.

CARTMEL, a town of Lancashire in England. It is seated among the hills called Cartmell-fells, not far from the sea, and near the river Kent; adorned with a very handsome church, built in the form of a cross like a cathedral. The market is well supplied with corn, sheep, and fish. Population 280 in 1811. W. Long. 2. 43. N. Lat. 54. 15.

CARTON, or CARTOON, in *Painting*, a design drawn on strong paper, to be afterwards chalked through, and transferred on the fresh plaster of a wall, to be painted in fresco. It is also used for a design coloured, for working in mosaic, tapestry, &c. The word is from the Italian *cartoni* (*carta*, "paper," and *oni*, "large,") denoting many sheets of paper pasted on canvas on which large designs are made, whether coloured or with chalks only. Of these many are to be seen at Rome, particularly by Domenichino. Those by Andrea Mantegna, which are at Hampton Court, were made for paintings in the old ducal palace at Mantua. But the most famous performances of this sort are,

The *Cartoons of Raphael*, so deservedly applauded throughout Europe by all authors of refined taste, and all true admirers of the art of design, for their various and matchless merit, particularly with regard to the invention, and to the great and noble expression of such a variety of characters, countenances, and most expressive attitudes, as they are differently affected and properly engaged, in every composition. These cartoons are seven in number, and form only a small part of the sacred historical designs executed by this great artist, while engaged in the chambers of the Vatican under the auspices of Popes Julius II. and Leo X. When finished, they were sent to Flanders, to be copied in tapestry, for adorning the pontifical apartments; which tapestries were not sent to Rome till several years after the decease of Raphael, and even in all probability were not finished and sent there before the terrible sack of that city in the time of Clement VII. when Raphael's scholars had fled from thence, and none left to inquire after the original cartoons, which lay neglected in the store-rooms of the manufactory. The great revolution also which followed in the Low Countries prevented their being noticed amidst the entire neglect of the works of art. It was therefore a most fortunate circumstance that these seven escaped the wreck of the others, which were torn in pieces and remained dispersed as fragments in different collections. These seven were purchased by Rubens for Charles I. and they have been so roughly handled from the first, that holes were pricked for the weavers to pounce the outlines, and other parts almost cut through in tracing also. In this state perhaps they as fortunately escaped the sale amongst the royal collection,

tion, by the disproportioned appraisement of these seven at 300l. and the nine pieces, being the Triumph of Julius Cæsar, by Andræa Mantegna, appraised at 1000l. They seem to have been taken small notice of till King William built a gallery, purposely to receive them at Hampton Court; whence they were moved, on their suffering from damps, to the Queen's Palace. They are now at Windsor Castle, and open to public inspection.

CARTOUCHE, in *Architecture* and *Sculpture*, an ornament representing a scroll of paper. It is usually a flat member, with wavings to represent some inscription, device, cipher, or ornament of armoury. They are, in architecture, much the same as modillions; only these are set under the cornice in wainscotting, and those under the cornice at the eaves of a house.

CARTOUCHE, in the military art, a case of wood, about three inches thick at the bottom, girt with marline, holding about four hundred musket balls, besides six or eight balls of iron, of a pound weight, to be fired out of a hobit, for the defence of a pass, &c.

A cartouche is sometimes made of a globular form, and filled with a ball of a pound weight; and sometimes it is made for the guns, being of a ball of half or quarter a pound weight, according to the nature of the gun, tied in form of a bunch of grapes, on a tompion of wood, and coated over. These were made in the room of partridge-shot.

CARTRIDGE, in the military art, a case of pasteboard or parchment, holding the exact charge of a firearm. Those for muskets, carabines, and pistols, hold both the powder and ball for the charge: and those of cannon and mortars are usually in cases of pasteboard or tin, sometimes of wood, half a foot long, adapted to the caliber of the piece.

Cartridge-Box, a case of wood or turned iron, covered with leather, holding a dozen musket cartridges. It is worn upon a belt, and hangs a little lower than the right pocket-hole.

CARTWRIGHT, William, an eminent divine and poet, born at Northway, near Tewkesbury, in Gloucestershire, in September 1611. He finished his education at Oxford; afterwards went into holy orders, and became a most florid preacher in the university. In 1642, he had the place of succentor in the church of Salisbury: and, in 1642, was chosen junior proctor in the university. He was also metaphysical reader there. Wit, judgment, elocution, a graceful person and behaviour, occasioned that encomium of him from Dean Fell, "That he was the utmost that man could come to." He was an expert linguist; an excellent orator; and at the same time was esteemed an admirable poet. There are extant of his, four plays, and some poems. He died in 1643, aged 33.

CARVAGE (*carvagium*), the same with Carrucage.

Henry III. is said to have taken carvage, that is, two marks of silver of every knight's fee, towards the marriage of his sister Isabella to the emperor. Carvage could only be imposed on tenants *in capite*.

Carvage also denotes a privilege whereby a man is exempted from the service of carrucage.

CARUCATURIUS, in ancient law books, he that held land in soccage, or by plough tenure.

CARUCATE. See Carrucate.

CARVER, a cutter of figures or other devices in wood. See Carving.

Carvers answer to what the Romans called *sculptores*, who were different from *cælatores*, or engravers, as these last wrought in metal.

Carver is also an officer of the table, whose business is to cut up the meat, and distribute it to the guests. The word is formed from the Latin *carptor*, which signifies the same. The Romans also called him *carpus*, sometimes *scissor*, *scindendi magister*, and *structor*.

In the great families at Rome, the carver was an officer of some figure. There were masters to teach them the art regularly, by means of figures of animals cut in wood. The Greeks also had their carvers, called διατροι, q. d. *diribitores*, or *distributors*. In the primitive times, the master of the feast carved for all his guests. Thus in Homer, when Agamemnon's ambassadors were entertained at Achilles's table, the hero himself carved the meat. Of latter times, the same office on solemn occasions was executed by some of the chief men of Sparta. Some derive the custom of distributing to every guest his portion, from those early ages when the Greeks first left off feeding on acorns, and learned the use of corn: The new diet was so great a delicacy, that to prevent the guests from quarrelling about it, it was found necessary to make a fair distribution.

In Scotland, the king has a hereditary carver in the family of Anstruther.

CARUI, or Carvi, in *Botany*. See Carum, Botany *Index*.

CARVING, in a general sense, the art or act of cutting or fashioning a hard body, by means of some sharp instrument, especially a chissel. In this sense carving includes statuary and engraving, as well as cutting in wood.

Carving, in a more particular sense, is the art of engraving or cutting figures in wood. In this sense *carving*, according to Pliny, is prior both to statuary and painting.

To carve a figure or design, it must be first drawn or pasted on the wood; which done, the rest of the block not covered by the lines of the design, is to be cut away with little narrow-pointed knives. The wood fittest for the use is that which is hard, tough, and close, as beech, but especially box: to prepare it for drawing the design on, they wash it over with white lead tempered in water; which better enables it either to bear ink or the crayon, or even to take the impression by chalking. When the design is to be pasted on the wood, this whitening is omitted, and they content themselves with seeing the wood well planed. Then wiping over the painted side of the figure with gum tragacanth dissolved in water, they clap it smooth on the wood, and let it dry: which done, they wet it slightly over, and fret off the surface of the paper gently, till all the strokes of the figure appear distinctly. This done, they fall to cutting or carving, as above.

CARUM. See Botany *Index*.

CARUNCULA, or Caruncle, in *Anatomy*, a term denoting a little piece of flesh, and applied to several parts of the human body. Thus,

Carunculæ

Carunculæ Myrtiformes, in *Anatomy*, fleshy knobs about the size of a myrtle berry, supposed to owe their origin to the breaking of the hymen. See Anatomy *Index*.

Caruncles, in the urethra, proceeding from a gonorrhœa, or an ulceration of the urethra, may be reduced by introducing the Bougie.

CARUS, a sudden deprivation of sense and motion, affecting the whole body. See Medicine *Index*.

Carus, *Marcus Aurelius*, was raised from a low station, by his great merit, to be emperor of Rome in 282. He shewed himself worthy of the empire; subdued his enemies; and gave the Romans a prospect of happy days, when he was unfortunately killed by lightning in 284.

CARWAR, a town of Asia, on the coast of Malabar in the East Indies, and where the East India Company have a factory, fortified with two bastions. The valleys about it abound in corn and pepper, which last is the best in the East Indies. The woods on the mountains abound with quadrupeds, such as tigers, wolves, monkeys, wild hogs, deers, elks, and a sort of beeves of a prodigious size. The religion of the natives is Paganism; and they have a great many strange and superstitious customs. E. Long. 73. 7. N. Lat. 15. 0.

CARY, Lucius, Lord Viscount Falkland, was born in Oxfordshire, about the year 1610; a young nobleman of great abilities and accomplishments. About the time of his father's death in 1633, he was made gentleman of the privy chamber to King Charles I. and afterwards secretary of state. Before the assembling of the long parliament, he had devoted himself to literature, and every pleasure which a fine genius, a generous disposition, and an opulent fortune, could afford: when called into public life, he stood foremost in all attacks on the high prerogatives of the crown; but when civil convulsions came to an extremity, and it was necessary to choose a side, he tempered his zeal, and defended the limited powers that remained to monarchy. Still anxious, however, for his country, he seems to have dreaded equally the prosperity of the royal party, and that of the parliament; and among his intimate friends, often sadly reiterated the word *peace*. This excellent nobleman freely exposed his person for the king in all hazardous enterprises, and was killed in the 34th year of his age at the battle of Newberry. In Wellwood's Memoirs we are told, that whilst he was with the king at Oxford, his majesty went one day to see the public library, where he was shown among other books a Virgil, nobly printed, and exquisitely bound. The Lord Falkland, to divert the king, would have his majesty make a trial of his fortune by the Sortes Virgilianæ, an usual kind of divination in ages past, made by opening a Virgil. The king opening the book, the passage which happened to come up, was that part of Dido's imprecation against Æneas, iv. 615, &c. which is thus translated by Dryden:

"Oppress'd with numbers in th' unequal field,
"His men discourag'd, and himself expell'd;
"Let him for succour sue from place to place,
"Torn from his subjects and his son's embrace." &c.

King Charles seeming concerned at this accident, the Lord Falkland, who observed it, would likewise try his own fortune in the same manner, hoping he might fall upon some passage that could have no relation to his case, and thereby divert the king's thoughts from any impression the other might make upon him: but the place Lord Falkland stumbled upon was yet more suited to his destiny than the other had been to the king's; being the following expressions of Evander, upon the untimely death of his son Pallas, Æn. xi. 152.

"O Pallas! thou hast fail'd thy plighted word;
"To fight with caution, not to tempt the sword,
"I warn'd thee, but in vain; for well I knew
"What perils youthful ardour would pursue;
"That boiling blood would carry thee too far;
"Young as thou wert in dangers, raw to war.
"O curst essay of arms, disastrous doom,
"Prelude of bloody fields and fights to come!"

He wrote several things both poetical and political; and in some of the king's declarations, supposed to be penned by Lord Falkland, we find the first regular definition of the English constitution that occurs in any composition published by authority. His predecessor, the first Viscount Cary, was ennobled for being the first who gave King James an account of Queen Elizabeth's death.

Cary, *Robert*, a learned English chronologer, born in Devonshire about the year 1615. On the Restoration, he was preferred to the archdeaconry of Exeter, but on some pretext was ejected in 1664, and spent the rest of his days at his rectory of Portlemoth, where he died in 1688. He published *Palæologia Chronica*, a chronology of ancient times, in three parts, didactical, apodeictical, and canonical; and translated the hymns of the church into Latin verse.

CARYA, -Æ, (Stephanus); *Caryæ, -arum*, (Pausanias); a town of Laconia, between Sparta and the borders of Messenia; where stood a temple of Diana, thence called *Caryatis, -idis;* whose annual festival, called *Carya, -orum*, was celebrated by Spartan virgins with dances. An inhabitant, *Caryates*, and *Caryatis*, *Caryatis apis*, a Laconian bee, (Stephanus).

Caryæ, -arum, in *Ancient Geography*, a place in Arcadia, towards the borders of Laconia. Whether from this of Arcadia, or that of Laconia, the *columnæ caryatides* of Vitruvius and Pliny (which were statues of matrons in stoles or long robes) took the appellation, is disputed.

CARYTES, in antiquity, a festival in honour of Diana, surnamed *Caryatis*, held at Caryum, a city of Laconia. The chief ceremony was a certain dance said to have been invented by Castor and Pollux, and performed by the virgins of the place. During Xerxes's invasion, the Laconians not daring to appear and celebrate the customary solemnity, to prevent incurring the anger of the goddess by such an intermission, the neighbouring swains are said to have assembled and sung pastorals or *bucolismi*, which is said to have been the origin of *bucolic* poetry.

CARYATIDES, or Cariates. See Architecture.

CARYL, Joseph, a divine of the last century, bred at Oxford, and some time preacher to the society of Lincoln's-inn, an employment he filled with much applause. He became a frequent preacher before the long parliament, a licenser of their books, one of the assembly.

assembly of divines, and one of the triers for the approbation of ministers; in all which capacities he showed himself a man of considerable parts and learning, but with great zeal against the king's person and cause. On the restoration of Charles II. he was silenced by the act of uniformity, and lived privately in London, where, besides other works, he distinguished himself by a laborious *Exposition of the Book of Job;* and died in 1672.

CARYLL, JOHN, a late English poet, was of the Roman Catholic persuasion, being secretary to Queen Mary the wife of James II. and one who followed the fortunes of his abdicating master; who rewarded him, first with knighthood, and then with the honorary titles of Earl Caryll and Baron Dartford. How long he continued in that service is not known; but he was in England in the reign of Queen Anne, and recommended the subject of the "Rape of the Lock" to Mr Pope, who at its publication addressed it to him. He was also the intimate friend of Pope's "Unfortunate Lady." He was the author of two plays: 1. "The English Princess, or the Death of Richard III. 1667," 4to; 2. "Sir Salomon, or the Cautious Coxcomb, 1671," 4to; and in 1700, he published "The Psalms of David, translated from the Vulgate," 12mo. In Tonson's edition of Ovid's Epistles, that of "Briseis to Achilles" is said to be by Sir John Caryll; and in Nichols's Select Collection of Miscellany Poems, vol. ii. p. 1. the first eclogue of Virgil is translated by the same ingenious poet. He was living in 1717, and at that time must have been a very old man. See three of his letters in the "Additions to Pope," vol. ii. p. 114.

CARYOCAR, in *Botany*, a genus of the tetragynia order, belonging to the polyandria class of plants. The calyx is quinquepartite, the petals five, the styles more frequently four. The fruit is a plum, with nucleusses, and four furrows netted.

CARYOPHYLLÆI, in *Botany*, the name of a very numerous family or order in Linnæus's Fragments of a Natural Method; containing, besides the class of the same name in Tournefort, many other plants, which from their general appearance seem pretty nearly allied to it. The following are the genera, viz. Agrostema, Cucubalus, Dianthus, Drypis, Gypsophilia, Lychnis, Saponaria, Silene, Velazia, Alsine, Arenaria, Bufonia, Cerastium, Cherleria, Glinus, Holosteum, Loeflingia, Mochringia, Polycarpen, Sagina, Spergula, Stellaria, Minuartia, Mollugo, Ortegia, Pharnaceum, Queria. All the plants of this order are herbaceous, and mostly annual. Some of the creeping kinds do not rise an inch, and the tallest exceed not seven or eight feet. See BOTANY, *Natural Orders.*

CARYOPHYLLUS, the PINK, in *Botany.* See DIANTHUS.

CARYOPHYLLUS, the CLOVE TREE. See BOTANY *Index.*

The caryophyllus aromaticus is a native of the Molucca islands, particularly of Amboyna, where it is principally cultivated. The clove tree resembles in its bark the olive, and is about the height of the laurel, which it also resembles in its leaves. No verdure is ever seen under it. It has a great number of branches, at the extremities of which are produced vast quantities of flowers, that are first white, then green, and at last pretty red and

2

hard. When they arrive at this degree of maturity, they are, properly speaking, *cloves.* As they dry, they assume a dark yellowish cast; and when gathered, become of a deep brown. The season for gathering the cloves is from October to February. The boughs of the trees are then strongly shaken, or the cloves beat down with long reeds. Large cloths are spread to receive them, and they are afterwards either dried in the sun or in the smoke of the bamboo cane. The cloves which escape the notice of those who gather them, or are purposely left upon the tree, continue to grow till they are about an inch in thickness; and these falling off, produce new plants, which do not bear in less than eight or nine years. Those which are called *mother cloves* are inferior to the common sort; but are preserved in sugar by the Dutch; and in long voyages, eaten after their meals, to promote digestion.

The clove, to be in perfection, must be full sized, heavy, oily, and easily broken; of a fine smell, and of a hot aromatic taste, so as almost to burn the throat. It should make the fingers smart when handled, and leave an oily moisture upon them when pressed. In the East Indies, and in some parts of Europe, it is so much admired as to be thought an indispensable ingredient in almost every dish. It is put into their food, liquors, wines, and enters likewise the composition of their perfumes. Considered as medicines, cloves are very hot stimulating aromatics, and possess in an eminent degree the general virtues of substances of this class. Their pungency resides in their resin; or rather in a combination of resin with essential oil: for the spirituous extract is very pungent; but if the oil and the resin contained in this extract are separated from each other by distillation, the oil will be very mild; and any pungency which it does retain, proceeds from some small portion of adhering resin, and the remaining resin will be insipid. No plant, or part of any plant, contains such a quantity of oil as cloves do. From 16 ounces Newman obtained by distillation two ounces and two drachms, and Hoffman obtained an ounce and a half of oil from two ounces of the spice. The oil is specifically heavier than water. Cloves acquire weight by imbibing water; and this they will do at some considerable distance. The Dutch, who trade in cloves, make a considerable advantage by knowing this secret. They sell them always by weight; and when a bag of cloves is ordered, they hang it, for several hours before it is sent in, over a vessel of water, at about two feet distance from the surface. This will add many pounds to the weight, which the unwary purchaser pays for on the spot. This is sometimes practised in Europe, as well as in the Spice islands; but the degree of moisture must be more carefully watched in the latter; for there a bag of cloves will, in one night's time, attract so much water, that it may be pressed out of them by squeezing them with the hand.

The clove tree is never cultivated in Europe. At Amboyna the Company have allotted the inhabitants 4000 parcels of land, on each of which they were at first allowed, and about the year 1720 compelled, to plant about 125 trees, amounting in all to 500,000. Each of these trees produces annually, on an average, more than two pounds of cloves; and consequently the collective produce must weigh more than a million.

lion. The cultivator is paid with the specie that is constantly returned to the Company, and receives some unbleached cottons which are brought from Coromandel.

CARYOTA. See BOTANY *Index*.

CASA, in ancient and middle-age writers, is used to denote a cottage or house.

CASA, *Santa*, denotes the chapel of the holy virgin at Loretto. The *Santa Casa* is properly the house, or rather chamber, in which the blessed virgin is said to have been born, where she was betrothed to her spouse Joseph, where the angel saluted her, the Holy Ghost overshadowed her, and by consequence where the Son of God was conceived or incarnated. Of this building the Catholics tell many wonderful stories too childish to transcribe. The *Santa Casa*, or holy chamber, consists of one room, forty-four spans long, eighteen broad, and twenty-three high. Over the chimney, in a niche, stands the image called the great *Madona* or Lady, four feet high, made of cedar, and, as they say, wrought by St Luke, who was a carver as well as a physician. The mantle or robe she has on, is covered with innumerable jewels of inestimable value. She has a crown, given her by Louis XIII. of France, and a little crown for her son.

CASAL, a strong town of Italy in Montserrat, with a citadel and a bishop's see. It was taken by the French from the Spaniards in 1640; and the duke of Mantua sold it to the French in 1681. In 1695 it was taken by the allies, who demolished the fortifications; but the French retook it, and fortified it again. The king of Sardinia became master of it in 1706, from whom the French took it in 1745; however the king of Sardinia got possession again in 1746. It is seated on the river Po, and contains 15,000 inhabitants. E. Long. 8. 37. N. Lat. 45. 12.

CASAL-*Maggiore*, a small strong town of Italy, in the duchy of Milan, seated on the river Po. E. Long. 11. 5. N. Lat. 45. 6.

CASA NOVA, MARC ANTONY, a Latin poet, born at Rome, succeeded particularly in epigrams. The poems he composed in honour of the illustrious men of Rome are also much esteemed. He died in 1527.

CASAN, a considerable town of Asia, and capital of a province of the same name in the Russian empire, with a strong castle, a citadel, and an archbishop's see. The country about it is very fertile in all sorts of fruits, corn, and pulse. It carries on a great trade in furs, and furnishes wood for the building of ships. The fortress is built of stone; but the town is of wood. The inhabitants amount to 17,500. Besides several schools, it has a university, founded in 1803. E. Long. 49. 25. N. Lat. 55. 38.

CASAS, BARTHOLOMEW DE LAS, bishop of Chiapa, distinguished for his humanity and zeal for the conversion of the Indians, was born at Seville in 1474: and went with his father who sailed to America with Christopher Columbus in 1493. At his return to Spain, he embraced the state of an ecclesiastic, and obtained a curacy in the island of Cuba: but some time after quitted his cure in order to procure liberty for the Indians, whom he saw treated by the Spaniards in the most cruel and barbarous manner; which naturally gave them an unconquerable aversion to Christianity. Bartholomew exerted himself with extraordinary zeal, for 50 years together, in his endeavours to persuade the Spaniards that they ought to treat the Indians with equity and mildness; for which he suffered a number of persecutions from his countrymen. At last the court, moved by his continual remonstrances, made laws in favour of the Indians, and gave orders to the governors to observe them, and see them executed.* He died at Madrid in 1566, aged 92. He wrote several works, which breathe nothing but humanity and virtue. The principal of them are, 1. An account of the destruction of the Indies. 2. Several treatises in favour of the Indies, against Dr Sepulveda, who wrote a book to justify the inhuman barbarities committed by the Spaniards. 3. A very curious and now scarce work in Latin, on this question, "Whether kings or princes can, consistently with conscience, or in virtue of any right or title, alienate their subjects, and place them under the dominion of another sovereign?

* See the article *Mexico*.

CASATI, PAUL, a learned Jesuit, born at Placentia in 1617, entered early among the Jesuits; and after having taught mathematics and divinity at Rome, was sent into Sweden to Queen Christina, whom he prevailed on to embrace the Popish religion. He wrote, 1. *Vacuum proscriptum*. 2. *Terra machinis mota*. 3. *Mechanicorum, libri octo*. 4. *De Igne Dissertationes*, which is much esteemed. 5. *De Angelis Disputatio Theolog*. 6. *Hydrostaticæ Dissertationes*. 7. *Opticæ Disputationes*. It is remarkable that he wrote this treatise on optics at 88 years of age, and after he was blind. He also wrote several books in Italian.

CASAUBON, ISAAC, was born at Geneva in 1559; and Henry IV. appointed him his library keeper in 1603. After this prince's death, he went to England with Sir Henry Wotton, ambassador from King James I. where he was kindly received, and engaged in writing against Baronius's annals. He died not long after this, in 1614; and was interred in Westminster-abbey, where a monument was erected to him. He was greatly skilled in the Greek, and in criticism; published several valuable commentaries; and received the highest eulogiums from all his cotemporaries.

CASAUBON, *Meric*, a son of the preceding, was born at Geneva in 1599. He was bred at Oxford, and took the degree of master of arts in 1621. The same year he published a book in defence of his father against the calumnies of certain Roman Catholics, which gained him the favour of King James I. and a considerable reputation abroad. He was made prebendary of Canterbury by Archbishop Laud. In the beginning of the civil war he lost all his spiritual promotions, but still continued to publish excellent works. Oliver Cromwell, then lieutenant-general of the parliament's forces, would have employed his pen in writing the history of the late war; but he declined it, owning that this subject would oblige him to make such reflections as would be ungrateful, if not injurious, to his lordship. Notwithstanding this answer, Cromwell, sensible of his worth, ordered three or four hundred pounds to be paid him by a bookseller in London, whose name was Cromwell, on demand, without requiring from him any aknowledgment of his benefactor. But this offer he rejected, though his circumstances were then mean. At the same time it was proposed by his friend Mr Greaves,

Greaves, who belonged to the library at St James's, that, if Casaubon would gratify Cromwell in the request above mentioned, all his father's books, which were then in the royal library, having been purchased by King James, should be restored to him, and a pension of 300l. a year paid to the family as long as the youngest son of Dr Casaubon should live; but this also was refused. He likewise refused handsome offers from Christina queen of Sweden, being determined to spend the remainder of his life in England. At the Restoration he recovered all his preferments, and continued writing till his death in 1671. He was the author of an English translation of Marcus Aurelius Antoninus's Meditations, and of Lucius Florus; editions of several of the classics, with notes; a treatise of use and custom; a treatise of enthusiasm; with many other works; and he left a number of MSS. to the university of Oxford.

CASAURINA. See Botany *Index*.

CASCADE, a steep fall of water from a higher into a lower place. The word is French, formed of the Italian *cascata*, which signified the same; of *cascaro*, "to fall," and that from the Latin *cadere*.

Cascades are neither natural, as that at Tivoli, &c.; or artificial, as those of Versailles, &c.; and either falling with a gentle descent, as those of Sceaux; or in form of a buffet, as at Trianon; or down steps, in form of a perron, as at St Cloud; or from bason to bason, &c.

CASCAIS, a town of Estremadura in Portugal, situated at the mouth of the river Tagus, 17 miles east of Lisbon. W. Long. 10. 15. N. Lat, 38. 40.

CASCARILLA. See Clutia and Croton.

CASE, among grammarians, implies the different inflections or terminations of nouns, serving to express the different relations they bear to each other; and to the things they represent. See Grammar.

Case also denotes a receptacle for various articles; as a case of knives, of lancets, of pistols, &c.

Case, in printing, a large flat oblong frame, placed aslope, divided into several compartments or little square cells; in each of which are lodged a number of types or letters of the same kind, whence the compositor takes them out, each as he needs it, to compose his matter. See Printing.

Case is also used for a certain numerous quantity of divers things. Thus a case of crown glass contains usually 24 tables, each table being nearly circular, and about three feet six inches diameter; of Newcastle glass, 35 tables; of Normandy glass, 25.

Case-Hardening of Iron, is a superficial conversion of that metal into steel, by the ordinary method of conversion, namely, by cementation with vegetable or mineral coals. This operation is generally practised upon small pieces of iron, wrought into tools and instruments to which a superficial conversion is sufficient; and it may be performed conveniently by putting the pieces of iron to be case-hardened, together with the cement, into an iron box, which is to be closely shut and exposed to a red heat during some hours. By this cementation a certain thickness from the surface of the iron will be converted into steel, and a proper hardness may be afterwards given by sudden extinction of the heated pieces of converted iron in a cold fluid. See Steel.

Case-Shot, in the military art, musket balls, stones, old iron, &c. put into cases, and shot out of great guns.

CASEMENT, or Casemate, in *Architecture*, a hollow moulding, which some architects make one-sixth of a circle, and others one fourth.

Casement is also used in building, for a little moveable window, usually within a larger, being made to open or turn on hinges.

CASERN, in fortification, lodgings built in garrison towns, generally near the rampart, or in the waste places of the town for lodging soldiers of the garrison. There are usually two beds in each casern for six soldiers to lie, who mount the guard alternately; the third part being always on duty.

CASERTA, an episcopal town of Italy, in the kingdom of Naples, and in the Terra de Lavoro, with the title of a duchy, seated at the foot of a mountain of the same name, in E. Long. 15. 5. N. Lat. 41. 5.

CASES, Peter-James, of Paris, the most eminent painter of the French school. The churches of Paris and of Versailles abound with his works. He died in 1754, aged 79.

CASH, in a commercial style, signifies the stock or ready money which a merchant or other person has in his present disposal to negotiate; so called from the French term *caisse*, i. e. "chest or coffer," for the keeping of money.

M. Savary shows that the management of the cash of a company is the most considerable article, and that whereon its good or ill success depends.

Cash-Book. See Book-Keeping.

CASHEL, or Cashil, a town of Ireland in the county of Tipperary, and province of Munster, with an archbishop's see. The ruins of the old cathedral testify its having been an extensive as well as handsome Gothic structure, boldly towering on the celebrated rock of Cashel, which taken together form a magnificent object, and bear honourable testimony to the labour and ingenuity, as well as the piety and zeal, of its former inhabitants. It is seen at a great distance and in many directions. Adjoining it are the ruins of the chapel of Cormac M'Culinan, at once king and archbishop of Cashel, supposed to have been the first stone building in Ireland; and seems, by its rude imitation of pillars and capitals, to have been copied after the Grecian architecture, and long to have preceded that which is usually called *Gothic*. Cormac M'Culinan was a prince greatly celebrated by the Irish historians for his learning, piety, and valour. He wrote, in his native language, a history of Ireland, commonly called the *Psalter of Cashel*, which is still extant, and contains the most authentic account we have of the annals of the country to that period, about the year 900. On the top of the rock of Cashel, and adjoining the cathedral, is a lofty round tower, which proudly defied the two successful attempts of Archbishop Price, who in this century unroofed and thereby demolished the ancient cathedral founded by St Patrick. In the choir are the monuments of Myler Magrath, archbishop of this see, in the reign of Queen Elizabeth, and some other curious remains of antiquity. Cashel was formerly the royal seat and metropolis of the kings of Munster; and on the ascent to the cathedral is a large stone on which

which every new king of Munster was, as the inhabitants report from tradition, formerly proclaimed. Cashel is smaller than it once was, containing only about 600 houses. The archbishop's palace is a fine building. Here is a very handsome market house, a sessions house, the county infirmary, a charter school for twenty boys and the same number of girls, and a very good barrack for two companies of foot. Dr Agar finished a very elegant church which was begun by his predecessor. W. Long. 7. 36. N. Lat. 52. 16.

CASHEW NUT. See ANACARDIUM, BOTANY *Index*.

CASHIER, the cash-keeper; he who is charged with the receiving and paying the debts of a society. In the generality of foundations, the cashier is called *treasurer*.

CASHIERS *of the Bank*, are officers who sign the notes that are issued out, and examine and mark them when returned for payment.

CASHMIRE, a province of India, for a long time belonging to Hindostan, but now an appendage of Afghanistan. It is about 90 miles in length, and nearly of an oval form, situated chiefly between 34 and 35 degrees of north latitude, and between 73 and 76 degrees of east longitude. Being girt in by a zone of hills, and elevated very considerably above an arid plain, which stretches many miles around it, the scenes which it exhibits are wild and picturesque. Rivers, hills, and valleys, charmingly diversify the landscape. Here, Mr Sullivan * informs us, a cascade rushes from a foaming precipice; there a tranquil stream glides placidly along; the tinkling rill, too, sounds amidst the groves; and the feathered choristers sing the song of love, close sheltered in the shade.

* Philosophical Rhapsodies.

At what time Cashmire came under the dominion of the Mogul government, and how long and in what manner it was independent, before it was annexed to the territories of the house of Timur, are points that are beyond our present purpose. Though inconsiderable as to its revenues, it was uniformly held in the highest estimation by the emperors of Hindostan. Thither they repaired in the plenitude of their greatness, when the affairs of the state would admit of their absence; and there they divested themselves of form, and all the oppressive ceremony of state. The royal manner of travelling to Cashmire was grand, though tedious and unwieldy, and showed, in an eminent degree, the splendour and magnificence of an eastern potentate. Aurengzebe, we are told, seldom began his march to that country, for a march certainly it was to be called, without an escort of 80,000 or 100,000 fighting men, besides the gentlemen of his household, the attendants of his seraglio, and most of his officers of state. These all continued with him during the time he was on the road, which generally was a month; but no sooner was he arrived at the entrance of those aerial regions, than, with a select party of friends, he separated from the rest of his retinue, and with them ascended the defiles which led him to his Eden.

The temperature of the air of Cashmire, elevated as it is so much above the adjoining country, together with the streams which continually pour from its mountains, enables the husbandman to cultivate with success the soil he appropriates to agriculture; whilst the gardener's labour is amply repaid in the abundant produce of his fruit. In short, nature wears her gayest clothing in this enchanting spot. The rivers supply the inhabitants with almost every species of fish; the hills yield sweet herbage for the cattle; the plains are covered with grain of different denominations; and the woods are stored with variety of game. The Cashmireans, according to our author, seem a race distinct from all the others in the east: Their persons are more elegant, and their complexions more delicate and more tinged with red.

On the decadence of the Mogul power in Hindostan, Cashmire felt some of the ravages of war. The inhabitants are sprightly and ingenious, and manufacture a beautiful species of shawls much valued in India. They are all Mahometans or idolaters. Cashmire is the capital town.

CASIMIR, the name of several kings of Poland. See (*History of*) POLAND.

CASIMIR, *Matthias Sorbiewski*, a Polish Jesuit, born in 1597. He was a most excellent poet; and is, says M. Baillet, an exception to the general rule of Aristotle and the other ancients, which teaches us to expect nothing ingenious and delicate from northern climates. His odes, epodes, and epigrams, have been thought not inferior to those of the finest wits of Greece and Rome. Dr Watts has translated one or two of his small pieces, which are added to his Lyric Poems. He died at Warsaw in 1640, aged 43. There have been many editions of his poems, the best of which is that of Paris, 1759.

CASING *of* TIMBER WORK, among builders, is the plastering the house all over the outside with mortar, and then striking it while wet, by a ruler, with the corner of a trowel, to make it resemble the joints of freestone. Some direct it to be done upon heart-laths, because the mortar would, in a little time, decay the sap-laths; and to lay on the mortar in two thicknesses, viz. a second before the first is dry.

CASIRI, MICHAEL, a learned orientalist, a native of Syria. See SUPPLEMENT.

CASK, or CASQUE, a piece of defensive armour wherewith to cover the head and neck; otherwise called the *head-piece* and *helmet* *. The word is French, *casque*, from *cassicum* or *cassicus*, a diminutive of *cassis* "a helmet." Le Gendre observes, that anciently, in France, the gens d'armes all wore *casks*. The king wore a *cask* gilt; the dukes and counts silvered; gentlemen of extraction polished steel; and the rest plain iron.

* See Helmet.

The cask is frequently seen on ancient medals, where we may observe great varieties in the form and fashion thereof; as the Greek fashion, the Roman fashion, &c. F. Joubert makes it the most ancient of all the coverings of the head, as well as the most universal. Kings, emperors, and even gods themselves, are seen therewith. That which covers the head of Rome has usually two wings like those of Mercury; and that of some kings is furnished with horns like those of Jupiter Ammon; and sometimes barely bulls or rams horns, to express uncommon force.

CASK, in *Heraldry*, the same with helmet. See HERALDRY, No. 45.

CASK, a vessel of capacity, for preserving liquors of divers kinds; and sometimes also dry goods, as sugar, almonds, Cask || Caslon.

almonds, &c.—A cask of sugar is a barrel of that commodity, containing from eight to eleven hundred weight. A cask of almonds is about three hundred weight.

CASKET, in a general sense, a little coffer or cabinet. See CABINET.

CASKETS, in the sea language, are small ropes made of sinnet, and fastened to gromets, or little rings upon the yards; their use is to make fast the sail to the yard when it is to be furled.

Biog. Brit. and *Anecdotes of Boyer*, by Nicholas.

CASLON, WILLIAM, eminent in an art of the greatest consequence to literature, the art of letter-founding, was born in 1692, in that part of the town of Hales Owen which is situated in Shropshire. Though he justly attained the character of being the Coryphæus in that employment, he was not brought up to the business; and it is observed by Mr Mores, that this handywork is so concealed among the artificers of it, that he could not discover that any one had taught it to another, but every person who had used it had learned it of his own genuine inclination. Mr Caslon served a regular apprenticeship to an engraver of ornaments on gun barrels; and after the expiration of his term, carried on this trade in Vine-street, near the Minories. He did not, however, solely confine his ingenuity to that instrument, but employed himself likewise in making tools for the bookbinders, and for the chasing of silver plate. Whilst he was engaged in this business, the elder Mr Bowyer accidentally saw, in a bookseller's shop, the lettering of a book uncommonly neat; and inquiring who the artist was by whom the letters were made, was hence induced to seek an acquaintance with Mr Caslon. Not long after, Mr Bowyer took Mr Caslon to Mr James's foundery, in Bartholomew-close. Caslon had never before that time seen any part of the business; and being asked by his friend, if he thought he could undertake to cut types, he requested a single day to consider the matter; and then replied that he had no doubt but he could. Upon this answer, Mr Bowyer, Mr Bettenham, and Mr Watts, had such a confidence in his abilities, that they lent him 500l. to begin the undertaking, and he applied himself to it with equal assiduity and success. In 1720, the society for promoting Christian knowledge, in consequence of a representation from Mr Solomon Negri, a native of Damascus in Syria, who was well skilled in the oriental tongues, and had been professor of Arabic in places of note, deemed it expedient to print, for the use of the Eastern churches, the New Testament and Psalter, in the Arabic language. These were intended for the benefit of the poor Christians in Palestine, Syria, Mesopotamia, Arabia, and Egypt, the constitution of which countries did not permit the exercise of the art of printing. Upon this occasion Mr Caslon was pitched upon to cut the fount; in his specimens of which he distinguished it by the name of English Arabic. Under the farther encouragement of Mr Bowyer, Mr Bettenham, and Mr Watts, he proceeded with vigour in his employment; and he arrived at length to such perfection, that he not only freed us from the necessity of importing types from Holland, but in the beauty and elegance of those made by him he so far exceeded the productions of the best artificers, that his workmanship was frequently exported to the continent. In short, his foundery became, in process of time, the most capital one that exists in this or in foreign countries. Having acquired opulence in the course of his employment, he was put into the commission of the peace for the county of Middlesex. Towards the latter end of his life, his eldest son being in partnership with him, he retired in a great measure from the active execution of business. His death happened in January 1766.

Caslon, Caspian sea.

CASPIAN SEA, a large lake of salt water in Asia, bounded by the province of Astracan on the north, and by part of Persia on the south, east, and west. It is 646 miles in length, 265 in breadth, and 2350 in circumference, including gulfs and bogs. This sea embraces between Astracan and Astrabad an incredible number of small islands. Its bottom is mud, but sometimes mixed with shells. At the distance of some German miles from land it is 500 fathoms deep; but on approaching the shore it is everywhere so shallow, that the smallest vessels, if loaded, are obliged to remain at a distance.

When we consider that the Caspian is enclosed on all sides by land, and that its banks are in the neighbourhood of very high mountains, we easily see why the navigation in it should be perfectly different from that in every other sea. There are certain winds that domineer over it with such absolute sway, that vessels are often deprived of every resource; and in the whole extent of it there is not a port that can truly be called safe. The north, north-east, and east winds, blow most frequently, and occasion the most violent tempests. Along the eastern shore the east winds prevail; for which reason vessels bound from Persia to Astracan always direct their course along this shore.

The surface of the Caspian sea is found to be 324 feet lower than the ocean. Although its extent is immense, the variety of its productions is exceedingly small. This undoubtedly proceeds from its want of communication with the ocean, which cannot impart to it any portion of its inexhaustible stores. But the animals which this lake nourishes multiply to such a degree, that the Russians, who alone are in condition to make them turn to account, justly consider them as a never-failing source of profit and wealth. It will be understood that we speak of the fish of the Caspian, and of its fisheries, which make the sole occupation and principal trade of the people inhabiting the banks of the Wolga and of the Jaik. This business is distinguished into the great and lesser fisheries. The fish comprehended under the first division, such as the sturgeon and others, abound in all parts of the Caspian, as well as in the rivers that communicate with it, and which they ascend at spawning time. The small fishes, such as the salmon and many others, observe the general law of quitting the salt waters for the fresh; nor is there an instance of one of them remaining constantly in the sea.

Seals are the only quadrupeds that inhabit the Caspian; but they are there in such numbers as to afford the means of subsistence to many people in that country as well as in Greenland. The varieties of the species are numerous, diversified however only by the colour. Some are quite black, others quite white; there are some whitish, some yellowish, some of a mouse colour, and some streaked like a tiger. They crawl by means of their fore feet upon the islands, where they become the prey of the fishermen, who kill

Caspian sea.

them with long clubs. As soon as one is dispatched, he is succeeded by several who come to the assistance of their unhappy companion, but come only to share his fate. They are exceedingly tenacious of life, and endure more than thirty hard blows before they die. They will even live for several days after having received many mortal wounds. They are most terrified by fire and smoke; and as soon as they perceive them, retreat with the utmost expedition to the sea. These animals grow so very fat, that they look rather like oil bags than animals. At Astracan is made a sort of gray soap with their fat mixed with pot-ashes, which is much valued for its property of cleansing and taking grease from woollen stuffs. The greatest numbers of them are killed in spring and autumn. Many small vessels go from Astracan merely to catch seals.

If the Caspian has few quadrupeds, it has in proportion still fewer of those natural productions which are looked upon as proper only to the sea. There have never been found in it any zoophytes, nor any animal of the order of mollusca. The same may almost be said of shells; the only ones found being three or four species of cockle, the common muscle, some species of snails, and one or two others.

But to compensate this sterility, it abounds in birds of different kinds. Of those that frequent the shores, there are many species of the goose and duck kind, of the stork and heron, and many others of the water tribe. Of birds properly aquatic, it contains the grebe, the crested diver, the pelican, the cormorant, and almost every species of gull. Crows are so fond of fish, that they haunt the shores of the Caspian in prodigious multitudes.

The waters of this lake are very impure, the great number of rivers that run into it, and the nature of its bottom, affecting it greatly. It is true, that in general the waters are salt: but though the whole western shore extends from the 46th to the 35th degree of north latitude; and though one might conclude from analogy that these waters would contain a great deal of salt, yet experiments prove the contrary; and it is certain, that the saltness of this sea is diminished by the north, north-east, and north-west winds; although we may with equal reason conclude, that it owes its saltness to the mines of salt which lie along its two banks, and which are either already known, or will be known to posterity. The depth of these waters also diminishes gradually as you approach the shores, and their saltness in the same way grows less in proportion to their proximity to the land, the north winds not unfrequently causing the rivers to discharge into it vast quantities of troubled water impregnated with clay. These variations which the sea is exposed to are more or less considerable, according to the nature of the winds; they affect the colour of the river waters to a certain distance from the shore, till these mixing with those of the sea, which then resume the ascendancy, the fine green colour appears, which is natural to the ocean, and to all those bodies of water that communicate with it.

It is well known, that, besides its salt taste, all sea water has a sensible bitterness, which must be attributed not only to the salt itself, but to the mixture of different substances that unite with it, particularly to different sorts of alum, the ordinary effect of different combinations of acids. Besides this, the waters of the Caspian have another taste, bitter too, but quite distinct, which affects the tongue with an impression similar to that made by the bile of animals; a property which is peculiar to this sea, though not equally sensible at all seasons. When the north and north-west winds have raged for a considerable time, this bitter taste is sensibly felt; but when the wind has been south, very imperfectly. We shall endeavour to account for this phenomenon.

The Caspian is surrounded on its western side by the mountains of Caucasus, which extend from Derbent to the Black sea. These mountains make a curve near Astracan, and directing their course towards the eastern shore of the Caspian, lose themselves near the mouth of the Jaik, where they become secondary mountains, being disposed in strata. As Caucasus is an inexhaustible magazine of combustible substances, it consequently lodges an astonishing quantity of metals in its bowels. Accordingly, along the foot of this immense chain of mountains, we sometimes meet with warm springs, sometimes springs of naphtha of different quality; sometimes we find native sulphur, mines of vitriol, or lakes heated by internal fires. Now the foot of Mount Caucasus forming the immediate western shore of the Caspian sea, it is very easy to imagine that a great quantity of the constituent parts of the former must be communicated to the latter: but it is chiefly to the naphtha, which abounds so much in the countries which surround this sea, that we must attribute the true cause of the bitterness peculiar to its waters; for it is certain that this bitumen flows from the mountains, sometimes in all its purity, and sometimes mixed with other substances which it acquires in its passage through subterranean channels, from the most interior parts of these mountains to the sea, where it falls to the bottom by its specific gravity. It is certain, too, that the north and north-west winds detach the greatest quantities of this naphtha; whence it is evident that the bitter taste must be most sensible when these winds prevail. We may also comprehend why this taste is not so strong at the surface or in the neighbourhood of the shore, the waters there being less impregnated with salt, and the naphtha, which is united with the water by the salt, being then either carried to a distance by the winds, or precipitated to the bottom.

But it is not a bitter taste alone that the naphtha communicates to the waters of the Caspian: these waters were analysed by M. Gmelin, and found to contain, besides the common sea salt, a considerable proportion of Glauber salt, intimately united with the former, and which is evidently a production of the naphtha.

As the waters of the Caspian have no outlet, it has been supposed that they are discharged by subterranean canals; but this is shewn to be incredible, by the lower level of this sea. The two great deserts which extend from it to the east and west are chiefly composed of a saline earth, in which the salt is formed by efflorescence into regular crystals; for which reason salt showers and dews are exceedingly common in that neighbourhood. The salt of the marshes at Astracan, and that found in efflorescence in the deserts, is by no means pure sea salt, but much debased

based by the bitter Glauber salt we mentioned above. In many places indeed it is found with crystals of a lozenge shape, which is peculiar to it, without any cubical appearance, the form peculiar to crystals of sea salt.

A great deal has been written on the successive augmentation and decrease of the Caspian sea, but with little truth. There is indeed to be perceived in it a certain rise and fall of its waters; in which, however, no observation has ever discovered any regularity.

Many suppose (and there are strong presumptions in favour of the supposition), that the shores of the Caspian were much more extensive in ancient times than they are at present, and that it once communicated with the Black sea. It is probable, too, that the level of this last sea was once much higher than it is at present. If then it be allowed, that the waters of the Black sea, before it procured an exit by the straits of Constantinople, rose several fathoms above their present level, which from many concurring circumstances may easily be admitted, it will follow, that all the plains of the Crimea, of the Kuman, of the Wolga, and of the Jaik, and those of Great Tartary beyond the lake of Aral, in ancient times formed but one sea, which embraced the northern extremity of Caucasus by a narrow strait of little depth; the vestiges of which are still obvious in the river Mantysch.

CASQUE, or CASK. See CASK.

CASSADA. See JATROPHA, BOTANY *Index*.

CASSANA, NICOLO, called NICOLETTO, an eminent Italian painter, was born at Venice in 1659, and became a disciple of his father Giovanni Francesco Cassana, a Genoese, who had been taught the art of painting by Bernardino Strozzi. He soon distinguished himself, not only by the beauty of his colouring, but by the gracefulness of his figures in historical compositions, as well as in portrait. The most eminent personages solicited him to enrich their cabinets with some of his performances; and were more particularly desirous to obtain their portraits, because in that branch he excelled beyond competition. The grand duke of Tuscany, who was an excellent judge of merit in all professons, and as liberal an encourager of it, invited Nicoletto to his court; and he there painted the portraits of that prince and the Princess Violante his consort. These performances procured him uncommon applause, as well as a noble gratuity, and he was employed and caressed by the principal nobility of Florence. Beside several historical subjects painted by this master while he resided in that city, one was a very capital design. The subject of it was the *Conspiracy of Catiline;* it consisted of nine figures as large as life, down to the knees; and the two principal figures were represented as with one hand joined in the presence of their companions, and in their other hand holding a cup of blood. Some of the English nobility on their travels sat to him for their portraits; which being sent to London, and highly admired, Nicoletto was invited to England, with strong assurances of a generous reception; and on his arrival he experienced the kindness, the respect, and the liberality, so peculiar to the natives of that kingdom. He had the honour of being introduced to the presence of Queen Anne, and to paint her portrait: in which he succeeded so happily, that the Queen distinguished him by many

2

marks of favour and honour; but he had not the happiness to enjoy his good fortune for any length of time, dying in London, universally regretted, in the year 1713.

CASSANA, *Giovanni Agostino*, called *L'Abate Cassana*, was brother to the preceding, and born in 1664. He was educated along with him by their father Francesco Cassana, and he finished his studies at Venice, where his brother Nicoli resided for some time. Although he composed and designed historical subjects with expertness, and with a correctness of outline equal to his brother; yet, from prudence and fraternal affection, he declined to interfere with him, and chose therefore to design and paint all sorts of animals and fruits. In that style he arrived at a high degree of excellence, imitating nature with exactness, beauty, and truth; expressing the various plumage of his birds, and the hairs of the different animals, with such tenderness and delicacy as rendered them estimable to all judges and lovers of the art. His works were admitted into the collections of those of the first rank, and accounted ornaments of those repositories of what is curious or valuable. He also painted fruits of those kinds which were the most uncommon, or naturally of odd and singular colours; and such fishes as seemed worthy to excite admiration by their unusual form, colour, or appearance. But, besides those subjects, he sometimes painted the portraits of particular persons of distinction, which he designed, coloured, and touched, with the same degree of merit that was visible in all his other performances. At last he determined to visit Genoa, where his family had lived in esteem; and took with him several pictures which he had already finished. His intention was to display his generosity, and to appear as a person of more wealth, and of greater consequence than he really was; and, to support that character, he bestowed his pictures on several of the principal nobility of that city. But, unhappily, he experienced no grateful return for all that prodigal munificence; he reduced himself by that vain liberality to the most necessitous circumstances; was deprived of the means to procure for himself even the common necessaries of life; and wasted away the remainder of his days in the bitterness of poverty, misery, and neglect.

CASSANDER, king of Macedon after Alexander the Great, was the son of Antipater. He made several conquests in Greece, abolished democracy at Athens, and gave the government of that state to the orator Demetrius. Olympias, the mother of Alexander, having caused Aridæus and his wife Eurydice, with others of Cassander's party, to be put to death, he besieged Pydne, whither the queen had retired, took it by a stratagem, and caused her to be put to death. He married Thessalonica, the sister of Alexander the Great; and killed Roxana and Alexander, the wife and son of that conqueror. At length he entered into an alliance with Seleucus and Lysimachus, against Antigonus and Demetrius; over whom he obtained a great victory near Ipsus in Phrygia, 301 years before the Christian era, and died three years after, in the 19th year of his reign.

CASSANDRA, in fabulous history, the daughter of Priam and Hecuba, was beloved of Apollo, who promised to bestow on her the spirit of prophecy, provided

vided she would consent to his love. Cassandra seemed to accept the proposal; but had no sooner obtained that gift, than she laughed at the tempter, and broke her word. Apollo, being enraged, revenged himself, by causing no credit to be given to her predictions, hence she in vain prophesied the ruin of Troy. Ajax, the son of Oileus, having ravished her in the temple of Minerva, he was struck with thunder. She fell into the hands of Agamemnon, who loved her to distraction; but in vain did she predict that he would be assassinated in his own country. He was killed, with her, by the intrigues of Clytemnestra; but their death was avenged by Orestes.

CASSANO, a town of Italy in the duchy of Milan, rendered remarkable by an obstinate battle fought there between the Germans and French in 1705. It is subject to the house of Austria, and is seated on the river Adda, in E. Long. 10. 0. N. Lat. 45. 20.

CASSANO, a town of Italy in Calabria Citerior, in the kingdom of Naples, with a bishop's see. E. Long. 16. 30. N. Lat. 39. 55.

CASSAVI, or CASSADA. See JATROPHA, BOTANY *Index*.

CASSEL, a town of French Flanders, in the department of the North. It contains 3600 inhabitants, and is seated on a mountain; and from whence there is one of the finest prospects in the world; for one may see no less than 32 towns, with a great extent of the sea, from whence it is distant 15 miles. E. Long. 2. 27. N. Lat. 50. 48.

CASSEL, the capital city of the landgravate of Hesse Cassel, in the circle of the Upper Rhine in Germany; (see HESSE CASSEL). It is divided into the Old, New, and High Towns. The New Town is best built, the houses being of stone, and the streets broad. The houses of the Old Town, which is within the walls, are mostly of timber; but the streets are broad, and the market places spacious. The place is strongly fortified, but the fortifications are not regular. It contained 20,300 inhabitants in 1810, and was the capital of the kingdom of Westphalia till 1814. There are several manufactories in the place, particularly in the woollen branch. It is seated on the declivity of a hill near the river Fulva, in E. Long. 9. 28. N. Lat. 51. 20.

CASSIA. See BOTANY *Index*.

CASSIA Lignea. See LAURUS.

CASSIDA. See SCUTELLARIA, BOTANY *Index*.

CASSIDA, in *Zoology*, a genus of insects belonging to the order of coleoptera. See ENTOMOLOGY *Index*.

CASSIMER, or CASIMER, the name of a thin tweeled woollen cloth, much in fashion for summer use.

CASSIMIRE, or CASHMIRE. See CASHMIRE.

CASSINE. See BOTANY *Index*. The Spaniards who live near the gold mines of Peru, are frequently obliged to drink an infusion of this herb in order to moisten their breasts; without which they are liable to a sort of suffocation, from the strong metallic exhalations that are continually proceeding from the mines. In Paragnay, the Jesuits make a great revenue by importing the leaves of this plant into many countries, under the name of Paraguay or South sea tea, which is there drank in the same manner as that of China or Japan is with us. It is with difficulty preserved in England.

CASSINI, JOHANNES DOMINICUS, a most excellent astronomer, was born at Piedmont in 1635. His early proficiency in astronomy procured him an invitation to be mathematical professor at Bologna when he was no more than 15 years of age: and a comet appearing in 1652, he discovered that comets were not accidental meteors, but of the same nature, and probably governed by the same laws, as the planets. In the same year he solved a problem given up by Kepler and Bullialdus as insolvable, which was, to determine geometrically the apogee and eccentricity of a planet from its true and mean place. In 1663, he was appointed inspector general of the fortifications of the castle of Urbino, and had afterwards the care of all the rivers in the ecclesiastical state: he still, however, prosecuted his astronomical studies, by discovering the revolution of Mars round his own axis; and, in 1666, published his theory of Jupiter's satellites. Cassini was invited into France by Louis XIV. in 1669, where he settled as the first professor in the royal observatory. In 1677 he demonstrated the line of Jupiter's diurnal rotation; and in 1684 discovered four more satellites belonging to Saturn, Huygens having fonnd one before. He inhabited the royal observatory at Paris more than forty years; and when he died in 1712, was succeeded by his only son James Cassini.

CASSINI, *James*, another celebrated astronomer, was the only son of the former. He was born at Paris, 18th February 1677. It would appear that his early studies were conducted in his father's house, where, from the pursuits and studies of his father, mathematics, and their application to astronomy, it is probable, were not neglected. He became a student afterwards at the Mazarine college, at the time that the celebrated Varignon was professor of mathematics. With the assistance of this eminent man young Cassini made such progress, that at 15 years of age he supported a mathematical thesis with great honour. At the age of 17 he was admitted a member of the Academy of Sciences; and the same year he accompanied his father in a journey to Italy, where he assisted him in the verification of the meridian at Bologna and other measurements. After his return he performed similar operations in a journey into Holland, and he discovered some errors in the measure of the earth by Snell, the result of which was communicated to the Academy in 1702. In 1696 he made also a visit to England, where he was made a member of the Royal Society. In 1712 he succeeded his father as astronomer royal at the observatory of Paris. In 1717 he gave to the Academy his researches on the distance of the fixed stars; in which he shewed that the whole annual orbit, of near 200 millions of miles diameter, is but as a point in comparison of that distance. The same year he communicated also his discoveries concerning the inclination of the orbits of the satellites in general, and especially of those of Saturn's satellites and ring. In 1725 he undertook to determine the cause of the moon's libration, by which she shews sometimes a little towards one side, and sometimes a little on the other, of that half which is commonly behind or hid from onr view.

In 1732 an important question in astronomy engaged

Cassini.

ged the ingenuity of our author. His father had determined, by his observations, that the planet Venus revolved about her axis in the space of 23 hours; and M. Bianchini had published a work in 1729, in which he settled the period of the same revolvtion at 24 days 8 hours. From an examination of Bianchini's observations which were upon the spots in Venus, he discovered that he had intermitted his observations for the space of three hours, from which cause he had probably mistaken new spots for the old ones, and so had been led into the mistake. He also determined the nature and quantity of the acceleration of the motion of Jupiter at half a second per year, and of that of the retardation of Saturn at two minutes per year; that these quantities would go on increasing for 2000 years, and then would decrease again. In 1740 he published his Astronomical Tables, and his Elements of Astronomy; very extensive and accurate works.

Astronomy was the principal object of our author's consideration, but he did not confine himself absolutely to that pursuit, but made occasional excursions into other fields. We owe to him Experiments on Electricity, Experiments on the Recoil of Fire-arms; Researches on the Rise of the Mercury in the Barometer at different Heights; Reflections on the perfecting of Burning-glasses; and some other memoirs.

One of the most important objects of the French academy was the measurement of the earth. In 1669 Picard measured a little more than a degree of latitude to the north of Paris; but as that extent appeared too small from which to conclude the whole circumference with sufficient accuracy, it was resolved to continue that measurement on the meridian of Paris to the north and the south, through the whole extent of the country. Accordingly, in 1683, the late M. de la Hire continued that on the north side of Paris, and the older Cassini that on the south side. The latter was assisted in 1700 in the continuation of this operation by his son our author. The same work was farther continued by the same academicians; and finally, the part left unfinished by De la Hire in the north was finished in 1718 by our author, with the late Maraldi, and De la Hire the younger.

These operations produced a considerable degree of precision. From this measured extent of six degrees, it appeared also, that the degrees were of different lengths in different parts of the meridian; and our author concluded, in the volume published for 1718, that they decreased more and more towards the pole, and that therefore the figure of the earth was that of an oblong spheroid, or having its axis longer than the equatorial diameter. He also measured the perpendicular to the same meridian, and compared the measured distance with the differences of longitude as before determined by the eclipses of Jupiter's satellites; from which he concluded that the length of the degrees of longitude was smaller than it would be on a sphere, and that therefore again the figure of the earth was an oblong spheroid, contrary to the determination of Newton by the theory of gravity. Newton was indeed of all men the most averse from controversy; but the other mathematicians in Britain did not tamely submit to conclusions in direct opposition to the fundamental doctrine of this philosopher. The consequence was, that the French government sent two different sets of measurers, the one to measure a degree at the equator, the other at the polar circle; and the comparison of the whole determined the figure to be an oblate spheroid, contrary to Cassini's determination.

Cassini, Cassini de Thury.

After a long and laborious life, James Cassini died in April 1756, and was succeeded in the Academy and Observatory by his second son. He published, A Treatise on the Magnitude and Figure of the Earth; as also, the Elements or Theory of the Planets, with Tables; beside a great number of papers in the Memoirs of the Academy, from the year 1699 to 1755.

Cassini de Thury, *Cæsar Francois*, a celebrated French astronomer, director of the observatory, and member of most of the learned societies of Europe, was born at Paris June 17. 1714. He was the second son of James Cassini, whose occupations and talents he inherited and supported with great honour. He received his first lessons in astronomy and mathematics from MM. Maraldi and Camus; and made such a rapid progress, that when he was not more than ten years of age he calculated the phases of a total eclipse of the sun. At the age of eighteen he accompanied his father in his two journeys undertaken for drawing the perpendicular to the observatory meridian from Strasbourg to Brest. A general chart of France was from that time devised; for which purpose it was necessary to traverse the country by several lines parallel and perpendicular to the meridian of Paris. Our author was charged with the conduct of this business; in which he was so scrupulous as to measure again what had been measured by his father. This great work was published in 1740, with a chart shewing the new meridian of Paris, by two different series of triangles, passing along the sea coasts to Bayonne, traversing the frontiers of Spain to the Mediterranean and Antibes, and thence along the eastern limits of France to Dunkirk, with parallel and perpendicular lines described at the distance of 6000 toises from one another, from side to side of the country.

Our author made a tour in 1741, in Flanders, in the train of the king. This gave rise, at his majesty's instance, to the chart of France; relative to which Cassini published different works, as well as a great number of the sheets of the chart itself. He undertook, in 1761, an expedition into Germany, for the purpose of continuing to Vienna the perpendicular of the Paris meridian; to unite the triangles of the chart of France with the points taken in Germany; to prepare the means of extending into that country the same plan as in France; and thus to establish successively for all Europe a most useful uniformity. Our author was at Vienna the 6th of June 1761, the day of the transit of the planet Venus over the sun, of which he observed as much as the state of the weather would permit him to do, and published the account of it in his *Voyage en Allemagne*.

Cassini, always meditating the perfection of his grand design, profited of the peace of 1783 to propose the joining of certain points taken upon the English coast with those which had been determined on the coast of France, and thus to connect the general chart of the latter with that of the British isles, as he had before united it with those of Flanders and Germany. The proposal was favourably received by the English government,

government, and presently carried into effect under the direction of the Royal Society, by the late General Roy.

Between the years 1735 and 1770, M. Cassini published, in the volumes of Memoirs of the French Academy, a great number of pieces, consisting chiefly of astronomical observations and questions; among which are researches concerning the parallax of the sun, the moon, Mars and Venus; on astronomical refractions, and the effect caused in their quantity and laws by the weather; numerous observations on the obliquity of the ecliptic, and on the law of its variations. He cultivated astronomy for 50 years, the most important for that science that ever elapsed for the magnitude and variety of objects; and in which he commonly sustained a principal share.

M. Cassini was of a very strong and vigorous constitution, which carried him through the many laborious operations in geography and astronomy which he conducted. An habitual retention of urine, however, rendered the last twelve years of his life very painful and distressing, till it was at length terminated by the small-pox the 4th of September 1784, in the 71st year of his age. He was succeeded in the academy, and as director of the observatory, by his only son John-Dominic Cassini, the fourth in order of direct descent who has filled that honourable station. *Hutton's Math. Dic.*

CASSIODORUS, Marcus Aurelius, secretary of state to Theodoric king of the Goths, was born at Squillace, in the kingdom of Naples, about the year 470. He was consul in 514, and was in great credit under the reigns of Athalaric and Vitiges; but at 70 years of age retired into a monastery in Calabria, where he amused himself in making sun-dials, water hour-glasses, and perpetual lamps. He also formed a library; and composed several works, the best edition of which is that of Father Garet, printed at Rouen in 1679. Those most esteemed are his Divine Institutions, and his Treatise on the Soul. He died about the year 562.

CASSIOPEIA, in fabulous history, wife to Cepheus king of Ethiopia, and mother of Andromeda. She thought herself more beautiful than the Nereides, who desired Neptune to revenge the affront; so that he sent a sea monster into the country, which did much harm. To appease the god, her daughter Andromeda was exposed to the monster, but was rescued by Perseus; who obtained of Jupiter, that Cassiopeia might be placed after her death among the stars; hence the constellation of that name.

Cassiopeia, in *Astronomy*, one of the constellations of the northern hemisphere, situated next to Cepheus. In 1572, there appeared a new star in this constellation, which at first surpassed in magnitude and brightness Jupiter himself: but it diminished by degrees, and at last disappeared, at the end of eighteen months. It alarmed all the astronomers of that age, many of whom wrote dissertations on it; among the rest Tycho Brahe, Kepler, Maurolycus, Lycetus, Gramineus, &c. Beza, the landgrave of Hesse, Rosa, &c. wrote to prove it a comet, and the same which appeared to the Magi at the birth of Jesus Christ, and that it came to declare his second coming; they were answered on this subject by Tycho. The stars in the constellation Cassiopeia, in Ptolemy's catalogue, are 13; in Hevelius's, 33; in Tycho's, 46: But in the Britannic catalogue Mr Flamstead makes them 55.

CASSIS, in antiquity, a plated or metalline helmet; different from the *galea*, which was of leather.

CASSITERIA, in the history of fossils, a genus of crystals, the figures of which are influenced by an admixture of some particles of tin.

The cassiteria are of two kinds; the whitish pellucid cassiterion, and the brown cassiterion. The first is a tolerably bright and pellucid crystal, and seldom subject to the common blemishes of crystal: it is of a perfect and regular form, in the figure of a quadrilateral pyramid: and is found in Devonshire and Cornwall principally. The brown cassiterion is like the former in figure: it is of a very smooth and glossy surface, and is also found in great plenty in Devonshire and Cornwall.

CASSITERIDES, in *Ancient Geography*, a cluster of islands to the west of the Land's End; opposite to Celtiberia, (Pliny); famous for their tin, which he calls *candidum plumbum*, formerly open to none but the Phœnicians, who alone carried on this commerce from Gades, concealing the navigation from the rest of the world, (Strabo). The appellation is from *Cassiteros*, the name for tin in Greek. Now thought to be the Scilly islands, or Sorlings, (Camden).

CASSIUS, Spurius, a renowned Roman general and consul, whose enemies accusing him of aspiring to royalty, he was thrown down from the Tarpeian rock 485 years before Christ; after having thrice enjoyed the consular dignity, been once general of the horse under the first dictator that was created at Rome, and twice received the honour of a triumph.

Cassius *Longinus*, a celebrated Roman lawyer, flourished 113 years before Christ. He was so inflexible a judge, that his tribunal was called the *Rock of the impeached.* It is from the judicial severity of this Cassius, that very severe judges have been called *Cassiani.*

Cassius, *Caius*, one of the murderers of Julius Cæsar; after his defeat by Mark Antony at the battle of Philippi, he ordered one of his freedmen to put him to death with his own sword, 41 years before Christ. See Rome.

CASSOCK, or Cassula, a kind of robe or gown, worn over the rest of the habit, particularly by the clergy. The word cassock comes from the French *cassaque*, a horseman's coat.

CASSONADE, in commerce, cask-sugar, or sugar put into casks or chests, after the first purification, but which has not been refined. It is sold either in powder or in lumps; the whitest, and that of which the lumps are largest, is the best. Many imagine it to sweeten more than loaf sugar; but it is certain that it yields a great deal more scum.

CASSOWARY. See Struthio, Ornithology *Index.*

CASSUMAR, in the *Materia Medica*, a root resembling that of zedoary.

It is cardiac and sudorific, and famous in nervous cases; it is also an ingredient in many compositions, and is prescribed in powders, boluses, and infusions. Its dose is from five to fifteen grains.

CASSUMBAZAR, a town of India in Asia, situated on the river Ganges, in the province of Bengal. E. Long. 37. 0. and N. Lat. 24. 0.

CAST is peculiarly used to denote a figure or small statue of bronze. See BRONZE.

CAST, among founders, is applied to tubes of wax fitted in divers parts of a mould of the same matter; by means of which, when the wax of the mould is removed, the melted metal is conveyed into all the parts which the wax before possessed.

CAST, also denotes a cylindrical piece of brass or copper, slit in two, lengthwise, used by the founders in sand, to form a canal or conduit in their moulds, whereby the metal may be conveyed to the different pieces intended to be cast.

CAST, among plumbers, denotes a little brazen funnel at one end of a mould, for casting pipes without soldering, by means of which the melted metal is poured into the mould.

CAST or *Caste*, in speaking of the eastern affairs, denotes a tribe, or number of families, of the same rank or profession. The division of a nation into casts chiefly obtains in the dominions of the Great Mogul, kingdom of Bengal, island of Ceylon, and the great peninsula opposite thereto. In each of these there are, according to Father Martin, four principal casts, viz. the cast of the *bramins*, which is the first and most noble; the cast of the *rajas*, or princes, who pretend to be descended from divers royal families; the cast of the *choutres*, which comprehends all the artificers; and that of the *parias*, the lowest and most contemptible of all; though Henry Lord, it must be observed, divides the Indians about Surat into four *casts*, somewhat differently from Martin, viz. into *bramins*, or priests; *cuttery*, or soldiers; *shuddery*, which we call *banians*, or merchants; and *wyse*, the mechanics or artificers. Every art and trade is confined to its proper *cast*, nor is allowed to be exercised by any but those whose fathers professed the same. So that a tailor's son can never rise to be a painter, nor a painter's son fall to be a tailor; though there are some employments that are proper to all the casts, *e. g.* every body may be a soldier or a merchant. There are also divers casts which are allowed to till the ground, but not all. The cast of *parias* is held infamous, insomuch that it is a disgrace to have any dealings or conversation with them; and there are some trades in the cast of *choutres*, which debase their professors almost to the same rank. Thus shoemakers, and all artificers in leather, as also fishermen, and even shepherds, are reputed no better than *parias*. See CASTE, SUPPLEMENT.

CASTAGNO, ANDREA DAL, historical painter, was born at a small village called *Castagno*, belonging to the territory of Tuscany, in 1409; and being deprived of his parents, was employed by his uncle to attend the herds of cattle in the fields; but having accidentally seen an ordinary painter at work in the country, he observed him for some time with surprise and attention, and afterwards made such efforts to imitate him, as astonished all who saw his productions. The extraordinary genius of Andrea became at last a common topic of discourse in Florence; and so far excited the curiosity of Bernardetto de Medici, that he sent for Andrea; and perceiving that he had promising talents, he placed him under the care of the best masters who were at that time in Florence. Andrea diligently pursued his studies, devoted himself entirely to practice under the direction of his instructors, became particularly eminent in design, and in a few years made so great a progress, that he found as much employment as he could possibly execute. He painted only in distemper, and fresco, with a manner of colouring that was not very agreeable, being rather dry and hard, till he learned the secret of painting in oil from Domenico Venetiano, who had derived his knowledge of that new discovery from Antonello da Messina. Andrea was the first of the Florentine artists who painted in oil; but although he was in the highest degree indebted to Domenico for disclosing the secret, yet he secretly envied the merit of the man who taught him the art; and because his own works seemed to be much less admired than those of Domenico, he determined to assassinate his friend and benefactor. He executed his design with the utmost ingratitude and treachery (for Domenico at that time lived with him, and painted in partnership with him), and he stabbed him at a corner of a street so secretly, that he escaped, unobserved and unsuspected, to his own house, where he composedly sat down to work; and thither Domenico was soon after conveyed, to die in the arms of his murderer. The real author of so inhuman a transaction was never discovered, till Andrea, through remorse of conscience, disclosed it on his death-bed, in 1480. He finished several considerable works at Florence, by which he gained great riches, and as great a reputation; but when his villanous misconduct became public, his memory was ever after held in the utmost detestation. The most noted work of this master is in the hall of justice at Florence, representing the execution of the conspirators against the house of Medicis.

CASTALIAN SPRING. See CASTALIUS.

CASTALIO, SEBASTIAN, was born at Chatillon, on the Rhone, in the year 1515. Calvin conceived such an esteem and friendship for him, during the stay he made at Strasburg in 1540 and 1541, that he lodged him some days at his house, and procured him a regent's place in the college of Geneva. Castalio after continuing in this office near three years, was forced to quit it in the year 1544, on account of some particular opinions which he held concerning Solomon's Song, and Christ's descent into hell. He retired to Basil, where he was made Greek professor, and died in that place in 1564, aged 48. He incurred the high displeasure of Calvin and Theodore Beza, for differing with them concerning predestination and the punishment of heretics. His works are very considerable both on account of their quality and number. In 1545, he printed at Basil four books of dialogues, containing the principal histories of the Bible in elegant Latin; so that youth might thereby make a proficiency in piety and in the Latin tongue at the same time. But his principal work is a Latin and French translation of the Scripture. He began the Latin translation at Geneva in 1542, and finished it at Basil in 1550. It was printed at Basil in 1551, and dedicated by the author to Edward VI. king of England. The French version was dedicated to Henry II. of France,

France, and printed at Basil in 1555. The fault which has been most generally condemned in his Latin translation, is the affectation of using only classical terms.

CASTALIUS FONS (Strabo, Pausanias); *Castalia*, (Pindar, Virgil); a fountain at the foot of Mount Parnassus, in Phocis, near the temple of Apollo, or near Delphi; sacred to the Muses, thence called *Castalides*. Its murmurs were thought prophetic. (Nonnius, Lucian). See the articles DELPHI and PARNASSUS.

CASTANEA. See FAGUS, BOTANY *Index*.

CASTANETS, CASTAGNETTES, or CASTANETTAS, a kind of musical instrument, wherewith the Moors, Spaniards, and Bohemians, accompany their dances, sarabands, and guitars. It consists of two little round pieces of wood dried, and hollowed in the manner of a spoon, the concavities whereof are placed on one another, fastened to the thumb, and beat from time to time with the middle finger, to direct their motion and cadences. The *castanets* may be beat eight or nine times in the space of one measure, or second of a minute.

CASTANOVITZ, a town of Croatia, situated on the river Unna, which divides Christendom from Turkey. E. Long. 17. 20. N. Lat. 45. 40. It is subject to the house of Austria.

CASTEL, LEWIS BERTRAND, a learned Jesuit, was born at Montpelier in 1688, and entered among the Jesuits in 1703. He studied polite literature in his youth; and at length applied himself entirely to the study of mathematics and natural philosophy. He distinguished himself by writing on gravity; the mathematics; and on the music of colours, a very whimsical idea, which he took great pains to reduce to practice. His piece on gravity, entitled *Traité de la Pensateur Universelle*, was printed at Paris in 1724. He afterwards published his *Mathematique Universelle*; which occasioned his being unanimously chosen a fellow of the Royal Society of London, without the least solicitation. He was also member of the academies of Bourdeaux and Rouen: but his *Clavecin oculaire* made the most noise; and he spent much time and expence in making an harpsichord for the eye, but without success. He also wrote for and against Sir Isaac Newton, and published several other works; the principal of which are, *Le plan du Mathematique abregée*, and a treatise entitled *Optique des Couleurs*. He led a very exemplary life, and died in 1757.

CASTELAMARA, a town of Italy, in the kingdom of Naples, and the Hither Principato, with a bishop's see, and a good harbour. E. Long. 14. 15. N. Lat. 41. 40.

CASTEL-ARAGONESE, a strong town of Italy, in the island of Sardinia, with a bishop's see, and a good harbour. It is seated on the N. W. coast of the island, in E. Long. 8. 57. N. Lat. 40. 56.

CASTEL-Branco, a town of Portugal, and capital of the province of Beira; seated on the river Lyra, 35 miles N. W. of Alcantara. W. Long. 8. 0. N. Lat. 39. 35.

CASTEL-Franco, a very small, but well fortified frontier town of the Bolognese, in Italy, belonging to the pope.

CASTEL-de-Vide, a small strong town of Alentejo. It was taken by Philip V. W. Long. 6. 25. N. Lat. 39. 15.

CASTEL Folit, a town of Spain, in Catalonia, seated on an inaccessible eminence, between Gironne and Campredon, about 15 miles from each, and near the river Fulva.

CASTEL Gandolpho, a town of Italy, in the territory of the church, with a castle, to which the pope retires in the summer season; 10 miles S. by E. of Rome. E. Long. 12. 46. N. Lat. 41. 44.

CASTEL-Novo, a strong town of Dalmatia, subject to the Venetians; seated on the gulf of Cataro, in E. Long. 18. 45. N. Lat. 42. 25.

CASTEL-Rodrigo, a town of Portugal, in the province of Tra-los-Montes, in W. Long. 7. 1. N. Lat. 41. 0.

CASTEL-Novo-de-Carfagnana, a town of Italy, in the Modenese, with a strong fortress. It is the capital of the valley of Carfagnana, and seated on the river Serchio, 17 miles above Lucca.

CASTEL-del-Ovo, a small island in the Tuscan sea, in the gulf of Naples, near a town of that name, to which it is joined by a stone bridge. The fortress is called Castel-del-Ovo, in which there is always a good garrison.

CASTLEBAR, a town of Ireland, in the county of Mayo, and province of Connaught, 35 miles N. of Galway. W. Long. 9. 25. N. Lat. 53. 45.

CASTELL, EDMUND, D. D. a learned English divine of the 17th century, distinguished by his skill in the eastern languages. He was educated at Cambridge; where he was master of Catharine hall, and Arabic professor; and was at length canon of Canterbury. He had the greatest share in the Polyglott Bible of London; and wrote the *Heptaglotton pro septem Orientalibus*, &c. On this excellent work, which occupied a great part of his life, he bestowed incredible pains and expence, even to the breaking of his constitution, and exhausting of his fortune, having expended no less than 12,000l. upon that work. At length, when it was printed, the copies remained unsold upon his hands. He died in 1685; and lies buried in the churchyard of Higham Gobyon in Bedfordshire, of which he was rector. It appears from the inscription on his monument, which he erected in his lifetime, that he was chaplain to Charles II. He bequeathed all his oriental manuscripts to the university of Cambridge, on condition that his name should be written on every copy in the collection.

CASTELLA, a town of the Mantuan, in Italy, about five miles north-east of the city of Mantua. E. Long. 11. 15. N. Lat. 45. 30.

CASTELLAN, the name of a dignity or charge in Poland: The castellans are senators of the kingdom, but senators only of the lower class, who, in diets, sit on low seats, behind the palatines, or great senators. They are a kind of lieutenants of provinces, and command a part of the palatinate under the palatine.

CASTELLANY, the territory belonging to any city or town, chiefly used in France and Flanders: Thus we say, the castellany of Lisle, Ypres, &c.

CASTELLARIUS, the keeper, or curator, of a castellum. Gruter gives an ancient sepulchral inscription in memory of a *castellarius*.

CASTELLATIO, in middle-age writers, the act of building a castle, or of fortifying a house, and rendering it a castle.—By the ancient English laws, castellation was prohibited without the king's special license.

CASTELLI, Bernard, an Italian painter, was born at Genoa in 1557; and excelled in colouring and in portraits. He was the intimate friend of Tasso, and took upon himself the task of designing and etching the figures of his Jerusalem Delivered. He died at Genoa in 1629.

Valerio Castelli, one of his sons, was born at Genoa in 1625, and surpassed his father. He particularly excelled in painting battles; which he composed with spirit, and executed them with so pleasing a variety, and so great freedom of hand, as gained him universal applause. His horses are admirably drawn, thrown into attitudes that are natural and becoming, full of motion, action, and life. In that style of painting he showed all the fire of Tintoretto, united with the fine taste of composition of Paolo Veronese. He died in 1659. The works of this master are not very frequent; but they are deservedly held in very high esteem. A greater number of his easel pictures are in the collections of the nobility and gentry of England.

CASTELLORUM operatio, castle work, or service and labour done by inferior tenants for the building and upholding of castles of defence; towards which some gave personal assistance, and others paid their contributions. This was one of the three necessary charges to which all lands among the Anglo-Saxons were expressively subject.

CASTELVETRO, Lewis, a native of Modena, of the 16th century, famous for his *Comment on Aristotle's Poetics*. He was prosecuted by the inquisition for a certain book of Melancthon, which he had translated into Italian. He retired to Basil, where he died.

CASTI, Giambatista, a modern Italian poet. See Supplement.

CASTIGATION, among the Romans, the punishment of an offender by blows, or beating with a wand or switch. Castigation was chiefly a military punishment; the power of inflicting of which on the soldiery was given to the tribunes. Some make it of two kinds; one with a stick or cane, called *fustigatio*: the other with rods, called *flagellatio*: the latter was the most dishonourable.

CASTIGATORY, *for* Scolds. A woman indicted for being a common scold, if convicted, shall be placed in a certain engine of correction, called the *trebucket castigatory*, or *cucking stool*; which, in the Saxon language, signifies the *scolding stool*; though now it is frequently corrupted into the *ducking stool*; because the residue of the judgment is, that when she is placed therein, she shall be plunged in water for her punishment.

CASTIGLIONE, Giovanni Benedetto, a celebrated painter, was born at Genoa in 1616. His first master was Gio-Battista Paggi. Afterwards he studied under Andrea Ferrari; and lastly perfected himself from the instructions of Anthony Vandyck, who at that time resided at Genoa. He painted portraits, historical pieces, landscapes, and castles; in the latter of which he is said chiefly to have excelled; as also in fairs, markets, and all kinds of rural scenes. By this master we have also a great number of etchings, which are all spirited, free, and full of taste. The effect is, in general, powerful and pleasing; and many of them have a more harmonized and finished appearance than is usual from the point, so little assisted by the graver. His drawing of the naked figure, though by no means correct, is notwithstanding managed in a style that indicates the hand of the master.

His son, *Francesco*, was bred under himself, and excelled in the same subjects; and it is thought that many good paintings which are ascribed to Benedetto, and are frequently seen at sales, or in modern collections, are copies after him by his son Francesco, or perhaps originals of the younger Castiglione.

Castiglione, a small but strong town of Italy, in Mantua, with a castle. It was taken by the Germans in 1701, and the French defeated the Imperialists near it in 1706. E. Long. 10. 29. N. Lat. 43. 23.

CASTIGLIONI, Balthazar, an eminent Italian nobleman, descended from an illustrious and ancient family, and born at his own villa at Casalico in the duchy of Milan in 1478. He studied painting, sculpture, and architecture, as appears from a book he wrote in favour of these arts; and excelled so much in them, that Raphael Urbino, and Buonaroti, though incomparable artists, never thought their works complete, without the approbation of Count Castiglioni. When he was 26 years of age, Guido Ubaldo, duke of Urbino, sent him ambassador to Pope Julius II. He was sent upon a second embassy to Louis XII. of France, and upon a third to Henry VII. of England. After he had dispatched his business here, he returned, and began his celebrated work, entitled *the Courtier*; which he completed at Rome in 1516. This work is full of moral and political instruction: and if we seek for the Italian tongue in perfection, it is said to be nowhere better found than in this performance. A version of this work, together with the original Italian, was published at London in 1727, by A. P. Castiglioni, a gentleman of the same family, who resided there under the patronage of Dr Gibson, bishop of London. Count Castiglioni was sent by Clement VII. to the court of the emperor Charles V. in quality of legate, and died at Toledo in 1529.

CASTILE, New, or The Kingdom of Toledo, a province of Spain, bounded on the north by Old Castile, on the east by the kingdoms of Arragon and Valencia, on the south by those of Murcia and Andalusia, and on the west by the kingdom of Leon. It is divided into three parts; Argaria to the north, Mancha to the east, and Sierra to the south. Madrid is the capital. Both these provinces are very well watered with rivers, and the air is generally pure and healthy; but the land is mountainous, dry, and uncultivated, through the laziness of the inhabitants. The north part produces fruits and wine, and the south good pastures and fine wool. The population of New Castile in 1787 amounted to 949,649 persons, including 14,000 priests, monks, and nuns.

Castile, *Old*, a province of Spain, with the title of a kingdom. It is about 192 miles in length, and 115 in breadth; bounded on the south by New Castile, on the east by Arragon and Navarre, on the north by

Biscay

Biscay and Asturias, and on the west by the kingdom of Leon. Burgos is the capital town.

Castile-del-Oro, a fertile and large country in South America, lying to the west of the Oroonoko. It comprehends eight governments; viz. Terra Firma, Proper Carthagena, St Martha, Rio de la Hacha, Venezuela, New Andalusia, Popayan, and the kingdom of New Granada.

CASTILLAN, or Castillane, a gold coin current in Spain, and worth fourteen rials and sixteen deniers.

Castillan, is also a weight used in Spain for weighing gold. It is a hundredth part of a pound Spanish weight. What they commonly call a weight of gold in Spain is always understood of the castillan.

CASTILLARA, a town of the Mantuan in Italy, situated six miles north-east of the city of Mantua. E. Long. 11. 25. N. Lat. 45. 20.

CASTILLON, a town of France, in the department of Gironde, situated on the river Dordogne, 16 miles east of Bourdeaux. W. Long. 2. 40. N. Lat. 44. 50.

CASTING, in foundry, the running of metal into a mould, prepared for that purpose.

Casting of Metals, of Letters, Bells, &c. See the article Foundry.

Casting in Sand or Earth, is the running of metals between two frames, or moulds, filled with sand or earth, wherein the figure that the metal is to take has been impressed *en creux*, by means of the pattern.

Casting, among sculptors, implies the taking of casts and impressions of figures, busts, medals, leaves, &c.

The method of taking of casts of figures and busts, is most generally by the use of plaster of Paris, *i. e.* alabaster calcined by a gentle heat. The advantage of using this substance preferably to others is, that notwithstanding a slight calcination reduces it to a pulverine state, it becomes again a tenacious and cohering body, by being moistened with water, and afterwards suffered to dry; by which means either a concave or a convex figure may be given by a proper mould or model to it when wet, and retained by the hardness it acquires when dry: and from these qualities, it is fitted for the double purpose of making both casts, and moulds for forming those casts. The particular manner of making casts depends on the form of the subject to be taken. Where there are no projecting parts, it is very simple and easy; as likewise where there are such as form only a right or any greater angle with the principal surface of the body: but where parts project in lesser angles, or form a curve inclined towards the principal surface of the body, the work is more difficult.

The first step to be taken is the forming the mould. In order to this, if the original or model be a bass relief, or any other piece of a flat form, having its surface first well greased, it must be placed on a proper table, and surrounded by a frame, the sides of which must be at such a distance from it as will allow a proper thickness for the sides of the mould. As much plaster as will be sufficient to cover and rise to such a thickness as may give sufficient strength to the mould, as also to fill the hollow betwixt the frame and the model, must be moistened with water, till it be just of such consistence as will allow it to be poured upon the model. This must be done as soon as possible; or the plaster would concrete or set, so as to become more troublesome in the working, or unfit to be used. The whole must then be suffered to remain in this condition, till the plaster has attained its hardness; and then the frame being taken away, the preparatory cast or mould thus formed may be taken off from the subject entire.

Where the model or original subject is of a round or erect form, a different method must be pursued; and the mould must be divided into several pieces: or if the subject consists of detached and projecting parts, it is frequently most expedient to cast such parts separately, and afterwards join them together.

Where the original subject or mould forms a round, or spheroid, or any part of such round or spheroid, more than one half the plaster must be used without any frame to keep it round the model; and must be tempered with water to such a consistence, that it may be wrought with the hand like very soft paste; but though it must not be so fluid as when prepared for flat-figured models, it must yet be as moist as is compatible with its cohering sufficiently to hold together; and being thus prepared, it must be put upon the model, and compressed with the hand, or any flat instrument, that the parts of it may adapt themselves, in the most perfect manner, to those of the subject, as well as to be compact with respect to themselves. When the model is so covered to a convenient thickness, the whole must be left at rest till the plaster be set and firm, so as to bear dividing without falling to pieces, or being liable to be put out of its form by slight violence; and it must then be divided into pieces, in order to its being taken off from the model, by cutting it with a knife with a very thin blade: and being divided, must be cautiously taken off, and kept till dry: but it must be always carefully observed, before the separation of the parts be made, to notch them across the joints or lines of the division, at proper distances, that they may with ease and certainty be properly conjoined again; which would be much more precarious and troublesome without such directive marks. The art of properly dividing the moulds, in order to make them separate from the model, requires more dexterity and skill than any other thing in the art of casting; and does not admit of rules for the most advantageous conduct of it in every case. Where the subject is of a round or spheroidal form, it is best to divide the mould into three parts, which will then easily come off from the model: and the same will hold good of a cylinder or any regular curved figure.

The mould being thus formed, and dry, and the parts put together, it must be first greased, and placed in such a position that the hollow may lie upwards, and then filled with plaster mixed with water, in the same proportion and manner as was directed for the casting the mould: and when the cast is perfectly set and dry, it must be taken out of the mould, and repaired where it is necessary; which finishes the operation.

This is all that is required with respect to subjects where the surfaces have the regularity above mentioned: but where they form curves which intersect each other, the conduct of the operation must be varied with respect to the manner of taking the cast of the

Casting.

the mould from off the subject or model; and where there are long projecting parts, such as legs or arms, they should be wrought in separate casts. The operator may easily judge, from the original subjects, what parts will come off together, and what require to be separated: the principle of the whole consists only in this, that where under-workings, as they are called, occur, that is, wherever a straight line drawn from the basis or insertion of any projection, would be cut or crossed by any part of such projection, such part cannot be taken off without a division; which must be made either in the place where the projection would cross the straight line; or, as that is frequently difficult, the whole projection must be separated from the main body, and divided also lengthwise into two parts; and where there are no projections from the principal surfaces, but the body is so formed as to render the surface a composition of such curves, that a straight line being drawn parallel to the surface of one part would be cut by the outline, in one or more places, of another part, a division of the whole should be made, so as to reduce the parts of it into regular curves, which must then be treated as such.

In larger masses, where there would otherwise be a great thickness of the plaster, a core or body may be put within the mould, in order to produce a hollow in the cast; which both saves the expence of the plaster, and renders the cast lighter.

This core may be of wood, where the forming a hollow of a straight figure, or a conical one with the basis outward, will answer the end; but if the cavity require to be round, or of any curve figure, the core cannot be then drawn while entire; and consequently should be of such matter as may be taken out piecemeal. In this case, the core is best formed of clay; which must be worked upon wires to give it a tenacity, and suspended in the hollow of the mould by cross wires lying over the mouth; and when the plaster is sufficiently set to bear handling, the clay must be picked out by a proper instrument.

Where it is desired to render the plaster harder, the water with which it is tempered should be mixed with parchment size properly prepared, which will make it very firm and tenacious.

In the same manner, figures, busts, &c. may be cast of lead, or any other metal, in the moulds of plaster; only the expence of plaster, and the tediousness of its becoming sufficiently dry, when in a very large mass, to bear the heat of melted metal, render the use of clay, compounded with some other proper materials, preferable where large subjects are in question. The clay, in this case, should be washed over till it be perfectly free from gravel or stones; and then mixed with a third or more of fine sand to prevent it cracking; or, instead of sand, coal ashes sifted fine may be used. Whether plaster or clay be employed for the casting in metal, it is extremely necessary to have the mould perfectly dry: otherwise the moisture, being rarefied, will make an explosion that will blow the metal out of the mould, and endanger the operator, or at least crack the mould in such a manner as to frustrate the operation. Where the parts of a mould are larger, or project much, and consequently require a greater tenacity of the matter they are formed of to keep them together, flocks of cloth, prepared like those designed for paper hangings, or fine cotton plucked or cut till it is very short, should be mixed with the ashes or sand before they are added to the clay to make the composition for the mould. The proportion should be according to the degree of cohesion required; but a small quantity will answer the end, if the other ingredient of the composition be good, and the parts of the mould properly linked together by means of the wires above directed.

There is a method of taking casts in metals from small animals, and the parts of vegetables, which may be practised for some purposes with advantage: particularly for the decorating grottoes or rock works, where nature is imitated. The proper kinds of animals are lizards, snakes, frogs, birds, or insects; the casts of which, if properly coloured, will be exact representations of the originals.

This is to be performed by the following method: A coffin or proper chest for forming the mould being prepared of clay, or four pieces of boards fixed together, the animal or parts of vegetables must be suspended in it by a string: and the leaves, tendrils, or other detached parts of the vegetables, or the legs, wings, &c. of the animals, properly separated, and adjusted in their right position by a small pair of pincers: a due quantity of plaster of Paris and calcined talk, in equal quantities, with some alumen plumosum, must then be tempered with water to the proper consistence for casting; and the subject from whence the cast is to be taken, also the sides of the coffin, moistened with spirit of wine. The coffin or chest must then be filled with the tempered composition of the plaster and talk, putting at the same time a piece of straight stick or wood to the principal part of the body of the subject, and pieces of thick wire to the extremities of the other parts, in order that they may form, when drawn out after the matter of the mould is properly set and firm, a channel for pouring in the melted metal, and vents for the air; which otherwise by the rarefaction it would undergo from the heat of the metal, would blow it out or burst the mould. In a short time the plaster and talk will set and become hard, when the stick and wires may be drawn out, and the frame or coffin in which the mould was cast taken away: and the mould must then be put first into a moderate heat, and afterwards, when it is as dry as it can be rendered by that degree, removed into a greater; which may be gradually increased till the whole be red hot. The animal or part of any vegetable, which was included in the mould, will then be burnt to a coal; and may be totally calcined to ashes, by blowing for some time gently into the channel and passages made for pouring in the metal, and giving vent to the air, which will, at the same time that it destroys the remainder of the animal or vegetable matter, blow out the ashes. The mould must then be suffered to cool gently; and will be perfect; the destruction of the substance of the animal or vegetable having produced a hollow of a figure correspondent to it; but it may be nevertheless proper to shake the mould, and turn it upside down, as also to blow with the bellows into each of the air-vents, in order to free it wholly from any remainder of the ashes; or where there may be an opportunity of filling the hollow with quicksilver without expence, it will be found a very effectual method of clearing the cavity, as all dust, ashes, or small detached bodies, will necessarily

necessarily rise to the surface of the quicksilver, and be poured out with it. The mould being thus prepared, it must be heated very hot when used, if the cast be made with copper or brass; but a less degree will serve for lead or tin; and the matter being poured in, the mould must be gently struck; and then suffered to rest till it be cold; at which time it must be carefully taken from the cast, but without the least force; for such parts of the matter as appear to adhere more strongly must be softened by soaking in water till they be entirely loosened, that none of the more delicate parts of the cast may be broken off or bent.

Where the alumen plumosum, or talk, cannot easily be procured, the plaster may be used alone; but it is apt to be calcined by the heat used in burning the animal or vegetable from whence the cast is taken, and to become of too incohering and crumbly texture; or, for cheapness, Sturbridge or any other good clay, washed over, till it be perfectly fine, and mixed with an equal part of sand, and some flocks cut small, may be employed. Pounded pumice stone and plaster of Paris, taken in equal quantities, and mixed with washed clay in the same proportion, is said to make excellent moulds for this and parallel uses.

Casts of medals, or such small pieces as are of a similar form, may be made in plaster by the method directed for bass relievos.

Indeed there is nothing more required than to form a mould by laying them on a proper board, and having surrounded them by a rim made by the piece of a card or any other pasteboard, to fill the rim with soft tempered plaster of Paris; which mould, when dry, will serve for several casts. It is nevertheless a better method to form the mould of melted sulphur; which will produce a sharper impression in the cast, and be more durable than those made of plaster.

The casts are likewise frequently made of sulphur, which being melted must be treated exactly in the same manner as the plaster.

For taking casts from medals, Dr Lewis recommends a mixture of flowers of brimstone and red lead: equal parts of these are to be put over the fire in a ladle, till they soften to the consistence of pap; then they are kindled with a piece of paper, and stirred for some time. The vessel being afterwards covered close, and continued on the fire, the mixture grows fluid in a few minutes. It is then to be poured on the metal, previously oiled and wiped clean. The casts are very neat; their colours sometimes a pretty deep black, sometimes a dark grey: they are very durable; and when soiled, may be washed clean in spirit of wine.

Dr Lettsom recommends tin foil for taking off casts from medals. The thinnest kind is to be used. It should be laid over the subject from which the impression is to be taken, and then rubbed with a brush, the point of a skewer, or a pin, till it has perfectly received the impression. The tin foil should now be pared close to the edge of the medal, till it is brought to the same circumference: the medal must then be reversed, and the tin foil will drop off into a chip box or mould placed ready to receive it. Thus the concave side of the foil will be uppermost, and upon this plaster of Paris, prepared in the usual manner, may be poured. When dry, the whole is to be taken out, and the tin foil sticking on the plaster will give a perfect representation of the medal, almost equal in beauty to silver. If the box or mould is a little larger than the medal, the plaster running round the tin foil will give the appearance of a white frame or circular border; whence the new made medal will appear more neat and beautiful.

Casts may be made likewise with iron, prepared in the following manner: "Take any iron bar, or piece of a similar form; and having heated it red hot, hold it over a vessel containing water, and touch it very slightly with a roll of sulphur, which will immediately dissolve it, and make it fall in drops into the water. As much iron as may be wanted being thus dissolved, pour the water out of the vessel; and pick out the drops formed by the melted iron from those of the sulphur, which contain little or no iron, and will be distinguishable from the other by their colour and weight." The iron will, by this means, be rendered so fusible, that it will run with less heat than is required to melt lead; and may be employed for making casts of medals, and many other such purposes, with great convenience and advantage.

Impressions of medals having the same effect as casts, may be made also of isinglass-glue, by the following means. Melt the isinglass, beaten, as when commonly used, in an earthen pipkin, with the addition of as much water as will cover it, stirring it gently till the whole is dissolved; then with a brush of camels hair, cover the medal, which should be previously well cleansed and warmed, and then laid horizontally on a board or table, greased in the part around the medal. Let them rest afterwards till the glue be properly hardened; and then, with a pin, raise the edge of it; and separate it carefully from the medal: the cast will be thus formed by the glue as hard as horn; and so light, that a thousand will scarcely weigh an ounce. In order to render the relief of the medal more apparent, a small quantity of carmine may be mixed with the melted isinglass; or the medal may be previously coated with leaf gold by breathing on it, and then laying it on the leaf, which will by that means adhere to it; but the use of leaf gold is apt to impair a little the sharpness of the impression.

Impressions of medals may be likewise taken in putty; but it should be the true kind made of calx of tin, and drying oil. These may be formed in the moulds, previously taken in plaster or sulphur; or moulds may be made in its own substance, in the manner directed for those of the plaster. These impressions will be very sharp and hard; but the greatest disadvantage that attends them, is their drying very slowly, and being liable in the mean time to be damaged.

Impressions of prints, or other engravings, may be taken from copperplates, by cleansing them thoroughly, and pouring plaster upon them; but the effect in this way is not strong enough for the eye; and therefore the following method is preferable, where such impressions on plaster are desired.

Take vermilion, or any other coloured pigment, finely powdered, and rub it over the plate: then pass a folded piece of paper, or the flat part of the hand, over the

Casting.

the plate to take off the colour from the lights or parts where there is no engraving; the proceeding must then be the same as where no colour is used. This last method is also applicable to the making of impressions of copperplates on paper with dry colours; for the plate being prepared as here directed, and laid on the paper properly moistened, and either passed under the rolling press, or any other way strongly forced down on the paper, an impression of the engraving will be obtained.

Impressions may be likewise taken from copperplates, either on plaster or paper, by means of the smoke of a candle or lamp; if, instead of rubbing them with any colour, the plate be held over the candle or lamp till the whole surface become black, and then wiped off by the flat of the hand, or paper.

These methods are not, however, of great use in the case of copperplates, except where impressions may be desired on occasions where printing ink cannot be procured: but as they may be applied likewise to the taking impressions from snuff-boxes, or other engraved subjects, by which means designs may be instantly borrowed by artists or curious persons, they may in such instances be very useful.

The expedient of taking impressions by the smoke of a candle or lamp may be employed also for botanical purposes in the ease of leaves, as a perfect and durable representation of not only the general figure, but the contexture and disposition of the larger fibres, may be extemporaneously obtained at any time. The same may be nevertheless done in a more perfect manner, by the use of linseed oil, either alone or mixed with a small proportion of colour, where the oil can be conveniently procured: but the other method is valuable on account of its being practicable at almost all seasons, and in all places, within the time that the leaves will keep fresh and plump. In taking these impressions it is proper to bruise the leaves, so as to take off the projections of the large ribs, which might prevent the other parts from plying to the paper.

Leaves, as also the petals, or flower leaves, of plants, may themselves be preserved on paper, with their original appearance, for a considerable length of time, by the following means.—Take a piece of paper, and rub it over with isinglass-glue treated as above directed for taking impressions from medals; and then lay the leaves in a proper position on the paper. The glue laid on the paper being set, brush over the leaves with more of the same; and that being dry likewise, the operation will be finished, and the leaves so secured from the air and moisture, that they will retain their figure and colour much longer than by any other treatment.

Butterflies, or other small animals of a flat figure, may also be preserved in the same manner.

Casting is also sometimes used for the quitting, laying, or throwing aside any thing; thus deer cast their horns, snakes their skins, lobsters their shells, hawks their feathers, &c. annually.

Casting of feathers is more properly called *moulting* or *mewing*.

A horse *casts* his hair or coat, at least once a-year, viz. in the spring, when he casts his winter coat; and sometimes, at the close of autumn, he casts his summer coat, in case he has been ill kept. Horses also sometimes *cast* their hoofs, which happens frequently to coach horses brought from Holland; these being bred in a moist marshy country, have their hoofs too flabby; so that coming into a drier soil, and less juicy provender, their hoofs fall off, and others that are firmer succeed.

Casting, Castle.

Casting *a Colt*, denotes a mare's proving abortive.

Casting *Net*, a sort of fishing net, so called, because it is to be *cast* or thrown out; which when exactly done, nothing escapes it, but weeds and every thing within its extent are brought away.

CASTLE, a fortress or place rendered defensible either by nature or art. It frequently signifies with us the principal mansion of noblemen. In the time of Henry II. there were no less than 1115 castles in England, each of which contained a manor.

Castles, walled with stone, and designed for residence as well as defence, are for the most part, according to Mr Grose, of no higher antiquity than the Conquest; for although the Saxons, Romans, and even, according to some writers on antiquity, the ancient Britons, had castles built with stone; yet these were both few in number, and at that period, through neglect or invasions, either destroyed or so much decayed, that little more than their ruins were remaining. This is asserted by many of our historians and antiquaries, and assigned as a reason for the facility with which William made himself master of this country.

This circumstance was not overlooked by so good a general as the Conqueror; who, effectually to guard against invasions from without, as well as to awe his newly acquired subjects, immediately began to erect castles all over the kingdom, and likewise to repair and augment the old ones. Besides, as he had parcelled out the lands of the English amongst his followers, they, to protect themselves from the resentment of those so despoiled, built strong holds and castles on their estates. This likewise caused a considerable increase of these fortresses; and the turbulent and unsettled state of the kingdom in the succeeding reigns, served to multiply them prodigiously, every baron or leader of a party, building castles; insomuch that towards the latter end of the reign of King Stephen, they amounted to the almost incredible number of 1115.

As the feudal system gathered strength, these castles became the heads of baronies. Each castle was a manor; and its castelain, owner, or governor, the lord of that manor. Markets and fairs were directed to be held there; not only to prevent frauds in the king's duties or customs, but also as they were esteemed places where the laws of the land were observed, and as such had a very particular privilege. But this good order did not long last; for the lords of castles began to arrogate to themselves a royal power, not only within their castles, but likewise its environs; exercising judicature both civil and criminal, coining of money, and arbitrarily seizing forage and provision for the subsistence of their garrisons, which they afterwards demanded as a right; at length their insolence and oppression grew to such a pitch, that, according to William of Newbury, "there were in England as many kings, or rather tyrants, as lords of castles;" and Matthew Paris styles

Grose's [An]tiquities [of] England and Wa[les], vol. i. P[re]face.

styles them very nests of devils, and dens of thieves. Castles were not solely in the possession of the crown and the lay barons, but even bishops had these fortresses; though it seems to have been contrary to the canons, from a plea made use of in a general council, in favour of King Stephen, who had seized upon the strong castles of the bishops of Lincoln and Salisbury. This prohibition (if such existed) was, however, very little regarded; as in the following reigns many strong places were held, and even defended, by the ecclesiastics: neither was more obedience afterwards paid to a decree made by the pope at Viterbo, the fifth of the kalends of June 1220, wherein it was ordained, that no person in England should keep in his hands more than two of the king's castles.

The licentious behaviour of the garrisons of these places becoming intolerable, in the treaty between King Stephen and Henry II. when only duke of Normandy, it was agreed, that all the castles built within a certain period should be demolished; in consequence of which many were actually rased, but not the number stipulated.

The few castles in being under the Saxon government, were probably, on occasion of war or invasions, garrisoned by the national militia, and at other times slightly guarded by the domestics of the princes or great personages who resided therein; but after the Conquest, when all the estates were converted into baronies held by knight's service, castle guard coming under that denomination, was among the duties to which particular tenants were liable. From these services the bishops and abbots, who till the time of the Normans had held their lands in frank almoign, or free alms, were, by this new regulation, not exempted; they were not, indeed, like the laity, obliged to personal service, it being sufficient that they provided fit and able persons to officiate in their stead. This was, however, at first stoutly opposed by Anselm, archbishop of Canterbury; who being obliged to find some knights to attend King William Rufus in his wars in Wales, complained of it as an innovation and infringement of the rights and immunities of the church.

It was no uncommon thing for the Conqueror and the kings of those days to grant estates to men of approved fidelity and valour, on condition that they should perform castle guard in the royal castles, with a certain number of men, for some specified time: and sometimes they were likewise bound by their tenures to keep in repair and guard some particular tower or bulwark, as was the case at Dover castle.

In process of time these services were commuted for annual rents, sometimes styled *wardpenny*, and waytfee, but commonly *castleguard* rents, payable on fixed days, under prodigious penalties called *sursizes*. At Rochester, if a man failed in the payment of his rent of castle guard on the feast of St Andrew, his debt was doubled every tide during the time for which the payment was delayed. These were afterwards restrained by an act of parliament made in the reign of King Henry VIII. and finally annihilated, with the tenures by knight's service in the time of Charles II. Such castles as were private property were guarded either by mercenary soldiers, or the tenants of the lord or owner.

Castles which belonged to the crown, or fell to it either by forfeiture or escheat, (circumstances that frequently happened in the distracted reigns of the feudal times), were generally committed to the custody of some trusty person, who seems to have been indifferently styled governor and constable. Sometimes also they were put into the possession of the sheriff of the county, who often converted them into prisons. That officer was then accountable at the exchequer, for the farm or produce of the lands belonging to the places intrusted to his care, as well as all other profits; he was likewise, in case of war or invasion, obliged to victual and furnish them with munition out of the issues of his county; to which he was directed by writ of privy seal.

The materials of which castles were built, varied according to the places of their erection: but the manner of their construction seems to have been pretty uniform. The outsides of the walls were generally built with the stones nearest at hand laid as regularly as their shapes would admit; the insides were filled up with the like materials, mixed with a great quantity of fluid mortar, which was called by the workmen groutwork.

The general shape or plan of these castles depended entirely on the caprice of the architects, or the form of the ground intended to be occupied; neither do they seem to have confined themselves to any particular figure in their towers; square, round, and polygonal, oftentimes occurring in the original parts of the same building.

The situation of the castles of the Anglo-Norman kings and barons was most commonly on an eminence, and near a river; a situation on several accounts eligible. The whole site of the castle (which was frequently of great extent and irregular figure) was surrounded by a deep and broad ditch, sometimes filled with water, and sometimes dry, called the *fosse*. Before the great gate was an outwork, called a *barbacan*, or *antemural*, which was a strong and high wall, with turrets upon it, designed for the defence of the gate and drawbridge. On the inside of the ditch stood the wall of the castle, about eight or ten feet thick, and between 20 and 30 feet high, with a parapet, and a kind of embrasures called *crennels* on the top. On this wall, at proper distances, square towers of two or three stories high were built, which served for lodging some of the principal officers of the proprietor of the castle, and for other purposes: and on the inside were erected lodgings for the common servants or retainers, granaries, storehouses, and other necessary offices. On the top of this wall, and on the flat roofs of these buildings, stood the defenders of the castle, when it was besieged, and from thence discharged arrows, darts, and stones on the besiegers. The great gate of the castle stood in the course of this wall, and was strongly fortified with a tower on each side, and rooms over the passage, which was closed with thick folding doors of oak, often plated with iron, and with an iron portcullis or grate let down from above. Within this outward wall was a large open space or court, called, in the largest and most perfect castles, the *outer bayle*, or *ballium*, in which stood commonly a church or chapel. On the inside of this outer bayle was another ditch, wall, gate, and towers, inclosing the inner bayle or court, within which the chief tower or *keep* was built. This was a very large square fabric, four or five stories high, Castle. high, having small windows in prodigious thick walls, which rendered the apartments within it dark and gloomy. This great tower was the palace of the prince, prelate, or baron, to whom the castle belonged, and the residence of the constable or governor. Under ground were dismal dark vaults, for the confinement of prisoners, which made it sometimes be called the *dungeon*. In this building also was the great hall, in which the owner displayed his hospitality, by entertaining his numerous friends and followers. At one end of the great halls of castles, palaces, and monasteries, there was a place raised a little above the rest of the floor, called the *deis*, where the chief table stood, at which persons of the highest rank dined. Though there were unquestionably great variations in the structure of castles, yet the most perfect and magnificent of them seem to have been constructed nearly on the above p'an. Such, to give one example, was the famous castle of Bedford, as appears from the following account of the manner in which it was taken by Henry III. A. D. 1224. The castle was taken by four assaults. "In the first was taken the barbacan; in the second the outer ballia; at the third attack, the wall by the old tower was thrown down by the miners, where, with great danger, they possessed themselves of the inner ballia, through a chink; at the fourth assault the miners set fire to the tower, so that the smoke burst out, and the tower itself was cloven to that degree, as to show visibly some broad chinks: whereupon the enemy surrendered." See a representation of a castle in Plate CXXXV. where 1 is the barbacan, 2 the ditch or moat, 3 the wall of the outer ballium, 4 the outer ballium, 5 the artificial mount, 6 the wall of the inner ballium, 7 the inner ballium, 8 the keep or dungeon.

Before the accession of James VI. to the throne of England, the situation of Scotland was such, that every baron's house was more or less fortified, according to the power or consequence of its lord, or according to the situation of the castle. Near Edinburgh or Stirling, where the inhabitants were more polished in their manners, and overawed by the seat of government, no more was necessary than towers capable of resisting the cursory attack of robbers and thieves, who never durst stop to make a regular investment, but plundered by surprise, and, if repulsed, instantly fled away. Such was Melville Castle. It anciently consisted of a strong built tower of three stories, embattled at the top, and was sufficiently strong to resist a sudden attack, unaided by artillery, or other engines of war. But, when further removed, as in Perthshire, Inverness-shire, or Aberdeenshire, then it was necessary to be better defended, and the aids of a peel or dungeon, with outer walls, moat, and wet ditch, barnakin, &c. added to enable the powerful lord to resist the formidable attack of his powerful adversary. The history of Scotland, so late as the reign of the Stuart family, affords a number of melancholy instances of inveterate feuds among the greater and lesser barons of that period: by which every mode of fortification then in use was seldom adequate to the defence of the castle against the storm or blockade of the enraged chieftain. The castle of Doune seems to answer this description of fortification, and has made several gallant defences, in the annals of Scotland. The third kind of fortresses we meet with in Scotland are those situated on the borders of England, or on the sea coasts of the kingdom, and in the Western isles, and very remote places. Many of the old castles in Scotland were situated on an island, in a deep lake, or on a peninsula, which by a broad deep cut was made an island. Of this kind was Lochmaben, in the stewartry of Annandale, the castle of Closeburn in the shire of Nithsdale, the castle of the Rive, situated on the river Dee in the shire of Galloway, Lochleven castle, and many others.

This kind of fortress was only accessible in a hard frost, or by boats, which were not easily transported by a people destitute of good roads and wheel carriages. In fact, they could only be taken by surprise or blockade; the first very difficult, the second very tedious; so that, before the use of artillery, they might be deemed almost impregnable. On that account, their situation was very desirable in the inland parts of Scotland.

On the sea coasts of Scotland we generally find the strongest and most ancient, as well as the most impregnable castles. These had to defend themselves from the invasion of the foreign enemy, as well as the attacks of the domestic foe. Thus we find the barons, whose lands extended to the sea coast, perched, like the eagle, on the most inaccessible rocks that lay within their possessions. Of this kind were Slains castle, Tantallon and Dunottar, on the east coast, and Dunvegan in the isle of Sky, with Dunolly on the west coast. These must have been most uncomfortable retreats, except to a barbarous people, or when a pressing danger forced the baron to seek his safety in the only possible retreat left him.

Castle, in ancient writers, denotes a town or village surrounded with a ditch and wall, furnished with towers at intervals, and guarded by a body of troops. The word is originally Latin, *castellum*, a diminutive from *castrum*. *Castellum* originally seems to have signified a smaller fort for a little garrison: though Suetonius uses the word where the fortification was large enough to contain a cohort. The *castella*, according to Vegetius, were often like towns, built on the borders of the empire, and where there were constant guards and fences against the enemy. Horsley takes them for much the same with what were otherwise denominated *stations*.

Castle, or *Castle-steed*, is also an appellation given by the country people in the north to the Roman *castella*, as distinguished from the *castra stativa*, which they usually call *chesters*. Horsley represents this as an useful criterion, whereby to discover or distinguish a Roman camp or station. There are several of these castella on Severus's wall: they are generally 60 feet square; their north side is formed by the wall itself, which falls in with them; the intervals between them are from six furlongs and a half to seven; they seem to have stood closest where the stations are widest. The neighbouring people call them *castles*, or *castle-steeds*, by which it seems probable that their ancient Latin name had been *castellum*. Some modern writers call them *mile castles*, or military *castellæ*; Horsley sometimes *exploratory castles*. In these *castella* the *areans* had their station, who were an order of men whose business was to make incursions into the enemy's country, and give intelligence of their motions.

Castle, in the sea language, is a part of the ship, of of which there are two; the forecastle, being the elevation at the prow, or the uppermost deck towards the mizen, the place where the kitchens are. Hindcastle is the elevation which reigns on the stern, over the last deck, where the officers cabins and places of assembly are.

Castle, *Edmund*. See Castel.

Castle-Bar, a borough and market town, capital of the county of Mayo in Ireland, is a well-inhabited place, and carries on a brisk trade: it has a barrack for a troop of horse; and there is here a charter school capable of receiving 50 children, and endowed with two acres of land, rent free, by the right honourable Lord Lucan, who has also granted a lease of 20 acres more at a pepper corn yearly.

Castle-Carey, a remarkable Roman station about four miles west from Falkirk, on the borders of Stirlingshire in Scotland. It comprehends several acres of ground, is of a square form, and is surrounded with a wall of stone and mortar; all the space within the walls has been occupied by buildings, the ruins of which have raised the earth eight or ten feet above its natural surface; so that the fort now seems like a hill top surrounded with a sunk fence. In 1770, some workmen employed in searching for stones for the great canal, which passes very near it, discovered several apartments of stone; and in one of them a great number of stones about two feet in length, and standing erect, with marks of fire upon them, as if they had been employed in supporting some vessel under which fire was put. In a hollow of the rock near this place, in 1771, a considerable quantity of wheat quite black with age was found, with some wedges and hammers supposed to be Roman.

Castle-Rising, a borough town of Norfolk in England, which sends two members to parliament. E. Long. 0. 40. N. Lat. 52. 46.

Castle-Work, service or labour done by inferior tenants, for the building and upholding castles of defence, toward which some gave their personal assistance, and others paid their contributions. This was one of the three necessary charges to which the Anglo-Saxons were expressly subject.

CASTLETOWN, the capital of the Isle of Man, seated on the south-west part of the island. It has a strong castle; but of no great importance, on account of its distance from the harbour. The number of houses is about 500. W. Long. 4. 39. N. Lat. 53. 30.

CASTOR, the Beaver, in *Zoology*, a genus of quadrupeds belonging to the order of glires. See Mammalia *Index*.

Castor, in *Astronomy*, a moiety of the constellation Gemini; called also Apollo. Its latitude northwards, for the year 1700, according to Hevelius, was 10° 4′ 23″; and its longitude, of Cancer, 17° 4′ 14″. It is also called Razalgenze, Apollo, Aphellan, Avellar, and Anelar.

Castor and Pollux, in Pagan mythology. Jupiter having an amour with Leda, the wife of Tyndarus king of Sparta, in the form of a swan, she brought forth two eggs, each containing twins. From that impregnated by Jupiter proceeded Pollux and Helena, who were both immortal; from the other Castor and Clytemnestra, who being begot by Tyndarus were both mortal. They were all, however, called by the common name of *Tyndaridæ*. These two brothers entered into an inviolable friendship; they went with the other noble youths of Greece in the expedition to Colchis, and on several occasions signalized themselves by their courage: But Castor being at length killed, Pollux obtained leave to share his own immortality with him; so that they are said to live and die alternately every day: for, being translated into the skies, they form the constellation of Gemini, one of which stars rises as the other sets.

Castor, Castoreum.

A martial dance, called the *Pyrrhic* or *Castorian* dance, was invented in honour of those deities, whom the Cephelenses placed among the Dii Magni, and offered to them white lambs. The Romans also paid them particular honours on account of the assistance they are said to have given them in an engagement against the Latins; in which, appearing mounted on white horses, they turned the scale of victory in their favour, for which a temple was erected to them in the forum.

Castor and Pollux, a fiery meteor, which at sea appears sometimes sticking to a part of the ship, in form of one, two, or even three or four fire-balls: when one is seen alone, it is more properly called *Helena*; two are denominated Castor and Pollux, and sometimes Tyndaridæ. Castor and Pollux are called by the Spaniards, San Elmo; by the French St Elme, St Nicholas, St Clare, St Helene; by the Italians, Hermo; by the Dutch, Tree Vuuren.

Castor and Pollux are commonly judged to portend a cessation of the storm, and a future calm; being rarely seen till the tempest is nigh spent. Helena alone portends ill, and witnesses the severest part of the storm yet behind. When the meteor sticks to the masts, yards, &c. they conclude, from the air's not having motion enough to dissipate this flame, that a profound calm is at hand; if it flutter about, it indicates a storm.

CASTOREUM, in the *Materia Medica*, Castor; the inguinal glands of the beaver. The ancients had a notion that it was lodged in the testicles; and that the animal when hard pressed would bite them off, and leave them to its pursuers, as if conscious of what they wanted to destroy him for. The best sort of castor is what comes from Russia. So much is Russian castor superior to the American, that two guineas per pound are paid for the former, and only 8s. 6d. for the latter. The Russian castor is in large hard round cods, which appear, when cut, full of a brittle, red, liver-coloured substance, interspersed with membranes and fibres exquisitely interwoven. An inferior sort is brought from Dantzic, and is generally fat and moist. The American castor, which is the worst of all, is in longish thin cods. Russia castor has a strong disagreeable smell; and an acrid, bitterish, and nauseous taste. Water extracts the nauseous part, with little of the finer bitter; rectified spirit extracts this last without much of the nauseous; proof spirit both: water elevates the whole of its flavour in distillation; rectified spirit brings over nothing. Castor is looked upon as one of the capital nervine and antihysteric medicines; some celebrated practitioners, nevertheless, have doubted its virtues; and Neumann and Stahl declare

clare it insignificant. Experience, however, has shown that the virtues of castor are considerable, though less than they have been generally supposed.

CASTRATION, in *Surgery*, the operation of gelding, *i. e.* of cutting off the testicles, and putting a male animal out of the capacity of generation.

Castration is in much use in Asia, especially among the Turks, who practise it on their slaves, to prevent any commerce with their women. The Turks often make a general amputation.

Castration also obtains in Italy, where it is used with a view to preserve the voice for singing. See EUNUCH.

The Persians, and other eastern nations, have divers methods of making eunuchs, different from those which obtain in Europe; we say, of making eunuchs, for it is not always done among them by cutting, or even collision. Cicuta and other poisonous herbs do the same office, as is shown by Paulus Ægineta. Those eunuchised in this manner are called *thlibiæ*. Besides which there is another sort, called *thlasiæ*, in whom the genitals are left entire, and only the veins which should feed them are cut; by which means the parts do indeed remain, but so lax and weak, as to be of no use.

Castration was for some time the punishment of adultery. By the laws of the Visigoths, sodomites underwent the same punishment.

By the civil law it is made penal in physicians and surgeons to castrate, even with consent of the party, who is himself included in the same penalty, and his effects forfeited. The offence of mayhem by castration is, according to all our old writers, felony; though committed upon the highest provocation. See a record to this purpose of Henry III. transcribed by Sir Edward Coke, 3 Inst. 62. or Blackstone's Com. vol. iv. p. 206.

Castration is sometimes found necessary on medicinal considerations, as in mortifications, and some other diseases of the testicles, especially the *sarcocele* and *varicocele*. Some have also used it in maniac cases.

CASTRATION is also in some sort practised on women. Athenæus mentions that King Andramytes was the first who castrated women. Hesychius and Suidas say Gyges did the same thing. Galen observes, that women cannot be castrated without danger of life; and Dalechampius, on the fore-mentioned passage of Athenæus, holds, that it is only to be understood of simple padlocking.

CASTRATION, in respect of brutes, is called GELDING and SPAYING.

CASTRATION also denotes the art of retrenching, or cutting away any part of a thing from its whole.—Castrating a book, among booksellers, is the taking out some leaf, sheet, or the like, which renders it imperfect and unfit for sale. The term is also applied to the taking away particular passages, on account of their obscenity, too great freedom with respect to government, &c.

CASTRATION, among botanists, a term derived from the fancied analogy betwixt plants and animals. The castration of plants consists in cutting off the *antheræ*, or tops of the stamina, before they have attained maturity and dispersed the pollen or fine dust contained within their substance. This operation has been frequently practised by the moderns, with a view to establish or confute the doctrine of the sexes of plants; the antheræ or tops being considered by the sexualists as the male organs of generation. The experiment of castration succeeds principally on plants which, like the melon, have their male flowers detached from the female. In such as have both male and female flowers contained within the same covers, this operation cannot be easily performed without endangering the neighbouring organs. The result of experiments on this subject by Linnæus, Alston, and other eminent botanists, may be seen under the article BOTANY.

CASTREL, a kind of hawk resembling the lanner in shape, but the hobby in size. The castrel is also called kestrel, and is of a slow and cowardly kind; her game is the grouse, though she will kill a partridge.

CASTRES, a city of Languedoc, in France, about 35 miles east of Thoulouse, containing 12,400 inhabitants. E. Long. 2. 20. N. Lat. 43. 40.

CASTRO, the capital of the island of Chiloe, on the coast of Chili in South America. W. Long. 82. 0. S. Lat. 43. 0.

CASTRO is also the capital of a duchy of the same name in the pope's territories in Italy, situated on the confines of Tuscany. E. Long. 12. 35. N. Lat. 42. 30.

CASTRO, *Pietro de*, a celebrated painter, who flourished about the middle of the 17th century. The subjects which this great artist chose to paint, were what are distinguished by the name of still life; vases, shells, musical instruments, gems, vessels of gold, silver, and crystal, books, and rich bracelets: and in those subjects his choice and disposition were elegant, and his execution admirable.

CASTRUCCIO CASTRACANI, a celebrated Italian general, was born (nobody knows of whom) at Lucca in Tuscany in 1284, and left in a vineyard covered with leaves, where he was found by Dianora a widow lady, the sister of Antonio, a canon of St Michael in Lucca, who was descended from the illustrious family of the Castracani. The lady having no children, she resolved to bring him up, and educated him as carefully as he had been her own. She intended him for a priest; but he was scarcely 14 years old when he began to devote himself to military sports, and those violent exercises which suited his great strength of body. The factions named the *Guelfs* and *Gibelines* then shared all Italy between them; divided the popes and the emperors; and engaged in their different interest not only the members of the same town, but even those of the same family. Francisco, a considerable person on the side of the Gibelines, observing Castruccio's uncommon spirit and great qualities, prevailed with Antonio to let him turn soldier; on which Castruccio soon became acquainted with every thing belonging to that profession, and was made a lieutenant of a company of foot by Francisco Guinigi. In his first campaign he gave such proofs of his courage and conduct as spread his fame all over Lombardy; and Guinigi, dying soon after, committed to him the care of his son and the management of his estate. Still distinguishing himself by his exploits, he filled his commander in chief with such jealousy and envy, that he was imprisoned by stratagem in order to be put to death. But the people of Lucca soon released him, and afterwards chose him for their sovereign prince.—The Gibelines considered him as the chief of their party;

Castruccio, Castrum Doloris.

party; and those who had been banished from their country fled to him for protection, and unanimously promised, that if he could restore them to their estates, they would serve him so effectually that the sovereignty of their country should be his reward. Flattered by these promises, he entered into a league with the prince of Milan. He kept his army constantly on foot, employing it as best suited his own designs. For services he had done the pope, he was made senator of Rome with more than ordinary ceremony; but while there, received news which obliged him to hasten back to Lucca. The Florentines entered into a war with him, but Castruccio fought his way through them; and the supreme authority of Tuscany was ready to fall into his hands, when a period was put to his life. In May 1328 he gained a complete victory over his enemies, who amounted to 30,000 foot and 10,000 horse; in which 22,000 of them were slain, with the loss of not quite 1600 of his own men; but as he was returning from the field of battle, tired with the action, and covered with sweat, he halted a little, in order to thank and caress his soldiers as they passed; when, the north wind blowing upon him, he was immediately seized with an ague, which he at first neglected, but it carried him off in a few days, in the 44th year of his age.

Machiavel, who has written the life of Castruccio, says, that he was not only an extraordinary man in his own age, but he would have been so in any other. He was of a noble aspect, and of the most winning address. He had all the qualities that make a man great; was grateful to his friends, just to his subjects, terrible to his enemies. No man was more forward to encounter dangers; no man more careful to escape them. He had an uncommon presence of mind, and often made repartees with great smartness. Some of them are recorded, which discover a singular turn of humour; and, for a specimen, we shall mention three or four of them.—Passing one day through a street where there was a house of bad fame, he surprised a young man, who was just coming out, and who, upon seeing him, was all over blushes and confusion: "Friend, you should not be ashamed when you come out, but when you go in."—One asking a favour of him with a thousand impertinent and superfluous words: "Hark you friend; when you would have any thing with me for the future, send another man to ask it."—Another great talker having tired him with a tedious discourse, excused himself at last, by saying, he was afraid he had been troublesome. "No indeed (replied he), for I did not mind one word you said."—He was forced to put a citizen of Lucca to death, who had formerly been a great instrument of his advancement; and being reproached by somebody for having dealt so severely with an old friend, replied, "No, you are mistaken, it was with a new foe."—One of his courtiers, desirous to regale him, made a ball and invited him to it. Castruccio came, entertained himself among the ladies, danced, and did other things, which did not seem to comport with the dignity of his rank. One of his friends intimating that such freedoms might diminish the reverence that ought to be paid him; "I thank you for your caution; but he who is reckoned wise all the day, will never be reckoned a fool at night."

CASTRUM DOLORIS, in middle age writers, denotes a catafalco, or a lofty tomb of state, erected in honour of some person of eminence, usually in the church where the body is interred; and decorated with arms, emblems, lights, and the like.

Castrum Doloris ‖ Casus Amissionis.

Ecclesiastical writers speak of a ceremony of consecrating a *castrum doloris*; the edifice was to be made to represent the body of the deceased, and the priest and deacon were to take their posts, and say the prayers after the same manner as if the corpse were actually present.

CASTS. See CASTING.

CASU CONSIMILI, in *Law*, a writ of entry granted where a tenant, by courtesy or for life, aliens either in fee, in tail, or for the term of another's life. It is brought by him in reversion against the person to whom such tenant does so alien to the prejudice of the reversioner in the tenant's lifetime.

Casu Proviso, in *Law*, a writ of entry founded on the statute of Gloucester, where a tenant in dower aliens the lands she so holds in fee or for life; and lies for the party in reversion against the alliance.

CASUAL, something that happens fortuitously, without any design, or any measures taken to bring it to pass.

Casual Revenues, are those which arise from forfeitures, confiscations, deaths, attainders, &c.

Casual Theology, a denomination given to what is more frequently called CASUISTRY.

CASUALTY, in a general sense, denotes an accident, or a thing happening by chance, not design. It is particularly used for an accident producing unnatural death.

CASUALTY, in *Scots Law*. *Casualties of a superior*, are those duties and emoluments which a superior has a right to demand out of his vassal's estate, over and besides the constant yearly duties established by the *reddendo* of his charter upon certain casual events.

CASUALTY, in *Metallurgy*. See CAUSALTY.

CASUIST, a person who proposes to resolve cases of conscience. Escobar has made a collection of the opinions of all the casuists before him. M. le Feore, preceptor of Louis XIII. called the books of the casuists the art of quibbling with God: which does not seem far from truth, by reason of the multitude of distinctions and subtleties they abound withal. Mayer has published a bibliotheca of casuists, containing an account of all the writers on cases of conscience, ranged under three heads; the first comprehending the Lutheran, the second the Calvinist, and the third the Romish casuists.

CASUISTRY, the doctrine and science of conscience and its cases, with the rules and principles of resolving the same; drawn partly from natural reason or equity; partly from authority of Scripture, the canon law, councils, fathers, &c. To casuistry belongs the decision of all difficulties arising about what a man may lawfully do or not do; what is sin or not sin; what things a man is obliged to do in order to discharge his duty, and what he may let alone without breach of it.

CASUS AMISSIONIS, in *Scots Law*. In actions proving the tenor of obligations inextinguishable by the debtor's retiring or cancelling them, it is necessary for the pursuer, before he is allowed a proof of the tenor, to condescend upon such a *casus amissionis*, or accident by by which the writing was destroyed, as shows it was lost while in the writer's possession.

CAT, in *Zoology*. See FELIS, MAMMALIA *Index*.

CAT, in sea affairs, a ship employed in the coal trade, formed from the Norwegian model. It is distinguished by a narrow stern, projecting quarters, a deep *waiste*, and by having ornamental figures on the prow. These vessels are generally built remarkably strong, and carry from four to six hundred tons, or, in the language of their own mariners, from 20 to 30 *keels* of coals.

CAT, is also a sort of strong tackle, or combination of pulleys, to hook and draw the anchor perpendicularly up to the *cat-head*. See *CAT-Heads*.

CAT's-Eye, or *Sun-stone* of the Turks, a kind of gem found chiefly in Siberia. Cat's-eye is by the Latins called *oculus cati*, and sometimes *onycopalus*, as having white zones or rings like the onyx, and its colours variable like OPAL, from which last it differs chiefly by its superior hardness. It is very hard, and semitransparent, and has different points, from whence the light is reflected with a kind of yellowish radiation somewhat similar to the eyes of cats, from whence it had its name. The best of them are very scarce, and jewellers cut them round to the greatest advantage. One of these stones, an inch in diameter, was in the possession of the duke of Tuscany.

CAT-fish, in *Ichthyology*. See SQUALUS, ICHTHYOLOGY *Index*.

CAT-Gut, a denomination given to small strings for fiddles, and other instruments, made of the intestines of sheep or lambs, dried and twisted together, either singly, or several together. These are sometimes coloured red, sometimes blue, but are commonly left whitish or brownish, the natural colour of the gut. They are also used by watchmakers, cutlers, turners, and other artificers. Great quantities are imported into England, and other northern countries, from Lyons and Italy.

CAT-Harpings, a purchase of ropes employed to brace in the shrouds of the lower masts behind their yards, for the double purpose of making the shrouds more tight, and of affording room to draw in the yards more obliquely, to *trim* the sails for a side-wind, when they are said to be close-hauled.

CAT-Heads, two strong short beams of timber, which project almost horizontally over the ship's bows on each side of the bowsprit; being like two radii which extend from a centre taken in the direction of the bowsprit. That part of the cat-head which rests upon the forecastle is securely bolted to the beams; the other part projects like a crane, as above described, and carries in its extremity two or three small wheels or *sheaves* of brass or strong wood, about which a rope, called the *cat-fall*, passes and communicates with the cat-block, which also contains three sheaves. The machine formed by this combination of pulleys is called the *Cat*, which serves to pull the anchor up to the cat-head, without tearing the ship's sides with its flukes. The cat-head also serves to suspend the anchor clear of the bow, when it is necessary to let it go; it is supported by a sort of knee, which is generally ornamented with sculpture. See Plate CXXXVI.

The cat-block is filled with a large and strong hood, which catches the ring of the anchor when it is to be drawn up.

CAT-Mint. See MENTHA, BOTANY *Index*.

CAT-Salt, a name given by our salt-workers to a very beautifully granulated kind of common salt. It is formed out of the bittern, or leach brine, which runs from the salt when taken out of the pan. When they draw out the common salt from the boiling pans, they put it into long wooden troughs, with holes bored at the bottom for the brine to drain out; under these troughs are placed vessels to receive this brine, and across them small sticks to which the cat-salt affixes itself in very large and beautiful crystals. This salt contains some portion of the bitter purging salt, is very sharp and pungent, and is white when powdered, though pellucid in the mass. It is used by some for the table, but the greatest part of what is made of it is used by the makers of hard soap.

CAT-Silver. See MICA.

CATACAUSTIC CURVES, in the higher geometry, that species of caustic curves which are formed by reflection. See FLUXIONS.

CATACHRESIS, in *Rhetoric*, a trope which borrows the name of one thing to express another. Thus Milton, describing Raphael's descent from the empyreal heaven to paradise, says,

"Down thither prone in flight
"He speeds, and through the vast ethereal sky
"Sails between worlds and worlds."

CATACOMB, a grotto, or subterraneous place for the burial of the dead.

Some derive the word *catacomb* from the place where ships are laid up, which the modern Latins and Greeks called *cumbæ*. Others say, that *cata* was used for *ad*, and *catacumbas* for *adtumbas*; accordingly, Dadin says, they anciently wrote *catatumbas*. Others fetch the word from the Greek, κατα, and τυμβος, a hollow, cavity, or the like.

Anciently the word *catacomb* was only understood of the tombs of St Peter and St Paul; and M. Chastelain observes, that, among the more knowing of the people of Rome, the word *catacomb* is never applied to the subterraneous burying-places hereafter mentioned, but only to a chapel in St Sebastian, one of the seven stational churches; where the ancient Roman kalendars say the body of St Peter was deposited, under the consulate of Tuscus and Bassus, in 258.

CATACOMBS of Italy; a vast assemblage of subterraneous sepulchres about Rome, chiefly at about three miles from that city, in the Via Appia; supposed to be the sepulchre of the martyrs; and which are visited accordingly out of devotion, and relics thence taken and dispersed throughout the catholic countries, after having been first baptized by the pope under the name of some saint. These *catacombs* are said by many to be caves or cells wherein the primitive Christians hid and assembled themselves together, and where they interred such among them as were martyred. Each *catacomb* is three feet broad, and eight or ten high; running in form of an alley or gallery, and communicating with others; in many places they extend within a league of Rome. There is no masonry or vaulting therein, but each supports itself; the two sides, which

which we may look on as the *parietes* or walls, were the places where the dead were deposited; which were laid lengthwise, three or four rows over one another, in the same *catacomb*, parallel to the alley. They were commonly closed with large thick tiles, and sometimes pieces of marble, cemented in a manner inimitable by the moderns. Sometimes, though very rarely, the name of the deceased is found on the tile: frequently a palm is seen, painted or engraven, or the cypher Xp, which is commonly read *pro Christo*. The opinion held by many Protestant authors is, that the *catacombs* are heathen sepulcres, and the same with the puticuli mentioned by Festus Pompeius; maintaining, that whereas it was the practice of the ancient Romans to burn their dead, the custom was, to avoid expence, to throw the bodies of their slaves to rot in holes of the ground; and that the Roman Christians, observing at length the great veneration paid to relicks, resolved to have a stock of their own: entering therefore the *catacombs*, they added what cyphers and inscriptions they pleased, and then shut them up again, to be opened on a favourable occasion. Those in the secret, add they, dying or removing, the contrivance was forgot, till chance opened them at last. But this opinion has even less of probability than the former. Mr Monro, in the *Philosophical Transactions*, supposes the *catacombs* to have been originally the common sepulchres of the first Romans, and dug in consequence of these two opinions, viz. that shades hate the light; and that they love to hover about the places where the bodies are laid.

Though the catacombs of Rome have made the greatest noise of any in the world, there are such belonging to many other cities. Those of Naples, according to Bishop Burnet, are much more noble and spacious than the catacombs of Rome. Catacombs have also been discovered at Syracuse and Catanea in Sicily, and in the island of Malta. The Roman catacombs take particular names from the churches in their neighbourhood, and seem to divide the circumference of the city without the walls between them, extending their galleries everywhere under, and a vast way from it; so that all the ground under Rome, and for many miles about it, some say 20, is hollow. The largest, and those commonly shown to strangers, are the catacombs of San Sebastiano, those of Saint Agnese, and the others in the fields a little off Saint Agnese. Women are only allowed to go into the catacombs in the churchyard of the Vatican on Whitsun Monday, under pain of excommunication. There are men kept constantly at work in the catacombs. As soon as these labourers discover a grave with any of the supposed marks of a saint upon it, intimation is given to the cardinal camerlingo, who immediately sends men of reputation to the place, where finding the palm, the monogram, the coloured glass, &c. the remains of the body are taken up with great respect, and translated to Rome. After the labourers have examined a gallery, they stop up the entry that leads to it; so that most of them remain thus closed up; only a few being left open to keep up the trade of showing them to strangers. This, they say, is done to prevent people from losing themselves in these subterraneous labyrinths, which indeed has often happened; but more probably to deprive the public of the means of knowing whither and how far the catacombs are carried.

The method of preserving the dead in catacombs seems to have been common to a number of the ancient nations. The catacombs of Egypt are still extant about nine leagues from the city of Grand Cairo, and two miles from the city of Zaccara. They extend from thence to the pyramids of Pharoah, which are about eight miles distant. They lie in a field covered with a fine running sand, of a yellowish colour. The country is dry and hilly; the entrance of the tombs is choked up with sand; there are many open, but more that are still concealed.

The bodies found in catacombs, especially those of Egypt, are called *mummies*; and as their flesh was formerly reckoned an efficacious medicine, they were much sought after. In this work the labourers were often obliged to clear away the sand for weeks together, without finding what they wanted. Upon coming to a little square opening of about 18 feet in depth, they descend into it by holes for the feet placed at proper intervals; and there they are sure of finding a mummy. These caves, or *wells* as they call them there, are hollowed out of a white free-stone, which is found in all this country a few feet below the covering of sand. When one gets to the bottom of these, which are sometimes 40 feet below the surface, there are several square openings on each side into passages of 10 or 15 feet wide; and these lead to chambers of 15 or 20 feet square. These are all hewn out in the rock; and in each of the catacombs are to be found several of these apartments communicating with one another. They extend a great way under ground, so as to be under the city of Memphis, and in a manner to undermine its environs. In some of the chambers the walls are adorned with figures and hieroglyphics; in others the mummies are found in tombs, round the apartment, hollowed out in the rock.

The Egyptians seem to have excelled in the art of embalming and preserving their dead bodies; as the mummies found in the Egyptian catacombs are in a better state than the bodies found either in the Italian catacombs or those of any other part of the world. See EMBALMING and MUMMY.

Laying up the bodies in caves, is certainly the original way of disposing of the dead; and appears to have been propagated by the Phœnicians throughout the countries to which they sent colonies: their interring as we now do in the open air or in temples was first introduced by the Christians. When an ancient hero died, or was killed in a foreign expedition, as his body was liable to corruption, and for that reason unfit to be transported entire, they fell on the expedient of burning, in order to bring home the ashes, to oblige the *manes* to follow; that so his country might not be destitute of the benefit of his tutelage. It was thus burning seems to have had its original; and by degrees it became common to all who could bear the expences of it, and took place of the ancient burying: thus *catacombs* became disused among the Romans, after they had borrowed the manner of burning from the Greeks, and then none but slaves were laid in the ground. See BURIAL, &c.

CATALAUNI, called also *Durocatalauni*, a town of of Gallia Belgica: *Catalauni*, the people. A name rather of the lower age than of classical antiquity. Now *Chalons sur Marne*, in Champagne. E. Long. 4. 35. N. Lat. 48. 55.

CATADROMUS, from κατα and δϱεμω, *I run*, in antiquity, a stretched sloping rope in the theatres, down which the *funambuli* walked to show their skill. Some have taken the word to signify the hippodrome or decursorium, wherein the Roman knights used to exercise themselves in running and fighting on horseback. But the most natural meaning is that of a rope fastened at one end to the top of the theatre, and at the other to the bottom, to walk or run down, which was the highest glory of the ancient *schœnobates*, or *funambuli*. Elephants were also taught to run down the *catadromus*, Suetonius speaks of the exploit of a Roman knight, who passed down the *catadromus* mounted on an elephant's back.

CATAGOGION, a heathen festival at Ephesus, celebrated on the 22d of January, in which the devotees ran about the streets, dressed in divers antic and unseemly manners, with huge cudgels in their hands, and carrying with them the images of their gods; in which guise they ravished the women they met with, abused and often killed the men, and committed many other disorders, to which the religion of the day gave a sanction.

CATAGRAPHA, in antiquity, denote oblique figures or views of men's faces; answering to what the moderns call *profiles*.

Catagrapha are said to be the invention of Simon Cleonæus, who first taught painters to vary the looks of their figures, and sometimes direct them upwards, sometimes downwards, and sometimes sidewards or backwards.

CATALEPSIS, or CATALEPSY, in *Medicine*, a kind of apoplexy, or drowsy disease, wherein the patient is taken speechless, senseless, and fixed in the same posture wherein the disease first seized him; his eyes open, without seeing or understanding. See MEDICINE *Index*.

CATALOGUE, a list or enumeration of the names of several books, men, or other things, disposed according to a certain order.

Catalogues of books are digested in different manners, some according to the order of the times when the books are printed, as that of Mattaire; others according to their form and size, as the common booksellers catalogues; others according to the alphabetical order of the authors names, as Hyde's catalogue of the Bodleian library; others according to the alphabetical order of matters or subjects, which are called *real* or *classical catalogues*, as those of Lipenius and Draudius; lastly, others are digested in a mixed method, partaking of several of the former, as De Seine's catalogue of Cardinal Slusius's library, which is first divided according to the subjects or sciences, and afterwards the books in each are recited alphabetically.

The most applauded of all catalogues is that of Thuanus's library, in which are united the advantages of all the rest. It was first drawn up by the two Puteani in the alphabetical order, then digested according to the sciences and subjects by Ishm. Bullialdus, and published by F. Quesnel at Paris in 1679; and reprinted, though incorrectly, at Hamburgh, in 1704. The books are here ranged with justness under their several sciences and subjects, regard being still had to the nation, sect, age, &c. of every writer. Add, that only the best and choicest books on every subject are found here, and the most valuable editions. Yet the catalogue of M. le Telliers archbishop of Rheims's library, made by M. Clement, is not inferior to any published in our age, either on account of the number and choice of the books, or the method of its disposition. One advantage peculiar to this catalogue is, the multitude of anonymous and pseudonymous authors detected in it, scarce to be met with elsewhere. Some even prefer it to Thuanus's catalogue, as containing a greater variety of classes and books on particular subjects.

The conditions required in a catalogue are, that it indicate at the same time the order of the authors and of the matters, the form of the book, the number of volumes, the chronological order of the editions, the language it is written in, and its place in the library; so as that all these circumstances may appear at once in the shortest, clearest, and exactest manner possible. In this view all the catalogues yet made will be found to be defective.

An anonymous French writer has laid down a new plan of a catalogue, which shall unite all the advantages, and avoid all the inconveniences of the rest.

The Jesuits of Antwerp have given us a catalogue of the popes; which makes what they call their *Propilæum*.

CATALOGUE of the Stars, is a list of the fixed stars, disposed in their several constellations; with the longitudes, latitudes, &c. of each; or according to their right ascensions, that is, the order of their passing over the meridian.

The first who undertook to reduce the fixed stars into a catalogue was Hipparchus Rhodius, about 120 years before Christ; in which he made use of the observations of Timocharis and Aristyllus for about 180 years before him. Ptolemy retained Hipparchus's catalogue containing 1026 fixed stars; though he himself made abundance of observations, with a view to a new catalogue, A. D. 140. About the year of Christ 880, Albategni, a Syrian, brought down the same to his time. Anno 1437, Ulugh Beigh, king of Parthia and India, made a new catalogue of 1022 fixed stars, since translated out of Persian into Latin by Dr Hyde. The third who made a catalogue from his own observations was Tycho Brahe, who determined the places of 777 stars for the year 1600, which Kepler from other observations of Tycho afterwards increased to the number of 1000 in the Rudolphine tables; adding those of Ptolemy omitted by Tycho, and of other authors; so that his catalogue amounts to above 1160. At the same time, William, landgrave of Hesse, with his mathematicians, Christopher Rothmannus and Justus Byrgius, determined the places of 400 fixed stars by his own observations, with their places rectified for the year 1593; which Hevelius prefers to those of Tycho's. Ricciolus, in his *Astronomia Reformata*, determined the places of 101 stars for the year 1700, from his own observations; for the rest he followed Tycho's catalogue, altering it where he thought fit. Anno 1667, Dr Halley, in the island of St Helena, observed

observed 350 southern stars not visible in our horizon. The same labour was repeated by F. Noel in 1710, who published a new catalogue of the same stars constructed for the year 1687.

Bayer, in his *Uranometria*, published a catalogue of 1160 stars, compiled chiefly from Ptolemy and Tycho, in which every star is marked with some letter of the Greek alphabet; the biggest star in any constellation being denoted by the first letter, the next by the second, &c. and if the number exceeds the Greek alphabet, the remaining stars are marked by letters of the Roman alphabet, which letters are preserved by Flamsteed, and by Senex on his globes. The celebrated Hevelius composed a catalogue of 1888 stars, 1553 of which were observed by himself; and their places are computed for the year 1660.

The last and greatest is the Britannic catalogue, compiled from the observations of the accurate Mr Flamsteed; who for a long series of years devoted himself wholly thereto. As there was nothing wanting either in the observer or apparatus, we may look on this as a perfect work so far as it goes. It is to be regretted the impression had not passed through his own hands: that now extant was published by authority, but without the author's consent: it contains 2734 stars. There was another published in 1725, pursuant to his testament; containing no less than 3000 stars, with their places rectified for the year 1689: to which is added Mr Sharp's catalogue of the southern stars not visible in our hemisphere, adapted to the year 1726.

The first catalogue, we believe, that was printed in the new or second form, according to the order of the right ascension, is that of De la Caille, given in his Ephemerides for the ten years between 1755 and 1765, and printed in 1755. It contains the right ascensions and declinations of 307 stars, adapted to the beginning of the year 1750. In 1757 De la Caille published his *Astronomia Fundamenta*, containing a catalogue of the right ascensions and declinations of 398 stars, likewise adapted to the beginning of 1750. And in 1763, the year after his death, was published the *Cœlum Australe Stelliferum* of the same author; containing a catalogue of the places of 1942 stars, all situated to the southward of the tropic of Capricorn, and observed by him while he was at the Cape of Good Hope in 1751 and 1752; their places being also adapted to the beginning of 1750. In the same year was published his Ephemerides for the ten years between 1765 and 1775; in the introduction to which are given the places of 515 zodiacal stars, all deduced from the observations of the same author; the places adapted to the beginning of the year 1765.

In the Nautical Almanack for 1773, is given a catalogue of 387 stars, in right ascension, declination, longitude and latitude, derived from the observations of the late celebrated Dr Bradley, and adjusted to the beginning of the year 1760. This small catalogue, and the results of about 200 observations of the moon, are all that the public have yet seen of the multiplied labours of this most accurate and indefatigable observer, although he has now (1798) been dead upwards of 36 years.

In 1775 was published a thin volume, entitled, *Opera Inedita*, containing several papers of the late Tobias Mayer, and among them a catalogue of the right ascensions and declinations of 998 stars, which may be occulted by the moon and planets; the places being adapted to the beginning of the year 1756.

At the end of the first volume of "Astronomical Observations made at the Royal Observatory at Greenwich," published in 1776, Dr Maskelyne, the present astronomer royal, has given a catalogue of the places of 34 principal stars, in right ascension and north polar distance, adapted to the beginning of the year 1770.

These, being the result of several years repeated observations, made with the utmost care, and the best instruments, it may be presumed, are exceedingly accurate.

In 1782 M. Bode of Berlin published a very extensive catalogue of 5058 of the fixed stars, collected from the observations of Flamsteed, Bradley, Hevelius, Mayer, De la Caille, Messier, Monnier, D'Arquier, and other astronomers; all adapted to the beginning of the year 1780; and accompanied with a celestial atlas or set of maps of the constellations, engraved in a most delicate and beautiful manner.

To these may be added Dr Herschel's catalogue of double stars, printed in the Phil. Trans. for 1782 and 1783; Messier's nebulæ and clusters of stars, published in the *Connoissance des Temps* for 1784; and Herschel's catalogue of the same kind given in the Phil. Trans. for 1786.

In 1789 Mr Francis Wollaston published "A Specimen of a General Astronomical Catalogue, in Zones of North-polar Distance, and adapted to January 1. 1790." These stars are collected from all the catalogues before-mentioned, from that of Hevelius downwards. This work contains five distinct catalogues; viz. Dr Maskelyne's new catalogue of 36 principal stars; a general catalogue of all the stars, in zones of north polar distance; an index to the general catalogue; a catalogue of all the stars in the order in which they pass the meridian; and a catalogue of zodiacal stars, in longitude and latitude.

Finally, in 1792, Dr Zach published at Gotha, *Tabulæ Motuum Solis;* to which is annexed a new catalogue of the principal fixed stars, from his own observations made in the years 1787, 1788, 1789, 1790. This catalogue contains the right ascensions and declinations of 381 principal stars, adapted to the beginning of the year 1800. *Hutton's Math. Dict.*

Besides these two methods of forming *catalogues* of the stars, Dr Herschel has proposed a new one, in which the comparative brightness of the stars is accurately expressed. It is long since astronomers were first led to arrange the stars in classes of different magnitudes by their various degrees of brilliancy or lustre. Brightness and size have at all times been considered as synonymous terms; so that the brightest stars have been referred to the class comprehending those of the first magnitude; and as the subsequent orders of stars have been supposed to decrease in lustre, their magnitude has been determined in the same decreasing progression; but the want of some fixed and satisfactory standard of lustre has been the source of considerable confusion and uncertainty in settling the relative magnitude of the stars. A star marked 1.2m. is supposed to be between the first and second magnitude; but 2.1m. intimates, that the star is nearly of the second magnitude, Catalogue of the Stars.

magnitude, and that it partakes somewhat of the lustre of a star of the first order. Such subdivisions may be of some use in ascertaining stars of the first, second, and third classes; but the expressions 5m. 5.6m. 6.5m. 6m. must be very vague and indefinite. Dr Herschel observes that he has found them so in fact; and he therefore considers this method of pointing out the different lustre of stars as a reference to an imaginary standard. If any dependence could be placed on this method of magnitudes, "it would follow, that no less than 11 stars in the constellation of the Lion, namely, β, σ, π, ξ, A, *b*, *c*, *d*, 54, 48, 72, had all undergone a change in their lustre since Flamsteed's time: For if the idea of magnitudes had been a clear one, our author, who marked β 1.2m. and γ 2m. ought to be understood to mean that β is larger than γ; but we now find that actually γ is larger than β. Every one of the eleven stars (says Dr Herschel) which I have pointed out may be reduced to the same contradiction."

The author has pointed out the instances of the insufficiency of this method, and of the uncertain conclusions that are deduced from it, in determining the comparative brightness of stars found not only in Mr Flamsteed's catalogue, but also in the catalogues of other astronomers. It is sufficiently apparent that the present method of expressing the brightness of the stars is very defective. Dr Herschel therefore proposes a different mode, that is more precise and satisfactory.

"I place each star (says he,) instead of giving its magnitude, into a short series, constructed upon the order of brightness of the nearest proper stars. For instance, to express the lustre of D, I say CDE. By this short notation, instead of referring the star D to an imaginary uncertain standard, I refer it to a precise and determined existing one. C is a star that has a greater lustre than D, and E is another of less brightness than D. Both C and E are neighbouring stars, chosen in such a manner that I may see them at the same time with D, and therefore may be able to compare them properly. The lustre of C is in the same manner ascertained by BCD; that of B by ABC; and also the brightness of E by DEF; and that of F by EFG.

"That this is the most natural, as well as the most effectual way to express the brightness of a star, and by that means to detect any change that may happen in its lustre, will appear, when we consider what is requisite to ascertain such a change. We can certainly not wish for a more decisive evidence, than to be assured, by actual inspection, that a certain star is now no longer more or less bright than such other stars to which it has been formerly compared; provided we are at the same time assured that those other stars remain still in their former unaltered lustre. But if the star D will no longer stand in its former order CDE, it must have undergone a change; and if that order is now to be expressed by CED, the star has lost some part of its lustre; if, on the contrary, it ought now to be denoted by DCE, its brightness must have had some addition. Then, if we should doubt the stability of C and E, we have recourse to the orders BCD and DEF, which express their lustre; or even to ABC and EFG, which continue the series both ways. Now having before us the series BCDEF, or if necessary even the more extended one ABCDEFG, it will be impossible to mistake a change of brightness in D, when every member of the series is found in its proper order except D."

In the author's journal or catalogue, in which the order of the lustre of the stars is fixed, each star bears its own proper name or number, *e. g.* "the brightness of the star δ Leonis may be expressed by β δ ε Leonis, or better by 94—68—17 Leonis; these being the numbers which the three above stars bear in the British catalogue of fixed stars."

This method of arrangement occurred to Dr Herschel so early as the year 1782; but he was diverted from the regular pursuit of it by a variety of other astronomical engagements. After many trials, he proposed, in the Transactions of the Royal Society of London for 1796, the plan which appeared to him the most eligible. It is as follows:—Instead of denoting particular stars by letters, he makes use of numbers; and in the choice of the stars which are to express the lustre of any particular one, he directs his first view to perfect equality. When two stars seem to be similar both in brightness and magnitude, he puts down their numbers together, separated merely by a point, as 30.24 Leonis; but if two stars, which at first seemed alike in their lustre, appeared on a longer inspection to be different, and the preference should be always decidedly in favour of the same star, he separates these stars by a comma, thus, 41,94 Leonis. This order must not be varied; nor can three such stars, as 20, 40, 39, Libræ, admit of a different arrangement. If the state of the heavens should be such as to require a different order in these numbers, we may certainly infer that a change has taken place in the lustre of one or more of them. When two stars differ very little in brightness, but so that the preference of the one to the other is indisputable, the numbers that express them are separated by a short line, as —17—70 Leonis, or 68—17—70 Leonis. When two stars differ so much in brightness, that one or two other stars might be interposed between them, and still leave sufficient room for distinction, they are distinguished by a line and comma, thus, —, or by two lines, as 32— —41 Leonis. A greater difference than this is denoted by a broken line, thus, -----29 Bootis. On the whole, the author observes, the marks and distinctions which he has adopted cannot possibly be mistaken; "a point denoting equality of lustre; a comma indicating the least perceptible difference; a short line to mark a decided but small superiority; a line and comma, or double line, to express a considerable and striking excess of brightness; and a broken line to mark any other superiority which is to be looked upon as of no use in estimations that are intended for the purpose of directing changes."

The difficulties that attend this arrangement are not disguised; but the importance and utility of it more than compensate for the labour which it must necessarily require. By a method of this kind, many discoveries of changeable and periodical stars might probably have been made, which have escaped the most diligent and accurate observers. We might then, as the author suggests, be enabled to resolve a problem in which we are all immediately concerned.

"Who, for instance, would not wish to know what degree of permanency we ought to ascribe to the lustre of our sun? Not only the stability of our climates, but the

Catalogue of the Stars.

the very existence of the whole animal and vegetable creation itself, is involved in the question. Where can we hope to receive information upon this subject but from astronomical observations? If it be allowed to admit the similarity of stars with our sun as a point established, how necessary will it be to take notice of the fate of our neighbouring *suns*, in order to guess at that of our own! That *star*, which among the multitude we have dignified by the name of *sun*, to-morrow may slowly begin to undergo a gradual decay of brightness, like β Leonis, α Ceti, α Draconis, δ Ursæ majoris, and many other diminishing stars that will be mentioned in my catalogues. It may suddenly increase, like the wonderful star in the back of Cassiopeia's chair, and the no less remarkable one in the foot of Serpentarius; or gradually come on, like β Geminorum, β Ceti, ζ Sagittarii, and many other increasing stars, for which I also refer to my catalogues; and, lastly, it may turn into a periodical one of 25 days duration, as Algol is one of three days, δ Cephei of five, β Lyræ of six, η Antinoi of seven days, and as many others as are of various periods."

Having thus explained the general principle on which this catalogue is formed, as we find it in the author's first memoir on the subject, we must refer the reader to the doctor's own account for its particular arrangement, observing only that the catalogue subjoined comprehends nine constellations, which are arranged in alphabetical order, with the comparative brightness of the stars accurately stated. In a subsequent paper published in the same volume, he has completely verified the utility of his method by experience, and shewn that there is no permanent change of lustre in the stars. In the notes to his first catalogue he mentioned α Herculis as a periodical star. By a series of observations on this star, compared with κ Ophiuchi, which was most conveniently situated for his purpose, he has been able not only to confirm this opinion, but to ascertain its period. His observations are arranged in a table, by means of which he determines that this star had gone through four successive changes in an interval of 241 days; and therefore the duration of its period must be about 60 days and a quarter. This fact concurs with other circumstances in evincing the rotatory motion of the stars on their axes. "Dark spots, or large portions of the surface less luminous than the rest, turned alternately in certain directions, either towards or from us, will account for the phenomena of periodical changes in the lustre of the stars, so satisfactorily, that we certainly need not look out for any other cause." If it be alleged that the periods in the change of lustre of some stars, such as Algol, β Lyræ, δ Cephei, and η Antinoi, are short, being only 3, 5, 6, and 7 days respectively; while those of ο Ceti, and of the changeable star in Hydra, and that in the neck of the Swan, are long, amounting to 331, 394, and 497 days; and that we cannot ascribe phenomena so different in their duration to the same cause—it may be answered to this objection, that the force of it is founded on our limited acquaintance with the state of the heavens. To the seven stars, the periodical changes of which were before known, we may now add α Herculis, which performs a revolution of its changes in 60 days.

"The step from the rotation of α Herculis to that of ο Ceti is far less considerable than that from the period of Algol to the rotation of α Herculis; and thus a link in the chain is now supplied, which removes the objection that arose from the vacancy." The rotation of the fifth satellite of Saturn is proved by the change observable in its light; and "this variation of light, owing to the alternate exposition of a more or less bright hemisphere of this periodical satellite, plainly indicates, that the similar phenomenon of a changeable star arises from the various lustre of the different parts of its surface, successively turned to us by its rotatory motion."

Catalogue of the Stars ‖ Catana.

Besides, we perceive a greater similarity between the sun and the stars, by means of the spots that must be admitted to exist on their surfaces, as well as on that of the sun.

Dr Herschel farther observes, that the stars, besides a rotatory motion on their axes, may have other movements; "such as nutations or changes in the inclination of their axes; which, added to bodies much flattened by quick rotatory motions, or surrounded by rings like Saturn, will easily account for many new phenomena that then offer themselves to our extended views."

CATALONIA, a province of Spain, bounded on the north by the Pyrenean mountains, which divide it from France; by the kingdom of Arragon and Valencia on the west; and by the Mediterranean sea on the south and east. It is 155 miles in length, and 100 in breadth. It is watered by a great number of rivers; the principal of which are the Lobregat, the Ter, and the Segra. The air is temperate and healthy; but the land is mountainous, except in a few places. It produces, however, corn, wine, oil, pulse, flax, and hemp, sufficient for the inhabitants. The mountains are covered with large forests of tall trees, such as the oak, the ever-green oak, the beech, the pine, the fir, the chesnut, and many others; with cork trees, shrubs, and medicinal plants. There are several quarries of marble of all colours, crystal, alabaster, amethysts, and lapis lazuli. Gold dust has been found among the sands of one or two of the rivers; and there are mines of tin, iron, lead, alum, vitriol, and salt. They likewise fish for coral on the eastern coast. The inhabitants are hardy, courageous, active, vigorous, and good soldiers. Catalonia is the most industrious province in Spain. It has considerable manufactures of cottons, woollens, and silk, and carries on an extensive commerce. The population of the whole province in 1788 was 814,000, of whom 12,400 were ecclesiastics, secular or regular. In the agriculture of the country, irrigation is practised to a great extent. There are in the province, one university, one archbishopric, one grand priory, seven bishoprics, sixteen commanderies of the order of Malta, and about 300 religious establishments. The principal towns are Barcelona the capital, Tarragona, Tortosa, Lerida, Solsonia, Cardona Vich, Girona, Seu d'Urgel, Pui Cerda, and Cervera. Catalonia was the last province in Spain which submitted to Philip in the succession war.

CATAMENIA, in *Medicine*. See MENSES.

CATAMITE, a boy kept for sodomitical practices.

CATANA, or CATINA, in *Ancient Geography*, a town of Sicily, situated opposite to Ætna, to the south-east; one of the five Roman colonies: anciently built by the people of Naxus seven years after the building of Syracuse, 728 years before Christ. It was the country of of Charondas the famous lawgiver. The town is still called *Catanea*. See *Catanea*.

CATANANCHE, Candia lions-foot. See Botany *Index*.

CATANEA, or Catania, a city of Sicily, seated on a gulf of the same name, near the foot of Mount Ætna, or Gibel. It was founded by the Chalcidians soon after the settlement of Syracuse, and enjoyed great tranquillity till Hiero I. expelled the whole body of citizens; and after replenishing the town with a new stock of inhabitants, gave it the name of *Ætna:* immediately after his decease, it regained its ancient name, and its citizens returned to their abodes. Catania fell into the hands of the Romans, among their earliest acquisitions in Sicily, and became the residence of a prætor. To make it worthy of such an honour, it was adorned with sumptuous buildings of all kinds, and every convenience was procured to supply the natural and artificial wants of life. It was destroyed by Pompey's son, but restored with superior magnificence by Augustus. The reign of Decius is famous in the history of this city, for the martyrdom of its patroness St Agatha. On every emergency her intercession is implored. She is piously believed to have preserved Catanea from being overwhelmed by torrents of lava, or shaken to pieces by earthquakes; yet its ancient edifices are covered by repeated streams of volcanic matter; and almost every house, even her own church, has been thrown to the ground. In the reign of William the Good, 20,000 Catanians, with their pastor at their head, were destroyed before the sacred veil could be properly placed to check the flames. In the last centnry the eruptions and earthquakes raged with redoubled violence, and Catania was twice demolished See Ætna.

The present prince of Biscari has been at infinite pains, and spent a large sum of money, in working down to the ancient town, which, on accounnt of the numerous torrents of lava that have flowed out of Mount Ætna for these last thousand years, is now to be sought for in dark caverns many feet below the present surface of the earth. Mr Swinburne informs us that he descended into baths, sepulchres, an amphitheatre, and a theatre, all very much injured by the various catastrophes that have befallen them. They were erected upon old beds of lava, and even built with square pieces of the same substance, which in no instance appears to have been fused by the contact of new lavas: The sciarra, or stones of cold lava, have constantly proved as strong a barrier against the flowing torrent of fire as any other stone could have been, though some authors were of opinion that the hot matter would melt the old mass and incorporate with it.

This city has been frequently defended from the burning streams by the solid mass of its own ramparts, and by the air compressed between them and the lava; as appears by the torrent having stopt within a small distance of the walls, and taken another direction. But when the walls were broken or low, the lava collected itself till it rose to a great height, and then poured over in a curve. A similar instance is seen at the Torre del Greco near Naples, where the stream of liquid fire from Vesuvius divided itself into two branches, and left a church untouched in the middle. There is a well at the foot of the old walls of Catania, where the lava, after running along the parapet, and then falling forwards, has produced a very complete lofty arch over the spring.

The church here is a noble fabric. It is accounted the largest in Sicily, though neither a porch nor cupola has been erected, from a doubt of the solidity of the foundations, which are no other than the bed of lava that ran out of Ætna in 1669, and is supposed to be full of cavities. The organ is much esteemed by connoisseurs in musical instraments.

Catania, according to Mr Swinburne's account, is reviving with great splendour. "It has already (he says) much more the features of a metropolis and royal residence than Palermo: the principal streets are wide, straight, and well paved with lava. An obelisk of red granite, placed on the back of an antique elephant of touchstone, stands in the centre of the great square, which is formed by the townhall, seminary, and cathedral. The cathedral erected by the abbot Angerius in the year 1094, was endowed by Earl Roger with the territories of Catania and Ætna, for the small acknowledgment of a glass of wine and a loaf of bread offered once a-year. It has suffered so much by earthquakes, that little of the original structnre remains, and the modern parts have hardly any thing except their materials to recommend them. The other religious edifices of the city are profusely ornamented, but in a bad taste. The spirit of building seems to have seized upon the people, and the prince of Biscari's example adds fresh vigour. It were natural to suppose men would be backward in erecting new habitations, especially with any degree of luxury, on ground so often shaken to its centre, and so often buried under the ashes of a volcano; but such is their attachment to their native soil, and their contempt of dangers they are habituated to, that they rebuild their houses on the warm cinders of Vesuvius, the quaking plains of Calabria, and the black mountains of Sciarra at Catania: it is, however, suprising to see such embellishments lavished in so dangerous a situation. There is a great deal of activity in the disposition of this people: they know by tradition that their ancestors carried on a flourishing commerce; and that before the fiery river filled it up, they had a spacious convenient harbour, where they now have scarce a creek for a felucca: they therefore wish to restore those advantages to Catania, and have often applied to government for assistance towards forming a mole and port, an undertaking their strength alone is unequal to; but whether the refusal originates in the deficiencies of the public treasury or the jealousy of the other cities, all the projects have ended in fruitless applications. The number of inhabitants dwelling in Catania has been estimated at 50,000: A considerable portion of this number appertains to the university, the only one in the island, and the nursery of all the lawyers." E. Long. 15. 19. N. Lat. 37. 30.

CATANZARO, a city in the kingdom of Naples, the capital of Calabria Ulterior, with a bishop's see. It is the usual residence of the governor of the province, and is seated on a mountain, in E. Long. 18. 20. N. Lat. 38. 58.

CATAPHONICS, the science which considers the properties of reflected sounds. See Acoustics.

CATAPHORA, in *Medicine*, the same as Coma.

CATAPHRACTA,

CATAPHRACTA, (from κατα, and φρασσω, *I fortify* or *arm*), in the ancient military art, a piece of heavy defensive armour, formed of cloth or leather, fortified with iron scales or links, wherewith sometimes only the breast, sometimes the whole body, and sometimes the horse too, was covered. It was in use among the Sarmatians, Persians, and other barbarians. The Romans also adopted it early for their foot; and, according to Vegetius, kept to it till the time of Gratian, when the military discipline growing remiss, and field exercises and labour discontinued, the Roman foot thought the cataphracta as well as the helmet too great a load to bear, and therefore threw both by, choosing rather to march against the enemy bare-breasted; by which, in the war with the Goths, multitudes were destroyed.

Cataphractæ Naves, ships armed and covered in fight, so that they could not be easily damaged by the enemy. They were covered over with boards or planks, on which the soldiers were placed to defend them; the rowers sitting underneath, thus screened from the enemy's weapons.

CATAPHRACTUS, denotes a thing defended or covered on all sides with armour.

Cataphractus, or *Cataphractarius*, more particularly denotes a horseman, or even horse, armed with a cataphracta. The *cataphracti equites* were a sort of cuirassiers, not only fortified with armour themselves, but having their horses guarded with solid plates of brass or other metals, usually lined with skins, and wrought into plumes or other forms. Their use was to bear down all before them, to break in upon the enemy's ranks, and spread terror and havock wherever they came, as being themselves invulnerable and secure from danger. But their disadvantage was their unwieldiness, by which, if once unhorsed, or on the ground, they were unable to rise, and thus fell a prey to the enemy.

CATAPHRYGIANS, a sect in the second century, so called as being of the country of Phrygia. They were orthodox in every thing, setting aside this, that they took Montanus for a prophet, and Priscilla and Maximilla for true prophetesses, to be consulted in every thing relating to religion; as supposing the Holy Spirit had abandoned the church. See Montanist.

CATAPLASMA, a poultice; from καταπλασσω, *illino*, to spread like a plaster. Cataplasms take their name sometimes from the part to which they are applied, or effects they produce; so are called *anacollema*, *frontale*, *epicarpium*, *epispasticum*, *vesicatorium*; and when mustard is an ingredient, they are called *sinapisms*.

These kinds of applications are softer and more easy than plasters or ointments. They are formed of some vegetable substances, and applied of such a consistence as neither to adhere nor run; they are also more useful when the intention is effected by the perpetuity of the heat or cold which they contain, for they retain them longer than any other kind of composition.

When designed to *relax*, or to promote suppuration, they should be applied warm. Their warmth, moisture, and the obstruction they give to perspiration, is the method of their answering that end. The proper heat, when applied warm, is no more than to promote a kindly pleasant sensation; for great heat prevents the design for which they are used. They should be renewed as often as they cool. For relaxing and suppurating, none excel the white bread poultice, made with the crumb of an old loaf, a sufficient quantity of milk to boil the bread in until it is soft, and a little oil; which last ingredient, besides preventing the poultice from drying and sticking to the skin, also retains the heat longer than the bread and milk alone would do. To preserve the heat longer, the poultice, when applied, may be covered with a strong ox's bladder.

When designed to *repel*, they should be applied cold, and ought to be renewed as oft as they become warm. A proper composition for this end is a mixture of oatmeal and vinegar.

CATAPULTA, in antiquity, a military engine contrived for the throwing of arrows, darts, and stones upon the enemy.—Some of these engines were of such force that they would throw stones of an hundred weight. Josephus takes notice of the surprising effects of these engines, and says, that the stones thrown out of them beat down the battlements, knocked off the angles of the towers, and would level a whole file of men from one end to the other, was the phalanx ever so deep. This was called the

Battering Catapulta, and is represented on Plate CXXXV. This catapulta is supposed to carry a stone, &c. of an hundred weight; and therefore a description of it will be sufficient to explain the doctrine of all the rest; for such as threw stones of 500 and upwards, were constructed on the same principles.

The base is composed of two large beams 2, 3. The length of these beams is fifteen diameters of the bore of the capitals 9. At the two extremities of each beam, two double mortises are cut to receive the eight tenons of two cross beams, each of them four of the diameters in length. In the centre of each of the beams of the base, and near two-thirds of their length, a hole, perfectly round, and 16 inches in diameter, should be bored; these holes must be exactly opposite to each other, and should increase gradually to the inside of the beams, so that each of them, being 16 inches on the outside towards the capitals 9, should be $17\frac{1}{2}$ at the opening on the inside, and the edges carefully rounded off. The capitals 9 are, in a manner, the soul of the machine, and serve to twist and strain the cordage, which forms its principle or power of motion.

The capitals are either of cast brass or iron; each consisting of a wheel with teeth, C 10, of $2\frac{1}{2}$ inches thick. The hollow or bone of these wheels should be $11\frac{1}{4}$ inches in diameter, perfectly round, and the edges smoothed down. As the friction would be too great if the capitals rubbed against the beams by the extreme straining of the cordage, which draws them towards these beams, that inconvenience is remedied by the means of eight friction wheels, or cylinders of brass, about the 13th of an inch in diameter, and an inch and one sixth in length, placed circularly, and turning upon axes, as represented at D 13, B 12. One of these friction wheels at large, with its screw, by which it is fastened into the beam, is represented at A.

Upon this number of cylindrical wheels the capitals 9 must be placed in the beams 2, 3, so that the cylin-

Catapulta. ders do not extend to the teeth of the wheels, which must receive a strong pinion 14. By means of this pinion the wheel of the capital is made to turn for straining the cordage with the key 15. The capital wheel has a strong catch 16, and another of the same kind may be added, to prevent any thing from giving way through the extreme and violent force of the strained cordage.

The capital piece of the machine is a nut or cross pin of iron, 17, seen at C, and hammered cold into its form. It divides the bore of the capitals exactly in two equal parts, and fixed in grooves about an inch deep. This piece, or nut, ought to be about two inches and one-third thick at the top 18, as represented in the section at B; and rounded off and polished as much as possible, that the cords folded over it may not be hurt or cut by the roughness or edges of the iron. Its height ought to be eight inches, decreasing gradually in thickness to the bottom, where it ought to be only one inch. It must be very exactly inserted in the capitals.

After placing the two capitals in the holes of the two beams in a right line with each other, and fixing the two cross diametrical nuts or pieces over which the cordage is to wind, one end of the cord is reeved through a hole in one of the capitals in the base, and made fast to a nail withinside of the beam. The other side of the cord is then carried through the hole in the opposite beam and capital, and so wound over the cross pieces of iron in the centre of the two capitals, till they are full, the cordage forming a large skain. The tension or straining of the cordage ought to be exactly equal, that is, the several foldings of the cord over the capital pieces should be equally strained, and so near each other as not to leave the least space between them. As soon as the first folding or skain of cord has filled up one whole space or breadth of the capital pieces, another must be carried over it; and so on, always equally straining the end till no more will pass through the capitals, and the skain of cordage entirely fills them, observing to rub it from time to time with soap.

At three or four inches behind the cordage, thus wound over the capital pieces, two very strong upright beams 21 are raised; these are posts of oak 14 inches thick, crossed over at top by another of the same solidity. The height of the upright beams is $7\frac{1}{2}$ diameters; each supported behind with very strong props 25, fixed at bottom in the extremities of the base 2, 3. The cross beam 24 is supported in the same manner by a prop in the centre.

The tree, arm, or stylus 22, should be of sound ash. Its length is from 15 to 16 diameters of the bore of the capitals. The end at the bottom, or that fixed in the middle of the skain, is 10 inches thick, and 14 broad. To strengthen the arm or tree, it should be wrapped round with a cloth dipped in strong glue like the tree of a saddle, and bound very hard with waxed thread of the sixth of an inch in diameter, from the large end at bottom, almost to the top, as represented in the figure.

At the top of the arm, just under the iron hand or receiver 27, a strong cord is fastened, with two loops twisted one within another, for the greater strength. Into these two loops the hook of a brass pulley 28 is put. The cord 29 is then reeved through the pulley, and fastened to the roll 30. The cock or trigger 31, which serves as a stay, is then brought to it, and made fast by its hook to the extremity of the hand 27, in which the body to be discharged is placed. The pulley at the neck of the arm is then unhooked; and when the trigger is to let it off, a stroke must be given upon it with an iron bar or crow of about an inch in diameter; on which the arm flies up with a force almost equal to that of a modern mortar. The cushion or stomacher 23, placed exactly in the middle of the cross-beam 24, should be covered with tanned ox-hide, and stuffed with hair, the arm striking against it with inconceivable force. It is to be observed, that the tree or arm 22 describes an angle of 90 degrees, beginning at the cock, and ending at the stomacher or cushion.

Catapu ‖ Catarac.

Catapulta for Arrows, Spears, or Darts. Some of the spears, &c. thrown by these engines, are said to have been 18 feet long, and to have been thrown with such velocity as to take fire in their course.

ABCD is the frame that holds the darts or arrows, which may be of different numbers, and placed in different directions. EF is a large and strong iron spring, which is bent by a rope that goes over three pulleys, I, K, L, and is drawn by one or several men; this rope may be fastened to a pin at M. The rope, therefore, being set at liberty, the spring must strike the darts with great violence, and send them, with surprising velocity, to a great distance. This instrument differs in some particulars from the description we have of that of the ancients; principally in the throwing of several darts at the same time, one only being thrown by theirs. Fig. 2.

CATARACT, in *Hydrography*, a precipice in the channel of a river, caused by rocks, or other obstacles, stopping the course of the stream, from whence the water falls with greater noise and impetuosity. The word comes from καταῤῥασσω, "I tumble down with violence;" compounded of κατα, "down," and ῥασσω, *dejicio*, "I throw down."—Such are the cataracts of the Nile, the Danube, Rhine, &c. In that of Niagara, the perpendicular fall of the water is 137 feet; and in that of Pistil Rhaiadr, in North Wales, the fall of water is near 240 feet from the mountain to the lower pool.

Strabo calls that a *cataract* which we call a *cascade*: and what we call a *cataract*, the ancients usually called a *catadupa*. Herminius has an express dissertation, "De admirandis mundi Cataractis supra et subterraneis;" where he uses the word in a new sense; signifying by cataract, any violent motion of the elements.

Cataract, in *Medicine* and *Surgery*, a disorder of the humours of the eye, by which the pupilla, that ought to appear transparent and black, looks opaque, blue, gray, brown, &c. by which vision is variously impeded, or totally destroyed. See Surgery.

CATARA, a town of Dalmatia, and capital of the territory of the same name, with a strong castle, and a bishop's see. It is subject to Venice, and is seated on a gulf of the same name. E. Long. 19. 19. N. Lat. 42. 25.

CATARACTES, the trivial name of a species of Larus. See Ornithology *Index*.

CATARRH, in *Medicine*, a distillation or defluxion from the head upon the mouth and aspera arteria, and through them upon the lungs. See MEDICINE *Index*.

CATASTASIS, in *Poetry*, the third part of the ancient drama; being that wherein the intrigue, or action, set forth in the epitasis, is supported, carried on, and heightened, till it be ripe for the unravelling in the catastrophe. Scaliger defines it, the full growth of the fable, while things are at a stand in that confusion to which the poet has brought them.

CATASTROPHE, in *Dramatic Poetry*, the fourth and last part in the ancient drama; or that immediately succeeding the catastasis: or, according to others, the third only; the whole drama being divided into protasis, epitasis, and catastrophe; or in the terms of Aristotle, prologue, epilogue, and exode.

The catastrophe clears up every thing, and is nothing else but the discovery or winding up of the plot. It has its peculiar place: for it ought entirely to be contained, not only in the last act, but in the very conclusion of it: and, when the plot is finished, the play should be so also. The catastrophe ought to turn upon a single point, or start up on a sudden.

The great art in the catastrophe is, that the clearing up of all difficulties may appear wonderful, and yet easy, simple, and natural.

It is a very preposterous artifice in some writers to show the catastrophe in the very title of the play. Mr Dryden thinks that a catastrophe resulting from a mere change in the sentiments and resolutions of a person, without any other machinery, may be so managed as to be exceedingly beautiful.

It is a dispute among the critics, whether the catastrophe should always fall out favourably on the side of virtue or not. The reasons on the negative side seem the strongest. Aristotle prefers a shocking catastrophe to a happy one.—The catastrophe is either simple or complex. The first is that in which there is no change in the state of the principal persons, nor any discovery or unravelling, the plot being only a mere passage out of agitation into quiet repose. In the second, the principal persons undergo a change of fortune, in the manner already defined.

CATCH, in the musical sense of the word, a fugue in unison, wherein, to humour some conceit in the words, the melody is broken, and the sense interrupted in one part, and caught again or supported by another; as in the catch in Shakespeare's play of the Twelfth Night, where there is a catch sung by three persons, in which the humour is, that each who sings, calls and is called *knave* in turn: Or, as defined by Mr Jackson, "a catch is a piece for three or more voices, one of which leads, and the others follow in the same notes. It must be so contrived, that rests (which are made for the purpose) in the music of one line be filled up with a word or two from another line; these form a cross purpose, or catch, from whence the name."

CATCH-Fly. See LYCHNIS, BOTANY *Index*.

CATCH-Pole, (quasi one that *catches* by the *pole*), a term used, by way of reproach, for the bailiff's follower or assistant.

CATCH-Word, among printers, that placed at the bottom of each page, being always the first word of the following page.

CATECHESIS, in a general sense, denotes an instruction given any person in the first rudiments of an art or science; but more particularly of the Christian religion. In the ancient church, catechesis was an instruction given *viva voce*, either to children or adult heathens, preparatory to their receiving of baptism. In this sense, *catechesis* stands contradistinguished from *mystagogica*, which were a higher part of instruction given to those already initiated, and containing the mysteries of faith. Those who give such instructions are called *catechists*; and those who receive them, *catechumens*.

CATECHETIC, or CATECHETICAL, something that relates to oral instruction in the rudiments of Christianity.—Catechetic schools were buildings appointed for the office of the catechist, adjoining to the church, and called *catechumena*: such was that in which Origen and many other famous men read catechetical lectures at Alexandria. See CATECHUMEN.

CATECHISM, in its primary sense, an instruction, or institution, in the principles of the Christian religion, delivered *viva voce*, and so as to require frequent repetitions, from the disciple or hearer, of what has been said. The word is formed from κατηχεω, a compound of κατα and ηχος, q. d. *circumsono*; alluding to the noise or din made in this sort of exercise, or to the zeal and earnestness wherewith things are to be inculcated over and over on the learners.—Anciently the candidates for baptism were only to be instructed in the secrets of their religion by tradition, *viva voce*, without writing; as had also been the case among the Egyptian priests, and the British and Gaulish druids, who only communicated the mysteries of their theology by word of mouth.

CATECHISM is more frequently used in modern times for an elementary book, wherein the principal articles of religion are summarily delivered in the way of question and answer.

CATECHIST, (κατηχιστης, *catecheta*), he that catechises, *i. e.* he that instructs novices in the principles of religion.

CATECHIST more particularly denotes a person appointed by the church to instruct those intended for baptism, by word of mouth, in the fundamental articles of the Christian faith. The catechists of churches were ministers usually distinct from the bishops and presbyters, and had their auditors or *catechumena* apart. Their business was to instruct the catechumens, and prepare them for the reception of baptism. But the catechists did not constitute any distinct order of the clergy, but were chosen out of any other order. The bishop himself sometimes performed the office; at other times presbyters, or even readers or deacons, were the catechists. Origen seems to have had no higher degree in the church than reader, when he was made catechist at Alexandria, being only 18 years of age, and consequently incapable of the deaconship.

CATECHU, in the *Materica Medica*, a name given to the extract otherwise known by the name of *Terra-Japonica*, or Japan earth. See *ARECA* and *MIMOSA*.

CATECHUMEN,

CATECHUMEN, a candidate for baptism, or one who prepares himself for the receiving thereof.

The catechumens, in church history, were the lowest order of Christians in the primitive church. They had some title to the common name of Christian, being a degree above pagans and heretics, though not consummated by baptism. They were admitted to the state of catechumens by the imposition of hands, and the sign of the cross. The children of believing parents were admitted catechumens, as soon as ever they were capable of instruction: but at what age those of heathen parents might be admitted, is not so clear. As to the time of their continuance in this state, there were no general rules fixed about it; but the practice varied according to the difference of times and places, and the readiness and proficiency of the catechumens themselves.

There were four orders or degrees of catechumens; the first were those instructed privately without the church, and kept at a distance for some time, from the privilege of entering the church, to make them the more eager and desirous of it. The next degree were the *audientes*, so called from their being admitted to hear sermons and the Scriptures read in the church, but were not allowed to partake of the prayers. The third sort of catechumens were the *genu-flectentes*, so called because they received imposition of hands kneeling. The fourth order was the *competentes et electi*, denoting the immediate candidates for baptism, or such as were appointed to be baptized the next approaching festival; before which, strict examination was made into their proficiency under the several stages of catechetical exercises.

After examination, they were exercised for twenty days together, and were obliged to fasting and confession: some days before baptism they went veiled; and it was customary to touch their ears, saying, *Ephatha, i. e.* be opened; as also to anoint their eyes with clay; both ceremonies being in imitation of our Saviour's practice, and intended to shadow out to the catechumens their condition both before and after their admission into the Christian church.

CATEGORICAL, in a general sense, is applied to those things ranged under a CATEGORY.

CATEGORICAL also imports a thing to be absolute, and not relative; in which sense it stands opposed to *hypothetical.* We say, a *categorical* proposition, a *categorical* syllogism, &c.

A *categorical* answer denotes an express and pertinent answer made to any question or objection proposed.

CATEGORY, in *Logic*, a series or order of all the predicates or attributes contained under any genus.

The school philosophers distribute all the objects of our thoughts and ideas into certain *genera* or classes, not so much, say they, to learn what they do not know, as to communicate a distinct notion of what they do know; and these classes the Greeks called *categories*, and the Latins *predicaments*.

Aristotle made ten categories, viz. substance, quantity, quality, relation, action, passion, time, place, situation, and habit, which are usually expressed by the following technical distich:

Arbor, sex, servos, ardore, refrigerat, ustos,
Rure cras stabo, nec tunicatus ero.

CATEK. See BENGAL.

CATENARIA, in the higher geometry, the name of a curve line formed by a rope hanging freely from two points of suspension, whether the points be horizontal or not. See FLUXIONS.

CATERPILLAR, in *Zoology*, the name of all winged insects when in their reptile or worm state. See ENTOMOLOGY *Index.*

Method of destroying CATERPILLARS *on Trees.*—Take a chafing dish with lighted charcoal, and placing it under the branches that are loaded with caterpillars, throw some pinches of brimstone upon the coals. The vapour of the sulphur, which is mortal to these insects, will not only destroy all that are on the tree, but prevent it from being infested with them afterwards. A pound of sulphur will clear as many trees as grow on several acres. This method has been successfully tried in France. In the *Journal Oeconomique*, the following is said to be infallible against the caterpillars feeding on cabbage, and perhaps may be equally serviceable against those that infest other vegetables. Sow with hemp all the borders of the ground where you mean to plant your cabbage; and, although the neighbourhood is infested with caterpillars, the space enclosed with the hemp will be perfectly free, not one of the vermine will approach it.

CATERPILLAR-*Eaters*, a name given by some authors to a species of worms bred in the body of the caterpillar, and which eat its flesh; these are owing to a certain kind of fly that lodges her eggs in the body of this animal, and they, after their proper changes, become flies like their parents.

M. Reaumur has given us, in his history of insects, some very curious particulars in regard to these little worms. Every one of them, he observes, spins itself a very beautiful case of a cylindric figure, made of a very strong sort of silk; these are the cases in which this animal spends its state of chrysalis; and they have a mark by which they may be known from all other animal productions of this kind, which is, that they have always a broad stripe or band surrounding their middle, which is black when the rest of the case is white, and white when that is black. M. Reaumur has had the pains and patience to find out the reason of this singularity, which is this: the whole shell is spun of a silk produced out of the creature's body; this at first runs all white, and towards the end of the spinning turns black. The outside of the case must necessarily be formed first, as the creature works from within: consequently this is truly white all over, but it is transparent, and shows the last spun or black silk through it. It might be supposed that the whole inside of the shell should be black; but this is not the case: the whole is fashioned before this black silk comes; and this is employed by the creature, not to line the whole, but to fortify certain parts only; and therefore is all applied either to the middle, or to the two ends omitting the middle; and so gives either a black band in the middle, or a blackness at both ends, leaving the white in the middle to appear. It is not unfrequent

unfrequent to find a sort of small cases, lying about garden walks, which move of themselves; when these are opened, they are found to contain a small living worm. This is one of the species of those caterpillar-eaters; which, as soon as it comes out of the body of that animal, spins itself a case for its transformation long before that happens, and lives in it without food till that change comes on; and it becomes a fly like that to which it owed its birth.

CATERVA, in ancient military writers, a term used in speaking of the Gaulish or Celtiberian armies, denoting a body of 6000 armed men. The word *caterva*, or *catervarius*, is also frequently used by ancient writers to denote a party or corps of soldiers in disorder or disarray; by which it stands distinguished from cohort or turma, which were in good order.

CATESBÆA, the LILYTHORN. See BOTANY *Index*.

CATHÆRETICS, in *Pharmacy*, medicines of a caustic nature, serving to eat off fungous flesh.

CATHARINE. *Knights of St CATHARINE of Mount Sinai*, an ancient military order, erected for the assistance and protection of pilgrims going to pay their devotion to the body of St Catharine, a virgin of Alexandria, distinguished for her learning, and said to have suffered martyrdom under Maximin. The body of the martyr having been discovered on Mount Sinai, caused a great concourse of pilgrims; and travelling being very dangerous, by reason of the Arabs, an order of knighthood was erected in 1063, on the model of that of the holy sepulchre, and under the patronage of St Catharine; the knights of which obliged themselves by oath to guard the body of the saint, keep the roads secure, observe the rule of St Basil, and obey their grand master. Their habit was white, and on it were represented the instruments of martyrdom whereby the saint had suffered; viz. a half wheel armed with spikes, and traversed with a sword stained with blood.

CATHARINE. *Fraternity of St Catharine at Sienna*, a sort of religious society, instituted in that city in honour of St Catharine, a saint famous for her revelations, and for her marriage with Jesus Christ, whose wedding ring is still preserved as a valuable relick. This fraternity yearly endows a certain number of destitute virgins, and has the privilege of redeeming annually two criminals condemned for murder, and the same number of debtors, by paying their debts.

CATHARTICS, in *Medicine*, remedies which promote evacuation by stool. See MATERIA MEDICA.

CATHEDRA, in a general sense, a chair. The word is more particularly used for a professor's chair, and a preacher's pulpit.

CATHEDRA is also used for the bishop's see, or throne in a church.

CATHEDRAL, a church wherein is a bishop's see or seat: See CHURCH and BISHOP. The word comes from the Greek *καθεδρα*, "chair," of *καθεζομαι*, *sedeo*, "I sit." The denomination *cathedral* seems to have taken its rise from the manner of sitting in the ancient churches, or assemblies of primitive Christians: in these, the council, *i. e.* the elders and priests, was called *Presbyterium*; at their head was the bishop, who held the place of chairman, *Cathedralis*, or *Cathedraticus*; and the presbyters, who sat on either side, were also called by the ancient fathers, *Assessores Episcoporum*. The episcopal authority did not reside in the bishop alone; but in all the presbyters, whereof the bishop was president. A *cathedral*, therefore, originally, was different from what it is now; the Christians, till the time of Constantine, having no liberty to build any temple: by their churches they only meant their assemblies; and by *cathedrals*, nothing more than consistories.

CATHERINE PARR. See PARR.

CATHERINE I. *Empress of Russia*, a most extraordinary personage, whose history deserves to be given in detail. She was the natural daughter of a country girl; and was born at Ringen, a small village upon the lake Virtcherve, near Dorpt, in Livonia. The year of her birth is uncertain; but according to her own account, she came into the world on the 5th of April 1687. Her original name was Martha, which she changed for Catherine when she embraced the Greek religion. Count Rosen, a lieutenant-colonel in the Swedish service, who owned the village of Ringen, supported, according to the custom of the country, both the mother and the child; and was, for that reason, supposed by many persons to have been her father. She lost her mother when she was but three years old; and, as Count Rosen died about the same time, she was left in so destitute a situation, that the parish-clerk of the village received her into his house. Soon afterwards Gluck, Lutheran minister of Marienburgh, happening, in a journey through those parts, to see the foundling, took her under his protection, brought her up in his family, and employed her in attending his children. In 1701, and about the 14th year of her age, she espoused a dragoon of the Swedish garrison of Marienburgh. Many different accounts are given of this transaction: one author of great credit affirms that the bride and bridegroom remained together eight days after their marriage; another, of no less authority, asserts, on the contrary, that on the morning of the nuptials her husband being sent with a detachment for Riga, the marriage was never consummated. This much is certain, that the dragoon was absent when Marienburgh surrendered to the Russians, and Catherine, who was reserved for a higher fortune, never saw him more.

General Bauer, upon the taking of Marienburgh, saw Catherine among the prisoners; and, being smitten with her youth and beauty, took her to his house, where she superintended his domestic affairs, and was supposed to be his mistress. Soon afterwards she was received into the family of Prince Menzikof, who was no less struck with the attractions of the fair captive. With him she lived until 1704; when, in the 17th year of her age, she became the mistress of Peter the Great, and won so much upon his affections, that he espoused her on the 29th of May 1711. The ceremony was secretly performed at Jawerof in Poland, in the presence of General Bruce; and on the 20th of February 1712, it was publicly solemnized with great pomp at Petersburgh.

Catherine, by the most unwearied assiduity and unremitted attention, by the softness and complacency of her disposition, but above all by an extraordinary liveliness

Catherine. liveliness and gaiety of temper, acquired a wonderful ascendency over the mind of Peter. The latter was subject to occasional horrors, which at times rendered him gloomy and suspicious, and raised his passions to such a height as to produce a temporary madness. In these dreadful moments Catherine was the only person who durst venture to approach him; and such was the kind of fascination she had acquired over his senses, that her presence had an instantaneous effect, and the first sound of her voice composed his mind and calmed his agonies. From these circumstances she seemed necessary not only to his comfort, but even to his very existence; she became his inseparable companion on his journeys to foreign countries, and even in all his military expeditions.

The peace of Pruth, by which the Russian army was rescued from certain destruction, has been wholly attributed to Catherine, though she was little more than an instrument in procuring the consent of Peter. The latter, in his campaign of 1711 against the Turks, having imprudently led his troops into a disadvantageous situation, took the desperate resolution of cutting his way through the Turkish army in the night. With this resolution he retired to his tent in an agony of despair, and gave positive orders that no one should be admitted under pain of death. In this important juncture the principal officers and the vice-chancellor Shassirof assembled in the presence of Catherine, and drew up certain preliminaries in order to obtain a truce from the grand vizier. In consequence of this determination, plenipotentiaries were immediately despatched without the knowledge of Peter, to the grand vizier, and a peace obtained upon more reasonable conditions than could have been expected. With these conditions Catherine, notwithstanding the orders issued by Peter, entered his tent, and prevailed upon him to sign them. Catherine, by her conduct on this occasion, acquired great popularity; and the emperor particularly specifies her behaviour at Pruth as one of the reasons which induced him to crown her publicly at Moscow with his own hand. This ceremony was performed in 1724; and although designed by Peter only as a proof of his affection, was the principal cause of her subsequent elevation.

Her influence continued undiminished until a short time before the death of the emperor, when some circumstances happened which occasioned such a coldness between them as would probably have ended in a total rupture, if his death had not fortunately intervened. The original cause of this misunderstanding arose from the following discovery of a secret connection between Catherine and her first chamberlain, whose name was Mons. The emperor, who was suspicious of this connection, quitted Petersburgh under pretence of removing to a villa for a few days, but privately returned to his winter palace in the capital. From thence he occasionally sent one of his confidential pages, with a complimentary message to the empress, as if he had been in the country, and with secret orders to observe her motions. From the page's information the emperor, on the third night, surprised Catherine in an arbour of the garden with her favourite Mons; while his sister, Madame Balke, who was first lady of the bedchamber to the empress, was, in company with a page, upon the watch without the arbour.

Peter, whose violent temper was inflamed by this discovery, struck Catherine with his cane, as well as the page, who endeavoured to prevent him from entering the arbour, and then retired without uttering a single word either to Mons or his sister. A few days after this transaction these persons were taken into custody, and Mons was carried to the winter palace, where no one had admission to him but Peter, who himself brought him his provisions. A report was at the same time circulated, that they were imprisoned for having received bribes, and making their influence over the empress subservient to their own mercenary views. Mons being examined by Peter, in the presence of Major-general Uschacoff, and threatened with the torture, confessed the corruption which was laid to his charge. He was beheaded; his sister received five strokes of the knout, and was banished into Siberia; two of her sons, who were chamberlains, were also degraded, and sent as common soldiers among the Russian troops in Persia. On the day subsequent to the execution of the sentence, Peter conveyed Catherine in an open carriage under the gallows to which was nailed the head of Mons. The empress, without changing colour at this dreadful sight, exclaimed, "What a pity it is that there is so much corruption among courtiers!"

This event happened in the latter end of the year 1724; and as it was soon followed by Peter's death, and Catherine upon her accession recalled Madame Balke, it has been suspected that she shortened the days of her husband by poison. But notwithstanding the critical situation for Catherine in which he died, and her subsequent elevation, this charge is totally destitute of the least shadow of proof; for the circumstances of Peter's disorder were too well known, and the peculiar symptoms of his last illness sufficiently account for his death, without the necessity of recurring to poison.

While Peter was yet lying in the agonies of death, several opposite parties were caballing to dispose of the crown. At a considerable meeting of many among the principal nobility, it was secretly determined, on the moment of his dissolution, to arrest Catherine, and to place Peter Alexievitch upon the throne. Bassevitz, apprised of this resolution, repaired in person to the empress, although it was already night. "My grief and consternation," replied Catherine, "render me incapable of acting myself: do you and Prince Menzikof consult together, and I will embrace the measures which you shall approve in my name." Bassevitz, finding Menzikof asleep, awakened and informed him of the pressing danger which threatened the empress and her party. As no time remained for long deliberation, the prince instantly seized the treasure, secured the fortress, gained the officers of the guards by bribes and promises, also a few of the nobility, and the principal clergy. These partizans being convened in the palace, Catherine made her appearance; she claimed the throne in right of her coronation at Moscow; she exposed the ill effects of a minority; and promised, that, "so far from depriving the great duke of the crown, she would receive it only as a sacred deposit, to be restored to him when she should be united, in another world, to an adored husband, whom she was now upon the point of losing."

The

Catherine.

The pathetic manner with which she uttered this address, and the tears which accompanied it, added to the previous distribution of large sums of money and jewels, produced the desired effect: at the close of this meeting the remainder of the night was employed in making the necessary preparations to insure her accession in case of the emperor's death.

Peter at length expired on the morning of the 28th of January 1725. This event being made known, the senate, the generals, the principal nobility and clergy, hastened to the palace to proclaim the new sovereign. The adherents of the great duke seemed secure of success, and the friends of Catherine were avoided as persons doomed to destruction. At this juncture Bassevitz whispered one of the opposite party, "The empress is mistress of the treasure and the fortress; she has gained over the guards and the synod, and many of the chief nobility; even here she has more followers than you imagine; advise therefore your friends to make no opposition as they value their heads." This information being rapidly circulated, Bassevitz gave the appointed signal, and the two regiments of guards, who had been gained by a largess to declare for Catherine, and had already surrounded the palace, beat to arms. "Who has dared (exclaimed Prince Repnin, the commander in chief), to order out the troops without my knowledge?" "I, (returned General Butterlin), without pretending to dispute your authority, in obedience to the commands of my most gracious mistress." This short reply was followed by a dead silence. In this moment of suspense and anxiety Menzikof entered, preceding Catherine, supported by the duke of Holstein. She attempted to speak, but was prevented by sighs and tears from giving utterance to her words: at length, recovering herself, "I come (she said,) notwithstanding the grief which now overwhelms me, to assure you, that, submissive to the will of my departed husband, whose memory will be ever dear to me, I am ready to devote my days to the painful occupations of government, until Providence shall summon me to follow him." Then, after a short pause, she artfully added, "If the great duke will profit by my instructions, perhaps I shall have the consolation, during my wretched widowhood, of forming for you an emperor worthy of the blood and the name of him whom you have now irretrievably lost." "As this crisis (replied Menzikof) is a moment of such importance to the good of the empire, and requires the most mature deliberation, your majesty will permit us to confer, without restraint, that this whole affair may be transacted without reproach, as well in the opinion of the present age as in that of posterity." "Acting as I do (answered Catherine) more for the public good than for my own advantage, I am not afraid to submit all my concerns to the judgment of such an enlightened assembly: you have not only my permission to confer with freedom; but I lay my commands upon you all to deliberate maturely on this important subject, and I promise to adopt whatever may be the result of your decisions." At the conclusion of these words the assembly retired into another apartment, and the doors were locked.

It was previously settled by Menzikof and his party that Catherine should be empress; and the guards, who surrounded the palace with drums beating and colours flying, effectually vanquished all opposition. The only circumstance, therefore, which remained, was to give a just colour to her title, by persuading the assembly that Peter intended to have named her his successor. For this purpose Menzikof demanded of that emperor's secretary, whether his late master had left any written declaration of his intentions? The secretary replied, "That a little before his last journey to Moscow he had destroyed a will; and that he had frequently expressed his design of making another, but had always been prevented by the reflection, that if he thought his people, whom he had raised from a state of barbarism to a high degree of power and glory, could be ungrateful, he would not expose his final inclinations to the insult of a refusal; and that if they recollected what they owed to his labours, they would regulate their conduct by his intentions, which he had disclosed with more solemnity than could be manifested by any writing." An altercation now began in the assembly, and some of the nobles having the courage to oppose the accession of Catherine, Theophanes archbishop of Plescoff called to their recollection the oath which they had all taken in 1722 to acknowledge the successor appointed by Peter, and added, that the sentiments of that emperor delivered by the secretary were in effect an appointment of Catherine. The opposite party, however, denied these sentiments to be so clear as the secretary chose to insinuate; and insisted, that as their late monarch had failed to nominate his heir, the election of the new sovereign should revert to the state. Upon this the archbishop farther testified, that the evening before the coronation of the empress at Moscow, Peter had declared, in the house of an English merchant, that he should place the crown upon her head with no other view than to leave her mistress of the empire after his decease. This attestation being confirmed by many persons present, Menzikof cried out, "What need have we of any testament? A refusal to conform to the inclination of our great sovereign, thus authenticated, would be both unjust and criminal. Long live the Empress Catherine!" These words being instantaneously repeated by the greatest part of those who were present, Menzikof, saluting Catherine by the title of empress, paid his first obeisance by kissing her hand; and his example was followed by the whole assembly. She next presented herself at the window to the guards and to the people, who shouted acclamations of, "Long live Catherine!" while Menzikof scattered among them handfuls of money. Thus (says a contemporary) the empress was raised to the throne by the guards, in the same manner as the Roman emperors by the prætorian cohorts, without either the appointment of the people or of the legions.

The reign of Catherine may be considered as the reign of Menzikof, that empress having neither inclination or abilities to direct the helm of government; and she placed the most implicit confidence in a man who had been the original author of her good fortune, and the sole instrument of her elevation to the throne.

During her short reign her life was very irregular; she was extremely averse to business; would frequently, when the weather was fine, pass whole nights in the open air; and was particularly intemperate in the use

Catherine. use of tokay wine. These irregularities, joined to a cancer and a dropsy, hastened her end; and she expired on the 17th of May 1727, a little more than two years after her accession to the throne, and in about the 40th year of her age.

As the deaths of sovereigns in despotic countries are seldom imputed to natural causes, that of Catherine has also been attributed to poison; as if the disorders which preyed upon her frame were not sufficient to bring her to her grave. Some assert that she was poisoned in a glass of spirituous liquor; others by a pear given her by General Diever. Suspicions also fell upon Prince Menzikof, who, a short time before her decease, had a trifling misunderstanding with her, and who was accused of hastening her death, that he might reign with still more absolute power during the minority of Peter II. But these reports deserve not the least credit, and were merely dictated by the spirit of party, or by popular rumour.

Catherine was in her person under the middle size, and in her youth delicate and well formed, but inclined to corpulency as she advanced in years. She had a fair complexion, dark eyes, and light hair, which she was always accustomed to dye with a black colour. She could neither read nor write: her daughter Elizabeth usually signed her name for her, and particularly to her last will and testament; and Count Osterman generally put her signature to the public decrees and dispatches. Her abilities have been greatly exaggerated by her panegyrists. Gordon, who had frequently seen her, seems of all writers to have represented her character with the greatest justness, when he says, "She was a very pretty well-looked woman, of good sense, but not of that sublimity of wit, or rather that quickness of imagination, which some people have believed. The great reason why the czar was so fond of her, was her exceeding good temper; she never was seen peevish or out of humour; obliging and civil to all, and never forgetful of her former condition; withal, mighty grateful." Catherine maintained the pomp of majesty with an air of ease and grandeur united; and Peter used frequently to express his admiration at the propriety with which she supported her high station, without forgetting that she was not born to that dignity.

The following anecdotes will prove that she bore her elevation meekly; and, as Gordon asserts, was never forgetful of her former condition. When Wurmb, who had been tutor to Gluck's children at the time that Catherine was a domestic in that clergyman's family, presented himself before her after her marriage with Peter had been publicly solemnized, she recollected and addressed him with great complacency; "What, thou good man, art thou still alive! I will provide for thee." And she accordingly settled upon him a pension. She was no less attentive to the family of her benefactor Gluck, who died a prisoner at Moscow; she pensioned his widow; made his son a page; portioned the two eldest daughters; and advanced the youngest to be one of her maids of honour. If we may believe Weber, she frequently inquired after her first husband; and, when she lived with Prince Menzikof, used secretly to send him small sums of money, until, in 1705, he was killed in a skirmish with the enemy.

But the most noble part of her character was her peculiar humanity and compassion for the unfortunate. Motraye has paid a handsome tribute to this excellence. "She had, in some sort, the government of all his (Peter's) passions; and even saved the lives of a great many more persons than Le Fort was able to do: she inspired him with that humanity which, in the opinion of his subjects, nature seemed to have denied him. A word from her mouth in favour of a wretch just going to be sacrificed to his anger, would disarm him; but if he was fully resolved to satisfy that passion, he would give orders for the execution when she was absent, for fear she should plead for the victim." In a word, to use the expression of the celebrated Munich, *Elle etoit proprement la mediatrice entre le monarque et ses sujets.*"

CATHERINE II. Empress of Russia, whose original name was Sophia Augusta Frederica, was the daughter of Christian Augustus of Anhalt Zerbst, a small district in Upper Saxony, and was born in the castle of Zerbst, on the 23d of May 1729. She was educated under the eye of her parents, along with her brother Prince Frederic Augustus, and at an early period displayed a masculine spirit. Elegant, majestic, and handsome in her person, her complexion exhibited the union of the lily and the rose, while a native dignity was tempered by a smile of beneficence. But it was early observed, that she concealed under this a certain austerity of disposition, and an ambition, which was even then considered as excessive, and proved afterwards to be insatiable.

She soon learned all the fashionable accomplishments of that day. In addition to her native language, she wrote and conversed in French; of music she acquired a competent knowledge, and excelled particularly in needlework, which she did not disdain to practise after her elevation to the throne.

The empress Elizabeth, who had pitched upon her nephew the duke of Holstein Gottorp Oldenbourg for her successor, was also desirous to choose a consort for him, and the princess of Anhalt Zerbst was selected upon this occasion, when only fourteen years of age. She was chiefly indebted for so unexpected an honour to the tender regard which her imperial majesty always entertained for the memory of her uncle, who had been her lover; and in an evil hour she united the fate of the prince, better known afterwards by the name of Peter III. to that of the princess of Anhalt Zerbst. In consequence of a special invitation, the future empress repaired to St Petersburgh, accompanied by her mother, and being admitted into the bosom of the Greek church, the ceremonial of marriage, after some delay, took place; on which these august personages were formally acknowledged, by her imperial majesty and the senate, as grand duke and duchess of Russia. Elizabeth, at the same time, presented them with the palace of Oranienbaum, delightfully situated on the gulf of Cronstadt, as a summer residence; this had formerly belonged to Menzikof, the favourite of Peter the Great, who, in this capricious court, had been by turns a pye-boy, a prince, and an exile.

The grand duke was far from being handsome; on the contrary, his person was disagreeable, and almost disgusting. His education had been greatly neglected, and he was passionately found of military parade. Frederick

Catherine. derick of Prussia was at once his friend and his model; he kept up a secret correspondence with that monarch at the time when Russia was at open war with him; he was accustomed in his cups to kneel before a picture of this hero; and after quaffing a bumper, he would exclaim, "My brother! we shall conquer the world together."

The first moments of this union seemed to be peculiarly auspicious. The illustrious pair were accustomed to withdraw themselves daily, as if desirous to enjoy the pleasure of each other's company, in preference to the giddy dissipation of a court. It was perceived at last, that grandeur was not incompatible with happiness, and that hymeneal felicity was not confined to plebeian life.

The empress hoped that the name and pretensions of Prince Iwan would be obliterated by the issue of the grand duke, and the whole empire impatiently wished for and now expected an heir to the throne of Peter the Great. It has since been discovered, that this young couple occupied their time in a far different manner than was then suspected! His highness, it seems, retired from society on purpose to perfect himself in the Prussian exercise, and his consort on these occasions participated in his diversions, for he was accustomed to make her stand for hours together, as a centinel, with a musquet at her shoulder. This species of entertainment did not altogether suit the disposition of a young princess of an ardent temperament, and her highness accordingly began, in her own language, to think "that she was made for something else." Although she did not love, she at this period governed her husband, and even concealed his foibles; imagining at first that she could not reign but by means of him, she wisely determined to make him appear worthy of a throne.

A marriage of eight years was not productive of any issue, and strange suspicions began to be entertained. This alarmed the court, for a formidable rival, who possessed a superior claim to the throne, still existed; it is true, he was in bondage, but in a country like Russia, the interval might not be long between a dungeon and a throne. The birth of a son and daughter, soon after this, put an end to all apprehensions of this kind, and tended not a little to give stability to the empire.

The grand duke, who at times discovered noble, and even magnanimous sentiments, had about this period formed a most unfortunate connection with Elizabeth Voronsoff, a lady of high rank, but neither celebrated for her beauty nor her talents. He seldom saw his consort in private, and all the hours that were not occupied either by military exhibitions, or the pleasures of the table, were entirely devoted to his mistress.

The grand duchess, on the other hand, is said to have spent much of her time in company with a young Pole, whose history, like that of Catherine's, has since been interwoven with the annals of Europe. This was Count Poniatowski, afterwards known as Stanislaus Augustus king of Poland. He was the third son of a grandee of the same name, the favourite of Charles XII. of Sweden, by the princess Ezatoryska, who boasted the possession of the noblest blood in Poland, as she traced her descent from the Jagellon, the ancient sovereigns of Lithuania. His person was of exquisite symmetry, his air noble, his manners agreeable; in short, he possessed a charming exterior, and his mind, a circumstance extremely rare, was no less graceful than his person. At this period he was in no higher station, than a gentleman in the suite of the minister plenipotentiary from England, who had formed an intimacy with his family during a former mission at Warsaw. Being now taught to look higher, he returned to his native country, and appeared soon after at Petersburgh, as ambassador from the king of Poland. In this new capacity he did not forget to pay his respects at the little court of Oranienbaum, and the young plenipotentiary, with a view of ingratiating himself with the grand duke, smoked, drank, and praised the king of Prussia. At length Paul Petrowisch received the Polish minister with coolness, and he was actually forbidden to visit at the palace. This, however, it is said, did not deter him from concealing the order of the white eagle, and disguising himself as a mechanic, under which assumed quality he repaired one summer's evening to the gardens, in the neighbourhood of the gulf of Cronstadt; but he was discovered by his highness, who ordered him to be brought before him, and, after affecting to reprimand the captain of his guard for his disrespect to the representative of a crowned head, told him he was at liberty to depart.

From this moment the grand duchess is said to have changed both her system and her conduct. She had formerly aspired only to direct the counsels of the future emperor; she now resolved, if possible, to obtain the crown for her son, and the regency for herself. Such a task would have discouraged a common mind, for it was impossible to achieve this without prevailing on the empress to consent to dethrone her own nephew. Bestuchef, the grand chancellor, who hated the heir apparent, joined cordially in their scheme: and Elizabeth, who herself had obtained the crown by means of a revolution, was taught to tremble for her life, in consequence of the designs of her successor, who was represented as having resolved to shorten her days by poison. But a sudden and unexpected revolution in the ministry put an end to these intrigues; for Bestuchef was driven into exile, and Poniatowski recalled.

A long and melancholy interval now ensued, during which the ambition of the grand duchess was rather suspended than annihilated. She, however, had recourse to, and soothed her anguish by means of books; it was in her study that she laid the foundation of her future greatness, and rendered herself in some measure deserving of a throne. During her leisure moments she found means to gain partisans, and she acquired the favour of the soldiery, who did duty around her person, by means of her liberality and condescension. Peter, on the other hand, to the personal exertions of a common soldier, added the orgies of a debauchee. Surrounded by his male and female favourites, he consumed whole days and nights in intoxication, and forgot that he was a prince. There were some few moments, however, when he appeared great, and even magnanimous, but unfortunately they were of short duration; and it was his misfortune to have a weak woman for his mistress, and an able and ambitious one for his wife.

Such was the situation of the court when Elizabeth died, on the 5th of January 1762. This event, so productive of interesting effects, had been long foreseen

 by

Catherine. by Catherine, who now began to act a more conspicuous part on the theatre of public affairs. Her sorrow, which appeared unbounded, was only equalled by her devotion. She was constantly employed either at her prayers in the cathedral, or occupied in public processions, during which she scrupulously adhered to all the ceremonious practices of the Greek church. The courtiers were astonished at the sudden change, and affected to survey it with contempt; but it imposed on the populace, and the priests were highly gratified with the zeal of the empress, more especially as her consort had always treated their mysteries with indignity.

Another design, meditated with no less art, proved unsuccessful. She is said to have made use of all her eloquence to persuade Peter, that he ought to leave off the barbarous custom of being proclaimed emperor by the army, in the same manner as his predecessors: instead of this, she proposed that his title should be recognised by the senate alone, and produced a speech which she herself had composed for the occasion; but Godowitz, one of the favourites, and the only friend of the new sovereign, perceived the snare, and, partly owing to his entreaties, and partly from an attachment to every thing military, the soldiery were as usual gratified with the ceremony of saluting the czar.

The grand duke now ascended the throne, by the name of Peter III. and the commencement of the new reign appeared to be peculiarly auspicious. The catastrophe, which terminated a short reign of six months, may be attributed to three apparently trifling, but, in reality, irretrievable errors; for it is allowed on all hands, that if they did not constitute the original cause, they at least afforded the pretext for his dethronement and murder. The first of these was, the sudden peace with, and marked predilection for, the king of Prussia, certainly the greatest monarch of his age; the second, an attempt to reform a barbarous and fanatical clergy, whose power Peter I. had curbed, but whose persons he still affected to consider as sacred; the third was, the war against Denmark.

Let it be recollected, however, in honour to his memory, that the young monarch, immediately after his elevation, threw open the state prisons, recalled Munich, Biron, Lestock, and several others, who had offended him during the late reign, from Siberia; that he limited the despotism of his officers, abridged his own power, by abolishing a state inquisition, exercised under the name of *the Secret Council of Chancery*; and that he framed the memorable decree which enfranchised the nobles from compulsive service in the army, and permitted them to travel without the royal permission.

The following answer to a letter from the king of Prussia, who had requested him to be on his guard against the plot then meditating, conveys no unfavourable opinion of his heart.

"Touching the interest you express for my safety, I request you will rest contented. I am called the father of my soldiers—they prefer a male to a female government. I walk alone constantly in St Petersburgh—if any mischief is meditated, it would have been effected long since; but I am a general benefactor. I repose myself on the protection of heaven; trusting to that, I have nothing to fear."

This false security proved his ruin. While his mind was occupied with plans of reform, and he aspired to rival, and even to excel, his illustrious predecessor, whose name he had assumed, a person who had sworn fidelity to him at the altar, and who owed allegiance by the double ties of a wife and a subject, was actually employed in planning a conspiracy, and organizing a revolt, against him. It has been said that he intended to have shut up his consort and son in a convent. But did a meditated imprisonment justify treachery, treason, and murder? On the other hand, it is known that, so far from this being the intention of Peter, he was preparing for a journey to Holstein, and had actually empowered his consort to act as regent during his absence.

The mistakes of the emperor did not escape the eagle eyes of his enemies. He purposed to carry his guards into Holstein, with a view to recover the possessions wrested from his ancestors. The regiments that had hitherto done duty at the palace, and were inured to the indulgences of the capital, revolted at the idea of a foreign war: they had been accustomed to be governed by women, and they were taught to fix their eyes on the consort of the czar.

It is not the least wonderful part of her conduct, that previously to the great catastrophe now meditating, Catherine contrived to appear abandoned by all the world. She knew how interesting a female, and more especially an empress, appeared while in distress: and she took care to heighten the sensibility of the public, by bursting at times into a flood of tears. This artful woman had found means to attach many persons to her destiny: it must be owned, however, that her adherents were neither so powerful, nor so numerous as to afford her any well-founded hopes of success. She had gained several subalterns, and some privates, of the guards: but her principal partizans consisted of the Princess D'Aschekof, niece to the new chancellor: Prince Rozamouski, who had risen from obscurity, having been originally a peasant; Odart, an intriguing Italian; and Panin, governor to the grand duke. The arrest of Passick, one of the conspirators, seemed to lead to a discovery, which would have proved fatal to the malcontents; but this very circumstance induced them to declare instantly, and in the end crowned an apparently rash attempt with success.

The empress, who was asleep at the castle of Petershoff, received intimation of their design by a common soldier, who soon after returned with a carriage and eight horses. On the faith of this man, and accompanied only by a few peasants, a German female domestic, and a French valet de chambre, she arrived at eight o'clock in the morning in the capital, and stopped opposite the barracks of the regiment of Ismailoff. There she addressed the soldiers in an eloquent speech, intermingled with sighs and tears, and actually found means to persuade them that she and her son had but that moment escaped from the hands of assassins, sent by the emperor to murder them. This story, by agitating the passions of the troops, had a wonderful effect on them, and they all swore, with the exception of only one regiment, to die in defence of her and the young archduke. On this the empress ordered a crucifix to be brought, and commanded the priests to administer a new oath of allegiance. She afterwards repaired to one of the principal churches, where she was met

Catherine. met by the bishop of Novogorod and the clergy, and, having returned thanks to Almighty God, ascended a balcony, and presented her son to the people. In a few hours she was again seen, dressed in the uniform of the guards, riding at the head of a numerous and well-appointed army against her husband.

That unfortunate prince first made a shew of resistance, and manned his Lilliputian batteries, at Oranienbaum, with his Holstein guards, in order to oppose what appeared to him to be a contemptible sedition. When it was too late, he attempted to get possession of Cronstadt. He might still have escaped to Revel, but the women in his galley were apprehensive of danger, and the courtiers shuddered at the proposition of old Munich, who wished them to assist the sailors in rowing.

On the first intelligence of the plot, this intrepid warrior had repaired to his benefactor, and advised him to march directly to the capital, at the head of his German troops." "I shall precede you, (said the generous veteran), and my dead body shall be a rampart to your sacred person." But, on the other hand, the emissaries of the empress, bathing his hands in their crocodile tears, deprecated resistance, magnified the danger, and invited him to repose in the inviolable fidelity of his consort. In short, on the 14th of July 1762, he was taken prisoner by the orders of his own wife, to whom he had been married 14 years, prevailed on by the threats and intreaties of Count Panin to renounce his crown, conveyed to the castle of Robscha, and three days afterwards put to death. Of the titled minions, who perpetrated this daring murder, one carried the guilty marks of the czar's scymitar on his forehead to the grave, and another, tortured for years by the remembrance of the last bloody scene in the tragedy of his expiring sovereign, exhibited a shocking spectacle of insanity and remorse.

The empress, on her assumption of the now vacant crown, notified the event to all the courts of Europe, under her new name of Catherine Alexiewna II. But there was still a competitor for the empire, and suspicion never slumbers near a throne. This was Prince Iwan, son to the princess of Mecklenburgh, and grand nephew to Peter the Great, and the empress Anna Iwanowna, who had destined him for her successor; but in consequence of a former revolution, he was seized while yet an infant, and doomed to lead a life of captivity. During 18 years of precarious existence, he had been shut up in the castle of Schlusselbourg, and never in all that time did he breathe the open air, or behold the sky, but once. This prince was visited by Peter III. who finding him in an arched room, 20 feet square, determined to set him at liberty; but, alas! the youth, in consequence of his long and solitary confinement had been deprived of his senses. In this situation, the emperor determined to build a house for him, with a convenient terrace, where he might take the air daily within the fortress. Such, however, are the changes of fortune, that, in three weeks, he himself was also precipitated from a throne, and exposed to a violent death. This event was but the prelude to that of Iwan; for, as orders had been given, in case of an attempt to rescue him, that an end should be put to his life; and a real or pretended plot having been hatched for this purpose, the motives and details of which have hitherto been involved in the most profound obscurity, the unhappy prince experienced the same fate as his generous protector. Catherine.

Catherine being now firmly seated on the throne, wisely determined to divert the thoughts of the nation from the late horrid scenes, and fix them on more agreeable objects. Having soothed Prussia, acquired a preponderance in the cabinet of Denmark, long become an absolute monarchy, and entered into a league with the popular party in Sweden, not yet bereft of its liberties, she cast her eyes on Courland, then governed by Prince Charles of Saxony, the second son of Augustus III. king of Poland; and, finding that country admirably situated for the increase of her present, and the extension of her future power, she, in 1762, expelled the lawful sovereign, and invested Biron, a creature of her own, with the ducal cap. Not content with this, the new duke, soon reduced to the most abject dependence, was prevented from resigning his precarious power, and the states assembled at Mittau were actually interdicted from nominating a successor. This, however, was only a prelude to far greater scenes, for she had hardly dethroned one sovereign before she undertook to create another. Augustus II. or, as he is called by some, Augustus III. of Poland, having died at Dresden, in 1763, her imperial majesty did not let slip so fair an opportunity for interfering in the appointment to the vacant throne, and even placing one of her dependents on it. Count Poniatowski, on the elevation of Catherine, had sent a friend to Petersburgh, to sound the disposition of the empress about his return to that capital, where he naturally hoped to participate in her power, and bask in the sunshine of the royal smiles. But the more prudent German, who was at this very moment meditating a splendid provision for him elsewhere, prohibited the journey from political motives. Accordingly, notwithstanding the opposition of the grand chancellor Bestucheff, and indeed of all her ministers, she determined to invest him with the ensigns of royalty. The head of the house of Brandenburgh, swayed by his hatred to Saxony and Austria, or, what is still more likely, the Prussian eagle having perhaps, even now, scented his future prey, Catherine was enabled to send 10,000 men into Poland, who, encamping on the banks of the Vistula, overawed the deliberations of the diet, assembled on the 9th of May 1764, and placed Stanislaus Augustus on the throne. Thus, by the appearance of a camp filled with Russian mercenaries, was violated one of the fundamental laws of the commonwealth, established ever since the time of Sigismund Augustus, two centuries before, in consequence of which the election of a king is deemed void while there are any foreign troops within the territories of the republic; and so justly jealous were the ancient Poles of their national independence, that the marshal of the diet, on those occasions, was accustomed to request all ambassadors to absent themselves, as he could not be answerable for the safety of their persons.

Having conferred the crown of Poland, September 7. 1764, on an amiable and accomplished prince, who, on account of his youth, his poverty, and even his dependence on Russia, would have been excluded from that painful pre-eminence had the free suffrage of the nation been collected; and who was, in consequence of

Catherine. of the hatred of his countrymen, still more subjected to the dominion of the empress, she began to prepare for a war against the Turks, which was accordingly declared in 1768. During this contest the Greek cross was triumphant both by sea and land. On the first of these elements her fleet, under Count Orloff, entered the straits of Gibraltar, and carried terror and desolation among the islands in the Archipelago, and throughout the defenceless shores of Asia Minor; on the second, her armies, under Galitzen and Romanzoff, achieved many important victories, seized on the fortress of Choczim, and prevailed on the Greek inhabitants of Wallachia and Moldavia to acknowledge her as their sovereign.

In the mean time, however, a dangerous insurrection broke out in the heart of her dominions, instigated by a Cossack of the name of Pugatscheff, who pretended to be Peter III. After displaying great valour and considerable talents, which had enabled him, at the head of raw and undisciplined levies, to contend against veteran troops and experienced generals, this unfortunate man was at length seized, inclosed in an iron cage, and beheaded at Moscow on the 21st of January 1775.

A peace had been concluded on the 21st of July, in the preceding year, with the Porte, which proved highly honourable to Russia; but it was prodnctive of little benefit, for the liberty of navigating the Black sea, and a free trade with all the ports of the Turkish empire, which would have afforded inestimable advantages to a civilized people, was scarcely of any consequence to a nation unacquainted alike with commerce and manufactures.

Accordingly, we find her imperial majesty still unsatisfied. Ambition, which in a female bosom is ever insatiable, stimulated her to attempt new acquisitions, and we learn with astonishment that her diplomatic artifices proved infinitely more hostile to the Turkish crescent, than even her victorious arms. Scarcely had four years elapsed, when, after an armed negotiation, a new treaty of pacification was agreed to by the reluctant sultan, on the 21st of March 1789, in consequence of which the Crimea was declared independent: an event not calculated to close ancient jealousies, but on the contrary to produce fresh dissensions, as it afforded an opening into the very heart of the Turkish empire, and a ready pretext for future interference. New claims and new concessions immediately followed. Russia insisted on establishing consuls in the three provinces of Moldavia, Wallachia, and Bessarabia, which she was accordingly permitted to do by the treaty of 1781. Mortifying as this compliance was, it produced but a short respite. The emperor Joseph was now brought upon the political stage, and the Roman and Russian eagles, after hovering over the carcase of the Turkish empire, and meditating to devour the whole, were at last content with a part of the prey. The empress, as it may be readily believed, was not inattentive to her own interests; and by the treaty of Constantinople, signed January 9. 1784, to Russia was ceded the entire sovereignty of the Crimea, which then received its ancient name of Taurica, the isle of Taman, and part of Cuban.

It was now in the 58th year of her age, and the 25th of her reign, that Catherine may be said to have attained the very summit of her wishes. There was no one who pretended to the throne, unless her son Paul Petrowitz, an amiable prince, who had attained his 33d year, without displaying the least symptom of ambition, and who besides was superintended with the most watchful jealousy. She had triumphed over a nation, supposed to be the *natural* enemy of Russia, both by arms and negotiations, and she dazzled her barbarous subjects with the blaze of her glory, for they were eager to forget her errors, in order to contemplate a grandeur which soothed their national vanity. Knowing the effect of splendour upon ignorance, she ushered in the year 1787 with a brilliant journey to Cherson. Accompanied thither at once by a court and an army, with foreign ambassadors, an emperor and a king in her train, she intended to have assumed the high-sounding titles of Empress of the East, and Liberator of Greece. At Kiow, where she remained during three months, she was received under triumphal arches, and, having heard the petitions of the deputies from distant nations, and extended the walls of that city, she inscribed, with an arrogant anticipation, the following motto, in Greek characters, on the quarter next to Constantinople: "Through this gate lies the road to Byzantium."

Scarcely, however, had the empress, after visiting Moscow, returned to her capital, than the Turk thought proper to declare war. Her majesty, long since prepared for an event which was far from being displeasing, called forth the stipulated succours of her ally the emperor; and the combined army under the prince de Cobourg made itself master of Choczim, at the end of a siege of three months. Oczakow, after a still more obstinate resistance, was taken by storm, by the Russians alone. A diversion, however, was made by the king of Sweden, who, subsidized with Turkish gold, and directed by Prussian counsels, fought his own battles at the expence of his ally. But the exertions of this monarch were principally confined to the indecisive naval actions of Stoogland, in which both parties claimed the victory, and this was soon after followed by a convention for peace.

Disembarrassed from an active, if not a powerful enemy, the empress no longer confined her conquests to the course of the Danube, but crowned the campaign with the capture of Ismael, which was taken by storm on the 22d of December. On this occasion Suwarrow, one of her favourite generals, displayed a horrid mixture of courage and cruelty, and thus proved, to a demonstration, that personal bravery is far from being incompatible with the deadliest revenge. Incensed at the gallant resistance of the Turks, like Cæsar, he snatched a standard from a subaltern, and planted it with his own hand on the walls of the city; like Sylla, he doomed the vanquished to experience a bloody proscription, and upwards of 30,000 men, women, and children, if we are to credit the boastful account of the barbarians themselves, perished by the sword and bayonet of the unsparing Russians.

Instead of regaining the Crimea, as had been expected by the sultan, the fortress of Oczakow, and all the territories between the rivers Bog and Dniester, were assigned to the empress, who now found herself nearer

Catherine. nearer to that Byzantium, on which she had so eagerly fixed her eye, by a whole campaign, than at the commencement of hostilities.

Having concluded a final treaty of peace with the Turk, on the 9th of January 1792, by which the river Dniester became the boundary of the two empires, and was to be navigated by both, the empress had more time to apply her attention to European politics. Part of Poland had been dismembered and partitioned during the year 1772, not only in contravention to the general rights of nations, but in direct opposition to the most solemn treaties on the part of Russia, Prussia, and Austria. The revolution which took place in that ill-fated country on May 3. 1791, and which afforded the prospect of a happy and stable government to the remains of the republic, was the signal of its annihilation. The imperial and royal spoilers seized this opportunity to fall once more in concert on their prey, which they forced to expire under their talons; and they have since cut it into shares, and attempted to disfigure it by new names, lest it should one day be reclaimed by the lawful owners. After this insult to humanity, Stanislaus, whom posterity may acknowledge as an unfortunate, but surely not as a great king, was forced soon after to abdicate, and allowed to retire into obscurity with his mistress, his children, and a pension.

Another great object had for some time engaged the attention of Catherine and her cabinet. This was the French revolution; an event pregnant with consequences that involved the claims, or, more properly speaking, the existence of all the sovereigns of Europe. With a treasury nearly exhausted by the war with the Ottoman Porte, which was not then terminated, and at a distance from the scene of action, the empress could not well engage in the contest; but she readily entered into the coalition, and soon after subsidized her late enemy the king of Sweden; but that enterprising prince met his fate, on the night of the 16th of March 1792, by the hand of an assassin.

Notwithstanding this sinister event, the head of the Greek church, compassionating the fate of the pretended father of the Christian world, promised to exert herself for the restoration of Avignon to the holy see. She also launched forth a menacing manifesto against France, and prepared for a new war.

The empress has hitherto been contemplated in her public character. It may not be amiss now to fix our eyes on the individual; to pay some attention to the sex of the sovereign, and, viewing majesty as it were in an undress, behold the woman lurking behind the princess.

It might have been supposed, that in the neighbourhood of the Hyperborean regions, the passions, if not dormant, would be at least moderate, and that the men would consequently be temperate, and the women chaste. The contrary, however, is the case; and it is left to the philosopher to determine, whether the double windows and heated rooms of St Petersburgh, added to an affectation of oriental manners, be not to the full as critical, in respect to female virtue, as the climate of Naples and Turin. Certain it is, however, that, during the reign of Catherine II. no remarkable increase of indecorum took place, and that any occasional indiscretions appear to have made but little impression on the public mind.

Count Gregory Orloff, distinguished in Russia by the appellation of Gregorevitsch, was one of the handsomest men in the north. Gratitude and affection both conspired to procure him a favourable reception at court: and from an obscure condition he soon rose to the highest offices of the state, which he, in fact, governed. His opinion in the cabinet was listened to with deference, and he was invested with the supreme military command. Still higher honours awaited him. The empress-queen was solicited to grant him a diploma of prince of the empire; it was next in contemplation to decorate him with the titles of Duke of Ingria and Carelia, and the chancellor Bestucheff actually proposed to the empress that he should be admitted as the partner of her bed and throne. But this scheme was blasted by the interference of Count Panin; who, not content with his own remonstrances, invoked the interposition of Razumoffsky and Vorontzoff, and found means to divert Catharine from her purpose.

Soon after this the conduct of Orloff began to give dissatisfaction; for he absented himself from court; went but seldom to the palace; resided principally in the country; and, being extremely addicted to hunting, dedicated whole weeks to the chace of the bear Panin, who had frequently experienced his arrogance, deemed this a happy opportunity to procure his disgrace. He accordingly introduced a young officer named Vissensky, who, being directed by the artful minister, behaved in such a manner as to give reason to believe that he would soon reign uncontrolled. Pride, however, on this occasion supplied the place of affection, and Orloff suddenly altering his conduct, his rival was dismissed with superb presents, and invested with an employment that required his residence in a remote province.

A new favourite soon after made his appearance in the person of Vassiltschikoff, a subaltern in the guards, and advantage was taken of the absence of Orloff to introduce him at the hermitage. This officer was young and handsome; but nature, which had been lavish to his person, seems to have been at no pains with his mind. He was immediately appointed chamberlain to the empress, enriched with splendid presents, and treated with the most flattering attention. In the mean time Gregorevitsch, who had been appointed to treat with the Turkish plenipotentiaries relative to a peace, on hearing of this unexpected event, instantly returned to the capital from Fokshiani, but was arrested at the gates of Petersburgh, and stripped of all his employments. He, however, experienced the imperial bounty, and received, as a recompense for his submission, the sum of 100,000 rubles in hand, a pension of 150,000 more, a magnificent service of plate; and, to crown the whole, an estate, with 6000 peasants upon it, was made over to him.

Vassiltschikoff, during 22 months, enjoyed all the distinction belonging to the reigning favourite; but at the end of that period he also found occasion to lament the inconstancy of fortune. This young man had conducted himself with great prudence, for he had never abused his influence. He possessed none of that haughtiness so common to upstarts; and he did not appear

Catherine. pear eager to increase his own fortune, or to diminish that of his rivals. Such was his moderation, that, as his elevation excited no envy, so his disgrace was unaccompanied by exultation. His faults are still unknown; and most probably he had ceased to please. His retreat, however, was accompanied by every mark of respect; and, as he repaired to Moscow, the place of his destined exile, he received presents, on his journey, which might be styled imperial on account of their magnificence.

No sooner was this change made public than Orloff appeared once more on the scene, and was readmitted to all his former influence. Supposing Panin to be the cause of his late exile, he extorted a promise from his royal mistress to dismiss him from his employments. Her assent was given with reluctance; and the prayers of the grand duke, who was too generous to suffer his preceptor to fall a prey to the suspicions of a man he did not love, induced her to revoke her intentions.

In the mean time the manly air and elegant appearance of Potemkin made a great impression on an illustrious personage. This officer had been bred in the guards; and, perceiving on that memorable day when the empress, mounted on a fine charger and dressed in regimentals, exhibited herself at the head of the troops, that she had forgotten to place a plume in her hat, he snatched this decoration from his own, and presented it to the new sovereign. Neither this action, nor the grace with which it was performed, had escaped unnoticed; and the time was now arrived when his attachment was to receive an ample remuneration.

The post of favourite is almost peculiar to Russia, and was during many years considered an *official employment*. Ever since 1730 the nation had been governed by women, except during the short and unfortunate reign of Peter III. In fine, it seemed to be sanctioned, if not by a fundamental law of the empire, at least by prescription; as four empresses had successively consecrated it by their practice, and the age of the last Elizabeth made it be considered in some measure as a mere appendage to imperial grandeur.

Potemkin soon grew giddy with success, and his pride and presumption keeping pace with his elevation, he accordingly exposed himself to a number of disagreeable events. Boasting one day of the extent of his power in presence of Count Alexis Orloff, the brother of his predecessor, he received a blow which deprived him of an eye; and Prince Gregory Orloff having requested his dismission, he was forced to repair to Smolensk, at once the place of his nativity and exile. Such was his vexation, partly from the loss of his eye, and partly from his disgrace, that he actually entertained some idea of turning monk; but a submissive letter produced his recal; and from that moment he seemed to have dropped all thoughts of the cowl.

Ambition now appears to have taken complete possession of the bosom of Potemkin; and this was amply gratified, for his influence soon extended to every department of the state, and he himself, after procuring the dismission of Count Zachar Chernicheff, became vice-president at war, with a seat in the council. But his aspiring hopes were not yet gratified, for he entertained still higher expectations.

With a view to the accomplishment of these, he affected to be once more seized with a fit of religion. and kept Lent with great strictness, living upon roots and water during that holy season. He also wearied all the saints in the Greek calendar with his prayers; went daily to confession, and having selected on this occasion the same priest that afforded absolution to a great personage, he besought him to inform her, that his alarmed conscience could no longer permit him to indulge in an intercourse, which, by marriage alone, would cease to be criminal.

This project, however, failed of success; and, soon after the empress's return to Petersburgh (for it was at Moscow that it had been first conceived), a young man from the Ukraine, of the name of Zavadoffsky, was honoured with the imperial countenance, while the haughty Potemkin received the customary intimation, "that he must prepare to travel." Potemkin did not dare to disobey, but he evaded the order; for, setting out in great form, he proceeded a few miles towards the place indicated for his exile, but returned in the course of next day, and placed himself in the evening exactly opposite to the empress as she was about to sit down to whist. Every one expected to behold some signal mark of the imperial displeasure; but, on the contrary, Catherine, handing him a pack of cards, desired the ex-favourite to cut in, observing that he had always been a fortunate player. His posts, his honours, his influence, were all restored to him, and he now occupied a new situation about the person of her imperial majesty, for he became her friend.

In the mean time the bosom of the humble Zavadoffsky began to catch the flame of ambition; and, as he was jealous of the grandeur of Potemkin, he aimed a deadly blow at his consequence. But the minister at war, become wily in his turn, warded it off, and made it recoil on the head of his rival. Perceiving a handsome young Servian officer of hussars, of the name of Zoritch, who had repaired to Petersburgh in search of promotion, he presented him with a captain's commission, and in a few days he was perceived behind the chair of the empress. A large estate, the rank of major-general, and an immense sum of money, soon became the appanage of this fortunate youth; but the empress perceiving that he was ignorant, and being disgusted at his want of accomplishments, recommended, as he could speak no language but that of the Russian boors, that he should be sent abroad for improvement.

Fortune seems to have been in a playful mood when she elevated Rimsky Korzakoff to the post of chamberlain, and successor to the Servian. This man had actually been a serjeant in the guards; he was now proclaimed aid-de-camp general to the empress, and presented with the palace of Vassiltschikoff.

He proved to be a vain upstart, whose dress exhibited a profusion of diamonds, and whose conduct was such as could not fail to involve him in ruin. This speedily occurred; for, being detected in a secret correspondence with a lady, she was banished from court, and he was obliged to repair to Moscow.

The same day that beheld his disgrace witnessed the good fortnne of Laskoi, a Pole by descent, and an officer of the body guards by profession. The education of this young man had been neglected; but this defect was in some measure remedied by the zeal and attachment of an illustrious personage, who superintended

Catherine.

tended his improvement; and in a short time he became as remarkable for the superior elegance of his manners, as the graces of his person: but, while in the flower of youth, and the very height of his favour, he was attacked by a mortal disease, which cut him off after a short illness. He died in the arms of his mistress, who was inconsolable on the occasion, and refused to take any sustenance during three whole days. A mausoleum, the plan of which was sketched out by an English artist, attested the respect of the empress, who burst in tears on seeing it two years after. His fortune he had bequeathed to her imperial majesty, but she presented it, with her accustomed generosity, to the sister of this handsome youth.

The next person who aspired to the post of favourite was a young man educated in Scotland, and who had become a fellow of the Royal Society of London. This was Prince Dashkoff, son to the celebrated princess of the same name, who had participated in the memorable revolution that levelled Peter III. with the dust. A lieutenant of the name of Yermoloff anticipated him, however, in this post, to which he was raised by the interest of Potemkin; but, proving ungrateful to his benefactor, he was suddenly disgraced, being replaced by Momonoff, who attended her imperial majesty during her journey to the Crimea. He fell in love, however, with a lady of the court; and no sooner was the empress informed of this circumstance, than she insisted on his marrying her immediately; after which they were sent into exile at Moscow.

Plato Zuboff, an officer of the horse guards, supplied his place. This aspiring young man, not content with wealth and honours, affected public employments; and it is asserted that the idea of the second division of Poland originated with him. In a short time he became omnipotent at Petersburgh. He was decorated with the title of prince; received the post of grand master of the artillery; all the admirals, generals, and ministers of the empire, were to be seen at his levee, bending lowly before him, and, if we are to believe the author of a work of some reputation, paying their compliments, at the same time, in great form, to his favourite monkey.

Catherine hitherto had only afforded empty promises to the enemies of France: but, at the instigation of Zuboff, she now formed the design of giving effectual assistance to the confederated kings; and, as a proof of her intentions, issued orders for a squadron of men of war to join the English fleet, and commanded a levy of 60,000 troops. She at the same time prosecuted a war on the frontiers of Persia, where her army, under the command of a near relation of the grand master of the artillery, had experienced a most humiliating defeat; and she was now preparing to send fresh succours to his assistance.

Such were the projects that occupied the mind of Catherine, the overthrow of the French republic, and the subjugation of the distant Persians, when she was smitten by the hand of death. This fortunate princess had hitherto enjoyed an almost uninterrupted state of good health during the whole of her long reign. She was sometimes, indeed, subject to a colic, and her legs were now and then observed to swell; but neither of these symptoms were alarming.

On the morning of the 9th of November she rose at her usual hour, and breakfasted on coffee, according to custom. Some time after she retired to her closet; and her long absence affording cause of suspicion to her attendants, they entered the apartment, and found her lying speechless. Dr Rogerson, her physician, being sent for, he treated her disease as an apoplexy, and considerable relief seemed to ensue after the application of the lancet. But the empress never entirely recovered her senses; and did not utter a single word during the remainder of her life, which was prolonged till ten o'clock in the evening of November 10. 1797.

Thus, with her usual good fortune, after a very short illness, died Catherine II. empress of all the Russias. During her youth she had been extremely handsome, but she got fat as she increased in years; she, however, preserved a certain air of gracefulness, intermingled with dignity, until the last moment of her life.

Her majesty in person was not above the middle size; but, being well proportioned, and carrying her head high, she appeared tall. Her forehead was open, her nose aquiline, her mouth agreeable, and her chin, without being ugly, was rather long. Her hair, in which she took great delight, was auburn, and her eye-brows dark and thick. Her eyes, according to some, were blue, whilst others insist that they were of a brown hue. Upon the whole, her physiognomy was not deficient in expression; but she had such a command of her countenance, that no one could there discover the secrets of her heart.

Her imperial majesty was accustomed, on great occasions, to dress in a splendid manner, and to wear a profusion of jewels. Being particularly fond of diamonds, she possesed a prodigious number; and one in particular was the largest that ever had been seen in Europe. Catherine, however, was accustomed in general to affect the ancient Russian fashions, for the most part wearing green, out of compliment to the nation. Her hair was powdered but slightly. On the other hand, her face was covered with rouge; and as her imperial majesty, like the ladies in the French court, wore it in proportion to her rank, it is not to be wondered if it was of a high colour.

The strictest temperance was regularly preserved by Catherine, in a country, and at a court, where a little deviation would not have given occasion to much scandal. A slight breakfast, a moderate dinner, and two or three glasses of wine (for she never indulged in supper), constituted her usual diet.

It is far more easy to describe the empress than the woman. The acts of the former have now become history, but those of the latter must be left to the pen of genius, that can analyze the springs of human action.

It must be confessed that both she and the empire appear to have been frequently a prey to favouritism; and this part of her conduct, by being connected with the happiness of millions of her subjects, is highly censurable.

As a sovereign she stands conspicuous. She increased the extent of Russia, and added not only new countries, but new nations, to that mighty empire. As a conqueror, her victories were numerous and brilliant: she triumphed equally by sea and by land, and had she lived but ten years longer, might have realized the

Catherine. the proud dream of her ambition, and beheld her grandson Constantine sitting on the throne of the Ottomans. Her merit as a legislator, too, is great; but she would have been far more worthy of our admiration, had she effected the generous idea of enfranchising all the peasantry of her immense dominions.

She was the only sovereign of Russia who ever exhibited a taste for letters. This was not all; she was an author herself, and did not disdain to compose little treatises for her grandchildren, whose education she superintended.

For music she also possessed an exquisite relish, and brought Gabrielli, and a number of singers of great note, from Italy, allowing them liberal salaries, and treating them with great attention. Throughout the whole of her long reign Catherine also evinced a marked predilection for painting. In the midst of a war with the Turks she purchased pictures in Holland, to the amount of 60,000 rubles, all of which were lost in consequence of a ship's being wrecked on the coast of Finland. This, however, rather served to stimulate her to fresh exertions, and her agents accordingly procured whatever was to be found in Italy worthy of notice. The Houghton collection from England was also transferred, by an act of her munificence, to the shores of the Baltic; and, while it added to her glory, disgraced this nation in the eyes of foreigners.

Her conduct to learned men was truly worthy of a woman of genius. She was proud of the correspondence and friendship of Voltaire; she invited Diderot to her court, and lived with him, while there, in habits of the utmost familiarity; to D'Alembert she looked up as to a superior being, and endeavoured, although in vain, to seduce him to reside at St Petersburgh; but he possessed a haughty soul, was devoted to liberty, and would not consent to degrade the mind of a freeman, by residing among a nation of slaves.

To the honour of Catherine, she was extremely attentive to the education of her people, and instituted a prodigious number of schools for their instruction. To remove their prejudices against inoculation, she herself submitted to the operation, and thus hazarded her life for her nation. Amidst the schemes of grandeur, the allurements of power, and the gratification of the passions, she found leisure to civilize and instruct her subjects: this added not a little to her glory, as it contributed to the benefit of so large a portion of the human race; but it will insensibly operate against a despotic government, by rendering the boors unfit for their chains, which they will some day break, perhaps, on the heads of the boyars, who at once enslave and oppress them.

No woman could so easily forgive; and in this point of view her conduct must be allowed to have possessed a great share of magnanimity. She generously pardoned old Munich and Godowitz, the one the counsellor, the other the favourite of Peter III. She even admitted the former of these into her confidence, and would have conferred honours and preferments on the latter; but he loved his late sovereign, and with a noble scorn spurned at the proffered friendship of his successor. To the mistress of Peter III. although her own rival, she granted her life, restored her fortune, and at length admitted her daughters to honourable situations at court.

No personage in our own times has attracted a greater share of censure and eulogium than Catherine; and no woman in any age ever exhibited more of the masculine greatness of one sex, and the feminine weakness of another. As a female, she appears at times the slave of passion, and the puppet of her courtiers; but while we behold her diminishing, in this point of view, into insignificance, we look again, and contemplate the *sovereign*, towering like an immense colossus, and with one foot placed on Cherson, and another at Kamtschatka, waving her iron sceptre over the subject nations, and regulating the destiny of a large portion of mankind.

The frailties, however, of the woman will soon be forgotten, while the glory that encircles the brows of the legislator and conqueror will long continue to dazzle the eyes of an admiring world. The present age, however, shudders at the untimely fate of Peter and of Iwan, and posterity will not easily pardon the degradation of Stanislaus, the partition of Poland, and the massacres of Ismailow and of Praga.

Catherine, St, Order of, in modern history, belongs to ladies of the first quality in the Russian court. It was instituted in 1714 by Catherine wife of Peter the Great, in memory of his signal escape from the Turks in 1711. The emblems of this order are a red cross, supported by a figure of St Catherine, and fastened to a scarlet string edged with silver, on which are inscribed the name of St Catherine, and the motto *Pro fide et patria*.

CATHERLOUGH, or Carlow, a town of Ireland in the county of Catherlough, and province of Leinster; seated on the river Barrow, 16 miles north-east of Kilkenny. W. Long. 7. 1. N. Lat. 52. 45.

Catherlough, or *Carlow*, a county of Ireland, about 28 miles in length, and eight in breadth; bounded on the east by Wicklow and Wexford, on the west by Queen's county, on the north by Kildare, and on the south and south-west by Wexford. It contains five baronies, 50 parishes, 13,000 houses, and 78,000 inhabitants. The county sends one member, and the town another to the imperial parliament. See Carlow, Supplement.

CATHETER, in *Surgery*, a fistulous instrument, usually made of silver, to be introduced into the bladder, in order to search for the stone, or discharge the urine when suppressed. See Surgery *Index*.

CATHETUS, in *Geometry*, a line or radius falling perpendicularly on another line or surface; thus the catheti of a right-angled triangle are the two sides that include the right angle.

Cathetus of Incidence, in *Catoptrics*, a right line drawn from a point of the object, perpendicular to the reflecting line.

Cathetus of Reflection, or *of the Eye*, a right line drawn from the eye perpendicular to the reflecting plane.

Cathetus of Obliquation, a right line drawn perpendicular to the speculum, in the point of incidence or reflection.

Cathetus, in *Architecture*, a perpendicular line supposed to pass through the middle of a cylindrical body, as a balluster, column, &c.

CATHNESS. See Caithness.

CATHOLIC,

Catholic to Cato.

CATHOLIC, in a general sense, denotes any thing that is universal or general.

Catholic Church. The rise of heresies induced the primitive Christian church to assume to itself the appellation of *catholic*, being a characteristic to distinguish itself from all sects, who, though they had party names, sometimes sheltered themselves under the name of Christians.

The Romish church distinguishes itself now by the name of *Catholic*, in opposition to all those who have separated from her communion, and whom she considers as heretics and schismatics, and herself only as the true and Christian church. In the strict sense of the word, there is no Catholic church in being, that is, no universal Christian communion.

Catholic King, is a title which has been long hereditary to the king of Spain. Mariana pretends, that Reccarede first received this title after he had destroyed Arianism in his kingdom, and that it is found in the council of Toledo for the year 589. Vasce ascribes the original of it to Alphonsus in 738. Some allege that it has been used only since the time of Ferdinand and Isabella. Colombiere says, it was given them on occasion of the expulsion of the Moors. The Bollandists pretend it had been borne by their predecessors the Visigoth kings of Spain; and that Alexander VI. only renewed it to Ferdinand and Isabella. Others say that Philip de Valois first bore the title; which was given him after his death by the ecclesiastics, on account of his favouring their interests.

In some epistles of the ancient popes, the title *catholic* is given to the kings of France and of Jerusalem, as well as to several patriarchs and primates.

CATHOLICON, in *Pharmacy*, a kind of soft purgative electuary, so called as being supposed an universal purger of all humours.

CATILINE, Lucius, a Roman of a noble family, who, having spent his whole fortune in debauchery, formed the design of oppressing his country, destroying the senate, seizing the public treasury, setting Rome on fire, and usurping a sovereign power over his fellow-citizens. In order to succeed in this design, he drew some young noblemen into his plot; whom he prevailed upon, it is said, to drink human blood as a pledge of their union. His conspiracy, however, was discovered by the vigilance of Cicero, who was then consul. Upon which, retiring from Rome, he put himself at the head of an army, with several of the conspirators, and fought with incredible valour against Petreius, lieutenant to Antony, who was colleague with Cicero in the consulship; but was defeated and killed in battle. See (*History of*) Rome.—Sallust has given an excellent history of this conspiracy.

CATO, Marcus Portius, the censor, one of the greatest men among the ancients, was born at Tusculum in the year of Rome 519, about the 232d before Christ. He began to bear arms at 17; and, on all occasions showed, extraordinary courage. He was a man of great sobriety, and reckoned no bodily exercise unworthy of him. He had but one horse for himself and his baggage, and he looked after and dressed it himself. At his return from his campaigns, he betook himself to plough his ground; not that he was without slaves to do it, but it was his inclination. He dressed also like his slaves, sat down at the same table with them, and partook of the same fare. He did not in the meanwhile neglect to cultivate his mind, especially in regard to the art of speaking; and he employed his talents, which were very great, in generously pleading causes in the neighbouring cities without fee or reward. Valerius Flaccus, who had a country seat near Cato, conceiving an esteem for him, persuaded him to come to Rome; where Cato, by his own merits, and the influence of so powerful a patron, was soon taken notice of, and promoted. He was first of all elected tribune of the soldiers for the province of Sicily; he was next made questor in Africa under Scipio. Having in this last office reproved him for his profuseness to his soldiers, the general answered, that "he did not want so exact a questor, but would make war at what expence he pleased; nor was he to give an account to the Roman people of the money he spent, but of his enterprises, and the execution of them." Cato, provoked at this answer, left Sicily, and returned to Rome.

Afterwards Cato was made prætor, when he fulfilled the duties of his office with the strictest justice. He conquered Sardinia, governed with admirable moderation, and was created consul. Being tribune in the war of Syria, he gave distinguished proofs of his valour against Antiochus the Great; and at his return stood candidate for the office of censor. But the nobles, who not only envied him as a *new* man, but dreaded his severity, set up against him seven powerful competitors. Valerius Flaccus, who had introduced him into public life, and had been his colleague in the consulship, was a ninth candidate, and these two united their interests. On this occasion Cato, far from employing soft words to the people, or giving hopes of gentleness or complaisance in the execution of his office, loudly declared from the rostra, with a threatening look and voice, "That the times required firm and vigorous magistrates to put a stop to that growing luxury which menaced the republic with ruin; censors who would cut up the evil by the roots, and restore the rigour of ancient discipline." It is to the honour of the people of Rome, that, notwithstanding these terrible intimations, they preferred him to all his competitors, who courted them by promises of a mild and easy administration; the comitia also appointed his friend Valerius to be his colleague, without whom he had declared that he could not hope to compass the reformations he had in view. Cato's merit, upon the whole, was superior to that of any of the great men who stood against him. He was temperate, brave, and indefatigable; frugal of the public money, and not to be corrupted. There is scarce any talent requisite for public or private life which he had not received from nature, or acquired by industry. He was a great soldier, an able statesman, an eloquent orator, a learned historian, and very knowing in rural affairs. Yet, with all these accomplishments, he had very great faults. His ambition being poisoned with envy, disturbed both his own peace and that of the whole city as long as he lived. Though he would not take bribes, he was unmerciful and unconscionable in amassing wealth by all such means as the law did not punish.

The first act of Cato in his new office, was naming his colleague to be prince of the senate; after which the censors struck out of the list of the senators the

Cato.

names of seven persons; among whom was Lucius the brother of T. Flaminius. Lucius, when consul, and commanding in Gaul, had with his own hand murdered a Boian of distinction, a deserter to the Romans; and he had committed this murder purely to gratify the curiosity of his pathic, a young Carthaginian, who longing to see somebody die a violent death, had reproached the general for bringing him away from Rome just when there was going to be a fight of gladiators. Titus Flaminius, full of indignation at the dishonour done to his brother, brought the affair before the people; and insisted upon Cato's giving the reason of his proceeding. The censor related the story; and when Lucius denied the fact, put him to his oath. The accused, refusing to swear, was deemed guilty; and Cato's censure was approved. But no part of the censor's conduct seemed so cruel to the nobles and their wives as the taxes he laid upon luxury in all its branches, dress, household furniture, women's toilets, chariots, slaves, and equipage. These articles were all taxed at three per cent. of the real value. The people, however, in general, were pleased with his regulations; insomuch that they ordered a statue to be erected to his honour in the Temple of Health, with an inscription that mentioned nothing of his victories or triumphs, but imported only, that by his wise ordinances in his censorship he had reformed the manners of the republic. Plutarch relates, that before this, upon some of Cato's friends expressing their surprise, that when many persons without merit or reputation had statues, he had none; he answered, "I had much rather it should be asked why the people have not erected a statue to Cato, than why they have." Cato was the occasion of the third Punic war. Being dispatched to Africa to terminate a difference between the Carthaginians and the king of Numidia, on his return to Rome he reported that Carthage was grown excessively rich and populous, and he warmly exhorted the senate to destroy a city and republic, during the existence of which Rome could never be safe. Having brought from Africa some very large figs, he showed them to the conscript fathers in one of the lappets of his gown. "The country (says he) where this fine fruit grows is but a three days voyage from Rome." We are told, that from this time he never spoke in the senate upon any subject, without concluding with these words, "I am also of opinion, that Carthage ought to be destroyed." He judged, that for a people debauched by prosperity, nothing was more to be feared than a rival state, always powerful, and now from its misfortunes grown wise and circumspect. He held it necessary to remove all dangers that could be apprehended from *without*, when the republic had *within* so many distempers threatening her destruction.

From the censor, dignified and severe, the reader will not perhaps be displeased to turn his view upon Cato sociable and relaxed. For we should have a false notion of him, if we imagined that nothing but a sad austerity prevailed in his speech and behaviour. On the contrary, he was extremely free; and often with his friends at table intermixed the conversation with lively discourses and witty sayings. Of these Plutarch has collected a pretty large number; we shall relate but one, and make use of Balzac's paraphrase, and the preface with which he introduces it. "The very censors, though sadness seemed to be one of the functions of their office, did not altogether lay aside raillery. They were not always bent upon severity; and the first Cato, that troublesome and intolerable honest man, ceased sometimes to be troublesome and intolerable. He had some glimpses of mirth, and some intervals of good humour. He dropped now and then some words that were not unpleasant, and you may judge of the rest by this. He had married a very handsome wife; and history tells us that she was extremely afraid of the thunder, and loved her husband well. These two passions prompted her to the same thing; she always pitched upon her husband as a sanctuary against thunder, and threw herself into his arms at the first noise she fancied she heard in the sky. Cato, who was well pleased with the storm, and very willing to be caressed, could not conceal his joy. He revealed that domestic secret to his friends; and told them one day, speaking of his wife, "that she had found out a way to make him love bad weather; and that he never was so happy as when Jupiter was angry." It is worth observing, that this was during his censorship; when he degraded the senator Manlius, who would probably have been consul the year after, only for giving a kiss to his wife in the day-time, and in the presence of his daughter.

Oeuvres diverses, p. 49.

Cato died in the year of Rome 604, aged 85. He wrote several works. 1. A Roman History. 2. Concerning the art of war. 3. Of Rhetoric. 4. A treatise of Husbandry. Of these, the last only is extant.

Cato

Cato, *Marcus Portius*, commonly called Cato *Minor*, or Cato of *Utica*, was great-grandson of Cato *the Censor*. It is said, that from his infancy he discovered by his speech, by his countenance, and even his childish sports and recreations, an inflexibility of mind; for he would force himself to go through with whatever he had undertaken, though the task was ill-suited to his strength. He was rough towards those that flattered him, and quite untractable when threatened; was rarely seen to laugh, or even to smile; was not easily provoked to anger; but if once incensed, hard to be pacified. Sylla having had a friendship for the father of Cato, sent often for him and his brother, and talked familiarly with them. Cato, who was then about 14 years of age, seeing the heads of great men brought there, and observing the sighs of those that were present, asked his preceptor, "Why does nobody kill this man?" Because, said the other, he is more feared than he is hated. The boy replied, "Why then did you not give me a sword when you brought me hither, that I might have stabbed him, and freed my country from this slavery?"

He learned the principles of the Stoic philosophy, which so well suited his character, under Antipater of Tyre, and applied himself diligently to the study of it. Eloquence he likewise studied, as a necessary means to defend the cause of justice, and he made a very considerable proficiency in that science. To increase his bodily strength, he inured himself to suffer the extremes of heat and cold; and used to make journeys on foot and bare-headed in all seasons. When he was sick, patience and abstinence were his only remedies: he shut himself up, and would see nobody till he was well. Though remarkably sober in the beginning of his

Cato.

his life, making it a rule to drink but once after supper, and then retire, he insensibly contracted a habit of drinking more freely, and of sitting at table till morning. His friends endeavoured to excuse this, by saying that the affairs of the public engrossed his attention all the day; and that, being ambitious of knowledge, he passed the night in the conversation of philosophers. Cæsar wrote, that Cato was once found dead drunk at the corner of a street, early in the morning, by a great number of people who were going to the levee of some great man; and that when, by uncovering his face, they perceived who it was, they blushed for shame: "You would have thought (added Cæsar), that Cato had found them drunk, not they him." Pliny observes, that by this reflection Cæsar praises his enemy at the same time that he blames him. And Seneca, his extravagant panegyrist, ventures to assert, that it is easier to prove drunkenness to be a virtue, than Cato to be vicious. He affected singularity; and in things indifferent, to act directly contrary to the taste and fashions of the age. Magnanimity and constancy are generally ascribed to him; and Seneca would fain make that haughtiness and contempt for others, which, in Cato, accompanied those virtues, a matter of praise. Cato, says Seneca, having received a blow in the face, neither took revenge nor was angry; he did not even *pardon the affront*, but *denied that he had received it.* His virtue raised him so high, that injury could not reach him. He is reputed to have been chaste in his youth. His first love was Lepida; but when the marriage was upon the point of being concluded, Metellus Scipio, to whom she had been promised, interfered, and the preference was given to him. This affront extremely exasperated our Stoic. He was for going to law with Scipio; and when his friends had diverted him from that design, by showing him the ridicule of it, he revenged himself by making verses upon his rival. When this first flame subsided, he married Attilia the daughter of Serranus, had two children by her, and afterwards divorced her for her very indiscreet conduct.

He served as a volunteer under Gallus in the war of Spartacus; and when military rewards were offered him by the commander, he refused them, because he thought he had no right to them. Some years after, he went a legionary tribune into Macedonia under the prætor Rubrius: in which station he appeared, in his dress and during a march, more like a private soldier than an officer: but the dignity of his manners, the elevation of his sentiments, and the superiority of his views, set him far above those who bore the titles of generals and proconsuls. It is said, that Cato's design in all his behaviour was to engage the soldiers to the love of virtue; whose affections he engaged thereby to himself, without his having that in his intention. "For the sincere love of virtue (adds Plutarch) implies an affection for the virtuous. Those who praise the worthy without loving them, pay homage to their glory; but are neither admirers nor imitators of their virtues." When the time of his service expired, and he was leaving the army, the soldiers were all in tears; so effectually had he gained their hearts by his condescending manners and sharing in their labours. After his return home, he was chosen to the questorship; and had scarce entered on his charge, when he made a great reformation in the questor's office, and particularly with regard to the registers. These registers, whose places were for life, and through whose hands passed incessantly all the public accounts, being to act under young magistrates inexperienced in business, assumed an air of importance; and, instead of asking orders from the questors, pretended to direct and govern as if they themselves were the questors. Cato reduced them to their proper sphere.

One thing by which Cato extremely pleased the people, was his making the assassins to whom Sylla had given considerable rewards out of the treasury for murdering the proscribed, disgorge their gains. Plutarch tells us, that Cato was so exact in discharging the duties of a senator, as to be always the first who came to the house, and the last who left it; and that he never quitted Rome during those days when the senate was to sit. Nor did he fail to be present at every assembly of the people, that he might awe those who, by an ill-judged facility, bestowed the public money in largesses, and frequently, through mere favour, granted remission of debts due to the state. At first his austerity and stiffness displeased his colleagues; but afterwards they were glad to have his name to oppose to all the unjust solicitations, against which they would have found it difficult to defend themselves. Cato very readily took upon him the task of refusing.

Cato, to keep out a very bad man, put in for the tribunate. He sided with Cicero against Catiline, and opposed Cæsar on that occasion. His enemies sent him to recover Cyprus, which Ptolemy had forfeited, thinking to hurt his reputation by so difficult an undertaking; yet none could find fault with his conduct.

Cato laboured to bring about an agreement between Cæsar and Pompey; but seeing it in vain, he sided with the latter. When Pompey was slain he fled to Utica; and being pursued by Cæsar, advised his friends to be gone, and throw themselves on Cæsar's clemency. His son, however, remained with him; and Statilius, a young man, remarkable for his hatred to Cæsar.

The evening before the execution of the purpose he had formed with regard to himself, after bathing, he supped with his friends and the magistrates of the city. They sat late at table, and the conversation was lively. The discourse falling upon this maxim of the Stoics, that "the wise man alone is free, and that the vicious are slaves;" Demetrius, who was a Peripatetic, undertook to confute it from the maxims of his school. Cato, in answer, treated the matter very amply; and with so much earnestness and vehemence of voice, that he betrayed himself, and confirmed the suspicion of his friends that he designed to kill himself. When he had done speaking, a melancholy silence ensued; and Cato perceiving it, turned the discourse to the present situation of affairs, expressing his concern for those who had been obliged to put to sea, as well as for those who had determined to make their escape by land, and had a dry and sandy desert to pass. After supper, the company being dismissed, he walked for some time with a few friends, and gave his orders to the officers of the guard: and going into his chamber, he embraced his son and his friends with more than usual

Cato. usual tenderness, which farther confirmed the suspicions of the resolution he had taken. Then laying himself down on his bed, he took up Plato's Dialogue on the Immortality of the Soul. Having read for some time, he looked up, and missing his sword, which his son had removed while he was at supper, he called a slave, and asked who had taken it away; and receiving no pertinent answer, he resumed his reading. Some time after, he asked again for his sword; and, without showing any impatience, ordered it to be brought to him: but having read out the book, and finding nobody had brought him his sword, he called for all his servants, fell into a rage, and struck one of them on the mouth with so much violence that he very much hurt his own hand, crying out in a passionate manner, "What! do my own son and family conspire to betray me, and deliver me up naked and unarmed to the enemy?" Immediately his son and friends rushed into the room; and began to lament, and to beseech him to change his resolution. Cato raising himself, and looking fiercely at them, "How long is it," said he, "since I have lost my senses, and my son is become my keeper? Brave and generous son, why do you not bind your father's hands, that when Cæsar comes, he may find me unable to defend myself? Do you imagine that without a sword I cannot end my life? Cannot I destroy myself, by holding my breath for some moments, or by striking my head against the wall?" His son answered with his tears, and retired. Apollonides and Demetrius remained with him; and to them he addressed himself in the following words: "Is it to watch over me that ye sit silent here? Do you pretend to force a man of my years to live? or can you bring any reason to prove, that it is not base and unworthy of Cato to beg his safety of an enemy? or why do you not persuade me to unlearn what I have been taught, that, rejecting all the opinions I have hitherto defended, I may now, by Cæsar's means, grow wiser, and be yet more obliged to him than for life alone? Not that I have determined any thing concerning myself; but I would have it in my power to perform what I shall think fit to resolve upon: and I shall not fail to ask your counsel, when I have occasion to act up to the principles which your philosophy teaches. Go tell my son, that he should not compel his father to what he cannot persuade him." They withdrew, and the sword was brought by a young slave. Cato drew it, and finding the point to be sharp; "Now, (said he) I am my own master:" And, laying it down, he took up his book again, which it is reported he read twice over. After this he slept so soundly that he was heard to snore by those who were near him. About midnight he called two of his freedmen, Cleanthes his physician, and Butas, whom he chiefly employed in the management of his affairs. The last he sent to the port, to see whether all the Romans were gone; to the physician he gave his hand to be dressed, which was swelled by the blow he had given his slave. This being an intimation that he intended to live, gave great joy to his family. Butas soon returned, and brought word that they were all gone except Crassus, who had staid upon some business, but was just ready to depart. He added, that the wind was high and the sea rough. These words drew a sigh from Cato. He sent Butas again to the port, to know whether there might not be some one, who, in the hurry of embarkation, had forgot some necessary provisions, and had been obliged to put back to Utica. It was now break of day, and Cato slept yet a little more, till Butas returned to tell him, that all was perfectly quiet. He then ordered him to shut his door; and he flung himself upon his bed, as if he meant to finish his night's rest; but immediately he took his sword, and stabbed himself a little below his chest; yet not being able to use his hand so well by reason of the swelling, the blow did not kill him. It threw him into a convulsion, in which he fell from his bed, and overturned a table near it. The noise gave the alarm; and his son and the rest of the family, entering the room, found him weltering in his blood, and his bowels half out of his body. The surgeon, upon examination, found that his bowels were not cut; and was preparing to replace them and bind up the wound, when Cato, recovering his senses, thrust the surgeon from him, and tearing out his bowels, immediately expired, in the 48th year of his age.

By this rash act, independent of all moral or religious considerations, he carried his patriotism to the highest degree of political phrensy; for Cato, dead, could be of no use to his country; but had he preserved his life, his counsel might have moderated Cæsar's ambition, and (as Montesquieu observes) have given a different turn to public affairs.

Cato, Catoche.

CATOCHE, or CATOCHUS, a disease by which the patient is rendered in an instant as immoveable as a statue, without either sense or motion, and continues in the same posture he was in at the moment of his being seized. See MEDICINE *Index*.

CATOPTRICS.

CATOPTRICS is that part of optics which explains the properties of reflected light, and particularly that which is reflected from mirrors.

As this and the other branches of OPTICS will be fully treated under the collective word, we shall, in the present article, 1st, Just give a summary of the principles of the branch, in a few plain aphorisms, with some preliminary definitions; and, 2dly, Insert a set of entertaining experiments founded upon them.

SECT. I. *Definitions.*

1 Definitions.

1. Every polished body that reflects the rays of light is called a mirror, whether its surface be plane, spherical, conical, cylindric, or of any other form whatever.

Plate CXXXVI.

2. Of mirrors there are three principally used in optical experiments: The plane mirror, GHI, (fig. 1.);

1.); the spherical convex mirror, GHI, (fig. 2.); and the spherical concave mirror, GHI, (fig. 3.)

3. The point K, (fig. 2, 3.) round which the reflecting surface of a spherical mirror is described, is called its centre. The line KH, drawn from its centre perpendicular to its two surfaces, is the axis of the mirror; and the point H, to which that line is drawn, is its vortex.

4. The distance between the lines AG and BG, (fig. 1.) is called the angle of incidence, and the distance between BG and CG is the angle of reflection.

SECT. II. *Aphorisms.*

I. In a plain mirror.

1. The image DF, (fig. 1.) will appear as far behind the mirror as the object AC is before it.

2. The image will appear of the same size, and in the same position as the object.

3. Every such mirror will reflect the image of an object of twice its own length and breadth.

4. If the object be an opaque body, and its rays fall on the mirror nearly in direct lines, there will be only one image visible, which will be reflected by the inner surface of the glass. But,

5. If the object be a luminous body, and its rays fall very obliquely on the mirror, there will appear to an eye, placed in a proper position, several images; the first of which, reflected from the outer surface of the glass, will not be so bright as the second, reflected from the inner surface. The following images, that are produced by the repeated reflections of the rays between the two surfaces of the glass, will be in proportion less vivid, to the eighth or tenth, which will be scarce visible.

II. In a spherical convex mirror.

1. The image DF, (fig. 2.), will always appear behind it.

2. The image will be in the same position as the object.

3. It will be less than the object.

4. It will be curved, but not, as the mirror, spherical.

5. Parallel rays falling on this mirror will have the focus or image at half the distance of the centre K from the mirror.

6. In converging rays, the distance of the object must be equal to half the distance of the centre, to make the image appear behind the mirror.

7. Diverging rays will have their image at less than half the distance of the centre. If the object be placed in the centre of the mirror, its image will appear at one eighth of that distance behind it.

III. In a spherical concave mirror.

1. That point where the image appears of the same dimensions as the object, is the centre of that mirror.

2. Parallel rays will have their focus at one half the distance of the centre.

3. Converging rays will form an image before the mirror.

4. In diverging rays, if the object be at less than one-half the distance of the centre, the image will be behind the mirror, erect, curved, and magnified, as DEF, (fig. 3.); but if the distance of the object be greater, the image will be before the mirror, inverted and diminished, as DEF, (fig. 4.)

5. The sun's rays falling on a concave mirror, and being parallel, will be collected in a focus at half the distance of its centre, where their heat will be augmented in proportion of the surface of the mirror to that of the focal spot.

6. If a luminous body be placed in the focus of a concave mirror, its rays being reflected in parallel lines, will strongly enlighten a space of the same dimension with the mirror, at a great distance. If the luminous object be placed nearer than the focus, its rays will diverge, and consequently enlighten a larger space. It is on this principle that reverberators are constructed.

IV. In all plane and spherical mirrors the angle of incidence is equal to the angle of reflection.

SECT. III. *Entertaining Experiments.*

5

I. Of all our senses the sight is certainly subject to the greatest illusion. The various writers on optics have described a great number of instances in which it deceives us, and have constantly endeavoured to investigate the causes, to explain their effects, and to reconcile appearance with reality. We every day discover new phenomena, and doubtless many more are reserved for posterity. It frequently happens, moreover, that a discovery which at first seemed of little consequence has led to matters of the highest importance. — I. Catoptrical illusions.

Take a glass bottle A (fig. 14.) and fill it with water to the point B; leave the upper part BC empty, and cork it in the common manner. Place this bottle opposite a concave mirror, and beyond its focus, that it may appear reversed, and before the mirror, (see Sect. II. aph. 3. 4. of a spher. concave mirror,) place yourself still further distant from the bottle, and it will appear to you in the situation *a*, *b*, *c*, (fig. 15.)

Now it is remarkable in this apparent bottle, that the water, which, according to all the laws of catoptrics, and all the experiments made on other objects, should appear at *ab*, appears on the contrary at *bc*, and consequently the part *ab* appears empty.

If the bottle be inverted and placed before the mirror (as in fig. 16.), its image will appear in its natural erect position; and the water, which is in reality at BC, will appear at *ab*.

If while the bottle is inverted it be uncorked, and the water run gently out, it will appear, that while the part BC is emptying, that of *ab* in the image is filling; and what is likewise very remarkable, as soon as the bottle is empty the illusion ceases, the image also appearing entirely empty. If the bottle likewise be quite full there is no illusion.

If while the bottle is held inverted, and partly empty, some drops of water fall from the bottom A towards BC, it seems in the image as if there were formed at the bottom of that part *ab*, bubbles of air that rose from *a* to *b*; which is the part that seems full of water. All these phenomena constantly appear.

The remarkable circumstances in this experiment are, first, not only to see an object where it is not, but also where the image is not; and secondly, that of two objects which are really in its same place, as the surface at one place, and the other at another; and to see the bottle in the place of its image, and the water where neither it nor its image are.

II. Construct a box AB, of about a foot long, eight inches

6 II. Appearance of a boundless vista, fig. 5.

inches wide, and six high; or what other dimensions you shall think fit, provided it does not greatly vary from these proportions.

On the inside of this box, and against each of its opposite ends A and B, place a mirror of the same size. Take off the quicksilver from the mirror that you place at B, for about an inch and a half at the part C, where you are to make a hole in the box of the same size, by which you may easily view its inside. Cover the top of the box with a frame, in which must be placed a transparent glass, covered with gauze, on the side next the inner part of the box. Let there be two grooves at the parts E and F to receive the two painted scenes hereafter mentioned. On two pieces of cut pasteboard let there be skilfully painted on both sides (see fig. 6. and 7.) any subject you think proper; as woods, gardens, bowers, colonnades, &c. and on two other pasteboards, the same subjects on one side only; observing that there ought to be on one of them some object relative to the subject placed at A, that the mirror placed at D may not reflect the hole at C on the opposite side.

Place the two boards painted on both sides in the grooves E and F; and those that are painted on one side only against the opposite mirrors C and D; and then cover the box with its transparent top. This box should be placed in a strong light to have a good effect.

When the eye is placed at C, and views the objects on the inside of the box, of which some, as we have said, are painted on both sides, they are successively reflected from one mirror to the other; and if, for example, the painting consists of trees, they will appear like a very long vista, of which the eye cannot discern the end: for each of the mirrors repeating the objects, continually more faintly, contribute greatly to augment the illusion.

7 III. Of a fortification of immense extent, fig. 8.

III. Take a square box ABCD, of about six inches long, and twelve high; cover the inside of it with four plane mirrors, which must be placed perpendicular to the bottom of the box CHFD.

Place certain objects in relief on the bottom of this box; suppose, for example, a piece of fortification, (as fig. 9.) with tents, soldiers, &c. or any other subject that you judge will produce an agreeable effect by its disposition when repeatedly reflected by the mirrors.

On the top of this box place a frame of glass, in form of the bottom part of a pyramid, whose base AGEB is equal to the size of the box: its top ILN must form a square of six inches, and should not be more than four or five inches higher than the box. Cover the four sides of this frame with a gauze, that the inside may not be visible but at the top ILN, which should be covered with a transparent glass.

When you look into this box through the glass LN, the mirrors that are diametrically opposite each other, mutually reflecting the figures enclosed, the eye beholds a boundless extent, completely covered with these objects; and if they are properly disposed, the illusion will occasion no small surprise, and afford great entertainment.

Note, The nearer the opening ILN is to the top of the box, the greater will be the apparent extent of the subject. The same will happen if the four mirrors placed on the sides of the box be more elevated. The objects, by either of these dispositions, will appear to be repeated nine, twenty-five, forty-nine times, &c. by taking always the square of the odd numbers of the arithmetical progression 3, 5, 7, 9, &c. as is very easy to conceive, if we remember that the subject enclosed in the box is always in the centre of a square, composed of several others, equal to that which forms the bottom of the box.

Other pieces of the same kind (that is, viewed from above) may be contrived, in which mirrors may be placed perpendicular on a triangular, pentagon, or hexagon (that is, a three, five, or six-sided) plane. All these different dispositions, properly directed, as well with regard to the choice as position of the objects, will constantly produce very remarkable and pleasing illusions.

If instead of placing the mirrors perpendicular, they were to incline equally, so as to form part of a reversed pyramid, the subject placed in the box would then have the appearance of a very extensive globular or many-sided figure.

8 IV. Surp[...]sing mult[...]plication [of] objects, fig. 10.

IV. On the hexagonal or six-sided plane ABCDEF draw six semidiameters GA, GB, GC, GD, GE, GF; and on each of these place perpendicularly two plane mirrors, which must join exactly at the centre G, and which placed back to back must be as thin as possible. Decorate the exterior boundary of this piece (which is at the extremity of the angles of the hexagon) with six columns, that at the same time serve to support the mirrors, by grooves formed on their inner sides. (See the profile H). Add to these columns their entablatures, and cover the edifice in such a manner as you shall think proper.

In each one of these six triangular spaces, contained between two mirrors, place little figures of pasteboard, in relief, representing such objects as when seen in a hexagonal form will produce an agreeable effect. To these add small figures of enamel; and take particular care to conceal, by some object that has relation to the subject, the place where the mirrors join, which, as we have said before, all meet in the common centre G.

When you look into any one of the six openings of this palace, the objects there contained being repeated six times, will seem entirely to fill up the whole of the building. This illusion will appear very remarkable; especially if the objects made choice of are properly adapted to the effect that is to be produced by the mirrors.

Note, If you place between two of these mirrors part of a fortification, as a curtain and two demi-bastions, you will see an entire citadel, with six bastions. Or if you place part of a ball-room, ornamented with chandeliers and figures in enamel, all those objects being here multiplied, will afford a very pleasing prospect.

9 V. Opa[que] bodies seeming rendere[d] transparent, fig. 11.

V. Within the case ABCD, place your mirrors, O, P, Q, R, so disposed that they may each of them make an angle of forty-five degrees, that is, that they may be half way inclined from the perpendicular, as in the figure. In each of the two extremities AB, make a circular overture, in one of which fix the tube

GL,

GL, in the other the tube MF, and observe that in each of these is to be inserted another tube, as H and I (A).

Furnish the first of these tubes with an object-glass at G, and a concave eye-glass at F. You are to observe, that in regulating the focus of these glasses, with regard to the length of the tube, you are to suppose it equal to the line G, or visual pointed ray, which, entering at the aperture G, is reflected by the four mirrors, and goes out at the other aperture F, where the ocular glass is placed. Put any glass you will into the two ends of the moveable tubes H and I; and, lastly, place the machinc on a stand E, moveable at the point S, that it may be elevated or depressed at pleasure.

When the eye is placed at F, and you look through the tube, the rays of light that proceed from the object T, passing through the glass G, are successsvely reflected by the mirrors O, P, Q, and R, to the eye at F, and there paint the object T in its proper situation; and these rays appear to proceed directly from that object.

The two moveable tubes H and I, at the extremities of each of which a glass is placed, serve only the more to disguise the illusion, for they have no communication with the interior part of the machine. This instrument being moveable on the stand E, may be directed to any object; and if furnished with proper glasses will answer the purpose of a common perspective.

The two moveable tubes H and I being brought together, the machine is directed toward any object, and desiring a person to look at the end F, you ask him if he sees distinctly that object. You then separate the two moveable tubes, and leaving a space between them snfficient to place your hand, or any other solid body; you tell him that the machine has the power of making objects visible through the most opaque body; and as a proof you desire him then to look at the same object, when, to his great surprise, he will see it as distinct as when there was no solid body placed between the tubes.

Note, This experiment is the more extraordinary, as it is very difficult to conceive how the effect is produced. The two arms of the case appearing to be made to support the perspective glass; and to whatever object it is directed, the effect is still the same.

VII. ...magi- ...s mir- ...g. 12.

VI. In the partition AB, make two apertures, CD, and EF, of a foot high, and ten inches wide, and about a foot distant from each other. Let them be at the common height of a man's head; and in each of them place a transparent glass, surrounded with a frame, like a common mirror.

Behind this partition place two mirrors H and I, inclined to it in an angle of forty-five degrees; that is, half way between a line drawn perpendicular to the ground and its surface; let them be both 18 inches square: let all the space between them be inclosed by boards or pasteboard painted black, and well closed, that no light may enter: let there be also two curtains to cover them, which may be drawn aside at pleasure.

When a person looks into one of these supposed mirrors, instead of seeing his own face, he will perceive the object that is in front of the other; so that if two persons present themselves at the same time before these mirrors, instead of each one seeing himself, they will reciprocally see each other.

Note, There should be a sconce with a candle placed on each side of the two glasses in the wainscot, to enlighten the faces of the persons who look in them, otherwise this experiment will have no remarkable effect.

This experiment may be considerably improved by placing the two glasses in the partition in adjoining rooms, and a number of persons being previously placed in one room, when a stranger enters the other, you may tell him his face is dirty; and desire him to look in the glass, which he will naturally do; and on seeing a strange face he will draw back; but returning to it, and seeing another, another, and another, like the phantom kings in Macbeth, what his surprise will be is more easy to conceive than express. After this a real mirror may be privately let down on the back of the glass; and if he can be prevailed to look in it once more, he will then, to his further astonishment, see his own face; and may be told, perhaps persuaded, that all he thought he saw before was the mere effect of imagination.

How many tricks, less artful than this, have passed in former times for sorcery, and pass at this time in some countries for apparitions!

Note, When a man looks in a mirror that is placed perpendicular to another, his face will appear entirely deformed. If the mirror be a little inclined, so as to make an angle of 80 degrees (that is, one-ninth part from the perpendicular), he will then see all the parts of his face, except the nose and forehead. If it be inclined to 60 degrees (that is, one-third part), he will appear with three noses and six eyes: in short, the apparent deformity will vary at each degree of inclination: and when the glass comes to 45 degrees (that is, half way down), the face will vanish. If, instead of placing the two mirrors in this situation, they are so disposed that their junction may be vertical, their different inclinations will produce other effects; as the situation of the object relative to these mirrors is quite different. The effects of these mirrors, though remarkable enough, occasions but little surprise, as there is no method of concealing the cause by which they are produced.

11 Fig. 13.

VII. Make a box of wood, of a cubical figure, ABCD, of about 15 inches every way. Let it be fixed to the pedestal P, at the usual height of a man's head. In each side of this box, let there be an opening

(A) These four tubes must terminate in the substance of the case, and not enter the inside, that they may not hinder the effect of the mirrors. The fourfold reflection of the rays of light from the mirrors, darkens in some degree the brightness of the object; some light is also lost by the magnifying power of the perspective. If, therefore, instead of the object-glass at G, and concave eye-glass at F, plain glasses were substituted, the magnifying power of the perspective will be taken away, and the object appear brighter.

ing of an oval form, of ten inches high, and seven wide.

In this box place two mirrors A, D, with their backs against each other; let them cross the box in a diagonal line, and in a vertical position. Decorate the openings in the sides of this box with four oval frames and transparent glasses, and cover each of them with a curtain, so contrived that they may all draw up together.

Place four persons in front of the four sides, and at equal distances from the box, and then draw up the curtains that they may see themselves in the mirrors; when each of them, instead of his own figure, will see that of the person who is next to him, and who, at the same time, will seem to him to be placed on the opposite side. Their confusion will be the greater, as it will be very difficult for them to discover the mirrors concealed in the box. The reason of this phenomenon is evident; for though the rays of light may be turned aside by a mirror, yet as we have before said, they always appear to proceed in right lines.

12 VIII. The perspective mirror, fig. 17.

VIII. Provide a box ABCD of about two feet long, 15 inches wide, and 12 inches high. At the end AC place a concave mirror, the focus of whose parallel rays is at 18 inches from the reflecting surface. At IL place a pasteboard blacked, in which a hole is cut sufficiently large to see on the mirror H the object placed at BEFD.

Cover the top of the box, from A to I, close, that the mirror H may be entirely darkened. The other part IB must be covered with a glass, under which is placed a gauze.

Make an aperture at G, near the top of the side ER; beneath which, on the inside, place, in succession, paintings of different subjects, as vistas, landscapes, &c. so that they may be in front of the mirror H. Let the box be so placed that the object may be strongly illuminated by the sun, or by wax lights placed under the enclosed part of the box AI.

By this simple construction the objects placed at GD will be thrown into their natural perspective; and if the subjects be properly chosen, the appearance will be altogether as pleasing as in optical machines of a much more complicated form.

Note, A glass mirror should be always here used, as those of metal do not represent the objects with equal vivacity, and are besides subject to tarnish. It is also necessary that the box be sufficiently large, that you may not be obliged to use a mirror whose focus is too short; for in that case, the right lines near the border of the picture will appear bent in the mirror, which will have a disagreeable effect, and cannot be avoided.

13 IX. To set fire to a combustible body by the reflection of two concave mirrors, fig. 18.

IX. The rays of a luminous body placed in the focus of a concave mirror being reflected in parallel lines, if a second mirror be placed diametrically opposite the first, it will, by collecting those rays in its focus, set fire to a combustible body.

Place two concave mirrors, A and B, at about 12 or 15 feet distance from each other, and let the axis of each of them be in the same line. In the focus C of one of them place a live coal, and in the focus D of the other some gunpowder. With a pair of double bellows, which make a continual blast, keep constantly blowing the coal, and notwithstanding the distance between them, the powder will presently take fire.

It is not necessary that these mirrors be of metal or brass, those made of wood or pasteboard gilded will produce the explosion, which has sometimes taken effect at the distance of 50 feet, when mirrors of 18 inches, or two feet diameter, have been used.

This experiment succeeds with more difficulty at great distances; which may proceed from the moisture in a large quantity of air. It would doubtless take effect more readily, if a tin tube, of an equal diameter with the mirrors, were to be placed between them.

14 The real apparition, fig. 19.

X. Behind the partition AB, place, in a position something oblique, the concave mirror EF, which must be at least ten inches in diameter, and its distance from the partition equal to three fourths of the distance of its centre.

In the partition make an opening of seven or eight inches, either square or circular: it must face the mirror, and be of the same height with it. Behind this partition place a strong light, so disposed that it may not be seen at the opening, and may illumine an object placed at C, without throwing any light on the mirror.

Beneath the aperture in the partition place the object C, that you intend shall appear on the outside of the partition, in an inverted position; and which we will suppose to be a flower. Before the partition, and beneath the aperture, place a little flowerpot D, the top of which should be even with the bottom of the aperture, that the eye, placed at G, may see the flower in the same position as if its stalk came out of the pot.

Take care to paint the space between the back part of the partition and the mirror black, to prevent any reflections of light from being thrown on the mirror; in a word, so dispose the whole that it may be as little enlightened as possible.

When a person is placed at the point G, he will perceive the flower that is behind the partition, at the top of the pot at D: But on putting out his hand to pluck it, he will find that he attempts to grasp a shadow.

If in the opening of the partition a large double convex lens of a short focus be placed, or, which is not quite so well, a bottle of clear water, the image of the flower reflected thereon will appear much more vivid and distinct.

Observation.

The phenomena that may be produced by means of concave mirrors are highly curious and astonishing. By their aid, spectres of various kinds may be exhibited. Suppose, for example, a person with a drawn sword places himself before a large concave mirror, but farther from it than its focus; he will then see an inverted image of himself in the air, between him and the mirror, of a less size than himself. If he steadily present the sword towards the centre of the mirror, an image of the sword will come out therefrom towards the sword in his hand, point to point, as it were to fence with him: and by his pushing the sword nearer, the image will appear to come nearer him, and almost to touch his breast, having a striking effect upon him. If the mirror be turned 45 degrees, or one-eighth, round,

round, the reflected image will go out perpendicular to the direction of the sword presented, and apparently come to another person placed in the direction of the motion of the image. If that person is unacquainted with the experiment, and does not see the original sword, he will be much surprised and alarmed. This experiment may be another way diversified, by telling any person, that at such an hour, and in such a place, he should see the apparition of an absent or deceased friend (of whose portrait you are in possession). In order to produce this phantom, instead of the hole in the partition AB in the last figure, there must be a door which opens into an apartment to which there is a considerable descent. Under that door you are to place the portrait, which must be inverted and strongly illuminated, that it may be lively reflected by the mirror, which must be large and well polished. Then having introduced the incredulous spectator at another door, and placed him in the proper point of view, you suddenly throw open the door at AB, when, to his great astonishment, he will immediately see the apparition of his friend.

It will be objected, perhaps, that this is not a perfect apparition, because it is only visible at one point of view, and by one person. But it should be remembered, that it was an established maxim in the last centuries, that a spectre might be visible to one person and not to others. So Shakespeare makes both Hamlet and Macbeth see apparitions that were not visible to others present at the same time. It is not unlikely, moreover, that this maxim took its rise from certain apparitions of this kind that were raised by the monks, to serve some purposes they called religious; as they alone were in possession of what little learning there then was in the world.

Opticians sometimes grind a glass mirror concave in one direction only, as it is said longitudinally; it is in fact a concave portion of a cylinder, the breadth of which may be considered that of the mirror. A person looking at his face in this mirror, in the direction of its concavity, will see it curiously distorted in a very lengthened appearance; and by turning the cylindrical mirror a quarter round, his visage will appear distorted another way, by an apparent increase in width only. Another curious and singular property attends this sort of mirror: If in a very near situation before it, you put your finger on the right hand side of your nose, it will appear the same in the mirror; but if in a distant situation, somewhat beyond the centre of concavity, you again look at your face in the mirror, your finger will appear to be removed to the other or left hand side of your nose. This, though something extraordinary, will in its cause appear very evident from a small consideration of the properties of sperical concave mirrors.

Ca[tro]-
[ma]n[]cy
Cat[ter]thun.

CATOPTROMANCY, Κατοπτρομαντεια, a kind of divination among the ancients; so called, because consisting in the application of a mirror. The word is formed from *κατοπτρον*, *speculum*, "mirror," and *μαντεια*, *divinatio*, "divination." Pausanias says, it was in use among the Achaians; where those who were sick, and in danger of death, let down a mirror, or looking glass fastened by a thread, into a fountain before the temple of Ceres; then looking in the glass, if they saw a ghastly disfigured face, they took it as a sure sign of death: on the contrary, if the flesh appeared fresh and healthy, it was a token of recovery. Sometimes glasses were used without water, and the images of things future represented in them. See GASTROMANCY.

CATROU, FRANCIS, a famous Jesuit, born at Paris in 1659. He was engaged for 12 years in the *Journal de Trevoux*, and applied himself at the same time to other works, which distinguished him among the learned. He wrote a general History of the Mogul empire, and a Roman history, in which he was assisted by Father Rouille, a brother Jesuit. Catrou died in 1737; and this last history was continued by Rouille, who died in 1740.

CATTERHUN, a remarkable Caledonian post a few miles north of the town of Brechin in the county of Angus in Scotland. Mr Pennant describes it as of uncommon strength. "It is (says he) of an oval form, made of a stupendous dike of loose white stones, whose convexity, from the base within to that without, is 122 feet. On the outside a hollow, made by the disposition of the stones, surrounds the whole. Round the base is a deep ditch, and below that about 100 yards, are vestiges of another, that went round the hill. The area within the stony mound is flat: the axis, or length of the oval, is 436 feet, the transverse diameter 200. Near the east side is the foundation of a rectangular building; and on most parts are the foundations of others small and circular: all which had once their superstructures, the shelter of the possessors of the post: there is also a hollow, now almost filled with stones, the well of the place." There is another fortification, but of inferior strength, in the neighbourhood. It is called the *Brown Catterthun*, from the colour of the ramparts, which are composed only of earth. It is of a circular form, and consists of various concentric dikes. On one side of this rises a small rill, which, running down the hill, has formed a deep gully. From the side of the fortress is another rampart, which extends parallel to the rill, and then reverts, forming an additional post or retreat. The meaning of the word *Catter-thun*, is *Camp-town*; and Mr Pennant thinks these might probably be the posts occupied by the Caledonians before their engagement at the foot of the Grampian mountains with the celebrated Agricola. See *(History of)* SCOTLAND.

Catterthun,
Catti.

CATTI, a people of Germany, very widely spread, on the east reaching to the river Sala, on the north to Westphalia; occupying, besides Hesse, the Wetterau, and part of the tract on the Rhine, and on the banks of of the river Lohne. The Hercynian forest began and ended in their country.

CATTIVELLAUNI, anciently a people of Britain, seated in the country which is now divided into the counties of Hertford, Bedford, and Bucks. The name of this ancient British people is written in several different ways by Greek and Roman authors, being sometimes called Catti, Cassii, Catticulcani, Cattidudani, Catticludani, &c. That they were of Belgic origin cannot be doubted; and it is not improbable that they derived their name of Catti from the Belgic word Katten, which signifies illustrious or noble, and that the addition of Vellauni, which means on the banks of rivers, might be given them after their arrival in Britain, as descriptive of the situation of their country. However this may be, the Cattivellauni formed one of the most brave and warlike of the ancient British nations when Cæsar invaded Britain, and long after. Cassibelanus, their prince, was made commander in chief of the confederated Britons, not only on account of his own personal qualities, but also because he was at the head of one of their bravest and most powerful tribes. In the interval between the departure of Cæsar and the next invasion under Claudius, the Cattivellauni had reduced several of the neighbouring states under their obedience; and they again took the lead in opposition to the Romans at their second invasion, under their brave but unfortunate prince, Caractacus. The country of the Cattivellauni was much frequented and improved by the Romans, after it came under their obedience. Verulamium, their capital, which stood near where St Alban's now stands, became a place of great consideration, was honoured with the name and privileges of a municipium or free city, and had magistrates after the model of the city of Rome. This place was taken and almost destroyed by the insurgents under Boadicea; but it was afterwards rebuilt, restored to its former splendour, and surrounded with a strong wall, some vestiges of which are still remaining. Durocobrivæ and Magiavintum, in the second iter of Antoninus, were probably Dunstable and Fenny Stratford, at which places there appear to have been Roman stations. The Salenæ of Ptolemy, a town in the country of the Cattivellauni, was perhaps situated at Salndy in Bedfordshire, where several Roman antiquities have been found. There were, besides these, several other Roman forts, stations, and towns in this country, which it would be tedious to enumerate. The territories of the Cattivellauni made a part of the Roman province called Britannia Prima.

CATTLE, a collective word, which signifies the four-footed animals, which serve either for tilling the ground, or for food to man. They are distinguished into large or black cattle, and into small cattle: of the former are horses, bulls, oxen, cows, and even calves and heifers: amongst the latter are rams, ewes, sheep, lambs, goats, kids, &c. Cattle are the chief stock of a farm: they who deal in cattle are styled graziers.

CATULLUS, Caius Valerius, a Latin poet, born at Verona, in the year of Rome 666. The harmony of his numbers acquired him the esteem and friendship of Cicero, and other great men of his time. Many of his poems, however, abound with gross obscenities. He wrote satirical verses against Cæsar, under the name of Marmoro. He spent his whole life in a state of poverty; and died in the flower of his age and the height of his reputation. Joseph Scaliger, Passerat, Muret, and Isaac Vossius, have written learned notes on this poet.

CATZ, James, a great civilian, politician, and Dutch poet, was born at Browershaven, in Zealand, in the year 1577. After having made several voyages, he fixed at Middleburg; and acquired by his pleadings such reputation, that the city of Dort chose him for its pensionary; as did also, some time after, that of Middleburg. In 1634, he was nominated pensionary of Holland and West Friesland; and in 1648, he was elected keeper of the seal of the same state, and stadtholder of the fiefs: but some time after, he resigned these employments, to enjoy the repose which his advanced age demanded. As the post of grand pensionary had been fatal to almost all those who had enjoyed it, from the beginning of the republic till that time, Catz delivered up his charge on his knees, before the whole assembly of the states, weeping for joy, and thanking God for having preserved him from the inconveniences that seemed attached to the duties of that office. But though he was resolved to spend the rest of his days in repose, the love of his country engaged him to comply with the desires of the states, who importuned him to go on an embassy to England, in the delicate conjuncture in which the republic found itself during the protectorate of Cromwell. At his return, he retired to his fine country seat at Sorgvliet, where he lived in tranquillity till the year 1660, in which he died. He wrote a great number of poems in Dutch; most of which are on moral subjects, and so esteemed, that they have been often printed in all the different sizes; and, next to the Bible, there is no work so highly valued by the Dutch.

CATZENELLIBOGEN, a town of Germany, in the duchy of Nassau, with a strong castle. It is capital of a county of the same name. E. Long. 7. 38. N. Lat. 50. 20.

CAVA, in *Anatomy*, the name of a vein, the largest in the body, terminating in the right ventricle of the heart. See Anatomy *Index*.

Cava, a considerable and populous town of Italy, in the kingdom of Naples, and in the Hither Principato, with a bishop's see. It is situated at the foot of Mount Metelian, in E. Long. 15. 5. N. Lat. 40. 40.

CAVAILLAN, a town of France, in the department of Vaucluse, and formerly a bishop's see. It is situated on the river Durance, in a fertile and pleasant country, and 20 miles south-east of Avignon. Population 7000. E. Long. 4. 17. N. Lat. 43. 52.

CAVALCADE, a formal pompous march or procession of horsemen, equipages, &c. by way of parade or ceremony, to grace a triumph, public entry, or the like.

CAVALCADOUR, or Cavalcadeur, anciently denoted a riding master; but at present is disused in that sense, and only employed to denote a sort of equerries or officers who have the direction of princes stables. The French say, *ecuyer cavalcadeur* of the king, the duke of Orleans, &c. Menage writes it *cavalcadour*, and derives it from the Spanish *cavalgadon*, a horseman.

CAVALCANTE, Guido, a nobleman of Florence in in the 13th century, who having followed the party of the Guelphs, experienced the changeableness of fortune. He showed great strength of mind in his misfortunes, and never neglected to improve his talents. He wrote a treatise in Italian concerning style, and some verses which are esteemed. His poem on the love of this world has been commented on by several learned men.

CAVALIER, a horseman, or person mounted on horseback: especially if he be armed withal, and have a military appearance.

Anciently the word was restrained to a knight, or *miles*. The French still use *Chevalier* in the same sense.

CAVALIER, considered as a faction. See BRITAIN, No. 109.

CAVALIER, in fortification, an elevation of earth of different shapes, situated ordinarily in the gorge of a bastion, bordered with a parapet, and cut into more or less embrasures, according to the capacity of the cavalier. Cavaliers are a double defence for the faces of the opposite bastion: they defend the ditch, break the besiegers galleries, command the traverses in dry moats, scour the salient angle of the counterscarp, where the besiegers have their counter batteries, and enfilade the enemy's trenches, or oblige them to multiply their parallels: they are likewise very serviceable in defending the breach and the retrenchments of the besieged.

CAVALIER, in the manege, one that understands horses, and is practised in the art of riding them.

CAVALIERI, BONAVENTURE, an eminent mathematician in the 17th century, a native of Milan, and a friar of the order of the Jesuati of St Jerome, was professor of the mathematics at Bologna, where he published several mathematical books, particularly the "Method of Indivisibles." He was a scholar of Galileo. His *Directorium generale Uranometricum* contains great variety of most useful practices in trigonometry and astronomy. His trigonometrical tables in that work are excellent.

CAVALLO, TIBERIUS, an eminent natural philosopher. See SUPPLEMENT.

CAVALRY, a body of soldiers that charge on horseback. The word comes from the French, *cavalerie*, and that from the corrupt Latin, *caballus*, a horse.

The Roman cavalry consisted wholly of those called *equites*, or knights, who were a distinct order in the distribution of citizens.—The Grecian cavalry were divided into *cataphractæ* and *non cataphractæ*, *i. e.* into heavy and light armed.—Of all the Greeks, the Thessalians excelled most in cavalry. The Lacedemonians, inhabiting a mountainous country, were but meanly furnished with cavalry, till, carrying their arms into other countries, they found great occasion for horse to support and cover their foot. The Athenian cavalry, for a considerable time, consisted only of 96 horsemen: after expelling the Persians out of Greece, they increased the number to 300; and afterwards to 1200, which was the highest pitch of the Athenian cavalry.

The chief use of the cavalry is to make frequent excursions to disturb the enemy, intercept his convoys, and destroy the country: in battle to support and cover the foot, and to break through and disorder the enemy: also to secure the retreat of the foot. Formerly, the manner of fighting of the cavalry was, after firing their pistols or carabines, to wheel off, to give opportunity for loading again. Gustavus Adolphus is said to have first taught the cavalry to charge through, to march straight up to the enemy, with the sword drawn in the bridle hand, and each man having fired his piece, at the proper distance, to betake himself to his sword, and charge the enemy as was found most advantageous.

CAVAN, a town of Ireland, and capital of a county of the same name, in the province of Ulster, situated in W. Long. 6. 32. N. Lat. 54. 0.

CAVAN, a county of Ireland, 47 miles in length and 23 in breadth; is bounded on the east by Monaghan, and on the south by Longford, West-Meath, and East-Meath. It has but two towns of any note, viz. Cavan and Kilmore. It contains 33 parishes, and in 1801 was computed to have 18,000 houses and 90,000 inhabitants. The county sends two members to the imperial parliament. It has nine market towns. See CAVAN, SUPPLEMENT.

CAVANILLES, ANTONIO JOSEPH, an eminent Spanish botanist. See SUPPLEMENT.

CAUBUL, an extensive country in Asia. See SUPPLEMENT.

CAUCASUS, the name of a very high mountain of Asia, being one of that great ridge which runs between the Black and Caspian seas. Sir John Chardin describes this as the highest mountain, and the most difficult to pass, of any he had seen. It has frightful precipices, and in many places the roads are cut out of the solid rock. At the time he passed it, the mountain was entirely covered with snow; so that, in many places, his guides behoved to clear the way with shovels. The mountain is 36 leagues over, and the summit of it eight leagues in breadth. The top is perpetually covered with snow; and our traveller relates, that the two last days he seemed to be in the clouds, and was not able to see 20 paces before him. Excepting the very top, however, all the parts of Mount Caucasus are extremely fruitful; abounding in honey, corn, fruits, hogs, and large cattle. The vines twine about the trees, and rise so high, that the inhabitants cannot gather the fruit from the uppermost branches. There are many streams of excellent water, and a vast number of villages. The inhabitants are for the most part Christians of the Georgian church. They have fine complexions, and the women are very beautiful.—In the winter they wear snow shoes in the form of rackets, which prevent their sinking in the snow, and enable them to run upon it with great swiftness.

CAUDEBEC, a rich, populous, and trading town, in Normandy, and capital of the territory of Caux. It is seated at the foot of a mountain near the river Seine, in E. Long. 0. 46. N. Lat. 40. 30.

CAUDEX, by Malpighi and other botanists, is used to signify the stem or trunk of a tree; by Linnæus, the stock or body of the root, part of which ascends, part descends. The ascending part raises itself gradually above ground, serving frequently for a trunk, and corresponds in some measure to the *caudex* of former writers; the descending part strikes gradually downward into the ground, and puts forth radicles or small fibres, which are the principal and essential part of every root. The descending caudex

dex therefore corresponds to the radix of other botanists. Agreeably to this idea, Linnæus considers trees and shrubs as roots above ground: an opinion which is confirmed by a well known fact, that trees, when inverted, put forth leaves from the descending caudex, and radicles or roots from the ascending. For the varieties in the descending caudex, see the article RADIX.

CAUDIUM, in *Ancient Geography*, a town of Samnium, on the Via Appia, between Calatia and Beneventum: *Caudinus*, the epithet. The *Caudinæ Furcæ, Furcatæ*, were memorable by the disgrace of the Romans; being spears disposed in the form of a gallows, under which prisoners of war were made to pass, and gave name to a defile or narrow pass near *Caudium* (Livy); where the Samnites obliged the Roman army and the two consuls to lay down their arms, and pass under the gallows, or yoke, as a token of subjection.

CAVE, any large subterraneous hollow. These were undoubtedly the primitive habitations, before men began to build edifices above ground. The primitive method of burial was also to reposite the bodies in caves, which seems to have been the origin of catacombs. They long continued the proper habitations of shepherds. Among the Romans, *caves* (*antra*) used to be consecrated to nymphs, who were worshiped in caves, as other gods were in temples. The Persians also worshipped their god Mithras in a natural cave consecrated for the purpose by Zoroaster. The cave of the nymph Egeria is still shown at Rome. Kircher, after Gaffarellus, enumerates divers species of caves; as divine, natural, &c.—Of natural caves some are possessed of a medicinal virtue, as the Grotto de Serpente; others are poisonous or mephitical: some are replete with metalline exhalations, and others with waters. Divine caves were those said to affect the human mind and passions in various ways, and even to inspire with a knowledge of future events. Such were the sacred caverns at Delphi which inspired the Pythia; the Sibyl's cave at Cumæ, still shown near the lake Avernus; the cave of Trophonius, &c.

CAVE, *Dr William*, a learned English divine, born in 1637, educated in St John's College, Cambridge; and successively minister of Hasely in Oxfordshire, Allhallows the Great in London, and of Islington. He became chaplain to Charles II. and in 1684 was installed a canon of Windsor. He compiled *the Lives of the Primitive Fathers in the three first Centuries of the Church*, which is esteemed a very useful work, and *Historia Literaria*, &c. in which he gives an exact account of all who had written for or against Christianity from the time of Christ to the 14th century: which works produced a very warm dispute between Dr Cave and M. le Clerc, who was then writing his *Bibliotheque Universelle* in Holland, and who charged the doctor with partiality. Dr Cave died in 1713.

CAVE, *Edward*, printer, celebrated as the projector of the *Gentleman's* MAGAZINE,—the first publication of the species, and since

The fruitful mother of a thousand more,

was born in 1691. His father being disappointed of some small family expectations, was reduced to follow the trade of a shoemaker at Rugby in Warwickshire. The free school of this place, in which his son had, by the rules of its foundation, a right to be instructed, was then in high reputation, under the Rev. Mr Holyock, to whose care most of the neighbouring families, even of the highest rank, intrusted their sons. He had judgment to discover, and for some time generosity to encourage, the genius of young Cave; and was so well pleased with his quick progress in the school, that he declared his resolution to breed him for the university, and recommend him as a servitor to some of his scholars of high rank. But prosperity which depends upon the caprice of others is of short duration. Cave's superiority in literature exalted him to an invidious familiarity with boys who were far above him in rank and expectations; and, as in unequal associations it always happens, whatever unlucky prank was played was imputed to Cave. When any mischief, great or small, was done, though perhaps others boasted of the stratagem when it was successful, yet upon detection or miscarriage, the fault was sure to fall to poor Cave. The harsh treatment he experienced from this source, and which he bore for a while, made him at last leave the school, and the hope of a literary education, to seek some other means of gaining a livelihood.

He was first placed with a collector of the excise; but the insolence of his mistress, who employed him in servile drudgery, quickly disgusted him, and he went up to London in quest of more suitable employment. He was recommended to a timber merchant at the Bankside; and while he was there on liking, is said to have given hopes of great mercantile abilities; but this place he soon left, and was bound apprentice to Mr Collins, a printer of some reputation, and deputy alderman. This was a trade for which men were formerly qualified by a literary education, and which was pleasing to Cave, because it furnished some employment for his scholastic attainments. Here, therefore, he resolved to settle, though his master and mistress lived in perpetual discord, and their house was therefore no comfortable habitation. From the inconveniences of these domestic tumults he was soon released, having in only two years attained so much skill in his art, and gained so much the confidence of his master, that he was sent without any superintendant to conduct a printing house at Norwich, and publish a weekly paper. In this undertaking he met with some opposition, which produced a public controversy, and procured young Cave the reputation of a writer.

His master died before his apprenticeship was expired, and he was not able to bear the perverseness of his mistress; he therefore quitted her house upon a stipulated allowance, and married a young widow, with whom he lived at Bow. When his apprenticeship was over, he worked as a journeyman at the printing-house of Mr Barbar, a man much distinguished and employed by the Tories, whose principles had at that time so much prevalence with Cave, that he was for some years a writer in Mist's Journal. He afterwards obtained by his wife's interest a small place in the post-office; but still continued, at his intervals of attendance, to exercise his trade, or to employ himself with some typographical business. He corrected the *Gradus ad Parnassum*; and was liberally rewarded by the Company

Company of Stationers. He wrote an Account of the Criminals, which had for some time a considerable sale; and published many little pamphlets that accident brought into his hands, of which it would be very difficult to recover the memory. By the correspondence which his place in the post-office facilitated, he procured a country newspaper, and sold their intelligence to a journalist in London for a guinea a-week. He was afterwards raised to the office of the clerk of the franks, in which he acted with great spirit and firmness; and often stopped franks which were given by members of parliament to their friends, because he thought such extension of a peculiar right illegal. This raised many complaints; and the influence that was exerted against him procured his ejectment from office. He had now, however, collected a sum sufficient for the purchase of a small printing office, and began the Gentleman's Magazine; an undertaking to which he owed the affluence in which he passed the last 20 years of his life, and the large fortune which he left behind him. When he formed the project, he was far from expecting the success which he found; and others had so little prospect of its consequence, that though he had for several years talked of his plan among printers and booksellers, none of them thought it worth the trial. That they were not (says Dr Johnson) restrained by their virtue from the execution of another man's design, was sufficiently apparent as soon as that design began to be gainful; for, in a few years, a multitude of magazines arose, and perished; only the London Magazine, supported by a powerful association of booksellers, and circulated with all the art and all the cunning of trade, exempted itself from the general fate of Cave's invaders, and obtained, though not an equal, yet a considerable sale.

Cave now began to aspire to popularity; and being a greater lover of poetry than any other art, he sometimes offered subjects for poems, and proposed prizes for the best performers. The first prize was 50l. for which, being but newly acquainted with wealth, and thinking the influence of 50l. extremely great, he expected the first authors of the kingdom to appear as competitors, and offered the allotment of the prize to the universities. But, when the time came, no name was seen among the writers that had been ever seen before; and the universities and several private men rejected the province of assigning the prize. The determination was then left to Dr Cromwell Mortimer and Dr Birch; and by the latter the award was made, which may be seen in Gent. Mag. vol. vi. p. 59.

Mr Cave continued to improve his Magazine, and had the satisfaction of seeing its success proportionate to his diligence, till in 1751 his wife died of an asthma. He seemed not at first much affected by her death, but in a few days lost his sleep and his appetite, which he never recovered. After having lingered about two years, with many vicissitudes of amendment and relapse, he fell by drinking acid liquors into a diarrhœa, and afterwards into a kind of lethargic insensibility; and died Jan. 10. 1754, having just concluded the 23d annual collection.

CAVEARE. See CAVIARE.

CAVEAT, in *Law*, a kind of process in the spiritual courts, to stop the proving of a will, the granting tithes of administration, &c. to the prejudice of another. It is also used to stop the institution of a clerk to a benefice.

CAVEATING, in fencing, is the shifting the sword from one side of that of your adversary to the other.

CAVEDO, in commerce, a Portuguese long measure, equal to $27\frac{354}{1000}$ English inches.

CAVENDISH, THOMAS, of Suffolk, the second Englishman that sailed round the globe, was descended from a noble family in Devonshire. Having dissipated his fortune, he resolved to repair it at the expence of the Spaniards. He sailed from Plymouth with two small ships in July 1586; passed through the straits of Magellan; took many rich prizes along the coasts of Chili and Peru; and near California, possessed himself of the St Ann, an Acapulco ship, with a cargo of immense value. He completed the circumnavigation of the globe, returning home round the Cape of Good Hope, and reached Plymouth again in September 1588. On his arrival, it is said that his soldiers and sailors were clothed in silk, his sails were damask, and his top-mast was covered with cloth of gold. His acquired riches did not last long: he reduced himself, in 1591, to the expedient of another voyage; which was far from being so successful as the former; he went no farther than the straits of Magellan, where the weather obliging him to return, he died of grief on the coast of Brasil.

CAVENDISH, *Sir William*, descended of an ancient and honourable family, was born about the year 1505, the second son of Thomas Cavendish of Cavendish in Suffolk, clerk of the pipe in the reign of Henry VIII. Having had a liberal education, he was taken into the family of the great Cardinal Wolsey, whom he served in the capacity of gentleman-usher of the chamber, when that superb prelate maintained the dignity of a prince. In 1527, he attended his master on his splendid embassy to France, returned with him to England, and was one of the few who continued faithful to him in his disgrace. Mr Cavendish was with him when he died, and delayed going to court till he had performed the last duty of a faithful servant by seeing his body decently interred. The king was so far from disapproving of his conduct, that he immediately took him into his household, made him treasurer of his chamber, a privy counsellor, and afterwards conferred on him the order of knighthood. He was also appointed one of the commissioners for taking the surrender of religious houses. In 1540, he was nominated one of the auditors of the court of augmentations, and soon after obtained a grant of several considerable lordships in Hertfordshire. In the reign of Edward VI. his estates were much increased by royal grants in seven different counties; and he appears to have continued in high favour at court during the reign of Queen Mary. He died in the year 1557. He was the founder of Chatsworth, and ancestor of the dukes of Devonshire. He wrote "The life and death of Cardinal Wolsey; printed at London in 1607; reprinted in 1706, under the title of "Memoirs of the great favourite Cardinal Wolsey."

CAVENDISH, *William*, Duke of Newcastle, grandson of Sir William Cavendish, was born in 1592. In 1610, he was made knight of the Bath; in 1620, raised to the dignity of a peer, by the title of Baron Ogle, Cavendish.

Ogle, and Viscount Mansfield; and in the third year of King Charles I. created earl of Newcastle upon Tyne, and Baron Cavendish of Bolesover. He was after this made governor to the prince of Wales, afterwards Charles II. When the first troubles broke out in Scotland, and the king's treasury was but indifferently provided, he contributed ten thousand pounds, and also raised a troop of horse, consisting of about two hundred knights and gentlemen, who served at their own charge, were commanded by the earl, and honoured with the title of *the prince's troop.* He had after this the command of the northern counties; and was constituted general and commander in chief of all the forces that might be raised north of Trent, and of several counties south of that river. He afterwards raised an army of eight thousand horse, foot, and dragoons; with which he took some towns, and gained several important victories. On this he was advanced to the dignity of marquis of Newcastle; but his majesty's affairs being totally ruined by the rashness of Prince Rupert, he, with a few of the principal officers of the army, went abroad, and staid for some time at Paris; where, notwithstanding the vast estate he had when the civil war broke out, his circumstances were now so bad, that himself and wife were reduced to the necessity of pawning their clothes for a dinner. He afterwards removed to Antwerp, that he might be nearer his own country: and there, though under great difficulties, resided for several years; but, notwithstanding his distresses, he was treated, during an exile of eighteen years, with extraordinary marks of distinction. On his return to England at the Restoration, he was advanced to the dignity of earl of Ogle, and duke of Newcastle. He spent his time in a country retirement, and was the patron of men of merit. His grace died in 1670, aged 84. He wrote a treatise on horsemanship, which is esteemed: and some comedies, which are not.

Mr Granger observes, that he was master of many accomplishments, and was much better qualified for a court than a camp; that he understood horsemanship, music, and poetry; but was a better horseman than musician, and a better musician than poet.

Cavendish, *Margaret*, duchess of Newcastle, famous for her voluminous productions, was born about the latter end of the reign of James I. and was the youngest sister of Lord Lucas of Colchester. She married the duke of Newcastle abroad in 1645; and on their return after the Restoration, spent the remainder of her life in writing plays, poems, with the life of her husband, to the amount of about a dozen of folios. "What gives the best idea of her unbounded passion for scribbling (says Mr Walpole), was her seldom revising the copies of her works, lest, as she said, it should disturb her following conceptions." She died in 1673.

Cavendish, *William*, the first duke of Devonshire, and one of the most distinguished patriots in the British annals, was born in 1640. In 1677, being then member for Derby, he vigorously opposed the venal measures of the court; and, the following year, was one of the committee appointed to draw up articles of impeachment against the lord treasurer Danby. In 1679, being re-elected to serve for Derby in a new parliament, Charles II. thought fit to make him a privy counsellor; but he soon withdrew from the board, with his friend Lord Russel, when he found that Popish interest prevailed. He carried up the articles of impeachment to the house of lords, against Lord-chief-justice Scroggs, for his arbitrary and illegal proceedings in the court of king's bench; and when the king declared his resolution not to sign the bill for excluding the duke of York (afterwards James II.) he moved the house of a commons, that a bill might be brought in for the association of all his majesty's Protestant subjects. He also openly named the king's evil counsellors, and voted for an address to remove them from his presence and councils for ever. He nobly appeared at Lord Russel's trial, in defence of that great man, at a time when it was scarce more criminal to be an accomplice than a witness for him. The same fortitude, activity, and love of his country, animated this illustrious patriot to oppose the arbitrary proceedings of James II.; and when he saw there was no other method of saving the nation from impending slavery, he was the foremost in the association for inviting over the prince of Orange, and the first nobleman who appeared in arms to receive him at his landing. He was created duke of Devonshire in 1694, by William and Mary. His last public service was in the union with Scotland, for concluding of which he was appointed a commissioner by Queen Anne. He died in 1707, and ordered the following inscription to be put on his monument.

Willielmus dux Devon,
Bonorum Principum Fidelis subditus,
Inimicus et Invisus Tyrannis.
William duke of Devonshire,
Of good Princes the faithful Subject,
The Enemy and Aversion of Tyrants.

Besides being thus estimable for public virtues, his grace was distinguished by his literary accomplishments. He had a poetical genius, which showed itself particularly in two pieces written with equal spirit, dignity, and delicacy: these are, an Ode on the Death of Queen Mary; and an allusion to the archbishop of Cambray's Supplement to Homer. He had great knowledge in the languages, was a true judge in history, and a critic in poetry; he had a fine hand in music, an elegant taste in painting, and in architecture had a skill equal to any person of the age in which he lived. His predecessor, Sir John Cavendish, was the person who killed the famous Wat Tyler in 1381.

Cavendish, *Henry*, an eminent chemist and natural philosopher. See Supplement.

Cavendish || Caviare.

CAVETTO, in *Architecture*, a hollow member, or round concave moulding, containing a quadrant of a circle, used as an ornament.

CAVEZON, in the manege, a sort of nose band, either of iron, leather, or wood, sometimes flat, and at other times hollow or twisted, clapt upon the nose of a horse to wring it, and so forward the suppling and breaking of the horse.

CAVIARE, a kind of food lately introduced into Britain. It is made of the hard roes of sturgeon *, formed into small cakes, about an inch thick, and three or four inches broad. The method of making it is, by taking out of the spawn all the nerves or strings, then washing it in white wine or vinegar, and spreading

* See *Acipenser*.

ing it on a table. It is then salted and pressed in a fine bag; after which it is cased up in a vessel with a hole at the bottom, that if any moisture is left it may run out. This kind of food is in great request among the Muscovites, on account of their three lents, which they keep with a superstitious exactness; wherefore the Italians settled at Moscow drive a very great trade in this commodity throughout that empire, there being a prodigious quantity of sturgeon taken at the mouth of the Wolga and other rivers which fall into the Caspian sea. A pretty large quantity of the commodity is also consumed in Italy and France. They get the caviare from Archangel, but commonly buy it at second hand of the English and Dutch.—According to Savary, the best caviare brought from Muscovy is prepared from the belluga, a fish eight or ten feet long, caught in the Caspian sea, which is much preferable to that made of the spawn of a sturgeon. A kind of caviare, or rather sausage, is also made from the spawn of some other fishes; particularly a sort of mullet caught in the Mediterranean. See MUGIL and BOTARGO.

CAVIDOS. See CABIDOS.

CAVIL (*cavillatio*), is defined by some a fallacious kind of reason, carrying some resemblance of truth, which a person, knowing its falsehood, advances in dispute for the sake of victory. The art of framing sophisms or fallacies is called by Boethius *cavillatoria*.

CAUK, or CAWK. See BARYTES, CHEMISTRY and MINERALOGY *Index*.

CAUKING, or *CAULKING of a Ship*, is driving a quantity of oakum, or old ropes untwisted and drawn asunder, into the seams of the planks, or into the intervals where the planks are joined together in the ship's decks or sides, in order to prevent the entrance of water. After the oakum is driven very hard into these seams, it is covered with hot melted pitch or rosin, to keep the water from rotting it.

Among the ancients, the first who made use of pitch in caulking, were the inhabitants of Phæacia, afterwards called Corsica. Wax and rosin appear to have been commonly used previous to that period; and the Poles at this time use a sort of unctuous clay for the same purpose on their navigable rivers.

CAULKING Irons, are iron chissels for that purpose. Some of these irons are broad, some round, and others grooved. After the seams are stopped with oakum, it is done over with a mixture of tallow, pitch, and tar, as low as the ship draws water.

CAUL, in *Anatomy*, a membrane in the abdomen, covering the greatest part of the guts; called, from its structure, *Reticulum*, but most frequently *Omentum*. See ANATOMY *Index*.

CAUL is likewise a little membrane, found on some children, encompassing the head when born.

Drelincourt takes the *caul* to be only a fragment of the membranes of the fœtus; which ordinarily break at the birth of the child. Lampridius tells us, that the midwives sold this *caul* at a good price to the advocates and pleaders of his time; it being an opinion, that while they had this about them, they should carry with them a force of persuasion which no judge could withstand; the canons forbid the use of it, because some witches and sorcerers, it seems, had abused it.

CAULIFLOWERS, in *Gardening*, a much esteemed species of cabbage. See BRASSICA.

CAURIS, in *Natural History*, a name given by some to the genus of shells called, by the generality of writers, *porcellana* and *concha venerea*. It is from a false pronunciation of this word *cauris* that these shells are called *cowries*. See *PORCELAIN Shell*, CONCHOLOGY *Index*.

CAURSINES (*Caursini*), were Italians that came into England about the year 1235, terming themselves *the pope's merchants*, but driving no other trade than letting out money; and having great banks in England, they differed little from Jews, save (as history says) they were rather more merciless to their debtors. Some will have them called *Coursines*, quasi *Causa Ursini*, bearish, or cruel in their causes; others *Caorsini* or *Corsini*, as coming from the isle of Corsica; but Cowel says, they have their name from *Caorsium*, *Caorsi*, a town in Lombardy, where they first practised their arts of usury and extortion; from whence spreading themselves, they carried their infamous trade through most parts of Europe, and were a common plague to every nation where they came. The then bishop of London excommunicated them; and King Henry III. banished them from the kingdom in the year 1240. But, being the pope's solicitors and money changers, they were permitted to return in the year 1250; though in a very short time they were again driven out of the kingdom on account of their intolerable exactions.

CAUSA MATRIMONII PRÆLOCUTI, in common law, a writ that lies where a woman gives lands to a man in fee to the intent he shall marry her, and he refuses to do it in a reasonable time, being thereupon required by the woman; and in such case, for not performing the condition, the entry of the woman into the lands again has been adjudged lawful.

The husband and wife may sue this writ against another who ought to have married her.

CAUSALITY, among metaphysicians, the action or power of a cause in producing its effect.

CAUSALTY, among miners, denotes the lighter, sulphureous, earthy parts of ores, carried off in the operation of washing. This, in the mines, they throw in heaps upon banks, which in six or seven years they find it worth their while to work over again.

CAUSE, that from whence any thing proceeds, or by virtue of which any thing is done; it stands opposed to effect. We get the ideas of cause and effect from our observation of the vicissitude of things, while we perceive some qualities or substances begin to exist, and that they receive their existence from the due application and operation of other beings. That which produces, is the cause; and that which is produced, the effect; thus, fluidity in wax is the effect of a certain degree of heat, which we observe to be constantly produced by the application of such heat.

Aristotle, and the schoolmen after him, distinguished four kinds of causes; the efficient, the material, the formal, and the final. This, like many of Aristotle's distinctions, is only a distinction of the various meanings of an ambiguous word; for the efficient, the matter, the form, and the end, have nothing common in their nature, by which they may be accounted species of the same *genus*; but the Greek word, which we translate

Reid on the Active Powers of Man.

Cause. translate *cause*, had these four different meanings in Aristotle's days, and we have added other meanings. We do not indeed call the matter or the form of a thing its cause; but we have final causes, instrumental causes, occasional causes, and many others. Thus the word cause has been so hackneyed, and made to have so many different meanings in the writings of philosophers, and in the discourse of the vulgar, that its original and proper meaning is lost in the crowd.

With regard to the phenomena of nature, the important end of knowing their causes, besides gratifying our curiosity, is, that we may know when to expect them, or how to bring them about. This is very often of real importance in life; and this purpose is served, by knowing what, by the course of nature, goes before them and is connected with them; and this, therefore, we call the *cause* of such a phenomenon.

If a magnet be brought near to a mariner's compass, the needle, which was before at rest, immediately begins to move, and bends its course towards the magnet, or perhaps the contrary way. If an unlearned sailor is asked the cause of this motion of the needle, he is at no loss for an answer. He tells you it is the magnet; and the proof is clear; for, remove the magnet, and the effect ceases; bring it near, and the effect is again produced. It is, therefore, evident to sense, that the magnet is the cause of this effect.

A Cartesian philosopher enters deeper into the cause of this phenomenon. He observes, that the magnet does not touch the needle, and therefore can give it no impulse. He pities the ignorance of the sailor. The effect is produced, says he, by magnetic effluvia, or subtle matter, which passes from the magnet to the needle, and forces it from its place. He can even shew you, in a figure, where these magnetic effluvia issue from the magnet, what round they take, and what way they return home again. And thus he thinks he comprehends perfectly how, and by what cause, the motion of the needle is produced.

A Newtonian philosopher inquires what proof can be offered for the existence of magnetic effluvia, and can find none. He therefore holds it as a fiction, a hypothesis; and he has learned that hypothesis ought to have no place in the philosophy of nature. He confesses his ignorance of the real cause of this motion, and thinks that his business as a philosopher is only to find from experiment the laws by which it is regulated in all cases.

These three persons differ much in their sentiments with regard to the real cause of this phenomenon; and the man who knows most is he who is sensible that he knows nothing of the matter. Yet all the three speak the same language, and acknowledge that the cause of this motion is the attractive or repulsive power of the magnet.

What has been said of this, may be applied to every phenomenon that falls within the compass of natural philosophy. We deceive ourselves, if we conceive that we can point out the real efficient cause of any one of them.

The grandest discovery ever made in natural philosophy, was that of the law of gravitation, which opens such a view of our planetary system, that it looks like something divine. But the author of this discovery was perfectly aware that he discovered no real cause,

but only the law or rule according to which the unknown cause operates. Cause.

Natural philosophers, who think accurately, have a precise meaning to the terms they use in the science; and when they pretend to shew the cause of any phenomenon of nature, they mean by the cause, a law of nature of which that phenomenon is a necessary consequence.

The whole object of natural philosophy, as Newton expressly teaches, is reducible to these two heads: first, by just induction from experiment and observation, to discover the laws of nature; and then to apply those laws to the solution of the phenomena of nature. This was all that this great philosopher attempted, and all that was thought attainable. And this indeed he attained in a great measure, with regard to the motions of our planetary system, and with regard to the rays of light.

But supposing that all the phenomena which fall within the reach of our senses were accounted for from general laws of nature justly deduced from experience; that is, supposing natural philosophy brought to its utmost perfection: it does not discover the efficient cause of any one phenomenon in nature.

The laws of nature are the rules according to which the effects are produced; but there must be a cause which operates according to these rules. The rules of navigation never navigated a ship. The rules of architecture never built a house.

Natural philosophers, by great attention to the course of nature, have discovered many of her laws, and have very happily applied them to account for many phenomena: but they have never discovered the efficient cause of any one phenomenon; nor do those who have distinct notions of the principles of the science make any such pretence.

Upon the theatre of nature we see innumerable effects which require an agent endowed with active power: but the agent is behind the scene. Whether it be the Supreme cause alone, or a subordinate cause or causes; and if subordinate causes be employed by the Almighty, what their nature, their number, and their different offices may be, are things hid, for wise reasons, without doubt, from the human eye.

CAUSE, among civilians, the same with action. See ACTION.

CAUSE, among physicians. The cause of a disease is defined by Galen to be that during the presence of which we are ill, and which being removed, the disorder immediately ceases. The doctrine of the causes of diseases is called ETIOLOGY.

Physicians divide causes into procatarctic, antecedent, and continent.

Procatarctic CAUSE (αιτια προκαταρκτικη), called also *primitive* and *incipient cause*, is either an occasion which of its own nature does not beget a disease, but happening on a body inclined to diseases, breeds a fever, gout, &c. (such as are watching, fasting, and the like); or an evident and manifest cause, which immediately produces the disease, as being sufficient thereto, such as is a sword in respect of a wound.

Antecedent CAUSE, (αιτια προηγουμενη), a latent disposition of the body, from whence some disease may arise: such as a plethora in respect of a fever, a cacochymia in respect of a scurvy.

Continent,

Cause Causticity.

Continent, Conjunct, or *Proximate* CAUSE, that principle in the body which immediately adheres to the disease, and which being present, the disease is also present: or, which being removed, the disease is taken away: such is the stone in a nephritic patient.

CAUSEWAY, or CAUSEY, a massive construction of stones, stakes, and fascines; or an elevation of fat viscous earth, well beaten: serving either as a road in wet marshy places, or as a mole to retain the waters of a pond, or prevent a river from overflowing the lower grounds. See ROAD.—The word comes from the French *chaussee*, anciently wrote *chaulsée;* and that from the Latin *calceata*, or *calcata;* according to Somner and Spelman, *à calcando.* Bergier rather takes the word to have had its rise *à peditum calceis, quibus teruntur.* Some derive it from the Latin *calx*, or French *chaux*, as supposing it primarily to denote a way paved with chalk stones.

CAUSEWAY, (*calcetum* or *calcea*), more usually denotes a common hard raised way, maintained and repaired with stones and rubbish.

Devil's CAUSEWAY, a famous work of this kind, which ranges through the county of Northumberland, commonly supposed to be Roman, though Mr Horsley suspects it to be of later times.

Giant's CAUSEWAY, is a denomination given to a huge pile of stony columns in the district of Coleraine in Ireland. See *GIANT's Causeway.*

CAUSSIN, NICHOLAS, surnamed the Just, a French Jesuit, was born at Troyes in Champagne, in the year 1580; and entered into the Jesuits order when he was 26 years of age. He taught rhetoric in several of their colleges, and afterwards began to preach, by which he gained very great reputation. He increased this reputation by publishing books, and in time was preferred to be confessor to the king. But he did not discharge this office to the satisfaction of Cardinal Richelieu, though he discharged it to the satisfaction of every honest man; and therefore it is not to be wondered at that he came at length to be removed. He died in the Jesuits convent at Paris in 1651. None of his works did him more honour than that which he entitled *La Cour Sainte.* It has been printed a great many times; and translated into Latin, Italian, Spanish, Portuguese, German, and English. He published several other books both in Latin and French.

CAUSTICITY, a quality belonging to several substances, by the acrimony of which the parts of living animals may be corroded and destroyed. Bodies which have this quality, when taken internally, are true poisons. The causticity of some of these, as of arsenic, is so deadly, that even their external use is proscribed by prudent physicians. Several others, as nitrous acid, lapis infernalis or lunar caustic, common caustic, butter of antimony, are daily and successfully used to consume fungous flesh, to open issues, &c. They succeed very well when properly employed and skilfully managed.

The causticity of bodies depends entirely on the state of the saline, and chiefly of the acid matters they contain. When these acids happen to be at the same time much concentrated, and slightly attached to the matters with which they are combined, they are then capable of acting, and are corrosive or caustic. Thus fixed and volatile alkalies, although they are themselves caustic, become much more so by being treated with quicklime; because this substance deprives them of all their fixed air, or carbonic acid, to which they owe their mildness. By this treatment, then, the saline principle is more disengaged, and rendered more capable of action. Also all combinations of metallic matters with acids form salts more or less corrosive, because these acids are deprived of all their superabundant water, and are besides but imperfectly saturated with the metallic matters. Nevertheless, some other circumstance is necessary to constitute the causticity of these saline metalline matters. For the same quantity of marine acid, which, when pure and diluted with a certain quantity of water, would be productive of no harm, shall, however, produce all the effects of a corrosive poison, when it is united with mercury in *corrosive sublimate*, although the sublimate shall be dissolved in so much water that its causticity cannot be attributed to the concentration of its acid. This effect is, by some chemists, attributed to the great weight of the metallic matters, with which the acid is united; and this opinion is very probable, seeing its causticity is nothing but its dissolving power, or its disposition to combine with other bodies; and this disposition is nothing else than attraction.

On this subject Dr Black observes, that the compounds produced by the union of the metals with acids are in general corrosive. Many of them applied to the skin destroy it almost as fast as the mineral acids; and some of the most powerful potential cauteries are made in this way. Some are reckoned more acrid than the pure acids themselves; and they have more powerful effects when taken internally, or at least seem to have. Thus we can take 10 or 12 drops of a fossil acid, diluted with water, without being disturbed by it; but the same quantity of acid previously combined with silver, quicksilver, copper, or regulus of antimony, will throw the body into violent disorders, or even prove a poison, if taken all at once.

This increased activity was, by the mechanical philosophers, supposed to arise from the weight of the metallic particles. They imagined that the acid was composed of minute particles of the shape of needles or wedges; by which means they were capable of entering the pores of other bodies, separating their atoms from each other, and thus dissolving them. To these acid spiculæ the metallic particles gave more force; and the momentum of each particular needle or wedge was increased in proportion to its increase of gravity by the additional weight of the metallic particle. But this theory is entirely fanciful, and does not correspond with facts. The activity of the compound is not in proportion to the weight of the metal; nor are the compounds always possessed of any great degree of acrimony: neither is it true that any of them have a greater power of destroying animal substances than the pure acids have.

There is a material difference between the powers called *stimuli* and *corrosives.* Let a person apply to any part of the skin a small quantity of lunar caustic, and likewise a drop of strong nitrous acid, and he will find that the acid acts with more violence than the caustic; and the disorders that are occasioned by the compounds of metals and acids do not proceed from a *causticity* in them, but from the metal affecting and proving a stimulus to the nerves: and that this is the case,

case, appears from their affecting some particular nerves of the body. Thus the compounds of antimony and mercury with the vegetable acids, do not show the smallest degree of acrimony; but, taken internally, they produce violent convulsive motions over the whole body, which are occasioned by the metallic matter having a power of producing this effect; and the acid is only the means of bringing it into a dissolved state, and making it capable of acting on the nervous system. In general, however, the compounds of metallic substances with acids may be considered as milder than the acids in a separate state; but the acid is not so much neutralized as in other compounds, for it is less powerfully attracted by the metal; so that alkaline salts, absorbent earths, or even heat alone, will decompound them; and some of the inflammable substances, as spirit of wine, aromatic oils, &c. will attract the acid, and precipitate the metal in its metallic form: and the metals can be employed to precipitate one another in their metallic form; so that the cohesion of these compounds is much weaker than those formed of the same acids with alkaline salts or earths.

CAUSTICS, is an appellation given to substances of so hot and fiery a nature, that, being applied, they consume, and as it were burn, the texture of the parts, like hot iron.

Caustics are generally divided into four sorts; the common stronger caustic, the common milder caustic, the antimonial caustic, and the lunar caustic. See PHARMACY and CHEMISTRY *Index*.

CAUSTIC Curve, in the higher geometry, a curve formed by the concourse or coincidence of the rays of light reflected from some other curve.

CAUSUS, or BURNING FEVER, a species of continual fever, accompanied with a remarkable inflammation of the blood.

CAUTERIZATION, the act of burning or searing some morbid part, by the application of fire either actual or potential. In some places they cauterize with burning tow, in others with cotton or moxa, in others with live coals; some use Spanish wax, others pyramidal pieces of linen, others gold or silver; Severinus recommends flame blown through a pipe; but what is usually preferred among us is a hot iron.

Cauterizing irons are of various figures; some flat, others round, some curved, &c. of all which we find draughts in Albucasis, Scultetus, Ferrara, and others. Sometimes a cautery is applied through a capsula, to prevent any terror from the sight of it. This method was invented by Placentius, and is described by Scultetus. In the use of all cauteries, care is to be taken to defend the neighbouring parts, either by a lamina, defensive plaster, or lint moistened in oxycrate. Sometimes the hot iron is transmitted through a copper cannula, for the greater safety of the adjoining parts. The degrees and manners of cauterizing are varied according to the nature of the disease and the part affected.

CAUTERY, in *Surgery*, a medicine for burning, eating, or corroding any solid part of the body.

Cauteries are distinguished into two classes: actual and potential: by actual cauteries are understood red hot instruments, usually of iron; and by potential cauteries are understood certain kinds of corroding medicines. See PHARMACY.

CAUTION, in the *Civil* and *Scots Law*, denotes much the same with what, in the law of England, is called BAIL.

CAUTIONER, in *Scots Law*, that person who becomes bound for another to the performance of any deed or obligation. As to the different kinds and effects of cautionry, see LAW, Part III. No. clxxv. 19.

CAWK. See CAUK.

CAXA, a little coin made of lead mixed with some scoria of copper, struck in China, but current chiefly at Bantam in the island of Java, and some of the neighbouring islands. See (the *Table* subjoined to) MONEY.

CAXAMALCA, the name of a town and district of Peru in South America, where there was a most sumptuous palace belonging to the Incas, and a magnificent temple dedicated to the sun.

CAXTON, WILLIAM, a mercer of London, eminent by the works he published, and for being *reputed* the first who introduced and practised the art of printing in England; as to which, see *(the History of)* PRINTING.

CAYENNE, a rich town and island of South America, and capital of the French settlements there, is bounded on the north by the Dutch colonies of Surinam, and situated in W. Long. 53. 10. N. Lat. 50.

This settlement was begun in 1646. A report had prevailed for some time before, that in the interior parts of Guiana, there was a country known by the name of *El Dorada*, which contained immense riches in gold and precious stones; more than ever Cortez and Pizarro had found in Mexico and Peru; and this fable had fired the imagination of every nation in Europe. It is supposed that this was the country in quest of which Sir Walter Raleigh went on his last voyage; and as the French were not behind their neighbours in their endeavours to find out so desirable a country, some attempts for this purpose were likewise made by that nation much about the same time; which at last coming to nothing, the adventurers took up their residence on the island of Cayenne. In 1643, some merchants of Rouen united their stock, with a design to support the new colony; but, committing their affairs to one Poncet de Bretigny, a man of a ferocious disposition, he declared war both against the colonists and savages, in consequence of which he was soon massacred. This catastrophe entirely extinguished the ardour of these associates; and in 1651, a new company was established. This promised to be much more considerable than the former; and they set out with such a capital as enabled them to collect 700 or 800 colonists in the city of Paris itself. These embarked on the Seine, in order to sail down to Havre de Grace; but unfortunately the abbé de Marivault, a man of great virtue, and the principal promoter of the undertaking, was drowned as he was stepping into his boat. Another gentleman, who was to have acted as general, was assassinated on his passage, and 12 of the principal adventurers who had promised to put the colony into a flourishing situation, not only were the principal perpetrators of this fact, but uniformly behaved in the same atrocious manner. At last they hanged one of their own number; two died; three were banished to a a desert island; and the rest abandoned themselves to every kind of excess. The commandant of the citadel deserted to the Dutch with part of his garrison. The savages, roused by numberless provocations, fell upon the remainder: so that the few who were left thought themselves happy in escaping to the Leeward islands in a boat and two canoes, abandoning the fort, ammunition, arms, and merchandise, fifteen months after they had landed on the island.

In 1663, a new company was formed, whose capital amounted only to 8750l. By the assistance of the ministry they expelled the Dutch who had taken possession of the island, and settled themselves much more comfortably than their predecessors. In 1667 the island was taken by the English, and in 1676 by the Dutch, but afterwards restored to the French: and since that time it has never been attacked. Soon after some pirates, laden with the spoils they had gathered in the South seas, came and fixed their residence at Cayenne; resolving to employ the treasures they had acquired in the cultivation of the lands. In 1688, Ducasse, an able seaman, arrived with some ships from France, and proposed to them the plundering of Surinam. This was agreed to. The expedition, however, proved unfortunate. Many of the assailants were killed, and all the rest taken prisoners and sent to the Caribbee islands. Cayenne surrendered to the British in 1809, but was restored to France at the peace of Paris in 1814.

The island of Cayenne is about 16 leagues in circumference, and is only parted from the continent by two rivers. By a particular formation, uncommon in islands, the land is higher near the water side, and low in the middle. Hence the island is so full of morasses, that all communication between the different parts of it is impossible, without taking a great circuit. There are some small tracts of an excellent soil to be found here and there; but the generality is dry, sandy, and soon exhausted. The only town in the colony is defended by a covert way, a large ditch, a very good mud rampart, and five bastions. In the middle of the town is a pretty considerable eminence, of which a redoubt has been made that is called the *fort*. The entrance into the harbour is through a narrow channel; and ships can only get in at high water, through the rocks and reefs that are scattered about this pass.

The first produce of Cayenne was the arnotto; from the culture of which the colonists proceeded to that of cotton, indigo, and lastly sugar. It was the first of all the French colonies that attempted to cultivate coffee. The coffee tree was brought from Surinam in 1721 by some deserters from Cayenne, who purchased their pardon by so doing. Ten or twelve years after they planted cacao. In the year 1752 there were exported from Cayenne 260,541 pounds of arnotto, 80,363 pounds of sugar, 17,919 pounds of cotton, 26,881 pounds of coffee, 91,016 pounds of cacao, 618 trees for timber, and 104 planks.

CAYLUS, Count de, Marquis de Sternay, Baron de Bronsac, was born at Paris in 1692. He was the eldest of the two sons of John Count de Caylus, lieutenant general of the armies of the king of France, and of the marchioness de Villette. The count and countess, his father and mother, were very careful of the education of their son. The former instructed him in the profession of arms, and in bodily exercises; the latter watched over and fostered the virtues of his mind, and this delicate task she discharged with singular success. The countess was the niece of Madame de Maintenon, and was remarkable both for the solidity of her understanding and the charms of her wit. She was the author of that agreeable book entitled "The Recollections of Madame de Caylus," of which Voltaire lately published an elegant edition. The amiable qualities of the mother appeared in the son; but they appeared with a bold and military air. In his natural temper he was gay and sprightly, had a taste for pleasure, a strong passion for independence, and an invincible aversion to the servitude of a court. Such were the instructors of the count de Caylus. He was only twelve years of age when his father died at Brussels in 1704. After finishing his exercises, he entered into the corps of the *Musquetoires;* and in his first campaign in the year 1709, he distinguished himself by his valour in such a manner, that Louis XIV. commended him before all the court, and rewarded him with an ensigncy in the *Gendarmerie.* In 1711 he commanded a regiment of dragoons, which was called by his own name; and he signalized himself at the head of it in Catalonia. In 1713, he was at the siege of Fribourg, where he was exposed to imminent danger in the bloody attack of the covered way. The peace of Rastadt having left him in a state of inactivity ill suited to his natural temper, his vivacity soon carried him to travel into Italy: and his curiosity was greatly excited by the wonders of that country, where antiquity is still fruitful, and produces so many objects to improve taste and to excite admiration. The eyes of the count were not yet learned; but he was struck with the sight of so many beauties, and soon became acquainted with them. After a year's absence, he returned to Paris with so strong a passion for travelling and for antiquities, as induced him to quit the army.

He had no sooner quitted the service of Louis, than he sought for an opportunity to set out for the Levant. When he arrived at Smyrna, he visited the ruins of Ephesus. From the Levant he was recalled in February 1717 by the tenderness of his mother. From that time he left not France, but to make two excursions to London. The Academy of Painting and Sculpture adopted him an honorary member in the year 1731; and the count, who loved to realize titles, spared neither his labour, nor his credit, nor his fortune, to instruct, assist, and animate the artists. He wrote the lives of the most celebrated painters and engravers that have done honour to this illustrious academy; and, in order to extend the limits of the art, which seemed to him to move in too narrow a circle, he collected, in three different works, new subjects for the painter, which he had met with in the works of the ancients.

Such was his passion for antiquity, that he wished to have had it in his power to bring the whole of it to life again. He saw with regret, that the works of the ancient painters, which have been discovered in our times, are effaced and destroyed almost as soon as they are drawn from the subterraneous mansions where they were buried. A fortunate accident furnished,

nished him with the means of showing us the composition and the colouring of the pictures of ancient Rome. The coloured drawings which the famous Pietro Sante Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the king of France's cabinet with them, he gave an edition of them at his own expence. It is perhaps the most extraordinary book of antiquities that ever will appear. The whole is painted with a purity and precision that are inimitable; we see the liveliness and the freshness of the colouring that charmed the Cæsars. There were only 30 copies published; and there is no reason to expect that there will hereafter be any more.

Count de Caylus was engaged at the same time in an enterprise still more favourable to Roman grandeur, and more interesting to the French nation. Colbert had framed the design of engraving the Roman antiquities that are still to be seen in the southern provinces of France. By his orders Mignard the architect had made drawings of them, which Count de Caylus had the good fortune to recover. He resolved to finish the work begun by Colbert, and to dedicate it to that great minister; and so much had he this enterprise at heart, that he was employed in it during his last illness, and warmly recommended it to M. Mariette.

In 1742, Count Caylus was admitted honorary member of the Academy of Belles Lettres; and then it was that he seemed to have found the place for which nature designed him. The study of literature now became his ruling passion; he consecrated to it his time and his fortune; he even renounced his pleasures to give himself wholly up to that of making some discovery in the field of antiquity. But amidst the fruits of his research and invention, nothing seemed more flattering to him than his discovery of encaustic painting. A description of Pliny's, but too concise a one to give him a clear view of the matter, suggested the idea of it. He availed himself of the friendship and skill of M. Magault, a physician in Paris, and an excellent chemist; and by repeated experiments found out the secret of incorporating wax with divers tints and colours, and of making it obedient to the pencil. Pliny has made mention of two kinds of encaustic painting practised by the ancients; one of which was performed with wax, and the other upon ivory, with hot punches of iron. It was the former that Count Caylus had the merit of reviving: and M. Muntz afterwards made many experiments to carry it to perfection.

In the hands of Count Caylus, literature and the arts lent each other a mutual aid. But it would be endless to give an account of all his works. He published above 40 dissertations in the Memoirs of the Academy of Belles Lettres. The artists he was particularly attentive to; and to prevent their falling into mistakes from an ignorance of costume, which the ablest of them have sometimes done, he founded a prize of 500 livres, the object of which is to explain, by means of authors and monuments, the usages of ancient nations. In order that he might enjoy with the whole world the treasures he had collected, he caused them to be engraved, and gave a learned description of them in a work which he embellished with 800 copperplates.

The strength of his constitution seemed to give him hopes of a long life; but a humour settling in one of his legs, which entirely destroyed his health, he expired on the 5th of September 1765, and by his death his family is extinct. The tomb erected to the honour of Count Caylus is to be seen in the chapel of St Germain l'Auxerrois, and deserves to be remarked. It is perfectly the tomb of an antiquary. This monument was an ancient sepulchral antique, of the most beautiful porphyry, with ornaments in the Egyptian taste. From the moment he procured it, he had destined it to grace the place of his interment. While he awaited the fatal hour, he placed it in his garden, where he used to look upon it with a tranquil but thoughtful eye, and pointed it out to the inspection of his friends.

The character of Count Caylus is to be traced in the different occupations which divided his cares and his life. In society, he had all the frankness of a soldier, and a politeness which had nothing in it of deceit or circumvention. Born independent, he applied to studies which suited his taste. His heart was yet better than his abilities. In his walks he used frequently to try the honesty of the poor, by sending them with a piece of money to get change for him. In these cases he enjoyed their confusion at not finding him; and then presenting himself, used to commend their honesty, and give them double the sum. He said frequently to his friends, "I have this day lost a crown; but I was sorry that I had not an opportunity of giving a second. The beggar ought not to want integrity."

CAYSTER, or CAYSTRUS, in *Ancient Geography*, a river of Ionia, whose mouth Ptolemy places between Colophon and Ephesus; commended by the poets for its swans, which it had in great numbers. Its source was in the Montes Cilbiani, (Pliny). *Caÿstrius Campus* was a part of the territory of Ephesus. *Campi Caÿstriani* of Lydia were plains lying in the middle between the inland parts and Mount Tmolus.

CAZEROM, or CAZERON, a city of Asia, in Persia, situated in E. Long. 70. N. Lat. 29. 15.

CAZIC, or CAZIQUE, a title given by the Spaniards to the petty kings, princes, and chiefs, of the several countries of America, excepting those of Peru, which are called *curatas*. The French call them *casiques*, a denomination which they always give to the Tartarian hordes.—The cazics, in some places, do the office of physicians, and in others of priests, as well as of captains. The dignity of cazic among the Chiites, a people of South America, does not descend to children, but must be acquired by valour and merit. One of the prerogatives attached to it is, that the cazic may have three wives, while the other people are allowed only one. Mexico comprehended a great number of provinces and islands, which were governed by lords called *caziques*, dependent on and tributary to the emperor. Thirty of these vassals are said to have been so powerful, that they were able, each of them, to bring an army of 100,000 men into the field.

CAZIMIR, a handsome town of Poland, in the palatinate of Lublin, situated on a hill covered with trees, in E. Long. 3. 10. N. Lat. 51. 5.

CEA. See CEOS.

CEANOTHUS. NEW-JERSEY TEA. See BOTANY *Index*.

CEBES,

CEBES, of Thebes, a Socratic philosopher, author of the admired *Table of Cebes;* or, "Dialogues on the Birth, Life, and Death of Mankind." He flourished about 405 years before Christ.—The above piece is mentioned by some of the ancient writers, by Lucian, D. Laertius, Tertullian, and Suidas: but of Cebes himself we have no account, save that he is once mentioned by Plato, and once by Xenophon. The former says of him, in his "Phædo," that he was a sagacious investigator of truth, and never assented without the most convincing reasons: the latter, in his "Memorabilia," ranks him among the few intimates of Socrates, who excelled the rest in the innocency of their lives. Cebes's *Tabula* is usually printed with Epictetus's *Manuale.*

CECIL, William, Lord Burleigh, treasurer of England in the reign of Queen Elizabeth, was the son of Richard Cecil, Esq. master of the robes to King Henry VIII. He was born in the house of his grandfather, David Cecil, Esq. at Bourn in Lincolnshire, in the year 1520; and received the rudiments of his education in the grammar-school at Grantham. From thence he was removed to Stamford; and about the year 1535, was entered of St John's College, Cambridge. Here he began his studies with a degree of enthusiastic application very uncommon in young gentlemen of family. At the age of 16 he read a sophistry lecture, and at 19 a voluntary Greek lecture, which was the more extraordinary as being at a time when the Greek language was by no means universally understood. In 1541 he went to London, and became a member of the society of Gray's Inn, with an intention to study the law; but he had not been long in that situation before an accident introduced him to King Henry, and gave a new bias to his pursuits. O'Neil, a famous Irish chief, coming to court, had brought with him two Irish chaplains, violent bigots to the Romish faith; with these Mr Cecil, visiting his father, happened to have a warm dispute in Latin, in which he displayed uncommon abilities. The king, being informed of it, ordered the young man into his presence, and was so pleased with his conversation, that he commanded his father to find a place for him. He accordingly requested the reversion of the *custos brevium*, which Mr Cecil afterwards possessed. About this time he married the sister of Sir John Cheke, by whom he was recommended to the earl of Hertford, afterwards duke of Somerset, and protector.

Soon after King Edward's accession, Mr Cecil came into the possession of the office of *custos brevium*, worth about 240l. a-year. His first lady dying in 1543, he married the daughter of Sir Anthony Cook, director of the king's studies. In 1547, he was appointed by the protector master of requests; and soon after attended his noble patron on his expedition against the Scots, and was present at the battle of Musselburgh. In this battle, which was fought on the 10th of September 1547, Mr Cecil's life was miraculously preserved by a friend, who on pushing him out of the level of a cannon, had his arm shattered to pieces. The sight and judgment of his friend must have been as extraordinary as his friendship, to perceive the precise direction of a cannon shot; unless we suppose, that the ball was almost quite spent; in which case the thing is not impossible. The story is told in his life by a domestic. In the year 1548, Mr Cecil was made secretary of state; but in the following year, the duke of Northumberland's faction prevailing, he suffered in the disgrace of the protector Somerset, and was sent prisoner to the Tower. After three months confinement he was released; in 1551 restored to his office; and soon after knighted, and sworn of the privy council. In 1553, he was made chancellor of the order of the Garter, with an annual fee of 100 merks.

Cecil.

On the death of Edward VI. Mr Cecil prudently refused to have any concern in Northumberland's attempt in favour of the unfortunate Lady Jane Gray: and when Queen Mary succeeded to the throne, he was graciously received at court; but not choosing to change his religion, was dismissed from his employments. During this reign, he was twice elected knight of the shire for the county of Lincoln; and often spoke in the house of commons with great freedom and firmness, in opposition to the ministry. Nevertheless, though a Protestant and a *patriot* (that is, a courtier out of place), he had the address to steer through a very dangerous sea without a shipwreck.

Queen Elizabeth's accession in the year 1558 immediately dispelled the cloud which had obscured his fortunes and ministerial capacity. During the horrid reign of her sister, he had constantly corresponded with the princess Elizabeth. On the very day of her accession, he presented her with a paper containing twelve articles necessary for her immediate dispatch; and, in a few days after, was sworn of the privy council, and made secretary of state. His first advice to the queen was, to call a parliament; and the first business he proposed after it was assembled was the establishment of a national church. A plan of reformation was accordingly drawn up under his immediate inspection, and the legal establishment of the church of England was the consequence. Sir William Cecil's next important concern, was to restore the value of the coin, which had in the preceding reigns been considerably debased. In 1561, he was appointed master of the wards; and, in 1571, created baron of Burleigh, as a reward for his services, particularly in having lately stifled a formidable rebellion in the north. The following year he was honoured with the Garter, and raised to the office of lord high treasurer of England. From this period we find him the *primum mobile* of every material transaction during the glorious reign of Queen Elizabeth. Notwithstanding the temporary influence of other favourites, Lord Burleigh was, in fact, her prime minister, and the person on whom she chiefly confided in matters of real importance. Having filled the highest and most important offices of the state for 40 years, and guided the helm of government during the most glorious period of English history, he departed this life on the 4th of August 1598, in the 78th year of his age. His body was removed to Stamford, and there deposited in the family vault, where a magnificent tomb was erected to his memory.—Notwithstanding his long enjoyment of such lucrative employments, he left only an estate of 4000l. per annum, 14,000l. in money, and effects worth about 11,000l. He lived, indeed, in a manner suitable to his high rank and importance.

portance. He had four places of residence, viz. his lodgings at court, his house in the Strand, his seat at Burleigh Park, near Stamford, and his seat at Theobald's. The last of these was his favourite place of retirement, where he frequently entertained the queen at a vast expence.

Lord Burleigh was doubtless a man of singular abilities and prudence, amiable in his private character, and one of the most able, upright, and indefatigable ministers ever recorded in the annals of this kingdom. His principal works are, 1. *La Complainte de l'ame pecheresse*, or the Complaint of a sinful Soul, in French verse, in the king's library. 2. Materials for Patten's *Diarium exped. Scoticæ*, London, 1541, 12mo. 3. Slanders and lies maliciously, grossly, and impudently vomited out, in certain traiterous books and pamphlets, against two counsellors, Sir Francis Bacon and Sir William Cecil. 4. A speech in parliament, 1562, Strype's Mem. vol. iv. p. 107. 5. Precepts or directions for the well ordering of a man's life, 1637, Harl. Cat. vol. ii. p. 755. 6. Meditations on the death of his lady, Ballard's Mem. p. 184. 7. Meditations on the state of England during the reign of Queen Elizabeth, manuscript. 8. The execution of justice in England for the maintenance of public and Christian peace, &c. Lond. 1581, 1583, Somer's tracts, 4th Collect. vol. i. p. 5. 9. Advice to Queen Elizabeth in matters of religion and state, ib. p. 101, 106. 10. A great number of letters. See Peck's *Desiderata Curiosa*, Howard's collections, &c. 11. Several pedigrees, some of which are preserved in the archbishop of Canterbury's library at Lambeth, No. 299,747.

CECILIA, St, the patroness of music, has been honoured as a martyr ever since the fifth century. Her story, as delivered by the notaries of the Roman church, and from thence transcribed into the Golden Legend and other books of the like kind, says, that she was a Roman lady, born of noble parents about the year 295: That, notwithstanding she had been converted to Christianity, her parents married her to a young Pagan nobleman named Valerianus; who going to bed to her on the wedding night, *as the custom is*, says the book, was given to understand by his spouse, that she was nightly visited by an angel, and that he must forbear to approach her, otherwise the angel would destroy him. Valerianus, somewhat troubled at these words, desired that he might see his rival the angel; but his spouse told him that was impossible, unless he would consent to be baptized and become a Christian. This he consented to; after which, returning to his wife, he found her in her closet at prayer, and by her side, in the shape of a beautiful young man, an angel clothed with brightness. After some conversation with the angel, Valerianus told him that he had a brother named Tiburtius, whom he greatly wished to see a partaker of the grace which he himself had received. The angel told him that his desire was granted, and that they should be both crowned with martyrdom in a short time. Upon this the angel vanished, and was not long in showing himself as good as his word; Tiburtius was converted, and both he and his brother Valerianus were beheaded. Cecilia was offered her life upon condition that she would sacrifice to the deities of the Romans; but she refused; upon which she was thrown into a cauldron of boiling water, and scalded to death. Others say, that she was stifled in a dry bath, *i. e.* an enclosure from whence the air was excluded, having a slow fire underneath it; which kind of death was sometimes inflicted by the Romans upon women of quality who were criminals. Upon the spot where her house stood, is a church, said to have been built by Pope Urban I. who administered baptism to her husband and his brother: it is the church of St Cecilia at Trastevere; within is a most curious painting of the saint, as also a stately monument with a cumbent statue of her with her face downwards. There is a tradition of St Cecilia, that she excelled in music; and that the angel who was thus enamoured of her, was drawn from the celestial regions by the charms of her melody; this has been deemed authority sufficient to making her the patroness of music and musicians. The legend of St Cecilia has given frequent occasion to painters and sculptors to exercise their genius in representations of her, playing on the organ, and sometimes on the harp. Raphael has painted her singing with a regal in her hands; and Domenichino and Mignard, singing and playing on the harp.

CECROPS, the founder and first king of Athens, about the time of Moses the lawgiver of the Hebrews. He was the first who established civil government, religious rites, and marriage among the Greeks; and died after a reign of 50 years. See ATTICA, N° 4.

CEDAR. See JUNIPERUS and PINUS, BOTANY *Index*.

The species of cedar famous for its duration, is that popularly called the cedar of Lebanon (*Pinus cedrus*), by the ancients *cedrus magna*, or the great cedar; also *cedrelate*, κεδρελατη. See PINUS, BOTANY *Index*.

CEDRENUS, GEORGE, a Grecian monk, lived in the 11th age, and wrote, "Annals, or an abridged History, from the beginning of the World to the Reign of Isaac Comnenus, emperor of Constantinople, who succeeded Michael IV. in 1057." This work is no more than an extract from several historians. There is an edition of it, printed at Paris in 1647, with the Latin version of Xylander, and the notes of Father Goar, a Dominican.

CEDRUS, the CEDAR TREE, MAHOGANY, &c. See JUNIPERUS, PINUS, and SWIETENIA, BOTANY *Index*.

CEILING, in *Architecture*, the top or roof of a lower room; or a covering of plaster over laths nailed on the bottom of the joists that bear the floor of the upper room; or where there is no upper room, on joists for the purpose; hence called *ceiling joists*. The word *ceiling* answers pretty accurately to the Latin *lacunar*, "every thing over head."

Plastered ceilings are much used in Britain, more than any other country: nor are they without their advantages, as they make the room lightsome; are good in case of fire; stop the passage of the dust; lessen the noise over head; and, in summer, make the air cooler.

CEILING, in sea language, denotes the inside planks of a ship.

CEIMELIA, from κειμαι, "to be laid up," in antiquity, denotes choice or precious pieces of furniture or ornaments, reserved or laid up for extraordinary

nary occasions and uses; in which sense, sacred garments, vessels, and the like, are reputed of the ceimelia of a church. Medals, antique stones, figures, manuscripts, records, &c. are the ceimelia of men of letters.

CEIMELIARCHIUM, the repository or place where ceimelia are preserved.

CEIMELIOPHYLAX, (from κειμηλιον and φυλαττω, *I keep*), the keeper or curator of a collection of ceimelia; sometimes also denominated *ceimeliarcha*. The ceimeliarcha, or ceimeliophylax, was an officer in the ancient churches or monasteries, answering to what was otherwise denominated *chartophylax* and *custos archivorum*.

CELÆNÆ, in *Ancient Geography*, the capital of Phrygia Magna, situated on a cognominal mountain, at the common sources of the Mæander and Marsyas. The king of Persia had a strong palace beneath the citadel, by the springs of the Marsyas, which rose in the market-place, not less in size than the Mæander, and flowed through the city. Cyrus the Younger had also a palace there, but by the springs of the Mæander, which river passed likewise through the city. He had, moreover, an extensive paradise or park, full of wild beasts, which he hunted on horseback for exercise or amusement; and watered by the Mæander, which ran through the middle. Xerxes was said to have built these palaces and the citadel after his return from his expedition into Greece.

Antiochus Soter removed the inhabitants of Celænæ into a city which he named, from his mother, Apamea; and which became afterwards a mart inferior only to Ephesus. See Apamea.

CELANDINE. See Chelidonium, Botany *Index*.

CELANO, a town of Italy, in the kingdom of Naples, in Farther Abruzzo. It is seated a mile from the lake Celano, anciently called Fucinus. E. Long 13. 39. N. Lat. 41. 56.

CELARENT, among logicians, a mode of syllogism, wherein the major and conclusion are universal negative propositions, and the minor an universal affirmative.

E. gr. cE None whose understanding is limited can be omniscient.
lA Every man's understanding is limited.
rEnt Therefore no man is omniscient.

CELASTRUS. See Botany *Index*.

In Senegal the negroes use the powder of the root of this plant as a specific against gonorrhœas, which it is said to cure in eight or sometimes in three days. An infusion of the bark of a species of staff tree, which grows in the isle of France, is said to possess the same virtues.

CELEBES, an island in the Indian sea, situated under the equator, and called by some *Macassar*. It extends 2° north, and 6° south latitude, and between 119° and 125° east longitude. It is of a very irregular figure, consisting of three long peninsulas. The air is hot and moist, and subject to great rains during the north-west winds, which blow from November to March, at which time the country is overflowed, and for this reason they build their houses on piles of wood ten feet high. The most healthful time is during the northern monsoons, which seldom fail blowing regularly in one part of the year. The chief vegetables are rice and cocoas; but they have ebony, sanders, &c. Their fruits and flowers are much the same as in the neighbouring parts of the Indies. They have pepper, sugar, betel, areca, the finest cotton, and opium. The natives have bright olive complexions, and the women have shining black hair. They are thought to be very handsome by the Dutch and Chinese, who often purchase them for bed-fellows. The men are industrious, robust, and make excellent soldiers. Their arms are sabres, and trunks, from whence they blow poisoned darts, which are pointed with the tooth of a sea-fish. Some likewise use poisoned daggers. They were the last of the Indian nations that were enslaved by the Dutch, which could not be effected till after a long war. They teach their children to read and write, and their characters have some resemblance of the Arabic. Their religion being Mahometan, the men indulge themselves in many wives and concubines. The employment of the women is spinning, cookery, and making their own and their husbands clothes. The men wear jewels in their ears, and the women gold chains about their necks. The inhabitants in general go half-naked, without any thing on their head, legs, or feet, and some have nothing but a cloth about their middle. The streets of the town Macassar are spacious, and planted with trees on every side. It stands by the side of the only large river they have in the island. The Dutch have a fort here, mounted with 40 guns, and garrisoned with 700 men; having gradually possessed themselves of a great part of the country. They were, however, dispossessed by the British during the late wars, but received back the colony at the peace in 1814. It is said that the population has diminished since the Dutch conquest.

The religion of these islands was formerly idolatry. They worshipped the sun and moon. They sacrificed to them in the public squares, having no materials which they thought valuable enough to be employed in raising temples. About two centuries ago, some Christians and Mahometans having brought their opinions to Celebes, the principal king of the country took a dislike to the national worship. Having convened a general assembly, he ascended an eminence, when, spreading out his hands towards heaven, he told the Deity, that he would acknowledge for truth that doctrine whose ministers should first arrive in his dominions, and, as the winds and waves were at his command, the Almighty would have himself to blame if he embraced a falsehood. The assembly broke up, determined to wait the orders of heaven, and to obey the first missionaries that should arrive. The Mahometans were the most active, and their religion accordingly prevailed. See Celebes, Supplement.

CELERES, in Roman antiquity, a regiment of body-guards belonging to the Roman kings, established by Romulus, and composed of 300 young men, chosen out of the most illustrious Roman families, and approved by the suffrages of the curiæ of the people, each of which furnished ten. The name comes from *celer*, "quick, ready;" and was given them because of their promptness to obey the king.

The celeres always attended near the king's person, to guard him, to be ready to carry his orders, and to execute

Celeres, Celeri.

execute them. In war they made the van-guard in the engagement, which they always began first; in retreats they made the rear-guard.

Though the celeres were a body of horse, yet they usually dismounted, and fought on foot; their commander was called tribune, or prefect of the celeres. They were divided into three troops of 100 each, commanded by a captain called centurio: their tribune was the second person in the kingdom.

Plutarch says, Numa broke the celeres. If this be true, they were soon re-established; for we find them under most of the succeeding kings: witness the great Brutus, who expelled the Tarquins, and who was the tribune of the celeres.

CELERI, in *Botany*, the English name of a variety of the Apium Graveolens.

The seed of celeri should be sown at two or three different times, the better to continue it for use through the whole season without running up to seed. The first sowing should be in the beginning of March, upon a gentle hot-bed; the second may be at the end of the same month, which ought to be in an open spot of light earth, where it may have the benefit of the sun; the third time of sowing should be in the latter end of April, or beginning of May, on a moist soil; and if exposed to the morning sun only, it will be so much the better, but it should not be under the drip of trees. The middle of May, some of the plants of the first sowing will be fit to transplant for blanching.

The manner of transplanting it is as follows: after having cleared the ground of weeds, you must dig a trench by a line about 10 inches wide, and 8 or 9 inches deep, loosening the earth in the bottom, and laying it level; and the earth that comes out of the trench should be equally laid on each side the trench, to be ready to draw in again to earth the celeri as it advances in height. These trenches should be made at three feet distance from each other; then plant your plants in the middle of the trench, at about four or five inches distance, in one straight row, having before trimmed the plants, and cut off the tops of the long leaves: and as they are planted, you must observe to close the earth well to their roots with your feet, and to water them plentifully until they have taken new root. As these plants advance in height, you must observe to draw the earth on each side close to them, being careful not to bury their hearts, nor ever to do it but in dry weather; otherwise the plants will rot. When your plants have advanced a considerable height above the trenches, and all the earth, which was laid on the sides thereof, hath been employed in earthing them up, you must then make use of a spade to dig up the earth between the trenches, which must also be made use of for the same purpose, continuing from time to time to earth it up until it is fit for use. The last crop should be planted in a drier soil, to prevent its being rotted with too much wet in the winter. You will do well to cover your ridges of celeri with some pease-haulm, or some such light covering, when the frost is very hard, which will admit the air to the plants; for if they are covered too close they will be very subject to rot: by this means you will preserve your celeri till spring: but you must remember to take off the covering whenever the weather will permit, otherwise it will be apt to cause the celeri to pipe and run to seed. The celeri, when full blanched, will not continue good above three weeks or a month before it will rot or pipe; therefore, in order to continue it good, you should have at least six or seven different seasons of planting, proportioned to the consumption.

Celeri || Celestins.

The other sort of celeri, which is commonly called *celeriac*, is to be managed in the same manner; excepting that this should be planted on the level ground, or in very shallow drills: for this plant seldom grows above eight or ten inches high, so requires but little earthing up; the great excellency of this being in the size of the root, which is often as large as ordinary turnips.

The best method to save the seed of celeri, is to make choice of some long good roots of the upright celeri, which have not been too much blanched, and plant them out, at about a foot asunder, in a moist soil, early in the spring; and when they run up to seed, keep them supported with stakes, to prevent their being broken down with the wind: and in July, when the seed begins to be formed, if the season should prove very dry, it will be proper to give some water to the plant, which will greatly help its producing good seeds. In August these seeds will be ripe, at which time it should be cut up, in a dry time, and spread upon cloths in the sun to dry; then beat out the seeds, and preserve it in bags for use.

Celeri, *Wild*, (*Apium antarcticum*), was found in considerable quantities by Sir Joseph Banks and Dr Solander on the coast of Terra del Fuego. It is like the garden celeri in the colour and disposition of the flowers, but the leaves are of a deeper green. The taste is between that of celeri and parsley. It is a very useful ingredient in the soup for seamen, because of its antiscorbutic quality.

CELERITY, in *Mechanics*, the swiftness of any body in motion. It is also defined to be an affection of motion, by which any moveable body runs through a given space in a given time.

CELESTINS, a religious order, so called from their founder Peter de Meuron, afterwards raised to the pontificate under the name of Celestin V. This Peter, who was born at Ifernia, a little town in the kingdom of Naples, in the year 1215, of but mean parents, retired, while very young, to a solitary mountain, in order to dedicate himself wholly to prayer and mortification. The fame of his piety brought several, out of curiosity, to see him; some of whom charmed with his virtues, renounced the world to accompany him in his solitude. With these he formed a kind of community in the year 1254: which was approved by Pope Urban IV. in 1264, and erected into a distinct order, called the *hermits of St Damien*. Peter de Meuron governed this order till 1286, when his love of solitude and retirement induced him to quit the charge. In July 1294, the great reputation of his sanctity raised him, though much against his will, to the pontificate. He then took the name of Celestin V. and his order that of *Celestins* from him. By his bull he approved their constitutions, and confirmed all their monasteries to the number of 20. But he sat too short time in the chair of St Peter to do many great things for his order; for having governed the church five months

months and a few days, and considering the great burden he had taken upon him, to which he thought himself unequal, he solemnly renounced the pontificate in a consistory held at Naples.

After his death, which happened in 1296, his order made great progress, not only in Italy but in France likewise; whither the then general Peter of Tivoli sent 12 religious, at the request of King Philip the Fair, who gave them two monasteries; one in the forest of Orleans, and the other in the forest of Compeigne at Mount Chartres. This order likewise passed into several provinces of Germany. They have about 96 convents in Italy, and 21 in France, under the title of priories.

The Celestins rise two hours after midnight to say matins. They eat no flesh at any time, except when they are sick. They fast every Wednesday and Friday, from Easter to the feast of the exaltation of the holy cross; and, from that feast to Easter, every day. As to their habit, it consists of a white gown, a capuche, and a black scapulary. In the choir, and when they go out of the monastery, they wear a black cowl with the capuche: their shirts are of serge.

CELETES, or Celetæ (from κελης, *a race-horse*) in antiquity, denote single or saddle-horses, by way of contradistinction from those yoked or harnessed together, called *bigarii*, *quadrigarii*, &c. The same denomination is also given to the cavaliers or riders on horseback: and hence some deduce celeres, the name of Romulus's guard.

CELEUSMA, or Celeuma, in antiquity, the shout or cry of the seamen, whereby they animated each other in their work of rowing. The word is formed from κελευειν, *to call, to give the signal.*

Celeusma, was also a kind of song or formula, rehearsed or played by the master, or others, to direct the strokes and movements of the mariners, as well as to encourage them to labour. See Celeustes.

CELEUSTES, *in Ancient Navigation*, the boatswain or officer appointed to give the rowers the signal, when they were to pull, and when to stop. He is also denominated *epopeus*, and by the Romans, *portisculus;* sometimes simply *hortator.*

CELIBACY, the state of unmarried persons. Scaliger derives the word from the Greek κοιτη, "bed," and λειπω, *linquo*, "I leave:" others say it is formed from *cœli beatitudo*, q. d. *the blessedness of heaven.*

The ancient Romans used all means imaginable to discourage celibacy. Nothing was more usual than for the censors to impose a fine on bachelors. Dionysius Halicarnassensis mentions an ancient constitution whereby all persons of full age were obliged to marry. But the first law of that kind, of which we have any certainty, is that under Augustus, called *lex Julia de maritandis ordinibus.* It was afterwards denominated *Papia Poppæa*, and more usually *Julia Papia*, in regard of some new sanctions and amendments made to it under the consuls Papius and Poppæus. By this law, divers prerogatives were given to persons who had many children; penalties imposed on those who lived a single life, as that they should be incapable of receiving legacies, and not exceeding a certain proportion.

CELIBATE, the same with celibacy; but it is chiefly used in speaking of the single life of the Popish clergy, or the obligation they are under to abstain from marriage. In this sense we say the law of *celibate.* Monks and religious take a vow of celibate; and what is more, of chastity.

The church of Rome imposes an universal celibacy on all its clergy, from the pope to the lowest deacon and subdeacon. The advocates for this usage pretend that a vow of perpetual celibacy was required in the ancient church as a condition of ordination, even from the earliest apostolic ages. But the contrary is evident, from numerous examples of bishops and archbishops, who lived in a state of matrimony, without any prejudice to their ordination or their function. It is generally agreed that most of the apostles were married. Some say all of them, except St Paul and St John. Others say St Paul himself was married, because he writes to his *yoke-fellow*, whom they interpret his wife. Be this as it will, in the next ages after the apostles, we have accounts of divers married bishops, presbyters, and deacons, without any reproof or mark of dishonour set on them; *e. g.* Valens, presbyter of Philippi, mentioned by Polycarp; and Chæremon, bishop of Nilus. Novatus was a married presbyter of Carthage, as we learn from Cyprian; who himself was also a married man, as Pagi confesses; and so was Cæcilius the presbyter who converted him; and Numidius, another presbyter of Carthage. The reply which the Romanists give to this is, that all married persons, when they came to be ordained, promised to live separate from their wives by consent, which answered the vow of celibacy in other persons. But this is not only said without proof, but against it. For Novatus presbyter of Carthage was certainly allowed to cohabit with his wife after ordination; as appears from the charge that Cyprian brings against him, that he had struck and abused his wife, and thereby caused her to miscarry. There seems indeed to have been, in some cases, a tendency towards the introduction of such a law by one or two zealots; but the motion was no sooner made than it was quashed by the authority of wiser men. Thus Eusebius observes, that Pinytus, bishop of Gnossus in Crete, was for laying the law of celibacy upon his brethren; but Dionysius bishop of Corinth wrote to him, that he should consider the weakness of men, and not impose that heavy burden on them. In the council of Nice, anno 325, the motion was renewed for a law to oblige the clergy to abstain from all conjugal society with their wives, whom they had married before their ordination; but Paphnutius, a famous Egyptian bishop, and one who himself never was married, vigorously declaimed against it, upon which it was unanimously rejected. So Socrates and Sozomen tell the story; to which all that Valesius, after Bellarmin, has to say, is, that he suspects the truth of it. The council in Trullo, held in 692, made a difference in this respect between bishops and presbyters; allowing presbyters, deacons, and all the inferior orders, to cohabit with their wives after ordination; and giving the Roman church a smart rebuke for the contrary prohibition, but at the same time laying an injunction upon bishops to live separate from their wives, and appointing the wives to betake themselves to a monastic life, or become deaconesses in the church. And thus was a total celibate established in the Greek church as to bishops, but not any

any others. In the Latin church, the like establishment was also made, but by slow steps in many places. For, in Africa, even bishops themselves cohabited with their wives at the time of the council of Trullo. The celibacy of the clergy, however, appears of an ancient standing, if not of command and necessity, yet of counsel and choice. But as it is clearly neither of divine nor apostolical institution, it is at first hard to conceive from what motive the court of Rome persisted so very obstinately to impose this institution on the clergy. But we are to observe that this was a leading step to the execution of the project formed of making the clergy independent of princes, and rendering them a separate body to be governed by their own laws. In effect, while priests had children, it was very difficult to prevent their dependence on princes, whose favours have such an influence on private men; but having no family, they were more at liberty to adhere to the pope.

CELIDOGRAPHIA, the description of the spots which appear on the surfaces of the sun and planets. See ASTRONOMY.

CELL, (*Cella*) in ancient writers, denotes a place or apartment usually under ground, and vaulted, in which were stored up some sort of necessaries, as wine, honey, and the like; and according to which it was called *Cella Vinaria*, *Ollearia*, *Mellaria*, &c. The word is formed from the Latin *celare*, to conceal.

CELLA was also used for the lodge or habitation of a common prostitute, as being anciently under ground, hence also denominated *fornix*.

Intravit calidum veteri centone lupanar,
Et cellam vacuam. Juv. Sat. vi. ver. 121.

On which place an ancient scholiast remarks, that the names of the whores were written on the doors of their several cells; by which we learn the meaning of *inscripta cella* in Martial, lib. xi. ep. 46.

CELLA was also applied to the bedchambers of domestics and servants; probably as being low and narrow.—Cicero, inveighing against the luxury of Antony, says the beds in the very cellæ of his servants were spread with pompous purple coverlets.

CELLA is also applied to the members or apartments of baths. Of these there were three principal, called *frigidaria*, *tepidaria*, and *caldaria*: to which may be added a fourth, called *cella assa*, and sometimes *sudatoria*.

CELLA likewise signified the *adyta*, or inmost and most retired parts of temples, wherein the images of the gods to whom the edifices were consecrated were preserved. In this sense we meet with *cella Jovis*, *cella Concordiæ*.

CELLA is also used for a lesser or subordinate sort of monastery dependent on a great one, by which it was erected, and continues still to be governed. The great abbeys in England had most of them *cells* in places distant from the mother abbey, to which they were accountable, and from which they received their superiors. The alien priories in England were cells to abbeys in Normandy, France, Italy, &c. The name *cell* was also given to rich and considerable monasteries not dependent on any other.

CELL signifies also a little apartment or chamber, such as those wherein the ancient monks, solitaries, and hermits, lived in retirement. Some derive the word from the Hebrew כלא, *i. e.* "a prison, or place where any thing is shut up."

The same name is still retained in divers monasteries. The dormitory is frequently divided into so many cells or lodges. The Carthusians have each a separate house, which serves them as a cell. The hall wherein the Roman conclave is held, is divided by partitions into divers cells, for the several cardinals to lodge in.

CELL is also a name given to the little divisions in honeycombs, which are always regular hexagons. See BEE.

CELL, in *Botany*, is applied to the hollow place between the partitions in the pods, husks, and other seed-vessels of plants: according as there is one, two, three, &c. of these cells, the vessel is said to be unilocular, bilocular, trilocular, &c.

CELLS, in *Anatomy*, little bags, or bladders, where fluids or other matters are lodged; called *loculi*, *cellulæ*, &c. Thus the *cellulæ adiposæ* are the little cells where the fat is contained; *cellulæ* in the *colon*, are spaces wherein the excrements are detained till voided, &c.

CELLAR, (*Cellarium*), in ancient writers, denotes the same with cella, viz. a conservatory of eatables or drinkables.

Cellar differs from vault, as the latter is supposed to be deeper, the former being frequently little below the surface of the ground. In which sense, *cellarium* also differed from *penus*, as the former was only a storehouse for several days, the latter for a long time. Thus it is the bactroperatæ, a sort of ancient Cynics, are said by St Jerome to carry their cellar about with them.

Cellarium also denoted an allowance of bread, wine, oil, or other provision, furnished out of the cella, to the use of the governor of the province and his officers, &c. In which sense, the word amounts to much the same with *annona*.

CELLARS, in modern building, are the lowest rooms in a house, the ceilings of which usually lie level with the surface of the ground on which the house is built; or they are situated under the pavement before the house, especially in streets and squares.

Cellars, and other places vaulted under ground, were called by the Greeks *hypogæa*: the Italians still call them *fundi delli case*.

CELLARER, or CELLERER, (*Cellerarius* or *Cellarius*), an officer in monasteries, to whom belong the care and procurement of provisions for the convent. The denomination is said to be borrowed from the Roman law, where *cellarius* denotes an examiner of accounts and expences. Ulpian defines it thus: "Cellerarius, id est, ideo præpositus ut rationes salvæ sint."

The *cellerarius* was one of the four *obedientiarii*, or great officers of monasteries: under his ordering was the *pistrinum* or bakehouse, and the *bracinum* or brewhouse. In the richer houses there were particular lands set apart for the maintenance of his office, called in ancient writings *ad cibum monachorum*. The *cellerarius* was a great man in the convent. His whole office in ancient times had a respect to that origin: he was to see his lord's corn got in, and laid up in granaries; and his appointment consisted in a certain proportion thereof, usually fixed at a thirteenth part of of the whole, together with a furred gown. The office of cellarer then only differed in name from those of bailiff and minstrel; excepting that the cellarer had the receipt of his lord's rents throughout the whole extent of his jurisdiction.

Cellarer was also an officer in chapters, to whom belonged the care of the temporals, and particularly the distributing of bread, wine, and money, to canons, on account of their attendance in the choir. In some places he was called *cellarer*, in others *burser*, and in others *currier*.

CELLARIUS, Christopher, was born in 1638, at Smalcade in Franconia, of which town his father was minister. He was successively rector of the colleges at Weymar, Zeits, and Mersbourg: and the king of Prussia having founded an university at Halle in 1693, he was prevailed on to be professor of eloquence and history there, where he composed the greatest part of his works. His great application to study hastened the infirmities of old age; for it is said, he would spend whole days and nights together at his books, without any attention to his health, or even the calls of nature. His works relate to grammar, geography, history, and the oriental languages; and the number of them is amazing. He died in 1707.

CELLINI, Benvenuto, an eminent statuary, who was bred a jeweller and goldsmith, but seems to have had an extraordinary genius for the fine arts in general. He was cotemporary with Michael Angelo and Julio Romano, and was employed by popes, kings, and other princely patrons of sciences and arts, so highly cultivated in the days of Leo X. and Charles V. some of his productions being esteemed most exquisite. He lived to a very considerable old age; and his life, almost to the last, was a continued scene of adventure, persecution, and misfortune, truly wonderful. He wrote his own history, which was not, however, published till the year 1730, probably, on account of the excessive freedom with which he therein treated many distinguished personages of Italy and other countries. It was translated into English by Dr Nugent in 1771, to which the reader is referred, as it will not admit of an abridgment suitable to the design of this work.

CELLULAR, in a general sense, is applied to any thing consisting of single cells.

Cellular Membrane. See Anatomy *Index*.

CELOSIA, Cock's-comb. See Botany *Index*.

CELSIA. See Botany *Index*.

CELSUS, Aurelius Cornelius, a celebrated physician of the first century, who wrote eight books on medicine, in elegant Latin. He was the Hippocrates of the Latins: and Quintilian gives him a high eulogium. The great Boerhaave tells us, that Celsus is one of the best authors of antiquity for letting us into the true meaning and opinions of Hippocrates; and that, without him, the writings of this father in physic would be often unintelligible, often misunderstood by us. He shows us also how the ancients cured distempers by friction, bathing, &c. His eight books *de Medicina* have been several times printed. The Elzevir edition, in the year 1650, by Vander Linden, is the best, as being entirely corrected from his manuscripts.

Celsus, an Epicurean philosopher, in the second century. He wrote a work against the Christians, entitled, *The True Discourse*: to which Origen, at the desire of Ambrose his friend, wrote a learned answer. To this philosopher Lucian dedicated his *Pseudomanies*.

CELTÆ, or Celtes, an ancient nation, by which most of the countries of Europe are thought to have been peopled. The compilers of the Universal History are of opinion that they were descended from Gomer the eldest son of Japhet, the son of Noah. They think that Gomer settled in the province of Phrygia in Asia; Ashkenaz his eldest son, or Togarmah his youngest, or both, in Armenia; and Riphath the second son in Cappadocia. When they spread themselves wider, they seem to have moved regularly in columns without interfering with or disturbing their neighbours. The descendants of Gomer, or the Celtæ, took the left hand, insensibly spreading themselves westward towards Poland, Hungary, Germany, France, and Spain; while the descendants of Magog, Gomer's brother, moving eastward, peopled Tartary.

In this large European tract, the Celtes began to appear a powerful nation under a regular monarchy, or rather under several considerable kingdoms. Mention is made of them indeed in so many parts of Europe, by ancient geographers and historians, that Ortellius took *Celtica* to be a general name for the continent of Europe, and made a map of it bearing this title. In those parts of Asia which they possessed, as well as in the different parts of Europe, the Celtes went by various names. In Lesser Asia they were known by the names of *Titans* and *Sacks*; in the northern parts of Europe, by those of *Cymmerians*, *Cymbrians*, &c.; and in the southern part they were called *Celtes*, *Gauls*, or *Galatians*.

With respect to the government of the Celtes we are entirely in the dark. All we know is, that the curates, and afterwards druids and bards, were the interpreters of their laws; judged all causes whether criminal or civil; and their sentence was reckoned so sacred, that whoever refused to abide by it was by them excluded from assisting at their sacred rites; after which no man dared to converse with him: so that this punishment was reckoned the most severe of all, even severer than death itself.

They neither reared temples nor statues to the Deity, but destroyed them wherever they could find them, planting in their stead large spacious groves; which, being open on the top and sides, were, in their opinion, more acceptable to the Divine Being, who is absolutely unconfined. In this their religion seems to have resembled that of the Persees and disciples of Zoroaster. The Celtes only differed from them in making the oak instead of fire the emblem of the Deity; in choosing that tree above all others to plant their groves with, and attributing several supernatural virtues both to its wood, leaves, fruit, and misletoe; all of which were made use of in their sacrifices and other parts of their worship. But after they had adopted the idolatrous superstition of the Romans and other nations, and the apotheosis of their heroes and princes, they came to worship them much in the same manner; as Jupiter under the name of *Taran*, which in the Celtic signifies thunder; Mercury, whom some authors call *Heus* or *Hesus*, probably from the Celtic *handh*, which signifies a dog, and might be the *Anubis latrans*

latrans of the Egyptians. But Mars was held in the greatest veneration by the warlike, and Mercury by the trading, part of the nation. The care of religion was immediately under the curates, since known by the name of druids and bards. These were, as Cæsar tells us, the performers of sacrifices and all religious rites, and expounders of religion to the people. They also instructed youth in all kinds of learning, such as philosophy, astronomy, astrology, &c. Their doctrines were taught only by word of mouth, esteeming them too sacred to be committed to writing. Other more common subjects, such as their hymns to their gods, the exploits of princes and generals in time of war, and especially before a battle, were couched in elegant verse, and recited, or rather sung, on all proper occasions; though even these were also kept from vulgar eyes, and either committed to memory, or, if to writing, the whole was a secret to all the laity. The latter indeed seems the most probable, if what Cæsar hints be true; namely, that those poetic records were increased in his time to such a bulk, that it took up a young bard near 20 years to learn them by heart. Diodorus tells us farther, that these poets used to accompany their songs with instrumental music, such as those of organs, harps, and the like; and that they were held in such veneration, that if in the time of an engagement between two armies one of these bards appeared, both sides immediately ceased fighting. The reason of this was, that they were universally believed to be prophets as well as poets; so that it was thought dangerous as well as injurious to disobey what they supposed came from their gods. These prophetic philosophers kept academies, which were resorted to, not only by a great number of their own youth, but also of those from other countries, insomuch that Aristotle says, their philosophy passed from thence into Greece, and not from Greece thither. Diodorus likewise quotes a passage from Hecateus, which is greatly in their praise; viz. that the druids had some kinds of instruments by which they could draw distant objects nearer, and make them appear larger and plainer; and by which they could discover even seas, mountains, and valleys, in the moon. But whatever might be their learning, it is certain, that in process of time they adopted several very barbarous customs, such as sacrificing human victims to their gods, as more acceptable to them than those of any other animals. And Diodorus tells us of another inhuman custom they used in their divinations, especially in great matters, which was done by killing some of their slaves, or some prisoners of war, if any they had, with a scymitar, to draw the augury from the running of his blood from his mangled limbs.

For the history, &c. of the different Celtic nations, see the article GAUL, &c.

CELTES, certain ancient instruments, of a wedge-like form, of which several have been discovered in different parts of Great Britain. Antiquarians have generally attributed them to the Celtæ; but not agreeing as to their use, distinguished them by the above unmeaning appellation. But Mr Whitaker makes it probable that they were British battle-axes. See *BATTLE-Axes*.

CELTIBERIA, in *Ancient Geography*, a country of the Hither Spain, along the right or south-west side of the river Iberus; though sometimes the greatest part of Spain was called by the name *Celtiberia*. The people were denominated *Celtiberi*, or the Celtæ seated on the Iberus. They were brave and very warlike; their cavalry in particular was excellent. They wore a black and rough cloak, the shag of which was like goats hair. Some of them had light bucklers like the Gauls: others hollow and round ones like those of other nations. They all wore boots made of hair, and iron helmets adorned with crests of a purple colour. They used swords which cut on both sides, and poniards of a foot long. Their arms were of an admirable temper, and are said to have been prepared in the following manner: they buried plates of iron under ground, where they let them remain till the rust had eaten the weakest part of the metal, and the rest was consequently hard and firm. Of this excellent iron they made their swords, which were so strong and well tempered, that there was neither buckler nor helmet that could resist their edge. The Celtiberians were very cruel towards their enemies and malefactors, but showed the greatest humanity to their guests. They not only cheerfully granted their hospitality to strangers who travelled in their country, but were desirous that they should seek protection under their roof.

CELTIS. See BOTANY *Index*.

CEMENT, in a general sense, any glutinous substance capable of uniting and keeping things together in close cohesion. In this sense the word *cement* comprehends mortar, solder, glue, &c. but has been generally restrained to the compositions used for holding together broken glasses, china, and earthen ware. For this purpose the juice of garlic is recommended as exceedingly proper, being both very strong, and if the operation is performed with care leaving little or no mark. Quicklime and the white of an egg mixed together and expeditiously used, are also very proper for this purpose. Dr Lewis recommends a mixture of quicklime and cheese in the following manner; "Sweet cheese shaved thin, and stirred with boiling-hot water, changes into a tenacious slime which does not mingle with the water. Worked with fresh particles of hot water, and then mixed upon a hot stone with a proper quantity of unslacked lime, to the consistence of a paste, it proves a strong and durable cement for wood, stone, earthen ware, and glass. When thoroughly dry, which will be in two or three days, it is not in the least acted upon by water. Cheese barely beat with quicklime, as directed by some of the chemists for luting cracked glasses, is not near so efficacious." A composition of the drying oil of linseed and white lead is also used for the same purposes, but is greatly inferior.

CEMENT, in building, is used to denote any kind of mortar of a stronger kind than ordinary. The cement commonly used is of two kinds; hot and cold. The hot cement is made of rosin, bees-wax, brick-dust, and chalk boiled together. The bricks to be cemented are heated, and rubbed one upon another, with cement between them. The cold cement is that above described for cementing china, &c. which is sometimes, though rarely, employed in building.

The ruins of the ancient Roman buildings are found to cohere so strongly, that most people have imagined the

Cement.

the ancients were acquainted with some kind of mortar, which, in comparison of ours, might justly be called *cement;* and that to our want of knowledge of the materials they used, is owing the great inferiority of modern buildings in their durability. In 1770, one M. Loriot, a Frenchman, pretended to have discovered the secret of the ancient cement, which, according to him, was no more than a mixture of powdered *quicklime* with lime which had been long slacked and kept under water. The slacked lime was first to be made up with sand, earth, brickdust, &c. into mortar, after the common method, and then about a third part of quicklime in powder was added to the mixture. This produced an almost instantaneous petrification, something like what is called the *setting* of alabaster, but in a much stronger degree; and was possessed of many wonderful qualities needless here to relate, seeing it has never been known to succeed with any other person who tried it. Mr Anderson, in his essays on agriculture, has discussed this subject at considerable length, and seemingly with great judgment. He is the only person we know who has given any rational theory of the uses of lime in building, and why it comes to be the proper basis of all cements. His account is in substance as follows:

Lime which has been slacked and mixed with sand becomes hard and consistent when dry, by a process similar to that which produces the natural *stalactites* in caverns. These are always formed by water dropping from the roof. By some unknown and inexplicable process of nature, this water has dissolved in it a small portion of calcareous matter in a *caustic* state. As long as the water continues covered from the air, it keeps the earth dissolved in it: it being the natural property of calcareous earths, when deprived of their fixed air, to dissolve in water. But when the small drop of water comes to be exposed to the air, the calcareous matter contained in it begins to attract the fixable part of the atmosphere. In proportion as it does so, it also begins to separate from the water, and to reassume its native form of limestone or marble. This process Mr Anderson calls a *crystallization:* and when the calcareous matter is perfectly *crystallized* in this manner, he affirms, that it is to all intents and purposes limestone or marble of the same consistence as before: and in this manner (says he), within the memory of man, have huge rocks of marble been formed near Matlock in Derbyshire." If lime in a caustic state is mixed with water, part of the lime will be dissolved, and will also begin to crystallize. The water which parted with the crystallized lime will then begin to act upon the remainder, which it could not dissolve before; and thus the process will continue, either till the lime be all reduced to an *effete*, or (as he calls it) *crystalline* state, or something hinders the action of the water upon it. It is this crystallization which is observed by the workmen when a heap of lime is mixed with water, and left for some time to macerate. A hard crust is formed upon the surface, which is ignorantly called *frosting*, though it takes place in summer as well as in winter. If therefore the hardness of the lime, or its becoming a cement, depends entirely on the formation of its crystals, it is evident that the perfection of the cement must depend on the perfection of the crystals, and the hardness of the matters which are entangled among them. The additional substances used in making of mortar, such as sand, brickdust, or the like, according to Mr Anderson, serve only for a purpose similar to what is answered by sticks put into a vessel full of any saline solution, namely, to afford the crystals an opportunity of fastening themselves upon it. If therefore the matter interposed between the crystals of the lime is of a friable, brittle nature, such as brickdust or chalk, the mortar will be of a weak and imperfect kind; but, when the particles are hard, angular, and very difficult to be broken, such as those of river or pit sand, the mortar turns out exceedingly good and strong. Sea sand is found to be an improper material for mortar, which Mr Anderson ascribes to its being less angular than the other kinds. That the crystallization may be the more perfect, he also recommends a large quantity of water, that the ingredients be perfectly mixed together, and that the drying be as slow as possible. An attention to these circumstances, he thinks, would make the buildings of the moderns equally durable with those of the ancients; and from what remains of the ancient Roman works, he thinks a very strong proof of his hypothesis might be adduced. The great thickness of their walls necessarily required a vast length of time to dry. The middle of them was composed of pebbles thrown in at random, and which have evidently had mortar so thin as to be *poured* in among them. By this means a great quantity of the lime would be dissolved, and the crystallization performed in the most perfect manner; and the indefatigable pains and perseverance for which the Romans were so remarkable in all their undertakings, leave no room to doubt that they would take care to have the ingredients mixed together as well as possible. The consequence of all this is, that the buildings formed in this manner are all as firm as if cut out of a solid rock; the mortar being equally hard, if not more so, than the stones themselves.
