Twickenham at Domesday was included in Isleworth. Anciently it was called Twittenham or Twicanham. The manor was given in 941 by King Edmund to the monks of Christ Church, Canterbury, from whom it had been previously taken, but it was again alienated, for it was restored to the same monks by Edred in 948. In the reign of Henry VIII. it came into the possession of the crown, and by Charles I. was assigned to Henrietta Maria as part of her jointure. It was sold during the Protectorate, but after the Restoration the queen mother resumed possession of it. In 1670 it was settled for life on Catherine of Braganza, queen of Charles II. It still remains in possession of the crown, but since the death of Catherine has been let on leases. In the neighbourhood are many residences of literary or historical interest. Pope's villa, where he lived from 1717 till his death in 1744, has been removed. Among old mansions of interest still remaining are Strawberry Hill, the residence of Horace Walpole, now much altered; Marble Hill, built by George III. for the countess of Suffolk, and subsequently resided in by the marquis of Wellesley; Orleans House, built in the reign of Queen Anne by Johnstone, occupied for some time by the duke of Orleans, and from 1879 to 1883 as a club house; York House, said to have been the residence of James II. when duke of York, bestowed by Charles II. on Lord Clarendon when he married the duke of York's daughter, and in modern times resided in by the Comte de Paris; and Twickenham House, formerly the residence of Sir John Hawkins, author of the *History of Music*, and the meeting place of the "Literary Club." Of the old manor house of Twickenham, to which Catherine of Aragon is said to have retired after her divorce from Henry VIII., and which was subsequently the residence of Catherine of Braganza, queen of Charles II., the only remains are a ruin called the Aragon tower. Twickenham Park House, for some time the residence of Lord Chancellor Bacon, has been demolished.

TWILIGHT. The light of what is called the "sky" depends upon the scattering or reflexion of direct sunlight in the earth's atmosphere, mainly if not entirely due to those fine dust particles which (as we have recently learned) form the necessary nuclei for condensation of aqueous vapour. Were it not for these particles the sky would appear by day as it does in a clear winter night, and the stars would be always visible. Alpine climbers and aeronauts, when they have left the grosser strata of the atmosphere below them, find this state of things approximated to; and even at the sea-level the blue of the sky is darker when the air contains but few motes. After the sun has set, its rays continue for a time to pass through parts of the atmosphere above the spectator's horizon, and the scattered light from these is called twilight. It is, of course, most brilliant in the quarter where the sun has set. Before sunrise we have essentially the same phenomenon, but it goes by the name of "dawn." The brilliancy of either depends upon several conditions, of which the chief is, of course, the degree by which the sun has sunk below the horizon. But the amount of dust in the air affects the phenomenon in two antagonistic ways: it diminishes the amount of sunlight which reaches the upper air after passing close to the earth and it increases the fraction of this light which is scattered to form twilight. Hence no general law can be laid down as to the duration of twilight; but it is usual to state (roughly) that it lasts until the sun is about 18° under the horizon. If we make this assumption, it is a simple matter of calculation to solve questions as to the duration of twilight at a given place at a given time of year, the maximum duration of twilight at a given place, &c. In the older works on astronomy such questions were common enough, but they have now little beyond antiquarian interest. The more complex phenomena of twilight, such as the "after-glow," &c., probably depend upon the precipitation of moisture on the dust particles as the air becomes gradually colder. This will of course alter the amount of scattering; but it may also lead (by reflexion from strata of such particles) to an increase in the amount of light to be scattered.

TYCHO BRAHE. See BRAHE.

TYLDESLEY WITH SHAKERLEY, a town of Lancashire, England, is situated on a considerable eminence, 11 miles west-north-west of Manchester and 199 north-west of London (by the London and North-Western Railway). The church of St George, a handsome building in the Early Pointed style, erected in 1827, has lately undergone restoration. Public baths were built in 1876. A public cemetery was formed in 1878. The town is the growth of the 19th century and depends upon its cotton-mills and the large collieries in the neighbourhood. It is governed by a local board of health of sixteen members. The population of the urban sanitary district (area 2490 acres) in 1871 was 6408 and in 1881 it was 9954.

At Domesday Tyldesley formed part of the manor of Warrington. One of its proprietors, Sir Thomas Tyldesley, was a distinguished Royalist. His son Edward in 1672 sold the manor to Ralph Astley, and from the Astleys it passed in 1728 to Thomas Johnson of Bolton. In 1823 it became the property of George Ormerod, author of the *History of Cheshire*.

TYLER, JOHN (1790-1862), tenth president of the United States, was accustomed with pride, but with the support of conjecture rather than evidence, to claim relationship with Wat Tyler of the reign of Richard II. The earliest of his American ancestors was Henry Tyler, a reputed native of Shropshire, England, who in 1652 settled at Middle Plantation, Va., on the outskirts of what is now the city of Williamsburg. John Tyler was the son of Judge John Tyler, some time governor of Virginia, and was born at Greenway in that State, 29th March 1790. In 1802 he entered the grammar school of William and Mary, where, though fond of fun and frolic and cultivating an inherited taste for the violin the made good progress in his studies. After graduating in 1806 he entered on the study of law, and in 1809 was called to the bar, where his progress from the first was rapid. He became a member of the State legislature in December 1811. In 1813 he raised a company in defence of Richmond, in command of which he subsequently served with the fifty-second regiment at Williamsburg and Providence Forge. In December 1816 he was elected to the house of representatives at Washington, where he displayed much readiness and skill in debate as an uncompromising advocate of popular rights. In 1825 he was elected governor of Virginia by a large majority, and the following year was re-elected unanimously. In 1827 he was chosen a senator. He opposed Clay on the tariff question in 1832, delivering a speech against the protective duties which lasted three days; but he voted for Clay's Compromise Bill of 1833. He was the only senator who voted against the Force Bill on 20th February of this year, a singularity of conduct which somewhat damaged his reputation in Virginia. Although opposed to the establishment of the United States Bank, he supported the resolutions in 1835 censuring President Jackson for the removal of the deposits, on the ground that the procedure was unconstitutional. In consequence of a vote of the Virginia legislature instructing him to vote for the expurgation of these resolutions from the senate journal he resigned, 21st February 1836. His action led the Whigs to bring him forward as a candidate for the vice-presidency, but he only received forty-seven votes. For some time after this he ceased to take an active part in politics; removing in the end of the year from Gloucester to Williamsburg, where he had better opportunities for legal practice, he devoted his chief attention to his professional duties. At the Whig convention which met at Harrisburg, Pennsylvania, 4th December 1839, he was nominated again for the vice-presidency on the Harrison ticket, and elected in November 1840. On the death of Harrison, soon after his inauguration in 1841, Tyler succeeded him. His ele-

vation to the presidency was thus accidental in a double sense, for he had been nominated for the vice-presidency to reconcile the extreme faction. His policy in office (see UNITED STATES) was opposed to the party who nominated him and was on Democratic lines. In 1845 he was succeeded by Polk, and he spent the remainder of his life in retirement from active duties. He was nominated in 1861 for the lower house of the permanent congress, but died at Richmond on the 18th of the following January.

See L. G. Tyler, *Life and Times of the Tylers*, 2 vols., 1884.

TYNDALE, WILLIAM (c. 1484-1536), translator of the New Testament and Pentateuch (see ENGLISH BIBLE, vol. viii. pp. 384, 385), was born in Gloucestershire, possibly in the parish of Slimbridge, about the year 1484. Of his early education nothing is known, about his twentieth year he went to Oxford, where tradition has it that he was entered of Magdalen Hall. He afterwards resided at Cambridge. Ordained to the priesthood, probably towards the close of 1521, he entered the household of Sir John Walsh, Little Sodbury, Gloucestershire, in the capacity of chaplain and domestic tutor. Here he spent two years, and in the course of his private studies began to contemplate seriously the work of translating the New Testament into English. His sympathy with the "new learning," which he had not concealed in conversation with the higher clergy of the neighbourhood at Sir John's table, led to his being summoned before the chancellor of Worcester as a suspected heretic; and "with the goodwill of his master" he left for London in the summer of 1523. There he preached a little at St Dunstan-in-the-West, and worked at his translation, living for some months in the house of Humphrey Monmouth, an alderman; but finding publication impossible in England he sailed for Hamburg in May 1524. After visiting Luther at Wittenberg, he settled in Cologne, where he made some progress with a quarto edition of his New Testament, when the interference of the authorities of the town compelled his flight to Worms. The octavo edition (see vol. viii. p. 384) was here completed in 1526. Where Tyndale resided in the interval between 1526 and 1530—the year of publication of his translation of the Pentateuch—is not known; his *Parable of the Wicked Mammon* (1527), *Obedience of a Christian Man* (1528), and *Præface of Prelates* (1530), all bear to have been printed at "Marlborowe in the land of Hesse" or "Marborch." From 1530 onwards he appears to have lived chiefly in Antwerp, but of his life there hardly anything is recorded, except that as a marked man he was continually the subject of plots and intrigues, and that at last he was arrested and thrown into prison in the castle of Vilvorde, some six miles from Brussels, in 1535. Having been found guilty of heresy, he was put to death by strangling, and his body afterwards burnt at the stake on October 6, 1536.

The *Works* of Tyndale were first published along with those of FRITH (*q.v.*) and Barnes, "three worthy Martyrs and principal Teachers of the Church of England," by John Daye, in 1573 (folio). His *Doctrinal Treatises and Introductions to Different Portions of the Holy Scripture* were published by the Parker Society in 1848. For biography, see Demans, *William Tyndale* (London, 1871); also the Introduction to Mombert's critical reprint of Tyndale's Pentateuch (New York, 1884), where a full bibliography is given. There seems no reason to doubt that the translation of Joshua, Judges, Samuel, Kings, and Chronicles in Matthew's Bible is substantially the work of Tyndale.

TYNE, a river in the north-east of England, is formed of two branches, the North Tyne, rising in the Cheviots on the borders of Roxburgh, and the South Tyne, rising at Tynhead Fell, at the south-eastern extremity of Cumberland. The North Tyne flows south-eastwards by Bellingham, a short distance below which it receives the Rede from the north, and 2 miles above Hexham it is joined by the South Tyne, which before the junction flows north-

ward to Haltwhistle, and then eastward, receiving the Allen from the right a short distance above Haydon Bridge. The united streams then have a course of about 30 miles eastwards to the sea at Tynemouth. For a considerable part of its course the Tyne flows through a pleasant and richly cultivated country, but in its lower reaches the presence of coal pits has almost completely robbed the scenery of its natural charms, and the former sylvan retreats of monks and abbots are now occupied by blast furnaces and shipbuilding yards, and similar scenes of busy industry, which line both banks of the river from Newcastle to the sea. The river is navigable to Blyth for small craft, and to Newcastle, 8 miles from its mouth, for large vessels.

The coal trade of the Tyne is the most important in England, and for its general shipping trade the river ranks next in importance to the Thames and the Mersey. The principal ports are Newcastle and North and South Shields, but below Newcastle the river is everywhere studded with piers and jetties. About a seventh of the whole tonnage of vessels built in England is built on the Tyne, the most important works being those of Jarrow. For boat-racing the Tyne vies in celebrity with the Thames.

TYNEMOUTH, a municipal and parliamentary borough of England, in Northumberland, includes the townships of Chirton, Cullercoates, North Shields, Preston, and Tynemouth. This last, the principal watering-place on this part of the coast, is picturesquely situated on a promontory on the north side of the Tyne at its mouth. It is connected with Newcastle, 8 miles to the west-south-west, by a branch of the North-Eastern Railway; its distance from London is 273½ miles by rail. The town has rapidly increased within recent years, and contains many well-built streets, squares, and villas. On the point of the promontory there is a small battery called the Spanish battery, and near it a monument has been erected to Lord Collingwood. Within the grounds to which the gateway of the old castle gives entrance are the ruins of the ancient priory of St Mary and St Oswin—the principal remains being those of the church. A pier, half a mile long, serves as a breakwater to the harbour. Among the principal public buildings are the assembly rooms and the aquarium (1872). The municipal buildings of the borough of Tynemouth are situated in North Shields, where are also the custom house, a master mariners' home, a seamen's institute, and a sailors' home founded by the late duke of Northumberland. Shipbuilding is carried on, and there are rope and sail works. The fish trade is of considerable importance and employs several steam and sailing boats. The population of the municipal and parliamentary borough of Tynemouth (incorporated in 1849; area 4303 acres), divided into the three wards of North Shields, Percy, and Tynemouth, was 38,941 in 1871, and 44,118 in 1881.

Tynemouth was a fortress of the Saxons, and was anciently known as Penhal Crag, "the head of the rampart on the rock." From remains found in 1783 it is supposed to have been a Roman station. The first church was built of wood by Edwin, king of Northumbria, about 625, and was rebuilt in stone by his successor Oswald in 634. The body of Oswin, king of Deira, was brought hither for burial in 651, and on this account Tynemouth came to be in great repute as a place of burial both for royal and ecclesiastical persons. The monastery was repeatedly plundered and burnt by the Danes, especially during the 9th century. After its destruction by Healfdene in 876 it was rebuilt by Tostig, earl of Northumberland, who endowed it with considerable revenue; but, having been granted in 1074 to the monks of Jarrow, it became a cell of Durham. Malcolm III., king of the Scots, and his son Edward, who were slain in battle at Alnwick on 13th November 1093, were both interred in the monastery. In 1095 Earl Mowbray, having entered into a conspiracy against William Rufus, converted the monastery into a castle, which he strongly fortified. By William Rufus the priory was conferred on St Albans abbey, Hertfordshire. It was surrendered to Henry VIII. on 12th January 1539, and the site and remains were granted by Edward VI. in 1550 to the earl of Warwick, afterwards duke of Northumberland. In 1644 the castle was taken by the Scots under the earl of Leven. The town enjoyed various immunities at a very early period, which were

afterwards the subject of some dispute. Edward I. restored to it several free customs of which it had been deprived. Afterwards it received a confirmation of its various former charters by Edward II. and Richard II.

TYPE-WRITING. See **WRITING MACHINES.**

TYPHON, or **TYPHOEUS**, son, according to Hesiod (*Theog.*, 820 sq.), of the Earth and Tartarus, is described as a grisly monster with a hundred dragons' heads who was conquered and cast into Tartarus by Zeus. According to *Iliad* ii. 282, he lies in the land of the Arimi (Cilicia). Other legends place his prison under Ætna or in other volcanic regions and make him the cause of eruptions. The myth, therefore, as we have it, rests on a personification of volcanic forces. He is the father of dangerous winds (typhoons), and by later writers is identified with the Egyptian Set (see vol. vii. p. 717).

TYPHUS, TYPHOID, AND RELAPSING FEVERS.

These are conveniently considered together, as they constitute the important class of continued fevers, having certain characters in common, although each is clearly distinguishable from the others. The following is a general account of the more salient features of each.

TYPHUS FEVER.

Typhus¹ is a continued fever of highly contagious nature, lasting for about fourteen days and characterized mainly by great prostration of strength, severe nervous symptoms, and a peculiar eruption on the skin. It has received numerous other names, such as spotted, pestilential, putrid, jail, hospital fever, &c. It appears to have been known for many centuries as a destructive malady, frequently appearing in epidemic form, in all countries in Europe, under the conditions to be afterwards referred to. The best accounts of the disease are those given by English writers, who narrate its ravages in towns and describe many "black assizes," in which it was communicated by prisoners brought into court to the judges, jurymen, court-officials, &c., with fatal effect, producing oftentimes a widespread consternation. Typhus fever would seem to have been observed in almost all parts of the world; but, although not unknown in warm countries, it has most frequently prevailed in temperate or cold climates.

The causes concerned in its production include both the predisposing and the exciting. Of the former the most powerful of all are those influences which lower the health of a community, especially overcrowding and poverty. Hence this fever is most frequently found to affect the poor of large cities and towns, or to appear where large numbers of persons are living crowded together in unfavourable hygienic conditions, as has often been seen in prisons, workhouses, &c. Armies in the field are also liable to suffer from this disease; for instance, during the Crimean War it caused an enormous mortality among the French troops. Some high authorities, including Dr Murchison, have held that such conditions as those referred to are capable of generating typhus fever by themselves, and the apparent occasional *de novo* origin of this disease has doubtless the support of many striking facts which would appear to favour this view (see **PATHOLOGY**, vol. xviii. p. 803). In the light, however, of recent researches into the relation of specific disease germs to the production of fevers and other infectious maladies, there is increasing difficulty in maintaining this position; and the direction of opinion is decidedly towards the view that, however much insanitary conditions and overcrowding act as causes predisposing to the reception of the disease, the introduction into the system of a living organism or germ is necessary to the manifestation of the phenomena of the fever. Nevertheless no specific organism has yet been clearly identified

¹ From τύφος, smoke or mist, in allusion to the stupor of the disease.

in the case of typhus fever. This disease is now much less frequently encountered in medical practice than formerly, — a fact which must mainly be ascribed to the great attention which in recent times has been directed to improvement in the sanitation of towns, especially to the opening up of crowded localities so as to allow the free circulation through them of fresh air. In most large cities, however, limited epidemic outbursts of the disease occur from time to time, under the conditions of overcrowding and poverty, although the increased facilities possessed by local authorities for recognizing such outbreaks, and for the prompt isolation or removal of infected persons to hospitals, operate in general effectually to prevent any extensive spread of the fever. All ages are liable to typhus, but the young suffer less severely than the old. The disease appears to be communicated by the exhalations given off from the bodies of those suffering from the fever, and those most closely in contact with the sick are most apt to suffer. This is shown by the frequency with which nurses and physicians take typhus from cases under their care. As in all infectious maladies, there is often observed in typhus a marked proclivity to suffer in the case of individuals, and in such instances very slight exposure to the contagion may convey the disease. Typhus is highly contagious throughout its whole course and even in the early period of convalescence. The contagion, however, is rendered less active by the access of fresh air; hence this fever rarely spreads in well-aired rooms or houses where cases of the disease are under treatment. As a rule one attack of typhus confers immunity from risk of others, but numerous exceptions have been recorded.

The course of typhus fever is characterized by certain well-marked stages. (1) The stage of *incubation*, or the period elapsing between the reception of the fever poison into the system and the manifestation of the special evidence of the disease, is believed to vary from a week to ten days. During this time, beyond feelings of languor, no particular symptoms are exhibited. (2) The *invasion* of the fever is in general well marked and severe, in the form of a distinct rigor, or of feelings of chilliness lasting for hours, and a sense of illness and prostration, together with headache of a distressing character and sleeplessness. Feverish symptoms soon appear and the temperature of the body rises to a considerable height (103°-105° Fahr.), at which it continues with but little daily variation until about the period of the crisis. It is, however, of importance to observe certain points connected with the temperature during the progress of this fever. Thus about the seventh day the acme of the fever heat has been reached, and a slight subsidence (1° or less) of the tem-

Course
of the
fever.

Temperature chart of typhus fever.

perature takes place in favourable cases, and no further subsequent rise beyond this lowered level occurs. When it is otherwise, the case often proves a severe one. Again, when the fever has advanced towards the end of the second week, slight falls of temperature are often observed, prior to the extensive descent which marks the attainment of the crisis. The pulse in typhus fever is rapid (100-120

or more) and at first full, but later on feeble. Its condition as indicating the strength of the heart's action is watched with anxiety. The tongue, at first coated with a white fur, soon becomes brown and dry, while sordes (dried mucus, &c.) accumulate upon the teeth; the appetite is gone and intense thirst prevails. The bowels are as a rule constipated, and the urine is diminished in amount and high-coloured. The physician on examination may make out distinct enlargement of the spleen. (3) The third stage is characterized by the appearance of the eruption which generally shows itself about the fourth or fifth day or later, and consists of dark red (mulberry coloured) spots or blotches varying in size from mere points to three or four lines in diameter, very slightly elevated above the skin, at first disappearing on pressure, but tending to become both darker in hue and more permanent. They appear chiefly on the abdomen, sides, back, and limbs, and occasionally on the face. Besides this, the characteristic typhus rash, there is usually observed a general faint mottling all over the surface. The typhus rash is rarely absent and is a very important diagnostic of the disease. In the more severe and fatal forms of the fever, the rash has all through a very dark colour, and slight subcutaneous hæmorrhages (*petechiæ*) are to be seen in abundance. After the appearance of the eruption the patient's condition seems to be easier, so far as regards the headache and discomfort which marked the outset of the symptoms; but this is also to be ascribed to the tendency to pass into the typhous stupor which supervenes about this time, and becomes more marked throughout the course of the second week. The patient now lies on his back, with a dull dusky countenance, an apathetic or stupid expression, and contracted pupils. All the febrile symptoms already mentioned are fully developed, and delirium, usually of a low muttering kind, but sometimes wild and maniacal (*delirium ferox*) is present both by night and day. The peculiar condition to which the term "coma vigil" is applied, in which the patient, though quite unconscious, lies with eyes widely open, is regarded, especially if persisting for any length of time, as an unfavourable omen. Throughout the second week of the attack the symptoms continue unabated; but there is in addition great prostration of strength, the pulse becoming very feeble, the breathing shallow and rapid, and often accompanied with bronchial sounds. (4) A crisis or favourable change takes place about the end of the second or beginning of the third week (on an average the 14th day), and is marked by a more or less abrupt fall of the temperature (*vide* chart) and of the pulse, together with slight perspiration, a discharge of loaded urine, the return of moisture to the tongue, and by a change in the patient's look, which clears up and shows signs of returning intelligence. Although the sense of weakness is extreme, convalescence is in general steady and comparatively rapid.

Typhus fever may, however, prove fatal during any stage of its progress and in the early convalescence, either from sudden failure of the heart's action—a condition which is specially apt to arise—from the supervention of some nervous symptoms, such as meningitis or of deepening coma, or from some other complication, such as bronchitis. Further, a fatal result sometimes takes place before the crisis from sheer exhaustion, particularly in the case of those whose physical or nervous energies have been lowered by hard work, inadequate nourishment and sleep, or intemperance, in all which conditions typhus fever is apt to assume an unusually serious form.

Occasionally troublesome sequelæ remain behind for a greater or less length of time as the effects of the fever. Among these may be mentioned mental weakness or irritability, occasionally some form of paralysis, an inflamed condition of the lymphatic vessels of one leg (the swelled leg of fever), prolonged weakness and ill health, &c. Gradual improvement, however, may be confidently anticipated and even ultimate recovery.

The mortality from typhus fever is estimated by Murchison and others as averaging about 13 per cent. of the cases, but it varies

much according to the severity of type (particularly in epidemics), the previous health and habits of the individual, and very specially the age,—the proportion of deaths being in striking relation to the advance of life. Thus, while in children under fifteen the death-rate is only 5 per cent., in persons over fifty it is about 46 per cent.

The treatment of typhus fever includes the prophylactic measures of attention to the sanitation of the more densely populated portions of towns. The opening up of cross streets intersecting those which are close-built and narrow, whereby fresh air is freely admitted, has done much to banish typhus fever from districts where previously it was endemic. Further, the enforcement of the law regulating the number of persons accommodated in common lodging-houses, and the application of the powers now vested in local authorities for dealing with cases of overcrowding everywhere, and for isolation and treatment of the infected, have had a like salutary effect. Where typhus has broken out in a crowded district the prompt removal of the patients to a fever hospital and the thorough disinfection and cleansing of the infected houses are to be recommended. Where, on the other hand, a single case of accidentally caught typhus occurs in a member of a family inhabiting a well-aired house, the chance of it being communicated to others in the dwelling is but small; nevertheless every precaution in the way of isolation and disinfection should be taken.

The treatment of a typhus patient is conducted upon the same general principles as have been illustrated in other fevers (see SCARLET FEVER, SMALLPOX). Complete isolation should be maintained throughout the illness, and the services of a day and a night nurse procured, who should keep a strict watch and preserve a record of the temperature and other observations, the times of feeding and the form of nourishment administered, as well as every other fact noticed, for the physician's information. Due attention should be given to the ventilation and cleansing of the sick chamber. The main element in the treatment of this fever is good nursing, and especially the regular administration of nutriment, of which the best form is milk, although light plain soup may also be given. The food should be administered at stated intervals, not, as a rule, oftener than once in one and a half or two hours, and it will frequently be necessary to rouse the patient from his stupor for this purpose. Sometimes it is impossible to administer food by the mouth, in which case recourse must be had to nutrient enemata. Alcoholic stimulants are not often required, except in the case of elderly and weakly persons who have become greatly exhausted by the attack and are threatening to collapse. The best indication for their use is that furnished by the condition of the circulation: when the pulse shows unsteadiness and undue rapidity, and the first sound of the heart is but indistinctly heard by the stethoscope, the prompt administration of stimulants (of which the best form is pure spirit) will often succeed in averting danger. Should their use appear to increase the restlessness or delirium they should be discontinued and the diffusible (ammoniacal or ethereal) forms tried instead.

Many other symptoms demand special treatment. The headache, which persists for days at the commencement and is with many a very distressing symptom, may be mitigated by removing the hair and applying cold to the head. The sleeplessness, with or without delirium, may be combated by quietness, by a moderately darkened room (although a distinction between day and night should be made as regards the amount of admitted light), and by soothing and gentle dealing on the part of the nurse. Opiate and sedative medicines in any form, although recommended by many high authorities, must be given with great caution, as their use is often attended with danger in this fever, where coma is apt to supervene. When resorted to, probably the safest form is a combination of the bromide of potassium or ammonium with a guarded amount of chloral. The writer has seen alarming effects follow the administration of opium. Occasionally the deep stupor calls for remedies to rouse the patient, and these may be employed in the form of mustard or cantharides to the surface (calves of legs, nape of neck, over region of heart, &c.), of the cold affusion, or of enemata containing turpentine. The height of the temperature may be a serious symptom, and antipyretic remedies appear to have but a slight influence over it as compared to that which they possess in typhoid fever, acute rheumatism, &c. The cold bath treatment, which has been recommended, cannot be carried out without serious risk to life in the necessary movement of the patient. It is a well-recognized rule that persons suffering from typhus fever ought not to be moved up in bed for any purpose after the first few days. Cold sponging of the hands and feet and exposed parts, or cold to the head, may often considerably lower the temperature. Throughout the whole progress of a case the condition of the bladder requires special attention, owing to the patient's drowsiness, and the regular use of the catheter becomes, as a rule, necessary with the advance of the symptoms.

The complications and results of this fever fall to be dealt with according to the methods of treatment applicable to their character and extent.

TYPHOID OR ENTERIC FEVER.

Typhoid or enteric fever (*εἰτερον*, the intestine) is a continued fever characterized mainly by its insidious onset, by a peculiar course of the temperature, by marked abdominal symptoms occurring in connexion with a specific lesion of the bowels, by an eruption upon the skin, by its uncertain duration, and by a liability to relapses.

This fever has received various names, such as gastric fever, abdominal typhus, infantile remittent fever, slow fever, nervous fever, &c. Dr Murchison, in reference to its supposed origin in putridity, uses the term "pythogenic fever," but this designation has not been generally adopted. Up till a comparatively recent period typhoid was not distinguished from typhus fever. For, although it had been noticed that the course of the disease and its morbid anatomy were different from those of ordinary cases of typhus, it was believed that they merely represented a variety of that malady. The distinction between the two diseases appears to have been first accurately made in 1836 by Messrs Gerhard and Pennock of Philadelphia, and still more fully demonstrated by Dr A. P. Stewart of Glasgow (afterwards of London). Subsequently all doubt upon the subject was removed by the careful clinical and pathological observations made by Sir William Jenner at the London fever hospital (1849-51). A clear distinction has been established between the two fevers, not only as regards their phenomena or morbid features, but equally as regards their origin. While typhus fever is a disease of overcrowding and poverty, typhoid may occur where such conditions are entirely excluded; and the connexion of this malady with specific emanations given off from decomposing organic or feculent matters, or with contamination of food or water by the products of the disease, is now almost universally admitted. Alike in sporadic cases and in extensive epidemic outbreaks the existence of insanitary conditions in house drainage, water supply, &c., can in the majority of instances be made out. The question whether such conditions alone will suffice to beget this fever—or, in other words, its *de novo* origin—has, as in the case of typhus, been much discussed, and an affirmative opinion expressed by some high authorities. But the same remark must again be made as to the difficulties in the way of maintaining such a position in view of the evidence of the part played by microbes in infective processes.

That all insanitary conditions in respect of drainage of houses and localities furnish the most ready means for the introduction of the contagion of typhoid there is a general agreement, as there is equally that the most certain means of preventing its appearance or spread are those which provide a thoroughly trustworthy and secure drainage, a safe method of disposal of sewage, and a pure and abundant water supply. Typhoid fever is much less directly communicable from the sick to the healthy than typhus. The infective agent appears to reside in the discharges from the bowels, in which, particularly when exposed and undergoing decomposition, the contagium seems to multiply and to acquire increased potency. Thus in sewers, drains, &c., in association with putrefying matter, it may increase indefinitely, and by the emanations given off from such decomposing material accidentally escaping into houses, or by the contamination of drinking water in places where wells or cisterns are exposed to fecal or sewage pollution, the contagion is conveyed. Of the precise nature of the contagious principle we have as yet no full information,¹ but there appears to be strong reason for believing that a specific microbe or organism plays a part in the propagation of the disease. Still it is obvious that for its successful

¹ A bacillus frequently noticed in certain tissues in cases of typhoid fever has not yet been satisfactorily proved to be an organism characteristic of that disease, nor even to be constantly present.

implantation in and effect upon the system a peculiar condition of preparedness or receptivity to the morbid agent must be presupposed to exist in the individual, regarding which also our knowledge is of the vaguest. There is abundant evidence that one of the vehicles for the conveyance of the contagion is food, especially milk, which may readily become contaminated with the products of the disease where an outbreak of the fever has occurred in a dairy.

Typhoid fever is most common among the young, the majority of the cases occurring between the ages of fifteen and twenty-five (Murchison). But children of any age may suffer, as may also, though more rarely, persons at or beyond middle life. It is of as frequent occurrence among the well-to-do as among the poor. The greater number of cases appear to occur in autumn. In all countries this fever seems liable to prevail; and, while some of its features may be modified by climate and locality, its main characters and its results are essentially the same everywhere.

The more important phenomena of typhoid fever will be better understood by a brief reference to the principal pathological changes which take place during the disease. These relate for the most part changes to the intestines, in which the morbid processes are highly characteristic, both as to their nature and their locality. The changes (to be presently specified) are evidently the result of the action of the contagium on the system, and they begin to show themselves from the very commencement of the fever, passing through various stages during its continuance. The portion of the bowels in which they occur most abundantly is the lower part of the small intestine (ileum), where the "solitary glands" and "Peyer's patches" on the mucous surface of the canal become affected by diseased action of a definite and progressive character, which stands in distinct relation to the symptoms exhibited by the patient in the course of the fever. (1) These glands, which in health are comparatively indistinct, become in the commencement of the fever enlarged and prominent by infiltration due to inflammatory action in their substance, and consequent cell proliferation. This change usually affects a large extent of the ileum, but is more marked in the lower portion near the ileo-cæcal valve (see ANATOMY). It is generally held that this is the condition of the parts during the first eight or ten days of the fever. (2) These enlarged glands next undergo a process of sloughing, the inflammatory products being cast off either in fragments or *en masse*. This usually takes place in the second week of the fever. (3) Ulcers are thus formed varying in size according to the gland masses which have sloughed away. They may be few or many in number, and they exhibit certain characteristic appearances. Thus they are frequently, but not always, oblong in shape, with their long axis in that of the bowel, and they have somewhat thin and ragged edges. They may extend through the thickness of the intestine to the peritoneal coat and in their progress erode blood-vessels or perforate the bowel. This stage of ulceration exists from the second week onwards during the remaining period of the fever, and even into the stage of convalescence. (4) In most instances these ulcers heal by cicatrization, leaving, however, no contraction of the calibre of the bowel. This stage of healing evidently occupies a considerable time, since the process does not advance at an equal rate in the case of all the ulcers, some of which have been later in forming than others. Even when convalescence has been apparently completed, some unhealed ulcers may yet remain and prove, particularly in connexion with errors in diet, a cause of relapse of some of the symptoms, and even of still more serious or fatal consequences. The mesenteric glands external to, but in functional relation with, the intestine, become enlarged during the progress of the fever, but usually subside after recovery.

Besides these changes, which are well recognized, others more or less important are often present. Among these may be mentioned one which the present writer has repeatedly observed in the severe and protracted forms of this fever, namely, marked atrophy, thinning, and softness of the coats of the intestines, even after the ulcers have healed,—a condition which may not improbably be the cause of that long-continued impairment of the function of the bowels so often complained of by persons who have passed through an attack of typhoid fever. Other changes common to most fevers are also to be observed, such as softening of the muscular tissues generally, and particularly of the heart, and evidences of complications affecting chest or other organs, which not unfrequently arise. The swelled leg of fever sometimes follows typhoid, as does also periosteal inflammation.

The symptoms characterizing the onset of typhoid fever are very much less marked than those of most other fevers, and the disease of the in the majority of instances sets in somewhat insidiously. Indeed, it is no uncommon thing for patients with this fever to go about for a considerable time after its action has begun. The most marked of the early symptoms are headache, lassitude, and discomfort, together with sleeplessness and feverishness, particularly at night; this last symptom is that by which the disease is most readily detected in its early stages. The peculiar course of the temperature

Nature

typhoid

Cause of
its out-
break.

is also one of the most important diagnostic evidences of this fever. During the first week it has a morning range of moderate febrile rise, but in the evening there is a marked ascent, with a fall again towards morning, each morning and evening, however, showing respectively a higher point than that of the previous day, until about the eighth day, when in an average case the highest point is attained. This varies according to the severity of the attack;

Temperature chart of typhoid fever.

but it is no unusual thing to register 104° or 105° Fahr. in the evening and 103° or 104° in the morning. During the second week the daily range of temperature is comparatively small, a slight morning remission being all that is observed. In the third week the same condition continues more or less; but frequently a slight tendency to lowering may be discerned, particularly in the morning temperature, and the febrile action gradually dies down as a rule between the twenty-first and twenty-eighth days, although it is liable to recur in the form of a relapse. Although the patient may, during the earlier days of the fever, be able to move about, he feels languid and uneasy; and usually before the first week is over he has to take to bed, and soon the effects of the attack become more apparent. He is restless, hot, and uncomfortable, particularly as the day advances, and his cheeks show a red flush, especially in the evening or after taking food. The aspect, however, is different from the oppressed stupid look which is present in typhus, and more resembles the appearance of hectic. The pulse in an ordinary case, although more rapid than normal, is not accelerated to an extent corresponding to the height of the temperature, and is, at least in the earlier stages of the fever, rarely above 100°. In severe and protracted cases, where there is evidence of extensive intestinal ulceration, the pulse becomes rapid and weak, with a dicrotic character indicative of cardiac feebleness. The tongue has at first a thin whitish fur and is red at the tip and edges. It tends, however, to become dry, brown or glazed looking, and fissured transversely, while sorbes may be present about the lips and teeth. There is much thirst and in some cases vomiting. Splenic and hepatic enlargement may be made out. From an early period in the disease abdominal symptoms show themselves with greater or less distinctness and are frequently of highly diagnostic significance. The abdomen is somewhat distended or tumid, and pain accompanying some gurgling sounds may be elicited on light pressure about the lower part of the right side close to the groin,—the region corresponding to that portion of the intestine in which the morbid changes already referred to are progressing. Diarrhoea is a frequent but by no means constant symptom. When present it may be slight in amount, or, on the other hand, extremely profuse, and it corresponds as a rule to the severity of the intestinal ulceration. The discharges are highly characteristic, being of light yellow colour resembling pea soup in appearance. Should intestinal hæmorrhage occur, as is not unfrequently the case during some stage of the fever, they may be dark brown, or composed entirely of blood. The urine is scanty and high-coloured. About the beginning, or during the course of the second week of the fever, an eruption frequently makes its appearance on the skin. It consists of isolated spots, oval or round in shape, of a pale pink or rose colour, and of about one to one and a half lines in diameter. They are seen chiefly upon the abdomen, chest, and back, and they come out in crops, which continue for four or five days and then fade away. At first they are slightly elevated, and disappear on pressure. In some cases they are very few in number, and their presence is made out with difficulty; but in others they are numerous and sometimes show themselves upon the limbs as well as upon the body. They do not appear to have any relation to the severity of the attack, and in a very considerable proportion of cases (particularly in children) they are entirely absent. Besides this eruption there are not unfrequently numerous very faint bluish patches or blotches about half an inch in diameter, chiefly upon the body and thighs. When present the rose-coloured spots continue to come out in crops till nearly the end of the fever, and they may reappear should a relapse subsequently occur. These various symptoms persist throughout the third week, usually, however, increasing in intensity. The patient becomes prostrate and emaciated; the tongue is dry and brown, the pulse quickened and feeble, and the abdominal symptoms more marked; while nervous disturbance is exhibited in delirium, in

tremors and jerkings of the muscles (*subsultus tendinum*), in drowsiness, and occasionally in "coma vigil." In severe cases the exhaustion reaches an extreme degree, although even in such instances the condition is not to be regarded as hopeless. In favourable cases a change for the better may be anticipated between the twenty-first and twenty-eighth days, more usually the latter. It does not, however, take place as in typhus by a well-marked crisis, but rather by what is termed a "lysis" or gradual subsidence of the febrile symptoms, especially noticeable in the daily decline of both morning and evening temperature, the lessening of diarrhoea, and improvement in pulse, tongue, &c. Convalescence proceeds slowly and is apt to be interrupted by relapses (due not unfrequently to errors in diet), which are sometimes as severe and prolonged as the original attack, and are attended with equal or even greater risks. Should such relapses repeat themselves, the case may be protracted for two or three months, but this is comparatively rare.

Death in typhoid fever usually takes place from one or other of the following causes. (1) Exhaustion, in the second or third weeks, death or later. The attending symptoms are increasing emaciation, weakness of the pulse, and cadaveric aspect. Sometimes sinking is sudden, partaking of some of the characters of a collapse. (2) Hæmorrhage from the intestines. The evidence of this is exhibited, not only in the evacuations, but in the sudden fall of temperature and rise in pulse-rate, together with great pallor, faintness, and rapid sinking. Sometimes hæmorrhage, to a dangerous and even fatal extent, takes place from the nose. (3) Perforation of an intestinal ulcer. This gives rise, as a rule to sudden and intense abdominal pain, together with vomiting and signs of collapse, viz., a rapid flickering pulse, cold clammy skin, and the marked fall of temperature. Symptoms of peritonitis (see PERITONITIS) quickly supervene and add to the patient's distress. Death usually takes place within 24 hours. Occasionally peritonitis, apart from perforation, is the cause of death. (4) Occasionally, but rarely, hyperpyrexia (excessive fever). (5) Complications, such as pulmonary or cerebral inflammation, bedsores, &c.

Certain sequelæ are sometimes observed, the most important being the swelled leg, periostitis affecting long bones, general ill-health, and anæmia, with digestive difficulties, often lasting for a long time, and sometimes issuing in phthisis. Occasionally, after severe cases, mental weakness is noticed, but it is usually of comparatively short duration.

The mortality in typhoid fever varies with the character of the Mor-outbreak, the general health and surroundings of the individuals attacked, and other conditions. At one time it was regarded as, on an average, about the same as that of typhus; but under modern methods of treatment the chances of recovery are much greater, and the death-rate may be stated as about 12 per cent. or perhaps somewhat less.

The treatment embraces those prophylactic measures which aim at preventing the escape of sewer gases into dwelling-houses by careful attention to the drainage and plumber-work, and also secure an abundant supply of pure water for domestic use (see HYGIENE, SEWERAGE, and VENTILATION). When an outbreak of the fever occurs in a family, all such matters should be specially inquired into, and the sources of milk supply carefully scrutinized. The discharges from the bowels of the typhoid patient should be at once disinfected with carbolic acid or other similar agent, and the greatest care taken as to their disposal, with the view of obviating any risk of contamination of drinking-water, &c. The general management is conducted upon the same principles as are observed in the case of typhus, except that in typhoid fever very special care is necessary in regard to diet. Milk, the great value of which as a fever-food was first clearly set forth by Prof. Gairdner, is of eminent service in typhoid, but it must be administered with due regard to time and to the digestive powers of the patient. When given too frequently or in too great quantity it may, by its imperfect digestion, prove a source of irritation to the bowels. Even when given with every care it may fail to agree, as is proved by the presence of undigested curd in the evacuations. In such a case its admixture with lime water or with peptonizing agents may render its digestion less difficult, but sometimes its use must for a time be suspended. It is, however, rare that milk cannot be borne when carefully administered. Barley water or simple soaps, such as chicken broth, beef-tea, &c., are occasionally useful either as substitutes for or adjuncts to milk. All through the fever the patient should be fed at regular periods—not, as a rule, oftener than once in one and a half or two hours—although in the intervals water or other fever-drink may be given from time to time. In convalescence the diet should still be largely milk and soft matters, such as custards, light puddings, meat jellies, boiled bread and milk, &c., but other solid foods, with the exception of fish, should be for a long time avoided. In changing the diet it is of importance to note its effect upon the temperature, which may sometimes be considerably disturbed from this cause, even after the apparent subsidence of all febrile action. Stimulants, although unnecessary in a large proportion of cases, are occasionally called for when there is great exhaustion, and in prolonged attacks. Their effect, however, should be care-

fully watched. They are usually best administered in the form of pure spirit.

The more prominent symptoms which mark the course of typhoid fever frequently call for special treatment. Thus, when the fever continues long, with little break in its course, the employment of remedies to control its action (antipyretics) may often be resorted to with benefit. Such drugs as quinine, salicin, salicylic acid, and salicylate of soda, kairin, antipyrin, antifebrin, &c. (in tea to thirty grain doses of one or other), may frequently break in upon the continuity of the fever, and by markedly lowering the temperature relieve for a time the body from a source of waste, and aid in tranquillizing the excited nervous system. The times for their administration are either one or two hours before the usual maximum temperature or during the period of remission. These remedies may, however, fail, or by inducing sickness or great prostration and depression of the circulation require to be discontinued. For a similar purpose the cold bath is recommended by many high authorities and is regularly employed in Germany. The method recommended by Liebermeister is this: "When the temperature rises above 104° Fahr., the patient should be placed in a bath of about 94°, which is gradually cooled down by the addition of cold water to 68° Fahr., and remain immersed for twenty or thirty minutes, the limbs being all the while gently rubbed. He should then be put back into bed." Another method is that of Dr Brand of Stettin: "When the patient's temperature attains 102° Fahr., he should be placed in a tepid bath of 70° and allowed to remain till a sense of coldness or shivering is produced, which usually occurs in from five to twenty minutes." By such means no doubt the temperature can often be reduced 2° or 3° Fahr., but it is very apt to rise again and the bath must then be repeated. It is claimed by the advocates of this method of treatment that it has been successful in diminishing greatly the mortality of typhoid fever, but they hold at the same time that its success in large measure depends upon its employment from an early stage in the disease. British physicians are much divided upon the point, many high authorities agreeing in its marked utility, while others no less eminent regard it as fraught with danger from the frequent movement of the patient from bed, the shock to the system, and the risk of hæmorrhage, pneumonia, or other complications, and as a plan of treatment difficult of being carried out in ordinary practice. Although employed in some fever hospitals and with apparent success, it has not yet commended itself for general adoption. Other methods of applying cold, while probably less effectual than the bath, are much more available, as, for example, the tepid or cold pack, the frequent sponging of portions of the body with cold water, or the application of icebags to the head. The present writer has resorted to these methods in many cases of typhoid fever, with the effect of markedly lowering a high temperature. When diarrhœa is excessive it may be restrained by such remedies as chalk, bismuth, Dover's powder, &c. Hæmorrhage is dealt with by preparations of ergot, or by acetate of lead, gallic acid, or other styptics. In the event of perforation of the bowel opium is the only means available to lessen the distress attending that fatal occurrence.

In the convalescent stage, and even after apparently complete recovery, the utmost care should be observed by the patient as to diet, all hard and indigestible substances being dangerous from their tendency to irritate or reopen unhealed ulcers, and bring on a relapse of the fever or cause a sudden perforation: Lastly, the general health demands careful attention for a length of time, in view of the remoter risks of chest and other diseases already alluded to.

RELAPSING FEVER.

This is a continued fever occasionally appearing as an epidemic in communities suffering from scarcity or famine. It is characterized mainly by its sudden invasion, with violent febrile symptoms, which continue for about a week and end in a crisis, but are followed, after another week, by a return of the fever.

This disease has received many other names, the best known of which are famine fever, short fever, synocha, bilious relapsing fever, recurrent typhus, and spirillum fever. As in the case of typhoid, relapsing fever was long believed to be simply a form of typhus. The distinction between them appears to have been first clearly established in 1826, in connexion with an epidemic in Ireland. Outbreaks of relapsing fever have occurred in all parts of the world at times and in places where famine has arisen; but the disease has been most closely observed and studied in epidemics in Great Britain and Ireland, Germany, Poland, Russia, America, and India. It has frequently been found to prevail along with an epidemic of typhus fever.

Relapsing fever is highly contagious, and appears, like typhus, to be readily communicated by the exhalations from the body. With respect to the nature of the contagion, certain important and interesting observations have been made. In 1873 Obermeier discovered in the blood of persons suffering from relapsing fever minute organisms in the form of spiral filaments of the genus *Spirorchæta* (see vol. xxi. p. 399, fig. 1, n), measuring in length $\frac{1}{100}$ to $\frac{1}{200}$ inch and in breadth $\frac{1}{1000}$ to $\frac{1}{2000}$ inch, and possessed of rotatory or twisting movements. This organism has received the name of *Spirillum obermeieri*. It appears to be present in abundance during the height of the febrile symptoms, and is not seen during the interval until the relapse is impending, when it is again present as before. This observation has been confirmed by numerous investigators, and it has been found that inoculation with the blood containing these *Spirilla* produced the symptoms of relapsing fever in both men and animals. Comparatively little is as yet known of the life-history of these organisms, and the question whether they are to be regarded as the prime source of the disease or as mere accompaniments affords ground for difference of opinion (see PATHOLOGY, vol. xviii. p. 403); nevertheless their discovery and the conditions of their presence already mentioned are noteworthy facts in reference not only to the pathology of this fever but also to the general doctrine of infectiveness in disease-processes. The most constantly recognized factor in the origin and spread of relapsing fever is destitution; but this cannot be regarded as more than a predisposing cause favouring the reception and propagation of the morbid agent, since in many lands widespread and destructive famines have prevailed without any outbreak of this fever. Instances, too, have been recorded where epidemics were distinctly associated with overcrowding rather than with privation. Relapsing fever is most commonly met with in the young. One attack does not appear to protect from others, but rather, according to some authorities, engenders liability.

The extreme contagiousness of relapsing fever has occasionally been shown by its spreading widely when introduced into a district, even among those who had not become predisposed by destitution or other depressing conditions. The contagion, like that of typhus, appears to be most active in the immediate vicinity of the patient and to be greatly lessened by the access of fresh air. It is capable of being conveyed by clothing. The incubation of the disease is about one week. The symptoms of the fever then show themselves with great abruptness and violence by a rigor, accompanied with pains in the limbs and severe headache. The febrile phenomena are very marked, and the temperature quickly rises to a high point

Temperature chart of relapsing fever.

(105°-107° Fahr.), at which it continues with little variation, while the pulse is rapid (100-140), full, and strong. There is intense thirst, a dry brown tongue, bilious vomiting, tenderness over the liver and spleen, and occasionally jaundice. Sometimes a peculiar bronzy appearance of the skin is noticed, but there is no characteristic rash as in typhus. There is much prostration of strength. After the continuance of these symptoms for a period of from five to seven days, the temperature suddenly falls to the normal point or below it, the pulse becomes correspondingly slow, and a profuse perspiration occurs, while the severe headache disappears and the appetite returns. Except for a sense of weakness, the patient feels well and may even return to work, but in some cases there remains a condition of great debility, accompanied with rheumatic pains in the limbs. This state of freedom from fever continues for about a week, when there occurs a well-marked relapse with scarcely less abruptness and severity than in the first attack, and the whole symptoms are of the same character, but they do not, as a rule, continue so long, and they terminate in a crisis in three or four days, after which convalescence proceeds satisfactorily. Second, third, and even fourth relapses, however, may occur in exceptional cases.

The mortality in relapsing fever is comparatively small, about 5 per cent. being the average death-rate in epidemics (Murchison). The fatal cases occur mostly from the complications common to continued fevers. The treatment is essentially the same as that for typhus fever (see above). (I. O. A.)

TYPOGRAPHY

PART I.—HISTORICAL.

TYPOGRAPHY (writing by types) is the art of printing (cast-metal) movable types on paper, vellum, &c. It is quite distinct, not only from writing, but from xylography or wood-engraving, *i.e.*, the art of cutting figures, letters, or words on blocks of wood and taking impressions from such blocks, by means of ink or any other fluid coloured substance, on paper or vellum.

Earliest definitions.

Possibly the earliest attempt to describe the art of typography is that in the *Donatus* issued by Peter Schoeffer, perhaps before 1456, the colophon of which says that it was finished "Arta nova imprimendi seu caracterizandi [from *character* = letter] . . . absque calami exaratione." Fust and Schoeffer in the Mainz psalter of 1457 said that it was formed by an "adventio artificiosa imprimendi ac caracterizandi absque calami ulla exaratione." The colophon of the *Catholicon* of 1460 is more precise, and says that the book was printed "non calami, stili, aut penne suffragio, sed mira patronarum formarum concordia, proportione, ac modulo." In 1462 Albrecht Pfister had "gedrucket" the *Four Histories*. In the *Liber Sextus, Decretalium*, published in 1465, Fust and Schoeffer say that it was completed "non atramento ["atramento communi," in the Justinianus of 1468 and 1472], plumali canna neque aera, sed artificiosa quadam adventione imprimendi seu caracterizandi," a phrase which they slightly varied in Cicero's *Officia*, issued in the same year: "non atramento, plumali canna neque aera, sed arte quadam perpulera." The edition of St. Jerome's *Epistles* of 1470 is said to have been completed by an "ars impressoria," the *Decretum Gratiani* of 1472 by an "ars quadam ingeniosa imprimendi," the *Dyalogus* of 1478 by an "ars magistra." We find further—"ars sancta" or "divina," "nova ars scribendi," "novum excubendi genus prope divinum," "sculptoria archetyporum ars," "ars mirifica formandi," "ars excusoria," "nova imprimendi ratio," "ars pressura," "chalcoctypa ars," "chalcoctypa ars" (1472 and later), "chalcoctypa excusoria impressoriaque," "libraria impressio," "empryntunge" (Caxton, 1482), "prenterei" (Schoeffer, 1492), "truckery" (1505), "impression des livres" (1498), and "prenten."

Printers.

The early printers called themselves, or were called by others, "librorum prothocacragmatici" (*Gramm. Rhythm.*, 1468), "impressores librorum," "excusator librorum" (Jenson, 1471), "chalcoctypus" (1473; Hain, 13036), "magister artis impressorie," "boeckprinter"; and during the 16th century we find them still frequently called "chalcoctypus" and "chalcoctypus."

Types.

The types were at first designated more by negative than positive expressions. In 1468 they were called "caragma," later on "character" or "character," "archetype note" (1473; Hain, 13036), "sculptoria archetyporum ars," "chalcoctypa ars," "formæ," "artificiosissimæ imprimendorum librorum formæ." We soon hear also of the process and material by which they were produced. The *Grammatica* of 1468, published by Schoeffer, says that it was "cast" (sum fusus libellus). In 1471 "æneæ formulæ" are spoken of; and Bernardus Cenninus and his son say that they had printed the Virgil "expressis ante calibe caracteribus et deinde fuis litoris" (with letters first cut into steel and then cast). In 1473 Friedrich Crouser at Nuremberg says that he had "cut" (sculpsit) the work of Diogenes (Hain, 6192). Johan Zeiner of Ulm says in 1474 that he had perfected a book, not with the pen, but with letters of metal ("stagneis caracteribus). In 1474 Joh. Ph. de Lignamine speaks of "metallicæ formæ." In 1476 Husner of Strasburg represents the Nider as being printed with "letters cut of metal (litteris sculptis artificiali certe conatu ex ære)." Nicolas Jenson printed in 1480 with letters "cut and cast" (sculptis ac conflatis).

Word "typography."

The word *typographus* does not seem to occur before 1488, when it was used in the preface of P. Stephanus Dulcinius Scæle to the *Astronomicum* of Manilius, printed in that year at Milan by Antonius Zarotus;¹ in 1498 Erasmus uses it in a letter (dated 13th Feb.) to Christianus, a Lübeck merchant;² and in 1517 Johan Schoeffer applies the word to himself in the colophon of the *Aeneas Sylvius* published by him. But of the use of the word *typographia* no earlier instance is known than 1520, in which year Gerardus Noviomagus (= Guldenhaurius) in his *Lucubratiuncula de Behavorum Insula* (pref. to Nicol. Boscuducensis, dated 1520) says: "inventa Germanorum . . . bombardæ videlicet, typographia, pyxis charactæ nautica;" and Johan Schott, a printer of Strasburg, in the *Geogr. Ptolem.*, published by him, describes his grandfather, Johan Mentelin, as "priusque typographiæ inventor." Gerardus, it may be added, borrowed the whole passage from Pet. Montanus (li. 1 *Adag.*, published a. 1504), who has *chalcoctypographia* instead of *typographia*.

¹ Maittaire, *Annales-Typogr.*, i. 508, note 1.

² *Opp.*, iii. col. 24.

typographia. Meermaan indeed³ speaks of a use of the word *typographia* (or at least of *typographus*) earlier than 1520, and refers to the preface of Bernardinus Veronensis in the edition of Tibullus, Catullus, and Propertius published at Venice in 1493 by Symon Bevilacqua, "at least," Meermaan adds, "as it (the preface) is read in the *Annal. Typogr.* of Maittaire, i. 560, 2d ed." But on page 560 Maittaire quotes the first two lines of Bernardinus's preface (till *dicti*) and then adds: "Græcis caracteribus destitutus, typographus necesse habuit hiatus in commentario hic illic relinquere," which is evidently Maittaire's own remark, not that of Bernardinus. The present writer at least has been unable to find such a passage in the Tibullus.

Although the art of writing and that of block-printing both differ widely from printing with movable metal types, yet this last recess seems to have been such a gradual transition from block-printing, and block-printing in its turn to have been such a natural outcome of the many trials that were probably made to produce books in some more expeditious manner than could be done with hand-writing, that a cursory glance at these two processes will not seem out of place, all the less as a discussion on the origin and progress of typography could hardly be understood without knowing the state of the literary development at the time that printing appeared.

The art of printing, *i.e.*, of impressing (by means of First certain forms and colours) figures, pictures, letters, words, lines, whole pages, &c., on other objects, as also the art of attempts engraving, which is inseparably connected with printing, at print- existed long before the 15th century. Not to go back to ing. remoter essays, there is reason to suppose that mediæval kings and princes (among others William the Conqueror) had their monograms cut on blocks of wood or metal in order to impress them on their charters. Such impressions from stamps are found instead of seals on charters of the 15th century. Manuscripts of the 12th century show initials which, on account of their uniformity, are believed to have been impressed by means of stamps or dies.⁴ But the idea of multiplying representations from one engraved plate or block or other form was unknown to the ancients, whereas it is predominant in what we call the art of block-printing, and especially in that of typography, in which the same types can be used again and again.

Block-printing and printing with movable types seem to have been practised in China and Japan long before they were known in Europe. It is said that in the year 175 the text of the Chinese classics was cut upon tablets, which were erected outside the university, and that impressions were taken of them, some of which are said to be still in existence. Printing from wooden blocks can be traced as far back as the 6th century, when the founder of the Suy dynasty is said to have had the remains of the classical books engraved on wood, though it was not until the 10th century that printed books became common. In Japan the earliest example of block-printing dates from the period 764-770, when the empress Shiyau-toku, in pursuance of a vow, had a million small wooden toy pagodas made for distribution among the Buddhist temples and monasteries, each of which was to contain a dhâranî out of the Buddhist Scriptures entitled "Vimala nirbhâsa Sûtra," printed on a slip of paper about 18 inches in length and 2 in width, which was rolled up and deposited in the body of the pagoda under the spire. In a journal of the period, under the year 957, the expression "printed" book (*suri-hon*) is found applied to a copy of the Buddhist canon brought back from China by a Buddhist priest. This, of course, must have been a Chinese edition; but the use of the term implies that printed books were already known in Japan. It is said that the Chinese printed with movable types (of clay) from the middle of the 11th century. The authorities of the British Museum exhibit as the earliest instance of Korean books printed with movable types a work printed in 1337. To the Koreans is attributed the invention of copper types in the beginning of the 15th century; and an inspection of books bearing dates of that

³ *Orig. Typogr.*, i. p. 32, note *cc.*

⁴ Passavant, *Le Peintre-Graveur*, i. 18, Leipsic, 1860-64; John Jackson, *Wood-Engraving*, London, 1839; Bucher, *Gesch. der techn. Künste*, p. 362 sq.

period seems to show that they used such types, even if they did not invent them.¹

From such evidence as we have it would seem that Europe is not indebted to the Chinese or Japanese for the art of block-printing, nor for that of printing with movable types.

MSS.
period.

In Europe, as late as the second half of the 14th century, every book (including school and prayer books), and every public and private document, proclamation, bull, letter, &c., was written by hand; all figures and pictures, even playing-cards and images of saints, were drawn with the pen or painted with a brush. In the 13th century there already existed a kind of book trade. The organization of universities as well as that of large ecclesiastical establishments was at that time incomplete, especially in Italy, France, and Germany, without a staff of scribes and transcribers (*scriptores*), illuminators, lenders, sellers, and custodians of books (*stationarii librorum, librarii*), and *pergamenerii*, i.e., persons who prepared and sold the vellum or parchment required for books and documents. The books supplied were for the most part legal, theological, and educational, and are calculated to have amounted to above one hundred different works. As no book or document was approved unless it had some ornamented and illuminated initials or capital letters, there was no want of illuminators. The workmen scribes and transcribers were, perhaps without exception, calligraphers, and the illuminators for the most part artists. Beautifully written and richly illuminated manuscripts on vellum became objects of luxury which were eagerly bought and treasured up by princes and people of distinction. Burgundy of the 15th century, with its rich literature, its wealthy towns, its love for art, and its school of painting, was in this respect the centre of Europe, and the libraries of its dukes at Brussels, Bruges, Antwerp, Ghent, &c., contained more than three thousand beautifully illuminated MSS.

Classes
of writ-
ing.

In speaking of the writing of the manuscripts of the 15th and two preceding centuries, it is essential to distinguish, in each country, between at least four different classes of writing, and two of these must be again subdivided each into two classes. All these different kinds of writing were, in the first instance, taken as models for cutting such portions of text as were intended to illustrate and explain the figures in block-books, and afterwards as models for the types used in the printing of books and documents.

(1) The *book hand*, that is, the ordinary writing of legal, theological, and devotional books, was used by the official transcribers of the universities and churches. These men had received a more or less learned education, and consequently wrote or transcribed books with a certain pretence of understanding them and of being able to write with greater rapidity than the ordinary calligrapher. Hence their writing may be called (a) the *current* or *ursive book hand*, of which a good many illustrations may be found in Wilh. Schum, *Exempla Codicum Ampton. Erfurtensum*. Quite distinct from this current writing, and much clearer and more distinct, is (b) the *upright* or *set book hand*, which was employed by some writers who worked for universities and churches, and also by a good many who may be presumed to have worked in large cities and commercial towns for schools and the people in general without university connexion. (2) In the *church hand* (Gothic or black letter) were produced transcripts of the Bible, missals, psalters, and other works intended for use in churches and private places of worship. This writing we may again subdivide into two classes,—(a) the *ornamental* or *caligraphic* writing, found exclusively in books intended for use in churches or for the private use of wealthy and distinguished persons, and (b) the ordinary *upright* or *set church hand*, employed for less ornamental and less expensive books. (3) The *letter hand* may be said to be intermediate between the set literary book hand and the set literary church hand, and to differ but little from either. It was employed in all public documents of the nature of a letter. (4) The *court* or *charter hand* was used for charters, title-deeds, papal bulls, &c.

¹ See Ero Satow, "On the Early Hist. of Printing in Japan," in *Trans. Asiat. Soc. of Japan*, x. 48 sq.; and Stan. Julien, "Documents sur l'Art d'Imprimer," &c. in *Journ. Asiat.*, 4^{me} ser., ix. 505.

Dypold Laber (Lanber), a teacher and transcriber at Hagenau in 15th-century Germany, is known to have carried on a busy trade in manuscripts just about the time of the invention of printing. His prospectuses, in handwriting of about the middle of the 15th century, announce that whatever books people wish to have, large or small, "geistlich oder weltlich, hübsch genolt," are all to be found at Dypold Lanber's the scribe. He had in stock *Gesta Romanorum, mit den Figuren genolt*; poetical works (*Parcival, Tristan, Freidank*); romances of chivalry (*Der Wiltarn Ritter; Von cime Getruwen Ritter der sin eigen Herteze gab umb einer schönen Frowen willen; Der Ritter unter dem Zuber*); Biblical and legendary works (*A Rimed Bible; A Psaller, Latin and German, Episteln und Evangelien durch das Jor; Vita Christy; Das gantze Passional, winterheil und summerteil*); devotional books (*Bellial; Der Selen Trost; Der Rosenkrantz; Die zehn Gebot mit Glosen; Small Bette-Bücher*); and books for the people (*Gute Bekehrte Artznen-Bücher; Gemolte Loss-Bücher, i.e., fortune-telling books; Schachtzabel genolt*). The lower educational books consisted for the most part of the *Abecedaria*, containing the alphabet, the Lord's prayer, the creed, and one or two prayers; the *Donatus*, a short Latin grammar extracted from the work of Aelius Donatus, a Roman grammarian of the 4th century, and distinctly mentioned in a school ordinance of Bantzen of 1418; the *Doctrinale*, a Latin grammar in leonine verse, compiled by Alexander Gallus (or De Villa Dei), a minorite of Brittany of the 13th century; the *Summula Logica* of Petrus Hispanus (afterwards Pope John XXI.), used in the teaching of logic and dialectics; and Diouysius Cato's *Disticha de Moribus*, and its supplement called *Faectus*, with the *Floretus* of St Bernard, used in the teaching of morals. As helps to the clergy in their attempts to educate the lower classes, and as a means of assisting and promoting private devotion, there were picture books accompanied with an easy explanatory text, for the most part representations of the mystic relation between the Old and New Testaments (typology). Among these books the *Biblia Pauperum*² stands first. It represents pictorially the life and passion of Christ, and there exist MSS. of it as early as the 13th century, in some cases beautifully illuminated.³ A richly illuminated MS. of it, executed in the Netherlands c. 1400, is in the British Museum (press-mark, King's, 5), and also fragments of one of the 14th century (press-mark, 31,303). A remodelling and development of this work is the *Speculum Humana Salvationis*, a work in rhyme of the 14th century, which in forty-five chapters represents the Bible history interwoven with Mariolatry and legend. Of this work the Paris national library and arsenal library each possesses a MS. composed in 1324, whereas the British Museum has nine MSS. (six being illuminated) of the 14th and 15th centuries, written in the Netherlands, Germany, France, and England, one (press-mark, 16,578) bearing the distinct date 1379 and another (press-mark, Egerton, 878) that of 1436. A work of a similar nature is the *Apocalypsis*, of which at least two recensions with illustrations may be pointed out. One gives the text as we know it, with or without commentary, for which cf. Brit. Mus., 17,333 (French), 18,633 (French, but written in England), Reg. 2 D. xiii., and 22,493 (French),—all four early 14th century. Another is more a short history or biography of St John, but the illustrations follow those of the former work very closely; cf. Brit. Mus., 19,896 (15th century, German). It is this last recension which agrees with the block-book to be mentioned hereafter. Other devotional works are the *Ars Moriendi*, the *Antichrist*, and other works which will be found mentioned among the block-books.

Block-Printing or Xylography.

When all this writing, transcribing, illuminating, &c., had reached their period of greatest development, the art of printing from wooden blocks (block-printing, xylography) on silk, cloth, &c., vellum, and paper made its appearance in Enrope. It seems to have been practised, so far as we have evidence, on cloth, &c., and vellum as early as the 12th century,⁴ and on paper as far back as the second half of the 14th century, while it was largely employed in the early part of the 15th in the production of (1) separate leaves (called *briefs*, from *breve*, scriptum), containing either a picture (*print, prent*, shortened from the Fr. *emprent, empreinte*, and already used by Chaucer, *C. T.*, 6186, six-text, D. 604, *printe, prente, preente*, and in other early English documents; also called in colloquial German *Helge, Helgelein*, or *Halge*) or a piece of text, or both together;

² We find this title applied to at least three works,—(1) the well-known block-book, of which we speak below, (2) a treatise "in qua de vitis et virtutibus agitur," and (3) a work in rhyme by Alexander Gallus.

³ See Lab and Schwarz, *Biblia Pauperum*, Zurich, 1867.

⁴ Weigel, *Anfänge*, i. 10.

and of (2) whole block-books, sometimes consisting of half picture and half text, or wholly of text, or altogether of picture.¹ It is, however, certain that about 1400 xylography was known all over Germany, Flanders, and Holland.

In these blocks, as in wood-engraving now, the lines to be printed were in relief. The block, after the picture or the text had been engraved upon it, was first thoroughly wetted with a thin, watery, pale brown material, much resembling distemper; then a sheet of damp paper was laid upon it, and the back of the paper was carefully rubbed with some kind of dabber or burnisher, usually called a *frotton*, till an impression from the ridges of the carved block had been transferred to the paper. In this fashion a sheet could only be printed on one side (anopisthographic); and in some copies of block-books we find the sides on which there is no printing pasted together so as to give the work the appearance of an ordinary book. There are only a few block-books which do not possess this characteristic, as the *Legend of St Servatius* in the royal library of Brussels, *Das Zeitglocklein* in the Bamberg library (cf. Falkenstein, p. 49), *Das geistlich und weltlich Rom* at Althorp and Gotha (cf. Falkenstein, p. 46); but these belong to the end of the 15th century, and therefore to a later period than the ordinary block-books. Consequently, if a man wanted to set up as a printer of briefs or books, he needed no apparatus but a set of wood-blocks and a rubber.

Formerly it was the general opinion that playing-cards had been the first products of xylography; but the earliest that have been preserved to us are done by hand, while the printed ones date from the 15th century, therefore from a period in which woodcuts were already used for other purposes. It is believed that some of the wood engravings and block-books were printed in monasteries. In a necrology of the Franciscan monastery at Nordlingen, which comes down to the beginning of the 15th century, this entry occurs: "VII. Id. Augusti, obiit Frater h. Luger, laycus, optimus inesor lignorum"; and on some of the engravings we find the arms of certain monasteries, which may, however, merely mean that they were printed for, not in, those monasteries. The registers of Ulm mention several wood-engravers (*formschneider*),—in 1398 a certain Ulrich; in 1441 Heinrich Peter von Erolzheim, Joerg, and another Heinrich; in 1442 Ulrich and Lienhart; in 1447 Claus (Nicolas), Stoffel (Christopher), and Johann; in 1455 Wilhelm; in 1461 Meister Ulrich, &c. In a register of taxes of Nördlingen we find from 1428 to 1452 a certain Wilhelm Kegel mentioned as *brieftrücker*; in 1453 his widow is called *all brieftrückerin*; and in 1461 his brother Wilhelm is registered for the same craft. At Mainz there was a printer, Henne Cruse, in 1440. At Nuremberg we find in 1449 Hans, a *formschneider*, while his son Junghans exercised the same industry from 1472 to 1490. Hans von Pfedersheim printed at Frankfurt in 1459, and Peter Schott at Strasburg in 1464. A certain George Glockendon exercised the same trade at Nuremberg till 1474, when he died, being succeeded by a son and afterwards by a grandson. In Flanders a Jan de Printere was established at Antwerp in 1417; and printers and wood engravers (*hout bildsnijlers*) worked there in 1442 (*Privileges of the Corporation of St Luke* at Antwerp). At Bruges *printers* and *beeldmakers* (makers, engravers of images) were enumerated in 1454 among the members of the fraternity of St John the Evangelist. The printers of playing cards seem to have constituted a separate class. These entries show that about the middle of the 15th century there were men who exercised the art of wood-engraving and printing as a trade or craft. It seems also certain that wealthy persons and religious institutions were wont to possess sets of blocks, and, when occasion arose, they printed a set of sheets for presentation to a friend, or in the case of monasteries for sale to the passing pilgrim. A printer of briefs or block-books had no need to serve an apprenticeship; any neat-handed man could print for himself. We learn from the inventory of the possessions of Jean de Hinsberg, bishop of Liège (1419-1455), and his sister, a nun in the convent of Bethany, near Mechlin, that they possessed "unum instrumentum ad imprimendas scripturas et ymagines," and "novem printe lignee ad imprimendas ymagines cum quatuordecim alapis lapideis printis." These entries would seem to indicate that people purchased engraved blocks of wood or of stone from the woodcutter rather than books from a printer.

The earliest dated woodcut that we know of is the St Christopher of 1423, preserved in the library of Lord Spencer at Althorp. The Mary engraving, which is preserved at Brussels and apparently bears the date mcccxxviii., is now declared to be of 1468, the date having been falsified. The next date after that of the St Christopher is 1437, found on a woodcut preserved in the imperial library at Vienna. It was discovered in 1779 in the monastery of St Blaise in the Black Forest, and represents the martyrdom of St Sebastian, with fourteen lines of text. The date, however, is said by others to refer to a concession of indulgences. A woodcut, preserved in the library at Vienna, which represents St Nicolas de Tolentino, has the date 1440, but written in by hand; as the saint was canonized

in that year, it may refer to that event. Another in the Weigel collection representing the bearing of the cross, St Dorothea and St Alexis, has the date 1443, also written in by hand, though the woodcut is considered to belong to that period. These are the only known wood-engravings with dates anterior to the second half of the 15th century. But there exist a good many woodcuts which, from the style of the engraving, are presumed to be of an earlier date, and to have been printed partly in the fourteenth and partly in the first half of the 15th century. J. D. Passavant² enumerates twenty-seven, all of German origin and preserved in various libraries in Germany, while in the *Collectio Weigeliana* (vol. i.) no fewer than 154 are recorded, some of which are to be ascribed to the Netherlands. We know of the existence of at least five engravings which may be ascribed to the Netherlands:—(1) representing the Virgin Mary, with Dutch inscriptions, in the museum at Berlin; (2) representing the Virgin Mary spoken of above, in the library at Brussels; (3) representing St Anthony and St Sebastian, in the Weigel collection; (4) a St Hubert and St Eustatius, in the royal library at Brussels; (5) representing the Child Jesus, in the library at Berlin; (6) the Mass of St Gregory, with indulgence, in the Weigel collection (cf. i. 195).

Of block-books of probable German origin the following are known:—

(1) *The Apocalypsis, or Historia S. Johannis Evangelistæ ejusque Visiones Apocalypticæ* (Germ. *Das Buch der haymlichen Offenbarungen Sanct Johans*). Of this work six or seven editions are said to exist, each containing forty-eight (the 2d and 3d edition fifty) illustrations, on as many anopisthographic leaves, which seem to have been divided into three quires of eight sheets each. The first edition alone is without signatures.

(2) *Ars Moriendi*. Of this work some authors think that there are early German editions, among others that spoken of below as the 2d Dutch edition. Certainly German is the edition of Hans Sporer of Nuremberg, 1473, in the public library at Zwickau, of another by Ludwig zu Ulm, in the Paris national library, and of that described in *Collectio Weigel*, (ii. 16), where also other, but opisthographic, editions are described.

(3) *Ars Memorandi*; thirty leaves, folio, printed on one side, fifteen leaves being letter-press and fifteen plates.

(4) *Salve Regina*, bears the name of its engraver, Lienhart von Regenspurck. It is composed of sixteen leaves; two leaves (signature a) are wanting in the only copy known of it, which was in the Weigel collection (ii. 103).

(5) *Vita Christi*; thirty-two leaves, sm. 8vo. Two copies in the Paris library (Sotheby, ii. 143).

(6) *The Ten Commandments for Unlearned People* (*Die zehn Eolt für die ungelernete Leut*). Ten leaves are preserved in the library at Heidelberg bound up with a manuscript (No. 438).³

(7) *The Passion of Our Lord*; sixteen leaves, in the Weigel collection (Sotheby, ii. 141).

(8) *The Antichrist* (*Der Enndchrist*); twenty-six leaves, small folio (Sotheby, ii. 33, Weigel, ii. 111). Copies, Lord Spencer and coll. Weig.

(9) *The Fifteen Signs of the Last Judgment*; twelve engravings, usually bound up with the engravings of *The Antichrist* (Sotheby, ii. 42). Copy, Lord Spencer. There is also an edition published at Nuremberg in 1472 by Junghanns Prillmaler.

(10) *Symbolum Apostolicum*; small quarto, seven leaves printed on one side only, and containing twelve woodcuts with German inscriptions. The only copy of it known is preserved in the library of Munich (Sotheby, ii. 148).

(11) *The Legend of St Meinrad*; forty-eight leaves. The only copy known is preserved in the Munich library (Sotheby, ii. 150).

(12) *The Acht Schalkheiten*, of which eight leaves were in the Weigel collection (i. 112; Sotheby, ii. 154).

(13) *The Fable of the Sick Lion*; twelve leaves, preserved in the library at Heidelberg (No. 438; see Sotheby, ii. 159, pl. lxxxvi.).

(14) *Defensorium Inviolatæ Virginitatis b. Mariæ Virginis*; sixteen leaves fol. The unique copy is in the British Museum. On the first leaf are the initials of the printer F[r]iedrich W[altheren] and the date 1470 (Sotheby, ii. p. 63).

(15) The same work, twenty-seven leaves, large folio, with the imprint "Johannes eysenhut impressor Anno ab incarnationis dnice M^o quadragesimo septuagesimo j^o" (cf. Sotheby, ii. 72). Copy in the British Museum.

(16) *The Dance of Death* (*Dance Macabre, Der Doten Dantz*), twenty-seven leaves (Sotheby, ii. 156).

(17) *Die Kunst Cirronantia* of Dr Johan Hartlieb (Sotheby, ii. 84).

(18) *Der Beichtspiegel or Confessionale*; eight engravings (Sotheby, ii. 145). Copy in the royal library at the Hague.

(19) *The Apostles' Creed*; seven leaves, folio. Copy at Wolfenbüttel.

(20) *The Credo*, in German, twelve leaves, quarto. Copy in the royal library at Munich.

¹ We have also evidence that sometimes the picture or figures were printed from blocks, space being reserved for the text, to be added afterwards by hand (see *Beuard, Origine*, i. 102).

² *Le Printre-Graveur*, i. 27 sq.

³ See Joh. Goffcken, *Der Bilderatichismus der 15. Jahrh.*, Leipzig, 1855, quarto. Sotheby, ii. 102.

Propugnacula, seu Turris Sapientia; one sheet, plano, Brit. Mus. (Sotheby, ii. 164).

Of
Nether-
landish
origin.

Block-books of Netherlandish origin are:—
(1) *Biblia Pauperum*; forty leaves (each bearing a signature, *a* to *v. a. v.*). As many as seven editions have been distinguished by Sotheby (i. 43; see also Holtrop, *Mon. Typ.*, p. 3).

(2) *Ars Moriendi*,¹ twenty-four leaves, small folio, thirteen containing text, eleven plates (see Sotheby, i. 69; Holtrop, p. 8).

(3) *Canticum Canticoorum, Historia seu Providentia B. Virginis Mariae ex Cantico Canticoorum*; sixteen leaves, in fol. (Sotheby, i. 77; Holtrop, p. 6).

(4) *Liber Regum, seu Historia Davidis*; twenty leaves, folio (Sotheby, i. 120b). Some consider this to be a German work.

(5) *Exercitium super Pater Noster*, by Henricus de Pomerio; ten leaves, small folio (Sotheby, ii. 137; Holtrop, p. 10).²

(6) *Temptationes Demonis Temptantis Homines de Septem Peccatis Mortalibus*; a single large folio leaf printed on one side. Two copies, one in British Museum, the other in the library at Wolfenbüttel.

(7) *Vita Christi, or the Life and Passion of Christ*; thirty-six cuts, originally printed in a press on six anopisthographic leaves, 8vo. In the library at Erlangen (see Campbell, *Annales*, 746).

(8) *Historia Sanctae Crucis*; a fragment of one leaf (with signature *g*), preserved in the Weigel collection (ii. 92), which seems to be a proof-sheet only.

(9) *Alphabet in figures* (Holtrop, p. 11; Sotheby, i. 122).³

(10) *Pomerium Spirituale*, by Henricus de Pomerio or Henry Bogaert; twelve leaves; having twelve woodcuts accompanied by MS. text, in the library at Brussels (Holtrop, *Mon. Typ.*, p. 9). It bears the date 1440 in two places; but some contend that this refers to the date when the book was written,⁴ not when the engravings were printed.

Besides the works of Sotheby, Holtrop, and Weigel, already quoted, consult W. M. Conway, *The Woodcutters of the Netherlands in the 15th Century*, Cambridge, 1884; Heineken, *Idée Générale*, Leipsic, 1771; J. Ph. Berjeau, *Faécimiles de la Biblia Pauperum, Canticum Canticoorum, Speculum*, London, 1859-1861; and *Id., Catal. Illustré des Livres Xylogr.*, London, 1865.

Early Printing at Mainz.

When we, for the moment, leave out of sight the question as to when, where, and by whom the art of printing with movable metal types was invented, and take our stand on well-authenticated dates in such printed documents as have been preserved to us, we find that the first printed date, 1454, occurs in two different editions of the same letters of indulgence issued in that year by Pope Nicholas V. in behalf of the kingdom of Cyprus.

These two editions are distinguished respectively as the 31-line and the 30-line indulgence. The former, of which three different issues with the printed date *mccccliii.*, and a fourth with the printed date *mcccclv.*, are known to exist, claims priority⁵ from a chronological point of view over the latter, of which one issue with the printed date *mccccliii.*, and two issues with the printed date *mcccclv.*, are known to exist, because one of the sold copies that has been preserved was issued at Erfurt on 15th November 1454, whereas of the 30-line indulgence the earliest sold copy that has as yet come down to us was issued at Cologne on 27th February 1455, though it distinctly has the printed date *mccccliii.*, but altered with the pen to *mcccclv.* In the 31-line indulgence occur (1) a large church type usually regarded as identical with that of the 36-line Bible, and used for the rubrics of the absolutions, for the word with which the document commences, and for the Christian name of the pope's legate; (2) a smaller text or brief type, which was afterwards very closely imitated, if not actually used, at Eltville, in printing the 1472 edition of the *Vocabularius ex quo* and an edition of the *Summa de Articulis Fidei* of Thomas Aquinas; (3) a large initial V and two large initials M, which differ from each other. In the 30-line indulgence occur (1) a large church type, which is used as in the 31-line indulgence, and is usually regarded as identical with that of the 42-line Bible; (2) a smaller text or brief type, of which as yet no further trace has been found; (3) a large initial U, and two large initials M, which differ from each other, the first being identical with the initial M of the second absolution of a 33-line indulgence printed by Peter Schoeffer in 1459 for "Raymundus Peyraudi, archidiaconus Alnisiensis in

¹ Heineken enumerates six editions, of which one has inscriptions in German. See also an article by Guichard, in *Bull. du Bibliophile*, Paris, 1841.

² See also W. M. Conway, *Notes on the Exercitium super Pater Noster*, 1887.

³ There is one copy in the British Museum and another in the library at Basel, this last having the date 1464 engraved on the letter A, which is mutilated in the former. A similar alphabet preserved at Dresden seems to be a copy made in Germany.

⁴ Mr W. M. Conway is of a different opinion; see *Notes on Exercitium*. Dumortier testifies to having seen another copy unaccompanied by MS. ("Notes sur l'Imprimerie," in *Bull. Acad. Roy. de Belg.*, vol. viii., 1841).

⁵ No inferences can be drawn from this priority, as it merely rests on the date of a sold copy that has come to light.

ecclesia Xanton," who issued it at the order of Pope Innocent VIII., "pro tuicione orthodoxe fidei contra Turchos." These two different editions are usually regarded as having been printed at Mainz; and, so long as there is no evidence to the contrary, we may assume that such was really the fact. But we must at the same time conclude that about November 1454 there were at least two rival printers at work there,—(1) the printer of the 31-line indulgence, whose name has not yet transpired, but who may have been Johan Gutenberg, perhaps subsidized by Johau Fust; (2) the printer of the 30-line indulgence, who was no doubt Peter (Schoeffer) de Gernsheym, on account of the connexion of this indulgence with that of 1489, which was unquestionably printed by him. Latterly four written copies of the same indulgence have been found, which respectively bear the dates,—Frankfort, 10th April 1454 (in the possession of Herr Lais, Wiesbaden); Frankfort, 11th April 1454 (Frankfort archives); 11th July 1454 (place unknown; Darmstadt archives); Lübeck, 6th October 1454. As their dates precede by a few weeks only the earliest known printed date (15th November 1454), they mark, perhaps, the exact time when printing made its appearance at Mainz in an already advanced state of perfection.

In following up the basis afforded by the above indulgences we may give a short chronological view of the early printing at Mainz, types and so far as it is at present known, referring for minute details to J. H. Hessels, *Gutenberg: Was he the Inventor of Printing?* 1882, p. Mainz, 150 sq.

TYPE 1 (large church type) and 2 (smaller brief type, used by an unknown printer, 1454.

(i.) 31-line indulgence; three different issues (A, B, C), with the printed year *mccccliii.*, and one issue (D) with the printed year *mcccclv.* All printed on vellum. Of issues A and B no sold copies have yet come to light. Three unsold copies of each are preserved at (1) Brunswick, (2) Wolfenbüttel, and (3) Hanover (Culemann). Of issue C eight sold copies are known to exist in various libraries, with dates from Nov. 15 1454 to Apr. 30 1455. Also four unused copies have been discovered. Of issue D ten sold copies with dates from Mar. 7 1455 to Apr. 30 1455 and four unused copies are known.

TYPE 1, continued; for type 2 see below.

(ii.) *Marungwidder die Durke*. An almanac for Jan. 1455, in 4to, 5 leaves, 20 and 21 uneven lines. The only copy known was discovered at Augsburg, and is now in the Munich library.

(iii.) *Conjunctiones et Oppositiones Solis et Lunae*. A calendar for 1457, a broadside sheet, printed on one side. The upper half of the only copy known was discovered at Mainz, and is now in the Paris library.

(iv.) *Der Cislanus* (not Cislanus) zu Dulsche. A broadside sheet, printed on one side, 36 lines, besides separate head-line. The Tross copy, mentioned in Suppl. to Brunet's *Manuel* (1878, s.v. "Cislanus"), was bought in 1870 for the Cambridge university library.

(v.) and (vi.) *Donatus*. Two different editions of 14(?) leaves each, 27 lines (B. Mus., C. 18 e 1, Nos. 2 and 5).

(vii.) *Donatus* of 30 lines, 12(?) leaves; a fragment of the 8th (?) in the Mainz library.

(viii.) 36-line Bible. 2 vols. fol., 882 leaves, with 2 columns of 36 lines each on a page. Some bibliographers call this the Pfister Bible, assuming that Pfister printed it. The Paris library possesses a paper copy, and also a separate copy of the last leaf, which bears the MS. date 1461. Other copies exist in

Lord Spencer's library, in the Brit. Mus., at Jena, Leipsic, Antwerp, &c.⁶

TYPE 3 (large church type) and 4 (smaller brief type, used by Peter Schoeffer de Gernsheym, 1454-1465.

(i.) 30-line indulgence; one issue (A) with the printed year *mccccliii.*, and two issues (B, C) with the printed year *mcccclv.* All printed on vellum. Of issue A only one copy has been discovered, now in Lord Spencer's library. It was sold at Cologne on Feb. 27 1455, the printed date *mccccliii.* having been altered with the pen to *mcccclv.* Of issue B two sold copies, with dates Apr. 11 and 29 1455, are in the Berlin library and the Brit. Mus. Of issue C two sold copies, with dates Feb. 22 and Apr. 24 1455, are at Hanover (Culemann) and Wolfenbüttel. An unsold copy is at Hanover (Culemann).

TYPE 3, continued (till about 1457); of type 4 no further trace is found.

(ii.) *Donatus* of 24, 25, or 26 lines, 24 (?) leaves; one leaf (the 6th or 9th?) in the Mainz library.

(iii.) *Donatus* of 32 lines, 14 (?) leaves, the 10th (?) in the Mainz library.

(iv.) *Donatus* of 33 lines, two leaves in the Paris library.

(v.) *Donatus* of 35 lines, folio; printed, according to the colophon, "per Petrum de Gernsheym in urbe Montanis cum suis capitalibus."

(vi.) 42-line Bible (also called *Mazarine Bible*), printed before Aug. 15 1456, as the binder of the paper copy in the Paris library states that he finished its rubrication on that day. 2 vols. fol., 641 leaves of 2 columns of 42 lines each, except that in some copies the columns of pp. 1-9 contain 40 lines only, while the 10th page has 3 columns of 41 lines each, though the difference in the number of lines makes no difference in the space which they occupy.⁷

(vii.) 42-line *Cantica ad Matutinas*. The first and only leaf known is in the Paris library. It is printed on vellum, and corresponds in every respect to the 42-line Bible, having double columns, 42 lines, &c.

The above four types and the books printed with them (besides a few others printed by Albrecht Pfister at Bamberg) are the only ones that stand in close connexion with the question regarding the introduction, or the possible invention, of printing at Mainz. It has been pointed out above that one of the initial M's of the 30-line indulgence of 1454 occurs again in an indulgence of 1489, printed by Schoeffer; hence types 3 and 4 and the books printed with them must be ascribed to this printer, in spite of the fact that the capital P found in the indulgence does not seem to occur again in the 42-line Bible. No further trace of the brief type 4 has yet been found, and perhaps Schoeffer melted it down for his other types. As Schoeffer, in the colophon of the *Donatus* (v.) which bears his

⁶ See Hessels, *Gutenberg*, p. 160; and Bernard, *Origine*, ii. 31

⁷ For other copies, see Bernard, *Origine*, i. 164, 177-192; and Hessels, *Gutenberg*, 170.

name alone, says that it was printed "cum suis capitalibus," and as these capitals gradually disappear after 1459 and the type of the 42-line Bible is no longer found after 1456, we must presume that the seven incunabula mentioned above were printed by Peter Schoeffer alone before he entered (in 1457) into partnership with Johan Fust.¹

There is no such certainty as regards types 1 and 2 and the books printed with them. If the 31-line indulgence may be assumed to have been printed at Mainz, its printer was in all probability Johan Gutenberg, though it would seem from a lawsuit of 1455 (see p. 690 below) between him and Fust that in that year Gutenberg had not yet printed anything, and in 1454 (1455) Fust evidently called him to account for not having produced anything. Certain circumstances point to Albrecht Pfister as the printer of the eight incunabula in the left-hand column. First, he undoubtedly printed with type 1 in that city as early as 1461, for on 14th February of that year he issued in that type an edition of Boner's *Edelstein* (88 leaves, fol., with wood engravings), and printed with the same type at least eight other works,² one of which was issued in 1462, the seven others without a date. Secondly, most of the copies of the 16-line Bible were at one time or another preserved in the libraries of Bavaria, and a great number of fragments have been discovered in monasteries in that country, even in a register of the abbey of St Michael at Bamberg of the year 1460. Thirdly, a transfer of type from Gutenberg to Pfister is contrary to all analogy in the infancy of printing, when every printer started with a type of his own making. But, as there is no direct evidence as to who really possessed types 1 and 2 before 1460, we have not felt justified in assigning the 31-line indulgence and the other seven incunabula (including the 36-line Bible) to Pfister.

It is alleged that, in consequence of the lawsuit between Gutenberg and Fust, the former was deprived of all tools, &c., which he had made, or is supposed to have made, with the money which the latter had advanced to him, and that afterwards a certain Dr Homery or Humery, a syndic of Mainz, lent him fresh money to enable him to establish another printing office. This allegation is made on the strength of a letter of obligation (of 26th February 1468), given by Dr Homery to Adolph, the archbishop of Mainz, by which he acknowledges to have received from the said archbishop "several forms, letters, instruments, implements, and other things belonging to the work of printing, which Johan Gutenberg had left after his death, and which had belonged and still did belong to him (Dr Homery)." It is presumed that with these types, which we may call the Mainz type No. 5, Gutenberg printed (i.) Joannes de Balbis, *Catholicon*, 1460, 373 leaves, folio, 2 columns of 66 lines each, copies of which exist in the Cambridge university library, three in the British Museum, two in the Paris library, in Lord Spencer's library, in the Wolfenbüttel and Mainz libraries, &c.; (ii.) Mattheus de Cracovia, *Tractatus Rationis*, 22 leaves, 4to, 30 lines, three copies of which are in the British Museum, one at Althorp, one in the Cambridge library, two in the Paris library, &c.; (iii. and iv.) Thomas Aquinas, *Summa de Articulis Fidei*, two editions in 4to, the first of 13 leaves and 34 lines,—two copies of which are in the British Museum, one in Lord Spencer's, the Cambridge library, &c.—and the second of 12 leaves and 36 lines,—copies in the British Museum and the Paris library; and (v.) indulgence of 1461 of 15 lines.

On 18th January 1465 Adolph II., archbishop of Mainz, appointed "Johan Gutenberg, on account of his grateful and willing service, his servant and courtier (*dhienere und hoffgesind*) for life, promising to supply him with clothing and each year 20 'malter' of corn and 2 'fuder' of wine." It has always been inferred from this that Gutenberg had quitted Mainz and gone to Eltville (Eltfeld) to reside at the archbishop's court, and that, his dignity as courtier preventing him from printing himself, he passed the *Catholicon* types on to Henry Bechtermunze at Eltville. But recent researches have shown that Gutenberg remained at Mainz till his death in 1468. We certainly find in 1467 the *Catholicon* type with some additions (already found in the indulgence of 1461) at Eltville near Mainz, in the hands of Henry and Nicholas Bechtermunze and Wigandus Spyes de Orthenberg, who finished on 4th November of that year (vi.) *Vocabularius ex quo* (a Latin-German vocabulary) in 4to, 166 leaves, 35 lines, the only known copy of which is in the Paris library, and (vii.) *Vocabularius ex quo*, second edition, with colophon dated 5th June 1469, 4to, 165 leaves, 35 lines, copies of which exist in Lord Spencer's library, at Blenheim, and in the Paris library. Now it is asked how the Bechtermunzes could have been using the *Catholicon* type in 1467, if we assume that it was this type to which Homery refers in his letter of obligation as being in his possession. Some, therefore, conclude that the *Catholicon* and the four other works in the same type were printed at Mainz by Henry Bechtermunze, who may afterwards have transferred his printing office to Eltville. In that case it is difficult to see what type Homery could refer to, unless it were type 2, a close imitation of which, if not the actual type, was used by Nicholas

Bechtermunze at Eltville in printing (12th March 1472) a third edition of the *Vocabularius ex quo*, 166 leaves, 35 lines, copies of which are preserved in the Paris and Hamburg libraries, and an edition of Thomas Aquinas, *Summa de Articulis Fidei*, 12 leaves, 35 lines (Munich library).

It is necessary to point out that for nearly seventy years eight books—(1) *Prognostication or Calendar*; (2) Hermaun de Saldis, *Speculum Sacerdotum*; (3) *Tractatus de Celebratione Missarum*; (4) a work in German treating of the necessity of councils; (5) *Dialogus inter Hugonem Cathonem et Oliverium super Libertate Ecclesiastica*; (6) Sifridus de Arena, *Determinatio Duarum Questionum*; (7) *Id., Responso ad Quatuor Questiones*; (8) *Klagspiegel*, or *Neu gletscht Rechtbuch*—have been ascribed to Gutenberg by the strength (a) of the date 1460, which was said to be found in the *Prognostication* in the Darmstadt library, and (b) of a so-called rubrication alleged to be in a copy of the *Tractatus de Celebratione Missarum*, in which "Johannes dictus a bono monte" and Johannes Numeister are represented as offering this work on 19th June 1463 to the Carthusians at Mainz. But the date in the *Prognostication* has been falsified from 1482 into 1460, and the rubrication in the *Tractatus* is a forgery.³ The eight books are now considered to have been printed by Erhard Reuwich.

When we set aside the above works, there is no further difficulty as regards the history of Mainz printing. Fust and Schoeffer worked together from 1457 to 1466, starting in August 1457 with an edition of the *Psalterium*, printed in large missal types, which, as far as we know, is the first printed book which bears a date, besides the place where it was printed and the name of the printers. It was reprinted with the same types in 1459 (the second printed book with date, place, and name of printer), in 1490, and in 1502 (the last work of Schoeffer, who had manufactured its types). In 1459 Fust and Schoeffer also published Gul. Durantus, *Rationale Divinorum Officiorum*, with the small type (usually called Durandus type) with which they continued to print long afterwards. In 1460 they published the *Constitutiones* of Pope Clement V., the text printed in a type (Clement type) about a third larger than the Durandus. This type was, however, in existence in 1459, as the colophon of the Durandus is printed with it.⁴

Spread of Typography.

Having explained the early printing of Mainz, in so far as it bears upon the controversy (see below) as to where and by whom the art of printing was invented, we can follow its spread to other countries. After Mainz it was first established in 1460 at Strasburg, where the first printers were,—1. Johann Mentelin, who completed a Latin Bible in that year, according to a rubrication in a copy at Freiburg in the Breisgau; 2. Adolph Rusch de Ingulien, who is presumed to be the printer of the undated books with a singularly shaped R,⁵ c. 1464; 3. Henricus Eggestein, 1471; 4. George Kusner; 5. Martin Flach, &c. In 1461 at Bamberg, where the first printer was Albrecht Pfister, who in that year published Boner's *Edelstein*, though it is still doubtful whether he did not print earlier (see above); 2. Joh. Sensenschmidt, c. 1480. 1465 at Subiaco; first and only printers Conrad Sweynheym and Arnold Pannarts, who completed in that year an edition of Cicero, *De Oratore*, and Lactantius, and removed to Rome in 1467. 1466 at Cologne, the printers being—1. Ulrich Zell, who published in that year Chrysostom, *Super Psalmo Quinquagesimo Liber Primus*, though it is presumed that he printed in 1463; 2. Arnold Ther Hoernen, 1470; 3. Johannes Koelhoff of Lübeck, 1470, who printed the *Cologne Chronicle* in 1499; 4. Nicolaus Gotz, 1474; 5. Goiswinus Gops, 1475; 6. Petrus de Olpe, 1476 (not 1470); 7. Conradus Winter of Homburg, 1476; 8. Joh. Guldenschaaf, 1477; 9. Henricus Quentel, 1479, &c.⁶ 1467 at Eltville; first printers Nicolas and Henry Bechtermunze and Wigandus Spyes de Orthenberg, who completed in that year a *Vocabularius ex quo*. 1467 at Rome; first printers Conrad Sweynheym and Arnold Pannarts from Subiaco, who published an edition of Cicero's *Epistolæ ad Familiares*, and Ulrich Hahn or Udalicus Gallus, who issued on 31st December 1467 *Turrecremata's Meditaciones*. 1468 at Augsburg; first printer Gunther Zainer or Zeyncr. Same year at Basel; first printer Bertold Rot of Hanau. Same year at Marienthal; Brothers of the Common Life. 1469 at Venice; printers,—1. Johannes of Spire; 2. his brother Vindelinus of Spire; 3. Christopher Valdarfer; 4. Nicolas Jenson, &c. The further spread of typography is indicated by the following data:—1470 at Nuremberg (Johan Sensenschmidt, Friedr. Creusner, Anton Koberger, &c.), Berona or Beromünster in Switzerland (Helyas Helye alias De Llouffen), Foligno (Emilianus de Orfinis and Johannes Numeister), Trevi (Johann Reynard), Savigliano

¹ See Hessels, *Gutenberg*, pp. 107-114.

² See further Bernard, *Origine de l'Imprimerie*, i. 216 sq.

³ M. Philipe, *Origine de l'Imprimerie à Paris*, p. 219, mentions two books printed in this type, which contain manuscript notes to the effect that they were purchased in 1464 and 1467, so that Ingulien should be placed before Eggestein.

⁴ Johan Veldener, who is said to have printed at Cologne, was never established there, but at Louvain (1473-77), Utrecht (1478-81), and Culemborg or Kulenburg (1483-84); see Holtrop, *Mon. Typ.*, pp. 42, 47, 169.

⁵ For details, Hessels, *Gutenberg*, p. 166 sq.

⁶ See Hessels, *Gutenberg*, p. 161 sq.

(Hans Glim), Paris (first printers the three partners Ulrich Gering, Michael Friburger, Martin Krautz); 1471 at Spire, Bologna, Ferrara, Florence, Milan, Naples, Pavia, Treviso, Savigliano (?), 1472 at Esslingen, Cremona, Mantua, Padua, Brescia, Parma, Monreale (Mondovì), Fivizzano, Verona, Iesi (?), St Ursino (?); 1473 at Laningen, Ulm (perhaps as early as 1469), Merseburg, Alost, Utrecht, Lyons, Messina, Buda; 1474 at Louvain, Genoa, Como, Savona, Turin, Vicenza, Valencia (?); 1475 at Lübeck, Breslau, Biauheuren, Burgdorf, Trent, Craoow (?), Modena, Reggio (in Calabria), Cagli, Caselle or Casale, Pieve (Pieve) di Sacco, Perugia, Piacenza, Saragossa; 1476 at Rostock, Bruges, Brussela, Angers, Polliano (Pogliano); 1477 at Reichenstein, Deventer, Gonda, Delft, Westminster, Luca, Ascoli, Palermo, Seville; 1478 at Oxford, St Maartensdyk, Colle, Schunnsried (in Wurtemberg), Eichstätt, Geneva, Vienne, Trogen (?), Chablis, Cosenza, Prague, Barcelona; 1479 at Erfurt, Würzburg, Nimeggen, Zwolle, Poitiers, Toscolano, Pinerolo, Novi, Lerida, Segorbe; 1480 at London, St Albans (or in 1479), Oudenarde, Hasselt, Reggio (in Modena), Salamanca, Toledo, Nonantola, Friuli (?), Caen; 1481 at Passau, Leipsic, Magdeburg, Treves, Urach, Casale di San Vaso, Saluzzo, Albi, Rougemont (?); 1482 at Reutlingen, Memmingen, Metz, Pisa, Aquia, Antwerp, Promentour, Zamora, Odense; 1483 at Leyden, Kuileburg (Culenborg), Ghent, Chartrea, Chalons-sur-Marne (?), Troyes, Gerona, Stockholm; 1484 at Bois-le-Duc, Siena, Udine, Soincen, Winterberg, Klosterneuburg, Rennes, Loudéac; 1485 at Heidelberg, Ratisbon, Pescia, Vercelli, Tréguier or Lantreguet, Salios, Burgos, Palma, Xeres; 1486 at Münster, Stuttgart, Chiavasco, Voghera, Casal Maggiore, Abbeville, Brünn, Schleswig; 1487 at Ingolstadt, Gaeta, Rouen, Murcia; 1488 at Stendal, Viterbo, Gradsca, Besançon, Constantinople; 1489 at Hagenau, San Cufat (near Barcelona), Coria, Pamplona, Tolosa, Lisbon; 1490 at Orleans, Grenoble, Dôle; 1491 at Hamburg, Nozanno, Gonpillières, Angoulême, Dijon, Lanteoac; 1492 at Zinna, Valladolid, Leiria; 1493 at Lüneburg, Cagliari, Freiburg (in Breisgau), Urbino, Acqui; 1494 at Oppenheim, Monterey, Braga; 1495 at Freisingen, Freiburg, Scandiano, Forlì, Limoges, Schoonhoven (monastery Den Hem), Wadstena, Cettinje; 1496 at Offenau, Provins, Granada; 1497 at Munich, Barco, Carmagnola, Avignon; 1498 at Tübingen, Perigueux, Schiedam, Tarragona; 1499 at Montserrat, Madrid; 1500 at Olmütz, Pforzheim, Sursée, Perpignan, Valenciennes, Jaen. Printing was introduced into Scotland in 1505 by the establishment of Andrew Millar at Edinburgh, and into Ireland, at Dublin, in 1551. As for non-European countries and towns, printing was established in Mexico in 1544, at Goa about 1550, at Tranquebar in 1569, Terceira in the Azores 1583, Lima 1585, Manila and Macao (China) 1590, in Hayti in the beginning of the 17th century, at Puebla in 1612, Cambridge (Mass.) 1638, Batavia 1668, Tiflis 1701, German-town 1735, Ceylon 1737, Halifax (Nova Scotia) 1766, Madras 1772, Calcutta 1778, Buenos Ayres 1789, Bombay 1792, in Egypt (at Alexandria, Cairo, and Gizeh) in 1798, at Sydney 1802, Cape Town 1806, Montevideo 1807, Sarepta 1808, Valparaiso 1810, Astrakhan 1815, in Sumatra and at Hobart Town and Santiago (in Chili) in 1818, in Persia (at Teheran) in 1820, and at Chios about 1821.²

Customs of early printers.

Till the moment (say 1477) that printing spread to almost all the chief towns of Germany, Italy, Switzerland, France, the Netherlands, Spain, England, not a single printer carried away with him a set of types or a set of punches or moulds from the master who had taught him, but, in setting up his printing office, each man cast a set of types for his own use, always imitating as closely as possible the handwriting of some particular manuscript which he or his patron desired to publish. When we compare Schoeffer's 30-line indulgence of 1454 with a manuscript copy of the same indulgence dated 10th April 1454, now in the hands of a private collector at Wiesbaden, we see that the types used in printing that document were specially cast for the purpose after the model of the handwriting employed for the written copies. We know also that the types of the 36-line and 42-line Bibles and those of the psalter of 1457 are the closest possible imitations of the ornamental church handwriting customary at the time of their production. Also, when we compare the 31-line indulgence of 1454 with the German block-book called the *Enndtchrist*, and both in their turn with the German MSS. of that period (especially the manuscript portions in the printed copies of the indulgences), we see that the cutter of the text type of the indulgence, as well as the engraver of the block-book, formed his characters according to some German handwriting (book hand) of the period. This imitation extended, not only to the shape of the letters, but likewise to all those combinations of letters (double *p*, double *f*, double *s*, *st*, *ti*, *tu*, *re*, *cu*, *ci*, *si*, *de*, *co*, *ci*, *te*, *ce*, *or*, *re*, *po*, *fa*, *he*, *be*, *ke*, &c.) and contractions (for *pro*, *-um*, *-em*, *-en*, *the*, *uer*, *-bis*, *-bis*, *sel*, *am*, *tur*, *qui*, *quod*, *secundum*, &c.) which were then, and had been for many centuries, in use by scribes. In most, if not all cases, the MSS. which the printers

imitated were indigenous to the place where they settled. Thus the first printers of Subiaco, though they were Germans and had most probably learned the art of casting types and printing at Mainz, clearly cut their types after the model of some Italian MS. which was free from any Gothic influence, but written in a pure Caroline minuscule hand, differing but slightly from the Caroline minuscules which the same printers adopted two years afterwards at Rome. The first Paris printers started in 1470 with a type cast in the most exact manner, on the model of the Caroline minuscule handwriting then in vogue at Paris. John de Westphalia, who introduced printing into Belgium, used from the beginning a type which he calls Venetian. Where therefore there is a great similarity, but no absolute identity, between the types of two printers (e.g., Schoeffer and Ulr. Zell), it should be attributed to the similarity of the handwritings which the printers followed rather than to any attempt on their part to imitate each other's types. To this universal system (clearly discernible in the first twenty-five years of printing) of each printer setting up business with a new type cast by himself, there are, according to the conjectures of a good many bibliographers, only two exceptions. One is Albrecht Pfister (see above); the other is the Bechtmunczes of Eltville (see above).

Another most important feature in the earliest books is that the uneven-printers imitated, not only the handwriting, with all its contractions of lines, combined letters, &c., but all the other peculiarities of the MSS. they copied. There is in the first place the unevenness of the lines, which very often serves as a guide to the approximate date of a book, especially when we deal with the works of the same printer, since each commenced with uneven lines, and gradually made them less uneven, and finally even. This unevenness was unavoidable in manuscripts as well as in block-books; but in the earliest printed books it is regarded as evidence of the inability of the printers to space out their lines. If this theory be correct, this inability was perhaps owing to the types being perforated and connected with each other by a thread, or to some other cause which has not yet been clearly ascertained. But it is not impossible that the unevenness was simply part and parcel of the system of imitating MSS., and that only gradually (about 1473 or 1474, but in some cases later) printers began to see that even lines looked better than uneven. This seems clear when we observe that the imitation of MSS. was carried so far that sometimes things which deviated from the work of the scribe, but had accidentally been printed in, were afterwards erased and altered in conformity with the MS. The Paris library, for instance, possesses two copies of the *Liber Epistolarum* of Gasparinus Pergamensis (printed at Paris in 1470) in both of which the initial G of the first line and the initial M of the fourth line were printed in, and, whilst they have been allowed to remain in one of the copies, in the other they were regarded as a fault and replaced by a rubricated L and M.

In the second place the initials of books or the chapters of books in MSS., and again in block-books and the earliest products of printing, were always, or at least in most cases (they are printed in the indulgences of 1454), omitted by the scribe and the printer, and afterwards filled in by the rubricator. As the latter artists were sometimes illiterate and very often filled up the gap by a wrong initial, we find in a good many MSS. as well as early printed books small letters written either in the margin or in the blank left for the initial, to guide the rubricator. In most cases where these letters (which are now called initial directors) were written in the margin, they were placed as much as possible on the edges of the pages in order that they might be cut away by the binder as unobtrusively; but in a vast number of instances they have remained till the present day.³ After a few years these initial directors were in a good many books printed in (in lower-case type) with the text. In all cases, whether written or printed, they were meant to be covered by the illuminated initial; but, as a matter of fact, the latter very seldom covers the initial director so completely as to make it invisible, and in a good many cases the intended illumination was never carried into effect.

With respect to the hypens, which were used in the 1454 *Bybels*, indulgences and the 36-line and 42-line Bibles, always outside the printed margin, some of the earliest printers did not employ them at the moment that they started their presses, and in the case of some printers the non-use or use of hypens, and their position outside or inside the printed margin, serve as a guide to the dating of their products. After about 1472 they become more uniform in their shape and more generally used.

The use of signatures is confined in MSS. mostly to mark the Signatures, and in block-books to mark each sheet or page; they do not occur in printed books before 1472 (at least in no earlier book with a date), when they appear in Job: Nider's *Præceptorium Divinae Legis*, published by Johan Koelhoff at Cologne.

Catchwords (*custodes*) were used for the first time about 1469 by Catch Johannes of Spire, at Venice, in the first edition of Tacitus. words

¹ See Rob. Dickson, *Introd. of Art of Print. into Scotl.*, Aberdeen, 1885.

² On the introduction of printing in various towns, consult Henry Cotton, *A Typog. Gazet.*, 8vo, Oxford, 1831, and (second series, 8vo, Oxford) 1866; (P. Beschamps) *Dict. de Glogr. à l'Usage du Libraire*, 8vo, Paris, 1870; R. C. Hawkins, *Titles of the First Books from the Earliest Presses Established in Different Cities in Europe*, 4to, New York, 1854.

³ The university library of Basel possesses a collection of the earliest Paris books still bound in their original binding, in which these initial directors are written not only on the outer edges, but on the inner sides of the pages, and so close to the back that they can only be seen by stretching the books wide open.

Pagina- tion. Pagination or rather foliation was first used by Arn. Ther Hoernen, at Cologne in 1471, in Adrianus's *Liber de Remediis Fortuitorum Casuum*, having each leaf (not page) numbered by figures placed in the end of the line on the middle of each right-hand page.

Slowness of pro- gress at first. The practice among early printers of imitating and reproducing MSS. was not abandoned till many years after the first printed book (1454) made its appearance; and, looking at the books printed, say from 1454 to 1477, from our present standpoint of daily improvement and alteration, the printing of that period may be said to have been almost wholly stagnant, without any improvement or modification. If some printers (for instance, Sweynheym and Pannarts at Subiaco and Rome, and Nicolas Jenson at Venice) produced handsome books than others, this is to be attributed to the beauty of the MSS. imitated and the paper used rather than to any superior skill. Generally speaking, therefore, we shall not be very far wrong in saying that the workmanship of Ketelaer and De Leempt's first book, published at Utrecht c. 1473, and that of Caxton's first book issued at Westminster in 1477, exhibit the very same stage of the art of printing as the 1454 indulgences. If therefore any evidence were found that Ketelaer and De Leempt and Caxton had really printed their first books in 1454, there would be nothing in the workmanship of these books to prevent us from placing them in that year. And conversely, if the indulgences of 1454 had been issued without a date or without any names to indicate their approximate date, their workmanship would invariably induce bibliographers to ascribe them to circa 1470, if not somewhat later. Even after 1477 the alterations in the mode of printing books proceeded very slowly and almost imperceptibly. It came to be no longer a universal system for printers to begin business by casting a type for themselves, but some received their types from one of their colleagues. And, though there were still many varieties of types, one sort began to make its appearance in two or three different places. The combinations of letters were the first to disappear; but the contractions remain in a good many books even of the 17th century.

Some theories have been based on, and others have been considered to be upset by, the supposition that the early printers always required as much type as printers of the present day, or at any rate so much as would enable them to set up, not only a whole quire of 4 or 5 sheets (= 8 or 10 leaves = 16 or 20 pages), but even two quires (= 40 pages). Consequently calculations have been made that, for instance, the printer of the 42-line Bible required a fount of at least 120,000 characters.¹ But, though the *Speculum Humanæ Salvationis* seems to have been printed by whole sheets (2 pages), there are numberless proofs that many early books were printed page by page, even when in small 4to. For instance, in some books it has been observed that portions of the types with which the text of the first, second, or third pages of a quire had been printed were used to "lock up" the types employed for the later pages of the same quire, as is evident from the blank impressions of such portions being found on these later pages. Again, in some books two, three, or four blank leaves are found at the end, showing a miscalculation of the printer. Moreover, the numerous itinerant printers of the 15th century, who established a press for a short time wherever they went, prove that the furniture of the earliest printing offices must have been of no great extent.

The Invention Controversy.

Contro- versy as to inven- tion of printing. Now that we have traced the art of printing from the moment (1454) that it made its appearance in a perfect state at Mainz, and have followed its spread to all the chief places of Europe till 1500, we must take notice of the controversy which has been carried on for nearly four hundred years as to when, where, and by whom the art was invented. For this purpose we will gather up into a chronological sequence (a) a few of the most important expressions used by the earliest printers in their colophons, (b) whatever documentary evidence there may be on the subject, and (c) some accounts of the earliest authors on the subject. (The letters A, B, &c., are for the sake of convenient reference.)

Early testi- monies; The earliest testimony (A) to which we may refer is the notarial instrument, dated 6th November 1455, of the lawsuit between Fust and Gutenberg, whereby the former sought to recover 2026 guilders from the latter in repayment of 1600 guilders (800 advanced in 1450 or 1449 and another 800 in 1452), with the interest thereon. Fust speaks here² of "the work" (line 24), and of "our common work" (line 60); Gutenberg speaks of "tools" in preparation, "workmen's wages, house-rent, vellum, paper, ink, &c." (lines 37-40), of "such work" (41), and of "the work of the books" (42);

¹ See Bernard, *Origine de l'Impr.*, i. 164, who was a printer himself and speaks very strongly on this point.

² We quote from the text of the instrument as published by J. D. Kochler, *Ehren-Rettung Johann Gutenberg's*, Leipzig, 1741.

whereas the judges speak of "the work to the profit of both" (49), and "their common use" (60). (B) In the earliest³ book pub- lished with a date (the Mainz psalter, issued 14th August 1457 by Fust and Peter Schoeffer) it is said that it was perfected at Mainz col- by an "adinventio artificiosa imprimendi ac caracterizandi absque phona, calami ulla exaratione" (repeated and varied later; see p. 681 above). &c.; (C) In 1460 the *Catholicon* was published at Mainz, without the name of the printer; but the colophon, after stating that the book was printed at Mainz, which town God's mercy had deigned to prefer above other nations of the earth, adds (D) that the book was printed and completed "non calami, stili, aut pennæ suffragio, sed mira patronarum formarumque concordia, proporcione, et modulo." This work is considered to have been printed by Gutenberg, and the mention of God's mercy is regarded as an allusion to the invention of printing. The phrase is, however, also found in the *Liber Sextus Decretalium*, in the *Summa* of Thomas Aquinas, and in the *Clementinæ*, published respectively on 17th December 1465, 6th March, and 8th October 1467, by Fust and Schoeffer. (E) On 17th January 1465 Adolph II., archbishop of Mainz, by a public decree, appointed Gutenberg as his servant in reward for "his services," but he does not speak of him as the inventor of printing, nor even as a printer. (F) In the *Grammatica Rhythmica*, published in 1466 by Fust and Schoeffer, the third line of the colophon runs: "Hinc Nazareni sonet oda per ora Jobannis," which was formerly regarded as an allusion to Johann Fust or Johann Gutenberg, but which more probably refers to Johann Brunnen or Fons, the author of the grammar. (G) On 26th February 1468 Dr Homery wrote to the archbishop of Mainz the letter quoted above, from which it may be inferred that Gutenberg had been a printer, though not a word is said as to his being the inventor of printing. (H) In 1468 Schoeffer reprinted Fons's *Grammatica*, and in the colophon it is said: "At Moguntina sum fusus in urbe libellus meque (the book) domus genuit unde caragma venit." (I) Schoeffer published on 24th May 1468 the first edition of *Justiniani Imper. Institutionum Juris Libri VI., cum Glossa*. To this were added by way of colophon some verses commencing: "Secma tabernaculi, &c.," in which it is said that (the ornament of the church) Jesus "hos dedit eximios sculpendi in arte magistros. . . Quos genuit ambos urbs Moguntina Johannes, librorum insignes prothocargmaticos," which is regarded as an allusion to Johann Gutenberg and Johann Fust as first printers. (K) In the same year (1468) Johannes Andreas, bishop of Aleria, says, in the dedication of his edition of St Jerome's *Epistles*, published in that year (13th December) at Rome, to Pope Paul II., that "Germany is to be honoured for ever as having been the inventress of the greatest utilities. Cardinal Cusa wished that the sacred art of printing, which then (under Cardinal Cusa, who died 11th August 1464) seemed to have arisen in Germany, were brought to Rome." (L) In 1470 Guil. Fichet, in an octastichon inserted in the Paris edition of 1470 of the *Letters* of Gasparinus of Bergamo, exhorts Paris to take up the almost divine art of writing (printing) which Germany is acquainted with. In the same year Erhard Windsberg writes to the same effect in an epigram inserted in the *Epistolæ Phalaridis* published at Paris about 1470. (M) In 1471 Ludov. Carbo speaks, in the dedication of the *Letters* of Pliny to Borso, duke of Modena, of the Germans having invented printing. Nicolaus Gupalatinus speaks (Venice, 1471) of a German being the inventor of printing, and Nicolaus Perottus of the art which had lately come from Germany. (N) On 21st May 1471 Nicolas Jenson published an edition of Quintilian, edited and revised by Ognibene de Louigo (Ornibonus Leonicensis), who in the preface speaks of its prior as "librariæ artis mirabilis inventor, non ut scribantur calamo libri, sed veluti gemma imprimantur, ac prope sigillo, prius omnium ingeniose demonstravit." (O) About 1472 the first three printers of Paris published Gasparinus Pergamensis's *Orthographiæ Liber*, to which is prefixed (in the copy of the university of Basel) a letter, dated 1st January, from Guillaume Fichet, prior of the Sorbonne, to Robert Gaguin, in which he says that "it is rumoured in Germany that not far from the city of Mainz a certain Johann Gutenberg (Johannes, cui cognomen Bonomontano) first of all invented the art of printing (impressoria artem), by means of which books are made with letters of metal, not with a reed (as the ancients did), nor with the pen (as is done at present)." (P) On 14th July 1474 Joh. Philippus de Lignamine published at Rome *Chronica Summarum Pontificum Imperatorumque*, in which we find, between two entries, relating one to 14th July 1459 and the other to 1st October 1459, an undated paragraph in which it is said that Jacobus with the surname of Gutenberg of Strasburg and a certain other one named Fustus, "imprimendarum litterarum in membranis cum metallicis formis petiti, trecentas cartas quisque eorum per diem facere innotescunt apud Moguntiam Germanie civitatem." The same is said of Mentelin, and (under 1464) of Conrad Sweynheym, Arnold Pannarts, and Udalricus Gallus. (Q) On 23d May 1476 Peter Schoeffer issued the third edition of the *Institutiones* of Justinian, with the same imprint as in the edition

³ The earliest is perhaps the *Donatus* issued by Peter Schoeffer, possibly before 1456, the colophon of which says that it was finished: "Arte nova imprimendi seu caracterizandi . . . absque calami exaratione."

of 1468 (see testimony I), but with the addition that Mainz is the "impressoria artis inventrix elimatrixque prima." (R) In 1478 an edition of the *Fasciculus Temporum* was issued at Cologne, in which it is stated under the year 1457 that the printers of books were multiplied on earth, deriving the origin of their art from Mainz. The earlier editions merely stated that the printers of books were multiplied on earth. (S) In 1483 Matthias Palmerius of Pisa published at Venice the *Chron. Euseb.*, in which under the year 1457 it is stated that students owe a great debt to Germany, where Johannes Gutenberg zum Jungen, knight of Mainz, invented the art of printing in 1440. (T) In the same year Jac. Phil. Foresta of Bergamo published *Supplementum Chronicorum*, in which he says under the year 1458 that the art of printing books was first discovered in Germany, according to some by Guthimberg of Strasburg, according to others by Faust (see P), according to others by Nicolas Jenson (see N). (V) On 6th March 1492 Peter Schoeffer published the *Niedersächsische Chronik* of Conrad Botho, saying in the colophon that it was "geprent . . . in . . . Mentz, die eyn anefangk is der prentery." (X) At the end of 1494 two Heidelberg professors, Adam Wernher and Joh. Herbst, composed some Latin verses in honour of Johannes Gensfleisch (a family name by which Gutenberg was known, and which was turned into the Latin Ansicarus), whom they called "primus librorum impressor" and "impressoria artis inventor primus." (Y) In 1499 Jacobus Wimpfeling (born at Schlettstadt 1450, died 1528) published (at Mainz, by P. Friedberg) an *Oratio in Memoriam Marsilii ab Inghen* (d. 1396), in which he, on leaf 22a, praises Joannes Ansicarus in verse on account of his invention at Mainz. (Z) These verses are preceded by an epitaph on Johann Gensfleisch, "artis impressoriae inventor" and "repertor," written in Latin by Adam Gelthus, a relative of Gutenberg. (AA) In the same year Polydora Vergil (*De Inventoribus Rerum*, Venice, 1499, lib. ii. cap. 7) says that a certain Peter [Schoeffer?], a German, invented in 1442 the art of printing at Mainz in Germany, as he had heard from the latter's countryman; this statement was repeated in a Venice edition of 1503. In later editions "Peter" was altered to "Joh. Gutenberg." (BB) In the same year Koehlfon, printer at Cologne, published *Cronica van der hilliger Stat van Coellen*, in which on fol. 312b it is said: (1) The art of printing was found first of all in Germany at Mainz about the year 1440; (2) from that time till 1450 the art and what belonged to it were investigated; (3) and in 1450, when it was a golden year (jubilee), they began to print, and the first book that they printed was the Bible in Latin, in a large letter, resembling that with which at present missals are printed. (4) Although the art was found at Mainz in the manner in which it is generally employed now, yet the first prefiguration was found in Holland from out the *Donatuses* which were printed there before that time, and from out of them was taken the beginning of the aforesaid art, and it was found much more masterly and exact (*subtilis*) than that other manner was, and has become more and more artistic. (5) Omnibonus wrote in a preface to Quintilian, and in some other books too, that a Walloon from France, named Nicol. Jenson (see N), discovered this art; but that is untrue, for there are those still alive who testify that books were printed at Venice before Nicol. Jenson came there, and began to set and make letters. (6) But the first inventor of printing was a citizen of Mainz, named Junker Johan Gudenburch. (7) From Mainz the art was introduced first of all into Cologne, then into Strasburg, and afterwards into Venice. (8) The origin and progress of the art were told to the writer verbally by Ulrich Zell of Hanau, still printer at Cologne (anno 1499), through whom the said art came to Cologne. (CC) In 1501 Jacob Wimpfeling (see Y), who stated in his *Oratio Querulosa contra Invasores Sacerdotum, Flammarum, &c.*, published at Delft c. 1495, that chalcography had been invented at Mainz, published a work (*Germania*, Strasburg, Joh. Prüss, 1501) in which he says (on p. 43) that the invention was made at Strasburg by Johann Gutenberg of Strasburg, and that it was perfected at Mainz. (DD) In 1503 Johann Schoeffer (the son of Peter Schoeffer and the grandson of Johann Fust) published an edition of Hermes Trismegistus, in which he represents himself as one of the most distinguished citizens of Mainz, descended from the most fortunate race who invented the art of printing. (EE) In 1504 Ivo Wittig, who was a relative of Gutenberg, and a canon and the keeper of the seal of the St Victor cathedral near Mainz (of which Gutenberg had been a lay member), erected in the house "Zum Gutenberg" a memorial stone and an epitaph to Joh. Gutenberg of Mainz, "qui primus omnium litteras ars imprimendas invenit." (FF) In 1505, in the German translation of Livy published by Johann Schoeffer (see KK), the dedication to the emperor Maximilian, which was probably written by Ivo Wittig (see EE), speaks of Johann Güttenberg as inventor of printing (1450) and Johann Faust and Peter Schoeffer as improvers of the art. This work was reprinted six times (1514, 1523, 1533, 1551, 1553) with the same dedication; but in 1509 the *Breviarium Moguntinum* says that it was printed at the expense and trouble of Johann

Schoeffer, whose grandfather (*i.e.*, Johann Fust) was the first inventor and author of the art of printing (see DD). (GG) In 1505 Jacob Wimpfeling, in his *Epithoma Germanorum* (Strasburg, 1505), asserts (on leaf xxxviii b. and xxxix a.) that in 1440 Johann Gutenberg of Strasburg invented there the art of printing. And in 1507, in his *Catal. Episcoporum Argent.* (Strasburg, 1507), he says that the art was invented, though in an imperfect manner, by a certain Strasburger, who afterwards went to Mainz and joined others working and trying the same art, where it was, under the guidance of Johann Gensfleisch, perfected in the house "boni montis" (Gutenberg). This he repeated in 1515. (HH) About 1506 Johannes Trithemius wrote his *Chronicon* of Spanheim, published at Frankfurt in 1601, in which he says (p. 566) that the art of printing books was discovered afresh at Mainz by Johan Gutenberg, who, after having spent all his property in accomplishing the new invention, perfected it by the advice and assistance of Johann Fust. The first propagator of the new art was, after the inventor, Peter Schoeffer. (II) In 1515 Johann Schoeffer published Joh. Trithemius's *Compendium sive Breviarium Historiae Francorum*, and said in the colophon that this book was published at Mainz, the first inventress of the art of printing, by Johann Schoeffer, grandson of the late Johann Fust, the first author of the said art, who finally from his own genius commenced to excogitate and to investigate the art in 1450, and in 1452 perfected it and commenced printing, assisted by many necessary inventions of Peter Schoeffer von Gernshein, his servant and adopted son. Johann Fust and Peter Schoeffer kept this art secret, binding all their servants and domestics by oath never to reveal it; but in 1462 it was spread by the same domestics into divers countries. (KK) On 9th December 1518 the emperor Maximilian accorded to Johann Schoeffer the privilege of printing Livy (1518-1519), and says in it that "he has learned and been advised on the faith of worthy testimonies that the ingenious invention of chalcography was effected by the printer's grandfather." (LL) In 1519 Joh. Thurmayer Aventinus (1474-1534) wrote that "in 1450 Joannes Faustus, a German, a citizen of Mainz, invented a new kind of writing, called chalcography, and completed it in two years; it was kept secret by him and Peter Schoeffer, his son-in-law, but divulged in Germany ten years afterwards by Faust's servant, Johannes Güttenberger, a Strasburger." (MM) In a pedigree of Lourens Janszoon Coster of Haarlem and his descendants, drawn up not later than 1520, it is asserted that in 1446 "he brought the first print into the world." This document, of which the date 1446 seems to have been altered into 1440, is preserved in the Haarlem town library. (NN) In 1520 Johan Schott, a printer at Strasburg and grandson of Johan Mentelin, the first printer of that town, published an edition of Ptolemy, at the end of which he printed the arms of his grandfather with the following legend: "Insigna Schottorum Familiae ab Friderico Rom. Imp. III. Joann. Mentelio primo Typographia Inventori ac suis concessum: Anno Christi 1466." Apart from the assertion that Mentelin was the inventor of printing, we may remark that the emperor Frederick III. raised Mentelin to the rank of a nobleman in 1466 and granted him new arms. (OO) About 1533 the Neapolitan Mariangelo Accorso, who had resided at the court of Charles V., wrote on an edition of *Donatus* (in the possession of Aldus Manutius, jun.) that "Joh. Faust of Mainz first discovered the art of printing with metal types, which afterwards he made of lead; his son Peter Schoeffer added afterwards much to polish the said art. This *Donatus* and *Confessionalia* were printed first of all in 1450. Faust derived the suggestion from a *Donatus* printed before in Holland from an engraved block." This paragraph is found on p. 411 of the *Biblioth. Apost. Vaticana* of Angelo Rocca (Rome, 1591). Some consider its latter part to have been derived from the *Cologne Chronicle* (BB), and it seems probable that it was a mixture of some of the above testimonies. (PP) In 1536 Johan Schott (see NN) published *Historien Handt-Buchlein* (Strasburg, 1536), in which (on leaf b¹ and b²) he says that "Hans Mentlin of Strasburg invented the art, which, through infidelity, was brought to Mainz." On the strength of this and other statements (CC, GG, NN) the bicentenary of the Strasburg invention was celebrated there in 1640. (QQ) In 1541 Joh. Arnold (Bergel or Bergellanus, who had settled as press-reader at Mainz two years previously, published his *Encomium Chalcographiae* (Mainz, Fr. Behem, 1541, 4to), in which the lawsuit between Fust and Gutenberg (A) is alluded to for the first time. Bergel had read Trithemius's books (HH), in which the invention is ascribed to Johann Gutenberg with two coadjutors, Johann Faust and Peter Schoeffer, which he (Bergel) had heard confirmed in conversations with Mainz citizens; he had also seen some old tools prepared for the work by the originators which were still in existence. Gutenberg invented it in 1450. (RR) About 1561 Jan Van Zuren (born at Haarlem in 1517) and Dirk Volkerts Coornhert (born at Amsterdam in 1522) established a printing office at Haarlem. Of the former it is alleged that he had compiled a work on the invention of printing, which is presumed to have been lost during the siege of Haarlem in 1573. It was not publicly spoken of till 1628, when Peter Scriverius published his *Laurecraan voor Laurens Coster*. Scriverius had only found the

¹ These verses were not published at the time, but in the 19th century by F. J. Mone, *Quellensamm. der bad. Landesgesch.*, iii. 163, from the contemporary MS. of Adam Wernher, preserved in the archives of Carlsruhe.

title, preface, and introduction, in which Van Zuren contended that the first foundations of the art were laid at Haarlem, and that it afterwards accompanied a foreigner to Mainz. In this introduction he does not mention the name of the inventor, nor a date, but points in indefinite terms to the house of the inventor as still existing. (SS) In the same year (1561) Van Zuren and Coornhert published an edition of the *Officia Ciceronis*, in which the latter, in a dedication to the magistracy of Haarlem, refers to the rumour that the art of printing books was invented first of all at Haarlem, and was brought to Mainz by an unfaithful servant and much improved there. He adds that very old and dignified persons had often told him, not only the family of the inventor, but also his name and surname, and had explained the first crude way of printing, and pointed out to him the house of the first printer. (TT) In 1566 Luigi Guicciardini, a Florentine nobleman who had visited the Netherlands and had resided many years at Antwerp, finished a description of the Netherlands (published in 1567), in which, alluding to Haarlem, he speaks of the invention there according to the assertions of the inhabitants, the evidence of some authors, and other remembrances; the inventor died before the perfection of his art; his servant went to Mainz, where he perfected the art, and hence the report that it was invented there. (VV) About 1568 (it is calculated) Hadrianus Junius wrote his *Batavia*, published at Leyden in 1583, with two prefaces, dated, the one from Leyden, 6th January 1575, the other from Delft *ad annum salutis* 1575. On p. 253 he says that the opinion that the forms of the letters whereby books are printed were first discovered at Mainz is very inveterate, but old and eminent inhabitants of Haarlem had assured him that they had heard from their ancestors that there lived at Haarlem, more than 128 years before, in a decent house then existing, near the marketplace, opposite the royal palace, Lourens (son of) Jan, surnamed Coster, who, while walking in the wood near Haarlem, began to shape beechen bark first into figures of letters, by which, reversely impressed one by one on paper, he composed one or two lines to serve as an example for the children of his son-in-law. When this succeeded, he began to contemplate greater things, and first of all invented, assisted by his son-in-law Thomas (son of) Peter, a more gluy and substantial kind of ink (as the ordinary ink was found to blot), with which he printed whole tablets with pictures, with the letters added. Junius had seen books of this kind printed by Coster (the beginnings of his labours) on the rectos of the leaves only, not on both sides; the book was written (in Dutch) by an anonymous author, and entitled *Speculum Nostræ Salutis*, in which care was taken that the blank versos could be pasted together, so that the blank pages should not present any unsightliness. Afterwards (Coster) changed the beechen characters into leaden, and the latter again into tin ones. Very ancient wine-pots cast of the remains of these types were still to be seen in the house of Lourens, which was afterwards inhabited by his great-grandson Gerard (son of) Thomas, who had died an old man a few years before. When the new merchandise attracted purchasers everywhere, workmen were added to (Lourens's) household, among whom was a certain John (whether, as was suspected, Faust, or another of the same name, Junius did not inquire), who was bound to the work of printing by oath. But, when he thought he knew the art of joining the letters and of casting the types, &c., he stole away, when everybody had gone to church, the whole apparatus of the types and the tools prepared by his master, and hastened to Amsterdam, thence to Cologne, until he arrived at Mainz, where he could remain in safety, and, having opened a work-office, issued within the space of one year, about 1442, the *Doctrinale* of Alexander Gallus and the *Tracts* of Petrus Hispanus, printed with the same types which Lourens had used at Haarlem. Junius recollects that Nicolaus Gale, his tutor, a man of firm memory and venerable old age, had told him that as a boy he had often heard a certain bookbinder Cornelius (a man of more than eighty years of age, who had been an under-workman in the same office) narrating the story of the invention (as he had heard it from his master), the polishing and increase of the crude art, &c., and cursing those nights which he had passed, during some months, with the culprit in one bed. The burgo-master Quirinus Talesius admitted to Junius that he had formerly heard nearly the same from the mouth of the same bookbinder. (XX) In 1628 Scriverius in his *Lucreantia* (see RR) placed the date of the Haarlem invention as far back as 1428, and mentioned as its inventor Lourens Jansoon, sheriff of Haarlem. He asserts that the art of printing appeared, "not in the manner as it is used now, with letters cast of lead and tin, but a book was cut leaf for leaf on wooden blocks," and the Haarlem inventor was robbed in 1440 by Johan Gutenberg. Scriverius based the date 1428 upon a Hebrew *Chronicle* compiled by Joseph ben Meir (born 1496, d. c. 1575), and published in 1554 at Sabionetta by Cornelius Adelkind, where, under the year of the Jewish era 5188 (= 1428), the author mentions a book (without giving the title) printed at Venice and seen by him. Scriverius, being convinced that this could only refer to a book printed at Haarlem, applied the entry to a xylographic *Biblia Pauperum*, of which he gave a description, together with several other block-books and early printed books.

(YY) In 1639 Boxhorn pushed the date of the Haarlem invention back to 1420, referring, as his authority, to the same *Chronicle* of Rabbi Joseph. Since that time the date of the Haarlem invention has been variously placed between 1420 and 1430.

Later testimonies are mere repetitions of earlier statements.¹ We need not say much about the story of Antonio Cambruzzi, who asserted that Pamfilo Castaldi invented printing at Feltre, in Italy, in 1456, and that Fausto Comesturbo, who lived in his house in order to learn the Italian language, learned the art from him and brought it to Mainz; this story, however, has found so much credence that in 1868 a statue was erected at Feltre in honour of Castaldi. Nor need we speak of Kuttenberg in Bohemia, where John Gutenberg is asserted to have been born and to have found the art of printing. We may also pass over Johann Fust, later on called Faust (testimonies P, T, DD, FF, II, KK, LL, OO), as we know from the Mainz lawsuit of 1455 (A) that he had simply assisted Gutenberg with loans of money. We may also pass over Johann Mentelin of Strasburg (testimonies NN, PP), only remarking here that he had already printed a Bible in 1460, and that he is mentioned in Strasburg registers as a chrysographer or gold-writer from 1447 to 1450; but of his whereabouts between 1450 and 1460 there is no record. That he had gone, or had been called, after 1450 by Gutenberg to Mainz has been asserted but not proved, and there is no reason why he should not be one of the two Johannes alluded to as the *prothocaragmatici* of Mainz in the Justinian of 1468 (testimony I). That Nicolas Jenson came to be regarded in certain circles and for a time as the inventor of printing is owing to testimony N being misunderstood. There remain, therefore, to be considered the testimonies which bear on the rival claims of Haarlem and Mainz. The controversy between Germany and Holland was publicly started as early as 1499 by the *Cologne Chronicle* (testimony BB), that between the two towns mentioned not publicly before 1561 (testimony RR), while no rival inventor to Gutenberg was mentioned publicly and in print earlier than 1588 (testimony VV).

Let us first consider the claims of Germany and Mainz as centred in the person of Henne (= Hans or Johann) Gensfleisch, called Gutenberg. Gutenberg or Gudenberg, the latter name derived from his mother, whose maiden name was Elsa Wyrich, who lived in the "Hof zum Gutenberg" at Mainz. He is supposed to have been born at that town about 1400. He is first mentioned in a Mainz document, dated 16th January 1430. In a document of 28th March 1430 he is spoken of as being "not in Mainz." Documents from 14th March 1434 to 18th September 1444 prove him to have been at Strasburg during that time, and documents dated respectively 17th October 1448, 6th November 1455, 21st June 1457, 10th April 1461, show that he was in or near Mainz on those days. By a decree of 17th January 1465 the archbishop of that town rewarded him for "his services," and in the bond of Dr Homery, dated 26th February 1468, he is spoken of as dead. There are, moreover, six forged documents (including some relics of an ancient press bearing the date 1441) respectively dated 24th March 1424, 1437, 3d July 1453, 20th July 1459, 19th June 1463, and an entry in an annuariaium which has been applied to Gutenberg, but does not concern him (see Hessels, *Gutenberg*).

In former years, when printing was believed to have been invented in 1440, the records of the Strasburg lawsuit of 1439, between Gutenberg and some Strasburg artisans about certain industrial undertakings (as the art of polishing stones, the manufacture of looking-glasses), were considered to prove the invention of printing at Strasburg, not, however, by Mentelin, as had been thought by some (testimonies NN, PP), but by Gutenberg. The records came to light about 1740, just when Schoepflin, the principal discoverer, had been commissioned to search for documents of this kind. Doubts may be suggested as to their genuineness, but they have all perished, partly during the revolution of 1793 and partly during the siege of Strasburg in 1870. However, nobody would now assert that printing was invented in 1439 or at Strasburg; and those who still believe that Gutenberg was the inventor of printing refer to them only as showing that he was a mechanic as early as 1439, and that he understood the art of pressing.²

¹ Over a hundred of them have been collected by Ger. Meerman, *Origines Typogr.*, ii. p. 58 sq.

² See Hessels, *Gutenberg*, pp. 23, 155, &c.

The first document that connects Gutenberg with the art of printing is the notarial instrument of 6th November 1455 (testimony A). But it says nothing of an invention or a new mode of printing. And yet the occasion was such as to make it almost imperative on Gutenberg to mention it, for he had spent 1600 guilders of Fust's money, apparently without printing anything,¹ and was on the point of being robbed by the latter and having taken away from him all that he had made and done to give effect to his idea or invention. In the next testimony (B), i.e., the earliest Mainz books with printed dates (1457 to 1467), there is evidence that the new art of printing is not only not kept secret but fully appreciated at Mainz, and its importance fully realized and advertised; but, though they speak of a "nova ars imprimendi" and an "adventivo imprimendi," there is not a syllable as to a Mainz invention or inventor. In testimonies C and D (the *Catholicon* of 1460) there is again not one word about an invention or an inventor, or about Mainz. Yet Gutenberg is supposed to have printed the *Catholicon*; and it is incredible that he, who had been wronged and robbed by his two rivals (Fust and Schoeffer), should agree with them in explaining and proclaiming the new art, but never with one word assert his claim to the honour and profit of the invention, if he had made any, and should even omit his name, whereas he saw his two rivals never neglect to print their names in full on every book which they published. Those who believe that Gutenberg was the inventor of printing suggest that he kept silent, as otherwise his creditors would have seized his copies and his printing office. But this explanation cannot be accepted; for the verbose colophon at the end of a gigantic folio book like the *Catholicon*, published at a time when there were perhaps not more than three printing offices in the world, was calculated to draw attention to its printer and his residence, not to conceal him. Testimony F (1466) is no longer regarded as having any reference to Gutenberg or the invention of printing. H (1468) was formerly thought to mean: "I, the book, am cast (i.e., its types are cast) in the Mainz city, and the house whence the type came (= where the type was invented) produced me." But of late years it has been shown that the author of the book, Johann Fons, was Peter Schoeffer's press-corrector. And, as he no doubt resided in Schoeffer's house, the two lines evidently mean: "I am a little book cast in Mainz, and I was born (= written) in the same house whence the type comes" (= where I am printed)." Testimony I (also of 1468) speaks of two Johannes (Gutenberg and Fust) as the "prothocragmatici librorum quos genuit urbs Moguntina." But this certainly means, not that the first printers of books were born at Mainz, but that the two Johannes were the chief printers of books (born) produced at Mainz.

When we now place together the clear documentary testimonies (A to I) of the first fourteen years of printing (1454 to 1468) at Mainz, we see that they all come from Mainz itself. Everybody connected with the art speaks of it in the most public and unreserved manner; its importance is as fully realized and advertised during that period as it is in the present day; the German nation is even congratulated on possessing it; there is never any secrecy about it; once (about 1456) it is even called a new art. But, in the midst of all this publicity, the art which Mainz and Germany possess is never said to have been invented at Mainz. The supposed Mainz inventor (Gutenberg) even speaks himself on two occasions (in the lawsuit of 1455 and in the *Catholicon* of 1460), but never says that he had made an invention. The archbishop, too, speaks publicly of Gutenberg in 1465 (testimony E), and rewards him for services, but does not speak of him as the inventor of printing, nor even as a printer. Nor does Dr Hemery, in his letter to the archbishop (testimony G), in which he refers to Gutenberg's printing apparatus, call him the inventor of printing.

In 1468 we enter on a new phase in the history of the invention. Even if we reject testimony I as being merely local, testimony K (1468) speaks of the art of printing as having arisen in Germany. This testimony, however, does not come from Germany, nor from Mainz, but from Italy, and is supposed to owe its inspiration to the two German printers who had established a printing office at Subiaco in 1465, and in 1467 at Rome, and who most likely learned their craft at Mainz. But, as the two printers are mentioned in the testimony, and as it does not speak of Gutenberg, nor of Mainz, it is far more likely that it was merely derived from the colophons of Fust and Schoeffer, or from something that Cardinal Cusa had heard during his embassies in Germany. To the Mainz colophons we must also ascribe (a) the two testimonies of 1470 (L) and (b) the three of 1471 (M), all five of which come from France and Italy. At last, in 1472, we find in testimony O the invention of printing ascribed to Gutenberg of Mainz, but it is mentioned as a rumour, and comes from France. Guil. Fichet of Paris, who gives it, is supposed to have heard the rumour from the three German printers

¹ In line 42 Gutenberg distinctly declares that "he hoped that he was under no obligation to Fust to devote the first 800 guilders to the work of the books;" and, as Fust, by advancing the second 800 guilders in 1452, had become Gutenberg's partner, it seems clear that the former claimed in 1454, when the trial is calculated to have commenced, his money and interest because Gutenberg had as yet not printed anything.

² Venit is the present out the perfect tense.

who commenced printing at Paris in 1470. But, as two of them had resided, immediately before they came to Paris, in the university of Basel, and are supposed to have learned their art there, the rumour is ascribed to "Bertolf von Hanauwe," who appears in the lawsuit of 1455 as Gutenberg's servant, and who was printing at Basel in 1468. Perhaps it came rather from information which Fichet obtained from the St Victor cathedral, near Mainz, as he speaks of the art having been invented not far from that town. Testimony P (1474) again comes from Italy, from Rome, and was perhaps derived from one of the German printers settled there at that time. It merely speaks of Gutenberg, Fust, and Mentelin as printers, but says not a word which even touches upon the invention of the art. In testimony Q (1476) we have definite mention of Mainz as the inventress of the art; it is given as an addition to the Mainz colophon of 1468 (see I). In 1478 Mainz is again mentioned in a Cologne testimony (R), which gives evidence of research, as it is an amplification of an earlier one in which Mainz was not mentioned. Germany, Gutenberg, and Mainz are again mentioned in the Venetian testimony S (1483), which gives for the first time 1440 as the date of the invention. In the same year we have two earlier testimonies (P and N) worked into one (T), to the effect that printing was invented either by Gutenberg or by Fust or by Jenson. Testimony V (1492), which states that printing commenced at Mainz, is practically equivalent to Q. In 1494 and 1499 we have three German testimonies (X, Y, Z) as to Gutenberg being the inventor of printing; these, however, come, not from Mainz, but from Heidelberg. Z is given by a relative of Gutenberg, Adam Gelthus; and, as the latter resided at Heidelberg, it is clear that he was the real source of the other two Heidelberg testimonies (X and Y). Two years later, when Wimpfeling, the author of testimony Y, had left Heidelberg, he ascribed (CC) the invention of printing to Strasburg, though stating that Gutenberg was the inventor. Testimony AA is recorded above to show the great confusion that reigned in people's minds about the invention. We must add to these testimonies those of 1504 (EE) and 1505 (FF), which are owing to Ivo Wittig, a relative of Gutenberg, and a canon and the keeper of the seals of the St Victor cathedral, near Mainz, of which Gutenberg had been a lay member according to its *liber fraternitatis*. Thus in the period from 1468 to 1505 we have (1) several vague statements made in Italy and France as to the art of printing being known or practised or invented in Germany, statements which arose from the books and colophons published at Mainz; (2) one item of rumour in 1472 that Gutenberg invented it near that town; (3) two Mainz statements, of 1476 and 1492, and one Cologne statement, of 1478, that it was invented at Mainz; (4) three German statements, of 1492, 1494, and 1499, that Gutenberg had invented it; and (5) two Mainz statements, of 1504 and 1505, to the same effect. It is to be particularly noticed that the statements (2, 4, 5) which speak distinctly of Gutenberg being the inventor can be clearly traced to Gutenberg himself and two of his relatives.

Seeing then how slender the basis is for the tradition that Contraprinting was invented by Gutenberg at Mainz, and that even this tradition's slender basis was not laid till fourteen years after the art had Gutenberg been fully established and proclaimed in that city, we cannot be surprised to find the tradition promptly contradicted. This contradiction was made in 1499 (testimony BB) in a *Chronicle* published at Cologne. To facilitate the understanding of this testimony it is divided above into eight sections. The first (taken from Hartmann Schedel's *Chronicle*, 1493), second, sixth, seventh, and eighth are no doubt due to the compiler of the *Chronicle*, and must not be connected with the third, fourth, and fifth, which, according to the compiler, are due to Ulrich Zell, a printer at Cologne, who had probably settled there about 1463, and had most likely learned his art at Mainz, as he called himself "clericus Moguntinus." As Zell's testimony leaves to Gutenberg nothing but the honour of having perfected the art, various attempts have been made to explain away this account. As long as no typographically printed *Donatus* had been found that could be fitted into Zell's account, it was argued that he meant *Donatus* printed from wooden blocks; and this argument is brought forward even at the present time. But a practical printer like Zell must have been able to express himself to that effect if he had really meant to say so; and, as block-printing was not less practised in Germany than in Holland, we could hardly assume that things printed in Holland would have inspired the German inventor rather than the same things printed in Germany. That testimony OO speaks of a *Donatus* printed from wooden blocks may be ascribed to the notion arising at that time (c. 1533) that block-printing had given rise to typography. It has also been asserted that Holland in the *Chronicle* means Flanders; but the *Chronicle* is usually very correct in geographical matters. It has also been suggested that Zell most likely learned his art in Fust and Schoeffer's office and invented the passage to injure the reputation of Gutenberg, who had been their enemy. Finally it has been said that Zell did not suggest or write the passage at all; but it is hard to see how this can be maintained in face of the compiler's own statement to that effect. Therefore, all these sugges-

Lourens
Coster's
claims.

tions failing to weaken Zell's testimony, we must see how far it can be brought into harmony with other circumstances and the testimonies MM, RR, SS, TT, VV, XX, YY, which claim the honour of the invention for Haarlem in Holland. Testimonies RR and SS do not mention the name of the inventor. But the former is a mere introduction destined for a complete book that was lost during the siege of Haarlem in 1573 before it was printed; we are, therefore, not entitled to say that Van Zuren did not know the name. SS may have omitted the name, because the publication of Van Zuren's work was in contemplation at the time that it was written. That Guicciardini (testimony TT) in 1566 did not mention the name of the reputed Haarlem inventor cannot be considered as an indication that it was not known or had not yet been "invented" when he wrote, as his accounts of the cities of the northern Netherlands are all very meagre and were for the most part derived from correspondence. In Junius's account (VV), however, we find every particular that could be desired. He begins by referring to the difficulty of vindicating the honour of the invention for Haarlem on account of the deep-rooted and general opinion that it took place at Mainz. He then mentions that Lourens (son of Jan) surnamed Coster resided at Haarlem "more than 128 years ago" and gives us to understand that in the year indicated by that phrase he invented the art of printing. As Junius's book was not published till after his death, in 1588, and the two prefaces in it are dated 1575 (he died 16th June 1575), the number 123 is supposed to go back from the date when he actually wrote his account, which he is calculated to have done about 1568. Thus we get the year 1440 as the supposed date of the Haarlem invention, though, if we based our calculation upon the date of the preface, the year 1446 or 1447 would have to be assumed. But, as Junius adds that Coster's types were stolen by one of his servants, who fled with them to Mainz, and establishing there a printing office printed within a year's time, in 1442, two books, he must, if this latter date is correct, have meant 1440. By testimonies XX and YY we see that in the 17th century the date of the Haarlem invention was first put back as far as 1428, then to 1423; and since then it has usually been regarded as 1428, especially after it was discovered that the Haarlem wood where Coster is said to have cut his wooden letters was destroyed during a siege in 1426.

The researches as regards the reputed Haarlem inventor have hitherto not been made in a manner adequate for scientific purposes. It would appear that by the pushing back of the date of the invention, in spite of Junius, to 1420-1428, two inhabitants of Haarlem have been mixed up by the Dutch authors on the subject. (1) Lourens Janszoon, who never bore the surname Coster, and whose existence seems to be authenticated by documents from 1404 to 1439, was sheriff, and a wine merchant and innkeeper, and is supposed to have died in 1439. About 1870, however, researches brought to light that there had been (2) a Lourens Janszoon Coster at Haarlem, duly authenticated by genuine official documents as a Chandler and innkeeper, from 1436 to 1433, who went away from Haarlem in the latter year. The name of this man and some genealogical particulars known of him fit into the story of Junius, though there are certain particulars in Junius's account which cannot yet be properly explained.

Junius bases his account of the Haarlem invention on three books, a Dutch edition of the *Speculum Humanæ Salvationis*, the *Doctrinale*, and the *Tracts* of Petrus Hispanus (Pope John XXI.). The first work, he said, was printed by Coster himself as a first specimen of his art, and it would seem from his words that he considered the work to be printed with wooden types. The two Dutch editions of the *Speculum*, however, were printed, like the two Latin editions of the same work, with movable metal type, though in one of the Latin editions there are twenty leaves the text of which is printed apparently from wooden blocks. The *Doctrinale* and the *Tracts* of Hispanus were printed, Junius says, at Mainz by Coster's workman with the types which he had stolen from Coster. Of the Hispanus *Tracts* no edition has yet come to light that would answer to Junius's description. But of the *Doctrinale* we have four editions, all printed in the same type (i.) as the four editions of the *Speculum*. With these same types are printed no less than six editions of the short Latin grammar of Ælius Donatus; and editions of this school-book printed in Holland were, according to Zell in the *Cologne Chronicle*, the models for the printing at Mainz, which commenced about 1450. As there are no other editions of Donatus printed in Holland that could be placed before the year 1450, the claims of Haarlem and Holland are based on them; and we will, therefore, briefly describe the types and books which must be connected with the *Specula*, *Doctrinalia*, and *Donatuses* just mentioned. In one of the editions of the *Speculum* in Dutch occur two leaves printed in a different type (ii.) from the rest of the work. This type is in its turn so very much like another type with which a work of Laur. Valla (*Facetiae Morales*) is printed that we link it (iii.) on to the two just mentioned. Then again type iii. is, in some of its capitals, identical with a type (iv.) used for a work of Ludovicus de Roma, *Singularia Juris*, at the end of which, on the last leaf, commences another work, printed in a different type (v.).

Early
Dutch
types

Type vi. is identical with type v., except in its capital P, which is larger. We have also works printed in two different types (viii., viii.) which both show such a great family likeness to each other and to types i. to vi. that it would not be advisable to separate them without evidence that they do not belong to the same office. With these eight types, which we cannot at present separate, forty-seven different books were printed, so far as we know at present. In type i.—four editions (two in Latin,¹ two in Dutch) of the *Speculum Humanæ Salvationis*, a work which consists of woodcuts with explanatory text underneath; a Dutch version of *The Seven Penitential Psalms*; one *Donatus* of 27 lines; two editions of *Donatus* of 28 lines; a *Liturgical Book* in 16mo; three editions of *Donatus* of 30 lines; one *Donatus*, in French, of 29 and 30 lines on a page; four editions of *Doctrinale* of 32 lines; one *Catonis Disticha* of 21 lines. In type ii.—two leaves only (49 and 60) of one of the Dutch editions of the *Speculum*. In type iii.—Laurentius Valla, *Facetiae Morales*, &c. In type iv.—four editions of *Donatus* of 24 lines; Lud. (Pontanus) de Roma, *Singularia Juris*; Lud. (Pontanus) de Roma (?), *Treatise on Canonical Law* (?). In type v.—Pius II., *Tractatus et Epitaphia* (printed at the end of the *Singularia Juris*), Guil. de Saliceto, *De Salute Corporis*; one *Donatus* of 26 lines; five editions of *Donatus* of 27 lines; one *Doctrinale* of 26 lines; one *Doctrinale* of 28 lines; one *Doctrinale* of 29 lines; one *Doctrinale* of 32 lines, *Catonis Disticha*; Guil. de Saliceto, *De Salute Corporis*, together with Turcocrema, *De Salute Animæ*; Pius II., *Tractatus de Amore*, &c.; Pindar of Thebes, *Iliados Homerice Epitome, cum Præfatione Pii II.*; another edition of the same work. In type vi.—one *Donatus* of 26 lines; one *Donatus* of 27 lines. In type vii.—one *Donatus* of 27 lines. In type viii.—an *Abecedarium* of two leaves and a *Donatus* of 31 lines.²

Type v. must have been in existence before 13th September 1474, as there is evidence that a copy of the *Saliceto*, printed in that type, was bought for the monastery of St James at Lille by its abbot Coorad du Moulin, who filled that office from the end of 1471 to 13th September 1474. As a work in this type (the *Tracts* and *Epitaphs* of Pius II.) is printed at the end of the *Singularia Juris* in type iv., we may assume that this type existed a considerable time before type v. As the books printed in types iv. and v. show greater progress in style and workmanship than the books printed in types i. to iii., we must assign the latter to an earlier period than the former. There is indeed positive evidence that type i. must have existed a considerable time before the end of 1473, as fragments of a *Donatus* printed in that type were used by a book-binder at Haarlem to strengthen the binding of an account-book of the cathedral church in that town for the year 1474. From these facts alone we may safely assume that none of the forty-seven books can be dated after 1474, or, if any, only a few in types v. and vii. On the other hand, four of the works in type v. cannot be dated before 1458, as they bear the name of Pius II., who was not elected pope till that year. When we consider that there are twenty different editions of the *Donatus* printed in these types, and place an interval of about eighteen months between the successive editions, we get a period of some thirty years from about 1445 to 1474 for the issue of the twenty editions. That we reach the year 1445 by such a calculation is purely accidental; but there is evidence that in 1446 and 1451 printed *Doctrinalia* were bought at Bruges and Valenciennes by Jean Le Robert, the abbot of Cambrai, according to two entries in his diary, preserved in the archives at Lille. And, as we know positively that there was no printing done at Mainz before 1454, nor anywhere else so early, we can only apply these entries to the *Doctrinalia* printed in Holland in the same types as the four editions of the *Speculum* (on which Junius based the tradition of the Haarlem invention), and six editions of the *Donatus*, which we may fit into Zell's account. That the editions of the *Speculum*, of the *Donatus*, and of the *Doctrinale* in type i. may be dated as early as 1445-1451 is clear when we compare them with the earliest products of Mainz printing, for which the *Donatuses*, according to the *Cologne Chronicle*, served as models. For instance, no difference in workmanship can be detected between the *Donatuses* printed in Holland and the three editions of *Donatus* in the 36-line Bible type and the four editions of the same in the 42-line Bible type, all seven presumably printed at Mainz and before 1456. Nor is the workmanship of the *Specula* (in type i.) or of the *Facetiae Morales* (in type iii.) different from or later than that of the Mainz *Catholicon* of 1460.

It has been pointed out above that the first products of the art of printing were not meant to be anything but faithful imitations of manuscript books, and that no material deviations from the general plan become observable till about 1473-1477. Nowhere is the plan of the MS. period more strictly adhered to than in the

¹ Twenty leaves of one of the Latin editions are apparently printed from wooden blocks, the text as well as the engravings.

² For a detailed list of these books, and further particulars regarding them, see J. H. Hessels, *Haarlem, the Birthplace of Printing*, London, 1887, p. 25 sq. The abbot speaks of *Doctrinalia* "gette" or "jettez en molle," and the phrase is, as Bernard (*Origine*, i. 87 sq.) shows by eight examples from 1474—the year when printing is first officially spoken of in France—to 1593, and down to the present day, applied to typographically-printed books only.

forty-seven books of which we are speaking. They are all without signatures, without initial directors, without hyphens, without catchwords, that is to say, without any of those characteristics which we see gradually, one after the other, come into almost general use from 1473 (if not earlier) to 1480. The four editions of the *Speculum* are all entirely printed anopisthographically, the woodcuts at the top of the pages as well as the explanatory text (in type i.) underneath, which would hardly be the case if the books had been printed after 1471, when the printing of woodcuts, together with text in inmovable types, had already been known for eleven years. Their types have nothing in common with any of those used in the Netherlands after 1473, but remind us in every respect of the earlier period of the Dutch block-books and MSS. They are all, so far as we know, without any colophon (except such a word as *explicit*), which would, for a collection of forty-seven books, be incompatible with a period after 1471, but not with the earlier period of the block-books and MSS. Moreover, out of the forty-seven books no less than thirty-five are printed on vellum, which is incompatible with a period after 1471, when printing on paper had become universal, but not with the earlier period of the MSS.

Invention at Haarlem by Coster.

There is, therefore, no reason whatever to discredit Zell's statement in the *Cologne Chronicle* of 1499, that the *Donatuses* printed in Holland were the models, the "beginning" of the art of printing, at Mainz, nor that of Hadrianus Junius in his *Batavia*, that printing was invented at Haarlem by Lourens Janszoon Coster. The two statements were made independently of each other. That of Zell must be regarded as a direct contradiction of the vague rumours and statements about an invention of printing at Mainz in Germany by Gutenberg, which gradually crept into print in and after 1468 in Italy and France, and which found their way into Germany about 1476, after Mainz and Germany had given the greatest publicity to the existence of the art in their midst for more than twenty-two years, but had been silent about an invention and an inventor. And, though Zell accords to Mainz the honour of having improved the art and having made it more artistic, he denies it the honour of having invented or begun it, and this latter honour was never claimed by that town before 1476. Junius's account is the embodiment of a local tradition at Haarlem, the first written traces of which we have in a pedigree (testimony MM) of the family of the reputed Haarlem inventor, which must have existed at least as early as 1520. His account has been indirectly confirmed by the finding of several fragments at Haarlem, all belonging to the groups of books mentioned above, but still more by the discovery of several fragments of the *Donatuses* printed in the *Speculum* type, all used as binder's waste by Cornelis, the book-binder, the very man whom Junius alleges to have been the servant of Coster. As the case stands at present, therefore, we have no choice but to say that the invention of printing with movable metal types took place at Haarlem about the year 1445 by Lourens Janszoon Coster.

Early Types and their Fabrication.

We must now take notice of two theories or traditions which have been current for a long time as to some intervening stage between the art of block-printing and the art of printing with movable cast types.¹ One theory or tradition would have it that the inventor of printing, after the idea of single, individual, movable types had arisen in his mind, practised his new invention for some considerable time with wooden types, and that he came only gradually to the idea of movable types cast of metal.

Wooden types.

Junius gives us to understand that in his opinion the Dutch *Speculum* was printed with such wooden types. Of Johann Gutenberg it was asserted that he printed his first Bible with wooden types. The Mainz psalter, printed in 1457 by Joh. Fust and Peter Schoeffer, was alleged to have been printed with wooden types, in which case the 4th edition, published in 1502, and even the 5th edition of 1516, would be printed with wooden types, the same being used for them as for the editions of 1457 and 1459. Theod. Bibliander was the first to speak (in 1548) of such types and to describe them: first they cut their letters, he says, on wood-blocks the size of an entire page; but, because the labour and cost of that way was so great, they devised movable wooden types, perforated and joined one to the other by a thread.² Bibliander does not say that he had ever seen such types himself, but Dan. Speckle or Specklin (died 1589), who ascribed the invention to Mentelin, asserts that he saw some of these wooden types at Strasburg.³ Angelo

Rochea asserted in 1591 that he had seen at Venice types perforated and joined one to the other by a thread, but he does not say whether they were of wood or of metal.⁴ In 1710 Paulus Pater asserted that he had seen wooden types made of the trunk of a box-tree, and perforated in the centre to enable them to be joined together by a thread, originating from the office of Fust at Mainz.⁵ Bodman, as late as 1781, saw the same types in a worn-eaten condition at Mainz; and Fischer stated in 1802 that these relics were used as a sort of token of honour to be bestowed on worthy apprentices on the occasion of their finishing their term.

Besides those who believed in these wooden types from the fact that the letters (especially in the *Speculum*) vary among themselves in a manner which would not be the case had they been cast from a matrix in a mould, there were authors and practical printers who attempted to cut themselves or to have cut for them some such wooden types as were alleged to have been used by the early printers. Some of them came to the conclusion that such a process would be quite practicable, others found by experiment that it would, in the case of small types, be wholly impossible. Up to the present time no book or document has come to light which can be asserted to have been printed with such single, movable, wooden types. But nearly all the experiments to which we have alluded were made with the idea that the inventor of printing, or the earliest printers, started, or had to start, with as large a supply of type as a modern printer. This idea is erroneous, as it is hardly any longer denied that, for a good many years after the first appearance of the art, printers printed their books (large or small) not by quires (quaternions or quinterions) but page by page.⁶ Therefore, all considerations of the experimenters as to the impracticability of such wooden types, on account of the trouble and length of time required for the cutting of thousands of types, fall to the ground in face of the fact that the earliest printers required only a very small quantity of type, in spite of the peculiar forms (combined letters, letters with contractions, &c.) which were then in vogue.

The other theory would have it that between block-sculpto printing and printing with movable cast types there was ^{fusi} an intermediate stage of printing with "sculpto-fusi" types, that is, types of which the shanks had been cast in a quadrilateral mould, and the "faces," i.e., the characters or letters, engraved by hand afterwards. This theory was suggested by some who could not believe in wooden types and yet wished to account for the marked irregularities in the types of the earliest printed books.

Gerardus Meerman, the chief champion of this theory, based it, not only on the words of Celsus (*Amores*, iii. 3), who in 1502 described Mainz as the city "que prima sculpsit solidos are characteres," but on the frequent recurrence of the word *sculptus* in the colophons of the early printers (for Jenson and Husner of Strasburg, see p. 681 above). Senseschmid in 1475 said that the *Codex Justinianus* was "cut" (*insculptus*), and that he had "cut" (*sculpsit*) the work of Lombardus, in *Psalterium*. Meerman also explained the account of the invention of printing by Trithemius⁷ as meaning that, after the rejection of the first wooden types, the inventors discovered a method of casting the bodies only of all the letters of the Latin alphabet from what they called matrices, on which they cut the face of each letter; and from the same kind of matrices a method was in time discovered of casting the complete letters of sufficient hardness for the pressure they had to bear, which letters they were before—that is, when the bodies only were cast—obliged to cut.⁸ In this way Meerman explained that the *Speculum* was printed in sculpto-fusi types, although in the one page of which he gives a facsimile there are nearly 1700 separate types, of which 250 alone are e's. Schoepflin claimed the same invention for Strasburg, and believed that all the earliest books printed there were produced by this means. Both Meerman and Schoepflin agreed that engraved metal types (*litteræ in ære sculptæ*) were in use for many years after the invention of the punch and matrix, mentioning among others so printed the Mainz psalter, the *Catholicon* of 1460, the Eggstein Bible of 1463, and even the *Præceptorium* of Nider, printed at Strasburg in 1476. But the great difficulty connected with the process of first casting the shanks and afterwards engraving the faces of the types has become apparent to those who have made experiments; and it seems more probable that the terms *sculpere*, *exculpere*, *insculpere* are only a figurative allusion to the first process towards producing the types, namely the cutting of the punch, which is artistically more important to the fabrication of types than the mechanical casting,—all the more as Schoeffer in 1468 makes his *Grammatica Vectus Rhythmica* say, "I am cast at

¹ We do not allude to Trithemius's assertion that the *Catholicon* of 1460 was printed from wooden blocks; for this story, which he declares he had heard from Peter Schoeffer, if it were true, would belong to the history of block-printing. Nor need we speak of Bergellanus's verses (1541), in which he distinctly alludes to carved blocks.

⁷ *Annales Hirsingensis*, ii. 421: "Post hæc inventis successerunt subtilior, Invenientque modum fundendi formas omnium Latini alphabeti litterarum, quas ipsi matrices nominabant, ex quibus rursus æneis sive stanneis characteres fundebant, ad omnem pressuram sufficientes, quos prius molibus sculptabant."

⁸ *Origines Typographicæ*, The Hague, 1705, Append., p. 47.

Mainz," an expression which could hardly be anything but a figurative allusion to the casting of the types.

Granting that all the earlier works of typography preserved to us are impressions of cast-metal types, there are still differences of opinion, especially among practical printers, as to the probable methods employed to cast them. It is considered unlikely that the inventor of printing passed all at once to the perfect typography of the punch, the matrix, and the mould. Bernard¹ considered that the types of the *Speculum* were cast in sand, as that art was certainly known to the silversmiths and trinket-makers of the 15th century; and he accounts for the varieties observable in the shapes of various letters on the ground that several models would probably be made of each letter, and that the types, when cast by this imperfect mode, would require some touching up or finishing by hand. He exhibits a specimen of a word cast for him by this process which not only proves the possibility of casting types in this manner but also shows the same kind of irregularities as those observable in the types of the *Speculum*.

But here again it is argued that in types cast by this or any other primitive method there would be an absence of uniformity in what founders term "height to paper." Some types would stand higher than others, and the low ones, unless raised, would miss the ink and not appear in the impression. The comparative rarity of faults of this kind in the *Speculum* leads one to suppose that, if a process of sand-casting had been adopted, the difficulty of uneven heights had been surmounted either by locking up the forme face downwards, or by perforating the types either at the time of casting or afterwards, and holding them in their places by means of a thread or wire. To this cause Ottley attributed the numerous misprints in the *Speculum*, to correct which would have involved the unthreading of every line in which an error occurred. And, as a still more striking proof that the lines were put into the forme one by one, in a piece, he shows a curious printer's blunder at the end of one page, where the whole of the last reference-line is put in upside down, thus:—

Die buas bespot slapende ende niet buetende.
 ʎɹɹɹɹɹ ɹɹɹɹɹ

A "turn" of this magnitude could hardly have occurred if the letters had been set in the forme type by type.

Another suggested mode is that of casting in clay moulds, by a method very similar to that used in the sand process, and resulting in similar peculiarities and variations in the types.

Ottley, who was the chief exponent of this theory, suggested that the types were made by pouring melted lead or other soft metal into moulds of earth or plaster, after the ordinary manner used from time immemorial in casting statues of bronze and other articles of metal. But the mould thus formed could hardly avail for a second casting, as it would be scarcely possible to extract the type after casting without breaking the clay, and, even if that could be done, the shrinking of the metal in cooling would be apt to warp the mould beyond the possibility of further use. Ottley therefore suggests that the constant renewal of the moulds could be effected by using old types cast out of them, after being touched up by the graver, as models,—a process which he thinks will account for the varieties observable in the different letters, but which would really cause such a gradual deterioration and attenuation in the type, as the work of casting progressed, that in the end it would leave the face of the letter unrecognizable as that with which it began. It would therefore be more reasonable to suppose that one set of models would be used for the preparation of all the moulds necessary for the casting of a sufficient number of types to compose a page, and for the periodical renewal of the moulds all through the work, and that the variations in the types would be due, not to the gradual paring of the faces of the models, but to the different skill and exactness with which the successive moulds would be taken. It is evident that the sand and clay methods of casting types above described must be slow. The time occupied after the first engraving of the models in forming, drying, and clearing the moulds, in casting, extracting, touching up, and possibly perforating the types required for one page, would exceed the time required by a practised xylographer for the cutting of a page of text upon a block. But he that has gone through the trouble of casting separate movable types has a clear gain over the wood-block printer in having a fount of movable types, which, even if the metal in which they were cast were only soft lead or pewter, might be used again and again in the production of any other page of text, while the wood-block can only produce the one page which

it contains. Moreover, only one hand could labour on the xylographic block; but many hands could be employed in the moulding and casting of types, however rude they might be. Bernard states that the artist who produced for him the few sand-cast types shown in his work assured him that a workman could easily produce a thousand such letters a day. He also states that, though each letter required squaring after casting, there was no need to touch up the faces.

There remains yet another suggestion as to the method Polytype² in which the types of the rude school may have been produced. This may be described as a system of what the founders of sixty years ago called polytype, which is a cast or facsimile copy of an engraved block, matter in type, &c.

Lambinet,² who is responsible for the suggestion, based upon a new translation of Trithemius's narrative, explains that this process really means an early adoption of stereotype. He thinks that the first printers may have discovered a way of moulding a page of some work—an *Abecedarium*—in cooling metal, so as to get a matrix-plate impression of the whole page. Upon this matrix they would pour a liquid metal, and by the aid of a roller or cylinder press the fused matter evenly, so as to make it penetrate into all the hollows and corners of the letters. This tablet of tin or lead, being easily lifted and detached from the matrix, would then appear as a surface of metal in which the letters of the alphabet stood out reversed and in relief. These letters could easily be detached and rendered mobile by a knife or other sharp instrument, and the operation could be repeated a hundred times a day. The metal faces so produced would be fixed on wooden shanks, type high, and the fount would then be complete. Lambinet's hypothesis was endorsed by Firmin-Didot, the renowned type-founder and printer of Lambinet's day. But it is impossible to suppose that the Mainz psalter of 1457, which these writers point to as a specimen of this mode of execution, is the impression, not of type at all, but of a collection of "casts" mounted on wood.

Whatever value there may be in the above theories with regard to the movable types of the first printer, certain it is that the shape and manufacture of the types used as early as c. 1470 do not seem to have differed materially from those of the present times.

This is evident (1) from the shape of the old types which were discovered in 1878 in the bed of the river Saône, near Lyons, opposite the site of one of the 15th-century printing houses of that city, and which there is reason to believe belonged once to one of those presses, and were used by the early printers of Lyons; (2) from a page in Joh. Nider's *Lepra Moralis*, printed by Conrad Homburch at Cologne in 1476, which shows the accidental impression of a type, pulled up from its place in the course of printing by the ink-ball, and laid at length upon the face of the forme, thus leaving its exact profile indented upon the page; (3) from an entirely similar page (fol. 4^b) in *Liber de Laudibus ac Festis Gloriosæ Virginis*, Cologne, c. 1463. From the small circle appearing in the two last-mentioned types, it is presumed that the letters were pierced laterally by a circular hole, which did not penetrate the whole thickness of the letter, and served, like the nick of modern types, to enable the compositor to tell by touch which way to set the letter in his stick. The fact that in these two cases the letter was pulled up from the forme seems to show that the line could not have been threaded.

Vinc. Fineschi, *Notizie Storiche sopra la Stamperia di Ripoli* (Florence, 1781, p. 49), gives an extract from the cost-book of the Ripoli press, about 1480, by which it appears that steel, brass, copper, tin, lead, and iron wire were all used in the manufacture of types at that period.³

The history and nomenclature of the earliest types are practically a continuation of the history and nomenclature of the characters figured in the earliest block-books, wood-engravings, and MSS. For instance, Gothic type was first seen about the year 1445; but it should not be forgotten that the Gothic writing, of which that type was an imitation, was already known and used about the second half of the 12th century. Again, the pure Roman type, which appeared about 1464, is nothing but an imitation of what in palæography is called the Caroline minuscule, a handwriting which was already fully developed towards the end of the 8th century. Consequently, details as to the history and development of the various types properly belong to the study of PALÆOGRAPHY (q.v.).

types

earliest type.

History of the earliest types.

The broad outlines of the history of the earliest types are as follows:—

Gothic. Gothic type, of the angular or pointed kind, was first used by the Harlem printer of the *Speculum*, *Donatus*, &c. (see specimen No. 1, taken from the British Museum copy of the *Speculum Humanæ Salvationis*, mixed Latin edition), presumably c. 1445. An entirely similar but larger type (No. 2, taken from the British Museum copy of Ludovicus [Pontanus] de Roma, *Singularia*) was used, presumably by the same printer, c. 1465-1470. Gothic type appeared in Germany as a church type in 1454, in the 31-line indulgence, presumably printed by Johan Gutenberg at Mainz (No. 3, from the Göttingen copy), and in the 30-line indulgence (No. 4, taken from the British Museum copy), printed by Peter Schoeffer at Mainz. Type No. 3 was also used about the same time for the 36-line Bible and type No. 4 for the 42-line Bible. Two much larger Gothic types appeared in the psalter of 1457, published by Fust and Schoeffer (see Bernard, *Origine*, pl. vii). In Italy Gothic type appears in 1468 (No. 5, taken from the British Museum copy of Cicero, *De Oratore* published at Rome by Ur. Hahn, 15th December 1468, in small Roman type, with imprint in Gothic), but in a more rounded form; it is practically the ordinary Italian writing influenced by the Gothic. In France Gothic began to be used in 1473; in England it appears first in Caxton's type about the year 1480.¹ It was employed extensively in a great many of the earliest presses all over Europe, and continued to be used largely at all times, especially for Bibles, law books, royal proclamations, &c. and even to this day it is the national character of Germany. It is now usually called *lettre de forme*, *black letter* or *English* in English-speaking countries, *lettre Flamand* in Holland, and *fraktur* in Germany.

Bastard Italian or Roman. Bastard Italian or bastard Roman was introduced in 1454 at Mainz in the 31 line (No. 6) and 30-line (No. 7) indulgence. It is also called *lettre de somme*, some think from the *Summa* of Thomas Aquinas, printed in the type of the Bible of 1462 by Fust and Schoeffer. Varieties of this kind of type were, like the Gothic, much used by the earliest printers, as, for instance, the printer of the 1460 *Catholicon*, &c., by Mentelin of Strasburg, c. 1460, and by Ulrich Zell at Cologne, c. 1466, &c. In England it appeared in the first three books printed (1478, 1479) at Oxford (No. 8, taken from the British Museum copy of Jerome's *Expositio in Symbolum Apostolorum*, wrongly dated 1468 for 1478).

Roman. Roman type, the Caroline minuscule of palæography, was first used in Germany about 1464, at Strasburg, by the printer whose font of type is known by a peculiarly shaped R, and who on that account is usually called "the R printer" (No. 9, taken from the British Museum copy of Durandus, *Rationale*, of which the Basel library possesses a copy which was bought in 1464).² In Italy it appears in 1465 at Subiaco (see Bernard, pl. xii., No. 19), at Rome in 1467 (*op. cit.*, pl. xii., No. 20), but in all its purity at Venice in 1469, used by Johannes of Spire (*op. cit.*, pl. xii., No. 23), and at Paris in 1470 (*op. cit.*, pl. xiii., No. 25). In England, it was not used before 1518, when Richard Pynson printed, Pace's *Oratio in Pace Nuperrima* (see facsimile in Reed's *Type Foundries*, p. 92).

Burgundian. Burgundian type, or *gros batarde* or *secretary*, was first used about 1470-72 by Colard Mansion at Bruges (No. 10, taken from the British Museum copy of *La Controverisie de Noblesse*, c. 1471-72). With a somewhat similar type (No. 11, taken from the British Museum copy of the *Recuyell*) William Caxton is presumed to have printed, likewise at Bruges, a set of five books, of which the *Recuyell of the History of Troye*, a translation of a work by Raoul le Fèvre, is the best known and was probably printed c. 1471.³ To this same class belong the first type (No. 12, from the British Museum copy of the *Dictes*) used in England by William Caxton for the printing of *Dictes and Sayings of the Philosophers* (18th November 1477), and that used by the printer of St Albans (No. 13, taken from the Cambridge university library copy of Aug. Dactus, *Elegancie*). It

was an imitation of the manuscript hand of the English and Burgundian scribes of the 15th century, and, after having figured for a long time in several of the early London and provincial presses, was about 1534 entirely superseded by the English black letter. To this class of type belong also the later *lettre de civilite* (c. 1570), the *scripti* (*lettre couleë*, *lettre de finance*, Dutch *geschreeven schrift*), *set court*, *base secretary*, and running secretary types.

On the types before 1500, consult also the facsimiles in Holtrop's *Mon. Typ. des Pays-Bas*, The Hague, 1868; R. C. Hawkins, *First Books and Printers of the Fifteenth Century*, New York, 1884; William Blades, *The Life of Caxton*, London, 1861-63; Bernard, *Origine de l'Imprimerie*, Paris, 1833, vol. i., plates iii.-xii.; Placidus Braun, *Notitia de Libris ab Artis Typogr. Inventionis usque ad Annum 1479 Inpressis*, Augsburg, 1788; H. Noel Humphreys, *Hist. of the Art of Printing*, fol., London, 1867. The types after 1500 can best be learned from the catalogues of type-founders, among which those of Messrs Eschedé of Harlem occupy a foremost place. Of others we may mention—*Indice dei Caratteri nella Stampa Vaticana*, 4to, Rome, 1628; *Epreuves des Caractères qui se trouvent chez Claude Lameste*, 4to, Paris, 1742; *Epreuves des Car. de la Fonderie de Claude Moez*, 8vo, Nantes, 1754; *Les Car. de l'Imprimerie par Fournier le Jeune*, 8vo, Paris, 1764; *Proef van Letteren, Bloemen, &c., van Ploos van Amstel*, 8vo, Amsterdam, 1767; *Epreuve de Car. de Jacques François Rosart*, 8vo, Brussels, 1771; *Schriften* by J. H. Frenzel, 4to, Frankfurt-on-Main, 1774; *Epreuves des Car. de la Fond. de J. L. Jomaris*, 8vo, Paris, 1776; *Epreuves des Car. de la Fond. de J. L. de Boubers*, 8vo, Brussels, 1777; *Proef van Letteren welke gegoeten worden door J. de Groot*, 8vo, The Hague, 1787; *Pantographie*, by Edmund Fry, 8vo, London, 1799; and *Manuale Typographicum*, by G. Bodoni, 4to, Parma, 1818.

Subsequent to 1500.

Though the *Cologne Chronicle* of 1499 denies to Mainz the honour of the invention of the art of printing, it was right in asserting that, after it had been brought there from Holland, it became much more masterly and exact, and more and more artistic. During the first half century of printing a good many printers distinguished themselves by the beauty, excellence, and literary value of their productions. We may mention as such:—Johan Fust and Peter Schoeffer at Mainz; Johan Mentelin and Heinrich Eggestein at Strasburg; Ulrich Zell at Cologne; Sweynheym and Pannarts at Subiaco and at Rome; Nicolas Jensen at Venice; Anton Koberger at Nuremberg; Kettelær and De Leempt at Utrecht; Johan Veldener at Louvain; Utrecht, and Kuilenburg; Gerard Leen at Gouda; Johan of Westphalia at Louvain; and William CAXTON (q.v.) at Westminster.

Very soon the demand for books increased, and with it came a reduction in their prices. This caused a decline in the execution of printing, which begins to be appreciable about 1480 in some localities, and may be said to have become general towards the end of the 15th century. At all times, however, we find some printers raise their art to a great height by the beauty of their types and the literary excellence of their productions. Among the later printers we may mention the Aldi of Venice (1490 to 1597; see

History of Modern Types.

Italic.

The Italic type¹ is said to be an imitation of the handwriting of Petrarch, and was introduced by Aldus Manutius of Venice for the purpose of printing his projected small editions of the classics. The cutting of it was entrusted to Francesco da Bologna, an artist who is presumed to be identical with the painter Francesco Francia or Raibolini. The fount is a "lower case" only, the capitals being Roman in form. It contains a large number of tied letters, to imitate handwriting, but is quite free from contractions and ligatures. It was first used in the *Virgil* of 1500. Aldus produced six different sizes between 1501 and 1558. It was counterfeited almost immediately in Italy, at Lyons, and elsewhere. Originally it was called Venetian or Aldine, but subsequently Italic type, except in Germany and Holland, where it is called "cursive." The Italians also adopted the Latin name "characteres cursivi seu cancellarii." In England it was first used by Wynkyn de Worde in Wakefield's *Oratio* in 1524. The character was at first intended and used for the entire text of classical works. When it became more general, it was employed to distinguish portions of a book not properly belonging to the work, such as introductions, prefaces, indexes, notes, the text itself being in Roman. Later it was used in the text for quotations, and finally served the double part of emphasizing certain words in some works, and in others, chiefly translations of the Bible, of marking words not rightly forming a part of the text.

Greek.

Greek type (*minuscules*) first occurs in Cicero, *De Officiis* printed at Mainz in 1465 by Fust and Schoeffer. The fount used is rude and imperfect, many of the letters being ordinary Latin. In the same year Sweynheym and Pannarts used a good Greek letter for some of the quotations in their edition of *Lactantius* (see, for instance, leaves 11a, 19a, 36a, 139, 140); but the supply was evidently short at first, as some of the larger quotations in the first part of the book were left blank to be filled in by hand. The first book wholly printed in Greek minuscules was the *Grammar of Lascaris*, by Paravisinus, at Milan in 1476, in types stated to have been cut and cast by Demetrius of Crete. The fount contains breathings, accents, and some ligatures. The headings to the chapters are wholly in capitals. The *Anthologia Græca* of Lascaris was printed at Florence in 1494 wholly in Greek capitals (*literæ majusculæ*), and it is stated in the preface that they were designed after the genuine models of antiquity to be found in the inscriptions on medals, marbles, &c. But as late as 1493 Greek type was not common, for in that year the Venice printer Symon Bevilaqua issued *Tibullius*, *Calpurnius*, and *Propertius* with blanks left in the commentary for the Greek quotations. In England Greek letters appeared for the first time in 1519 in W. de Worde's edition of Whitenton's *Grammatica*, where a few words are introduced cut in wood. Cast types were used at Cambridge in Galen's *De Temperamentis*, translated by Linacre, and printed by Siberch in 1521, who styles himself the first Greek printer in England; but the quotations in the Galen are very sparse, and Siberch is not known to have printed any entire book in Greek. The first printer who possessed Greek types in any quantity was Reginald Wolfe, who held a royal patent as printer in Greek, Latin, and Hebrew, and printed in 1543 two *Homilies* of Chrysostom, edited by Sir John Cheke, the first Greek lecturer at Cambridge. In Edinburgh, in 1563, and as late as 1579, the space for Greek words was left blank in printing, to be filled in by hand. In 1632 Cambridge applied to Oxford for the loan of a Greek fount to print a Greek Testament, and the same university made an offer in 1700 for the purchase of a fount of the king's Greek at Paris, but withdrew on the French Academy insisting as a condition that every work printed should bear the imprint "characteribus Græcis e typographeo regio Parisiensi." It should not be forgotten that the large number of ligatures in the Greek of that day made the production of a fount a serious business. The Oxford Augustin Greek comprised no fewer than 354 matrices, the

great primer 456, and even one fount showed 776 different sorts. The Dutch founders effected a gradual reduction of the Greek typographical ligatures. Early in the 19th century a new fashion of Greek, for which Porson was sponsor and furnished the drawings, was introduced, and has remained the prevailing form to this day.

The first Hebrew types are generally supposed to have appeared Hebrew in 1475 in Petrus Niger's *Tractatus contra Perfidios Judæos* (leaf 10), printed by Conrad Fyner at Esslingen. De Rossi states that a Hebrew work in four folio volumes entitled *Arba Turim* of Rabbi Jacob ben Asher, was printed in 1475 at Pieve di Sacco in Austrian Italy, while in the same year, a few months earlier, Salomon Jarchi's *Comment. on the Pentateuch* appeared at Reggio in Italy, printed in the Rabbinical character. Numerous other Hebrew works followed before 1488, in which year the first entire Hebrew Bible was printed, with points, at Sconico, by a family of German Jews. The first English book in which any quantity of Hebrew type was used was Dr Rhys's *Cambro-Brytanica Cymræcæ Lingvæ Institutiones*, printed by Thomas Orwin in 1592, though already in 1524 Greek characters, but cut in wood, were used by W. de Worde in Wakefield's *Oratio*. But the Hebrew fount made use of in Walton's *Polyglott* in 1657 was probably the first important fount cut and cast in England, though there were as yet no matrices there for Rabbinical Hebrew. In the beginning of the 18th century Amsterdam was the centre of the best Hebrew printing in Europe.

The first book printed in Arabic types is said to be a *Diurnale Arabo-Græcorum Arabum*, printed at Fano in Italy in 1514.² Two years later P. P. Porrus's *Polyglott Psalter*, comprising the Arabic version, was printed at Genoa; and two years later a *Koran* in Arabic is said to have been printed at Venice. In 1505 an *Arabic Vocabulary* at Granada had the words printed in Gothic letters with the Arabic points placed over them; and in other presses where there were no Arabic types the language was expressed in Hebrew letters or cut in wood. De Guignes and others mention a fount of Arabic used by Gromors in Paris in 1539-40 to print Postel's *Grammar*. In England some Arabic words were introduced in Wakefield's *Oratio* of 1524, but apparently cut in wood. In Minshew's *Ductor in Linguas*, 1617, the Arabic words are printed in Italic characters. Laud's gift of Oriental MSS. to Oxford in 1635, and the appointment of an Arabic lecturer, were the first real incentives to the cultivation of the language by English scholars. Previous to this it is stated that the Raphelengius Arabic press at Leyden had been purchased by the English Orientalist, William Bedwell; but, if it was brought to England, it does not appear to have been immediately made use of. The Arabic words in Thomas Græve's *Oratio de Lingvæ Arabicæ Utilitate*, printed at Oxford in 1639, were written in by hand.

Syriac type, probably cut in wood, first appeared in Postel's *Syriac Linguarum XII. Alphabeti*, printed in Paris in 1538; but the characters are so rude in form and execution as to be scarcely legible. In 1555, however, Postel assisted in cutting the punches for the Syriac Peshito New Testament, printed at Vienna in 4to, the first portion of the Scriptures, and apparently the first book printed in that language. In 1569-72 Plantin at Antwerp included the Syriac New Testament in his *Polyglott*, and reissued it in a separate form in 1574. In England Syriac was usually expressed in the earlier works in Hebrew characters. But in 1652, when the prospectus and preliminary specimen of Walton's *Polyglott* were issued, we find Syriac type in use.

Of the Armenian character the press of the Vatican possessed a good fount in 1591, when Angelo Roccha showed a specimen in his *Bibliotheca Apostolica Vaticana*. A psalter is said to have been printed at Rome in 1565, and Bowe Mores mentions doubtfully a liturgy printed at Cracow in 1549. Armenian printing was practised in Paris in 1633; but the Armenian bishops, on applying to France for assistance in printing an Armenian Bible in 1662, were refused, and went to Rome, where, as early as 1636, the press of the Propaganda had published a specimen of its Armenian matrices. The patriarch, after fifteen months' residence in Rome, removed to Amsterdam, where he established an Armenian press, and printed the Bible in 1666, which was followed in 1668 by a separate edition of the New Testament. In 1669 the press was set up at Marseilles, where it continued for a time, and was ultimately removed to Constantinople. In England the first Armenian type was that presented by Dr Fell to Oxford in 1667. The alphabet given in the prolegomena of Walton's *Polyglott* was cut in wood.

Of Ethiopic the earliest type appeared in Potken's *Psalter and Ethiopic Song of Solomon*, printed at Rome in 1513. The work was reprinted at Cologne in 1518 in Potken's *Polyglott Psalter*. In 1548 the New Testament was printed at Rome by some Abyssinian priests. The press of the Propaganda issued a specimen of its fount in 1631, and again in Kircher's *Prodromus Coptus* in 1636. Erpenius at Leyden had an Ethiopic fount, which in 1626 was acquired by the Elzevirs. Usher attempted to procure the fount for England; but, his attempt failing, punches were cut and matrices prepared by the London founders for the London *Polyglott*, which showed the Psalms, Canticles, and New Testament in the Ethiopic version.

¹ These paragraphs on the various types are for the most part taken from T. B. Reed's *History of the Old English Letter Foundries*, London, 1837, p. 50 sq.

² See Panzer, vii. 2.

Coptic. Of Coptic the press of the Propaganda possessed a fount, and a specimen was issued in 1636, in which year also Kircher's *Prodromus Coptus* appeared from the same press. In England David Wilkins's edition of the New Testament was printed in 1716 from Coptic types cast with matrices which Dr Fell had presented to Oxford in 1667. The alphabets shown in the introduction and prolegomena to the London *Polyglott* of 1655 and 1657 were cut in wood.

Samaritan. Of Samaritan the press of the Propaganda had a fount in 1636, and the Paris *Polyglott*, completed in 1645, contained the entire Pentateuch in type the punches and matrices of which had been specially prepared under Le Jay's direction. The fount used for the London *Polyglott* in 1657 is admitted to have been an English production, and was probably cut under the supervision of Usher.

Slavonic. With Slavonic type a psalter was printed at Cracow as early as 1491, and reprinted in Montenegro in 1495. The only Slavonic fount in England was that given by Dr Fell to Oxford, and this, Mores states, was replaced in 1695 by a fount of the more modern Russian character, purchased probably at Amsterdam. The *Oratio Dominica* of 1700 gives a specimen of this fount, but renders the

Russian. Hieronymian version in copper-plate. Modern Slavonic, better known as Russian, is said to have appeared first in portions of the Old Testament printed at Prague in 1517-19. Ten years later there was Russian type in Venice. A Russian press was established at Stockholm in 1625, and in 1696 there were matrices in Amsterdam, from which came the types used in Ludolph's *Grammatica Russica*, printed at Oxford in that year, and whence also, it is said, the types were procured which furnished the first St Petersburg press, established in 1711 by Peter the Great. Mores notes that in 1778 there was no Russian type in England, but that Cottrell was at that time engaged in preparing a fount. It does not appear that this project was carried out, and the earliest Russian in England was cut by Dr Fry from alphabets in the *Vocabularia*, collected and published for the empress of Russia in 1736-89. This fount appeared in the *Pantographia* in 1799.

Etruscan. A fount of the Etruscan character cut by William Caslon about 1733 for Swinton of Oxford was apparently the first produced. Fournier in 1766 showed an alphabet engraved in metal or wood. In 1771 the Propaganda published a specimen of their fount, and Bodoni of Parma in 1806 exhibited a third in his *Oratio Dominica*.

Runic. Runic types were first used at Stockholm in a Runic and Swedish *Alphabetarium*, printed in 1611. The fount, which was cast at the expense of the king, was afterwards acquired by the university. About the same time Runic type was used at Upsala and at Copenhagen. Voskens of Amsterdam had matrices about the end of that century, and it was from Holland that Francis Junius is supposed to have procured the matrices which in 1677 he presented to Oxford. This fount appears in the *Oratio Dominica* of 1700, and in Hickey's *Thesaurus*, 1703-5, and it remained the only one in England.

Gothic. Matrices of Gothic type were presented to Oxford by Francis Junius in 1677, and a fount of them was used for the *Oratio Dominica* of 1700 and in Hickey's *Thesaurus*. A different fount was used for Chamberlayne's *Oratio Dominica*, printed at Amsterdam in 1715. Caslon cut a fount which appeared in his first specimen in 1734. This and the Oxford fount were the only two in England in 1820.

Scandinavian. Founts of Icelandic, Swedish, and Danish were included in Junius's gift to Oxford in 1677, and were, perhaps, specially prepared in Holland. The first-named is shown in the *Oratio Dominica* of 1700 and in Hickey's *Thesaurus*. Printing had been practised in Iceland since 1531, when a *Breviary* was printed at Hoolum, in types rudely cut, it is alleged, in wood. In 1574, however, metal types were provided, and several works produced. After a period of decline, printing was revived in 1773, and in 1810 Sir George Mackenzie reported that the Hoolum press possessed eight founts of type, of which two were Roman, and the remainder of the common Icelandic character, which, like the Danish and Swedish, bears a close resemblance to the German.

Anglo-Saxon. For the Anglo-Saxon language the first type was cut by John Day in 1567, under the direction of Archbishop Parker, and appeared in Ælfric's *Paschal Homily* in that year and in the *Ælfrici Res Gestæ* of Asser Menevensis in 1574. Anglo-Saxon type was used by Browne in 1617, in Minshew's *Ductor in Linguis*; and Haviland, who printed the second edition of that work in 1626, had in 1623 made use of the character in Lisle's edition of Ælfric's *Homily*.

Irish. The first fount of Irish character was that presented by Queen Elizabeth to O'Kearney in 1571, and used to print the Catechism which appeared in that year in Dublin, from the press of Franckton. But the fount is only partially Irish, many of the letters being ordinary Roman or Italic. It was used in several works during the early years of the 17th century, and as late as 1652 in Godfrey Daniel's *Christian Doctrine*, printed in Dublin. The Irish seminaries abroad were better supplied with Irish type. A new type was cut by Manon, and appeared in 1681 in Boyle's New Testament, printed by Robert Everingham.

Naschic. The earliest specimen of music type occurs in Higden's *Polychronicon*, printed by De Worde at Westminster in 1495. The square notes appear to have been formed of ordinary quadrats, and

the staff-lines of metal rules imperfectly joined. In Caxton's edition of the same work in 1482 the space had been left to be filled up by hand. The plain chant in the Mainz psalter of 1490, printed in two colours, was probably cut in wood. Hans Frosehauer of Augsburg printed music from wooden blocks in 1473, and the notes in Burtius's *Opusculum Musicæ*, printed at Bologna in 1487, appear to have been produced in the same manner; while at Lyons the missal printed by Matthias Hus in 1485 had the staff only printed, the notes being intended to be filled in by hand. About 1500 a musical press was established at Venice by Ottavio Petrucci, at which were produced a series of mass-books with lozenge-shaped notes, each being cast complete with a staff-line. In 1513 he removed to Fossombrone, and obtained a patent from Leo X. for his invention of types for the sole printing of figurative song (*cantus figuratus*). Before 1550 several European presses followed Petrucci's example, and music type was used, among other places, at Augsburg in 1506 and 1511, Parma in 1526, Lyons in 1532, and Nuremberg in 1549. In 1525 Pierre Hautin cut punches of lozenge-shaped music at Paris. Round notes were used at Avignon in 1532. In England, after its first use, music-printing did not become general till 1550, when Grafton printed Marbeck's Book of Common Prayer, "noted" in movable type, the four staff-lines being printed in red and the notes in black. There are only four different sorts of notes used,—three square and one lozenge. About 1660 the detached notes hitherto employed began to give place to the "new tied note," by which the heads of sets of quavers could be joined. But at the close of the 17th century music-printing from type became less common, on account of the introduction of stamping and engraving plates for the purpose.

Printing for the blind (compare vol. iii. p. 826) was first introduced in 1784 by Valentin Haüy, the founder of the asylum for the blind children in Paris. He made use of a large script character, from which impressions were taken on a prepared paper, the impressions being so deeply sunk as to leave their marks in strong relief and legible to the touch. Haüy's pupils not only read in this way, but executed their own typography, and in 1786 printed an account of their institution and labours as a specimen of their press. The first school for the blind in England was opened in Liverpool in 1791, but printing in raised characters was not successfully accomplished till 1827, when Gall of the Edinburgh asylum printed the Gospel of St John from angular types. Alston, the treasurer of the Glasgow asylum, introduced the ordinary Roman capitals in relief, and this system was subsequently improved upon by the addition of the lower-case letters by Dr Fry, the type-founder, whose specimen gained the prize of the Edinburgh Society of Arts in 1837. Several rival systems have competed in England for adoption, of which the most important are those of Lucas, Frere, Moon, Braille, Carton, and Alston; the last-named, as perfected by Dr Fry, seems likely to become the recognized method of printing for the blind in all European countries.

As regards initials in the earliest printed books, see above, p. 686. **Initials** The trouble and cost involved in the use of the initial director early suggested the use of wood-cut initials, and Erhard Ratdolt of Venice, about 1475, is generally supposed to have been the first printer to introduce the *litteræ florentes*, called also *litteræ tourneures*, or *typi tornatissimi*, which eventually superseded the hand-painted initials. Caxton introduced one or two kinds in 1484. Among the earliest to be used are the so-called Lombardic initials or capitals. The more elaborate initials, such as those used in the Mainz indulgences and psalter, by Aldus at Venice, by Johann Schoeffer at Mainz in 1513, by Tory and the Estiennes at Paris, by Froben at Basel, and by the other great printers of their day, were known as *litteræ græcæ*. Besides these, the ordinary "two-line letters" or large plain capitals came into use; and these were generally cast, whilst the ornamental letters were for the most part engraved on wood or metal.

Type ornaments and flowers began, like the initials, with the Ornament-illuminators, and were afterwards cut on wood or metal. The first metals printed ornament or vignette is supposed to be the scutum or arms of Fust and Schoeffer in their edition of the Bible of 1462. There is no vignette in the Subiaco *Laclantius* of 1465 (as stated by Mr Reed, *Letter Foundries*, p. 82). In Holtrop's *Monum. Typogr. des Pays-Bas* may be seen borders used by some of the earliest printers of Holland (1475-1490) which would not look bad even in the present time. Caxton in 1490 used ornamental pieces to form the border for his *Fifteen O's*. At the same time the Paris printers engraved still more elaborate border pieces. At Venice entire frames were engraved in one piece, while Aldus as early as 1495 used tasteful head-pieces cut in artistic harmony with his *litteræ græcæ*. Early in the 16th century we observe detached ornaments and flourishes which have evidently been cast from a matrix.

PART II.—PRACTICAL.

Defini-
tion.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material, the definition being based on the etymology (Old Fr. *empreindre*, from Lat. *imprimere*). Technically the same definition might be applied to such arts as those of calico and oilcloth printing, and even of moulding, embossing, coining, and stamping; but in point of fact these are never understood when the word "printing" is employed. There is also printing without pressure, such as photographic printing. The use of a pigment or ink must be regarded as an indispensable element. The application of the term is therefore confined to the use of pressure and a pigment for literary and pictorial purposes. As thus defined, printing includes three entirely different processes—not inaptly called the polygraphic arts—viz., chalcography or copperplate printing (compare ENGRAVING, vol. viii. p. 439 sq.), LITHOGRAPHY (*q.v.*) or chemical stone-printing, and typography or letterpress printing. The last-named is that to which the present article is confined.

Typo-
graphy,
chalco-
graphy,
and
litho-
graphy.

The difference between the three methods lies essentially in the nature or conformation of the surface that is inked, and which afterwards gives a reproduction or image in reverse on the material to be impressed. In copperplate printing the whole of a flat surface is inked, and a portion of the ink sinks into an incision or trench, in which it still remains after the surface is cleansed. When pressure is brought to bear, this ink is transferred to the paper, giving an impression of a line. In lithographic printing the flat surface is protected except at certain places, where it is slightly coated with the ink, which practically leaves the stone quite level, but also marks a line when pressure is brought to bear. In typography the printing surface is in relief. It alone receives ink, the remainder being protected by its lower level. Any kind of printing done from a relief surface belongs to letterpress printing, such as a woodcut, a casting in metal, india-rubber, celluloid, xylonite, &c. (or "stereotype"), or a deposition by electricity (or "electrotype"). The typographic method requires a surface that is more difficult to form than either of the other two. In lithography the surface may be obtained by merely writing or drawing on the stone; in copperplate printing the line may be immediately incised into or scratched on the plate; but for letterpress printing the surface between the lines in relief has to be cut away. Hence the tediousness of wood-engraving, in which all the surface of the block has to be removed except those parts that are to be printed from and which form the black lines in the impression; and the conformation of a type surface is similar.

Typography, however, has many compensating advantages. Impressions are taken with much greater facility. The inking appliance glides over the relief lines to be printed from, whereas it would cling to the entire surface of the stone or the metal; hence much greater pressure would be required in these cases. The unprintable part of the stone in lithography has to be damped, so as to repel the ink; the same portion has to be inked and then cleaned off in copperplate printing; but in letterpress printing the ink only that has to be transferred to the paper needs to be applied to the type. When the design has been drawn on the stone or scratched into the copper, the result does not admit of any further application beyond that at first contemplated. But in letterpress printing the surface may be of a composite character. It may be formed of single pieces representing the several letters, and these, when once formed, may be employed in endless combinations. Only by such means are cheap newspapers and books possible. Before the invention of typography (as in the East to the present day), the dif-

ferent pages of a book were printed from wooden blocks, cut after the manner of a wood-engraving. Blocks of this kind are of no use for printing after their first purpose has been fulfilled. They must necessarily be made very slowly and with much labour. In forming a page of a book, on the other hand, by the typographic method there need (excluding necessary wear and tear) only be the cost of "composing" the types and of "distributing" them into their proper receptacles, from which they may be re-taken many times to form other compositions.

Types: their Material Characteristics.

Exclusive of such printing surfaces as wood-blocks and casts, the Booky letters, marks, and signs with which letterpress printing is executed work are called *types*, a proportioned quantity of each of the letters of fount the alphabet in any one body or face forming a *fount*. A book-work fount contains single letters, diphthongs, ligatures (such as ff, fl), accented letters, figures, fractions, points, reference marks, dashes or metal rules (as —), leaders (as), braces (—), and sigos (as &, £). It also includes quadrats, —pieces of metal of various widths, which do not print, but are used to compensate for the shortness of occasional lines, as at the close of a paragraph—and spaces, which separate words and letters. There are thus about 226 separate characters in every ordinary English book-work fount. The table used by type-founders to regulate the number of each Bill of the several sorts in a fount is called a *bill of type*. The sorts are type, supplied by English type-founders in certain definite proportions, depending upon the number of lower-case m's. A bill of 3000 m's usually contains the following:—

| Lower-case. | Figures, &c. | Capitals. | Small Caps. |
|--------------|-----------------|-----------|---------------|
| a ... 3,000 | ... 4,500 | A ... 700 | A ... 450 |
| m ... 9,000 | ... 800 | B ... 450 | B ... 270 |
| b ... 2,000 | ... 600 | C ... 500 | c ... 350 |
| c ... 4,000 | ... 3,000 | D ... 550 | D ... 350 |
| d ... 5,000 | ... 1,000 | E ... 750 | E ... 450 |
| e ... 14,000 | ? ... 300 | F ... 450 | F ... 300 |
| f ... 3,000 | ! ... 200 | G ... 450 | G ... 270 |
| g ... 2,000 | ' ... 800 | H ... 450 | H ... 300 |
| h ... 6,000 | (... 400 | I ... 900 | I ... 450 |
| i ... 9,000 | [... 200 | J ... 300 | J ... 200 |
| j ... 500 |] ... 250 | K ... 300 | K ... 200 |
| k ... 800 | + ... 100 | L ... 550 | L ... 300 |

| — ... 100 | — ... 30 | .. 50 | — 25 |

Large quads, one-tenth of fount. Italic, one-tenth of Roman.

Such a fount would weigh about 750 lb if of pica size, 480 lb if long primer, 400 lb if bourgeois, 330 lb brevier, 250 lb minion, 220 lb nonpareil. The numbers of the respective letters are based on the requirements of the English language; other languages of course require different proportions. In Latin and French, for instance, q and u would be deficient, h in excess, and w needless. The number of the respective letters may be, and sometimes is, apportioned by weight; for example, in one of the "schemes" of founts

1 There is a tradition in one of the oldest English foundries that this scale originated in a laborious calculation of the comparative number of different letters used in setting up a lengthy debate in the House of Commons, it being supposed then that the purest English was spoken there. The scale is, however, frequently found defective in practice. It is a curious fact, for instance, that the matter of Charles Dickens's works will empty the vowel boxes long before those of the consonants, and that Lord Macaulay's staterial style will run with like persistency on consonants.

used by type-founders a fount of 125 lb Roman with, as its complement, 10 lb Italic, includes 8 oz. of E, M, C; 9 oz. of T; 8 lb of e; 5 lb each of a, h, n, o, t; and so on, down to 3 oz. of z. To estimate the quantity of type required for a page, the number of square inches it contains is measured and divided by 4, the quotient being the approximate weight of the matter in pounds. In small founts, however, 50 per cent. is added, and in large ones 30 to 40 per cent., to allow for the letters generally left in the cases, not being required in the job, and for sorts, &c. These figures, although useful, are only approximative, the proportion of the several ingredients of type-metal used by different founders for the various sizes of type greatly varying the calculation.

Parts of a type.

Each of the parts of a type has a technical name. In the annexed diagram (fig. 1) of the capital letter M the darkest space *a, a*, is called the *face*; and only that part of the type touches the paper in printing. The face is divided into the *stem*, marked 1, which comprises the whole outline of the type M; the *serifs*, or the horizontal lines marked 2, which complete the outline of the letter; the *beard*, consisting of the bevel or sloping part marked *b, b*, and the *shoulder* or flat portion below *b*. The shank is the entire body of the letter, *d*, the front part (that shown) being known as the *belly* and the corresponding part behind as the *back*. The spaces at *h* and *h* are the *counters*, which regulate the distances apart of the stems in a line of type. The hollow groove extending across the shank at *e, e* is the *nick*, which enables the workman to recognize the direction of the type and to distinguish different founts of the same body. The absence of this simple expedient would retard the operation of composing types by fully one-half. The earliest type-founders did not know the use of the nick. In some letters, such as *j* and *f*, a part of the face overhangs the shank; this is called the *kern*. The groove *g* divides the bottom of the type into two parts called the *feet*. An impression from that part of a type on which it stands would be as . Types must be perfectly rectangular, the minutest deviation rendering them useless. Any roughness at the sides is called *burr*, and any injury to their faces a *batter*. Smoothness, sharpness of angle, and perfection of finish are also prime requirements. A line of types, when viewed along the back, presents the appearance of a solid bar of metal.

FIG. 1.—Finished type.

Species of letter.

Types which have the face cast in the middle of the shank, as *a, c, e, m, &c.*, and thus leave an open space above them corresponding to that below, caused by the beard, are known as *short letters*. Those whose stem extends to the top of the shank, as *b, d, f, &c.*, are called *ascending letters*. Those that have a stem extending over the shoulder, as *g, p, &c.*, are called *descending letters*. Those that are both ascending and descending, and extend over the whole of the shank, as *Q* and *j*, are *long letters*. Small letters and figures cast upon the upper part of the shank, as *1^a*, are called *superiors*; those very low down on the shank are *inferiors*, as *H₃*. Types that are very heavy and massive in appearance are called *fat-faced*; those that are fine and delicate, *lean-faced*. A type whose face is not in proportion to the depth of the shank (e.g., a small pica cast on a pica body) is a *bastard type*.

Specimens of principal bodies.

Types are of various sizes, ranging from those used in printing pocket Bibles to those for large placards. The variation is confined to the superficial dimensions of their ends, or *bodies*, as they are called. Each body has a distinctive name. The following are specimens of the principal bodies of ordinary types, and show the relation of the various bodies one to another—

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Canon—17½ lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Double great primer—25½ lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Double English—32 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Double Pica—41½ lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Great primer—51½ lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

English—64 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Pica—71½ lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Small pica—83 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Long primer—89 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Bourgeois—102½ lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Brevier—111 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Minion—122 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Emerald—138 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Nonpareil—143 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Ruby—166 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Pearl—178 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Diamond—207 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Gem—222 lines to the foot.

Printing has been defined to be the act, art, or practice of impressing letters, characters, or figures on paper, cloth, or other material.

Brilliant—239 lines to the foot.

It is a confusing and inconvenient anomaly that the types made Size of by different English founders vary in size, although they bear the types. same name. The above figures refer to the types of Messrs Miller and Richard, the royal type-founders for Scotland; but other eminent makers supply, for instance, long primer which is 89½, 90, or 92 lines to the foot. This has been remedied in America by an agreement on the part of the founders to adopt one standard pica, to divide that pica into a certain number of equal parts, and to cast all their types as multiples of one of these parts. They divide the pica into twelve points, and the point is the unit upon which the system is based. There is also another practical advantage in this multiple system: each type bears a simple proportion to the others, and therefore can be used in exact combination. Thus pearl is 5, nonpareil 6, minion 7, brevier 8, bourgeois 9, long primer 10, small pica 11, and pica 12 points. In Germany, France, and other countries of the Continent a uniform system of points has been adopted, based on a scale of 133 "Ciceros" (corpus 12) to 60 centimetres. The types which most nearly correspond to those already mentioned are:—

| | Point | Size in | Point | Size in |
|---------------|--------|---------|------------|--------------|
| | Emis | Centi- | Emis | Centi- |
| | Foot. | metre. | Foot. | metre. |
| Perl 5 | 162.15 | .1879 | Borgis 9 | .90.08 .3683 |
| Nonpareille 6 | 135.12 | .2856 | Garmond 10 | .81.07 .3759 |
| Colonel 7 | 115.83 | .2632 | Cicero 12 | .67.56 .4511 |
| Petit 8 | 101.34 | .3008 | | |

The number of lines given to the foot in the above specimens of bodies is the theoretic and practically the only approximate standard. The height of types varies slightly with different founders, the mean being 3/16 in. The old Scotch height is about 1/16 in. higher. Types lower than the ordinary dimension are said to be *low to paper*, and if surrounded by higher types will not give a perfect impression. Spaces and quadrats were formerly only three-fourths of an inch in height; but, since electrotyping has become so common, they are almost invariably cut high, i.e., up to the shoulder of the type. Six lines of pica and twelve lines of nonpareil each cover an inch in depth. It is, however, not possible to know the size of a type in a printed page by placing a rule measure upon it, as many books are not set solid: the lines are not close together, but leaded out with pieces of lead, to make them cover a larger space. A communication of great importance contributed to a newspaper may be set up in the same type as the leading article; but if not leaded it will appear to the non-technical reader to be in a smaller character.

The width of pages or columns, in the technical language of the printing office, is expressed according to the number of "ems"—

that is, of a pica m,—the square of the depth of pica. As the letter is one-sixth of an inch, the em is the same width, and a page of twenty-four ems wide is equal to one 4 inches wide. The columns of this *Encyclopædia* are 19 ems wide.

Varieties of face.

According to the purpose for which they are used, types are divided into two classes—book type, including Roman and Italic, and job type, including a multitude of fanciful forms of letters, chiefly founded on the shape of the Roman and Italic letters, and intended to be more prominent, delicate, elegant, &c. It is impossible to enumerate all the varieties of the latter class, as additions are being constantly made and once popular styles always going out of fashion. The leading varieties are the antiques, which are Roman letters with strokes of nearly uniform thickness, as M; sanserifs or grotesques, which have no serifs, as M; blacks, as ff; and serifs, which represent the modern cursive or Italian handwriting, as M. Black letter is now only a jobbing type in English-speaking countries, although, as stated in the historical section of this article, it was the first character used in printing. It is still used in Germany, with certain modifications, as the principal text-letter for books and newspapers. A comparison of the numerous reproductions that have been issued of Caxton's works with any modern line of black letter will show how greatly the form and style have been altered within a period of four centuries. The present style of Roman type dates only from about the first quarter of the 18th century. Previously the approved shape was as follows:—

Printing has been defined to be the act, art, or

The use of this type was revived by Whittingham of the Chiswick Press about 1843, and it has since become a favourite form, under the name of old style. Some of the punches cut by the first notable English type-founder, William Caslon (1692-1766), have been preserved and types are being constantly cast from them. Nearly all founders now produce modernized old style. For the recent revival of old style printing, see p. 710 below.

Large letters, such as are employed for large bills and posters, are made of wood, chiefly rock maple, sycamore, pine, and lime. These are cut up, planed to the required size, and then engraved, generally by special machinery, this being a business quite distinct from that of letter-founding. The larger letters are designated as two line, three line, four line, &c.,—meaning twice, thrice, or four times the depth of face of pica or great primer, &c.

Type metal.

Type metal is an alloy, of which lead is the principal ingredient; but, owing to its softness, antimony and tin are added (see vol. ii. p. 129 and vol. xiv. p. 378). A patent type metal (Besley's) was invented in 1855 in which the mixture consisted of lead, regulus of antimony, tin, nickel, copper, and bismuth. Nearly all type is now made with some of these metals superadded. Ductility, hardness, and toughness are the prime requisites of a type metal.

Making of types.

The earliest printers made their own types, and the books printed from them can now be distinguished with almost as much certainty as handwriting can be identified. The modern printer has recourse to the type-founder. The first step in the making of type is cutting the letter on the end of a piece of fine steel, forming the punch (see fig. 2), which is afterwards hardened. This is an operation requiring great care and nicety (there being comparatively few adepts at it), in order that the various sorts in a fount may be exactly uniform in width, height, and general proportions to each other. A separate punch is required for each character in every fount of type, and the making of them is the most expensive branch of type-founding. During the process of its manufacture the punch is frequently tested or measured by delicate gauges to insure its accuracy. When finished it is held over a light, the flame of which blackens the letter, and thus enables an impression, called a *smoke proof*, to be stamped on paper. When the letter is perfect, it is driven into a piece of polished copper, called the *drive* or *strike* (fig. 3). This passes to the justifier, who makes the width and depth of the faces uniform throughout the fount. They must then be made to line exactly with each other. When completed, the strike becomes the matrix (fig. 4), wherein the face of the type is made. This method of making a matrix has until now been in almost universal use in Great Britain. It is, however, a very slow and costly process. In America the great majority of matrices are made otherwise. If the design of the fount to be produced is original, it is often cut by hand or by an engraving-machine on the piece of metal which is to form the matrix. If, on the other hand, an existing fount has to be copied, the matrix is made by electro-deposition.

FIG. 2.—Punch. FIG. 3.—Drive. FIG. 4.—Matrix.

A perfectly good type is selected, and inserted in a mould specially made, called a *fusible mould* (fig. 5). Sufficient metal of a more fusible nature than the type is cast round it, and forms a shape similar to that of the ordinary matrix. This fusible cast is then placed in a box protected by glass and gutta-percha, in order that the copper deposit may be kept square and to the proper dimensions. This arrangement also limits the deposition to the face. The box is immersed in the copper electrotyping solution, in which it may be left until the deposit of metal has increased to a thickness at which it may be backed up with copper, or it is left until it reaches the full thickness, which is about $\frac{1}{8}$ of an inch. It is then fitted in line, set, position, and height. The minutest imperfection or blemish is reproduced by the deposition, and the type cast from such a matrix is a perfect counterpart of the original. A school of type-engravers has recently sprung up in the United States, cutting exclusively on metal and producing ornamentation and finish which the punch-cutters cannot rival. It is expected that in the course of time the electrotype matrix will nearly supersede that made in the old-fashioned way with the punch. In the ordinary method the mould in which the body of the type is formed is made of hardened steel in two parts; one part is fastened to the machine and is stationary, while the other is movable so that it may be adjusted for the proper width of the letters, as one is wider than another. The combined matrix and mould are then adjusted to the type-casting machine, which manufactures types at the rate of from 25 to about 120 per minute, according to the body. The metal is kept fluid by a little furnace underneath and is injected into the mould by a pump, the spout of which is in front of the metal pot. The mould is movable, and at every revolution of the wheel it comes up to the spout, receives a charge of metal, and flies back with a fully formed type in its bosom; when the upper half of the mould is lifted, a type is ejected. The spring in front holds the copper matrix in close proximity to the mould. The letter a, for instance, stamped in the matrix is directly opposite the aperture in the mould which meets the spout of the pump. When a due proportion of a's are cast, another matrix with b stamped on it takes its place, and so on throughout the whole fount. The types, however, are not finished when they leave the machine. There will be found attached to each a wedge-shaped *jet* (fig. 6), somewhat similar to that on a bullet cast in a hand-mould. These are picked off by boys at the rate of from 2000 to 6000 per hour. A burr which still adheres to the shoulder of the type is taken off by the rubbers, who rub the sides on circular stones or on files. The types afterwards go to the setters, who arrange them in long lines ready for the dresser, and he slips them into a long stick, turns them on their face, and, after duly fastening them, cuts with a plane a groove in the bottom, which forms the feet. (These processes are now frequently performed by a machine, which produces types that do not require rubbing or dressing.) The types are then dressed and the picker takes them in hand, in order to pick out each defective letter with the aid of a magnifying glass. They are finally made up into parcels of a convenient size, called *type-founders' pages*, weighing about 3 lb each.

FIG. 5.—Mould.

Subjoined is a description of a machine for performing automatically the various operations of casting and finishing type which was invented about twenty years ago by Messrs J. R. Johnson and J. S. Atkinson. In this apparatus the metal is fused, injected into and the mould, the cast letter turned out, rubbed or planed, first on one side and then on the other, the feet cut out and smoothed, the dressed sides planed alternately, and the finished letter set up on a stick ready for use by the printer. The casting machine and the dressing machine are in reality distinct, though mounted on a common frame. The whole is driven by a steam-engine or other prime mover. The casting machine consists of a furnace covered by a shallow pot holding the fused metal. In this is a pump, and the mould is placed opposite its nozzle. The mould being adjusted and the matrix in its place, the molten metal is injected and then solidifies, forming a perfect type, but with jet attached. This letter is then thrust out, and the mould closes again for another jet of molten metal. All this is effected by one revolution of the axle of the machine. The letters pass through a channel one by one into the dressing machine. On arriving there they have each of their sides planed in succession by being held against cutters. When one side is made true with respect to the set of the letter on

FIG. 6. Type with jet.

Automatic type-casting machine.

its face, it is passed over a second cutter, which planes the second side absolutely parallel to the first. After this the type is carried in a line at right angles to its former course past a series of similar cutters, which plane out the foot, further smooth its surface, and plane each of the two dressed sides in succession; this completes the dressing or finishing of the types, which, continuing on their course, pass upon a composing stick and are ready for the printer. The line of types presents the appearance of a solid bar of metal, so true, flat, and square are the surfaces of the several separate letters. This machine has been considerably improved by Mr P. M. Shanks. The new machine is of simpler construction and its parts are more compact. It does not produce better type, nor work quicker,—the speed in all type machines being regulated by the time required to cool the volume of metal, which, when on the machine, is assisted by having water percolating through the heated parts of the mould. The working of the new machine is more readily grasped by the manipulator, and there is considerable reduction in its cost.

Type-Setting or Composing.

We may now describe the manipulation of the types in the printing office, and for the sake of conciseness reference must be made only to the operations connected with ordinary book-work. These differ in details from the methods in use in the other two departments of the printing business,—news-work and job-work.

Type-case.

The types, received from the foundry in the packages called pages, are placed in shallow trays called *cases*. These contain compartments or *boxes*, each of which is appropriated to some particular *sort* or character. The cases when in use stand on *frames* or sloping desks. The case at the top is the *upper case*, and that below the *lower case*. The former contains ninety-eight equal-sized boxes, appropriated principally to the capital and small capital letters; the latter has fifty-three boxes of various sizes, appropriated to the lower-case sorts. The difference in the size of the boxes corresponds to the difference of quantity of letters in a fount, as already stated,—the lower-case e for instance having the largest box. The localization of the letters, &c., is a subject on which opinions differ, the object being to bring the letters most frequently required nearest to the hand of the compositor as he stands at work. As a man picks out from the boxes seldom less than 1500 letters per hour and distributes or replaces on the average about 5000 per hour, it is necessary that the most economical allocation of the boxes should be adopted. The system of allocating the various types is called the *lay* of the case; fig. 7 illustrates the plan used in the principal English book offices; but there are many deviations.

FIG. 7.—Type-case.

The types when taken from the cases are arranged in lines or "composed" in an instrument called a *composing stick*, made of iron, brass, or gun metal. The slide in the middle is movable so as to accommodate varying lengths of lines. In the composing room the frames are arranged in rows, supporting the cases. The compositor fixes the "copy," or document which he is to repeat in type, in a convenient place before his eye, and on some part of the case that is seldom used. In his left hand he holds the composing stick, and with the thumb and first finger of the right hand lifts the letters from the boxes, and arranges them in the composing stick, every letter, point, or sign being picked out separately. In this operation he is much assisted by the use of a *setting-rule*, a thin brass or steel plate which, being removed as successive lines are completed, keeps the type in place. When so many words and parts of words as will nearly fill the line have been composed, it is made the exact length required by inserting or diminishing the space between the several words. This is called *justifying* the line and is effected by means of the spaces already mentioned. If the work is not "solid"—that is, if the lines are not close together—the strips of metal called *leads* are used. They vary in thickness, but always form aliquot parts of pica body. A good compositor must possess intelligence and a reasonable amount of general knowledge: he must be able to read his copy with readiness, and to understand its meaning, in order to punctuate it properly. He should be able to spell correctly, as some copy is almost undecipherable in regard to separate letters, while other copy is incorrectly spelt. When the composing stick is filled, the type is lifted on to a *galley*, a shallow tray of wood or metal, two or three sides of which are flanged, for the purpose of supporting the type, when the

Composing.

galley is slightly inclined. Stickful after stickful of type is placed on the galley until it is full. The matter is then fastened up, a proof taken at the proof press, and the work of the *reader* or *corrector* of the press—described below—begins. The proof, marked with the necessary corrections, is given back to the compositor, in order that he may make the required alterations in the type.

The type, being duly corrected, is made up into pages of the *Imposing* required length (unless the author has desired to see proof in *ing* slip). It is then *imposed*, that is, the pages are arranged in such a manner that, when printed and the sheet folded, they will fall in due numerical sequence. The impression from any arrangement of pages will be the reverse of that in which they are laid down. If an ordinary four-page newspaper supplement be opened and spread out with the first page uppermost, it will be found that on this side the order of pages is 4, 1; when turned the pages are 2, 3. The type pages must be ranged in the reverse way, as 1, 4; 3, 2. Thus the fourth page is placed alongside the first, because both must be printed together on the outside; the third page is to the left, and the second to the right, because in books the odd page—the *verso*—is always to the right. For a quarto a sheet of paper is folded twice, that is once across its breadth and then once in a perpendicular direction down the middle. It contains four leaves, and if these are printed on both sides eight pages. The two sides of a sheet are called the outer and inner forms respectively. A sheet of octavo is folded three times, making 8 leaves or 16 pages. The size of a book depends, not only upon the number of times the sheet has been folded, and described accordingly as 4to, 8vo, 12mo, &c., but upon the size of the sheets. The dimensions of the papers commonly used in book-printing are:—imperial, 22×30 inches; super royal, 20½×27½; royal, 20×25; medium, 19×24; demy, 17½×22½; double crown, 20×30; double foolscap, 17×27; post, 15½×19½. Hence to say that a book is a quarto merely gives no precise indication of its dimensions, as a quarto of one size of paper may be smaller than an octavo of another; it is also necessary to know the size of the sheets of which it is composed.

When a printed book is opened, it will be found that at the foot *Signatures* of certain pages there is usually a letter and at the foot of another *tures* a letter and a figure, as B, B2; further on another letter and another letter and figure. On going through the book it will be seen that the letters are in regular alphabetical order, and occur at regular intervals of eight, twelve, sixteen, &c., pages. These designate the several sheets of which the book is composed and are called *signatures*, so that a sheet may be designated B, and the pages of which it consists are thereby sufficiently indicated. (Occasionally, as in the present work, numbers are used instead of letters.) These signatures assist the binder in folding, as they occupy a certain specified place in each sheet; hence to ascertain if the sheet has been folded properly it is only necessary to examine the position of the signature. The binder also is thus assisted in *gathering* or collating together the sheets of a volume in proper order. Signature A is omitted, because it would be on the title or first page, and would be both unnecessary and unsightly. By old custom J, V, and W are discarded, I and J, U and V being originally used indiscriminately by printers, while W was written UU or VV. When the alphabet is exhausted, a new one is commenced, distinguished by a figure precedent, as 2B, 2C, &c.

The pages of types are arranged in proper order on a flat table, *Forme* covered with stone or metal, called the *imposing stone*, and are then ready to be made into a *forme*, that is, in such a state that they can be securely fastened up and moved about. The forme is enclosed in an iron frame or *chase*, subdivided by a cross bar. The portions of the type are separated by *furniture*, which may be of metal or wood or both. It is of the same height as the chase, but lower than the type, and therefore does not print, but forms the margin of the printed pages. At the sides of the two sections of the formes are pieces of furniture of a tapering shape, called *side-sticks*, and at the top and bottom corresponding pieces, called *foot-sticks*. Small wedges, called *quoins*, are inserted and driven forward by a mallet and a *shooting-stick*, so that they gradually exert increasing pressure upon the type. Other mechanical means for locking up are also occasionally adopted. When sufficiently locked up, the whole is quite as firm and portable, however many thousands of pieces of metal it may consist of, as if it were a single plate. In this rapid sketch we purposely omit mention of several operations which, though important and indispensable, are only of interest to the workman.

For many years endeavours have been made to construct *Type-machines* for type-setting which should obviate hand labour, setting them singly in the composing stick is an irksome and monotonous operation, and one which it might be thought comparatively easy to perform by automatic machinery. But of the many different composing machines that have been invented less than half a dozen have stood the test of practical experience. These have been confined to special classes of work, and it is open to doubt whether the nimble fingers of a good compositor, aided by the brains which no machinery can supply, do not favourably compare on the

ground of economy with any possible mechanical arrangement. On the other hand, employers and makers of machines allege that owing to the opposition of the men machine type-setting has not had fair play. However that may be, it is undeniable that a composing machine is still rare in printing offices, and where employed it is only as an auxiliary to the ordinary labour of the men. It deserves to be mentioned that nearly the whole of the *Times*, with the single exception of the advertisements, has for years past been set up by machinery, and that more than 10,000 pages of the present edition of the *Encyclopædia Britannica* have also been so set up. We have not space to describe with any

FIG. 8.—Fraser composing machine.

minuteness the construction of composing machines. In the Fraser machine (fig. 8), one of the simplest of its class, which has been made use of to the extent already mentioned in the present work, the types are contained in a series of grooved trays A, in the upper part of the machine, the trays having previously been filled by complementary apparatus called the distributor. In these trays the types are kept in position, and pressed towards the front part of each tray, by slips of metal attached by cords to the box-wheels B; each of these contains a spring of sufficient strength to press the line of types steadily forward against the separators C, which are formed with an inverted shoulder, under which the front type in each line passes. The keys are connected by levers to the separators, and the depression of any key causes the corresponding separator to descend, carrying with it the front type of the line into the grooved face-plate, down which it slides into the composing stick G. Immediately the finger is lifted from the key the spiral spring D raises the separator to its original position, and the next type in the line takes the place of the one just released, and so in succession as fast as the keys can be pressed. Under the keys runs a rod connected by a crank motion with the pusher G, which, with every depression of a key, pushes forward the line of type in the composing stick, thus making room for the next letter. The matter is thus set in one continuous line, ready to be divided into lines of the required length either by the operator at the machine or by another hand working in conjunction. The speed of the machine varies from 6000 to 12,000 types per hour, but is regulated solely by the skill of the operator, as the machine will work as fast as the keys can be pressed. The composing machines now employed at the *Times* office are an improved form of an apparatus invented by Charles Kastenbein, and introduced there in 1872. The operator sits in front of four rows of keys one above the other, something like the manuals of an organ, but only about 3 feet wide. Each of the keys corresponds to a type or character. The types are kept in tin tubes placed vertically at the top of the machine. The depression of a key works a series of levers, and an iron finger pushes the undermost type from its tube, when it falls into a groove formed in a conducting plate, narrowing at the bottom to its apex. Immediately below is a receptacle, and by the action of a treadle the type is pushed along a channel. Other letters follow, the matter being thus set up in a long line, on a groove of the width of an em quad, and running from left to right. The type when it first comes into the groove is in an upright position, but in passing along it becomes twisted, so that the letters stand at an angle of about 45° when they reach the point at which they are justified. This groove communicates at its dexter extremity with the justifying galley,—a simple apparatus, something of the nature of a composing stick and galley combined. Then the type is divided into portions or lines of the required length and justified in the galley, which is adjustable to the width of the required length. As the long line approaches him, the justifier with a small bodkin accelerates a portion large enough in his judgment to fill the width of his column. When this is done he presses his foot on the treadle under him, and thereby causes the line to be pushed into the galley. The line is justified by spaces and quads, and enough type is then taken for another line. The speed depends on the operator, and varies from 6000 to 13,000 types per hour, the average being about 8000, with two operators,—a justifier and a compositor being also necessary. These machines are worked in the *Times* office at the rate of a column of solid minion an hour. The machine occupies a floor space of only about 4 feet wide by 2 deep.

Another machine at present in use is that of Mr Robert Hattersley of Manchester. It probably furnished the general scheme of others in use. One of the most ingenious machines of the kind is that of Mr Alexander Mackie of Warrington, its general principle being

the adoption of setting up types of the Jacquard card of the power loom, which weaves automatically the most intricate patterns of cloth. The apparatus consists of three parts,—two used for preparing the “card” or ribbon, which directs the third in the operation of type composing. The perforator is like a small cottage pianoforte. When the keys are struck they produce a perforation, and the ribbon is made to move aside a little, so that a new surface may be presented for puncturing. The composer is a circular iron table, 4 feet in diameter, having round its periphery a number of boxes divided into sections, each of which holds one kind of type. On a slightly lower plane is a wheel carrying little brass tables, hinged at one end. When the machine is in motion, the types are pushed out on to the table, which passes with its freight round its course until it comes to the point of delivery, when the types are swept off. The rising of the table, and the drawing out of the types, are guided by the perforated paper. Hence the machine sets types without a human compositor. When once the ribbon is perforated, it may be used over again for subsequent editions of the same work, which may be in a different size of type. These machines are only in use in the office of the inventor.

As has been already described under REPORTING (vol. xx. p. 406), the parliamentary reports of some newspapers are set up entirely without copy,—by the ear, not by the eye. It has been found that by the aid of the machine the matter can be set up half as fast again as it could be written out: the average speed of the composing machine is 230 lines per hour when the copy is dictated to the operator, whereas the most skilful workman setting at ease in the usual way can do but 50 lines per hour.

For many years it was a favourite idea with inventors, especially Logotypes who were not practical printers, that great economy might be gained in composition by the use of word-characters or “logotypes,” instead of single letters. The constant repetition of many words seemed to suggest that they might be cast in one piece. Combinations suitable for affixes and suffixes, as ad-, ac-, in-, -ing, -ment, &c., it was also suggested, should be used instead of the single component letters. The suggestion has, however, not been carried out, at least to any considerable extent. The chief practical objection to it is that it involves the use of cases with an inconveniently large number of boxes. The more the variety of characters is multiplied the more “travel” of the compositor’s hand over the cases is necessary for picking them up, and by so much is the speed of his work retarded. Logotypes, too, are more liable to accident; when one letter is damaged the combination is rendered useless.

The correction of the type is a subject that should be understood by all who have to do with printing, as many mistakes are made on the part of authors which a little technical knowledge would prevent. In the course of setting any copy or MS. which may be given him the compositor unavoidably picks up some wrong letters, or mistakes the words in the copy before him, or fails to follow the style prescribed for the work. These are called *printer’s errors*. When the compositor has finished his task, a first proof of the matter is taken. This proof is read through and compared with the copy by the proof reader or corrector of the press and an assistant, the copy-holder or reading boy. The proof is then sent back to the compositor and the latter is required to correct all the inaccuracies indicated therein—in fact, to attend to all the directions given by the reader—and this has to be done at his own cost if he is working on piece—that is, paid by results according to work done—or by the employer if he is working “on establishment wages” or paid by time. Another proof called a *revise* is now taken; this is carefully compared with the previous proof. If the corrections have not all been made, the revise is marked accordingly, and sent back to the compositor, who is required to remedy the imperfections. When the proof is deemed accurate, or “clean,” it is sent, generally along with the copy, to the author,—being now termed an author’s proof. Finally, in the printing office the matter is carefully re-read and compared with the last author’s proof by the press reader, who signs it and on his responsibility the type is printed off.

The operation of distributing the types is the converse of that of composing: it is de-composing the forme and returning the butting several letters to their proper boxes in the case. It is done, as already mentioned, with remarkable rapidity. The forme is first washed over with an alkaline or other detergent to remove the ink from its surface, and then laid down on the imposing surface, unlocked, and damped; this assists the cohesion of the type, after the chase, furniture, side sticks, &c., are removed. The compositor then takes in his left hand, supported by a setting rule, a portion of type in lines, and with the right hand takes a word or so between the finger and thumb, letting each letter drop separately into its proper box. There is hardly any operation which so strikes a spectator as distributing, for a competent distributor literally showers the types into their receptacles. The types are held upside down, that is, with the nicks uppermost; hence the letters of each word are read from left to right like ordinary matter when printed, but the words are of course dealt with in the inverse order.

Distributing machines of many different kinds have been invented.

Type-distributing machines.

They may be divided into two classes,—those worked entirely by keys or notes, like the pianoforte, and those in which the distributing is to a certain extent done automatically. For the former class only the type in ordinary use in printing offices is required. For the latter the type requires to be specially prepared, each character having a distinctive nick or nicks upon it, which correspond with the particular channel of the machine it is intended to occupy, and by which it is guided to its special compartment. Kastenbein has produced a distributor which may be described as a composing machine reversed. The matter to be decomposed is placed at the top in its appropriate tray or fixed galley, the sides of which are adjustable to fit any measure, the back being so constructed that it may be advanced to keep the matter always up to the front. As the matter is pressed towards the front, the first letter of it is brought to contact with a steel pusher, behind it being an aperture communicating with the channel of the guide plate. The matter is read by the operator; and he touches the key corresponding to the letter that comes first. Thus the types are conveyed one by one to the guide plate or conductor. It has grooves furnished with little gates or switches, like the points of a railway, and these direct the types into their proper channels. The tubes into which the types are deposited are placed at the foot of each groove. Thus every time a key is depressed the switches move, the pusher sends the type to be distributed out of the line, it falls through the aperture, and, passing down the channels in the guide plate, reaches the proper tube. The speed is to a certain extent dependent upon the skill of the operator, but averages between 3500 and 4000 per hour. A good compositor can by hand alone distribute as many letters as this. But for the purposes of the composing machine, hand distributed types would have to be set up again, as the composing machine is supplied not from ordinary cases but from tubes of type. In the Fraser distributing machine (fig. 9) the page of matter to be distributed is placed on the upper part of the machine at H, whence by suitable apparatus it is moved line by line towards the separator J in front. The matter is there read by the operator, and as each letter comes in contact with the separator the corresponding key is pressed and the type is conveyed to the guide plate, where a series of switches guide it to its proper compartment in the tray of the composing machine.

FIG. 9.—Fraser distributing machine.

were composed, mosaic-like, of movable types. Now has succeeded the period of stereotyping, in which pages formed of single blocks—but of metal, not of wood—are used. The two essential parts are, therefore, the making of the matrix and of the cast, which is composed of an alloy something like that for type metal. The mould may be of plaster of Paris or papier-mâché; the latter being the simplest material, and that almost universally used, need alone be here referred to. The following account of the process, when carried out on the smallest possible scale, is sufficient perhaps to show the general principles of the art. The papier-mâché for the mould, called *fong*, is made by uniting several sheets of paper with a paste made of wheaten flour, starch, and alum, to which whiting is added. These ingredients are often varied, the general object in using them is to obtain a paste which will stand a high temperature without burning. A sheet of brown paper is laid down on a smooth surface and pasted over; blotting paper is laid on that and pressed down, then pasted over, and a sheet of tissue paper added, which is also pasted, and another sheet of tissue paper placed on the top. This is well smoothed and pressed to give the incorporated material greater firmness and cohesion. Next, to prepare the forme for being moulded, it is surrounded with metal "clumps" of the height of the type, placed close to the matter, and then oiled to prevent the fong sticking to it. The latter is then thoroughly damped, to render it quite plastic. The forme being on a level surface, the fong is laid upon it, and on that a piece of linen. The surface is next well beaten all over with a long-handled brush, till the fong sinks into all the declivities of the forme and receives a deep impression of it. This is a process requiring experience and practice. The linen being removed, a piece of very stout paper is laid on the top, and also beaten down, so as to strengthen the fong, and the moulding is finished. The next point is to dry the mould.

In the most rudimentary method a combined drying and casting press is used. It consists of a flat iron surface, with a lid attached to one end by hinges. Over the surface is a cross-head fitted with a screw; pressure may be exerted on anything placed between, the arrangement being like that of a screw letter-copying press. The cross-head can be moved to one side when it is necessary for the lid to be lifted up. Underneath the press is a series of gas jets, by means of which the bed plate is heated. The press stands on supports, but is attached to them only by an axle, and it can be readily changed from the horizontal to the vertical position. The lid of the box is raised and the forme with the fong upon it placed on the centre of the iron surface. After being covered with a blanket, the lid is screwed down upon the whole, and the gas being lighted, the forme and mould are heated for a few minutes, after which the lid is raised, the steam evaporates, and the fong, which has now become the matrix, is thoroughly dry. In large stereotyping foundries, after the fong has been well beaten upon the forme, until the impression of the types is plainly seen on the back, it is baked and dried (the forme still underneath) on a long thick iron slab, called a *hot chamber*, because it is heated from within by steam. The matrix is then removed from the forme, and any superfluous margin cut away or trimmed; after this the matrix is dusted with powdered French chalk and is ready for being cast from.¹ A method has lately come into use for obviating the necessity of keeping the matrix on the type while it is being hardened by drying by heat, whereby the type is injured. The matrix is dried separately, being removed when moist from the forme, as soon as the impression is obtained. It is then placed on a bed of sand heated by gas. The forme is never heated, and there is a great saving of time, because the drying can be done in two minutes. The matrix is laid on the bed of the casting box face upwards, with gauges around it to determine the height or thickness of the cast. The lid is put down and screwed tightly, and the position of the press altered from the horizontal to the upright. The metal is then poured in and the press restored to its former position. The matrix is carefully raised and the plate exposed. It has only to be "trimmed," the superfluous metal cut away, and the back planed, to be ready for mounting on a block of wood to make it type high.

In stereotyping for the Walter and similar presses the process is as follows. The forme is laid on the table of the moulding machine and the fong placed on it and thoroughly beaten in by hand or passed through a moulding machine, which performs the same operation. The forme is next placed on a heating surface, press; and when nearly dried the matrix is removed from it and again dried. It is then placed in the casting box, which is curved to the circumference of the cylinder of the press. The box, being on a swivel, is set upright. The metal is now poured in from a ladle and the plate cast. It is allowed to stand a minute and then taken out, still hot, and placed upon a "finishing saddle" of the same circular form as the back of the plate, and secured by clamps and screws. An angular-shaped knife or chisel, fixed in a carriage, is moved by a handle in a semicircular direction across the surface of the plate, in order to remove superfluous portions of metal and to form a bevel whereby the plate can be subsequently

¹ These matrices can be preserved for several years, and the stereotyping process postponed until actually required.

Stereotyping, Electrotyping, &c.

Advantages of stereotyping.

The method of reproducing and multiplying letter-press printing surfaces by taking casts of them, or stereotypes, has greatly contributed to the progress of typography,—much more so, indeed, than might be realized by those who are unacquainted with the practical details of the art. Stereotyping (*στυπέω*, fixed or solid; *τύπος*, type or forme) is the method of taking casts from a fixed or movable forme; thus, printing from stereotypes is distinguished from typography, in which impressions are taken from movable types. It does not supersede type-founding, but supplements it, for a page of reading matter requires first of all to be set up letter by letter, and then the casts or plates are taken, each of which may be printed from with nearly as much perfection as from the original forme. Hence a printing surface may be reproduced to an almost infinite extent, and the means of production of impressions on the press or machine are increased in proportion to the number of casts taken. It ensures an accurate copy of an original text, whereas in reproduction by resetting the movable types there is a liability to deviation. When only a cast is worked from, any accident may be repaired by taking another cast, and the cost is slight compared with that of composing over again. A smaller quantity of type may be used in an office where this process is used; a portion of a work may be set up, a cast taken, and the types returned to the cases. The plates are more easily stored than movable formes, and are not liable to the danger, as in the latter, of types falling out. Above all, the mould may be bent to any curve required, and a circular cast obtained, which may be fastened round the cylinder of a machine (see *infra* in regard to rotary printing).

Process of stereotyping.

The process of stereotyping, divested of merely technical details, is as follows. From a forme of matter, which may be wholly, or in part composed of movable types, a matrix or mould is taken. The original is in relief; the mould consequently is in intaglio. From this the stereo plate is cast, and it of course is again in relief. This in turn may likewise become an original, and casts may be taken from a plate, or other casts from the same mould. The first books were printed from solid wooden blocks, each of which formed a page. Then came the era of typography, in which these pages

clamped on the machine. If necessary the plate may be smoothed at the back by a specially-contrived planing machine. The plate is now ready for being placed on the printing machine. Each single operation can be performed with the utmost possible despatch. If the organization is sufficiently perfect, the time for making a plate, from the moment when the forme comes down from the machine-room to that wherein the perfect plate is set on the machine, need only be about eight minutes.

For news-papers. In newspaper establishments where stereotyping is thus adopted the pages are not all made up simultaneously: some are kept open till the last for the latest telegrams. The moment a page is completed and locked up in its chase it is sent down to the foundry, and as many casts taken as there are printing machines to be set going. One page follows another with rapidity, the first being placed in position on the machine, while the later ones are in the foundry. When all the plates are finished and fixed in their places, six, eight, or ten machines may be simultaneously printing at the rate of nearly 12,000 per hour each. The enormous increase in the circulation of the great daily newspapers would have been impossible but for the extraordinary facilities for rapid production provided by stereotyping. This process is also of special utility to the newspaper printer in the case of telegrams arriving late. In machines which printed from the type, late telegrams could only be inserted by a "stop-press", that is, the printing was interrupted while the alteration was being made. But, when the papier-mâché casts of the pages have been taken, the type itself is liberated and sent back to the composing room, so that, if later news arrives while the machines are running, the foreman printer alters the page, a fresh cast of it is taken, and a machine started without interrupting the production for a moment. The London evening papers have usually five editions, and for every edition fresh casts are made of one or more of the pages.

Celluloid and india-rubber stereotypes. Quite recently the substance called celluloid has been introduced instead of the metal referred to previously. A mould is made of yellow oxide of lead and glycerin formed into a semi-fluid paste, which is applied to the surface of the type. The matrix is placed on a powerful press and a heated sheet of celluloid about $\frac{1}{8}$ of an inch thick is laid on it. When pressure is applied, a perfect facsimile is obtained, and it is ready to be printed from when mounted in the usual way. Whereas a good electrotype from a wood block averages six hours in its production, a cast in celluloid can be got in less than an hour. These blocks are very tough and many thousands more of impressions can be printed from them than from stereotypes without their showing signs of wear. For small stamps india-rubber is used as a stereotyping material, and afterwards vulcanized. These stamps, being flexible, print on rough surfaces which would not take an impression from ordinary stereotypes. With a flexible surface, too, much less pressure is required.

Printing by means of punches. Machines have been invented to do away with the use of types altogether. The principle is to punch the characters successively on some substance which will act like the flong and become a mould from which stereo plates may be cast. In an apparatus recently introduced the flong is a prepared piece of millboard, which is placed in front of the steel punches. The latter are driven into the flong with lightning speed and great accuracy. By turning a handle all the Roman punches are changed to Italic; by another a set of sans-serif or other fonts comes into play. For setting time-tables and logarithms the apparatus is said to save ninety per cent. over the ordinary system of hand-setting. The obstacle to the more general use of it is the difficulty of correcting errors. In another machine the punches are driven into a block of teak wood. They are cast to thicknesses which are the multiple of a "point"; hence by a simple calculation they may be spaced out to the exact number of points chosen for the length of the line, and every line leaves the machine justified. The block when complete is removed and a stereotype taken, which can be printed as in the ordinary method of typography.

Electro-typing. For the reproduction of wood engravings electrotyping has nearly superseded stereotyping, as it produces much better copies. For obtaining plates of type matter it is also better than stereotyping, as many thousands of impressions may be taken without reducing the sharpness of an electro, while ordinary stereotype would be almost worn out by printing a much smaller number. This arises from the superior hardness and toughness of copper, of which the surface of the electro is formed. Electrotyping, however, is costlier and slower.

The forme to be electrotyped is placed upon a level plate, and surrounded with type-high clumps or metal furniture, and then floated with plaster of Paris, which prevents the mould of wax (to be afterwards made) from penetrating too far into the interstices of the spaces. The forme is next brushed with finely powdered blacklead or plumbago. The moulding composition is made of melted wax, with the addition of a little blacklead. This is poured into a shallow metal moulding tray, to which two pieces of stout wire are soldered, in order that it may be afterwards suspended in the depositing trough. After the composition is cooled and set its surface is brushed with blacklead, and it is then ready for moulding.

The moulding press may be something like a letter-copying press, or, in a large establishment, may consist of a powerful hydraulic or other press capable of exercising a pressure of many tons. The forme is placed exactly under the centre of the platen, with the moulding tray containing the wax, slightly warm, upon it. An impression is then taken, and the mould afterwards separated from the forme. The mould has next to go through the process of *building*, that is, heated wax is dropped upon such portions as should be more deeply sunk in the finished electrotype plate, namely, the places where "whites" are to appear in the print. The mould, having been finished, has to be blacklead, plumbago being a conductor of electricity, while wax is a non-conductor. The material is well brushed in, filling all the interstices of the forme; and the entire surface of the mould must be properly covered, to ensure a perfect deposit of the copper. To facilitate this operation, a blackleading machine is used in large establishments. The forme is placed upon a carriage formed of transverse bars and is moved backwards and forwards by a handle and rounce to bring it under the blacklead brush. After the mould is blacklead, the back of the moulding pan is coated with wax, to prevent the copper from being deposited upon it. The mould is now quickly immersed in one of the compartments of the battery. The process of depositing a copper solution upon the blacklead surface of the mould is continued until a solid plate is formed, which, though it is scarcely thicker than a finger nail, being about $\frac{1}{2}$ inch, forms, when properly backed, the best and most enduring surface for letterpress printing that has been discovered.

The moulding tray containing the mould is hung on the brass rod of the depositing trough facing a plate of copper, and the connexion of the battery made. That is, the mould is attached to one pole of the battery and the plate of copper to the other. The copper, so to speak, is decomposed on the one hand and recomposed on the other: in other words, the current of electricity being complete, and the mould submerged in the sulphate of copper solution, the deposition of copper on the mould at once commences. Here it remains until the deposit is sufficient, the time usually occupied being from 8 to 12 hours, according to the state of the solution and the strength of the batteries. The dynamo-electro machine, which is now employed in large houses, very materially reduces this period; otherwise Smee's batteries are generally used. When the deposit, or, as it is called, the *shell*, formed on the wax mould is of proper thickness, it is disengaged from the wax,—the mould being placed with its back on an inclined board, and boiling water poured over the shell, which melts the surface of the wax, except a thin coating, the removal of which is effected by placing the mould and shell on a steam heating table. Thus the wax mould is destroyed, and it is not possible to obtain more than one shell from a mould, whereas the stereotype process enables almost any number of casts to be taken from the same matrix. The shell, being too thin and fragile to be printed from, is next backed, or filled up with metal of a somewhat softer kind than stereo metal. The shell, after being further cleaned, is lowered on to the top of a vessel of molten type metal; and, when the solder previously used to unite the copper and the metal has fused, the latter is poured over it in a molten state until it is covered. The plate is washed, dried, and polished, the back roughly planed to a surface parallel to the front, the edges squared, and all imperfections made good. The thickness of a plate is usually a pica or $\frac{1}{8}$ inch. It is mounted as an ordinary stereotype plate. Within the last few years the process has been greatly facilitated by the employment of specially contrived apparatus, and illustrations can be produced in three hours from the time the mould is made. Curved electros are produced, as well as curved stereotypes, for use in rotary printing. Facing, with nickel by the electroplating process is now largely adopted for hardening stereotypes and electrotypes and rendering them more durable. This process also prevents the deterioration of such plates by the action of the acids or other chemical reagents often present in printing inks, such as cyanide of potassium in red ink and nitric acid in some blue inks.

Poly-typing. Polytyping is a method invented in France about the end of the 18th century, but now seldom practised in the United Kingdom. The apparatus somewhat resembles a pile-driver. It has two upright guides about six feet high, and a pulley at the top, which elevates by means of a rope a heavy plate, on which the matrix is placed in an inverted position. At the foot of the machine there is a substantial iron bed, upon which the operator places some molten metal. He then pulls the rope until the matrix, with its weight attached, is elevated to the top of the machine, when it is suddenly allowed to fall. The result is similar to that made on a medal by means of a die,—a perfect reproduction of the matrix in relief, which is mounted on a metal stand to type height. The results are excellent, as the plastic metal is forced into the finest lines of the matrix. Duplicates of a block can be thus produced more rapidly than by the ordinary stereotype process; and another advantage is that the intaglio parts are much deeper,—a point of some importance in printing. The matrix may be made from the block by the electrotyping process.

Substitutes for Wood-Engraving.

Process blocks. Formerly the only available method of obtaining illustrations which could be printed on the letter-press in conjunction with type was that of wood-engraving. At the present time a number of comparatively new processes are in operation, in which the engraving is done almost automatically by the adoption of chemical processes and the well-known principles of photography. Engravings of this kind are called in the trade *process blocks*, or sometimes *zincotypes*, owing to the metal of which they are formed. There is space here for only the barest possible account of the processes.

Typo-etching. In the first method, which is sometimes called *typo-etching*, the drawing is made with ordinary lithographic ink on stone, or on paper and transferred to stone. It is then re-transferred to a plate of polished zinc by the ordinary lithographic process. Zinc is employed on account of its cheapness and its ready solubility in the acids used for etching. It has properties similar to those of the lithographic stone in taking up the ink and the water. The transfer is made to adhere to the plate by being passed through a lithographic press; the paper is then stripped off; and the whole of the ink is left on the plate, which is inked up as a litho stone with a view to render the lines as solid and strong as possible to resist the acid. The covering of the lines is strengthened by dusting powdered asphalt or some other suitable material over the plate, which is warmed just sufficiently to incorporate the asphalt with the ink. The plate is next placed in a bath of acid (its back and other parts, where the acid is not required to act, being protected by varnish), in order that the unprotected parts, or those which are to form the whites of the finished picture, may be dissolved away. In order to prevent the acid eating not only straight down into the plate but on the sides of the furrows it forms, and thus undermining them, an ingenious device has been adopted. As soon as the etching has proceeded to a very slight depth, the plate is removed from the bath, washed, and heated. The ink and other protective medium are thus melted and run down the sides of the little furrows formed by the acids and thereby protect them from further action. Inking and dusting with resinous material are repeated, and etching resumed, until the depressions of the block have been brought to the proper depth. The etching is carried on in troughs to which a rocking motion is given, so that the acid flows to and fro in waves over the surface, and little bubbles of gas, &c., are carried away. Where large spaces of white occur, the metal is cleared away by a drill; after the block has been mounted type high, it is ready for the printer.

Tone blocks. This process is only available for the production of "line blocks," i.e., those in which the original drawing is done in lines or dots, as for an ordinary woodcut. The highest achievement of process blocks has been the production of *tone blocks*, which may be made direct from oil-paintings, water-colours, photographs, drawings in chalk, wash, pencil, &c., or indeed from anything from which a photographic negative can be taken. The exact nature of the processes is a trade secret, but the rationale is given in Mr Truman Wood's *Modern Methods of Illustrating Books* (London, 1887), to which we are indebted for the following details. The problem is to translate, as it were, the light and shade of the negative into solid outlines of black and white. The shades must be lines of various breadths or of various distances apart, or spots or grain of various degrees of fineness or closeness. In a surface-block any part that touches the paper prints, and any part that does not touch the paper does not leave any mark at all. The photographic image is continuous: there are no outlines in it, the picture being formed of graduated tints or shades, ranging from the white of the paper up to the darkest colour that the process employed can give. To make a block for letter-press printing the graduated tints of the photograph have to be broken up into stipple or grain, and it must be a stipple closest in the shadows, gradually becoming more open through the range of the intermediate tones, and vanishing altogether in the highest lights. To describe the ingenious methods adopted to secure this end would involve an account of several photographic operations which would be out of place here. In one process, perfected by Meisenbach of Munich in 1882, grained negatives are produced by placing a transparent screen, on which a suitable grain is imprinted, in contact with the negative or the positive to be copied, and then photographing the two together. The negative is transferred to a plate of suitable material, which is grained or etched in the usual manner, to form a typographic block. Another device is to print from the original negative upon a piece of silk, the threads of which break up the picture into a regular grain. The positive on the silk is then photographed and a printing block made. These blocks require from their very low relief delicate and careful printing, but are made to give excellent results.

Typo-etching. A process of typographic etching has been invented by Messrs Dawson, in which the design is drawn with an etching needle on a brass plate covered with a wax etching ground, in the same manner as for an ordinary etching. The metal is therefore bared at the lines, which are separated by ridges and spaces of wax. These spaces are

strengthened by the addition of melted wax, which runs up to the edges of the lines, but does not run over on to them as might be expected, filling them up. The supply is continued until the spaces between the lines, representing the whites of the finished print, have been raised to a height sufficient to give the necessary relief, when an electrotype is taken. This electrotype forms the printing surface.

Shanks's process is a device for producing pictures simply by the use of mechanism, and is an application of the eidograph. The process-plate to be drawn upon is moved under the drawing implement, which is a rapidly revolving cutter, and the plate on its carrier is mounted on the end of a series of levers in the same way as the slide rest of a lathe, so as to have motion in two directions, one at right angles to the other, and consequently by a combination of the two to have motion in any direction in the same plane. If a plate of a suitable substance, such as hardened plaster of Paris, be mounted on the carrier, and the bracing point at the other end of the lever be moved over the lines of a drawing, the cutter will plough a little furrow, which will follow these lines. When the plate is finished, a stereotype is taken from it and forms the printing surface. The lines of the casts are remarkably strong owing to the conformation of the furrow of the mould, and they can be printed on fast rotary machines. The weather charts given in some newspapers are produced by this process. A block with the recurring outlines being made, plates are moulded from it, so that the details alone have to be separately cut upon future plates. Mr Shanks's method is remarkably simple and expeditious, and the results are economical and trustworthy.

Press Work and Presses.

The characteristic of printing, as already pointed out, is that the pigment—the ink—with which the printing surface of the type is coated is transferred to the paper or other material by pressure. The manner in which this pressure is exerted gives rise to two classes of machinery,—those in which the platen and the cylinder respectively are employed. After the paper is placed on the type, in the one case a flat plate of iron moves parallel to the forme and comes in contact with it, causing the impression on the paper, while in the other case a cylinder revolves over the surface, which travels in gearing with the cylinder.

Space does not permit of any sketch, however slight, of the origin and progress of type-printing machinery. We can only refer to what may be regarded as representative appliances in present use. In America all kinds of apparatus for printing are called "presses"; in England, however, an appliance of a more automatic character than the hand-press is usually called "a machine." As the hand-press is now almost obsolete, this distinction will probably be abandoned, and the shorter and more expressive word "press" be applied to all. Venturing to adopt this suggestion, we may say that of platen presses there are the hand-press, the treadle platen press, and the steam or other power-driven press.

Fig. 10 is a view of the Albion press. It is wholly of iron and Hand-steel. Although this press is nearly superseded, it is desirable to point out its component parts, as they indicate the general principles on which all typographic machinery is based. The flat plane on which the type is laid is called the *bed* of the press; the other flat plane which moves vertically and presses the paper on the type is the *platen*. These are the two essential parts of the press. The platen is perfectly smooth and level on its under surface, in order to give the whole of the type forme an equable pressure. It is mounted in a strong iron frame, with a cross-piece or head. The platen is propelled by a piston, which moves up and down. The power is gained by bringing an inclined bar of steel perpendicular to the direct line of pressure, and in doing so the piston is forced down. This steel bar is the *chill*, shaped like an elbow. At one end is a bar or handle which, on being pulled towards the operator, straightens the chill or brings it into the vertical position. At the sides are guide-plates fixed into the frame, to preserve the parallelism of the platen, for the slightest vibration or lateral movement would prevent a clear sharp impression being taken. There are appropriate appliances, such as a helical spring, fixed on the head of the press, whereby the platen raises itself when the pressure is not required. In order to bring the forme readily under the platen, and to withdraw it so that it may be inked and the sheet to be printed placed in position, the table is mounted on a carriage, that runs on two rails by turning a handle connected with two endless bands. The paper is fixed to certain marks on the *tymp*an, a kind of metal frame hinged on to the carriage, when it is in a sloping position. This ensures the paper being printed in the exact place required. The *tymp*an, over which calico or parchment is stretched, is double, and contains within it a pad of paper or a piece of blanket, to moderate the force of the impression of the platen. To it is hinged another metal frame, the *frisket*, which is covered with paper, cut to correspond with the shape of the type forme on the press. The ink is applied with a cylinder or *roller*, which revolves in an iron frame, and is

covered about an inch thick with a composition of glue and treacle or of glyceric or other substance. The ink is spread out with a palette knife or similar appliance on a table adjoining the press, and by repeatedly revolving the roller over it, it becomes coated with an extremely thin film of ink. The roller is then moved over the surface of the forme on the press, until sufficient ink has been transferred to it. This is called *rolling*, and is a very important part of press-work, for if inefficiently performed there will be too much ink on

FIG. 10.—Albion press.

the impression, or even blotches, which are called *monks*, or the print will be too pale or grey in places, such imperfections being called *frisks*. The sheet of paper to be printed is next laid on the tympan, to pins serving as guides. The frisket is

folded down on the tympan, which is in turn folded down on the forme with the right hand, while with the left the handle is turned and the press carriage brought under the platen. The bar is pulled by the right hand, the handle turned the reverse way with the left hand, the carriage brought out again, the tympan raised, the frisket opened, and the printed sheet removed, the tympan being ready to receive another white sheet. The frisket serves, among other things, to keep the edges and parts of the sheet not required to be printed from being discoloured by contact with the ink or the sides of the forme, and to aid in steadying the sheet when the tympan is depressed and in the removal of the sheet when it is raised. Such is a bare outline of the method of printing at a hand-press,—one necessarily imperfect from a technical point of view, but sufficient to indicate the essentials of the operation.

Another press which has been much used is the Columbian,—a name given to it by its inventor, Clymer, an American. The power is gained by an ingenious combination of levers. Two of these are connected by a rod with the bar handle, which is in itself a lever. The platen is attached to the head by a strong iron bolt, the descent being made steady and regular by vertical guides. It is counterbalanced by a powerful lever or beam, having an adjustable weight shaped like an eagle, which raises it automatically. In the bar handle is a screw stop by means of which the length of the lever rod can be adjusted and its pressure, or the *pull*, perfectly regulated.

Nine distinct processes have thus to be gone through in order to print one side of a sheet of paper at a hand-press:—(1) inking the roller, (2) inking the forme, (3) laying the sheet on the tympan, (4) folding down the tympan, (5) running in the forme under the platen, (6) taking the impression by depressing the platen, and then immediately afterwards allowing it to raise itself by means of the counterpoise or spring, (7) running out the forme, (8) lifting the tympan and frisket, and (9) removing the sheet. The object of successive improvers of the printing press has been to render the apparatus more automatic, or to substitute for it a "machine" that will reduce these nine operations to the minimum. In modern machines this has been effected to the extent of rendering necessary only three of them—(1) laying on or "feeding" the sheets, (2) applying the motive power, (3) taking off or delivering the sheets; and rotary machines both feed and deliver themselves automatically. Nearly all cylinder machines have a delivery apparatus, and quite recently an appliance for the automatic feeding to them of single sheets of paper has been invented.

With respect to the platen press we notice first that which is capable of being driven by a rotating shaft or wheel. It should be observed that the adoption of the rotatory principle was essential to the acceleration of speed. This was recognized by the projector of the machine¹ press, William Nicholson, and by Frederick Koenig, who first brought the invention into use and constructed a practical

press. The essential arrangements of every machine are four, their respective objects being (1) to feed in the paper, (2) to ink the forme, (3) to print the sheet, and (4) to deliver or take it off.

The treadle platen press is the simplest of machine presses capable of being worked by a wheel. When other motive power is not available it is driven by a treadle, like that of a lathe. The type forme is usually secured by clamps on an almost vertical bed (fig. 11), and the platen rocks backwards and forwards, being thus brought

in contact with the type on the bed. Just before the impression is taken, the two surfaces are momentarily parallel. The inking is effected by small composition rollers, adjusted in a roller carrier swinging on a pivot. The rollers receive ink from a "fountain" or duct of ink at the top of the machine, below which is an arrangement, such as a revolving disk, for distributing the ink. The constant motion of the

FIG. 11.—Minerva press.

rollers and of the revolving ink disk is equivalent to the manual movements of the operator who "rolls" at the hand-press. The rollers are carried by self-acting appliances over the face of the forme, and return to the ink table to be replenished with ink, after which the impression takes place. The sheet to be printed is placed in proper position on the platen, which is covered with paper or parchment, and is secured there during the movement of the platen by movable fingers called *grippers*. The platen on advancing brings the paper in contact with the type forme, after the printing it returns to its original position, when the sheet is removed and another sheet adjusted ready for being printed. The treadle platen press is only adapted for work on paper of small size, up to half sheet demy, but within this limit it is greatly superior to the hand-press. If sufficiently strong and well built, it gives a far more powerful impression, and it occupies about a sixth of the space. Its great merit, however, is its superior speed. The hand-press, when worked by two men, one rolling the types and one pulling the handle of the press, produces only about 250 impressions per hour. The treadle press is worked by a boy, who has only to depress the treadle with his foot, and lay on and take off the sheets with his hands, and he can work at the rate of more than 1000 per hour. The treadle press is also superior to the hand-press in the uniformity of its results, since the automatic inking ensures a greater regularity in the colour of the impressions than with the old hand-inking process.

The ordinary or "double" platen press was, in principle, very similar to the hand-press. It was about 13 feet long. The platen, in the centre, was massive, as the machine printed sheets as large as double demy, and it had a perpendicular motion, being guided in grooves and worked by a connecting rod fixed to a cross beam and crank, which acquired its motion from the main shaft. In other respects the machine differed from the hand-press in having two type beds or coffins and two inking tables arranged at the ends of the carriage, which travelled backwards and forwards, being worked by a drum underneath. The paper to be printed was laid to marks on the frisket, and this was linged on the tympan, which in turn was fastened to the end of the coffin by hinges or joints. The frisket and tympan were opened by running up bars at suitable positions. After a newly printed sheet was removed, another was placed on the frisket, which as the carriage moved ran down the bars and closed on the sheet, which then received its impression. This arrangement was dangerous to the boys who had to lay on the sheets.

Formerly it was thought that the very finest printing could not be done by a cylinder impressing a forme in the progress of its reciprocating motion, for that was liable to slur or blur the impression. Hence platen presses were employed for the best work. Of recent years engineers have brought the cylinder press to such perfection that there is not the slightest danger, under the superintendence of a capable man, of any slur. Working quite as well as the platen press, the cylinder press is enormously quicker and more productive; it requires less driving power; and much better inking is obtained, which is all-important for fine woodcut printing. Accordingly, for even the best illustrated book-work, the platen power-press is now almost entirely superseded by the cylinder.

Cylinder machines are of two kinds,—(1) presses in which the type is on a flat plane and (2) those in which the type, or more correctly the impressing surface, is cylindrical. The first are called *cylinder presses*, the second—a development of the first—the *rotary web presses*.

The simplest kind of mechanical press is called the single-

¹ The best account of its invention is contained in a series of articles by Mr. William Blades in the *Printers' Register*, 1833-34, and Th. Goebel's *Friedrich Koenig und die Erfindung der Schnellpresse* (Stuttgart, 1853). This last has been translated into French by Paul Schmidt, *F. Koenig et l'invention de la Presse Mécanique* (Paris, 1855).

Single-cylinder press.

cylinder or one-sided machine, which has been recently brought to the highest state of perfection by Mr Samuel Bremner. It is generally used for commercial and fine book-work on one side of the paper. There are different varieties of cylinder machines, distinguished by trade-marks or the names of their makers; but the general principles, apart from details, are practically identical. There is a strong cast-iron frame, with bearings to carry the cylinder, which runs across the machine transversely, nearly in the centre. The cylinder revolves by gearing connected with a main shaft, which also works the other moving parts. This shaft is turned by a wheel for hand or steam power. The table for

FIG. 12 — Extra colour Bremner machine, with sheet-flyers.

carrying the type is also provided with a flat inking board of wood or iron, used for distributing the ink. It travels backwards and forwards, that is, with a reciprocating motion. At one end of the machine is the *feeding-board*, on which the pile of paper to be printed is placed. The layer-on places each sheet against metal marks, consisting of rectangular pieces of steel or brass mounted on a bar underneath, which rises and falls according as the sheet is being laid to and taken away from them. When placed against these marks, ensuring correct "lay," the sheet is seized by grippers or light metal claws fixed on a bar inside the cylinder. These clutch the sheet and carry it forward round the cylinder, which in its revolution brings it forcibly in contact with the type forme moving forward underneath, when the impression is effected. Immediately after the grippers release their hold, and the sheets are removed singly by an attendant called a *taker off*, or by a mechanical automatic arrangement called a *flyer*, and deposited on the taking-off board. At the end of the machine farthest from the laying-on board is fixed a trough, which contains the ink; it is fitted with the *duct roller* of cast-iron, which revolves by means of a band or ratchet-wheel and pawl. A flat bar or knife with a thin edge is set up against the metal roller lengthways by adjusting screws, which regulate the passage of the ink, and permit a thin film to pass the knife. A composition roller, called a *vibrator*, is fixed underneath, which takes off the ink that has already been deposited on the duct roller and leaves a ridge or strip of it on the inking slab. As the carriage returns, this strip of ink is distributed on the inking table by rollers placed diagonally across the machine. The diagonal position gives them a waving motion; hence they are called *wavers*. The inking of the forme is done by another set of rollers called *inkers*, placed near the impression cylinder. The inking rollers receive their ink from what is distributed on the table and coat the type while it is passing underneath them.

Advantages of single-cylinder machine over hand-presses

Thus the nine operations of the hand press requisite to print one impression are greatly reduced. The bed carrying the type to and fro from the point of impression moves mechanically, superseding the running in and out of the carriage by the rounce and handle of the hand-press. The inking table, although independent, forms part of the type table, and some of the rollers distribute and others ink, this again being done mechanically and without a second operator. The platen and the tympan, as well as the levers by which the impression is given, are in effect combined in the cylinder, which rotates by gearing, the pressure being applied during the motion of the table itself. The laying-on of the sheet

upon the tympan and folding it down on the forme are superseded by the presentation of the paper to the grippers; and the taking-off of the sheet after raising the tympan is superseded by removing it when released by the grippers and laying it on the adjacent table,—both immeasurably easier operations and done much more rapidly. Indeed both laying-on and taking-off may be done automatically, as is explained below. The result is that, while two men are required to print a sheet of book-work on one side of the paper at

the speed of 250 an hour at the hand-press, machines of this class worked by one operator print about 1200 per hour. Even

this comparison does not convey a complete idea of the enormously increased productiveness of the cylinder machine over that of the press. By the latter, the largest sheet practically that could be printed was double demy, 23 x 35 inches, the superficies of which is 805 square inches; single-cylinder machines are now made to print eight sheet double crown, the superficies of which is 4300 square inches. These sheets being afterwards cut up into double crown sheets, the productiveness of the machine to the press would be, per hour, about 5000 to 250.

As already mentioned, a self-acting feeding apparatus has been invented for supplying single sheets to cylinder machines. The pile of paper is laid on a feeding board or table, between gauges. A pneumatic tube takes up one sheet at a time; it is then run down tapes to a point at which india-rubber fingers bring it to the side lay of the machine, and it is printed with perfect accuracy of register. Once started, the machine works automatically, and the services of both layer-on and taker-off are dispensed with.

We may now describe that class of machines by which the paper Perfect is printed on both sides, or perfected, during one passage through the machine. The Applegath and Cowper or ordinary machine presses has two impression cylinders, having a continuous rotary motion towards each other. The frame is necessarily long, usually about 15 feet, and the width of the machine about 5 feet, these dimensions depending upon the size of the sheet to be printed. The table or carriage is double, containing two beds for the two formes of type, to impress the two sides of the paper, and two distributing tables for the ink. At each end is a complete roller apparatus, consisting of duct, duct roller, vibrator, and wavers. Close to the large cylinders on each side are the inking rollers. The table has a reciprocating motion, as to a single-cylinder machine. The distinctive feature is the ingenious manner in which the sheets are printed first on one side and then on the other. This is effected by carrying them over cylinders and drums by means of tapes. The pile of sheets stands on a high table placed at one end. The sheet is fed into the apparatus and led round an entry drum; thence it is carried round the large right-hand impressing cylinder, and underneath this, on the table, which is moving at the same speed as the cylinder, is the inner forme properly inked. The paper thus receives an impression on one side. It is next led up to the right hand drum, which it passes over, the printed side of the sheet being then downwards. Continuing, it is brought under the second or left-hand drum and on to the left-hand impression cylinder, which it passes with the printed side still downwards, or next to the cylinder, exposing the other side to the type of the outer forme on the table underneath. The drums have thus reversed the position of the paper: the side which was outside when passing the first forme is inside when passing the second forme, which accordingly prints the sheet on the opposite or blank side. The sheet is finally run out by the tapes and delivered in the space between the large cylinders, seized by a taking-off boy, and deposited

on a table or taking-off board. This press is known as the *drop-bar perfecting machine*, owing to a peculiarity of the arrangement by which the paper is conveyed into the tapes. In front of the feeding table is a rod or bar of steel, along which are fitted several metal disks or bosses about half an inch thicker than the bar itself. These can be shifted, by means of small screws, to any position along the rod to suit the size of the sheet to be printed.

To this bar is fixed a short arm, with a pulley at the end, which works round a wheel attached to a cam with a dip. Every time the pulley drops into the dip, the bar descends upon the paper, which is laid to marks at the front; and the bar, possessing a rotary motion from the tapes, runs the sheet between a roller

and a small drum on to the inner forme cylinder, as already stated. Other kinds of machines are distinguished as the *web*, having a web or a series of broad tapes which lie on the laying-on board and are fastened to a small drum underneath it. The drum has a series of small cogs, and when it is forced forward it moves the web or tapes in the same direction. The sheet, having been laid to a back mark on the tapes, is propelled between two revolving rollers and thus taken into the machine.

There are several distinct types of perfecting presses in use, but we can only notice one or two. In the Anglo-French machine, which was invented in England but improved in France, grippers are used instead of tapes and

FIG. 13.—Marioni combined perfecting and duplex single-cylinder machine.

the intermediate drums for conveying the sheet from one cylinder to the other. The cylinders are on a level, but alternately rise and fall, allowing the sheet to clear the forme. Quite recently a single-cylinder perfecting press has been invented. The cylinder is double the usual size and has two printing surfaces and a double set of grippers. Two sheets are printed at each revolution, the first being the white paper and the second the partly printed sheet which has immediately preceded it. The sheet is fed in as to an ordinary single side press, printed on one side, taken off, reversed, again gripped, and perfected, when it is automatically delivered on the table.

It has been mentioned that 250 sheets or a *token* per hour, printed on one side only, represent the work of two men at the hand-press. Two youths at a perfecting machine will complete from 1200 to 2000 copies per hour, equal to 4000 impressions on

one side only,—an increase of about sixteenfold. This, however, does not represent the whole of the superiority of these machines. Sheets much larger than double crown (20 x 30 inches) can hardly be worked at a press; the machine perfects a sheet nearly double this size—50 x 40 or four royal, so that the proportionate product of the machine to the press is about as 32 to 1.

Perfecting machines are not so much used for book-work as formerly. The single-cylinder machine has been brought to such perfection, and is so superior in its inking arrangements, that printers prefer it. In America nearly all machines are one-sided. For newspapers of limited circulation, however, the perfecting machine is well adapted. Complete copies of a journal are produced as soon as the machine is started; extra copies can be worked off while news-agents are waiting; and a number of sheets need not be printed off on one side to be completed when a sudden demand arises.

Fig. 13 shows a new form of French perfecting machine for printing book-work, the Marioni com-

FIG. 14.—Walter machine.

—receives successively an impression on each side, after which it is cut up into sheets of the proper size and folded as it is run out, the sheets being deposited on a table ready for removal. As representative of this class of machines we may take the *Walter press*, whose mechanical arrangement is shown in fig. press. 14. The paper to be printed from, a continuous web about 8000 yards in length, is wound on a small roller at P. It is passed over a tension roller, and then over the damping cylinders W, W, and thoroughly wetted on both sides. The damping cylinders are hollow, and contain sponges from which the water is distributed by centrifugal force, the outside of the cylinder being covered with

Rotary press.

combined perfecting and duplex single-cylinder machine. The improvement in this machine over the perfecting two-cylinder machine described above consists in the alteration of some mechanical parts, so that the same machine can be used for printing sheets either on both sides or on one side only. It therefore serves the purpose of two single-cylinder machines or of one perfecting machine, the change from one to the other being very simple. The rotary press differs essentially from the cylinder machine. In the former the printing surface and the impressing surface both rotate continuously, and the paper,—not cut up into single sheets, but carried between the two cylinders in a roll or web, like a ribbon,

blankets. The paper next passes on to the printing cylinders *T, T'*, on which the printing surface—not composed of movable types but of stereo plates—is fixed, and to the impression cylinders *I, I'*. The printing cylinders contain each the plate in curvilinear shape, constituting the forme for one side of the paper. The web is led between the printing and the impression cylinders, as shown by the dotted line. After being printed on one side by *T*, it travels round *I* and receives an impression on the other side from *T'*, thus being "perfected." It then passes on to the cutting cylinders *K, K'*, one of which has a serrated knife, which enters the paper, and on the application of tension divides the web, causing the peculiar saw like edge seen in copies of journals printed on rotary machines. The paper is next carried in over tapes to the point where the complete severance takes place. Soon after they encounter a pendulous frame, which delivers them in two piles on to the tables *x, z*, whence they are removed. There is an ink supply trough *a*, which is connected with the distributing rollers by a revolving metal roller *b*. The distributing rollers of metal are marked *f, g, h, i*, and the rollers which ink the forme, made of the ordinary composition, are marked *k, k*.

The average rate of speed of the Walter press is 12,000 per hour, the sheets being printed on both sides. In this apparatus everything is automatic: there is self-feeding and self-delivery, the web of paper at one end being transformed into properly printed single sheets at the other. The machine requires only one man to superintend its general working, including the replacing of the web when printed and the removal of the successive piles of sheets. In respect of speed, if the perfecting machine is to the hand press as 32 to 1, the rotary will be to the hand press as 96 to 1. The Walter press, requiring a space of only about 14 feet by 5, is not more remarkable for its speed and economy than for its simplicity of construction and its compactness. And the same remark applies to several other machines, such as the Victory, the Hoe, and the Prestonian, which have since come into use. Their general appearance is that of a collection of small cylinders or rollers, through which the paper seems to fly at railway speed, issuing forth in two descending torrents of sheets accurately cut into lengths. Without such machinery the prodigious issues of some of the morning journals would not be possible. One daily paper averages a circulation of more than a quarter of a million. This enormous number of sheets are printed in about four hours, owing to the type matter being stereotyped and placed on several presses.

Printing from webs of paper.

Printing from webs of paper instead of single sheets will probably be adopted in the future for all newspapers and even books of large circulation. Hand-feeding is limited by the ability of the operator to lay the sheets on the feeding board with the necessary accuracy. One chief obstacle to the more general adoption of rotary printing is the expense of stereotyping the type formes. Although a machine has been constructed in which movable types can be placed round the periphery of an impressing cylinder, it cannot compete with the Walter and other presses using stereo plates. The problem of printing directly from flat formes of ordinary types, as well as from stereotypes, with paper supplied in the roll, is one that may be commended to engineers. The saving in stereotyping in many cases would be very considerable, but, even where this is not an object, the readiness and ease with which the type could be manipulated would ensure for such an apparatus admission into offices where the large rotaries of the present day are inadmissible. It would also enable illustrated journals to be printed from the web. The pictures introduced into some of our daily journals are very rude when compared with those in periodicals printed on flat-bed machines. This is owing partly to the distortion that arises when the cast from a flat block is accommodated to a curved surface, partly to the fact that stereotyping does not give the fine and delicate reproduction that electrotyping supplies, and partly to the imperfect inking powers of the machines. Quite recently a plan has been patented whereby curved electrotypes of pictures can be fastened to blank or depressed portions of an ordinary curved stereo plate; but the method is not always practicable. With a flat-bed machine the forme to be printed from might be of a composite kind,—partly movable types, partly stereotype, and partly electrotype. One difficulty of constructing a web printing machine with a flat bed is that of turning the sheet so that it may be printed almost simultaneously on both sides. It would have to be reversed by the continued rotary movement of the cylinder. This, however, is quite within the limits of practicability, and experiments are now being made to devise a machine with this feature.

Roller composition. For about three centuries after the invention of printing the formes were inked by leather balls. When machine presses were introduced, their earliest inventor tried to use cylinders covered with leather; but the plan was most unsatisfactory, until a subsequent inventor adopted a composition of glue and treacle, which was cast into cylinders having an inner "stock" of metal or wood. For about half a century this composition was used exclusively for both hand and machine presses. Since then glycerina has been introduced for roller making. Hansard's recipe, in use when the 4th edition of the present work was issued, was—glue 4 parts,

treacle 12 parts, Paris white 1 part. But a much better composition is now formed of glue 10 parts, sugar 10 parts, and glycerin 12 parts. The glycerin has the property of always keeping the roller moist and soft, while the tendency of glue and treacle is to dry and harden. A glycerin roller lasts much longer than one of glue and treacle.

Printing ink has peculiar qualities. It is required to change from the soft adhesive state in which it is applied to the type to that of a perfectly hard and dry substance after being transferred to the printing ink. This change of condition must be under control, and when air is excluded the ink should keep in good order any length of time. During its application to the type its solidification should be as slow as possible, and unaccompanied by the emission of any unpleasant or deleterious odour. It ought not to affect the rollers, and, having been applied to the paper, its action should be confined to a very slight penetration, just sufficient to prevent its detachment without injuring the surface of the paper. It must dry into a hard, inodorous, and unalterable solid. The ingredients of ink are burnt linseed or other oil, resin, and occasionally soap, with various colouring matters; that for black ink is usually lamp black, but charcoal and other cheaper materials are occasionally introduced. Ink is removed from types and blocks by detergents, such as potash and pearl ash; benzine is also well adapted for the purpose.

Colour Printing

The apparatus previously described is intended for monochrome printing, whatever be the shade of the ink. When two colours or more have to be printed in one composition, there must be a separate type forme or separate engraving, and a separate printing, for each. Many attempts have been made to print several colours simultaneously by dividing the trough or manipulating the rollers. All these have been more or less unsuccessful, with the exception of a press invented by Mr W. Cousins, which prints from type formes in two colours. In construction it is somewhat similar to the ordinary single-cylinder machine, but is provided with two sets of inking apparatus, including ductors, wipers, and inkers, each of which acts totally independent of the rest. The cylinder is placed in the centre of the machine and makes two continuous revolutions, giving an impression for each colour. There are two type formes, each containing only the lines to be worked in one of the colours. These are in two beds adjoining one another, and the circumference of the cylinder being equal to the length of one bed, one colour is printed by the first revolution and the other by the second. The sheet is thus printed twice without being released from the grippers, whereby perfect register is ensured. The speed is slow, averaging 300 to 400 complete impressions per hour.

The method by which the beautiful coloured supplements issued occasionally with illustrated newspapers are printed may be slightly referred to. A copy of the artist's painting is first of all made, on a scale regulated by the size of the reproduction. This being supplied to the engraver, an outline or key block is made and proofs pulled. It is now necessary to determine the tones of colour to be used,—a process demanding great experience. The key block will, if printed first, afford a guide for the registration of the subsequent printings; sometimes, however, that is reserved for a later stage. The colours on which the subsequent printings are done must be of a transparent nature. The blocks are sometimes produced by the typographic etching process, which gives a softness, delicacy, and variety unattainable by the graver. The blending of the colours is the most delicate task the printer has to undertake. A large picture is often printed in ten or more workings, some of them in their turn intensifying and bringing previous colour workings into stronger relief, others giving shape and form to the picture. Almost to the end of the process, however, the picture will want vitality, its outlines will be hard and bare, or vague and undefined, according to the sequence of the colours. Another working may give grey tones where wanted, and may increase the depth and transparency of various parts. A deep flesh working may have a marked effect on the development, and, near the close of the series, if the entire colouring is found to be too warm, it may be corrected by overprinting very nearly the whole subject. Chromo-typography has undoubtedly made great strides during the past twenty years, its best results being shown in the coloured prints for illustrated journals. For the production of pictures for commercial and artistic purposes chromo-lithography is generally resorted to on account of its relative economy. In lithography for typographic purposes the line has to be cut and the space on both sides removed so as to leave the line alone to be charged with the ink, or the white space has to be etched away with an acid. The printing of isolated points too is easily effected from a stone, whereas most minute labour is necessary to engrave them. Typographic etching has here, however, been of great assistance. The differences of printing surface caused by the colours are met and overcome by the lithographic stone with great facility, even when the spaces are largest and most uneven; it is quite the contrary in regard to typography, wherein the work has to be charged with ink to a greater extent according to its size, and the quantity

of ink requisite varies with the fineness of the strokes and of their distance apart. Owing to this we see in most letter-press polychromatic prints a deficiency of transparency, of half-tints, of depth of ground, and of general harmony. Even if it were possible to make chromo-typography as easy as chromo-lithography, there would still be the obstacle of its very much greater cost, owing to the expense of the engraving and of the casts from the key block. In chromo-lithography the designer can repeat the designs for the different stones by a process that costs almost nothing. Also in the process of multiplying the blocks the deviation in the register of the successive colours is practically unavoidable. In lithography the surface to be printed is nearly level; hence the sheet is not shifted and twisted or stretched in places, as it is in typography, owing to the alternate closeness and absence of contact between the sheets and the raised and depressed surface of the block. Whatever success the letter-press method has attained of late is owing to the invention of electrotyping and process blocks, and to the improvement of machinery. For to print these pictures enormous strength and rigidity, and the most perfect arrangements for securing register, are absolutely essential.

Recent Changes

Progress in printing. We will now give a cursory glance at the changes that have been effected during the last twenty-five years in the processes and the products of the art of printing. That these have been of a most drastic kind may be gathered from a comparison of the appliances figured and described in the 5th or the previous editions of the *Encyclopædia Britannica* with those referred to above. The hand press has been almost completely superseded by the machine press. Cylindrical impression has displaced platen impression, and the finest book-work and woodcut work are done on a cylinder press. In book-work, indeed, other significant changes have taken place. Whereas formerly it was deemed essential that the paper should be damped before printing, in order to get a delicate and perfect impression, some of the finest books and periodicals are now printed on dry paper, highly calendered, even the illustrated journals and some of the evening papers being so worked. Then, it was thought necessary for the safety of the type to interpose a thick soft blanket between it and the pressing surface, whether cylinder or platen; now, it is found equally safe, and far more conducive to a good impression, to make the packing as thin and hard as possible. Then, fine woodcuts were "brought up" by the use of many "overlays" and "underlays" to correct inequalities in the surface of the blocks and emphasize some of the parts; now, although the art of "making ready" has been brought to great perfection, the fewer and thinner the overlays employed the better. And it may not be irrelevant to point out that the printing of woodcuts has improved in the same degree as the engraving of them.

Improvements in newspaper printing. Perhaps, however, the most remarkable change is that made in newspaper printing. The highest achievement mentioned in the article "Printing" in the 8th edition of this work was the six-cylinder Hoe machine. The makers of that apparatus subsequently contrived machines of eight and ten cylinders. But they have now been wholly superseded by the rotary presses on the Walter principle. The hand feeding-in of single sheets is entirely done away with, and all newspapers of considerable circulation are printed from long reels of paper, uncut, as originally made at the paper-mill. The maximum number of copies which a machine of this class would print with ten feeding attendants and four taking away attendants would be 8000 an hour. For folding the 8000 printed copies five folding machines and at least two attendants would be required to keep pace with the printing machines. Thus nineteen men were required to print and fold 8000 copies per hour with the best machines as late as 1870. With a rotary machine doing the same or a larger quantity of work only two men are required. The cost for printing and folding 1000 copies by the Hoe machine was estimated at 1s. 4d., while with the rotary it is only about 2d. Hence the saving of wages to a newspaper issuing 200,000 copies a day on 313 working days would be nearly £3700 in a year. This, in connexion with improvements in paper, or rather the discovery of cheaper materials, bringing the price of "news" down to about 2d. per lb.—one quarter of its price a very few years ago—accounts for much of the enterprise of modern journalism. For some time after the abolition of the paper duty there was a loss on the circulation of a large-sized penny journal, now there is a considerable gain. Lately rotary presses for small jobbing work have been constructed; and before long the rotary principle will probably be rendered available for illustrated periodicals and fine book-work, printed from webs or reels of paper instead of single sheets. Great improvements have also been made in type-founding, and the Roman and Italic founts now used by English printers are equal to those of any country in the world. It is sometimes said that English *éditions de luxe* are not equal to those of the French, and that this is owing to the inferiority of the founders. This is, however, not quite true: some of the best French books are printed from English types or from types cut in the English manner. It is also the fashion to compare modern printed books with those of the Elzevirs

and Baskerville. Yet as a matter of fact their best faces have been reproduced with perfect success by modern founders. From a mechanical point of view the impression given by the best machine presses to-day is undoubtedly superior to that of the hand-presses of the 17th and 18th centuries. If modern books suffer in any respect on comparison with those of former times, which are so highly prized by bibliophiles, it is owing to their want of general artistic ensemble, and not to any deficiency in mechanical execution. The artistic taste of English printers has, however, been greatly raised during the last few years, and a very interesting movement is going on which must produce important results in the future. In 1856 Mr Andrew W. Tuer of London organized the Printers' Specimen Exchange, a scheme intended to promote the technical education of the working printer. Each contributor to the exchange furnishes periodically a certain fixed number of typographical specimens, all alike, which are collated into sets, and again distributed to the members, each of whom gets a volume, consisting of one copy of the work of each of his fellow-contributors. By this plan they become acquainted with the progress made by their brethren, and good taste and good work are fostered and mutually encouraged. The eighth quarto volume, issued in 1887, contains nearly 400 fine specimens of typography by as many different hands. It forms also the best criterion of the character of the jobbing work done at the present day, not only in England but abroad, for the scheme is of an international character. The results of the revival of artistic printing during the last decade are especially noticeable in jobbing work. Much of this improvement is due to the superior material with which the printer is furnished, and especially to the great variety of ornamental types which have been introduced. The specimen books of the principal type-founders are splendid volumes, containing several thousand different faces. The best work of German printers is noteworthy for its studied neatness and attractiveness, tasteful and harmonious arrangement of colour and tint, a characteristic and conscientious attention to details of finish, exact register, and beauty of impression. American work excels in originality of design, brilliancy of colour, and perfect finish. English printers are closely following the best points of each of these schools of typography. There is a distinct leaning at present to the German style, but with little slavish imitation. The distinctness of English typography is maintained, while the beautiful German combination borders, produced with such profusion of late, are judiciously utilized, often in conjunction with American type. In the arrangement of colours English printers prefer the quiet harmonious tints of the Germans to the bold striking contrasts of the Americans.

The vast extent of the operations of the printing fraternity Division at the present day is in remarkable contrast to those of the 15th of century, when the making of books was an art like the sculpture labour of statues or the designing of buildings. Now, printing is a manufacture in which large capital and the greatest division of labour are essential. The old printers were almost entirely independent of other craftsmen. From the casting of the type to the mixing of the ink they did nearly everything for themselves. Gradually the different departments of the art were constituted separate and recognized trades. The type-founder was probably the first to secede from the concern; then printers delegated to others the making of presses; afterwards the ink and the rollers found separate and distinct manufacturers; and there arose a class of persons who, though belonging to other trades, made printing appliances a specialty, such as printers' smiths, printers' joiners, and printers' engineers. Subdivision again has taken place in regard to the operations which chiefly appertain to printing. The same man was formerly able to set up and print off the types, to fold the sheets perhaps, and even to make them up into books. The operative printer has now become either a pressman or a compositor. If he is of the first denomination, he may be classed according as he works at press or machine. If he is a machinist, he may superintend or be a "minder," or he may be a layer-on or a taker-off of the sheets. If he is a minder, he may understand only book machines or only news machines; he may know all about platens and little about cylinders; or of cylinders he may know only one kind. Entirely novel machines create a new class of artisans. There are men perfectly competent to manage a Walter press who are ignorant how to work two-colour or fine book-work machines. In the compositor's department division of labour is carried out to a still minuter degree. An old-fashioned printer would set up indifferently a placard, a title-page, or a book. At the present day we have jobbing hands, book hands, and news hands, the word "hand" suggesting the factory-like nature of the business. There are jobbing hands who confine themselves to posters, and know little about general work even in this department. Book hands comprise those who set up the titles and those who set up the body of the work. Of these latter again, while one man composes, another, the "maker up," arranges the pages. Even the art of fitting up the furniture or "dressing the chase" is given to the "quin-drawer overseer." News hands include advertisement hands and general hands. Some men work by day, others altogether by night; some do general

book-work composition; others set up bead lines. others make up the galleys; others "prove" them.

Old Style Printing.

Old style printing. Within the last few years there has been an interesting revival of the old style of book printing. It owes its origin to Mr Whittingham of the Chiswick Press, who in 1843 was desirous of printing in appropriate type a work of fiction the diction of which was supposed to be that of the reign of Charles II. As the original "old face" matrices of the first Caslon had been preserved, a fount was cast from them, and on getting a proof with good ink, on good paper, from a modern press the impression was found to be far superior to specimens printed from the original fount. Since then the demand for old-faced characters has steadily increased, and all foundry-men now supply imitations of the old types. Comparing the old face and the modern characters, the latter are more regular in size, lining, setting, and colour,—using these words in the technical sense of the founder. They have finer strokes and serifs, and produce in the page a more regular and sparkling general effect. At the same time it may be conceded that legibility has been to a certain extent sacrificed to beauty and general effect. About 1882 an eminent French printer made a number of experiments to ascertain what it is that constitutes legibility in type, and found that people read with less fatigue according as the letters—(a) are rounder, (b) are more equal in thickness, (c) have shorter upstrokes, (d) are dissimilar to each other, and (e) are well proportioned to their own body. Drawings of letters from old books were visible and legible at a distance at which modern letters could not be distinguished. The revival has also brought about the re-introduction of antique head pieces and tail pieces, vignettes, and initial letters, which have been reproduced from old books by photography and typesetting. For this kind of printing white paper has given place to toned, of a straw tint, which is often more agreeable to the eyes than the excessively bleached paper which was hitherto the fashion. Also hand made instead of machine made paper has to a large extent come into vogue. Its characteristic is the "deckle edge", which distinguishes it from the clean cut edge of machine papers, and is highly prized by some bibliophiles. When extreme verisimilitude is required, this kind of printing is done on the blank leaves of real old books some of which have been ruthlessly destroyed for this modern craze. On the whole, however, the revival of old style printing has been beneficial. It has encouraged printers to study the more artistic attributes of the productions of the great printers of the past, and has educated the public taste by presenting them with examples of the best kind of book making.

Printing Establishment

Departments of a print- ingestab- lishment. A large book printing establishment contains many distinct departments, some of which have not been previously referred to and may here be summarily mentioned. The reading department, sometimes called the *closet*, consists of a number of small apartments, each furnished with a desk, a couple of stools, and a shelf for books of reference, and having for its occupants the reader and his reading-boy. There is also the warehouse, where all the printed and unprinted sheets (or "white paper" as it is called, whatever its colour) are stored. Adjacent to this are folding, cutting, hot and cold pressing, drying, and other branches, each employing separate classes of artisans. Another department is the machine-room, where, arranged in long rows with an avenue between, are the various printing machines. The men in this part of the establishment wear cotton vestments, covering all their other apparel, and caps, invariably made of paper, something like clerical birettas. The machine overseer has his box and keeps an account of the produce of each machine. Under him are the persons whose business it is to cut out overlays for the cut or illustrated forms. These men are in their way artists, for to them is attributable much of the beauty and perfection of working of each block that goes through their hands. They have by them three or four priors or "pulls" of the block, and their tools consist of scissors, paste, a sharp knife or two, and perhaps a razor-like blade set in a wooden handle. Their work is to deepen the shadows, raise the lights, lower the edges, and perform a hundred other offices for a block. Standing sentry over each machine is the machine minder, under him are the takers-off and layers-on. The engine room and boiler-house are close by, and higher up may be the hand-press-room,—provided these appliances are used. Here are the pressmen and their apprentices. There is the storekeeper's department, fitted up with shelves, racks, and drawers, for the orderly storage of type and materials. The plate-safe or plate-room is the repository of the stereo and electro plates, each plate being kept wrapped up in paper, with a distinctive index number marked thereon. There are also rooms for casting rollers, stereotyping rooms, drying rooms for paper, hydraulic pressing rooms, sinks for washing forms, and lifts for conveying them

from one department to another. There will possibly be several composing-rooms, such as the *stab*, where all the men are paid on established weekly wages, the piece room, where they are paid by results, and the apprentices' room. There may be rooms where particular jobs are done, especially if weekly periodicals are turned out, and the names of these designate the rooms. At the end of each room is the overseer. It is also a common practice for a Compositors' number of men to form themselves into a kind of business partnership called a *companionship* or *ship*. All the transactions of the partnership may be with his own *clicker*,—the workman who is selected to keep the accounts of the partnership. From him the compositor receives his portion of copy and the necessary directions, and to him he gives the matter when it is composed. At the end of the week he "writes his bill," delivers it to the clicker, and from the latter receives at pay time the wages he has earned. The clicker gets the matter proved or "pulled" by the proof-puller, who usually does nothing else but pull proofs. He will then send the proof with the copy to the overseer, and the overseer sends it to the reading department to be corrected. The proof, when corrected, is returned through the overseer (who retains the copy) to the clicker, and he gives it to the compositor who set it up. When the type is corrected a revise is pulled, which goes through the same hands to the overseer again; and then it is despatched to the author, editor, or publisher. In a well-ordered composing-room strict silence is enjoined upon the workmen. Among the industrial pursuits there is none more monotonous and more exacting, none demanding more patience, sustained industry, and power of endurance than the compositor's art. In a large newspaper office the quantity of types picked up in a few hours is marvellous. No better illustration of this could be given than the fact that several recent issues of the *Times* have consisted of three sheets or twenty-four pages, each page comprising six columns. In one of these issues 84½ of the 144 columns were filled with advertisements, 2559 in number, set in extremely small type; the remaining 59½ columns contained articles, reviews, letters, reports, and paragraphs. The total length of the column aggregate was 264 feet (62 more than the height of the London Monument). If the matter comprised in the paper, instead of being broken up into columns, had been set in one continuous line it would have reached one mile 950 yards. The number of separate types used in printing this issue was calculated at over two millions, and the quantity of printed matter was reckoned to be equivalent to that contained in two octavo volumes of 480 pages each. The literary and mechanical staff of a first-rate London daily newspaper, excluding casual reporters and unattached writers on various subjects, aggregates about 300 persons.

Bibliography.—On the practice of the art and its auxiliary processes, see Southward, *Dictionary of Typography* (3d ed., London, 1875, 8vo); with the *Literary Almanack* by William Blais, and *Practical Printing: a Handbook of the Art of Typography* (3d ed., London, 1887, 2 vols., 8vo). This last is the fullest work on the subject in the English language, embracing composition, press work, stereotyping, and electrotyping, and the warehouse department of a printing office. Gould's *Letterpress Printer* (2d ed., Middlesborough, 1880, 12mo) has a short introduction by Southward, giving a sketch of the origin and progress of the different typographical processes and appliances from the beginning. See also F. J. F. Wilson, *Typographic Printing Machines and Machine Printing* (3d ed., London, 1883, 8vo); *List of Technical Terms relating to Printing Machinery* (London, 1882, 8vo); Noble, *Machine Printing* (London, 1883, 8vo); and Wilson, *Stereotyping and Practice of Colour Printing* (London, 1881, 8vo). This last contains a history of stereotyping and electrotyping by Southward. The best works in French are—*Le Livre, Guide Pratique du Compositeur et de l'Imprimeur* (Paris, 1855-72, 8vo, two parts), includes machine work, stereotyping, and electrotyping; Clave, *Manuel de l'Apprenti Compositeur* (3d ed., 12mo, Paris, 1833); and Monet, *Les Machines et Appareils Typographiques, suivi des Procédés d'Impression* (Paris, 1879, 8vo). The best German work, and one which from its completeness surpasses all others, is Waldow's *Illustrirte Encyclopädie der graphischen Kunst* (Leipzig, 1884 lar. 8vo), containing 2798 articles and 581 illustrations, with a list of German books on typography, &c.

Periodicals.—No trade or interest in the world has, perhaps, so many representatives in the press as printing. The journals which record its progress and describe its products are unrivalled in their excellent mechanical attributes, some equalling the highest class of book-work printing and using paper of the most luxurious description. Their literary character is usually worthy of their mechanical excellence, and they comprise an immense collection of facts and speculations on the subjects involved. They also attract a class of writers who in time become specialists and do the most valuable work in historical investigation. The *Printers' Register* (monthly), contains several valuable contributions of the English printing trade journals, such as "Numismatic Typographic," "Bibliotheca Typographica," "Books and their Enemies," "The Inventor of the Steam Printing Press," and "Early Type Specimen Books." The *Paper and Printing Trades Journal* (quarterly), begun in 1872, is printed in old style fashion, and reproduces in tone as well as in manner some of the best examples of the French and Italian schools in head and tail pieces, vignettes, and ornamental initials. In France appear *L'Imprimerie* (semi-monthly) and the *Bulletin de l'Imprimerie*; in Germany, *Archiv für Buchdrucker-kunst* (monthly) and the *Bulletin de l'Imprimerie*; in Italy *L'Arte della stampa* (monthly) and *Journal für Buchdrucker-kunst* (Chicago) and the *American Bookmaker* (New York). The fullest list of such journals, past and present, is Louis Mohr's *Die periodische Fachpresse der Typographie* (Strasburg, 1879). There is also an extended list, with historical annotations, in Bigmore and Wynman's *Bibliography of Printing*. (J. 80.)

TYR. See *ÆSIR*, vol. i. p. 211.

TYRE, the ancient $\tau\upsilon\rho\varsigma$, Greek $\tau\upsilon\rho\varsigma$, the most famous

of Phœnician cities, is now represented by the petty town of Šūr, with about 5000 inhabitants, built round the har-

four at the north end of a peninsula, which till the time of Alexander's siege was an island. The mole which he constructed to reach the island city has been widened by deposits of sand, so that the ancient island is now connected with the mainland by a tongue of land a quarter of a mile broad. The greatest length of the former island, from north to south, is about $\frac{5}{8}$ of a mile and its area about 142 acres, a small surface for so important a town. The researches of Renan seem to have completely refuted the once popular idea that a great part of the original island has disappeared by natural convulsions, though he believes that the remains of a line of submerged wall at the south end indicate that about 15 acres more were once reclaimed from the sea and have been again lost. Confined to this narrow site—on which, moreover, place was found for the great temple of Melkarth with its courts and for all the necessities of a vast trade, for docks and warehouses, and for the great purple factories which in the Roman time were the chief source of wealth and made the town an unpleasant place of residence (Strabo, xvi. 2, 23; Pliny, v. 76)—Tyre was very closely built; Strabo tells us that the many-storied houses were loftier than those of Rome. In the Roman period the population overflowed its bounds and occupied a strip of the opposite mainland, including the ancient Palætyrus. Pliny gives to the whole city, continental and insular, a compass of 19 Roman miles; but this account must be received with caution. In Strabo's time the island was still the city, and Palætyrus on the mainland was 30 stadia off, while modern research indicates an extensive line of suburbs rather than one mainland city that can be definitely identified with Palætyrus. The ancient history of Tyre has been dealt with in the article PHŒNICIA; the topography is still obscure owing to the paucity of Phœnician remains. The present harbour is certainly the Sidonian port, though it is not so large as it once was; the other ancient harbour (the Egyptian port) has disappeared, and is supposed by Renan to have lain on the other side of the island, and to be now absorbed in the isthmus. The most important ruins are those of the cathedral, with its magnificent monolith columns of rose-coloured granite, now prostrate. The present building is assigned by De Vogué to the second half of the 12th century, but the columns must be older and may have belonged to the 4th-century church of Paulinus (Euseb., *H. E.*, x. 4). The water supply of ancient Tyre came from the powerful springs of Râs al-'Ain on the mainland, one hour south of the city, where there are still remarkable reservoirs, in connexion with which curious revivals of Adonis worship have been observed by Volney and other travellers. Tyre was still an important city and almost impregnable fortress under the Arab empire. From 1124 to 1291 it was a stronghold of the crusaders, and Saladin himself besieged it in vain. After the fall of Acre the Christians deserted the place, which was then destroyed by the Moslems. The present town has arisen since the Metâwila occupied the district in 1766.

TYROL, a province of Austria, with the title of "county," lies between 10° 10' and 13° E. long. and 45° 40' and 47° 45' N. lat., and is continuous on the north-west with the Austrian province of Vorarlberg, on the north with Bavaria, on the east with Salzburg and Carinthia, on the south-east and south-west with Italy, and on the west with Switzerland. The last-named country forms in the lower Engadine an angle penetrating deeply into Tyrol. The country is entirely mountainous, being traversed by the main chain of the Alps. It may be roughly divided into the valley systems of the Lech and the Inn to the north of the chain and of the Etsch or Adige (Vintschgau) and the upper Drave (Puster valley) to the south (see ALPS). Its area is 10,316 square miles; its population in 1880 was 805,176,

inclusive of military, showing an increase of nearly 4 per cent. since 1869. Of these 432,062 spoke German, 360,975 Italian or some Romance dialect, and the remainder some form of Slavonic; 565,468 persons were able to read and write, 56,728 to read only, leaving about 22 $\frac{3}{4}$ per cent. of the total population, including children, wholly illiterate. Education is strictly compulsory, but the schools are for the most part closed during the summer months, when all available hands are required in the fields and on the mountain pastures. Agriculture and forestry occupy about two-thirds of the entire population. Every householder owns a piece of cultivable land in the valley, while his goats, sheep, or cattle are driven with those of his neighbours to the mountain pastures (*Alpen, Almten*) which belong to the commune. Each commune has a president chosen by an elected committee of householders. The man selected cannot decline, but is bound to serve his term of office. The tenure of property is for the most part of the nature of absolute ownership. In 1880 100,393 persons of both sexes were returned as proprietors, 10,283 as tenants. The chief products are milk, butter, and cheese. Of grain-crops maize, which is largely grown in the Inn valley and Vintschgau, holds the first place. Wheat is grown in the lower valleys, barley and rye in the higher, the latter in favourable spots to a height of over 5000 feet. Potatoes are found above 6000 feet. In the Etsch valley, or district about Meran and Botzen, red and white wine of excellent quality is produced (in 1884 about 6,500,000 gallons). Of late years the cultivation of fruit has much developed, especially in south Tyrol. Silk is also produced (in 1885 1268 tons of cocoons). Game is still plentiful in the remoter valleys. In every district there are a certain number of licensed hunters, the principal game being red deer, chamois, hares, blackcock, ptarmigan, &c. Mining occupies about one-fifth of the population. At Hall near Innsbruck are important salt works, and at Brixlegg in the same valley copper and lead are smelted. Iron is worked at Fulpmes in the Stubai valley and at Prad in the Vintschgau. Zinc is found at the head of the Passeir valley. In the Middle Ages gold and silver were found in sufficient quantities to make it worth while to extract them. About 4340 square miles of the country are covered with forest, chiefly pine, fir, and larch, which, however, is felled in a recklessly wasteful way. The capital of the county is INNSBRUCK (*q.v.*).

The general average of comfort in Tyrol is high, and the cost of living is very moderate. The peasant and his family are clothed in stuffs spun and woven at home, from the wool and flax produced in their own neighbourhood. The people are for the most part somewhat reserved in manner, but courteous and hospitable. The savage fights which used to be a favourite pastime among the younger men are now almost, or quite, a thing of the past. In some valleys there is a good deal of musical talent; and companies of Tyrolese singers, particularly from the Ziller valley, travel about all over Germany. The zither is a favourite instrument, especially in the southern valleys; in the northern the guitar is more frequent. The religion is almost exclusively Roman Catholic; but in Innsbruck there are some hundreds of Protestants. The priests belong chiefly to the peasant class, and receive their education at Brixen and the university of Innsbruck. This contains about 600 students in the various faculties and possesses a library of some 60,000 volumes. There is a diet, or *Landtag*, with its seat at Innsbruck, consisting of thirty-four representatives of the peasants, thirteen of the citizens, four of the prelates, ten of the nobles, three of the chambers of commerce at Innsbruck, Botzen, and Roveredo, and one of the university, of Innsbruck. To the imperial reichsrath Tyrol sends eighteen members. Tyrol is garrisoned by troops recruited exclusively in Tyrol and Vorarlberg, and never, except in time of war, employed outside these provinces. Besides this there are the *Landwehr* and the *Landsturm* or militia.

History.—The country corresponding to modern Tyrol first appears in history when the Rætians were subdued by Drusus and Tiberius. This nation, by some held to have been cognate with the Etruscans, occupied the valleys from the source of the Rhine to that of the Drave. To the north of them were the Vindelici, and to the east the Norici, the former were apparently separated

from them by the ridges north of the Inn, the latter by the watershed between the Etsch and the Drave. Pliny (*N. H.*, iii. 24) gives the names of all the tribes. After their subjection by Rome these races became Romanized and shared the fortunes of the empire. Their position on and about the roads by which the central Alps are most easily crossed laid them especially open to inroads, and before the end of the 3d century the Alemanni had traversed the country. In the course of the next three centuries this people settled in the north western valleys. But the peopling of the greater part of the province by Teutons was effected by the Bajuvarii, who were by the year 600 established throughout nearly the entire remainder of German Tyrol, some of the Romanized Bœotians probably being left, mixed with a few Alemannic stragglers, in the upper Vintschgau, while the Lombards pressed up from the southward and took possession of the district around Trent. The Alemanni and Bajuvarii, governed immediately by their own dukes, owned a kind of allegiance to the kings of the Franks, and ultimately became in the time of Pippin and Charles incorporated in the Frankish monarchy. The country was then divided for administrative purposes into counties (*comitatus*, *Grafschaften*), under counts, whose rank, at first merely official, in course of time became, with their office, hereditary. The most powerful among them appear to have been those of the Vintschgau, where a fertile soil and a climate less rigorous than that of the northern valleys allowed more development of wealth. In the 12th century the counts of Tirol begin to be conspicuous. This was a small district near Meran, taking its name from the ancient castle of Tirol, known in the later Roman time as Teriols. These, in the course of the next century, acquired the lordship over nearly all the territory now contained in the province of Tyrol south of the main chain of the Alps, besides the advocacy (*Schirmvogtei*) of the wealthy sees of Brixen and Trent. Meantime the valley of the Ino and those adjoining it had come under the dominion of the counts of Andechs, a Bavarian family, who were also titular counts of Meran. The last of these died without issue in 1248. His wife's sister, Adelaide, married to Meinhard, count of Gorz, was left in sole possession of nearly the whole of the province. Their son Meinhard II. (1257-1295) was connected with some of the most powerful houses in Germany; and, being a man of great ability and equal unscrupulousness, he succeeded in acquiring the few outlying portions of territory and castles still belonging to the smaller nobles, and thus consolidated Tyrol within the limits by which it has ever since been bounded. Carinthia and Styria also formed part of his domains; but their connexion with Tyrol has never been other than a personal one. Meinhard II. was succeeded in turn by his sons Otho and Henry. The latter (1310-1335), a weak and extravagant prince, seems to have done much towards organizing the government of the country. His elder daughter Margaret, known in Tyrolese history and legend as *Die Marillasche*, "the Pocket-mouth," the heiress of his territories, took as her second husband (in 1342) Louis of Brandenburg. Their son Meinhard III., who succeeded to the county on his father's death in 1361, died in 1363. Margaret thereupon made over all her possessions to the house of Hapsburg, and since that time Tyrol has formed part of the hereditary dominions of the archdukes of Austria (see AUSTRIA). The fidelity of the Tyrolese to their counts has for many centuries been proverbial. The Brenner has more than once offered them a secure line of retreat and the mountains a rampart of defence. Maximilian I. (1493-1519) had an especial affection for Tyrol. He conferred on the province its present title of *Die gefürstete Grafschaft*; he profited on more than one occasion by the refuge it afforded, he spent much of his time within it, and at his death he directed that a sumptuous monument to himself should be erected in the Franciscans' church at Innsbruck. Tyrol has more than once been the scene of sharp fighting. In 1499 the men of Gräubünden or the Grisons (see SWITZERLAND) invaded the county and defeated the Tyrolese in the neighbourhood of Mals. In 1703 Max Emmanuel, elector of Bavaria, penetrated the upper Inn valley, but was driven back. During the wars of the French Revolution French and Austrian armies met more than once within the limits of the province. By the treaty of Pressburg, 1805, the province was transferred to Bavaria. On the renewal of war between Bonaparte and Austria in 1809 the people rose and expelled the Bavarians, and afterwards, under the leadership of Andrew Hofer, an innkeeper of the Passeir valley, repeatedly defeated the French, Bavarian, and Saxon forces. Innsbruck was more than once taken and retaken; and on 12th August Hofer, after defeating Marshal Lefebvre, was installed in the capital as commandant. But the ill-success of the Austrian arms elsewhere prevented any support from being sent, and by the treaty of Schönbrunn in October the Tyrolese were again given up to their new rulers. Hofer, being captured through treachery, was shot at Mantua, 20th February 1810. On the fall of Bonaparte, Tyrol reverted to the house of Hapsburg.

See A. Jäger, *Die Verfassung Tirols*, Innsbruck, 1851-55; Egger, *Die Tiroler und Voralpberger*, Innsbruck, 1872-79; Steub, *Drei Sommer in Tirol*, Stuttgart, 1871 (2d ed.). (A. J. B.)

TYRONE, an inland county of Ireland, in the province

of Ulster, is bounded N. and W. by Donegal, N.E. by Londonderry, E. by Lough Neagh and Armagh, and S. by Monaghan and Fermanagh. Its greatest length from north to south is 46 miles and from east to west 60. The total area in 1881 was 806,653 acres or about 1260 square miles. The surface is for the most part hilly, rising into mountains towards the north and south, but eastwards towards Lough Neagh it declines into a level plain. Running along the north-eastern boundary with Londonderry are the ridges of the Sperrin Mountains (Sawell 2236 feet and Meenard 2064 feet). Farther south there are a range of lower hills and Mullagbearn to the north of Omagh (1890 feet). South of Clogher a range of hills (1265 feet) forms the boundary between Tyrone and Monaghan. On each side of the Mourne river near Omagh rise the two picturesque hills Bessy Bell and Mary Gray. The Foyle forms a small portion of the western boundary of the county, and receives the Mourne, which flows northward by Omagh and Newtown Stewart. The principal tributaries of the Mourne are the Derg, from Lough Derg, and the Owenkillew, flowing westward from Fir Mountain. The Blackwater, which is navigable by boats to Moy, rises near Five-Mile Town, and forms part of the south-eastern boundary of the county with Monaghan and Armagh. With the exception of Lough Neagh, bounding the county on the east, the lakes are small, also few in number. Lough Fea is picturesquely situated in the north-west, and there are several small lakes near Newtown Stewart. The Ulster Canal runs along the southern boundary of the county from Lough Neagh to Caledon. The substratum of the northern mountains is mica slate interspersed with primary limestone. Yellow sandstone appears in the north-west, in the centre towards Omagh, and in the south-west, where it plunges into Fermanagh. The greater portion of the central area of the county is occupied by Old Red Sandstone. The Tyrone coal field (6 miles long by 1 to 2 broad) extends between Lough Neagh and Dungannon, all the measures being represented. The coal field is much broken by faults and has been worked chiefly near the surface, and generally in an unskilful manner; the principal pits are near Dungannon and at Coal Island. The coal is bituminous. There are also indications of copper, iron, and lead.

Agriculture.—The hilly portions of the county are unsuitable for tillage, but in the lower districts the soil is remarkably fertile, and agriculture is generally practised after improved methods, the county in this respect being in advance of most parts of Ireland. The excellent pasturage of the hilly districts affords sustenance to a large number of young cattle. The total number of holdings in 1855 was 27,953, of which 16,469 or nearly two-thirds were each between 5 and 30 acres in extent (8365 between 5 and 15 and 8104 between 15 and 30). Only 43 were above 500 acres; 642 were between 100 and 500 acres, 2373 between 50 and 100, 3937 between 30 and 50, 2573 between 1 and 5, and 1921 did not exceed 1 acre. There were 237,523 acres under crops, including meadow and clover (255,251 acres in 1876), 318,550 acres under grass, 1765 fallow, 9378 woods, 72,071 bog and marsh, 109,539 barren mountain land, and 30,112 water, roads, fences, &c. The area under corn crops decreased between 1876 and 1885 from 115,738 acres to 105,343,—oats from 114,223 acres to 104,040, and wheat from 1166 to 1013. The areas under the other corn crops are very small and fluctuate considerably. The area under green crops between 1876 and 1885 decreased from 64,971 to 59,357 acres,—potatoes from 44,001 to 40,649, turnips from 17,157 to 15,581, mangel wurzel from 750 to 487, and other green crops from 3063 to 2670. Flax (23,901 acres in 1876) covered 16,364 acres in 1885. The area under meadow and clover in 1876 was 50,671, and in 1885 56,434, but there has been no increase since 1873. The number of horses decreased between 1876 and 1885 from 25,033 to 23,185, of mules from 71 to 49, of asses from 1121 to 921, of cattle from 176,841 to 168,072, of sheep from 45,274 to 44,434, and of pigs from 49,012 to 39,530. On the other hand, the number of goats increased from 7950 to 8984, and of poultry from 674,826 to 737,859.

According to the latest landowner's *Returns* (1876), the county was divided among 2787 proprietors owning 775,285 acres at a total annual value of £426,224, the average value per acre being nearly

11s. Of the proprietors 1070 owned less than 1 acre each, the total distributed amongst them being 272 acres. The estimated extent of waste land was 4000 acres. The following possessed over 10,000 acres each—duke of Abercorn 47,615 acres, earl of Castlestuart 32,615, earl of Caledon 29,236, commissioners of church temporalities 23,902, Sir John M. Stewart 27,906, Arthur W. Cole Hamilton 16,683, representatives of Sir William M'Mahon 16,326, Sir William Verner 16,043, earl of Belmore 14,359, Thomas Arthur Hope 13,996, Lord Dorchester 12,608, Michael Smith 10,968, Louisa Elizabeth De Bille 10,455, and Thomas R. Browne 10,125.

Communication.—Besides Lough Neagh and the Ulster Canal, Tyrone has the river Foyle, which is navigable for small craft to a point opposite St Johnstone, and thence by artificial cutting to Strabane, and the Blackwater, which is navigable for boats to Moy. The Great Northern Railway intersects the county by Dungannon, Pomeroy, Omagh, Newtown Stewart, and Strabane.

Manufactures.—The manufacture of linens and coarse woollens (including blankets) is carried on. Brown earthenware, chemicals, whisky, soap, and candles are also made. There are a few breweries and distilleries, and several flour and meal mills. But for the lack of enterprise the coal and iron might aid in the development of a considerable manufacturing industry.

Administration and Population.—The county comprises 3 baronies, 46 parishes, and 2164 townlands. Formerly it returned two members to parliament, the borough of Dungannon also returning one; but in 1885 Dungannon was disfranchised and the county arranged in four divisions—east, mid, north, and south—each returning one member. It is in the north-western circuit, and assizes are held at Omagh and quarter-sessions at Clogher, Dungannon, Omagh, and Strabane. There are fourteen petty sessions districts within the county and portions of four others. The county is in the Belfast military district.

From 312,956 in 1841 the population had decreased by 1861 to 235,500, by 1871 to 215,766, and by 1881 to 197,719 (96,466 males and 101,253 females). In 1881 there were 109,793 Roman Catholics (119,937 in 1871), 44,256 Protestant Episcopalians (49,201 in 1871), 38,564 Presbyterians (42,156 in 1871), 3597 Methodists (3115 in 1871), and 1509 of other denominations (1357 in 1871). The number of persons in the county who could read and write in 1881 was 95,764, who could read only 38,783, the remainder (60,172) being wholly illiterate. Twenty-two persons could speak Irish only and 9796 Irish and English. For the seven years ending 1885 the average number of emigrants annually was 3085. The population of the principal towns in 1881 was—Strabane 4196, Omagh (the county town) 4133, Dungannon 4084, and Cookstown 3870.

History and Antiquities.—Anciently Tyrone was included in the portion of Ulster made "sword-land" by the Scots. It became a principality of one of the sons of Niall of the Nine Hostages, and from his name—Eogain—was called Tir Eogain, gradually altered to Tyrone. From Eogain were descended the O'Neals or O'Neills and their numerous septs. The family had their chief seat at Dungannon until the reign of Elizabeth, when it was burned by Hugh O'Neill to prevent it falling into the hands of Lord Mountjoy. The earldom of Tyrone had been conferred on Coo Bacagh O'Neill by Henry VIII., but he was driven into the Pale by one of his sons Shan, who with the general consent of the people was then proclaimed chief. From this time he maintained a contest with English authority, but his last remaining forces were completely defeated near the river Foyle in May 1567. During the insurrection of 1641 Charlemont Fort and Dungannon were captured by Sir Phelim O'Neill, and in 1645 the Parliamentary forces under General Munro were signally defeated by Owen Roe O'Neill at Benburb. At the Revolution the county was for a long time in the possession of the forces of James II. Dungannon was the scene of the famous volunteer convention in 1782. Rathes are scattered over every district of the county. There is a large cromlech near Newtown Stewart, another at Tamblight near Coagh, and another a mile above Castledearg. At Kilmellie near Dungannon are two circles of stones. The monastic remains are of comparatively little interest. There are still some ruins of the ancient castle of the O'Neills, near Benburb, and among other ruined old castles mention may be made of those of Newtown Stewart, Dungannon, Strabane, and Ballygawley.

TYRTÆUS, Greek elegiac poet, lived at Sparta about the middle of the 7th century B.C. According to the legend current in later times, he was a native of the Attic deme of Aphidnæ, and was invited to Sparta, on the suggestion of the Delphic oracle, to assist the Spartans in the Second Messenian War. It is difficult, if not impossible, to determine the element of truth in this story. Herodotus at least either did not know, or disbelieved, the tradition, which meets us first in Plato (*Laws*, i. 629A), to the effect that, although Tyrtæus was by birth an Athenian, he had the Spartan citizenship conferred upon

him (see Herod., ix. 33). From Plato down to Pausanias we can trace the gradual growth and expansion of the legend. Ephorus is the first to call Tyrtæus a lame poet; by later generations he is represented as a lame schoolmaster. Basing his inference on the ground that Tyrtæus speaks of himself as a citizen of Sparta (*Fr.* 2 v. 3), Strabo (viii. 4, 10) was inclined to reject the story of his Athenian origin, regarding the elegies in question as spurious. On the whole, perhaps, the conjecture of Busolt (*Gr. Gesch.*, p. 166) comes nearest to the truth: the entire legend may well have been concocted during the 5th century in connexion with the expedition sent to the assistance of Sparta in her struggle with the revolted Helots at Ithome. It is possible, as Busolt suggests, that Tyrtæus was in reality a native of Aphidna in Laconia. However this may be, it is certain from the fragments of his poems that he flourished during the Second Messenian War (*owc.* 650 B.C.)—a period of remarkable musical and poetical activity at Sparta (see TERPANDER)—that he not only wrote poetry but took part in the actual service of the field, and that he endeavoured to compose the internal dissensions of Sparta by inspiring the citizens with a patriotic love for their fatherland and its institutions.

We possess in all about twelve fragments of Tyrtæus's poetry, varying in length from one to forty-four lines. They are preserved by Strabo, Lycurgus, Stobæus, and others. We may divide them into two varieties, according to the metre and dialect in which they are composed. The first class consists of elegies in the Ionic dialect, written partly in praise of the Spartan constitution and King Theopompus (*Εἰννομία*), partly to stimulate the Spartan soldiers to deeds of heroism in the field (*Υποθήκαι*—the title is, however, later than Tyrtæus). The interest of the fragments preserved from the *Εἰννομία* is mainly historical: they form our only trustworthy authority for the events of the First Messenian War (*Fr.* 5, 6, 7). The *Υποθήκαι* possess considerable poetic merit, in spite of the occasional monotony of their versification. Addressed to a nation of warriors, they paint in vivid colours the beauty of bravery and the shame of cowardice; there are also lines in them which reveal the soldier as well as the poet, e.g., *Fr.* 10, 31-32. One striking feature is the genuinely Greek feeling for plastic beauty, showing itself in the beautiful picture of the youthful form lying dead upon the battle-field (*Fr.* 10, 27-30, and 12, 23-34; see also Symonds's *Greek Poets*, i. p. 74). The popularity of these elegies in the Spartan army was such that, according to Athenæus (xiv. 630 F), it became the custom for the soldiers to sing them round the camp fires at night, the polemarch rewarding the best singer with a piece of flesh. Of the second class of Tyrtæus's poems, marching songs, written in the anapaestic measure and the Dorian dialect, the remains are too scanty to allow of our pronouncing a judgment on their poetic merit.

See Bergk, *Poetæ Lyrici Græci*, vol. ii. pp. 8-22, Leipzig, 1882. Fragment 10 (*τεθνάμεναι γὰρ καλόν*, &c.) has been translated into English verse by Campbell.

TYTLER. The surname of three Scottish writers, principally on historical subjects.

1. ALEXANDER FRASER TYTLER (1747-1812), Lord Woodhouselee, Scottish judge, was the eldest son of William Tytler (see below), and was born at Edinburgh on 15th October 1747. After passing through the High School, he was sent in 1763 to a school at Kensington taught by Dr Elphinston, the translator of Martial's *Epigrams*. He returned to Edinburgh in 1765, skilled in Latin versification, and with a competent knowledge of Italian, and a taste for drawing and natural history. He was called to the bar in 1770. His first work, a supplement to the *Dictionary of Decisions*, undertaken on the suggestion of

Lord Kames, was published in 1778, and a continuation appeared in 1796. In 1780 Tytler was appointed conjoint professor of universal history in the university of Edinburgh, becoming sole professor in 1786. In 1782 he published *Outlines* of his course of lectures, afterwards extended and republished under the title of *Elements of General History*. The *Elements* has passed through many editions, and has been translated into several European languages as well as into Hindustani. The lectures themselves were published in 1834 in Murray's *Family Library*. In 1790 Tytler was appointed judge-advocate of Scotland, and while holding this office he wrote a *Treatise on the Law of Courts-Martial*. In 1801 he was raised to the bench, taking his seat (1802) in the court of session as Lord Woodhouselee. He died at Edinburgh on 5th January 1813.

Besides the works already mentioned, he was the author of several papers in the *Mirror*, the *Lounger*, and the *Transactions of the Royal Society of Edinburgh*; he also wrote *Life and Writings of Dr John Gregory*; *Essay on the Principles of Translation*, 1790; a dissertation on *Final Causes*, prefixed to his edition of Derham's *Physico-Theology*, 1799; a political pamphlet entitled *Ireland profiting by Example*, 1799; an *Essay on Laura and Petrarch*; and *The Life and Writings of Henry Home, Lord Kames*, 1807.

2. PATRICK FRASER TYTLER (1791-1849), as the son of Lord Woodhouselee and grandson of William Tytler, may be said to have inherited a taste for literary and historical pursuits. He was born at Edinburgh on 30th August 1791, and was educated chiefly at the High School and university, being called to the bar in 1813. His earliest literary effort appears to have been a chapter or two contributed to Alison's *Travels in France* (1815); and his first independent essays were papers in *Blackwood's Magazine*. Inheriting the family talent for music, and with a facility in throwing off humorous little poems and songs, he made several contributions to Thomson's *Select Melodies of Scotland*, 1824. In 1819 he published the *Life of James Crichton of Chuny*, commonly called the *Admirable Crichton*, a second edition appearing in 1823. This was followed by a *Memoir of Sir Thomas Craig of Riccarton*, 1823; an *Essay on the Revival of Greek Literature in Italy*, and a *Life of John Wickliff*, published anonymously, in 1826. The *History of Scotland* was undertaken at the suggestion of Sir Walter Scott, and occupied Tytler for nearly twenty years, in the course of which he removed to London for convenience of research. The first volume appeared in 1828, and the ninth and last in 1843. The original investigations on which the work was founded gave it an authority which no previous history of Scotland possessed, and the clear and graphic style made it interesting and popular. The last few years of his life were spent in physical prostration and mental depression, and he died at Great Malvern on 24th December 1849.

During the progress of his *History* a large amount of other work came from his pen, as the following list shows:—*Lives of Scottish Worthies*, for Murray's *Family Library*, 3 vols., 1831-33; *Historical View of the Progress of Discovery in America*, 1832, and *Life of Sir Walter Raleigh*, 1833, for the Edinburgh Cabinet Library; *Life of Henry VIII.*, 1837; *England under the Reigns of Edward VI. and Mary*, from original letters, 2 vols., 1839; article "Scotland" in the seventh edition of the *Encyclopædia Britannica* (afterwards published separately as a school history); *Notes on The Darnley Jewel*, 1843; on the *Portraits of Mary Queen of Scots*, 1845 (privately printed); and *Memoirs of the War carried on in Scotland and Ireland, 1639-91*, by General Mackay, edited in conjunction with Hog and Urquhart, and presented to the Bannatyne and Maitland Clubs in 1833.

3. WILLIAM TYTLER (1711-1792), of Woodhouselee, writer on historical and antiquarian subjects, was the son of Alexander Tytler, writer in Edinburgh, and was born in that city on 12th October 1711. He was educated at the High School and the university, and, having adopted his father's profession, was in 1744 admitted into the society of Writers to the Signet. While successfully practising as a lawyer, he found time to devote attention to historical

investigation. In 1759 he published an *Inquiry, Historical and Critical, into the Evidence against Mary Queen of Scots, and an Examination of the Histories of Dr Robertson and Mr Hume with respect to that Evidence*. This work, which warmly defended the character of the queen, met with great success. Four editions, the later ones considerably enlarged, were published in the author's lifetime; and it was translated into French. In 1783 he published the *Poetical Remains of James the First, King of Scotland*, to which he added a dissertation on the life and writings of the royal author. He wrote an essay on "Scottish Music," which was appended to Arnot's *History of Edinburgh*. His "Dissertation on the Marriage of Queen Mary to the Earl of Bothwell" and "Observations on the Vision, a Poem," appeared in the *Transactions of the Society of Antiquaries of Scotland* (1791-92). A paper in the *Lounger*, on "Defects of Modern Female Education," and an *Account of Fashionable Amusements in Edinburgh in the Seventeenth Century* complete the list of his works. He died at Edinburgh on 12th September 1792.

TYUMEN, a district town of West Siberia, in the government of Tobolsk, is situated at a point where the chief highway from Russia across the Urals touches the first navigable river (the Tura) of Siberia. A railway passing through Ekaterinburg and the principal iron-works on the eastern slopes of the middle Urals connects Tyumen with Perm, the terminus of steamboat traffic on the Kama and Volga. The Tura being a tributary of the Tobol, which joins the Irtysh, a tributary of the Ob, Tyumen has regular steam communication with Omsk and Semipalatinsk by the Irtysh (steamers penetrating as far as Lake Zaisan in Dzungaria); with Tomsk, Barnaul, and Biysk, in the Altai, by the Ob and the Tom; with Irbit—the seat of the great Siberian fair—by the Tura and the Nitsa; and by the Tobol, the Irtysh, and the Ob with the Arctic Ocean and the fisheries of the lower Ob. Tyumen stands also at the western extremity of the Siberian highway which goes via Omsk, Tomsk, and Krasnoyarsk to Irkutsk. In summer the Tura sometimes falls so low that steamers have to stop 90 miles off, passengers and goods being taken thence to Tyumen in lighter vessels. The town is well built, and stands on both banks of the Tura, which is here spanned by a bridge. The portion on the low left bank is inhabited by the poorest class and is often inundated; the best houses are on the high right bank. The streets are unpaved, but the houses (principally wooden) are for the most part inclosed by gardens. The people, who are famed throughout Siberia for their good looks, have always been renowned for their industrial skill. Woollen cloth, linen, belts, and especially boots and gloves, are manufactured to a large amount (70,000 pairs of boots and 300,000 pairs of gloves annually). Tyumen carpets, although made in the simplest way and with the plainest tools, have a wide renown in Russia and Siberia, and recently have appeared in the markets of western Europe as of Oriental origin. All kinds of metal wares are made in small workshops. Sheepskins and various kinds of cloth are extensively manufactured, and the leather prepared at the tanneries (100 in number) is extensively sold all over Siberia, the Kirghiz steppe, and Bokhara. An establishment has recently been opened for the construction of barges, and a paper-mill, the first in Siberia, was opened in 1886. The trade of Tyumen is exceeded only by that of Irkutsk and of Tomsk. In addition to its primary schools Tyumen has a "real" school. The population, which is of a fluctuating character in summer, is differently estimated at 13,000, 14,500, and 18,000.

TZARSKOYE SELO. See TSARSKOYE SELO.

TZETZES, JOANNES, a voluminous Byzantine writer of the 12th century. See GREECE, vol. xi. p. 145 sq.

U

U holds the twenty-first place in our alphabet. The corresponding place in the Greek alphabets was occupied by Y (with some slight variations of form). The form in the Italian alphabets was generally V. These three are only modifications of one original; but they are independent symbols with us, though Y does not represent any sound otherwise unrepresented. It will be most convenient to describe the three forms once for all.

With T we reach the end of the original Phœnician alphabet. The remaining symbols—no fewer than six with us, four in the completed Latin alphabet—are accretions, either modifications of old symbols for greater exactness or old symbols themselves which had fallen out of their proper place and were added again. The first new symbol was needed to represent the important vowel sound *u*. We have already seen that the Greeks employed the Phœnician symbols for the breaths which they did not want as symbols for the vowels which they did want. Thus we should have expected that the Phœnician *vau* would have been used for *u*. But *vau* was already employed for *u*, which was a living sound in early Greek, the form used was F (the so-called digamma), the origin of our F. What then was the origin of the symbol for *u*? In the earliest Greek we find the two forms Y and V, e.g., in inscriptions of Thera. Now the Moabite form of *vau* is Y, which resembles the Y more than F. It is difficult to see why the presumably oldest Phœnician form should appear, not in the sixth place of the Greek alphabet, but at the end, where it must have been an arbitrary addition; and, although the Y form could be derived from F (middle steps are found), it is not easy to get F from Y. We may suppose that the two symbols, F and Y, were obtained by the Greeks from independent Phœnician alphabets, the first being kept by those Greeks who required a symbol for *u*, and did not at first need any special sign to distinguish *u* (which in the earliest Greek times known to us had the value of German *u*) from *o*; while the others took the form Y to express the modified *u*, and probably never really adopted the F, except as a numeral; it does not appear even in the very old Abu Simbel inscription written by the Ionian mercenaries of Psammitichus. It is noteworthy that in that inscription both the forms Y and V appear, whereas in those of Thera and Melos we have sometimes the one sometimes the other, but not both in the same inscription, and a study of the writing leads to the conclusion that the Y was felt to be the true (i.e., the older) form, but that V was used more frequently for the sake of simplicity.

At Rome the single form V denoted both the vowel *u* and also the consonantal *u*. F retained its place as sixth in the alphabet, but with the value of *f*, which was unknown to the Greeks; a peculiar form, C, in which the middle stroke has gone to the bottom, seems to have been affected by its neighbour E, this is found in Etruscan, Umbrian, and Samnite inscriptions, it has, however, the value of *v*, while a curious symbol S appears at the end of the Etruscan alphabet, and is also used in the Eugubine tables, with the value of *f*; the origin of this is uncertain. It may be a rounded form of the second symbol in the digraph FB (i.e., FH) by which the sound F is indicated in a very old inscription (see *Rhein. Mus.*, xlii. 317), if this is so, the Latin alphabet has the first member of the digraph, the Etruscan has the second. Next, the symbol Y was added (together with Z) in the 1st century B.C. to represent more exactly, in borrowed words, the sound of Greek *upsilon*.

Lastly, the form U was differentiated from V. It is the uncial form, and so belongs to the general transition from the pointed to the rounded character which conduced to greater convenience of writing. Examples of it may be seen in the article on PALEOGRAPHY; see the specimen of Latin uncial of the 5th or 6th century (vol. xviii. p. 153), and the half-uncial of the Lindisfarne Gospels, about 700 A.D. (*ibid.*, p. 159). It was clearly a matter of convenience to have separate symbols to represent sounds so distinct as *u* and *v*; but the application of the two symbols seems to have been due to chance rather than design. The form V remained in use at the beginning of words, whereas *u*, which was the uncial and cursive form, naturally was used rather in the middle; by degrees the initial form was appropriated to consonants,—perhaps, as Dr Taylor suggests (*Alphabet*, ii. 189), because the consonant is commoner at the beginning of words, or for some other reason, while the medial form was connected with vowels.

The sound which U denotes is produced by "rounding" the lips to the furthest extent consistent with a clear vowel-sound, and by raising the back of the tongue higher than for any other rounded sound. It has two varieties (like all other vowels) according as the position of the tongue is more or less tense, producing thereby a narrower or a wider aperture for the voice to pass through; whence the sounds are technically called "narrow" and "wide" respectively. The narrow sound is heard in English only when the vowel is long, as in "book," "rule," but in northern English (Scotch) "book" may be heard short. The wide sound is heard in "full," "good." The digraph *oo* is commonly used for the *u* sound, and attests the fact that the original sound of *ō* has frequently passed into *ū*, as in "good," "food," &c., written "gode," "foðe" in Middle English; sometimes, however, the *oo* has come by analogy into words where *ū* is the original sound, as in "room," M.E. "roun," O.E. "rūm." Original *ū* has commonly passed into the *au* sound, spelt in English *ou* or *ow*, as in "how," "house," "mouse," "bower," for O.E. "hū," "hūs," "mus," "būr." According to Mr A. J. Ellis, words derived from the French had in Chaucer's time the sound of French *u*, and Sir John Cheke's statement "cum duke, take, lute, rebuke, δυκ, τυκ, λυτ, ρεβυκ dicimus, Græcum *v* sonaremus," seems strong for the same practice in the 16th century. In the 17th century the modern pronunciation of *u* as *iu* in "muse," "duke," "mute," "pure" had come in. Hence also we may explain the substitution of *u* for *y* in some genuine English words, as "busy" (orig-*ysig*). At the same time begins the corruption of *u* to the (so-called) *ū* sound in "but," "shut," &c., this is not a *u* sound at all, but the neutral vowel as heard indifferently in "but," "sun," "son," "blood", it is often confounded by writers with the true *ū* heard in "pull" and in the northern pronunciation of "but," "shūt." For the history of the German "modified" *u* (spelt *ū*, but originally *ue*) see under Y.

UBEDA, a town of Spain, head of an administrative subdivision in the province of Jaen, stands on a gentle slope about 5 miles from the right bank of the Guadalquivir, and about 22 miles to the east of the Menjíbar station on the railway from Madrid to Cordova. Under the Moorish rule it was a place of considerable consequence, its population being said to have at one time numbered 70,000. Some portions of the old walls, with towers and gates, still remain, but none of the public buildings are of great age, the oldest church, that of San

Salvador, dating from 1540-56. The population within the municipal boundaries in 1877 was 18,149.

UDAIPUR [ODDEYPURE], or MEWAR, a native state in Rajputana, India, with an area of 12,670 square miles. It extends from 23° 49' to 25° 58' N. lat., and from 73° 7' to 75° 52' E. long., and is bounded on the N. by the British territory of Ajmere; on the E. by the native states of Bundi, Gwalior, Tonk, and Patābgarh; on the S. by Banswāra, Dungarpur, and Mahi Kāntha; and on the W. by the Aravalli Mountains, separating it from Marwar and Sirohi. The greater part of the country is level plain. A section of the Aravalli Mountains extends over the south-western and southern portions, and is rich in minerals, but the mines have been long closed. The general inclination of the country is from south-west to north-east, the Banas and its numerous feeders flowing from the base of the Aravalli range. There are many lakes and tanks in the state, the finest of which is the Dhebar or Jaisamand, with an area of nearly 21 square miles; it is considered to be the largest sheet of artificial water in the world. There are only two metal roads in the state; the Nimach State Railway passes through the north-eastern part.

In 1881 the population, exclusive of 51,076 Bhils, was 1,443,144 (males 772,635, females 670,459); Hindus numbered 1,321,521, Mohammedans 43,322, Jains 78,171, and Christians 130. The only town with over 10,000 inhabitants is Udaipur, the capital (38,214). This city is picturesquely situated on a lake 2000 feet above sea-level, and faces wooded hills. It contains the royal palace, which is a noble pile of granite and marble, built on the crest of a rocky ridge overlooking the lake, city, and valley. There are no manufactures of any importance in the state, and the crops as a rule only suffice for local wants. The principal imports are salt, piece goods, groceries, metals, medicines, sugar, ivory, and tobacco; and the exports are mostly confined to turmeric, gur, cotton, indigo, til, opium, and cattle. The total income of Udaipur in 1885-86 was £259,624. The state was taken under the protection of the British Government in 1817, and it pays an annual tribute of £20,000. The family of the raja of Udaipur ranks highest in dignity among the Rajput chiefs of India.

UDAL (Danish *odel*) is a kind of right still existing in Orkney and Shetland, and supposed to be a relic of the old allodial mode of landholding existing antecedently to the growth of feudalism in Scotland. The udal tenant holds without charter by uninterrupted possession on payment to the crown, the kirk, or a grantee from the crown of a tribute called *seat* (Danish *skat*), or without such payment, the latter right being more strictly the udal right. Udal lands descend to all the children equally. They are convertible into feus at the option of the udallers.

UDALL, NICHOLAS (b. 1505-d. 1556¹), author of the earliest extant regular English comedy. Udall was a typical man of the Renaissance in England, a schoolmaster by profession, a classical scholar, a translator of Terence and Erasmus, and a writer of pageants and interludes. He was high in favour at court, wrote verses for the city pageant exhibited at Anne Boleyn's coronation in 1533, and was honoured by Mary in 1554 as one that had "heretofore showed and mindeth hereafter to show his diligence in setting forth of dialogues and interludes before us for our regal disport and recreation." The severity of his discipline at Eton, where he was headmaster, has been immortalized by the quaint lines of one of his pupils, Thomas Tusser. The exact history of the production of his comedy *Ralph Royster Doyster* is not known. A printed copy wanting the title-page came to light in 1818, and we know that it was licensed to be printed in 1566. It is a distinct advance in construction on the Merry Interludes of John Heywood, but it is not a comedy in the strict English sense, being, like the interludes, essentially farcical

¹ The date of Udall's death is sometimes erroneously given as 1564, in which year his play of *Ezekias* was performed at Cambridge before Queen Elizabeth. He was buried at St Margaret's, Westminster, on 23d December 1556 (see memoir in Cooper's edition of *Royster Doyster*).

in motive, character, and incident. Although an imitation of the Latin comedy, it is far from being a servile imitation, and abounds in fresh fun and cleverness. It has been twice reprinted,—by the Shakespeare Society (with a memoir by Mr Cooper) and in Arber's Reprints.

UDINE, a town of Italy, in the province of Udine, in a wide plain near the foot of the Carnic Alps, on the Roja, 84 miles by rail north-east from Venice and 49 miles north-west from Trieste. It is enclosed by an imposing wall of considerable antiquity, some 4 or 5 miles in circumference, and fortified with towers. In the centre, on an eminence, stands the old castle, at one time the residence of the patriarchs of Aquileia, and now used as a prison. Grouped around this is the old part of the town, with narrow crooked streets, some of which are lined with arcades. The cathedral, which is a Romanesque building with fine pillars, and an hexagonal tower bearing 14th-century sculptures, contains some interesting examples of native art (by Giovanni Martini da Udine and others). The church of S. Maria della Purità has frescos by Tiepolo. On the principal square stands the town-hall, built in 1457 in the Venetian-Gothic style, and skilfully restored since a fire in 1876; opposite is a clock tower resembling that of the Piazza di San Marco at Venice. The archiepiscopal palace and Museo Civico, as well as the municipal buildings, have some valuable paintings. Several of the palaces of the nobility have striking architectural features, and the town is adorned by many beautiful public walks. The leading industry of Udine is silk-spinning, but it also possesses manufactures of linen, cotton, hats, and paper, tanneries, and sugar refineries, and has a considerable trade. The population in 1881 was 23,254.

Udine is the *Vedinum* of Pliny: it was then a municipium, but quite an inconsiderable place compared with Forum Julii (Cividale) 11 miles to the east, or Aquileia 22 miles to south-south-east. In the Middle Ages it became a flourishing and populous city; in 1238 the patriarch Berthold made it the capital of FRIULI (*q.v.*), and in 1420 it became Venetian.

UEBERWEG, FRIEDRICH (1826-1871), best known by his *History of Philosophy*, was born on the 22d January 1826 at Leichlingen, in Rhenish Prussia, where his father was Lutheran pastor. His mother, left early a widow, devoted her scanty means to the education of her only son. Ueberweg passed through the gymnasium at Elberfeld, and studied at the universities of Göttingen and Berlin. In 1852 he qualified himself at Bonn as privat-docent in philosophy. His *System of Logic*, published in 1857 (English translation 1871), and his essay *On the Authenticity and the Order of the Platonic Writings*, crowned by the Imperial Academy of Vienna (published 1861), contributed to draw attention to him as at once a scholar and a thinker. In 1862 he was called to Königsberg as extraordinary professor, and in 1867 he was advanced to the ordinary grade. He married in 1863, and on the 9th June 1871 he died prematurely.

The chief work of his later years was his compendious *History of Philosophy*, which is unmatchable for fullness of information combined with conciseness, accuracy, and impartiality of treatment. The first part appeared in 1862. An English translation, in two volumes, was published in 1872, and has gone through several editions. Ueberweg translated, in 1869, Berkeley's *Principles of Human Knowledge*, with notes, for Kirchmann's *Philosophische Bibliothek*. In philosophy Ueberweg was strongly opposed to the subjectivistic tendency of the Kantian system, maintaining in particular the objectivity of space and time, which involved him in a somewhat violent controversy with several opponents. His own mode of thought he preferred to describe as an ideal realism, which refused to reduce reality to thought, but asserted a parallelism between the forms of existence and the forms of knowledge. Beneke and Schleiermacher seem to have exercised most influence upon the development of his thought. A short memoir, by his friend F. A. Lange (author of the *History of Materialism*), gives some account of what may not be called personal opinions in philosophy and theology, which did not find expression in Ueberweg's published writings.

UFA, a government of south-eastern Russia, on the western slope of the Urals, has Vyatka and Perm on the N., Orenburg on the E. and S., Samara and Kazan on the W., and comprises an area of 47,112 square miles. In virtue alike of its physical characters and of its population, which belongs chiefly to the Ural-Altai stock, it forms an intermediate link between Europe and Asia, and it was only recently separated from the government of Orenburg, which is now limited to the eastern slopes of the Urals. Several craggy and densely wooded ridges, running from south-west to north-east parallel to the main chain of the southern Urals, occupy its eastern part. They are separated by broad and long longitudinal valleys, and rise to altitudes of from 2500 to 3500 feet above the sea; their highest peaks—Iremel (5040 feet), Nurgush, Urenga, and Taganai (3950 feet)—are above the limits of tree-vegetation, but in no case reach those of perpetual snow. The high longitudinal valleys of the Urals are the seat of an important mining industry. Southward Ufa extends over the slopes of the Obschii Syrt plateau, the angular space between the latter and the Urals being occupied by elevated plains (from 1000 to 1500 feet), deeply grooved by the river valleys and sometimes described as the "Ufa plateau." It slopes gently towards the depression of the Kama; and its undulating surface, especially its broad valleys (500 to 600 feet above the sea), covered as they are with a fertile soil, are being rapidly colonized by Russian settlers. Towards the Kama the fertility of the soil increases, and the black-earth regions of Menzelinsk and Birsik may be described as granaries for that part of Russia.

The geological structure of Ufa is very varied. The main ridge of the Urals consists of gneisses and various crystalline slates resting upon granites and syenites; next comes a broad strip of limestones and sandstones, the fossil fauna of which is intermediate in its lowest parts between the Upper Silurian and the Lower Devonian. These form the highest ridges of Ufa. Farther west the Devonian deposits are followed by Lower and Upper Carboniferous and "Artinsk schists," which, together with Permian deposits, cover western Ufa. Quaternary deposits are extensively developed in all the valleys, most of which were occupied by lakes during the Lacustrine period. Ufa has not the mineral resources of Perm; only traces of gold have been found in its valleys, and silver ores are absent; but its wealth in iron (Devonian) and copper (Permian) seems likely to have great mining importance in the future. The district of Zlatoust is celebrated for its granite, epidote, nephrite, and a variety of decorative stones and minerals. Coal is spread over a wide area, but only in layers too thin to make working remunerative. Fire-clay, kaolin, and sandstone for making grindstones are obtained to some extent; naphtha, sulphur, and saltpetre have been observed in several places.

Ufa belongs almost entirely to the drainage area of the Byelaya, a great tributary of the Kama, which rises in Orenburg, flows south and west till it pierces a mountain chain at Bugutchan, and then runs north and north-west, watering the high plains and receiving a number of important tributaries, among which the Sim, the Tanyp, and the Ufa are also navigable. The banks of the Byelaya are thickly peopled, and it is an important channel for trade; but it sometimes reaches so low an ebb in summer that steamers cannot proceed beyond Birsik. The Kama flows for 120 miles along the western border of the government. Marshes lie along its course, so that its banks are but thinly inhabited. Forests cover nearly half the area, but the plains on the left of the Byelaya are comparatively thinly wooded. The climate of Ufa is very continental. The average temperature at Ufa is 37° F., and the winter is extremely cold (January 5°-5 F., July 68° F.); at the Zlatoust observatory (1340 feet) the average temperature is only 32°-2 (January 2°; July 61°-8). Even in the hilly tracts of Zlatoust the annual rainfall is only 19 inches. The rivers are frozen 153 days at Ufa, and 202 about Zlatoust.

The population of Ufa is now rapidly increasing (1,793,260 in 1882, as against 1,291,020 in 1865). Only one-third of the whole is Russian, the remainder being chiefly Bashkirs (50 per cent., including Mescheriaks and Tepters), Tartars (8·4 per cent.), Tchermishes, Teluvashes, Mordvinians, and Votiaks. In the south the Bashkirs, Tartars, and other Ural-Altaians constitute two-thirds of the population. Among the Russians two distinct elements must be distinguished,—some 100,000 peasants, who formerly were mining serfs, and now support themselves chiefly by work in or for the mines, and nearly 620,000 agriculturists, for the most part more recent immigrants. The latter carry on agriculture on an extensive

scale, and export large quantities of corn. The Bashkirs are chiefly cattle-breeders, but of late they have been driven more and more to tillage, owing to the appropriation by speculators of their extensive pasture-lands. Bee-keeping is largely carried on, and hunting is still an important source of income to the Bashkirs. In the north-east the trade in timber and the manufacture of various wooden wares are largely engaged in by the peasantry. The mining industry is advancing, notwithstanding many obstacles (see vol. xxi. p. 85); the iron-works of Zlatoust especially have a wide reputation. Flour-mills, distilleries, and tanneries come next in importance. The exports of corn, linseed, timber, wooden wares, metals, tallow, hides, and cattle are considerable, and trade is active, especially at the fairs of Menzelinsk, Ufa, and Zlatoust.

There are six administrative districts, the chief towns of which (with populations in 1884) are—Ufa (25,660), Belebei (4200), Birsik (8000), Menzelinsk (6100), Sterlitamak (8940), and Zlatoust (18,990). The leading places Tchety and Berezovka on the Kama, and several iron and copper works (Satskinsk, Yurezan, Katav-Ivanovsk, about 6000 inhabitants each) ought also to be mentioned.

UFA, capital of the above government, is situated at the confluence of the Ufa with the Byelaya, on high crags intersected by ravines, which are covered with gardens and orchards. The better part of the town contains a few stone buildings connected with the administration, two cathedrals, and a few churches; the remainder is a scattered aggregation of small wooden houses. There are two classical gymnasia for boys and girls, a theological seminary, and several lower schools. The town has a few good hospitals. The manufactures are insignificant in Ufa itself, but there are several iron and copper works of importance within the district. Owing to the fertility of the neighbouring regions, and the position of the town at the junction of two important rivers, the Ufa merchants carry on a brisk export trade. The population has rapidly increased of late, reaching 25,660 in 1884.

Ufa was founded in 1574, when a fort was built on the Byelaya, three other forts being erected about the same time at Birsik, Menzelinsk, and Berezovka, to connect Ufa with the Russian settlements on the Kama. The wooden kreml of Ufa, protected by wooden towers and an outer earthen wall, had to sustain the attacks of the revolted Bashkirs and Russian serfs in 1662 and at later dates; and in 1773 Tchika, one of the chiefs of the Pugatcheff revolt, besieged it for four months.

UGANDA, a country of eastern Central Africa, to the north-west of the Victoria Nyanza. It has an area of about 34,000 square miles, extending from 1° N. lat. to the Kitangule river, and from 31° E. long. to the Nile. The country bordering the lake and to the north-west is mountainous, the mountains being arranged in low parallel chains. The hills, covered with splendid timber and abundant underwood, rise to a height of 400 feet above their valleys, through which sluggish streams flow to the lake. Farther north the country becomes a plain, and the eastern portion of Uganda, between Rubaga and the Nile, consists of undulating country, varied by deep narrow valleys. The geological formation of the country is volcanic or metamorphic; two or three feet of rich black alluvial soil form the upper strata, covering a bed of red sandy clay, often 30 feet thick. In some places porcelain earth is found, as well as large masses of mica. Ironstone is present in considerable quantities, but as yet no other metals have been discovered. The climate is mild, and the temperature remarkably uniform throughout the year; the thermometric range is from 50° to 90° F.; but the mean annual variation is only 20°. The annual rainfall is 50 inches, the greatest amount of rain occurring in March, April, May, and September, October, and November, when rain falls nearly every day, thunderstorms being frequent.

The population of Uganda is about five millions. The men are tall and well-built, and have good features and dark chocolate-coloured skin, with woolly hair. The women in their youth are good-looking. The country is divided into three provinces—Uddu in the south, Singo in the west, and Changwe in the east, to which must be added about 400 islands in the lake. The government of the country is feudal, the king being nominally supreme. Succession to the throne is hereditary, but the successor is usually a minor

chosen by three hereditary chiefs, who with the young king's mother carry on the government until he is of age. The reigning family in Uganda is descended from the Wahuma tribe; the late king Mtesa professed to trace back his descent to Kintu (or Ham), the founder of the dynasty. The country is ruled by the king, three hereditary chiefs, and a council of minor chiefs,—two hereditary chiefs and a certain proportion of the others being continually in residence at Rubaga, the capital of the country. The laws are strict, and the administration of justice is conducted in an orderly manner. There is no real taxation, but the people are compelled to render feudal service to all their superiors. The Waganda may be divided into four classes, the lowest class being the slave population, consisting of prisoners taken in war and their descendants; next come the "bachopi" or peasants, who form the mass of the population; the third class are the "batongoli," or chiefs, who are recruited from the bachopi, but whose honours are not hereditary; they receive their rank for distinguished bravery in the field or for services rendered to the state, and they are the governors of the villages. The highest class is that of the "bakungu," a superior grade of chiefs, all belonging to the "luchiko" or state council, and being governors of large districts of land. The three great hereditary chiefs belong to this class, and they are supreme governors of the three great districts into which Uganda is divided. The Waganda are very warlike; all adult males are compelled to serve in the army when required, and the military organization, having its headquarters at the capital, ramifies throughout the whole land. Game is very plentiful: elephants, buffaloes, zebras, rhinoceroses, wild boars, twelve species of antelopes, lions, leopards, jackals, foxes, hyenas, hares, chimpanzees, and several species of monkeys inhabit the forest. Snakes are numerous; hippopotami, crocodiles, and otters abound in the lake and in the Nile, as also many water-rats. The principal birds are parrots, guinea-fowl, owls, vultures, adjutants, goatsuckers, kites, eagles, ducks, geese, storks, cranes, herons, gulls, scarlet flamingos, darters, the sacred and glossy ibis, and brilliantly coloured honey-birds. The principal insects are mosquitoes, fleas, locusts, white and driver ants, and butterflies of many species. The domestic animals are cows, goats, and a few sheep and dogs. The Waganda live chiefly upon a vegetable diet, the banana forming the staple food; it grows everywhere, and requires little or no cultivation. The sweet potato is the chief vegetable cultivated, but coffee, sugar-cane, cassava, maize, sesame, millet, tullabone, several species of beans, and two or three kinds of pumpkins are grown to a small extent. The principal fruits are the mpafu and a species of amomum. Strangers have introduced wheat, rice, guavas, papaws, pomegranates, tomatoes, onions, and radishes. Wine is made from the banana tree, and is a staple drink. Butter and cheese are also made. A good deal of manufacture is carried on, for the people are ingenious and clever workmen, and their work is tasteful, neat, and exact. Two kinds of pottery, a coarse and a fine variety, are manufactured in considerable quantities. The basket work is extremely good, and the metal work far superior to any seen among the neighbouring tribes. The manufacture of bark-cloths, in which most of the people are clothed, is very extensively carried on; and their wood-work and boat-building are of very superior quality. Tanning, dyeing, and bead-work employ numbers of the people. There is not very much home trade in Uganda; it is limited to the barter of native manufactures. Several times a year caravans arrive from Zanzibar, bringing calico, guns, powder, files, knives, &c. The standard value of any article is reckoned by 100 cowries or an arm's length of calico and beads; hoes, salt, and fish are also employed as mediums of exchange. The language spoken in Uganda belongs to the great Bantu family, and is very rich in words. It has ten classes of nouns, the noun being the most important part of speech. Grammatical inflexions are formed by prefixes; the inflexions of verbs, adjectives, and pronouns vary according to the class of the governing noun. Adjectives agree with the substantive in number and case, and always follow the noun. There are personal, possessive, relative, demonstrative, and interrogative pronouns, and several forms of verbs. The Waganda are very good arithmeticians. The root of all multiples is ten; tallies are used as aids to the memory. The people are very musical; their voices are clear and melodious, and of considerable range. They have a great variety of tunes,—orchestral, dance, and vocal music having distinct characteristics. Their musical instruments consist of harmonicons, rattles, drums, horns, whistles, flutes, and harps. The Waganda have no images or outward symbols of their gods; and they think that the world is ruled by spirits or demons, to whom Katonga, the great creator, has deputed his power. They worship Mukasa, the god of the lake; Naduala, the god of small-pox; Chiwuka and Nenda, the gods of war; and several of the former monarchs of Uganda, who are believed to be demi-gods. A thunder spirit is also invoked. The gods of war are supposed to inhabit certain trees, and offerings are made to them before entering the war-path; like offerings are also made to the god of the lake before commencing a voyage upon its waters.

The Waganda are courteous, cleanly, given to hospitality, but drunken, and to a certain extent indolent. Their standard of

morality, even judged by that of the surrounding tribes, is not high. Human life is little respected; they are untruthful and indecent. Unless moved by passion, they are not cruel; passionate, they are not revengeful. Children are well treated, as are the aged men. On account of the extensive prevalence of polygamy, women occupy a somewhat low social grade.

Uganda was first visited by Speke and Grant in 1860, and the country has since been visited by numerous Europeans, chiefly missionaries. The Church Missionary Society and the Roman Catholics have mission stations in the country. In 1886 some forty of their converts were burnt at the stake, and in the same year Bishop Hannington was murdered on the borders of the country by the orders of King Mwanga.

See Speke's *Journal*, Grant's *Walk across Africa*, Stanley's *Through the Dark Continent*, and Wilson and Felkin's *Uganda and the Egyptian Sudan*. Also a monograph "On the Waganda Tribe," by R. W. Felkin, in *Proc. Roy. Soc. Ed.*, vol. xiii., and an *Outline Grammar of the Luganda Language*, by C. T. Wilson.

UGLITCH, a district town of Russia, in the government of Yaroslavl, is situated on the upper Volga, principally on its right bank, 67 miles to the west of the capital of the province. Its historical remains are mostly associated with the prince Dmitri (see vol. xxi. p. 93). The wooden house he occupied, a church of St Demetrius "on the Blood" erected at the spot where he was killed, and a kiosk on the site of the convent where his mother was forcibly consecrated a nun,—all commemorate this chapter in the history of the rule of the boiars at Moscow at the beginning of the 17th century. An old cathedral, erected in the 13th century but subsequently restored, and containing the grave of Prince Roman, recalls a still earlier period of municipal independence. Uglitch has now become a commercial and industrial city with 11,930 inhabitants (1883), and has an important trade, being one of the chief loading places on the upper Volga. Its industries comprise the sewing of sacks for corn and flour (about one million every year) and the knitting of woollen socks; and it has a paper-mill, distilleries, copper works, and linen factories. Corn, paper, sausages (with which the name of Uglitch has long been associated), candles, &c., are shipped at the town.

Uglitch is one of the oldest towns of Russia; its local annals go as far as back as the 9th century. Until the 14th century it maintained its independence as a separate principality, which extended over eastern Tver, and elected its own princes. In 1329 the sons of Prince Rostan the Saint renounced their independence in favour of Moscow, and fifty years later the Uglitch princes finally sold their rights to the great prince of Moscow. The Tartars plundered the town during their invasions of 1237, 1293, and 1403, as also did the Lithuanians at a later date.

UHLAND, JOHANN LUDWIG (1787-1862), German poet, was born at Tübingen, on April 26, 1787. He studied at the university of his native place, taking jurisprudence as his special subject, but also devoting much time to literature. Having graduated as a doctor of laws in 1810, he went for some months to Paris; and from 1812 to 1814 he worked at his profession in Stuttgart, in the bureau of the minister of justice. He had begun his career as a poet in 1807 and 1808 by contributing ballads and lyrics to Seckendorf's *Musenalmach*; and in 1812 and 1813 he wrote poems for the *Poetischer Almanach* and for the *Deutscher Dichterwald*. In 1815 he collected his poems in a volume entitled *Gedichte*, which almost immediately secured a wide circle of readers, and gives him his place in German literature. To every new edition he added some fresh poems; and the sixtieth edition, published in 1875, included a number of pieces found among his papers. He wrote two dramatic works—*Ernst, Herzog von Schwaben* and *Ludwig der Baier*—the former published in 1817, the latter in 1819. These, however, are unimportant in comparison with his *Gedichte*. In some respects Uhland must be classed with the writers of the romantic school, for, like them, he found in the Middle Ages the subjects which appealed most strongly to his imagination. But his style has a precision, suppleness, and grace which sharply dis-

tinguish his most characteristic writings from those of the romantic poets. His best lyrics have the charm which belongs to the unaffected expression of delicate sentiment; and in almost all his ballads he displays a remarkable power of giving picturesque form to his conceptions of character. He was a man of pure and noble impulse, and it was in presenting scenes which awaken love, or admiration, or pity that he did the fullest justice to his powers. Uhland's poetic sympathy with some characteristics of the age of chivalry did not prevent him from sharing the best aspirations of his own time. He wrote manly poems in defence of freedom, and in the states assembly of Würtemberg he played a distinguished part as one of the most vigorous and consistent of the liberal members. In 1829 he was made a professor, at Tübingen university, of German literature and the German language, but he resigned this appointment in 1833, when it was found to be incompatible with his political duties. In 1848 he became a member of the Frankfort parliament, in which he sat as one of the most respected members of the liberal party.

Uhland was not only a poet and politician; he was also an ardent student of the history of literature. In 1812 he published an interesting essay on *Das altfranzösische Epos*; and ten years afterwards this was followed by an admirable work on Walther von der Vogelweide. He was also the author of an elaborate study of *Der Mythos von Thór nach nordischen Quellen* (1836), and he formed a valuable collection of *Alte hoch- und niederdeutsche Volkslieder*, which appeared in 1844-45. He died on November 13, 1862. After his death his prose works were reprinted, with some additions, under the general title *Uhland's Schriften zur Geschichte der Dichtung und Sage* (1865-73), and an edition of his poems and dramas, in three volumes, was issued in 1863.

See Liebert, *Ludwig Uhland, eine Skizze* (1863); Mayer, *Ludwig Uhland, seine Freunde und Zeitgenossen* (1867); and *Ludwig Uhland's Leben, aus dessen Nachlass und aus eigener Erfahrung zusammengestellt von seiner Witwe* (1874).

UJJI, a town in eastern Central Africa, of considerable importance, also known by the name of KAVELE, is situated on the eastern shores of Lake Tanganyika, in 4° 55' S. lat. and 30° 5' E. long. It is the chief town on that lake, and is the centre of a brisk trade in ivory. Formerly it was a great slave-market. The town is of a straggling character, Arab houses of sun-dried bricks being mingled with native huts. The population, which fluctuates considerably, is very mixed, being composed of Arabs and the representatives of numerous Central African tribes. Ujji has been visited by various European travellers, who have made it their headquarters, and it was here that Stanley found Livingstone, on October 28, 1871. Opinions vary as to the salubrity of its climate, but the balance of testimony appears to prove that during the greater part of the year it is very unhealthy.

UJJAIN, or OOJEIN, a town in the native state of Gwalior, central India, situated on the right bank of the Sipra, in 23° 11' 10" N. lat. and 75° 51' 45" E. long., 1698 feet above sea-level. In ancient times Ujjain was the great and famous capital of Málwá, one of the seven sacred cities of the Hindus, and the spot which marked the first meridian of Hindu geographers. Though much decayed, it is still a large and populous city, with considerable commerce. The modern city is surrounded on all sides by an almost uninterrupted belt of groves and gardens. In 1881 the population of the town numbered 32,932. Its trade consists chiefly in the export of opium and the import of European goods, especially cotton fabrics.

UKRAINE ("frontier"), the name formerly given to a district of European Russia, now comprising the governments of KHARKOFF, KLEFF, PODOLIA, and POLTAVA (*q.v.*).

ULCER. See SURGERY, vol. xxiii. p. 683.

ULFILAS (311-381), the apostle of Christianity to the Gothic race, and, through his translation of the Scriptures into Gothic, the father of Teutonic literature, was born among the Goths of the trans-Danubian provinces in the year 311.¹ There is a tradition that his ancestors were Christian captives from Sadagolthina in Cappadocia, who had been carried off to the lands beyond the Danube in the Gothic raid of 267, but the evidence on which this rests is inadequate. An authoritative record of the outlines of his life has only been discovered within the last fifty years, in a writing of Auxentius, his pupil and companion.

At an early age Ulfilas was sent, either as an envoy or as a hostage for his tribe, to Constantinople, probably on the occasion of the treaty arranged in 332. During the preceding century Christianity had been planted sporadically among the Goths beyond the Danube, through the agency in part of Christian captives, many of whom belonged to the order of clergy, and in part of merchants and traders. Ulfilas may therefore have been a convert to Christianity when he reached Constantinople. But it was here probably that he came into contact with the Arian doctrines which gave the form to his later teaching, and here that he acquired that command over the Greek and Latin tongues which equipped him for his labours as a translator. For some time before 341 he worked as a "lector" or reader of the Scriptures, probably among his own countrymen in Constantinople, or among those attached as *fœderati* to the imperial armies in Asia Minor. From this work he was called to return as missionary bishop to his own country, being ordained by Eusebius of Nicomedia and "the bishops who were with him" in 341. This ordination of Ulfilas as missionary bishop by the chiefs of the semi-Arian party is at once an indication of their determination to extend their influence by active missionary enterprise and evidence that Ulfilas was now, if he had not been before, a declared adherent of the Arian or semi-Arian party. He was now thirty years of age, and his work as "bishop among the Goths" covered the remaining forty years of his life. For seven of these years he wrought among the Visigoths beyond the Danube, till the success which attended his labours, and the growing numbers of his flock, drew down the persecution of the still pagan chief of the tribe. This "sacrilegus iudex" has been identified with Athanaric, a later persecutor, probably without sufficient ground. The persecution was so severe that, to save his flock from extinction or dispersion, Ulfilas decided to withdraw both himself and his people from its range. With the consent of the emperor Constantius, he led them across the Danube, "a great body of the faithful," and settled in Mœsia at the foot of the range of Hæmus, and near the site of the modern Tirnova (348). Here they developed into a peace-loving pastoral people.

The life of Ulfilas during the following thirty-three years is marked only by one recorded incident, his visit to Constantinople in 360, to attend the council convened by the Arian or Homoian party. His work and influence were not, however, confined to his own immediate flock, but radiated by means of his writings (homilies and treatises), and through the disciples he despatched as missionaries, among all the tribes of the Gothic stock beyond the Danube. By this time probably he had made some progress with his version of the Scriptures, and copies of parts of it would begin to circulate. Thus the church beyond the Danube, which had not been extinguished on Ulfilas's withdrawal, began to grow once more in numbers and importance, and once more had to undergo the fires of persecution. Catholic missionaries had not been wanting in the meanwhile, and in the indiscriminate persecution by

¹ Krafft gives 313 as the date, Waitz 318.

Atharic between 370 and 375 Catholics and Arians stood and fell side by side. The religious quarrel either accentuated, or was accentuated by, political differences, and the rival chiefs, Atharic and Frithigern, appeared as champions of Paganism and Christianity respectively. Then followed the negotiations with the emperor Valens, the general adhesion of the Visigoths under Frithigern to Arian Christianity, the crossing of the Danube by himself and a host of his followers, and the troubles which culminated in the battle of Adrianople and the death of Valens (378). The part played by Ulfilas in these troublesome times cannot be ascertained with certainty. It may have been he who, as a "presbyter Christiani ritus" conducted negotiations with Valens before the battle of Adrianople; but that he headed a previous embassy asking leave for the Visigoths to settle on Roman soil, and that he then, for political motives, professed himself a convert to the Arian creed, favoured by the emperor, and drew with him the whole body of his countrymen,—these and other similar stories of the orthodox church historians appear to be without foundation. The death of Valens, followed by the succession and the early conversion to Catholicism of Theodosius, dealt a fatal blow to the Arian party within the empire. Ulfilas lived long enough to see what the end must be. Hardships as well as years must have combined to make him an old man, when in 381 he was sent for to Constantinople. The emperor had summoned him, for what purpose cannot be clearly ascertained. A split seems to have taken place among the Arians at Constantinople. Party riots were too familiar there, and a fierce dispute over a theological dogma, however abstruse, placed the peace of the city, if not the security of the palace, in jeopardy. Ulfilas was summoned to meet the innovators, and either by argument or by influence to induce them to surrender the opinion which caused the dispute. His pupil Auxentius describes how, "in the name of God," he set out upon his way, hoping to prevent the teaching of these new heretics from reaching "the churches of Christ by Christ committed to his charge." No sooner had he reached Constantinople than he fell sick, "having pondered much about the council," and before he had put his hand to the task which had brought him he died, probably in January 381. A few days later there died, also in Constantinople, his old enemy and persecutor, Atharic.

The Arianism of Ulfilas was a fact of pregnant consequence for his people, and indirectly for the empire. It had been his lifelong faith, as we learn from the opening words of his own testament—"Ego Ulfilas semper sic credidi." If, as seems probable from the circumstances of his ordination, he was a Semi-Arian and a follower of Eusebius in 341, at a later period of his life he departed from this position, and vigorously opposed the teaching of his former leader. He appears to have joined the Homoian party, which took shape and acquired influence before the council of Constantinople in 360, where he adhered with the rest of the council to the creed of Ariminum, with the addendum that in future the terms *ὁμοουσιος* and *ὁμοια* should be excluded from Christological definitions. Thus we learn from Auxentius that he condemned Homoiousians and Homoiousians alike, adopting for himself the Homoian formula, "filium similem esse patri suo." This Arian form of Christianity was imparted by Ulfilas and his disciples to most of the tribes of the Gothic stock, and persisted among them, in spite of the persecution, hatred, and political disasters it involved, for two centuries.

The other legacy bequeathed by Ulfilas was of less questionable value. His version of the Scriptures (see *GOthic LANGUAGE*, vol. x. p. 852) is his greatest monument as a way-breaker and a scholar. By it he became the first to raise a barbarian tongue to the dignity of a literary language; and the skill, knowledge, and adaptive ability it displays make it the crowning testimony of his powers as well as of his devotion to his work.

The personal qualities of the man may be inferred from his pupil's description of him as "of most upright conversation, truly a confessor of Christ, a teacher of piety, and a preacher of truth,—a man whom I am well competent to praise according to his merit, yet altogether keep silent I dare not."

ULM, an ancient and important commercial town in Würtemberg, and an imperial fortress of the first class, is situated on the left bank of the Danube, in a fertile plain at the foot of the Swabian Alps, 45 miles to the south-east of Stuttgart and 63 miles to the north-west of Munich. The town, quaintly built with narrow and confined streets, still preserves the dignified and old-fashioned appearance of an ancient imperial town, and contains many mediæval buildings, both of historic and of artistic interest. Among these, besides numerous handsome private houses, are the town-house, of the 16th century, in the Transition style from late Gothic to Renaissance; the Kornhaus and market-buildings; the Ehingerhaus or Neubronnerhaus, now containing the industrial museum; the "new building," erected in 1603 on the site of a palace of Charlemagne; and the commandery of the Teutonic order, built in 1712-18 on the site of a habitation of the order dating from the 13th century. By far the most important and conspicuous building in Ulm, however, is the magnificent early Gothic cathedral, next to the cathedral of Cologne the largest church in Germany, and capable of containing 30,000 people. Begun in 1377, and carried on at intervals till the 16th century, the building was long left unfinished; but in 1844 the work of restoration and completion was undertaken, and has steadily progressed ever since. Ulm cathedral has double aisles and a pentagonal apsidal choir, but no transepts. Its length (outside measurement) is 464 feet, its breadth 159 feet; the nave is 136 feet high and 47½ wide; the aisles, which are covered with rich net-vaulting, are 68 feet in height. The massive and richly decorated square tower in the centre of the west façade, for centuries terminated by a temporary spire, is now being completed according to the original plans, by the addition of an octagonal story and a tall open spire, which is to be carried up to the height of 534 feet. The towers of the choir have also been rebuilt in the course of the present restoration; they are 282 feet high. The interior, which is unusually well lighted, produces an impression of much dignity from the great height of the nave, the absence of obtrusive decoration, and the massive manner in which the walls and piers are treated. It contains some fine stained glass, the largest organ in Germany (1856), and a number of interesting old paintings and carvings by Syrlin, Engelberger, and other masters of the Swabian school. The cathedral belongs to the Protestant Church. Trinity Church dates from 1617-21; and there are also a Roman Catholic church and a modern synagogue in the town. The Danube, joined by the Iller just above the town and by the Blau just below, becomes navigable at this point, so that Ulm occupies the important commercial position of a terminal river-port. The trade, especially in wood and grain, has an upward tendency; and the Ulm market for leather and cloth is also rising in importance. Ulm is famous for its vegetables (especially asparagus), barley, beer, pipe-bowls, and sweet cakes (Ulm's Zückerbrot). Bleaching, brewing, and brass-founding are carried on, as well as a large miscellany of manufactures, including hats, metal goods, agricultural implements, tobacco and cigars, cement, paper, and chemicals. The population in 1886 was 33,611.

The various routes which converge at Ulm have made it at all times a strategic point of great importance, and it has long been a fortress of the first rank. In 1844-59 the German Confederation carefully fortified it with walls, ramparts, and ditches, and in 1876 the new German empire added a very comprehensive outer girdle of detached forts, culminating in the powerful citadel of Wilhelmsburg. The defensive works embrace also the Bavarian town of Neu-Ulm (7823 inhabitants), on the opposite bank of the Danube, united with the older city by two stone bridges. Ulm is thus the basis of operations for the German army behind the Black Forest,

and can easily shelter a force of 100,000 men; its peace garrison is 5600.

Ulm is mentioned as early as the year 854. It subsequently became a free imperial city, and the leading town in Swabia. In the 15th century it attained the summit of its prosperity, and ruled over a district of many square miles, with a population, rural and urban, of about 60,000. Towards the end of the Middle Ages it frequently appears at the head of various Swabian leagues. In 1530 it adopted the Augsburg Confession. In 1803 it passed to Bavaria, and in 1810 to Württemberg. In 1805 General Mack, with 33,000 Austrians, capitulated to Napoleon at Ulm. Ulm is remarkable in the history of German literature as the spot where the "meistersänger" lingered longest, preserving, without text and without notes, the traditional lore of their craft. In 1830 there were twelve "meistersänger" alive at Ulm; but in 1839 the four survivors formally made over their insignia and guild property to a modern singing society, and closed the record of "Meistergesang" in Germauy. The last formal meeting of the Nureuberg "meister" took place in 1770.

ULPIANUS, DOMITIUS, Roman jurist, was of Tyrian ancestry, but the time and place of his birth are unknown. He made his first appearance in public life as assessor in the *auditorium* of Papinian and member of the council of Septimius Severus; under Caracalla he was master of the requests. Elagabalus deprived him of his functions and banished him from Rome, but on the accession of Alexander (222) he was at once recalled and reinstated, and finally became the emperor's chief adviser and *præfectus prætorio*. His curtailment of the privileges granted to the prætorian guard by Elagabalus provoked their enmity, and several times he only narrowly escaped their vengeance; ultimately, in 228, he was murdered in the palace, in the course of a riot between the soldiers and the mob.

Ulpian's period of literary activity extended from about 211 to 222 A.D. His works include *Ad Sabinum*, a commentary on the *ius civile* in over fifty books; *Ad Edictum*, a commentary on the Edict, in eighty-three books; collections of Opinions, Responses, and Disputations; books of Rules and Institutions; treatises on the functions of the different magistrates,—one of them, the *De Officio Proconsulis Libri X.*, being a comprehensive exposition of the criminal law; monographs on various statutes, on testamentary trusts, and a variety of other works. His writings altogether have supplied to Justinian's *Digest* about a third of its contents, and his commentary on the Edict alone about a fifth. As an author he is characterized by doctrinal exposition of a high order, judiciousness of criticism, and lucidity of arrangement, style, and language. *Domitii Ulpiani Fragmenta*, consisting of twenty-nine titles, were first edited by Tilius (Paris, 1549). There are modern editions by Hngo (Berlin, 1834) and Böcking (Bonn, 1836), the latter containing fragments of the first book of the *Institutiones* discovered by Endlicher at Vienna in 1835.

ULRICI, HERMANN (1806-1884), one of the most active philosophical writers in Germany since Hegel's death, was born at Pforten, Prussia, on March 23, 1806. Educated for the law, he gave up his profession upon the death of his father in 1829, and after four years of further study, devoted to literature, philosophy, and science, qualified as a university lecturer. In 1834 he was called to a professorship at Halle, where he remained till his death on the 11th January 1884. His first works were in the domain of literary criticism. His treatise *On Shakespeare's Dramatic Art* (1839) has been translated into English. In 1841 he published a work *Ueber Princip u. Methode der Hegelschen Philosophie*, in which he subjected Hegel's system to a severe criticism. The critical attack was continued in the *Grundprincip der Philosophie* (1845-6), which at the same time expounds his own speculative position; to this must be added as complementary his *System der Logik* (1852). His later works, dealing with perennial problems of philosophy, have found a more extended circle of readers. Such are *Glauben und Wissen* (1858), *Gott und die Natur* (1862, 3d ed. 1875), *Gott und der Mensch* (2 vols., 1866-73, 2d ed. 1874). From 1847 onward Ulrici was associated with the younger Fichte in the editorship of the *Zeitschrift für Philosophie*.

His philosophical standpoint may be characterized as a reaction from the pantheistic tendency of Hegel's idealistic rationalism

towards a more pronouncedly theistic position. The Hegelian identity of being and thought is also abandoned and the truth of realism acknowledged, an attempt being made to exhibit idealism and realism as respectively incomplete but mutually complementary systems. Ulrici's later works, while expressing the same views, are largely occupied in proving the existence of God and the soul from the basis of scientific conceptions, and in opposition to the materialistic current of thought then popular in Germany.

ULSTER. See IRELAND.

ULTRAMARINE, a magnificent blue pigment, which occurs in nature as a proximate component of LAPIS LAZULI (*q. v.*). Lapis lazuli has long been known as a precious stone, and highly valued as such, and as early at least as the 11th century the art of extracting a blue pigment from it was practised. From the beginning of the 16th century this pigment began to be imported into Europe from "over the sea," as *azurum ultramarinum*. To extract it, the stone, after having been powdered coarsely, is heated to redness and thrown into cold water to facilitate its conversion into a very fine powder, which is next treated with dilute acetic acid to remove the carbonate of lime which is present in almost all specimens. The insoluble blue residue is mixed up into a "dough" with a composition of resin, pitch, and linseed oil, and this dough is then kneaded under water, which is renewed as long as it runs off with a blue colour. The blue liquor, when allowed to stand, deposits a fine precipitate, which is collected, washed, dried, and sold as ultramarine. As the yield amounts to only 2 to 3 per cent. of the mineral used, it is not surprising to learn that the pigment used to be weighed up with gold. It was valued chiefly on account of its brilliancy of tone and its inertness in opposition to sunlight, oil, and slaked lime (in fresco-painting).

Lapis lazuli has the composition of a double silicate of lime and soda combined with sulphates and sulphides of the metals named. Of the many analyses made (compare LAPIS LAZULI) we quote the following, carried out by Schultz in Rammelsberg's laboratory — combined sulphur (not SO₂), 3.16; combined sulphuric acid, SO₃, 5.67; silica, 43.26; alumina, 20.22; oxide of iron, calculated as Fe₂O₃, 4.20; lime, 14.73; soda, 8.76.

In 1814 Tassaer observed the spontaneous formation of a blue compound, very similar to ultramarine, if not identical with it, in a soda-furnace at St Gobain, which caused the "Société pour l'Encouragement d'Industrie" to offer a prize for the artificial production of the precious colour. The problem was solved almost simultaneously by Guimet and by Christian Gmelin, then professor of chemistry in Tübingen; but while Guimet kept his process a secret (it has indeed never become known) Gmelin published his, and thus became the originator of an industry which flourishes to this day chiefly in Germany. There are very few ultramarine works in other countries, and none, as far as we know, in Great Britain. The raw materials used in the manufacture are—(1) iron-free kaolin, or some other kind of pure clay, which should contain its silica and alumina as nearly as possible in the proportion of 2SiO₂. Al₂O₃ demanded by the formula assigned to ideal kaolin (a deficit of silica, however, it appears can be made up for by addition of the calculated weight of finely divided silica); (2) anhydrous sulphate of soda; (3) anhydrous carbonate of soda; (4) sulphur (in the state of powder); and (5) powdered charcoal or relatively ash-free coal, or colophony in lumps. The numerous modes of manufacture may be viewed as modifications or combinations of three processes.

(1) In the *Nuremberg process* the soda is used as sulphate, or partly as such and partly as carbonate. The following recipe gives an idea of the proportions in which the materials are used:—kaolin (calculated as anhydrous matter) 100 parts; calcined sulphate of soda 83 to 100 (or 41 of sulphate and 41 of carbonate); charcoal 17; powdered sulphur 13. These ingredients are mixed most intimately; they are then rammed tight into fire-clay crucibles and kept at a nearly white heat for 7 to 10 hours, access of air being prevented as far as possible. The product obtained is a greyish or yellowish green mass, which is soaked in and washed with water; the porous residue is ground very fine in mills, again washed, dried, and again ground in the dry state and passed through sieves. The product at this stage has a green colour, and is sometimes sold as "green ultramarine," although it has not a high standing amongst green pigments. For its conversion into blue ultramarine it is heated with sulphur in the presence of air to a relatively low temperature. Of the various apparatus used for this important stage of the manufacture, the easiest to describe is a large muffle, heated from the outside. On its floor the green ultramarine is spread out to a depth of 2½ to 3 inches, and heated (with closed doors) to a

temperature at which sulphur powder when thrown in catches fire spontaneously. This temperature being maintained, a shovelful of sulphur is thrown in and allowed to burn off while the mass is being constantly agitated with iron rakers. Another dose of sulphur is then added, and so on until a sample taken out is found to have come up to the highest attainable brilliancy and depth of blue. The product is then lixiviated with water, which removes a deal of sulphate of soda formed in the process; it is then ground up very fine, and finally subjected to elutriation to produce a graduated series of ultramarines of different degrees of fineness. In some works the process of sulphuration is divided into two or more periods, after each of which the product is washed, dried, and ground before being returned to the muffle to produce a higher degree of homogeneity.

(2) In the carbonate of soda process the soda is used solely, or at least principally, in the carbonate form. The following is one of many recipes:—kaolin (calculated as anhydrous matter) 100; carbonate of soda 100; charcoal 12; sulphur 60. The mixture is heated in a reverberatory furnace to form in the first instance a white mass, which is so porous that it readily passes, by oxidation, into green and partly even into blue ultramarine. Green ultramarine, saleable as such, cannot be produced in this manner. The half-blue product is finished by sulphuration pretty much as explained above for the Nuremberg process. Well-made soda-ash ultramarine has a richer colour than the Nuremberg variety.

(3) *Silica ultramarine* is soda-ash ultramarine in whose preparation a quantity of finely divided silica, equal to 5 to 10 per cent. of the weight of the kaolin, has been added. It is distinguished by a reddish tinge, which is the more fully developed the greater the proportion of added silica. It is more highly proof against the action of alum solution than non-siliceous ultramarine is.

Since 1873 the Nuremberg works have been producing four varieties of magnificently violet ultramarine. The mode of manufacture has not transpired. At the Paris Exhibition in 1867 a magnificent block of ultramarine exhibited by the Kaiserslautern works attracted attention. In its manufacture the roasting (blueing) process is said to have been continued for three weeks.

Artificial, like natural, ultramarine has a magnificently blue colour, which is not affected by light nor by contact with oil or lime as used in painting. Hydrochloric acid at once bleaches it with liberation of sulphuretted hydrogen gas and milk of sulphur. The natural pigment is proof against dilute acetic acid and solution of alum; the artificial pigment is even alum-proof only in a higher or lower relative sense. Hence there is room for progress in one direction at least. The composition of the pigment is quite similar to that of lapis lazuli; but the constitution of both is still a chemical enigma. It is remarkable that even a small addition of zinc-white (oxide of zinc) to the reddish varieties especially causes a considerable diminution in the intensity of the colour, while dilution with artificial precipitated sulphate of lime ("annaliu") or sulphate of baryta ("blanc fix") acts pretty much as one would expect. Ultramarine being very cheap (it sells at 7d. to 10d. per lb), it is largely used for wall painting, the printing of paper hangings and calico, &c., and also as a corrective for the yellowish tinge often present in things meant to be white, such as linen, paper, &c. Large quantities are used in the manufacture of paper, and especially for producing that kind of pale blue writing paper which is so popular in Great Britain. Only the very finest ultramarine can be used for paper tinging, because the least admixture of coarse particles becomes visible in the paper as dark spots or stains.

ULUGH BEG, MIRZA MORAMMED BEN SHAH ROK (1394-1449), astronomer, grandson of TIMUR (*q.v.*), succeeded his father as prince of Samarkand in 1447, after having for years taken part in the government, and was murdered in 1449 by his eldest son. He occupied himself with astronomical pursuits, and erected an observatory at Samarkand, from which were issued tables of the sun, moon, and planets, with an interesting introduction, which throws much light on the trigonometry and astronomical methods then in use (*Prolégomènes des Tables Astronomiques d'Ouloug Beg*, ed. by Sédillot, Paris, 1847, and translated by the same, 1853). The serious errors which he found in the Arabian star catalogues (which were simply copied from Ptolemy, adding the effect of precession to the longitude) induced him to redetermine the positions of 992 fixed stars, to which he added 27 stars from Al Sâfi's catalogue, which were too far south to be observed at Samarkand. This catalogue, the first original one since Ptolemy, was edited by Th. Hyde at Oxford in 1665 (*Tabulæ Longitudinis et Latitudinis Stellarum Fixarum ex Observatione Ulughbeighi*), and in 1843 by Baily in vol. xiii. of the *Memoirs of the Royal Astronomical Society*.

ULVERSTON, a market-town in the north-west of Lancashire, England, is picturesquely situated near Morecambe Bay, on the borders of the Lake district, 9 miles north-east of Barrow-in-Furness, and 256 north-west of Loodon. The town bears small evidence of its great antiquity. The principal streets branch from the market-place, and the houses built of stone are generally rough-cast and whitened. A rivulet flows through the town. The church of St Mary, founded in 1111, retains the south door of the original building in the Transition style, but the greater portion of the structure is Perpendicular, of the time of Henry VIII. It consists of chancel, nave, aisles, south porch, and embattled western tower, and contains an altar-tomb with recumbent figure of Walter Sandys of Conishead, dated 1588. After the destruction of Furness Abbey, Ulverston succeeded Dalton as the most important town in Furness, but the rapid rise of Barrow within recent years has relegated it to quite a secondary place. Formerly it had a considerable trade in linens, checks, and gingham, but this has greatly fallen off. It possesses, however, large iron and steel works (North Lonsdale Iron and Steel Company), a large chemical work, an extensive paper manufactory, a bolt manufactory, breweries, tanyards, and wooden hoop manufactories. The population of the urban sanitary district (area 3120 acres) in 1871 was 7607, and in 1881 it was 10,008.

Early in the 12th century the lordship of Ulverston came into the possession of Stephen, earl of Boulogne, afterwards king of England, by whom it was presented to the monks of Furness Abbey as part of the endowment. In 1196 the *vill* of Ulverston was granted by the abbot of Furness to William de Laucaster, first baron of Kendal. In 1280 it obtained the charter of a market. The town became escheated to the abbot of Furness as chief lord in 1342, but this escheatment was suspended by Edward II. in favour of John de Coupland, who captured David II. of Scotland at the battle of Dufham. After his death it reverted to the abbey. It is now in the possession of the family of Buccleuch.

ULWAR, an alternative form of ALWAR (*q.v.*).

ULYSSES. See ODYSSEUS.

UMAN, a district town of Russia, in the south of the government of Kieff, is now a small industrial and trading town, with 15,400 inhabitants, many of whom are Jews, who carry on an active trade in the export of corn, spirits, &c. It has a remarkable park (290 acres), planted in 1796 by the orders of Count Potocki, in connexion with which a gardening school is maintained.

Uman was founded towards the beginning of the 17th century as a fort against the raids of the Tartars. The Cossacks of the Ukraine, who kept it, revolted against their Polish rulers about 1665, and had to sustain a fierce siege. In 1674 it was plundered and most of its inhabitants murdered by the Ukrainians and Turks, during the wars for the hetmanship. In 1712 its last inhabitants were transferred by Peter I. to the left bank of the Dnieper. But by the end of the 18th century, when it again became the property of the Potockis, it was re-peopled and became one of the busiest trading towns of Little Russia. In 1768, when the Cossacks revolted anew against their Polish serf proprietors, they took Uman and murdered most of its inhabitants.

UMBALLA, an alternative form of AMBĀLA (*q.v.*).

UMBER. See PIGMENTS.

UMBRELLA now means a portable protector from rain, while the name parasol is given to the generally smaller, lighter, and more fanciful article carried by ladies as a sun-shade. But primarily the umbrella (*ombrella*, Ital. dim. from Lat. *umbra*, shade) was a sun-shade alone,—its original home having been in hot brilliant climates. In Eastern countries from the earliest times the umbrella was one of the insignia of royalty and power. On the sculptured remains of ancient Nineveh and Egypt there are representations of kings and sometimes of lesser potentates going in procession with an umbrella carried over their heads; and throughout Asia the umbrella had, and still has, something of the same significance. The Mahratta princes of India had among their titles "lord of

the umbrella." In 1855 the king of Bûrma in addressing the governor-general of India termed himself "the monarch who reigns over the great umbrella-wearing chiefs of the Eastern countries." The baldachins erected over ecclesiastical chairs, altars, and portals, and the canopies of thrones and pulpits, &c., are in their origin closely related to umbrellas, and have the same symbolic significance. In each of the basilican churches of Rome there still hangs a large umbrella.

Among the Greeks and Romans the umbrella (*σκιάς, σκιάδειον, umbraculum, umbella*) was used by ladies, while the carrying of it by men was regarded as a sign of effeminacy. Probably in these southern climes it never went out of use, and we find from allusions by Montaigne that in his day its employment as a sun-shade was quite common in Italy. The umbrella was not unknown in England in the 17th century, and was already used as a rain protector. Michael Drayton, writing about the beginning of the 17th century, says, speaking of doves:—

"And, like umbrellas, with their feathers
Shield you in all sorts of weathers."

Although it was the practice to keep an umbrella in the coffee-houses early in the 18th century, its use cannot have been very familiar, for in 1752 Colonel Wolfe, writing from Paris, mentions the carrying of them there as a defence against both rain and sun, and wonders that they are not introduced into England. The traveller Jonas Hanway, who died in 1786, is credited with having been the first Englishman who habitually carried an umbrella. That practice he began thirty years before his death; at first he was singular, and his habit was derided, but he lived to see his example commonly followed.

The umbrella as at first used, based on its Eastern prototype, was a heavy ungainly article which did not hold well together, and no little ingenuity has been exercised to bring it into the elegant, compact, and strong form which is now quite common. The early umbrella had a long handle, with ribs of whalebone or cane, very rarely of metal, and stretchers of cane. The jointing of the ribs and stretchers to the stick and to each other was very rough and imperfect. The covering material consisted of oiled silk or cotton, heavy in substance, and liable to stick together in the folds. Gingham soon came to be substituted for the oiled cloth, and in 1848 William Sangster patented the use of alpaca as an umbrella covering material. One of the most notable inventions for combining lightness, strength, and elasticity in the ribs of umbrellas was the "Paragon" rib patented by Samuel Fox in 1852. It is formed of a thin strip of steel rolled into a U or trough section, a form which gives great strength for the weight of metal. The use of such ribs, combined with the notched rings and runners which give a separate hinge and joint to each rib and stretcher, and with the thin but tough covering materials now in use, has principally contributed to the strength, lightness, and elegance which ordinary umbrellas now present. Umbrella silk is principally made at Lyons and Crefeld; but much of it is so loaded in dyeing that it cuts readily at the folds. Textures of pure silk or of silk and alpaca mixed have better wear-resisting properties.

UMBRIA (*Ὀμβρικὴ, Ὀμβρική, Ὀμβροί, UMBRI*). The early Greeks applied the name *Ὀμβρικὴ* to all central and northern Italy. Herodotus (iv. 49) speaks of it somewhat vaguely, as if it extended up to the Alps. The Umbrians probably extended across central Italy from sea to sea down as far as Latium. Ptolemy (iii. 13, 19) tells us that the Umbri were considered the most ancient nation of Italy (*antiquissima gens Italice*), by which he probably means, of the Italian stock. The Greek writers included under the name of Umbria the district known in later times as Picenum. Pseudo-Scylax makes Umbria march with Samnium, and describes Ancona as a city of Umbria. The Umbrians seem to have found the Siculi and Liburni in occupation of the land into which they advanced, the former holding the parts lying towards the interior, the latter people the district along the Adriatic. The Umbrians were one of the chief peoples of that branch of the Indo-European family which had entered Italy from the north

and driven out and absorbed the older inhabitants. They were more closely connected with the Samnites and Oscans than with the Latin stock, as is shown by their language. Their possession of the fertile regions of upper Italy exposed them to the constant assaults of fresh bodies of invaders, pressing on over the Alps, and perhaps likewise from the seaboard. Their force was extended over a wide area, and thus too weak to withstand the attacks from various sides to which they were exposed. Thus their extensive territory was gradually reduced by the successive encroachments of other peoples. First came the Etruscans, who according to Herodotus (i. 94) were Lydians, who established themselves in the land of the Umbrians. From which side of Italy they made their invasion, whether from the mouth of the Po or from the western coast of what later became Etruria, or whether from both, we have no means of determining. That the Umbrians did not yield without a struggle we cannot doubt. It was only after three hundred of their towns had been captured by the Etruscans that they succumbed. Nevertheless they still retained considerable influence in upper Italy, which, according to Strabo (v. 216), continued down to the time of the Roman conquest. For he says that there was a large Umbrian element in the Roman colonies in the region of the Po, as also some Etruscan. For, according to him, the Umbrians and Etruscans lived in a continual rivalry for the pre-eminence, so that if the one people made an expedition northwards, the other determined not to be outdone. So when the Etruscans had marched against the barbarians who dwelt near the Po, and had soon again been expelled owing to their effeminacy, the Umbrians in turn marched against the conquerors of the Etruscans. In consequence of this alternating struggle for these regions they planted many colonies, some Etruscan, others Umbrian. Most of the colonies were Umbrian because the Umbrians lay closer to the disputed territory. Thus, even though they lost the sovereignty, the Umbrian race probably continued to form a considerable portion of the population of a wide extent of country. At all events, at the time of the Gaulish inroad the Etruscans seem to be in possession of the mouth of the Po. At this time, therefore, Umbria as a state consisted of the region bounded on the W. by the Tiber, on the S. by the Sabines, on the E. by Picenum and the Adriatic, while on the N. it extended close up to the southern or Spinetic mouth of the Po. Scylax describes the Etruscans as extending from the Tyrrhenian Sea to the Adriatic, and represents them as in possession of the ancient Greek town of Spina. How much farther south the Etruscan sway had once reached we cannot determine, but that they had once held this region, as far as Ravenna at least, is rendered probable by the tradition that Ravenna had been founded by a colony of Thessalians who, not brooking the insulting treatment which they received from the Etruscans, gladly admitted some Umbrians, who thus became the possessors of the city. When the great Gaulish inroad took place at the beginning of the 4th century B.C. Etruscans and Umbrians alike suffered severely. Some of the Celtic tribes crossed the Po and formed permanent settlements. The Ananes settled in the Apennines, the Boii between the former and the Adriatic; next came the Lingones; and finally the Senones occupied the seaboard of the Adriatic as far as the Rubicon. This region in Roman times was known as the *Ager Gallicus* (Polybius, ii. 16). But it was not only in the north and west that the Umbrians had been driven back. The early Greeks had included under the name of Umbria the district along the Adriatic, afterwards known as Picenum. This consisted of a fertile region, extending from beyond Ancona to the river Matrino. It is not improbable that the *Ricentes* issued from the Sabine region. Tradition alleged

that the Picentes, led by the woodpecker (*picus*) of Mars, marched forth to occupy what is now the March of Ancona. But it was probably only after a long struggle that this conquest was effected, for from another tradition we learn that the Sabines, after carrying on war against the Umbrians for a long time, at length vowed a sacred spring, and dedicated all the produce of the year to the gods. Then at length they became victorious (Strabo, v. 250). Thus, by the advance of the Gauls from the north and the Picentes from the south, the Umbrians were shut off from the seaboard, and confined to the district known as Umbria in historical times. When Rome began the consolidating of Italy, Umbria consisted of the region bounded by the Ager Gallicus on the N., by Etruria (the Tiber) on the W., by Picenum on the E., and by the Sabines on the S. The Umbrians kept a desperate hold of this district, which lies between the two arms of the Apennines. This position indicates of itself that they had been driven before stronger foes. Henceforward they play but an insignificant part in Italian history. This is explained by the physical formation of their country. It is an extremely mountainous region, with a few small plains between, which were noted for their fertility. Hence arose a number of small but thriving communities, none of which had the capacity of developing into a leading state such as Rome became for the Latins. Their want of seaports likewise excluded them from trade, the mouths of all the rivers which flowed from their country being in the hands of their enemies.

Of the Umbrians' political and municipal organization little is known. In addition to the city (*lota*) they seem to have had a larger territorial division in the *tribus* (tribu, acc.) as we gather from Livy (xxxi. 2, per Umbrium quam tribum Sapiunam vocant; cf. xxxiii. 37) and from the Eugubine Tables (trifor Tarsinates, vi. B. 54). From the fertility of their land their communities were very prosperous. The olive and vine flourished in their valleys; they grow spelt abundantly; and the boars of Umbria were famous. Ancient authors describe the Umbrians as leading effeminate lives, and as closely resembling their Etruscan enemies in their habits (Theopompus, fragm. 142; Pseudo-Scymnus, 366-8). It is almost certain that each race influenced and modified the other to a large extent. Mommsen has pointed out that the names of many towns in Etruria are Umbrian, a fact which shows how persistent even after conquest was their influence in that region. On the other hand, we have conclusive proof of strong Etruscan influences in Umbria. For instance, they undoubtedly borrowed their alphabet and the art of writing from the Etruscans. Their writing runs from right to left. The alphabet consists of nineteen letters. It has no separate symbols for O, G, Q; the aspirates ϕ and χ are wanting; on the other hand, it possesses forms for Z and V, and has likewise the Etruscan f (8). It also has a symbol ϵ peculiar to itself for expressing the sound of palatal k when followed by either e or i . It is also very probable that they borrowed the art of coining money from Etruria. Two towns are known to have issued coins, which consist entirely of bronze, and belong almost entirely to the series of *aes grave*. The most important is that of Tuder (Todi), which must have been a place of some note. It was a strong fortress on the left bank of the Tiber on the confines of Etruria. Iguvium (Gubbio), which struck coins after the standard of Tuder, was a strong place likewise on the western or Etruscan side of the Apennines. The fact that it is only in towns on the side next Etruria that a coinage is found indicates that it was from the Etruscans they borrowed the art. The Umbrians counted their day from noon to noon. But whether they borrowed this likewise from the Etruscans we do not know (Pliny, ii. 77). In their measuring of land they employed the *vorsus*, a measure common to them and the Oscans (Frontinus, *De Limit.*, p. 30), 3½ of which went to the Roman *jugerum*. When the Romans undertook the conquest of Italy, the most feeble resistance of all was offered to them by the Umbrians. In the great struggle between the Samnite confederacy and Rome Umbria played an insignificant part. It is probable that all through the Second Samnite War their sympathies were altogether on the side of their Samnite kinsmen, and that some assistance was afforded by individual communities. It is not unlikely therefore that it was with a view to keep the Umbrians in check that the Romans planted a colony at Nequinum on the Nar, whose inhabitants were known as Nartes Interamnates, and who are included with the Etruscans, Ispydes, and Tadinates in the list of persons who were forbidden to be present at the sacred rites of Iguvium. At length in 308 B.C. the Umbrians made a vigorous effort to aid the Samnites, which, had

it taken place earlier in the war, might have had the most important influence on the issue of the struggle. As it was, it came too late; the Etruscans had already laid down their arms. The Umbrians, who threatened to march on Rome, were intercepted by Rullianus with the Roman army from Samnium on the upper Tiber, a step which the Samnites now broken could not prevent; and this was sufficient to disperse the Umbrian levies. When the Third Samnite War broke out, the Umbrians took no active part in its operations; but how their sympathies lay is evident from their affording a ready passage to the Samnite army under Gellius Egnatius on its march to Etruria, 296 B.C. When the battle of Sentinum (295) finally crushed the Samnites and Etruscans, Umbria remained in the hands of the Romans. Henceforward the process of Latinizing went on steadily, for by the 1st century B.C. we find them employing the Latin alphabet in copies of the ancient sacerdotal ritual of Iguvium (see EUGUBINE TABLES). We know that the Oscan language only finally expired in the 1st century of our era, and there is no reason for believing that the Umbrian had disappeared much earlier. When the Romans conquered the Senones, 280 B.C., the Ager Gallicus was restored to Umbria, and both together formed under the empire the sixth region of Italy.

Strabo (v. 227) regards Ravenna as the boundary of Umbria. The Via Flaminia passed up through it from Oriculum to Ariminum, along which lay the important towns of Narnia (Narni) Carsulæ (Carsigliano), Mevania (Bevagna), Forum Flaminii, Nuceria, and Forum Sempronii. To the east lay Interamna (Terni), the probable birthplace of Tacitus, Spolegium (Spoleto), and the most important town of Camerinum on the side of the Apennines towards Picenum. On the side towards Etruria lay Tuder (Todi), Iguvium, which occupied a very advantageous position close to the main pass through the Apennines, Ameria (Amelia), and Hispellum (Spello); on the Clitumnus (Clitunno) was Assisium (Assisi), the birthplace of Propertius, whilst far to the north lay Sarsina, the birthplace of Plautus. For the position of the country in the time of Augustus, see vol. xiii. Plate V.

See Bréal, *Les Tables Eugubines*, 1875; Bücheler, *Umbria*, 1883; Kirchhoff, *Griech. Alphabet*, 4th ed., 1887; Head, *Historia Numorum*, 1887. (W. R. I.)

UMMERAPOORA, another form of AMARAPURA (*q.v.*).

UNAO, a British district in the Lucknow division of Oudh, India, under the jurisdiction of the lieutenant-governor of the North-Western Provinces. The area of the district is 1768 square miles, and it is bounded on the N. by Hardoi, E. by Lucknow, S. by Rai Bareilly, and W. by the Ganges. Unao is very flat, and has no features of particular interest. Rich and fertile tracts, studded with groves, alternate with stretches of waste land and plains of barrea *usar*, the whole being intersected with small streams, the water from which is extensively used for irrigation. The Ganges is the only navigable river in the district. The temperature varies from about 75° to 103° in the hot weather, and from 46° to 79° in the cold season. The average annual rainfall is about 34 inches.

In 1881 the population was 899,069 (males 461,167, females 437,902); of these 830,342 were Hindus, 63,677 Mohammedans, and 49 Christians. Unao, the capital and administrative headquarters, 9 miles north-east of Cawnpore, had 9509 inhabitants. The cultivated area of Unao amounted in 1885-86 to 598,131 acres, and 289,356 acres were returned as cultivable. The principal crops are rice, wheat, and other food grains, cotton, sugar-cane, and indigo. The cultivation is mainly dependent on irrigation. The principal exports are grain of all kinds, gur, ghi, tobacco, and a little indigo and saltpetre; and the chief imports are piece goods, salt, iron, cotton, spices, &c. The gross revenue of the district in 1885-86 amounted to £183,083, the land yielding £144,914. During the mutiny of 1857-58 Unao was the scene of several severe engagements between General Havelock's little army and the rebels. On the death of Rájá Jasa Sinh, one of the leading rebels, and the capture of his two sons, the whole family estates were confiscated, and the villages either restored to their former owners or given to other landholders for their loyalty.

UNDULATORY THEORY. See OPTICS and WAVE THEORY.

UNGVAR, chief town of the county Ung, in the north-east of Hungary, stands on the river Ung. It is the seat of the bishop of Munkács, and has a fine Greek cathedral, an episcopal seminary, a lyceum, a gymnasium, and also a teachers' college, a county hall, and an interesting ancient castle. The town and district produce good wine in large quantity, and abound in mineral springs. There is a good trade in timber and china clay. The population in 1886 was 13,460.

UNICORN, an animal with one horn. The name is applicable and has sometimes been applied to the rhinoceros, which is, for example, the Sumatran unicorn of Marco Polo. But the figure usually associated with the name is the well-known heraldic one of an animal with the form of a horse or ass, save that a long straight horn with spiral twistings, like the tusk of the narwhal, projects from its forehead. The belief in the existence of a one-horned animal of this kind goes back to Aristotle (*Part. An.*, iii. p. 663), who names as one-horned "the oryx and the ludian ass." Later descriptions of the Indian unicorn, e.g., that of Ælian (*Nat. An.*, xvi. 20), are plainly influenced to some extent by accounts of the rhinoceros, but the authority of Aristotle determined the general form ascribed to the animal. The twisted horn, of which Ælian already speaks, seems to have been got by referring to Aristotle's unicorn actual specimens taken from the narwhal; see Yule's *Marco Polo*, ii. 273. The ancient and mediæval lore of the subject may be seen in Bochart, *Hierozoicon*, iii. 26. The familiar legend that the unicorn could be taken only by the aid of a virgin obtained currency through the *Physiologus* (see vol. xix. p. 7). The English Bible, following the Septuagint (*μὀνοκέρας*), renders the Hebrew *rēm* (רֵמ) by "unicorn." But two horns are ascribed to the *rēm* in Deut. xxxiii. 17, and the Hebrew word reappears in Arabic as the name of the larger antelopes, probably the *Antilope leucoryx*, while in Assyrian the *rīmu* appears to be the wild ox. There are recent fossil remains in the Lebanon both of *Bos primigenius* and *Bison urus*, though both have been long extinct in Palestine.

UNITARIANISM. The term Unitarianism in its widest sense includes certain lines of the great religious and theological movement or revolution of the Reformation in the 16th century, when this is regarded as the commencement of the process of the humanization of theology and ethics on the basis of the autonomy of the human mind. In another sense the term stands for a set of theological opinions, more or less variable, and yet in their general drift connected, some of them as old as Christianity, and one section of which only is indicated by the term when used as synonymous with Antitrinitarianism. But there is another meaning of the term, a still narrower one, and to Unitarianism in this sense this article must be confined. We must limit ourselves to a brief account of Unitarianism as it appears in ecclesiastical organizations in separation from the orthodox churches. This treatment of the subject is of course incomplete, and would be misleading were the incompleteness not expressly announced. For a marked feature of the late history of the Unitarian churches is the growing tendency they exhibit of working out to their logical results, some of the wider principles of the Reformation to which they ultimately owe their origin, rather than the design of formulating and propagating systems of theology. To not a few modern Unitarian leaders the bond which connects them with a specifically Unitarian organization is the spirit and tendency of the larger movement for which it happens to provide freer play than the orthodox churches, while they repudiate the imputation of belonging to a dogmatic sect. Modern Unitarians have also, both in Europe and America, emphatically and successfully resisted the inclination of some of their number to lay down, though in the most general terms, a creed of Unitarianism. Indeed, in opposing this inclination, it might sometimes seem as if the only essential article of Unitarianism were the maintenance of free inquiry in religion,—an impression, however, which a careful study of the history of Unitarian thought would remove. In the same way such a study would show that Unitarian churches are in agreement on many points of doctrine with early and recent theologians of all churches and sects.

This brief sketch of Unitarianism, as it has appeared in organized religious societies, takes us into but a few countries, and covers but a limited space of time. Poland, Transylvania, England, and America are the only countries in which Unitarian congregations have existed in any numbers or for any length of time. Elsewhere, either the law of the land has rendered their existence impossible, or they have been unnecessary in consequence of the substantial adoption by the existing churches of their principles and doctrines. The former was the case in Italy, Switzerland, Germany, and England in the 16th and 17th centuries, the latter to a certain extent in England in the 18th century, still more in Germany in the 18th and 19th centuries, and in Holland in the present century, as also to a large extent in France in the Reformed Church.

Poland (1565-1658).—The Unitarians, under the names of Arians, Samosatensians, Pinczewians, were formed into a separate church in 1565 by their exclusion as Antitrinitarians from the synods of the Trinitarian Protestants. Very early in the progress of the Reformation in Poland individuals had arrived at heterodox opinions on baptism and the Trinity, very much under the influence of the heterodox Italian refugees in Switzerland, some of whom visited Poland (Lelio Sozzini, 1551 and 1558; Paul Alciati, 1561; G. V. Gentile, 1561; Biandrata, 1555). Gonesius and Gregory Pauli were the first to openly preach Antitrinitarian doctrine. After their separation from the orthodox, the Polish Unitarians developed divergent views as to the nature of Christ, as to the lawfulness of paying divine worship to Him, as to the subjects of baptism (infants or adults), and as to the relation of Christians to the state. On the first point some were Arians and others Humanitarians, while those who claimed divine worship for Christ were called *Adorantes* and those of the opposite view *Nonadorantes*. An epoch in the history of the party was made by the arrival of Fausto Sozzini at Cracow in 1579 (see Socinus). He succeeded in converting the great majority of the churches to his views and in silencing the dissentients. Henceforth the Polish Unitarians adopted the Socinian practice of paying worship to Christ, the Socinian view of the necessity of baptism and of the Christian's duty towards the state. They rapidly became a numerous and powerful body in Poland, distinguished by the rank of their adherents, the ability and learning of their scholars, the excellence of their schools, and the superiority and wide circulation of their theological literature. Racow, the theological centre of the Socinians, with its school and printing presses, obtained a world-wide fame. It was there that the *Racovian Catechism* was published (1605 in the Polish language, 1608 in German, and 1609 in Latin). But before the death of Fausto Sozzini (1604) the situation of the Unitarians became more difficult, and in 1611 the Jesuits obtained their first open triumph over them. In the rapid course of the Catholic reaction, which was not resisted by the orthodox Protestants as long as the Socinian heretics only suffered, the church and school at Lublin, the most important place next to Racow, were first put down (1627), and Racow, with its church, school, and printing-press suffered the same fate in 1638. The final blow to the whole body followed in 1658, when all adherents of "the Arian and Anabaptist sect" were commanded to quit the kingdom within two years. A few renounced their faith, but the large majority fled into Transylvania, Prussia, Silesia, Holland, and England.

Transylvania (1568-1887).—Next to Poland Transylvania was the most important seat of Unitarianism. It was there the name was first used by the sect as its own designation, and it is there only that the sect has had a continuous existence down to our own time. It is generally considered that the Italian refugee Biandrata was the founder of Transylvanian Unitarianism, but the present representatives of the body claim for it a nobler and domestic origin. Biandrata attended John Sigismund as a physician in 1560 and under his influence Unitarianism made rapid progress. In 1568 its professors, favoured by the king and many magnates, after separating from the orthodox church, constituted themselves a distinct body under the distinguished man Francis David, who is now regarded as the apostle of true Transylvanian Unitarianism. Their principal centre was Klausenburg (Kolozsvár), where they had a large church, a college, and a printing-press. But the same conflict between a more radical and a more conservative tendency which appeared amongst the Unitarians of Poland greatly disturbed the churches of Transylvania, particularly with regard to the worship of Christ. On the side of the *Adorantes* was Biandrata, and on that of the *Nonadorantes* David. The party of David succumbed to force and fraud, and he himself died in prison a martyr to his convictions. Gradually the Socinian view prevailed, though in 1618 an old order to worship Christ required reinforcement. In the latter half of the 18th century the more logical view of David entirely disappeared. Under the Austrian dynasty the Unitarians

were often exposed to great trials, until Joseph II. secured to them their rights and privileges. An official confession of faith of the year 1787 remains, with some modifications, essentially Socinian. But of late years the Transylvanian Unitarians have been in close relation with their co-religionists in England and America, some of the ministers having been educated at Manchester New College, and in consequence their theology is becoming essentially modern. The number of members was 32,000 in 1789, in 1847 40,000, distributed in 104 parishes with 120 pastors. Their present number is 53,539 in 106 parishes. Their chief centres are Kolozsvár, Thorda, and Keresztur, where they have excellent schools.

England (1773-1837).—For two and a half centuries previous to the rise of organized Unitarianism in England, opinions commonly called by this name found numerous individual advocates and some martyrs. John Bidle (1615-62) published catechisms of Unitarian doctrine, translated Socinian works, and publicly discussed and preached an English form of Socinianism. But the severity of the law against Antitrinitarians, coupled with the gradual growth of free opinion in the Established Church and amongst the Presbyterian congregations, made the formation of separate Unitarian churches impossible, and, as was felt, less necessary for another hundred years. The adoption of a completely Humanitarian view of Christ's person by a few solitary individuals (Lardner 1730, Priestley 1767, Lindsey 1773), assisted by the awakened earnestness of the time, led to their formation. Lindsey resigned a valuable living in Yorkshire, and gathered the first professedly Unitarian church in London. Other clergymen followed his example, and amongst the Presbyterians several ministers, like Joseph Priestley, exchanged their Arian for Humanitarian views. This process went on with deep permanent effects in some of the Dissenting academies. In the year 1791 was formed the Unitarian Book Society for the distribution of literature, and several provincial associations originated about the same time. In 1806 the Unitarian Fund Society was established, with the object of promoting Unitarian Christianity by direct mission work. In 1818 arose another society for protecting the civil rights of Unitarians. These various societies were consolidated in 1825 under the name of the British and Foreign Unitarian Association, which has now its headquarters in the building formerly used as Lindsey's chapel and residence in Essex Street, London. Early in this century nearly the whole of the old Presbyterian congregations, which, unlike those of the Baptists and Independents, had undogmatic trust-deeds, passed through the stages of Arminianism and various forms of Arianism into Socinianism in its peculiar English and mainly Priestleyan form. The penal laws against Antitrinitarianism, which had long been obsolete, were repealed in 1813, and in 1844 the right of Unitarians to the chapels which they held in succession from their Presbyterian forefathers was legally secured to them by the Dissenters' Chapels Act without altering their undogmatic trust-deeds. Though these congregations, popularly known as Unitarian, on principle declined to restrict the progress of thought by imposing on either their ministers or members any dogmatic statements of belief, the generality of them adopted with some modifications the theological system of Priestley, which was a combination of Locke's philosophy with the crudest rationalistic supernaturalism. With the rise of a more spiritual philosophy in Germany, which bore fruit in England and America before the close of the second decade of the century, the theology of English Unitarianism underwent a radical change, very much in the first instance under the influence of Dr Channing's writings. Without at all sacrificing its critical and rational bent, a deeper emotional and spiritual element was introduced into it, which gradually, at the cost of some years of internal conflict, dispossessed the purely external and supernaturalistic Socinian and Priestleyan legacy. English Unitarian theology was thereby brought into close sympathy with modern scientific theology in Germany and elsewhere. This great and saving transformation was mainly due directly to James Martineau, J. J. Taylor, and J. H. Thom, aided by the writings of Channing and then of Theodore Parker. One consequence of the greater substantial agreement of the present theology of the larger number of the Unitarian churches with the scientific theology of the century is that not a few representatives of these churches disclaim the name Unitarian as one tending to perpetuate divisions which have really no right to continued existence. The main reason for continued separation from the larger liberal churches, whether Established or Dissenting, earnestly urged by many Unitarians of this class, is the use in those churches of theological formulæ which modern theology regards as of historic interest only. The number of congregations in England and Wales generally described as Unitarian is about 300, nearly half of which date from between 1662 and 1750, and nearly all of which have undogmatic trust-deeds. Their constitution is purely congregational. For the education of their ministers they have Manchester New College, London (strictly undenominational), the Unitarian Home Missionary Board, Manchester, and Carmarthen College, supported and managed by the Presbyterian Board in London, but practically Independent and Unitarian. The organs of the body are *The Inquirer*, *The Christian Life*, *The Uni-*

tarian Herald (weeklies), and *The Christian Reformer* (monthly). In Scotland there are 7 Unitarian congregations and 2 Universalist, the latter being, as in America, Unitarian in doctrine. In Ireland the number is about 40, being nearly all Presbyterian in constitution. They are much stronger in the north than in the south of Ireland. In the north Antitrinitarian views began to spread about 1750; but the first congregation at Dublin traces its Unitarianism back to Thomas Emlyn, who was imprisoned for his Arian opinions in 1702 at the instigation of orthodox Dissenters.

United States (1815-1887).—In the United States Unitarianism had no organized existence previous to 1815, and as in England at the present time the name has always covered great differences of opinion within a common outline of belief or common drift of religious thought. Historical American Unitarianism represents "the liberal wing of the Congregational body." Of the existing 370 churches 120 or more were originally the parish churches founded by the Puritan Congregationalists, which, like the Presbyterian congregations in England, passed gradually from Calvinism through Arminianism to Unitarianism, of which Harvard College became the spiritual centre. In 1812 there was but one church in America, professedly Unitarian (that of Kieg's Chapel, Boston), though the ministers of Boston generally held Unitarian views. In 1815 Belsham's account of the "State of the Unitarian Churches in America" (in his *Life of Lindsey*, London, 1812) led to a controversy, the issue of which was the distinct avowal of Unitarian principles on the part of the liberal clergy of New England. Dr Channing came forward as the prophet and champion of American Unitarianism, though the older he grew the more emphatically he repudiated sectarianism in every form. The Congregational body was thereby split into two sections, one of which styled themselves Unitarian Congregationalists. In 1825 the American Unitarian Association was formed, mainly for the diffusion of Unitarian literature and the support of poor congregations. At that time the Unitarian churches numbered about 122. Twenty years later they were some 230, while now they are about 370. The theological colleges of the body are the Divinity School of Harvard University, which is, like Manchester New College, undenominational, and the Theological School of Meadville. As in England so in America the theology of Unitarians has passed through marked changes, which have been attended by conflicts more or less acute. From 1815 to about 1836 a Biblical, semi-rationalistic semi-supernaturalistic theology prevailed, in the heart of which Channing's elevated ethical ideas were fermenting and slowly preparing a new birth. From 1836 forces such as Biblical criticism, Carlyle and Emerson's "transcendentalism," and Theodore Parker's "absolute religion" opened the era of modern theology, bringing American Unitarianism into living touch with the philosophy and theology of Germany. An effort in 1865 to bring the right and left wings of the body into a closer confederation with a more pronounced profession of Christianity led to the formation of a Free Religious Association on the broad basis of the love of truth and goodness. In the Western States the same controversy as to the basis of religious association has been raging for more than ten years. In May 1886 a resolution was passed by the Western Unitarian Conference by a majority of more than three-fourths adopting a purely ethical and non-theological basis. This led to a split in the body, and the formation of a new Western Association on a distinctly Christian platform. The left wing of American Unitarians show greater sympathy with recent scientific speculation and less fear of pantheistic theories than is the case with English Unitarians. The organs of the body are *The Unitarian Review* (Boston), *The Christian Register* (Boston), and *The Unitarian* (Chicago).

Literature.—On Unitarianism in general, see Fock's *Der Socinianismus*, Kiel, 1847; Wallace, *Antitrinitarian Biography*, London, 1850; *Unitarianism exhibited in its Actual Condition*, edited by J. R. Beard, London, 1846. On Socinianism and Unitarianism in Poland and Transylvania: the above works; the historical sketch of Thomas Rees in his translation of the *Racovian Catechism*, London, 1682; J. J. Taylor in *Theological Review*, Jan. 1869; *Report of an Official Visit to Transylvania*, by Alexander Gordon, London, 1879. On Unitarianism in England: Wallace and Beard's works; J. J. Taylor, *A Report of the Religious Life of England*, London, 1846, 3d ed., 1876; James Martineau, *The Three Stages of Unitarian Theology*, London, 1869; Bonet-Maury, *Early Sources of English Unitarian Christianity*, English trans., London, 1884; *Unitarian Christianity, Ten Lectures on the Positive Aspects of Unitarian Thought and Doctrine*, with preface by Rev. J. Martineau, D.D., London, 1831. On Unitarianism in America: Fock; Beard; J. H. Allen, *Our Liberal Movement in Theology*, 2d ed., Boston, 1883; *The Year-Book of the Unitarian Congregational Churches for 1857*, Boston, 1856; Count Goblet d'Alviella, *The Contemporary Evolution of Religious Thought in England, America, and India*, English trans., 1885. (J. F. S.)

UNITAS FRATRUM. See MORAVIAN BROTHERS.

UNITED BROTHERS IN CHRIST, a body of Protestant Christians in the United States of America, which in 1886 included 4332 organized churches (4078 in 1877), 185,103 members (143,881 in 1877), 1378 itinerant ministers, 890 local preachers, 3169 Sunday schools, with 28,547 teachers and 179,729 scholars. The total value of church property held by the denomination was \$3,345,064; the sum raised for salaries, church building expenses, col-

heritors. The Act itself had been passed by the Assembly, although the presbyteries to which it had been previously submitted as an overture had disapproved of it by a large majority; and in accordance with a previous Act (1730), which had taken away even the right of complaint, the protests of the dissentient majority were refused. In the following October Ebenezer ERSKINE (*q.v.*), minister of Stirling, who happened to be moderator of the synod of Perth and Stirling, preached a synod sermon, in the course of which he took occasion to refer to the Act in question as in his opinion unscriptural and unconstitutional.¹ Some of his expressions were objected to by members of synod because "tending to disquiet the peace of the church and impugning several Acts of Assembly and proceedings of church judicatories," and after long and keen debate it was resolved that he should be censured for them. This judgment, on appeal, was affirmed by the Assembly in May 1733, whereupon Erskine protested to the effect that he held himself still at liberty to teach the same truths and to testify against the same or similar evils on every proper occasion. This protest, in which he was joined by William Wilson, Alexander Moncrieff, and James Fisher, ministers at Perth, Abernethy, and Kinclaven respectively, was regarded by the Assembly as contumacious, and the commission of Assembly was ordered to procure its retraction or to proceed to higher censures. In November accordingly the protesting ministers were severed from their charges, their churches declared vacant, and all ministers of the church prohibited from employing them in any ministerial function. They replied by protesting that they still adhered to the principles of the church, though now obliged to "make a secession from the prevailing party in ecclesiastical courts," maintaining their continued right to discharge all the duties of the ministerial and pastoral office "according to the word of God, the Confession of Faith, and the constitution of the church," and appealing to the "first free, faithful, and reforming General Assembly of the Church of Scotland." In December 1733 they formally constituted themselves into a presbytery, but for some time their meetings were devoted almost entirely to prayer and religious conference. In 1734 they published their first "testimony," with a statement of the grounds of their secession, which made prominent reference to the doctrinal laxity of previous General Assemblies. In 1736 they proceeded to exercise "judicial powers" as a church court, published a "judicial testimony," and began to organize churches in various parts of the country. Having been joined by four other ministers, including the well-known Ralph Erskine, they appointed Mr Wilson professor of divinity. For these acts proceedings were again instituted against them in the Assembly, with the result that, having disowned the authority of that body in an "act of declinature," they were in 1740 all deposed and ordered to be ejected from their churches. Meanwhile the members of the "Associate Presbytery" and its adherents steadily increased, until in 1745 there were forty-five congregations under its jurisdiction, and it was reconstituted into an "Associate Synod." A violent controversy arose the same year respecting the religious clause of the oath taken by burghesses in Edinburgh, Glasgow, and Perth ("I profess and allow with my heart the true religion presently professed within this realm and authorized by the laws thereof"), and resulted in April 1747 in a "breach," when two bodies were formed; each claiming to be the "Associate Synod"; those who condemned the swearing of the burghess oath as sinful came to be popularly known as "Antiburghers," while the other party, who contended that abstinence from

it should not be made a term of communion, were designated "Burghers." The Antiburghers not only refused to hold further friendly conference with the others, but ultimately went so far as to pass sentences of deposition and the greater excommunication on the Erskines and other ministers who held the opposing view.

The Associate (Antiburgher) Synod held its first meeting in Edinburgh in the house of Adam GRIB (*q.v.*) on April 10, 1747. It grew with considerable rapidity, and in 1788 had ninety-four settled charges in Great Britain and nineteen in Ireland, besides a presbytery in America. For purposes of organization it was formed in that year into four provincial synods, and took the name of "The General Associate Synod." The "new light" controversies as to the province of the civil magistrate in matters of religion led to the publication of a revised testimony in the "voluntary" sense in 1804, and in consequence M'Crrie, the historian of Knox, with three other brethren, withdrew to form the Constitutional Associate Presbytery.

The Associate (Burgher) Synod held its first meeting at Stirling on June 16, 1747. The number of congregations under its charge rapidly increased, and within thirty years there were presbyteries in connexion with it in Ireland and North America, as well as throughout Scotland. In 1782 the American presbyteries took the designation of the Associate Reformed Church in America. About the year 1795 the "voluntary" controversy respecting the power of the civil magistrate in matters of religion arose within this synod also, and a large majority was found to have adopted "new light" views. This led in 1799 to the secession of the "Associate Presbytery," which in 1805 took the designation of the Associate Synod or Original Burgher Synod.²

In 1820 the General Associate or Antiburgher Synod (to the number of 129 congregations³) united with the 154 congregations of the Associate or Burgher Synod. The body thus constituted, "The United Secession Church," had increased by 1847 to 400 congregations, the whole of which united in that year with the Relief Synod to form the United Presbyterian Church.

(2) *Relief Church*.—The Presbytery of Relief was constituted in 1761 by three ministers of the Church of Scotland, one of whom was Thomas GILLESPIE (*q.v.*), who had been deposed by the Assembly in 1752 for refusing to take part in the intrusion of unacceptable ministers. The number of congregations under its charge increased with considerable rapidity, and a Relief Synod was formed in 1773, which in 1847 had under its jurisdiction 136 congregations; of these 118 united with the United Secession Church in that year. The Relief Church issued no distinctive "testimonies," and a certain breadth of view was shown in the formal declaration of their terms of communion, first made in 1773, which allowed occasional communion with those of the Episcopal and Independent persuasion who are "visible saints." A Relief theological hall was instituted in 1824.

See M'Kerrow, *History of the United Secession Church, 1841*; Struthers, *History of the Relief Church, 1843*; Mackelvie, *Annals and Statistics of the United Presbyterian Church, 1873*.

UNITED PROVINCES. See HOLLAND.

² The majority of this synod joined the Church of Scotland in 1839. The small minority which still retained the name joined the Original Seceders (see next note) in 1842, the resultant body assuming the designation of United Original Seceders. A small majority (twenty-seven ministers in all) of the Synod of United Original Seceders joined the Free Church in 1852. A synod of this name still exists, having under its jurisdiction four presbyteries, with twenty-nine charges (of which two are in Ireland).

³ A dissentient remnant (eight congregations) of the General Associate Synod united with the Constitutional Associate Presbytery in 1827, the resultant body being called the Associate Synod of Original Seceders.

¹ The passing of the Act was certainly unconstitutional; it was rescinded in 1734, "because not made according to former Acts."

PART I.—HISTORY AND COLONIZATION.

I. DISCOVERY AND SETTLEMENT OF AMERICA.

Early voy-
ages and
discoveries

1. THE date on which America was first discovered by Europeans is a matter of uncertainty. The legends respecting the early voyages hither are numerous, but the most ancient of them are doubtless fictions. No account of the discoveries, previous to the time of Columbus, can be relied upon, excepting those made by the Icelanders, who, about the year 1000, attempted to colonize the country, but without any permanent success. It was not until the coming of Columbus, in 1492, that any benefit was derived by the old world from the discovery of the great continent of America.

The success of Columbus aroused the spirit of enterprise, and other voyages were made, notably those of the Cabots in 1497-98, Ponce de Leon in 1512, and Verazzano in 1523, under the auspices of the English, Spanish and French governments, respectively. The Spaniards gave the name of "Florida" to North America, while the French called it "Canada or New France," and these two nations in some way conceived the idea that the whole country belonged to them.

Efforts
to found
colonies.

2. But the English had not forgotten that the Cabots, with English ships, had first reached the mainland of North America, and from this fact they laid claim to the northern part of that continent. Many unsuccessful attempts were made by Englishmen to found colonies. The first of these was Sir Humphrey Gilbert who made two efforts, one in 1578, and the other in 1583, without success, and lost his life in a storm while returning home. Sir Walter Raleigh, Gilbert's half-brother, obtained a patent from Queen Elizabeth, and in 1584 sent out two ships, commanded by Amidas and Barlow, to fix upon a place for a settlement. They explored the coast of what is now North Carolina. Struck with the beauty and fertility of the country, they gave a most flattering account of it on their return home, and Raleigh named it Virginia, in honor of the "virgin queen" Elizabeth. In the spring of 1585 he sent out a colony which settled on Roanoke Island, but it was starved out in the same year. Again, in 1587, Raleigh sent out another colony under White to the same place, but it entirely disappeared, and no trace of it could be found when White came back three years later. In 1602, Gosnola, with twenty colonists, took a short and direct route, and came upon the coast of Massachusetts. He wintered upon an island in the vicinity and then went back, taking the colonists, who refused to stay any longer, with him.

The Plym-
outh and
London
companies.

3. In 1606, James I. granted a charter to two companies formed in England. This charter gave them the whole continent of North America, from the thirty-fourth to the forty-fifth parallel of latitude. The one called the Plymouth Company was to take the northern half, and the other, the London company, the southern half, and their nearest settlements must be a hundred miles apart. Moreover, each colony was to be governed by a resident council appointed by the king, with power to choose one of their own number for president.

The
Jamestown
colony.

4. The earliest attempts at colonization under the new English patent were made by the Plymouth company, but the expeditions which they sent out in 1606, 1607 and 1608, were unsuccessful, and it was left for the London company to found the first permanent English settlement in the new world. In 1606 this company sent out about a hundred men, mostly adventurers, in a fleet of three vessels commanded by Christopher Newport. Being driven by a storm into Chesapeake Bay, he found there a fine river which he named the

James river, after the king, and choosing a low peninsula, he there planted the colony of Jamestown on May 13, 1607. But very soon the colonists became dissatisfied. Dissensions arose and Wingfield, president of the council, was deposed. They suffered from starvation, and had it not been for the indefatigable exertions of Captain John Smith, the settlement would have entirely broken up. The colonists experienced many vicissitudes, but after a few years they became prosperous and the permanent settlement of Virginia was established. In the meantime, the policy of the London company toward the settlers became more liberal, and a representative government was granted them in 1619, which was the beginning in America of government by the people. In 1619 a Dutch vessel brought in some negroes purchased by the planters, and thus slavery was introduced into the English colonies.

Plymouth
colony.

5. The first settlers of Massachusetts were a band of Puritans, or Separatists, as they were called, because they had separated from the Church of England. Being driven from England, they sought refuge in Holland; but wishing to find a home in the new world for themselves and their children, they returned to England again, and from thence a band of 102 set sail in the Mayflower, and landed at Plymouth, in America, December 21, 1620. The little colony survived the rigors of a northern winter, the burden of poverty, and the lack of food, and became permanently established.

Massachu-
setts Bay
colony.

6. In 1628 John Endicott, with a company, made a settlement at Salem; other towns, also, sprang up around it, and these were all united under a charter obtained from Charles I, with the name of the Massachusetts Bay colony. These two colonies, Plymouth and Massachusetts Bay, were for many years independent of one another; but were at last united in 1692, under the name of Massachusetts.

7. In 1624, the London company surrendered its charter to the king, who made a disposition of the territory which they had controlled, as he thought fit. A part of it was granted to Lord Baltimore in 1632, and received the name of Maryland. All the country between the English settlements of Virginia and the Spanish posts in Florida was called Carolina. This territory comprised the present states of North Carolina, South Carolina, Georgia, Alabama and part of Florida. In 1729 North and South Carolina were organized, and in 1732 Georgia was colonized by James Oglethorpe, and Savannah founded. Thus, out of the territory, originally granted to the London company, five colonies had been formed.

Maryland
Carolina
Georgia.

8. To the territory granted to the Plymouth company, the name New England had been given by Captain John Smith in 1614. The founding of the Plymouth and Massachusetts Bay colonies has already been mentioned. The greater number of the people who came from England in the great Puritan migration, settled in the latter colony. At the same time many found it expedient to seek other parts of New England. Now only did new-comers thus try new places, but the older settlements began to send out companies. In 1623 New Hampshire was first colonized under a grant to Captain John Mason and Sir Ferdinand Gorges. Connecticut and Rhode Island also became colonies, and were afterward chartered by the crown in 1662 and 1663. Thus, out of that part of the country originally granted to the Plymouth company, were formed the colonies of Massachusetts, Connecticut, New Hampshire and Rhode Island. Maine was considered a part of Massachusetts and was not counted as

Island.

a separate colony among those that finally combined to form the original thirteen states. The territory now occupied by Vermont was claimed in part by New York, in part by New Hampshire, and she did not become a separate state until after the revolutionary war.

9. As has been said, the charter granted to the London and Plymouth companies provided that their nearest settlements should be one hundred miles apart, thus leaving a strip of territory between the two main grants which was really neutral ground, and was never appropriated by either company. The Spaniards had confined their explorations to the south and made settlements there, but they claimed the whole continent north of them. The French had established themselves in the north, and held Canada and part of the northern states; they claimed everything south of them and called the whole New France. The English settlements were midway between the French and Spanish, and the English claimed everything from New England and Carolina westward to the Pacific, naming it all Virginia. Thus, so far, North America was divided between the three European powers, England, France and Spain.

The rise of the Dutch power.

10. A fourth power now appeared. In 1609, the Dutch East India company sent out Henry Hudson, an Englishman in their employ, in the ship named the "Half Moon" to make discoveries in America. He reached the continent and explored the coast as far south as Virginia, then turning to the north he entered the mouth of the river which bears his name, and sailed up the stream as far as the present city of Albany. Having completed his discovery he returned home. Upon the strength of Hudson's explorations, Holland laid claim to all the land along the great river, and called the whole territory New Netherlands. In 1621, the Dutch West India company was formed, and immediately received large grants of land on both sides of the Hudson extending from the Connecticut river on the north to the Delaware river on the south. Previous to this, however, a Dutch settlement had been founded in 1614, on Manhattan Island, the present site of New York City, which was afterwards called New Amsterdam.

The Swedish colony.

The Dutch now began to establish settlements and trading posts in their possessions, which included that neutral territory lying between the original grants to the London and Plymouth companies. In 1638, Delaware was colonized by the Swedes, who founded a settlement on Delaware Bay, which was called New Sweden. But disputes about a territory arose between the Swedish and Dutch colonists, which led to a war between them, ending in the final surrender of New Sweden to the New Netherlands in 1655.

End of the Dutch power.

11. But New Netherlands was soon destined to change hands. The introduction of a foreign element between the northern and southern portions of the English colonies had always been recognized as a source of trouble and danger, and in fact the Dutch settlers, occupying territory claimed by the English on both sides of them, were continually involved in disputes with their neighbors, especially with those of Connecticut. War having arisen between England & Holland, the English king, Charles II, determined to seize the Dutch possessions in North America; so in 1664 he granted the whole of their territory to his brother, the Duke of York. In the same year the duke sent out three vessels under the command of Colonel Nichols, who, upon arriving in the harbor of New Amsterdam, demanded a surrender of the territory to his English majesty. Governor Stuyvesant, being unprepared for defense, complied with the demand, and the whole country passed into the hands of the English. In honor of the duke, the name New Amsterdam was changed to New York, and the whole territory received the same name.

New York

12. After the Duke of York had gained possession of the Dutch territory, he in turn sold the southern part of

it to two English noblemen, Lord Berkely and Sir George Carteret. This tract, in compliment to Sir George, who had been governor of the island of Jersey, was called New Jersey. A liberal constitution was formed by the proprietors, and Philip Carteret appointed governor. The Dutch had several small trading stations in this territory at an earlier date, and the Quakers, having bought the rights of Lord Berkely, came soon afterwards. In 1676 a division was made, the Quakers taking West Jersey and Carteret retaining East Jersey, which became Puritan. In 1702 the colony was given up by the proprietors to Queen Anne in order that a royal governor might be appointed, and the two provinces were then made into one.

13. The territory comprised within the limits of the state of Pennsylvania was granted in 1681, by Charles II to William Penn, son of Admiral Penn, in payment of an old debt due from the crown to the Penn family. In 1682, the present state of Delaware, then known as the "Territories," was added to his domain, and regarded as a part of Pennsylvania, but in 1703 it became a separate colony. Thus, the formation of the original thirteen colonies has been described. The London Company's territory furnished five, viz: Virginia, Maryland, North Carolina, South Carolina and Georgia. The Plymouth Company's grant, comprising New England, gave four, viz: Massachusetts, Connecticut, Rhode Island and New Hampshire. The neutral territory included between the original grants to the two companies furnished four, viz: New York, New Jersey, Pennsylvania and Delaware.

Pennsylvania.

Delaware.

The original thirteen colonies.

14. It is in vain to look for well balanced constitutions in the earlier periods of colonial history. England herself can scarcely boast of having a fixed constitution previous to the revolution in the year 1688, a period subsequent to the settlement of the colonies. The legal and constitutional history of the colonies, therefore, affords but little instruction. As has been shown, in less than eighty years from the first permanent English settlement in North America, the two original patents granted to the Plymouth and London companies were divided and subdivided into twelve distinct and unconnected provinces, and in fifty years more a thirteenth, Georgia, was added to the southern extreme of the previous establishments. To each of these, after various changes, there was ultimately granted a form of government resembling in its most essential parts, as far as local circumstances would permit, that which was established in the parent state. Without entering into details, it may be observed, in general, that agreeably to the spirit of the British constitution, ample provision was made for the liberty of the colonists. The colonial forms of government were, in the main, unhampered by the royal prerogatives. In some of the provinces the inhabitants chose their own governors and all other public officers, and their legislators were under little or no outside control. In others, the crown delegated most of its powers to particular persons, who were also invested with the property of the soil. To those colonies which were most immediately dependent upon the king were granted the same rights and privileges as their fellow subjects in the mother country.

The constitutions of the colonies

15. During the period of colonization, three forms of government were observable—proprietary, charter and royal. The proprietors of land grants offered liberal governmental privileges to those who were willing to settle on their lands, and thus several of the colonies became proprietary. These were Maryland, Carolina, Georgia, New York, New Hampshire, Pennsylvania (also including Delaware) and New Jersey. Some of the proprietors becoming tired of their grants, surrendered them to the crown, and the colonies, established in such territory, became royal provinces, over which the king appointed governors with the power of absolute veto on legislation. The colonies thus coming under the royal authority were, North Carolina, South

Forms of government.

Carolina, Georgia, New York, New Hampshire and New Jersey. Virginia became a royal province about 1620. Three colonies, only, remained proprietary down to the Revolution; these were Pennsylvania, Delaware (now a separate colony) and New Jersey. The colonies organized under a charter government were Massachusetts, Connecticut and Rhode Island. These charters were granted by royal authority, and gave the colonists the right of choosing their own officers, and making and enforcing their own laws as they thought best. Upon the accession of James II to the throne, he held that all the colonial lands in New England belonged to the crown. Accordingly he sent over Sir Edmund Andros, who was to revoke all the charters, and assume the governorship of the province of New England and New York. The charter of Massachusetts was annulled in 1684, but Connecticut and Rhode Island retained theirs in spite of the royal authority. In 1692, a new charter was granted to Massachusetts, but under its conditions she partly became a royal province.

Colonies under a charter government.

English policy toward the colonists;

Growth and prosperity of the colonies.

Causes of increase in population.

Social life and customs of New England.

16. For the first century and a half after the settlement of the colonies, England, in the main, exercised a wise and liberal policy toward them. She allowed them to govern themselves by such laws as their local legislatures thought necessary, and left their trade open to every individual in her dominions. She also gave them full permission to pursue their respective interests in such a manner as they thought proper, and reserved little for herself but the benefit of their trade, and that of a political union under the same head. This indulgence had a very marked effect upon the growth and prosperity of the colonies. They increased in wealth, numbers and resources with a rapidity never before equalled in ancient or modern history. They extended their settlements 1,500 miles along the sea coast, and 300 miles to the westward. In the short space of 150 years their numbers increased to three millions, and their commerce to such a degree as to be more than a third of that of Great Britain, although much restricted by the navigation laws imposed upon them by the mother country. The rapid increase in the population of the colonies was principally owing to internal causes. Though somewhat accelerated by the influx of strangers previous to 1630, yet, after that time, immigration formed but a small feature in peopling the country. The hardships of colonial life, which came to be better understood, and the constant struggles between the people and the home government respecting rights and privileges, served as a check to the advent of new comers. Hence the population of the colonies arose mainly from natural increase. In consequence of the equality of fortune and simplicity of manners which prevailed among them, their inhabitants multiplied far beyond the proportion of old nations, corrupted and weakened by the vices of wealth, above all, of vanity, than which, perhaps, there is no greater enemy to the increase of the human species.

17. In the settlement of a new country, many hardships and privations must of necessity be endured, and the American colonists experienced their share of them, more especially those of New England. In that section the climate was more rigorous than in the other parts of the country, and the cultivation of the soil more difficult. The habitations outside of the regular settlements were often far apart, so that intercommunication was infrequent. The dwellings of the settlers were of the ruder sort, being composed of logs, and so imperfectly constructed that they afforded a poor protection against the cold of a New England winter. While the colonists were poor there was necessarily great plainness of living among them. Luxuries were unknown to them, but there was an abundance of the coarser kinds of food. Pork and beans, boiled corn meal and milk, or pork and peas, formed the staple articles of diet. Bread was commonly made of "rye and Indian," and seldom of flour. Tea and coffee were not yet introduced.

but home-made beer and cider were largely used. Being principally of Puritan stock, there were but few secular amusements among them. Dancing, and the theater, or anything approaching it, were forbidden; musical instruments were rare, and no one was allowed to own a set of dice or a pack of cards. In their desire to promote virtue, the Puritans, no doubt, were too austere in their mode of living, yet the standard of morality among them was certainly very high. In the southern colonies life was more easy, as a general thing. A large proportion of the settlers there were men of good family, attracted to the new world by a desire to make money and to enjoy personal freedom. Many of them secured patents for plantations of their own, instead of attempting to improve the lands in common, and brought out laborers to work them at their private expense. The soil was very productive, and the growth of tobacco, rice and indigo formed a great source of wealth, so that luxury abounded in that part of the country to a much greater extent than in any other. The existence of slavery among them caused a great deal of ignorance and idleness, as the wisest of them admitted; but there grew up an aristocratic class, among whom there were many men of high character and energy. The settlers in the region which now forms the middle states principally followed the occupation of farming, the soil and climate being well adapted for the growth of cereals.

18. The religion of the colonists was chiefly Protestant. A majority of them, especially in the north, were of that class of men who, in England, were called dissenters. In New England they were largely Congregational. All the other leading denominations also had their representatives in different parts of the country. In the royal colonies there was a strong tendency towards the Church of England, which became the prevailing religion among them. In Virginia it was established by law. In fact nearly every colony at the outset attempted to establish some form of religious belief on a governmental foundation, and on account of this, as is well known, persecutions at the first arose. But the spirit of religious freedom predominated, and in general, men were left at liberty to worship God according to the dictates of their own consciences.

The religious condition.

Religious freedom.

19. The English colonists were, from their first settlement in America, devoted to liberty, according to English ideas and English principles. After a long struggle between the king and his parliament culminating in the English revolution, the following fundamental principles were settled: "That it was the undoubted right of English subjects, being freemen or freeholders, to give their property only by their own consent. That the House of Commons exercised the sole right of granting the money of the people of England, because that house alone represented them. That taxes were the free gifts of the people to their rulers. That the authority of sovereigns was to be exercised only for the good of their subjects. That it was the right of the people to meet together, and peaceably to consider their grievances, to petition for a redress of them, and finally, when intolerable grievances were unredressed, to seek relief, on the failure of petitions and remonstrances, by forcible means." Upon these fundamental principles thus established, the colonists took their stand, and all encroachments on their rights were met with a more determined spirit of opposition than would have been possible, had they emigrated from the mother country in the preceding century, when the doctrines of the divine right of kings and passive obedience to their will were generally accepted.

The spirit of liberty.

Rights of English subjects.

20. There were many causes favorable to liberty among the colonists. Their removal to so great a distance from the parent government greatly weakened their attachment to their sovereign, and with each succeeding generation that affection became still less marked, and at length was almost entirely lost. Their

Causes favorable to liberty

religion also fostered a love of liberty. They were chiefly Protestants, and all Protestantism is founded on a strong claim to natural liberty and the right of private judgment. The state of society in the colonies was favorable to a spirit of liberty and independence. Their inhabitants, unaccustomed to the distinctions of rank which characterized European nations, were imbued with the idea that all men are by nature equal. All their impressions were calculated to inspire them with a belief that democratic forms of government were by far the best. With rank and titles they had nothing in common; kings, nobles and bishops were unknown to them. They could not easily be persuaded that their grants of land or their civil rights were the gifts of princes. Many of them had never heard of Magna Charta, and those who knew the circumstances of the remarkable period of English history when that great charter was obtained, did not rest their claims to liberty and property on the transactions of that important day. They looked to the Parent of the universe as the source of all their rights. Their political creed was short but sound. They believed that God made all mankind originally equal; that he endowed them with the rights of life, property and as much liberty as was consistent with the rights of others. That all government was a political institution between men naturally equal, not for the aggrandizement of one or a few, but for the general happiness of the whole community. Impressed with sentiments of this nature, they grew up, from the earliest infancy, with that confidence which is well calculated to inspire a love for freedom and a prepossession in favor of independence.

II.—THE CONTEST BETWEEN ENGLAND AND FRANCE.

21. While the English were establishing their colonies along the Atlantic coast, and gradually working their way into the interior, the French were penetrating the continent by the way of the St. Lawrence, taking advantage of the discoveries made by Cartier, Champlain and others. The two great pioneers of French occupation were the fur trader and the missionary. It was about the time of the settlement of Massachusetts Bay that the Jesuit Fathers, who had already been laboring for many years among the Algonquins and Hurons of Canada and New York, began to push their explorations westward with renewed zeal and enterprise, accompanying, and often leading the Canadian fur traders on their long journeys. Among the soldiers, also, who came to New France, as the French possessions in America were called, were men who were intent upon enlarging their king's domains. Several of the Jesuits were martyred. Allouez made known the copper mines of Lake Superior. Dablou and Marquette founded Sault Ste. Marie, the first white settlement in the northwestern states. Marquette, accompanied by the trader Joliet, first reached the upper waters of the Mississippi in 1673.

22. One of the greatest of French explorers was Robert de la Salle, who came out to Canada to seek his fortune. A tract of land was granted him a few miles beyond Montreal, but he was bent upon new discoveries. He secured the aid of some rich men and of Count Frontenac, governor of Canada, and having built some vessels, he explored the upper lakes, made his way to the Illinois river, and erected a fort on the present site of Peoria. At last he made the great journey which he had for some time been planning. He set out from Fort Miami, on Lake Michigan, with a party of Frenchmen and Indians. He dragged his canoes from stream to stream until, after innumerable hardships and dangers, from which he never flinched, he launched them upon the waters of the Mississippi and floated down its current. He explored the great river to its mouth, and in 1682, took possession of the vast territory drained by it and its tributaries in the name of Louis XIV, king of France, and named it Louisiana after him. He then

retraced his course and hastened back to France. The king fitted out an expedition for La Salle that he might establish a colony at the mouth of the Mississippi. The naval commander, Beaujeu, lauded La Salle and his company at Matagorda bay, in Texas, which La Salle supposed at first was the mouth of the Mississippi. Then Beaujeu sailed back and left the colonists to their fate. They built a fort, and La Salle set out to find the Mississippi, but utterly failed. Dividing his men, he left one party in possession of the fort, and with the other endeavored to force his way to Canada, there to obtain relief. He never reached the end of his journey. After suffering terrible hardships, he was treacherously murdered (1687) by some of his own party when on his way. France sent out another expedition under D'Iberville, who (1702) founded Mobile. In 1718 the city of New Orleans was founded by the French Mississippi Company.

23. The French planted military posts at intervals along the great river, and settlements rose up about them. The French colonies and outposts also extended from New Brunswick and Nova Scotia, up the valley of the St. Lawrence, and through the region of the great lakes. Thus the English settlements became enclosed by a cordon of military posts, and at that time it seemed as though the whole continent were destined to become French rather than English. The French also had an advantage from the fact that they had secured the good will of most of the Indian tribes through their own prudent policy and the influence of their missionaries. The English settlers looked upon their French neighbors with jealousy and alarm, for they interfered with the extension of their settlements, especially in the north. In the southern colonies the inconvenience of the French occupancy was comparatively but little felt. Their social characteristics and the nature of their industry were not favorable to western migration, so, as there was nothing to tempt them away from their plantations into the wild interior they kept close to the seacoast. But in the north it was different. There the constant increase of commerce was followed by the increased wealth of the towns, and consequently the lands about them became more valuable. The great bulk of the emigrants who came over landed at the northern ports since trade was more active in the northern colonies. Many of these, being unable to purchase homes near the great centers of trade and the many flourishing settlements, or being impelled by a spirit of enterprise, went in search of new lands farther from the coast. Thus the northward and westward growth of New England and the English conquest of New Netherlands brought the two great rivals face to face.

24. The great struggle between France and England began in 1690. King James II had been dethroned (1688), and William of Orange placed upon the English throne. The French king, Louis XIV, espoused the cause of James, and a war followed, known as King William's War, in which the colonies became involved. Both the French and English colonists made use of Indian allies, and the warfare was marked by the most barbarous excesses. The Indians of Maine and New Hampshire were incited by French traders to attack the English towns. In 1689 Dover was burned. Casco was attacked, but the timely arrival of reinforcements from Massachusetts saved it. All the settlements further east were broken up. In 1690 the war became more earnest. Three war parties of French and Indians were sent out by Count Frontenac from Montreal, Three Rivers and Quebec. The first surrounded the settlement of Schenectady in the night, and put it to the sword. The second destroyed Salmon Falls, New Hampshire, and then in conjunction with the third party, captured Casco.

The English colonies became aroused and determined to punish the invaders. An expedition fitted out under the united efforts of Massachusetts, Plymouth, Connecticut and New York was sent out under Fitz John

French military posts.

King William's war.

France in America.

Robert de la Salle.

Winthrop, against Montreal. An attack made on the town was repulsed by Frontenac. In the meantime Sir William Phipps, with a fleet, sent out from Massachusetts, plundered Port Royal and other French settlements. Then, sailing up the St. Lawrence, he attempted to surprise Quebec. But Frontenac, having defeated the attack on Montreal, reached Quebec before him, and the enterprise failed. The war continued until 1697, when a treaty of peace was made between France and England. Both parties had suffered severely, and neither had gained any real advantage.

Queen Anne's war.

25. The truce between the two great rivals lasted about five years, when war again broke out between them (1702). At once the French and English in America fell to fighting, and the war that followed is called Queen Anne's War. During the five years of peace the French had continued to make settlements in the west. They never lost sight of the great idea which inflamed their ambition, which was to establish a great French-American empire. They had founded Detroit, Mobile and numerous villages on the Mississippi. In the east they had recovered all the places taken from them by the English in the last war, inaugurated new missions, and increased their influence over the Indians. At this time Spain was in alliance with France, and the English settlers found themselves opposed not only by the French in the north and west, but by the Spaniards of Florida in the south. The English colonists directed their first operations against the Spaniards. St. Augustine was captured (1702), but had to be abandoned. Three years later the Christian Indian settlements of middle Florida were destroyed by the English, and the missions entirely broken up.

The war of the north.

26. New England suffered greatly in this war. There was an atrocious massacre at Deerfield in 1704. Haverhill, which had not fully recovered from the massacre of 1697, was plundered and burned a second time, and many of the colonists killed (1708), and the whole of that part of the country was harassed by barbarous foes. Receiving but little help from England, the colonists for several years were unable to undertake any important expeditions. An attack on Charleston, S. C. (1706), by the French and Spaniards, was repulsed. Port Royal was again taken from the French (1710), and with it the most of Acadia, which now became known as Nova Scotia.

Expedition against Canada.

In 1711 an English fleet arrived in Boston to cooperate with the colonists in an attempt to conquer Canada, but all operations in that quarter proved a failure. In 1713 a treaty of peace was signed at Utrecht, by which the English acquired Newfoundland and Acadia. The eastern Indians were also induced to make peace about this time.

27. Many years of peace now followed, during which the colonies increased rapidly in population and advanced in material prosperity. The French still pursued their scheme of building up a great empire in the west. They controlled the valuable fur trade of the whole Mississippi valley. After their expulsion from Acadia they had crossed to the island of Cape Breton, and erected the strong fortress of Louisburg. At Niagara they had a fort commanding the communication between Lakes Erie and Ontario. Natchez was founded in 1716. In 1710 New Orleans was built, and soon became the capital of Louisiana. The French missionaries also continued their conquests in the wilderness of the Mississippi. After several years of peace, France again declared war against England (1744), and immediately began hostilities against the settlements. The campaign which followed is known as King George's war, because it occurred in the reign of George II.

King George's war.

28. The colonists determined to carry on the war by their own means without waiting the uncertain aid from England. An expedition was planned against Louisburg which was successful, and that strong fort-

ress fell into the hands of the Americans (1745). This achievement of untrained soldiers was received with enthusiasm by the colonies, and with astonishment in Europe. The treaty of Aix-la-Chapelle (1748) put an end to the war; and greatly to the disgust of New England, Louisburg was restored to the French in exchange for Madras, in Hindustan, which France had taken from England.

Declaration of war.

29. The colonists had but a short time to reap the benefits of peace, after the treaty already referred to, when the sound of approaching war filled the land with anxiety and gloom. After an interval of about eight years, Great Britain formally declared war against France. The causes leading to this war, which was called the French and Indian war, were the alleged encroachments of the French on the frontiers of the colonies in America belonging to England. The French determined to connect their northern and southern possessions by a line of posts extending along the frontiers of the English possessions, from Lake Ontario to the Ohio, and down the Ohio and Mississippi to New Orleans. Up to the middle of the last century the English had not attempted to explore or settle the regions lying beyond the Blue Ridge and Alleghany mountains, but in 1749 a company of traders from London and Virginia, called the Ohio company, obtained a grant from the crown of 600,000 acres of land on the east bank of the Ohio river, in what is now West Virginia and Pennsylvania. In the years immediately following they made surveys and established a few settlements. One of the surveyors was George Washington.

The Ohio Company.

30. The French, regarding these operations of the Ohio Company as an encroachment upon their territory, strengthened the fort at Niagara, built another at Presque Isle (1753), now Erie, established Posts at La Boeuf and Venango (now Waterford and Franklin, in the oil region of northwestern Pennsylvania), seized the English traders, and confiscated their goods. When rumors came of what the French had done, Governor Dinwiddie of Virginia sent Washington, then not yet twenty-two years of age, to look into the matter, and expostulate with the French regarding their encroachments. After an arduous and perilous winter journey Washington brought back such a report of the determination and activity of the French, that the Virginia Assembly at once took measures to build a fort (1754) at the junction of the Monongahela and Alleghany rivers; but while the fort was being erected the French suddenly appeared, drove the English away, and finished for themselves the fort, which they called Fort Du Quesne.

Washington's mission.

31. In the meantime, a body of 400 men had been raised in Virginia and North Carolina, and sent out under Washington into the disputed territory. Meeting at Grand Meadows a French force which had been sent out to intercept him, he attacked and defeated them (1754). Learning of the approach of a greatly superior force of the enemy, he erected Fort Necessity. Here he was attacked by the French, and compelled to surrender, but on honorable terms. During this time, both the rival governments of France and England were making preparations for the coming struggle, though there was no formal declaration of war until 1756.

Washington's first skirmish.

32. In 1755 General Braddock, with a force of English and American troops, marched against Fort Du Quesne, but was defeated with great slaughter, and but for the skill displayed by Washington the whole army would have been annihilated. Braddock himself was mortally wounded, and died shortly afterwards. After his death, General Shirley took command, and made an attempt to reduce Fort Niagara, but accomplished nothing. General William Johnson was appointed to attack Crown Point. He defeated the French General Dieskau in the battle of Lake George (Sept. 5, 1755), but was unable to reach Crown-

Braddock's defeat.

Point. In the same year all the French inhabitants of Acadia were banished.

French and Indian War. 33. In May, 1756, war was formally declared by Great Britain, and by France in the following month. Lord Loudon was appointed commander-in-chief of all the forces in America, but owing to necessary delay, General Abercrombie preceded him and took the command. The Marquis de Montcalm became the French commander. Abercrombie awaited the arrival of Loudon before attempting anything. Both officers proved inefficient, and by their delays allowed the French not only time to strengthen their posts, but also to attack those of the English.

Campaigns of 1756 and 1757. 34. In August, 1756, Montcalm captured Fort Ontario with a large number of military stores, guns, prisoners and vessels. In June, 1757, Lord Loudon organized an expedition against Louisburg, but abandoned the attempt on learning that the garrison at that place had been strongly reinforced by a French fleet. In the meantime, Montcalm, collecting his forces at Ticonderoga, marched against Fort William Henry, and compelled it to surrender. After the surrender, many of the garrison were massacred by the French Indian allies. Thus after four years' hostilities, the incompetency of the British commanders still gave the French the advantage. But a change in the British home policy changed the aspect of the war. The celebrated William Pitt was called to the ministry, and immediately began to act with vigor. Able officers were appointed to command, and expeditious organized against different points. Louisburg was captured July 27, 1758. Fort Du Quesne also was taken, and its name changed to Fort Pitt. General Abercrombie's attack on Ticonderoga (July, 1758,) met with a bloody repulse, but Fort Frontenac was taken, with a large quantity of stores and goods.

The Conquest of Canada. 35. Pitt now determined to dispossess the French of the whole of their American territory. Their armies were directed at the same time against three of their strongest posts, Quebec, Ticonderoga and Montreal. General Amherst captured Ticonderoga July, 1759. Fort Niagara surrendered to Sir William Johnson July 25, 1759. But the most important feature of the campaign was the taking of the almost impregnable fortress of Quebec by the gallant Wolfe, who lost his life in the action. Soon after Montreal surrendered to Amherst. In this campaign the French were driven from all the important posts in Canada, and their power in America was broken forever. The war was virtually at an end, though peace was not restored until the signing of the Treaty of Paris, February, 1763. By this agreement, to which Spain and Portugal were also parties, France surrendered everything east of the Mississippi, except New Orleans, to England. New Orleans and that part of Louisiana beyond the Mississippi were ceded to Spain by the French. In exchange for Havana, which had been captured by the British, Spain yielded Florida to England. In 1800 Spain restored Louisiana to France, and Napoleon sold it to the United States in 1803.

The Treaty of Paris. 36. When the treaty of peace was signed, it was trusted that there would be an end to those horrid ravages which had desolated the interior of the country. But the month of May, 1763, proved the fallacy of such hopes. The Indians did not wish to see the country transferred by the French to the English. It was one thing to have the French trading among them, another to have the hated English occupying their lands. It was about this time that the famous insurrection of the Indian tribes broke out. The Delawares and Shawnees and other of the tribes of the Ohio were foremost in this conspiracy. Pontiac, an Ottawa chief, was the prime mover and master spirit in this affair, and hence it is called Pontiac's war. Pontiac expected the French to join him, for they were secretly encouraging him. Most of the western tribes were

drawn by him into the plot, but Sir William Johnson prevented a greater part of the Iroquois from joining him. Pontiac's plans were deeply laid, and conducted with Indian craft and secrecy. At a concerted time an attack was made upon all the posts from Detroit to Fort Pitt (formerly Fort Du Quesne). The Indians captured and destroyed eight of the twelve forts, but were unable to take the important posts of Detroit and Fort Pitt, though Pontiac besieged the former place for five months. The frontiers of Maryland, Virginia and Pennsylvania were laid waste, and terrible havoc wrought in the frontier settlements. The English, surprised by the first attack, soon roused themselves and met the danger promptly. The power of the tribes became broken, and most of them sued for peace. Pontiac retired to the Illinois country, and made a stand there for some time longer, finally submitting in 1766.

III. CAUSES OF THE AMERICAN REVOLUTION.

37. The addition to the British empire of new provinces, equal in extent to old kingdoms, not only excited the jealousy of European powers, but occasioned doubts in the minds of enlightened British politicians whether or not such immense acquisitions of territory would conduce to the benefit of the parent state. They saw, or thought they saw, the seeds of disunion planted in the too widely extended empire. To combine in one uniform system of government the extensive territory then under British sway, appeared to men of reflection a work of doubtful practicability; nor were their conjectures at fault. The seeds of discord were soon planted, and speedily grew up to the rending of the empire. The high notions of liberty and independence which were nurtured in the colonies by their local situation, and the state of society in the new world, were increased by the removal of hostile neighbors. The events of the war had also given them some experience in military operations, and confidence in their own ability. Foreseeing their future importance from the rapid increase of their numbers and extension of their community, and being extremely jealous of their rights, they readily admitted and indulged in sentiments and ideas which were favorable to independence. While combustible materials were daily collecting in the new world, a spark to kindle the whole was produced in the old.

38. In the first period of the settlement of English America, the mother country regarded the provinces as instruments of commerce. She contented herself with a monopoly of their trade without taking upon herself the care of their internal policy, or seeking a revenue from them. Previous to the close of the war in 1755, the catalogue of grievances she imposed upon the colonists was undoubtedly small. The following appear to have been the chief: An act of the British parliament forbidding the cutting down of pitch and tar trees, not being within a fence or enclosure, and sundry acts which operated against colonial manufactures. By one of these, it was made illegal after the 24th of June, 1750, to erect in the colonies any mill or other engine for slitting or rolling iron, or any plating forge, to work with a tilt hammer, or any furnace for making steel. By another, hatters were restrained from taking more than two apprentices at a time, or any for less than seven years. The colonists were also prohibited from transporting hats and home manufactured woollens from one province to another. These regulations were, for the most part, evaded; but if carried into execution, would have been but slightly inconvenient, and that only to a few. These restrictions, though seemingly a species of affront, and calculated to keep the colonists in a constant state of inferiority and subjection, would have been overlooked and forgotten had not other grievances been superadded.

39. The sad story of colonial oppression began in the

Origin of the disputes.

Colonial
oppression.

year 1764. Great Britain then adopted new regulations respecting her colonists, which, after disturbing the ancient harmony of the two countries for about twelve years, terminated in the dismemberment of the empires. These consisted in restricting their former commerce, but more especially in subjecting them to taxation by the British parliament. The imposition of duties, for the purpose of raising a revenue in America, was considered as a dangerous innovation, but the methods adopted for securing their collection were resented as arbitrary and unconstitutional. It was enacted by parliament, that whoever was caught violating the acts, should be tried in the courts of admiralty. Thus the defendant in such a case was deprived of the right of trial by jury, and subjected to the necessity of having his case decided upon by a single man, a creature of the crown, whose salary was to be paid out of forfeitures adjudged by himself. Moreover, the prosecutor was not called upon to prove his accusation, so the defendant was obliged, either to evince his innocence or to suffer. Thus the guards which the British constitution had placed around property and the barriers which the ancestors of both countries had erected against arbitrary power, were thrown down, as far as they concerned the colonists thus charged with violating the laws for raising a revenue in America.

English
Theory
of Colonial
Taxation.

The Col-
onial
Theory of
Taxation

40. After the peace of Paris, 1763, the national debt of Great Britain amounted to nearly 150,000,000 sterling. To aid in diminishing this heavy debt, the British minister conceived the idea of raising a substantial revenue in the British colonies, from taxes imposed by the parliament of the mother country. On the one hand it was urged that the late war had originated on account of the colonies—that it was reasonable, since it had terminated in a manner so favorable to their interests, that they should help to defray the expenses arising from it. Thus far both parties were agreed; but England contended that her parliament, as the supreme power, had the constitutional right to impose them on every part of the empire. This theory, plausible in itself, and in accordance with the letter of the British constitution, when all the dominions were represented in one assembly, was denied by the colonies as contrary to the spirit of the same government, when, on account of the extension of the empire, it was necessary to have many distinct representative assemblies. The colonists believed that the chief excellence of the British constitution consisted in the right of the subject to grant or withhold taxes, and in their having a share in enacting the laws by which they were to be bound. They conceived that the superiority of the British constitution to other forms of government was, not because of the parliament's forming the supreme council of the nation, but because the people had a share in it by appointing members who constituted one of its constituent branches, and without whose concurrence no law, binding on them, could be enacted. In the parent state it was asserted to be essential to the unity of the empire, that the British parliament should have the right of taxation over every part of the royal dominions. In the colonies it was believed that taxation and representation were inseparable, and that they, as colonies, could neither be free nor happy if their property could be taken from them without their consent. The American people reasoned thus: That if the British parliament, in which they had no representation, were able to take any part of their property from them by direct taxation, then they might take as much as they pleased, and there would be no security for anything that remained from further spoliation.

41. The colonists claimed that they had the exclusive right of laying taxes on themselves, free from extraneous influences, just as much as the British Parliament claimed the peculiar privilege of raising money independent of the crown. The parent state appeared

to the colonists to stand in the same relation to their local legislators as the monarch of Great Britain to the British Parliament. His prerogative is limited by that palladium of the people's liberty, the exclusive privilege of granting their own money. In fact, they claimed that though subjects of the King, they were not under the control of the British Parliament; that if the King required money of the colonies, he must obtain it through colonial legislation, just as in England he would obtain it through the British Parliament.

42. The charters, which were supposed to contain the principles on which the colonies were founded, became the subject of serious investigation on both sides. One clause was found to run through the whole of them, except that which had been granted to William Penn. This was a declaration, "that the emigrants to America should enjoy the same privileges as if they had remained, or had been born, within the realm;" but such was the subtlety of disputants that both parties construed this general principle so as to favor their respective opinions. The American people contended, that as English freeholders could not be taxed but by representatives, in choosing whom they had a vote, neither could the colonists; but it was answered that if the colonists had remained in England they must have been bound to pay the taxes imposed by Parliament. It was therefore inferred that, though taxed by that authority, they lost none of the rights of native Englishmen residing at home. The advocates of the British policy could see nothing in charters but security against taxes by royal authority. The colonists, adhering to the spirit more than to the letter, looked upon their charters as a protection against all taxes not imposed by representatives of their own choice. The nature and extent of the connection between Great Britain and America was a great constitutional question, involving many interests and the general principles of civil liberty. It was a vain attempt to decide this by any other recourse to parchment authorities, made at a time long past, when neither the grantor nor grantees foresaw anything like the present state of the two countries. It needed great skill and tact to so manage affairs, that everything might redound to the satisfaction and good of all concerned; to strike the middle line which would have secured as much liberty to the colonies, and as great a degree of supremacy to the mother country as their common good required. But this skill was lacking in British statesmanship. On the one hand, the spirit of the British constitution was opposed to the idea that the British Parliament should exercise the same unlimited authority over the unrepresented colonies which it exercised over the inhabitants of Great Britain. The colonists, on the other hand, did not claim a total exemption from its authority, but allowed the mother country a certain undefined prerogative over them; and accepted the idea that Parliament had a right to make any acts binding them in many subjects of internal policy and regulating their trade. That nice point, which marked the end of parliamentary authority and the beginning of the colonial independence, was not ascertained. Had the question never been agitated, or had a satisfactory compromise been effected, the American Revolution, undoubtedly, would never have become a part of our history.

43. The great French and Indian war, though crowned with success, had aroused a spirit of discontent in the colonies. From the beginning, as has been shown, the commercial policy of England toward the colonies had been wholly restricted. "It was a system of monopoly." Her navigation laws had closed their ports against foreign vessels; obliged them to export their productions only to countries belonging to the British crown; to import European goods solely from England, and in English ships; and had subjected the trade between the colonies to duties. All manufactures, too, in the

strictive
Policy of
England.

colonies, that might interfere with those of the mother country had been either totally prohibited, or subjected to intolerable restraints. The acts of Parliament, imposing these restrictions and prohibitions, had at various times caused great discontent and opposition on the part of the colonists, especially among those of New England. But nothing so aroused the jealous sensibilities of the colonists as any attempts on the part of the parent state to raise a revenue from them by taxation. They had ever maintained, from the earliest period of their establishment, that they could only be taxed by a legislature in which they were represented.

44. While the French war was in progress, many projects were hatched in England with regard to the colonies which were to be put in force when peace was declared. In 1760, an attempt was made in Boston to collect duties on foreign sugar and molasses imported into the colonies. Writs of assistance were applied for by customhouse officers, empowering them to break open stores, ships and private dwellings in search of goods that had paid no duty, and to compel others to assist them in carrying out their odious measures. The merchants opposed the writ on constitutional grounds. The question was brought into the courts, where James Otis argued so eloquently in favor of American rights, that all who heard him were ready to oppose all writs of assistance. John Adams, who was present, said, "Then and there was the first scene of opposition to the arbitrary claims of Great Britain. Then and there American Independence was born." In his speech, Otis used the words, "Taxation without representation is tyranny." This sentence became a watchword in America during the exciting times which followed.

45. In 1765 Lord Grenville, having previously given notice of his intentions to the American agents in London, introduced into Parliament a long cherished scheme for the purpose of raising a revenue from the American colonies by means of a stamp duty. Petitions poured in against it from the Americans, and at first it met with strong opposition in the House of Commons. But the remonstrances of the colonies could not change the avaricious feelings of Parliament, and the bill passed by a large majority. Those shortsighted legislators did not foresee that in the passage of an act so odious to the colonies, they were awakening an opposition and spirit of independence among them which would materially weaken their own power. The night after the bill passed Benjamin Franklin, who was then in London, wrote to Mr. Charles Thomson, "The sun of liberty is set; you must light up the candles of industry and economy." Mr. Thomson answered, "I was apprehensive that other lights would be the consequence, and I foresee the opposition that will be made."

46. By this act, no written instrument, such as commercial transactions, marriage licenses, deeds, suits at law, and the like, could be legal, unless stamped paper was used, which the colonists were compelled to purchase at an exorbitant price of the British agents. Moreover, it contained another startling provision, and that was, that the colonial legislatures were commanded to grant permission to billet the royal troops in America in inns, alehouses, barns, and vacant houses, and to furnish them with bedding, potables, candles, cooking utensils, etc. As soon as it became known that the Stamp Act was passed, the colonies, from one end of the land to the other, were full of indignation. Parliament had turned a deaf ear to their petitions, and showed by the passage of the Act a determination to treat them, not as English citizens, but as servants and slaves. Parliament, they said, might make laws to regulate the commerce of the empire, and so draw a revenue from America, but it had no right to levy a direct tax like this. Only the colonial government,

acted by the people, could do such a thing. They must either surrender without a struggle their liberty, or oppose strongly and firmly the grasping avarice of a nation, the most powerful in the world.

47. They were not long in making up their decision and proclaiming it to the world. The legislature of Virginia was in session when the news arrived. Patrick Henry, then a young man, but possessed of brilliant talents, opposed it with all the energy of his great mind. He brought before the house five resolutions which were adopted, and which closed by declaring, "That any person, who, by speaking or acting, should assert or maintain that any class of men except the general assembly of the province, had a right to impose taxation, he should be considered an enemy to his majesty's colony." In advocating these resolutions, he boldly denounced the policy of the British government, and declared that the king had acted the part of the tyrant. Warming up with his subject, and alluding to the fate of other tyrants, he exclaimed with flashing eyes and in thunder tones, "Cæsar had his Brutus, Charles I his Cromwell, and George III—" "Treason! treason!" arose from every part of the house. Pausing a moment until the tumult had subsided, he added, "may profit by their example. If this is treason make the most of it." Similar sentiments flew like lightning through the other colonies. The tongues and pens of the citizens labored to kindle the latent sparks of patriotism. The press strongly opposed the innovation and called upon the citizens to resist it.

48. The expediency of calling a continental congress, to be composed of deputies from each of the provinces, had early occurred to Massachusetts. So the assembly of that province fixed on New York as the place, and the second Tuesday of October, 1765, as the time for holding the congress, and invited all the other colonies to send delegates to the same. Nine colonies took part in it, and sent their most distinguished men. For the first time the whole country had a common cause, and there was need that the people should consult together. This congress drew up a declaration of their rights and a statement of their grievances. They asserted in strong terms their exemption from all taxes not imposed by their own representatives. They also concurred in a petition to the king, a memorial to the House of Lords, and a petition to the House of Commons. The colonies that were prevented from sending their delegates, forwarded petitions, similar to those which were adopted by the deputies who attended.

49. On the 1st of November, the day on which the Stamp Act was to go into operation, the bells were tolled, and the flags hung at half mast, as if for the "funeral of liberty." The courts were closed; business was suspended. The houses of the British officials were attacked by mobs, and the effigies of the planners of the Act were carried about the streets in public derision and then burned, or torn in pieces by the enraged populace. In different parts of the country the stamp-masters were compelled to resign their offices to prevent being mobbed. The Stamp Act was so formed that the penalty of disobedience would be no less than the suspension of the whole machinery of the political and social order, and the creation of a state of anarchy. Neither trade nor navigation could proceed, no contract could be legally made, no process against an offender could be instituted, no student could receive a diploma, nor even could the estates of the dead be legally settled, or the marriage ceremony performed, until the stamp duty was paid. By degrees, however, things began to assume their usual course, and all kinds of business was transacted in open defiance of the Act.

50. Associations, under the title of the "Sons of Liberty," were formed in every part of the country. They denounced the Stamp Act as being an outrage on

the British constitution, and resolved that they would defend those who fell into the hands of British tyranny, on account of their clinging to their rights as freemen. Merchants resolved to import no more goods from Great Britain until the act was repealed, and the people generally denied themselves the use of foreign luxuries. No one would venture to carry the Stamp Act into execution: in fact, no stamped paper was to be seen; all had been either destroyed or concealed.

The Effect
in England

51. The information of the violent proceedings of the colonies was received in England with consternation. A small party in Parliament upheld the colonies. In the House of Commons William Pitt uttered the memorable words: "We are told that America is *obstinate*—America is in open rebellion. *Sir, I rejoice that America has resisted!* Three millions of people so dead to all the feelings of liberty as voluntarily to submit to be slaves would have been fit instruments to make slaves of all the rest." In the meantime Lord Grenville had been dismissed, and the Marquis of Rockingham, a friend of the Americans, appointed in his place. Under his administration the obnoxious Stamp Act was repealed March 18, 1766, for the English government saw that it was impossible to enforce it. At the same time, Parliament took care to say that it "had a right to bind the colonies in all cases whatever."

Repeal of
the Stamp
Act.

How the
News was
Received.

52. The news of the repeal was received with the liveliest expressions of joy and gratitude. Public thanksgivings were held, English goods imported and a general calm succeeded the storm which had raged so violently. By the people of New England and New York less joy was felt. They feared, from the passage of the declaratory act, that this was only a truce in the war against American rights. In the mirror of the past they saw reflected the future, and trembled at the picture. Nor were their suspicions unfounded. Scarcely had the excitement over the Stamp Act died out, when other causes of complaint arose. In June, 1767, Charles Townsend, chancellor of the exchequer, brought into Parliament a bill imposing duties in the British colonies on glass, paper, painters' colors and tea, which became a law. Another law was also enacted, appointing officers of the navy as custom-house officers, to enforce the act of trade and navigation. Previous to this new act of tyranny, the legislative power of New York had been suspended, until it should furnish the king's troops with certain supplies at the expense of the colony.

A new
Scheme of
Taxation.

53. Early in 1768 the general court of Massachusetts sent a petition to the king, and addressed circular letters to the colonial assemblies, asking their co-operation in obtaining the redress of their grievances. The British ministry were alarmed and demanded of the court that they should rescind the vote directing circulars to be sent. The assembly refused, and the governor dissolved it. This attempt to intimidate only served to strengthen the opposition. Shortly after this Mr. Hancock's sloop Liberty was seized for not having entered all the wines brought from Madeira. This act of the custom-house officers was resented by the people. The houses of the officials were attacked, and they were compelled to seek safety in flight. The refractory spirit of the citizens of Boston had been displayed on so many occasions that General Gage was directed to station one or more regiments there to overawe the citizens and protect the officers in the discharge of their duties. Two regiments were accordingly ordered from Halifax, who took possession of the state house, and planted two pieces of cannon at the principal entrance. All this only tended to increase the general indignation.

The Seizure of Hancock's Sloop

54. Early in the year 1769 Parliament passed resolutions censuring the conduct of the citizens of Massachusetts, and directing the governor to make strict inquiries as to all treasons committed in that province since the year 1767, that the offenders might be sent to

England for trial. The legislature of Virginia, on the receipt of that order, passed resolutions denying the right of the king to remove an offender out of the colony—away from his home and friends—for trial. The governor, on bearing of the resolutions, immediately dismissed the assembly. The members met at a private house, and entered into a written agreement not to import any of the taxed articles. Their example was extensively followed. The assembly of Massachusetts convened, but refused to proceed to business while armed troops surrounded the state house. The governor refused to remove them, and the assembly adjourned to Cambridge. Toward the close of the season the governor requested them to provide funds to pay for the quartering of the troops, but they refused, declaring that they would never make any provisions to support a standing army among them in times of peace. The governor, therefore, prorogued the assembly.

The Boston
Massacre.

55. The presence of the soldiers in Boston was a constant cause of irritation, and the citizens had many quarrels with them. At length on March 5, 1770, a serious collision occurred between the troops and a mob, and the soldiers fired, killing five of the crowd, and mortally wounding two others. The reports of this Boston massacre, as it was called, were greatly exaggerated, and filled the country with excitement. The citizens assembled in crowds, and could only be dispersed by the governor promising them that justice should be done. The troops were removed from the city, and Captain Preston, who ordered the firing, and his men tried for murder. Although the excitement was intense, yet such was the love of justice that the soldiers, who were defended by John Adams and Josiah Quincy, were all acquitted except two, who were convicted of manslaughter.

56. In England, on the very day of the outrage in Boston, Lord North was called to the British Ministry. He introduced a bill into Parliament which passed on April 12, removing the duties that had been laid in 1767, excepting that on tea, but still declaring their right of taxing the colonies. For a long time no tea had been imported, and the effect had begun to be severely felt by the British merchants. By an act of Parliament, therefore, the East India company were allowed to import their teas into America free of duty in England. The naked question of the principle regarding taxation was thus presented. The scheme was an insidious one, but it failed most completely. Lord North supposed that by reducing the tax on tea to three pence a pound, the Americans would buy largely, thus relieving the East India company, who had large quantities of tea stored up in its English warehouses. Tea was accordingly shipped from England in great quantities to various parts of the colonies. This brought matters to a crisis. One sentiment prevailed throughout the whole continent. Taxation was to receive its final blow. Whoever submitted to it was an enemy to his country. From New York and Philadelphia the ships were sent back, with their cargoes, to London. In Charleston the tea was landed, but not permitted to be sold, and being stored in damp cellars, finally perished. Still more decisive action was taken in Boston. The ships anchored in the harbor. Some small parcels of tea were brought on shore, but the sale of them was prohibited. The captains of the vessels would have made sail back to England, but they could not obtain the consent of the consignees, a clearance at the custom house, or a passport from the Governor to clear the port. To settle the matter completely, a company of men disguised as Indians went on board the ships during the night and threw the cargoes into the water. Three hundred and forty-two chests were thus broken open and the contents thrown into the harbor (December 16, 1773).

Destruction of Tea
at Boston.

57. When the news of this affair reached England,

The Boston Parliament, in order to punish the inhabitants of Boston, passed the Boston Port Bill in 1774, which prevented the lading and unloading of goods, wares and merchandise in that town and harbor on and after June 1, 1774, and the seat of government was to be transferred to Salem. But the people of Salem refused to build their fortunes on the ruins of their countrymen, and the inhabitants of Marblehead generously offered the Boston people the use of their warehouses and harbor. In the following March, two other bills, equally tyrannical, passed both houses of Parliament. One subverted the whole constitution and charter of Massachusetts, taking all power out of the hands of the people and vesting it in the crown. The other authorized the governor to send any person indicted for murder or other capital offence committed in aiding the magistracy, to England or some other colony for trial.

Other Tyrannical Bills.

Popular Agitation.

58. These laws, which were gross violations of the rights and charters of the colonies, excited the deepest indignation everywhere in America. The people of Boston, reduced to distress by the stoppage of their trade, were regarded as martyrs of liberty, and contributions were made for their relief, not only in the thirteen colonies, but even in London and Quebec. In Boston itself, although patriotic meetings were held almost daily in Faneuil Hall and the Old South Church, all disorderly and unconstitutional proceedings were avoided, so that nothing was done for which the British authorities could punish the people. The friends of the crown about this time became known as Tories, and the popular party as Whigs. The Quebec Act, which was passed among the other acts just mentioned, extended the boundaries of Canada over the whole territory situated north of the Ohio, and east of the Mississippi. This was done to prevent Canada from joining the rebellious colonies. The colonies warmly protested against this concession to liberty of conscience, for the Act sanctioned throughout the province the free exercise of the Roman Catholic religion, and confirmed to the clergy of that profession their accustomed dues and rights, thus practically establishing the Roman Catholic system in the new territory. To such freedom the colonists were on principle opposed at the time, though somewhat later they found it expedient to adopt nearly the same policy, and to promote a closer union among themselves by juster treatment of their Roman Catholic brethren.

The old Continental Congress.

59. Committees of correspondence had already been formed at the suggestion of Patrick Henry, Thomas Jefferson, Richard Henry Lee and other Virginians, and by this means the colonies took counsel together for the common defense. In May, 1774, proposals were made by the assemblies of several of the provinces for a general congress of delegates. The scheme was taken up with great enthusiasm, and on September 5, 1774, an assembly of fifty-five delegates, representing all the colonies except Georgia, met in Philadelphia, under the presidency of Peyton Randolph, of Virginia. This was the first or, as it is often called, the "old" continental congress. The action of this body was still mainly deliberative. They passed a resolution highly commending the conduct of Massachusetts in the conflict with the wicked ministers, and exhorted all to press on in the cause of liberty. They drew up a bill of rights, entered into an agreement for themselves and for all their constituents to cease all importations from Great Britain, and adopted measures for organizing committees in every town and city to see that this agreement was enforced by every species of popular influence. They also voted an address to the king, one to the people of Great Britain and another to Canada. Their petition to the king entreated him, in eloquence the most affectionate and respectful, to restore to them their violated rights—their rights as English freemen. Provision was then made for another congress to meet in the following May, unless the grievances should

meanwhile be redressed. When the proceedings of Congress were published in England, Pitt (now Lord Chatham) said: "For solidity of reason, force of sagacity and wisdom of conclusion under a complication of difficult circumstances no nation or body of men can stand in preference to the general congress at Philadelphia. The histories of Greece and Rome give us nothing equal to it, and all attempts to impose servitude upon such a mighty continental nation must be in vain."

Pitt's Opinion.

60. These resolutions of the Continental Congress aroused the indignation of the British government. America, they said, had long wished to become independent, and to prevent this was the duty of every Englishman, and that it must be done at every hazard. In the meantime, the situation of affairs in Massachusetts became alarming. The people collected arms, enrolled themselves into companies and prepared to start out at a moment's notice, from which circumstance they were called "minute men." Public speakers and writers boldly defended the right of the people to withstand oppression. Royal officers were forced to resign. General Gage began to fortify Boston Neck, and the powder and other military stores in Cambridge and Charleston were, by his order, removed to Boston. He had about 4,000 troops under him, and sent home a request for 20,000 more. An assembly was called in Massachusetts, but dissolved by the governor. The members then met in Salem, appointed a committee of safety and sent messengers to New Hampshire, Rhode Island and Connecticut, asking for their assistance in raising an army of 20,000 men to act in any emergency. England, although she could distinctly see the upheaving of the violence of colonial indignation, shut her eyes to the sight. Chatham, Burke, Fox, Barré and other enlightened statesmen in Parliament urged the government to recede from its untenable position, but the obstinacy of the king prevented any conciliation; it was resolved that America was in rebellion and must be subdued; and so the revolution began.

The People Take Arms

61. It was a fortunate circumstance for the colonies that the royal army was posted in New England. The people of that northern country have their passions more under the command of reason and interest than in a southern climate. One rash, offensive action against the royal forces at this early period, though successful, might have worked great mischief to the American cause. It would have lost them European friends and weakened the disposition of the other colonies to assist them. The patient and the politic New England men, fully sensible of their situation, submitted to many insults and restrained their feelings of resentment. In civil wars or revolutions it is a matter of much consequence who strikes the first blow. The compassion of the world is nearly always in favor of the attacked. For the space of nine months after the arrival of General Gage the behavior of the people of Boston is particularly worthy of imitation by those who wish to overturn established governments. They conducted their opposition with exquisite address. They avoided every kind of outrage and violence, preserved peace and good order among themselves, successfully engaged the other colonies to make common cause with them and counteracted General Gage so effectually as to prevent his doing anything for his royal master, while by patience and moderation they protected themselves from just censure. Though resolved to bear as long as prudence and policy dictated, they were all the time preparing for the last extremity by furnishing themselves with arms and training their militia.

Conduct of the People.

62. Provisions had also been collected and stored in different places, particularly at Concord, about twenty miles from Boston. General Gage sent out a detachment of 800 men, under the command of Colonel Smith and Major Pitcairn, to destroy these stores. Notwithstanding the precautions taken to prevent the

The Beginning of the Struggle.

spread of the intelligence, the march of the troops had been well made known by expresses and signal guns. Thus, when the British troops, early in the morning of the 14th of April, 1775, reached Lexington, two-thirds of the way to Concord, they found a small body of Americans, under Captain Parker, drawn up on the common to dispute the way. Captain Parker had given orders not to fire unless fired upon. The British troops rushed upon them, firing and calling upon them to disperse. Eight of the Americans were killed and several more wounded. The little band of patriots slowly retreated, returning the fire as they went, and the British kept on to Concord, where they destroyed a few stores. At a bridge near the village they encountered 400 Americans, hastily collected from the neighboring towns, and were so warmly received that they began a hasty retreat. The militia pressed them on all sides; the retreat became a rout, and when the British were at last rescued by the arrival of Lord Percy with reinforcements, they had lost 273 men. They continued their retreat under Percy, bearing their dead and wounded with them. All the way, from behind stone walls, fences and farmhouses, the angry farmers galled them with shot. They did not desist until the troops had crossed Charlestown Neck and were safe under the guns of the British vessels.

63. As arms were to decide the controversy, it was another fortunate circumstance for the Americans that the first blood was drawn in New England. The inhabitants of that country were so connected with each other by descent, manners, religion, politics and a general equality, that the killing of a single individual interested the whole people and made them consider it a common cause. The blood of those who were killed at Lexington and Concord proved to be the firm cement of an extensive union. Intelligence of these events spread like wild fire throughout the country; the torch of war had been lighted, blood had been offered on the altar of liberty, fearfully was the death of those patriots slain at Lexington and Concord to be avenged. Couriers galloped in every direction, beating a drum, and shouting in tones that thrilled every listening ear, "To arms, to arms! liberty or death." The streets of Lexington and Concord had been soaked in blood, and the whole country was in a blaze of wrath. But amidst the intense excitement which prevailed, the still thoroughly English characteristics of the people manifested themselves. The provincial congress of Massachusetts, which was in session at the time of the fight, dispatched an account of it to Great Britain, accompanied with many depositions to prove that the British were the aggressors. They also made an address to the people of Great Britain, in which, after complaining of their sufferings, they said: "These have not yet detached us from our royal sovereign; we profess to be dutiful and loyal subjects, and though hardly dealt with as we have been, are still ready with our lives and fortunes to defend his person, crown and dignity. Nevertheless, to the persecution and tyranny of his evil ministry, we will not tamely submit." From this commencement of hostilities, the dispute between Great Britain and the colonists took a new direction.

64. Up to this time no party in America had thought of a separation from the mother country, but now the colonists were aflame with the spirit of independence. Mechanics left their shops, and farmers the plow, and hurried to the scene of conflict. In the course of one or two days the king's army found itself besieged in Boston by an irregular and ill-furnished, but large and determined body of men who marched to the scene of action from all parts of New England. The provincial congress of Massachusetts came together under the presidency of Dr. Joseph Warren, voted to raise 13,000 men, and invited the other New England colonists to make up the army to 30,000. In a few days a line of encampment stretched from Roxbury to the river Mys-

tic, and the British forces in Boston were environed by an army of 20,000 soldiers. Benedict Arnold gathered about him a band of volunteers, and rushed to Boston. Here he formed the bold plan of seizing the important fortresses of Ticonderoga and Crown Point.

65. Having received instructions from the committee of safety to raise a sufficient number of men for the purpose, he marched to Bennington, where he found that Colonel Ethan Allen had collected a large band for the same object. They marched on together at the head of three hundred men, and reached Ticonderoga on the 10th of May, 1775. Advancing to the gateway, Arnold and Allen entering side by side, Allen rushed to the governor's room and demanded his surrender. "In whose name?" stammered the terrified governor. "In the name," said Allen, "of the Great Jehovah and the Continental Congress." This was high authority, and the governor immediately surrendered. They were equally successful in obtaining Crown Point. By this fortunate expedition they gained possession of two important fortresses, and gave the American troops about Boston a much-needed supply of arms and ammunition.

66. The second Continental Congress met at Philadelphia, May 10, the day of the capture of Ticonderoga. Peyton Randolph was at first the president, but John Hancock soon succeeded him in that position. Washington, Jefferson, Franklin, the Adamses, Patrick Henry and R. H. Lee, were members. The Congress was moderate, and asked only for a redress of grievances, not for independence; but it took active measures for carrying on the war. It formed a federal union, assumed the general authority of government, issued bills of credit to the amount of three millions of dollars for defraying the military expenses, and pledged the faith of the United Colonies for their redemption.

IV.—THE WAR FOR INDEPENDENCE, 1775-83.

67. In May, 1775, the British army in Boston received reinforcements from England, under Generals Howe, Clinton and Burgoyne, which, together with the garrison, formed an army of more than twelve thousand men. The Americans comprised a number of independent commands under Generals Artemus Ward, of Massachusetts; Israel Putnam, of Connecticut; Nathanael Green, of Rhode Island, and other states, General Ward being recognized as chief. The whole number of men was about sixteen thousand. Upon the arrival of the English reinforcements, General Gage now proclaimed martial law throughout the state, offering pardon, however, to all rebels who would return to their allegiances, excepting Samuel Adams and John Hancock. The Americans, learning that General Gage was determined to penetrate into the country by the way of Charlestown Neck, issued orders to Colonel Prescott, on the evening of the 16th of June, to take one thousand men and form an intrenchment on Bunker's Hill, an eminence which commanded the neck of the Charlestown peninsula. By some mistake they went further on, and occupied Breed's Hill. At midnight those stern-hearted men stood on the top while Putnam marked out the line of entrenchments. By daylight they had thrown up a redoubt eight rods square, in which they could shelter themselves. In the morning the English officers and the people of Boston could hardly believe their eyes as they saw this redoubt almost over their heads. The patriots on the hill were first seen from the ships, which immediately opened fire. All the artillery of the city and the floating battery were pointed against that single, silent structure. Still those hardy heroes toiled on amid the storm of shot and shell which fell among them, until by noon they had run a trench nearly down to the Mystic river on the north; then laying down their picks and shovels

they took up their muskets, and prepared themselves for the coming attack.

Battle of Bunker Hill 68. The cannonading having failed to dislodge the Americans, about noon Gage sent a body of about three thousand men, under Howe and Pigot to carry the height by assault. Having crossed the Charles river from Boston in boats, they advanced up the hill under cover of fire from the ships and batteries. The provincials stood firm. "Don't one of you fire," was the command of Putnam, "till you see the whites of their eyes." The English advanced, stopping every few yards, to deliver their deep and regular volleys against the intrenchment; but not a shot replied. That silence was more awful than the thunder of cannon. When the hostile columns had almost reached the works, the stern order "*Fire!*" rang with startling clearness on the air. Suddenly a sheet of flame burst from that low, dark wall, and down went the enemy rank by rank. Their lines wavered, then broke, and the troops fell back in disorder to the landing place. There they rallied, and soon moved forward again to the charge, and again were driven back by the steady fire of the colonists. At this critical moment General Clinton arrived with reinforcements. By his exertions the troops were again rallied, and a third time advanced to the charge. Throwing aside their knapsacks and reserving their fire, the soldiers, with fixed bayonets, marched swiftly and steadily over the heaps of their fallen comrades, up to the intrenchments. Only one volley struck them, for the Americans had fired their last rounds of ammunition, and were without bayonets. Clubbing their muskets, they still beat back the enemy, until the order was given to retreat, when they retired slowly and made good their way over Charlestown Neck. At the beginning of the retreat the brave General Warren was killed. The Americans lost 449 in killed, wounded, and prisoners, while the British loss was nearly 1,500. The result of the battle was encouraging to the provincials. It gave them confidence in themselves, and consequence in the eyes of their enemies. They had proved to themselves and others that they could measure weapons with the disciplined troops of Europe, and inflict the most harm in the conflict. This dear bought victory, won only through the exhaustion of the American's powder, was so little satisfactory to the British Government that General Gage was superseded by General Howe. This engagement, known as the battle of Bunker Hill, was the first real battle of the Revolutionary War.

Washington appointed Commander-in-Chief. 69. In the meantime, Congress on the 15th of June, at Philadelphia, elected George Washington, by a unanimous vote, to the high office of commander-in-chief of the united colonies. Washington, who was present, accepted the appointment, expressing a sense of the high honor which he had received, and the vast responsibility of the station. He refused to accept any compensation for his services, merely asking Congress to defray his expenses. Congress also adopted the unorganized force before Boston, naming it the Continental Army. In subordination to the commander-in-chief, Messrs. Ward, Charles Lee, Schuyler, and Putnam were appointed major-generals; Horatio Gates, adjutant-general, and Messrs. Pomeroy, Montgomery and Wooster, Heath, Thomas, Spencer, Sullivan and Greene, brigadier-generals. Soon after his election, General Washington, accompanied by Lee, proceeded to Cambridge to take command of the army, which amounted to about 14,000 men. He found them a crowd of brave, undisciplined soldiers, unprovided with arms, ammunition, and provisions. His first business was to organize them into an army, while he kept watch over the British in Boston.

Attack on Canada. 70. Meanwhile an expedition was organized for an attack on Canada, under the command of General Schuyler; but Schuyler, falling sick by the way, the command devolved on Richard Montgomery. This

officer captured St. John's and Chambly, both on the Sorel river, and then made himself master of Montreal; but in making an assault on Quebec, December 31, 1775, he was repulsed, losing his own life, while Benedict Arnold, another leader, was wounded. Sometime afterward the British army in Canada was reinforced, and the Americans were obliged to abandon all designs in that quarter. While these events were taking place on the northern frontiers, English ships were laying waste towns and cities upon the Atlantic coast. Bristol in Rhode Island, and Falmouth in Massachusetts, were burned because they had taken part in the rebellion. Congress thought it time to turn its attention to the construction of armed vessels. Thirteen were accordingly fitted out, a navy established, and a large number of privateers licensed, which scoured the seas and did great injury to the English commerce. General Washington employed in the service several cruisers to intercept the store ships of the enemy. Regular courts of admiralty were established for the adjudication of prizes, and by these timely measures much good was accomplished.

71. In the summer of 1775, Dunmore, the royal Governor of Virginia, was driven out of Williamsburg, then the capital of the colony, and obliged to seek safety on board a British man-of-war. Collecting some ships and a considerable number of men, partly slaves and indentured servants, to whom he promised freedom, he burned Norfolk (January, 1776), which was the largest and richest town in Virginia, and made descents upon various parts of the coast. In North Carolina there was some sharp fighting between the Tory settlers and the patriotic militia, in which the Tories were worsted. In South Carolina, the gallant defense of Charleston (June, 1776,) where a British fleet, under Sir Peter Parker, aided by a large land force, under General Clinton, was beaten off with great loss by a small body of men commanded by Colonel Moultrie, filled the colonists with encouragement.

72. During the year 1775 the royal government was generally terminated throughout the country, the King's governors abdicating their posts and taking refuge on board the English shipping. An act was passed by the English Government prohibiting all trade and commerce with the rebellious provinces, and authorizing the capture of all American and other vessels found trading with the colonies, and the crews of the captured vessels were to be treated, not as prisoners, but as slaves. The colonists had sent over their last petition, styled the *Olive Branch*, to the King, but both houses of Parliament refused to hear it, alleging that they could not receive any proposition coming from an unlawful assembly. Until now they hoped for reconciliation with the mother country, but the rejection of this last petition determined the complete separation of Great Britain and the colonies.

73. At the beginning of 1776 Washington, by the help of Congress, had succeeded in getting into military order the army, which now ceased to be a collection of little colonial militia organizations. On the 2d of January he hoisted the Union flag in compliment of the United Colonies. This flag bore the strips which are found in the flag of today, but the crosses of St. George and St. Andrew were retained on a blue ground in the corner, blending the ideas of a new nationality and English supremacy. The present flag was adopted June, 14, 1777. Early in March, Washington was ready to drive the British out of Boston. On the night of the 4th he occupied and fortified Dorchester Heights, overlooking the harbor. General Howe, who succeeded George, saw that he must fight at a great disadvantage, or abandon the town. Thinking "discretion the better part of valor," he gathered together his forces, took to the fleet and sailed away. With him went those families which had remained loyal to the king. Thus Boston was relieved of the

Evence of 1776.

Evacuation of Boston.

presence of the British, to the great joy of the inhabitants. There was now open war between the two countries. But after this New England scarcely knew the presence of soldiers, as it became the policy of England to strike at the heart of the colonies. Putting Boston in a state of defense, Washington now hastened to New York, where he was certain the next blow would be struck, and Lee was ordered to take command of the troops in the South. The fortifications which Lee had begun were hastily completed. Greene was placed in command of a division on Long Island. Measures were taken to disarm the Tory inhabitants, and the royal governor, Tryon, was driven to seek refuge on board a British man-of-war in the lower bay.

74. Even after the war had fairly begun, the colonies still looked forward to a reconciliation with the mother country and the first proposals of a separation were received with general disapproval. But the conflict of arms, and the obstinate refusals of all overtures on the part of Parliament, gave impulse to a bolder policy. All this time the Second Continental Congress was in session at Philadelphia, and it agreed to consider definitely the question of independence. Then it took a recess of four weeks, to give the delegates an opportunity to go back to the people and learn what was the general judgment. When the members returned to their seats there was no longer any doubt what course should be pursued. A committee had been appointed to propose a full declaration. The committee was elected by ballot, and consisted of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman, and Robert R. Livingston. Mr. Jefferson and Mr. Adams acted as a sub-committee to prepare the draft, and Mr. Jefferson drew up the paper. The chief merit of the document is his. Some changes were made in it, on the suggestion of other members of the committee, and by others in Congress while it was under discussion. On July 2, 1776, Congress adopted the resolution, "That these United Colonies are, and of right ought to be, free and independent states; that they are absolved from all allegiance to the British crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved." Two days latter Congress adopted the declaration written by Jefferson. It declared what were the natural rights of all men; it recited the acts of George III, King of Great Britain, by which he had abused his authority over the colonies, and deprived them of their rights and liberties. It reminded the world how patiently the colonies had born their injuries; of the petitions they had addressed to the King, which had been disregarded; how the colonies had appealed, not to the King only, but to their brethren, the people of England, but that all had been in vain. Therefore, as the representatives of the *United States of America*, in general Congress assembled, the delegates published this declaration of the independence of the States. The declaration was received by the people with demonstrations of joy. Washington caused it to be read to his soldiers in New York on the 9th of July. On the same evening the excited inhabitants pulled down a leaden statue of George III on horseback, which stood on the Bowling Green, and it was melted into bullets for the use of the patriot army. In all the other parts

The Effect of the Declaration.

The Effect in England.

75. The British ministry were confounded at what they called the daring enormity of the colonists, in spurning the royal power and authority. They were surprised that rebels dared to show such temper and spirit. Forthwith they determined by augmented forces to crush them at a blow, and to coerce them into a sense of duty and submission to their king. Doubting the competency of their own power to subjugate the colonies, the English Parliament, at an immense expense, resorted to the aid of foreign mercenaries to carry on their bloody work. 17,000 troops, hired from the

German States, were conveyed hither to aid in the subjugation of the colonies.

76. When the British had failed to get possession of South Carolina in the early summer of 1776, they turned their attention to New York. The American army was intrenched on Long Island and the heights overlooking New York when the British fleet entered the harbor and landed some of their troops on Staten Island. General Howe and his brother, Admiral Howe, had been appointed commissioners to receive the submission of any rebels who might throw themselves on the king's mercy. They had been instructed to propose conditions of peace, but they had no authority to grant independence, and Washington refused any other terms. On the 23d of August the British forces under Generals Clinton, Cornwallis, Porter and Grant, landed on the southern shore of Long Island. The larger part of the American army was posted in what is now the heart of Brooklyn. General Putnam was in command of Long Island, but his army was greatly inferior in numbers and equipments to the enemy. On the morning on August 27, Putnam was attacked by the British and compelled to retreat to Brooklyn. Had the British general followed up his advantage, he might have slain or captured all of Putnam's force. But at nightfall, under cover of the fog, Washington skillfully withdrew all the forces on the Brooklyn side and united them with the rest of his army in New York. He had completely foiled the enemy.

The Attack on New York.

77. It was impossible to hold New York, because it could be shelled from Brooklyn Heights and attacked on both sides by the English fleet, so Washington withdrew his forces to Harlem Heights, and fortified himself there. The British then entered New York, and it remained in their hands until the close of the war.

Evacuation of New York.

The condition of the patriots was now deplorable. The army, greatly reduced by losses in battle, was still further weakened by desertions and insubordination. Thousands of disheartened soldiers went home. But Washington succeeded in partly establishing discipline, and opposed so bold a front to the enemy that Howe did not venture to attack him directly. Lord Cornwallis, however, succeeded in gaining a position on the opposite side of the Hudson. Washington was compelled to withdraw across the river, knowing that the enemy would aim for Philadelphia. The two armies crossed New Jersey in hot haste, Washington maneuvering so as to defeat the British design of cutting him off from that city. The armies, while in motion, were often in sight of each other. Washington continued his retreat slowly, followed by the enemy, until early in December he crossed the Delaware river near Trenton. Howe now thought the campaign over, and went into winter quarters.

Operations in New Jersey.

78. The succession of disasters, beginning with the battle of Long Island, greatly discouraged the Americans. The legislatures of New Jersey and Pennsylvania adjourned and left the states almost without a government. Congress, fearing for its safety in Philadelphia, removed to Baltimore, leaving Washington with almost dictatorial powers. Apathy and disorder prevailed among the troops, many of whom had to march with bare, bleeding feet along the frozen roads. A great number of prominent persons, believing that the cause of independence was lost, hastened to make their peace with the British authorities. It was truly a time which "tried men's souls." Amidst the prevailing gloom, Washington stood firm. Strengthened by the arrival of Lee's division, now under command of Sullivan, since the capture of Lee by the British, Washington determined to strike a blow that would revive the drooping courage of the people. He resolved to fall upon a detachment of Hessian troops, stationed at Trenton under Rhal, and chose Christmas night for the attack. Recrossing the Delaware with 2,400 men, he attacked the town while the Hessians were carous-

The Battle of Trenton.

ing, and completely routed them, taking one thousand prisoners.

79. This brilliant exploit had a wonderful effect upon the people. The soldiers who were about to return home consented to serve six months longer; Congress, which had exhibited great firmness during these times of trial, put forth fresh efforts to strengthen the army, and Washington, invested for six months with the authority of a dictator, crossed the Delaware again and occupied Trenton. Cornwallis now advanced toward that place with all his available forces, and Washington's danger was greater than before. But again his masterly genius prevailed. Leaving his camp fires burning, he abandoned his position, passed silently around the enemy, and at sunrise (January 3, 1777), fell upon the British reserves at Princeton, just as they were starting out to take part in the expected battle at Trenton, and routed them. Thus Howe, instead of occupying all New Jersey, was cooped up at Brunswick and Amboy, and Philadelphia was relieved of further danger from Cornwallis. After these splendid successes Washington retired with his army toward Morristown, which he made his headquarters, and arranged his troops in safe positions between that place and the highlands of the Hudson. Here he passed the winter, frequently making sudden and daring exploits, without risking a general engagement. By this means the enemy was compelled to abandon every post in New Jersey, except New Brunswick and Perth Amboy. Philadelphia being now in no danger from the British, Congress returned to that place.

80. Aware of the importance of inducing the French to espouse the American cause, and relying on the enmity of France against Great Britain, Congress appointed as commissioners to the court of France, Benjamin Franklin, Silas Deane and Arthur Lee. They were instructed to procure arms and ammunition, and to obtain permission to fit out American vessels in the French ports, to annoy the commerce of England. They also directed them to solicit a loan of 10,000,000 francs, and to endeavor, by every means in their power to prevail on the French government to recognize the independence of the United States. The commissioners were kindly received and obtained the aid they requested, although the French government was not willing, as yet, to recognize the United States as an independent nation.

81. Commissions were offered to French and other foreign officers who wished to serve in the American army, and a large number of ambitious soldiers consequently embarked for America. Washington was embarrassed by the arrival of such a large number, not all of whom were men of merit. Among the foreigners, however, who thus gave their services to the American cause were several distinguished officers; Baron de Kalb, an Alsatian; Kosciusko and Pulaski, the famous Polish patriots; Baron Steuben, an experienced and accomplished Prussian soldier, and the young French Marquis de La Fayette, who purchased a ship with his own means and sailed for America to offer his sword, without pay, to the cause of independence.

82. Near the end of May, 1777, the American army, numbering about 18,000 men, moved from its winter quarters at Morristown and took a position at Middlebrook, on which the British left their encampment, and General Howe endeavored to induce General Washington to meet him on equal ground. But Washington chose to continue his defensive warfare, and not to risk an open battle. Finding various feints and attempts ineffectual, Howe ordered a hasty retreat to Staten Island. He then embarked 16,000 troops, and leaving Sir Henry Clinton in command at New York, put to sea, keeping his destination secret. On the 20th of August, the fleet entered Chesapeake Bay, intending an attack on Philadelphia. Washington hurried to Philadelphia by forced marches, and on September 11,

engaged Howe at Brandywine creek. After a hard-fought battle the Americans were forced to retreat. After some days occupied in maneuvering and skirmishing, on the morning of October 4 Washington made a sudden attack on Howe's position at Germantown. For a while the victory seemed in favor of the Americans, but, owing to a heavy fog, they became confused, and the British troops rallied and drove them back with heavy loss. After these battles the British became masters of Philadelphia, and Washington took up his winter quarters at Valley Forge, about twenty miles distant from that city.

83. While these events were occurring in the middle states, in July, 1777, Burgoyne, with an army of British, Hessians and Indians, entered the states from Canada, intending to seize the whole line of the Hudson river. While on his route he sent out detachments on both sides, one under St. Leger against Fort Schuylcr, and another under Colonel Baum, to seize the American stores collected at Bennington. St. Leger's enterprise failed, and Baum was completely routed by the Green Mountain boys at Bennington (August 16). October 7, Burgoyne was defeated by the Americans under Gates, at Bemis Heights, and October 17 was compelled to surrender at Saratoga. The surrender of Burgoyne proved to be the turning point of the war. It gave artillery and arms to the American army, it encouraged the soldiers, and made a great impression in Europe.

84. In the meantime the winter was passing and bringing with it severe trials to the American army at Valley Forge. The men were without shoes, and the snow was stained with the marks of their bleeding feet. There was no money to pay them. The bills issued by Congress had become so depreciated as to be almost worthless. Food was so scarce that Washington was authorized to seize provisions wherever he could find them. About this time there was a plot to compel Washington to resign, and to have Lee or Gates put in his place. But the scheme failed, and Washington became more popular than ever. In the spring of 1778 the condition of affairs improved. Robert Morris, of Philadelphia, afforded relief to the treasury by raising large sums of money for the government, on his personal credit, and continued to serve the country in this way until the end of the war. When the news of Burgoyne's capture reached France, she instantly made a treaty of alliance with America (February 6, 1778), and sent out a fleet under Count d'Estaing to aid the colonies. The news of the treaty was received by the Americans with great joy. The British Government now sent over commissioners to offer terms of peace, giving the Americans all they asked for, except independence, but all propositions short of that were refused.

85. General Howe was now instructed to concentrate all his forces in New York. Consequently the British suddenly left Philadelphia, and set out on their march. Washington instantly left Valley Forge, and pursued the enemy with 12,000 men. He came up with them at Monmouth where a hotly contested, but indecisive, battle was fought. The enemy continued their retreat, and were enabled to gain New York. Having failed in their designs against New England and the Middle States, the British now transferred their operations to the South. An expedition was sent by sea and Savannah, Georgia, was taken at the end of the year 1778. Augusta was then occupied, and Georgia was practically in the hands of the British. Thus ended the campaign of 1778. General Lincoln received orders from Congress to take command of the southern forces, and the army under Washington retired to winter quarters near Middle Brook, New Jersey.

86. There were no great movements during 1779. Campaign Washington resolved to make the campaign a defensive one. General Clinton, who commanded at New York,

sent out an expedition which captured the half finished fort at Stony Point, situated on the west bank of the Hudson river. Washington determined upon its recapture, and upon the night of July 16, it was carried at the point of the bayonet by the troops under the gallant General Wayne, or "Mad Anthony Wayne" as he was called. In October, the Americans, aided by the French, made an attack on Savannah in order to wrest it from the British. At the end of five hours' hard fighting, in which the brave Pulaski was mortally wounded, the French refused to continue the attack longer, and sailed for the West Indies, whereupon the Americans retired to Charleston. This brought the southern campaign of 1779 to an end. This year was signalized by the victories achieved by the infant navy of America, under the command of the intrepid Paul Jones, who fought with the "Serapis" one of the most desperate naval battles on record (September 23).

87. The seat of the war was now mainly in the South. The people there were nearly equally divided in allegiance. Savannah, the chief town of Georgia, was already in possession of the British, and in May Charleston was captured by them. The enemy had now a large army in the field in that quarter. At first it was opposed by no united American army. The patriotic planters gathered in companies, and rode here and there under the leadership of daring men like Marion and Sumter. They harassed the British wherever they could find convenient points of attack. Clinton, having gained possession of South Carolina, returned to New York, leaving Cornwallis in command. Meantime an American force under Baron De Kalb, had been sent by Washington to the South; but Congress interfered and put Gates in De Kalb's place. Gates, whose military capacity was much overrated, collected together about six thousand men, and marched hastily toward Camden, in the interior of South Carolina. Here he was met by the British under Cornwallis, who inflicted a disgraceful and disastrous defeat upon him (August 16, 1780). During the fight the heroic De Kalb lost his life. Gates fled to North Carolina, leaving his fugitive soldiers to take care of themselves. Soon afterward he was removed from command, and Greene appointed in his place. In September, 1780, Arnold's treachery against the government was discovered, and he was compelled to flee to the British lines. Major Andre, who had been arranging terms with Arnold, was captured on his return, tried as a spy, condemned, and executed October 2, 1780. Greene being now in command of the American troops in the South, showed at once the qualities of a good general. He secured additions to the weakened southern army, and began operations against Cornwallis. In December, 1780, Greene was at Charlotte, North Carolina, and Cornwallis was in South Carolina, moving northward. Greene divided his forces in two bodies. His plan was to get on each side of the British army, and while avoiding a general battle, to annoy the enemy continually. Although General Greene's men were scantily clad, half starved, and dispirited, destitute of arms and ammunition, the officers under his command were as brave men as ever followed a leader. Morgan, Lee, Marion, Sumter and Colonel Washington formed a group to which the British army could furnish no parallel. In the course of his movements, Cornwallis dispatched Tarleton against Morgan, who commanded one of the divisions of Greene's army. They met at Cowpens (January 17), and after one of the severest conflicts of the war, Tarleton was completely defeated, with the loss of the greater part of his force, and all his artillery and baggage.

88. Morgan now hastened his march eastward to join Greene, and Cornwallis followed in hot pursuit. In order to move faster the British burned their stores and superfluous baggage, but Morgan succeeded in

effecting a junction with Greene. Now followed a series of masterly movements by Greene, lasting through the winter, the spring, and the following summer. The hostile forces met at Guilford Court House (March 15, 1781). The battle was fought desperately for two hours, and all the advantages of a victory were on the side of the Americans. Notwithstanding Cornwallis claimed the victory, he retreated, closely pursued by Greene. Cornwallis avoided a battle and retreated to Wilmington, and from there proceeded to Petersburg, Virginia. Greene moved to South Carolina, where he had a fight at Hobkirk's Hill (April 25), with a force under Lord Rawdon, whom Cornwallis had left in command. Here Greene was compelled to retreat, but Rawdon's loss was so great that he soon after evacuated his main position at Camden. During April and May Greene swept through the country, carrying the British posts in succession, until the enemy were confined to three points, Ninety-six, Eutaw Springs and Charleston.

89. Having rested his army, Greene marched against Eutaw Springs, where he found the British forces under Colonel Stuart (Rawdon having resigned and sailed for England) drawn up to receive him. A severe engagement took place (September 8, 1781), both sides claiming the victory. This was the last general action in South Carolina; the British, abandoning the open country, retired to Charleston. Cornwallis arrived in Virginia in May, 1781. Having received reinforcements, he fortified himself at Yorktown, on the south side of York river. Tarleton occupied Gloucester Point, opposite Yorktown. The British force in Virginia at this time was about 8,000 men.

90. Meanwhile Washington, having been reinforced by a lately arrived body of 6,000 French troops, under Rochambeau, was threatening New York. About this time the French admiral, De Grasse, who had been engaged against the English in the West Indies, came north to co-operate a little while with Washington, and it was resolved, instead of carrying out on an attack upon New York, which had been planned, to strike a hard blow at Cornwallis in Virginia. The army of Rochambeau marched from Newport to meet Washington in the highlands. Their destination was kept secret, and the movements of both so artfully contrived that Clinton supposed they were going to attack New York. He did not discover their object until they had reached the Delaware. Sir Henry then sent out an expedition under Benedict Arnold to ravage Connecticut, hoping thereby to cause Washington to return, but this maneuver did not effect its object. Washington and Rochambeau pressed forward with the utmost alacrity. They received the gratifying intelligence that De Grasse had already arrived with his fleet and had blockaded the Chesapeake, thus cutting off the escape of the British by water. On September 30, 1781, the allies invested Yorktown and Gloucester. After a siege of nearly three weeks, Cornwallis, finding it no longer possible to hold Yorktown, surrendered his whole army of nearly 8,000 men to Washington (October 19, 1781). On that day Clinton left New York to join Cornwallis. A week later, when off the Virginia capes, he heard of the news of the surrender. It was too late for him to be of any service, and he returned to New York.

91. The surrender of Cornwallis sent a thrill of joy through the country, and was the most decisive event of the war. The territory of the thirteen states was now restored to the jurisdiction of Congress, and the contest decided in favor of America. The surrender of Cornwallis was accepted both by the Americans and the English in America as the end of the war. Congress recommended the states to observe a day of thanksgiving to God for the signal success of the American arms. The people waited impatiently for the two governments to agree upon terms of peace. There were after this a few encounters between the two armies, but

there was no general battle. The British still had possession of New York harbor and the surrounding country. General Washington went into camp with his army at Newburgh, on the Hudson. There he could keep open communication between New England and the rest of the country. The French allies remained in Virginia. Generals Wayne and Greene drove such portions of the British forces as remained in the Carolinas and Georgia down to the sea-coast, and shut them up in Savannah and Charleston. There they were protected by their vessels. The people of Great Britain became clamorous for peace. The obstinate king was still resolved "never to consent to a peace at the expense of a separation from America, but a resolution in favor of peace, supported by the leading members, passed the House of Commons February 27, 1782. The king was compelled to dismiss Lord North and accept a ministry headed by the Marquis of Rockingham, who was committed to the policy of peace, and commissioners were appointed on both sides to negotiate a treaty, hostilities being stopped in the interval.

The Treaty
of Peace.

92. Much firmness and wisdom were shown by Messrs. Jay, Franklin, Adams and Laurens, the American commissioners. Many questions were raised, an important one of which was that of boundary, England wishing to keep the Ohio valley and part of Maine. The property of the Tories had been confiscated; the English wished it restored. England tried to exclude New England from the right to fish off the banks of Newfoundland. These and other questions caused delay. The delay was increased by the efforts of France and Spain to postpone the final settlement until they should get all which they demanded as nations from Great Britain. The preliminary articles of peace were settled at Paris on the 30th of November, 1782, and in September, 1783, a formal treaty was signed. By this treaty Great Britain acknowledged the independence and sovereignty of the United States, and a new nation took its place among the governments of the earth.

The Army
disbanded.

93. The American army was now disbanded. During the progress of negotiations the temper of the officers and soldiers was far from satisfactory. They had received but a small portion of their pay, had often suffered from absolute hunger, and were becoming restless under their wrongs and neglect. Some of them so far forgot themselves as to desire the establishment of a military despotism, and Washington received a letter in which he was advised to declare himself king—a proposition which he indignantly refused to entertain for a single moment. Then anonymous letters were circulated among the troops in March, 1783, tending to inflame their minds and advising them to organize for the purpose of enforcing Congress to grant their demands. To counteract this movement Washington called all the officers together, and in his subsequent farewell address soothed them by kind words and promises, and appealed to the nobler sentiments of the heart. Thus the danger was dispelled, and on November 3, still glowing with patriotism, the soldiers separated, resolved to endure all necessary privations. The army certainly had been treated badly by both Congress and the States, but there was some excuse for their conduct in that the country was very poor, and that, after spending nearly \$100,000,000 during the war, the treasury found itself at the end about \$40,000,000 in debt. This was exclusive of the outlay of the separate states, which amounted to \$60,000,000 or \$70,000,000 more.

Evacuation
of New
York.

On November 25 the British evacuated New York, and Washington's troops marched in by the way of King's Bridge. On November 2 Washington issued his farewell address to the army; on December 4, with a heart full of love and gratitude, he bade his officers adieu. It was a deeply affecting scene, and men, who had braved the horrors of many a battle, now, as they approached their beloved commander-in-chief, were

melted to tears and incapable of utterance. Washington then proceeded to Annapolis, at that time the seat of Congress, and tendered his resignation as commander-in-chief of the armies of the United States, and immediately retired as a private citizen to his home at Mount Vernon, on the Potomac, in Virginia.

Washington's
Resignation.

V.—THE FORMATION OF THE FEDERAL CONSTITUTION.

94. The States were governed during the latter part of the war by "Articles of Confederation," proposed by Congress at the time of the Declaration of Independence, but not adopted until several years later. Nearly all power was vested in the separate states; Congress had but little authority; there was no president or other executive chief. During the war for independence the army, which was called the Continental army, was under the authority of the Continental Congress, and it received its pay, when paid at all, in Continental currency. These two words "Continental Currency," were placed at the head of the paper money which Congress began to issue at the beginning of the war. No other way of raising money to meet the military expenses seemed clear to Congress than to issue this currency, since there would be no revenue from duties, as resolutions had been passed to have no trade with Great Britain. All the colonies represented in Congress agreed to redeem the bills which should be issued, just as each colony had been accustomed to redeem its own bills. At first the money was found to be very useful, and its value was not questioned, as nearly everyone thought that the war would soon be over. But the war dragged along; Congress had been obliged to issue bills to the amount of \$20,000,000; whether or not the colonies would be able to win independence was a matter of doubt; the country was poor, and it was not certain that the Confederation would last. Under these circumstances people began to refuse to take the money at the value printed upon it.

95. Under the "Articles of Confederation," adopted in 1777, the powers of Congress were but small. The colonies were jealous of each other, and especially the smaller of the larger, and so they all wished to give the "Confederation," as it was called, just as little power as they could. The new government was to be merely a "firm league of friendship" between sovereign states, which were to retain every power not "expressly" delegated to Congress. At this time Congress consisted of but one house, in which each state had an equal vote. There was no national executive head. Congress retained the power to borrow money, but was not authorized to raise money by taxes, or to fix the rate of duties on foreign goods imported, or compel obedience to any law. In fact, the provincial spirit which manifested itself in the several colonies, so prevailed over the spirit of nationality, as to completely take from it all power of action, even in the most violent emergencies, without the express consent of the several provinces. This was done by the celebrated "Articles of Confederation," by which Congress was reduced from a prompt and energetic exercise of power, assumed and used for the general good, to a mere advisory body, which, strictly speaking, had no authority at all; for the very first article, after that giving title to the instrument, made the following declaration: "Each state retains its sovereignty, freedom and independence, and every power, jurisdiction, and right which is not by this confederation expressly delegated to the United States in Congress assembled." Thus Congress was bound, hand and foot, by the narrow-minded jealousy of the several states. Important measures required the votes of nine of the 13 states, and amendments the votes of all. Congress alone could decide upon the needed amount of money, but the power of collecting the taxes was vested in the states, only. Congress could decide disputes between the states, but it had no power to compel respect or obedience to its

Powers of
Congress.

decisions. It alone could make treaties with foreign nations, but no individual state was bound to respect those treaties, so far as Congress was concerned. Every state had the power of regulating its own commerce, both foreign and domestic. In truth, all the acts of Congress were simply recommendations to the state assemblies; and these recommendations were always largely debated, oftentimes rejected, and never assented to in season to have their best effect. Washington and the army and the Revolutionary cause were thus nearly sacrificed by a states-right prejudice, as bad in principle as it was slow and injurious in fact.

96. When Congress tried to borrow money in Europe, it succeeded in getting some at high rates of interest. But in the present state of the country foreigners were slow to lend; they were not sure of getting their money back again. They knew they would not if the states failed in establishing their independence. And even if they did, the question was, would they pay if peace came? Under the then existing form of government it seemed doubtful. The several states could raise money to meet their obligations by taxing their citizens; they could also impose duties on articles of trade. The government, as vested in Congress, could do neither of these things; it could only apportion to the several states their share of the public expenses. If the states refused to pay, Congress had no power to compel them. Foreign countries, also, did not like to make treaties with such a loose and feeble government. Washington said: "We are one nation to-day, and 13 to-morrow: who will treat with us on these terms?" Thus, both Congress and the states struggled on, making more paper money and borrowing at high rates of interest. Laws were passed requiring the people to take the paper money in payment of debts. But the currency became more and more worthless, so that about the middle of the war, 16 hundred dollars of it was asked for a suit of clothes. After the alliance with France, the prospect brightened. People had more confidence in the success of the United States, and it became easier to borrow money in Europe. About this time, also, Robert Morris, of Philadelphia, who thoroughly understood the mistakes which had been made, was offered the position of superintendent of finance. He accepted the office only on condition that Congress should abandon the attempt to compel the people by law to take the paper money in payment of debts. In 1781 Congress passed a resolution that it would pay all its debts in solid coin, and recommended the states to do the same. It chartered the Bank of North America, and this bank lent money both to the government and to the people. At the close of the war the government found itself deeply in debt. Part of this money was due to foreigners, and part to the people of the country. How this debt was to be paid, was the question to be settled by the Confederation.

Robert Morris,

The Sale of Unoccupied Lands.

97. One way was through the sale of unoccupied lands. When the Confederation was forming there was much dispute and uncertainty about the western boundaries of the different colonies. Virginia, for example, claimed the country now occupied by Kentucky, Indiana, Ohio and Illinois. It was proposed that the states should give up their western lands to the United States. Virginia was the first to do this, and other states followed her example (1784). Congress used this property to pay the debts of the government. It gave lands to officers and soldiers in payment of their claims. Many of these moved out on their lands, and companies were formed for colonizing, especially in the Ohio valley. Congress could not go much farther. It could say what taxes ought to be laid, and could recommend a uniform rate of duties throughout the country; but it was obliged to ask the state to lay the taxes, to levy the duties, and then to pay the money raised into the treasury of Congress.

98. It perceived that this would never do—that a

stronger form of government was necessary for the welfare and prosperity of the country. Disorders arose within the separate states, and a state of anarchy in general prevailed. The western counties of North Carolina undertook to form a state of their own, called Frankland. The part of Virginia which afterward became Kentucky, made a similar attempt. An extensive rebellion in Massachusetts, led by an ex-captain in the Continental army, named Daniel Shays (December, 1786), and directed against the collection of taxes, etc., for six months resisted the authority of the state. It was finally put down by a military force under General Lincoln. The one act of authority which Congress could exercise was in providing for the government of the country which had been ceded to it by the states. This led to the passage of the important ordinance in 1787. By this ordinance all the district northwest of the Ohio was formed into one territory. Congress appointed a governor, a council and judges. The people of the territory were allowed to choose their own assembly and make their own laws. The most important provision of the ordinance was that by which slavery was forever excluded from the northwest territory.

Shays' Rebellion

Ordinance of 1787

Difficulties of the Country.

99. It was impossible for the country to go on as it was. The states were separating from one another, and from Congress. Congress could with difficulty bring enough members together to form a quorum. Scarcely any one outside paid attention to what it did. Least of all was it respected by foreign governments. John Adams, who had been sent as minister to England, could hardly get a hearing there. Many of the states refused or neglected to pay even their allotted shares of interest on the public debt, and Congress had not the power to compel payment. The national credit became worthless. Foreign nations refused to make commercial treaties with the United States, preferring rather to take advantage of the impotency of Congress, and lay any burden upon American commerce that they thought fit. In 1785, Algeria declared war against the United States. Having no efficient navy, Congress recommended the building of five ships of war, but as it had the power to recommend only, the ships were not built, and American commerce was left a prey to the Algerine pirates. Great Britain still refused to carry out the treaty of 1783, or send a minister to the United States. The federal government was despised abroad, and disobeyed at home.

100. Amidst this discouraging and confused state of affairs, the more thoughtful of the people saw that some change in the form of government was necessary and so a convention of delegates was called to meet in Independence hall, Philadelphia, May 14, 1787, in order to decide upon a new constitution, and make, if possible, a stronger government, without doing harm to the liberties of the people. The states sent their ablest men to represent them. Many of the delegates had been members of the first Congress. Among others, Virginia sent Washington, Edmund Randolph, George Mason, Madison and George Wythe; New York, Hamilton; Massachusetts, Rufus King, Strong and Gerry; Pennsylvania, Franklin, Robert Morris, Gouverneur Morris and James Wilson; New Jersey, Paterson; Connecticut, Sherman, William S. Johnson and Ellsworth; and South Carolina, Rutledge and the two Pinckneys. Washington was appointed president of the convention.

Convention of 1787

101. There was great difference of opinion among the delegates regarding the question at issue, but all agreed that it was necessary to give the government greater authority. After a long discussion, lasting many weeks, the convention drew up a constitution of the United States (September 17, 1787) which was to take the place of the articles of confederation. The convention reported its work to Congress, and Congress submitted it to the several states. By the terms of the constitution, it must be ratified by nine states before it could become the law of the land. Much opposition

The Constitution.

was manifested toward its adoption. It was discussed everywhere, and its every article was earnestly debated. Hamilton, Madison and John Jay of New York published a celebrated series of papers called *The Federalist*, in which they went over all its features with great thoroughness, showing the reasons for the action of the convention. By this means they did much to convince the people of the importance of the work done. Delaware was the first to ratify the constitution, which it did unanimously. Pennsylvania followed, ten days afterward, with a two-thirds vote in favor. Eight other states also ratified it, so that it went into effect in 1788. Of the three states which remained, New York accepted the constitution in time to take part in the first presidential election that same year. North Carolina accepted it during the year following; and Rhode Island, last of all, in the year after that (1790). Thus the old "Confederation" came to an end and the new

The Union, "Union" began.

102. The opening words of the constitution are as follows: "We, the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessings of liberty to ourselves and our posterity, do ordain and establish this constitution for the United States of America." This first sentence of the constitution is often called the preamble, but no such term was applied to it by the framers of the constitution, neither is it found in the original manuscript. It is not a preamble in any sense, but is the enacting clause—an integral part of the constitution, stating that it was the people of the whole United States who established it. A preamble gives reasons why a resolution should be adopted or enacted, but it is no part of the resolution or enactment. The enacting clause, on the contrary, is mandatory. No other part of a statute is more important. Thus, this introductory sentence gives the authority and the ends for which the constitution was made. It was ordained by the people of the United States as a nation, and for the purposes so admirably set forth in its opening clause; and wherever in the constitution the words "United States" occur they signify the nation as a whole; wherever the word "States" occurs, it denotes the states considered separately, or as distinguished from the nation.

The Preamble.

Articles of the Constitution.

103. The constitution contains seven articles, which are subdivided into sections. Besides these seven articles, fifteen amendments have been made to the constitution, which are as binding as the original articles. By the first article all legislative power is vested in the Congress of the United States, which consists of a senate and house of representatives. Under the confederation the whole governmental authority was vested in Congress. There was no executive department and no judicial. The first resolution adopted in the constitutional convention stated that a national government ought to be formed, consisting of supreme legislative, executive and judicial departments. Most legislative bodies have two houses. This is true of all the existing state governments, and was true of all the states at the time the constitution was framed, except Pennsylvania and Georgia, which had but one each. The Continental Congress had but one house. While there is a general distribution of powers among the three great departments of government, the exercise of these powers is not absolutely exclusive.

The House of Representatives.

104. The federal house of representatives is descended, through the state houses of representatives, from the colonial assemblies. It is an assembly representing the whole population of the country as if the people were all in one great state. It is composed of members chosen every year by the people of the states. A candidate for election to the house must be at least twenty-five years old, must have been seven years a citizen of the United States, and must be an inhabitant

of the state in which he is chosen. As the federal Congress is a taxing body, representatives and taxes are apportioned among the several states according to the same rule, that is, according to population. At this point a difficulty arose in the convention as to whether slaves should be counted as population. If they were to be counted, the power of the slave states in all matters of national legislation would be greatly increased. The difficulty was adjusted by a compromise measure according to which five slaves were to be reckoned as three persons. Since the abolition of slavery this provision has become obsolete, but until 1860 it was a very important factor in American history.

The Three-Fifths Compromise.

105. In the federal house of representatives the great states, of course, have much more weight than the smaller ones. In 1790 the four largest states had 32 representatives, while the other nine had only 33. The largest state, Virginia, had ten representatives, to one from Delaware. These disparities have increased. In 1886, out of thirty-eight states, the nine largest had a majority of the house, and the largest state, New York, had 34 representatives to one from Delaware. This feature in the house of representatives caused the smaller states in the convention to oppose the whole scheme of constructing a new government. They were determined that all the states, both great and small, should have equal representation in Congress. Their prolonged opposition threatened to ruin the whole plan, when a method of compromise was fortunately discovered. It was intended that the national legislature, in imitation of the state legislatures, should have an upper house or senate, and at first the advocates of a strong national government proposed that the senate also should represent population. But it happened that in the state of Connecticut a unique governmental method had been adopted. There it had always been the custom to elect the governor and upper house by a majority vote of the whole people, while for each township there was an equality of representation in the lower house. The Connecticut delegates in the convention, therefore, being familiar with a legislature in which the two houses were elected on different principles, suggested a compromise. Let the house of representatives, they said, represent the people, and let the senate represent the states; let all the states, great and small, be equally represented in the senate. Such was the famous "Connecticut Compromise." Had this not been adopted the convention would doubtless have broken up without accomplishing its purpose. After it was accepted, and the jealous fears of the smaller states allayed, the work, yet to be accomplished, was comparatively easy.

The Connecticut Compromise.

106. Thus it came about that the upper house of the national legislature is composed of two senators from each state. As they represent the state, they are chosen by its legislature and not by the people. They are chosen for a term of six years, and one-third of the number of terms expire every second year, so that, while the whole senate may be renewed by the lapse of six years, there is never a "new senate." The senate has thus a continuous existence and a permanent organization, whereas each house of representatives expires at the end of a two-years' term, which is usually known as a "congress," and is succeeded by a "new house." A candidate for the senatorship must be at least thirty years of age, must have been nine years a citizen of the United States and must be an inhabitant of the state which he represents.

The Senate.

107. Congress must assemble at least once in every year, and the constitution appoints the first Monday in December for the time of meeting; but Congress can, if necessary, enact a law changing the time. The established custom is to hold the election for representatives upon the same day as the election for president—the Tuesday after the first Monday in November. As the period of the new administration does not begin until the fourth day of the following March, the new

Time of Assembling.

house of representatives does not assemble until the December following that date, unless the new president should think it necessary to call an extra session of Congress at an earlier date. Each house is judge of the elections, qualifications and returns of its own members, determines its own rules of procedure and may punish its members for disorderly behavior, or by a two-thirds vote expel a member. Absent members may be compelled under penalties to attend. Each house is required to keep a journal of its proceedings, and at proper intervals to publish it, except such parts as for reasons of public policy should be kept secret.

108. Senators and representatives receive a fixed salary by law, which is paid out of the public treasury. In all cases, except treason or felony or breach of the peace, they are privileged from arrest during their attendance in Congress, as also while on their way to it and while returning home; "and for any speech or debate in either house they shall not be questioned in any other place." During the session of Congress neither house may, without the consent of the other, adjourn for more than three days, or to any other place than that in which Congress is sitting. No person can at the same time hold any civil office under the United States government and be a member of either house of Congress.

Privileges of members.

109. The vice-president is the presiding officer in the senate, with power to vote only in case of a tie. The house of representatives elects its presiding officer, who is called the Speaker. In the early history of the House of Commons, in England, its presiding officer was naturally enough its *spokesman*. He could speak for it in addressing the crown. Instances of this kind occurred during the fourteenth century, until in 1376 the title of Speaker was definitely given to Sir Thomas Hungerford, and from that date the title has always held. The same title was given to the presiding officers of the American colonial assemblies, and thence it passed on to the state and federal legislatures. The Speaker presides over the debates, puts the questions and decides points of order. He also appoints the committees of the house of representatives.

Presiding officers.

110. The house of representatives has the sole power of impeachment, and the senate has the sole power to try all impeachments. When the president of the United States is tried, the chief justice of the supreme court must preside. As a precaution against the use of impeachment for party purposes, a two-thirds vote is required for conviction. In case of conviction the judgment cannot extend further than "to removal from office, and disqualification to hold or enjoy any office of honor, trust or profit under the United States;" but the person convicted is liable afterward to be tried and punished by the ordinary process of law.

Power of impeachment.

111. The constitutional provisions for legislation are admirably simple. All bills for raising revenue must originate in the lower house, but the upper house may propose or concur with amendments as in the case of other bills. After a bill has passed both houses, it must go to the president for his approval. If he approves it, he signs it, and it becomes a law. If he disapproves it, he returns it to the house in which it originated, with a written statement of his objections, which must be entered in full upon the journal of the house. The bill is then reconsidered, and if it obtains a two-thirds vote it is sent, together with the objections, to the other house. If it passes there by a two-thirds vote, it becomes a law. Otherwise it fails. If the president keeps a bill longer than ten days (Sundays excepted) without signing it, it becomes a law without his signature, unless Congress adjourns before the expiration of the ten days, in which case it fails to become a law, just as if it had been vetoed. This method of vetoing bills just before the expiration of Congress, by keeping it in one's pocket, so to speak, was styled a "pocket

The president's veto power.

veto," and was first employed by President Jackson in 1829.

112. By the constitution, Congress has the power "to lay and collect taxes, duties, imposts and excises, to pay the debts and provide for the common defense and general welfare of the United States," but all duties, etc., were to be uniform throughout the United States. Other powers are naturally attached to this—such as the power to borrow money on the credit of the United States; to regulate foreign and domestic commerce; to coin money and fix the standard of weights and measures; to provide for the punishment of counterfeiters; to establish post-offices and post-roads; to issue copyrights and patents; to establish courts inferior to the supreme court; to punish offenses committed on the high seas, or against the law of nations; to declare war, grant letters of marque and reprisal, and make rules concerning captures on land and water; to raise and support an army and navy (no appropriation to be for more than two years), and to make rules for the regulation of the land and naval forces; to provide for calling out the militia to suppress insurrections and repel invasions, and to command the militia while actually employed in the service of the United States. The several states, however, were to train their own militia and appoint the officers. Congress may also establish a uniform rule of naturalization, and uniform laws on the subject of bankruptcies, but it has not yet done so. It was also empowered to establish a national capital or federal district (which is the District of Columbia, containing the city of Washington), to exercise exclusive control over it, and over forts, magazines, arsenals, dockyards and other needful buildings, which it erects within the several states upon lands purchased for such purposes with the consent of the state legislature; and finally, "to make all laws which shall be necessary and proper for carrying into execution the foregoing powers and all other powers vested by this constitution in the government of the United States, or in any department or office thereof." This last clause may be called the elastic clause of the constitution. It has been the subject of continued debate, and has undergone a great deal of stretching for one purpose and another. It was a profound disagreement in the interpretation of this clause which, after 1789, divided the American people into two great political parties.

Powers granted to Congress.

The "Elastic Clause."

113. The national authority of Congress is further sharply defined by the express denial of sundry powers to the several states. The states are expressly forbidden to impose any duties on imports or exports, except for inspection charges, which must be passed over to the treasury of the United States; to make treaties of any kind; to lay any duty on tonnage; to keep troops or ships of war in time of peace; to engage in war unless actually invaded, or in such imminent danger as will admit of no delay; to grant letters of marque and reprisal; to coin money; to emit bills of credit; to make anything but silver a legal tender; to pass any bill of attainder, *ex post facto* law, or law impairing the obligation of contracts, or to grant any title of nobility.

Powers denied to the States.

114. Some express prohibitions were laid upon the National Government. Duties may be laid upon imports, but not upon exports. Duties and excises must be uniform throughout the country, and no commercial preference can be shown one state over another. The privilege of the writ of *habeas corpus* cannot be suspended except "when, in cases of rebellion or invasion, the public safety may require it." A census must be taken every 10 years in order to adjust representation, and no direct tax can be imposed except according to the census. No bill of attainder, or *ex post facto* law can be passed. A bill of attainder is a special legislative act by which a person may be condemned to death, or to outlawry and banishment, without the opportunity of defending himself, to which he is entitled in a court of law.

Prohibitions laid upon Congress.

Congress can grant no title of nobility, and no federal officer can accept a present, office, or title from a foreign state without the consent of Congress. "No religious test shall ever be required as a qualification to any office or public trust under the United States." Money is to be taken from the treasury only in consequence of appropriations made by law.

Qualifications for the presidency.

115. No one is eligible to the office of president unless he is a native born citizen. The candidate must be at least 35 years old, and must have been 14 years a resident of the United States. The president's term of office is four years. The constitution says nothing about his re-election, and there is no written law forbidding his being re-elected many times. Some of the presidents have served two consecutive terms, and it seems to have become the established custom not to go beyond that. The president is solemnly sworn to execute his office faithfully, and "to preserve, protect, and defend the Constitution of the United States" to the best of his ability. In case of his death, resignation, or inability to perform the duties of his office, the vice-president takes his place; and, in the case of the inability of both, the members of the cabinet succeed in the order prescribed in the Presidential Succession Act of 1886. The president is commander-in-chief of the military and naval forces of the United States, and of the militia in the several states actually engaged in the service of the United States; and he has the prerogative of granting reprieves and pardons for offences against the United States, except in cases of impeachment. He can make treaties with foreign powers; but no treaty is valid unless confirmed by a two-thirds vote of the senate. He appoints ministers to foreign countries, consuls, and the greater officers, such as the heads of executive departments and judges of the supreme court, and all other officers whose appointment Congress has not vested in other officers; but all presidential appointments are to be confirmed by the senate. When vacancies occur during the recess of the senate, he may fill them by granting commissions to expire at the end of the next session. He commissions all federal officers. He receives all foreign ministers. He may summon either or both houses of Congress to an extra session, and if the two houses disagree in regard to the time of adjournment, he may adjourn them to such a time as he thinks best, but of course, not beyond the time fixed for the beginning of the next regular session. The president must from time to time make a report to Congress on the state of affairs in the country, and suggest such a line of policy or such special measures as may seem proper to him. This report has taken the form of an annual written message. He may also call upon the heads of departments for an opinion, in writing, on any subject relating to such department. The president is paid by the United States, and his salary is not to be increased or diminished by Congress during his term of office. The act authorizing any increase must apply only to the successors of the president who signs the act.

Powers and duties of the president.

The President's message.

Executive departments.

116. The constitution made no express provision for the creation of executive departments, but left the matter to Congress. At the beginning of Washington's administration three departments were created—those of state, treasury and war, and an attorney general was appointed. Since then the number of departments has been increased, until now (1890) there are eight: those of state, of the treasury, of war, of the navy, of the post-office, of the interior, of justice, and of agriculture. The chief officer of each department is called its secretary. The secretaries of these departments are the president's advisers, and constitute his cabinet. They are selected by the president and are confirmed by the senate, but are responsible to no one but the president.

117. The secretary of state ranks first among the cabinet officers. He is the minister of foreign affairs, and is the only officer who is authorized to communicate

with other governments in the name of the president. He is at the head of the diplomatic and consular service, issuing instructions to the United States ministers abroad, and taking a leading part in the negotiation of treaties. He keeps the national archives, and superintends the publication of laws, treaties and proclamations, and he is the keeper of the great seal of the United States. The cabinet officer next in rank is the secretary of the treasury. He conducts the financial business of the country, superintends the collection of revenue, and gives warrants for the payment of moneys out of the treasury. He also superintends the coinage, the national banks, the custom-houses, the coast-survey and lighthouse system, the marine hospitals, and life-saving service. He sends reports to Congress, and suggests such measures as seem good to him. He is aided by two assistant secretaries, six auditors, a register, a comptroller, a solicitor, a director of the mint, commissioner of internal revenue, chiefs of the bureau of statistics and bureau of printing and engraving, etc.

Secretary of the Treasury.

118. The war and navy departments need no special description here. The war department is divided into ten bureaus, among which is the weather bureau, presided over by the chief signal officer. The navy department consists of eight bureaus, and among its many duties it has charge of the naval observatory at Washington, and publishes the nautical almanac. The department of the interior is divided into eight bureaus. It deals with public lands, pensions, patents, Indian affairs, education, public documents, and the census. The postmaster-general's department has to do with the postal affairs of the country. The attorney-general's department was organized in 1870 into the department of justice. The attorney-general is the president's legal adviser, and represents the United States in all law suits to which the United States is a party. The agricultural department, which was created in 1889, superintends the agricultural interests of the country.

119. The best method of electing the president was a question which perplexed the constitutional convention as much as any other. To submit the election of an officer so exalted to the popular vote, was regarded with general distrust. At one time the convention decided to have the president elected by Congress, but there was a grave objection to this; it would be likely to destroy his independence and make him the mere creature of Congress. At last the plan of an electoral college was devised. Each state is entitled to a number of electors equal to the number of its representatives and senators together; and the electors choose the president and vice-president, meeting at their state capitals for that purpose, and sending separate certificates of their choice of president and vice-president to the presiding officer of the Senate at Washington. No federal senator or representative, or any person holding civil office under the United States, can serve as an elector. Each state may appoint or choose its electors in such a manner as it sees fit; at first, they were more often than otherwise chosen by the legislatures; now they are always elected by the people. The day of election must be the same in all the states. By act of Congress the electors are to be chosen on the Tuesday after the first Monday in November.

The Electoral College.

120. It was the original intention that the electors should be left free to make their own choice, and there are instances in early years of electors of one party voting for personal friends of the opposite party. At first the electoral votes did not state whether the candidates named in them were candidates for the presidency or vice presidency. Each elector simply wrote down two names, only one of which could be the name of a citizen of his own state. In the official count, the candidate who had the highest number of votes, provided they were a majority of the whole number, was declared president, and the next highest became vice-president. The natural result of this was seen in the

Powers of electors.

first contested election in 1796, which gave the presidency to John Adams, while his antagonist, Thomas Jefferson, became vice-president. In 1800, Jefferson and his colleague Burr received exactly the same number of electoral votes. This threw the election into the house of representatives, and such intrigues followed for the purpose of defeating Jefferson that the country was threatened with civil war. This necessitated a change in the method of election. In 1804, the twelfth amendment was adopted. The method by this amendment was changed so that the electors make separate ballots for president and vice-president. In the official count the votes for the president are first counted. If no candidate has a majority then the house of representatives must immediately choose the president from the three names highest on the list. In this choice the house votes by states, each state having one vote; a quorum for this purpose must consist of at least one member from two-thirds of the states, and a majority of all the states is necessary for a choice. Then if no candidate for the vice-presidency has a majority, the senate makes its choice from the two names highest on the list. A quorum for the purpose consists of two-thirds of the whole number of senators, and a majority of the whole number is necessary to a choice.

The twelfth amendment.

121. In 1877 an unforeseen difficulty arose, and one for which no provision had been made. During the presidential contest between Tilden and Hayes, South Carolina, Florida and Louisiana had each set up rival governments. Ballots for Tilden and ballots for Hayes were sent in at the same time by the two hostile sets of electors in each of these states, each list being certified by one of the two rival governors in the same state. In the absence of any recognized means of deciding which ballots to count, the two parties in Congress submitted the result to arbitration. An "electoral commission" was created for the occasion, consisting of five senators, five representatives and five judges of the supreme court. By this expedient, a clumsy one perhaps, the difficulty was tidied over. The question of conflicting returns has at length been set at rest by the act of 1887, which provides that no electoral votes can be rejected in counting, except by the joint action of both houses of Congress.

The electoral commission.

122. The judiciary is the third of the three great departments of the general government. The constitution itself provides for one supreme court, but leaves to Congress to determine how many inferior courts should be established. The organization of the supreme court is also left to Congress. The chief reason why a national judiciary is necessary in addition to the state systems is that the state judges might be biased in favor of their own state. Laws of Congress often bear with greater hardship on some states than others, and public opinion in those states upon whom the burden lay, might be so strong in opposition, that no judge elected and supported by those people would sustain it. But if the judge belonged to a national system, and thus represented and was supported by the whole nation, he would have nothing to fear, and thus his decision would be more impartial. The experience of the confederation taught this. The national judiciary consists of three grades of courts: The supreme court, the circuit courts and the district courts. The supreme court is the highest in the land, and was established by the constitution itself. The others were established by Congress. The supreme court consists at present of a chief justice and eight associate justices, and its jurisdiction is almost wholly appellate; that is, cases are not tried in it, but it only hears appeals from other courts, and that only in the most important cases. It has original jurisdiction in a few cases. Of the circuit courts there are nine in the country. Each of the nine judges of the supreme court is also presiding judge of a circuit court. The area of the United States, not including the territories, is divided into nine circuits, and in

Need for a federal judiciary.

Courts.

each circuit the presiding judge is assisted by special circuit judges. The circuits are divided into fifty-six districts and in each of these there is a special district judge. The districts never cross state lines. They cover each a state or a part of a state.

123. By the constitution, the judges hold office during good behavior. In no other department of the general government are offices held for so long a term. The purpose is to insure a correct and impartial administration of justice by making the judges independent of conflicting parties. The object of the framers of the constitution was to remove them as far as possible from undue political influences. As with the president, so in this case. Congress, though it fixes the salaries of the judges, cannot diminish them while in office. The jurisdiction of the federal courts does not extend to all kinds of cases, but only to such as the constitution specifies. The cases enumerated in the constitution in which the national courts have jurisdiction may be divided into three general classes, (1) those arising under the constitution, the laws of Congress and treaties, (2) those affecting foreigners, and (3) those between different states or the citizens of different states. Cases which arise under the constitution, laws or treaties of the United States may be those where a person is given a right by the constitution, etc., which he does not have by the laws of his state, as for instance a right to sue an infringer of a patent granted to him, or where he violates a law of Congress or treaty, as counterfeiting coin, or doing anything forbidden by a treaty, or where any question arises as to the meaning of the constitution, laws or treaties of the United States, or as to whether a law of Congress is constitutional or not. In these cases it makes no difference whether the parties are citizens of the same state or not. The jurisdiction is given to the national judiciary for two reasons: First, in order that in the interpretation and enforcement of its own laws, it may not be dependent on the states; and second, in order that the interpretation may be uniform throughout the country.

Tenure of office.

Salary.

Federal jurisdiction.

Cases under United States laws.

124. In cases affecting foreigners, the decision properly belongs to the federal courts, for the reason that if a foreigner is injured here, the nation, and not the state, is responsible to the foreigner's government; therefore the nation, and not the state, should make redress for the injury. And where the foreigner is an ambassador, or other minister, the supreme court has original jurisdiction in the case. Admiralty jurisdiction is also given to the federal courts, for the reason that many admiralty cases affect foreigners. Another reason is, that admiralty is a part of the regulation of commerce, which is a subject taken away from the states and given entirely to the United States.

Cases affecting foreigners.

125. The third class of cases in which the federal courts have jurisdiction, is where the parties on the two sides, plaintiff and defendant, are either two different states, or citizens of different states. The federal courts are to decide controversies between two or more states; because, domestic tranquility requires that the contention of states should be peacefully terminated by a common judicatory, and because, in a free country, justice ought not to depend on the will of either of the litigants. They are to decide controversies between a state and the citizens of another state; because, in case a state (which comprehends all its citizens) has demands against some citizens of another state, it is better that she should prosecute their demands in a federal court than in a court of the state to which those citizens belong, the danger of irritation and criminations arising from apprehensions and suspicions of partiality being thereby obviated. They are to decide controversies between citizens of the same state claiming lands under grants of different states; because, as the rights of the two states to grant the land are drawn into question, neither of the two states ought to decide the controversy.

Cases affecting different States or their citizens.

Original
and appel-
late juris-
diction.

126. The judicial power of the United States extends to all cases of law and equity arising under the constitution and laws thereof, and to treaties made under their authority. But there are two kinds of jurisdiction, original and appellate. Original jurisdiction is jurisdiction of a cause from its beginning. If a party can begin his suit in the circuit court, for instance, then that court has original jurisdiction in the case. If he cannot bring his case into the circuit court until it has been tried in some lower court, then the circuit court is said to have appellate jurisdiction. Appeal lies from the district court to the circuit court when the matter involved is of a value greater than \$500, and from the circuit court to the supreme court when \$5,000 or more is involved.

Court of
claims.

127. No direct suit can be brought against the United States either by a citizen or a state, without the authority of an act of Congress. But in 1855 Congress established a court, called the court of claims, in which those having claims against the United States, may bring a suit in the ordinary way. The demand is presented to the court by petition, setting forth specifically its origin and nature, and the party is allowed to prove it by the same rules of evidence which are usually adopted in a court of justice. If a claim is established Congress makes provision for its payment. An attorney, called the solicitor of the United States, appears before this court in behalf of the government.

Treason.

128. In the constitution, treason is made to consist only in levying war against the nation, or in adhering to its enemies, giving them aid and comfort. The purpose was to make the meaning as definite as possible, so that all opportunity for constructive treason might be removed. It has been decided by the court that there must be an actual levying of war; that a conspiracy to subvert the government by force is not treason. But if war be actually levied, that is, if a body of men be actually assembled for the purpose of effecting by force a treasonable purpose, all those who perform any part, however minute, or however remote from the scene of action, and who are actually leagued in the general conspiracy, are to be considered as traitors. Conviction of treason requires the testimony of two witnesses to the same overt act of treason, or a confession in open court. A private confession passes for nothing. To Congress is given the power to declare the punishment of treason, "but no attainder of treason is to work corruption of blood, or forfeiture, except during the life of the person attainted." The *attainder* spoken of in this clause must be that connected with the judgment pronounced by a court, and not a legislative attainder, for we have already seen that Congress is forbidden, as also the states, from passing any bill of attainder. Congress might provide for a judicial attainder in the case of treason, but the effects of this attainder must be limited to the life of the offender.

As treason is a crime against sovereignty, a violation of one's allegiance, there can be no treason against a particular state. The states, however, have always asserted their power to punish for treason against them individually. It has never been fully maintained in practice; but the theory had its effect in the secession period. If a state, by its courts, punishes treason, it must not be as treason against itself, but as treason against the union; and in this view, the propriety of that state legislation which affixes to it particular penalties, is doubtful.

Relations
of States.

129. Article IV of the constitution contains a number of important provisions, most of which affect the relations of the states to each other, and to the general government. The first one is in regard to the effect which the laws, records and judgments of our state shall have in another, and the provision is that they shall have full effect everywhere. No state can grant privileges to its own citizens, from which the citizens of

Privileges
of citizens.

other states are excluded. There must be an equality of citizenship everywhere. Without such a provision, any state might deny to citizens of other states the right to buy and hold real estate, or to become voters after living in the state the prescribed time, or to enjoy equal privileges in trade or business. The subject of delivering up fugitives from justice, is one which among different nations, has involved some doubts. The constitution of the United States, however, provides that they shall always be given up to those who, in the states, have a right to require it. By the common law, a slave escaping into a non-slaveholding state became free. But the constitution provided that fugitive slaves were to be surrendered to their owners. Escaped slaves were, under this provision, returned to the south up to 1861. The clause is of course obsolete now.

Fugitive
criminalsFugitive
slaves.

130. The constitution provides for the admission of new states to the union, but it does not allow a state to be formed within another state. A state cannot "be formed by the junction of two or more states, or parts of states, without the consent of the legislatures of the states concerned, as well as of the Congress." Shortly before the making of the constitution, the United States had been endowed for the first time with a public domain. The territory northwest of the Ohio river had been claimed, on the strength of old grants and charters, by Massachusetts, Connecticut, New York and Virginia. In 1777 Maryland refused to sign the Articles of Confederation until these states should agree to cede their claims to the United States, and thus, in 1784, the Federal government came into possession of a magnificent territory, out of which five great states—Ohio, Indiana, Illinois, Michigan and Wisconsin—have since been made. While the Federal convention was sitting at Philadelphia the Continental Congress at New York was doing almost its last, and one of its greatest pieces of, work in framing the ordinance of 1787 for the organization and government of this newly acquired territory.

New
States.The
Northwest
Territory.

131. In 1803 the vast territory of Louisiana, comprising everything (except Texas) between the Mississippi river and the crest of the Rocky Mountains, was purchased from France. A claim upon the Oregon territory was soon afterward made by discovery and exploration, and finally settled in 1846 by treaty with Great Britain. In 1848 by conquest, and in 1853 by purchase, the remaining Pacific lands were acquired from Mexico. All of this vast region has been at some time under territorial government. As for Texas, on the other hand, it has never been a territory. Texas revolted from Mexico in 1836 and remained an independent state until 1845 when she was admitted to the union. Territorial government has generally passed through three stages: First, there are governors and judges appointed by the president; then, as population increases, there is added a legislature chosen by the people, and empowered to make laws subject to confirmation by Congress; finally, entire legislative independence is granted. The state is then ripe for admission to the union as a state.

Other terri-
tories and
their gov-
ernments.

132. The national government was to guarantee each of the states a republican form of government, and to protect each of them against invasion or, on application of the legislature or governor, against domestic violence. This clause makes a republican government necessary in every state. It is equivalent to saying that no other shall be permitted to be established. This is the only instance in the constitution where the government has a duty enjoined upon it, while the particular department is not mentioned. Here the obligation is from the United States to the states; but whether to be exercised by the president or by Congress is one of the questions that has grown out of the reconstruction measures. In the case of Rhode Island the supreme court held "It rests with Con-

Guarantee
clause.

gress to decide what government is the established one in a state. For, as the United States guarantee to each state a republican government, Congress must necessarily decide what government is established before it can determine whether it is republican or not. And when the senators and representatives of a state are admitted to the councils of the union, the authority of the government under which they are appointed, as well as its republican character, is recognized by the proper authority."

Republican government.

133. The constitution does not define a *republican* government. The national government may be assumed to be republican in form, and thus a model for the states. Mr. Madison says: "We may define a republic to be a government which derives all its powers directly or indirectly from the great body of the people, and is administered by persons holding their offices during pleasure, for a limited period, or during good behavior." Farrar says: "The principle of republicanism is the equal right of the people, the citizens, all the members of the body politic. In theory it is the government of public opinion. The fundamental principles of right and justice for the government, the representative character of the governors, and their practical responsibility to the governed, are the essentials of republicanism."

State governments.

134. The constitution indirectly requires various provisions in the state governments by enjoining duties. The senators of the United States are to be elected by the state legislatures. Members of the house of representatives are to be elected by the same electors as vote for the members of the most numerous branches of the state legislature. The executive of the states is often referred to. The judges are to take oath to obey the constitution of the United States. Thus the states must have three great departments, the legislative, executive and judicial. The legislature must be in two branches, and the most numerous branch must be elected by the people. The states are supposed to have written constitutions.

The first ten amendments.

135. One of the strongest objections urged by its opponents against the adoption of the constitution as it came from the hands of the convention, was the want of a recognition of certain rights of citizens. To meet this objection, in September, 1789, the first ten amendments were proposed by Congress, and in December, 1791, they were declared in force. These ten amendments, which are called a "Bill of Rights," because they contain a list of the rights deemed most important to the liberty of the people, do not change any original provision of the constitution. They act merely as restrictions and limitations upon the powers of Congress, and were deemed unnecessary by those who framed the constitution for the reason that these rights were so generally acknowledged, and that the powers of Congress were limited to those expressly granted to it. But as several of the state conventions had, at the time of adopting the constitution, expressed a desire that declarations and guarantees of certain rights should be added in order to prevent misconstruction and abuse, the first Congress, at its first session, proposed twelve amendments, ten of which were ratified by the requisite number of states. These amendments forbade the establishment of any religion by Congress, or any abridgment of freedom of worship, of speech, or of the press, or of the popular right to assemble and petition the government for redress of grievances, the billeting of soldiers, unreasonable searches or seizures, or general warrants, trials for infamous crimes except through the action of a grand jury, subjecting a person for the same offence to be twice put in jeopardy of life or limb, compelling him to witness against himself in criminal cases, the taking of life, liberty, or property without due process of law or without compensation for property, and the demand of excessive bail, or the imposition of excessive or of

cruel or unusual punishments. They confirmed the right of the people to keep and bear arms, to a jury trial from the vicinage in criminal cases or in cases involving more than twenty dollars, to a copy of the indictment, to the testimony against the prisoner, to compulsory process in his half, and to counsel for him. Finally, it is declared that "the enumeration of certain rights shall not be construed to deny or disparage others retained by the people," and that "the powers not granted to the United States by the constitution, nor prohibited by it to the states, are reserved to the states respectively, or to the people."

Supreme law of the land.

136. All the debts of the federation, and its engagements, were made binding on the new government; and the constitution, and the laws and treaties to be made under it were declared to be "the supreme law of the land;" the judges in every state were to be bound thereby, "anything in the constitution or laws of any state to the contrary notwithstanding." The language of this clause is clear and explicit. The people of the United States established this constitution for the United States. It was the work of the nation itself, and was binding in every part of the republic. This clause was intended to affirm the supremacy of the national government over the state governments. If the constitution was not the supreme law of the land it would not be a constitution, it would be a nullity. Its supremacy is necessarily involved in the instrument itself, yet it was necessary to declare it, in order that all might understand it and no room be left for controversy.

VI. THE GOVERNMENT UNDER THE CONSTITUTION.

137. As soon as the constitution had been ratified by the requisite number of states, Congress named the first Wednesday in January, 1789, as the day for the choice of electors, the first Wednesday in February for the choice of president and vice-president, and the first Wednesday in March for the inauguration of the new government at New York city. The last date fell on the 4th of March, and this has been the limit of each president's term since that time. The election took place at the appointed time, and when the votes of the electors were counted before Congress it was found that George Washington had been unanimously elected president, and that John Adams, standing next on the list, was vice-president. Before the inauguration, the old Confederate Congress had "given up the ghost." On October, 1788, its record ceased, and for nearly six months the United States were without any national government. The contest for nationality had been successful, and the old order of things passed away for ever.

Inauguration of president.

Washington the first president.

138. The nation over which George Washington was called to preside in 1789 was a third-rate power, inferior in population and wealth to Holland, for example, and about on a level with Portugal or Denmark. The first census was taken in 1790, and the population was then four millions. The people were thinly scattered through the thirteen states between the Atlantic and the Alleghanies, beyond which mountainous barrier a few hardy pioneers were making the beginnings of Tennessee, Kentucky, and Ohio. Roads were few and bad, none of the great rivers were bridged, mails were irregular. There were few manufactures. There were many traders and merchant seamen in the coast towns of the north, but the great majority of the people were farmers, who lived on the produce of their own lands, and seldom undertook long journeys. Hence the different parts of the country knew very little about each other, and entertained absurd prejudices, and the sentiment of union between the states was extremely weak. East of the Alleghanies the red man had ceased to be dangerous, but tales of Indian massacre still came from regions no more remote than Ohio and Georgia. Spain still held vast possessions west of the Mississippi.

The condition of the country.

The first census.

The only other power which had possessions in North America was England. The feeling entertained toward the states in England was one of mortification and chagrin, accompanied by the hope that the half-formed union would fall to pieces, and its separate states be driven by disaster to beg to be taken back into the British empire. The rest of Europe knew little about the United States, and cared less.

139. It was under these circumstances that the young government began its career, and it was fortunate for it that it began under the auspices of such an administration as Washington's. Congress met in New York, March 4, 1789. It adopted twelve amendments to the constitution, ten of which, as has been shown, were ratified by the states. But the most pressing business before Congress was to obtain money to pay the debt of the confederation. This difficult work was so successfully accomplished that little change has been found necessary in financial methods from that day to this. Washington's cabinet consisted of Thomas Jefferson, as secretary of state; Alexander Hamilton, as secretary of the treasury; and Henry Knox, as secretary of war. John Jay was appointed chief justice, and Edmund Randolph attorney general. The financial success of the government was mainly due to the organizing genius of Hamilton, assisted by the skill and tact of Madison, as leading member of the house of representatives. Hamilton saw in the payment of the national debt an opportunity to give strength to the United States in the eyes of foreign nations. He saw also that it gave an opportunity to bind the states in a more perfect union. He proposed three measures: First, that the government should assume the foreign debt of the Confederation, and pay it in full; secondly, that the domestic debt, which seemed to have been virtually repudiated, should likewise be assumed and paid; thirdly, that the debts of the separate states should also be assumed and paid by the federal government. The first proposition was adopted unanimously. The second was opposed on the ground that it would only benefit speculators, who had bought up United States securities at a discount, but by dint of forcible reasoning the measure was carried. The third measure caused great debate, and met with violent opposition. There was a fierce and bitter fight over it, which at last was only settled by great political manipulation.

140. There were already two parties in the country, the Federalists, who desired a strong general government, and who had urged the people to accept the constitution, and the anti-Federalists, who wished to give more power to the state government, and less to the general government. Hamilton was the leader of the Federal party, and the anti-Federalists united to defeat his last measure. At this time the site of a Federal capital was to be selected. The northern people generally wished to have it not further south than the Delaware river, while the southerners were determined to have it no further north than the Potomac. Hamilton was bent on carrying his point, and took advantage of this dispute. He persuaded two Virginia congressmen to change their votes and support his measure. In return he promised to use his influence to have the capital located upon the banks of the Potomac, instead of at some northern point. This change of votes gave him the requisite majority. The assumption of state debts was a master stroke of policy. All those persons to whom any state owed money were at once won over to the support of the Federal government. Many of these persons were powerful and wealthy; and all now felt a common interest in upholding the national credit, which, through these wise and vigorous measures of Hamilton, was soon completely restored.

141. The next step was to raise a revenue for the carrying on of the government, and this must be raised by Federal taxation. There were two ways in which

this could be done—by imposing duties on goods imported into the country, or by levying internal taxes. By the first method, the United States would declare its right to tax foreigners; by the second, to tax its own citizens. The former method was mainly resorted to, because it was more indirect, and because the people, as yet, did not like the idea of being directly taxed to support the general government, even though it had been established by themselves. However, a tax was laid upon the manufacture of spirituous liquors in 1794, and this caused serious trouble. The settlers in the mountains of Pennsylvania and Virginia had long since found out that it cost more to carry their corn and wheat to market than they could sell it for, and accordingly they distilled it into whisky. When Congress laid a tax on whisky, they bitterly opposed it, and when the revenue officers came to collect the tax, the settlers refused to pay it, and threatened to take up arms. But Washington instantly sent an army of sixteen thousand men into the disaffected region, and the insurrection was summarily suppressed.

142. The Indian tribes on the Ohio became very troublesome to the settlers who now began to pour into the west. General Harmer, who was sent against the savages in 1790, was defeated near the present site of Fort Wayne, Indiana, and General St. Clair met with a similar disaster the next year. General Wayne ("Mad Anthony") was then despatched to the Indian country. He devastated their villages, sweeping everything before him till he reached the Maumee river, in the north-west corner of Ohio. There he won a great victory near the site of Maumee City, August 20, 1794, and obliged the Indians to sue for terms. By a treaty concluded in the following year, the United States acquired from the savages a large tract for settlement in the present states of Ohio and Indiana.

143. About this time the divisions between political parties become strongly marked. The occasional irritation shown in the debates in Congress is an evidence that the first ill defined estimate of the new scheme of government was giving way to positive and settled opinions of its powers, and of the policy which should be followed in managing it. As we have seen, people were first divided into two great national parties in the autumn of 1787, when the question at issue was whether the Federal constitution should be ratified by the states. It is probable that a majority of the American people were anti-Federalists in 1789, although the Federalists, by the active assistance of many of their natural opponents, had gained the executive, the house, the judiciary and most of the state legislatures, and were able to defeat the disagreeing factions known collectively as anti-Federalists. Hamilton's measures as secretary of the treasury embodied an entire system of public policy, and the opposition to them made the differences between the two parties still more prominent. Hamilton's opponents, led by Jefferson, made the objection to his principal measures that they assumed powers in the national government which were not granted to it by the constitution. Hamilton then fell back upon the elastic clause of the constitution, and maintained that these powers were implied in it. Jefferson held that this doctrine of "implied powers" stretched the elastic clause too far. He claimed that this clause ought to be construed strictly and narrowly. Hamilton contended that it ought to be construed loosely and liberally. Hence the names "strict-constructionist" and "loose-constructionist," which mark, perhaps, the most profound and abiding antagonism in the history of American politics.

144. During the year 1792, the various anti-Federalist factions had become cemented into one party through their efforts in resisting the Federalists, but the party still lacked a name. That of anti-Federalist was no longer applicable, for its opposition to the Federal

Origin of political parties.

union had entirely ceased, and the parties had become divided in the only sound and healthy way possible in a free country, namely, into those who wished to extend, and those who wished to limit, the powers of government. Neither party had been consistent in applying its principles, but in the main, Hamilton can be called the founder of the Federalist party, which had for its successors the National Republicans of 1828, the Whigs of 1833 to 1852, and the Republicans of 1854 to the present time; while Jefferson may be regarded as the founder of the party which, after discarding the old name of anti-Federalist, adopted that of Democratic-Republican. This always was the *official* party title. They preferred to be called Republicans, while their enemies tried to call them Democrats, an epithet which was then supposed to convey a stigma. However, the correct name for this party was Republican from about 1792 to about 1828, and since then it has been known as the Democratic party.

145. At the request of both Federalists and Republicans, Washington consented to serve as president a second time, so that the party contest was narrowed down to the vice-presidency. For this office the anti-Federalists, or Republicans, as they were now called, supported George Clinton, of New York, while the Federalists presented the name of John Adams. Jefferson would doubtless have been put forward, but that would have cost Virginia her vote, for her electors could not have voted for Washington and Jefferson, both being from Virginia. The presidential election took place November 6, 1792, and resulted in a Federalist success and the re-election of John Adams. During Washington's first term, Vermont, by consent of Congress, was admitted into the Union (February 18, 1791.) and Kentucky became a state on the 1st of June, 1792. In the year 1791 a bill for the establishment of a national bank was introduced into Congress, which passed after a strong debate.

National bank.

Washington's second term.

146. During the first years of the American Republic, the terrible scenes of the French Revolution were enacted. Jefferson and the anti-Federalists sympathized strongly with the French Revolutionists, and wished to aid them in their struggle against the European powers. This party specially affected the leveling principles avowed by the French Republicans, and the opposite party did not object to these principles to a limited degree. Early in April, 1793, news was received that the French Republic had declared war against Great Britain and Holland. It excited the sympathies of the American people for their sister republic, even though that republic was the aggressor; and it needed a firm hand and indomitable will like Washington's at this time to control public affairs, for the country was in a position to drift easily into war as an ally of France. Washington consulted his cabinet, and by their unanimous advice determined to regard the former treaty as nullified by the change of government in France, and to issue his proclamation of neutrality between the French Republic and her enemies. The proclamation at once called down a storm of rage and invective against the president. He was assailed by the press and extreme republicans, and accused of being an enemy to France and republican institutions, of disregarding a solemn treaty, and of usurping the functions of Congress in regard to the announcement of peace or war.

Proclamation of neutrality.

147. The French expected the Americans to help them in their war with England; and in 1793 they sent over a minister to the United States to induce them to do so. This man was called Citizen Genet. He arrived at Charleston, South Carolina, in April, and was received with the most extravagant marks of public attachment. Misled by the warmth of his reception, he entered on and persisted in a course which would only have been pardonable if he had been still on French soil. He fitted out privateers from American ports to cruise against the enemies of France, and

Citizen Genet

sought to embark the American people in the cause of his country whatever might be the determination of the government. Many Republicans were disposed to uphold him in all his acts, but his insolence presently disgusted his own supporters. He violently assailed President Washington and the government, and otherwise misbehaved himself, until Washington sternly checked his proceedings, and at length complained of him to the French government, which thought best to recall him.

148. About this time war was apprehended between the United States and England. England had never accredited a minister resident to the United States, and had refused to carry out those articles of the Treaty of 1783, which bound her to surrender her military posts on United States soil, and to pay for the slaves carried away by her armies. She had also issued orders which bore hard upon American merchants and sailors. She claimed the right to lay hold of any provision for the enemy which she might find in a neutral vessel, to seize the product of French colonies wherever found; and to board any vessel to make search for seamen of British birth, and carry them off for her own service. It was also believed that her agents had interfered to prevent treaties of peace with the savages of the northwest, and had incited them to renewed attacks upon the frontier settlements. Her refusal to evacuate the western posts was grounded on the alleged unjustifiable neglect of the United States to enforce that article of the treaty of 1783 which provided for the payment of debts due to British subjects. For her further offensive measures no justification was offered, except her sovereign will. Out of these circumstances war might easily have grown, and it required all the wisdom of Washington and his advisers to prevent it. So bitter was the feeling against England held by men of both parties, that Congress began at once to take measures to raise an army, equip a navy and to stop all commerce with her. War was imminent, and Washington determined to avert it.

Threatened war with England.

149. He appointed John Jay, who was then chief justice, to be envoy extraordinary to England, for the purpose of preserving peace by a new treaty, in which the points in dispute between the two countries should be settled. Jay concluded a treaty with England which did not satisfy him, but which was the best he could secure. It reached America March 7, 1795, and was sent to the senate in special session, June 8. The treaty provided that the western posts be surrendered to the United States, that compensation be made for illegal captures of American property, and British creditors be secured the means of collecting debts, contracted prior to the Revolution. But England still retained the right of impressing American seamen of English birth, and of shutting off American commerce from the West Indian trade. When the conditions of the treaty became known there was great excitement in all portions of the country, and the wrath of the Republicans rose to fever heat. Hamilton was stoned on the street, and scurrilous newspapers railed against Washington, calling him the "step-father of his country." But the senate ratified the treaty, and Washington signed it, because, imperfect though it was, it was better than none, and would avert war. It was the first substantial recognition which England had made of the sovereign rights of the United States, and the result proved Washington's wisdom, for peace prevailed, commerce revived, and many who had at first denounced the treaty, became its friends.

Jay's treaty.

150. During Washington's second term, party contests had become numerous in the sessions of Congress. After much opposition on the part of the Republicans, the Federalists succeeded in passing a system of indirect taxation to provide for the increased expenses of the government. A Federalist bill to prevent such practices as Genet's was opposed by the Republicans,

Party contests

but was passed with some modifications. An attempt was made by some of the Republicans to secure the passage of resolutions censuring Hamilton's management of the treasury, but it met with no success. The supreme court had decided that an action brought by a citizen of the United States would lie against a state, just as against any other corporation. This alarmed the Republicans. An amendment to the constitution was therefore adopted by Congress, securing states against suits in the United States courts. It was afterward ratified by the required number of states, and became the XIth Amendment, which has enabled so many states to repudiate debt with impunity. In June, 1796, Tennessee, formerly a part of North Carolina, became a state of the union.

151. The time for a new election of president was now at hand. Washington was importuned to accept a third term of office. Electors nominated by both parties were called upon to promise that, if elected, they would give their first votes to Washington, but he refused to accept. When he retired from the presidency he made a farewell address to the people of the United States. In that address, which is weighty with words of wisdom, he urged the people to prize the Union which they had formed; to remember that each part of the country had free intercourse with all other parts, and that each could help the other. He begged them to suffer no parties to gain ascendancy in the Union which should weaken its strength, and bade them to glory in the name of America. He reminded them that Europe had interests in which America had little concern, warned them against the admission of any European or other foreign influence into American councils, and urged them to make religion, education and public good faith the basis of government.

152. As Washington refused to be a candidate for a third term, the election of 1796 was warmly contested by the two parties. No formal nominations were made but it was understood that the Republican electors would cast their votes for Thomas Jefferson, of Virginia, and Aaron Burr, of New York, and the Federalist electors for John Adams, of Massachusetts, and Thomas Pinckney, of Maryland. Hamilton, having made so many enemies by his political zeal, was not considered a suitable candidate. The principles of the two parties were distinctly understood. The Republicans claimed to be the friends of liberty and the rights of man, the advocates of economy and of the rights of the states. The Federalists claimed support as the authors of the Government, the friends of neutrality, peace and prosperity, and the direct inheritors of Washington's policy. In February, 1797, the electrical votes were counted, and John Adams, the Federalist candidate, was found to be elected president, and Jefferson, according to the rule at the time, as second on the list, became vice-president. This was an unwise rule, since under it the death of the president might reverse the result of the election.

153. On March 4, 1797, Adams and Jefferson were sworn into office. Shortly after the commencement of President Adams' administration the French Directory, displeased with the strict neutrality which the United States had observed during its war with England, and also on account of the treaty of peace which had been recently entered into between England and the United States, adopted resolutions highly injurious to American commerce, and refused to receive Mr. Pinckney, the American minister, until the United States had complied with their demands. The first act of Mr. Adams was to call an extra session of Congress, to determine how a war with France was to be avoided. A special commission of three envoys was sent to France, John Marshall, afterward chief justice, Charles Pickney and Elbridge Gerry, but the French government refused to receive them. Prince Talleyrand had the impudence to send secret agents to deal

with the envoys. These agents demanded that a large sum of money be paid the government before the envoys could be received at all. After that the United States must lend money to France to enable her to carry on her war. When this was done France would repeal some of the acts which injured American commerce.

154. The envoys indignantly refused to accept such terms and sent home to America an account of this infamous proposal, and Mr. Adams laid the dispatches before Congress, substituting the letters X. Y. Z. for Talleyrand's emissaries. Hence, these papers have ever since been known as the "X. Y. Z. dispatches." April 8 the senate voted to publish the X. Y. Z. letters and the dispatches of the envoys. To England they seemed of such importance that they were sent to every part of Europe to excite feeling against France. One burst of indignation arose in America, and for the moment the Republican party seemed overwhelmed. Pinckney had declared, "Millions for defence, but not one cent for tribute," and the words were taken up as a popular cry. The United States prepared for war. A few excellent frigates were built, an army was raised, and Washington was placed in command with the rank of lieutenant-general. It was during this excitement that the song of "Hail Columbia" was published. American men-of-war were ordered to seize any French vessels which should commit depredations on American commerce, and some naval engagements took place with success on the American side. Intercourse with France was suspended. The treaties with France were no longer binding upon the United States, and authority was given to the president to issue letters of marque and reprisal.

155. The country was now on the side of the government. The Federalists, who had been losing ground, were now stronger than before. They attempted to strengthen the government still further by passing in Congress two acts called the alien and sedition laws. The first of these acts, passed June 25, 1798, authorized the president to order out of the country any alien whom he might regard as dangerous to the peace and liberty of America, and made provisions for the fining and imprisonment of such aliens as refused to obey the president's order. July 14 the sedition law was passed. By this act a heavy fine and imprisonment were imposed upon such as should combine or conspire together to oppose any measure of the government, and upon such as should utter any false, scandalous or malicious writing against the government, Congress or president of the United States. This act was to remain in force until March 3, 1801. These laws placed a power in the hands of the government which alarmed the Republicans. They claimed that the laws were aimed against them. They opposed the action of Congress, not as friends of France but as Americans. They believed that less power should be given to the federal government, and more to the separate states. This belief, which so nearly prevented the adoption of the constitution, had never disappeared. It showed itself on every occasion, and helped to shape the course of the Democratic-Republican party. This party came to be called the Statesright party, because it was jealous lest the states should not have all their rights under the constitution.

156. Thus, when the Federalists forced through Congress the alien and sedition laws, they called forth a vigorous remonstrance from the southern Republicans. A series of resolutions, drawn up by Jefferson, was adopted by the legislature of Kentucky (1798), and a similar series, drawn up by Madison, was adopted in the same year by the legislature of Virginia. These are known as the Kentucky and the Virginia Resolutions of 1798. The Virginia Resolutions asserted that in adopting the constitution the states had surrendered only a limited portion of their powers; that whenever

Kentucky and Virginia resolutions of 1798.

the Federal government should exceed its delegated authority, it was the right and duty of the states to interpose and pronounce such acts unconstitutional. Accordingly, by these resolutions, Virginia declared the alien and sedition laws to be a usurpation by the Federal government of powers not granted to it, and were thereby unconstitutional, and she appealed to the other states to join in that declaration. The response from other states being unfavorable, Virginia repealed those resolutions the next year, 1799.

157 The attitude assumed by Virginia in these resolutions was certainly uncalled for, either on her part or that of any other state, inasmuch as the constitutionality of the acts of Congress could be decided by a competent tribunal only—the federal supreme court. The Kentucky Resolutions were to the same general effect as those of Virginia, but with the additional declaration that the federal constitution was merely a compact, to which the several states were the one party and the federal government the other, and that each party must decide for itself as to the infractions of the compact, and as to the proper remedy to be adopted. These resolutions received as little attention as those of Virginia. In the following year (1799) Kentucky repealed the resolutions, but with the additional clause that a state might rightfully nullify and declare void any act of Congress which it might consider unconstitutional. This was a dangerous assumption, for it verged upon the right of secession, and these resolutions were used by the south as a partial precedent for nullification in 1832, and for secession in 1860.

158. Meanwhile, though there was open hostility between France and the United States, war was not actually declared. The French, seeing the warlike attitude of the United States, became more civil. Talleyrand tried to disavow the X. Y. Z. affair, and made conciliatory proposals to Vans Murray, the American minister at the Hague. The president had expressed his determination to send no more ministers to France until assured of a friendly reception, but he suddenly appointed three envoys to that country against the protest of two of his cabinet. Their protest was sustained by the leading Federalists throughout the country, and by this act the president lost, in some degree, the support of his party. For some time also there had been intense jealousy and dislike between Adams and Hamilton, the other great Federalist leader, and this increased the difficulties of the Federalist party. When the new embassy reached Paris, they found the government in the hands of Napoleon Bonaparte, who gave them a cordial welcome, and they soon succeeded in settling the matters in dispute in an amicable manner. The policy of John Adams in making peace with France, contrary to the popular sentiment, demands the highest commendation, but it lost him the presidency for a second term.

159. On the 14th of December, 1799, George Washington died at Mount Vernon after only one day's illness. The event was mourned all over the United States with sincere sorrow, and was appropriately observed by Congress and other public bodies. Bonaparte ordered the standards of the French army to be shrouded in crape for ten days, and in England a fleet of sixty British men-of-war lowered their flags to half mast. In the following year the national capital was removed from Philadelphia to the site chosen on the banks of the Potomac. The city there laid out received the name of Washington.

160. By the spring of 1800 it became manifest that the Federalist party was losing ground. In April the New York state election went against them. Soon after this, the dismissal by the president of some of the cabinet officers who were too friendly with Hamilton, caused an irreparable break in the party. Hamilton printed a severe attack on the president, and endeavored to make arrangements for giving Pinckney a

majority of Federalist electors that he might be chosen president and Adams vice-president, as these two were the nominees of the Federalist party. The Republican candidates were Thomas Jefferson, of Virginia, and Aaron Burr, of New York. The fourth presidential election took place in November, 1800. The election was very close. In February, 1801, the electoral votes were counted, of which 73 were for Jefferson, 73 for Burr, 65 for Adams, 64 for Pinckney, and 1 for Jay. There was no highest name on the list, and it was left for the house of representatives to choose between the two highest candidates. The house was Federalist, but was restricted to a choice between two Republicans. Some of the Federalists wished to elect Burr instead of their great opponent, Jefferson, but Hamilton used all his influence against such a scheme, and at last, on February 17, 1801, Jefferson was elected by the house, and Burr became vice-president.

161 The inauguration of Jefferson was the first that took place in the city of Washington. The new president's first inaugural message announced the future policy of the Republican party to be careful fostering of the state governments, the restriction of the powers of the Federal government to their lowest constitutional limit, the immediate payment of the national debt and the reduction of the army, the navy, the taxes, and the duties on imports, to the lowest available point. Many of the Federalists believed that speedy ruin to the country would follow the advent of Jefferson to the presidency. He was "an atheist in religion and a fanatic in politics," and the vice-president was only more tolerable because less known. The party which supported them, it was claimed, was composed of revolutionists, disorganizers and Jacobins. The Federalist party, which contained the larger portion of the intellect, wealth and culture of the country, honestly believed, no doubt, that the government had fallen into bad hands. But their fears were groundless. The president's first administration was marked by national prosperity. The principal offices of government were transferred to the Republican party, and executive pardons were issued to those persons who had been imprisoned under the alien and sedition laws. The supreme court, under the lead of Chief Justice Marshall, remained Federalist in complexion, and did a grand work for several years in interpreting and strengthening the constitution. President Jefferson instituted the custom of sending a written message to both houses of Congress as more befitting Republican simplicity, instead of giving the address in person, which had hitherto been the rule.

162 The population of the United States was rapidly increasing, and was beginning to press forward into the Mississippi valley. In 1802 Ohio was admitted into the union. Mississippi and Indiana were already organized as territories, and a growing interest was felt in the western country. By a secret treaty with Spain in 1800, France had recovered the territory of Louisiana, the Spanish civil officers, however, were left in command, and in 1802 the Spanish intendant at New Orleans issued a proclamation closing the Mississippi to American commerce. This action threatened to result in war. Jefferson had opened negotiations with Napoleon for the purchase of the territory. The French emperor had at first refused to treat on the subject. He had acquired this territory with the vague intention of regaining the French ascendancy in America, which had been lost in the seven years' war. Knowing that whoever controlled the mouth of the Mississippi must become master of the whole valley, Jefferson proposed to buy New Orleans. Napoleon had refused this, also, but in 1803 the prospect of a renewed war with Great Britain made him change his mind. He knew that in case of war an English fleet would be sent to take possession of Louisiana, and that it would be impossible for the French to hold the port of New Orleans. He was determined that the place should not fall into the

Death of Washington

Removal of the capital

The fourth presidential election

The Louisiana purchase

hands of his powerful enemy, so he offered to sell it to the United States for fifteen million dollars. The president at once agreed to the proposition, though he believed that the constitution gave the Federal government no power to purchase foreign territory and make it a part of the union. In this instance, an article for the ratification of the purchase was prepared as an amendment to the constitution, but was never offered, as the president's action met with a general acquiescence and has since been imitated in similar instances without question. The Louisiana purchase included everything west of the Mississippi not already occupied by Spain, and comprised the whole or part of the present states of Arkansas, Colorado, Iowa, Kansas, Louisiana, Minnesota, Missouri, Nebraska, Oregon, the two Dakotas, Montana, Washington, Wyoming, Idaho, and the Indian territory. The effect of this great acquisition of territory, by such an active and prosperous people as the Americans, was to insure them the ultimate control of the continent without incurring any foreign warfare worth historic mention. It set the nation free for an indefinite length of time from European complications, but, on the other hand, it was the means of creating some new and formidable features in the rivalry between the free states and slave states.

The
Tripolitan
war.

163. The Barbary states on the southern shores of the Mediterranean were in the habit of sending out piratical vessels to prey upon the commerce of other nations and reduce their sailors to slavery. All the great powers of Europe, as well as the United States, had adopted the custom of paying tribute to these petty governments, in order to secure immunity for their trade. But these pirates grew increasingly insolent, so that the patience of the American government became entirely exhausted. A small fleet was sent out to the Mediterranean, which bombarded Tripoli. After a desultory warfare extending over two years, the Tripolitans sued for peace. The English government then followed the example of the United States, and in a few years more this abominable nuisance was suppressed.

The XIIIth
amendment.

In the latter part of 1803, during the first session of the VIII Congress, the manner of the presidential election was amended to the form which it has at present. The amendment having been ratified by the necessary number of states, this became the XII amendment to the constitution. Articles of impeachment were voted by the house against a federalist judge, Chase of Maryland, for arbitrary and oppressive conduct in trying cases under the alien and sedition laws. At the next session of Congress in 1804, Chase was tried and acquitted.

Hamilton
and Burr.

164. In 1804 Jefferson was re-elected president, with George Clinton for vice-president, in place of Aaron Burr, who had separated from his party. The federalists then made Burr a candidate for the governorship of New York, but here, as in 1801, Hamilton used his influence against him, and Burr was defeated. Resenting this opposition, Burr contrived to force Hamilton into the acceptance of a challenge. They met on July 11, 1804, and Hamilton was killed. The mourning of the country over the loss of this distinguished man was intense, and the wretched Burr found that his public career was at an end. Bankrupt in fortune, and a fugitive from home, he visited New Orleans and other parts of the south and west (1805) for the purpose of arranging an enterprise whose exact object has never been positively discovered. He planned either the seizure of Mexico, or the establishment of a monarchy west of the Alleghenics. He was arrested by the federal government on a charge of treason, and was tried before Chief Justice Marshall in September, 1807, but after a long investigation he was acquitted in consequence of a defect in the chain of evidence. Afterward he became an outcast from society and died in obscurity.

Burr's con-
spiracy.

165. On the 4th of March, 1805, Jefferson and Clinton were sworn into office. Jefferson's second administration was the beginning of a stormy period which ended in war. The wars of Napoleon still continued, and France and Great Britain were using every expedient to cripple each other without regard to the rights of neutral nations. In the beginning of these wars the United States, being a neutral power, had acquired a valuable foreign commerce, but this was speedily destroyed by the arbitrary measures of the belligerents. With his famous Berlin and Milan decrees, Napoleon sought to prevent neutral vessels from entering British harbors, and claimed the right to seize all vessels trading with England or her colonies (1806). England replied with her orders of council issued by the king, which forbade all commerce with the ports of Europe that were within the French dominion or in countries allied with France. If an American vessel touched at almost any port of continental Europe, the first British cruiser that came along deemed her its lawful prey; if she touched at a British port, she was liable to capture by the first French craft that she should meet. Jefferson had abandoned the policy which Adams had adopted of building a strong navy. He imagined it possible to defend American harbors by means of gunboats carrying each one gun, and had recommended this plan, which Congress adopted. This "Gunboat System" was always hateful to the navy, and was a constant object of federalist ridicule and attack.

166. While the offensive measures of England and France made American merchantmen a prey to both parties, England, in another respect, possessed a peculiar power of annoying the United States. She still claimed and exercised the right of stopping American vessels and seizing all sailors, even naturalized citizens, who were supposed to be British subjects. In June, 1807, the insolence of this claim was carried so far that the British man-of-war, Leopard, stopped the United States frigate, Chesapeake, off the entrance of Chesapeake Bay, fired into her, killing or wounding twenty-one of the crew, and took off four men, three of whom were Americans. President Jefferson demanded reparation for this outrage, and issued a proclamation ordering all British war vessels out of American waters. The British government was ready to disavow the act of the Leopard, but there was no willingness shown to make reparation. Feeling unprepared for war, the United States government had recourse to an exceedingly stupid and dangerous measure. The president recommended a bill by which American vessels should be prohibited from leaving foreign ports, and foreign vessels from taking cargoes from the United States, and all coasting vessels should be required to give bonds to land their cargoes in the United States. This was the celebrated Embargo Bill, which did more harm to American commerce than all the cruisers of France and England were able to do. It also intensified party feeling and even threatened the existence of the union.

The right
of search

Embargo
bill.

167. As time went on the Embargo Act became so unpopular that before the close of Jefferson's second term many of his friends forsook him. A great pressure was brought to bear upon Congress to repeal the act. It passed in its place the Non-intercourse Act. This act prohibited trade with England and France so long as their obnoxious measures should be kept in force, but it allowed free trade with other countries. Among the other important events of Mr. Jefferson's administration were the passing of an act of Congress prohibiting the slave trade after January 1, 1808; the beginning of the United States coast survey, a valuable work which is still continued to the great credit of American science, and the application of steam to navigation by Robert Fulton. Jefferson refused to be a candidate for a third term, and at the election in 1808, James Madison, of Virginia, was chosen president

Non-inter-
course act.

Other
events.

by the Republican, or, as it now began to be called, the Democratic party. Clinton was re-elected vice-president. The candidates of the Federalists were C. C. Pinckney and Rufus King.

Madison's
administration.

168. The Non-intercourse Act went into force March 4, 1809, when Mr. Madison succeeded to the presidency. He belonged to Jefferson's party and continued his policy. Party feeling had grown very bitter. New England, which suffered the greatest from the breaking up of trade, was the stronghold of the Federalists. They complained loudly that if it were not for the Embargo and Non-intercourse Acts there would be no trouble. The southern and western people, who were principally Democratic Republicans, retorted that they had evidence of negotiations between the New England Federalists and England; that the Federalists were planning for a separation of New England from the union. This charge was indignantly denied, but it helped increase political hostilities. In 1810 Congress repealed the Non-intercourse Act, which had accomplished nothing in the way of intimidation. Congress then informed England and France that if either nation would repeal its obnoxious measures the Non-intercourse Act would be revived against the other. Napoleon was studying how he might get the advantage of England, and he withdrew, or pretended to withdraw, his decrees prohibiting commerce with England so far as the United States were concerned, but at the same time gave secret orders by which the decrees were to be practically enforced as harshly as ever. Congress at once revived the Non-intercourse Act against Great Britain alone.

beginning
of hostili-
ties.

169. England and the United States grew more irritated with each other, and in 1811 hostilities actually began on sea and land. In May the United States frigate *President* hailed the British man-of-war *Little Belt* and was answered by a shot. The *President* then replied with a shot in turn, and a sharp action ensued in which the *Little Belt* was badly crippled, and lost thirty-one killed and wounded. Tecumseh, the famous Shawnee chief, had gathered a large number of warriors, and at the instigation of the British they were attacking the northwestern settlements. General Harrison marched against them, and on November 7 he defeated them at Tippecanoe. The English continued to seize vessels and men. More than nine hundred American vessels had been seized since 1803, and several thousand American seamen had been impressed into the British service. The people of the United States were exasperated at their losses and their inability to protect themselves. Madison wished to continue the general peace policy of Jefferson, but new leaders had sprung up in the Republican party who were in favor of war. Chief among these were Henry Clay, of Kentucky, speaker of the house, William H. Crawford, in the senate, and John C. Calhoun, of South Carolina, in the house. These became the recognized congressional leaders of the party. The economical and retrenching policy of Jefferson was abandoned, and preparations were begun for hostilities. Bills were passed to enlist men, to organize the militia and to enlarge and equip the army.

Declara-
tion of war.

170. President Madison was given to understand that his nomination for a second term of office depended upon his adoption of the war policy, otherwise De Witt Clinton, of New York, would be nominated in his stead. The president accepted the conditions and on June 18, 1812, war against Great Britain was formally declared. It was soon learned that the British government had revoked the orders in council five days after the declaration of war, but this concession came too late. Even if it had come in time probably nothing short of an abandonment of the right of search and impressment on Great Britain's part would have proved satisfactory. The war feeling was by no means unanimous. The New England Federalists bitterly op-

posed it. The chief support came from the south and west, which felt less keenly the effect upon their prosperity, caused by the breaking up of commerce. Immediately after the declaration of war the Federalist members of Congress had published their protest against it in an address to their constituents. When requisitions were made by the president upon the governors of the different states for their respective quotas of troops, according to the act passed by Congress to embody the militia, the governors of Massachusetts and Connecticut refused to allow their militia to leave their states on the ground that it was unconstitutional for the Federal government to call out the militia except in case of an invasion or resistance to the laws of the United States, and neither of these had taken place. April 30, 1812, Louisiana was admitted into the union of states.

171. The war opened by the invasion of Canada by General Hull, who was ordered to cross at Detroit and attack Fort Malden a few miles distant, but he was compelled to fall back again to Detroit. Here he was attacked by a large force of British and Indians under General Brock and Tecumseh. Believing he was not strong enough to defend the place he surrendered (August 16, 1812), not only Detroit, with its garrison and stores, but the whole territory of Michigan. Being exchanged, after some time he was tried by a court-martial on charges of treason and cowardice. He was acquitted of treason and was sentenced to be shot for cowardice, but was pardoned by the president on account of his past good services. In October another attempt was made upon Canada near Niagara. A small force crossed the river and attacked the British in a strong position on Queenstown Heights. At first the Americans were successful but were at last defeated with heavy loss.

Surrender
of Detroit

Queens-
town
Heights.

172. To compensate for these disasters on land the little American navy won imperishable glory on the ocean. The United States frigate *Essex*, Captain Porter, captured the British sloop-of-war *Alert* after a fight of eight minutes, without losing a man. The *Constitution*, Captain Hull commanding, fought a famous action with the British frigate *Guerrière* near the Gulf of St. Lawrence (August 19), and in less than an hour completely destroyed her. This victory dispelled the belief that the British navy was invincible, and the whole country was filled with transports of delight. On the 18th of October the sloop-of-war *Wasp*, commanded by Captain Jones, captured the British brig-of-war *Frolic* off the coast of North Carolina, but the same day the British ship *Poictiers* took both the captor and her prize. On October 25 the frigate *United States*, under Commodore Decatur, fought a memorable action with the British ship *Macedonian*, which surrendered to Decatur after being nearly cut to pieces. This engagement took place off the Island of Madeira, but Decatur succeeded in carrying his prize to America. The *Constitution*, commanded by Captain Bambridge, in a two hours' fight off the coast of Brazil, knocked to pieces the British frigate *Java* (December 29), which lost 230 men and had to be burned, while the *Constitution* lost but twelve men and not a single spar.

Naval
exploits.

173. During the first six months of the war the despised American navy, of which even the Americans expected but little, became the admiration of the world. Privateers also were very active, and before the end of the year the captures from the British numbered about fifty vessels of war, two hundred and fifty merchant vessels, and three thousand men. Under the impulse of these successes the Federalists, who had been opposed to the war, were beaten in the autumn elections, and Madison was re-elected president, with Eldridge Gerry for vice-president. The American disasters on land had led the government to collect a large army, which was placed under the command of General Har-

tion of
Madison

The war in the north-west.

risson. He first made an attempt (January, 1813,) to recover Detroit and the territory of Michigan, but was driven back to Fort Meigs by Proctor, who besieged him there, but unsuccessfully. So much of the frontier was occupied by the great lakes that it was of the greatest importance to get control of these, and for this purpose, both British and Americans were busily engaged during the summer of 1813 in building fleets. Captain Oliver H. Perry directed the building of the fleet on Lake Erie, and sailors were sent forward from the sea-coast. He had just completed nine vessels, which were at anchor in Put-In-Bay, when he saw the British approaching. He at once moved out to meet the enemy (September 10) and in a little more than two hours was able to send this dispatch to General Harrison, who was in command on the Sandusky: "We have met the enemy and they are ours; two ships, two brigs, one schooner, and one sloop." This victory turned the scale of war in the northwest. Harrison shipped his army across the lake in Perry's fleet, and attacking Proctor at the River Thames (October 5), inflicted a crushing defeat upon him. This was a severe blow to the Indians also, for their great leader, Tecumseh, was killed. The American success restored the north-western territory to the country.

Battle of Lake Erie.

The Creek war.

174. In the spring of 1813 Tecumseh had visited and roused the Creek Indians of the southwest, and in August they took occasion to attack the frontier settlements, beginning with the terrible massacre at Fort Mimms, near Mobile. General Andrew Jackson, with the formidable Tennessee militia, marched into the Creek country, and won a series of telling victories, by which they were entirely subdued, and purchased peace by the surrender of two-thirds of their hunting grounds. In the meantime the British, after the defeat which they had suffered from the American navy in 1812, strengthened their Atlantic squadron. During the summer of 1813 they attempted to blockade the coast from Maine to Georgia. Congress, in turn, hastened to build new ships; and the courageous privateers continued to fight pluckily, and to bring prizes into the United States ports. In February, 1813, the American sloop *Hornet*, Captain Lawrence commanding, destroyed the British brig *Peacock*, which sank before all of her crew could be removed. On his return to the United States, Lawrence was promoted to the frigate *Chesapeake*, with which, on June 1, he had a severe engagement with the British frigate *Shannon* near Boston. Lawrence was mortally wounded at the beginning of the action. As he was carried below, he exclaimed: "Don't give up the ship!" The *Chesapeake*, however, was captured by boarding, after she had lost a large proportion of her officers and men. The *Argus*, Captain Allen, was captured by the British man-of-war *Pelican* (August 14), after a gallant fight in which Captain Allen received his death wound. Lieutenant Burrows, in the brig *Enterprise*, captured the British brig *Boxer* (September 5), after a short action. The frigate *Essex*, Captain Porter, made a brilliant and successful cruise during the year 1813, and did great damage to the British commerce. At length, however, she was attacked in March, 1814, by the British ships *Phoebe* and *Cherub*, and after the bloodiest fight of the war, the *Essex* was compelled to surrender. The sloop *Peacock* captured the British brig *Epervier* off the coast of Florida (April, 1814). The *Wasp* made a brilliant cruise, taking a number of British vessels. The old *Constitution*, Captain Stewart, engaged singly the British sloops-of-war *Cyane* and *Levant* off the coast of Portugal, and captured both in a remarkable night engagement, February 20. The *Hornet* captured the British brig *Penguin* in March, off the Cape of Good Hope, and in June, the *Peacock* closed the long record of victories by taking the British ship *Nautilus*. These last three actions took place after peace had been concluded.

Events on the sea.

On the Niagara frontier.

175. In the summer of 1814, the Americans made a

fresh attempt to invade Canada under General Brown, with whom served Brigadier-General Winfield Scott. They crossed the Niagara river and in four hard-fought battles defeated the British at Chippewa (July 5), Lundy's Lane (July 25), and Fort Erie (August 15 and September 17), but in spite of these successes, they could not establish themselves in Canada, and retired across the line before cold weather came. In March, 1814, Napoleon was dethroned and sent to Elba, and the European war being over, England was enabled to spare more men for the war in America. Her policy was to march two armies into the United States. One was to descend from Canada by the route which Carleton and Burgoyne had followed, and the other was to land at New Orleans and move northward. To divert attention a fleet under Admiral Cockburn sailed up the Potomac and attacked the capital. There was scarcely any resistance, and the British wantonly destroyed public buildings, books and papers (August, 1814). Nothing was spared except the patent office and the jail. The British then moved upon Baltimore. General Ross and his troops were landed a few miles below the town, but the Americans gallantly repulsed them. Then the fleets bombarded the forts which protected Baltimore (September 12 and 13). Fort Mchenry received the hottest fire from the fleet. It was upon seeing the flag still flying from the fort, when the smoke cleared away, that Francis S. Key wrote the national song, "The Star-Spangled Banner." The fleet finally abandoned the attempt and sailed away.

Capture of Washington.

176. The British in Canada, having been reinforced by the arrival of fresh troops from England, advanced with an army of fourteen thousand men under Prevost, to attack Plattsburg, on Lake Champlain, while a British squadron, under Captain Downie, sailed up the lake to co-operate with him. The Americans, under General Macomb, being only fifteen hundred strong, fell back behind the Saranac, and there made a vigorous defense. They had also a squadron of small vessels under Commodore Macdonough, and this was stationed at the entrance of Plattsburg bay. Captain Downie attacked Macdonough (September 11, 1814), at the same time that General Prevost attempted to force the passage of the Saranac, but the British fleet was annihilated by Macdonough and Prevost, beaten at every point by Macomb, retreated in disaster to Canada. But while this attempt on New York proved a failure, the British succeeded in seizing the unoccupied wilds of Maine east of the Penobscot river, and thus created a panic in New England.

Battle of Plattsburg.

177. The expedition against Washington was designed chiefly as an insult; the expedition against New Orleans was for conquest. If the British could gain this important position they would control the Mississippi and the western country. In December, a British army of 12,000 men under General Parkenham, landed below New Orleans. General Jackson hastened to that city with 6,000 militia to oppose him, and fortified the town as best he could. After a fortnight's siege the British determined to assault the American works. Early on the morning of January 8, 1815, they made the attack. Jackson's men, trained to rifle shooting and aided by artillery, met them with great coolness, and in less than half an hour the British were in full retreat, leaving Pakenham and 2,600 men behind them, killed or wounded, while the American loss was but 8 killed and 13 wounded. This battle also occurred after peace was declared.

The war in the south.

178. Negotiations for peace had been begun in August, 1814. The American government was anxious for almost any honorable peace in preference to continuing the war with England. The latter country had revoked the orders in council long before, but still England's demands were such that they could not be accepted with honor by the Federal government. The war feeling was thus continued among the republicans,

and some of their leaders began to meditate measures which the strict constructionist principles of the party would not justify. Propositions were made to introduce the English system of impressment of seamen, and of allowing officers of the army to enlist minors over eighteen years of age without the consent of their parents or guardians. The Connecticut legislature ordered the governor to resist the execution of these and similar measures if they should become laws. In view of these things, and provoked by the British invasion of Maine, the legislature of Massachusetts had invited the other New England states to send delegates to Hartford, Connecticut, "to confer upon the subject of their public grievances." Delegates from Massachusetts, Connecticut and Rhode Island, and from parts of Vermont and New Hampshire, met at Hartford in December, 1814, to discuss the situation of affairs and decide upon the proper course to be pursued. Among other measures they recommended the adoption of several amendments to the constitution, chiefly with intent to restrict the powers of Congress over commerce, and to prevent naturalized citizens from holding office. As there was much secrecy in its proceedings a popular suspicion was aroused that a dissolution of the union had been proposed, perhaps resolved upon, in its meetings. This suspicion completed the ruin of the Federalist party. Some years afterward the journal of the convention was published in order to justify its members, and to show that no treasonable designs were officially proposed. It was then, however, too late to be of benefit to the party, for the popular opinion had become fixed.

The Hartford convention

179. The final negotiations for peace took place at Ghent, in Belgium, the commissioners on the part of the United States being John Quincy Adams, James A. Bayard, Henry Clay, Jonathan Russell and Albert Gallatin. The treaty was signed December 24, 1814, and promptly ratified by both governments. It was welcome to the administration, whose want of experience in the conduct of the war had involved the country in great financial straits. The treaty left things apparently just as they had been before the war. Nothing was said about the right of search and impressment of seamen, out of which the war arose, but the United States had shown to the European nations that she would not be insulted with impunity. The British ceased to enforce their claims, and hence the United States may be said to have succeeded in the object of the contest. England withdrew her claims to sovereignty. The nation was not only established in its own domain, but it had equal rights with Europe on the broad seas. The last vestige of subjection to the Old World disappeared when Decatur sailed into the harbor of Algiers in June, 1815. That country had again declared war on the United States. Decatur compelled the Dey to come on board his flag ship and sign a treaty renouncing forever all demands against Americans. The other Barbary States signed similar treaties, and from that time on American commerce became completely free.

Treaty of Ghent.

Algerine war.

Downfall of the Federal party.

180. The close of the war marks the final downfall of the federal party. From this period the few remaining Federalists ceased from any united party action. There was but one party, whose principles consisted of a combination of those which had characterized the original Federal and Republican parties. The leading principle of the Federal party, the establishment and continuance of the Federal government, had been quietly adopted by the Republicans, while the Republican principle of limiting the duties and powers of the government had been as quietly accepted by the Federalists after the Republican party had come into power. In the presidential election of 1816, the Federalist candidate, Rufus King, received only 34 electoral votes against 187 for the Republican candidate, James Monroe. His administration lasted from 1817 to 1825, for

in 1820 the Federalists put no candidate in the field, and Monroe, being nominated for a second term, his election was practically unanimous. His administration has been called the "Era of good feeling." People forgot the old quarrels in their joy at the end of the war and the revival of business. For a time the violent party feeling, which had flamed so high during the European strife, had quieted down. New occasions for political contest had not yet come. Congress occupied itself chiefly in the regulation of internal affairs. Taxes were reduced, and a slight increase was made in the tariff. The feeling was growing among the Republicans that the tariff ought to be so arranged as to afford protection to those manufactures which had been developed in the United States during the war, but were now suffering from a competition with the cheaper goods which were imported from England. But no action was taken on the subject.

The era of good feeling

181. As has been stated, the charter of the national bank which had been granted during Washington's first administration, had expired in 1811, and the Republicans, then in power, had refused to re-charter it. The attempt to carry on the war by loans had resulted in almost a state of bankruptcy. In April, 1816, a bill was passed, granting a charter for a national bank to expire in 1836. It was modeled upon the one which the Republicans had formerly opposed. The Republican newspapers warmly advocated the scheme, and republished Hamilton's argument in favor of such a bank, thus showing how far loose constructionist ideas had spread in the Republican party. The bank was organized with a capital of \$35,000,000, four-fifths of which might be in government stock. It was to have custody of the government revenues, but the secretary of the treasury was empowered to divert the revenues to other custodians, giving his reasons for such actions to Congress.

The national bank.

182. In 1817 hostilities broke out with the Seminole and Creek Indians of Spanish Florida, Georgia, and Alabama; General Jackson, being sent to the scene of disturbance, chastised the savages and destroyed their villages. Jackson, with all his admirable qualities, was not a cautious man. Satisfied that the Spaniards had incited the Indians to make war, he invaded Florida (April, 1818), and took possession of Spanish forts and built a fort of his own. Then he seized Pensacola and sent the Spanish troops and civil authorities to Havana. Though Jackson's high-handed measures were not fully sustained by Congress, yet, so popular was he, that instead of being reproved by Congress, he was regarded as a great hero worthy of warmest praise. Spain vigorously protested against these proceedings as a gross violation of neutrality, but she was too weak to offer any effectual resistance. The matter was finally arranged by the purchase of Florida by the United States for \$5,000,000 (1819).

Trouble in Florida.

183. The growth of the nation was so rapid that for six years after the close of the war of 1812 a new state was added each year. Indiana was added in 1816. Mississippi in 1817, Illinois in 1818, Alabama in 1819, Maine in 1820, and Missouri in 1821. The population now numbered nearly ten millions; the public revenue had increased from five million dollars during the time of Washington to twenty-five million dollars. Since 1790 the government had granted patents to its inventors. A few had been granted prior to 1812, but after that the number increased rapidly. In 1836 the patent office was made a distinct bureau under the secretary of state, and a commissioner of patents was appointed at its head. The great coal and iron regions lying in the Appalachian range were now yielding their riches. Charcoal was formerly used in smelting iron, but in 1820 the ironworkers of Pennsylvania began to make experiments in mixing anthracite coal with charcoal. When it was found that anthracite coal could be used alone the manufacture of iron received a new impetus.

Growth of the nation.

and increased rapidly. With a country so large, and with a population spreading in every direction, the urgent demand of western settlers for some quicker and easier mode of inter-communication and transportation led to a variety of plans to accomplish the end. Private companies and sometimes the state built roads and canals. The greatest of these public works was the Erie canal, which owed its execution chiefly to the energetic governor of New York, De Witt Clinton. It was begun in 1817, and opened for traffic in 1825. It extended across the state from Lake Erie to the Hudson, and was the largest canal in the world. When the enterprise was first undertaken, and until its completion, it was called "Clinton's big ditch," but it was one of the principal means by which the city of New York became the chief commercial city of the new world. This was before the locomotive had been perfected, so that steam railroads were not yet in operation.

Erie canal.

Steam-boats.

184. In 1807, Robert Fulton had invented the steamboat. In 1811 a steamboat was launched on the Ohio river at Pittsburg, and presently many like craft were traveling the western rivers, thus opening an easy means of communication between distant points. Just after the Erie canal was begun, a steamboat was built, which was the first to navigate Lake Erie. The next year the steamer *Savannah* crossed the Atlantic, went as far as St. Petersburg and returned. Six years later, when the Erie canal was finished, the steamer *Enterprise* went from America to India by way of the Cape of Good Hope. In 1826 the first railroad in the United States was opened from Milton to Quincy, in Massachusetts. It was only two miles long, and was used for hauling granite, the cars being drawn by horses. In 1830 the first passenger railroad in America was opened, the Baltimore and Ohio Railroad, which was fifteen miles in length. The cars were at first drawn by horses, but with next year a locomotive was used. The construction of railroads now began in all directions, and during the next twenty years nearly ten thousand of miles were built. By the application of steam to industry, the discovery of large tracts of coal and iron ore, the invention of labor-saving machines, the communication by steam and railroad, the means were given to an energetic people for transforming the wilderness of the southern half of North America into a rich and prosperous country.

Railroads.

Monroe doctrine.

185. In its international relations the action of the government had become strong, quiet, and self-respecting. Mexico and the Spanish colonies of South America had revolted against Spain and established republics, and in 1822 President Monroe acknowledged them as independent nations. During the revolt it seemed likely that the "Holy Alliance" of Austria, Prussia, and Russia meant to assist Spain in bringing her revolted colonies to obedience. Great Britain had been gradually withdrawing her support from the alliance, and Canning, the new British secretary, determined to impress a check upon it by calling in the weight of the American government. A hint was given to the American minister, and in his annual message to Congress, in 1823, Mr. Monroe declared that "We could not view an interposition for oppressing them (the South American states), or in controlling in any other manner their destiny by any European power, in any other light than as a manifestation of an unfriendly disposition towards the United States." This statement announced the great fact that "the American continents are not to be considered as subjects for future colonization by any European power." This principle, so boldly declared, became known as the "Monroe doctrine," and, having the full sympathy of England, it proved effectual. The attitude of the national mind implied in such a declaration showed that our period of national weakness had come to an end.

186. Before the Revolution all the colonies held negro slaves, but north of Maryland these slaves were few in number, and were soon emancipated in all the northern states except Delaware. In the early years of the Republic many of the wisest men in the south were desirous of getting rid of slavery. All but three of the United States which made the confederation forbade the importation of slaves. These three were North Carolina, South Carolina, and Georgia; and they insisted, when the constitution was formed, that the right to import slaves should continue until 1808. At the close of the eighteenth century there was a strong anti-slavery feeling even in Virginia and North Carolina, and the supposition generally prevailed that the slavery system would gradually die out without causing any serious political trouble. In two states only, South Carolina and Georgia, was slavery looked upon with any marked degree of favor, and this was owing to the fact that these two states were mostly given to the cultivation of rice and indigo, which seemed to make slave labor indispensable. In 1783, the famous cotton-gin was invented by Eli Whitney, a Connecticut schoolmaster living in Georgia. The construction of this machine was so simple that the slaves could use it, and cotton could be cleaned and prepared for market with great rapidity. Hitherto very little cotton had been raised in South Carolina and Georgia, but with the advent of the cotton-gin, cotton-growing became a profitable industry, and in consequence there was an increasing demand for slaves. As the importation of slaves had been prohibited by the constitution after 1808, the cotton-planters could henceforth obtain slaves only by purchasing them in such border states as Kentucky and Virginia. To the tobacco-planters of these states, this seemed to promise a source of great profit, and many of them gave their attention to the raising of slaves for the southern markets. Hence anti-slavery sentiments were soon extinguished among them. There was no likelihood now that slavery would die a natural death. The interests of the south seemed to be bound up in the slavery system, and the way was prepared for uniting all the slave states into a solid south, as opposed to a solid north. The greatest danger to slavery had been the growing conviction that it was wrong in principle and that the nation ought not to permit it. But slavery existed under the laws, and the states where it did not exist were not at first disposed to interfere. They held that slavery was purely an affair of the states in which it was found. Besides, the northern States were now engaged in a variety of enterprises, while the southern States were still chiefly employed in the few agricultural industries of tobacco, cotton, rice, and sugar. The south thus looked to the north for clothing, tools, much of their food, and all the luxuries of life. The merchants of the north found a great market for their goods in the south; their manufacturers, also, needed cotton to keep their mills in motion. For these reasons, chiefly, the relations between the two great sections in regard to slavery had not been disturbed; but the time was at hand when this question of slavery was to be the paramount one in the whole republic.

The slavery system.

The cotton-gin.

The slavery struggle.

187. In the northwest territory slavery was prohibited by law; in all territories south of that domain it was permitted. There soon grew up a contest between the free and the slave states for control of the government, the south wishing to extend the area of slavery by the admission of new slave states, the north seeking to confine the institution to the localities where it already existed, while the abolitionists of the North wished to put a stop to it altogether. Thus began the "irrepressible conflict" between free and slave labor which ended, after more than forty years, in the great civil war. It was not until the Mississippi was crossed, and settlements began to be made in the great territory originally called Louisiana, which Jefferson had added to the national domain, that the question

arose whether the states made from it were to be slave states or free. The first discussion was over the admission of the territory of Missouri as a state. A kind of compromise had been kept up from the beginning by admitting a slave state and a free state by turns, so as to counterbalance each other in Congress. Thus Vermont had been counterbalanced by Kentucky, Tennessee by Ohio, Louisiana by Indiana, Mississippi by Illinois. In the same manner, the admission of Alabama, in 1819, should have counterbalanced the admission of Maine in the following year; but, as Missouri was also knocking at the door of Congress, the southern members refused to admit Maine until it should be agreed to admit Missouri as a slave state.

The Missouri compromise.

188. When Missouri applied for permission to enter the sisterhood of states, and a bill was brought before Congress to that effect (1819), an amendment was offered to the bill, forbidding slavery or involuntary servitude in Missouri, except as a punishment for crime. At once party lines were broken. The members from the free states voted for the amendment, and the members from the slave states against it. It was carried in the house, but rejected by the senate, and the bill was lost. At the next session of Congress, Missouri again presented her plea for admission as a state, and Maine made her first application for the same privilege. The Maine bill passed without opposition in the house, but by a sectional vote of that body slavery was again prohibited in Missouri. In the senate, the Maine bill and a Missouri bill permitting slavery were united, and then passed by a sectional vote. As the case now stood, both bills were compelled to stand or fall together, and the responsibility of their acceptance or rejection was thrown upon the house. The house held to its first action, and rejected the combined bills as passed by the senate. The difficulty was at length settled by the famous Missouri Compromise of 1820, in which each section gave up some of its demands, the house by permitting slavery in Missouri, and the senate by permitting Maine and Missouri to be voted upon separately. Thus Maine and Missouri were admitted into the union, the latter as a slave state; but it was agreed by both branches of Congress that slavery should be prohibited forever in all other territories north of the parallel of 36° 30', which was the southern boundary of Missouri.

Visit of La Fayette.

189. In 1824, Congress requested President Monroe to invite La Fayette to visit the United States as a guest of the nation. The marquis, then sixty-seven years of age, spent eleven months in a tour of the states, receiving everywhere the highest honors. His great fortune had been lost during the French Revolution, and Congress voted him a present of a township of land and two hundred thousand dollars in money. On the 17th of June, 1825, the fiftieth anniversary of the battle of Bunker Hill, General La Fayette laid the corner-stone of the Bunker Hill monument. There were present on the occasion about forty of the survivors of the battle and two hundred soldiers of the Revolution. A memorable oration was delivered by Daniel Webster.

190. In the presidential election of 1824, there were no recognized parties, and political issues were so obscure that the contest turned chiefly upon the personal merits of the candidates. The leading candidates were John Quincy Adams, of Massachusetts, secretary of state, William H. Crawford, of Georgia, secretary of the treasury, Henry Clay, of Kentucky, speaker of the house, and Andrew Jackson, a private citizen of Tennessee. On account of the number of the candidates and the character of the contest, the presidential campaign of 1824 has been humorously styled the "Scrub race for the Presidency". All the candidates claimed to be Republicans. Crawford and Jackson were representatives of the strict constructionist principles, but Jackson was not in favor with the Crawford faction on account of his leaning toward a protective tariff. Adams

The scrub race for the presidency.

and Clay were loose constructionists. The personal nature of the canvass is shown in the tendency of the supporters of the different contestants to designate themselves as "Jackson men" or "Adams men" rather than by any real party title. John B. Calhoun, of South Carolina, was generally supported for the vice-presidency by the friends of all the other candidates. In February, 1825, the electoral votes were counted, and were found to be, for president, 99 for Andrew Jackson, 84 for John Quincy Adams, 41 for William H. Crawford, and 37 for Henry Clay, and for vice-president, 182 for John C. Calhoun, and 78 for various other persons. Calhoun was therefore declared elected vice-president. Jackson had received the greatest number of electoral votes for president, but no one had a majority; and so the election went to the house of representatives. As Clay stood fourth on the list he was not eligible, and only three names were open to choice in the house. The friends of Clay therefore—unable to vote for him—united with the friends of Adams and thus secured the election of the latter. The feeling excited by this result had a tendency to widen the breach between the two divisions of the Republican party, and before long they became openly opposing parties.

The Adams administration.

191. From the beginning of Mr. Adams's administration, both factions of the defeated party united in an opposition to the president, which continued through his whole term of office. Adams appointed Clay to the leading position in his cabinet, and at once the charge was made that Adams and Clay had formed a corrupt bargain, in which the latter had agreed to cast his influence in favor of Adams, in return for which Clay should receive the position of secretary of state, which was then usually considered as the stepping-stone to the presidency. This imputation was indignantly denied by Clay, but the cry of "bargain and intrigue" was kept up until Adams retired from the presidency at the end of his four years of office. In the first year of his administration, the South American states, which had now become independent, proposed to hold a congress at Panama, to consult upon matters of interest common to the whole of America. They invited the United States to send delegates. President Adams accepted the invitation in behalf of the union. Congress, however, after a stormy debate, refused to send delegates. It was claimed that these South American states had abolished slavery, that they were near neighbors to the south, that they might include Cuba, which was still a part of Spain, make the island independent, and free the slaves there. The whole scheme was fraught therefore with danger to the slave states, and was rejected. The slave states were strong supporters of the doctrine of state sovereignty. They held that the states were independent of one another and of the federal government, a doctrine which had been held from the beginning of the union. The independent power of the state was a safeguard against too great a power in the central government.

The proposed congress.

192. The first tariff act of 1789 involved the idea of protection to home manufactures. The duties, however, ranged only from 7½ to 10 per cent., averaging about 8½ per cent. The system, too, which was introduced by Hamilton, seemed to be rather for political than economic purposes. Up to the passage of the tariff act, the laying of duties had been controlled by the states. The possibility of secession among the states in which the state-rights feeling was strong, was a feature that every statesman had to take into account. Hamilton wished to establish the new Federal government as firmly as possible, and his object in the tariff system seems to have been to create a class of manufacturers, running through all the states, but dependent for prosperity on the Federal government and its tariff. This would be a strong factor in support of the government against any attempt at secession, or any tendency

Protective tariff.

to return to the old system of control by State legislature. The war of 1812 had made it difficult to obtain manufactured goods from abroad, and many needed articles had begun to be made in the United States. After the war was over, American manufacturers wished to continue their business, but as they could not compete successfully with English manufactured goods, a higher protective tariff was thought necessary. In 1816 a tariff was instituted which imposed a duty of about twenty-five per cent. on imported cotton and woolen goods, and specific duties on iron imports. The English manufacturers made far more cloth than could be used in England alone, and they sold it to other countries. They could make the cloth better and more cheaply than it could be made in the United States. The people of the United States, therefore, would prefer to buy it of England rather than of the American manufacturers. Now England had established herself in India, and received at first most of her cotton from that country. She wished to favor her own merchants, who brought the cotton from India, and therefore she laid a tax upon the cotton from the southern states. Then the south began to send her cotton to the north, where they could sell it without paying duties, and favored a heavy duty on all cotton goods brought from England. By this means they thought, that Northern manufacturers could make up their cotton into goods which would cost the buyers less than English goods of the same kind. They reasoned thus: If the cotton has to travel across the Atlantic, pay a tax there, be made into cloth, cross the Atlantic again, and then pay a heavy duty at the custom-house, it will cost the merchant who buys it so much that he when he sells it he must ask a higher price than for the cloth made perhaps in the next town to him. So the customer will buy the native cloth. This tariff on European goods, therefore, was called a protective tariff, because it was intended to protect the American planter and manufacturer. At first the northern people did not favor it. Their business was much more in ships than in mills; and if the tariff prevented the importation of European goods, their vessels would not be of much use.

193. There was nothing new in the principle of the protective tariff. As has been shown, Hamilton had urged it at the beginning of the government, and it was the method used by many countries for the protection of their own industries. But the tariff of 1816 in the United States came at a time when it had a marked effect in the history of the people. If the United States could manufacture its own goods from its own products, and sell them to its own citizens, then one part of the country would help another, and the whole union would prosper together. Thus the tariff fell into its place as one of the plans adopted by the country when it settled down to the work of possessing the land and improving it. But as time went on, the south, which had at first favored a protected tariff to ensure the sale of her cotton, now began to oppose any further increase of duties on foreign goods. Thus in 1822, a proposition for making the tariff more protective was defeated by the southern section in Congress. The tariff of 1824 was adopted by very small majorities. It was an advance on all preceding tariffs in its consistent design of excluding foreign competing goods from American markets. It was passed by the northern members, except those from the northeast, against the almost unanimous vote of the southern members, who considered it unconstitutional, sectional, and unjust. In 1828, the Protectionists, as those who favored a high protective tariff were now called, succeeded, after a debate of six weeks, in passing another tariff bill which was so protective as to be satisfactory to manufacturers but very objectional to the southern states, where it was pronounced a legalized robbery. From this time, the nullification doctrines of the Kentucky

resolutions of 1799 began to gain strength rapidly in the south.

194. In the presidential canvass of 1828, the two factions of the great Republican party now assumed the character of two distinct and opposite parties. The supporters of Jackson assumed the name of Democrats, while the opposition, which favored the re-election of Adams, were known at first as National Republicans. But in the course of Jackson's administration, as they saw fit to represent him as a kind of a tyrant like George III, they assumed the name of Whigs; and henceforth, until 1854, Whig and Democrat were the names of the two great political parties in the United States. Without entering into a detailed history of these parties and their principles, it may be said in general that the questions which have divided them have been concerned with the powers of the national government. The Whigs wished to give the Federal government the power to use the public money in the making of roads, improving rivers and harbors, etc., under the general head of *Internal Improvements*; the Democrats claimed that these things ought to be done by the states or by private enterprise. The Whigs espoused the policy of laying duties on imports as high as revenue results would approve; within this limit the duties were to be defined for purposes of protection; and the superabundant revenues were to be expended on internal improvements. This was known as the "American system." This policy was opposed by the Democrats, but not always intelligently. The Whigs also favored the continuance of the national bank which had been chartered in 1816. The Democrats strongly opposed it, and on the question they achieved a complete and decisive victory under President Tyler. On the question of internal improvements, however, the opposite still holds the ground, but most of its details have been settled by the great development of the powers of private enterprise during the past sixty years, and it is not at present a leading question. The question of the tariff, however, remains to-day as a "burning question," but it is no longer argued on grounds of constitutional law, but on grounds of political economy.

195. In the presidential canvass of 1828 Jackson was elected president, with John C. Calhoun as vice-president, and on March 4 they were sworn into office. The eight following years have been called "the reign of Andrew Jackson," from the arbitrary methods which he seemed to assume in regard to money affairs in his administration. One of the greatest mistakes of the president was the use of government offices as rewards for his friends and adherents. As early as the beginning of the present century a vicious system was growing up in New York and Pennsylvania. In those states the appointive offices came to be used as bribes or as rewards for partisan services. By securing votes for a successful candidate, a man with little in his pocket and nothing particular to do, could obtain some office with a comfortable salary. It would be given him as a reward for political services, and some other man, more competent than himself, would have to be turned out in order to make room for him. A more effective method of driving "good citizens" out of politics could hardly have been devised. The result was that the civil service of those states was seriously damaged in quality, politics degenerated into a wild scramble for office, salaries were paid to men who did little or no public service in return, and thus the line which separates taxation from robbery was often crossed. About the same time the idea obtained that there is something especially democratic, and therefore meritorious, about "rotation in office." Government offices were regarded as plums at which everyone ought to be allowed a chance to bite. The way was prepared in 1820 by W. H. Crawford, of Georgia, who succeeded in getting the law enacted which limits the

in office."

terms of office for postmasters, revenue collectors and other servants of the Federal government to four years. The importance of this measure was not understood, and it excited very little discussion at the time. After Jackson obtained the presidency the methods of New York and Pennsylvania were applied on a national scale. Jackson cherished the absurd belief that the administration of his predecessor Adams had been corrupt, and he accordingly turned men out of office with a keen zest. During the forty years between Washington's first inauguration and Jackson's the total number of removals from office was seventy-four, and out of this number five were defaulters. During the first year of Jackson's administration the number of changes made in the civil service was said to be 2,000. Such was the abrupt inauguration upon the broadest scale of the so-called "spoils system." The phrase originated with W. L. Marcy, of New York, who in a speech in the senate in 1831 declared that "to the victors belong the spoils." The author of the phrase did not of course realize that he was making one of the most infamous remarks recorded in history, and Jackson doubtless would have been greatly surprised could he have foreseen that he was introducing a gigantic system of political knavery and corruption, which would help sustain all manner of abominations, from grasping monopolies and civic jobbery down to political rum shops.

The "spoils system" made national.

196. Jackson made another mistake which, however, was trivial compared with the adoption of the spoils system. He was bitterly opposed to the United States bank because he believed that it was unauthorized by the constitution and a means of political corruption. As the charter was about to expire in 1836 he urged Congress not to renew it. An angry controversy followed. A bill renewing the charter passed in 1832, but Jackson vetoed it. Subsequently he recommended that the public money should be removed from the bank, and when Congress refused to consent to this measure he took the responsibility of ordering the secretary of the treasury to remove it (1833), a measure which, at first, was followed by great distress among merchants. It was in this quarrel that the supporters of the bank became known as Whigs, while the partisans of the president kept the old name of Democrats. The bank was finally closed in 1836 when its charter expired.

The United States Bank.

Indian troubles.

197. In 1832 hostilities with the Sac and Fox tribes of Indians broke out in what is now Wisconsin. Their chief, Black Hawk, was captured, and the Indians were removed beyond the Mississippi. Georgia wished to get rid of the Creeks and Cherokees remaining within the state; but they refused to go. The United States had made treaties with them and these treaties acknowledged the right of the Indians to the land which they held. They were more civilized than the Indians in general and had farms which they cultivated. A few of their chiefs were persuaded to sign a new treaty with Georgia, giving up their lands. The other Indians at once put them to death; they declared that these chiefs had no authority to sign for the tribes, and that in consequence there was no treaty. Georgia would not wait for the Indians to yield but ordered a survey of their lands to be made for settlement by the whites. It must be remembered that although the territory was within the boundaries of Georgia it was yet distinctly under the control of the Indians by agreement with the United States. The federal government was very desirous of getting the Indians out of Georgia, and tried every means to persuade them to leave, and accordingly in a tacit manner suffered the state to crowd the Indians out. It was no less true that the state was taking to itself a power which belonged to the union. The wrangle over the Indians began in the administration of John Quincy Adams, and continued after Andrew Jackson was chosen president. Jackson

had no love for the Indians, having fought them all his life, and he did not now interfere. Georgia had her own way, and the doctrine of state sovereignty was more firmly held than ever.

198. At this time the southern people felt themselves to be Virginians, Carolinians, Georgians, rather than American citizens. They were brought up through this feeling of undue loyalty to their native states to have a secondary regard for the national union, and because possessed of an institution which they were anxious to maintain, they were necessarily fearful of the influence of an entirely free government. Since slavery could be sustained only by state law, in opposition to the spirit of the age, the state must be made so sovereign as to be able to withstand all national interference. To make sure of this result at the time now before us, some of the prominent southerners met on a certain occasion to try the temper of President Jackson by an attempted defiance of the national authority. But the indignant and determined response of the president checked for a moment their designs, few men daring any longer to follow to their ultimate conclusions the teachings of the great southern leader, John C. Calhoun; and so, for nearly two years, but little opposition was openly undertaken. Calhoun, however, never ceased his plotting; and in 1832, such had been the progress of his plans, that he deemed himself strong enough to carry his state-rights doctrine triumphantly through, in spite of the known hostility of the patriotic Jackson. Congress, as will be remembered, had enacted a tariff of a mixed character, mainly for revenue, but incidentally protecting some of the manufacturing interests of the northern states; and among the articles thus protected were coarse woolen goods, which were used in the south as clothing for its slaves. The price of those articles was thus made a trifle higher than it would have been without this protection; and the slave holders, always a unit for the state-rights doctrine, had to pay this higher price. The north was all the while under the same tariff, paying an increased price for cotton on every yard of imported cloth. This was not considered by the south, and so in 1832, a state convention in South Carolina declared the tariff acts unconstitutional, and therefore null and void, and resolved that any attempt to collect the duties at any port in that state should be resisted by force of arms. Preparations were also made to take South Carolina out of the union. "Nullification" was the name given to this act by which the state declared certain laws of the general government to have no force in her territory.

Nullification.

199. The 1st of February, 1833, in case Congress did not repeal its protective system prior to that date, was fixed upon as the limit of the state's forbearance; for after that day, South Carolina, in the event of the non-compliance of the United States with her sovereign pleasure, was to consider herself as forming no part of the Federal union. All she desired, she said, if her demands were refused, was "to be let alone," when she would proceed to govern herself, according to the alleged Jeffersonian doctrine, as an independent state. The excitement was intense all over the union. Webster was in the senate and General Jackson in the presidential chair, and they worked together, though opposite in their party connections, like twin brothers, for the salvation of their common country. Webster pleaded for the union, claiming that the constitution was not a "compact of states," but a "nation," created by the whole people for their collective government and benefit. In the course of controversy in the senate, he held his famous debate with Mr. Hayne, lasting for several days, and presented the arguments against the right of secession with an eloquence and force never equalled in any discussion on that question. President Jackson firmly believed that the states should manage their own affairs but he also held that when laws were passed in Congress for the whole country,

Webster and Hayne.

no one state had a right to refuse obedience to such laws. He declared that "the Federal union must and shall be preserved," and sent an armed fleet to Charleston harbor, warning South Carolina at once that, if she resisted, the whole force of the union would be used against her. For a while it looked as if there would be a resort to arms, but Clay, who was the leader of the Protectionists, came forward and proposed a compromise by which the tariff was modified. South Carolina had won her point. The doctrine of nullification had not been put to the test of arms; but the doctrine of state sovereignty had established itself more firmly at the south.

200. After the fall of the United States bank many state banks had been formed, often with little capital, to supply the expected need of paper money. These banks issued notes which were largely used in the purchase of public lands from the United States, and the treasury was accumulating paper currency of doubtful value. Soon after Congress had adjourned, the president directed the secretary of the treasury to issue the so-called specie circular, ordering the United States agents to receive in future only gold and silver in payment for lands. The demand for specie at once became pressing, and could only be met by the banks in which the revenue was deposited. Other banks fell into difficulties which culminated in the great "panic of 1837," which took place under Martin Van Buren's administration. General Jackson having served two terms, was succeeded by Mr. Van Buren, who became president on March 4, 1837. The administration of Mr. Van Buren (1837-41) was occupied chiefly with efforts to remedy the commercial disasters of the nation. The new president had taken Jackson's cabinet, and had declared his purpose "to follow in the footsteps of his illustrious predecessor." He, therefore, caught the first full effects of the storm produced by Jackson's financial policy, from which even Jackson's popularity and admitted honesty would hardly have saved him. A spirit of reckless speculation had been excited by the excessive amount of paper money in circulation, and property had acquired a fictitious value. Most of the banks which were not lucky enough to have government deposits at command went down under the specie circular of 1836. The "pet banks" which had received the deposits of the public money, had used them as loans to business men, and now, when a sudden demand for those deposits was made, many of these banks also were involved in the general ruin. The sudden calling in of these loans was the beginning of this famous panic of 1837, the counterpart of which had never before been seen in the United States. Early in May the banks of New York city refused to pay gold or silver for their notes, and the New York legislature authorized a suspension of specie payments throughout the state for one year. This was followed at once by the suspension of banks in other cities. The president by proclamation (May 15) called an extra session of Congress, to meet September 4, and consider and secure the financial interests of the government. Meanwhile the panic continued during the summer of 1837, causing widespread ruin among banks, corporations and business men, and violently reducing nominal fortunes to far less than their real value.

201. Finally, after some vicissitudes, the financial difficulties of the nation were satisfactorily adjusted by the adoption of one phase of the National Bank question, that of the so-called sub-treasury system which was ultimately established in 1846, and has been in force ever since. By this system the public revenues are not deposited in any bank, but are paid over on demand to the treasury department by the collectors, who are required to give bonds for the proper discharge of their duty. The establishment of this system was creditable to Van Buren's administration, but the country was not prosperous during his term of office, and he was

defeated as a candidate for re-election (1840) after a remarkably exciting canvass. The Whigs relying upon the same kind of popular feeling which had elected Jackson, again put in nomination the plain soldier, Harrison, who had been Van Buren's opponent in the preceding canvass, and who had lived in a log cabin and had hard cider on his table. In the famous "hard cider campaign" of 1840, Harrison won a sweeping victory, obtaining 234 electoral votes to Van Buren's 60. John Tyler, of Virginia, a Democrat in politics, was elected vice-president. The election of Tyler was a political mistake on the part of the Whigs, for in one month after his inauguration, President Harrison died, and Tyler succeeded to the presidency. Thus the government had a Democratic head, and the Whigs lost, in the main, the fruits of their victory.

202. Mr Tyler retained Harrison's cabinet, and promised to carry out his policy. In an extra session of Congress beginning May 31, a bill to abolish the sub-treasury of the previous administration was passed by both houses, which now had a Whig majority, and was signed by the president. Both houses then passed a bill to incorporate the fiscal bank of the United States. Many of the objectionable features of the old United States bank had been discarded; but the measure still met with great disfavor among the Democrats. The bill was vetoed by the president. He stated as his objection, that the powers given to the bank were such as he and the majority of the people believed to be unwise and unconstitutional to grant. An effort was made to pass the bill over the veto by a two-thirds vote, but it failed. The Whig leaders then requested the president to present them with an outline of a bill which he would be willing to sign. After consultation with the cabinet it was given, and passed by both houses. The president vetoed this bill also. A two-thirds vote could not be obtained to pass it over the veto. This action of the president in vetoing a bill which had been drawn according to his own suggestions, roused the indignation of the Whigs who had elected him, and all his cabinet resigned. Daniel Webster, however, the secretary of state, retained office long enough to finish a negotiation with Great Britain for the settlement of a dispute regarding the northwestern boundary.

203. The northwestern corner of North America down Oregon to the parallel of 54° 40', now known as the territory of Alaska, then belonged to Russia. The region known as Oregon, which lay between Russian America and California, was claimed by the United States on the ground of the discoveries of Lewis and Clarke. After the second war with England, when both countries claimed this region, it was agreed in 1818 that they should hold it jointly for ten years. The Hudson Bay Company, which was fully equipped for the fur trade, increased its stations. At the end of ten years it seemed to have almost entire possession. In 1828 it was agreed to continue the joint occupation until notice of its termination should be given by one nation or the other. When this agreement was renewed St. Louis was the great center of the fur trade of the west. Expeditions from that point into the disputed territory soon became common. The hunters brought back word of the fine farming and grazing lands which they had seen, and parties of emigrants began to make settlements in that direction. The Hudson Bay Company put every possible obstacle in the way of immigration, as they had wished to keep the country for hunting and trapping. They managed to create the impression in the United States that the Rocky Mountains could not be crossed by wagons, and that the country on the other side was a barren wilderness. In 1836, Dr. Marcus Whitman was sent out with a company of missionaries to the Oregon Indians. He was a man of energy and foresight. He saw that it was practicable for emigrant trains to cross the mountains by good passes, and he

knew that if he could make this generally known the people of the United States would soon occupy the country.

204. When Lord Ashburton came in 1842 to settle with Mr. Webster the boundary line between the British possessions and the United States, the Hudson Bay Company had succeeded in keeping out almost all American emigrants. They had laid their plans also to bring in English settlers from the Red river country, so as to strengthen the British claim to all Oregon. As soon as Dr. Whitman learned this, he set out in October of that year, and made his way across the entire continent to Washington. There he found that a treaty had been signed, but that Oregon had been left out of consideration altogether. Dr. Whitman's errand was to make known to the administration at Washington the value of Oregon, and then to organize companies of emigrants to settle within its bounds. He did both. In the following summer he had a great body of settlers over the mountains, and at the close of 1844 there were three thousand Americans in Oregon. The people were fast deciding the question of ownership. Congress now took up the matter in earnest. The American people claimed the whole western territory, and the Democrats went into the next presidential campaign with the alternative war-cry "Fifty-four, forty, or fight," meaning that the parallel of 54° 40' must be made the northern boundary. But the wiser men were ready to compromise, and a treaty was made with Great Britain in 1846, by which the forty-ninth parallel was made the dividing line west of the Rocky Mountains.

"Fifty-four, forty, or fight."

Dorr's rebellion.

205. In 1842 an affair known as "Dorr's Rebellion" occurred in Rhode Island. The state was still governed under the old colonial charter, and a party led by Thomas Dorr was anxious to exchange it for a new constitution giving greater power to the people. Dorr assumed to be governor by the votes of his partisans; the lawful governor, under the charter, called for the assistance of the United States, and civil war was imminent, when President Tyler sent troops into the state to uphold the old government. Dorr was convicted of treason and sentenced to imprisonment for life, but he was soon pardoned, and a more liberal constitution was afterward adopted.

Opposition to slavery.

206. Calhoun was steadily teaching the southern states that their safety lay in the doctrine of state sovereignty, and the slaveholders were beginning to think that the union was not worth much to them unless it protected the slave system. Meanwhile, a very different belief was becoming common in the north, which was largely due to the influence of William Lloyd Garrison, of Massachusetts. He had established a weekly paper in 1831, called *The Liberator*, which was devoted to the entire and immediate abolition of African slavery in America. Many others, men and women, came forward to support him, and in 1833 the National Anti-Slavery Society had been formed, and its branches had multiplied rapidly. The renewal of the slavery question alarmed the southern people and also many of the northern people, who considered any attack upon slavery dangerous to the peace of the union. From this time dates the existence of the party opposed to slavery in the United States, at first known as abolitionists. They did not, however, constitute a political party, but as individuals kept up an incessant attack upon the evil of slavery. They were persecuted in every way possible, but every attempt to intimidate them only gave a new opportunity for the discussion of the rights and wrongs of the slave. The slaveholders and their friends at the north declared that the abolitionists were destroying the peace of the country, and charged them with inciting the slaves to insurrection. Hence they called upon all friends of the union to put them down. Finally mob violence was resorted to in Boston and other northern cities to destroy abolition printing

The abolitionists.

Mob violence.

presses, break up abolition meetings and silence abolition orators.

207. These lawless outrages only served to fire the zeal of the abolitionists, and they began to offer petitions to Congress to abolish slavery in the District of Columbia, while the dissemination of abolitionist books and papers was greatly increased in every part of the country. Congress in 1835 had resolved to lay all future petitions on the subject of slavery upon the table. In 1836 the president's message to Congress made indignant reference to the practice of sending abolition documents through the United States mail. He recommended a bill to prohibit the practice in future. Accordingly, a bill was introduced in Congress, prohibiting any postmaster from knowingly putting any abolition documents or newspapers into the mails. The bill was rejected. The right of petition has been a right always held sacred by the people, and a champion for this right appeared in John Quincy Adams, who had been sent back to Washington as a representative from his district in Massachusetts. He presented these petitions again and again. The slavery party refused to admit them, and in consequence multitudes of people at the north were gained over to the anti-slavery side.

Petitions to Congress.

208. The political parties had not yet openly divided on the question of slavery, but the opposition to the Democratic party had become firmer, which resulted, as has been shown, in the formation of the Whig party (1836). Since Missouri had been admitted into the union two other states had been formed, Arkansas in 1836 and Michigan in 1837. Half of the states were now free states and half slave. But in population the free states were rapidly gaining on the slave states. In 1830 they exceeded them by over a million; in 1840 the excess was nearly two and a half millions. Moreover, after the admission of Arkansas, Florida was the only territory which could be admitted as a slave state, whereas the north had still a vast space westward at its command. To southern statesmen it seemed likely that the north would presently far exceed the south in territory, population, wealth and political power and would steadily gain a majority in the senate and the house. It was, therefore, probable that before long the north would come to control the action of Congress, and might then try to abolish slavery. This the south naturally dreaded, and this feeling of dread was intensified and exasperated by the abolitionist agitation. The only safeguard for the south seemed to be the acquisition of fresh territory, and southern statesmen looked for this to the great country of Texas, which lay south of 36° 30', was suited to the institution of slavery and was already occupied by many southerners.

Arkansas and Michigan.

209. Texas was originally a part of the Spanish province of Mexico. In 1821 Mexico revolted from Spain, and formed a republic moulded after the United States. Like other Spanish states in America it abolished slavery. The south thus had for its neighbor a free country hemming it in on the south and southwest. Presidents John Quincy Adams and Jackson each had made the attempt to buy Texas from Mexico, but she had refused to sell. Meanwhile emigration had set in from the southwestern states, and many Americans had made their home in Texas. The most noted of these was General Sam Houston, the leader of an adventurous set of men. At his instigation Texas rebelled against Mexican rule, and, in the decisive battle of San Jacinto (1836), won her independence and set up a government of her own with Houston at the head. Texas then applied for admission to the union. The importance of such an addition was seen at once. Out of this vast territory five states could be formed. If slave states they would greatly strengthen the slavery party. The whigs, under Webster and Clay, opposed annexation on the ground that it would bring on a war with Mexico, which had not acknowledged the independence of Texas. The ques-

Annexation of Texas.

tion of annexation was hotly discussed in the presidential election of 1844. Van Buren, who had opposed annexation, was rejected by the democratic party, and James K. Polk, of Tennessee, who favored annexation, was nominated. The whig candidate was Henry Clay; and there was a third candidate, which decided the result of the election. The abolitionists had put forward James Birney as a presidential candidate in 1840, who had received very few votes. They now nominated him again. A close and bitter contest followed. The democratic party was committed to the annexation of Texas, although the demand for the tariff of 1842, and for "the whole of Oregon or none, with or without war with England" helped to gain votes. Nevertheless the success of the Whigs seemed probable, until the weakness of Clay's moral fibre ruined it. He wrote a letter in which he tried to conciliate southern Democrats by saying that he would be "glad to see" the annexation take place at some future time. By this device he won no democratic votes, for Polk was a warm advocate of annexation, but angered a great many anti-slavery Whigs, who purposely threw away on Birney their votes, by which means New York was carried for Polk, and he was elected president. It was the most closely contested election in the history of the United States, except those of 1800, 1876 and 1884. The result in fourteen of the twenty-six states was doubtful for some days, and most of these chose Polk electors by very slender majorities. In several of them the small abolition vote would have turned the scale and chosen Clay electors. Thus Polk was elected, and, in December, 1845, Texas was annexed by resolution of Congress, and admitted into the union (December, 1845) with the understanding that it might be hereafter divided, so as to make several slave states. Florida had already been admitted as a state in March of the same year. In spite of the strong opposition to the annexation by the anti-slavery party there was a general feeling of pride that the country had acquired so large an addition to its domain. Politicians in favor of annexation did their best to draw the popular mind away from the question of slavery, and to hold out splendid prospects of the rapidly increasing United States. They began to aver that it was the "manifest destiny" of the nation to possess the whole continent. But the slavery question could not be held in abeyance. With the election of Polk the north and south were finally arrayed in opposition to each other. The policy of the Democratic party now began to be shaped chiefly by the adherents of Calhoun, the representatives of slavery and nullification, though the latter political heresy was not likely to be pushed to the front so long as the control of the federal government was in their hands; but the slavery question became the "burning question" from that time on until it was decided by the civil war.

The Mexican war.

210. When Texas was annexed to the United States, Mexico was so occupied with intestine dissensions and revolution that her exhibition of resentment was at first confined to a formal protest, and the withdrawal of her minister from Washington. No aggressive movement was made by her even when the United States troops under General Taylor occupied the east bank of the Nueces river, a part of the state which Mexico insisted had never belonged to Texas. In the meantime, in anticipation of trouble, a naval expedition had been sent by the American government to the gulf, December 31, 1845, and an act passed extending the United States revenue system over the doubtful territory beyond the Nueces river, to carry out which a revenue officer was appointed to reside in the new district. Even then Mexico did not institute hostilities, but expressed her willingness to negotiate concerning the disputed territory between the Nueces and the Rio Grande. In March, 1846, General Taylor was ordered by the president to advance from the Nueces to the Rio Grande, and oc-

cupy the debatable district. These measures, adopted by the president, by which our troops crossed the boundary claimed by Mexico, were considered by a large portion of the people of the United States as impolitic, if not unjust, and the occupation of a territory by our troops, which at least was a subject of dispute, was deemed by many a belligerent act. General Ampudia so considered it, and notified the American general to retire beyond the Nueces within twenty-four hours. In April General Arista superseded Ampudia in command, and communicated to Taylor that he considered hostilities commenced. Early in May Arista, with 6,000 Mexicans, crossed the Rio Grande, attacked General Taylor with his force of 2,300 at Palo Alto, and was badly defeated. The next day Taylor assumed the offensive, attacked Arista at Resaca de la Palma, and compelled him to retreat in haste across the Rio Grande.

211. The United States government, before it could hear of these actions, declared war against Mexico (May 13, 1846), and called for 50,000 volunteers. Mexico likewise declared war against the United States for interfering in her affairs with Texas. Soon after the declaration of war, Colonel Stephen W. Kearney was ordered to lead an expedition into New Mexico for the purpose of separating that province from Mexico. Leaving Bent's Fort, he followed what was known as the Santa Fe trail, along the Arkansas river, across the Colorado mountains to the Rio Grande, and down that river to Santa Fe. Here he took possession of the country in the name of the United States, declaring New Mexico a territory of the Union, and left a governor and some troops. Then he set off for California, to carry out the same design of separating a Mexican province from the Republic of Mexico and attaching it to the United States. Before war was declared Captain John C. Fremont was sent on an exploring expedition to California. Some vessels of the navy also were sent to the Pacific coast to be in readiness. The United States had reason to think that England would make an excuse of the Mexican troubles to set up a claim to California. Fremont and his men, aided by officers of the navy with marines, made no delay when they learned that war was in progress. They easily took possession of one village after another. They expelled the Mexican soldiers, and finally seized Monterey, the capital of the province. There were a number of American settlers there, who proceeded to declare the independence of California and organize a government.

212. When Colonel Kearney left Santa Fe, he ordered Colonel Doniphan, with about a thousand volunteers, to chastise the Navajo Indians. Having performed this duty and compelled the savages to make a treaty of peace, Doniphan marched a thousand miles to join the army in Mexico. At Bracito, December 25, 1846, he defeated a large force of Mexicans, and near Chihuahua, February 28, gained a decided victory over an army four times as large as his own. Finally he reached General Wool, at Saltillo, May 22, after a march which is considered as one of the most brilliant exploits of the war.

213. In the meantime Taylor had conquered the northern portion of Mexico; while Scott, landing at Vera Cruz, advanced and captured the City of Mexico. The United States soldiers were victorious over the Mexicans wherever they came into conflict, and whatsoever the disparity of numbers, as instanced in Doniphan's victory; while at Buena Vista, February 22, 1847, Taylor routed a Mexican army more than four times greater than his own. To the student of history the Mexican war will have great interest, as having been the school in which most of our great generals, who made their mark in the civil war, received their practical training. The capture of the City of Mexico (September 14, 1847), put an end to the war. A treaty was entered into with Mexico, by which the Rio Grande was made the southwestern boundary of the United

War declared.

Fremont in California.

Doniphan's expedition.

States, and the Gila river the northern boundary of Mexico. The United States paid Mexico \$15,000,000 for the territory which was thus added to its domain, exclusive of Texas. Five years later, the United States bought the Mesilla valley, south of the Gila river, for \$10,000,000. General James Gadsden was the agent in this purchase. By these two cessions Mexico transferred to the United States the country now comprised in California, Arizona, Nevada, Utah, and parts of Wyoming, Colorado, Kansas, and New Mexico.

The Gadsden purchase.

214. This immense acquisition of territory, though a fortunate one in many respects, had an immediate effect upon American politics far more disturbing than anything which had occurred since 1820. The general sentiments of the anti-slavery party had been opposed to the war, and these sentiments had been fully set forth in a series of remarkable political poems entitled, "The Biglow Papers," by James Russell Lowell. The sectional strife which had been allayed for the time being by the Missouri Compromise, now began to be renewed. In the new territory acquired from Mexico, slavery had been forbidden by the Mexican law, and the north desired this prohibition kept in force, but the south opposed the idea. It was proposed by some, as the simplest solution or the difficulty, to prolong the Missouri Compromise line from the Rocky mountains to the Pacific, but neither party was willing to give up so much to the other. The increased opposition to slavery in the north had created an increased obstinacy in the south, so it was rapidly becoming a difficult thing to effect compromises between the two sections. In 1846, David Wilmot, a Democratic member of the house, from Pennsylvania, offered an addition to a bill, making appropriations for the purchase of the Mexican territory. This addition was the celebrated "Wilmot Proviso," applying to any newly acquired territory the provision of the ordinance of 1787, "that neither slavery nor involuntary servitude shall ever exist in any part of said territory, except for crime, whereof the party shall be first duly convicted." The Whigs and northern Democrats united in favor of the proviso, and it passed the house, but was sent to the senate too late to be acted upon.

The Biglow Papers

The Wilmot Proviso.

215. In the same year that peace was made with Mexico (1848) came the presidential election. Several efforts had been made to pass the Wilmot Proviso, but without success, but it called into existence the Free Soil party, formed by the union of anti-slavery Democrats and Whigs with the Abolitionists. As a compromise between the advocates and opponents of the extension of slavery, a bill had been passed by the senate establishing territorial governments in Oregon, New Mexico and California, with a provision that all questions concerning slavery in those territories should be referred to the United States supreme court for decision. It was voted for by members from the slave states, but lost in the house. A bill was then passed in the house, by a sectional vote, to organize the territory of Oregon, without slavery. This was passed by the senate with an amendment declaring that the Missouri Compromise Line extended to the Pacific ocean. The amendment was rejected by the house, again by a sectional vote, and, the senate withdrawing, the bill passed.

The Free Soil party.

216. The Whig National Convention met at Philadelphia, June 7, 1848, and nominated Zachary Taylor, of Louisiana, and Millard Fillmore, of New York. No platform was adopted, and resolutions affirming the Wilmot Proviso as a party principle were repeatedly voted down. The Democratic National Convention met at Baltimore, May 22. It revived the strict constructionist platform of 1840 and 1844, and nominated Lewis Cass, of Michigan, and William O. Butler, of Kentucky. The National Convention of Free Soilers met at Buffalo, August 9. It adopted a platform declaring that Congress had no more power to make a

Conventions.

slave than to make a king, and that there should be no more slave states and no more slave territories. It nominated Martin Van Buren, of New York, and Charles Francis Adams, of Massachusetts. The Free Soilers decided the election by drawing the Democratic vote from New York, and so Taylor became president. He was brave, honest and shrewd, and by far the ablest president between Jackson and Lincoln. Though a Louisiana slaveholder, he was unflinching in his devotion to the union.

217. The leading political struggle during Taylor's administration related chiefly to the admission of California as a state in the union. Texas was the last slave state. The tide of emigration was moving steadily westward and northwestward. In 1846 Iowa was admitted into the union, and in 1848 Wisconsin. While the representatives of the people in Congress were struggling with the question of free or slave territory, the people themselves were rapidly increasing the influence of the free states. In the year that California became the property of the United States (1848) gold was discovered in the valley of the Sacramento, and a very hasty exploration showed that there was an immense deposit of the precious metal in the newly acquired territory. The news spread all over the world and immediately there followed a great rush to the gold region. In a little over a year the population had become large enough to entitle it to admission to the union, and there was need of a strong government to keep in check the numerous hordes of ruffians who had flocked in along with honest people. President Taylor was eager to bring California into the union before the question of slavery in that territory should be discussed in Congress. He urged the people to call a convention and organize a state. They did this (1849), and since they were almost wholly from the north, they framed a constitution prohibiting slavery, and applied for admission. The south earnestly opposed the admission of California as a free state, and the extreme southern party even took some steps toward secession. The debates were conducted on both sides with great bitterness.

California

218. The controversy went on for a year, until it was settled by a group of compromise measures devised by Clay, who thirty years before had succeeded so well with his Missouri Compromise. He proposed that California should be admitted as a free state; that any new states properly formed from Texas should also be admitted; that the territories of New Mexico and Utah should be organized without the Wilmot Proviso (i. e., with squatter sovereignty, by which the people of each territory were left free to settle the question of the existence of slavery for themselves); that the slave trade should be abolished in the District of Columbia, and especially that a more rigid fugitive slave law should be enacted. The constitution expressly gave to slave-holders the right to recover their slaves if they escaped into another state, but the increasing hostility of the people in the free states to the slavery system made it extremely difficult for slave-holders to find and recover runaway slaves when they had escaped into the northern states. This matter was one of great irritation to the southerners. They complained that they were deprived of their rights in direct opposition to the constitution. The new fugitive slave law was therefore so drawn as to require the arrest, by United States officers, of fugitive slaves in the northern states, and it also gave the officers the right to call upon any citizen to help them in their search and capture. The law also imposed penalties on all rescuers and denied them a jury trial.

Clay's compromise.

The fugitive slave law.

219. Webster gave his support to the Compromise of 1850. Like many others, he viewed with alarm the growing dissensions between the two sections of the country. He worked with all his might to preserve the Union against the attacks of the extreme pr

Effects of the compromise.

slavery men on the one hand and of the Abolitionists on the other. California was admitted to the union, and the fugitive slave law was passed. Instead of bringing quiet, as the Missouri Compromise had done, the Compromise of 1850 was the beginning of a more bitter and deadly strife. Perhaps the most important feature of the Compromise, in its bearing upon future events, was the fugitive slave law. The cruelties attending its execution aroused the fierce indignation of the north. The disgust and horror felt toward it caused the passage, by some northern legislatures, of "personal liberty laws," intended to protect free negroes falsely alleged to be fugitive slaves. During the discussion of Clay's Compromise Bill of 1850, President Taylor died after a very short illness (July 9, 1850), and Vice-President Fillmore succeeded to the vacant office. He enforced the Compromise Act impartially, but the fugitive slave law was often evaded and sometimes forcibly resisted. It strengthened the anti-slavery party in the free states, while the agitation of the question of the morality and wisdom of slavery was hotly resented at the south.

liberty
laws.

Fillmore
president.

Develop-
ment of the
country.

220. It was now the middle of the century, and the union seemed full of prosperity. So various had the interests of the people become that a new department in the administration had been created (1849) called the department of the interior, and comprised a number of offices like the census office, patent office, land office, and bureau of Indian affairs, all of which had formerly been scattered among the other departments. The secretary of this department was made a member of the cabinet. During Mr. Fillmore's administration postage was reduced, so that an ordinary letter could be sent to any place in the country for three cents. Before that it had cost ten cents to send a letter from Philadelphia to Boston. At once the number of letters transmitted through the mails was wonderfully increased. The extinction of Indian titles in northern Michigan brought about the discovery of the great copper mines of that region, whose existence had long been suspected before it could be proved. Railroads in the east were beginning to show something of a connected system, and the increase of railways in the west made it possible for the great farms to send grain and other provisions to the city very cheaply. Railroads in the south had hardly changed since 1840. In 1840 Samuel F. B. Morse, an American artist, had received a patent for an electric telegraph apparatus, and four years later he sent his first dispatch over the wires from Baltimore to Washington. This practical proof of the power of the telegraph was followed by a rapid extension of lines in every direction.

The
telegraph.

Govern-
ment ex-
peditions.

221. Several expeditions were ordered by government to gain a better knowledge of the national domain. In 1848, and again in 1852 and 1853, Captain John C. Fremont was sent out with exploring parties to the Rocky Mountains. The discoveries which he made, and the new importance of California since the discovery of gold there, induced the government to make more careful surveys. The war department undertook one to determine the most practicable and economical route for a railroad from the Mississippi river to the Pacific ocean. Captain Wilkes was sent to the Pacific Ocean, where he explored the Antarctic continent; an expedition under Lieutenant Lynch explored the valley of the Jordan and the Dead Sea; and Commodore Perry was sent with a fleet to Japan, a country which had heretofore been almost unknown to Europe and to America.

222. Between the east and the west railroads were growing busier. Towns and cities sprang up along their routes, and where a new and fertile district was found the settlers did not rest until they had a railway for the transportation of their produce; and very often the railroad itself was the pioneer of a new territory, being followed by the people who made claims along

its route. Ships and steamers were constantly crossing the Atlantic. Improvements were made by American shipbuilders in the construction of sailing vessels and the clippers, as they were called, were built, which were able to sail with a good wind almost as swiftly as steamers. The increased development of wealth in the country gave a fresh impetus to the spirit of invention. McCormick invented his reaping machine, and obtained a patent for it in 1834. Its results have been hardly less in importance to the United States than the invention of the locomotive. Since then agricultural machines and implements have rapidly increased. It was agricultural machines that made the western farms profitable, and enabled the railroads to fill the west so rapidly with population. Friction matches had come into use, and anthracite coal was now extensively used both in manufactures and locomotion. In 1839 Good-year had devised his method of vulcanizing india-rubber. In 1846 came the sewing machine, the powerloom, and the use of anæsthetics in surgical practice. The rotary printing press was invented in 1847.

Inventions.

223. During this rapid change in all the conditions of life, it was not strange that there should be a corresponding change in the minds of men, and that their ideas should become somewhat unsettled. Hence transcendentalism in religion, literature and politics began to flourish; visionary proposals of every kind were made; new communities were established, and new sects sprang up. In 1830 Joseph Smith had declared that he had received a revelation from God which was contained in a book called The Book of Mormon. He formed a society of men and women who were his disciples, and called themselves Mormons, and they made a settlement in Missouri. In 1838, Smith, with his followers, was driven away to Nauvoo, in Illinois. Ten years later, Smith was killed, and the Mormons, under Brigham Young, removed beyond the western frontier, and settled on the broad plain about Great Salt Lake, in the new Territory of Utah. Their missionaries traveled in the older states and in Europe, making converts, and bringing them to the new Mormon home. They offered to people who were discontented, and to the hard-worked poor, a land of promise and plenty. They appealed to religious people, and declared that God was with them, as He had been with the Jews of old. Salt Lake City was founded, and became their capital. Since then, having rapidly increased in wealth and population, they have now become a dangerous factor in the American system. Their peculiar tenets, which consist mainly in their polygamy and submission to their sacred hierarchy, have rendered it impossible to admit them as a State into the Union, while their numbers are so great that it is contrary to American instincts to deprive them of the right of self-government, and keep them under the power of Congress. A solution of the vexing question may soon be reached by the increasing enforcement of the United States laws against polygamy.

The
Mormons.

224. About the middle of the century, the American methods of education were greatly improved, and American literature began to attract the world's attention. There were publication societies formed by the churches, which multiplied books, papers and tracts without number, and these found their way to remote villages and homes. Educational societies helped establish schools and colleges in the thinly settled parts of the country. There was a Colonization Society, which tried to answer some of the difficult questions of slavery by sending free blacks to Liberia, in Africa. This was the time when the lyceum system became popular. In the cities and towns courses of lectures were instituted, and the latest thoughts in science, art, literature, politics and philosophy, were given to the people. The newspaper had become a national institution, and was a familiar visitor to the great majority of families of the republic. There were daily papers

Education
and
literature.

News-
papers.

in all the cities and towns, and in many papers the contents of books were published, aside from the general news and topics which interested the country. American authors were taking their place among the great men of the ages in the realm of letters. Before 1830, Bryant, Irving and Cooper, had become distinguished. In 1847, Edgar Allan Poe, the most imaginative of American poets, had died. In 1850, Washington Irving had written all his works except his *Life of Washington*. The poems by which William Cullen Bryant is best known had been written and given to the world. James Fenimore Cooper died the next year, leaving behind him a long list of novels, the best of which were descriptive of American life. Then came Longfellow, Whittier, Hawthorne, Holmes, Bancroft, Prescott and Emerson. The *Scarlet Letter* had been given to the public, which made Hawthorne famous. Longfellow had published *Evangeline*, and many of his most popular poems. Whittier had become celebrated as a poet; Oliver Wendell Holmes, as a poet and wit, William Gilmore Simms, as a novelist; Ralph Waldo Emerson had become known by his essays as one of the great masters of English prose; James Russell Lowell, poet and satirist, had issued his *Biglow Papers*, which helped people to understand the meaning of the Mexican war, while they laughed over the verses. And besides these, there were many others who assisted in raising the standard of American literature, and making it a distinct voice of the nation.

American authors.

225. All these things—churches, lyceums, public meetings, societies, newspapers and books, had their influence in shaping public opinion; and as they increased, more earnest grew the discussion of the slavery question. About this time, when the administration of Fillmore was coming to an end, a book was brought out which had an enormous sale, and was translated into all the literary languages of the world. This book was "*Uncle Tom's Cabin*," written by Mrs. Harriet Beecher Stowe, and it was for the time more widely read throughout the world than any other book. It was a story claiming to show what negro slavery really was, and what it meant in the lives of men and women, white and black, in the Southern States of the Union. The book was candidly written, and in a wonderful spirit of fairness, rather understating than exaggerating the evils of slavery, and its truths were all the more convincing for that reason. Its influence was doubtless very great in strengthening the anti-slavery feeling at the north, and in finally extinguishing the disturbing evil of the country.

Uncle Tom's Cabin.

VII.—THE APPROACHING CONFLICT.

226. June 1, 1852, the Democratic National Convention met at Baltimore. Its platform included the strict constructionist platforms of former conventions, endorsed the Virginia and Kentucky resolutions of 1798, and pledged the Democratic party to a faithful observance of the compromise of 1850, including the Fugitive Slave Law, and denounced all agitation of the slavery question. It nominated Franklin Pierce, of New Hampshire, and William R. King, of Alabama. The Whig National Convention met June 16 at Baltimore. In its platform it adopted its usual loose constructionist principles, though somewhat more cautiously worded than formerly, and endorsed the compromise of 1850 and the Fugitive Slave Law. It nominated Winfield Scott, of Virginia, and William A. Graham, of North Carolina. The Free Soil Democratic Convention convened at Pittsburgh August 11. In its platform it declared slavery to be a sin against God and a crime against man, and denounced the compromise of 1850, and the two parties who supported it. It nominated John P. Hale, of New Hampshire, and George W. Julian, of Indiana. Some of the Whigs, dissatisfied with General Scott, wished to bring forward Daniel Webster as an independent candidate, but Mr. Webster

Conventions of 1852.

died in October of that year. Henry Clay had also died in June of the same year. These two great leaders of the Whig party were succeeded by such men as Sumner, Seward and Chase, avowed enemies of slavery. John C. Calhoun was also dead, and Jefferson Davis, afterwards to play such an important part in the nation's history, acquired the leadership of the slave-holders of the south.

227. The slavery question was the principal issue in the presidential election in November, 1852, and in the contest the Whigs met with a crushing defeat, which put an end to their party. When the electoral votes were counted in February, 1853, it was found that Pierce and King had received 254, and Scott and Graham only 42. Mr. Pierce's administration (1853-57) was chiefly occupied with the slavery dispute, in which he represented the policy of the southern party. He chose William L. Marcy for secretary of state, James Guthrie for secretary of the treasury, Jefferson Davis for secretary of war, and Caleb Cushing for attorney-general.

Pierce's administration.

228. The slave power was now at a loss what to do for new territory in which to extend itself. The north had already a preponderance in the senate, consequent upon the admission of California, and, from the rapid growth of the northwestern states, in which New England ideas and sentiments were becoming predominant, the southern leaders recognized the fact that ere long the north would hold the power in the house. Webster had shown, in his memorable speech of March 7, 1850, that there was no more territory for slavery within the limits of the union. What, then, were the southern states to do? It seemed absolutely necessary at once to get a new slave state to balance California, but the available land south of 36° 30' was already occupied. New Mexico and the Indian Territory south of Arkansas presented themselves, but the westward movement of population along these lines would be far too slow for their purpose.

The slave power.

229. Seeing no legitimate method to acquire territory, their former plan was repeated, if not by the southern states themselves, certainly under the instigation of many of their citizens, and by members of the state rights party of the south, and for their advantage; for it was precisely at this period that William Walker, of Tennessee, the notorious filibuster, undertook to snatch Sonora for the south from Mexico, exactly as his predecessors had done with Texas. But he failed. In 1855, he and his band made the same experiment in Nicaragua. Here, for a time, he was successful. He overturned the lawful government, made himself president, and almost made the state in readiness for slavery and annexation to the federal government. But he was subsequently driven out, after which he returned home greatly disappointed and mortified. After two more unsuccessful attempts on Nicaragua, he planned his fifth and last expedition against Honduras. He was encouraged and assisted by his southern friends; mass meetings of his supporters were held even in New York, and in many other northern cities; and the state sovereignty party everywhere applauded his efforts to revolutionize and wrong a state. But Walker failed more fatally this time. He was defeated, captured and shot.

Filibustering.

230. Having been foiled in the attempt to gain a foothold in Central America, the slave power now turned to another state as offering a solution of their difficulties. The southern states wished to annex Cuba. Mr. Pierce proposed to buy it, and at his suggestion a conference was held at Ostend, in Belgium (1854) between the American ministers to Spain, England and France, Messrs. Pierre Soulé, James Buchanan and John Y. Mason to consider the question. A memorandum drawn up by these gentlemen and submitted to the president, is known as the Ostend Manifesto. It declared that Cuba was necessary to the United States; that it was the duty of this country to prevent the

Cuba.

Ostend manifesto.

emancipation of slaves in the island; and that if Spain refused to sell Cuba, the United States would be justified in taking it from her by force. This declaration caused great indignation in the north. Nothing, however, came of it.

231. Meanwhile, the tendencies to disunion were becoming stronger. Texas, the last slave State ever admitted, had refused to be divided, hence the South could hope for no further increase of numbers. After 1850, the political power had passed out of the hands of the south. The free states now, by uniting, could control both houses of Congress, elect the president and vice-president, dictate the appointment of judges and other federal officers, and make what laws they pleased. Thus the interests of the south depended upon the one question whether the free states would thus unite or not. Under circumstances so critical it were better for the slave power that all questions calling public attention to the question of slavery should be avoided; this, however, was simply impossible. The numbers interested in its solution had become too great to be silenced. It was the question of the hour, discussed in all ranks of society, breaking up party lines, and even disorganizing ecclesiastical institutions. The Protestant church organizations of the United States had been greatly agitated by the irrepressible question, and some of them became divided. In 1845, the Baptist church separated into a northern and southern branch, and the Methodist church shared the same fate the following year. The Presbyterian church managed to maintain its integrity until 1861, when it also yielded to the pressure; and the only churches retaining their national character were the Episcopal and Roman Catholic.

232. The southern leaders, strongly desirous of acquiring more territory in which to extend slavery, now concocted a seemingly practicable scheme to get control of that part of the country lying west of Missouri and Iowa. This land lay to the north of 36° 30', and according to the terms of the Missouri compromise, was forever to be free soil. A plan was devised to obtain if possible, the repeal of that celebrated compact. With the aid of some of the northern members of Congress this might be done. The scheme proved successful so far as legislation could go. In December, 1853, a bill was introduced in the senate to organize the territory of Nebraska. A southern senator at once arose and demanded that the Missouri compromise should not be so construed as to prohibit slavery within the new territory. The bill was at once dropped. But a sufficient number of free state Democrats soon acquiesced in the southern demand to make it a success. One week later a new bill was brought in, known as the Kansas-Nebraska bill. It divided the region covered by the previous Nebraska bill into two territories, one directly west of Missouri, and between the parallels of 37° and 40°, to be called Kansas, and the other north of this and between the parallels 40° and 43°, to be called Nebraska. Thus two states were opened to the southern institution, instead of one, for this new bill distinctly declared that the Missouri Compromise had been swept away by the later compromise of 1850. President Pierce had pledged himself to the south, in his letter accepting his nomination, to acknowledge and execute this latest bargain with slavery, in case he should be elected.

233. The bill was enacted, but the position was now assumed, that Congress had no authority to vote slavery *in*, or to vote it *out* of either of these territories, since it belonged of natural right to their respective populations to decide for themselves the character of their own institutions. This idea was known as that of squatter sovereignty, and it was proclaimed in order to open Kansas to an immediate slave immigration from Missouri, while Nebraska might afterward be captured in the same way from slaveholding Kansas. It was a

plausible doctrine, because it appealed to that strong love of local self-government which has always been one of the soundest political instincts of the American people. The plan was an astute one. It originated with Stephen A. Douglass, a northern Democrat, and laid bare the finest region of country which opened up for settlement, as a battle-ground between the slave-labor and the free-labor systems.

234. This act was the most palpable blunder ever known in the history of American politics. Its practical result was to create a furious rivalry between north and south, as to which should first get settlers enough in Kansas to secure a majority of the popular vote. The issue, thus clearly defined, wrought a new division between political parties. The southern Democrats and southern Whigs united in favor of the Kansas-Nebraska bill, while the northern Whigs and Free-Soilers united against it. The division between the northern and southern Whigs was final. The northern section at once repudiated their old party name, and combining with all the northern men who were opposed to the extension of slavery took the name of anti-Nebraska men, and succeeded in electing a majority of the house of representatives. A new party had arisen in 1852, which was now an important factor in American politics. It assumed the form of a secret oath-bound organization, of whose name, nature and objects, nothing was told, even to its members until they had reached its higher degrees. Their consequent declaration that they knew nothing about it gave the society its popular name of "Know-Nothings," but it assumed the name of the "American party." Its design was to oppose the influence of the Roman Catholic church, the easy naturalization of foreigners, and to aid the election of native-born citizens to office. Its nominations were made by secret conventions of delegates from the various lodges, and its nominees were to be voted for by all its members under penalty of expulsion in case of refusal. For a time it was quite successful in state elections, and was now aiming at a greater extension of its influence. At first it had intended to ignore the slavery question, but after a few years of existence the complications arising from the discussion of this subject affected its organization and resulted in its disunion.

235. The old Whig party disappeared about this time. Some of its members joined the American party, and the majority, including the old anti-slavery men and Free Soilers, with many others, united under the name of the Republican party. The name was at once recognized by the Democrats, who, in contempt, called them "Black Republicans," because of their alleged fondness for negroes. The Democratic party, which had been practically the only party since 1852, had now to contend with a political organization which adopted broad constructionist principles, declared itself in favor of protective tariff, internal improvements and a national system of bank currency, and added to them the further principle that the Federal government has the power to control slavery in the territories. It affirmed, at first, that it had no design to interfere with the institution of slavery in the states where it belonged, but simply intended to exclude it from the territories. But with the enunciation of its fundamental principles it was at once recognized as an anti-slavery party, and the only one to which the southern slave could look with the faintest hope of aid in throwing off the chains of bondage. The Democratic party had quite thrown aside its original title—that of Republican—but the name was still popular, and the new party, by a skillful stroke of policy, took advantage of this feeling and assumed the old name. Thus, in 1856, the two great parties, which were to figure so largely for the next thirty years in the history of the country, were arrayed against each other.

236. The attention of the whole country had now been turned to the struggle provoked by the Kansas-

The struggle for Kansas.

Nebraska bill, and the repeal of the Missouri Compromise. Kansas had been offered as a prize to be contended for by free and slave states, and both had accepted the contest. As in the case of California, it was found a slow work to colonize the new territory, even from Missouri, by permanent settlers, for the people of that state had land enough of their own, still unoccupied, to absorb for years their surplus population. The only recourse, therefore, was to send their worst inhabitants across the border, not to settle, but to vote and fight for slavery. Consequently gangs of "border ruffians" poured into Kansas from Missouri and Arkansas. But the free states were not behind in a struggle. Anti-slavery societies subscribed money to hasten immigration into the contested territory, and people from the free states migrated thither in such numbers that in a few months they constituted a decided and lawful majority of the actual settlers. The administration took alarm at the ill success of its own plans. Many of the inhabitants of Missouri undertook to impede the passage of northern emigrants through their state, but the immigrants circumvented them by winding their way around through the free state of Iowa. In the meantime the government sent an army to Kansas, professedly to keep the peace, but it would seem in reality to compel the acceptance and establishment of slavery. The first election of a delegate to Congress took place November 29, 1854, and was carried by organized bands from Missouri, who crossed the border on election day, voted, and returned at once. In the spring of 1855, the ruffians in this way voted to organize a territorial legislature, and this measure was carried in the same lawless manner. In July, 1855, this legislature, all pro-slavery, met at Pawnee, and adopted a state constitution. To save trouble, as well as to secure at once the establishment of slavery, they took a summary vote, adopting in their entirety the laws of slaveholding Missouri. At the same time they enacted a set of original statutes, which denounced the penalty of death for nearly 50 different offences against the institution of human bondage.

Free-state government.

237. To defend themselves against these illegal proceedings, the actual settlers held a free-state convention at Topeka, September 5, 1855, repudiating the work of the pro-slavery party; and on January 15, 1856, they elected state officers under the lawful constitution. Nine days afterwards, the state-rights president, in a special message to Congress, endorsed the pro-slavery legislature, and pronounced the attempt to form a free-state government, without the approval of the Federal authorities in the territory, to be an act of rebellion. He then issued a proclamation warning all persons against such acts of resistance to the lawful government, and despatched another body of troops to enforce the constitution of the border ruffians. The struggle continued unabated. In the senate-chamber Charles Sumner had been stricken to the floor with a bludgeon and nearly murdered by Brooks, in the presence of several southern and unresisting senators, for daring to criticise these unjust and one-sided proceedings. Brooks was expelled by northern votes, but was immediately returned by his southern constituents. In Kansas, the free-state settlers refuse to recognize the territorial government of the slave party, and as the pro-slavery settlers and their allies would not render obedience to the other government, the contest passed into a real civil war, the two sides mustering considerable armies, fighting battles, capturing towns, and paroling prisoners. Two free-state towns, Lawrence and Ossawatimie, were sacked. The free-state legislature peaceably assembled at Topeka, and was dispersed by order of the president. Many of its members were arrested and imprisoned. Every free-state citizen's dwelling had to be guarded and defended by armed force, and no free-state man could plow or plant or gather in his crops without fighting for his life.

Sumner and Brooks

238. The free settlers still continued to maintain their position, in spite of the persistence of slave party, with the whole force of the administration at its back. Several pro-slavery governors—Shannon, Geary and Walker—were sent to represent the southern party, and subdue the citizens to its purpose and control. A second slave constitution, made at Lecompton, was offered to the people in a tricky and nefarious manner. It was to be voted for "with" or "without" slavery, but in either case there would be an affirmation of the doctrine of states-rights. The free settlers accordingly refused to vote. The constitution of necessity was adopted and the new document sent to Washington, was accepted by the president and State-rights party. But the measure failed to carry through the house. Another territorial legislature was elected, and this body sent the Lecompton constitution to the polls to be voted for, or against, as a whole. It was defeated by a majority of six thousand. In spite of this, however, the president, in a special message, urged upon Congress the Lecompton constitution *with* its slavery features, declaring that the new legislature had no right to submit it to a second vote. But he was not sustained. In July, 1859, the citizens of Kansas met again in convention at Wyandotte, and adopted a resolution forever excluding slavery. It received a majority of four thousand at the polls.

Lecompton constitution

239. In the heat of the Kansas struggle came the presidential election of 1856. The Democrats nominated James Buchanan and John C. Breckenridge, adopted the strict constructionist platform of former conventions, and added to it an endorsement of the Kansas-Nebraska bill and the principle of squatter sovereignty. The Republicans nominated the western explorer, John C. Fremont, and declared the right and duty of Congress to prohibit slavery in the territories, thus planting themselves upon the ground of the Wilmot Proviso. The small remnant of Whigs, including the Know-Nothings of the north and those southern men who wished no further discussion of slavery, nominated Fillmore, and tried to turn attention away from the great question at issue by protesting against the too hasty naturalization of foreign-born citizens. Buchanan received 174 electoral votes, Fremont 114 and Fillmore 8. The large Republican vote showed that the northern people were at length awakened to the situation, and the south in consequence was both astonished and alarmed. For the first time in the history of the country a distinctively anti-slavery candidate had obtained an electoral vote, and had nearly gained the presidency. Though the Democratic party had been successful in this election, its triumph was seen to be far less complete than when it came out of the election of 1852. It no longer controlled twenty-seven of the thirty-one states; all the free states but five had cast their votes against it, and its candidate no longer had a majority of the popular vote, but was simply chosen by a majority of the electoral vote.

Presidential campaign of 1856.

The strongest section of the Union was in the hands of its political opponent, through whose ranks a spirit of earnest enthusiasm was being increasingly diffused.

240. The strength of the opposition manifested against the Democratic party in this election, more than ever convinced the south that the time was fast approaching when political power would pass from those who defended slavery to those who opposed it. Hence the slave power gathered up its forces for the great struggle which must inevitably ensue. It became more aggressive than ever. It demanded a renewal of the African slave trade, which had been forbidden since 1808, and without waiting for the question to be settled, the nefarious traffic was opened on an extensive scale, with but little attempt at concealment. During the year 1857, twenty-two vessels engaged in this business were captured by the British fleet watching the African coast and every vessel but one of these was American. By 1860 the trade had assumed large proportions, and was

African slave-trade.

openly advertised in the southern newspapers. But this was not deemed sufficient. To insure the perpetuation of the "peculiar institution," it was necessary to enlist the active protection of the Federal government in its favor. Squatter sovereignty had not served the purpose, for in the Kansas struggle, despite all the efforts made, slavery had been worsted. Squatter sovereignty was accordingly thrown aside, and a demand made that the Federal government should protect slavery in all the territories.

241. Up to this time the constitutionality of the Missouri Compromise had never been considered in the supreme court. The question was brought to test in a case which was decided in 1857, two days after Buchanan's inauguration. One Dred Scott, a slave who had been taken by his owner from Missouri into free territory, and had therefore sued for his freedom, was sold to a citizen of another state. Scott then transferred his suit to the Federal courts, under the power given them to try suits between citizens of different states, and the case came by appeal to the supreme court. The decision was startling to the north. It declared, in substance, that according to the constitution, no slave, or the descendant of slaves, could be a citizen of the United States; that slaves were not persons, but property, and that slave-owners could migrate from one part of the union to another and take their negroes with them, just as they could take their horses or any other property. It, moreover, pronounced the Missouri Compromise Act unconstitutional and void, slaves being private property, with which Congress had no right to interfere. And it further declared that it was the duty of Congress, not to prohibit, but to protect, slavery in the territories. The mass of the northern people held the opposite of Chief Justice Taney's decision. They claimed that slaves were regarded by the constitution, not as property, but as "persons held to service or labor" by State laws; that Congress was constitutionally bound to protect liberty as well as property; and that its duty was to prohibit, not to protect, slavery in the territories. It was plain that the decision of the supreme court would never be received as the law by the free states. A storm of angry dissent arose, of which the slave-holders hastened to take advantage. They maintained that the duty of Congress to protect slavery in the territories had been confirmed by the highest judicial authority in the land, and that the Republicans had refused to accept its rulings; therefore, whatever the result might be, the Republican party must accept the responsibility. At this time, as will be seen, the northern, or Douglass Democrats as they were called, who had heretofore supported the south, now refused to follow the southern lead any further, but chose rather to divide the party.

242. In 1860 the slave states were fifteen in number, namely, Delaware, Maryland, Virginia, North Carolina, South Carolina, Georgia, Alabama, Kentucky, Tennessee, Louisiana, Mississippi, Arkansas (admitted 1836), Florida (1845), and Texas (1845). The free states were eighteen, namely, Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Ohio, Indiana, Illinois, Michigan (admitted 1837), Iowa (1846), Wisconsin (1848), California, Minnesota (1858), and Oregon (1859). Kansas had adopted a free state constitution, but was not admitted until 1861. At this period the population of the United States was more than 31,000,000, an increase of over 8,000,000 in ten years. The population of the slave states was 12,000,000, including 4,000,000 slaves and 250,000 free blacks; but the colored element in the southern population could hardly be regarded as a factor of strength, but rather as a possible source of danger. No serious slave uprising had ever threatened the south, but John Brown's raid and the alarm which it produced in the southern states betokened a danger

which added a new terror to the chances of a civil war. Brown, a Connecticut man of the old Puritan type, had been an anti-slavery leader in the Kansas fights. His plan was to raise an insurrection among the slaves of Virginia, and arm them to liberate their people by force. In October, 1859, he and his men surprised and seized Harper's Ferry, where there was a large store of muskets and ammunition; but the negroes did not rise, and Brown was overpowered by national and state troops, and hanged (December 2) by the authorities of Virginia.

243. The next election for the presidency was looked forward to as a critical time. Many persons of influence in the south declared that if the election should strengthen the preponderance of the north, the slave states would break up the union and form a confederacy of their own. The Democratic national convention, which met at Charleston, S. C., April 23, 1860, was characterized by its stormy session. The demands of the southern extremists produced a political schism, and the convention with the party was split into two distinct portions. The Douglas Democrats refused to yield to the wishes of the slave power, and still maintained the principle that the question of slavery in each territory should be decided by its settlers; but they made a concession by offering a resolution that the party would abide by the decisions of the supreme court. The southern delegates offered resolutions affirming the doctrine of the Dred Scott decision, that neither congress nor the territorial legislatures had a right to prohibit slavery in the territories. The convention adopted the Douglas platform, whereupon the delegates from many southern states, successively protested and withdrew, and at once organized a new convention in Charleston, adopted their platform, and adjourned to meet again in Richmond, June 11. The original convention, after balloting fifty-seven times for candidates without a choice, adjourned to meet again at Baltimore, June 18. Upon reassembling at the appointed time, it seated some new delegates friendly to Douglas, whereupon the remaining southern delegates, who chiefly belonged to the border states, also withdrew, and joined their brethren at Richmond. Here they nominated John C. Breckenridge and Joseph Lane for president and vice-president. The remainder of the Baltimore convention nominated Stephen A. Douglas and Herschel V. Johnson. The Republican convention assembled at Chicago, May 16. It adopted a somewhat broad constructionist platform; advocated the exclusion of slavery from the territories by congressional measure; declared in favor of a protective tariff, the homestead bill, internal improvements, and a Pacific railway. It nominated Abraham Lincoln and Hannibal Hamlin. There was a fourth organization called "The Constitutional Union Party," composed of the fragments of the old Whig and Know-Nothing parties. It declared as its political principles, "The constitution of the country, the union of the states, and the enforcement of the laws." Its candidates were John Bell and Edward Everett. Four parties were now in the field, and only two had the courage of their convictions, the southern Democrats and Republicans. The Bell party had adopted a "take it as you please" platform; it simply evaded the slavery question altogether; while the Douglas platform sought to throw the responsibility of a decision concerning the question upon any shoulders except those of the Douglas Democrats.

244. An exciting canvass now followed. The Republican party had been gaining confidence and enthusiasm, and the discordant efforts of the three parties opposed to it, only made Lincoln's election more certain. In the electoral college Lincoln obtained 180 votes, Breckenridge 72, Bell 39, and Douglas 12. No candidate received a majority of the popular vote, Lincoln standing first and Douglas second. The popular vote for Douglas, though large, was not so distributed

Election of 1860.

as to gain a majority in any state except Missouri; beside the nine electoral votes in that state, he obtained three in New Jersey. Thus the election resulted in a decisive victory for the Republicans. Its significance was far reaching. The interests of the south and even of slavery there would be safe enough under Lincoln, but the overthrow of the Dred Scott and squatter sovereignty doctrines was certain, and an immediate stop would be put to the extension of slavery in the territories. In such circumstances the course of events was evident. Nullification was no longer feared by the nation. Secession on the part of a single state even, was now almost out of the question. No one of the southern states would agree to secede unless assured of support by the others; a combined action was necessary to assure the success of any secession plans.

Secession.

245. During the discussion which preceded the election, the north heard repeated threats from the south, that if the Republican party were successful, the slaveholding states would leave the union; but these threats were looked upon as merely the angry declarations of a few heated politicians. Yet these disunion expressions were sincere. The southern people had learned to look upon the north as thoroughly hostile to the south. They made little distinction between the Republican party and the Abolitionists, and they felt instinctively that a government elected in a spirit of opposition to slavery would find many ways to injure it. The political habits, and the way of life at the south, made it easy for southern voters to believe in disunion as a cure for the evils with which they felt they were threatened. The doctrine of state independence had become familiar to them; it had been laid down in the Kentucky and Virginia resolutions of 1798, and had been maintained by Georgia in the difficulty with the Indians, and by South Carolina in her Nullification Act. They had remained "Planting States;" they still had their own social life; the same families lived upon the same estates. There was no such constant movement from one state to another as at the north, nor any such introduction of immigrants from Europe. They were, as they have always had been, Carolinians or Virginians, rather than Americans. South Carolina took the lead in fulfilling the promise of secession. As soon as it was announced that Mr. Lincoln was elected, her legislature ordered (November 10, 1860,) the assembling of a convention in December following. The senators from the state, and all office holders in South Carolina under the Federal government at once resigned. The convention met at the appointed time, and on December 20, unanimously passed an ordinance of secession declaring "that the union now subsisting between South Carolina and the other states under the name of the United States of America is hereby dissolved." As reasons for this course, the convention referred to the nullification of the Fugitive Slave Law by the personal-liberty bills, and the election of a president, "whose opinions and purposes were hostile to slavery." The convention then took all the necessary steps to put the state in readiness for war, and adjourned. A copy of the ordinance was sent to each of the slave states, and several of them now rapidly followed this bold lead. Similar ordinances were passed by Mississippi, January 9, 1861; Florida, January 10; Alabama, January 11; Georgia, January 19; Louisiana, January 26, and Texas, February 1. Tennessee, North Carolina, Arkansas and the border states still refused to join their more southern neighbors. One force, however, might be exerted which would compel them to a decision. Should the Federal government attempt to coerce the seceding states, a state which did not wish to secede, but maintained the doctrine of state sovereignty and the right of secession, would be inclined to take up arms in its defence. Thus, in the following spring, four more of the slave states reinforced the original seven seceding states, making their final number eleven.

246. The act of secession, at first, met with opposition in the south, not from any sentiment that the act was wrong, but from the expediency of its exercise. Delegates had been elected to the state conventions who were to vote against secession, but they were defeated through the idea which had obtained that the state "could make better terms out of the union than in it." It was held that it would be more advantageous to their rights and interests to withdraw temporarily from the Federal government until proper guaranties for the observance of these should be given; and if all conditions were satisfactory, then they might deem it best to return. In planning secession, the southern leaders recognized many things in favor of independence on which they supposed they might reasonably count.

Plans of the South.

To gain success, it was not necessary for them to conquer the north, or any part of it, but only to hold their own frontier; whereas, should the north attempt coercion, it would necessitate the military occupation, by its armies, of the whole vast area of the southern country, which would be a tremendous undertaking never attempted before on a corresponding scale by any civilized government. They did not believe the United States authorities would really attempt such a measure. In this they fatally erred. They believed that all the slave states would join in the secession movement. This, however, was not done. Then they hoped that the action of the Republican administration would be so paralyzed by Democratic opposition in the north, that its efforts at coercion would be rendered futile. In this they were doomed to disappointment; for when war came, the great majority of the northern Democrats loyally supported the government; while those, nicknamed "Copperheads," who endeavored to impede its efforts, were too small in number to do any serious harm. Finally, they thought they might look for aid from England and France. "Cotton is king," was the cry, and while the English manufacturers were dependent for their cotton from the south, it would scarcely be possible that the English government would allow the southern coasts to be blockaded. But the sentiment of the great majority of England's working people was found to be in favor of the north. The great mass of the English people, in spite of many aristocratic sympathizers with the south, felt that the action of Great Britain in the African slave-trade question, would not permit her, without the most glaring inconsistency, to give support to the principal slave power in the world. With respect to France the case was just as hopeless. Napoleon III, it is true, was desirous of recognizing the independence of the south, for he had designs upon Mexico incompatible with the Monroe doctrine, but he was unwilling to make the move without the concurrence of England, and this he could not obtain. Thus the southern leaders failed in their expectations, and were thrown upon their own resources.

247. In February, 1861, a convention of delegates from the seceding states met at Montgomery, the capital of Alabama, and formed a government under the name of the Confederate States of America. The title thus declared that the states formed a confederacy and not a union. The government was a provisional one for a year, since only seven of the southern states were represented. Jefferson Davis, of Mississippi, was chosen president and Alexander H. Stevens, of Georgia, vice-president. A provisional constitution was formed, and an army, treasury, and other executive departments established. The permanent constitution, adopted in March, was copied from that of the United States, except that it made careful provision for slavery, and forbade a protective tariff or the maintenance of internal improvements at general expense. The seceding states at once took measures to take possession of the arsenals, forts and other property of the United States within their borders. Mr. Buchanan's secretary of war was John B. Floyd, of Virginia, a zealous secessionist, and

Organization of the Confederacy.

VIII.—THE CIVIL WAR.

by his orders an immense quantity of muskets, cannon, ammunition, and other warlike stores had been transferred from northern to southern arsenals. All this fell into the hands of the secession party. The army was scattered at remote posts where it could be of no use, and most of the navy was at foreign stations. General Scott urged President Buchanan to strengthen the garrisons of the southern forts, but Mr. Floyd protested, and nothing in that direction was done.

248. The forts throughout the south were mainly in the hands of southern men, who delivered them to the new authorities. The commanders of Fort Pickens, at Pensacola, and of the forts at Key West and Tortugas refused to give them up. The greatest interest, however, attached to the forts within the borders of South Carolina. The harbor of Charleston was commanded by Forts Sumter and Moultrie and Castle Pinckney. Fort Sumter was not yet finished, and the garrison, under Major Anderson, was occupying Fort Moultrie, a weaker work. This officer secretly transferred his men and supplies to Fort Sumter during the night of December 26, 1860. South Carolina demanded the evacuation of the fort. President Buchanan refused the demand, and sent the steamer *Star of the West* with supplies and reinforcements for the fort. He intended the expedition to be a secret one, but it was known at once in Charleston, and when the steamer appeared it was fired upon and driven back (January 9, 1861). The South Carolinians had taken possession of the other forts in Charleston harbor, and now erected additional works. General P. G. T. Beauregard was placed in command of the harbor defences. President Buchanan was filled with perplexity. In his message to Congress he stated his inability to execute the laws in the seceding states, but Congress gave him no help. He condemned the doctrine of secession, and denied the right of the states to secede; he also denied the right of the government to coerce them when they did secede. His cabinet was divided. The southern members dropped out as their states seceded, and General Cass, of Michigan, secretary of state, resigned in displeasure at Mr. Buchanan's inaction.

249. The resignation of the southern senators and representatives gave the Republicans a majority in Congress. That body now proceeded to admit Kansas as a state, and passed a protective tariff designed to encourage manufactures. Otherwise Congress did nothing but pass resolutions intended to pacify the south. Time which should have been spent in concentrating the energies of the Federal government, and preparing it to assert its supremacy, was frittered away in vain discussions about measures proposed to avert the disaster. Mr. Seward, senator from New York, and one of the most conspicuous of the Republicans, was willing to give up congressional prohibition of slavery in the territories, to enforce the fugitive slave law, and to perpetuate slavery by a constitutional amendment. The people throughout the country were in a state of bewilderment. The government authorities seemed to have no power to direct affairs. Great meetings were held in the principal cities of the north denouncing abolitionism and urging extreme concessions. Prominent journals of both parties declared that armed coercion was madness and never would be permitted. At the suggestion of the Virginia legislature, a peace congress, composed of delegates from thirteen free states and seven border states, met at Washington (February 4, 1861), and tried to bring about harmony between the sections, by proposing a number of amendments to the constitution. Nothing came, however, of any of these schemes. Disunion was now an assured fact, and was soon to pass into open hostility. It was during this state of affairs that the new administration of Abraham Lincoln entered upon its perplexing duties.

250. Mr. Lincoln was inaugurated March 4, 1861. In his address he declared that he had neither the right nor the desire to interfere with slavery where it already existed; that no state could lawfully go out of the union; and that he should maintain the laws and constitution of the United States to the best of his ability. The new administration was beset with difficulties on every side, and the condition of affairs seemed almost desperate. Many of those who for years had guided the "ship of state," and who understood its workings, were now foremost in advocating secession. Mr. Lincoln's officers were new to the business of the Federal government. The treasury, by defalcation, was nearly bankrupt. Few troops were within call; and the army had been almost broken up by the surrender of detached forces in the Confederate states, and the capture of munitions of war. The vessels of the navy were sailing or at anchor in distant waters, and numerous officers of both the army and the navy were resigning their commissions on the ground that they owed allegiance first to the states from which they came. Seven states had already revolted, and others were ready to swell the number upon the first attempt to enforce the Federal authority. The public officers were largely occupied by persons in sympathy with the secession movement, and every step taken by the new government was known at once to the leaders of the Confederacy, and to crown all, Mr. Lincoln was beset by a vast horde of office-seekers eager to take advantage of the change of administration.

251. The president waited a month and then notified Governor Pickens, of South Carolina, that he should send supplies to Fort Sumter at all hazards. This announcement precipitated an attack upon the fort. Major Anderson was first summoned to surrender, but he refused. At daybreak on the morning of April 12, 1861, the Confederacy began its open conflict with the United States. All the batteries around the fort opened fire upon it; the fort replied, and the bombardment continued for thirty-six hours without loss of life on either side. The ammunition in the fort was then exhausted, and the works inside were on fire. Thereupon the United States flag, for the first time in its history, was lowered to insurgent citizens, and the garrison capitulated. This event aroused the north as if from a trance. Until now, the mass of the people had refused to believe in real danger; but the first shock of arms thoroughly convinced them that the south was ready to fight, and could not be curbed without war. It did more than this. In the northern states party distinctions were for a time swept aside; there was but one party worth the name—the party for the union. The southern states were no longer "erring sisters" to be coaxed by concessions. The whole north called loudly for the full exercise of the Federal power to compel the south to obedience at the point of the bayonet.

252. The day after the evacuation of Fort Sumter President Lincoln called for 75,000 volunteers for three months (April 15). The response was so promptly made that the first Massachusetts troops began their march on the same day, and in a surprisingly short time the quota was full; nay, it could have been filled three or four times over, and the many who were refused felt a keen disappointment at not being allowed to bear arms in defense of the union. In the south, also, the effect of the first conflict was correspondingly great. To the ignorant masses it did not seem possible that any other power could be superior to that of their own state; while the more intelligent classes had, from their childhood, imbibed the doctrine that state sovereignty was the foundation of civil liberty. Hence all felt bound to follow the lead of their state; and when

the president of the new Confederacy issued his call for men, it was answered, as in the north, by overflowing numbers.

The border states.

253. Those southern states which had wavered were now compelled to make their choice. When Mr. Lincoln called for troops the Governors of Arkansas, Virginia, North Carolina and Tennessee refused to obey. North Carolina and Arkansas then seceded, and joined the Confederacy. In Tennessee and Virginia "military leagues" were formed with the Confederate states, by which Confederate troops were allowed to take possession of their territory, and by their aid the question of secession was submitted to popular vote. Thus the secession of these two states was accomplished in part, but not wholly. The people of the Alleghany mountains were loyal to the union; in eastern Tennessee they aided the Federals as much as possible; the opposition to secession was so strong in the western counties of Virginia that the inhabitants refused to obey the convention which passed the ordinance; they chose a legislature which claimed to be the true government, and at last formed a new state which was admitted into the union in 1863 under the name of West Virginia. Even thus curtailed, Virginia was a most important accession to the confederacy: it increased its military strength greatly, and at once became the chief battle-ground of the war. The confederate government was moved from Montgomery to Richmond; and since Washington was separated only by the Potomac from the confederacy, it was clear that the great contest would be fought in the country which lay between the two capitals. Moreover, Virginia was the richest and greatest of the slave states, and furnished the southern army with its ablest leaders, many of whom—such as Lee, Jackson, Johnston, and Ewell—were opposed to secession, but thought it right to shape their own course by that of their state.

254. There was a strong anti-union element in Missouri, Kentucky, Maryland, and Delaware, and the most momentous results—involving, doubtless, the success of the union cause—were involved in the action they would now take. Aside from Virginia, Missouri was the most powerful slave state, and her geographical position, with that of Kentucky and Maryland, was of incalculable military importance. Had these three states united with the confederacy it might have won the prize for which it was contending—independence. Missouri, however, did not break away, though the issue was for some time doubtful with her. Delaware cast her lot with the union. In Maryland and Kentucky efforts were made to maintain neutrality, but they were soon induced to declare in favor of the Federal government. Kentucky, however, had some of her sons in the southern ranks, among whom was John C. Breckinridge, a former vice-president of the United States, who became an officer in the confederate army.

Military condition of the north.

255. The Federal government was in no want of men, but the action of Secretary Floyd had almost stripped it of arms to equip them. Agents were sent abroad to purchase guns, private manufactories were worked day and night to produce them, and in a short time the administration was able to call more men into the field. The northern people were unmilitary in their habits and thoughts. They had a militia, but it was poorly organized. The Mexican war had drawn few volunteers from this section, and the United States army was very small and imperfectly equipped. The early action of the Confederates also had weakened it. There was, however, a greater population to draw from than at the south. There was also a wider range of industry to supply the necessary funds to carry on the war. The agricultural products of the United States far exceeded in volume those of any other country, and in merchant shipping it was only second to Great Britain. Between 1830 and 1860 American civilization

had shown a wonderful growth in all directions—in facilities of travel and exchange, in home comforts, in manufactures, in literature and art, and especially in the development and building up of that moral sense which enabled the country to pass so successfully through the trying times of the next four years.

256. But this material and moral progress was mostly confined to the north. The south was far from possessing an equal share in it. Her case was one of arrested development, not from any natural inferiority in the people, but simply because their moral sense and spirit of enterprise had been blighted by the curse of slavery. Labor was held to be degrading, and those who carried on the few branches of industry were considered an inferior caste; railroads, commerce and manufactures could not thrive, and hence there was but little immigration; the progressive ideas from the modern world outside were opposed from the fear that they might prove injurious to the pet institution of slavery. Thus the advance of civilization was checked, and whatever might have conduced to the material welfare of the south was kept away as far as possible. In the north the rising man was marked by the extent of his business relations; in the south by his ability to buy slaves, which assured him nearly always an entrance into the ranks of the dominant class. This class furnished the representatives and senators in Congress, the governors, and all the officeholders over which the slave power had control. Thus its ablest and best men combined to defend certain tendencies which were foreign and hostile to those of the rest of the country, and of the world in general. With such odds against it, the struggle of the south during the four years of war showed of what heroic stuff its people were made.

Of the south.

257. The first blood of the war was shed in the streets of Baltimore. Massachusetts and Pennsylvania troops on their way to Washington were attacked by a Baltimore mob (April 19, 1861,) and some of the soldiers killed. The populace, which sympathized with the south, declared that no northern troops should pass through the city. The railroad was blocked up, bridges were burned, telegraph wires were cut, and all direct communication with the north was stopped, until the president sent a military force from Annapolis to occupy Baltimore and keep the road open. In a short time the active hostility of the people was overcome, and the national capitol made secure. By July 4 the confederates had pushed their forces as far as Manassas Junction, about thirty miles from Washington. Their line of defence was already marked out, and its length has been estimated at eleven thousand miles, including the Atlantic and gulf coasts. It comprised the left bank of the Potomac from Fortress Monroe nearly to Washington; from thence it extended to Harper's Ferry, on through the mountains of western Virginia and the southern part of Kentucky, crossing the Mississippi a short distance below Cairo. From this point its direction was through southern Missouri to the eastern border of Kansas; then southwest, through the Indian territory, and along the northern boundary of Texas to the Rio Grande. The area contained within this interior line and the sea-coast was about 800,000 square miles, with a population of over 9,000,000. It comprised, also, the territory devoted to the raising of cotton, an article necessary to the manufacturing interests of the world. It was upon this production that the south relied largely for aid; all the munitions of war could be procured in exchange for it; and she believed it would be a powerful factor in preventing the blockading of her ports.

First blood of the war.

258. In consideration of this fact, and also that the confederate line of sea-coast was over three thousand miles in length, with but one port of refuge for a blockading fleet about the middle of the line, it scarcely seemed possible that a blockade could be maintained with any marked degree of success. Nevertheless

The blockade.

the president issued a proclamation (April 19, 1861) declaring a blockade of all the southern ports, and the Federal government proceeded to purchase and arm a large number of merchant vessels. But it could not at once bring together a navy powerful enough to keep vessels from entering or leaving the blockaded ports. The south not only sent out vessels laden with cotton to the West Indies and to Europe, but received in return military supplies of all kinds. Upon the appearance of Mr. Lincoln's blockade proclamation, Mr. Davis issued one also, granting letters of marque and reprisal to private vessels, against the commerce of the United States. The governments of Great Britain and France now issued proclamations of neutrality, thus making the contest between the north and the south a civil war, according to subsequent decisions of the supreme court.

Congress. 259. At the meeting of Congress (July 4, 1861) the Republicans had a majority in both branches, the free states and border states only, being represented. The house voted to devote its time solely to the business connected with the war. It supported the president's proclamation closing the southern ports against commerce. Bills were passed to define and punish conspiracy against the United States, and to confiscate all private property, including slaves, employed against the Federal government; to authorize a loan; to call out 500,000 volunteers, and to appropriate money for the army and navy. During this session occurred the first battle of Bull Run (July 21, 1861). General Scott had been appointed commander-in-chief of the union forces. The first military movements were in the mountains of western Virginia, and the success of the union army there led many people to suppose that in a short time the rebellious states would be compelled to obedience. Mr. Seward, who was secretary of state, was especially cheerful, and promised that the war should be over in ninety days. The newspapers and people generally urged an immediate movement upon Richmond. Very few had any knowledge of the difficulties before them, and General Scott, pressed by public opinion, gave the order to advance. This resulted in the first serious battle of the war. The union forces were defeated, and retreated in a panic upon Washington. Both armies were yet so new in military training that the confederates gained nothing from their success.

Effect of the defeat. 260. This disaster opened the eyes of the north, and the country settled down into a more serious temper. Congress was, more than ever, stimulated to increased energy, and pledged itself to vote any amount of money and any number of men necessary to maintain the union. Propositions to consider negotiations for peace were constantly offered by extreme Democrats, and as constantly rejected by large majorities, on the ground that negotiation with armed rebellion was unconstitutional. General Scott, having resigned the command of the northern armies on account of his age and infirmity, was succeeded by General George B. McClellan, whose successful campaign in western Virginia had given him a high reputation throughout the army. He had a genius for organization, and possessed the unbounded confidence of the people. He immediately set about forming the first great army of the war—the Army of the Potomac—at Alexandria, in preparation for a second advance. But the advance was delayed much too long to suit the impatience of the people and the administration; and as the winter of 1861-62 passed away without any forward movement, the expressions of dissatisfaction became louder and more general. The confederacy also spent the summer and autumn of 1861 in organizing its northern Army of Virginia, under General Beauregard.

Confederate army. 261. In the autumn of 1861 a portion of General Stone's command on the Upper Potomac was sent on a reconnoissance into Virginia, under Colonel Baker, and, being attacked by the confederate general, Evans,

at Ball's Bluff, was disastrously defeated. Colonel Baker was among the killed. Although Missouri had not seceded, a strong party, with which the governor was acting, wished to carry it over to the confederacy. A confederate camp near St. Louis was broken up by Captain Lyon, of the regulars, and the St. Louis arsenal was saved to the government. The state was afterward invaded by confederates from Arkansas, who were defeated by Lyon (now a general) at Booneville, June 17, and by Sigel at Carthage, July 5. A large force of confederates under McCullough and Price attacked Lyon at Wilson's Creek (August 10). Lyon was killed, and his command fell back toward the center of the state. Price with 20,000 men then attacked Lexington, which was garrisoned by 2,000 federal troops under Colonel Mulligan. After an heroic defense of three days the little garrison was compelled to surrender (September 20) after their water supply had been cut off for forty-eight hours. General Fremont was now appointed to the command of the western department. He drove Price into the southwest corner of the state, and was about to give battle when he was superseded by General Hunter (November 2). Hunter retreated to St. Louis, with Price in pursuit; but in a fortnight Hunter was replaced by Halleck, and Price was driven into Arkansas. Kentucky, like Missouri, was distracted by dissensions among its own people, and by armies on both sides. General Polk of the confederate army occupied Hickman and Columbus, towns on the Mississippi. There was also a confederate force at Belmont, Missouri, opposite Columbus. Ulysses S. Grant, recently appointed a brigadier-general of volunteers, now first came into notice. He drove the confederates out of Belmont (November 7), but was unable to hold the town because it was commanded by the fortifications of Columbus.

262. From the beginning of the war, the federal government was embarrassed by the question of fugitive slaves. Congress had passed the act confiscating slaves employed in service hostile to the United States. While General Fremont was in command of the forces of the west, he had issued a proclamation declaring the slaves of Missouri confederates free men, but this was countermanded by President Lincoln, who did not wish to estrange those slave-holders, especially in Kentucky, who were still loyal to the union. In Virginia, General Benjamin F. Butler had declared that slaves were "contraband of war," and therefore liable to confiscation by military law. But as yet the disposition of the north was to subdue the south without interfering with slavery; and some union commanders restored to their masters the slaves who had escaped to the federal lines.

263. Formidable expeditions were fitted out to recapture southern harbors. A combined land and naval force, under General Butler and Commodore Stringham reduced and occupied two forts at Hatteras Inlet, North Carolina, at the entrance to Albemarle and Pamlico Sounds (August 29), and Port Royal harbor, near Beaufort, South Carolina, was secured through the reduction of Forts Walker and Beauregard by the fleet under Commodore Dupont (November 7), and a land force under General Thomas W. Sherman. These successes were of great value to the Federal government. They not only closed important southern ports, but they furnished convenient stations for the blockading fleet. The "paper blockade," as it had been called, was soon made a very effective one along the whole length of the southern coast from the Potomac to the Rio Grande, an achievement which by many had been deemed impossible. Still, in spite of the watchfulness of the federal navy, several confederate men-of-war and privateers sailed out of port, and did much damage to merchant ships. The practice of "running the blockade" became a very profitable

business; and notwithstanding the danger of capture, which was the case in many instances, the profits on a single successful voyage were so great that adventurers found they could afford to take the risk.

Foreign relations.

264. As has been stated, the south depended largely upon assistance from abroad, and the southern leaders still clung to the hope that they could prevail upon Great Britain and France to recognize the independence of the confederacy. Two commissioners, therefore, Messrs. Mason and Slidell, were sent by the confederate government to London and Paris. They ran the blockade, made their way to Havana, and then embarked for England in the British mail-steamer Trent. Some distance out, the Trent was overhauled by an American man-of-war under Captain Wilkes, the two commissioners were taken off (November, 1861), and carried to Boston harbor, where they were imprisoned in Fort Warren. This action, which was illegal and unauthorized, caused great excitement in England, and came very near causing a collision between the two countries. Lord Palmerston made a peremptory demand for the surrender of the prisoners. The American government had already disavowed the act of Captain Wilkes, which, though it was justified by the British claim of the "right of search," was contrary to American principles. The confederate envoys were therefore promptly released and sent to England. Just before this occurrence President Lincoln requested two confidential agents to visit France and England in order to help the federal cause and avert the danger of foreign war by their influence with the governments and with persons of distinction. The persons selected for this delicate and important trust were Archbishop Hughes, of New York, and Mr. Thurlow Weed. They sailed in November and rendered very valuable service, Mr. Weed in England, and the archbishop in France.

Second year of the war.

265. At the beginning of 1862 the war had assumed vast proportions. The number of men under arms on both sides was nearly a million. The confederates held possession of the Mississippi river from the gulf or Mexico to the southern boundary of Kentucky, and occupied a chain of strong positions extending thence through Tennessee and Kentucky to the southwestern corner of Virginia. Between the Alleghanies and the Blue Ridge was the fertile Shenandoah valley, often disputed by both armies. At the east the confederates were posted in great force between the Potomac and the Rappahannock. Now that Delaware, Maryland, Kentucky and Missouri had been saved to the union, it was certain that the battle would be fought out in the territory to the south of them. The plan of the Federal authorities was to open the Mississippi and penetrate the confederate line at the west, while at the same time McClellan attacked Richmond, and a land and naval force continued the process of capturing the southern ports on the Atlantic coast. Simon Cameron, who had been secretary of war, resigned January 20, 1862, and was succeeded by Edwin M. Stanton. All the Federal armies were to move simultaneously on the 22d of February, Washington's birthday, but this order could not be strictly carried out.

The war in the west.

266. The first advance was made in the west. General Grant had entered Kentucky from Illinois, and succeeded in securing the mouths of the Tennessee and Cumberland rivers, two streams which were to serve as military highways by which the Federal armies were to penetrate into the heart of the confederacy. The chief confederate positions between the Mississippi river and the Alleghany mountains were Fort Henry on the Tennessee, Fort Donelson on the Cumberland (both in Tennessee), and Bowling Green and Mill Spring in southern Kentucky. This line of defense was in command of General Sidney Johnston, with headquarters at Bowling Green. Here he was confronted by General Buell's army, the middle one of the three great Federal armies, which came to be known as the Army

of the Cumberland. Forts Henry and Donelson formed the center of the confederate line, and was confronted by Grant, whose troops afterwards formed the army of the Tennessee. In January, 1862, General Thomas with the left of Buell's force thoroughly defeated the confederate right at Mill Spring. General Grant, aided by the river fleet under Commodore Foote, now assailed the center. Fort Henry was first attacked and reduced by the gunboats before Grant had time to invest it. The combined forces then assaulted Fort Donelson, which after a brave resistance was captured (February 16) with 15,000 prisoners. The center of the confederate line was now pierced, and Johnston and Polk were compelled to retreat for fear of being cut off. Columbus, Bowling Green and Nashville were evacuated, and the whole of Kentucky and most of Tennessee was in the hands of the Federals. General Buell occupied Nashville; a strong union party showed itself in Tennessee, and Senator Andrew Johnson was appointed military governor of the state.

Forts H and Don.

267. The confederates formed their second line of defense along the railroad from Memphis to Chattanooga, and began massing their forces at Corinth. The armies of Grant and Buell were to unite and attack the enemy in his new position. Grant moved up the Tennessee river and halted at Pittsburg Landing, or Shiloh, about twenty miles from Corinth, there to await the arrival of Buell. Here Johnston made a brilliant attack upon him with the intention of crushing him before Buell could come up. A terrible battle was fought (April 6 and 7,) in which the confederate leader, who was one of the slain, came very near effecting his purpose. But the federal forces, though driven back at nearly every point, stubbornly resisted, and at the close of the first day, Buell's advance guard came upon the scene. The next morning, Grant, now reinforced, assumed the offensive; and after a fight of several hours, the confederates were driven back to Corinth.

Pittsburg Landing

268. While these operations were taking place in Tennessee, Commodore Foote with his gun-boats entered the Mississippi with a small army under Pope, and captured Island Number Ten on the day of Grant's victory at Shiloh. Two months later Fort Pillow was abandoned by the confederates, and Memphis at once fell into the hands of the union army. The victory at Shiloh decided the fate of Corinth, an important railroad center, though it was not captured for several weeks afterward on account of the slow advances of General Halleck, who had assumed command of the federal forces at that point. Meanwhile a fleet under Farragut and Porter, with a land force under Butler, had been sent to attack New Orleans. Farragut ran past the batteries and forts at the entrance of the river, attacked and destroyed the ironclads which met him, and captured New Orleans, which was occupied by the army under Butler. Farragut with a part of his fleet then pushed up the river, clearing away all obstacles, passed the batteries at Vicksburg, and met the federal gunboats under Captain Davis, above. Thus the war in the west had been, so far, marked by an almost unbroken series of victories for the federal armies. At the northern boundary of the state of Mississippi the union advance stopped for a time, but all was held that had been won. To gain control of the great river, it was necessary to take Vicksburg, with its outpost, Port Hudson, which, between them, commanded the entrance to the Red river, and thus kept open the communications of the eastern part of the confederacy with its states of Texas, Louisiana and Arkansas. To capture Vicksburg would cut off these states, and greatly cripple the fighting power of the confederate government. The occupation of Chattanooga was also necessary to the success of the union arms. It would open the way into Georgia, and prevent the confederates from recovering any of the lost ground in Tennessee.

On the Mississippi

New Orleans taken

The Monitor and the Merrimac

269. While the south had met with defeat in the west,

it was encouraged by a success in Hampton Roads. The confederates had taken the Merrimac, a former frigate of the United States navy, and transformed her into an ironclad ram, with sloping sides and huge iron beak. On March 8, 1862, this strange-looking craft entered Hampton Roads and attacked the federal fleet lying there, which consisted of five wooden ships of war. The Merrimac destroyed the Cumberland, and also compelled the frigate Congress to surrender. At night she went back to Norfolk. The next morning she was seen coming out again to complete the work of destruction. Suddenly the Monitor, a turreted ironclad vessel, advanced to meet her, and after an obstinate engagement of several hours the Merrimac was compelled to retire. These encounters were remarkable as the first engagements between ironclads and wooden vessels and between two ironclads. The result caused a revolution in the navies of the world; the day of wooden war-vessels was seen to be over, and all the great powers began at once the construction of iron and steel vessels.

270. The military operations in Virginia during the year 1862 offered a strong contrast to the course of events in the west. This was owing partly, no doubt, to the superior ability of the confederate commanders, as compared with their antagonists, partly because on the union side military affairs were too much intermingled with politics. While General McClellan was organizing a splendid army of 200,000 men near Washington, General Banks was ordered to occupy the Shenandoah valley. He began his advance in February, and having, as he supposed, cleared the valley of the enemy, set out with his own corps proper to join McClellan. As soon as he was gone, General Jackson, popularly known as "Stonewall Jackson," hastened to attack the division of Shields which remained in the valley. After a desperate battle at Kernstown (March 23), Jackson was compelled to retire. Banks returned to the valley and Shields was sent to join McDowell at Fredericksburg. General Fremont now approached from the west, in order to unite with Banks near Stanton. To prevent this Jackson formed the plan of attacking the Federal forces in detail. He nearly succeeded in getting into the rear of the main body with a much larger army than Banks could muster. By a hurried retreat Banks reached and crossed the Potomac, with the confederate cavalry in close pursuit. Shields hastened back to the valley, but his advance guard was defeated at Port Republic (June 8) by Jackson, who, the same day, had checked Fremont at Cross Keys. Having thus saved the valley to the confederates, and obliged the government at Washington to detain for the defense of the capital a large body of troops which McClellan greatly needed for other duty, Jackson joined the confederate army in front of Richmond.

271. General McClellan concentrated the Army of the Potomac between Washington and Manassas, as if intending to advance against Richmond by that route. He then withdrew his forces and went by water to Fortress Monroe in order to advance up the peninsula between the James and York rivers. Here he was held in check for a month by Johnston at Yorktown, and when McClellan was ready to take the place, the confederates retreated toward Richmond. The union forces followed, and both armies concentrated around Richmond. McClellan gained the battles of Williamsburg (May 5), and West Point (May 9), and advanced within seven miles of the city. A panic broke out in the southern capital, and the confederate Congress adjourned in haste. It was just at this time that Stonewall Jackson, by his brilliant and daring exploits in the Shenandoah valley, obliged the federal government to keep in front of Washington a corps under McDowell which was about to co-operate with McClellan by way of Fredericksburg. The movements of McClellan in-

volved the separation of the two wings of his army by the little river Chickahominy, which by a sudden rise was changed into a wide stream. The confederates under Johnston at once attacked the union left wing at Fair Oaks and Seven Pines. A fierce battle ensued, lasting two days; the result, however, was a union victory. Johnston was wounded, and was succeeded by Robert E. Lee, who retained command of the army of Virginia during the rest of the war.

272. The absence of McDowell, who was expected to support McClellan's right, compelled a change in the whole plan of operations. Although Lee had been repulsed in an attack on the Federal lines at Mechanicsville (June 26), he fell upon them again at Gaines Mill, the day following, in overwhelming force, and drove them across the Chickahominy with severe loss. Jackson had now reinforced Lee, and McClellan was cut off from his base of supplies on York river. Unable to reunite his wings and regain his base, the union general decided upon the difficult maneuver of establishing another base on the James river. While effecting this change, the union troops were hard pressed by Lee and Jackson, who, during the period from June 23 to July 1, attacked them at Golding's Farm, Savage's Station, White Oak Swamp, Glendale, etc., and finally at Malvern Hill, where the confederates were signally repulsed. This was the last of a series of engagements known as the "Seven Days' Battles," in the course of which McClellan lost over 15,000 men. Lee suffered almost as much. The union army had now reached the James river, and established itself in a position from which it could not be driven.

273. Lee and Jackson then turned their attention toward Washington, which was defended by an army under General Pope. Pope's forces stretched along the Rappahannock and Rapidan to the Shenandoah valley. General Banks held a position at the western end of the line, and was attacked by Jackson at Cedar Mountain. Lee followed close behind, and the two generals forced Banks back and then attacked Pope. McClellan received orders from Washington to join Pope, and a portion of his forces came up in time to take part in the second battle of Bull Run, August 29. Pope's army was put to rout, Washington was threatened and the whole country was wild with excitement. Lee now led his victorious army across the upper Potomac and entered Maryland. McClellan, gathering up the remnants of the two defeated armies, followed and confronted the confederates at Antietam creek. A desperate struggle took place (September 17). It left each army exhausted; but the victory remained with the union forces. The confederates recrossed the Potomac and retired up the Shenandoah valley. The administration was dissatisfied with McClellan's course, and his command was given to General Burnside. The new commander at once moved toward Richmond, proposing to cross the Rappahannock at Fredericksburg. Here he found Lee posted upon the hills behind the town. Burnside crossed the river, and, forming his army in three divisions, attempted to storm the heights (December 13). It was a day of terrible slaughter for the federal troops. They were repulsed with the loss of twelve thousand men, the army was demoralized and retreated to the north side of the river. Burnside was then superseded by General Hooker. The close of 1862 thus found the opposing armies in nearly the same positions as at the beginning of the war. At the north gloom and discouragement prevailed. At the state elections held in the autumn there was a majority against the administration in several of the northern states, and the result of the campaigns on the Potomac gave great strength to the peace party, which believed that the attempt to subjugate the south ought to be abandoned.

Chattanooga, while Grant's remained at Corinth till it should be ready to start for Vicksburg. The campaign was so badly managed by Halleck that the confederates, under Bragg, seized Chattanooga before Buell's arrival. They were thus enabled to press him so vigorously that he had to be largely reinforced from Grant's army. Thus weakened, Grant was unable to advance for several months. During the summer of 1862 the confederates made a great effort to repair the disasters they had suffered on the Tennessee and Mississippi rivers by an invasion of Kentucky. An army under Kirby Smith moved from Knoxville, East Tennessee, while another, under Bragg, marched from Chattanooga. The confederate general, Smith, defeated General Nelson near Richmond, Kentucky, August 30, and advanced toward the Ohio, threatening Cincinnati. General Lew Wallace, however, compelled him to fall back to Frankfort. Bragg in the meantime hastened toward the city of Louisville. Buell, leaving Nashville, by forced marches reached the place one day ahead of Bragg. Being reinforced he slowly pushed the confederates back. Bragg formed a junction with Smith at Frankfort, and four days later a severe but indecisive battle was fought at Perryville (October 8). The confederates then retreated through Cumberland Gap.

Operations in Kentucky.

275. During Bragg's campaign, the confederate army in Mississippi under General Van Dorn made an attempt to turn Grant's left wing at Corinth, and thus force him back down the Tennessee river. This wing was commanded by General Rosecrans, who defeated Price at Iuka, a few miles from Corinth, September 19. On October 4, Van Dorn and Price together attacked Corinth, but were repulsed by Rosecrans with a loss of five thousand men, and pursued forty miles. Soon after this Rosecrans superseded Buell in command of the army of the Cumberland. Bragg had advanced to Murfreesborough, in central Tennessee. There Rosecrans attacked him (December 31), and a bloody battle was fought, in which 40,000 men were engaged on each side, and each lost more than 10,000. This engagement is generally known as the battle of Stone river. It was indecisive. On January 2, 1863 Bragg renewed the attack with great vigor, but this time he was signally defeated and compelled to retire to Chattanooga.

Iuka and Corinth.

Stone river.

276. While these battles were being fought, Grant had begun his first movement against the strong and important post of Vicksburg, on the Mississippi. His plan was to march from Jackson, Mississippi, while Sherman, with his 40,000 men, and Porter with a fleet of gunboats, descended the river from Memphis. The movements were made according to this arrangement, but Van Dorn's cavalry succeeded in getting in Grant's rear and cutting off his supplies. This compelled Grant to abandon his march to Jackson. Sherman and Porter attacked the bluffs north of Vicksburg, but were repulsed with heavy loss (December 29). Hearing of Grant's misfortune they returned to Memphis.

Affair on the coast.

277. After Hatteras Inlet to Pamlico Sound had been captured, it was next resolved to attack the confederate position on Roanoke Island, which commands the passage between Pamlico and Albemarle Sounds. A land and naval expedition under General Burnside and Commodore Goldsborough took the forts and batteries of the island (February 8, 1862), captured a confederate flotilla, occupied Newbern, North Carolina (March 14), and reduced Fort Macon, at Beaufort, April 25. Expeditions from Port Royal under Commodore Dupont took possession of Darien and Brunswick, Georgia, and of Jacksonville, Fernandina, and Saint Augustine, Florida. April 11, 1862, General Gilmore captured Fort Pulaski on the Savannah river. Thus the port of Savannah was completely closed, although no effort was made for some time to occupy the city.

Congress.

278. During the movements of the armies in 1862, Congress had not been idle. It was chiefly occupied in

measures connected with the prosecution of the war. Its most far-reaching action was in the provision for a uniform national currency. At the beginning of the war the government had borrowed large sums of money to defray expenses, and it continued to borrow, as new demands arose. The result was similar to that which occurred in the Revolutionary war. The promises to pay became less valuable as compared with gold, which was the standard of value throughout the civilized world. The banks in the several states could no longer obtain gold without paying a high price for it; and at the end of 1861 they suspended specie payments. In order to provide a currency for the people, a bill was passed by congress, early in 1863, authorizing the issue of notes by the United States treasury. These notes received the popular name of "greenbacks," from the color of the paper on which they were printed; and to insure their success they were declared by Congress to be "legal tender" (February 25, 1862). Early in 1863, Congress passed an act establishing national banks. Heretofore the states had incorporated all banks, and the bills of each bank were seldom current except in its own neighborhood. By the national banking system, the banks were to be organized, and United States bonds deposited at Washington. The banks were then permitted to issue notes up to ninety per cent. of the value of the bonds deposited, and the notes, being thus secured, became current in every part of the country. The national banks are still in operation. A homestead bill was passed, which assigned public lands to actual settlers at reduced rates. Congress also prohibited slavery in the District of Columbia; slaves of insurgent were ordered to be confiscated; and the army was forbidden to surrender fugitive slaves to their masters. It provided for the construction of a Pacific railroad and telegraph, and began a further development of the system of granting public lands to railway corporations.

Paper currency.

National banks.

279. Since the south had brought on the war in defense of slavery, the abolition sentiment had spread very rapidly in the north, and it had now become supported by the military needs of the hour. At the beginning of the conflict the union leaders and people generally had not favored any interference with slavery, but circumstances had proved their position to be untenable. President Lincoln, who watched anxiously every movement, was convinced that the time had come when the federal government could no longer attempt to carry on the war successfully and spare the system of slavery, which was perceived by every discerning man to be at the foundation of the confederacy. He therefore announced (September, 1862,) that unless the revolting states should return to their allegiance by January 1, 1863, he should declare the slaves in these states to be free. It was a formal notice given out of respect to law; no one seriously expected that it would be regarded by the confederate states. And it was not. They only grew more firm in consequence of the action taken. On the first day of January, 1863, in accordance with his notice, the president issued his celebrated Proclamation of Emancipation. This act caused much discussion. Mr. Lincoln could not, legally, issue such a declaration, for the constitution gave him no authority to abolish slavery. But he acted on the principle of military necessity, advocated by John Quincy Adams in his speech of April 14, 1842, in which he said: "Whether the war be civil, servile, or foreign, I lay this down as the law of nations: I say that the military authority takes for the time the place of all municipal institutions, slavery among the rest. Under that state of things, so far from its being true that the states where slavery exists have the exclusive management of the subject, not only the president of the United States, but the commander of the army, has power to order the universal emancipation of slaves." However the case may be, the president's course was dictated by clear common sense and wise statesmanship. The events of the pre-

Emancipation.

Proclamation.

ceding summer had shown that the war was far from being at an end. The cutting off of the cotton supply had been a general calamity, and the distress produced in consequence created a fear lest England and France should unite in an attempt to put an end to the contest. But the proclamation changed all this. By it the struggle was converted into a crusade against slavery, and in this light foreign intervention was now simply impossible, owing to Great Britain's attitude toward slavery. Moreover, should the federal government be successful, the question of slavery would practically be settled forever, for its abolition would be certain when the union was re-established. One of the first results of the act was the formation of regiments of negro soldiers. An attack made by one of these regiments, under Colonel Shaw, upon Fort Wagner, in Charleston harbor, though unsuccessful, showed so much bravery that the prejudice against negro soldiers disappeared, and great numbers were enrolled.

Negro soldiers.

Third year of the war.

280. General Hooker spent three months in reorganizing and strengthening the Army of the Potomac. At the end of April, 1863, he began his march toward Richmond with 120,000 men. Sending the sixth corps, under Sedgwick, to cross the Rappahannock below Fredericksburg, he threw his main body across the river a few miles higher up, and before Lee understood his purpose he had advanced to Chancellorsville. Here Lee won one of the most marked of his victories (May 1 to 4), with only one-half as many men as Hooker commanded. Jackson made a magnificent attack upon the union right, taking it by surprise, and drove it back in confusion. Sedgwick, on the left, had carried the heights of Fredericksburg and was pushing on toward Chancellorsville, when the disaster on the right enabled Lee to face him with the main confederate force. Sedgwick was compelled to retire during the night which followed the 4th of May, and Hooker recrossed the Rappahannock the next night. Hooker's loss was 16,000; Lee's was 12,000; but the confederates further sustained a severe disaster in the death of Stonewall Jackson.

Battle of Chancellorsville.

Invasion of Pennsylvania.

281. Lee now repeated the maneuver he had practiced after defeating General Pope. Turning Hooker's right flank, he pushed on through the western part of Maryland into Pennsylvania, so as to threaten Philadelphia, Baltimore, and Washington. There was intense alarm at the north, and reinforcements were hurried into Pennsylvania from all quarters. In consequence of a disagreement with General Halleck, Hooker resigned the command of the Army of the Potomac, and it was given to General George G. Meade. The two hostile armies, each 100,000 strong, were now moving in parallel lines, with the Blue Ridge and South Mountain range between them. On the 1st of July they came into collision at Gettysburg. A tremendous battle was fought, lasting until the close of July 3. It resulted in the defeat of Lee, with a loss of nearly 40,000 men; Meade's loss was 24,000. This battle was one of the greatest of modern times, the loss on both sides being more than one-third of the whole number engaged. It was also the turning point of the civil war. The south was never able to collect so fine an army again, and never recovered from the exhaustion of the Gettysburg campaign. Lee moved slowly back to his old position on the Rapidan, where he and Meade held each other in check until the following spring. Many in the north were inclined to believe that Lee's former successes had been due to Stonewall Jackson's ability, and that he had lost his prestige upon the death of that brave commander. But the campaign of 1864 was to prove the contrary.

Battle of Gettysburg.

The Vicksburg campaign.

282. On the next day after the battle of Gettysburg, General Grant gained a decisive victory on the Mississippi. Having failed in several attempts to take Vicksburg from the north, he now determined to transfer his army to the south side of this strongly

fortified place. To do this it was necessary to cross the river, march down its west bank, cross again below Vicksburg, and march up the east bank, while the fleet, which had run past the batteries of Vicksburg after the capture of New Orleans, would have to pass them again in order to transport the army over the river and protect the crossing. This plan was carried out in April. Commodore Porter performed his task successfully under a heavy fire, and on the 29th of April opened a cannonade upon Grand Gulf, at the mouth of the Big Black river, where it had been determined to attempt a crossing. The confederate batteries here proving too strong, the fleet ran past them, also, and the crossing was made at Bruinsburg, a few miles below. Grant now pushed rapidly forward. The confederates were beaten at Port Gibson, and compelled to evacuate Grand Gulf. McPherson and Sherman captured Jackson, the capital of Mississippi, and a place of great military importance on account of its railway connections. The union army then turned, fell upon the confederate general, Pemberton, who had marched out of Vicksburg to unite with Johnston, defeated him at Champion Hills (May 16), and at the crossing of the Black river (May 17), and at last shut him up in Vicksburg. After a siege of forty-five days Pemberton surrendered, and the great confederate stronghold of the west, with 27,000 prisoners, fell into the hands of the victorious Federals. Port Hudson, under siege at the same time, could no longer hold out, and the Mississippi, as President Lincoln said, "ran unvexed to the sea." This was the heaviest blow that the confederacy had as yet received; its whole western zone was now virtually conquered, and it became possible to concentrate greater union forces against its middle and eastern zones. The news of Gettysburg and Vicksburg made the Fourth of July, 1863, a day of rejoicing in the north, and of mourning in thousands of bereaved homes.

Jackson.

Champion Hills and Black River

Capture of Vicksburg

283. The Vicksburg campaign marked the decline of the confederate fortunes in the west, as the Gettysburg campaign did in the east. In the meantime the people had learned to give a more careful attention to the welfare of the soldiers who were bearing the brunt of the conflict. The Sanitary Commission, the Christian Commission, and other voluntary associations, had been organized, and were doing a grand work for the moral and physical needs of the men in the field; and this care was not confined solely to northern troops, but was often extended to the confederates as well. The expenses of the National government for prosecuting the war now amounted to \$2,000,000 per day on an average, and notwithstanding the heavy taxation imposed upon the country the debt had increased to \$500,000,000 by June, 1862; during 1863 it was double that amount; by June, 1864, it had grown to \$1,700,000,000; and at the end of August, 1865, it attained its maximum, \$2,845,907,626. But the best of care and judgment was exercised in the use of these vast expenditures. The army was constantly supplied with improved weapons and munitions of war; the blockading fleets were kept in perfect order, and everything was done to insure the success of the union arms.

The Sanitary and Christian Commissions.

Government expenses.

284. As early as April, 1862, the confederate Congress had passed a conscription act, enrolling in the army all adult white males below a certain age, but as the war went on the demand for men became continually greater and the conscription was made more sweeping. Toward the end of the war every white man between the ages of seventeen and fifty-five was held liable to military service, and in practice the only limit was physical incapacity. The federal government also was compelled to take almost a similar course. In March, 1863, Congress passed an act for the enrollment of all able-bodied male citizens between the ages of eighteen and forty-five, and the president was authorized to make drafts for military service,

Conscription.

those between twenty and thirty-five to be first called upon. Under this law a call for 300,000 troops was made in May. As the full number was not made up by volunteering a draft was ordered to supply the deficiency. The first attempts to carry it out resulted in forcible resistance in many places, the most notable being the "draft riots" in New York city in July, just after the battle of Gettysburg. These riots lasted four days in that city. During this time New York was in the hands of a lawless mob, many shocking murders were committed and \$2,000,000 worth of property was destroyed. All opposition was at length put down, but exemptions and substitute purchases were freely permitted, and the states endeavored to fill their respective quotas as far as possible by offering bounties as a stimulus to volunteering.

Draft riots.

Chatanooga.

Chickamauga.

285. After his renowned victory near Murfreesboro, Rosecrans remained quiet for a period, preparing for a new campaign. Late in June he began a series of skillful movements against Bragg which compelled the confederate general to fall back upon Chattanooga. Early in September Rosecrans forced him to evacuate the place by threatening his communications. The union general followed him across the Tennessee river and was thus beyond the strong position of Chattanooga. General Bragg, having been heavily reinforced from Virginia, turned at Chickamauga creek to give battle. A severe engagement was fought (September 17-20, 1863) in which Longstreet routed the right of the union forces, but the wonderful skill and bravery of General Thomas, who commanded the left wing, saved the federal army and secured its retreat to Chattanooga. Bragg having gained possession of the mountains around the place cut off almost all avenues of further retreat and laid siege to Chattanooga. The government at Washington had committed the mistake of dividing the union forces, for while Rosecrans was left to face an army greatly superior in numbers, under General Bragg, General Burnside was sent into east Tennessee with an independent command. Bragg was now so sure of Rosecrans' defeat that he dispatched Longstreet with a part of his army to attack Burnside at Knoxville. In October Rosecrans was superseded by Thomas, and Grant was put in command of all the western armies. He was joined at Chattanooga by two corps under Hooker from the Potomac. General Sherman came up from Vicksburg with a greater part of the army of the Tennessee. Bragg's positions on Lookout Mountain and Missionary Ridge were now assaulted. The former was successfully stormed by Hooker (November 24), part of the fighting taking place amidst a thick mist which covered the summit, hence this has been called the "battle above the clouds." On the next day Missionary Ridge was carried by the main army, Hooker on the right, Thomas in the center and Sherman on the left. Bragg was driven from all his positions back to Dalton and was soon afterward superseded by General J. E. Johnston. Longstreet raised the siege of Knoxville and retreated across the mountains into Virginia to join Lee.

Lookout Mountain and Missionary Ridge.

Charleston.

Confederate cruisers

286. Many attempts had been made to reduce Charleston, South Carolina, the strongest, as well as the most important of the southern seaports, but without success. At length Fort Wagner was taken (September 7) after a tremendous bombardment by the Federal fleet and Gillmore's batteries; Fort Sumter, also, was reduced to ruins. The blockading vessels were thus enabled to enter the harbor, and the port of Charleston was entirely closed. Taking advantage of every loophole in the British foreign enlistment act, the confederate authorities had succeeded in fitting out several formidable cruisers, which, in the course of the year 1863, did immense damage to American commerce. Whenever they were closely pursued by United States vessels they took refuge in neutral ports, and then put out to sea again upon the first favorable opportunity. The most

active ones were the *Florida*, the *Alabama* and the *Georgia*. The *Florida*, built at Liverpool, after having captured twenty-one vessels, was seized in the harbor of Bohia, Brazil (October, 1864). The *Georgia*, built at Glasgow, put to sea in April, but was captured after a short cruise by the United States frigate *Niagara*. The most important of the confederate cruisers was the *Alabama*. She was built at Liverpool for the confederate captain, Semmes. The British government was urged by the American minister, Mr. Adams, to enforce its own laws, and prevent her going to sea; yet she was allowed to set sail in July. After destroying more than sixty vessels, she was met by the United States steamer *Kearsage*, commanded by Captain Winslow, off Cherbourg (June 19, 1864), and after an hour's action the *Alabama* was sunk.

The Kearsage and Alabama.

287. At the beginning of 1864, several detached operations were carried on which, though attracting much attention at the time, had but little direct bearing upon the closing campaigns of the war. General Sherman made his raid nearly across the state of Mississippi, destroying railroads, bridges and supplies. General Seymour, leading a union expedition into Florida, was defeated. General Banks was sent up the Red river to attack Shreveport, and bring away cotton. The expedition ended in failure and disaster. General Rosecrans was appointed to command in Missouri. He succeeded in repelling an invasion by Price, who was finally driven from the state. General Forrest, with a confederate force made a raid into Tennessee and Kentucky, and captured Fort Pillow (April 12), where a number of negro troops were massacred.

Minor operations.

288. The success of Grant in the west had made him the chief figure in the war. In March, 1864, he superseded Halleck as commander-in-chief, with the rank of lieutenant-general. He at once took personal direction of the campaign against Richmond, while retaining Meade in immediate command. The army of the Potomac was re-organized in three corps, under Hancock, Warren and Sedgwick, to which was soon added another under Burnside, while General Philip Sheridan was called from the west, and appointed to the command of all the cavalry in the eastern army. Lee's forces, which comprised the flower of the southern troops, had otherwise been divided into three corps, under Generals A. P. Hill, Ewell and Longstreet. Sherman had been left in command of the three western armies of the Ohio, the Cumberland, and the Tennessee, and he was to oppose Johnston at Dalton. According to arrangement, a simultaneous advance was made in Georgia and Virginia, early in May. The army of the Potomac, numbering about 125,000 men (nearly twice as many as Lee's), crossed the Rapidan and entered the "Wilderness" on the other side. It was Grant's object to push through this difficult country as rapidly as possible and get between Lee's army and Richmond. In pursuing the direct route through Fredericksburg to Richmond, the union army encountered a series of strong defensive positions, of which Lee availed himself with consummate skill. The battles began on the 5th, and continued until the 12th without interruption, both sides fighting with the utmost bravery and suffering severely. Lee was steadily forced back, and on the 9th Grant was clear of the Wilderness with his forces concentrated near Spottsylvania court-house. Here there was furious and obstinate fighting for ten days, with scarcely any intermission. Then followed the battles of North Anna and Cold Harbor in which the union losses were terrible. Having now reached the Chickahominy, and finding it impossible to break through Lee's lines of defense, Grant crossed the river, and moving far to the right of his adversary, transferred his army beyond the James to assail Richmond from the south. This involved the reduction of the strongly-fortified town of Petersburg, on the Appomattox, practically a part of Petersburg.

Grant in the east.

Sherman.

The Wilderness

Petersburg.

the defenses of Richmond, from which it was twenty miles distant. It also brought the Federal lines into dangerous proximity to Lee's railroad communications with the south. At this point, therefore, the confederate commander stationed the best part of his troops, and stubbornly resisted all Grant's efforts to extend his lines further to the southwest or to reach the railroads.

289. A long siege of Richmond and Petersburg was now begun early in June, but neither army remained inactive. In July, Lee sent Early into the Shenandoah valley, with a corps strong enough to menace Washington, hoping that Grant might be induced to call off troops from Petersburg. The chief result of Early's movement was the burning of Chambersburg, and the capture of a quantity of supplies. Grant put Sheridan in command of the valley, who defeated Gen. Early at Winchester (September 19), and at Fisher's Hill two days later, after which he destroyed all the rich crops in the valley and carried off the cattle, so that the confederates might not be tempted to repeat the raid. But Early, having obtained fresh troops, suddenly fell upon the federals at Cedar Creek (October 19), driving them back in great confusion. Sheridan was absent when the battle was fought, but, getting intelligence of it, he rode rapidly up the valley, rallied his men, who were, however, being enheartened by their respective commanders, and scattered Early's forces, which never met Sheridan again as a compact army during the remainder of the war.

Meanwhile, Grant had succeeded in getting possession of a few miles of the Weldon railroad, upon which Lee depended for transportation, but the confederate general brought his supplies in wagons round that portion held by the federals. The two armies now remained in comparatively the same position until the following spring.

290. The western campaign in 1864 began at the same time as Grant's movement in Virginia. Sherman advanced from Chattanooga with 100,000 men under Thomas, McPherson, and Schofield, against Johnston's force of 75,000. The objective point of the campaign was the capture of Atlanta, Georgia, a very strongly fortified place about one hundred miles south of Chattanooga, and the chief manufactory of the confederate military supplies. Johnston, with his weaker force, dared not risk a regular battle, but he made the best use of the various defensive positions which the rough and mountainous country afforded. By a series of masterly flank movements Sherman compelled him to evacuate one position after another. Severe battles were fought at Resaca (May 15), Dallas (May 25), Lost Mountain (June 14), and Kenesaw Mountain (June 27). By the 10th of July Johnston was entrenched behind the defenses of Atlanta, and the two armies were facing each other with the Chattahoochee river between them. Johnston's retreat had been conducted with great skill, but he was now superseded by Hood (July 17), who was known as a "fighting general." Hood at once proceeded to carry out the active policy of the confederate government, and assumed the offensive. Before the end of the month he had made three furious assaults on the union lines and was repulsed in every one of them. The federals, however, sustained a heavy loss in the death of General McPherson. At length, by fine maneuvering, Sherman succeeded in gaining the rear of Atlanta, and cutting the supply railroads. This obliged the confederates to retreat in all haste, and on the 2d of September, Sherman was able to telegraph to Washington that Atlanta was won.

291. Hood, by the direct command of Davis, now made a fatal mistake, which materially hastened the downfall of the confederacy. He moved northward by Tusculum and Florence into middle Tennessee, thinking that Sherman would follow him in order to defend that state. But Sherman was no more to be controlled by this device than Grant had been by Early's

raid into the Shenandoah. He divided his army, sending back part of it under Thomas to take care of Hood, while he himself prepared to continue his advance through Georgia. Hood, moving northward toward Nashville, was met and defeated at Franklin (November 30), with heavy loss, by Schofield. The confederate general arrived at Nashville with about 44,000 men. The union forces awaited him there behind the fortifications. Thomas, having completed his preparations, suddenly moved out of his works and fell upon the confederate lines (December 15). The battle lasted two days and ended in the utter rout and demoralization of Hood's forces. Thus one of the two great armies of the confederacy was scattered, never again to be united. Of all the battles fought in the course of the war, this was the most complete victory.

292. While these things were going on, the presidential election of 1864 took place. Some of the more radical men, dissatisfied with what they called Mr. Lincoln's timid and irresolute policy, met in convention (May 31) at Cleveland, Ohio, and nominated John C. Fremont for the presidency. Mr. Lincoln and Andrew Johnson were nominated (June 7) for president and vice-president by the Republican National Convention at Baltimore. The Democratic National Convention declared in its platform that the inability of the federal government to restore the union by war was demonstrated by four years of failure; that the constitution had been violated in all its parts under the plea of military necessity; and that a cessation of hostilities ought to be obtained. It nominated George B. McClellan and George H. Pendleton as president and vice-president. This declaration of the peace Democracy that the war was a failure, when all things were now pointing toward the final success of the north, caused many doubtful votes to be cast for the Republican candidates, and assured their election. When the electoral votes were counted, Lincoln and Johnson had received 212, McClellan and Pendleton 21.

293. Sherman had burned Atlanta, destroyed the railroads and telegraphs in his rear, sent back the sick and wounded, and much of the baggage, and set out (November 14) on his "famous march through Georgia." His army, 65,000 strong, was spread out over a breadth of forty miles, subsisting mainly on the produce of the country. For a month scarcely anything was heard of him at the north, when he suddenly turned up at Savannah, Ga. He had met with but little opposition on his route. The confederates had numerous bodies of troops which might have been concentrated to oppose his march, but he had threatened so many points and kept the enemy in so much doubt as to his objects that they could not tell for which point he was making. On December 13 Fort McAllister was taken by assault, and on the 20th Savannah was evacuated by the confederates, Sherman sending the news of the capture to president Lincoln as a "Christmas gift." He also sent word that the confederacy was nothing but a shell, and that he was ready with his victorious army to march northward.

294. The only important ports, except Galveston, which remained open to the confederacy in the summer of 1864, were Mobile in Alabama, and Wilmington, in North Carolina. The forts commanding the entrance to Mobile Bay were captured (August 5) and the port was closed. On January 16, 1865, Wilmington, North Carolina, was taken by a combined land and naval force, under General Terry and Commodore Porter. On the day before this event, Sherman had begun his northward march, passing through Columbia, to Fayetteville, North Carolina. This movement had forced the evacuation of Charleston and other coast cities, and their garrisons had been concentrated under Johnston as a last hope. The military support of the confederacy now rested on the army which Lee commanded within the intrenchments of Richmond and Petersburg, and on the remnant of the western forces with which

Johnston was trying to check Sherman's advance. Some sharp fighting took place north of Fayetteville, but Goldsborough was reached March 21, and Johnston retreated to Raleigh. Sherman pushed on after him, but events in Virginia were fast rendering a contest in North Carolina unnecessary. While the union army occupied Goldsborough, Sherman took a steamer on the coast and hurriedly visited the James river, where he met the president, General Grant and General Meade, and arranged with them the plan of operations for the future. During Sherman's march through North Carolina, Sheridan had led a column of cavalry up the Shenandoah valley to destroy Lee's communications in the rear of Richmond. He passed along the James river, doing great damage to the canal and railroads, and joined the main army in front of Petersburg just as Sherman arrived there for his conference with the president and Grant.

Fall of the confederacy.

295. The situation of Lee was now becoming desperate. He determined to abandon Petersburg and Richmond, move by way of Danville, and effect a junction with Johnston. With this purpose he made one desperate attempt to break the center of the union lines at Fort Steadman, intending under cover of the attack to withdraw his force. The effort failed, and Lee was repulsed with heavy loss. Grant resumed his attempts to push his lines further round to the south of Petersburg. Sheridan was put in command of the extreme left. Here he attacked Lee's right at Five Forks (April 1), destroyed the Southside railroad, and maintained his position. To avoid being outflanked Lee was compelled to lengthen out his line, already too thin. The next morning (April 2) Grant made a general assault, and carried his army within the lines of the Petersburg defences. Lee retreated, with the intention of bringing his forces and Johnston's together for a final stand, while the advance guard of the union army entered Richmond. The confederate authorities hastened to escape to Danville, having first set fire to the shipping, tobacco warehouses, etc., at Richmond. No time was lost in celebrations of the victory. Grant pressed on in the pursuit of Lee with all vigor. He had so disposed the federal army that the escape of the confederates was almost impossible. The confederate forces were headed off at Appomattox Court House, where Lee surrendered (April 9, 1865). The terms of surrender offered by Grant were very generous; all private property belonging to officers and soldiers was to be retained, the men were even allowed to keep their horses, "because," Grant said, "they would need them for the work on their farms." Officers and men were at once set free on parole, with the understanding that so long as they did not violate their parole, nor break the laws, they would not be disturbed by the federal government.

Richmond.

Surrender of Lee.

Surrender of Johnston.

296. Sherman had begun his final operations against Johnston when the news arrived of the surrender of Lee. Johnston thereupon capitulated (April 26) on much the same terms that had been accorded to the confederate army in Virginia, after an unsuccessful effort at a more favorable settlement. All the other confederate forces in the field also surrendered, and the great civil war came to an end. The news was received with an outburst of joy at the north. Mr. Lincoln had begun his second term on March 4, 1865. At that time the end of the struggle was plainly near, and the president in his inaugural address had already expressed the hope that there would be a reconciliation between the two sections. He said: "With malice toward none, with charity for all, with firmness in the right as God gives us to see the right, let us strive to finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the battle, and for his widow and for his orphans; to do all which may achieve and cherish a just and a lasting peace among ourselves and with all nations."

297. The public rejoicings over the capture of Richmond were clouded by the death of the wise and noble Lincoln. He had gone to Ford's theater on the evening of April 14, and was sitting in his box, when an actor named J. Wilkes Booth entered unperceived and shot the president through the head, crying: "The south is avenged. *Sic semper tyrannis.*" Almost at the same time one of Booth's accomplices named Payne attempted to assassinate Secretary Seward, who was ill at home, and wounded him seriously but not fatally. There had been a plot on the part of some desperate characters when the confederacy fell, to destroy the leaders of the federal government, but their plans were accomplished in part only. The chief parties implicated perished miserably. Booth and Payne escaped for a time, but were soon caught. Booth was killed while resisting arrest. Payne and three others were hanged, and several persons concerned in the plot were sentenced to imprisonment. The president lingered a few hours, and died without giving any sign of consciousness. His death caused the deepest sorrow, not only in the north, but in the south as well, and throughout all the civilized world. He had won the abiding love and trust of the people, and his name will forever be linked with that of Washington; for he was in many ways the second founder of his country.

Assassination of Lincoln.

Seward

298. Jefferson Davis, while trying to escape, was captured by a detachment of General J. H. Wilson's cavalry at Irwinsville, Georgia, and was sent to Fortress Monroe. Here he was confined a close prisoner for a long time on charge of treason. He was at last liberated on bail furnished by Horace Greeley and others, and all proceedings against him were finally abandoned. In fact, the glorious triumph of the government of the United States was in no wise sullied by any dismal executions for treason. The assassination of Lincoln checked for a time the movement which had already begun for the restoration of the seceding states. People who had been ready in their joy to make peace with those who had been leaders in the confederacy now were ready to believe that the spirit which had brought on the war was unchanged. There was a demand that the laws against treason, passed by Congress during the heat of the war, in 1862, should be rigidly enforced. These laws prescribed that the punishment of treason and rebellion should be death, or fine and imprisonment. But a wiser judgment prevailed. There was no hanging for treason. The leaders of the confederacy were never brought to trial. The president of the confederate states was suffered to go free; and the vice-president, before his death, became an efficient and respected member in the Congress of the United States. For a long time, however, all persons who had previously taken oath of allegiance to the federal government, and then had broken it by joining the confederacy, were debarred from holding any office under the government of the United States.

Jefferson Davis.

299. At the close of the war the federal armies numbered about 1,000,000 men, of whom nearly 600,000 were present in the field. The number of confederate soldiers surrendered and paroled was, 174,000, besides whom there were 63,000 prisoners in the hands of the Federals. The whole number of men who served on the union side during the war was about 1,500,000. Of these, 96,000 were killed, 184,000 died of disease while in the service; many thousands more died of wounds or sickness after being discharged. The armies of the confederacy are supposed to have reached their strongest point at the beginning of 1863, when they numbered about 600,000. There was great dissatisfaction among the southern people at the manner in which Jefferson Davis conducted the war; and the arbitrary attempts of the confederate government to force men into the ranks, aroused, at last, a spirit of opposition. During the latter part of the war desertions had become very frequent; and this fact, taken in connection with the losses

Number of men in the armies.

in battle, and from disease, caused a great reduction in the numerical force, so that at the end of the struggle, it is doubtful whether the confederate armies contained more than 200,000 men. As soon as possible after organized resistance had ceased, the Federal armies began to be disbanded. The men were discharged at the rate of about 300,000 a month, 50,000 being retained in service as a standing army.

300. The expenses of the Federal government amounted at one time to three and a half million dollars a day. By August 31, 1865, the whole debt had reached its maximum, amounting to about \$2,845,907,626. Some \$800,000,000 of revenue had also been spent mainly on the war. Beside the regular outlay by the government enormous sums were spent by states, cities, counties and towns, in bounties to volunteers, and by the sanitary commissions and other societies for the comfort of sick and wounded soldiers, and for the whole army in general. The expenses of the confederate government can never be known. Its debt was estimated at about \$2,000,000,000, but this was wiped out by the failure of the confederacy, all its bonds and notes becoming worthless. The amount of property destroyed by the union and confederate armies can scarcely be estimated, and the money value (\$2,000,000,000,) of the slaves in the south fell a sacrifice to the war. In the United States funds were raised by the sale of bonds, the issue of paper money, of "greenbacks," and the imposition of heavy taxes, including for some years a tax on incomes. The notes became greatly depreciated, so that in July, 1864, the price of gold in paper currency was nearly three dollars. Gold and silver almost disappeared from circulation.

Confederate finances.

301. The finances of the confederacy were in a ruinous condition long before the end of the war. It could make no drafts on the future, by bond issues, and it was a very difficult matter to find purchasers for southern bonds. As expenses increased, they had to be met by paper issues, and each issue was accompanied by a corresponding decline in value, until a dollar in coin was worth fifty dollars in paper. Large sums were required to buy even the most necessary articles. Boots were worth two hundred dollars; shoes, one hundred and twenty-five dollars; coats, three hundred and fifty dollars; pantaloons, more than one hundred dollars; flour, two hundred and seventy dollars per barrel; potatoes, twenty to twenty-five dollars per bushel; bacon, ten dollars per pound; meal, sixty-five to seventy-five dollars per bushel; butter, sixteen dollars per pound. Other things were proportionately high in price; luxuries of all kinds had disappeared, and almost the entire population was reduced to extreme poverty.

VIII.—THE RESTORATION OF THE UNION.

302. At the beginning of the war the greater part of the northern people was opposed to any interference with slavery, and the federal government announced its determination not to meddle with the question. But the progress of the war compelled it to a different course. Hence, first came the Proclamation of Emancipation; then in February, 1865, congress passed the thirteenth amendment to the constitution, abolishing slavery in the United States forever. After the war was over the first wish of those who had been most prominent in putting down the confederacy was that the union should be restored as quickly as possible to its former state, with the exception of slavery. It was to be many years, however, before the warring sections of the union could be transformed into a harmonious nation. The war had devastated the country in which it had been engaged. The people on each side had suffered in the loss of friends, home and property, and could not at once be reconciled. The great change which had taken place in the abolition of slavery

The 13th amendment.

reached to the very foundations of southern society and industry.

303. Upon the death of Mr. Lincoln, Vice-President Johnson succeeded to the office of president, and to the difficult task of the reconstruction of the rebellious states. He had been selected by the republican party as representing the union men of the south. He was not, however, in full sympathy with the Republicans, and it soon became evident that there was a breach between the president and Congress, which constantly widened. The first business engaging the attention of the government after the restoration of peace was the establishments of regular governments in the southern states. The president issued various proclamations, in which he declared all southern ports open to commerce except four in Texas, and granted amnesty and pardon to all persons engaged in the rebellion, except fourteen specific classes of leaders, who were to make special applications for pardon. About the manner of restoring the state governments, however, a serious quarrel arose between the president and Congress. The constitution made no provision for the readmission of a state which had withdrawn from the union, and Mr. Johnson, as a former states-right Democrat, held that the southern states had never been out of the union; that the leaders were solely responsible; that as soon as the seceded states applied for readmission under such a form of government as the constitution required, the federal government was bound to admit them without imposing conditions upon subjects over which the constitution had not expressly given Congress jurisdiction. The Republican leaders held that the action of the seceded states had deprived them of their rights as members of the union; that in the relation they now occupied they were in the category of territories seeking admission to the union, in which case Congress could admit or reject them at will. The particular question which brought on the controversy was the civil status of the negro. The Republicans held that slavery had been the cause of the war; that it was now abolished; and that only by giving the freedman the right to vote could he be protected, and the results of the war secured. They also claimed that no state should be admitted until it had granted the right of suffrage to the negroes within its borders. Johnson held this to be a matter of internal regulation beyond the control of Congress.

Quarrel between the president and Congress.

304. When Johnson succeeded to the presidency in April, 1865, he had a clear field before him, for congress was not to meet until December. From May 9 to July 13 he appointed provisional governors for seven states, whose duties were to reorganize the governments. The state governments were organized, but passed such stringent laws in reference to the negroes that the Republicans declared it was a worse form of slavery than the old. When Congress met in December, 1865, it was very largely Republican and firmly determined to protect the negro against outrage and oppression. The first breach between the president and the party in power was the veto of the first Freedmen's Bureau bill in February, 1866, which was designed for the welfare of the colored people. President Johnson objected that it had been passed by a congress in which the southern states had no representatives. The bill failed to pass by a two-thirds vote. Congress then passed a civil right's bill in March, 1866, by which freedmen were made citizens of the United States, and United States officers were instructed to protect these rights in the courts. The president vetoed this bill also, the objection being that it interfered with the rights of the states. This bill was passed over the veto. To make the bill stronger, Congress adopted the Fourteenth Amendment to the constitution (June 16), and submitted it to the states, the necessary majority of which ratified it. Both houses then passed a joint resolution that no delegation from any of the states

The Fourteenth amendment.

lately in rebellion should be received by either the senate or the house until both united in declaring said state a member of the union.

Admission of Nebraska

305. The president disapproved of these measures, and there was now open hostility between the executive and congress. In February, 1867, a bill was passed admitting Nebraska as a state, with the provision that it should never enact any law denying the right of suffrage to any person because of his color or race. This was vetoed, and passed over the veto. On March 2, 1867, the "bill to provide efficient governments for the insurrectionary states," which embodied the congressional plan of reconstruction, was passed over the president's veto. This bill divided the southern states into military districts, each under a brigadier-general, who was to preserve order and exercise all the functions of government until the citizens had formed a state government, ratified the amendments, and been admitted to the union. On the same day the Tenure of Office bill was passed over the veto. This provided that civil officers should remain in office until the confirmation of their successors; that the members of the cabinet should be removed only with the consent of the senate; that, while Congress was not in session the president might *suspend* (not remove) any official; and in case the senate at the next session should not ratify the suspension, the suspended official should resume his office.

Tenure of Office bill

Impeachment of the president

306. On August 5, 1867, the president had requested Edwin M. Stanton to resign his office as secretary of war. Mr. Stanton refused, was suspended, and General Grant was appointed to his place. When congress met, the senate refused to agree to Stanton's removal. General Grant then resigned the office, and Stanton again took possession. The president removed him a second time, and appointed General Lorenzo Thomas to the place. Stanton held to his office, and sent notice to the speaker of the house; thereupon the house passed a resolution (February 24, 1868), for the impeachment of the president. The articles of impeachment accused him of disobeying the tenure of office law, and of various other offences. The trial took place according to the constitution, members of the house appearing as accusers, and the senate acting as judges, with Chief Justice Chase, of the supreme court, in the chair. After the trial began the president made a tour of the north and west, and delivered many violent and passionate speeches to the crowds which assembled to meet him, and denounced the congress then sitting as "no congress," because of its refusal to admit delegations from the southern states. On these speeches the house based additional articles of impeachment. The exciting trial lasted two months, and ended in May with a vote of thirty-five for conviction, and nineteen for acquittal. Thus there was not a two-thirds majority for conviction. The senate adjourned *sine die*, and a verdict of acquittal was entered.

Alaska.

307. The Russian possessions in North America, comprising a large and thinly populated territory at the northwest corner of the continent, were purchased of the Russian government by the United States in 1867 for the sum of \$7,200,000. This territory is known as Alaska. Nevada, the thirty-sixth state, was admitted during Mr. Lincoln's administration (1864); Nebraska, the thirty-seventh, was admitted in 1867. In 1868 General Grant was elected president, as the candidate of the Republican party, thus sealing the process of the reconstruction; Schuyler Colfax became vice-president. The Democratic candidates were Horatio Seymour, of New York, and Frank P. Blair, of Missouri. Virginia, Mississippi and Texas were the only states of the late confederacy which were excluded from this election; all the rest had been reconstructed and admitted by Congress in June, 1868. The Republican candidates carried twenty-six of the thirty-four voting states. In his inaugural address, General Grant declared that the

Grant's election

government bonds ought to be paid in gold, advocated a speedy return to specie payments, and made many important recommendations in reference to public affairs. Regarding the good faith of the nation, he said: "To protect the national honor, every dollar of the government's indebtedness should be paid in gold, unless otherwise expressly stipulated in the contract." Congress acted promptly upon his recommendation, and on March 18, 1869, an act was passed, entitled "An Act to strengthen the public credit." Its language gave a pledge to the world that the debts of the country would be paid in coin, unless there were in the obligations express stipulations to the contrary.

Act to strengthen the public credit.

308. On February 26, 1869, the Fifteenth Amendment to the constitution was passed by Congress. Its adoption had been previously recommended by Grant. It guaranteed the right of suffrage without regard to race, color, or previous condition of servitude. It was ratified by the requisite three-fourths of the states, and declared in force March 30, 1870. In the meantime the foreign affairs of the country had been favorably established. Its promptness in disarming at the end of the war had put it under no disadvantage in dealing with other nations. The successful completion of the Atlantic cable (1866) gave a promptness and dispatch to diplomacy which was well suited to American methods. The most important measure of foreign policy during President Grant's administration was the treaty with Great Britain (May 8, 1871), known as the Treaty of Washington. Soon after entering upon his office, the president had begun negotiations, looking to a settlement of the claims made by the United States against Great Britain, arising from the depredations upon American commerce by confederate cruisers fitted out in British ports, the questions growing out of the Canadian fishery disputes, and the location of our northern boundary line at its junction with the Pacific ocean, which the jurisdiction of the island of San Juan in controversy.

The XVth amendment

Treaty of Washington.

309. A high joint commission had assembled at Washington, composed of American and English statesmen, which formulated the Treaty of Washington, and by its terms the claims against Great Britain, commonly known as the "Alabama claims," were referred to a court of arbitration, which held its session at Geneva, Switzerland. In September, 1872, it awarded the United States the sum of \$15,500,000, which was subsequently paid by the British government. The fishery question was referred to arbitration by three commissioners, one to be chosen by the United States, one by Great Britain, and the third by the other two, provided they should make a choice within a stated time, otherwise the selection to be made by the Emperor of Austria. The two commissioners having failed to agree, the third was named by the Emperor of Austria. The award was unsatisfactory to the United States. The decision of the commission was severely criticised by the people and the press, and the dispute has been reopened since from time to time, to the detriment of both countries. The San Juan question was referred to the Emperor of Germany as arbitrator with sole power. His award fully sustained the claim of the United States.

San Juan.

310. President Grant's first administration had been vigorous and progressive, but a number of Republicans had become estranged, feeling that they were being ignored by the executive. These persons formed themselves into an organization under the name of Liberal Republicans. This opposition resulted in the nomination of Horace Greeley for president, and B. Gratz Brown for vice-president, by the Liberal party (1872). These nominations were afterwards adopted by the Democratic party. The republican convention renominated President Grant, with Henry Wilson as nominee for vice-president. When the election took place Grant carried thirty-one states with a popular vote of 3,597,070, the largest that had ever been given for any

Liberal Republicans.

Re-election of Grant.

president. He received 286 electoral votes, against 66 which would have been cast for Mr. Greeley had he lived. The noted journalist, however, died soon after the election. The canvass had been one of the most exciting and aggressive in the history of the country, and abounded in personal attacks on the candidates. During President Grant's first term of office the work of reconstruction according to the plan settled by Congress had been steadily carried out, and by July, 1870, the work had been accomplished, and all the states were again members of the union, although the votes of Arkansas and Louisiana were not received by Congress in 1872, because of fraud and illegality in the election.

Relations with Spain.

311 The relations between the United States and Spain were frequently disturbed by incidents growing out of an insurrection in Cuba, which had lasted for a number of years. Several American citizens had been arrested by the Spanish authorities, under the pretense that they had been furnishing aid to the insurgents, and American vessels plying in Cuban waters had been subjected to much inconvenience. Matters at length culminated in the seizure by Spain (October, 1873), without justification, of the American steamer *Virginius*. This outrage created intense excitement in the United States, and many statesmen were clamorous for war; but the president took more pacific measures, and, by acting with promptness and firmness, soon wrung from Spain ample apology and full separation. Political troubles were still rife in certain states of the south. In March, 1871, the disorders in the southern states, growing out of the conflicts between the whites and the negroes, had assumed such proportions that the president sent a special message to Congress requesting "such legislation as shall effectually secure life, liberty and property, and the enforcement of law in all parts of the United States." On April 20 Congress passed an act which authorized the president to suspend, under defined circumstances, the writ of habeas corpus in any district, and to use the army and navy in suppressing insurrections. He issued a proclamation (May 4), ordering all unlawful armed bands to disperse, and after expressing his reluctance to use the extraordinary power conferred upon him, said he would "not hesitate to use that power to its full extent, whenever and wherever it should be necessary to do so for the purpose of securing to all citizens the peaceful enjoyment of the rights guaranteed to them by the constitution and the laws of the United States." As this did not produce the desired effect, he issued a proclamation of warning (October 12), and on October 17 suspended the writ of habeas corpus in parts of North and South Carolina. He followed this by vigorous prosecutions, which resulted in sending a number of prominent offenders to prison, and the outrages soon ceased.

Case of the *Virginius*.

Political troubles in the south.

312. Soon after President Grant entered upon his second term of office, the disputes in Louisiana concerning the result of the election in 1872 became more bitter, and armed violence was threatened in that state. Early in 1873 the president called the attention of Congress to the inadequacy of the laws applying to such cases, saying that he had recognized the officers installed by the decision of the returning-board as representing the *de facto* government, and if he had exercised undue interference by such a course he urged Congress to an immediate decision in regard to the matter. Congress, however, took no action, and left with the president the sole responsibility of dealing with this delicate question. The next year the difficulty was renewed and a fierce contest arose between the Republicans under Kellogg, and the Democrats under McEnery, the respective candidates of the two parties for the governorship, which resulted in armed hostilities. Kellogg, the *de facto* governor, called upon the federal government for protection, which it immediately granted by sending troops thither, and the outbreak

was for a time suppressed. But troubles again arose, and General Sheridan was sent to report upon the situation of affairs, and if necessary, to take command of the troops and adopt vigorous measures to preserve the peace. Sheridan became convinced that his duty was to sustain the government of Kellogg, and on the demand of the governor he ejected some of McEnery's adherents from the state capitol. As Congress still omitted to take any action in the case, the president continued his recognition of the government, of which Kellogg was the head, until the election of a new governor. After this there was no serious trouble. Difficulties of the same nature arose in Arkansas and Texas, which were almost as perplexing to the executive as those in Louisiana; but these attracted less attention from the people.

313. In April, 1874, Congress passed a bill known as the "Inflation bill," which increased the paper currency of the country, and was contrary to the financial policy which the president had maintained and advocated in his state papers. Strenuous efforts were made by his warmest political supporters to convince him that the measure was financially wise and politically expedient. President Grant gave much thought and study to the question, and at length fully decided that the measure would in the end prove injurious to the true business interests of the country, and delay the resumption of specie payment. He, therefore, returned the bill to Congress with his veto (April 22). The arguments contained in his message were unanswerable, the bill was not passed over his veto, and his course was sustained by the whole country. The president now earnestly advocated the resumption of specie payment. In a letter addressed to Senator Jones, of Nevada, he gave a full statement of his views on the question. This letter was made public, and attracted much attention; and in January, 1875, the resumption act was passed, which to a large extent embodied the views that had been suggested by the president. There were doubts in the minds of many as to the ability of the government to carry it into effect; but it proved entirely successful, and the country was finally relieved from the stigma of circulating an irredeemable paper currency.

The Inflation bill.

The resumption act.

314. Great trouble was caused soon after the close of the war by the depredations of the Indian tribes of the west and southwest. The Sioux and Cheyennes having begun hostilities, an expedition was sent out against them under the direction of General Hancock in 1867, and another, in 1868, beyond the Arkansas river, where General Custer gained an important victory. In an expedition against the Modocs of Oregon, in 1873, General Canby was treacherously murdered during a parley with the Indian chiefs. The Sioux had ceded to the United States a large tract of country in what was then Dakota territory, reserving to themselves the district known as the Black Hills. When it was rumored that gold had been found on their reservation, the whites began to push into this region, regardless of the rights of the Indians. The Sioux were a warlike tribe, and they retaliated by attacking the frontier settlements in Montana and Wyoming. United States troops were sent out against them, but met at first with a terrible disaster. In June, 1876, General Custer, with about two hundred and fifty soldiers, was surprised and the entire force massacred. The war lasted into the winter of 1877 when the Sioux, with their chiefs, Sitting Bull and Crazy Horse, went across the border into British territory.

The Custer massacre.

315. During 1875, the president had reason to suspect that frauds were being practiced by government officials in certain states, in collecting the revenue derived from the manufacture of whiskey. He at once took active measures for their detection, and the vigorous pursuit and punishment of the offenders. He issued a stringer order for their prosecution, closing with the famous

Whiskey frauds.

words, "Let no guilty man escape." Many indictments soon followed; the ringleaders were sent to the penitentiary, and an honest collection of the revenue was secured. The year for nominating a president was at hand, and the excitement ran high. Friends of the convicted, political enemies and rivals for succession in his own party, resorted to the most desperate means to break the president's power and diminish his popularity. The grossest misrepresentations were practiced, first in trying to bring into question the honesty of his purpose in the prosecution of offenders, and afterward in endeavoring to rob him of the credit of his labors, which had resulted in the purifying of the revenue service. But these efforts signally failed. In 1876 the United States celebrated the one hundredth anniversary of the Declaration of Independence. There were great rejoicings throughout the country, and the various battles of the revolution, as well as the signing of the Declaration, were commemorated by appropriate exercises. The centennial year was chosen for holding a great international exhibition at Philadelphia, to which all the nations of the world were invited to contribute. It was opened in May and closed in November, having been visited by about ten millions of people.

The centenary of independence.

316. The changes at the south, and the dissatisfaction of many at the north with the rule of the Republican managers, were seen in the election of 1876. The Democrats nominated Samuel J. Tilden and Thomas A. Hendricks for president and vice-president; and the Republicans, Rutherford B. Hayes and William A. Wheeler. A national Greenback convention was also held, May 17, composed of men who desired national paper money instead of national bank notes, and who opposed resumption of specie payments. It nominated Peter Cooper and Samuel F. Cary. The contest was very close, and a dispute arose as to the counting of the votes of certain southern states, both sides claiming them. The controversy was finally settled by the appointment of an electoral commission of fifteen, eight of which decided in favor of Mr. Hayes. In this year, Colorado, the thirty-eighth state (and the last up to 1887) was admitted in time to take part in the election.

Election of 1876.

317. The administration of President Hayes, although much attacked by the politicians of both parties, was on the whole, very satisfactory to the people at large. By withdrawing the federal troops from southern state houses, and restoring to the people of those states practical self-government, it prepared the way for that patriotism among those lately estranged from the union, that fraternal feeling between the two sections of the country, and the wonderful material advancement of the south which we now witness. It conducted with wisdom and firmness the preparation for the resumption of specie payments, as well as the funding of the public debt at lower rates of interest, and thus facilitated the development of the remarkable business prosperity which continued to its close. While in its endeavors to effect a thorough and permanent reform of the civil service, there were conspicuous lapses and inconsistencies, it accomplished important and lasting results. Not only without any appropriations of money, and without encouragement of any kind from Congress, but in the face of the decided hostility of a large majority of its members, the system of competitive examinations was employed in some of the executive departments at Washington, and in some of the great government offices in New York, thus proving its practicability and usefulness. The removal by President Hayes of some of the most powerful party managers from their offices, avowedly on the ground that the offices had been used as part of the political machinery, was an act of high courage, and during his administration there was far less meddling with party politics on the part of the government officials than at any period since Andrew Jackson's time.

The Hayes administration.

318. The financial condition of the United States had been steadily improving since the war. A few months after the conclusion of peace the public debt had reached its highest amount, \$2,800,000,000, and by the close of President Hayes' administration no less than one thousand million dollars of that amount had been paid off. The credit of the government rose, and the paper money, once worth only a third of its denomination in gold, increased in value. The operation of refunding the debt had been begun July 14, 1870. At that time Congress passed an act authorizing the issue of five, four and a half, and four per cent bonds to take the place of those at higher interest. \$500,000,000 were issued in five per cent bonds, \$185,000,000 in four and one half per cent, and \$710,345,950 at four per cent, thus reducing the annual interest charge from \$81,639,684 to \$61,738,838. This first refunding operation was completed in the year 1879, at the time when specie payments were resumed. In 1881 about \$200,000,000 of six per cent bonds fell due. Mr. Windom, secretary of the treasury, took the responsibility of allowing the holders of the bonds to exchange them for three and one-half per cent bonds, redeemable at the pleasure of the government. Holders of other bonds to the amount of \$300,000,000 also availed themselves of this privilege, thus saving \$10,000,000 interest. In 1875 Congress passed a law providing that the paper "fractional currency" used for small change should be redeemed at once in silver, and that after the 1st of January, 1879, the "greenbacks" should be paid on demand in coin.

Financial condition. Refunding the debt.

319. At the elections of 1880 the Republican candidates were General James A. Garfield for president, and General Chester A. Arthur for vice-president; while the Democrats nominated General Winfield S. Hancock and William E. English. The Republican ticket was successful, receiving the electoral votes (214 in number) of all the northern states except California—which was divided—Nevada and New Jersey. The Democratic electoral vote was 155 including 11 from Georgia, which, not having been cast on the day appointed by law, were objected to when the returns were opened. As they could not effect the result the question whether they should be counted or not was never decided. The new administration was inaugurated March 4, 1881, and the scramble for office which had marked each advent to the presidency since 1829, followed. There was bitter dissension in the party in New York over the distribution of offices. The New York senators, feeling aggrieved at certain appointments in their state, resigned, and then made efforts to be re-elected by their state legislature, in which they failed. In the midst of it all President Garfield was shot (July 2, 1881) by a crazy disappointed office-seeker. The avowed object was to promote to the presidential chair Vice-President Arthur, who represented the Grant or "stalwart" wing of the party. The president was not instantly killed. For three months he lay helpless, while the nation watched anxiously every turn in his condition. The sympathy shown by all parts of the country did much to draw the nation together and to lessen the old distrust. Garfield died September 19, 1881, and was succeeded by Vice-President Arthur.

Election of 1880.

Garfield's assassination.

320. The prominent events of President Arthur's administration may be here summarized. Shortly after his accession to the presidency he participated in the dedication of the monument erected at Yorktown, Va., to commemorate the surrender of Lord Cornwallis at that place, Oct. 19, 1781. A convention was made with Mexico (July 29, 1882) for re-locating the boundary between that country and the United States from the Rio Grande to the Pacific, and on the same day an agreement was also effected permitting the armed forces of either country to cross the frontier in pursuit of hostile Indians. The death of President Garfield called

Arthur's administration.

general attention to that reprehensible system under which each party, while in office, had paid its party expenses by the use of minor offices for its adherents. The president's power of appointment could not be controlled; but the Pendleton Act (1883) permitted the president to make appointments to designated classes of offices on the recommendation of a board of civil service commissioners. From the British government a full recognition of the rights and immunities of naturalized American citizens of Irish origin was obtained, and all such who were under arrest in England or Ireland as suspects were liberated. A bill passed by Congress prohibiting the immigration of Chinese laborers for a term of twenty years was vetoed (April 4, 1882), as being a violation of the treaty of 1880 with China, which permitted the limitation or suspension of immigration, but forbade its absolute prohibition. The veto was sustained, and a modified bill, suspending immigration for ten years, was passed, May 6, 1882, which received the executive approval. A law was passed (August 3, 1882) for returning convicts to Europe, and on February 26, 1885, importation of contract laborers was forbidden.

321. The suspension of the coinage of standard silver dollars and the redemption of the trade dollars were repeatedly recommended; also, the repeal of the stamp taxes on matches, proprietary articles, playing cards, bank checks, drafts, and of the tax on surplus bank capital and deposits. These taxes were repealed by act of congress (March 3, 1883); and by executive order of June 25, 1883, the number of internal revenue collection districts was reduced from 126 to 83. The tax on tobacco was reduced by the same act of congress. On July 12, 1882, an act became law enabling the national banks, which were then completing their twenty year terms, to extend their corporate existence. The attention of Congress was frequently called to the decline of the American merchant marine, and legislation was recommended for its restoration, and the construction and maintenance of ocean steamships under the United States flag. In compliance with these recommendations, the following laws were enacted: June 26, 1884, an act to remove certain burdens from American shipping; July 5, 1884, an act creating a bureau of navigation, under charge of a commission, in the treasury department; and March 3, 1885, an amendment to the postal appropriation bill granting \$800,000 for contracting with American steamship lines for the transportation of foreign mails.

322. The reduction of letter postage from three to two cents was recommended, and was effected by the act of March 3, 1883; the unit of weight was made (March 3, 1885) one ounce instead of a half ounce; the rate on transient newspapers and periodicals was reduced (June 9, 1884,) to one cent for four ounces, and the rate on similar matter, when sent by the publisher to actual subscribers, was reduced to one cent a pound (March 3, 1885). The fast mail and free delivery systems were largely extended. Special letter deliveries were established March 3, 1885. The star service at the west was increased at reduced cost; the foreign mail service improved; and various postal conventions were negotiated. A law for the adjudication of the French spoliation claims was passed (January 20, 1885), and preparations made for carrying it into effect. On March 3, 1885, a bill was passed retiring General Grant with the rank of general of the army, and with full pay.

323. In 1884 the Republicans nominated James G. Blaine and General John A. Logan, and the Democrats Cleveland and Hendricka. The greenback and anti-monopolist parties put forward the name of Benjamin F. Butler. The prohibitionists, also, had organized themselves into a party, and presented as their candidate Governor St. John. A small majority of the democratic candidates in the state of New York gave

them its electoral votes, and decided the election in their favor. They were inaugurated March 4, 1885. The president announced in regard to official changes that, with the exceptions of heads of departments, foreign ministers, and other offices charged with the execution of the policy of the administration, no removals would take place except for cause. He therefore came into conflict with many influential members of his party who advocated the speedy removal of Republican office-holders and the appointment of Democrats, in order to strengthen the party as a political organization. While that class of politicians objected to the slowness with which removals were made, and to the appointment of independents, and in a few instances Republicans, the Republicans and some of the civil service reformers complained of other appointments as not being in accord with the professions of the president. He declared "offensive partisanship" to be a ground for removal; and numerous Republican functionaries were displaced under that rule, while the term itself became a by-word. On March 13, 1885, the president issued a proclamation announcing the intention of the government to remove from the Oklahoma country, in Indian territory, the white intruders who sought to settle there, which was done shortly afterwards by a detachment of soldiers.

324. In his message at the opening of the XLIXth Congress, December 8, 1885, President Cleveland recommended the abolition of duties on works of art, the reduction of the tariff on necessities of life, the suspension of compulsory silver coinage, more stringent laws for the suppression of polygamy in Utah, an act to prohibit the immigration of Mormons, and the extension of the civil service reform. In January, 1886, Congress passed the bill regulating the presidential succession in the event of a vacancy. Mr. Cleveland exercised the veto power beyond all precedent. Of 987 bills passed by both houses in the session ending August 5, 1886, 115 were vetoed. Of these 102 were private pension bills, and six were bills for the erection of public buildings. Of the general measures which failed to receive his signature, the most important was the Morrison resolution requiring the secretary of the treasury to apply to the redemption of bonds any surplus to the treasury exceeding \$100,000,000. The river and harbor bill, containing appropriations, deemed by many useless and extravagant, and the bill taxing oleomargarine two cents a pound, which was considered an unjust discrimination against one class of producers for the benefit of another, were not vetoed. On signing the latter, the president sent a message to Congress, in which he gave as his reason that the stamps required by the act would mark the character of the substance and prevent it being fraudulently sold.

325. The presidential campaign of 1888 was noted for the number of candidates in the field, who were as follows: Republican, Benjamin Harrison and Levi P. Morton; Democratic, Grover Cleveland (renominated) and Allen G. Thurman; prohibition, Clinton B. Fisk and John A. Brooks; union labor, A. J. Streeter and Charles E. Cunningham; industrial reform, Albert E. Redstone and John Colvin; united labor, Robert E. Cowdry and W. H. T. Wakefield; woman suffragists, Belva A. Lockwood and Albert H. Love. The main issue between the two leading parties, Republican and Democratic, was on the tariff question; the former favoring a modified protected tariff, while the latter demanded a tariff chiefly for revenue. The principles of the other parties related to labor, national currency, prohibition and woman's suffrage. The Republican party was successful, and Harrison as president, with Morton as vice-president, was inaugurated March 4, 1889. The administration of Mr. Harrison, thus far, has been characterized by the passage of the McKinley tariff bill, which both increases and diminishes the duties on many necessary articles

and adds to the duties on luxuries, and by the regulation of pension matters. The invalid pension bill has been passed, granting pensions to all disabled soldiers without reference to the time when the disability was contracted. On the beginning of June, 1890, the enumeration of the general census for the last decade was begun, under the control of Superintendent Porter, and the returns of the census enumerators give the population of the United States at 63,250,000, which is less than was anticipated. Many consider the returns as imperfectly made.

The census

The present nation.

326. In the meanwhile the prosperity of the United States has known no cessation. During the civil war of 1861-1865, the emperor of France, Napoleon III., attempted to establish in Mexico a foreign government under Maximilian, an Austrian archduke, aided by a French army. The remonstrance of the United States and the resolution of the Mexicans compelled Napoleon to abandon the attempt. Maximilian was seized by the Mexicans and executed (1867). A new invasion of Mexico from the United States was begun, but it was the peaceful invasion of commerce. Railways were pushed down along the great plateau which reaches from the United States into the heart of the country, making thus a closer connection between the two peoples. In 1869 the first of the great railroads, the Central Pacific, was finished, connecting the Atlantic and Pacific Oceans, and opening the country to settlement and travel. Since then other railroads have stretched their iron bands across the continent. Of the 290,000 miles of railroad in the world, there are, probably, about 135,000 miles in the United States. This country possesses, also, more than 150,000 miles of telegraph lines; and the American telephone lines are still longer in the aggregate. In 1866, a previous attempt in 1857 having failed, a telegraphic cable was laid upon the bed of the Atlantic between America and Europe. This cable was followed by others, so that now the citizen of the United States may know each day the principal events which occur in the civilized world. The stimulus given to new territory possessing the requisites for settlement by the introduction of a new railway has been wonderful beyond description. Most of the western railways have had to build up their own traffic. The railway has been mainly constructed under land grants from the government, and the sales of these lands have brought into existence the towns and even the states which support it.

327. In the government reports of 1854 Nebraska was described as a desert country totally unsuited for agriculture, and in the maps of the time it was put down as a part of the Great American Desert. It is now one of the leading agricultural states of the union with a population of over a million. Since the admission of Colorado in 1876 six other states have been admitted to the union, namely, North and South Dakota, Washington, Montana, Wyoming and Idaho. There are yet five territories, including Alaska, not yet organized into states, and the District of Columbia. The mineral wealth of the country has become greatly developed. A few years after the discovery of gold in California the precious metal was found also at Pike's Peak, Colorado (1858). Since then it has been discovered in most of the Pacific states and territories. In 1858 silver was discovered in Nevada, and this metal has been found widely distributed in the country bordering on the Pacific coast. The extent of the vast coal fields of the country has been pretty clearly ascertained. In 1883 it was estimated at over 200,000 square miles. Petroleum was discovered in 1859 in north-western Pennsylvania, numerous wells were sunk and vast quantities of the oil have been taken from the earth, but the reservoir seems to be unfailling. Manufacturing establishments of every variety have rapidly increased in every part of the country. The absolute free trade which exists between the states has resulted

New states

in a constant shifting of centers of production and an increasing development. Among the nations of the world, Great Britain, in 1870, stood first in wealth, France the second and the United States the third. In 1880 the United States had left France behind in the race and stood at least second. When all the census returns of 1890 shall be given they will doubtless show that this country ranks with the first. The United States, whose population has been developed within less than three centuries, does already more than one-third of the world's mining and one-fourth of its manufacturing. It embraces also one-fifth of its agriculture.

328. In this wonderful progress and development the south, since the close of the war, has borne her share. Being relieved of the incubus of slavery she has come up "through great tribulation" to assume her rightful place as a most important factor in advancing the prosperity of an undivided nation. Under the stimulus of free labor her growth has been extraordinary. New railroads have been built and new territory opened up. Southern railways occupy a leading position in the railway systems of the country. Southern manufactures began to effect northern markets. Cotton mills have been successfully established, which have the advantage of an immediate contiguity to the cotton-raising states. The great mineral fields, over which contending armies fought fierce battles during the late war, have been brought to light and are being rapidly developed. Pennsylvania iron-masters have a new rival to contend with in the iron production of the south. The former slave is now a free laborer, and the white man is no longer ashamed to work. White labor produced ten per cent of the cotton crop of 1860 and fifty-five per cent of that of 1886. Under slavery, cotton-seeds were waste material; in 1886 600,000 tons of them were crushed, yielding a new production in the form of cotton-seed oil valued at \$12,000,000 per annum.

329. Among the political and economic questions demanding the attention of the government, no one of them is more important than the question of the reform of the civil service, but it is not avowedly made a party question. Twenty years ago both parties laughed at the idea of civil service reform, now each one makes a show at least of treating it with respect, and the control of the immediate political future, probably lies with the party which will treat it in the most serious and practical manner. It is a question that was not distinctly foreseen in the days of Hamilton and Jefferson, when the constitution was made and adopted, otherwise the founders of the constitution might have had something to say concerning it. The question as to the civil service arises from the fact that the president has the power of appointing a very large number of petty officials, chiefly postmasters and officers concerned with the collection of the government revenue. Such officials have properly nothing to do with politics; they are simply the agents or clerks or servants of the national government in conducting its business, and if this business is to be managed on the ordinary principles of prudence which prevail in the management of private business, such servants ought to be selected for personal merit and retained for life or during good behavior. In 1883 Congress passed the civil service act allowing the president to select a board of examiners and make appointments upon their recommendation. Candidates for office are subjected to an easy competitive examination. The system has worked well in other countries, and under Presidents Arthur and Cleveland it was applied successfully to a considerable part of the civil service. It has also been adopted in some of the states and principal cities of the union. It is objected to by the opponents of reform, on the ground that its examinations are not always intimately connected with the work of the office; but, even if

The south

Civil service reform.

The civil service act of 1883

Objections

this were so, it removes the offices from the category of things known as "patronage," and this alone endows the system with great merit. Then again, it relieves the president of much needless work and wearisome importunity. The executive and heads of departments appoint (in many cases through subordinates) about 115,000 officials. It is therefore impossible for the principals to know much about the character or competency of those appointed. It becomes necessary to act by advice, and the advice of an examining board is sure to be much better than that of political schemers intent upon getting a salaried office for their needy friends. The examination system has made a fair beginning and will doubtless be gradually improved and made more stringent. Something has been also done toward stopping two old abuses attendant upon political canvasses, namely, that of forcing government clerks, under penalty of losing their places, to contribute part of their salaries for election purposes, and that of allowing them to neglect their work in order to take an active part in the canvass.

330. Another political reform promising excellent results is, the adoption by many states of some form of the Australian ballot-system, for the purpose of checking intimidation and bribery at elections. The ballots are printed by the state, and contain the names of all the candidates of all the parties. Against the name of each candidate the party to which he belongs is designated, and against each name there is a small vacant space to be filled with a cross. At the polling place the ballots are kept in an enclosure behind a railing and no ballot can be brought outside under penalty of fine or imprisonment. One ballot is nailed against the wall outside the railing, so that it may be read at pleasure. The space behind the railing is divided into separate booths quite screened from each other, each booth is provided with a pencil and a convenient shelf on which to write. The voter goes behind the railing, takes the ballot which is handed to him, carries it to one of the booths, and marks a cross against the names of the candidates for whom he votes. He then puts his ballot into the box, and his name is checked off on the register of voters of the precinct. This system is very simple; and it enables a vote to be given in absolute secrecy. It is favorable to independence in voting, and is unfavorable to bribery, because, unless the briber can follow his man to the polls and see how he votes, he cannot be sure that his bribe is effective. During the past few years, complaints of bribery and corruption have attracted especial attention in the United States, and it is highly creditable to the good sense of the people that preventive measures have been so promptly adopted by many of the states. With an independent and uncorrupted ballot, and the civil service taken "out of politics," all other reforms will become far more easily accomplished.

But a very few of the works treating of the History of the United States in its manifold phases can be here given, as they are so numerous. *The Histories of the United States*, by George Bancroft, David Ramsay, Richard Hildreth, Bryant Higginson, Lossing, Lester, Frost, Schouler, Von Holst, Ridpath, Hamilton, Hassard, Gray, Leeds; *American History*, edited by Edward L. PART II.—PHYSICAL GEOGRAPHY AND STATISTICS.

PHYSICAL GEOGRAPHY AND STATISTICS.

North America is very unequally divided between races speaking English and those whose official language is Spanish. From the parallel of 30° south the continent narrows very rapidly, and nearly all the country to the north of this parallel is under the control of English-speaking people. It is true that many emigrants from various portions of Europe, and some from Asia, as well as the descendants of Africans, are mingled with the descendants of the English; but this does not materially affect the truth of the statement, that north of 30° the English language is not only dominant, but almost universal. This vast region, embracing an area of more than seven millions of square miles, is pretty equally divided, so far as area is concerned, between colonial possessions of Great Britain and a country of which the nucleus was once colonial and English, but which for a little more than a hundred years has been independent of the mother country, and which has greatly increased in area since that change took place, by the absorption, as explained elsewhere, of land formerly to a certain extent controlled by, or in nominal possession of, people speaking French and Spanish. The Spanish-speaking inhabitants of North America are known as Mexicans and Central Americans, the colonial English as Canadians; and owing to the difficulty of making a convenient and euphonious adjective-appellative out of the name United States, the citizens of "the States" are being more and more generally designated by the term "Americans."

The British possessions in North America, although about equal in area to the United States, are much less densely populated than this country, and will in all probability ever remain so, since in regard to climate, soil, and mineral productions, the northern portion of the continent stands in a position greatly inferior to that of the more southern region. To the United States belongs that portion of North America which by its position in latitude is, in large part, capable of supporting a dense population, and where the climatic conditions are highly favorable to intellectual and physical development.

The area embraced under the designation of "the United States" (of North America) extends from the Atlantic to the Pacific Ocean. Its boundaries, other than these oceans, are in part natural and in part artificial. The Gulf of Mexico forms the southern boundary of the United States between the meridians of 83° and 97°. Between Mexico and the United States, the boundary is in part natural and in part arbitrary. The most essential feature of this boundary is the Rio Grande, from the mouth of which the division line between Mexico and the United States follows this river to the point where the parallel of 31° 47' intersects it.

The boundary line between the United States and Canada follows the middle of the St. Lawrence River and the Great Lakes, from the point where the 45th parallel cuts that river to a point on Lake Superior where the Rainy Lake River enters that lake, thence up that river to a point on the west side of the Lake of the Woods, and thence along the 49th parallel to Puget Sound.

The triangular area between Lakes Ontario and Erie on one side and Lake Huron on the other extends far to the south of the remaining portion of Canada, and this southerly area constitutes the most valuable and thickly inhabited portion of the Dominion.

The United States, as thus limited, leaving out of consideration the remote territory of Alaska, comprises an area of 3,025,600 square miles. This includes 55,600 square miles of water surface, embracing the following items:—

| | |
|---|-----------|
| Coast waters, bays, gulfs, sounds, etc..... | 17,990 |
| Rivers and smaller streams..... | 14,500 |
| Lakes and ponds..... | 23,900 |
| Leaving the total land surface..... | 2,970,000 |
| Total..... | 3,025,600 |

Under the head of "lakes and ponds," as given above, no portion of the Great Lakes is included. The area of Alaska is given in the Census Report of 1880 as being 531,409 square miles, which figures, however, can be only a rough approximation, and which differ greatly from those given in the Report of the Commissioner of the General Land Office for the year ending June 30, 1886. The total of the possessions of the United States is therefore, approximately, 3,557,009 square miles. The area of the British Possessions in North America, including Newfoundland, but not the Arctic Archipelago, is given by Behm and Wagner as 3,248,077, and by Mr. Selwyn, Government Geologist of Canada, at 3,530,630 square miles.—the latter estimate including Newfoundland, and also the islands in the Arctic Ocean and Hudson's Bay. The area of Mexico is given by Behm and Wagner as 751,177 square miles, and that of Central America 211,320 square miles. The total area of North America, including the Arctic Archipelago and Central America, may therefore be approximately stated as follows:—

| | |
|--------------------------|-----------|
| British Possessions..... | 3,530,630 |
| United States..... | 3,557,009 |
| Mexico..... | 751,177 |
| Central America..... | 211,320 |
| Total..... | 8,050,136 |

The area of the United States lies between the 67th and 125th degrees of longitude, and the 25th and 47th degrees of latitude.

The form and character of the coast lines of the United States may properly first claim our attention in a topographic sketch of the area under consideration. The facilities for good harbors are lacking on both coasts. The deficiency in this respect on the Pacific side is striking, there being only one important bay on this coast between San Diego and Puget Sound; namely, that of San Francisco. This, as compared with the mass of the land, is of insignificant size, but as furnishing a large, safe, and easily accessible harbor, is of the greatest importance. The indentation at San Diego is much smaller than that of San Francisco, but that also furnishes a commodious harbor. With these exceptions there are within the limits of the United States no satisfactory harbors on the Pacific coast except those of Puget Sound and Columbia River in the extreme north.

The eastern coast of the United States is provided with several good harbors and some large bays. On the Maine coast there is a harbor of Portland, which may be taken as a type of a number of safe and commodious ports along the coast. In Massachusetts, Cape Cod incloses a large and safe bay, at the lower end of which is situated the harbor of Boston. In New York, the situation of the city by the same name makes that port the most important center of commerce in the United States.

The superiority and commodiousness of the harbor of New York depends in part on the breadth of the Hudson near its mouth—this river being in fact almost an arm of the sea—and also on the position of Long Island, the western end of which is so placed with reference to the coast of New Jersey and a closely contiguous small island (Staten Island) as to inclose a large land-locked area called the Upper Bay.

Long Island, off the coast of Connecticut, has a length of 120 miles. It is the only island of any importance on the Atlantic coast. There are a number of smaller ones, such as Block Island, Nantucket and Martha's Vineyard.

South of New York are the Chesapeake and Delaware Bays. The latter receives the water of the Delaware River, and the Chesapeake that of the Potomac and the Susquehanna. The largest indentation on the coast of the United States is the Gulf of Mexico.

It is into this great reservoir that the superfluous waters of the larger portion of the United States are carried, chiefly by the Mississippi and Missouri, but also by direct drainage into the Gulf from the adjacent States. The peninsula of Florida, projecting from and extending five degrees south of the mainland, and forming the eastern boundary of the Gulf, is of more importance in its relations to the currents entering into the Gulf than it is as an addition to the inhabitable territory of the country.

A large portion of the northern boundary of the United States is of a peculiar kind. It is neither land, river, nor ocean, but fresh water: it being a line drawn through the central portion of four of the so-called "Great Lakes"—Ontario, Erie, Huron and Superior. Lake Michigan, on the other hand, is wholly within the limits of the United States.

The Great Lakes, which are five in number, constitute a most important feature in the topography of the country. They are remarkable for their size, and for the near approach to equality of altitude above the sea-level of the surface of the four largest ones. Navigation is entirely uninterrupted between Erie, Huron and Michigan, and these have the following elevations: Erie 573 feet; Huron, 582; Michigan, 582. Lake Superior is twenty feet higher than Lake Michigan, but this obstruction has been overcome by the building of a canal around the Falls of St. Mary (Saint Ste. Marie), with a single lock of sufficient dimensions to accommodate vessels and steamers of the largest size. Lake Ontario is 326 feet lower than Erie and these two lakes are connected by a canal on the Canada side; while Erie is also thus connected, on the American side, with the Hudson River, and through this with the Atlantic.

As before remarked, the chief drainage of the United States is to the Gulf of Mexico, through the system of the Mississippi-Missouri and their tributaries, as will be seen by the following table, showing the extent of the various important divisions of the drainage area of the country, as given by the U. S. Census of 1880:—

| | |
|------------------------|-----------|
| Atlantic and Gulf..... | 2,178,210 |
| Great Basin..... | 228,150 |
| Pacific Slope..... | 619,240 |

The drainage area of the Mississippi-Missouri River is estimated at 1,240,039 square miles, or somewhat over one-third of the entire area of the country. The drainage into the Atlantic and areas, Gulf, as stated above at 2,178,210 square miles, is divided as follows:—

| | |
|----------------------------|-----------|
| New England coast..... | 61,830 |
| Middle Atlantic coast..... | 83,020 |
| South Atlantic coast..... | 132,020 |
| Great Lakes..... | 175,540 |
| Gulf of Mexico..... | 1,725,980 |
| Total..... | 2,178,210 |

The drainage into the Gulf of Mexico is thus divided:—

| | |
|------------------------------------|-----------|
| Into the Gulf direct..... | 485,941 |
| Through the Mississippi River..... | 1,240,039 |
| Total..... | 1,725,980 |

This indication of the overwhelming preponderance of the drainage of the territory of the United States into the Gulf of Mexico naturally opens the way to a recognition of the most important fact in the topography of the country — namely, the existence of such an orographic structure as compels the waters to concentrate themselves into one great system of tributaries coming in from the east and the west, and uniting in a main north-and-south channel. The cause of this state of things becomes evident when we notice the general relief of the country, and the positions of the various water-sheds. To acquire the best general idea of the relief of the surface of the United States, we may begin by supposing the land to be depressed, or the level of the ocean raised, to an amount equal to one thousand feet. By doing this we should flood a great strip of country across the continent. Mexico would remain on the west a great mass of land, while to the north of the United States the land would rapidly diminish as higher latitudes were reached.

GENERAL TOPOGRAPHY.

In describing the physical features of a country, it is necessary to consider its general plan, the skeleton or framework of mountains, to which its plains, valleys, and river systems are subordinate, and on the direction and elevation of whose parts its climate is, to a very large degree, dependent.

The skeleton of the United States is represented by two great systems of mountain ranges, or combinations of ranges, one forming the eastern, the other the western side of the framework by which the central portion of our continent is embraced. These two systems are the Appalachian ranges and the Cordilleras of North America. These systems are of very different magnitude and extent. Between them stretches a great interior valley, occupied by the Mississippi and the great lakes.

The central portion of the United States is nearly a level area, embracing a tract of country about 1250 miles east and west, and about 1200 miles north and south. It slopes gently downward to the center from the east and west, and towards the Gulf of Mexico, from its northern limits. The mountain regions, both on the east and west coasts, are not embraced under one continuous range, but are complicated in their orographic structure.

The eastern and western elevated regions being made up of a great number of topographically more or less detached portions, it was not until a comparatively recent period that these regions received such general distinctive appellations as would evidently be required in any discussion or description of the country as a whole. At the present time, by general consent of geographers and geologists, the eastern elevated side of the continent is called the APPALACHIAN REGION; the western the CORDILLERAN, while the comparatively level country between these ranges is known as the MISSISSIPPI VALLEY.

The Great Basin of the Mississippi is bisected through its center by a supreme artery, which, above St. Louis, has received the name of the *Missouri*, and below the *Mississippi* River.

This is 5,000 miles in length, and its surface is a continuous inclined plane, descending seven inches in the mile. Into this central artery, as into a common *trough* descend innumerable rivers coming from the great mountain chains of the continent.

All of the immense area thus drained forms a single *basin*, of which the circumference of mountains form the rim. It may be also called an *amphitheatre*, embracing 1,500,000 square miles of surface. This has been, during the antediluvian ages, the bed of a great ocean, such as is now the Gulf of Mexico, or the Mediterranean, above the surface of which the mountains protruded themselves as islands. Gradually filled up by the filtration of the waters during countless ages, it has reached its present altitude above the other basins, over which the oceans now still roll, and into which the waters have retired.

The Basin of the Mississippi is, then, a pavement of calcareous rock, many thousand feet in depth, formed by the sediment of the superincumbent water, deposited stratum upon stratum, compressed by its weight and crystallized into rock by its chemical fermentation and pressure. It is in exact imitation of this sublimine process of the natural world that every housewife compresses the milk of her dairy into solid cheese and butter. It is, therefore, a homogeneous, undulating plain of the *secondary* or sedimentary formation, surmounted by a covering of soil from which springs the vegetation, as hair from the external skin of a animal. Through this coating of soil, and into the soft surface strata of rock, the descending fresh waters burrow their channels, converging everywhere, from the circumferent rim to the lowest level, and pass out to the sea.

The most noticeable facts in regard to this vast area are its high elevation above sea-level and the general plain-like character of its surface. These conditions are well illustrated by the statement that at Cairo, the junction of the Ohio and the Mississippi, we are 1,100 miles from the Gulf, and yet only about 300 feet above the sea-level. At Pittsburgh, the head of the Ohio River proper, we have attained an elevation of only 699 feet. Going in the opposite direction, or following up the tributaries of the Mississippi and of the Missouri, which come in from the west, we have a similar condition of things. One may travel up the Platte or the Kansas for hundreds of miles, rising so gradually and so imperceptibly that the country seems all the time a level plain. From Council Bluffs to the source of Lodge Pole creek, along the line of the Union Pacific railroad, the ascent averages only 5 feet to the mile. From St. Paul, which is only 700 feet above the sea, we travel for 670 miles westerly before the mouth of the Yellowstone is reached, and here we have attained an altitude of only 2,010 feet, with an average rise of only 2 feet to the mile.

The great lakes, those vast expansions of the upper waters of the St. Lawrence, are among the grandest of the geographical features of the North American continent. They are remarkable

for their immense area, and for their uniformity of elevation above sea-level, and the consequent facilities which they afford for commercial intercourse.

Their combined area is a little more than 90,000 square miles, Lake Superior having over 30,000, and Lakes Michigan and Huron each over 20,000 square miles of surface. Erie, Huron, and Michigan are nearly on the same level, the extreme difference between the first and the last-named being only about 16 feet, while Superior is only 20 feet higher than Michigan, or 36 above Erie. The divide between the great lakes and the waters flowing into the Mississippi and its tributaries is also everywhere low, and at the lower end of Lake Michigan it is so trifling that only a small amount of excavation has been required to cause waters which formerly flowed into that lake to run toward the Gulf of Mexico. Lake Ontario is, indeed, 323 feet lower than Lake Erie, about half the descent from one to the other being made in one single plunge of the vast body of water, forming a cataract which has, in all probability, no rival in the world.

The level and fertile region of the Mississippi valley is prolonged toward the far southwest, around the Gulf of Mexico and far into the interior of Texas, where it finally passes into the elevated, barren plateau of the Llano Estacado.

All that portion of the Mississippi basin lying between the Mississippi River and the Atlantic, is densely timbered, excepting only a portion of Indiana, Illinois, and Wisconsin; so also are the States of Louisiana, Arkansas, and South Missouri. An irregular line from the head of Lake Erie, running toward the south and west into Texas, defines the cessation of the timber. Between this line and the sea exists a continuous forest region, perpetually moistened by showers from the ocean. Beyond this line, and deeper into the continent, the upland ceases to nourish timber, which is replaced by luxuriant annual grasses, though narrow lines of forest continue upon the saturated bottoms of the rivers and in the islands. This is the Prairie region of luxuriant annual grasses and soft arable soil, over which the fires annually sweep after the decay of vegetation.

The termination of this belt is marked by an irregular line parallel to the first, where the rain ceases, and the timber entirely disappears. It is about 40 miles in width, and within it artificial irrigation is not practiced or necessary, it being everywhere soft, arable and fertile.

To this succeeds the immense *rainless* region onward to the mountains, exclusively pastoral, of a compact soil, coated with the dwarf buffalo grass, without trees, and the abode of the aboriginal cattle. That no desert does or can exist within this basin, is manifest from the abundance and magnitude of the rivers; the uniform calcareous formation; the absence of a tropical sun; its longitudinal position across the temperate zone; and the greatness and altitude of the mountains on its western rim. The river system of the Mississippi Basin resembles a fan of River palm-leaf. The stem in the State of Louisiana rests in the Gulf; above, the affluent rivers converge to it from all parts of the compass. From the east come in the Homechitto, the Yazoo, the Ohio, the Illinois, and the Upper Mississippi. From the west, the Red River, the Washita, the Arkansas, the White, St. Francis and Osage Rivers, the Kansas, the Triple Platte, the L'Eau qui Cours, and the Yellowstone, all navigate rivers of great length and importance. These rivers present a continuous navigable channel of 22,500 miles, having 45,000 miles of shore—an amount of navigation and coast equal to the Atlantic Ocean. The area of the Mississippi Basin classifies itself into one-and-a-half-fifths of the compactly growing forest, the same of prairie, and two fifths of great plains. Through all of these the river system is ramified as minutely complex as are the veins and arteries of the human system.

Beyond this great main river stretch out the vast prairies of the Plains. These plains are not deserts; they are calcareous, and form the *Pastoral Garden* of the world. Their position and area may be easily understood. The meridian line which terminates the States of Louisiana, Arkansas, Missouri and Iowa on the west, forms their eastern limit, and the Rocky Mountain crest their western limit. Between these two limits they occupy a longitudinal parallelogram of less than 1,000 miles in width, extending from the Texan to the Arctic coasts. There is no timber upon them, and single trees are scarce. They have a gentle slope from the west to the east, and abound in rivers. They are clad thick with nutritious grasses, and swarm with animal life. The soil is not silicious or sandy, but is a fine calcareous mould. They run smoothly out to the navigable rivers, the Missouri, Mississippi, and St. Lawrence, and to the Texan coast. The mountain masses toward the Pacific form no serious barrier between them and that ocean. No portion of their whole sweep of surface is more than 1,000 miles from the most facile navigation. The prospect is everywhere gently undulating and graceful, being bounded, as on the ocean, by the horizon. Storms are rare, except during the melting of the snows upon the crest of the Rocky Mountains.

The climate is comparatively *rainless*; the rivers serve, like the Nile, to irrigate rather than drain the neighboring surface, and have few affluents. They all run from west to east, having beds shallow and broad, and the basins through which they flow are flat, long and narrow. The area of the Great Plains is equivalent to the surface of the twenty-four States between the Mississippi and the Atlantic Sea. They are one homogeneous formation, smooth uniform, and continuous, without a single abrupt mountain, timbered space, desert, or lake. From their simple dimensions and position they define themselves to be the *pasture-fields of the world*.

The Pastoral Region is longitudinal. The bulk of it is made the Temperate Zone, out of which it runs into the Arctic Zone or the north, and into the Tropical Zone on the south. The parallel Atlantic arable and maritime region flanks it on the east; that of the Pacific on the west.

Mountain regions.

Mississippi basin.

Area of Great Lakes.

While, on the whole, so nearly a plain, this vast area, comprising over a million and a half square miles, has considerable diversity of surface, it being not altogether destitute of mountains, some of which rise to a considerable altitude. To describe, even with a moderate amount of detail, the basin of the largest river system but one in the world would require many volumes. All that can be done is to indicate the salient features of its geology, as supplementary to that which has been said in regard to the structure of the great mountain systems by which this geologically comparatively undisturbed region is framed in.

Tertiary
and Creta-
ceous rocks.

Geological
formation.

The Tertiary and Cretaceous rocks, extending along the Gulf and up the Mississippi Valley as far as the Ohio River, underlie about one-half of Alabama and Arkansas, the entire State of Mississippi, Louisiana, parts of Tennessee, Kentucky, a small corner of Missouri, and nearly all of Texas. Thence this geological formation follows the general trend of the Rocky Mountains, on their eastern side and underlies the western half of Kansas, nearly all of Nebraska, North and South Dakota, a portion of Iowa, and the western part of Minnesota.

Triassic rocks stretch over a large area of Texas; they also extend into the Indian Territory and the southern part of Kansas. All but a small portion of the Northern Central group of States and portions of the Southern Central group of States, are of the Paleozoic rock formation, covered by post-Tertiary and recent detrital formations. In southeastern Missouri, the Azioic area is important from an economical standpoint. Iron ores of immense value occur in Pilot Knob, Iron Mountain and other localities. Iron is also found in the Azioic formations about Lake Superior, in the States of Wisconsin and northwestern Minnesota. North of this iron region is the copper-bearing rock of the lower Silurian age. Over New York, northern Pennsylvania, and the country bordering on the Great Lakes is found a large amount of "drift." How this so-called "drift" was distributed over this area is a question which has long been a subject of discussion among geologists. By far the larger number of those who have investigated the subject ascribe the origin of this coarse detrital material to glacial causes. It is believed that at one time the northern part of the continent was covered with ice, and that which we see on the present surface of the region that was thus covered, is the result of the action of these glaciers, or of the floods which were produced when they melted.

THE CORDILLERAN REGION.

The Cordilleras are a part of the great system or chain of mountains which borders the Pacific coast of both divisions of the American continent, South and North America, and forms its dominating and most imposing feature.

From Mexico the system of the Cordilleras enters our territory, widening and gaining in complexity. Just above the southern border of Arizona, along the parallel of 32°, occurs the greatest depression of the Cordilleras existing anywhere north of southern Mexico, and here the continent may be traversed without rising to an elevation of over 4,000 feet. The country along this line is a table land, with many short and broken ranges of no great altitude built upon it, but deeply excavated by numerous canons, as the narrow valleys of the streams in the Cordilleras are universally called, of which the canon of the Colorado may be taken as the type.

The Cor-
dilleras.

On this plateau, in latitude 35°, is a group of extinct volcanoes, similar to the range which traverses Mexico. These grand volcanic cones, of which San Francisco mountain is the loftiest and the best known, rise to nearly double the altitude of the plateau on which they stand. The greatest width of the Cordilleras is along the line passing from the vicinity of San Francisco, by Great Salt Lake, to Fort Laramie, or between latitudes 38° and 42°. Here the mass of mountains and plateaus attains a breadth of fully a thousand miles; and if the Black Hills, an outlier of the Rocky Mountains, in latitude 44°, are included—as they may properly be—the total breadth of the complex of ranges will be, in its maximum, over 1,100 miles. The whole area embraced within the mountainous belt which we call the Cordilleras is but very little, if any, short of a million of square miles, or one-third the area of the country. Hence it may, with propriety, be called the greatest physical feature of our territory.

To roughly indicate the shape of the mass of the Cordilleras we may consider it as having a lozenge-shaped figure, bounded by two parallel north and south sides and two northwest and southeast sides. The length of each side is approximately 600 miles. The western edge of the figure corresponds in trend to the line of the Pacific coast, which, as a glance at the map will show, is northwest and southeast as far as Cape Mendocino, and from there to Vancouver Island north and south nearly. The north and south trending portion of the Pacific edge of the Cordilleras is known as the Cascade range; the northwest and southeast range as the Sierra Nevada. Here, bordering on the Cascade and Sierra Nevada ranges, but still nearer the ocean, are the Coast ranges, parallel with the loftier masses on the east, and insculcating with them, at various points, in such a manner that a distinct separation between coast and interior ranges seems hardly possible, either on geographical or on geological grounds.

The Rocky Mountains proper form the eastern rim of the Cordilleras. Throughout New Mexico, Colorado, and southern Wyoming their face ranges north and south. The northern part of this system, lying in northern Wyoming and Montana, presents to the plains a northwest and southeast face, similar to that of the Sierra Nevada.

The lozenge-shaped figure thus indicated, framed in, as it were, by the Cascade range and Sierra Nevada on the west and the Rocky Mountains on the east, incloses a high plateau, which, through its center east and west, has an elevation of from 4,000 to 10,000 feet above sea-level, falling off toward both the north and the south from its central line.

Let us consider it in its great general features. It may be divided into—

- 1st. The section of the Rocky Mountains,
- 2d. That of the plateaus,
- 3d. That of the Great Basin, and
- 4th. That of the Pacific

The country lying east of the first section is a great plain, extending to an undefinable eastern limit, which may be set, however, roughly at the 100th meridian. This plain is not strictly level, but undulating, like the swell of the sea. Most of the stream valleys are shallow depressions, and the divides between them are but slightly marked. These plains rise slowly westward, with an even gradient, to a height of 4,000 to 6,000 feet at the eastern base of the Rocky Mountains, being the highest in Colorado, decreasing thence northward and southward. They are covered with grasses almost throughout, and form a grazing-ground of almost incalculable capacity.

With the exception of the Missouri and the Yellowstone, none of the streams are of any importance to navigation, and they are of use only for irrigation. The capacity of this region for supporting life is largely dependent upon its rainfall, which will be discussed further on.

The Rocky Mountains form the eastern member of the Cordilleran system;—a member made up of many subordinate ranges, each range or sub-group of ranges having a distinctive name, recognized by those living near, while the name "Rocky Mountains" is in general use as the proper appellation when a number of these sub-groups of ranges are intended to be included under one common name.

Rocky
Mountains.

From the south border of the United States to about latitude 43° their general course is nearly north and south, and from this point northward to the British line it is nearly northwest, thus forming the two eastern sides of the lozenge above spoken of. They consist of a number of ranges, nearly all of which trend parallel to one another—a few degrees east of south and west of north, or roughly parallel to the northeastern side of this region.

In the southern portion the ranges run out one after another into the plains, forming an *echelon* arrangement, thus giving to the system a nearly north and south face.

In Colorado the underlying plateau attains a greater elevation than in any other part of the Cordilleran system, reaching an extreme height in the South Park of 10,000 feet. Here, too, the ranges reach a greater altitude than in any other part of the Rocky mountain system. Numberless peaks rise from 14,000 to 14,500 feet above sea-level. There are few passes in the ranges at a height much below timber-line, which is from 11,000 to 12,000 feet. Northward and southward the plateau decreases gradually in height, carrying downward the ranges which stand upon it. Southward through New Mexico the ranges not only decrease in height, but become broken and scattering, while the extent of level plateau country becomes much greater. Toward the north, in southern Wyoming, all the ranges step abruptly, leaving to represent the Rocky mountain system only a line of plateaus of an elevation of 6,000 to 7,000 feet stretching from Bridger pass, in the southern part of the territory, northwestward to the South pass, at the south end of the Wind River chain. In this latitude a number of ranges rise abruptly from the plateau, beginning with the Big Horn on the east, then the Wind River range, some of whose peaks are more than 13,000 feet in altitude, and the multitudinous ranges which border the headwaters of the Snake river. From this point, as the system continues onward into Idaho and Montana, the underlying plateau and the ranges also greatly decrease in height, but not in complexity. In the northwestern part of Montana and northern Idaho, indeed, the whole country is a mass of mountain ranges, whose elevation is from 8,000 to 9,000 feet, separated in most cases, by very narrow valleys, the whole area being densely covered with forests.

THE PLATEAU PROVINCE.

The region of which the principal or more striking, topographical and geological features are next to be indicated, is that lying south of the Great Basin, and which is drained by the Colorado and its tributaries. It is included chiefly within the boundaries of the Territories of Utah and Arizona; but, to a certain extent, similar characteristic features are found in the adjacent portion of Colorado, New Mexico, and Nevada.

For convenience of geological discussion, that belt of country Provinces, which lies between the meridian of Denver, Colorado, and the Pacific, and between the 34th and 43d parallels, is divided into provinces, each of which possesses topographical features which distinguish it from the others. The easternmost is named the Park Province. It is situated in the central and western parts of Colorado, and extends north of that State into Wyoming, and south of it into New Mexico. It is pre-eminently a mountain region, having several long ranges of the second order of magnitude. The structure and forms of these mountains are not exactly similar to those of any other region now well known, but possess some resemblance to the Alps, though not a very close one.

To the westward of these ranges in Colorado, there are, near the western boundary of that State, regions having a very different and topography. The mountains disappear almost wholly, and in their stead there are platforms and terraces nearly, and in terraces, horizontal on their summits or floors, and abruptly terminated by long lines or cliffs. They lie at greatly varying altitudes, some as high as 11,000 feet above the sea, others no higher than 5,000, and with still others occupying intermediate levels. Seldom does the surface of the land rise into conical peaks, or into long, narrow, crested ridges; but the profiles are long, horizontal lines, suddenly dropping down many hundred or even two thousand feet, upon another flat plain below. This region has been very appropriately named, by Professor Powell, the Plateau Province. It occupies a narrow strip in the extreme western part of Colorado, a similar

strip of western New Mexico, a large part of southern Wyoming, and rather more than half of Utah and Arizona.

Drainage basin of the Colorado. This region may be roughly defined as comprising the drainage basin of the Colorado river and its tributaries. The upper portions of its tributaries flow, however, in the Rocky Mountains and the Wahsatch range, and enter the plateau region lower in their courses. This region lies west of the southern section of the Rocky Mountains east of the Great Basin, and constitutes a great depression or valley in the Cordilleran region of a roughly triangular shape, its apex being in western Wyoming, near the head of the Green river, one of the forks of the Colorado. It is a region of table lands and canons; of table lands horizontal or nearly so, stretching for many miles with scarcely an undulation in the uniform surface, but suddenly ending abruptly in a line of cliffs, perhaps thousands of feet in height, and extending in an unbroken line for hundreds of miles. In this region every stream is in a gorge, cut hundreds, or even thousands of feet below the surface; by the action of water on the soft, stratified sandstones and limestones. Most of this region is uninhabited and uninhabitable, not only by reason of the climate, which forbids agricultural pursuits, but from its almost hopeless impassableness.

Separating this region from the Great Basin is the Wahsatch range, which may be considered as a spur from the Rocky Mountains. It is a range of considerable breadth and altitude, extending from north to Utah nearly to the middle latitude of the State, and descending to the general level of the country on the south and east by a series of plateaus, forming a veritable giant's stairway. The elevation of this range in its highest portion is from 10,000 to 11,000 feet, one or two peaks only reaching an altitude of 12,000 feet. Joining this range in the northern part of Utah is that of the Uinta, which differs from nearly all the ranges of the Cordilleran region by having an east and west trend. It forms the southern limit of the Green River basin, the region upon which the fugitive name "Great American Desert" has been lately bestowed, and where it is probable it has at last found a final resting-place.

This range far exceeds the Wahsatch in elevation, a number of its peaks extending skyward nearly 14,000 feet, and its broad, plateau like summit being for a considerable extent at an elevation of 12,000 feet.

Canons. The Grand Canon District is a part of the Plateau Province, As already indicated, it lies between the Park and Basin Provinces, and its topography differs in the extreme from those divisions found on either side of it. It is the land of tables and terraces, of buttes and mesas, of cliffs and canons. Standing upon any elevated spot where the radius of vision reaches out 50 or 100 miles, the observer beholds a strange spectacle. The most conspicuous objects are the lofty and brilliantly colored cliffs. They stretch their tortuous courses across the land in all directions, yet not without system; here throwing out a great promontory, there receding in a deep bay, and continuing on and on until they sink below the horizon or swing behind some loftier mass or fade out in the distant haze. Each cliff marks the boundary of a geographical terrace, and marks also the termination of some geological series of strata, the edges of which are exposed like courses of masonry in the scarp-walls of the palisades. Very wonderful at times is the sculpture of these majestic walls. Each geological formation exhibits in its cliffs a distinct style of architecture which is not reproduced among the cliffs of other formations, and these several styles differ as much as these which are cultivated by different races of men. The character which appeals most strongly to the eye is the coloring. The gentle tints of an eastern landscape, the pale blue of distant mountains, the green of vernal or summer vegetation, the subdued colors of hill and meadow, are wholly wanting here, and in their place is the brilliant red, yellow and white, which are intensified rather than alleviated by alternating belts of gray. Like the architecture, the colors are characteristic of the geological formations, each series having its own group and range of colors. They culminate in intensity in the Permian and Lower Trias, where dark, brownish reds alternate with bands of chocolate, purple, and lavender, so deep, rich, and resplendent, that a painter would need to be bold to venture to portray them as they are.

Cliffs. The Plateau country is also the land of canons, in the strictest meaning of that term. Gorges, ravines, *canadas* are found, and are more or less impressive in every high region; and in the vernacular of the west, all such features are termed canons indiscriminately. But these long, narrow, profound trenches in the rocks, with inaccessible walls, are seldom found outside the plateaus. There they are innumerable, and are the almost universal form of drainage channels. Nearly everywhere the drainage channels are cut from 500 to 3,000 feet below the general platform of the immediate country. They are abundantly ramified, and every branch is a canon. All these drainage channels lead down to one great trunk channel cleft through the heart of the Plateau Province for eight hundred miles—the *chaum of the Colorado*, and the canon of its principal fork, the Green River.

Gorges and ravines. The region is for the most part a desert of the barrenest kind. At levels below 7,000 feet the heat is intense, and the air is dry in the extreme. The vegetation is very scanty, and even the ubiquitous sage is sparse and stunted. Here and there the cedar is seen, the hardiest of arborescent plants, but it is dwarfed and sickly, and seeks the shadiest nooks. At higher levels the vegetation becomes more abundant and varied. Above 8,000 feet the cedars are forested, and the ground is carpeted with rank grasses and an exuberant growth of beautiful summer flowers. The winters there are cool and moist; the winters severe and attended with heavy snow-fall. The Plateau Province is naturally divided into two portions, a northern and a southern. The dividing line is the Uinta range. This fine mountain platform is, in some respects, an important

Vegetation. The region is for the most part a desert of the barrenest kind. At levels below 7,000 feet the heat is intense, and the air is dry in the extreme. The vegetation is very scanty, and even the ubiquitous sage is sparse and stunted. Here and there the cedar is seen, the hardiest of arborescent plants, but it is dwarfed and sickly, and seeks the shadiest nooks. At higher levels the vegetation becomes more abundant and varied. Above 8,000 feet the cedars are forested, and the ground is carpeted with rank grasses and an exuberant growth of beautiful summer flowers. The winters there are cool and moist; the winters severe and attended with heavy snow-fall. The Plateau Province is naturally divided into two portions, a northern and a southern. The dividing line is the Uinta range. This fine mountain platform is, in some respects, an important

one which trends east and west. Starting from the eastern flank of the Wahsatch, the Uintas project eastward more than 150 miles, and nearly join perpendicularly the Park ranges of Colorado. Of the two portions into which the Plateau Province is thus divided, the southern is much the larger. Both have in common the plateau features; their topographies, climates, and physical features in general, are of similar types, and their geological features and history appear to be closely related. But each has also its peculiarities. The northern portion is an interesting and already celebrated field for the study of the cretaceous strata, and the Tertiary lacustrine beds. The southern part of the Plateau Province may be regarded as a vast basin, everywhere bounded by highlands, except at the southwest, where it opens wide and passes suddenly into a region having all the characteristics of the Great Basin of Nevada. The northern half of its eastern rim consists of the Park ranges of Colorado. Its northern rim lies upon the slopes of the Uintas. At the point where the Uintas join the Wahsatch, the boundary turns sharply to the south, and for 200 miles the High Plateaus of Utah constitute the elevated western margin of the Province. A crude conception of this region may be gained by imagining three lines, each 200 miles long, placed in the positions of three sides of a square; the fourth side being for the moment neglected. Upon the eastern side, conceive the Park Ranges of Colorado; upon the northern, the Uintas; and upon the western side, the southern portion of the Wahsatch and the High Plateaus of Utah; and all these highlands having altitudes ranging from 9,000 to 12,000 feet above sea-level, while the included area varies from 5,000 to 7,000 feet in height. The space thus partially bounded may represent the northern part of the southern Plateau Province. Along the line required for the fourth and south side of the complete square there is no boundary. The topography continues on beyond it to the southward, and also widens out both west and east and overpreads an additional area more than twice as great as that already defined. From the eastern coast of the High Plateaus may be obtained an instructive overlook of the northern portion of the southern Plateau country.

Throughout the great carboniferous age the entire area of the Plateau Province was submerged beneath the ocean. Deposition of strata went on continuously, leaving at the close of this age a subaqueous surface, which was exceedingly flat, and, except around the borders of the Province, quite free from any appreciable inequalities. The thickness of the carboniferous system is from 4,500 feet to 5,000 feet in the interior of the Province, but, around its borders, and in the Uinta mountains, it is sometimes found in far greater volume. After the Carboniferous came the Permian age, in which were laid down from 800 to 1,500 feet of sandy shales. The same state of affairs continued through the Trias, during which period sandstone beds were deposited. Directly upon the Trias rests the Jurassic—a wonderful bed of sandstone 800 to 1,200 feet thick, and very white and sugary. Next comes the Cretaceous system—a mass of yellow sandstones with clayey and marly shales, aggregating from 4,000 to 5,000 feet thick. At the close of the Cretaceous period there are evidences that extensive disturbances took place, resulting at some places in the dislocation and flexing of the strata.

The last period of deposition was marked by the accumulation of the Eocene beds. Around the southern flanks of the Uintas their aggregate thickness exceeds 5,000 feet, but southward the upper members disappear, and 80 miles north of the Grand Canon only about 1,000 to 1,200 feet make their appearance. In the course of geological history, this area, which had been a region of deposition and subsidence, became one of elevation and denudation. Since that change took place, the havoc wrought by erosion has been stupendous, the thickness of strata removed exceeding 10,000 feet in some considerable areas, and averaging probably 5,500 to 6,000 feet over the entire Province.

THE GREAT BASIN.

West of the Plateau Province is the Great Basin, so named by Fremont, because it has no drainage to the ocean.

The first general idea of the drainage and principal topographical features of the Great Basin is due to Bonneville, who fitted out a party which started from Green River with the intention of making the entire circuit of Great Salt Lake. This, as Irving Bonnevill states, was a favorite idea of Bonneville's; and in preparing for and his expedition all the resources at his command were taxed. The party, consisting of forty men, did not, however, succeed in carrying out Bonneville's plans, but were driven, by the difficult topography and utter barrenness of the country on the south side of the lake, toward the west, traveling in which direction they soon came upon the head waters of the river called upon Bonneville's maps "Mary or Ogden's," but which is now known as the Humboldt. This river they followed until they found that "it lost itself in a great swampy lake (the sink of the Humboldt), to which there was no apparent discharge." From here the party crossed the Sierra Nevada and made their way to Monterey. Bonneville's party was thus the first to explore and map the route afterward generally followed by emigrants, and along which the Central Pacific—the first trans-continental railroad—was built. The peculiar course of Bear River, here already noticed, was shown on this map, and the general character of the drainage of the Pacific coast was, for the first time, correctly indicated by Bonneville. The first working out of any of the details of the topography of the Great Basin is due to Butler Ives, a topographer in the employ of the Central Pacific Railroad, the directors of this work having been desirous of ascertaining whether there was any practicable route across the Basin other than that through the valley of the Humboldt; which, however, was the one ultimately adopted, all other routes having been found too difficult. Still further and more detailed explorations and surveys were made on the western side of the Basin, first by the California Geological Survey, and later by the United States Engineers; and a belt

Carboniferous age

Sandstone

Geological history.

Bonneville's party.

hundred miles in width was also surveyed across this region, starting from the crest of the Sierra Nevada and going east to the eastern base of the Rocky Mountains. This belt was the field occupied by the Fortieth Parallel Survey under the direction of Clarence King.

The topography of the Great Basin is wholly peculiar, and bears no resemblance to either of the two just mentioned. It contains a large number of ranges, all of which are very narrow and short, separated from each other by wide intervals of smooth, barren plains. The mountains are of a low order of magnitude for the most part though some of the ranges and peaks attain considerable dimensions. Their appearance is strikingly different from the noble and picturesque outlines displayed in Colorado. They are jagged, wild and ungraceful in their aspect, and, whether viewed from far or near, repel rather than invite the imagination.

The Wahsatch, however, is an exception. This noble range is properly a part of the Basin Province, and is one of the finest and most picturesque of the West, but so completely does it contrast with the other basin ranges that it may be regarded as an anomaly among them. Its topographical features of this region are also found outside of the limits which Fremont assigned to the Great Basin, and reach southward towards Arizona, and northward towards Idaho and Oregon.

This Great Basin is of enormous extent, comprising nearly all of Nevada and large parts of Utah, Wyoming, Idaho, Oregon, and California. Instead of being one great basin as its name implies, it consists in reality of a number of smaller basins. It is traversed by a series of narrow ranges, which are in general highly contorted, extending sometimes for hundreds of miles, having a general north and south trend. Between these ranges lie narrow, flat valleys floored with detritus from the mountains. The rainfall over this region is so light, and the atmosphere so dry, that there are few living streams within its whole expanse. The little rivulets which trickle down the mountain side in the spring are absorbed in the valleys at their bases, so that each valley in very many cases is a sink for its own waters. On the east and the west sides, however, at the bases respectively of the Wahsatch and the Sierra Nevada, is a lake, or a series of lakes, into which flow considerable bodies of water from these ranges.

On the east is Great Salt Lake, having an extent of 2,310 square miles, and receiving drainage from an area of 32,490 square miles, the larger part of which consists of high mountains. The rapidity of evaporation in this dry climate is so great that the lake is kept at approximately the same level despite the liberal contributions made to it by its tributary streams.

The middle portion of the basin, along a line running down eastern Nevada, is more elevated than that of the east or the west side, forming a sort of division, or water parting, between the two portions. Such of the waters as do not immediately sink flow off toward the Great Salt Lake on the one side and the sinks at the base of the Sierras on the other. The latter are known as the Carson Lake and sink, Humboldt Lake, Mad and Pyramid Lakes, forming a line along the western part of Nevada.

Into this system of sinks flow not only the streams from the east slope of the Sierras, but the Humboldt River—a stream which rises in northwestern Utah, and, flowing directly across the trends of numberless ranges, receiving more or less water from them all, reaches the Carson sink scarcely larger than at its head.

A third system of sinks may be mentioned, viz., that lying in central Oregon, of which Harney's Lake is the principal one.

It remains to give a slight sketch of the ranges of the Pacific division. They consist of the Sierra Nevada of California, the Cascade range of Oregon and Washington Territory, and the system of Coast ranges which border the Pacific. These ranges have one very marked feature in common: they are almost precisely parallel throughout to the line of the Pacific coast. Trending in the southern half considerably east of south, they turn at about the parallel of 42° to a course almost directly north.

The great mass of the Cascade range has the form of a volcanic plateau of an elevation very little above the country on its eastern border. At intervals along its crest, however, are stationed high volcanic peaks, ranging from 8,000 to more than 14,000 feet above sea-level. Among these may be mentioned Mount Rainier, in Washington territory, 14,444 feet high; Mount Shasta, 14,442 feet high, in California; and Mount Hood, in Oregon, 11,225 feet in height. In northern California, just south of Mount Shasta, the range is very much broken down, and at this point the Pitt River, the head stream of the Sacramento, has cut its way through the range into California. Beyond this gorge again the range continues, with but slight change in its characteristics, until we have passed the head of the Feather River, where its character changes from that of a volcanic range to one of granite and gneiss rocks. With this change comes an increase in elevation, at first gradual, but ultimately attaining enormous proportions about latitude 36° 30'. Here the range has a great breadth, while most of the peaks reach elevations of more than 14,000 feet, and the passes have an elevation of about 12,000 feet. In this region is the highest peak of the Sierras, Mount Whitney, which falls but little short of 15,000 feet, and is the culminating point of this group.

West of the Sierras and the Cascades lies the great valley extending from Puget Sound southward into the lower part of California. It is walled in from the Pacific on the west by the Coast ranges. In Washington territory it is drained by numerous minor streams flowing through the Cascade and the Coast ranges into the Columbia River and Puget Sound. In Oregon it comprises the valley of the Willamette and the upper valleys of the Rogue and the Umpqua Rivers. In California it comprises the valley of the Sacramento and the San Joaquin. These valleys are separated from one another by cross ranges of mountains, which have the character of spurs sent down by the Cascade range, join-

ing the Coast ranges on the west. The great valley is terminated by the westward trend of the Coast ranges and their junction with the Sierra Nevada in southern California.

Of the Coast ranges little need be said, except that they are of Coast minor elevation compared with the eastern part of the system, ranging from 3,000 to 4,000 feet south of the bay of San Francisco to 5,000 or 6,000 feet in the northern part of the State. They have, however, a very important effect in modifying the climate of the great valley—an effect quite as important as that of the Sierra Nevada and the Cascade ranges upon the climate of the region lying to the east of them. Want of navigability is the characteristic of all the streams which drain the Cordillera. Instead of vast stretches open to steam navigation, as with the Mississippi and its tributaries, allowing access to areas 2,000 and 3,000 miles away from its mouth we have the Colorado, which is of little account for the purposes of navigation, the Columbia, with two portages before the Cascade range is crossed, and the Sacramento and the San Joaquin, navigable for moderate sized boats for only a few score of miles. With these exceptions there is no stream of any importance opening access to the interior along the whole Pacific coast. On the other hand, the amount of water-power stored in the streams of the west is fabulous. All the streams fall rapidly through nearly their entire courses, and in and near the mountains there is an abundance of water.

THE APPALACHIAN REGION.

Leaving now the Cordillera, we have next to consider the eastern border of our territory—the northeast and southwest trending mass of ranges—known as the Appalachian region. In this portion of our brief *resumé* of the physical features of the United States we shall have to rely mainly on the labors of others, and especially on those of Prof. Guyot and of Prof. J. P. Leslie, of the Pennsylvania Geological Survey, who have labored with great zeal and ability in making the topography of our eastern border intelligible.

A glance at the map shows that the central portion of North America, from the Gulf of Mexico to the Arctic ocean, is a region of great rivers and lakes, and not of mountains. A sinking of the land of less than 1,000 feet would open a water-way through from north to south; 2,000 feet of such a sinking, or an equivalent rise of the ocean, would divide our territory into two distinct and remote portions. On the east we should have a comparatively narrow belt of land, extending in a northeast and southwest direction from Pennsylvania to Georgia, with groups of outlying islands on the north, especially in about latitude 44°, where the tops of the Green, the White, and the Adirondack mountains would rise in the form of lofty and precipitous islands above the waste of waters. On the west the mass of land remaining uncovered would be of grand, almost continental dimensions, for its breadth would be fully equal to 1,500 miles, narrowing as we followed it northward, while in length, north and south, it would extend entirely across our present territory. The breadth of the ocean separating these masses of land would be not far from a thousand miles.

The Appalachian chain extends from the promontory of Gaspé, Appalachian chain in a general southwesterly direction, for a distance of about 1,300 miles, into Alabama, where it dies out, and is buried under the horizontal strata of more recent geological formations, which cover nearly the whole surface of that state. The base from which this chain rises on the eastern side is the Atlantic seaboard, which, in the early history of the United States, seemed to be the whole country, and which is still commercially the most important, and is the seat of our largest cities. The plain is slightly inclined toward the Atlantic, and its elevation above the sea is inconsiderable. In New England it hardly exceeds 300 to 400 feet; but toward the south, after passing the bay of New York, where it is nearly at the sea level, it gains in altitude, and also in width, finally attaining a height of a thousand feet at the base of the mountains and a breadth of some 200 miles. The western base of the Appalachian range is a plateau region, which descends gradually toward the great lakes and the tributaries of the Ohio, having a general elevation of a thousand feet or more, but deeply gashed by the streams which traverse it and run in valleys depressed from 300 to 500 feet below the general level of the country.

The Appalachian chain presents, in many of its features, a most marked contrast to the Cordillera just described. Prof. Guyot calls attention to a conspicuous feature of the most folded portion of the Appalachians, characterizing the chain through its entire length; that is, the existence of a great central valley, running through the system from northeast to southwest, which can be traced without difficulty, although not perfectly uniform in its development. It is the Lake Champlain and Hudson River valley in New York, the Kittatinny valley of Pennsylvania, the great valley of Virginia, and finally still farther south, the valley of East Tennessee. The chain, or the system of chains, bordering this central depression on the southeast is also a persistent feature of the Appalachian system; for it extends, with but few interruptions, from Vermont to Alabama, being known by a variety of names as it passes from one state into another. It is the Green Mountain range of Vermont, the Highlands of New York, the South Mountains of Pennsylvania, the Blue Ridge, of Virginia, and, finally, the Iron, Smoky, and Unaka mountains of North Carolina and Tennessee.

Possessing these features in common as a whole, the Appalachian chain presents three subdivisions, each exhibiting its own well-marked peculiarity of structure. These are the northern, extending from Gaspé to the Hudson; the middle, from New York to the Kanawha, or New river, in Virginia; the southern from New river to the southwestern extremity of the system. Each of these subdivisions has its peculiar curvature of general direction. The northern trends to the north from the Hudson river to near the Canada line, there bends to the eastward, sweeping a great

curve, so as to present on the whole its concavity to the southeast; the middle subdivision also curves quite regularly, the ridges trending from east and west around to southwest, so that the concavity faces the Atlantic shore; while the most southern portion of the range, from New river southward, bends to the west again, so as to form a gentle curve concave toward the northwest.

The most northern division of the three is quite distinct from the one next south, both geographically and geologically. It includes all the mountain groups and ranges north and east of the valleys of the Mohawk and the Hudson rivers, which make a complete break through the system, both vertically and longitudinally, forming the great natural highway between the east and the west, or between the great lakes and the Atlantic seaboard. This was the first route across the country which was traversed by canal and by railroad. So complete is the physical break here that a rise and of the ocean of 400 feet only would separate all the extensive region of the included between the St. Lawrence, the Atlantic ocean, and the Hudson and Mohawk valleys into a great island entirely detached from the rest of the continent. A rise of only 140 feet only would detach all that country which lies east of the Hudson and Lake Champlain.

geograph-
ical treat-
ment.

In any geographical treatment of this eastern group of the Appalachians the subdivisions taken will necessarily be rather artificial, for the mass of elevation is very irregular in its development. The most continuous ranges are the White mountains, the Green mountains, and the Adirondacks. Of the first-named group Mount Washington is the culminating point, 6,288 feet high; of the last mentioned, Tahawas, or Mount Marcy, with an altitude of 5,379 feet, is the dominating peak. Greylock, in Massachusetts (3,505 feet), and Mount Mansfield, in Vermont, 4,431 feet, are the highest points in those states.

The line of summits extending through Massachusetts and New Hampshire, beginning with Wachusett, on the south, and extending up to the White mountains, through Monadnock, Saco, Kearsarge, and other peaks, is broken and irregular. Both the White mountains and the Adirondacks are rather isolated masses, while the Green Mountains proper are in more intimate connection with the Canadian range, which terminates in Gaspé.

The central division of the Appalachian chain extends from the Hudson river to the Kaowaha, which makes an almost complete cut across the chain, heading in the Blue Ridge, and marking an important change in the character of the topography. This central division is about 450 miles in length. It is very narrow toward its northern end, but widens out in Pennsylvania, decreasing again in Virginia. It is composed of a considerable number of subordinate chains, each curved toward the west, and remarkable for their regularity, their parallelism, their abrupt declivities, and their moderate elevation, both relative and absolute, which rarely rises to 2,500 feet above the sea-level.

West of this division of the Appalachian chain is the great plateau, which occupies all that part of New York which lies south of the Mohawk, and also the northwestern part of Pennsylvania, and reaches an elevation near Lake Erie of 2,000 feet. From this table-land the drainage descends by the great lakes to the St. Lawrence to the Gulf of Mexico by the Ohio, and to the Atlantic by the Susquehanna, which breaks across the whole chain, finding its way in the most unexpected manner through gaps in the different ranges.

The topography of the Appalachians in Pennsylvania has been carefully worked out by the State Geological Survey, and it is so remarkable in its character that some additional details may with propriety be given in regard to that portion of the chain.

According to Prof. H. D. Rogers, the mountain-zone of Pennsylvania may be divided into five well-marked parallel belts, which are as follows, when enumerated in order from the east toward the west: 1st. The South mountains, already mentioned as being the continuation of the Highlands of New York, and the equivalent of the Blue Ridge of Virginia. 2d. The great Appalachian valley. 3d. The central Appalachian ridges, or the Appalachian chain proper. 4th. The sub-Appalachian valley. 5th. The Alleghany Mountain, or the southeast escarpment of the Alleghany plateau.

The South Mountains have already been alluded to as part of the system of ranges bordering the great central depression of the Appalachians on the east. In Pennsylvania this belt consists of two detached ranges of hills, one of which is the prolongation of the New York Highlands, the other the northeastern termination of the Blue Ridge. Both of these groups of hills have a moderate elevation in Pennsylvania, hardly exceeding 600 or 700 feet.

The Appalachian valley, or Kittatinny valley, as it is usually called in Pennsylvania, stretches from the Delaware to Maryland, forming a part of the great central valley previously mentioned. It has an elevation of from 200 to 600 feet, and forms a broad, moderately undulating plain, having a width of from 10 to 18 miles. This valley is, beyond doubt, one of the most favored parts of our country—climate, soil, mineral resources, and scenery all combining to make it attractive to settlers.

The third division, or the Appalachian chain proper, may be thus described, using nearly the language of Professor H. D. Rogers: It is a complex chain of long, narrow, very level mountain ridges, separated by long, narrow, parallel valleys. These ridges sometimes end abruptly in swelling knobs, and sometimes taper off in long, slender points. Their ravine or gully for many miles; in other instances, they are treched at equal intervals with great regularity. Their crests are, for the most part, sharp, and they preserve an extremely equable elevation, being only here and there interrupted by notches or gaps, which sometimes descend to the water-level, so as to give passage to the rivers. The whole range is the combined result of an elevation of the strata in long, slender, parallel ridges, wave-like in form, and of excessive erosion of them by water; and the present configuration of the

surface is one which demonstrates that a remarkable and as yet little understood series of geological events has been concerned in its formation. The ridges, which are but the remnants of the eroded strata, are variously arranged in groups, with long, narrow crests, some of which preserve remarkable straightness for great distances, while others bend with a prolonged and regular sweep. In many instances, two narrow, contiguous parallel mountain crests unite at their extremities and inclose a deep, narrow, oval valley, which, with its sharp mountain sides, bears not unfrequently a marked resemblance to a long, slender sharp-pointed canoe.

Between the Appalachians and the Rocky Mountains there are within our borders no connected masses of mountain ranges; isolated hill-ranges rise like islands at various points, as in Missouri and Arkansas, and there are a few short ranges on the south shore of Lake Superior.

North of the great lakes and the St. Lawrence, however, there is the dividing ridge which separates the waters flowing into the last named stream from those which run into Hudson's bay. This is an imperfectly known region, wonderfully cut up by rivers and dotted with lakes. The highest point of the Laurentian range, as these mountains are called, is supposed to be where the Saguenay cuts the chain, and 4,000 feet is given as the approximate elevation, while peaks in the parallel ridges nearer the St. Lawrence exceed half that height. Among the summits ~~soo~~ with such picturesque effect from Quebec, Mt. St. Ann is the highest, and the elevation is given by Bayfield at 2,687 feet.

This range falls off in elevation as we follow it west, and in the country between the Ottawa and lake Huron the highest summits do not appear to exceed 1,500 to 1,700 feet. The range is made up of rounded hills, densely wooded on its highest portion, almost exclusively with coniferous trees. Its valleys are very wide and full of great ponds and lakes, so that one may traverse almost the whole region with the aid of the birch canoe. Sir William Logan noted, in 1863, that over a thousand lakes have already been laid down on the maps of the Canadian portion of the Laurentian mountains, although the region had been as yet only imperfectly explored.

East of the Appalachian system, and separating it from the Atlantic, is the strip of country known as the Atlantic plain. This Atlantic is the portion of the United States first occupied, and it is to-day Plains, the most densely settled portion of the country. In New England this region has a widely varying breadth and rough, irregular surface, while its soil in general is not sufficiently rich to enable the farmers of this region to compete successfully in the production of wheat or corn with those of the Mississippi valley.

The breadth of the Atlantic plain is least about the bay of New York, the ranges of the Appalachian system here reaching nearly to the sea-coast. Southward from this point it increases gradually in breadth, till it reaches its maximum in South Carolina and Georgia. This part, which comprises by far the larger portion of the Atlantic plain, has a very uniform, gentle slope from it which of the mountains to the sea. The only feature about it which requires notice is the line of separation between the metamorphic and the formations, extending eastward from the Appalachians, and the recent stratified beds. This line is marked very generally by falls or rapids in the streams flowing seaward, which are in many cases the sites of valuable water-powers, and mark the head of navigation in all streams of any considerable size, as in the Potomac at Georgetown, and in the James at Richmond.

The general character of the coast line may be briefly described. In Maine it is bluff and rocky, with deep water immediately off shore, and it is deeply indented by numerous bays and arms of the sea. These in turn are dotted by hundreds of islands of the greater or less size. Proceeding southward, the character of the coast gradually changes from this bluff, rocky nature at first to sandy beaches, as in Massachusetts and on Long Island, with small extents of coast swamp. This character develops farther in New Jersey, so that we have along the whole coast a line of sandy islands or reefs, back of which are coast marshes and swamps. The general character of these is briefly described by Professor Cook in his volume on the geology of New Jersey, under the head of "Tide Marshes":

They are of very recent origin, and, in fact, are formed largely within the memory of the present generation. The interval between high-water mark on the shore and the beaches or barriers on the sea-side is mainly occupied by marsh. There are between 250,000 and 300,000 acres of marsh on the coast of New Jersey. The marshes are covered with grass, weeds, or coarse sedge; there is no growth of wood upon them; the upper surface is near the level of high water, the parts near the water-course being high enough not to be covered by ordinary tides, while the parts more remote from the water-course are lower, so as to be always wet. Underneath, the sod which covers them is made of soft earth of various qualities; the depth of this underlying mud is variable; all, however, coming within the extreme depth of 40 feet.

Farther southward the breadth of this swamp section along the coast increases. On the eastern shore of Maryland there is inside of the line of reefs a section, several miles in breadth, of swamy and overflowed land—a paradise for sea fowl and for the hunter, and besides innumerable swamps.

In North Carolina the reefs inclose, such as Pamlico and Albemarle regions, large bays or sounds, such as Pamlico in this state is well given. The character of the swamps and reefs of this state is well given by Professor W. C. Kerr (*Geology of North Carolina*, vol. 1, 1875),

The chain of long, linear sand islands constitutes a very remarkable feature of the entire coast, constitutes a drifting sands, they form an impregnable barrier to the waves of the Atlantic. They are, in fact, sand dunes of various elevations, from a few feet above tide level (in many cases broken over by storm tides) to 25 or 30 feet, and sometimes more, as in Killdeer hills, along Currituck sound. The breadth of these islands varies from a few rods to

more than 2 miles. The largest of them, and the widest, is known as Hatteras island, the easternmost point of which is the well-known cape Hatteras. These islands are composed partly of flat marshes and partly of swell- and ridges of beach-sand, which the wind has heaped in ridges, often far beyond the reach of the highest waves.

As the sand and comminuted shells are rolled back in waves from the beach by the winds, they are in part caught and fixed by trailing tufts of coarse grass, which has the power of continuous growth upward with the rise of the knobs and ridges of sand, and they are in part carried over into the flats and marshes and the shallow sounds beyond, which are thus gradually silting up. The banks are generally covered with low, scrubby thickets of cedar, live-oak, pine, yaupon, myrtle, and a number of smaller shrubby growths.

Swamps, pocosins, and savannas—There is a large aggregate of territory (between 3,000 and 4,000 square miles), mostly in the counties bordering on the sea and the sounds, known as swamp lands. They are locally designated "dismals," or "pocosins," of which the Great Dismal Swamp, on the borders of North Carolina and Virginia, is a good type. They differ essentially in their characteristic features from an ordinary swamp. They are not alluvial tracts, or subject to overflow. On the contrary, they are situated on the divides or water-sheds between the rivers and sounds, and are frequently elevated many feet above the adjacent streams, of which they are the sources. Some of them are in large part peat swamps or bogs, being characterized by the occurrence of an accumulation of decayed and decaying vegetation, from 1 or 2 to 10 feet deep and even more, which, with the growing plants, acts as a sponge, arresting or retarding the escape of the rain-water, whether by evaporation or efflux. The prominent ingredients are peat and fine sand, in various proportions, and, when of any agricultural value at all, there are also small proportions of clay, iron, lime, and alkalis. The vegetation varies with the character of the soil, and serves, therefore, as an index of its fertility. The prevalent growth of the best swamp soils is black gum, poplar, cypress, ash, and maple. As the soil becomes more peaty, the proportion of cypress increases. Where juniper abounds peat is in excess, and the soil of little value or none. On the best lands there is often besides a rank growth of canes; but such a growth is also often found on soils too peaty to be of any value. Much of the poorest and most worthless tracts of swamp, which are covered with several feet of half-decayed wood and other vegetable matter saturated with water, is occupied by a stunted and scattered growth of bay, swamp pine, and other scrubby vegetation; or, if the drainage be a little better, with a thickety growth of bays, galberries, and a few other shrubs, with an occasional pine and maple. Most of the large bodies of swamp contain lands belonging to all these descriptions, and inclose, besides, within their boundaries, knolls, hummocks, belts, and ridges, like islands, of firm land, and some of them large areas of barren, sandy soil, covered with a tangle of brambles and tufts of sedge, and in the middle of several of them occur fresh-water lakes of considerable extent.

These swamps are, taken as a whole, quite well settled, a large proportion of the inhabitants being colored. This is particularly the case in South Carolina, in which state much of the swampy lower coast region is utilized for rice plantations. The Okefenokee swamp, of Georgia and Florida, is rather an inland swamp, and is described elsewhere. The Everglades of Florida, which appear to offer great difficulties to settlement, are also sketched in another part of this report. The swampy region along the coast extends, with but few minor interruptions, all the way down the Atlantic coast and around the Gulf. It is not, however, so markedly characteristic along the Gulf coast in Alabama and Mississippi as farther west. In Louisiana it has a great breadth, and is almost uninhabitable. In Texas, although the character of the coast continues to be the same so far as relates to the line of low, sandy, outlying islands, yet the area of the coast swamp becomes very much less, being confined to a small patch about the Sabine lake and narrow strips along a number of the streams. Whether it is due to geological causes, or to the lighter rainfall upon this section of the coast, is a question which there is not space to discuss here.

The broken, irregular course of the whole Atlantic and Gulf coast affords many excellent harbors, particularly on the New England coast, where the harbors are large, deep, and well-sheltered; farther southward the entrances are narrow and shelving, and are liable to be choked up by sand drifted in by storms. The streams in nearly all cases form bars across their mouths, formed by the detritus brought down from the upper waters.

The Pacific coast, as compared to the Atlantic, is extremely simple. It contains few harbors of any value to navigation. Those of San Diego and San Francisco are the principal and almost the only ones. The coast is, in general, bluff and rocky, and the water is deep immediately off shore.

THE POLITICAL AND NATURAL SUBDIVISIONS.

Having given a description of the physical character of the area covered by the United States, without reference to political divisions, it becomes necessary to state how this region is divided politically, and how these divisions can be grouped, in a manner as natural as possible.

Some difficulties are thrown in the way of such a subdivision of the country as shall meet with general acceptance by the fact that some of the States and Territories are so large that they include areas of very different physical character; and also because a nomenclature was introduced, and extensively made use of, when one half the present area of the country was so little known or considered that a name for it was not thought of as being necessary.

The area of the United States is at present divided into forty-

nine subdivisions, excluding Alaska. There are forty-four States, three Territories, and two other subdivisions, neither States nor Territories—the District of Columbia and the Indian Territory.

Any Territory is likely, at any time, to be received into the Union as a State; and this may be done by subdividing the Territory, making a State of one portion and allowing the remainder to remain in a Territorial condition, or by admitting the whole as one State, or by dividing it into two or more States. Only once has a State been divided after having been received into the Union—namely, Virginia—and this was the result of the Civil War; and it is not possible to say under what circumstances such a thing is likely to happen again. Nor has any State been remanded back to the Territorial condition after having been received into the Union; although one State—Nevada—has less than half the population required for the election of one representative to Congress, according to the last apportionment, based on the census of 1880. There is, in fact, no provision in the Constitution for this exigency.

The desirability of grouping these forty-nine political divisions (Alaska being omitted as not continuous with the rest of the United States) according to their geographical situation and topographical and climatic conditions, so that different regions may be spoken of by some collective name, will be evident to all.

The plan suggested for the subdivision of the area included within the United States by Mr. Gannett, geographer of the census of 1880, was "to divide the country into three great divisions, corresponding to the three primary topographical divisions of the country: the Atlantic region, the region of the Great Valley, and the Western or Cordilleran region." The physical character of these different regions has already been indicated at some length in the preceding pages. The region of the Great Valley is called by Mr. Gannett the Central Region, which is again subdivided into two parts—the Northern Central and the Southern Central—the Ohio River and the southern boundary of Missouri and Kansas being the dividing line. The Atlantic Division is also divided by him into two subdivisions by a line following the south boundary of Pennsylvania and New Jersey—these two subdivisions being called, respectively, the North Atlantic and South Atlantic divisions. On the east, the Western or Cordilleran division is marked by the eastern boundaries of New Mexico, Colorado, Wyoming and Montana.

The following table shows the area of each of these divisions in square miles and in percentage of the entire area of the United States:—

| | Area. | Percentage of total area. |
|--|-----------|---------------------------|
| North Atlantic..... | 168,765 | 5.6 |
| South Atlantic (including Delaware Bay)... | 283,155 | 9.4 |
| Northern Central..... | 765,855 | 25.3 |
| Southern Central..... | 614,550 | 20.3 |
| Western..... | 1,193,275 | 39.4 |
| Total..... | 3,025,600 | 100.0 |

[In the Western Division, as here limited, Mr. Gannett includes an area of 5,740 square miles of "unorganized territory," lying north of Texas and west of the Indian Territory.]

The adoption of this scheme of subdivision of the country does not the less render desirable and convenient for various purposes a different nomenclature for certain regions, based more exclusively on geographical position. Thus the States bordering on the Gulf of Mexico will naturally often be spoken of as the Gulf States; the region of the Great Lakes will be so designated, and this again subdivided into the Upper and Lower Lake Regions; while each great river will give a name to its own adjacent region, as the Ohio Valley, the Upper and Lower Mississippi Valley, the Upper Missouri, etc.

Appended is a statement of the names of the political divisions included in each subdivision of the United States, as suggested by Mr. Gannett:

| Division. | Subdivision. | States Within Subdivision. |
|-----------|-------------------|--|
| Atlantic. | North Atlantic. | Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania. |
| | South Atlantic. | Delaware, Maryland, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida. |
| Central. | Northern Central. | Ohio, Indiana, Illinois, Michigan, Wisconsin, Minnesota, North Dakota, South Dakota, Iowa, Nebraska, Kansas, Missouri. |
| | Southern Central. | Kentucky, Tennessee, Alabama, Mississippi, Arkansas, Indian Territory, Louisiana, Texas. |
| Western. | | Montana, Idaho, Wyoming, Colorado, New Mexico, Utah, Nevada, Arizona, Washington, Oregon, California. |

The tabular statement following gives for the States and Territories a *resume* of their areas, population in 1880 and 1890, population per square mile at the latter date, and the increase per cent. during the decade 1881-90. The Territories are given in italics in the table.

POLITICAL AND NATURAL DIVISIONS.

AREAS AND POPULATION—CENSUS OF 1890.

| States and Territories. | Area, in Square Miles. | Population, 1880. | Population, 1890. | Per Sq. Mile. | Increase Per Cent. 1880-1890. |
|-------------------------|------------------------|-------------------|-------------------|---------------|-------------------------------|
| | | | | | |
| Alabama..... | 51,540 | 1,262,605 | 1,508,673 | 29.3 | 19.5 |
| Arizona..... | 112,920 | 40,440 | 59,691 | 0.6 | 47.5 |
| Arkansas..... | 53,045 | 802,525 | 1,125,385 | 21.2 | 40.2 |
| California..... | 155,980 | 661,694 | 1,204,002 | 7.7 | 39.2 |
| Colorado..... | 103,645 | 194,327 | 410,974 | 3.9 | 111.5 |
| Connecticut..... | 4,845 | 622,700 | 745,861 | 153.9 | 39.8 |
| North Dakota..... | 71,100 | 36,990 | 182,425 | 2.6 | 393.2 |
| South Dakota..... | 76,620 | 98,238 | 167,871 | 4.3 | 235.7 |
| Delaware..... | 1,960 | 146,600 | 167,871 | 85.7 | 14.5 |
| Dist. of COLUMBIA..... | 60 | 177,624 | 229,796 | 3829.9 | 29.4 |
| Florida..... | 54,240 | 269,493 | 390,435 | 7.4 | 44.9 |
| Georgia..... | 58,980 | 1,542,180 | 1,834,566 | 31.1 | 18.9 |
| Idaho..... | 84,290 | 52,610 | 84,229 | 1.0 | 158.3 |
| Illinois..... | 56,600 | 3,077,871 | 3,818,536 | 68.2 | 24.1 |
| Indiana..... | 35,910 | 1,978,301 | 2,189,030 | 60.7 | 10.7 |
| Iowa..... | 55,475 | 1,624,615 | 1,966,729 | 34.4 | 21.7 |
| Kansas..... | 81,700 | 996,096 | 1,423,485 | 17.4 | 42.9 |
| Kentucky..... | 40,000 | 1,649,690 | 1,855,436 | 46.4 | 12.5 |
| Louisiana..... | 45,420 | 939,946 | 1,116,528 | 22.1 | 18.8 |
| Maine..... | 29,895 | 648,436 | 640,281 | 105.1 | 1.7 |
| Maryland..... | 9,860 | 934,843 | 1,040,431 | 106.5 | 11.3 |
| Massachusetts..... | 8,040 | 1,783,685 | 2,233,407 | 277.8 | 25.2 |
| Michigan..... | 57,430 | 780,773 | 1,300,017 | 36.4 | 27.7 |
| Minnesota..... | 75,205 | 1,131,517 | 1,294,887 | 17.4 | 13.5 |
| Mississippi..... | 46,340 | 2,168,380 | 2,577,080 | 38.9 | 23.4 |

* This includes "Unorganized Territory." † Estimate.

CLIMATE.

In endeavoring to set forth the principal features of the climate of the United States, it will be assumed that the reader has made himself acquainted with the topography of the country, as briefly indicated in the preceding pages. The great influence which certain of these features have on the distribution of the winds, the rainfall, and the temperature will be sufficiently apparent from that which follows.

The United States extends from the tropics north across the temperate zone, and from sea-level to an elevation of over 14,000 feet—an elevation which carries with it an arctic climate. The mean annual temperature ranges over more than 40° F., while the extremes of recorded temperature run from 55° below zero

up to a maximum above 115°. The mean temperature of the hottest month, of the year, July, ranges from below 60° to above 90°, while the mean temperature of the coldest month ranges from zero to more than 65°. Were the country a plain, the mean temperature of the year would be almost purely a question of latitude; a difference of elevation, however, especially when it takes the form of a mountain range, causes a deflection southward of the isothermals, an abrupt rise of about 300 feet of elevation implying a decrease of annual temperature of one degree. Thus we find that the Appalachian system causes a very marked deflection to the southward of the isothermals. On the plains, however, where the upward slopes are very gradual, it is to be noted that the elevation causes little or no deflection southward of the lines of temperature, the plains and plateaus generally having a mean annual temperature nearly or quite as high as points in the same latitude in the Mississippi valley or on the Atlantic coast. The temperature of the great western plains and plateaus is, however, modified locally to a marked extent by the exposure to west and northwest winds, which have an unbroken sweep in some places for hundreds of miles, acquiring tremendous force. Attention should be called here to the well-known fact that the climate of central Montana, including most of the settlements on the upper Missouri, is abnormally warm. It lies at a comparatively low elevation, being only 3,000 to 4,000 feet above sea-level, and is sheltered from the fierce westerly winds by the Missouri range, while the northerly winds, to which it is exposed, come from the moisture plains of the Saskatchewan.

The two maps showing the mean temperature of the warmest month, July, and the mean temperature of the coldest month, January, as given in the United States Census for 1880, Vol. 1—illustrate, though only to a limited extent, the range of temperature in different sections of the country. The former shows a comparatively limited number of grades, running from 60° to 80°, the lines following approximately the parallels of latitude, except where deflected by mountain masses. The influence of the coast in averaging the climate is distinctly perceptible on this map. There is apparently a northward movement of the temperature lines in the Cordilleran region, showing that in the summer the temperature is abnormally high in this arid section. These characteristics are illustrated conversely by the January map, which also shows the influence of the sea and other large bodies of water, while in the Cordilleran region the temperature lines are borne southward by the aridity and consequently extreme character of the climate. The fourth of these temperature maps, showing a generalization from the highest recorded readings of the thermometer, coupled with the fifth map, which shows a similar generalization with regard to the minimum temperature, illustrates the extreme range of the thermometer in different parts of the country. In the former we see a belt running along the seacoast from Maine to Texas, where the thermometer never rises above 100°, while within it is a region, stretching from New York southward along the Atlantic plain and the lower Mississippi valley, where the maximum reaches 105°, thus illustrating in the clearest manner the effect of the sea in averaging the temperature. The same thing is illustrated, though not so markedly, upon the map of minimum temperatures.

The fourth map shows also another peculiar characteristic, viz, the fact that as we pass up the slope of the plains the maximum temperature increases, not on a parallel, as in the case of the mean annual temperature, but approximately on a contour or on a meridian, being apparently proportional to the aridity of the atmosphere and the amount of rainfall. This characteristic is, to a certain extent, disguised in the heart of the Cordilleran region by reason of the great diversity of surface which is encountered there, but in general it holds good throughout.

The map showing minimum temperatures is not so clear on these points. Its lines follow parallels more nearly; but there is a marked deflection toward the southwest as we pass westward from the Mississippi valley. The characteristics of this map are still further concealed by the effect of the details of topography in the Cordilleran region. A marked change in temperature, as well as in rainfall, takes place at the crest line of the Sierra Nevada and the Cascade range. This change is not particularly apparent in the mean annual temperature, but on the map showing the temperature of July and January it is quite apparent, being shown by the slight difference between the mean temperature of July and that of January is but 10°. This effect is still more marked in the last two maps, where, in the Mississippi valley, the range between maximum and minimum averages 110°, and in the Cordilleran region 125°. On the Pacific coast it decreases to only 60°, showing that this section of the country enjoys by far the most uniform climate as regards temperature.

The material for these temperature and rainfall maps was drawn mainly from "Temperature Tables" and "Rainfall Tables" prepared by Professor Charles A. Schott, and published by the Smithsonian Institution. The map of mean annual temperature was compiled, very largely, directly from Mr. Schott's admirable chart in the first of the above-mentioned volumes. The rainfall maps were prepared previous to the publication of the last edition of the Smithsonian "Rainfall Tables," and, as much new material had been collected in addition to that published in the first edition, the maps were plotted from original sources.

No less than 98 per cent. of the total population lives between 40° and 70° F. of mean annual temperature, leaving a very small proportion to be distributed among the other sections. Of these groups, those having a temperature above 55° contain the entire cotton region; those above 70°, the sugar and rice regions; while between 50° and 60° is comprised most of the tobacco region. The prairie region of the Mississippi valley lies almost entirely below 55°, while the great wheat region of Minnesota and Dakota is mainly below 40° of mean annual temperature.

The hottest part of the country is, naturally, the southern end of Florida, the southern Texas and southwestern Arizona come next in degree of temperature.

A rough computation shows that the mean annual temperature of the country is about 50° F., to which the location of the population almost precisely corresponds, differing from it by only a fraction of a degree.

We give below a table prepared by selection from the voluminous records of the recent work on American temperature, showing the mean annual temperature of the atmosphere at a given point in each of the forty-nine States and Territories of the Union. The place is selected either the capital or some leading city or town where observations have been most continuously kept:

| State or Territory | Place of Observation | Mean annual temperature | State or Territory | Place of Observation | Mean annual temperature |
|----------------------|----------------------|-------------------------|--------------------|----------------------|-------------------------|
| Alabama | Mobile | 69° | Mississippi | Jackson | 61° |
| Alaska | Sitka | 46° | Missouri | St. Louis | 59° |
| Arizona | Pucson | 69° | North Carolina | Raleigh | 63° |
| Arkansas | Little Rock | 63° | Ohio | Columbus | 50° |
| California | San Francisco | 55° | North Carolina | Charlotte | 63° |
| Colorado | Denver | 48° | Ohio | Cincinnati | 52° |
| Connecticut | Hartford | 50° | Ohio | Columbus | 50° |
| Delaware | Wilmington | 53° | Ohio | Columbus | 50° |
| District of Columbia | Washington | 51° | Ohio | Columbus | 50° |
| Florida | Jacksonville | 69° | Ohio | Columbus | 50° |
| Georgia | Atlanta | 62° | Ohio | Columbus | 50° |
| Idaho | Boise | 52° | Ohio | Columbus | 50° |
| Illinois | Springfield | 51° | Ohio | Columbus | 50° |
| Indiana | Indianapolis | 51° | Ohio | Columbus | 50° |
| Indian Territory | Fort Gibson | 61° | Ohio | Columbus | 50° |
| Iowa | Des Moines | 49° | Ohio | Columbus | 50° |
| Kansas | Topeka | 51° | Ohio | Columbus | 50° |
| Kentucky | Louisville | 58° | Ohio | Columbus | 50° |
| Louisiana | Baton Rouge | 68° | Ohio | Columbus | 50° |
| Maine | Portland | 45° | Ohio | Columbus | 50° |
| Maryland | Baltimore | 48° | Ohio | Columbus | 50° |
| Massachusetts | Boston | 45° | Ohio | Columbus | 50° |
| Michigan | Lansing | 47° | Ohio | Columbus | 50° |
| Minnesota | St. Paul | 42° | Ohio | Columbus | 50° |
| Missouri | St. Louis | 59° | Ohio | Columbus | 50° |
| Montana | Helena | 42° | Ohio | Columbus | 50° |
| Nebraska | Omaha | 49° | Ohio | Columbus | 50° |
| Nevada | Carson City | 49° | Ohio | Columbus | 50° |
| New Hampshire | Concord | 40° | Ohio | Columbus | 50° |
| New Jersey | Trenton | 51° | Ohio | Columbus | 50° |
| New Mexico | Santa Fe | 51° | Ohio | Columbus | 50° |
| New York | Albany | 48° | Ohio | Columbus | 50° |
| North Carolina | Raleigh | 63° | Ohio | Columbus | 50° |
| Ohio | Columbus | 50° | Ohio | Columbus | 50° |
| Oregon | Portland | 52° | Ohio | Columbus | 50° |
| Pennsylvania | Harrisburg | 50° | Ohio | Columbus | 50° |
| Rhode Island | Providence | 48° | Ohio | Columbus | 50° |
| South Carolina | Columbia | 62° | Ohio | Columbus | 50° |
| Tennessee | Nashville | 60° | Ohio | Columbus | 50° |
| Texas | Austin | 67° | Ohio | Columbus | 50° |
| Vermont | Montpelier | 43° | Ohio | Columbus | 50° |
| Virginia | Richmond | 60° | Ohio | Columbus | 50° |
| Washington Territory | Spokane | 51° | Ohio | Columbus | 50° |
| West Virginia | Martinsburg | 51° | Ohio | Columbus | 50° |
| Wisconsin | Madison | 42° | Ohio | Columbus | 50° |
| Wyoming | Fort Bridger | 41° | Ohio | Columbus | 50° |

The position of the isothermal lines in the United States may now be noticed; and in this connection the influence of the topography of the country becomes at once extremely apparent. The isothermal lines of the mean annual temperature have quite a marked regularity from the Atlantic coast west to the foot of the Rocky Mountains, being in general only slightly modified in their direction, which is nearly east and west. This indication of a change of temperature, essentially dependent on that of latitude, is in striking contrast with the condition of things on the Pacific coast, as will be seen farther on. But as soon as the Cordilleran region is reached, the isothermal lines are bent away from their east and west course, and become irregular and often concentric in their passage across the various mountain ranges.

By the character of these isothermal lines, three climatic divisions of the United States are suggested: 1. The Eastern Region, including all the territory lying east of the foot of the Rocky Mountains; 2. The Plateau and Mountain Region of the Cordilleras; 3. The Narrow belt on the Pacific coast, west of the Cascade and Sierra Nevada Ranges.

The Eastern division is, of course, by far the most important and best known in its details, since it is that region where the statistics go back the farthest, and where the population and wealth are concentrated. Its climatic conditions will, therefore, first be considered. As the topographical features of this division are simple, and do not anywhere interpose any very decided or not easily overcome barrier to the movement of the people, so the climate partakes of a similar character, the passage from one type to another being gradual and decidedly uniform, although rapid.

The isothermal lines of mean annual temperature of 44° and 72°, include nearly the entire area of the United States. The corresponding degrees of latitude are about 45° and 29°, so that the average change of temperature with the latitude is a trifle over 1° 6' for each degree of latitude. The importance of this rapid change of temperature with the latitude, with reference to the intellectual and commercial development of the country is obvious, and has been already pointed out by eminent climatologists.

The isothermal of 72° passes through the center of Florida; then, entering Texas, is suddenly deflected southward, running parallel with the isothermals of 68° and 64° to the boundary line of Mexico. The isothermal of 76° crosses the extreme south end of

Florida, almost on the parallel of 25°. The isothermal of 68° enters Florida just below the parallel of 31°, and crossing the state in an almost direct east and west line, passes through the southern part of Alabama, Mississippi, and Louisiana, and into Texas, to the meridian of 102°, where it is suddenly deflected southward to the boundary line of Mexico. The isothermal of 64° enters the United States on the South Carolina coast. It passes in a westerly direction very nearly on the parallel of 33° as far west as the meridian of 100°, when it is deflected southward, like the other isothermals, by the gradually increasing elevation of the Plateau Region. The isothermal of 60° is, in its general course, parallel with that of 64° except that the deflection to the south between the meridians of 83° and 87° is greater, owing to the influence of the lofty southern extremity of the Appalachians. It traverses North Carolina, South Carolina, Alabama; passes into the southern part of Tennessee; is deflected into Mississippi, then enters Tennessee again, passing across Arkansas and the Indian Territory into New Mexico, when it is deflected toward the south, making two loops as it runs nearly coincident with the meridian of 101° to the parallel of 31° in Texas, when it again bends to the west, and, after a south-west course, is deflected toward the north-west. The isothermal of 56° enters the United States on the Maryland coast. Its general direction to the meridian of 87° is south-west. Here, in central Alabama, it is deflected to the northeast, following this general direction to the parallel of 35° in Kentucky, when it bends again to the west and runs in an almost direct westerly course to the meridian of 101°, where it is deflected to the south, passing through New Mexico into Texas, where it suddenly bends back to the north, and, after making a long loop in New Mexico, passes in a north-westerly course across Arizona. The isothermal of 52°, west of the Appalachians runs almost coincident with the Ohio river as far as Cincinnati, then in an undulating course passes in a nearly westerly direction through Indiana, Illinois, Northern Missouri, and near the northern boundary of Kansas to the eastern border of Colorado, where it is deflected to the south, and runs in a direction nearly south by west for a distance of fully five hundred miles along the eastern base of the Rocky Mountains. A large area is included between the isothermals of 44° and 52° It comprises: New England, except the larger part of Maine, New Hampshire and Vermont; the southern and central portions of New York; Pennsylvania; nearly all Ohio; the northern two-thirds of Indiana and Illinois; the southern half of Michigan and Wisconsin; nearly all Iowa; the southeastern corner of Minnesota; nearly the whole of Nebraska; and the southern third of Dakota. The isothermal of 40° enters the United States on the eastern border of Maine, and, passing through the center of the state, traverses the northern end of New Hampshire and Vermont. It then passes out of the United States, but enters the country again at the western end of Lake Superior, crossing the central part of Minnesota, bending to the south on the meridian of 97°, and making a large loop in Eastern Dakota, then turning to the northwest, and again passing out of the United States at the meridian of 167°.

West of the meridian of 165°, within the second climatic division or the Cordilleran region, the course of the isothermal is largely determined by the position of the several mountain ranges embraced in that area of complicated topography to which the name of Cordilleras is given. These ranges, unlike the Appalachians, are lofty enough to produce a decided influence upon the climate, although nowhere reaching what may be called the region of perpetual snow. This deficiency of lasting accumulations of snow, however, is in very considerable part due to the smallness of the precipitation. If this were as great in the Rocky Mountains as it is in the Sierra Nevada, the former ranges would, no doubt, be covered to a large extent with permanent snow-fields and glaciers descending from them. Observations of mean temperature, however, on the higher ranges are extremely deficient, so that only a few generalizations can be given with regard to the position of the isothermals in that portion of the territory of the United States.

The isothermal of 44° follows a course in the Cordilleran region which embraces within a great loop to the south, the entire higher portion of the Rocky Mountains, as far south as parallel 34°. The tops of the Sierra Nevada, Blue Mountains, and Cascade Ranges are also included within the loop of the 44°. The Central portion of the Cascade Range, and the Rocky Mountains in the south-western corner of Colorado, have a mean annual temperature of 40°. The highest part of the Rocky Mountains is indicated as having a mean temperature of less than 36°. Accurate and long continued observations in this region would, however, furnish an extremely complicated system of isothermal curves, since the ranges are numerous, and many of them high.

As the land assumes a more decidedly plateau character in Arizona, Utah and Nevada, the mean annual temperature rises in this portion of the country. In Nevada, the isothermal of 72° extends as far north as the parallel of 36°, and the isothermal of 52° reaches to the Trinity Mountains in parallel 40°. In this Cordilleran region, we find that a great change may be made in the latitude with but a very moderate one in the mean annual temperature, as shown by the parallelism of the isothermals with the coast line. The temperature is higher and more uniform along the Pacific coast than it is on the Atlantic coast of the United States. The isothermal of 60° runs nearly parallel with the coast, and not far from it from the 35th parallel nearly to the 31st. The isothermal of 52° follows the coast from San Francisco as far north as the parallel of 46°.

The isothermals for the summer months—June, July, and August—show greater irregularity on Mr. Schott's chart than those of the year. This holds true especially in the eastern region of the country. The summer isothermals all bend to the north in a very characteristic manner, owing in great measure to the southerly winds, which are beated by the Gulf of Mexico. The summer

Isothermal line.

Summer isothermal.

isothermal of 80° bounds on the north an irregular area, including Florida, the southern part of Georgia, Alabama and Mississippi; Louisiana, the southeastern corner of Arkansas; the southeastern half of Texas; and a tongue of land in New Mexico. Within this area the mean summer temperature ranges from 80° to 85°. The southwestern half of Arizona, and patches in southern and central California have a like summer temperature of from 80° to 85°. A strip including the greater part of North and South Carolina, portions of Georgia, Alabama, Mississippi, Tennessee, Kentucky, Missouri, Arkansas, Kansas, the Indian Territory, Texas, New Mexico, Colorado, Utah, Arizona, and California, lies between the mean summer isothermals of 76° and 80°. The belt near the Ohio, extending north as far as the Great Lakes, and south along the Appalachian table land into Tennessee, Mississippi, Alabama, and Georgia, and west through Indiana, Illinois, Iowa, portions of Wisconsin, Minnesota, Dakota, and Montana, Nebraska, and northern Kansas, lies between the summer isothermals of 68° and 76°. On the Pacific coast the summer isothermals approach more nearly to the mean annual isothermals in their character and position than do those on the Atlantic coast of the United States. The region of the United States lying north of the States named above has a mean summer temperature ranging from 56° to 68°.

Winter isothermals.

The isothermals for the winter months—December, January and February—in the eastern region of the United States, are more regular than the summer curves, thus approaching in this respect the character of the mean annual isothermals. The winter isothermal of 52° coincides almost exactly with the mean annual isothermal of 68°. It runs parallel with, and at a little distance from, the Gulf of Mexico. The winter curve of 48° corresponds very closely with that of 64° for the year and the winter curve of 42° with the mean annual isothermal of 60°. The winter isothermal of 32° enters the United States at the southern end of Massachusetts, and passes in a southwesterly course across Long Island, just south of New York City, through New Jersey and across the northern end of Maryland, where it is deflected to the south, and makes a long loop around the Appalachians; then near the Ohio, through Indiana, Illinois, Missouri, and Kansas, into New Mexico, where at the meridian of 105° it is deflected to the southwest and passes around the Rocky Mountains and through the center of the Great Basin. On the Pacific coast, the winter isothermals also closely coincide with the mean annual isothermals. For example, the winter isothermal of 52° corresponds in character and position with the annual curve of 60°.

Winds.

The peculiarities of the North-American climate which most strongly impress themselves on newly arrived visitors, and which are not so apparent in general statistical statements as they are in Nature, may be best set forth and discussed after the more essential facts regarding the other principal climatic elements have been presented.

And it would seem to be next in order to state the principal facts regarding the distribution of the winds in the United States, since a knowledge of these will be essential to an understanding of the important subject of the amount and distribution of the precipitation.

The prevailing winds of the United States, as of all countries lying in the middle latitudes, are westerly. At the 40th parallel as an average position, and on the mean annual isothermal of 50°, the evidence of this prevalence and constancy are overwhelming. Dr. Gibbons has noticed, with great care at San Francisco, the course of the higher strata of clouds—the cirrus, and the very high stratus—where they were visible, and has found them to come uniformly from some westerly point. During three years of very careful registry directed to this particular point in western New York, but three instances of a contrary direction were observed. During storms the lower clouds are from various points, and the wind is quite variable during the greater storms; two strata of different movement often lying beneath that from the west, yet the stratum from a westerly point usually deposits the rain, and when it ceases the rainfall ceases, though the lower strata may continue to run on the wind twenty-four hours, or even longer.

Below the 35th parallel and on the Gulf coast only, do the showers of summer take a different movement, showing that the stratum occupied by the cumulus of average height does not there move from the west, but from the east or southeast—an inflection of the trade-wind mingling with a local coast wind.

The following table, arranged from data furnished by the Signal Service Bureau, gives an idea of the direction of the wind in various parts of the country:

STATEMENT showing how many times the wind was observed blowing from the eight principal points of the compass during each season of the year ending June 30, 1884. Compared from observations taken at the several stations of observations at 7 a. m., 2 p. m. and 9 p. m. (local time).

The winds along the whole extent of the Atlantic Coast region are a marked resemblance in their important features, notwithstanding the great difference in latitude. Westerly winds predominate during the entire year; but they are chiefly southwesterly in summer, and northwesterly in winter.

In the district between the Appalachians and the Mississippi, easterly and southwesterly winds are prevalent both in winter and summer. On the other hand, over a large territory in the southwestern portion of the United States, covering an area of about one third of the country, and including Nebraska, Kansas, eastern Wyoming and Colorado, Arkansas, Texas, Utah, New Mexico and Arizona the summer winds are from the south, while the winds of winter are north and northwest. In northern Michigan, Wisconsin, and Minnesota, this reversal of the winter winds is less marked. In New Mexico and among the Rocky Mountains generally, the winds are of the most extremely irregular character. At the passes of the Sierra Nevada, and at all entrances from the coast of the Pacific to the interior, arid districts and deserts, there are violent and continuous westerly winds. On the coast of California, the inward draft of air produced by interior rarefaction is decidedly developed. Capt. Wilkes has designated this as the locality of the "Mexican Monsoon," blowing alternately up and down this coast, or northwest and southeast. The duration of the northern monsoon is from December to May; the currents of air are from the northwest, and nearly parallel with the coast. During its prevalence fine weather is experienced. From May to September the currents of air are from the south and southwest. These are the stormy months, attended with great explosions of electricity, and with copious and constant precipitation. This interior rarefaction, above mentioned, is sufficient to bring a northwest wind on the coast from the 42d to the 35th parallel, and a south or southwest wind for a long distance below the entrance to the Gulf of California—lines which, if projected to the interior, would cross nearly at right angles over the central areas of the dry interior. On the other side of the continent the southeast monsoon of Texas blows directly toward the northwest wind of California—all proving how great and important this agency of interior rarefaction is in producing the surface winds of the latitudes below the well-determined belt of westerly winds.

To sum up what has been said in regard to the winds of the United States, the following may be added:

1. The influence of the trades is but very slightly felt in the extreme southeasterly portion of the country.
2. The prevailing winds elsewhere are, in general, westerly.
3. On the Atlantic coast, east of the Appalachians, northwesterly winds prevail in winter; southwesterly in summer.
4. In the region between the Mississippi and the Appalachians, southwest and west winds prevail both in winter and summer.
5. Over a wide area, extending from southeastern California to Missouri, and along the base of the Rocky Mountains from New Mexico to southern Dakota, the winds of summer are nearly the reverse of those of winter, being south, southeasterly or southwesterly, with a great predominance of southerly; but north and northwest in winter.
6. On the Pacific coast, the prevailing and normal westerly direction is maintained through the year, intensified in summer by the superadded moonson influence of the heated plateau region to the east.
7. Through the Plateau or interior Cordilleran region, the surface winds are variable and irregular in character, but the higher currents are in the normal westerly direction.
8. The region of the Lower Colorado is one in which southerly winds greatly predominate in summer, but where in winter there is not so complete a reversal of the summer wind as there is in the area specified under 5.

Rainfall

The prosperity of a country depends largely upon its rainfall, as, to a very great extent, the primary industry, that upon which all others depend directly, viz., agriculture, may be said to flourish in a degree directly proportioned to the amount of moisture. Of rainfall, this country receives in its different parts a very different supply. Throughout the eastern half of the United States, the rainfall is ample for all purposes of agriculture, while in the western half, with the exception of a narrow strip along the Pacific coast, the supply is very deficient. With the exception of the Cordilleran region, the rainfall is nearly all derived from the Gulf of Mexico and the Atlantic ocean. Of the two, the principal source is the Gulf. The warm, moist currents which accompany the Gulf Stream from the Caribbean sea are not deflected toward the eastward in the Gulf of Mexico, as the great oceanic river is, but pass northward and eastward over the land in a broad belt extending from the coast of Texas to the peninsula of Florida. Judging from its effects in the form of rainfall, the central portion of this current passes over eastern Louisiana and Mississippi and western Alabama. The natural result of leaving the warm ocean surface and entering the continent is to cool these air currents, and make them deposit their vapor. The heaviest deposit is along the northern shore of the Gulf, in the States of Louisiana, Mississippi, and Alabama, and the western part of Florida, where the rainfall reaches 60 inches per annum. Were there no mountains or other irregular topographical features to modify the rainfall, this wave would move inland in a northeasterly direction, the precipitation decreasing eastward, northward, and westward, the lines of equal rainfall taking the form of great concentric ellipses. This form we see roughly outlined in the western part of the Mississippi valley, the rainfall decreasing regularly to the northward and westward. To the northeastward, however, these moisture-laden currents encounter the southern end of the Appalachian chain, and are driven at once up to high altitudes, where they are forced to disgorge their vapor, giving to this end of the mountain system a heavy rainfall; while farther along the chain, toward the northeast, the rainfall diminishes, becoming even less than that of the lower country on the east and west. The portion of

the moisture-laden current which passes to the eastward of the Appalachian chain meets and mingles with moist air currents coming directly from the Atlantic, and produces, in the central parts of North and South Carolina, an area of abnormally heavy rainfall. A second source of moisture is the Atlantic ocean. Here the moist air currents from the Gulf Stream produce a line of heavy rainfall along the Atlantic coast, reaching from Florida to the neighborhood of the bay of New York. This strip is quite narrow, being confined to the coast and its immediate neighborhood. Back of that and over the greater portion of the Atlantic plain, the precipitation is notably less. The conditions of the coast as regards rainfall are somewhat changed north of the latitude last mentioned; that is near the bay of New York. The Gulf Stream, which has been gradually trending off shore, is here at a considerable distance from the coast. Between the coast and the Gulf Stream has appeared a polar current flowing southwesterly. The contact between the warm air currents of the Gulf Stream and the cold winds accompanying this polar current undoubtedly causes the heavy fogs which prevail on the banks of Newfoundland and St. George's Banks, extending, in a greater or less degree, to the New England coast. Although there is a decrease in the rainfall of this part of the coast from that farther south, yet it is not particularly marked. The precipitation is, however, greatest on the coast, and decreases inland.

Leaving now the eastern half of the country, let us trace the rainfall westward. The lines indicating a smaller degree of rainfall succeed one another at intervals more or less regular as we go west, out of the course of the great continental waves of moisture, and up the slope of the plains. The country here is uniform and generally level, and there is nothing to interrupt the regular decrease in the amount of precipitation until we reach the base of the Rocky Mountains. From this line westward to the Sierra Nevada, we find the conditions of rainfall which are incident to a mountain country accompanied by a dry atmosphere. Taking the Cordilleran region as a whole, with the exception of that part lying west of the Sierra Nevada and Cascades, the rainfall probably does not average more than 10 or 15 inches annually. This, however, is not deposited uniformly over the country; there are certain conditions under which the rainfall in some parts of this region is much greater than in others. Other things being equal, the higher the latitude and the greater the altitude, the greater will be the rainfall. Under this rule the more northern parts of the Cordilleran region enjoy a greater rainfall than the southern parts. The mountains and high plateaus are better watered than the low lands. The best watered parts of this region are the northern parts of Washington and Idaho, the western part of Montana, northwestern Wyoming, which includes the elevated region known as the Yellowstone National Park, and the high plateaus and ranges of central Colorado. The most arid portions, and those which receive the least rainfall, are western Arizona, southern Nevada, and southeastern California. Although throughout this region we have but few and scattered observations of rainfall, the relative amount can be predicted with a considerable degree of certainty by the character of the vegetation. Everywhere arborescent vegetation implies a considerable amount of rainfall, and accordingly we find the higher plateaus, the mountains, and the regions in the higher latitudes covered with forests. A second zone of rainfall is indicated by the bunch and gama grasses which cover the plains and most of the mountain valleys. They indicate a rainfall not in general sufficient for the needs of agriculture. A third zone is indicated by *Artemisia*, or "sage brush," as this characteristic western shrub is popularly called; while a fourth zone is indicated by the cactus, the yucca, or by an absence of all vegetation whatever.

As has been suggested heretofore, the rainfall in the Cordilleran region east of the Sierra Nevada is in general insufficient for the needs of agriculture, excepting in a few isolated areas where local topography induces a rainfall greater than the normal one. In that section, irrigation is everywhere necessary for the production of cereal crops. Generally it may be stated that a less annual rainfall than 20 inches, or a less rainfall than 12½ inches during the growing season of crops—that is, during the spring and summer—is insufficient for their successful cultivation; and where this supply is not furnished naturally, an equivalent must be supplied by means of irrigation. This limit is reached along a line running approximately on a meridian, and passing through the middle of Dakota, western Nebraska, western Kansas, and central Texas. In the neighborhood of this line, and extending perhaps a degree on each side of it, is a debatable ground, where, in some seasons, the rainfall is sufficient for all crops, while in others it is insufficient. This is Powell's sub-humid region. As a rule, wherever irrigation is necessary, the possible extent of agriculture, and in consequence the possible density of settlement, are dependent upon the amount of water carried in the streams. In most parts of the Cordilleran region, there is apparently a far greater amount of land suitable for cultivation than can ever be irrigated, even under the most economical distribution of water. Concerning this point, however, we are at present much in the dark, the capacity of few streams having been measured, even approximately. Under the wasteful system of irrigation at present practiced throughout the West (except in some portions of southern California), the limit of settlement will very soon be reached, so far as the population is dependent upon agriculture.

A question which has assumed practical importance of an almost national character is the effect of the planting of trees and the cultivation of the soil upon climate, many high authorities maintaining that these causes produce an increase in rainfall, and consequently that it is possible to redeem the whole Cordilleran region by a judicious system of cultivation and tree-planting, particularly of the latter. It is doubtful whether that effect can be produced by this or by any other means within the power of man.

Such facts as we have within the form of rainfall records in the Cordilleran region do not substantiate the theory, the records showing that the rainfall has not increased in the regions covered by our border settlements since their earliest formation. At the same time, it seems highly probable that a change has been produced, which, while not affecting the climate, has modified decidedly the conditions of moisture. The effects of cultivation upon the soil in covering it with vegetation, and especially with trees, has in general been to retain the moisture upon and in the soil, instead of allowing it to run directly off into the streams, or to be taken up at once by evaporation. In other words, a much larger proportion of the rainfall is rendered effective for agricultural purposes. This effect is already very marked through out Dakota, Kansas, and Nebraska, and even to some extent in Utah and Colorado.

It remains to sketch the rainfall of the Pacific coast. It is in all respects peculiar, and different from that of the rest of the country. There along the whole coast, and extending eastward as far as the Sierra Nevada and the Cascade range, well defined wet and dry seasons—the former corresponding to the eastern winter, the latter to the eastern summer. Taking the year through the rainfall is very much heavier in the northern part of this section than in the southern. In western Washington Territory, it rains almost constantly for six months of the year, while even in the wet season, the supply of rain in southern California is scanty.

An explanation of this peculiar climate is to be found in the ocean currents and the prevailing winds. The winds on the western coast are, as a rule, the "anti trades," blowing from the west and southwest. These winds pass, on nearing the coast, over the great Japanese current, which north of Oregon, is relatively to the land, a warm current, while south of Oregon it is, relatively, a cool current. In passing over this portion of the sea, the atmosphere becomes surcharged with moisture. In reaching the coast, the amount of precipitation from this moisture-laden atmosphere depends upon the change of temperature which it encounters. North of Oregon, the land being, as stated above, colder than the sea, there is great precipitation, while south of that state the land being the warmest, the precipitation decreases, till in southern California, where the difference between the sea and land temperature is the greatest, it is almost nothing. The line of demarcation between the different temperatures varies with the season, ranging northward in the summer and southward in the winter, thus giving the alternations between the wet and dry seasons so peculiar to this coast. The influence of the mountains of the Pacific coast, although not sufficient to account for all the phenomena of this climate, still plays a very important part in it. The ascent of the warm currents up the mountain sides of course cools them very greatly, and causes them to deposit whatever remaining moisture they may contain. To illustrate the extent of the action of mountain ranges, it may be stated that, although in the valley of the San Joaquin the rainfall is very light, yet upon the high Sierras it has been found to reach 90 inches in a single year.

The colder months in the United States, including May and September of the warmer months, precipitate most of the rain and snow which falls in what are called general storms. Most of the rain falling before the middle of June in the latitude of Washington is in storms of two or three days' duration. A south or southeast wind, with high temperature and a palpable sense of preparation, usually begins the change; east and northeast winds follow next for a day or more, during which most of the rain falls, and west or northwest winds blow with unusual strength for two days following, restoring the equable and average weather for the month. In the Northern States, a greater number of months is included in those of general rains, which may occur in every month of summer, though they rarely do so. In the Gulf States the period of summer showers is more extended generally, though where the hurricanes of August and September occur, as they do in all the Southern States bordering the Gulf and the Atlantic, the number of extended rains in the summer is more nearly equal to that in New York and New England. In the southwest, at a distance from the coasts, they are rare from the close of April to the middle of October; in the interior farther west they are equally rare, and on the Pacific coast they belong only to the rainy months. But on the Pacific the rains have little, if any, correspondence at any season with those east of the Rocky Mountains.

Some general distinctions should be made at the outset of the examination of storms in the temperate latitudes. The hurricanes, typhoons and tornadoes, each of which more generally belong to the tropics, frequently enter these latitudes in their original forms, and subsequently become blended with the forms which originate here, either by encountering one of these, or by putting on such forms by a gradual process of change. The West India hurricanes impress their character on a series of successive or continuous storms along the Gulf Stream in nearly every case of their approach to temperate latitudes, and the tracks of these in the western Atlantic and along the coast present the most frequent instances of the mingling of forms which were originally wholly different, with the widely extended rains above the 35th parallel.

The observations with respect to the general winter storms of the United States may be stated as follows:

1. The general winter storms of the United States often cover an area of from three to five hundred miles in diameter, which area is usually oblong or oval, with its greatest length from southwest to northeast.

2. They all move eastward with the westerly winds of the belt where they are formed, and in a line with the isothermals of the month in which they occur—coming from a point north of west at the Mississippi river, and leaving the Atlantic coast in a direction north of east. This course conforms in both cases to the course of the isothermals; or, in other words, they do not leave the measure of heat where they originate to go into colder or warmer climates.

3. Their movement is generally at the rate of movement of the air in these latitudes, or nearly twenty miles per hour; but it may be much greater, or very little.

4. They may be initiated at all points of this belt, and at any meridian, and they have equally no point at which they are more likely to become exhausted and to disappear than any other.

5. They are more violent at the Atlantic coast and at the Gulf Stream than elsewhere, because the contrast of land and sea air is there very great in the colder seasons, and because the direct line of their progress carries them into a belt of high temperature. When the contrast is not great, as in the warmer months, there is no decided increase of severity there.

6. They are more generally attended by northeast winds than Northeast any others during the first half; or, in other words, the rarefied winds, area almost always induces a draft from that quarter first, and it continues over most of the district in which a draft contrary to the general movement is created.

7. None of the winds from other than westerly points are winds of propulsion, or propagated from their apparent point of origin; they are all, including a portion from the west, winds of aspiration, induced by the agitation, or by the disturbance of equilibrium itself.

8. All the movements and processes are usually carried past the mean by the forces set in motion in these storms; the minimum of heat, moisture, clouds and winds, following the removal of the excess of the first two; and this minimum, though a calm and quiescent state, is itself an extreme and not an average condition in these latitudes.

Tornadoes have less connection with general storms than hurricanes, though they often exist as the nucleus of a general rain inland, and, though belonging to the summer mainly, they are sometimes found in storms of mid-winter. The term *tornado* is one properly limited to local storms of excessive violence, afflicting but a narrow strip of surface a few miles in length, and usually while no storms of consequence exist anywhere in the vicinity, but sometimes as the nucleus of an extended rain. The leading characteristic is intense electrical action, and several lines or threads of tornado force are sometimes developed in a wide stratum of air of high temperature with clouds and rain, particularly if in a cool month, or when the general storm is of much more than the usual excess of temperature. These may be exhausted after traversing a short path, and may reappear, without disturbing the general condition and without producing any conformity to their peculiar violence in the whole area covered by the rain, as the hurricanes of the Atlantic do.

These hurricanes evidently control the movements of any storm or condition with which they come in contact, superadding to it the characteristics of hurricane violence, until this violence becomes exhausted by distance, while tornadoes have no general influence whatever. The following extract is taken from the report on tornadoes for 1880, by Mr. John P. Finley:

"A map prepared to show the entire topography of that portion of the United States included within the meridians of 89° and 101° would plainly illustrate an important truth in the tornado problem—viz., that there is not another section of our vast domain wherein there exists opportunities so unlimited for the unobstructed mingling and opposition of warm and cold currents and currents highly contrasted in humidity. As an area of low barometer (not necessarily a storm area) advances to the Lower Missouri valley warm and cold currents set in toward it from the north and south respectively, which, if the low pressure continues about stationary for some time, ultimately emanate from the warm and moist regions of the Gulf and the cold and comparatively dry regions of the British Possessions. Here lies the key to the marked contrasts of temperature and moisture, invariably foretelling an atmospheric disturbance of unusual violence, for which this region is peculiarly fitted by Nature, and in apparent recognition of which it has received the euphonious title of the "battle-ground of tornadoes." It cannot be disputed that, so far as the history of tornadoes is concerned, the majority have occurred over this region, because of its peculiar topography. From the Gulf northward to the central portion of the Lower Missouri valley, and from the British Possessions southward to the same locality, there is permitted an entirely free movement of the air; nothing in the shape of earth or water exists to modify its character, except, perhaps, to intensify the contrast of attributes. Over Texas, Louisiana, Arkansas, and Indian Territory occurs a broad expanse of rolling surface—sometimes abruptly hilly, but on the whole presenting a sameness of outline to a marked degree. Similarly conditioned are the States of Minnesota, Iowa, Nebraska, and the eastern half of Dakota Territory. West of the 101st meridian we find a rugged and abrupt country, traversed by great mountain chains, which deflect the course and modify the temperature and moisture of passing currents. On the east side of the 89th meridian, the Great Lakes introduce an equally important factor into the modification of passing currents."

As to the duration of the tornadoes observed in the year 1879, he writes:

"The time of passing any point was variously estimated from five seconds to two minutes. "Quicker than thought," was an expression often used as conveying the observer's idea of the rapidity of destruction. Estimating the average diameter of the cloud at 150 feet, and its average velocity at a mile in two minutes, we have its mean duration at any one point, about ten and a half seconds. There were times in the passage of the cloud when it appeared to remain almost stationary, whirling upon its narrow base like a top; again it was reported as moving no faster than a horse gently galloping, but only for half a mile or so, when it would make up for lost time by dashing forward at a rate of 50 or 60 miles per hour, and then gradually working down to its accustomed velocity of about 30 miles per hour."

Storms of
March,
1858.

The storm of March 11-14, 1858, deserves notice in this connection—for, although not a tornado, it caused much suffering. Its most interesting feature was the extraordinary amount of snow which fell; and as this fall took place in the most densely settled part of the country, and caused a complete stoppage for several days of all intercourse between New York and the adjacent cities, it was, probably, of all the storms which have occurred since this country was settled—the one which gave rise to the largest amount of comment. The average snow fall in central Connecticut and over a large part of eastern New York exceeded forty inches, and in places this was piled up in drifts of from fifteen to forty feet in height. The maximum precipitation reported (57½ inches) was at Middletown, Conn. This remarkable storm was the result of a conflict between a cyclone advancing from the south, but deflected to the west on reaching New England, and a cold wave coming from the west.*

THE FORESTS OF NORTH AMERICA.

General
Remarks.

The North American continent, or that part of it situated north of Mexico, which will alone be considered here, may be conveniently divided with reference to its forest geography, into the Atlantic and Pacific regions, by a line following the eastern base of the Rocky Mountains and its outlying eastern ranges from the Arctic circle to the Rio Grande. The forests which cover these two divisions of the continent differ as widely, in natural features, composition, and distribution as the climate and topography of eastern America differ from the climate and topography of the Pacific slope. The causes which have produced the dissimilar composition of these two forests may be sought in the climatic conditions of a geological era earlier than our own and in the actual topographical formation of the continent; they need not be discussed here.

The forests of the Atlantic and Pacific regions, dissimilar in composition in the central part of the continent, are united at the north by a broad belt of subarctic forests, extending across the continent north of the fiftieth degree of latitude. One-half of the species of which this northern forest is composed extends from the Atlantic to the Pacific; and its general features, although differing east and west of the continental divide, in conformity with the climatic conditions peculiar to the Atlantic and the Pacific sides of the continent, still possess considerable uniformity. The forests of the Atlantic and the Pacific regions are also united at the south by a narrow strip of the flora peculiar to the plateau of northern Mexico, here extending northward into the United States. Certain characteristics of species of this flora extend from the Gulf of Mexico to the shores of the Pacific, and while the peculiar features of the eastern and the western slopes of the interior mountain system of the continent are still maintained here, the Atlantic and Pacific regions of the Mexican forest belt possess many general features in common. Typical North American species, moreover, peculiar to the forest of the Atlantic or of the Pacific, mingle upon the Black hills of Dakota, and upon the Catalpa and other mountains of western Texas, the extreme eastern ridges of the Rocky Mountain range, and the outposts between the Atlantic and the Pacific regions.

The Atlantic
region.

The forests of the Atlantic Region may be considered under six natural divisions: the Northern Forest, the Northern Pine Belt, the Southern Maritime Pine Belt, the Deciduous Forest of the Mississippi Basin, and the Atlantic Plain, the Semi-tropical Forest of Florida, and the Mexican Forest of Southern Texas.

These natural divisions, although composed in part of species found in other divisions and possessing many general features in common, are still for the most part well characterized by predominant species or groups of species, making such a separation natural and convenient.

The Northern Forest stretches along the northern shores of Labrador nearly to the sixtieth degree of north latitude, sweeps to the south of Hudson bay, and then northward to within the Arctic circle. This Northern Forest extends southward to the fiftieth degree of north latitude on the Atlantic coast, and nearly to the fifty-fourth degree at the 100th meridian. It occupies 10 degrees of latitude upon the Atlantic seaboard and nearly 20 degrees in its greatest extension north and south along the eastern base of the Rocky Mountains. The region occupied by this Northern Forest, except toward its southwestern limits, enjoys a copious rainfall; it is divided by innumerable streams and lakes, and abounds in swampy areas often of great extent. The nature of the surface and the low annual mean temperature check the spread of forest growth, and reduce the number of arboreal species, of which this forest is composed, to eight. Of these, four cross to the Pacific coast, while the remainder, with a single exception, are placed west of the continental divide by closely allied forms of the Pacific forest. The white and the black spruce are characteristic trees of this region; they form an open, stunted forest upon the low divides of the water-sheds, and reach a higher latitude than any other arboreal species of the continent; the willows and wide bottoms are clothed with broad sheets of poplars, dwarf birches and willows. The forest of this entire region is scattered, open, stunted, and of no great economic value. It embraces, south of the sixtieth degree of north latitude, the northern extension of the great midcontinental plateau, which will be considered hereafter.

South of the Northern Forest the Northern Pine Belt extends from the Atlantic coast to the ninety-sixth meridian of longitude; east of the Appalachian Mountain system it extends south over nearly 6 degrees of latitude, with a long, narrow spur following the higher Alleghany ridges for nearly 3 degrees farther south; west of the Alleghany Mountains, in the region of the great lakes, the pine forest is replaced south of the forty-third degree of latitude by the deciduous growth of the Mississippi basin. The sec-

ond division of the Atlantic forest may be characterized by the white pine (*Pinus strobus*), its most important if not its most generally-distributed species. East of the Appalachian system this tree often forms extensive forests upon the gravelly drift plain of the St. Lawrence basin, or farther south and west appears in isolated groves, often of considerable extent, scattered through the deciduous forest. Forests of black spruce are still an important feature of this region, especially at the north; and within its boundaries the hemlock, the yellow cedar, the bass-wood, the black and the white ash, the sugar-maple and several species of birch and elm find their northern limits, and the center of their most important distribution. The hickories and the oaks, characteristic features of the deciduous forests of all the central portion of the Atlantic region, reach here the northern limits of their distribution, as do the chestnut, the sassafras, the tulip tree, the magnolia (here represented by a single species) the red cedar, the tupelo, the yeamore, the beech, and other important genera.

The Southern Maritime Pine Belt extends from the thirty-sixth Southern degree of north latitude along the coast in a narrow belt, varying from one hundred to two hundred miles in width, as far south as Cape Malabar and Tampa bay; it stretches across the Florida peninsula and along the coast of the Gulf of Mexico until the alluvial deposits of the Mississippi are encountered; it reappears west of that river in Louisiana, north and south of the Red river, and here gradually mingles with the deciduous forests of the Mississippi basin in Arkansas and eastern Texas. This belt is well characterized by the almost continuous growth, outside of the broad river bottoms and the immediate neighborhood of the coast, by the open forest of the long-leaved pine (*P. palustris*). The live oak, the palmetto, and various species of pine characterize the coast forest of this region; through the river bottoms and along the borders of the shallow ponds, scattered through the pine forest, different gums, water oaks, hickories and ashes, attain noble dimensions. The southern cypress (*Taxodium*), although extending far beyond the limits of this natural division, here attains its greatest development and value, and, next to the long-leaved pine, may be considered the characteristic species of the maritime pine belt.

The Deciduous Forest of the Mississippi Basin and the Atlantic Deciduous Plain occupies, with two unimportant exceptions to be considered hereafter, the remainder of the Atlantic region. Through this deciduous forest, where peculiar geological features have favored the growth of *Coniferae*, belts of pine, growing gregariously or mixed with oaks and other broad-leaved trees, occur especially upon some portions of the Atlantic plain and toward the limits of the Southern Maritime Pine Belt, west of the Mississippi river. The characteristic features of the forest of this whole region are found, however, in the broad-leaved species of which it is largely composed. Oaks, hickories, walnuts, magnolias, and ashes give variety and value to this forest; and here, with the exception of a few species peculiar to a more northern latitude, the deciduous trees of the Atlantic region attain their greatest development and value. Upon the slopes of the southern Alleghany mountains and in the valley of the lower Red river, regions of copious rainfall and rich soil, the deciduous forest of the continent attains unsurpassed variety and richness. Upon the Alleghany mountains northern and southern species are mingled, or are only separated by the altitude of these mountains; rhododendrons, laurels, and magnolias here attaining their maximum development, enliven the forests of northern pines and hemlocks which clothe the flanks of these mountains, or are scattered through forests of other broad-leaved species. The cherry, the tulip tree, and the chestnut here reach a size unknown in other parts of the country. The forest of the Red river valley is hardly less varied. The northern species which the elevation of the Alleghany mountains has carried south are wanting, but other species peculiar to the Atlantic and Gulf coasts are here mingled with plants of the southern deciduous forest. The seven species of *Carya* (the hickories) are nowhere else closely associated. A great variety of the most important oaks grow here side by side; here is the center of distribution of the North American hawthorns, which do not elsewhere attain such size and beauty. The orange is peculiar to this region; the red cedar, the most widely distributed of American *Coniferae*, the southern and the yellow pine (*Pinus palustris* and *mitis*) here reach their best development. Just outside of this region, upon the "bluff" formation of the lower Mississippi valley and of western Louisiana, the stately southern magnolia, perhaps the most beautiful of the North American trees, and the beech, assume their greatest beauty, and give a peculiar charm to this southern forest.

The western third of the Atlantic region is subjected to very different climatic conditions from those prevailing in the eastern portion of the continent; it consists of an elevated plateau, which falls away from the eastern base of the Rocky Mountains, forming what is known as the Great Plains. This great interior region, on account of its remoteness from natural reservoirs of moisture, receives a meager and uncertain rainfall, sufficient to insure a growth of herbage, but not sufficient to support, outside the narrow bottoms of the infrequent streams, the scantiest forests. This treeless plateau extends north to the fifty-second degree of north latitude; it follows southward the trend of the Rocky Mountains far into Mexico, extending eastward at the point of its greatest width, in about latitude 40° N., nearly to the ninety-seventh meridian. This whole region is generally destitute of forest. The narrow bottoms of the large streams are lined, however, with willows, poplars, elms, and hackberries—trees adapted to flourish under such unfavorable conditions. These diminish in size and number with the rainfall, and often disappear entirely from the banks of even the largest streams toward the western limits of the plateau, south of the forty-fifth degree of latitude. North and east of these central treeless plains a belt of prairie extends from the sixtieth degree of north latitude to southern

Forest
Gains

Texas. The average width east and west of this prairie region, through much of its extent, is not far from 150 miles. Its eastern extension, between the fortieth and forty-fifth degrees of latitude, is much greater, however, here reaching the western shores of Lake Michigan, and forming a great recess in the western line of the heavy forest of the Atlantic region with a depth of nearly 600 miles. The transition from the heavy forest of the eastern and central portions of the Atlantic region to the treeless plateau is gradual. The change occurs within the prairie regions. Here is the strip of debatable ground, where a continuous struggle between the forest and the plain takes place. There is here sufficient precipitation of moisture to cause, under normal conditions, a growth of open forest; but so nicely balanced is the struggle, that any interference quickly turns the scale. Trees planted within this prairie belt thrive if protected from fire and the encroachment of the tough prairie sod, and so extend the forest line westward; if the forest which fringes the eastern edge of the prairie is destroyed, it does not soon regain possession of the soil, and the prairie is gradually pushed eastward.

The eastern line of the plain, where arborescent vegetation is confined to the river bottoms, and which divides it from the prairie where trees grow naturally, to some extent, outside of the bottoms, and where they may be made to grow under favorable conditions everywhere, is determined by the rainfall enjoyed by this part of the continent. The extreme eastern point reached by this line is found, upon the fortieth degree of north latitude, near the northern boundary of the state of Kansas. North of the fortieth degree it gradually trends to the west, reaching the eastern base of the Rocky Mountains in about latitude 52°. This northwestern trend of the eastern plain line may be ascribed to the comparatively small evaporation which takes place during the shorter summer of the north, and to a slight local increase of spring and summer rainfall. South of the fortieth degree the plain line gradually trends to the southwest under the influence of the Gulf of Mexico, reaching its extreme western point in Texas upon the one hundredth meridian.

Other causes, however, than insufficient rainfall and a nicely balanced struggle between the forest and the plain have prevented the general growth of trees in the prairie region east of the ninety-fifth meridian. The rainfall of this region is sufficient to insure the growth of a heavy forest. The rain falling upon the prairies of Minnesota, Wisconsin, Iowa, Illinois, and Missouri equals in amount that enjoyed by the Michigan peninsula and the whole region south of lakes Ontario and Erie, while prairies exist within the region of the heaviest forest growth. It is not want of sufficient heat, or of sufficient or equally distributed moisture, which has checked the general spread of forest over these prairies. The soil of which the prairies are composed, as is shown by the fact that trees planted upon them grow with vigor and rapidly, is not unsuited to tree growth. It is not, perhaps, improbable that the forests of the Atlantic region once extended continuously as far west at least as the ninety-fifth meridian, although circumstantial evidence of such a theory does not exist; and the causes which first led to the destruction of the forests in this region, supposing that they ever existed, cannot, with the present knowledge of the subject, be even guessed at. It is, however, fair to assume that forests once existed in a region adapted, by climate, rainfall, and soil, to produce forests, and that their absence under such conditions must be traced to accidental causes. It is not difficult to understand that the forest once destroyed over such a vast area could not easily regain possession of the soil protected by an impenetrable covering of sod and subjected to the annual burnings which have occurred down to the present time; while the force of the wind, unchecked by any forest barrier, over such an area would, even without the aid of fires, have made the spread of forest growth slow and difficult. The assumption that the eastern prairies may have once been covered with forests is strengthened by the fact that since they have been devoted to agriculture, and the annual burning has been stopped, trees which were formerly confined to the river bottoms have gradually spread to the uplands. Small prairies situated just within the western edge of the forest have entirely disappeared within the memory of persons still living: the oak openings—open forests of large oaks through which the annual fires played without greatly injuring the full-grown trees—once the characteristic feature of these prairies, have disappeared. They are replaced by dense forests of oak, which only require protection from fire to spring into existence. In western Texas, the mesquit, forced by annual burning to grow almost entirely below the surface of the ground, is, now that prairie fires are less common and destructive, spreading over what a few years ago was treeless prairie. The prairies, then, or the eastern portions of them situated in the region of abundant rainfall, are fast losing their treeless character, and the forest protected from fire is gradually gaining in every direction; regions which fifty years ago were treeless outside the river bottoms now contain forests covering 10 or even 20 per cent. of their area. These eastern well-watered prairies must not, however, be confounded with their dry western rim adjoining the plains—the debatable ground between forest and plain—or with the plains themselves. There is now no gradual, constant spread of forest growth upon the plains. They are treeless on account of insufficient moisture to develop forest growth; and while trees may, perhaps, if planted, survive during a few years beyond the western limits of the prairie as here laid down, the permanent establishment of forests there does not seem practicable, and, sooner or later, a period of unusual drought must put an end to all attempts at forest cultivation in a region of such insufficient and uncertain rainfall.

It remains to consider the *Semi-tropical Forest of Florida* and the *Mexican Forest of Southern Texas*.

A group of arborescent species of West Indian origin occupies the narrow strip of coast and islands of southern Florida. This

belt of semi-tropical vegetation is confined to the immediate neighborhood of the coast and to occasional hammocks or islands of high ground situated in the savannas which cover a great portion of southern Florida, checking, by the nature of the soil and want of drainage, the spread of forest growth across the peninsula. This semi-tropical forest belt reaches Cape Malabar on the east and the shores of Tampa bay on the west coast, while some of its representatives extend fully 2 degrees farther north. It is rich in composition; nearly a quarter of all the arborescent species of the Atlantic forest are found within this insignificant region. The semi-tropical forest, in spite of its variety, is of little economic importance. The species of which it is composed here reached their extreme northern limit of their distribution; they are generally small, stunted, and of comparatively little value. Certain species, however, attain respectable proportions; the mahogany, the mastie, the royal palm, the mangrove, the sea-grape, the Jamaica dogwood, the manchineel, and other species here become considerable and important trees.

In western and southern Texas the trees of the Mississippi basin, checked by insufficient moisture from farther extension southward outside the river bottoms, are replaced by species of the plateau of northern Mexico. The streams flowing into the Gulf of Mexico are still lined, however, east of the one hundredth meridian, with the species of the Atlantic basin, which thus reach southward to beyond the Rio Grande. The Mexican forest belt of Texas extends from the valley of the Colorado river, near the ninety-eighth meridian, to the Rio Grande. It touches the coast not far from the Neeces river, and extends to the eastern base of the mountain ranges west of the Pecos; here the species of which it is composed mingle with those peculiar to the Pacific-Mexican forest. The forest of this region, like that of all countries of insufficient moisture, is open, stunted, and comparatively of little value. It is characterized by enormous areas covered with chaparral (dense and often impenetrable thickets of thorny shrubs and small trees), by a stunted and occasional arborescent growth upon the hills and plains, and by fringes of heavier timber along the river bottoms. The most valuable and perhaps the most characteristic species of this whole region—the mesquit—extends to the Pacific coast. With this exception, none of the arborescent species peculiar to this region attain any considerable size or importance, although the forest of small junipers which cover the low limestone hills of the Colorado valley are locally valuable in a country so generally destitute of trees. The region immediately adjoining the Rio Grande abounds in different species of *Acacia*, *Leucana*, and other Mexican *Leguminosae*; and farther west, upon the dry plains of the Presidio, the Spanish bayonet (*Yucca baccata*) covers wide areas with a low, open, and characteristic forest growth.

The Pacific forest region is coextensive with the great Cordillera Mountain system of the continent. The causes which have influenced the present position and density of these forests must be sought in the peculiar distribution of the rainfall of the region. The precipitation of moisture upon the northwest coast is unequalled by that of any other part of the continent. It gradually decreases with the latitude until, in Southern California, the temperature of the land so far exceeds that of the ocean that precipitation is impossible through a large part of the year. The interior of all this great region, shut off by the high mountain ranges which face the ocean along its entire extent, is very imperfectly supplied with moisture. It is a region of light, uncertain, and unequally distributed rainfall, heavier at the north, as upon the coast, and decreasing gradually with the latitude in nearly the same proportion. This entire region is composed of a mass of mountain ranges with a general north and south trend, separating long and generally narrow valleys. The precipitation of moisture within the interior region is largely regulated by the position of the mountain chains. Warm currents ascending their sides become cold, and are forced to deposit the moisture they contain. It follows that, while the interior valleys are rainless or nearly so, the mountain ranges, and especially the high ones, receive during the year a considerable precipitation of both rain and snow. If the distribution of the forests of any region is dependent upon the distribution and amount of moisture it receives, forests exceeding in density those of any other part of the continent would be found upon the northwest coast; they would gradually diminish toward the south, and entirely disappear near the southern boundary of the United States; while the forests of all the interior region, from the summit of the principal Coast Ranges to the eastern base of the Rocky Mountains, would be confined to the flanks and summits of the mountains. These forests would be heavy upon the high ranges, especially toward the north; they would disappear entirely from the valleys and low mountain ranges. An examination of the forests of the Pacific region will show that, in general distribution and density, they actually follow the distribution of the rainfall of the region. These forests well illustrate the influence of moisture upon forest growth. Within the Pacific region, the heaviest and the lightest forests of the continent coexist with its heaviest and lightest rainfall.

The forests of the Pacific region may be considered under four divisions: the Northern Forest, the Coast Forest, the Interior Forest, and the Mexican Forest. The Pacific Forest.

The *Northern Forest* of the Pacific region extends from nearly the seventieth to about the fifty-eighth degree of north latitude, or, immediately upon the coast, is replaced by the Coast Forest nearly 2 degrees farther north; it extends from the continental divide, here mingled with the Northern Forest of the Atlantic region, to the shores of the Pacific. The southern limit of this open, scanty Northern Forest, composed of species which extend across the continent, or of species closely allied to those of the Northern Forest of the Atlantic region, is still imperfectly known, especially in the interior. The determination of the southern

**MEAN ANNUAL
RAINFALL CHART
OF THE UNITED STATES.**

From Chart by CHARLES A. SCHOTT.

age in Alaska and British Columbia of several species, as well as the northern range here of a few others, must be still left to further exploration. The white spruce, the most important and the most northern species of the forest of the North Atlantic region, is here also the most important species. It attains a considerable size as far north as the sixty-fifth degree, forming, in the valley of the Yukon, forests of no little local importance. The canoe birch, the balsam poplar, and the aspen, familiar trees of the North Atlantic region, also occur here. The gray pine and the balsam fir of the Atlantic region are replaced by allied forms of the same genera. The larch alone, of the denizens of the extreme Northern Forest of the Atlantic coast, finds no congener here in the northern Pacific forest.

The Pacific Coast Forest, the heaviest, although far from the most varied, forest of the continent, extends south along the coast in a narrow strip from the sixtieth to the fiftieth parallel; here it widens, embracing the shores of Puget sound and extending eastward over the high mountain ranges north and south of the boundary of the United States. This interior development of the Coast Forest, following the abundant rainfall of the region, is carried northward over the Gold, Selkirk, and other interior ranges of British Columbia, in a narrow spur extending north nearly to the fifty-fourth parallel. It reaches southward along the Cœur d'Alene, Bitter-Root, and the western ranges of the Rocky Mountain system to about latitude 47° 30', covering northern Washington Territory, Idaho, and portions of western Montana.

The Coast Forest south of the fiftieth degree of latitude occupies the region between the ocean and the eastern slopes of the Cascade Range; in California the summits of the principal southern prolongation of these mountains, the Sierra Nevada, mark the eastern limits of the Coast Forest, which gradually disappears south of the thirty-fifth parallel, although still carried by the high ridges of the southern Coast Range nearly to the southern boundary of the United States. The Coast Forest, like the forests of the whole Pacific region, is largely composed of a few coniferous species, generally of wide distribution. The absence of broad-leaved trees in the Pacific region is striking; they nowhere form great forests, as in the Atlantic region; when they occur they are confined to the valleys of the coast and to the banks of mountain streams, and, economically, are of comparatively little value or importance. The characteristic and most valuable species of the northern Coast Forest are the Alaska cedar (*Chamaecyparis*), the tide-land spruce, and the hemlock. These form the principal forest growth which covers the ranges and islands of the coast between the sixty-first and fiftieth parallels. Other species of the Coast Forest reach here the northern limits of their distribution, although the center of their greatest development is found farther south.

The red fir.

The red fir (*Pseudotsuga*), the most important and widely distributed timber tree of the Pacific region, reaches the coast archipelago in latitude 51°; farther inland it extends fully 4 degrees farther north, and in the region of Puget sound and through the Coast Forest of Washington Territory and Oregon it is the prevailing forest tree. The characteristic forest of the northwest coast, although represented by several species extending south as far as cape Mendocino, near the fortieth parallel, is replaced south of the Rogue River valley by a forest in which forms peculiar to the south rather than to the north gradually predominate. The forest of the northwest coast reaches its greatest density and variety in the narrow region between the summits of the Cascade Range and the ocean. North of the fifty-first parallel it gradually decreases in density, and south of the forty-third parallel it changes in composition and character. This belt of Coast Forest is only surpassed in density by that of some portions of the redwood forest of the California coast. The red fir, the great tide-land spruce, the hemlock, and the red cedar (*Thuja*) reach here enormous dimensions. The wide river bottoms are lined with a heavy growth of maple, cottonwood, ash, and alder, the narrow interior valley with an open growth of oak. In this great coniferous forest the trunks of trees two or three hundred feet in height are often only separated by the space of a few feet. The ground, shaded throughout the year by the impenetrable canopy of the forest, never becomes dry; it is densely covered by a thick carpet of mosses and ferns, often of enormous size. The more open portions of this forest are choked by an impenetrable growth of various *Vaccinæ* of almost arboreal proportions, of hazel, the vine-maple, and other shrubs. The soil which has produced the maximum growth of forest in this region is, outside the river bottoms, a thin, porous gravel of glacial origin, rarely more than a few inches in depth; the luxuriance of vegetable growth, therefore, illustrates the influence of a heavy rainfall and temperate climate upon the forest.

The general character of this forest in the interior, although composed largely of the species peculiar to the coast, differs somewhat from the Coast Forest proper in composition and largely in natural features. The dense, impenetrable forest of the coast is replaced, east of the summit of the Cascade Range, by a more open growth, generally largely destitute of undergrowth. The red fir, the hemlock, and the red cedar (*Thuja*) are still important elements of the forest. Less valuable species of the Coast Forest—the white fir (*Abies grandis*), the yew, the alders, the mountain hemlock (*Thuja Pattoniana*), the hawthorn, the buckthorn, and the white pine (*Pinus monticola*)—are still represented. The latter, a local species upon the coast, only reaches its greatest development toward the eastern limit of this region, here forming considerable and important forests. Other species peculiar to the Coast Forest, the maples, the ash, the oak, the arbutus, and the Alaska cedar, do not extend east of the Cascades. The tide-land spruce is replaced by an allied species of the interior region. The widely distributed yellow pine (*Pinus ponderosa*), barely represented in the northern portions of the immediate Coast Forest, be-

comes, east of the mountains, one of the most important and characteristic elements of the forest. The Coast Forest south of the forty-third degree of latitude changes in composition. The tide-land spruce, the hemlock and the *Thuja* are gradually replaced by more southern species. The sugar pine (*P. Lambertiana*) here first appears. The California laurel (*Umbellularia*) covers with magnificent growth the broad river bottoms. The *Libocedrus*, several oaks, and the chinquapin here reach the northern limits of their distribution. The change from the northern to the southern forest is marked by the appearance of the Port Orford cedar (*Chamaecyparis Lawsoniana*), adding variety and value to the forests of the southern Oregon coast. Farther south, near the northern boundary of California, the redwood forests (*Sequoia*) appear.

The Coast Forest of California will be most conveniently discussed under three subdivisions: the forest of the Coast Range, the forest of the western slope of the Sierra Nevada, which, toward the northern boundary of the state, extends to the coast, covering the mass of mountains which here unite the Sierra Nevada and the Coast Range; and, third, the open forest of the long, narrow valleys lying between the Coast Range and the Sierra Nevada south of this northern connection. The important feature of the Coast Range, as far south as the thirty-seventh degree of latitude, is the belt of redwood occupying an irregular interrupted strip of territory facing the ocean, and hardly exceeding thirty miles in width at the points of its greatest development. The heaviest growth of the redwood forest occurs north of the bay of San Francisco; and here, along the slopes and bottom of the narrow canons of the western slope of the Coast Range, the maximum productive capacity of the forest is reached. No other forest of similar extent equals in the amount of material which they contain the groups of redwood scattered along the coast of northern California. The red fir reaches, in the California Coast Range, a size and value only surpassed in the more northern forests of the coast; the yellow pine is an important tree in the northern portions of this region, and here flourish other species of the genus endemic to this region. The forest of the Coast Range is marked by the presence within its limits of several species of singularly restricted distribution. *Cupressus macrocarpa* and *Pinus insignis* are confined to a few isolated groves upon the shores of the bay of Monterey; *Abies bracteata* occupies three or four canons high up in the Santa Lucia mountains; it is found nowhere else; and *Pinus Torreyana*, the most local arboreal species of North America, has been detected only in one or two small groups upon the sand-dunes just north of the bay of San Diego. The characteristic forest of the Coast Range is checked from farther southern development a little below the thirty-fifth parallel by insufficient moisture; the scanty forests which clothe the high declivities of the Coast Range farther south belong in composition to the Sierra forests.

The heavy forest which covers the western slopes of the Sierra Nevada, a forest only surpassed in density by the redwood belt of the coast and the fir forest of Puget sound, occupies, in its greatest development, a belt situated between 4,000 and 8,000 feet elevation. This forest belt extends from about the base of mount Shasta to the north to the thirty-fifth parallel; farther south it diminishes in density and disappears upon the southern ridges of the Coast Range just north of the southern boundary of California. Its greatest width occurs in northern California, where to the south of mount Shasta, the Sierra system is broken down into a broad mass of low ridges and peaks. The characteristic species of this forest is the great sugar pine (*P. Lambertiana*), which here reaches its greatest development and value, and gives unsurpassed beauty to this mountain forest. With the sugar-pine are associated the red fir, the yellow pine, two noble *Abies*, the *Libocedrus*; and, toward the central part of the state, the great *Sequoia*, appearing first in small isolated groups, and then, farther south, near the headwaters of Kern river, in a narrow belt extending more or less continuously for several miles. This heavy forest of the Sierras, unlike the forest which farther north covers the western flanks of the Cascade Range, is almost destitute of undergrowth and young trees. It shows the influence of a warm climate and unevenly distributed rainfall upon forest growth. The trees, often remote from one another, have attained an enormous size; but they have grown slowly. Above this belt the Sierra forest stretches upward to the limits of tree growth. It is here subalpine and alpine in character, and of little economic value. Different pines and firs, the mountain hemlock, and the western juniper, are scattered in open stretches of forest upon the high ridges of the Sierras. The forest below the belt of heavy growth gradually becomes more open. Individual trees are smaller, while the number of species increases. The small pines of the upper foothills are mingled with oaks in considerable variety. These gradually increase in number. Pines are less frequent, and finally disappear.

The forest of the valleys is composed of oaks, the individuals often widely scattered and of great size, but nowhere forming a continuous, compact growth. The Coast Forest of the Pacific region, unsurpassed in density, is composed of a comparatively small number of species, often attaining enormous size. It presents the same general features throughout its entire extent, except as modified by the climatic conditions of the regions which it covers. The species which compose this forest range through nearly 26 degrees of latitude, or northern species, are replaced in the south by closely allied forms; and, as in the Atlantic region, the southern species far exceed in number those peculiar to the north.

The Interior Forest extends from the southern limits of the northern subarctic forest to the plateau of northern Mexico; it occupies the entire region between the eastern limits of the Pacific Coast Forest and the extreme western limits of the Atlantic region. The forests of this entire region, as compared with the

Coast of California.

The Sierra Nevada forests

Valley forests.

Forests east and west of it, are stunted and remarkable in their poverty of composition. They are confined to the high slopes and canons of the numerous mountain ranges composing the interior region, while the valleys are treeless, or, outside of the narrow river bottoms, nearly treeless. The interior forest attains its greatest development and considerable importance upon the eastern slope of the California Sierras and upon the flanks of the high peaks of the southern Rocky Mountain system, from Colorado, where the timber line reaches an extreme elevation of 13,500 feet, to southern New Mexico and western Arizona. The minimum in North American forest development, outside the absolutely treeless regions, both in the number of species and in the proportion of forest to entire area, is found south of the Blue Mountains of Oregon, in the arid region between the Great Basin mountains and the Sierra Nevada, known as the Great Basin. Here the open, stunted forest is confined to the highest ridges and slopes of the infrequent canons of the low mountain ranges which occupy, with a general north and south trend, this entire region. The individuals which compose this forest are small, although often of immense age, and everywhere show the marks of a severe struggle for existence. Seven arborescent species only have been detected in the forests of the northern and central portions of this region. The mountain mahogany (*Cercocarpus*), the only broad-leaved species of the region, with the exception of the aspen, which throughout the entire interior region borders, above an elevation of 8,000 feet, all mountain streams, reaches here its greatest development. This tree, with the nut pine (*Pinus monophylla*), characterizes this region. Stunted junipers are scattered over the lowest slopes of the mountains, or farther south often cross the high valleys, and cover with open growth the *mesas*, as the lower foot-hills are locally known. An open forest of arborescent yuccas (*Yucca brevifolia*) upon the high Mojave plateau is a characteristic and peculiar feature of the flora of this interior region. The red fir and the yellow pine, widely distributed throughout the Pacific region, do not occur upon the mountain ranges of the Great Basin.

Forests interior.

The heavy forests of the interior region, found along the western slopes of the California Sierras and upon the Rocky Mountain system, are, for the most part, situated south of the forty-second degree of latitude. The forests of the whole northern interior portion of the continent, outside the region occupied by the northern Rocky Mountains by the eastern development of the Coast Forest, feel the influence of insufficient moisture; the number of species of which they are composed is not large; the individuals are often small and stunted, while the forests are open, scattered, without undergrowth, and confined to the canons and high slopes of the mountains. The most generally distributed species of this northern region, a scrub pine, (*Pinus Murrayana*), occupies vast areas, almost to the exclusion of other species, and is gradually taking possession of ground cleared by fire of more valuable trees. South of the fifty-second parallel the red fir (*Pseudotsuga*) and the yellow pine (*Pinus ponderosa*) appear; with them is associated, in the Blue Mountains and in some of the ranges of the northern Rocky Mountains, the western larch (*Larix occidentalis*), the largest and most valuable tree of the Columbian basin.

The forest covering the eastern slope of the Sierra Nevada consists almost exclusively of various species of pine, often of great size and value. The characteristic species of this region are the yellow pine and the closely allied *Pinus Jeffreyi*, here reaching its greatest development. The red fir is absent from this forest, while the oaks, multiplied in many forms on the western slopes of these mountains, have here no representative.

The forests of the southern Rocky Mountain region, less heavy and less generally distributed than those of the western slope of the Sierras, are, as compared with those of the Great Basin, heavy, dense, and valuable. They owe their existence to the comparatively large precipitation of moisture distributed over this elevated region. The characteristic species of the Colorado mountains is a spruce (*Picea Engelmannii*); it forms, at between 8,000 and 10,000 feet elevation, extensive and valuable forests of considerable density and great beauty; with it are associated a balsam fir of wide northern distribution, and various alpine and subalpine species of pine; at lower elevations forests of yellow pine and red fir cover the mountain slopes, while the bottoms of the streams are lined with cottonwood, alder, and maple, or with an open growth of the white fir (*Abies concolor*), a species of the Coast Forest, here reaching the eastern limits of its distribution; the foot-hills above the treeless plain are covered with scant groves of the nut-pine (*Pinus edulis*), stunted junipers, and a small oak, which in many forms extends through a large area of the southern interior region. A forest similar in general features to that of Colorado, and largely composed of the same species, extends over the high mountains of New Mexico to those of western Texas and western and northwestern Arizona, where a heavier forest of pine covers the elevated region lying along the thirty-fifth parallel, culminating in the high forest-clad San Francisco mountains of northern Arizona.

The species of the interior Pacific region mingle along its southern borders with the species peculiar to the plateau of northern Mexico. The Pacific-Mexican Forest, although differing widely in natural features from the Atlantic-Mexican Forest, possesses several species peculiar to the two. The forests of this region are confined to the high mountains and their foot-hills, and to the banks of the rare water-courses. They disappear entirely from the Colorado desert and from the valleys and low mountain ranges of southwestern Arizona. The most important and generally distributed species peculiar to the valleys of this region is the mesquit, the characteristic species of the Atlantic-Mexican region. The sawarow, however, the great tree cactus, is perhaps the most remarkable species of the region, giving an unusual and striking appearance to the dry *mesas* of central and southern Arizona.

The high mountain ranges, extending across the boundary of the United States, between the one hundred and fifth and the one hundred and eleventh meridians, enjoy a larger and more regularly distributed rainfall than the regions east, and especially west, of these meridians. The forests which cover the southern mountain ranges are often dense and varied. Upon their summit and almost inaccessible upper slopes the firs and pines of the Pacific region are mingled with pines, a juniper, an arbutus, and various other species peculiar to the Mexican plateau. Extensive forests of a cypress of Mexican origin also characterize this mountain vegetation. The bottoms of the canons are lined with a dense growth of cottonwood, hackberry, a noble sycamore, an ash, a cherry, and other deciduous trees. The high foot-hills and *mesas* are covered with open groves of various oaks peculiar to the Mexican-Pacific region, here reaching, within the United States at least, their greatest development.

Such are some of the prominent forest features of North America; a dense forest, largely composed, except at the north, of a great variety of broad-leaved species, and extending from the Atlantic sea-board in one nearly unbroken sheet until checked by insufficient moisture from further western development—the forest of the Atlantic region; a forest of conifers, occupying the ranges of the great Cordilleran mountain system, unsurpassed in density in the humid climate of the coast, open and stunted in the arid interior—the forest of the Pacific region.

A more detailed examination of the distribution of North American arborescent genera and species will serve to illustrate the wealth of the forests of the Atlantic and the comparative poverty of those of the Pacific region. It will show, too, more clearly how widely the forests of these two great regions differ in composition.

The economical importance of the forests of the United States is very great, but can hardly be expressed by figures. Some facts, however, may be stated in this connection. The wood from the forest is used in the main for fuel. Although coal exists in abundance over certain regions, and although there are parts of the thickly settled regions where forests are scanty, there is no district where some wood is not used as fuel. In the cities of the East—even those which are in the immediate vicinity of coal—a good deal of wood is necessarily consumed in the form of kindlings,—an important item where anthracite is the coal supplied; and, moreover, open fires are extensively used by the wealthier class, in conjunction with coal in furnaces. In other regions where coal is abundant, forests are also abundant, and as these must be cut down to be sawn into lumber, or to clear the land for cultivation, there is a large supply of wood available as fuel, but not fit to be used for building or manufacturing. Except in the large cities, and occasionally in the towns of second and third rank, wood is used almost exclusively for the building of houses and barns in the United States. Fences also consume a very large amount of wood, this material being in common use for this purpose wherever timber is abundant, and often where it is not, as in the prairie States, where, however, within a few years, wire has begun to be very extensively used for fences. There is also a very large consumption of wood for furniture and for those portions of various implements, especially agricultural, which are made of this material. An even larger supply of wood is required for the boxes and barrels in which various articles of merchandise are transported. The consumption of wood in the form of barrels, as required by the two articles flour and salt, is very large.

The great demand for cheap wooden ware, and the extensive use of wood in building houses, and for various portions of the finish-wooden ing and fittings of houses and barns, has led to the invention of very ingenious machinery by the aid of which wood is wrought into almost every variety of forms with very little direct help from human hands. This makes the coarser kinds of furniture and of household implements exceedingly cheap. As an example, it may be mentioned that barrels strong enough to hold in transportation two hundred and eighty pounds of salt are made in Michigan for so small a sum as twenty cents.

The building of log houses—that is, of such dwellings as are made by piling trunks of trees on each other, either in their natural shape, or partly squared with the axe—is almost a thing of the past, although once extremely common. Very few districts in the region of abundant forests are so far away from saw-mills and railroads as to make a log house the most economical form of dwelling. Occasionally some large, substantial and well-finished buildings are erected "log-house fashion," either as a matter of fancy, or to attract attention by an exterior of exceptional appearance.

Some idea of the importance of the forests from an economic point of view can be gained from the following figures; the census of 1880, in reference to the manufacture of saw-wood:

| | |
|---------------------------------------|----------------|
| Number of establishments..... | 25,518 |
| Capital invested..... | \$181,786,122 |
| Average number of hands employed..... | 147,936 |
| Feet of lumber produced..... | 18,091,356,000 |
| Number of laths..... | 1,761,788,000 |
| Number of shingles..... | 5,555,446,000 |
| Number of staves..... | 1,248,226,000 |
| Number sets headings..... | 146,523,000 |
| Feet of bobbin and spool stock..... | 34,076,000 |

| | |
|--|---------------|
| Total value of the above specified products..... | \$230,655,061 |
| Value of other products..... | 2,682,668 |

Total value..... \$233,337,729

The consumption of wood "for domestic purposes"—that is, as used in houses—is given by the census of 1880 as amounting to 9,537,439 cords, having an estimated value of \$206,950,040.

The total consumption of wood as fuel is given as follows:—

Value of wood

| | Cords. | Value. |
|---------------------------------|--------------------|----------------------|
| For domestic fuel..... | 140,537,439 | \$206,950,040 |
| By railroads..... | 1,971,813 | 5,126,714 |
| By steamboats..... | 787,862 | 1,812,683 |
| In mining and smelting..... | 634,845 | 3,548,285 |
| In making bricks and tiles..... | 1,157,522 | 3,978,331 |
| In making salt..... | 540,445 | 121,681 |
| In woollen manufacture..... | 158,208 | 425,239 |
| Total..... | 145,778,137 | \$211,962,373 |

The total value of the wood used as lumber and as fuel amounts, therefore, to no less than \$555,350,102, if the figures given by the census of 1880 are to be trusted. The value of the wood consumed as fuel in the United States was more than three times as great as that of the coal mined. In fact, the timber of the country is the greatest of all its material possessions. The coal, once exhausted, can never be restored, not even with the lapse of an indefinite amount of time, for the conditions favorable to the production of coal on the earth have entirely ceased to exist. The timber, on the other hand, is restored, after destruction by man, by the kindly hand of Nature. This is the case, at least, over the whole of the once densely timbered portion of the country, where the various growths succeeding each other after the primal forest has been removed offer a satisfactory substitute for that which has been made use of, either naturally or as an easily attainable result of cultivation. In regions where the rainfall is of insufficient amount, there appears to be a tendency in Nature to replace the original growth by one of inferior quality. Whether this inferiority would be lasting or not, seems a doubtful matter. That there has been a diminution of the precipitation, certainly dating back to the Tertiary age, and, in all probability, to a much earlier time, is a geological fact established beyond all possible doubt. That this diminution has anything to do with the removal of the forests by the hand of man, or that man can to any perceptible extent influence the general climate of the country, there is not the slightest reason for believing.

SCENOGRAPHICAL.

The great extent of the territory occupied by the United States is a sufficient reason why there should be a corresponding variety in the scenery. In the early history of the country, when only the Atlantic coast and the eastern side of the Appalachian belt were known to travelers, the landscape was generally considered monotonous by those who visited this region as tourists, or with a view to the enjoyment and description of its scenery. This impression of uniformity and monotony was further confirmed, as the Mississippi Valley and the region of the Great Lakes were added to the tourist's range. Many persons visited the prairies of Illinois and the adjacent States for the purpose of getting an idea of a vast expanse of almost unbroken country such as could hardly be obtained elsewhere in the Northern Hemisphere without visiting Southeastern Russia and the country east of the Urals. The general resemblance of the Appalachian Mountain scenery to that of parts of Northern and Central Europe—as, for instance, that of the White Mountains to that of the Erzgebirge, or that of Northern New England to that of Scandinavia—could hardly escape notice, similarity of topographical features being supplemented in many cases by the absence of any specially marked differences in the floras of the regions in question. Thus the writer, having spent a summer in a geological exploration of New Hampshire, found himself after a very short interval of time traveling through Southern Sweden. The impression of the scenic similarity of the two regions was extremely interesting. Not only were the rocks, rock-forms and topographical features the same, but the vegetation—although of course not identical so far as the species were concerned—made, from the scenic point of view, almost exactly the same impression on the eye in the Scandinavian country that it did over large portions of New England.

Farthest West.

In those early days of travel, especially of English travel, to the United States, the dominating idea was to see Niagara Falls, which was the great point of attraction. Occasionally an adventurous traveler went farther West and down the Mississippi; but for ninety-nine out of a hundred tourists who visited this country and described its scenery, Niagara was the Ultima Thule. The opening of the "Farthest West" by roads and railroads, the scientific exploration of the Cordilleran region, the development of its mineral resources, and the rapidly growing desire on the part of many to see as much of the world as possible—all this has very greatly enlarged the range of experience in the enjoyment of scenery, while the art of photography has rendered it possible for those not caring to travel, to understand and enjoy the scenic features of distant countries, and to compare understandingly the landscapes of regions widely separated from each other.

To attempt to describe the principal features of the scenery of a country having an area of more than three million square miles, is, of course, something not to be thought of in the present connection. All that can be done is to indicate some of the points most visited, and most worthy of being visited, by tourists, and to compare in a general way, some of the more striking features of the landscape of this country with those of regions of similar scenic character in other parts of the world.

Appalachian Mountain scenery.

In doing this we may begin with the mountains. The Appalachian Mountain scenery is only to be compared with that of the minor chains of Europe, since these eastern ranges never rise to the snow-line, and are almost always wooded to their summits. The principal features of Appalachian topography have been already dwelt upon to as great an extent as space would allow; and it needs here only to be stated that, while the nature of the

often of exceeding interest to geologists and other close students of nature, they do not exhibit any forms which in grandeur can be compared with those of common occurrence in the Cordilleras or the Alps or, still more, in the Himalaya. There are from the scenic point of view few, if any, unique figures in the Appalachian ranges. The nearest approach to such is perhaps the Natural Bridge in Virginia—an arch of lime-tone gracefully spanning a chasm about two hundred feet deep and sixty feet wide—and the Profile in the Franconia Notch, in which masses of rock are so disposed as to represent, in gigantic dimensions, and with striking approach to accuracy in general outline, the profile of a human face. Fully as fine a profile as that in the White Mountains is to be seen in Colorado; but as this latter locality is not easily accessible, and is surrounded by an abundance of grand scenery, it is hardly known to the general tourist, and seems never to have been described, while of the Profile in the White Mountains the descriptions are numerous. To the trained eye of the topographer and geologist the extraordinary intricate and exceptional forms of the ranges and valleys in Central Pennsylvania are of vastly greater interest than such accidental and fanciful occurrences as the Profile in the Franconia Notch.

White Mountain flume

A purely American name for something which is not of uncommon occurrence in mountain regions is the word "flume," which as applied in the United States, and chiefly in the White Mountains, means a narrow passage or defile between nearly perpendicular rocks, through which runs a stream, and usually with a succession of cascades. The White Mountain flume, in the Franconia Notch, is the locality of this kind most visited. It is about four hundred feet in length, and the walls are from twenty to fifty feet in height. A deep cut in the sandstone at Keesville, New York near Lake Champlain, on the AuSable River, is called a "chasm." The term "notch," is used in the White Mountains, and to a limited extent in the Adirondacks, for pass or mountain valley. Similar passes or depressions in the Appalachian ranges farther South, especially in Pennsylvania, are called "gaps." Those which are deeply cut down, so as to give passage to streams, are called "water gaps;" those in which the depression in the ridge is not sufficiently deep to give passage to a water-course, are known as "wind-gaps." The gorge at the great bend of the Delaware, where this stream traverses the Kittatinny Range, and which is known as the "Delaware Water-Gap," is a prominent scenic feature of this kind.

New England Mountains

The points in the New England portion of the Appalachian system which are most visited by tourists for the sake of the panoramic views which they afford are Mount Washington—the only point over six thousand feet in elevation in the Appalachians north of North Carolina; Mount Lafayette, in the Franconia Range (5,200 feet); Moosilauke (4,790 feet), a little farther south; Monadnock, near the southern border of New Hampshire (3,169 feet); Mount Mansfield, in the Green Mountain Range in Vermont (4,390 feet); Greylock, in the northwest corner of Massachusetts (3,505 feet). The Adirondacks also attract great numbers of visitors, where the lakes and streams afford opportunities for boating and fishing, and where the scenery is extremely attractive, especially in the autumn after the leaves have begun to change their color, most of this region being still covered with the primeval forest. Mount Marcy, or Tahawas 5,344 feet, and Whiteface (4,871 feet) are the points most frequently ascended in this region; but there are many others, ranging from three to five thousand feet in elevation, which offer fine views, and are not at all difficult of access. The Catskill group is also a region much resorted to by tourists, partly on account of the beauty of the scenery, and partly because it is so easily reached from New York. The high mountain region in North Carolina is too remote to attract many visitors from the Northern and Eastern States; and the facilities for travel in that region are as yet extremely deficient, in striking contrast with the condition of things in this respect in the mountain districts of New England and New York, where almost every point can be reached by railroad, and where hotels are numerous and commodious, and the business of receiving and taking care of "summer boarders" seems to be a most important one for the permanent residents.

Cordilleran Mountains

The mountain scenery of the Cordilleran region is extremely varied in character, as has already been made evident to the reader in the sketch of the topography of that part of the country scenery given in the preceding pages. Only a few of its more important features can here be indicated.

In elevation the Cordilleran ranges are comparable to the Swiss Alps, although there is no point in the United States proper quite as high as Mont Blanc (15,784 feet), or Monte Rosa (15,217 feet); but there are several which surpass the Finster Aarhorn, the culminating point of the Bernese Oberland (14,026 feet),—and there are a large number which have a greater elevation than the Jungfrau (13,671 feet). A very curious feature in the Cordilleras is the closeness with which the highest peaks approach each other in altitude, as shown by the following table of elevations of all the points in the United States supposed to be over fourteen thousand three hundred feet high, all of which are in the Rocky Mountains, and all in Colorado with the exception of the two volcanic cones, Shasta and Rainier:—

| MOUNTAIN. | ELEVATION AT SEA-LEVEL. | AUTHORITY. |
|--------------------|-------------------------|--------------------------|
| Blanca Peak..... | 14,464 | Hayden Survey. |
| Mount Rainier..... | 14,414 | U. S. Coast Survey. |
| Mount Shasta..... | 14,442 | Cal. Geol. Survey. |
| Mount Harvard..... | 14,375 | Hayden (14,452 Whitney). |
| Mount Elbert..... | 14,351 | Hayden Survey. |
| Gray's Peak..... | 14,341 | Hayden (14,319 Whitney). |
| Mount Rosalie..... | 14,340 | Hayden Survey. |
| Torrey's Peak..... | 14,336 | Hayden (14,375 Whitney). |
| Mount Evans..... | 14,330 | Hayden. |
| La Plata Mt..... | 14,311 | Hayden Survey. |

Elevations
in Colorado.

The above are all the points in the Cordilleras believed to be over fourteen thousand three hundred feet in elevation, with the exception of Mount Whitney, which has been several times measured with rather discordant results, ranging all the way from 14,600 to 14,898 feet; there is good reason, however, for believing this to be the highest point in the United States, not including Alaska. All the heights given above, with the exception of Rainier, were obtained by the aid of the barometer, and are not to be taken as being absolutely accurate. The elevations in Colorado by the Hayden Survey, which are the result of a combination of barometrical and trigonometrical measurements, are probably pretty close approximations to the truth. The measurement of Rainier, depending as it did on trigonometrical measurements made at a great distance, are—in the writer's opinion—not to be accepted as final, and may be farther from the truth than a single barometrical observation would have been; but this mountain, although several times ascended, has not been measured barometrical-ly.

Comparison
of Cordil-
leras and
Alps.

The essential difference between the Cordilleran ranges and the Alps is that the latter are much more extensively covered with snow than are the former, and that this snow gives rise to permanent glaciers, descending far below the snow-line, and constituting a very prominent and exceedingly attractive feature in the scenery of the Higher Alps. With the exception of the great volcanic cones of the Sierra Nevada and Cascade Range there is no part of the Cordilleras where snow or ice forms a prominent feature in the scenery during the summer, at the time when the mountains are visited by tourists. The winter snow, of course, covers the mountains, often to a very large extent, and summer snow-falls do the same occasionally; but the effect of this latter kind of occurrence is in no respect to be compared with that of the permanent Alpine snows and glaciers; indeed, the irregular melting away of the summer's snow on the flanks of the ranges, leaving great patches promiscuously scattered here and there, is often rather a disagreeable than a pleasant feature. A remarkable exception is the cross of snow on the "Mountain of the Holy Cross," to which allusion has already been made. There are small masses of ice around the highest peaks of some of the Cordilleran ranges, but these are frequently covered and entirely concealed by snow, even during the summer; and whether properly called glaciers or not, they have no effect on the landscape, and are only seen by those ascending to the summits of the highest peaks, and then only in favorable seasons.

The snow and ice covering the higher portions of the great volcanic cones of the Pacific coast are, however, conspicuous features in the scenic effect produced by these grand masses; and the type of landscape which they present is a peculiar one, and, perhaps, the most impressive which this country offers. Lassen's Peak is the most southern of these volcanic masses, and it is nearly as high as Mount Hood; but it rises from a so much higher base, and being so much farther south, is so much less covered with snow than that cone, that it is by no means as grand an object as its more northern rival. The snow-fields on the upper portion of the southern flank of Lassen's Peak have always presented nearly the same appearance in summer when seen in different years by the writer, indicating a considerable degree of permanency; yet when these fields were climbed over there was no indication of the existence of ice visible.

Mount
Shasta.

Mount Shasta, seventy miles farther north, and nearly four thousand feet higher than Lassen's Peak, is, of course, much more covered with snow, which, although diminishing greatly in amount after several successive dry seasons, never disappears entirely, even on the south side. On that side, when this mountain was ascended by the writer in September, 1862, seven miles of the ascent were made over a snow-field filling one of the great ravines by which this mighty cone is furrowed. Seven years later this field was almost entirely gone at the same season of the year, and the evaporation of the snow had uncovered a large field of ice on the north side of the cone, of which nothing had been visible in 1862, in looking from the summit down upon the flanks of the mountain in that direction. At all times of the year when seen by us, from 1860 to 1864, at a distance of fifty or sixty miles, Mount Shasta presented the appearance of a dazzling white cone when shone upon by the sun. The outline of the mass, as seen from a point fifty-three miles distant in a southerly direction, was that of an almost regular cone, growing slightly steeper toward the summit, and having a slope of 25°-27° on one side, and of 30°-31° on the other, with a smaller, somewhat steeper, subsidiary cone on the western side.

Mount
Hood.

Mount Hood is a very conspicuous and grand mountain mass on account of its isolation, its regular form, and the extent to which it is covered with snow. It appears higher than it really is, because it can be seen from a point only about thirty miles distant, which is but little above the sea-level, and where the fine scenery of the Columbia River and of the basaltic region adjacent to it makes an admirable foreground. It is a favorite subject for landscape artists, and has been repeatedly climbed by tourists, the ascent being without special difficulty. The same may be said in regard to Mount Shasta.

Mount
Rainier.

Mount Rainier, of which the aboriginal name is said to be Tacoma, is much less accessible than either Hood or Shasta, but has been climbed several times, and first in 1870 by Messrs. Stevens and Van Trump, of Olympia, Washington. As seen from the southern end of Puget Sound, at a distance of forty miles from its base, this mountain is an object of surpassing grandeur. It is of almost exactly the same height as Shasta, but is much more deeply and extensively covered with snow and ice than is that cone. As Rainier is in the midst of a tangled forest without roads, and almost without trails, it can only be reached by travelers fitted out with pack animals and camp equipment, and who are able and willing to bear the fatigues of camp life in a difficult forested country. So far as known to the writer, its higher por-

tions have never been visited by any skillful photographer; while Shasta and Hood have been finely photographed from a great number of points of view by Mr. C. E. Watkins, of San Francisco.

On the whole, these great isolated snow-covered volcanic cones of the Pacific coast are, from the scenic point of view, the grandest objects which this country presents. In the picturesque effect which they produce they may be fairly placed on an equality with anything which the Alps have to show. Indeed, so far as an opinion can be relied on which is based on comparison of photographs only, these almost extinct volcanoes of the Cascade Range must be fully as attractive from a scenic point of view as the higher ones of Mexico, and, perhaps, not much less admirable as scenic objects than the much loftier cones of South America, which all rise from very high bases, and of which the snow-covered portions seem but insignificant in extent as compared with the uncovered rocky slopes.

Among the scenic features of the Cordilleras in the United States there are two forms of rock masses which are, in certain regions, developed to such an extent as to make them peculiar and exceedingly impressive as elements of the landscape. One is the pinnacled character of the granitic masses; the other the dome-shaped summits of the same rock. The pinnacles are something like the Aiguilles of the Mont Blanc group, but in the latter the rock is chiefly slaty and not granitic. In parts of the Cordilleras, notably in the vicinity of Mount Whitney; in a group of mountains called the Castle Range, near Mount Shasta, and in the Wind River Range, the granite occurs in the form of almost isolated pinnacles, or groups of pinnacles, which rise literally thousands of feet above the general level or crests of the ridges on which they stand, so sharp and so vertical that the descriptive term "spike" is one which involuntarily suggests itself to the mind on seeing them. These pinnacles are, of course, too steep to be covered by snow; but they rise often from great snow-fields, presenting a wonderful appearance of mingled desolation and grandeur, and making, perhaps, as strong an impression on the mind as any type of mountain scenery can.

The dome structure of the granitic masses, so wonderfully exhibited in parts of the Sierra Nevada, is also a feature of great scenic interest, and one which, so far as known to the writer, is not seen anywhere else in the world on so grand a scale. These domes are especially well exhibited in the region just above the Yosemite Valley; and here also is that unique feature of the scenery—one of those great, rounded, and exceedingly steep masses, rising almost five thousand feet above the adjacent valley, and which has been split in two so that on the side fronting that valley it presents an absolutely vertical face of somewhat over fifteen hundred feet in height.

Next to mountains, water-falls, perhaps, offer the greatest scenic attractions, and the number and variety of form of those occurring in the United States is very great. Indeed, there are in the Cordilleras great numbers of water-falls which have been seen by explorers, but which have never been described or named; and some of these unknown localities are finer than any of the much-visited falls of the Alps, or even of Norway.

Among the well-known and frequently visited water-falls, there are three which deserve special notice—Niagara, the Shoshone, and the Yosemite Falls. The first is the type of a fall in which the volume of water is the all-important feature. In the Shoshone fall, the volume of water is large, although greatly inferior to that of the Niagara; the height is considerable,—somewhat greater than that of Niagara,—and the surrounding scenery grand and entirely uninjured by the so-called "improvements" of civilization. The Yosemite fall, on the other hand, is one in which the volume of water is small, but the height extraordinary, while the setting of the fall is surpassingly grand. Niagara is so well-known that description is unnecessary. It is the one of the scenic attractions of the country most frequently visited, not only because it is one of the greatest of the water-falls of the world,—in volume of the Zambezi surpassing it in elevation and, perhaps, in volume,—but because it is within a few hours' easy ride of the Atlantic coast. The Yosemite Valley, with all its water-falls, is farther away from the East than the Shoshone Falls, but really much more accessible than the latter, which lies at a considerable distance from any inhabited region. Among the entirely unvisited regions of water-falls, that of the Canon of the Tuolumne River, a few miles north of the Yosemite Valley, is, perhaps, the most interesting. Here are falls and cascades of large volume and great height, set in the midst of the wildest and most romantic scenery—a region into which hardly a traveler has ever found his way. Very much the same may be said with truth of the region of the Southern High Sierra adjacent to Mount Whitney, where we find many of the same features as those which characterize the Yosemite, and on almost as grand a scale as in this now very frequently visited and comparatively accessible locality.

A most remarkable type of scenery, and one which combines features equally interesting to the tourist and the scientific observer, is that of the plateaux of the Cordilleras, of which a brief account has already been given in the preceding pages. The canons of the Colorado and its branches, once so remote, have now been brought comparatively near by the extension of railroads toward the Southwest, and the tide of pleasure travel is beginning to flow in that direction. In the peculiar type of scenery which is unfolded along the Colorado, this country is without a rival. The region of Northern China may be stranger and more unintelligible in the record which it presents of past geological events; but from a scenic point of view the tremendous canons of the Southern Plateau region, with their many-colored walls, may unhesitatingly be included in the list of the earth's greatest wonders. A portion of the country which has within the past few years become the resort of travelers in search of the picturesque, and which is now quite accessible by railroad, is the Geyser region of

Secretary of
Colorado
Rival.

the Yellowstone. Here the scientifically interesting and the picturesque unite to furnish a type of scenery without a rival of its kind, surpassing even the now devastated wonderland of New Zealand. The Yellowstone Park, as it is frequently called, because reserved by the United States and devoted to public use as a visiting ground or park, with the idea of protecting it from speculators and mischief-makers, was early known to some of the more adventurous of the tur-hunters who roamed over the Great Northwest; but it is only within a few years that descriptions of it have been published, and its extraordinary character so clearly established as to induce travelers to undertake the long journey necessary for its inspection. Thermal springs in great number, many of which are the periodically spouting, or geyser type; pools of hot water, both large and small, the sides and bottoms of which are lined with the most exquisitely and brilliantly colored microscopic vegetation, remarkable deposits from the hot springs, some of which exhibit curious forms, seen nowhere else, except in Asia Minor and in New Zealand, as it was before the volcanic eruption of 1866; grand mountain scenery, with water-falls, lakes and deep canyons, whose walls are fantastically colored by volcanic deposits and sulphurous emanations—these are the principal features of the Yellowstone region. It can be reached by the Northern Pacific railroad, from a station on which road, called Livingstone, ten hundred and thirty-two miles from St. Paul, a branch fifty-one miles in length runs to Cinnabar, on the boundary line of the so-called "Yellowstone National Park." There are numerous excellent photographs of this region, which has also been finely illustrated in a folio volume with chromo, lithographs from paintings by Thom: s Moran. The geological and scenic peculiarities of the Yellowstone region have been fully elucidated in various United States Geological reports, and especially in a voluminous one by Dr. A. C. Peale, included in the second volume of Hayden's Report for the year 1875.

Thermal Springs.

Garden of the Gods.

There is a type of scenery of a remarkable character well exhibited along the base of the Rocky Mountains at various points, and especially at a locality called the Garden of the Gods, near Pike's Peak, and easily accessible by railroad. The attraction here is the remarkable effect of the erosion and withering of the soft sandstones, which occur in beds of great thickness. Many fantastic shapes, such as columns or obelisks, of large dimensions, occurring either singly or in clusters, and often capped in the most curious manner by great flat tables of harder rock, are seen in this interesting region. Indeed, all along the eastern base of the Rocky Mountains in Colorado are many strange and picturesque forms, partly the result of direct uplift, and partly of erosion, which are alike interesting to the lover of the picturesque, and the student of geology. The long crested uplifts of sedimentary rock worn into curved outlines, and often of grand dimensions, which characterize this region are known by the familiar name of "hog-backs," and the region itself as the "hog-back country."

Of the scenic effect of the vegetation of the country, and especially its forests, notice has already been taken to as great an extent as space here permits.

MINERAL RESOURCES.

Iron ore was smelted at Falling Creek, Virginia, as early as 1620. The raids upon the whites at this time, made by the Indians, put a stop to the industry. From 1643 to 1671 the business of smelting and manufacturing iron was successfully carried on at Lynn, Massachusetts. About 1789 there were fourteen furnaces and more than thirty forges in operation in Pennsylvania.

Mining business.

The business of mining for other metals than iron within the territory of the United States is of much more recent origin. To this statement, however, an exception must be made in reference to the metal copper, which had been extensively mined in the Lake Superior region long before the first visit of the English to these shores. Indeed, so ancient are these workings that no positive knowledge exists as to the people or tribes by whom they were executed. When the region in question was opened to the whites for settlement in 1844, it was found that the copper-bearing rocks had been mined through their whole extent along the southern shore of Lake Superior, and even on the almost inaccessible island called Isle Royale. There is no reason to suppose that these ancient workings, which in some places had been carried to a depth of more than fifty feet in the solid rock, were known to the Indians inhabiting that region at the time of the first visit of the Jesuit fathers in 1659-60; and the appearance of the excavations indicates, beyond possibility of doubt, that they had been made long before that time.

Governor Winthrop.

About the middle of the seventeenth century the metalliferous indications common in New England, and especially in Connecticut, engaged the attention of Governor Winthrop, by whom mineralogical notices of that region were sent to England and published in the Transactions of the Royal Society.

Just at the beginning of the eighteenth century a Frenchman, Le Sueur, explored the region of the Upper Mississippi, and sent back to France, rock which he had mined, supposing it to be an ore of copper; but it proved to be of no value. Later in 1719 and 1720, the French again attempted to explore what was then called the western portion of the country, along the Mississippi near the junction of the Missouri; and some mining of the lead ore, which at that time had already become known, was attempted. The precious metals being what was sought for, and there being none found in the region, the enterprise was soon abandoned.

At the beginning of the present century, as it appears from what has been stated all that had been done in the way of discovering and developing the metallic wealth of the United States was the mining and smelting of the ores of iron, on a limited scale, in the Atlantic States, and a small production of lead in the mining region of Missouri. Exact statistics of these metals at the beginning of the nineteenth century are wanting. The amount of iron produced in 1810 has been estimated at fifty thou-

sand tons; the production of lead about that time may have been approximately one thousand tons a year.

An event of great importance took place almost immediately after the value of the Lake Superior copper mining district had been fully ascertained, in the year 1844. This was the demonstration of the fact that gold existed in large quantities along the western slope of the Sierra Nevada.

The occurrence of gold on that portion of the Pacific coast, called by the Mexican-Spanish Upper California, had been known for several years prior to its discovery by immigrants from the United States and workings had been carried on for this metal in the Coast Ranges, far south of the locality where it was discovered in 1848.

The demonstration of the fact that over a vast extent of that distant country gold was to be had in almost unlimited quantity, as it at first—not without reason—appeared, led to an extraordinary excitement throughout the older States, and to an emigration from all parts of the world toward the newly discovered land of gold on an unprecedented scale of magnitude.

COAL.

The area underlain by the coal-measures in the United States is very large, as will be seen from the following table, which represents approximately the coal areas of Carboniferous age east of the Cordilleran region. That different portions of the areas here designated are of very different value, as respects quality and quantity of coal, is certain; and that portions of them do not contain coal-beds of sufficient thickness or of good enough quality to be worked with profit, either at present or at any future time, is also an undoubted fact, although these unproductive portions are, except perhaps, in the case of the Western and Michigan fields, of comparatively small extent:—

| Name of the field. | Area. | Coal beds. |
|--|--------------------|------------|
| Rhode Island | 500 sq. miles. | " |
| Appalachian | 59,165 " | " |
| Central (Illinois, Indiana, and Kentucky) | 47,250 " | " |
| Western (Missouri, Iowa, Kansas, Arkansas and Texas) | 78,400 " | " |
| Michigan | 6,700 " | " |
| Total | 192,045 sq. miles. | |

Of these fields the Appalachian is at present by far the most important, and is likely to remain in this position for an indefinite period. The coal field of Rhode Island is not now, nor has it ever been, worked to such an extent as to be of special importance. The Michigan coal-field has also no present value, the quality of the coal being inferior, and the conditions not such as to allow successful competition with the coal of adjacent regions. The present relative importance of the different States as regards the production of coal and the yield of the various fields will be easily recognized from an inspection of the following table:—

COAL PRODUCED IN THE SEVERAL STATES AND TERRITORIES, NOT INCLUDING THE LOCAL AND COLLIERY CONSUMPTION, AND THE VALUE OF THE MINES IN 1885.

| STATES AND TERRITORIES | 1882. | 1883. | 1881. | 1885. |
|------------------------|------------------|------------------|------------------|------------------|
| Pennsylvania: | <i>Long tons</i> | <i>Long tons</i> | <i>Long tons</i> | <i>Long tons</i> |

The commercial product, exclusive of that which is consumed at the mines, known as colliery consumption, during 1885, was: Pennsylvania anthracite, 36,137,272 short, or 32,265,421 long tons, the market value of which has been estimated to have been \$72,274,544; bituminous, brown coal, lignite, and small lots of anthracite, mined in Colorado and Arkansas, 71,195,358 short, or 63,567,284 long tons, the market value of which has been estimated to have been \$30,640,724, making a total production of 107,332,629 short, or 95,832,705 long tons, valued at \$152,915,268. The total production, including colliery consumption, was Pennsylvania anthracite 33,335,973 short, or 34,225,543 long tons, all other coals 72,621,549 short, or 64,849,668 long tons, making the total absolute production of the coal mines of the United States for the year, 110,957,522 short, or 99,069,216 long tons.

The coal areas of Carboniferous age in the United States are five in number. They are:

The Massachusetts-Rhode Island area, comprising approximately 500 square miles;

The Allegheny area, about 59,000 square miles;

The Michigan area, about 6,700 square miles;

The Illinois, Indiana and West Kentucky area, about 47,000 square miles; and

The Iowa, Missouri, Kansas, Arkansas and Texas area, about 78,000 square miles;

Forming a total of about 191,200 square miles, underlaid by coal-bearing strata, of which not over 120,000 square miles contain workable coal-beds.

Two general classes of coal are recognized, viz., anthracite and bituminous, the latter being often subdivided into bituminous and semi-bituminous coal.

Anthracite forms the whole of the coal found in the Massachusetts-Rhode Island area and in that portion of Pennsylvania occurring in the neighborhood of Pottsville, Mahanoy City, Shamokin, Hazleton, Manch Chunk, Wilkes-Barre and Scranton. It also occurs to a limited extent in Virginia.

Bituminous coal occupies the rest of the districts just named.

A glance on a map of the coal-fields shows how unequally the coal areas are distributed over the United States. While New England and the seaboard Atlantic States contain practically no coal, the greatest development of the workable coal strata is in the Allegheny mountains and to the west of them, extending from Pennsylvania and Ohio in an unbroken line to Alabama.

Next to the one just mentioned the most important field is the one occurring in Illinois, Indiana and Western Kentucky. The coal area which extends from Iowa to Texas is of much less importance and extent, and the Michigan coal-field has scarcely been opened.

Different coal fields.

THE MASSACHUSETTS-RHODE ISLAND AREA.—The coal is confined to eastern Rhode Island and Bristol and Plymouth counties in Massachusetts. At present the only mine worked is at Portsmouth, Rhode Island, where E one of the three beds found, is being exploited. The coal-beds in this area seem to vary from one to thirteen in number, but the explorations made in the past have been so unsystematic and pecuniarily, so unsatisfactory, that the data on which these views are founded are not very reliable. The character of the coal is the hardest kind of anthracite, often containing spangles and plates of graphite disseminated through it, which characteristics are due to the highly metamorphic action it has undergone. To this same action is due in a great measure the peculiar folded character of the deposits, which has locally caused expansions and contractions of the coal-beds, so that in some places they are thirteen feet thick, and in others but a few inches. Such an irregularity renders the cost of mining the coal very great, owing to the large amount of "dead work" required, and to this cause may in part be ascribed the slight progress which has been made in the development of the region. The working is now confined to a single mine.

THE ALLEGHANY AREA, the most important in the United States Allegheny in its extent in the number of workable coal-beds and in the quality and variety of the coals found, is situated in Pennsylvania, Ohio, West Virginia, Virginia, eastern Kentucky, East Tennessee and northern Alabama. This area is divided into numerous different fields, more or less contiguous to one another, and of which a brief mention follows:

THE ANTHRACITE COAL-FIELDS OF EASTERN PENNSYLVANIA.—The anthracite fields are confined to a limited area of not over 475 square miles, situated in the counties of Carbon, Schuylkill, Northumberland, Columbia, Dauphin, Luzerne and Lackawanna. Three districts are commonly recognized in this region, known as the first, second and third coal-fields. The Coal Measures within this region are almost universally surrounded by two mountain-ridges, the exterior one consisting of sub-Carboniferous sandstone. This is separated from the interior ridge by a valley, more or less broad, or easily decomposing red shale, overlying which occurs the true conglomerate, holding in its bosom the valleys or basins in which the anthracite occurs. These two series of ridges were the efficient protectors of the coal from the denuding agents, which removed it from the intervening barren districts, separating the different anthracite basins from each other and from the bituminous coal-fields of Central Pennsylvania.

North of the anthracite coal-fields proper, is the semi-anthracite Semi-anthracite of the Bernice basin in Sullivan county, Pennsylvania, where the principal coal-bed, eight to nine feet thick, contains eight to nine beds in per cent. volatile matter. The coal, while classed as an anthracite, Sullivan lacks the brilliant anthracite luster and conchoidal fracture, generally breaking in cubes; in consumption it closely resembles the Penn-s semi-anthracite of Lykens Valley, in Dauphin county. The whole of this coal is carried North and West for distribution and consumption.

THE BROAD-TOP-COAL-FIELD OF PENNSYLVANIA.—The coals of this basin, which occupies about twenty-five square miles, all belong to the Lower Protective Coal Measures, of which more presently, with the exception of a few acres of coal of the Pittsburgh bed. The measures in this coal-field have been much disturbed, so that the relations of the strata are not fully understood, and consequently frequent errors have been made in identifying the coal in different portions of the district. There are apparently three workable beds. The coal of this district, while actually bituminous in character, is commonly called semi-bituminous on account of the comparatively small amount of volatile matter it contains, often as low as eight per cent. At one time the mines of this district were actively worked, the coal being used for steam-raising and rolling-mill purposes. Since the opening of the Clearfield coal-district and the more active exploitations of the Cumberland coal-beds, the mining interests of this district have languished, owing in part to an inferiority in quality of this coal to either of the others; in part to the greater cost of extraction due to the more disturbed condition of the strata.

THE BITUMINOUS COAL-FIELDS OF PENNSYLVANIA.—While the bituminous coal fields of Pennsylvania are contiguous to those of Ohio and West Virginia, the latter being actually but extensions of the former, they are, for the sake of description, separated geographically.

In the bituminous coal area of Pennsylvania, Ohio and West Virginia geologists and engineers have recognized (1) Upper Barren Measures; (2) Upper Productive Coal Measures; (3) Lower Barren Measures; (4) Lower Productive Coal Measures; (5) Inter-conglomerate coals.

The following coal strata occur in the Upper Productive Coal Measures, commencing with the upper bed: Waynesburg coal-bed, Sewickley coal-bed, Red-stone coal-bed, Pittsburgh coal-bed. Of these the Pittsburgh is of far the greatest economical value, but the others are locally of importance.

In the Lower Barren Measures are a few beds which are most uncertain in character and of little economical value; they are most unreliable in character, and while locally they thicken, so as to be of some local value, they speedily thin out again.

Below the Lower Barren Measures are found the following coal strata, viz: Upper Freeport coal-bed, Lower Freeport coal-bed, Upper Kittanning coal-bed, Lower Kittanning coal-bed, Clarion coal-bed and Brookville coal-bed.

Still lower, geologically, are the coals occurring in the Great Conglomerate, which include the Clarion group, C the Quakertown bed of Lawrence county, and the Sharon bed of Mercer county. These coals occur in six different basins, of which the sixth is the most southwesterly in position and least distinct as to its division. Each basin is separated from its neighbor by an anticlinal way or rather by a series of separate anticlinals, the ends of which past each other.

Having the Alleghany mountains as an eastern barrier, coal fields extend westwardly in a more or less unbroken succession into Ohio. But the coal-beds are by no means equally distributed over this area. As middle Pennsylvania and middle New York were lifted, by geological action, much higher above the old sea-level than southwestern Pennsylvania, Ohio and Virginia were, the destruction of the coal measures toward the Southwest, the North and Northeast, gradually diminishing toward the Southwest. Only the lowest, or two or three lowest, beds of coal have been left as isolated patches on the mountain tops of Wyoming, Sullivan, Lycoming, Clinton, Bradford, Tioga, Potter, Cameron, McKean and Warren counties.

The great productive bituminous coal-field may be said to commence in the belt of counties composed of Clearfield, Jefferson, Clarion, Venango and Mercer counties—a distance of 140 miles to the Ohio line from the crest of the Alleghenies. In the counties last mentioned, as well as in Cambria, Indiana, Armstrong, Butler, Lawrence, Beaver, Somerset (with the exception of the Salisbury patch), eastern Westmoreland, and eastern Fayette, only the Lower Productive coal-beds, and in places the inter-conglomer-

ate coals have been left, while the Upper Productive Measures have been swept away. These latter are found in a great part with all the Lower Productive Coal Measures in Alleghany, western Westmoreland and western Fayette counties, while the whole of the Upper and Lower Productive Measures occur in Washington and Greene counties. In brief, the Coal Measures are most good toward the Northeast, and are least disturbed toward the Southwest.

The Ohio coal fields.

THE COAL-FIELDS OF OHIO.—The Ohio coal fields are but the western extension of the bituminous coal-region of Pennsylvania; consequently, the coal-beds which are found in them are the same, with local modifications, as those of the latter State. Commencing at the Pennsylvania-Ohio line we find that "the margin of the coal basin forms a tortuous line, commencing in the northern part of Trumbull county, passing thence southwesterly to the Mahoning Valley, where it is deflected far to the southeast. West of Youngstown it runs through the southern townships of Trumbull county, where it is deflected north nearly to the center of Geauga county, where it incloses a long tongue and two or three small islands of coal. Thence returning into Portage, it passes southeasterly through the southern part of Summit, where it is deflected to the northwest. From here it runs southwesterly again to the southwest corner of Holmes. Thence it passes easterly southward along the western margin of Holmes and Coshocton; thence southwesterly through the eastern part of Licking. From here its course for fifty miles is nearly south to the center of Hocking, where it turns slightly westward, and passes through Vinton, Jackson, Pike, and Scioto to the Ohio, where it crosses " into Kentucky. The counties more or less underlain by coal in Ohio are Mahoning, Columbiana, Portage, Stark, Holmes, Carroll, Tuscarawas, Jefferson, Harrison, Belmont, Guernsey, Coshocton, Muskingum, Perry, Noble, Morgan, Washington, Moore, Meigs, Athens, Jackson, Gallia, Lawrence, Trumbull, Summit, Medina, Wayne, Licking, Hocking, Pike and Scioto.

Virginian coal fields.

THE COAL-FIELDS OF WEST VIRGINIA AND VIRGINIA.—No State in the Union surpasses West Virginia in the variety of coals it contains, nor does any contain an equal amount in proportion to its area; for, of the fifty-four counties in the State, but six are entirely destitute of this important fuel. In many of them, however, the coal is so deeply buried, and in others the means of transportation are so bad quite, that it will be many years before the mineral wealth they contain will even commence to be developed. In Virginia, on the other hand, there are but six counties which contain coal of Carboniferous age, and they are in the extreme southwestern corner of the State, adjoining West Virginia and Kentucky. The coal-field of West Virginia and Virginia is but an extension of the Appalachian coal field from Pennsylvania, Maryland and Ohio, and the general system of the measures, is the same, with the exception that locally some of the coal-beds in the Great Conglomerate are of a sufficient thickness to be profitably worked.

Maryland coal field.

THE MARYLAND COAL-FIELD, better known as the Cumberland coal-basin, is but a prolongation of the Potomac basin mentioned under West Virginia. This coal-field is one of the most important in the United States, due to the thickness of the main bed, its good quality, and the large annual production. The coal is most extensively used for rolling-mill and steam-raising purposes, its chief and only competitor among the bituminous coals being that from the Clearfield region of Pennsylvania. This coal-field is an outlier of the main Alleghany coal area, of which there are several others in Pennsylvania, such as the Broad-Top, Snowshoe, Ralston and Blossburg basins. The coal is semi-bituminous in character, and does not coke quite so readily as those which contain more gas.

THE EASTERN KENTUCKY COAL-FIELD is but a continuation of that described in Ohio and West Virginia. The western boundary of the Alleghany coal area in Kentucky is approximately as follows, in a north-south direction: Starting at the Ohio river near Tygart's creek, the line runs through Greenup, Carter, Rowan, Morgan, Powell, Estill, Jackson, Laurel, Pulaski, Wayne and Clinton counties to the Tennessee line. This coal-field underlies the whole of fifteen counties and a portion of five others, containing 8,983 square miles. The boundary line is very crooked, throwing off numerous spurs, extending west of the line mentioned.

THE TENNESSEE COAL-FIELD is but a prolongation southward of the eastern Kentucky field. Its area is co-extensive with that of the Cumberland mountain or table-land. The Cumberland mountain crosses Tennessee obliquely, and although much indented by valleys and coves, is nowhere completely cut in two by them. The eastern border of this table-land is comparatively a nearly direct or gracefully curving line, the indentations made by the streams on this side being scarcely noticeable. It is very irregular, however, along its western border, being cut out and notched by deep valleys and coves, separated from each other by long spurs jutting to the West. These deep indentations give the western outline a very ragged appearance. Along the Kentucky line the coal-field is about seventy miles wide, while it narrows along the Alabama line to fifty miles.

THE GEORGIA COAL-FIELD.—The Tennessee coal-field west of the Sequatchie valley extends over the border into Alabama, and then soon dies out. That on the eastern side of the valley, on the contrary, extends through Dale, Walker and Chattooga counties in Georgia into Alabama. Almost the whole of the former is underlain by an excellent quality of bituminous coal, while there is not quite such an extent of it in the other two counties.

THE ALABAMA COAL REGION is an extension southward of the Georgia into northern Alabama. It is divided into three fields, the Black Warrior, the Cahaha and the Coosa. Of these three the first is the largest.

THE ILLINOIS, INDIANA AND WEST KENTUCKY AREA—The coal

measures of this portion of the United States form but one area.

THE INDIANA COAL-FIELD.—The Carboniferous Measures occur in the counties of Possey, Vanderburgh, Warwick, Spencer, Perry, Crawford, Gibson, Pike, Dubois, Knox, Daviess, Martin, Sullivan, Greene, Clay, Owen, Vigo, Parke, Vermillion, Fountain and Warren, or, in other words, in the southwestern part of the State. There are three beds of coking coal in this field, varying from four and a half to ten feet in thickness, and three seams of open-burning or splint coals that range from two and a half to five feet in thickness, the average thickness being four feet. One bed of cannel coal occurs in Daviess county, about four and a half feet thick. The principal coals mined with this exception are the block coals from Clay county.

PETROLEUM.

Petroleum has been known to exist in this country almost from its first settlement. The records of travels, especially through the region west of the Appalachian chain, in what was then known as the Great Ohio Valley, contain constant evidences of the existence of this material in the reports of burning springs and the oil that accompanied them.

It was not, however, until 1859, at the time of the drilling of Drake's first well, that it began to assume any commercial importance. The excitement attending the discoveries in the Pennsylvania oil field led to explorations in many States, and developed the fact that petroleum existed in many localities. These localities are chiefly on the western slopes of the Appalachian chain, reaching from Petrolia in Ontario to just across the Tennessee State line in Alabama. Some quite extensive fields are also found in California and in Wyoming, and later evidences of the existence of oil have been discovered in other States, but the Appalachian and the California oil fields are at present the only ones of commercial importance.

The most important of these fields are what are described further on as the Pennsylvania and New York oil fields. Next in importance to these is the Macksburg field in Ohio, near Marietta, the third in importance being the California field. West Virginia produces some small amounts of heavy oil for lubricating purposes, its light oil having been comparatively exhausted some years since. There are also oil fields that with better facilities for transportation might be of importance in both Tennessee and Kentucky. The Wyoming oil fields described farther on in this report are also of importance in the amount of petroleum that can some day be made available; but of this field, as of all others outside of the Pennsylvania and Macksburg regions, with the exception of California, it will be found that the expense of producing and transporting the oil to market will effectually prevent any great production in these fields until the price of Pennsylvania petroleum shall materially advance.

In the following table will be found a consolidation of the statistics of the production of petroleum in the various fields of the country, so far as the same could be obtained from the beginning of operations in these fields:—

PRODUCTION OF CRUDE PETROLEUM IN THE UNITED STATES FROM 1859 TO 1887.
(In barrels.)

| Years. | Pennsylvania and New York. | West Virginia. | Ohio. | Kentucky, Tennessee, and other States. | California. | Total. |
|--------|----------------------------|----------------|---------|--|-------------|------------|
| 1859 | 2,000 | | | | | 2,000 |
| 1860 | 500,000 | | | | | 500,000 |
| 1861 | 2,113,609 | | | | | 2,113,609 |
| 1862 | 3,656,690 | | | | | 3,656,690 |
| 1863 | 2,611,309 | | | | | 2,611,309 |
| 1864 | 2,116,109 | | | | | 2,116,109 |
| 1865 | 2,497,700 | | | | | 2,497,700 |
| 1866 | 3,537,700 | | | | | 3,537,700 |
| 1867 | 3,347,390 | | | | | 3,347,390 |
| 1868 | 3,646,117 | | | | | 3,646,117 |
| 1869 | 4,215,000 | | | | | 4,215,000 |
| 1870 | 5,201,745 | | | | | 5,201,745 |

| 1873 | 9,893,786 | | | | | 9,893,786 |
| 1874 | 10,426,845 | | | | | 10,426,845 |
| 1875 | 8,787,574 | 3,000,000 | 290,000 | | | 12,067,574 |
| 1876 | 8,998,995 | 1,200,000 | 31,763 | | | 10,230,758 |
| 1877 | 13,135,475 | 172,000 | 29,888 | | 13,000 | 13,337,363 |

PRODUCTION OF CRUDE PETROLEUM.—Continued.

| Years. | Pennsylvania and New York. | West Virginia. | Ohio. | Kentucky, Tennessee, and other States. | California. | Total. |
|--------|----------------------------|----------------|-----------|--|-------------|-------------|
| 1878 | 15,163,462 | 180,000 | 38,179 | | 15,297 | 15,296,868 |
| 1879 | 19,685,176 | 180,000 | 29,112 | | 19,858 | 19,914,146 |
| 1880 | 26,077,631 | 179,000 | 38,940 | | 40,552 | 26,286,123 |
| 1881 | 27,375,549 | 151,008 | 33,867 | | 99,892 | 27,671,258 |
| 1882 | 30,053,500 | 128,000 | 39,761 | | 128,636 | 30,319,897 |
| 1883 | 23,128,389 | 125,000 | 47,632 | | 142,857 | 23,444,878 |
| 1884 | 20,772,269 | 90,000 | 60,081 | | 292,000 | 21,114,290 |
| 1885 | 25,798,000 | 102,000 | 650,000 | | 325,000 | 26,845,000 |
| 1886 | 22,356,193 | 145,000 | 1,782,970 | | 377,145 | 28,285,115 |
| 1887 | | | 5,018,915 | | 678,572 | 28,249,597 |
| Total. | 330,312,443 | 4,664,000 | 8,030,208 | 276,817 | 2,289,709 | 345,573,177 |

Pennsylvania and New York fields.

More than 50 per cent. of all the oil produced in the United States is from the Bradford and Alleghany fields, these two districts being credited with 11,099,512 of the 21,842,041 barrels produced in the country in 1885. The production in these fields, however, is kept up only by the liberal use of nitro-glycerine, and even with the use of explosives to an extent before unknown the production is falling off, and it is a question if the vigor of these old fields can be restored.

California fields.

From the time of the first settlement of California by the whites there have been evidences, in the form of spring and seepage from the asphaltum beds, of the existence of petroleum in the State. No attempts, however, were made to utilize these deposits until the excitement following the Pennsylvania oil discoveries led to prospecting these surface deposits and the eager searching for others. During the years 1865 and 1866 upwards of seventy companies, each with a large nominal capital, were incorporated in California for the purpose of searching for petroleum. While a majority of these companies proceeded no further than to organize, having never expended any money in actual operations, some of them began active operations, sinking wells and driving tunnels in their search. Most of the work at this time was in Humboldt, Colusa, Contra Costa, Santa Clara, and Los Angeles counties.

About 1875 the oil business in California took on new life. Two wells put down that year yielded some 15 or 20 barrels each per day. Drilling by steam began to be more generally used in place of the spring pole. In 1877 the Ventura and the Pico Canon wells produced daily 30 and 40 barrels respectively. Some 20 barrels of refined oil were made daily at the Pico refinery at the latter place. The next year 40 barrels of crude oil were for a number of days taken from the Boyer well, in the Santa Cruz mountains, every 24 hours. The oil here, as in most cases in California, was brought to the surface by pumping, no flowing wells having as yet been struck in the State.

From this time there has been a steadily increasing output of oil in California.

Wyoming fields.

There are, as far as now known, two oil fields in this State, probably originally the same, but now divided by the range of mountains in which the headwaters of the North Platte and Wind rivers find their sources.

Washington fields.

As yet no valuable deposits of petroleum or its concomitant, asphaltum, have been found anywhere in the far west, except in California. Recently encouraging indications of mineral oil are reported to have been met with at Puyallup, in Washington.

NATURAL GAS.

According to Mr. Swank, natural gas was first used as a fuel in connection with the manufacture of iron and steel at Leechburg, Armstrong county, Pennsylvania, in 1874, when it was taken from a well twelve hundred feet deep, and where it at that time furnished all the fuel required for puddling, heating, and making steam at the rolling-mill of Messrs. Rogers and Darchfield. Between

1874 and 1881 the use of natural gas was introduced at various other establishments for puddling and rolling. The use of this new fuel spread so rapidly, that in 1887 there were ninety-six rolling-mills and steel works either wholly or in part using natural gas; and Mr. Swank states that at the present time nearly one-fourth of all the establishments of this kind in the United States are thus supplied with fuel. The territory in which are located iron and steel works using natural gas extends as far east as Johnstown, seventy-nine miles east of Pittsburgh. Some gas is used in Ohio, piped from wells in the adjacent region of Pennsylvania and some is also obtained from local wells. Pennsylvania gas is also used to a limited extent in West Virginia. Natural gas has also been obtained at various localities in Indiana.

According to Mr. Ashburner, of the Pennsylvania Survey, there were, in 1885, no less than 1,500 dwellings, 66 glass factories, 34 rolling-mills, and 45 other industrial establishments supplied with natural gas in the city of Pittsburgh alone; and this was estimated as representing or displacing an amount of coal equal to ten thousand tons a day. In the following table is given the amount and value of the coal displaced by natural gas throughout the country, as nearly as it could be estimated, for the years 1885-87:—

| | Amount. | Value. |
|------|-----------------|-------------|
| 1885 | 2,796,000 tons. | \$4,857,200 |
| 1886 | 5,761,000 " | 10,012,000 |
| 1887 | 8,800,000 " | 15,838,500 |

The rapid increase in the amount of natural gas consumed during the last few years is easily seen in the above table. The surpassing importance of Pennsylvania in general, and of the Pittsburgh District in particular, as consumers of this kind of fuel, and the progress which has been made in other States in the development of this branch of industry may be seen in the following table, in which the detailed statistics for the year 1887 are given:—

AMOUNT OF COAL DISPLACED BY NATURAL GAS.

| Locality. | Coal Displaced. | Value. |
|--|-----------------|--------------|
| Pennsylvania: | | |
| Alleghany County | 4,890,000 tons. | \$6,846,250 |
| Remainder of Pittsburg District | 1,437,900 " | 2,415,750 |
| Western Pennsylvania (outside) of Pittsburg District | 1,603,100 " | 4,487,500 |
| Total Pennsylvania. | 7,931,000 tons. | \$13,749,500 |
| New York | 94,600 " | 333,000 |
| Ohio | 446,000 " | 1,040,000 |
| West Virginia | 53,500 " | 120,000 |
| Indiana | 268,000 " | 600,000 |
| Illinois | 2,500 " | 6,000 |
| Kansas | 4,460 " | 15,000 |
| Elsewhere | 4,460 " | 15,000 |
| Total | 8,804,520 tons. | \$15,838,500 |

The development of the iron and steel business in the United States during the last half century has been as rapid as that of steel. In 1850 the total production of iron throughout the world was about six million tons, of which fully half was to be credited to Great Britain; that of the United States was about one million tons, or one-sixth of the whole amount. In the years from 1881 to 1887 the total production of pig-iron throughout the world varied between nineteen and twenty-two millions of tons, averaging a little over twenty millions, of which about four-fifths were due to England, the United States and Germany. In the last fifteen years the proportional production of England has gradually declined; for the five years ending 1885 it was very nearly five-twelfths, and in 1887 a very little over one-third of the total. England and the United States together made in 1887 nearly five-eighths of the total.

In regard to the geographical distribution of special products the Special Agent of the Census of 1880 in charge of this department—Mr. J. M. Swank—makes the following statement:

"A glance at the statistics for 1880 shows that New England now makes but little pig-iron, and that the South makes considerable pig-iron and scarcely any rolled iron; that the West has largely embarked in the manufacture of steel by the Bessemer process, while New York cannot boast of a single Bessemer establishment, but has preferred the open-hearth process; that New York makes most of the blooms that are made from ore, and Pennsylvania most of the blooms that are made from pig and scrap-iron; that Michigan is the leading producer of charcoal pig-iron, and now makes no other kind; that West Virginia has developed a remarkably active interest in the manufacture of cut nails; that only five States make Bessemer steel; and two States, Pennsylvania and New Jersey, make nearly all of our crucible steel; and that Pennsylvania has made a greater effort than any other State to manufacture all kinds of iron and steel."

At the close of the year 1887 there were 613 blast furnaces, then either completed or building (not counting any of which had been abandoned), in the United States, and they were thus distributed:

| Division. | Subdivision. | Number. | Total. |
|-------------|------------------------|---------|--------|
| ATLANTIC | North Atlantic..... | 315 | 375 |
| | Middle Atlantic..... | 54 | |
| | South Atlantic..... | 6 | |
| CENTRAL | Northeastern Central.. | 147 | 233 |
| | Northwestern Central.. | 13 | |
| | Southeastern Central.. | 71 | |
| | Southwestern Central.. | 2 | |
| CORDILLERAN | Rocky Mountain..... | 2 | 5 |
| | Plateau..... | 0 | |
| | Pacific Coast..... | 3 | |
| Total..... | | 5 | 613 |

Blast furnaces.

Of the 613 blast furnaces, 243 were in Pennsylvania, Ohio coming next in order with seventy-eight. In the Northern States there were 459; in the Southern 154, of which forty-four were in Alabama (twenty-four completed and twenty building). Of 414 iron and steel rolling mills, 169 were in Pennsylvania, Ohio coming next with fifty-five. Of Bessemer and Clapps-Griffiths steel works there were forty-three, of which nineteen were in Pennsylvania and six in the Southern States. Of open-hearth steel works there were fifty, of which twenty-seven were in Pennsylvania and two in the Southern States. Of crucible steel works there were forty-one, of which twenty-one were in Pennsylvania, and two in the Southern States.

The production of pig iron and of Bessemer steel ingots and rails in the United States since 1850 is stated in the following table, compiled from the statistics collected by the American Iron and Steel Association:

| | 1851. | 1852. | 1853. | 1854. |
|----------------------------|-----------|-----------|-----------|-----------|
| Pig-iron..... | 4,144,253 | 4,624,323 | 4,595,510 | 4,697,808 |
| Bessemer steel ingots..... | 1,371,247 | 1,514,857 | 1,477,345 | 1,375,317 |
| Bessemer steel rails..... | 1,187,709 | 1,284,065 | 1,148,799 | 996,465 |
| | | 1855. | 1856. | 1857. |
| Pig-iron..... | | 4,044,526 | 5,683,329 | 6,417,148 |
| Bessemer steel ingots..... | | 1,519,426 | 2,269,190 | 2,936,033 |
| Bessemer steel rails..... | | 959,470 | 1,562,409 | 2,101,903 |

From the above table it will be seen that 1852 and 1853 were years of large production, both of iron and steel; that in 1854 and 1855, there was a considerable falling off in the amount of pig-iron made, while the production of steel remained nearly the same; and it will also be noticed that in 1856 there was a large increase in both iron and steel, which increase was continued in 1857—the production of the latter year being more than a million and a half of tons greater than it was in 1854. The increase of Bessemer steel for purposes other than the manufacture of rails is also clearly indicated in the following table:—

| | 1852. | 1853. | 1854. |
|-----------------------------------|-----------|-----------|-----------|
| Production of Bessemer steel..... | 1,514,687 | 1,477,345 | 1,375,317 |
| Percentage used in rails..... | 85 | 78 | 72 |
| | 1855. | 1856. | 1857. |
| Production of Bessemer steel..... | 1,519,426 | 2,269,190 | 2,936,033 |
| Percentage used in rails..... | 63 | 78 | 72 |

Bessemer Steel.

The production of Bessemer steel was forty-nine per cent. larger in 1856 than it was in 1855, and 29 per cent. larger in 1857 than in 1856. The total number of completed Bessemer steel works in the United States at the close of 1856 was thirty-three, with sixty-nine converters. Pennsylvania in that year made fifty-nine per cent. of the ingots produced; Illinois, 21; and other States, 20.

The rapid growth and present importance of the steel industry in the United States will be appreciated on examination of the following table, in which the amount of steel of all kinds, produced is given for each fifth year from 1870 on, and also for the years 1856 and 1857, in tons:

| Year. | Bessemer steel ingots. | Open-hearth steel ingots. | Crucible steel ingots. | All other steel. |
|-----------|------------------------|---------------------------|------------------------|------------------|
| 1870..... | 37,500 | 1,339 | | 31,250 |
| 1875..... | 335,283 | 8,080 | 35,179 | 11,256 |
| 1880..... | 1,074,261 | 100,850 | 64,664 | 7,553 |
| 1885..... | 1,519,420 | 133,375 | 57,549 | 1,514 |
| 1886..... | 2,269,191 | 218,973 | 71,972 | 2,266 |
| 1887..... | 2,936,033 | 322,069 | 75,376 | 5,593 |
| Year. | | | | Total. |
| 1870..... | | | | 70,089 |
| 1875..... | | | | 389,799 |
| 1880..... | | | | 1,247,334 |
| 1885..... | | | | 1,711,919 |
| 1886..... | | | | 2,562,502 |
| 1887..... | | | | 3,330,071 |

Production of rails

The production of rails of all kinds in the United States is given in the following table for the year 1857, in which the manufacture

of Bessemer steel rails began, and also for 1870 and for each succeeding fifth year, as well as for the years 1856 and 1857:

| Year. | Bessemer steel rails. | Open-hearth steel rails. | Total steel rails. | Iron rails, all kinds. |
|-----------|-----------------------|--------------------------|--------------------|------------------------|
| 1857..... | 2,277 | | 2,277 | 410,319 |
| 1870..... | 30,357 | | 30,357 | 523,214 |
| 1875..... | 259,699 | | 259,699 | 447,900 |
| 1880..... | 852,196 | 12,156 | 864,352 | 449,858 |
| 1885..... | 959,471 | 4,279 | 963,750 | 13,227 |
| 1886..... | 1,574,703 | 4,491 | 1,579,194 | 21,142 |
| 1887..... | 2,101,903 | 17,145 | 2,119,048 | 20,591 |

| Year. | Total iron and steel. |
|-----------|-----------------------|
| 1857..... | 412,596 |
| 1870..... | 533,171 |
| 1875..... | 707,610 |
| 1880..... | 1,375,211 |
| 1885..... | 976,977 |
| 1886..... | 1,600,536 |
| 1887..... | 2,139,639 |

The ores of iron are widely disseminated over the United States General and are of very different qualities; but there are certain regions sur- vey of greatly predominating importance, and certain geological hori- zous or formations from which much the larger portion of these kinds of ores is derived. To each of these a few words of description may iron ore be devoted.

The great coal field of the Central United States is surrounded on the north, east and south by the uplifted older rocks of the Wisconsin—Michigan, the Appalachian and the Ozark regions.

This basin and its border contain the fuel and the ore on which and with which the material prosperity of the United States of the twentieth century must be built. It becomes, therefore, of importance to obtain a general survey of the distribution of the various kinds of iron ore both geographically and in the geological column.

On the extreme edge of the border that incloses the coal basin we find in the north and east the Archaean with its immense development of magnetic and specular ores. Next within this and overlying it is the Canadian-Cambrian series, the substructure of the first great longitudinal valley of the Appalachians extending from Canada to Alabama. This valley is not less remarkable for its enormous wealth in limonite ores than for the fertility and durability of its soil. Still farther inward the shales of the Clinton age mark a belt of hematite ore extending from central Alabama to and through eastern New York, and thence westward across the State. The belt thus outlined will be seen, on the map, to have a breadth of from fifty to over one hundred miles. Within it, but less persistent in longitudinal representation, are deposits of iron ores occurring—some here, some there—in strata of almost every age from the Archaean to the Coal Measures, and the great coal-field thus iron-bound, is itself rich in carbonate ores, generally occurring either as clay iron stone, or as black band, or in places as a ferri-ferous limestone altered to limonite. The map does not attempt to represent the actual distribution of the ores of the Coal Measures, but only the areas within which they were sampled for this investigation.

On the South the Archaean rocks come to the surface only in eastern Missouri, and they here exhibit a great development of magnetic and specular ores. But they occupy only a small area in the broad iron-bearing belt on the map that stretches with a breadth of one hundred miles or more northwesterly from Alabama to western Missouri. With the exception of the Missouri Archaean ores this belt consists wholly of later ores, viz: specular and limonite ores of the Cambrian in Missouri, and limonites on the Sub-carboniferous limestones of Missouri, Tennessee and Kentucky.

On the North, far removed from the coal-field, are the extensive and numerous deposits of rich specular and magnetic ores of the Huronian in northern Minnesota and northern Michigan. Farther eastward the northern border is represented beyond our field of investigation by ores of different kinds, but especially Archaean in that part of the territory of the Dominion of Canada lying north of the great lakes.

Iron in various mineral conditions, and especially as an oxide, is among the most widely disseminated of the elements. It is a base with a strong affinity for the acids most frequent in the waters circulating in the upper crust of the earth, viz: carbonic sulphuric and the organic acids. It also has a stronger affinity for oxygen, and in the presence of this it forms the nearly indestructible and—in the ordinary processes of Nature—in the absence of organic matter, almost insoluble sesquioxide. As a sesquioxide, in the presence of organic matter it provides the oxygen for decay, and its residuary protoxide is itself dissolved by the resulting organic acid, and enters into circulation. If the laboratory is a marsh or pond, the iron protosalt is reoxidized at the surface of the water and returns to the bottom as the higher oxide to again part with part of its oxygen and again to be dissolved as a protosalt, and this is continued until the organic matter is consumed; then the iron accumulates on the bottom as a hydrated oxide, or limonite, or "bog-ore."

Rock strata containing organic matter and diffused iron oxide have lived through similar processes, except that the iron after furnishing its oxygen to the decaying matter and forming a solu-

able protosalt with the resulting organic acid, has entered into more extended circulation.

The most common solvents of iron in Nature are carbonic acid and sulphuric acid; the latter becomes an important agent in moving and concentrating iron, under certain circumstances, as in solfataric action and in the oxidation of pyritiferous rocks like the Devonian shales of Pennsylvania and Virginia. But doubtless carbonic acid is the most general agent. Besides arising from the oxidation of organic matter confined in sedimentary strata, it enters the earth as an accessory of rain water, and more is taken up by the water from the decaying vegetable mould; it is also liberated in depth from limestone by the action of chemical processes and enters the ascending currents. However formed, it becomes an accessory constituent of the water that permeates the rocks, and alone, or in connection with other agents, it decomposes the silicates and carries off the iron as a bicarbonate. It follows the channels of flow until it reaches an arresting cause. One such arresting cause, of ultimately great economic importance, is the carbonate of lime in limestones and dolomites and calcareous sandstones, resulting in the replacement of lime by iron; another of equal importance is oxygen, whether at the surface, where the soluble iron protosalt, emerging in spring water is oxidized to a limonite, or in caverns or small cavities, where it is oxidized, and, parting with its acid, is deposited in successive thin films to form stalactitic and mammillary masses of hydrated sesquioxide; therefore when we consider the general diffusion of iron in both detrital and crystalline rocks, in all sediments and all eruptions, and remarkable reciprocating relation in the most common and essential processes of Nature, it is not strange that we should find it represented by local accumulations in the rocks of every geological age.

The annexed table, published by Mr. Swank, shows the production of iron ore in tons in the leading ore-producing districts for the years 1856, 1857:—

| | 1856. | 1857. |
|---|-----------|-----------|
| Lake Superior mines of Michigan and Wisconsin..... | 3,263,961 | 4,344,651 |
| Vermilion Lake mines of Minnesota..... | 304,396 | 394,252 |
| Missouri mines..... | 379,776 | 427,785 |
| Cornwall, Pennsylvania..... | 688,054 | 667,210 |
| New Jersey mines..... | 500,501 | 547,589 |
| Chateaugay mines, New York..... | 214,800 | 219,390 |
| Crown Point mines, New York..... | 60,084 | 64,940 |
| Port Henry mines, New York..... | 298,868 | 428,322 |
| Other Lake Champlain mines, New York..... | 15,000 | 29,000 |
| Hudson River Ore and Iron Company, New York..... | 75,000 | 142,422 |
| Tilly Foster mines, New York..... | 17,728 | 14,316 |
| Forest of Dean mines, New York..... | 13,000 | 21,164 |

| Total of the above districts..... | 6,322,408 | 8,151,047 |

American imports of iron and steel.

AMERICAN IMPORTS OF IRON AND STEEL.—It has been sufficiently shown that this country is a large producer of iron and steel. The statistics of our production of these articles do not, however, show the magnitude of their consumption by our people. We export only very small quantities of iron and steel, principally in the form of machinery, but have been large importers of iron and steel in all forms, which we have consumed in addition to the large quantities we have ourselves produced. Our imports of iron and steel during the last fifteen calendar years have been as follows. The quantities of pig, bar, band, plate, and sheet iron, rails, old iron, and tin plates, are given for every year mentioned and for 1882 and succeeding years the quantities of other iron and steel which could not be obtained for preceding years are added:

| Years. | Long tons. | Years. | Long tons. |
|-----------|------------|-----------|------------|
| 1871..... | 1,141,933 | 1879..... | 769,984 |
| 1872..... | 1,183,066 | 1880..... | 1,886,919 |
| 1873..... | 640,858 | 1881..... | 1,180,749 |
| 1874..... | 301,647 | 1882..... | 1,192,296 |
| 1875..... | 239,712 | 1883..... | 694,330 |
| 1876..... | 204,211 | 1884..... | 654,696 |
| 1877..... | 211,408 | 1885..... | 578,478 |

Gold and silver.

The production of gold in the Southern States rose to nearly a million of dollars a year in a few years after the first mining excitement began in that region. This was in 1831 and 1834. Then there was a falling off to about half that; but from 1842 on, until the time of the discovery of gold in California by the Americans, there was a rise in the product of the Southern Appalachian region to nearly a million a year (1842-48).

The discoveries of the precious metal in California have already been noticed. By the end of the year at the beginning of which the first nugget of gold had been picked up in Sutter's mill-race on the American River (1848), miners were at work along the eastern slope of the Sierra Nevada from the Tuolumne to Feather River, a distance of full a hundred and fifty miles. There are

supposed to have been not less than fifty thousand men mining for gold at the close of the year 1850; and those who had good opportunity for observing estimate the number thus engaged during the years 1832 and 1853 at not less than one hundred thousand. At first some assistance was had from the aboriginal population; but in general there was no hired help, each man working for himself, or a small number of persons owned the same claim and mined together as joint partners. The earliest washings were along the rivers, on the "bars," or gravel accumulations along the sides or on the beds of the streams, and in the "gulches," or ravines leading down the steep sides of the valleys, or canons, through which these rivers flow. Soon the rivers themselves were partially turned from their courses by means of wing-dams, or entirely carried to one side of their natural channels by "fluming," or building artificial channels of timber. The sands and gravels thus exposed were the most productive "placers"; and those who first got hold of the rich bars on the American, Yuba, Feather, Stanislaus, and other smaller streams in the heart of the gold region made sometimes from one to five thousand dollars a day per man. These very rich spots were, however, soon worked out, and it might be days or weeks before another of equal richness was found. From the spring of 1848 to 1851 nearly all the mining was of the character thus indicated, that in the river-beds being called "wet-diggings," and that in the ravines or gulches adjacent to the rivers "dry-diggings."

The yield of gold in California during the ten years of its greatest productiveness—namely, from 1850 to 1859 inclusive—has been estimated as averaging as high as 58½ millions of dollars a year. During the period, 1860-64, there was a rapid falling off in the yield, which may be accounted for not only by the approaching exhaustion of the river diggings, but also by the fact that the discovery of the Comstock Lode turned the attention of the miners in the direction of Nevada, whither great numbers of stamp-mills were transported bodily in the course of the years 1861 and 1862, these mills being such as had been worked in California with little or no profit to the owners.

From 1865 on, the gold mining business in California assumed a certain degree of permanence; at least, the yield of the precious metal became, for a number of years, pretty nearly stationary, never falling below fifteen millions, nor rising quite as high as twenty millions; the average for the fifteen years, 1865-79, being about seventeen millions. The figures for the years 1881-87, as given in the reports of the Director of the Mint, are as follows:—

| | |
|-----------|--------------|
| 1881..... | \$18,200,000 |
| 1882..... | 16,800,000 |
| 1883..... | 14,120,000 |
| 1884..... | 13,000,000 |
| 1885..... | 12,700,000 |
| 1886..... | 14,725,000 |
| 1887..... | 13,400,000 |

The most powerful impulse to mining operations, and the immediate cause of a somewhat lengthy period of wild excitement and speculation, was the discovery and successful opening of the so-called Comstock Lode—a metalliferous deposit, which, considering all the circumstances and conditions connected with it, may be truthfully said to be the most interesting one ever discovered. The conditions which have given this lode its pre-eminence are: the great extent and depth of its workings; the rapidity with which they have been carried on; the large amount of the precious metals produced; the extraordinary temperature encountered; and, finally, the very full record which has been kept of the facts observed.

The Comstock Lode lies on the east slope of the Virginia Range, the Comstock a northerly offshoot from the range of the Sierra Nevada. The region is a desert, supporting scarcely any vegetation besides the sage brush. Potable water is found only in quantities too small to supply a settlement, and the town now depends for its supply on a point in the Sierra Nevada, thirty miles away. The mines were first opened in this inhospitable region in 1859, but have since been pushed with such vigor that their product is supposed seriously to have affected the silver market of the world. They have produced about \$315,000,000 worth of bullion, of which \$175,000,000 was silver (at the rate of one ounce equals \$1.2929). Of the total yield, \$115,871,000 has been disbursed in dividends.

The last great ore body discovered yielded \$111,707,609.39, of which \$74,250,000 was paid in dividends. The number of men employed in the mines on June 1, 1880, was 2,770, and the sum annually disbursed in wages is now \$4,550,000. The aggregate horsepower of the machinery of the mines is 24,130. The total length of shafts and galleries exceeds 150 miles, and the greatest depth reached is above 3,000 feet.

The gold regions of the United States are divided into three sections, the Pacific, Rocky Mountain and Eastern. These three great divisions will be taken up and treated in order.

STATISTICS OF THE PACIFIC DIVISION.

In production of gold California still holds the first place. The vast deposits of auriferous gravel continue to yield largely, though their final exhaustion in view of the enormous hydraulic operations now being prosecuted, is to be looked for at no distant day. Pervious to the discovery of the Bodie district the placer mines furnished more than two-thirds of the total gold output of the State; but the large yield of that district, amounting to over two and three-quarter millions in gold during the years in addition to the considerable silver product, has placed the deep mines about on a par with the placers in point of productiveness.

California furnishes 71.47 per cent. of the total placer product of the United States, and 40.00 per cent. of the total gold product of the deep mines, or 51.38 per cent. of the gold product of the country (from all sources).

The production of this State shows a considerable decline, as compared with that of the preceding six years. This is not due to

any general falling off in the prosperity of the mining industry of the State, but to the decrease in the yield of the leading source, the Comstock Lode.

The bullion product of Nevada represents an average of \$44 16 gold, \$112.29 silver, and \$156.45 gold and silver for each square mile of its area. In this respect Nevada is surpassed by Colorado, the figures for which are \$25.98 gold, \$159.22 silver, and \$185.20 total.

The bullion product of Utah is remarkably steady, varying latterly but little from year to year, while a marked impulse has been given to the mining industry of Arizona by the fine showing of the new Tombstone district, in Pima county.

The deposits of Idaho bullion (so far as it is possible to segregate them, a very large portion having passed through private refineries and thus lost their identity) up to the close of the fiscal year ending June 30, 1880, are stated by the director of the mint to have been \$24,137,417 gold, \$727,296 silver, and \$24,864,713 total. This amount is far less than the actual output up to that date, vague unofficial estimates placing the total yield as high as \$90,000,000.

Of the gold product for the census year 1880, 59.42 per cent. is from placers and 40.58 per cent. from the deep mines. Idaho furnishes 7.32 per cent. of the placer output of the United States, 2.18 per cent. of the deep mining gold, and 4.43 per cent. of the total gold; 1.13 per cent. of the silver, and 2.69 per cent. of the entire product of the precious metals in the whole country. As a gold producer the territory ranks sixth, and in silver, seventh. The average yield per square mile is \$17.45 gold, \$5.30 silver, and \$22.75 total. In this respect Idaho stands fifth in point of gold, seventh in silver, and sixth in developed richness in gold and silver.

Oregon is one of the oldest of the western mining States, the discovery of gold within its limits having followed closely upon that in California. Its output has never been very large in comparison with the yield of its neighbor State, but although the mines have become secondary to its agricultural resources in point of importance, they still furnish occupation and profit to many of its inhabitants. The quartz veins of Baker county, in the eastern portion of the State, adjoining Idaho Territory, continue to yield the larger portion of the total deep mine product of this State. The prevailing type of the Oregon ores is a free gold quartz, though rebellious gold ores, requiring special treatment, are found in some localities, and a small amount of silver is produced in Grant county.

Of the small product reported from the deep mines of Washington, nearly the whole comes from Peshaston district, in Yakima county, where gold quartz mining is conducted on a small scale.

The Upper Columbia placers furnish over one-half the total placer yield of the State.

This vast territory, occupying an area of over half a million square miles, is for the most part still an unexplored region. The small amount of prospecting which has been done has developed the fact that Alaska contains many gold-bearing localities, none of which however, have yet yielded any considerable output.

STATISTICS OF THE DIVISION OF THE ROCKY MOUNTAINS.

From an average annual production of only three or four millions, Colorado has suddenly risen to the first rank as a producer of the precious metals among the States and Territories for gold and silver combined, as well as for silver alone, while for gold it holds the fourth rank. In the relation of production to area it holds the first rank likewise for gold and silver combined, and for silver alone, and the third for gold alone. In the relation of production to population, however, it ranks only third for gold and silver together, second for silver alone, and sixth for gold alone. The total value of its product during the census year in gold and silver was, in round numbers, nineteen and a quarter million dollars; and, if we add to this the value of lead and copper in crude metal produced, we have a total value of metallic product of twenty-two and three-quarters million dollars.

The metallic production of Dakota is derived from the region of the Black Hills, and in greater part from Lawrence county, where free milling gold quartz ores of low grade are reduced in amalgamating mills of great size.

Montana has within its boundaries the elements favorable to a large production of the precious metals—rich and varied ores and abundant fuel, both coal and wood. As yet, however, owing to lack of development and want of sufficient transportation facilities, it has not taken its proper rank as a producer.

The mines of New Mexico have been attracting much attention; but their practical development is awaiting the completion of the railroads which are about to intersect it.

Wyoming is surrounded on three sides by important mining regions, but has as yet developed but few mines within its borders.

The following table shows the yield of the States of the Eastern division, for the year 1880:—

EASTERN DIVISION.

| | | | |
|---------------------|---------|----------|-----------|
| Alabama..... | \$1,300 | | \$1,300 |
| Georgia..... | 81,030 | | 81,352 |
| Maine..... | 3,100 | | 10,200 |
| Michigan..... | | 25,858 | 25,858 |
| New Hampshire..... | 11,000 | 16,000 | 27,000 |
| North Carolina..... | 118,957 | 140 | 119,097 |
| South Carolina..... | 13,043 | 56 | 13,099 |
| Tennessee..... | 1,998 | | 1,998 |
| Virginia..... | 9,322 | | 9,322 |
| Total..... | 239,646 | \$49,586 | \$289,232 |

The relative quota contributed by each of the three great arbitrary divisions into which the country has been apportioned is indicated in the following table:—

| | | | |
|--------------------------------------|--------------|--------------|--------------|
| Pacific Division..... | \$25,261,828 | \$21,143,881 | \$46,405,709 |
| Division of the Rocky Mountains..... | 7,878,189 | 19,917,490 | 27,795,679 |
| Eastern Division..... | 239,646 | 49,586 | 289,232 |
| Total..... | \$33,379,663 | \$41,110,957 | \$74,490,620 |

The following table shows the production of gold and silver for each State and Territory during the year 1885:—

| | | | |
|---|--------------|--------------|--------------|
| Alaska..... | \$300,000 | \$2,000 | \$302,000 |
| Arizona..... | 880,000 | 3,800,000 | 4,680,000 |
| California..... | 12,700,000 | 2,500,000 | 15,200,000 |
| Colorado..... | 4,200,000 | 15,800,000 | 20,000,000 |
| Dakota..... | 3,200,000 | 100,000 | 3,300,000 |
| Georgia..... | 136,000 | | 136,000 |
| Idaho..... | 1,800,000 | 3,500,000 | 5,300,000 |
| Montana..... | 3,300,000 | 10,060,000 | 13,360,000 |
| Nevada..... | 3,100,000 | 6,000,000 | 9,100,000 |
| New Mexico..... | 800,000 | 3,000,000 | 3,800,000 |
| North Carolina..... | 152,000 | 3,000 | 155,000 |
| Oregon..... | 800,000 | 16,300 | 816,300 |
| South Carolina..... | 43,000 | | 43,000 |
| Utah..... | 180,000 | 6,750,000 | 6,930,000 |
| Washington..... | 120,000 | 70,000 | 190,000 |
| Texas, Alabama, Tennessee, Virginia, Vermont, Michigan and Wyoming..... | 90,000 | 5,000 | 95,000 |
| Total..... | \$31,801,000 | \$51,600,000 | \$83,401,000 |

GOLD AND SILVER PRODUCTION OF THE DIFFERENT STATES FOR THE YEAR 1887.

| State or Territory. | Gold. | Silver. (Coining value.) | Total. |
|-----------------------------------|--------------|--------------------------|--------------|
| Alaska..... | \$675,000 | \$300 | \$ 675,300 |
| Arizona..... | 830,000 | 3,800,000 | 4,630,000 |
| California..... | 13,400,000 | 1,500,000 | 14,900,000 |
| Colorado..... | 4,000,000 | 15,000,000 | 19,000,000 |
| Dakota..... | 2,400,000 | 540,000 | 2,940,000 |
| Georgia..... | 110,000 | 500 | 110,500 |
| Idaho..... | 1,900,000 | 3,000,000 | 4,900,000 |
| Michigan..... | 25,000 | 35,000 | 60,000 |
| Montana..... | 5,230,000 | 15,500,000 | 20,730,000 |
| Nevada..... | 2,500,000 | 4,900,000 | 7,400,000 |
| New Mexico..... | 500,000 | 2,300,000 | 2,800,000 |
| North Carolina..... | 225,000 | 5,000 | 230,000 |
| Oregon..... | 900,000 | 10,000 | 910,000 |
| South Carolina..... | 50,000 | 500 | 50,500 |
| Utah..... | 220,000 | 7,000,000 | 7,220,000 |
| Washington..... | 150,000 | 100,000 | 250,000 |
| Other States and Territories..... | 20,000 | 250,500 | 270,500 |
| Total..... | \$33,136,000 | \$53,941,800 | \$87,077,800 |

PRODUCTION OF GOLD AND SILVER IN THE UNITED STATES FOR THE YEARS 1880-1887.

| Year. | Gold. | Silver. | |
|-----------|--------------|----------------|-------------------|
| | | Coining Value. | Commercial Value. |
| 1880..... | \$56,000,000 | \$39,200,000 | |
| 1881..... | 34,700,000 | 43,000,000 | |
| 1882..... | 32,500,000 | 46,500,000 | |
| 1883..... | 30,000,000 | 46,200,000 | |
| 1884..... | 30,800,000 | 48,800,000 | \$42,000,000 |
| 1885..... | 31,800,000 | 51,600,000 | 42,504,447 |
| 1886..... | 35,000,000 | 51,000,000 | 39,445,312 |
| 1887..... | 33,000,000 | 53,357,000 | 40,456,000 |

The annexed table still further illustrates this branch of the subject by showing the consumption of the precious metals in the United States in the industrial arts, as reported by the Mint, for the years 1880, 1881, 1883 and 1885:—

| | Gold. | Silver. |
|-----------|--------------|-------------|
| 1880..... | \$ 8,634,193 | \$3,464,161 |
| 1881..... | 10,086,723 | 3,388,421 |
| 1883..... | 14,439,464 | 5,586,330 |
| 1885..... | 11,152,120 | 4,568,413 |

Quick-silver.

Nearly all the quicksilver produced in the United States comes from California. The total produce of the Californian mines, during the years 1880-1887, has been as follows:—

| | |
|------|--------|
| 1880 | 59,926 |
| 881 | 60,851 |
| 882 | 52,732 |
| 1883 | 46,725 |
| 1884 | 31,913 |
| 1885 | 32,073 |
| 1886 | 23,981 |
| 1887 | 33,825 |

No new discoveries of localities of importance have been made during the past few years, and the mines which are now worked in California have been of late years in a rather depressed condition, owing to the low price of the metal, the increased expense of production consequent on the greater depth of the workings, and the growing scarcity of the ore. No quicksilver mine earned or paid any dividend in 1885; but since that time there has been a rise in the price of the metal, and a somewhat increased activity in its exploitation. Two mines paid dividends in 1886; the New Almaden, \$118,010.75, and the Etta, \$20,000; the former also paid, in 1888, \$22,663. A considerable portion of the quicksilver mined in California is used in that and the adjacent Cordilleran States, a part goes to Mexico, and there is a small and varying export to China. The low price of silver has materially affected the profits of exports to foreign countries.

Tin.

The ore of tin has been discovered in several localities in the United States, and there have been many attempts made to open mines in various parts of the country; but up to the present time the amount of this metal produced has been entirely insignificant. Among the localities in the Appalachian region where mining for tin has been attempted are, Winslow, Maine; Jackson, New Hampshire; one on the northwestern slope of the Blue Ridge, in Rockbridge county, Virginia; and one near Ashland, in Clay county, Alabama. The veins in the first two localities mentioned are unquestionably too small for successful working. In regard to the other places, it does not yet seem to be known whether the conditions there existing are sufficiently favorable to warrant the expectation that they will become profitable. The fact that there are no apparent indications—judging from the descriptions which have been published—of superficial deposits which could be successfully streambed for tin seems a strong reason for believing that in no one of these localities could there be a successful competition carried on with the stanniferous districts of the East Indies and of Australia, where the detrital ores of tin exist in the greatest abundance. Of course tin mining could be made profitable in this country if a sufficiently high duty were laid upon this metal.

The stanniferous region from which the most has been expected is the Black Hills of Dakota, at a locality of about twenty miles southwest of Rapid City.

According to the official report of Mr. A. Williams, Jr. on the mineral resources of the United States, for the years 1883-84, a large amount of money has been expended in opening and prospecting the Etta mine, and in erecting mills and reduction works.

So far as known, however, up to January, 1889, there has been no production of tin of commercial importance in Dakota, nor have regular shipments of this metal from that region been begun. Tin ore has also been found in the southern part of the State of California, and several attempts have been made to put the mines upon the market. The observations of the present writer in this region in 1860, did not lead him to the conclusion that it was likely ever to become of importance for its production of this metal.

Zinc.

Zinc has become within the past few years an important article of production in the United States.

The business of making metallic zinc had not become of any importance previous to 1875. Since that time it has increased at a moderate and pretty uniform rate.

The latest and most reliable statistics of zinc are those given by Mr. C. Kirchhoff, Jr. in the "Mineral Resources of the United States for 1887," as follows, in tons:—

| State. | 1882. | 1883. | 1884. | 1885. | 1886. | 1887. |
|-----------------------------|--------|--------|--------|--------|--------|--------|
| Illinois | 16,250 | 14,992 | 15,709 | 17,345 | 18,818 | 19,892 |
| Kansas | 6,576 | 8,044 | 7,017 | 7,591 | 7,975 | 10,574 |
| Missouri | 2,232 | 5,118 | 4,669 | 4,176 | 5,241 | 7,732 |
| Eastern and Southern States | 5,087 | 4,768 | 7,019 | 7,216 | 6,037 | 6,643 |
| Total | 30,145 | 32,922 | 34,414 | 36,528 | 38,071 | 44,946 |

The production of zinc in the United States for the year 1888 is estimated at 50,800 tons—a moderate increase over the preceding year. This country furnishes, therefore, at the present time a little over one-sixth of the total production of the world, which has increased since the beginning of the present decade from about 225,000 to very nearly 300,000 tons.

For a long term of years the production of lead in the United States was limited to the Mississippi valley. The deposits occur in two districts—one, the so-called "Upper Mines," covering an area of three to four thousand square miles included within the States of Wisconsin, Iowa, and Illinois; the other, the "Lower Mines," in Southeastern Missouri.

The mode of occurrence of the galena in both the Upper and Lower Mines of the Mississippi Valley is extremely simple. In the Upper Mines the geological age of the group of strata in which this ore is found is Lower Silurian. In these mines the principal lead-bearing rock is a crystalline dolomite, from 250 to 275 feet in thickness where not partially removed by erosion. The upper portion of this formation is somewhat argillaceous; the middle, a very pure heavy-bedded dolomite; the lower, a similar rock, but containing numerous cherty or flinty masses. This group of strata is locally known as the Upper Magnesian Limestone. It is separated from a rock of very similar lithological character, called the Lower Magnesian Limestone, by three groups of strata, which are commonly designated as the Blue Limestone, the Buff Limestone, and the St. Peter's Sandstone. The first of these is a thin-bedded, highly fossiliferous, purely calcareous rock; the second, a heavy-bedded argillaceous dolomite; the third, a nearly chemically pure quartzose sandstone. The Blue Limestone is from fifty to seventy feet in thickness; the Buff, fifteen to twenty; and the Sandstone, from eighty to a hundred. The Blue and the Buff limestones are of about the same geological age as the Trenton and Black River groups of the New York Geological Survey.

The yield of the Upper Mines is gradually diminishing; and this will continue to be the case, since the extent of the lead-bearing rock is limited, and the vertical range of the crevices confined to a moderate thickness, there being no probability that paying mines will be discovered in the Lower Magnesian Limestone. The lead ores of Missouri occur, and almost always in association with those of zinc, in three somewhat distinct districts: in the southeastern portion of the State, where also nickel and cobalt ores are found; in the central, and in the southwestern. The mines of the Southeastern district are in the Lower Silurian. The numerous lead mines opened and worked in various States situated in the Appalachian region, from Maine to North Carolina, have nearly all proved unsuccessful ventures. A few have for a short time produced a moderate supply of this metal; one or two have been quite permanent, although yielding but a very small amount of lead; while much the larger number have proved entire failures.

While the Mississippi Valley lead mines have furnished, of late years, but a small proportion of the world's supply of this metal, the United States has largely increased its product; so that, from 1880 on, this country has furnished a quarter or more of the entire amount of lead smelted in the world.

The total yield of metallic lead throughout the United States for the years 1873-87 is given (in tons) in the following table, prepared by Mr. Kirchhoff. The desilverized lead of the Cordilleran States is separated from the non-argentiferous of the Mississippi Valley, and its percentage of the total stated. The table as here presented extends back to the time when the argentiferous lead ores of the country began to be of importance:—

Yield of metallic lead in the United States.

Yield of metallic lead in the United States.

| Year. | Desilverized Lead. | | Non-Argentiferous Lead. | Total. |
|-------|--------------------|---------------------|-------------------------|---------|
| | Amount. | Per Cent. of Total. | | |
| 1873 | 17,999 | 47.7 | 19,983 | 37,982 |
| 1874 | | | | 46,410 |
| 1875 | 31,168 | 58.5 | 22,082 | 53,250 |
| 1876 | 33,615 | 58.8 | 23,590 | 57,205 |
| 1877 | 45,310 | 62.0 | 27,815 | 73,125 |
| 1878 | 57,401 | 70.6 | 23,902 | 81,303 |
| 1879 | 57,723 | 69.7 | 25,116 | 82,839 |
| 1880 | 62,620 | 71.7 | 24,724 | 87,344 |
| 1881 | 77,067 | 73.7 | 27,473 | 104,540 |
| 1882 | 92,745 | 78.3 | 25,967 | 118,712 |
| 1883 | 109,068 | 84.8 | 19,465 | 128,533 |
| 1884 | 107,112 | 86.4 | 17,796 | 124,908 |
| 1885 | 95,926 | 83.0 | 18,723 | 114,649 |
| 1886 | 102,526 | 85.0 | 18,571 | 121,097 |
| 1887 | 121,028 | 84.3 | 22,454 | 143,482 |

The Engineering and Mining Journal estimates the production of lead in the United States for the year 1888 at no less than 168,700 tons. It is an interesting fact that Idaho is beginning to be of considerable importance as a lead-producing State. The principal mines are in the Coeur d'Alene district.

To other very important articles—such as lime, cement, and Non-metallic building-stone—only brief allusion can here be made, since their mode of occurrence is so varied, and the manner in which they are utilized so irregular, that they hardly come within the scope of the present work. Only very imperfect statistics could be obtained in regard to such materials as lime and building stones, of which the use is so wide-spread and so little under possible control. According to the estimates of the officer in charge of the division of Mining Statistics of the United States Geological Survey, the value of the lime and building-stone used in the country in the year 1887 was, for each of these articles, greater than that of the petroleum produced. The item of coal alone constitutes nearly seven-tenths of the value of the non-metallic minerals mined; and the five items of coal, petroleum, natural gas, building-stone, and lime together make up fully nineteen-twentieths of the sum total. Other important articles are: salt, of the produce of which in 1887 the value was \$4,093,846; cement, \$5,186,877; limestone for flux in the iron manufacture, \$3,225,200; phosphate-rock, \$1,836,818. The importance of the salt manufacture in the United States is so

*Mineral Resources of the United States, for the year 1887.

great that space may be found here for a few remarks on the geological mode of occurrence of salt, and the geographical distribution of the salt industry.

The common salt of the world is obtained for use in four different ways; namely, the evaporation of the ocean water, the evaporation of the water of saline lakes, the evaporation of saline water or brine obtained by boring, and the mining of solid or rock-salt. By each of these methods salt is, or has been, produced in the United States; but the third of these is at present by far the most important source of supply of this substance in this country.

In the early history of the country the salt used was in part imported from England, and in part produced by the evaporation of sea-water on the islands adjacent to the coast in a low latitude, and especially Turk's Island.

Cope-1 The present sources of supply for copper in the United States are chiefly the Lake Superior region and the Territories of Montana and Arizona. The produce of the other States is comparatively insignificant.

The mines of Lake Superior, of the date of the opening of which mention has already been made, are of a peculiar character. From these mines only is copper taken exclusively in its native state.

The "Cliff Mine," on Keweenaw Point, which was worked from 1845 to 1872 to a depth of nearly 1,500 feet, is of historical importance in the development of the mining industry of the country, as being the first permanent deep mine worked, and as being the first mine of any ore, other than that of iron to pay regular dividends. The Minnesota mine, near the Ontonagon river, was another one of interest, and, like most of those to the west of Keweenaw Point, of a somewhat different character from that of the Cliff mine, since the cupriferos lode ran parallel with the formation instead of across it. These longitudinal occurrences are, apparently, intermediate in character between contact deposits and stratified veins.

The Lake Superior region, soon after it was first opened, in 1845, began to produce largely and for many years it supplied from seven to nine-tenths of the copper furnished by the United States.

The growth in the production of copper in the United States compiled up to 1885, inclusive from the best data available, is shown in the following table. It proves in a striking manner how preponderating was, until the past few years, the influence of the Lake Superior district; and again of one great mine in it, the Calumet and the Hecla, for more than a decade. In order to point out more clearly how preponderating has been the output of the Lake district from 1867 to 1880, a column has been added giving its percentage of the total product from year to year. It should be stated that the yield of copper from pyrites is not here included.

Production of copper in the United States from 1845 to 1885, inclusive.

| Years. | Total production. | Lake Superior. | Calumet and Hecla. | Percentage of Lake Superior of total product. |

The following is, in detail, the output of the Lake Superior mines. In the majority of cases it is the official product, based on smelting works returns; in a few instances it is an official estimate of the ingot product based on the known output of mineral. The Mass is the only larger mine in the case of which the ingot was estimated from the published statement of the output of mineral. The total is accurate, therefore, within a few thousand pounds.

The production of Lake Superior copper mines, 1880 to 1885.

Montana is next in importance to the Lake Superior district as a copper-producing region. The mines are for the most part in the neighborhood of Butte City, covering an area of two and a half miles long by one mile wide.

Although there has, of late years, been a falling off in the production of copper in Arizona, so that at present this Territory is overshadowed by Lake Superior and Montana, it appears that this is due to its unfavorable situation with reference to a market, rather than to any exhaustion of its cupriferous deposits, which are numerous and important.

There are many localities in the Atlantic States, from Maine to North Carolina, where mining for copper has been attempted, but in few of these has anything like a permanent paying mine been developed. The Vermont Copper Company, located at Vernon, has made, perhaps, the nearest approach to a success of any copper-mining company on the eastern side of the Appalachians, since operations were carried on here for many years uninterruptedly and with moderate profit. This mine was abandoned for a time, but work has lately been resumed. The present high price of this metal has been a great stimulus to mining, and within the past few months many localities which had been abandoned have been taken hold of again by capitalists. This is true for both Eastern and Cordilleran States.

The effect of this excitement will be seen in the annexed table, arranged and condensed from the various official reports on the Mineral Resources of the United States. It affords a comprehensive view of the progress of the copper-mining business in this country during the years 1882 to 1888; the amounts are given in tons:—

| States or Districts. | 1882. | 1883. | 1884. | 1885. | 1886. | 1887. | 1888. |
|-----------------------------------|--------|--------|--------|--------|--------|--------|---------|

The total production of copper throughout the world for the year 1888 has been estimated at 255,000 tons. Of this amount a little over two-fifths is to be credited to the United States.*

*This is the estimate given in the Engineering and Mining Journal of Jan. 12, 1889, from which the figures given in the preceding table for the year 1888 are taken.

The following table gives the amount and value of metallic products in the United States:

| Metals. | 1882. | | 1883. | | 1884. | | 1885. | | 1886. | | 1887. | |
|---------------------------|------------|---------------|------------|---------------|------------|---------------|-----------|---------------|-----------|---------------|------------|-------------|
| | Quantity. | Value. | Quantity. | Value. | Quantity. | Value. | Quantity. | Value. | Quantity. | Value. | Quantity. | Value. |
| Pig-Iron (tons)..... | 4,585,510 | \$91,910,200 | 4,097,568 | \$73,761,624 | 4,014,525 | \$64,712,400 | 5,683,329 | \$95,195,769 | 6,417,148 | \$121,923,800 | 41,293,210 | \$3,441,300 |

As will be seen from the table given farther on, the production of salt in the United States and Virginia, at the present time, is much less than that of Michigan and New York. The advantages which the two last-named States offer are, on the whole, decidedly superior to those of the former; so that the production of Ohio has remained nearly stationary during the last six years, while that of the Kanawha Valley, once the most important salt-producing region in the country, has during that time decidedly decreased, so that at present it is hardly one-tenth as large as that of New York, and less than one-seventeenth of that of Michigan.

The quantity of rock-salt which has been shown by geological observation, or proved by the drill, to exist within the limits of the United States is very large. To the existence of large bodies of this material in Western New York and Michigan allusion has already been made. Salt has also recently been discovered in Kansas, by persons engaged in prospecting for oil and gas, at several localities, and in quantities said to be large. Neither Kansas nor in any of the States mentioned as important pro-

ducers of salt, has the mining for rock-salt been of any importance up to the present time. A locality where this material occurs in large quantity, and the existence of which has been known for a long time, namely, Petite Anse, an island in Vermilion Bay, on the coast of Louisiana, and which became of importance during the Civil War, is now quite extensively worked, and is the only source from which salt is obtained to any extent in Louisiana. The quantity mined at this locality has risen, from 276,000 barrels in 1882, to over 340,000 in 1887.

Rock salt also occurs in large quantity in various portions of the Cordilleran region, and it has been mined at some localities both for household and metallurgical purposes. A deposit has been long known to exist on the Rio Virgen, in Lincoln County, Nevada, where the salt appears to occur in very large quantity, it being—as is stated—exposed in a canon cut through it for a distance of two miles, the deposit occupying an extensive area, with an unknown, but certainly very considerable thickness. There are also large deposits of this mineral in Utah, especially in San Pete County, near the town of Nephi. Most of the salt used in that State at present, however, comes from the salt-farms around Salt Lake.

The following table gives, in barrels, the amount of salt produced in the United States from 1883 to 1877:—

| States. | 1883. | 1884. | 1885. | 1886. | 1887. |
|--------------------|------------------|------------------|------------------|------------------|------------------|
| Michigan..... | 2,894,672 | 3,161,806 | 3,297,403 | 3,677,257 | 3,944,309 |
| New York..... | 1,619,486 | 1,788,454 | 2,304,787 | 2,431,563 | 2,353,560 |
| Ohio..... | 351,000 | 320,000 | 306,847 | 400,000 | 365,000 |
| West Virginia..... | 320,000 | 310,000 | 223,184 | 250,000 | 225,000 |
| Louisiana..... | 253,215 | 228,934 | 299,271 | 299,691 | 341,093 |
| California..... | 214,286 | 178,571 | 221,428 | 214,285 | 28,000 |
| Utah..... | 167,143 | 114,285 | 107,140 | 164,285 | 325,000 |
| Nevada..... | 21,429 | 17,857 | 28,593 | 30,000 | |
| Other States.. | 400,000 | 400,000 | 250,000 | 240,000 | 250,000 |
| Total..... | 6,192,231 | 6,514,937 | 7,038,653 | 7,707,081 | 7,831,982 |

General summary.

The astonishing rapidity with which the mineral and metalliferous resources of the Cordilleran region have been developed during the past thirty years will have been made apparent to the reader who has examined the preceding pages. In 1854 the present writer estimated the total value of the metals produced in the United States at \$79,827,000, of which nearly \$50,000,000 was to be credited to gold.† The change which has taken place since that time will be seen on examining the following tables, which give, in compact form, results obtained and published by the Chief of the Division of Mining Statistics, of the United States Geological

*By W. A. Roberg, in Mineral Resources of the United States for the year 1887, p. 611. A barrel is five bushels of fifty-six pounds each.

†See Metallic Wealth of the United States, pp. 505-510.

Survey. The first table shows the total value of the non-metallic products of the United States for the years 1882 to 1887, and also the grand total of both metallic and non-metallic products for the same years. The second shows the amount and value of the metallic products of the United States for the years 1882-87. The value of the iron is the spot value; that of the gold and silver, the coin value; that of the copper, lead, and zinc, the value at New York; that of the quicksilver, the value at San Francisco:—

| | 1882. | 1883. | 1884. | 1885. | 1886. | 1887. |
|-----------------------------|----------------------|----------------------|----------------------|----------------------|----------------------|----------------------|
| Metallic..... | \$219,755,109 | \$203,116,559 | \$186,414,674 | \$181,599,395 | \$215,364,825 | \$250,419,283 |
| Non-Metallic..... | 228,410,380 | 242,111,839 | 229,459,674 | 240,114,544 | 243,963,083 | 255,861,942 |

| Total..... | \$456,165,489 | \$453,240,748 | \$413,485,748 | \$428,713,909 | \$465,327,888 | \$512,281,225 |

PART III. POLITICAL GEOGRAPHY AND STATISTICS.

POPULATION AND IMMIGRATION.

The first census of the United States was taken in 1790, and there has been one taken every tenth year since that time. The following table shows the absolute number of inhabitants, "excluding Indians not taxed," at each decennial period, and also the rate per cent. of increase during the previous ten years:

| Year. | Population. | Percentage of Increase. |
|-----------|----------------------|-------------------------|
| 1790..... | 3,929,214 | |
| 1800..... | 5,308,433 | 35.11 |
| 1810..... | 7,229,881 | 36.40 |
| 1820..... | 9,633,822 | 33.06 |
| 1830..... | 12,806,020 | 33.55 |
| 1840..... | 17,069,453 | 32.67 |
| 1850..... | 23,191,876 | 35.86 |
| 1860..... | 31,443,321 | 35.58 |
| 1870..... | 38,558,371 | 22.63 |
| 1880..... | 50,155,783 | 30.08 |
| 1890..... | 63,221,428 estimate. | |

Growth of population.

The effect of the Civil War on the growth of population in the United States is easily seen in the diminished ratio of increase shown by the figures for the decade 1860-1870. With that exception the rate has been extraordinary large and uniform, but less in the decade 1870-80 than in any preceding one. That this rapid growth of the population, due in so large a part to immigration, will continue to be maintained is in the highest degree improbable. The fact that nearly the whole of the more valuable portion of the public lands has been already taken up, as will be seen farther on, can hardly fail to check immigration, although the population, is at present, far from dense, and far from being so large that there is not ample room for a much larger number.

The area embraced within the United States at the time of taking the first census was about eight hundred and fifty thousand square miles, a precise statement of the amount being impossible, owing to the peculiar wording of that part of the treaty in which the northern and western boundaries of the country are defined.

The density of the population at that time was about 4.6 persons per square mile, this population being almost exclusively confined to the Atlantic sea-board. At that time not more than five per cent. of the inhabitants of the country lived west of the Appalachian range, the settlements being very closely limited to the borders of the navigable streams. At the time of taking the census of 1850, the boundaries of the United States had become definitely established, the only addition made since that time being the territory acquired in 1853 by the Gadsden purchase (about 47,330 square miles). At that time the average density of the population of the whole country was a little less than eight persons per square mile.

The following table shows the density of the population at the epoch of each census which has been taken during the time when the area of the country remained (with the exception of the purchase of Alaska, not here included) unchanged:—

| Year. | Area of U. S. | Population per sq. mile. |
|-----------|---------------|--------------------------|
| 1860..... | 3,025,600 | 10.39 |
| 1870..... | " | 12.74 |
| 1880..... | " | 16.57 |

The movement of the population has, from the beginning, been from the east toward the west, the first settlements having been made on the Atlantic coast, and the emigration to the United States having been almost exclusively from European countries. The Pacific coast had, previously to the annexation of California, received a small number of whites coming from Mexico, and since that time there have been some accessions to the population in that region by means of emigration from China; but the number added from this direction is almost insignificant in comparison with that which has come into the country from the east. Hence the center of population has been moving westward, and the investigations of the Coast Survey and of the Census Bureau have shown that this movement has been in an almost exactly westerly direction, and that the center of population has always remained very near the parallel of 39°. In 1790 it was in the latitude 39° 16'.5, at a point of about twenty-three miles east of Baltimore; in 1880 it

was eight miles west by south from Cincinnati, in latitude 39° 51', having moved westward 457 miles in ninety years. The most southerly point reached was that of 1830, when the center was in latitude 38° 57'. The most rapid movement was in the period 1850-60—namely, eighty-one miles, this being due to the rapid transfer of a considerable population from the Eastern to the Pacific States, consequent on the discovery of the gold of California.

The division of the population by sexes, as shown by the census of 1880, was as follows:

| | |
|--------------|------------|
| Males..... | 25,518,820 |
| Females..... | 24,636,963 |

The number of females for each 100,000 males in 1870 and 1880 was as follows:

| | | |
|------------------------------------|--------|--------|
| | 1870. | 1880. |
| Number of females to 100,000 males | 96,514 | 97,801 |

As a natural result of the conditions influencing emigration from the older to the newer States, it is found that females are in excess in the Atlantic States. In the District of Columbia, Rhode Island and Massachusetts, the excess of females over males is five per cent. or more; in Connecticut, New Hampshire, North Carolina, South Carolina, New York, Virginia and Alabama, it is from two and a half to five per cent.; in Maryland, Georgia, New Jersey, Louisiana, Tennessee, Pennsylvania and Maine it is less than two and a half per cent. The States, on the other hand, in which the males are considerably in excess of the females, are those situated in the Cordilleran region, where mining is the chief pursuit, and where the conditions of life are such as are more easily borne by men than by women. In Michigan, Minnesota, Kansas and Nebraska, which are not Cordilleran States, but, which are on the extreme northern, western or southwestern borders of the Central region, the number of females is from eighty to ninety per cent. of that of the males, and New Mexico is in the same category.

In the Pacific coast States the number of females is from fifty to eighty per cent. of that of the males; and the same is true of Colorado and Dakota, which are situated on the eastern borders of the Rocky Mountain, and which are partly agricultural and partly mining States. In those States in which mining and stock-raising are by far the predominant interests, and which are entirely inclosed in the Cordilleras, namely, Idaho, Nevada, Wyoming and Montana, the inequality in the numbers of the sexes is greatest, there being in these territories less than half as many females as males. The same inequality exists in the territory of Arizona.

Of the colored population the census of 1880 showed the number to be 6,589,793 to 43,492,970 whites, or 15,162 colored in every 100,000 whites. The slight increase in this ratio from that given by the census of 1870 (14,528 to 100,000) is believed to be chiefly, if not entirely, due to the imperfection of the census of 1870. The colored population is still, in spite of some slight emigration, almost entirely confined to the former slave States, and in three of them—South Carolina, Mississippi and Louisiana—the colored are in excess of the whites. In Alabama, Florida, Georgia, Virginia, North Carolina and the District of Columbia the colored element runs from fifty to ninety per cent. of the white; in Arkansas, Texas, Tennessee and Maryland, from twenty-nine to thirty-five per cent; in Delaware and Kentucky, from nineteen to twenty-two per cent; in Missouri, Kansas, West Virginia, New Jersey, Ohio, Rhode Island, Pennsylvania and Indiana, from two to 7 per cent; in all the remaining States it is less than two per cent.; and in most of them, especially the more northern ones, it is less than one per cent.

DISTRIBUTION OF THE POPULATION OF THE UNITED STATES IN 1880, BY DRAINAGE BASINS.

| Drainage Basin. | Area in sq. miles. | Population. | |
|----------------------------|--------------------|-------------------|---------------|
| | | Total. | Per sq. mile. |
| New England Coast.. | 61,830 | 3,788,334 | 61.2 |
| Middle Atlantic Coast. | 83,020 | 9,240,897 | 111.3 |
| South Atlantic Coast.. | 132,040 | 4,114,563 | 31.2 |
| Great Lakes..... | 175,340 | 5,684,147 | 32.4 |
| Gulf of Mexico..... | 1,725,980 | 25,884,117 | 14.9 |
| Total Atlantic..... | 2,178,210 | 48,717,293 | 22.4 |
| Great Basin..... | 22,150 | 227,107 | 1.0 |
| Pacific Ocean..... | 619,240 | 1,211,383 | 1.9 |
| Total..... | 3,025,600 | 50,155,783 | |

The distribution of the population in reference to the topographical and climatic features of the country is such as naturally arises from the constant operation of two causes, both acting in the same direction. Emigration and overflow from a more thickly settled region toward one more thinly inhabited takes place, with insignificant exceptions, from the east toward the west. Immigrants arrive from Europe, are landed on the Atlantic coast—about three-fourths at one point, New York—and thence in large

part find their way westward in the direction of lands unoccupied or only thinly settled. To the east of the Mississippi the land is almost everywhere exceptionally fertile, and the climatic conditions are, over a large area, as explained elsewhere, very much the same, and on the whole highly favorable. Soon after crossing the Mississippi, we find that this favorable condition of things begins to change. Not only is the immigrant getting farther and farther from his home, but he is finding his environment less and less suited to the development of those conditions which favor the existence of a dense population. Never, by any possibility, can the region of small rainfall, and, in large part, of rugged mountains, extending from the first belt of States beyond the Mississippi to the belt lying directly on the Pacific coast, become a densely populated portion of the country. This dryer region is also the most elevated, as has already been fully explained. The results of the conditions thus indicated are sufficiently shown in the above table and the following:

GEOGRAPHICAL DISTRIBUTION OF THE POPULATION OF THE UNITED STATES IN ACCORDANCE WITH THE TOPOGRAPHICAL FEATURES.

| Region. | Population. | Percentage of Total Population. |
|---|-------------|---------------------------------|
| North Atlantic Coast..... | 2,616,882 | 5.1 |
| Middle Atlantic Coast..... | 4,375,194 | 8.7 |
| South Atlantic Coast..... | 875,847 | 1.7 |
| Gulf Coast..... | 1,055,851 | 2.1 |
| Northeastern Appalachian Region..... | 1,669,226 | 3.3 |
| Central Appalachian Region..... | 2,344,223 | 4.7 |
| Region of the Great Lakes..... | 3,049,470 | 6.1 |
| Interior Table-land..... | 5,716,326 | 11.4 |
| Southern Appalachian Region..... | 2,695,085 | 5.4 |
| Ohio Valley..... | 2,442,792 | 4.9 |
| Southern Interior Table-land..... | 3,627,478 | 7.2 |
| Mississippi River Belt, south..... | 710,268 | 1.4 |
| Mississippi River Belt, north..... | 1,991,362 | 4.0 |
| Southwestern Central Region..... | 2,932,807 | 5.8 |
| Central Region..... | 4,401,246 | 8.8 |
| Prairie Region..... | 5,722,485 | 11.4 |
| Missouri River Belt..... | 835,445 | 1.7 |
| Western Plains..... | 323,819 | 0.7 |
| Heavily Timbered Region of the Northwest..... | 1,122,337 | 2.2 |
| Cordilleran Region..... | 932,311 | 1.9 |
| Pacific Coast..... | 715,789 | 1.4 |

The larger divisions of the country are represented as follows, both as to the aggregate population and its different elements:—

| Region. | Percentage of Population. | | |
|-------------------------|---------------------------|----------|----------|
| | Total. | Foreign. | Colored. |
| Atlantic Plain..... | 29.84 | 32.74 | 40.50 |
| Central Valley..... | 53.50 | 51.62 | 50.02 |
| Appalachian Region..... | 13.38 | 8.40 | 7.22 |
| Cordilleran Region..... | 3.28 | 7.24 | 2.26 |

In regard to the distribution of the population of the United States in towns and cities, and the positions of those centres, the following may be stated:—

In 1790 there were in the country four cities having a population of from 8,000 to 20,000 and two above 20,000, but not one surpassing 75,000 in number. Fifty years later, there were forty-four towns and cities having a population of 8,000 and over, and one of about 500,000. In 1880 there were 286 towns with over 8,000 inhabitants.

The following statement gives the names and population of all the cities having, in 1890, a population of over 100,000:—

| Name. | OVER 1,000,000. | Population in 1890. |
|-----------------------------------|-----------------|---------------------|
| New York..... | | 1,513,501 |
| Chicago..... | | 1,098,577 |
| Philadelphia..... | | 1,044,806 |
| OVER 500,000 AND UNDER 1,000,000. | | |
| Brooklyn..... | | 804,377 |
| OVER 250,000 AND BELOW 500,000. | | |
| St. Louis..... | | 460,357 |
| Boston..... | | 446,507 |
| Baltimore..... | | 433,639 |
| San Francisco, Cal..... | | 297,990 |
| Cincinnati..... | | 286,309 |
| Cleveland, Ohio..... | | 261,546 |
| Buffalo, N. Y..... | | 255,543 |

OVER 100,000 AND BELOW 250,000.

| | |

The census of 1880 showed that of the total population, 50,155,783, there were 6,673,143 born in foreign countries, or 13.364 persons foreigners to 100,000 native born; this ratio was a little less than in 1870, when the number of foreign-born was 16,875 to 100,000 native.

The following tables show the number of immigrants arriving in the United States for each decade from 1821 to 1880, and for each year from 1881 to 1887. The yearly average during each decade rose rapidly, from 14,344 in the decade 1821-30 to 294,469 for the decade 1871-80. The number of immigrants for the year 1881 was more than twice as great as the yearly average of the preceding decade. The maximum was reached in 1882, when the number of immigrants reached 730,349, from which time forward there was a falling off, the figures in 1885 being 350,510. A portion of this apparent decrease seems to be due to the fact that the statistics of the immigration by land from Canada and Mexico—the latter very small in amount, however—could not be collected; so that since July 1, 1883, arrivals of this kind have been excluded from the tables of immigration. In the first table herewith given, the nationality of the immigration is only imperfectly given, the British Islands being separated from the rest of Europe, and the figures also being for China. As will be noticed, the immigration from Europe and China made up about five-sixths of the total during the decade 1871-80. But in the decade 1851-60 the immigration from Europe made up twenty-four twenty-fifths of the total, that from China being practically null. The apparent increase of immigration from extra-European countries indicated in the table for the decades since 1860 is chiefly due to the rapid increase of immigration into the United States from the adjacent Dominion; but this is made up in part of persons who have come to the United States from Europe by way of Canada:

[To this and the following table notice must be taken of the fact that for the last half of 1885 and for 1886 and 1887 the immigration from British North America and Mexico is not included.]

Still further light will be thrown on this subject by the following table, in which the nationality of the immigration into the United States is given in considerable detail for the years 1881 to 1887, in percentages of the total amount. From this table it will be seen that Germany has furnished during the past seven years somewhat less than one-third of the total immigration; Great Britain and Ireland somewhat more than a quarter; Norway and Sweden about a tenth; British North America about a tenth; Austro-Hungary a little over six per cent; Russia (including Poland), from four to five per cent; and Italy nearly the same. These nationalities together have furnished during the past six years about ninety-five per cent of the total. The immigration from Italy and Russia shows a moderately rapid, but pretty uniform, increase from year to year:—

PERCENTAGE TABLE SHOWING THE NATIONALITY OF IMMIGRANTS INTO THE UNITED STATES FOR THE YEARS 1881-87.*

| | 1881. | 1882. | 1883. | 1884. | Nationality of immigrants. |

The immigration into the United States is very unequally distributed over the surface of the country. An inspection of the census tables and the accompanying maps shows that immigrants in very large proportion seek Northern regions. In the Southern States, with the exceptions of Florida, Louisiana, and Texas, the foreign element is practically null. Virginia, North Carolina, South Carolina, Alabama, Georgia, and Mississippi have less than one per cent of foreign-born population; and no State south of Pennsylvania and the Ohio River and east of the Mississippi has as much as four per cent. In the belt of States between the parallels of 41° and 45°, on the other hand, the foreign element is most strongly represented. Thus in Massachusetts, Connecticut, Rhode Island, New York, Michigan, Wisconsin, Minnesota, and Dakota the foreign-born population is over twenty-five per cent of the native, and in the two last-named States over fifty per cent. Iowa, Nebraska, and Kansas, forming a belt of States extending southwesterly from Wisconsin and Minnesota to the 37th parallel, have a foreign-born population ranging between ten and twenty-five per cent of the native, except in the case of Nebraska, where the foreign is a little over twenty-five per cent. In some of the thinly inhabited States farther west the foreign element is still more prominent, as in Colorado, Utah, Nevada, Arizona, and California. In Nevada, for example, according to the census of 1880, the foreign-born inhabitants were to the natives in the ratio of 70,065 to 100,000. But it must be remembered in this connection that the entire population of Nevada at that time was only 62,266, and that of Arizona 40,440. In no State or Territory does the foreign element equal the native, and only in Nevada, Arizona, Dakota, Minnesota, and California is it more than half as large, while in the two last-named States it is but little more than half. Texas forms an exception to the other Southern States, the foreign element being of importance, especially in the southwestern portion of the State. The State as a whole has, however, only a little less than eight per cent of foreign-born inhabitants.

The percentage increase of the native white element of the population was, for the three decades 1851-80, as follows:—

| | |
|--------------|-------|
| 1851-60..... | 32.35 |
| 1861-70..... | 22.95 |
| 1871-80..... | 31.25 |

Early in 1882 an Act was passed by Congress suspending Chinese immigration into the United States for the term of twenty years. This was vetoed by the President, and another one was passed having nearly the same provisions as the first, but limiting the time of its operation to ten years. This Act was not vetoed; but became a law May 6, 1882. This second Act is entitled "An Act to execute certain treaty stipulations relating to Chinese." From and after ninety days after the passage of this Act the entrance of Chinese "laborers" into the United States was forbidden, and any master of a vessel bringing them here was punishable by a fine of \$500 for each laborer so brought, and also by imprisonment for a term not exceeding one year. The pretext for this unprecedented Act was "that the coming of Chinese laborers to this country endangers the good order of certain localities" within the territory of the United States. The term "laborers" was held to mean "both skilled and unskilled laborers, and Chinese employed in mining."

Further legislation relating to the exclusion of the Chinese from the United States was had by Congress in 1888. The two Acts were passed, the first having been approved Sept. 13, 1888, and a second, supplementary to this, Oct. 1, of the same year. The object of these two Acts was to prevent the Chinese who were then in the United States from returning after having left this country. The first Act, (approved Sept. 13) allowed a native of China to re-

turn, provided he had a "lawful wife, child or parent within the United States, or property therein of the value of one thousand dollars, or debts of like amount due him and pending settlement." This privilege was entirely cancelled by the supplementary Act, approved Oct. 1; and as the matter now stands, only "Chinese officials, teachers, students, merchants, or travelers for pleasure or curiosity are permitted to enter the United States." Furthermore, it is provided that in order to become entitled to such entrance they must "obtain the permission of the Chinese Government or other Government of which they may at the time be citizens or subjects." This permission, and the personal identity of the party having obtained it, must be authenticated by the diplomatic or consular representative of the United States at the port or place from which the party comes. It is further provided that any master of a vessel landing, or attempting to land, any Chinese laborer, "in contravention to the provisions of this Act, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished with a fine of not less than five hundred nor more than one thousand dollars, in the discretion of the Court, for every Chinese laborer or other Chinese person so brought, and may also be imprisoned for a term of not less than one year, nor more than five years, in the discretion of the Court."

Provisions have also been made by Act of Congress for the regulation of the immigrant carrying business, and rules have been prescribed as to food, water, light, space occupied, etc. A tax of fifty cents is also imposed on all immigrants landing in this country to be used "in defraying the expense of regulating immigration under this Act, and for the care of immigrants arriving in the United States, for the relief of such as are in distress, etc."

By an Act of Congress, approved Aug. 3, 1882, it is provided that no convict, lunatic, idiot, or person "unable to take care of himself or herself without becoming a public charge" shall be permitted to land. Under the provisions of this Act it appears that from 1883 to Sept. 25, 1888, 7,764 immigrants had been returned from the United States to their own countries—or an average of about 1,300 persons a year. Of those thus returned from 1883 to 1888 inclusive, there were 27 convicts, 371 lunatics, and 131 idiots. The remainder (7,235 persons) were returned as "liable to become a public charge."†

THE PUBLIC LANDS.

The emigration from Europe and other countries consists largely of people seeking homes in the New World; and this want is chiefly supplied by the purchase of government land—public lands, as usually designated by the authorities—that is, of such land as is offered for sale by authority of the General Government, under the direction of the General Land Office—a branch or sub-department of the Department of the Interior. It is desirable, therefore, that the way in which the General Government came in possession of these lands should be briefly stated, and some idea given of their extent and position.

The boundaries of the United States as fixed by the provisional treaty made with Great Britain in 1782, and by the definitive treaty in 1783, gave to the United States essentially the region south of the Great Lakes and east of the Mississippi, as far south as the parallel of 31°; and the southern boundary east of the Mississippi, as thus established, nearly along the 31st parallel, was, in 1763, re-affirmed by treaty with Spain, by which the line between the United States and the Floridas was fixed; but difficulties soon arose in regard to the northern boundary, both in its eastern and western portions, which were, during many years, the subject of heated discussion, and which more than once threatened to involve the two countries, Great Britain and the United States, in war. The most important points, were, however, peaceably settled in 1846, and the last point in dispute finally disposed of, by reference to the Emperor of Germany as arbitrator, in 1872.

At the time of the adoption of the Constitution by the original thirteen States, most of them had claims, rather vague, and in many cases decidedly conflicting, to a more or less indefinite area of country west of their settlements, and extending back to the Mississippi River. After much discussion, the States having these claims, influenced by the distinct realization of the trouble which would ensue in case an attempt was made to maintain them, did, in response to a resolution of Congress, consent to a transfer of these claims to the United States. The first cession of this kind was that of New York, in 1781, and the last, that of Georgia, in 1802. The region thus ceded was divided into two territories, one of which was called the "Territory Northwest of the River Ohio," the other the "Territory South of the River Ohio." This region formed the nucleus of the public lands of the United States. This did not include the present States of Kentucky and Tennessee, the former having been admitted to the Union without any claim on the part of the United States to proprietorship in the soil, and similar rights in regard to the latter having been relinquished by Act of Congress. The total area of the United States at this time was about 850,000 square miles. The first addition made to this was by the French cession of the undetermined area known as Louisiana. This was brought about by Jefferson, who recognized the fact that France would not be able to hold the

*This tax is not collected from immigrants coming from Canada or Mexico.

†A very stringent Act was passed by Congress in 1885, prohibiting the importation and immigration of foreigners and aliens "under contract or agreement to perform labor in the United States, its Territories, and the District of Columbia." This Act has had little practical effect on the number of immigrants arriving in this country; nor has the writer been able to procure any definite information as to whether any persons have ever been sent back under its provisions.

*The immigration into the United States arriving at the six principal ports (embracing about ninety-eight per cent of the entire immigration) was, for the first nine months of the year 1888, 132,802 a slight increase over that of the corresponding months of the preceding year.

Exclusion of Chinese

Rules for immigrants

Extent and position.

First addition.

region against the English, with whom Bonaparte, at that time (1803-1804) First Consul, was about to go to war. The treaty of cession with Bonaparte gave no precise limits to the territory ceded, but only described it as being the same as that ceded by Spain to France according to the treaty of San Ildefonso. This vagueness was, no doubt agreeable to the wishes of the American negotiators, who did not lack foresight, and who must easily have comprehended the fact that the more vague the terms of the cession the better the chance of a future extension of the claims of the United States westward. In point of fact the French cession did not include the country west to the Pacific, as it was afterward held to do, for the French had no claim whatever to the region west of the head of the Missouri. As a consequence of this cession, however, this vast region did come into possession of the United States, the boundary having been finally settled in 1872, after ninety years of discussion. The final settlement was by a reference of the point in dispute to the Emperor of Germany, who decided in favor of the United States; the main question with regard to the extension of the boundary along the line of the 49th parallel to the Pacific, having been settled in 1846 by the Webster-Ashburton treaty, which fixed the boundary as far west as the Straits of Fuca. This cession of Louisiana, as finally settled by treaty with England, added largely to the area of the United States, extending its limits to the Pacific Ocean, and giving that country complete possession of the Central River system of the continent. The cost of this cession to the United States was about twenty-three and a half million dollars in principal and interest.

A further addition to the territory of the United States was by a cession from Spain of the territory comprised in the present State of Florida, which took place in 1819, the area thus conveyed being about 58,680 square miles, and the cost about six and a half millions of dollars. Previous to this cession, however, the United States had, by Act of Congress passed in secret session in 1812, but not promulgated until 1818, taken possession of an area of about 9,740 square miles in West Florida, which was claimed by the Spanish Government as its property, but which claim was relinquished by the cession of 1819.

The next acquisition of territory by the United States was the result of the admission into the Union of the Republic of Texas, a former province of Mexico, having an area of 265,780 square miles. This annexation led to a war with the country to which Texas had formerly belonged, the result of which was the conquest of Mexico, the occupation of its capital by the United States army, and the dictation of a treaty of peace called the "treaty of Gaudalupe-Hidalgo," which was proclaimed July 4, 1848. By this treaty the southern boundary of the United States was established; but subsequently, Dec. 30, 1853, a purchase was made of a strip of land lying south of the Gila River in New Mexico and Arizona, and containing about 47,330 square miles. This is known as the "Gadsden purchase."

Claims of Great Britain and Mexico.

The claims of both Great Britain and Mexico to the region lying west of the Missouri and northwest of Texas being extremely vague, it is not possible to state, with any approach to precision, what portions of this area originally belonged to the two powers in question. All that can be said is that, remotely, in consequence of the purchase of "Louisiana" from Bonaparte, and more directly, as the result of treaties with Great Britain and Mexico settling the northern and southern boundaries of the United States, the last named country came into possession of a little over 1,800,000 square miles of land, as shown in the following statement of the nature and size of the areas added from time to time to what was the original domain of the Colonies at the time of their establishment as an independent government:

| | Square miles. |
|---|---------------|
| Original area of the United States..... | 849,145 |
| Added by purchase of Florida, 1819, including 9,740 square miles previously in dispute, but in possession of the United States..... | 58,680 |
| Annexation of Texas, 1848..... | 265,780 |
| Gadsden Purchase, 1853..... | 47,330 |
| Purchase of Louisiana and cessions by Mexico, 1804-48..... | 1,034,065 |
| Total..... | 3,025,600 |

Alaska.

One other addition to the area of the United States was made in 1867, namely, by the purchase from the Russian Government of the region known as Alaska, which comprises an area of about 530,000 square miles. The price paid for this piece of land was \$7,200,000. The purchase of this territory, the nearest point of which is four hundred miles distant from the northern line of Washington, was an entirely unprecedented act on the part of the United States, all the rest of the possessions of this country forming one compact mass of land. Whenever, in the course of this work, mention is made of the United States, it will be understood that Alaska is not included, unless a statement to that effect is specially made in the same connection.

The entire area of the public lands of the United States (exclusive of Alaska, no portion of which has yet been surveyed) is estimated by the Commissioner of the General Land Office, in his report for the year 1886, at 2,536,725 square miles, or 1,815,504,147 acres. Of this area there had been surveyed, up to June 30, 1886, 971,174,973 acres, leaving 844,329,269 unsurveyed. In reference to this unsurveyed portion the Commissioner made the following remark: "The volume of land in the unsurveyed portion of the public domain suitable for homes and subject to settlement under the laws of the United States is of comparatively small proportions."

Of the public lands of the United States a large quantity has

been sold for cash, and a much larger amount taken, under various Acts of Congress, for schools and other educational purposes; as military bounty; as "swamp land," given to the respective States where it occurs, or has been claimed to occur; as a bonus for the construction of various lines of railroad, especially those traversing the continent from east to west; as "homesteads" to actual settlers, and for various other purposes. It is impossible to state the exact amount of the public land which has been thus disposed of, but it is certain that nearly all the valuable portion of the nation's great inheritance has been taken up already, or has passed out of the control of the Government. In regard to this point, the following quotation may be made from the introduction to the volume entitled "Statistics of Agriculture," forming a part of the report of the census of 1880, and published in 1883, the remarks here quoted being from the pen of General Walker, formerly superintendent of that census:

"It thus appears that, notwithstanding the imposing total of Valuable 1,400,000 square miles of still unsettled territory, the amount of land available for occupation for ordinary agriculture is not already large. The Public Land Commission in their report of 1880, say: gone. It was estimated June 30, 1879, that (exclusive of certain lands in Southern States) of lands over which the survey and disposition laws had extended, lying in the West, the United States did not own, of arable, agricultural public lands, which could be cultivated without irrigation or other artificial appliances, more than the area of the present State of Ohio, namely, 25,566,960 acres. The quantity of land taken up in the arable region during the year ending June 30, 1880, was about 7,000,000 acres. The Commission, therefore, reaches the startling conclusion that, at the same rate of absorption, the arable lands so situated will all be taken up within three years, or by June 30, 1883."

"It is indeed an astonishing announcement that the public land system, so far as relates to agricultural settlers, has virtually come to an end; that the homestead and pre-emption acts are practically exhausted of their contents."

Professor A. B. Hart has compiled from public documents the following approximate statement of the manner in which the public lands had been disposed of up to the various periods mentioned. The numbers given indicate acres:

| Date. | Sales. | Grants to individuals other than for internal improvements. | Grants to States other than for internal improvements. | Grants for internal improvements to States and Corporations. | Total. |
|--------------|-------------|---|--|--|-------------|
| To 1790..... | 1,487,986 | 35,049 | | | 1,523,036 |
| 1801..... | 1,574,917 | 2,154,660 | | | 3,729,577 |
| 1820-21..... | 19,423,212 | 7,260,152 | | | 33,375,901 |
| 1841..... | 93,043,927 | 9,765,033 | 8,830,654 | 1,780,505 | 113,430,119 |
| 1861..... | 161,796,816 | 75,406,345 | 115,962,531 | 31,690,842 | 382,856,534 |
| 1881..... | 181,837,359 | 140,524,032 | 158,137,191 | 162,230,009 | 642,778,684 |
| 1884..... | 192,584,116 | 167,483,506 | 158,417,594 | 162,230,009 | 680,715,315 |

In reference to the wasteful and reckless manner in which the public lands of the United States had been given away, until but little of value remains, Professor Hart makes the following remarks:—

"Experts in the Land Office assure us that, making all deductions and allowances, the remaining lands are worth upward of a thousand million dollars. There is no evidence in the past policy of the government for believing that we shall actually net one-tenth of that amount. The greater part of the region is officially classified as 'desert lands,' and is for sale in tracts of six hundred and forty acres, at a dollar and a quarter an acre. Nothing but the temporary increase of pre-emption enables the Land Office to present to pay its running expenses out of income. The golden time is past; our agricultural land is gone; our timber lands are

fast going; our coal and mineral lands will be snapped up as fast as they prove valuable.*

AGRICULTURE.

The following statements and tables present a succinct view of the nature and importance of the agricultural interests of the United States, beginning with the cereals.

I.—THE CEREALS.

The following table shows the production of the cereals in bushels, as returned by the census of 1880:—

| | Production in bushels. |
|------------------|------------------------|
| Barley..... | 44,113,495 |
| Buckwheat..... | 11,817,327 |
| Indian corn..... | 1,754,861,535 |
| Oats..... | 407,858,999 |
| Rye..... | 19,831,595 |
| Wheat..... | 459,479,505 |

Production of cereals.

The production of barley was largest in California (twelve and a half million bushels); other States producing considerable quantities were: New York, Iowa, Minnesota, Nebraska, Ohio. No other State produced as much as one million bushels. In 1886 the total production of barley in the United States was 59,428,000 bushels; of that amount California produced 16,038,000 bushels; and New York, Minnesota, Wisconsin and Iowa each over five million and less than ten million bushels; while Nebraska, Michigan and Dakota each produced over one million and less than five million bushels.

The total production of buckwheat within the United States, according to the census of 1880, was 11,817,327 bushels; of this amount New York and Pennsylvania produced respectively, 4,461,200 and 3,592,326 bushels. No other State produced as much as half a million bushels; the production of this cereal in the Gulf States being extremely small, that of the Pacific States being also very insignificant. No one of the States, other than New York and Pennsylvania, produced as much as half a million bushels.

In 1886 the total production of buckwheat was 11,809,000 bushels, or almost exactly the same as in the last census year (1879).

Indian corn is the most bulky crop among the cereals, the total yield as reported by the census of 1880 being 1,754,861,535 bushels. The principal production of this crop is in the belt of States lying north of the Ohio, and in the same latitude on the west of the Mississippi, as will be seen from the following table:—

| State. | Production in bushels in 1879. |
|---------------|--------------------------------|
| Illinois..... | 325,792,481 |
| Iowa..... | 2,502,247 |
| Missouri..... | 202,485,723 |
| Indiana..... | 115,482,300 |
| Ohio..... | 111,877,124 |

These five States produced, as will be seen, considerably more than half the total yield of the country in the year for which the statistics are given. As we go north, south, east and west from this belt we find the yield of Indian corn diminishing. Still, this cereal is a product of importance even as far south as the Gulf States, but is of comparatively little consequence in New England, the total production of the six New England States in 1879 being only 8,376,133 bushels.

In 1886 the total yield of Indian corn was 1,665,411,000 bushels, and the States producing over one hundred million bushels each were:

| States. | Production in bushels in 1886. |
|---------------|--------------------------------|
| Illinois..... | 209,818,000 |
| Iowa..... | 198,847,000 |
| Missouri..... | 143,709,000 |
| Kansas..... | 126,712,000 |
| Indiana..... | 118,795,000 |
| Nebraska..... | 106,129,000 |

Yield of Indian corn.

These six States produced in that year considerably more than half of the total, and the gradual advancement westward of the agricultural development of the country is shown in the appearance of Nebraska in the above column of figures as a producer of over a hundred millions of bushels. The yield of Indian corn in this State, according to the census of 1870, was 4,736,710 bushels, and in 1879 it had increased to 65,450,115 bushels. The figures for Dakota for the same years were 133,140 and 2,000,864 bushels.

Of this crop, so important as it is for home consumption, but a very small fraction is exported. The following table exhibits the total produce of the country for the years since the census year (1879) up to and including the year 1886, together with the percentage exported for each year:

| Year. | Production in bushels. | Per cent. exported. |
|-----------|------------------------|---------------------|
| 1880..... | 1,717,434,543 | 5.5 |
| 1881..... | 1,194,916,000 | 3.7 |
| 1882..... | 1,617,025,100 | 2.6 |
| 1883..... | 1,551,066,895 | 3.0 |
| 1884..... | 1,795,528,000 | 2.9 |
| 1885..... | 1,936,176,000 | 3.3 |
| 1886..... | 1,665,441,000 | 2.5 |

*Quarterly Journal of Economics, vol. i. p. 181 (number for January, 1887).

The yield of corn in 1887 is given by the Department of Agriculture as 1,456,161,000 bushels, and that of 1888 is estimated at 1,987,790,000 bushels. Since 1879 the home consumption of this cereal has averaged about twenty-seven bushels per annum for each inhabitant of the country; in the ten years preceding it averaged about twenty-five bushels.

The total yield of oats, as reported by the census of 1880, was 407,858,999 bushels. The distribution of this crop is pretty uniform all over the country, with the exception of the Gulf and Pacific Coast States, where the yield of this cereal is very small, barley taking the place of oats in California almost entirely.

The following table exhibits the production of oats in the United States from 1880 to 1888:

| Year. | Production in bushels. |
|-----------|------------------------|
| 1880..... | 417,885,330 |
| 1881..... | 416,481,000 |
| 1882..... | 488,250,610 |
| 1883..... | 571,302,400 |
| 1884..... | 583,628,000 |
| 1885..... | 629,409,000 |
| 1886..... | 624,134,000 |
| 1887..... | 659,618,000 |
| 1888..... | 701,735,000 |

The increase in the number of acres cultivated in oats since the census year has been very marked; more so than in the case of wheat or Indian corn. The average for the decade, 1870-79 was 11,000,000 acres; that for the years 1880-87 was 21,000,000 acres.

The amount of rye grown in the United States as returned by Rye, the census of 1880 was 10,831,595 bushels; the principal States where this crop is raised being, in the order of their yield, Pennsylvania, 3,683,621; Illinois, 3,121,785; New York, 2,634,690; Wisconsin, 2,298,513; and Iowa, 1,518,605 bushels. The production of this cereal in the States south of Kentucky and Virginia is extremely small, but some rye is given as grown in every State and Territory, except Arizona and Nevada. The production of rye in 1886 was 24,489,000 bushels; Kansas appearing this year as a producer of a little over two million bushels, and Nebraska of nearly one million.

Wheat is an extremely important crop in the United States. Wheat, and is the only cereal of which the export is considerable. The great wheat-growing States are those along the north side of the Ohio, from New York westward and across the Mississippi into Iowa, Kansas and Northwest, including Nebraska, Minnesota and Dakota. The yield of the census year (1879) was 459,479,505 bushels. In that year, Illinois, Indiana, Ohio, Michigan, Minnesota and Iowa each produced over thirty million bushels; the total yield of those six States was somewhat more than half that of the whole country. In 1887 the total was very nearly the same (456,329,000 bushels), but the distribution of this yield was somewhat different. There were in that year also six States producing each more than thirty million bushels. Of these six, four are among those included in a similar category for the year 1879—Michigan and Iowa have dropped out of that list, and Dakota and California must be inserted in their places.* These six States, as before, produce almost exactly half the entire yield of the country. What is more remarkable is, that Dakota, which in 1879 only figured with a produce of 2,830,289 bushels, appears in 1879 as furnishing no less than 52,406,000 bushels, or more than one-tenth of the whole crop of this cereal. Other States of importance in 1887 were Missouri, Iowa and Michigan, each of which produced between twenty and thirty millions of bushels; and Nebraska, Oregon, Pennsylvania, Wisconsin, Kentucky and New York, each of which produced between ten and twenty millions of bushels.

In the tabular statement of the yield of wheat for the year 1887, as given by the Department of Agriculture, forty-two States and Territories appear as producing more or less of this cereal, but the quantity grown south of Kentucky and Virginia is very small. The yield of the Gulf States is entirely insignificant, Florida and Louisiana not appearing at all in the list; and that of New England is equally unimportant, the whole produce of that section of the country being in that year only 74,547 bushels.

The following table gives the production of wheat, total value, value per bushel, and amount exported for each of the years, 1880-87:—

| Year. | Total production. (Bushels.) | Total value of crop | Av. value per bushel (in cents.) | Amt. exported. (Bushels.) |
|----------|------------------------------|---------------------|----------------------------------|---------------------------|
| 1880.... | 493,549,868 | \$174,201,850 | 95.1 | 186,321,514 |
| 1881.... | 383,240,000 | 456,880,427 | 119.3 | 121,892,389 |
| 1882.... | 504,185,470 | 444,602,125 | 88.2 | 147,811,316 |
| 1883.... | 421,086,160 | 383,649,272 | 91.0 | 111,534,182 |
| 1884.... | 512,765,000 | 390,862,260 | 64.5 | 132,570,367 |
| 1885.... | 357,112,000 | 275,320,396 | 77.1 | 94,565,794 |
| 1886.... | 457,218,000 | 314,226,020 | 68.7 | 153,804,970 |
| 1887.... | 456,329,000 | 310,612,960 | 68.1 | |
| Average | 448,815,699 | 373,794,413 | 83.3 | 135,500,076 |

The estimate of the Agricultural Department of the yield of wheat for the year 1888 is 415,868,000.

The grass crop is well understood to be the greatest of all the Grass crops of the United States. Altogether, in addition to the very and hay, large amount consumed from the ground during the grazing sea-

*The yield of California remained nearly the same in 1887 that it was in 1879. In the former year it was a trifle over thirty millions; in the latter a trifle under that amount.

on, the value of the harvested hay reaches nearly to that of the greatest of the cereal crops. The following statistics are presented:—

The area mown in 1879 was 30,631,054 acres; in 1880, 36,501,688 acres. The value of the hay cut in the latter year was 353,437,699.* In one State (New York) the value amounted to over fifty millions of dollars; in one (Pennsylvania) to over thirty and less than forty millions; in three States (Illinois, Ohio and Iowa), to over twenty and less than thirty millions.

The grass and hay producing industry decreases in importance as we go from the North toward the South. Thus, the thirteen States in each of which (in 1879) more than a million of acres were mown are all north of the parallel of 37°; and all but two (Missouri and Kansas) north of 39°, excepting very small fractions of Ohio, Indiana and Illinois.

The number and value of the animals on farms in the year 1886 was as follows:—

| | Number. | Value. |
|----------------------------|------------|---------------|
| Horses..... | 13,172,936 | \$946,096,154 |
| Mules..... | 2,191,727 | 174,853,563 |
| Milch cows..... | 14,856,414 | 366,252,173 |
| Oxen and other cattle..... | 34,378,363 | 611,750,520 |
| Sheep..... | 43,544,755 | 89,279,926 |
| Hogs..... | 44,346,525 | 220,811,082 |

The importance of the crop of Indian corn has given a great development to the business of fattening swine, and an average of about fifteen per cent. of this production has, during the past twenty-seven years, been exported. The average value of "hog products" (live hogs, bacon, hams, pork and lard) exported has been, during the years 1881-87, \$73,671,607 per annum, as against \$65,139,498 in the decade 1871-80.

The statistics of dairy products given in the Agricultural Report of the Census of 1880 for the year 1879 are presented in a very condensed form, as follows:—

| | |
|--|-------------------|
| Milk sold, or sent to butter and cheese factories..... | 530,129,755 gals. |
| Butter made on farms..... | 777,250,287 lbs. |
| Cheese made on farms..... | 27,272,489 lbs. |

The very great extent and importance of the poultry industry in the United States is made apparent by the following statement of facts gathered by the census of 1880:—

| | |
|--|-------------|
| Barnyard poultry on hand, June 1, 1880.... | 102,272,135 |
| Other poultry on hand June 1, 1880..... | 23,235,187 |
| Eggs produced in 1879..... | 456,910,916 |

At twelve cents a dozen, the annual value of the egg product to the farm would reach nearly \$55,000,000, and the value of the fowls consumed as food may fairly be estimated at \$20,000,000. The average yield of eggs per fowl is fully twice as great in the Northern States as it is in the Southern.

The cotton production of the United States is of great importance, both from the extent to which this material is manufactured within the country, and because it is the first on the list in value among the exports.

Cotton is mentioned in the records of the Colony of South Carolina as early as 1664, and a small quantity was exported in 1747. The invention of the cotton-gin by Eli Whitney, in 1794, was followed by a rapid development of the cotton-raising business throughout the Southern States. The first crop of sea-island cotton was raised in 1790, from seed that came either from the Bahamas or Barbadoes Islands.

The total production of the country in the year 1879 is given by the census of 1880 at 5,737,257 bales, of 375 pounds; this having been assumed to be the weight of the bale, in 1879—the average proportion of seed to fibre, or lint, in the crop as it comes from the field being given as two to one. The stated number of bales is equivalent, therefore, to 1,382,599 tons (of 2,000 pounds) of lint or fibre, and 2,725,197 of seed.

This production was divided among the States as follows:

| | Field. | Av. Product per acre. |
|-----------------------|-----------|-----------------------|
| | Bales. | Fraction of bale. |
| Mississippi..... | 955,808 | 0.46 |
| Georgia..... | 814,441 | 0.31 |
| Texas..... | 803,642 | 0.37 |
| Alabama..... | 699,654 | 0.30 |
| Arkansas..... | 608,256 | 0.58 |
| South Carolina..... | 522,548 | 0.38 |
| Louisiana..... | 508,569 | 0.59 |
| North Carolina..... | 389,598 | 0.44 |
| Tennessee..... | 330,644 | 0.46 |
| Florida..... | 54,907 | 0.22 |
| Missouri..... | 19,733 | 0.60 |
| Indian Territory..... | 17,000 | 0.49 |
| Virginia..... | 11,000 | 0.46 |
| Kentucky..... | 1,367 | 0.51 |
| Total..... | 5,737,257 | gen. av. 0.40 |

From the above table it will be seen that the limit of profitable cultivation of cotton is pretty sharply drawn at about the parallel of 37°; the production of Virginia and Kentucky—the southern border of which States is in the latitude 36° 30'—being exceedingly small. The production of Missouri is limited to a highly fertile

* This includes only hay cut on farms, and not that cut on public lands and lands of non-residents.

region lying in the extreme southeastern portion of the State while that of Kentucky pertains to the country lying adjacent to Western Tennessee and the rich bottom-lands along the Mississippi River. It does not appear that any cotton is produced north of the Ohio River.

According to Professor E. W. Hilgard, Special Agent of the Census of 1880, in charge of the subject of Cotton Production, the high production of Mississippi is due in part to the great fertility and large area of the "bottom-land" along the Mississippi River within the limits of that State, and in larger part to the fertility of the "uplands," or table-land bordering the Mississippi bluff, and the interior "prairie-belts." These favorable conditions have as a result that cotton culture is the one pursuit to which the population of this State devotes itself. It is rather great natural advantages than skill and industry which give Mississippi the first place in the production of cotton. Professor Hilgard thinks that by enlarging the area of tillable land in the Yazoo bottom, by simple exclusion of the overflows of the Mississippi, without any change in the methods of culture, the produce of the State might be raised to two and a quarter millions of bales; and that with improved cultivation the production might be brought up to five millions, so that under these conditions Mississippi alone could produce the entire crop now grown in the United States.

Georgia stands second in total production among the States, Georgia and but the average production per acre is but two-thirds that of Mississippi. The area of what would be called in the last-named State producing first and second class cotton soil is in Georgia quite limited—far more so than is the case in the neighboring State of Alabama; yet the former State is slightly in advance of the latter in the average product per acre. The high position of Georgia as a cotton producing State is due therefore, not to natural advantages, but to better cultivation of the soil, the use of fertilizers, and the thrift of an industrious population.

Texas—much the largest in area of the cotton producing States, Texas.

and also slightly larger in population than any of the other Gulf States—stands third on the list of total production. In the average product per acre it is among the very lowest. This fact seems to be due, in large part at least, to the position of Texas in reference to precipitation. In this State the total amount of rainfall is considerably less than in the other Gulf States, owing to its position in reference to the prevailing winds; and the diminution of rainfall is rapid as we recede from the coast. The precipitation is largest in the extreme northeastern portion of the State, and here—north of the 32d parallel and east of the 98th meridian—more than half the cotton product of the State is grown. The fact that Texas is so much larger than the other cotton producing States must also be borne in mind in connection with its position as the third on the list. It has, in fact, an area more than five times as great as the average area of the six other principal cotton States.

Alabama is naturally as well suited for the growth of cotton as Alabama and also the two States adjacent to it on the east and west, Georgia and Mississippi; and its position as fourth on the list, and as inferior to both these States, is considered by Professor Hilgard to be due to the fact that Mississippi is still within the period of the first flush of fertility, while Georgia has reached the stage where her fields are being renovated by the use of fertilizers; while the soil of Alabama has begun to be exhausted, but this exhaustion has not yet proceeded so far that the cultivators realize the necessity of making good this deficiency by proper modes of cultivation, as is done to a certain extent in Georgia.

In South and North Carolina the average cotton production per acre is high as compared with that of Alabama and Georgia, and in the case of North Carolina approaches that of Mississippi itself. The reason for this condition of things is to be found chiefly in the introduction of improved methods of culture, and the use of fertilizers. In South Carolina the so-called sea-island cotton is produced—a variety of cotton of great value, although small in amount, the production of it for the year 1880 being set down in the Census Report as 9,966 bales. The finest cotton ever known to have been produced is the long-staple cotton of Edisto Island, which sold for two dollars a pound when other cottons were only bringing nine cents. The islands where this crop is grown line the coast, sometimes forming three or four parallel belts, having their greatest development at the mouth of Broad River, from which in each direction along the coast they diminish in numbers.

All the important cotton-producing States with the exception of Arkansas and Tennessee, lie either on the Gulf of Mexico or the Atlantic coast; but the principal cotton-producing areas in the case of each of these States are at a considerable distance from the coast. Thus, in Mississippi by far the greater portion of the area planted in cotton lies in the northern and western part of the State, while in the extreme south there is an area where cotton culture is either very subordinate or practically non-existent; nor is this decrease of cotton culture accompanied by a corresponding increase of some other production. In Louisiana an obvious fact—rendered apparent by a glance at the map showing the relative areas given to cotton culture in the State—is the decrease of cotton culture as we advance southward. In Alabama the central prairie region, or black-soil belt, a narrow strip of country only about twenty-five miles wide, running east and west through the centre of the State, more than a hundred miles from the coast, produces forty per cent of the entire cotton crop. Adjacent to this particularly rich belt on the north and south is a belt of less but still large productiveness, making the total width of the centre cotton belt about seventy-five miles; and here at least sixty per cent. of the cotton of the State is raised. In Georgia the principal cotton-producing belt runs nearly parallel with the coast, and at a distance of from one hundred to one hundred and fifty miles from it. A similar condition of things is clearly indicated in both North and South Carolina.

Animals
daily products.

Cotton.

Alabama

South and
North
Carolina.

On comparing the facts here stated with the position of the isothermal and isohyetal curves in the region where cotton is grown, it will be seen that nearly the entire production of cotton comes from the area included between the isothermals of 60° and 65°, and there is none cultivated in any region of lower mean annual temperature than 56°. It also appears that the cotton-producing area is one of comparatively large precipitation, being nowhere less than thirty-eight inches, and generally considerably over that amount; and also that this precipitation is pretty uniformly distributed throughout the year. From this it is seen that the climatic conditions favoring the growth of cotton are of such a nature as to limit its successful production to a comparatively small area, differing in this respect materially from some of the other staples of the country, especially Indian corn and wheat. It will also be evident that the conditions existing on the Pacific coast do not favor the successful cultivation of cotton in that region.

Table of Cotton Production.

The following table exhibits the production of cotton and the amount exported for each year from 1880 to 1887. The average annual yield during the twenty years previous to 1861 was 1,335,000 pounds; during the twenty-three years from 1865 to 1886 it was 2,207,000,000 pounds—an increase of 65.3 per cent. During the period 1853-87 the average was 2,036,345,355 pounds, or a little less than the average of the years 1865 to 86:—

| Year. | Production in Pounds | Exports in Pounds. |
|--------------|----------------------|--------------------|
| 1880 | 3,199,822,682 | 2,190,928,772 |
| 1881 | 2,588,286,636 | 1,739,975,961 |
| 1882 | 3,405,070,410 | 2,208,075,062 |
| 1883 | 2,757,544,422 | 1,862,572,530 |
| 1884 | 2,742,966,011 | 1,891,659,472 |
| 1885 | 3,182,350,531 | 2,058,037,444 |
| 1886 | 3,157,378,443 | 2,169,457,330 |
| 1887* | 3,300,900,100 | 2,200,000,000 |
| *Approximate | | |

The climatic conditions under which tobacco can be raised seem to be quite variable, since more or less of this crop is furnished by almost every State in the Union. The yield of the extreme Southern and extreme Northern States is, however, very small; as (in 1879), of Maine only 250 pounds; of Oregon, 17,325; of New Mexico, 890; of Louisiana, 55,954.

Kentucky largest tobacco producing State.

The largest tobacco-producing State is Kentucky, with 171,120,784 pounds in 1879, according to the census of 1880. Next comes Virginia, with 79,988,868; then Pennsylvania, 36,943,272; Ohio, 34,735,235; Tennessee, 29,365,052; North Carolina, 26,986,213; Maryland, 26,082,147; Missouri, 12,015,657; Wisconsin, 10,608,423. From this it is evident that the culture of tobacco is carried on most successfully in the Middle Atlantic States and those bordering on the Ohio River, diminishing gradually in this latitude westerly, and having no importance in the extreme Western States. The mean temperature of the chief tobacco-producing area is indicated by the statement that it lies between the isothermals of 52° and 60°. As regards precipitation, a somewhat moist climate seems to be required, and there is little tobacco raised where the rainfall averages less than thirty-eight inches. The isothermal of thirty-two inches seems to be the limit beyond which it cannot pass. The total yield of the United States in the year 1879 was 472,661,159 pounds, having an estimated value as raised, in the producers' hands, of \$51,104,870.

The production of tobacco in 1886 was about eleven per cent. larger than in 1879—namely, 532,537,000 pounds. The relative rank of the States in the production of this crop was almost exactly the same at the two periods. Kentucky and Virginia together furnished in 1886 more than half the total, or 255,104,000 pounds. The entire value of the tobacco raised in 1886 was \$39,468,218.

Rice.

The production of rice for the year 1879 as returned by the census of 1880 was as follows:—

| | Pounds. | Average yield per acre. |
|----------------|-------------|-------------------------|
| Alabama | 810,889 | 514 |
| Florida | 1,294,677 | 508 |
| Georgia | 25,369,687 | 725 |
| Louisiana | 23,188,311 | 552 |
| Mississippi | 1,718,951 | 491 |
| North Carolina | 5,609,191 | 517 |
| South Carolina | 52,077,515 | 664 |
| Texas | 62,152 | 186 |
| Total | 110,131,373 | gen. av. 632 |

Sugar.

The production of sugar from the sugar-cane is extremely small as compared with the consumption of this article. Louisiana is the only State of any importance in this connection, although a small quantity of sugar is made in each of the following States: Georgia, Florida, Texas, Alabama, Mississippi and South Carolina. The total production in the year 1879, as returned by the census of 1880, was—of sugar, 178,872 hogsheds, and of molasses, 16,573,273 gallons, of which Louisiana furnished 171,706 hogsheds and 11,696,248 gallons.

The census of 1880 gives the following statistics of the production for that year of sugar and molasses from sorghum and the maple:

| | Sugar | Molasses. |
|---------|-------------|------------------|
| Sorghum | 12,792 lbs. | 28,444,202 gals. |
| Maple | 36,576,061 | 1,796,048 |

The principal production of sorghum molasses is in the States of Missouri, Tennessee, Kentucky, Illinois, and Iowa; that of maple sugar, in Vermont and New York, in each of which States the produce was over 10,000,000 pounds.

The following additional facts in regard to the agriculture of the

United States are condensed and arranged from the volume entitled "Statistics of Agriculture," in the Census Report for 1880:— Summary.

| | | |
|----------------------------|-----------------|-----------------|
| Total number of farms..... | 1870. 2,659,985 | 1880. 4,008,907 |
|----------------------------|-----------------|-----------------|

The term "farm," as here used, is understood to mean a tract of not less than three acres, unless \$500 worth of produce has actually been sold off from it during the year, and owned or leased by one man and cultivated under his care:—

| | |
|---|-------------------|
| Total area of United States in acres..... | 1,856,108,800 |
| Number of acres in farms..... | 536,081,835 |
| | 1860. 1870. 1880. |

| | | | |
|--|------|------|------|
| Proportion of unimproved land in farms to improved, in percentage..... | 59.9 | 53.7 | 46.9 |
|--|------|------|------|

Of the 4,008,907 farms returned, 74 per cent were cultivated by their owners, 8 per cent by tenants on basis of fixed money rental, and 18 per cent by tenants paying a share of the product or rent.

The total value of the farms of the United States, including land, buildings and fences, is given by the census of 1880 at \$10,197,096,776; and the estimated value of all farm productions sold consumed, or on hand, in 1879, was \$2,12,540,927.

The following tabular statement, from the volume of the Census Report of 1880, entitled "Statistics of Agriculture," and published in 1883, presents a resume of the principal facts connected with the agricultural interests of the country, so far as concerns the amounts or values of the different products:—

CONDENSED TABULAR VIEW OF AGRICULTURAL PRODUCTS CHIEFLY Tabular IN THE YEAR 1879, ARRANGED FROM THE CENSUS REPORT, VOLUME statement. ENTITLED "STATISTICS OF AGRICULTURE," PUBLISHED 1883.

| | |
|---|---------------------|
| Number of farms..... | 4,008,907 |
| Value of farms, including land, fences, and buildings..... | \$10,197,096,776 |
| Estimated value of farm products for 1879..... | \$2,122,540,927 |
| Wool produced..... | 210,681,751 pounds |
| Milk (not including that sent to butter or cheese factories)..... | 530,129,755 gallons |
| Butter (including that made on farms and in factories)..... | 806,672,071 pounds |
| Cheese (made on farms and in factories)..... | 243,157,850 " |
| Barley..... | 43,997,495 bushels |
| Buckwheat..... | 11,817,327 " |
| Indian corn..... | 1,754,591,076 " |
| Oats..... | 407,858,999 " |
| Rye..... | 19,831,595 " |
| Wheat..... | 459,482,137 " |
| Cotton..... | 5,755,359 bales |
| Flaxseed..... | 7,170,951 bushels |
| Flaxstraw..... | 421,098 tons |
| Flax fibre..... | 1,665,546 pounds |
| Hemp..... | 5,025 tons |
| Sugar (sugar-cane)..... | 178,872 hhds. |
| Molasses (sugar-cane)..... | 16,573,273 gallons |
| Sugar (sorghum)..... | 12,792 pounds |
| Molasses (sorghum)..... | 28,444,202 gallons |
| Sugar (maple)..... | 36,576,061 pounds |
| Molasses (maple)..... | 1,796,048 gallons |
| Hay mown..... | 35,150,711 tons |
| Clover-seed..... | 1,922,982 bushels |
| Grass-seed..... | 1,317,701 " |
| Eggs..... | 456,910,916 dozen |
| Honey..... | 25,743,208 pounds |
| Wax..... | 1,105,689 " |
| Rice..... | 110,131,373 " |
| Tobacco..... | 472,661,157 " |
| Potatoes, Irish..... | 169,458,539 bushels |
| Potatoes, sweet..... | 33,378,693 " |
| Orchard products (sold or consumed)..... | \$50,876,154 |
| Market-garden products..... | \$21,761,250 |
| Hops..... | 26,546,373 pounds |
| Broom corn..... | 29,480,106 " |
| Peas..... | 6,514,977 bushels |
| Beans..... | 3,075,050 " |
| Wood, amount cut..... | 51,442,624 cords |
| Forest products, value of all consumed or sold..... | \$95,774,735 |

The following general summary presents in one table the estimated quantities, number of acres cultivated, and aggregate value of the principal crops of the country in the year 1886:—

| Products. | Quantity. | No. of Acres | Value. |
|------------------|-----------------------|--------------|-----------------|
| Indian corn.... | 1,665,441,000 bushels | 75,694,268 | \$610,311,000 |
| Wheat..... | 457,218,000 " | 36,806,184 | 314,226,020 |
| Rye..... | 24,489,000 " | 2,129,918 | 13,181,340 |
| Oats..... | 624,134,000 " | 23,658,474 | 186,137,930 |
| Barley..... | 59,428,000 " | 2,652,957 | 31,840,510 |
| Buckwheat..... | 11,869,000 " | 917,915 | 6,465,120 |
| Potatoes..... | 168,051,000 " | 2,287,136 | 78,441,940 |
| Total..... | 3,010,630,000 bushels | 144,146,792 | \$1,240,603,850 |
| Tobacco..... | 532,570,000 pounds | 750,210 | 39,468,218 |
| Hay..... | 41,796,499 tons | 36,501,688 | 353,437,699 |
| Cotton..... | 6,445,864 bales | 13,454,603 | 257,295,327 |
| Grand total..... | | 199,853,293 | \$1,890,805,094 |

MANUFACTURES.

The most important facts connected with the manufacturing interests of the United States, as revealed by the census of 1880 and those of the preceding decades, may be stated, in the most condensed form, as follows:—

First, a table is given showing certain of the principal items connected with manufactures in the form of totals for the whole United States, for the three census years 1860, 1870, and 1880:—

TABULAR STATEMENT OF MANUFACTURES IN THE UNITED STATES.

| | 1860. | 1870. | 1880. |
|--|-----------------|-----------------|---------------|
| Number of Establishments..... | 140,433 | 252,148 | 253,852 |
| Capital Invested..... | \$1,069,855,715 | \$2,118,208,769 | 2,790,272,606 |
| Average Number of Hands Employed..... | | 1,615,598 | 2,019,035 |
| Males above 16 years..... | | 323,770 | 531,639 |
| Females above 15 yrs. Children and Youths..... | | 114,628 | 181,921 |
| Total am't. paid in wages during the year..... | \$978,878,968 | \$775,584,343 | \$947,953,795 |
| Value of Materials used..... | 1,031,605,092 | 2,488,427,242 | 3,396,823,549 |
| Value of Products..... | 1,855,861,676 | 4,232,325,442 | 5,369,579,191 |

The proportion in which the various branches of manufacture are geographically distributed over the country, according to the census of 1880, is shown by the following percentage statement:—

TABLE OF GEOGRAPHICAL DISTRIBUTION OF MANUFACTURES IN THE UNITED STATES.

| | Proportion of total Area. | Number of Establishments. | Amount of Capital invested. | Hands Employed. | Wages Paid. | Gross Product. |
|------------------|---------------------------|---------------------------|-----------------------------|-----------------|-------------|----------------|
| N. Atlantic | 5.6 | 44.87 | 61.94 | 62.23 | 64.33 | 59.64 |
| S. Atlantic | 9.4 | 10.16 | 5.89 | 7.59 | 4.99 | 5.26 |
| N. Central | 25.5 | 34.33 | 25.78 | 24.39 | 24.86 | 28.94 |
| S. Central | 20.3 | 7.55 | 3.75 | 3.85 | 3.11 | 3.47 |
| W. (Cordilleran) | 39.4 | 3.09 | 2.64 | 1.94 | 2.71 | 2.69 |

Next may follow a statement of the various most extensive manufacturing industries arranged in the order of their importance, with reference to the value of their products. In this table all branches of manufacture are included in which the total production exceeds \$40,000,000 in value:—

TABLE OF INDIVIDUAL MANUFACTURING INDUSTRIES IN THE UNITED STATES, ACCORDING TO THE CENSUS OF 1880.

| Products. | Number of Establishments. | Number of Hands employed. |
|---|---------------------------|---------------------------|
| Flouring and Grist Mill Products..... | 24,338 | 58,407 |
| Slaughtering and Meat Packing..... | 872 | 27,297 |
| Iron and Steel..... | 1,005 | 140,973 |
| Woolen of all classes..... | 2,689 | 161,557 |
| Lumber, Sawed..... | 25,708 | 147,956 |
| Foundry and Machine Shop Products..... | 4,958 | 145,357 |
| Cotton Goods..... | 1,065 | 185,472 |
| Clothing, Men's..... | 6,166 | 160,813 |
| Boots and Shoes..... | 17,972 | 133,819 |
| Sugar and Molasses, Refined..... | 49 | 5,857 |
| Leather, Tanned..... | 3,105 | 23,812 |
| Liquors, Malt..... | 2,191 | 26,220 |
| Carpentering..... | 9,184 | 54,138 |
| Printing and Publishing..... | 3,467 | 58,478 |
| Furniture..... | 5,227 | 59,304 |
| Leather, Curried..... | 2,319 | 11,053 |
| Agricultural Implements..... | 1,943 | 39,580 |
| Mixed Textiles..... | 470 | 43,373 |
| Bread and other Bakery Products..... | 6,396 | 22,488 |
| Carriages and Wagons..... | 3,841 | 45,394 |
| Tobacco, Cigars, etc..... | 7,145 | 53,297 |
| Paper..... | 692 | 24,422 |
| Tobacco, Chewing, Smoking and Snuff..... | 477 | 32,756 |
| Tin ware, Copper ware, and Sheet-iron ware..... | 7,595 | 26,248 |
| Blacksmithing..... | 28,101 | 34,526 |
| Liquors, Distilled..... | 844 | 6,502 |
| Silk and Silk Goods..... | 382 | 31,337 |

| Products. | Amount paid in Wages. | Value of Materials. | Value of Products. |
|--|-----------------------|---------------------|--------------------|
| Flouring and Grist Mill Products..... | \$17,422,316 | \$441,545,225 | \$505,185,712 |
| Slaughtering and Meat Packing..... | 10,508,530 | 267,738,902 | 303,562,413 |
| Iron and Steel..... | 55,476,785 | 191,271,150 | 296,557,685 |
| Woolen of all classes..... | 47,389,087 | 164,371,551 | 267,252,913 |
| Lumber, Sawed..... | 31,845,974 | 146,155,885 | 233,268,729 |
| Foundry and Machine Shop Products..... | 65,982,133 | 103,345,983 | 214,378,468 |
| Cotton Goods..... | 45,614,419 | 113,765,537 | 210,950,383 |
| Clothing, Men's..... | 45,940,353 | 131,363,282 | 209,548,460 |
| Boots and Shoes..... | 50,995,144 | 114,966,575 | 196,920,481 |
| Sugar and Molasses, Refined..... | 2,875,032 | 144,698,499 | 155,484,915 |
| Leather, Tanned..... | 9,204,243 | 85,949,207 | 113,348,336 |
| Liquors, Malt..... | 12,198,053 | 56,836,500 | 101,058,355 |
| Carpentering..... | 24,582,077 | 51,621,120 | 94,152,139 |
| Printing and Publishing..... | 30,531,657 | 32,460,395 | 90,780,341 |
| Furniture..... | 23,695,080 | 35,860,206 | 77,845,725 |
| Leather, Curried..... | 4,845,413 | 59,306,509 | 71,351,297 |
| Agricultural Implements..... | 15,359,610 | 31,531,170 | 68,640,456 |
| Mixed Textiles..... | 13,316,753 | 37,227,741 | 66,221,703 |
| Bread and other Bakery Products..... | 9,411,328 | 42,612,072 | 65,824,896 |
| Carriages and Wagons..... | 18,988,615 | 30,597,886 | 64,951,617 |
| Tobacco, Cigars, etc..... | 18,464,862 | 29,577,833 | 63,979,575 |
| Paper..... | 8,525,355 | 39,951,297 | 55,119,914 |
| Tobacco, Chewing, Smoking and Snuff..... | 6,419,024 | 34,397,072 | 52,793,056 |
| Tin ware, Copper ware and Sheet-iron ware..... | 10,722,974 | 25,232,281 | 48,066,038 |
| Blacksmithing..... | 11,126,601 | 14,572,363 | 43,774,271 |
| Liquors, Distilled..... | 2,663,967 | 27,744,245 | 41,063,663 |
| Silk and Silk Goods..... | 9,146,705 | 22,467,701 | 41,033,045 |

The remarkable concentration of the manufacturing interests of the United States in the extreme northeastern portion of the country will be evident from the above table. New England, New York, New Jersey, and Pennsylvania, embracing only a little over one-twentieth of the area of the whole country, produce six-tenths of the total gross product of its manufactures. Similar conditions are shown in contrasting the northern with the southern sections of the country. The North Atlantic and North Central divisions, with thirty-one per cent of the total area, furnish over eighty-eight per cent. of the gross product. The Western or Cordilleran region, with nearly forty per cent. of the total area of the country, furnishes only a little over two and a half per cent. of its manufactures.

The Census Report of 1882 gives a great mass of statistics in reference to the manufacture of cotton in the country, from which the following are selected as representing the most essential features of this extremely important business:—

| | |
|---------------------------------|--------------|
| Number of spindles..... | 10,653,435 |
| Number of looms..... | 225,759 |
| Bales of cotton consumed..... | 1,570,344 |
| Number of persons employed..... | 172,544 |
| Wages paid..... | \$42,040,510 |

These are said to be the final figures of the specific manufacture of cotton yarn and woollen fabrics, including some cotton hosiery; and by the term "specific" is meant cotton "worked into a fabric known and sold under that name."

Including the cotton used in mixed goods and upholstery, the total consumption is estimated at 1,760,000 bales. The total number of operatives employed, including those engaged in print and dye works and bleacheries, and also in manufacturing special fabrics in which cotton forms a part, is 198,238. The operatives employed in the specific cotton mills are thus classed as to age and sex:—

| | |
|------------|---------|
| Men..... | 59,685 |
| Boys..... | 15,107 |
| Women..... | 84,539 |
| Girls..... | 13,213 |
| Total..... | 172,544 |

The average wages earned in the cotton mills amount, for 300 days in the year, to 81 cents per day. Since 1840 the hours of labor have been reduced from 13 or 14 to 11, and the average earnings per hour are now more than double what they were at that time.

The manufacture of cotton is carried in nearly all the Atlantic, Central, and Southern States, but is principally developed in and near Massachusetts. This State alone consumed considerably more cotton in 1880 than all the other States outside of New England. Of 1,570,344 bales consumed in "specific" cotton manufacture in the country, in 1880, 1,129,498 were taken by New England. Massachusetts and Rhode Island, having together about ten thousand square miles of area, consumed 742,337 bales, or nearly half the whole consumption of the United States.

Some cotton cloth is still made by hand in the mountainous sections of the South, some two or three hundred thousand persons

being supplied in this way. As a measure of their work, it is said by Mr. Atkinson, Special Agent of the Census in charge of the subject of Cotton, that "two carders, two spinners, and one weaver could produce eight yards of coarse cotton cloth in a day of ten hours." To this he adds: "Of the whole force engaged in the specific cotton manufactures, about 160,000 are employed on goods for home consumption. It would take 16,000,000 to make the same number of yards by hand-work, and the cloth would be of a far different kind—more durable, it is true, but coarse and unrightly."

The following table will furnish the necessary data for an understanding of the importance of the petroleum business in the United States:—

| Year ending June 30. | Production in Barrels of 42 Gallons. | Exports, in gallons. | | | Total Value of Exports. |
|----------------------|--------------------------------------|----------------------|------------|-------------|-------------------------|
| | | Illuminating Oil. | Crude Oil. | Total. | |
| 1864 | 2,478,709 | 12,791,518 | 9,980,654 | 23,210,369 | \$10,782,689 |
| 1865 | 2,424,905 | 12,722,005 | 12,293,897 | 25,496,849 | 16,563,413 |
| 1866 | 3,165,700 | 34,255,921 | 16,057,943 | 50,987,341 | 24,830,887 |
| 1867 | 3,591,900 | 62,686,957 | 7,341,248 | 70,255,481 | 21,407,642 |
| 1868 | 3,613,709 | 67,909,961 | 10,029,659 | 79,456,888 | 21,810,676 |
| 1869 | 4,046,558 | 84,403,492 | 13,425,566 | 100,636,684 | 31,127,433 |
| 1870 | 4,411,016 | 97,902,505 | 10,403,314 | 113,735,294 | 32,668,960 |
| 1871 | 5,558,775 | 132,698,955 | 9,850,038 | 149,892,691 | 36,894,810 |
| 1872 | 5,842,497 | 122,639,575 | 13,550,768 | 145,171,583 | 34,058,390 |
| 1873 | 7,242,343 | 158,102,414 | 18,439,407 | 187,815,187 | 42,050,756 |
| 1874 | 11,188,741 | 217,220,504 | 17,776,419 | 247,866,483 | 41,245,815 |
| 1875 | 10,083,823 | 191,551,933 | 14,718,114 | 221,955,308 | 30,078,568 |
| 1876 | 8,823,142 | 204,814,673 | 20,520,397 | 243,660,152 | 32,915,786 |
| 1877 | 10,822,871 | 262,441,844 | 26,819,202 | 309,198,914 | 61,780,438 |
| 1878 | 14,738,262 | 289,214,541 | 26,936,727 | 338,841,303 | 46,574,974 |
| 1879 | 16,917,606 | 331,586,442 | 25,874,488 | 378,310,010 | 40,305,249 |
| 1880 | 22,382,509 | 367,325,823 | 28,297,997 | 423,964,609 | 36,218,625 |
| 1881 | 25,805,363 | 332,283,045 | 39,984,844 | 397,660,262 | 40,315,609 |
| 1882 | 23,650,181 | 488,213,033 | 41,304,997 | 559,954,590 | 51,232,706 |
| 1883 | 26,662,868 | 419,821,081 | 52,712,306 | 505,931,622 | 44,913,079 |
| 1884 | 23,714,924 | 415,615,693 | 67,186,329 | 513,660,692 | 47,103,248 |
| 1885 | 21,750,619 | 458,243,192 | 81,037,092 | 574,628,180 | 50,257,947 |
| 1886 | 22,463,744 | 469,471,451 | 80,246,763 | 577,781,752 | 50,199,844 |
| 1887 | 25,816,000 | 430,845,811 | 76,062,875 | 592,803,267 | 46,824,933 |
| 1888 | 28,249,597 | 456,417,221 | 85,538,725 | 578,351,638 | 47,042,409 |

Industries. The relation of materials to product, in the statistics of industry, needs to be carefully borne in mind; and for the purpose of throwing light on this subject, the Census Report of 1889, in the volume devoted to manufactures (published in 1883) groups the manufacturing and mechanical industries into four classes, as follows: I. Those industries in which the subject-matter is of a distinct and immediate commercial value, but the property does not reside in the person who treats it; II. Those industries in which the entire value of the subject-matter is carried into the value of "materials," and appears again in the product, enhanced by the value of labor, use of capital, rent, freight, etc., but in which the value is small compared to the cost of labor; III. Industries which are otherwise under the same conditions as those of the second class, but in which the value of the materials approaches, or even moderately exceeds, the value of the labor employed, and becomes thus an important element in the final value of the product, enhancing the apparent production of the industry in a high degree; and IV. Industries in which the value of the materials far exceeds all other elements in the cost of production combined, although, in fact, comparatively little value has been added by these operations, and only a small number of artisans or laborers supported. The following table is intended to illustrate the relation of materials to product, indicated above:—

RELATIONS OF WAGES AND MATERIALS TO PRODUCTS IN MANUFACTURING AND MECHANICAL INDUSTRIES.* 1880.

| Class. | Number of Hands Employed. | Amount paid in Wages. | Value of Materials. | Value of Products. | Excess of Products over Materials. | Excess of Products over Wages and Materials. | Wages in \$100 of Products. | Materials in \$100 of Products. | Wages and Materials in \$100 of Products. | Product, per capita, gross. | Product, per capita, deducting Materials. |
|--------|---------------------------|-----------------------|---------------------|--------------------|------------------------------------|--|-----------------------------|---------------------------------|---|-----------------------------|---|
| | | | | | | | | | | | |
| I. | 123,787 | \$46,972,802 | \$64,875,494 | \$154,523,518 | \$69,648,024 | \$52,675,222 | \$28.55 | \$39.43 | \$77.98 | \$1,329,08 | \$804.99 |
| II. | 240,315 | 91,618,876 | 86,007,672 | 252,180,128 | 166,172,456 | 74,553,580 | 36.33 | 34.10 | 70.43 | 1,049.15 | 691.33 |
| III. | 2,254,204 | 768,628,877 | 2,227,225,636 | 3,796,006,083 | 1,568,780,427 | 800,151,550 | 20.25 | 58.67 | 78.92 | 1,683.66 | 695.93 |
| IV. | 114,239 | 40,733,240 | 1,018,714,747 | 1,156,809,482 | 138,154,735 | 97,421,495 | 3.52 | 88.05 | 91.57 | 10,126.74 | 1,200.34 |
| Total | 2,732,595 | \$947,953,795 | \$3,396,823,549 | \$5,369,579,191 | \$1,972,755,642 | \$1,024,801,847 | \$17.65 | \$63.26 | \$80.91 | \$1,965.01 | \$721.93 |
| I. | 110,504 | \$25,689,883 | \$67,850,482 | \$154,692,177 | \$66,841,695 | \$51,151,812 | \$23.07 | \$43.86 | \$66.93 | \$1,400.00 | \$785.87 |
| II. | 350,112 | 160,543,330 | 172,617,561 | 503,291,640 | 330,684,129 | 170,120,800 | 31.89 | 34.30 | 66.19 | 1,824.03 | 869.91 |
| III. | 1,430,845 | 533,293,694 | 1,482,951,729 | 2,698,700,545 | 1,152,854,816 | 617,545,122 | 20.30 | 66.28 | 76.58 | 1,856.44 | 811.66 |

| Total | 2,009,739 | \$762,296,747 | \$2,417,096,548 | \$4,117,556,551 | \$1,700,460,903 | \$938,163,456 | \$18.51 | \$58.70 | \$77.21 | \$2,048.80 | \$646.11 |

* All the industries tabulated were assigned terms to one class or another, according to the principles indicated in the text. The lines of division taken for the second, third, and fourth classes were: (1) where the value of the materials is less than two-fifths of that of the ultimate product; (2) where the value of the materials is from two-fifths to four-fifths of that of the ultimate product; and (3) where the value of the materials is over four-fifths of that of the ultimate product.
† In this table the same groups of industries in 1870 are compared with each other. The table differs from that contained in the volume on Manufactures of the Ninth Census, and in the Compendium of that census in this, that the mining and fishing interests, and the statistics of a few industries which form the subject of special reports in the census of 1880 are, for purposes of comparison, excluded herefrom.

VALUES IN DOLLARS OF THE PRODUCTS OF DOMESTIC AGRICULTURE EXPORTED FROM THE UNITED STATES FOR THE YEARS 1886, 1887 AND 1888.

| | 1886. | 1887. | 1888. |
|--|--------------------|--------------------|--------------------|
| Animals..... | 12,518,660 | 10,598,362 | 12,885,000 |
| Animal Oils..... | 718,654 | 810,670 | 924,136 |
| Provisions, including Meat } and Dairy Products..... } | 90,625,216 | 92,783,296 | 93,058,705 |
| Breadstuffs..... | 125,846,558 | 165,768,662 | 127,191,687 |
| Fruits..... | 3,308,308 | 2,669,965 | 3,510,208 |
| Seeds..... | 1,949,990 | 1,907,409 | 1,516,690 |
| Textiles, Unmanufactured..... | 205,561,916 | 206,300,059 | 223,022,032 |
| Vegetable Oils and Oil-cake..... | 9,255,170 | 9,011,451 | 8,458,608 |
| Tobacco Leaf..... | 27,158,457 | 25,948,277 | 21,936,084 |
| All Other Agricultural Products..... | 8,011,666 | 7,275,647 | 8,356,746 |
| Total Value of Agricultural Products..... | 484,954,595 | 523,073,798 | 500,840,086 |
| Total Value of all Exports of Domestic Merchandise..... | 665,964,852 | 703,022,923 | 683,862,104 |
| Percentage Value of Agricultural Products..... | 73.82 | 74.40 | 73.23 |

From a comparison of the facts given in the various tables herewith presented, it will be evident that, with the exception of those items called "manufactures" in the Census Reports which are not properly manufactures, but the conversion of articles of food into a more suitable and convenient form for shipment to foreign countries—as, for instance, slaughtering of animals, and grinding and packing of wheat in barrels—the manufactures of the United States are intended and used for home consumption. The amount of these exports is very small as compared with the total of the exports. There is no one manufactured article of which the United States has anything like a monopoly abroad, or which greatly predominates in importance as an article of export over any other article.

The following data, compiled from the reports of the Bureau of Statistics, will give a sufficiently complete and comprehensive view of the nature of the imports into the United States.

The imported articles, including those admitted free of duty and the dutiable, are thus classified:—

A. Articles of food and live animals. B. Articles in a crude condition which enter into the various processes of domestic industry. C. Articles wholly or partially manufactured for use, as materials in the manufactures and mechanic arts. D. Articles manufactured ready for consumption. E. Articles of voluntary use, luxuries, etc. The following table gives the amount in value of each of these classes imported during the years 1884 and 1885, and the average for the five years (1881-85); also the ad valorem rate of duty on the dutiable articles of each class, and the percentage relation of the ad valorem duty to the entire duty collected:—

| Year. | 1884 and 1885. | | | | Average of Years 1881-85. | | | |
|------------|----------------|---------------|------------------------------|--------------------------|---------------------------|---------------|------------------------------|--------------------------|
| | Free of Duty. | Dutiable. | Ad Valorem Rate on Dutiable. | Per Cent. of Total Duty. | Free of Duty. | Dutiable. | Ad Valorem Rate on Dutiable. | Per Cent. of Total Duty. |
| 1884 A. | \$92,589,286 | \$132,136,969 | 44.75 | 31.15 | \$86,851,648 | \$130,072,238 | 44.90 | 29.47 |
| 1885 | 86,559,991 | 107,706,369 | 57.28 | 34.79 | 86,066,234 | 129,907,732 | 46.41 | 30.57 |
| 1884 B. | 94,039,567 | 44,457,174 | 26.82 | 6.28 | 97,895,975 | 54,358,668 | 29.96 | 8.21 |
| 1885 | 82,507,747 | 37,101,595 | 25.48 | 5.33 | 95,001,401 | 49,163,935 | 28.57 | 7.12 |
| 1884 C. | 12,186,427 | 69,774,216 | 26.48 | 9.73 | 11,719,623 | 66,492,197 | 29.42 | 9.87 |

UNIVERSALIST CHURCH, a religious body in the United States of America, especially in the New England States, which has for its distinguishing tenet the doctrine of the final salvation of all souls from sin through Christ. The pioneers of Universalism in America were Dr George De Benneville, who taught from 1741 principally in Pennsylvania, Dr Charles Chauncy, of the First Church, Boston (notably in *The Salvation of All Men*, published in 1784) Dr Joseph Huntington, of Coventry, Conn (whose *Calvinism Improved* was published after his death in 1796), John Murray, Elhanan Winchester, Caleb Rich, and very specially Hosea Ballou Murray is, however, regarded as "the father of Universalism in America" In 1750 James Rely had avowed himself a Universalist basing his belief on a theory quite peculiar Murray who had preached as a Methodist in England and Ireland was Rely's most distinguished convert In 1770 he came to America and, under circumstances so strange that most Universalists regard them as coincidental, overcoming a deep reluctance, he preached at Good Luck New Jersey and organized a society "The Independent Christian Church," at Gloucester, Massachusetts Hosea Ballou—a convert from the Calvinist Baptists—took up the cause in 1790, and published the work that is regarded by Universalists as

epoch-making, *A Treatise on Atonement*. The number of ministers increased, and societies were formed. These in due time became the constituents of larger organizations, till a "New England convention" saw occasion, in 1803, to adopt a "profession of faith," which in three short articles avowed belief in the Bible as making known in a Divine revelation the nature of God, the mission of Christ, the final holiness of all souls, and the necessity of good works. In 1866 a general convention, composed of delegates from the State conventions, was incorporated. It has jurisdiction throughout the United States and Canada. It has a "Murray fund" of about \$135,000. Under the auspices of the Universalist Church are the "woman's centenary association," the "Universalist historical society," several organized charities, four colleges, three theological schools, and five academies,—the total value of the schools, including endowments, being hardly less than 3 million dollars. It publishes eight periodicals. The *Year Book* for 1887 gives the following summary:—1 general convention; 22 State conventions, 945 parishes, 38,429 families; 696 churches, 35,550 members, 634 Sunday schools, 51,871 members, 789 church edifices, value above indebtedness, \$7,493,927, 673 clergymen in fellowship and 120 licensed lay preachers.

UNIVERSITIES'

Original meaning of the term "university."

Its limitation in mediæval times

THE mediæval Latin term *universitas* (from which the English word "university" is derived) was originally employed to denote any community or corporation regarded under its collective aspect. When used in its modern sense, as denoting a body devoted to learning and education, it required the addition of other words in order to complete the definition,—the most frequent form of expression being "*universitas magistrorum et scholarium*" (or "*discipulorum*") In the course of time, probably towards the latter part of the 14th century, the term began to be used by itself, with the exclusive meaning of a community of teachers and scholars whose corporate existence had been recognized and sanctioned by civil or ecclesiastical authority or by both But the more ancient and customary designation of the university in mediæval times (regarded as a place of instruction) was "*studium generale*" (or sometimes "*studium*" alone), a term implying a centre of instruction for all² The expressions "*universitas studii*" and "*universitatis collegium*" are also occasionally to be met with in official documents.

It is necessary, however, to bear in mind, on the one hand, that a university often had a vigorous virtual existence long before it obtained that legal recognition which entitled it, technically, to take rank as a "*studium generale*," and, on the other hand, that hostels, halls, and colleges, together with complete courses in all the recognized branches of learning, were by no means necessarily involved in the earliest conception of a university The university, in its earliest stage of development, appears to have been simply a scholastic guild,—a spontaneous combination, that is to say, of teachers or scholars, or of both combined, and formed probably on the analogy of the trades guilds, and the guilds of aliens in foreign cities, which, in the course of the 13th and 14th centuries, are to be found springing up in most of the great European centres. The design of these organizations, in the first instance, was

little more than that of securing mutual protection,—for the craftsman, in the pursuit of his special calling,—for the alien, as lacking the rights and privileges inherited by the citizen And so the university, composed as it was to a great extent of students from foreign countries, was a combination formed for the protection of its members from the extortion of the townsmen and the other annoyances incident in mediæval times to residence in a foreign state. It was a first stage of development in connexion with these primary organizations, when the chancellor of the cathedral, or some other authority, began, as we shall shortly see, to confer on their masters the right of teaching at any similar centre that either already existed or might afterwards be formed throughout Europe,—"*facultas ubique docendi*." It was a still further development when it began to be recognized that, without a licence from either pope, emperor, or king, no "*studium generale*" could be formed possessing this right of conferring degrees, which originally meant nothing more than licences to teach.

In order, however, clearly to understand the conditions under which the earliest universities came into existence, it is necessary to take account, not only of their organization, but also of their studies, and to recognize the main influences which, from the 6th to the 12th century, served to modify both the theory and the practice of education. In the former century, the schools of the Roman empire, which had down to that time kept alive the traditions of pagan education, had been almost entirely swept away by the barbaric invasions. The latter century marks the period when the institutions which supplied their place—the episcopal schools attached to the cathedrals and the monastic schools—attained to their highest degree of influence and reputation. Between these and the schools of the empire there existed an essential difference, in that the theory of education by which they were pervaded was in complete contrast to the simply secular theory of the schools of paganism. The cathedral school taught only what was supposed to be necessary for the education of the priest; the monastic school taught only what was supposed to be in harmony with the aims of the monk. But between the pagan system and the Christian system by which it had been superseded there yet existed some

Chief facts in the history of learning before the university era.

¹ It is the design of the present article to exhibit the universities in their historical development, each being brought under notice, as far as practicable, in the order of its original foundation. In the alphabetical enumeration in the table at the end, the date of foundation thus serves to indicate approximately the place where any university is first referred to

² Denifle, *Die Universitäten des Mittelalters*, i. 39.

thing that was common to both: the latter, even in the narrow and meagre instruction which it imparted, could not altogether dispense with the ancient text-books, simply because there were no others in existence. Certain treatises of Aristotle, of Porphyry, of Martianus Capella, and of Boetius continued consequently to be used and studied; and in the slender outlines of pagan learning thus still kept in view, and in the exposition which they necessitated, we recognize the main cause which prevented the thought and literature of classic antiquity from falling altogether into oblivion.

Revival
in time
of Charles
the Great.

Under the rule of the Merovingian dynasty even these scanty traditions of learning declined throughout the Frankish dominions; but in England the designs of Gregory the Great, as carried out by Theodorus, Bede, and Alcuin, resulted in a great revival of education and letters. The influence of this revival extended in the 8th and 9th centuries to Frankland, where Charles the Great, advised and aided by Alcuin, effected a memorable reformation, which included both the monastic and the cathedral schools; while the school attached to the imperial court, known as the Palace School, also became a famous centre of learned intercourse and instruction.

Its con-
nexion
with uni-
versity of
Paris
doubtful.

But the activity thus generated, and the interest in learning which it served for a time to diffuse, well nigh died out amid the anarchy which characterizes the 10th century in Latin Christendom, and it is at least questionable whether any real connexion can be shown to have existed between this earlier revival and that remarkable movement in which the university of Paris had its origin. On the whole, however, a clearly traced, although imperfectly continuous, succession of distinguished teachers has inclined the majority of those who have studied this obscure period to conclude that a certain tradition of learning, handed down from the famous school over which Alcuin presided at the great abbey of St Martin at Tours, continued to survive, and became the nucleus of the teaching in which the university took its rise. But, in order adequately to explain the remarkable development and novel character which that teaching assumed in the course of the 12th and 13th centuries, it is necessary to take account of the operation of certain more general causes to which the origin of the great majority of the earlier universities may in common unhesitatingly be referred. These causes are—(1) the introduction of new subjects of study, as embodied in a new or revived literature; (2) the adoption of new methods of teaching which were rendered necessary by the new studies; (3) the growing tendency to organization which accompanied the development and consolidation of the European nationalities.

General
causes of
formation
of first
universi-
ties.

That the earlier universities took their rise to a great extent in endeavours to obtain and provide instruction of a kind beyond the range of the monastic and cathedral schools appears to be very generally admitted, and this general fact has its value in assisting us to arrive at a conclusion with respect to the origin of the first European university,—that of Salerno in Italy, which became known as a school of medicine as early as the 9th century. The circumstances of its rise are extremely obscure, and whether it was monastic or secular in its origin has been much disputed. One writer¹ derives its origin from an independent tradition of classical learning which continued to exist in Italy down to the 10th century. Another writer² maintains that it had its commencement in the teaching at the famous Benedictine monastery of Monte Cassino, where the study of medicine was undoubtedly pursued. But various facts may be urged in contraven-

Rise of
uni-
versity of
Salerno.

tion of such a theory. The school at Salerno, so far as its history can be traced, appears to have been entirely a secular community; it was distinguished also by its catholic spirit, and, at a time when Jews were the object of religious persecution throughout Europe, members of this nationality were to be found both as teachers and learners at Salerno. Situated, moreover, as it was on the sea-coast, its communication with the neighbouring island of Sicily was easy and frequent; and it would accordingly seem far more probable that it was owing to the new knowledge gained from the Saracens, after their occupation of that island, that Salerno acquired its reputation. It was by a band of these invaders that Bertharius, abbot of Monte Cassino, and the author of certain medical treatises, was massacred along with his monks in the year 883. The Saracens were famed for their medical skill, and, by their translations of Galen and Hippocrates, did much to advance the study; and, according to Jourdain,³ there were translations from the Arabic into Latin long before the time of Constantine the African, but these versions have perished. In the course of the 11th century, under the teaching of Constantine the African (d. 1087), the celebrity of Salerno became diffused all over Europe. Ordericus Vitalis, who wrote in the first half of the 12th century, speaks of it as then long famous. In 1231 it was constituted by the emperor Frederick II. the only school of medicine in the kingdom of Naples.

It was at a considerable interval after the rise of the school at Salerno, about the year 1113, that Irnerius commenced at Bologna his lectures on the civil law. This instruction, again, was of a kind which the monastic and cathedral schools could not supply, and it also met a new and pressing want. The states of Lombardy were at this time rising rapidly in population and in wealth; and the greater complexity of their political relations, their increasing manufactures and commerce, called for a more definite application of the principles embodied in the codes that had been handed down by Theodosius and Justinian. But the distinctly secular character of this new study, and its intimate connexion with the claims and prerogatives of the Western emperor, aroused at first the susceptibilities of the Roman see, and for a time Bologna and its civilians were regarded by the church with distrust and even with alarm. These sentiments were not, however, of long duration. In the year 1151 the appearance of the *Decretum* of Gratian, largely compiled from spurious documents, invested the studies of the canonist with fresh importance; and numerous decrees of past and almost forgotten pontiffs now claimed to take their stand side by side with the enactments contained in the *Corpus Juris Civilis*. They constituted, in fact, the main basis of those new pretensions asserted with so much success by the papedom in the course of the 12th and 13th centuries. It was necessary, accordingly, that the *Decretum* should be known and studied beyond the walls of the monastery or the episcopal palace, and that its pages should receive authoritative exposition at some common centre of instruction. Such a centre was to be found in Bologna. The needs of the secular student and of the ecclesiastical student were thus brought for a time into accord, and from the days of Irnerius down to the close of the 13th century we have satisfactory evidence that Bologna was generally recognized as the chief school both of the civil and the canon law.⁴ It has indeed been asserted that university degrees were instituted there as early as the pontificate of Eugenius III. (1145-53), but the statement rests on no good authority, and is in every way improbable. There is, however, another tradition which is in better harmony

Barbarossa grants privileges to foreign students at Bologna.

with the known facts. When Barbarossa marched his forces into Italy on his memorable expedition of 1155, and reasserted those imperial claims which had so long lain dormant, the professors of the civil law and their scholars, but more especially the foreign students, gathered round the Western representative of the Roman Cæsars, and besought his intervention in their favour in their relations with the citizens of Bologna. A large proportion of the students were probably from Germany; and it did not escape Frederick's penetration that the civilian might prove an invaluable ally in the assertion of his imperial pretensions. He received the suppliants graciously, and, finding that their grievances were real, especially against the landlords in whose houses they were domiciled, he granted the foreign students substantial protection, by conferring on them certain special immunities and privileges (November 1158).¹ These privileges were embodied in the celebrated *Authentica, Habita*, in the *Corpus Juris Civilis* of the empire (bk. iv. tit. 13), and were eventually extended so as to include all the other universities of Italy. In them we may discern the precedent for that state protection of the university which, however essential at one time for the security and freedom of the teacher and the taught, has been far from proving an unmixed benefit,—the influence which the civil power has thus been able to exert being too often wielded for the suppression of that very liberty of thought and inquiry from which the earlier universities derived in no small measure their importance and their fame.

The "universities" at Bologna.

But, though there was a flourishing school of study, it is to be observed that Bologna did not possess a university so early as 1158. Its first university was not constituted until the close of the 12th century. The "universities" at Bologna were, as Denifle has shown, really student guilds, formed under influences quite distinct from the protecting clauses of the *Authentica*, and suggested, as already noted, by the precedent of those foreign guilds which, in the course of the 12th century, began to rise throughout western Europe. They had their origin in the absolute necessity, under which residents in a foreign city found themselves, of obtaining by combination that protection and those rights which they could not claim as citizens. These societies were modelled, Denifle considers, not on the trade guilds which rose in Bologna in the 13th century, but on the Teutonic guilds which arose nearly a century earlier in north-western Europe, being essentially "spontaneous confederations of aliens on a foreign soil." Originally, they did not include the native student element.

Democratic character of these communities.

The power resulting from this principle of combination, when superadded to the privileges conferred by Barbarossa, gave to the students of Bologna a superiority of which they were not slow to avail themselves. Under the leadership of their rector, they extorted from the citizens concessions which raised them from the condition of an oppressed to that of a specially privileged class. The same principle, when put in force against the professors, reduced the latter to a position of humble deference to the very body whom they were called upon to instruct, and imparted to the entire university that essentially democratic character by which it was afterwards distinguished. It is not surprising that such advantages should have led to an imitation and extension of the principle by which they were obtained. Denifle considers that the "universities" at Bologna were at one time certainly more than four in

number, and we know that the Italian students alone were subdivided into two,—the Tuscans and the Lombards. In the centres formed by secession from the parent body a like subdivision took place. At Vercelli there were four "universitates," composed respectively of Italians, English, Provençals, and Germans, at Padua there were similar divisions into Italians, French (*i.e.*; *Francigenæ*, comprising both English and Normans), Provençals (including Spaniards and Catalans). When accordingly we learn from Odofred that in the time of the eminent jurist Azo, who lectured at Bologna about 1200, the number of the students there amounted to some ten thousand, of whom the majority were foreigners, it seems reasonable to conclude that the number of these confederations of students ("societates scholarium") at Bologna was yet greater. It is certain that they were not formed simultaneously, but, similarly to the free guilds, one after the other,—the last in order being that of the Tuscans, which was composed of students from Tuscany, the Campagna, and Rome. Nor are we, again, to look upon them as in any way the outcome of those democratic principles which found favour in Bologna, but rather as originating in the traditional home associations of the foreign students, fostered, however, by the peculiar conditions of their university life. As the Tuscan division (the one least in sympathy, in most respects, with Teutonic institutions) was the last formed, so, Denifle conjectures, the German "university" may have introduced the conception which was successively adopted by the other nationalities.

Other similar communities in Italy.

In marked resemblance to the guilds, these confederations were presided over by a common head,—the "rector scholarium," an obvious imitation of the "rector societatum" or "artium" of the guild, but to be carefully distinguished from the "rector scholarum," or director of the studies, with whose function the former officer had, at this time, nothing in common. Like the guilds, again, the different nations were represented by their "consiliarii," a deliberative assembly with whom the rector habitually took counsel.

Mature age of a student.

While recognizing the essentially democratic character of the constitution of these communities, it is to be remembered that the students, unlike the majority at Paris and later universities, were mostly at this time of mature years. As the civil law and the canon law were at first the only branches of study, the class whom they attracted were often men already filling office in some department of the church or state,—archdeacons, the heads of schools, canons of cathedrals, and like functionaries forming a considerable element in the aggregate. It has been observed, indeed, that the permission accorded them by Frederick I. of choosing, in all cases of dispute, their own tribunal, thus constituting them, to a great extent, *sui juris*, seems to presuppose a certain maturity of judgment among those on whom this discretionary power was bestowed.

With the middle of the 13th century, these various confederations became blended, for the first time, into one or other of the two great divisions already referred to,—those of the Ultramontani and the Citramontani, Johannes de Varanis being rector of the former and Pantaleon de Venetiis of the latter. Innocent IV., in according his sanction to the new statutes of the university in 1253, refers to them as drawn up by the "rectores et universitas scholarium Bononiensium." With the commencement of the 16th century, the two corporations were combined under one rector.

Amalgamation of the "universitates" into two divisions.

About the year 1200 were formed the two faculties of medicine and philosophy (or the arts²), the former being instituted.

¹ See Savigny, *Gesch. d. rom. Rechts*, iii. 152, 491-492. See also Giesbrecht, *Gesch. d. Kaiserzeit* (ed. 1880), v. 51-52. The story is preserved in a recently discovered metrical composition descriptive of the history of Frederick I.; see *Sitzungsberichte d. Bairisch. Akad. d. Wissenschaft, Phil.-Hist. Klasse*, 1879, ii. 285. Its authenticity is called in question by Denifle, but it would seem to be quite in harmony with the known facts.

² The arts course of study was that represented by the ancient *trivium* (*i.e.*, grammar, logic, and rhetoric) and the *quadrivium* (*i.e.*, arithmetic, geometry, music, and astronomy), as handed down from the schools of the Roman empire. See J. B. Mullinger, *History of the University of Cambridge*, i. 24-27.

somewhat the earlier. It was developed, as that of the civil law had been developed, by a succession of able teachers, among whom Thaddæus Alderottus was especially eminent. The faculty of arts, down to the 14th century, scarcely attained to equal eminence. The teaching of theology remained for a long time exclusively in the hands of the Dominicans; and it was not until the year 1360 that Innocent VI. recognized the university as a "studium generale" in this branch,—in other words, as a place of theological education for all students, with the power of conferring degrees of universal validity.

Account of the university by Auglicus

In the year 1371 the cardinal legate, Anglicus, compiled, as chief director of ecclesiastical affairs in the city, an account of the university, which he presented to Urban V. The information it supplies is, however, defective, owing to the fact that only the professors who were in receipt of salaries from the municipality are mentioned. Of these there were twelve of civil law and six of canon law; three of medicine, three of practical medicine, and one of surgery; two of logic, and one each of astrology, rhetoric, and notarial practice. The professors of theology, who, as members of the religious orders, received no state remuneration, are unmentioned.

The earliest colleges.

Colleges existed at Bologna at a very early date, but it is not until the 14th century that we find them possessing any organization. They were designed solely for necessitous students, not being natives of Bologna. A separate house, with a certain fund for the maintenance of a specified number of scholars, was all that was originally contemplated. Such was the character of that founded by Zoen, bishop of Avignon, in February 1256 (O.S.), the same month and year, it is to be noted, in which the Sorbonne was founded in Paris. It was designed for the maintenance of eight scholars from the province of Avignon, under the supervision of three canons of the church, maintaining themselves in the university. Each scholar was to receive 24 Bolognese lire annually for five years. The college of Brescia was founded in 1326 by William of Brescia, archdeacon of Bologna, for poor foreign students without distinction as to nationality. The Spanish college, founded in 1364, for twenty-four Spanish scholars and two chaplains, is noted by Denifle as the one college founded in mediæval times which still exists on the Continent.

Origin of university of Paris.

Of the general fact that the early universities rose in response to new wants the commencement of the university of Paris supplies us with a further illustration. The study of logic, which, prior to the 12th century, was founded exclusively on one or two meagre compends, received about the year 1100, on two occasions, a powerful stimulus,—in the first instance, from the memorable controversy between Lanfranc and Berengar; in the second, from the no less famous controversy between Anselm and Roscellinus. A belief sprang up that an intelligent apprehension of spiritual truth depended on a correct use of prescribed methods of argumentation. Dialectic was looked upon as "the science of sciences"; and, when, somewhere in the first decade of the 12th century, William of Champeaux opened in Paris a school for the more advanced study of dialectic as an art, his teaching was attended with marked success. Among his pupils was Abelard, in whose hands the study made a yet more notable advance; so that, by the middle of the century, we find John of Salisbury, on returning from the French capital to England, relating with astonishment, not unmingled with contempt, how all learned Paris had gone well nigh mad in its pursuit and practice of the new dialectic.

Teaching of Abelard.

Abelard taught in the first instance at the cathedral school at Notre Dame, and subsequently at the schools on the Montagne Sainte-Geneviève, of which he was the

founder, and where he imparted to logic its new development. But in 1147 the secular canons of Ste Geneviève gave place to canons regular from St Victor; and henceforth the school on the former foundation was merely a school for the teaching of theology, and was attended only by the members of the house.¹ The schools out of which the university arose were those attached to the cathedral on the Île de la Cité, and presided over by the chancellor,—a dignitary who must be carefully distinguished from the later chancellor of the university. For a long time the teachers lived in separate houses on the island, and it was only by degrees that they combined themselves into a society, and that special buildings were constructed for their class-work. But the flame which Abelard's teaching had kindled was not destined to expire. Among his pupils was Peter Lombard, who was bishop of Paris in 1159, and widely known to posterity as the compiler of the famous volume of the *Sentences*. The design of this work was to place before the student, in as strictly logical a form as practicable, the views (*sententiæ*) of the fathers and all the great doctors of the church upon the chief and most difficult points in the Christian belief. Conceived with the purpose of allaying and preventing, it really stimulated, controversy. The logicians seized upon it as a great storehouse of indisputable major premises, on which they argued with renewed energy and with endless ingenuity of dialectical refinement; and upon this new compendium of theological doctrine, which became the text-book of the Middle Ages, the schoolmen, in their successive treatises *super Sententias*, expended a considerable share of that subtlety and labour which still excite the astonishment of the student of metaphysical literature.

Study of theology

Lombard's Sentences.

It is in these prominent features in the history of these early universities—the development of new methods of instruction concurrently with the appearance of new material for their application—that we find the most probable solution of the question as to how the university, as distinguished from the older cathedral or monastic schools, was first formed. In a similar manner, it seems probable, the majority of the earlier universities of Italy—Reggio, Modena, Vicenza, Padua, and Vercelli—arose, for they had their origin independently alike of the civil and the papal authority. Instances, it is true, occur, which cannot be referred to this spontaneous mode of growth. The university of Naples, for example, was founded solely by the fiat of the emperor Frederick II. in the year 1224; and, if we may rely upon the documents cited by Denifle, Innocent IV. about the year 1245 founded in connexion with the curia a "studium generale,"² which was attached to the papal court, and followed it when removed from Rome, very much as the Palace School of Charles the Great accompanied that monarch on his progresses.

Rise of other early universities

As the university of Paris became the model, not only for the universities of France north of the Loire, but also for the great majority of those of central Europe as well as for Oxford and Cambridge, some account of its early organization will here be indispensable. Such an account is rendered still further necessary by the fact that the recent and almost exhaustive researches of Denifle, the Dominican father, have led him to conclusions which on some important points run altogether counter to those sanctioned by the high authority of Savigny.

Early organization of university of Paris.

The original university, as already stated, took its rise entirely out of the movement carried on by teachers on the

¹ The view of Thurot (*De l'Organisation de l'Enseignement dans l'Université de Paris*, pp. 4-7) that the university arose out of a combination of these several schools is rejected by Denifle (see *Die Universitäten*, &c., 1. 653-694).

² Where the words *studium generale* are placed within marks of quotation they occur in the original charter of foundation of the university referred to.

stand, who taught by virtue of the licence conferred by the chancellor of the cathedral. In the second decade of the 13th century, it is true, we find masters withdrawing themselves from his authority by repairing to the left bank of the Seine and placing themselves under the jurisdiction of the abbot of the monastery of Ste Geneviève; and in 1255 this dignitary is to be found appointing a chancellor whose duty it should be to confer "licentia docendi" on those candidates who were desirous of opening schools in that district. But it was around the bestowal of this licence by the chancellor of Notre Dame, on the Île de la Cité, that the university of Paris grew up. It is in this licence that the whole significance of the master of arts degree is contained; for what is technically known as admission to that degree was really nothing more nor less than receiving the chancellor's permission to "incept," and by "inception" was implied the master's formal entrance upon, and commencement of, the functions of a duly licensed teacher, and his recognition as such by his brothers in the profession. The previous stage of his academic career, that of bachelorhood, had been one of apprenticeship for the mastership; and his emancipation from this state was symbolized by placing the magisterial cap (*biretta*) upon his head, a ceremony which, in imitation of the old Roman ceremony of manumission, was performed by his former instructor, "under whom" he was said to incept. He then gave a formal inaugural lecture, and, after this proof of magisterial capacity, was welcomed into the society of his professional brethren with set speeches, and took his seat in his master's chair.

The uni-
versity
formed.

This community of teachers of recognized fitness did not in itself suffice to constitute a university, but some time between the years 1150 and 1170, the period when the *Sentences* of Peter Lombard were given to the world, the university of Paris came formally into being. Its first written statutes were not, however, compiled until about the year 1208, and it was not until long after that date that it possessed a "rector." Its earliest recognition as a legal corporation belongs to about the year 1211, when a brief of Innocent III. empowered it to elect a proctor to be its representative at the papal court. By this permission it obtained the right to sue or to be sued in a court of justice as a corporate body.

ment.

This papal recognition was, however, very far from implying the episcopal recognition, and the earlier history of the new community exhibits it as in continual conflict alike with the chancellor, the bishop, and the cathedral chapter of Paris, by all of whom it was regarded as a centre of insubordination and doctrinal licence. Had it not been, indeed, for the papal aid, the university would probably not have survived the contest; but with that powerful assistance it came to be regarded as the great Transalpine centre of orthodox theological teaching. Successive pontiffs, down to the great schism of 1378, made it one of the foremost points of their policy to cultivate friendly and confidential relations with the authorities of the university of Paris, and systematically to discourage the formation of theological faculties at other centres. In 1231 Gregory IX., in the bull *Parens Scientiarum*, gave full recognition to the right of the several faculties to regulate and modify the constitution of the entire university,—a formal sanction which, in Denifle's opinion, rendered the bull in question the Magna Charta of the university.

In comparing the relative antiquity of the universities of Paris and Bologna, it is difficult to give an unqualified decision. The university of masters at the former was probably slightly anterior to the university of students at the latter; but there is good reason for believing that Paris, in reducing its traditional customs to statutory form,

largely availed itself of the precedents afforded by the already existing code of the Transalpine centre, while its rectorship, proctorships, and four "nations" are all clearly distinct adaptations of the corresponding divisions at Bologna. These nations, which included both professors and scholars, were—(1) the French nation, composed, in addition to the native element, of Spaniards, Italians, and Greeks; (2) the Picard nation, representing the students from the north-east and from the Netherlands; (3) the Norman nation; (4) the English nation, comprising, besides students from the provinces under English rule, those from England, Ireland, Scotland, and Germany. These several nations first came into existence some time before the year 1219, and all belonged to the faculty of arts; but the fully developed university was divided into four faculties,—three "superior," viz, those of theology, canon law, and medicine, and one "inferior," that of arts. The head of each faculty was the dean; the head of each nation was the proctor. The rector, who in the first instance was head of the faculty of arts, by whom he was elected, was eventually head of the whole university. Each of the nations and each of the superior faculties, while subject to the general authority which he represented, was, like a royal colony, in a great measure self-governed, and made statutes which were binding simply on its own members. Congregations of the faculty of arts were presided over by the rector, who discharged the same function when general congregations of the whole academic community were convened. In the former the votes on any question were taken by nations, in the latter by faculties and nations. Only "regents," that is, masters actually engaged in teaching, had any right to be present or to vote in congregations. Neither the entire university nor the separate faculties had thus, it will be seen, originally a common head, and it was not until the middle of the 14th century that the rector became the head of the collective university, by the incorporation under him, first, of the students of the canon law and of medicine (which took place about the end of the 13th century), and, secondly, of the theologians, which took place about half a century later.

Apart from the broad differences in their organization, the very conception of learning, it will be observed, was different at Bologna from what it was at Paris. In the former it was entirely professional,—designed, that is to say, to prepare the student for a definite and practical career in after life; in the latter it was sought to provide a general mental training, and to attract the learner to studies which were speculative rather than practical. In the sequel, the less mercenary spirit in which Paris cultivated knowledge added immensely to her influence and reputation. The university became known as the great school where theology was studied in its most scientific spirit; and the decisions of its great doctors upon those abstruse questions which absorbed so much of the highest intellectual activity of the Middle Ages were regarded as almost final. The popes themselves, although averse from theological controversies, deemed it expedient to cultivate friendly relations with a centre of such importance for the purpose of securing their influence in a yet wider field. Down therefore to the time of the great schism (1378), they at once conciliated the university of Paris and consulted what they deemed to be the interests of the Roman see, by discouraging the creation of faculties of theology elsewhere. The apparent exceptions to this policy are easily explained: the four faculties of theology which they sanctioned in Italy—Pisa (1343), Florence (1349), Bologna (1362), and Padua (1363)—were designed to benefit the Italian monasteries, by saving the monks the expense and dangers of a long journey beyond the Alps; while that at

ties.

Toulouse (1229) took its rise under circumstances entirely exceptional, being designed as a bulwark against the heresy of the Albigenses. The popes, on the other hand, favoured the creation of new faculties of law, and especially of the canon law, as the latter represented the source from which Rome derived her most warmly contested powers and prerogatives. The effects of this twofold policy were sufficiently intelligible: the withholding of each charter which it was sought to obtain for a new school of theology only served to augment the numbers that flocked to Paris; the bestowal of each new charter for a faculty of law served in like manner to divert a certain proportionate number from Bologna. These facts enable us to understand how it is that, in the 13th and 14th centuries, we find, even in France, a larger number of universities created after the model of Bologna than after that of Paris.

In their earliest stage, however, the importance of these new institutions was but imperfectly discerned alike by the civil and the ecclesiastical power, and the first four universities of Italy, after Bologna, rose into existence, like Bologna itself, without a charter from either pope or emperor. Of these the first were those of Reggio and Modena, both of which are to be found mentioned as schools of civil law before the close of the 12th century. The latter, throughout the 13th century, appears to have been resorted to by teachers of sufficient eminence to form a flourishing school, composed of students not only from the city itself, but also from a considerable distance. Both of them would seem to have been formed independently of Bologna, but the university of Vicenza was probably the outcome of a migration of the students from the former city, which took place in the year 1204. In the course of the century Vicenza attained to considerable prosperity; its students were divided into four nations, each with its own rector; and in 1264 it included in its professoriate teachers, not only of the civil law, but also of medicine, grammar, and dialectic. The university of Padua was founded in 1222 as the direct result of the migration of a considerable number of students from Bologna. Some writers, indeed, have inferred that the "studium" in the latter city was transferred in its entirety, but the continued residence of a certain proportion in Bologna is proved by the fact that two years later we find them appealing to Honorius III. in a dispute with the civic authorities. In the year 1228 the students of Padua were compelled by circumstances to transfer their residence to Vercelli, and the latter city guaranteed them, besides other privileges, the right to rent no less than five hundred lodging-houses at a fixed rental for a period of eight years. At first Padua was a school only of the civil and canon law; and during the oppressive tyranny of Ezzelin (1237-1260) the university maintained its existence with some difficulty. But in the latter part of the century it incorporated the faculties of grammar, rhetoric, and medicine, and became known as one of the most flourishing schools of Italy, and a great centre of the Dominicans, at that time among the most active promoters of learning.

Naples, The university of Naples was founded by the emperor Frederick II. in the year 1225, as a school of theology, jurisprudence, the arts, and medicine,—his design being that his subjects in the kingdom of Naples should find in the capital adequate instruction in every branch of learning, and "not be compelled in the pursuit of knowledge to have recourse to foreign nations or to beg in other lands." In the year 1231, however, he decreed that the faculty of medicine should cease to exist, and that the study should be pursued nowhere in the kingdom but at Salerno. The university never attained to much eminence, and after the death of Frederick came for a time altogether to an end, but was restored in 1258 by King Manfred. In 1266 its

faculty of medicine was reconstituted, and from 1272-74 Thomas Aquinas was one of its teachers of theology. The commencement of the university of Vercelli belongs to about the year 1228; it probably included, like Naples, all the faculties, but would seem to have been regarded with little favour by the Roman see, and by the year 1372 had ceased to exist, although mention of colleges of law and medicine is to be found after that date. The two universities of Piacenza and Pavia stand in close connexion with each other. The former is noted by Denifle as the earliest in Italy which was founded by virtue of a papal charter (6th February 1248), although the scheme remained for a long time inoperative. At length, in the year 1393, the university was reconstituted by Giovanni Galeazzo Visconti, duke of Milan, who in the same year caused the university of Pavia to be transferred thither. Piacenza now became the scene of a sudden but short-lived academic prosperity. We are told of no less than twenty-seven professors of the civil law,—among them the celebrated Baldus; of twenty-two professors of medicine; of professors of philosophy, astrology, grammar, and rhetoric; and of lecturers on Seneca and Dante. The faculty of theology would appear, however, never to have been duly constituted, and but one lecturer in this faculty is mentioned. With the death of Galeazzo in 1402, this precarious activity came suddenly to an end; and in 1404 the university had ceased to exist. Its history is, indeed, unintelligible, unless taken in conjunction with that of Pavia. Even before Irærius taught at Bologna, Pavia had been widely known as a seat of legal studies, and more especially of the Lombard law, although the evidence is wanting which would serve to establish a direct connexion between this early school and the university which was founded there in 1361, by virtue of the charter granted by the emperor Charles IV. The new "studium" included faculties of jurisprudence, philosophy, medicine, and the arts, and its students were formally taken under the imperial protection, and endowed with privileges identical with those which had been granted to Paris, Bologna, Oxford, Orleans, and Montpellier; but its existence in Pavia was suddenly suspended by the removal, above noted, of its students to Piacenza. It shared again in the decline which overtook the university of Piacenza after the death of Giovanni Galeazzo, and during the period from 1404 to 1412 it altogether ceased to exist. But in October 1412 the lectures were recommenced, and the university entered upon the most brilliant period of its existence. Its professors throughout the 15th century were men of distinguished ability, attracted by munificent salaries such as but few other universities could offer, while in the number of students who resorted thither from other countries, and more especially for the study of the civil law, Pavia had no rival in Italy but Padua. Arezzo appears to have been known as a centre of the same study so early as 1215, and its earliest statutes are assigned to the year 1255. By that time it had become a school of arts and medicine also; but for a considerable period after it was almost entirely deserted, and is almost unmentioned until the year 1338, when it acquired new importance by the accession of several eminent jurists from Bologna. In May 1355 it received its charter as a studium generale from Charles IV. After the year 1373 the school gradually dwindled, although it did not become altogether extinct until about the year 1470. The university of Rome (which is to be carefully distinguished from the school attached to the curia) owed its foundation (1303) to Boniface VIII., and was especially designed by that pontiff for the benefit of the poor foreign students sojourning in the capital. It originally included all the faculties; but in 1318 John XXII. decreed that it should possess the power of confer-

ring degrees only in the canon and civil law. The university maintained its existence throughout the period of the residence of the popes at Avignon (see *POPEDOM*), and under the patronage of Leo X could boast in 1514 of no less than eighty professors. This imposing array would seem, however, to be but a fallacious test of the prosperity of the academic community, for it is stated that many of the professors, owing to the imperfect manner in which they were protected in their privileges, were in the receipt of such insufficient fees that they were compelled to combine other employments with that of lecturing in order to support themselves. An appeal addressed to Leo X. in the year 1513 represents the number of students as so small as to be sometimes exceeded by that of the lecturers ("ut quandoque plures sint qui legant quam qui audiant"). Scarcely any of the universities in Italy in the 14th century attracted a larger concourse than that of Perugia, where the study chiefly cultivated was that of the civil law. The university received its charter as a *studium generale* from Clement V in the year 1308, but had already in 1306 been formally recognized by the civic authorities, by whom it was commended to the special care and protection of the "podestà." In common with the rest of the Italian universities, it suffered severely from the great plague of 1348-49, but in 1355 it received new privileges from the emperor, and in 1362 its first college, dedicated to Gregory the Great, was founded by the bishop of Perugia. The university of Treviso, which received its charter from Frederick the Fair in 1318, was of little celebrity and but short duration. It is doubtful, indeed, whether it continued to exist after the city became subject to the republic of Venice in the year 1339, but in 1409 the Venetian senate issued a decree that no subjects of the republic should resort for study to any city in its dominions save that of Padua, and from this date the *studium* at Treviso must be held to have been no longer in existence. The circumstances of the rise of the university of Florence are unknown, but the earliest evidence of academic instruction belongs to the year 1320. The dispersion of the university of Bologna, in the March and April of the following year, afforded a favourable opportunity for the creation of a *studium generale*, but the necessary measures were taken somewhat tardily, and in the meantime the greater number of the Bolognese students had betaken themselves to Siena. The charter of foundation for Florence was accordingly not granted until 31st May 1349, when Clement VI decreed that there should be instituted a *studium generale* in theology, jurisprudence, medicine, and every other recognized faculty of learning, the teachers to be professors who had obtained the degree of doctor or master either at Bologna or Paris, or "some other *studium generale* of celebrity." On 2d January 1364 the university also obtained the grant of imperial privileges from Charles IV. On 14th February 1388 it adopted a body of statutes which are still extant, and afford an interesting study in connexion with the university history of the period. The university now entered upon that brilliant period in its history which was destined to so summary an extinction. "It is almost touching," says Deaife, "to note how untiringly Florence exerted herself at this period to attract as teachers to her schools the great masters of the sciences and learning." In the year 1472, however, under the influence of Lorenzo de' Medici, it was decided that Florence was not a convenient seat for a university, and its students were removed to Pisa. The commencement of the university of Siena belongs to about the year 1241, but its charter was first granted by the emperor Charles IV., at the petition of the citizens, in the year 1357. It was founded as a *studium generale* in jurisprudence, the arts, and medicine. The

imperial charter was confirmed by Gregory XII. in 1408, and the various bulls relating to the university which he subsequently issued afford a good illustration of the conditions of academic life in these times. Residence on the part of the students appears to have been sometimes dispensed with. The bishop of Siena was nominated chancellor of the university, just as, says the bull, he had been appointed to that office by the imperial authority. The graduates were to be admitted to the same privileges as those of Bologna or Paris, and a faculty of theology was added to the curriculum of studies. The university of Ferrara owes its foundation to the house of Este,—Alberto, marquis of Este, having obtained from Boniface IX. in 1391 a charter couched in terms precisely similar to those of the charter for Pisa. In the first half of the 15th century the university was adorned by the presence of several distinguished humanists, but its fortunes were singularly chequered, and it would appear for a certain period to have been altogether extinct. It was, however, restored, and became in the latter part of the century one of the most celebrated of the universities of Italy. In the year 1474 its circle of studies comprised all the existing faculties, and it numbered no less than fifty-one professors or lecturers. In later times Ferrara has been noted chiefly as a school of medicine.

Of the universities modelled on that of Paris, Oxford would appear to have been the earliest, and the manner of its development was probably similar. Certain schools, opened within the precincts of the dissolved nunnery of St Frideswyde and of Osney abbey, are supposed to have been the nucleus round which the university grew up. In the year 1133 one Robert Pullen, a theologian of considerable eminence (but whether an Englishman or a Breton is uncertain), arrived from Paris, and delivered lectures on the Bible. He was followed a few years later by Vacarius, a native of Lombardy, who as a student at Bologna had inherited the tradition of the teaching of Irnerius. Although both the pope and King Stephen regarded the civil law at this time with considerable distrust, Vacarius maintained his ground, and the study became one of the recognized faculties at Oxford. Towards the close of the 12th century Giraldus Cambrensis describes the town as a place "where the clergy in England chiefly flourished and excelled in clerical lore." In one respect, indeed, Oxford was more favoured than even Paris, for the town authorities could not pretend to assert any right of interference with the university such as that to which the French monarch and the court frequently laid claim. In the 13th century mention first occurs of university "chests," especially the Frideswyde chest, which were benefactions designed as funds for the assistance of poor students. Halls, or places of licensed residence for students, also began to be established. In the year 1257 when the bishop of Lincoln, as diocesan, had trespassed too closely on the liberties of the community, the deputies from Oxford, when preferring their appeal to the king at St Albans, could venture to speak of the university as "*schola secunda ecclesie*," or second only to Paris. Its numbers about this time were probably some three thousand, but it was essentially a fluctuating body, and whenever plague or tumult led to a temporary dispersion a serious diminution in its numerical strength generally ensued for some time after. Against such vicissitudes the foundation of colleges proved the most effectual remedy. Of these the three earliest were University College, founded in 1249 by William of Durham; Balliol College, founded about 1263 by John Balliol, the father of the king of Scotland of the same name, and Merton College, founded in 1264. The last-named is especially notable as associated with a new conception of university education, namely, that of collegiate

Oxford.

discipline for the secular clergy, instead of for any one of the religious orders, for whose sole benefit all similar foundations had hitherto been designed. The statutes given to the society by Walter de Merton are not less noteworthy, as characterized not only by breadth of conception, but also by a careful and discriminating attention to detail, which led to their adoption as the model for later colleges, not only at Oxford but at Cambridge. Of the service rendered by these foundations to the university at large we have significant proof in the fact that, although representing only a small numerical minority in the academic community at large, their members soon obtained a considerable preponderance in the administration of affairs.

Cam-
bridge,

The university of Cambridge, although it rose into existence somewhat later than Oxford, may reasonably be held to have had its origin in the same century. There was probably a certain amount of educational work carried on by the canons of the church of St Giles, which gradually developed into the instruction belonging to a regular studium. In the year 1112 the canons crossed the river and took up their residence in the new priory in Barnwell, and their work of instruction acquired additional importance. Then, as early as the year 1224, the Franciscans established themselves in the town, and, somewhat less than half a century later, were followed by the Dominicans. At both the English universities, as at Paris, the Mendicants and other religious orders were admitted to degrees, a privilege which, until the year 1337, was extended to them at no other university. Their interest in and influence at these three centres was consequently proportionably great. In the years 1231 and 1233 certain royal and papal letters afford satisfactory proof that by that time the university of Cambridge was already an organized body with a chancellor at its head; and in 1229 and 1231 its numbers were largely augmented by migrations from Paris and from Oxford. Cambridge, however, in its turn suffered from emigration; while in the year 1261, and again in 1322, the records of the university were wantonly burnt by the townsmen. Throughout the 13th century, indeed, the university was still only a very slightly and imperfectly organized community. Its endowments were of the most slender kind; it had no systematic code for the government of its members; the supervision of the students was very imperfectly provided for. An important step in the direction of reform in this last respect was, however, made in the year 1276, when an ordinance was passed requiring that every one who claimed to be recognized as a scholar should have a fixed master within fifteen days after his entry into the university. But the feature which most served to give permanence and cohesion to the entire community was, as at Oxford, the institution of colleges. The earliest of these was Peterhouse, first founded as a separate institution by Hugh Balsham, bishop of Ely, in the year 1286, with a code which was little more than a transcript of that given by Walter de Merton to his scholars at Oxford. About forty years later was founded Michaelhouse, and at nearly the same time (1326) Edward II. instituted his foundation of "king's scholars," afterwards forming the community of King's Hall. Both these societies in the 16th century were merged in Trinity College. To those succeeded Pembroke Hall (1347) and Gonville Hall (1348). All these colleges, although by no means conceived in a spirit of hostility to either the monastic or the Mendicant orders, were expressly designed for the benefit of the secular clergy. The foundation of Trinity Hall (1350) by Bishop Bateman, on the other hand, as a school of civil and canon law was probably designed to further ultramontane interests. That of Corpus Christi (1352), the outcome of

the liberality of a guild of Cambridge townsmen, was conceived with the combined object of providing a house of education for the clergy, and at the same time securing the regular performance of masses for the benefit of the souls of departed members of the guild. But both Trinity Hall and Corpus Christi College, as well as Clare Hall, founded in 1359, were to a great extent indebted for their origin to the ravages caused among the clergy by the great plague of 1349.

Turning to France, or rather to the territory included within the boundaries of modern France, we find Montpellier a recognized school of medical science as early as the 12th century. William VIII., lord of Montpellier, in the year 1181 proclaimed it a school of free resort, where any teacher of medical science, from whatever country, might give instruction. Before the end of the century it possessed also a faculty of jurisprudence, a branch of learning for which it afterwards became famed. The university of medicine and that of law continued, however, to be totally distinct bodies with different constitutions. Petrarch was sent by his father to Montpellier to study the civil law. On 26th October 1289 Montpellier was raised by Nicholas IV. to the rank of a "studium generale," a mark of favour which, in a region where papal influence was so potent, resulted in a considerable accession of prosperity. The university also now included a faculty of arts; and there is satisfactory evidence of the existence of a faculty of theology before the close of the 14th century, although not formally recognized by the pope before the year 1421. In the course of the same century several colleges for poor students were also founded. The university of Toulouse is to be noted as the first founded in any country by virtue of a papal charter. It took its rise in the efforts of Rome for the suppression of the Albigensian heresy, and its foundation formed one of the articles of the conditions of peace imposed by Louis IX. on Count Raymond of Toulouse. In the year 1233 it first acquired its full privileges as a "studium generale" by virtue of a charter given by Gregory IX. This pontiff watched over the university with especial solicitude, and through his exertions it soon became a noted centre of theological and especially of Dominican teaching. As a school of arts, jurisprudence, and medicine, although faculties of each existed, it never attained to any reputation. The university of Orleans had a virtual existence as a studium generale as early as the first half of the 13th century, but in the year 1305 Clement V. endowed it with new privileges, and gave its teachers permission to form themselves into a corporation. The schools of Orleans had an existence, it is said, as early as the 6th century, and subsequently supplied the nucleus for the foundation of a university at Blois; but of this university no records now exist.¹ Orleans, in its organization, was modelled mainly on Paris, but its studies were complementary rather than in rivalry to the older university. The absorbing character of the study of the civil law, and the mercenary spirit in which it was pursued, had led the authorities at Paris to refuse to recognize it as a faculty. The study found a home at Orleans, where it was cultivated with an energy which attracted numerous students. In January 1235 we find the bishop of Orleans soliciting the advice of Gregory IX. as to the expediency of countenancing a study which was prohibited in Paris. Gregory decided that the lectures might be continued; but he ordered that no beneficed ecclesiastic should be allowed to devote himself to so eminently secular a branch of learning. Orleans subsequently incorporated a faculty of arts, but its reputation from this period was always that of a school of legal studies, and in the 14th century its reputation in this respect was surpassed by no other uni-

Mont-
pellier.

Orleans.

¹ See Ch. Desmazié, *L'Université de Paris* (1200-1875).

Angers, versity in Europe. Prior to the 13th century it had been famed for its classical learning; and Angers, which received its charter at the same time, also once enjoyed a like reputation, which, in a similar manner, it exchanged for that of a school for civilians and canonists. The roll of the university forwarded in 1378 to Clement VII. contains the names of 8 professors *utriusque juris*, 2 of civil and 2 of canon law, 72 licentiates, 284 bachelors of both the legal faculties, and 190 scholars. The university of Avignon, Avignon, was first recognized as a "studium generale" by Boniface VIII. in the year 1303, with power to grant degrees in jurisprudence, arts, and medicine. Its numbers declined somewhat during the residence of the popes, owing to the counter attractions of the "studium" attached to the curia; but after the return of the papal court to Rome it became one of the most frequented universities in France, and possessed at one time no less than seven colleges. The university of Cahors enjoyed the advantage of being regarded with especial favour by John XXII. In June 1332 he conferred upon it privileges identical with those already granted to the university of Toulouse. In the following October, again following the precedent established at Toulouse, he appointed the *scholasticus* of the cathedral chancellor of the university. In November of the same year a bull, couched in terms almost identical with those of the Magna Charta of Paris, assimilated the constitution of Cahors to that of the oldest university. The two schools in France which, down to the close of the 14th century, most closely resembled Paris were Orleans and Cahors. The civil immunities and privileges of the latter university were not, however, acquired until the year 1367, when Edward III. of England, in his capacity as duke of Aquitaine, not only exempted the scholars from the payment of all taxes and imposts, but bestowed upon them the peculiar privilege known as *privilegium fori*. Cahors also received a licence for faculties of theology and medicine, but, like Orleans, it was chiefly known as a school of jurisprudence. It was as a "studium generale" in the same three faculties that Grenoble, in the year 1339, received its charter from Benedict XII. The university never attained to much importance, and its annals are for the most part involved in obscurity. At the commencement of the 16th century it had ceased altogether to exist, was reorganized by Francis of Bourbon in 1542, and in 1565 was united to the university of Valence. The university of Perpignan, founded, according to Denifle, in 1379 by Clement VII. (although tradition had previously ascribed its origin to Pedro IV. of Aragon), and that of Orange, founded in 1365 by Charles IV., were universities only by name and constitution, their names rarely appearing in contemporary chronicles, while their very existence becomes at times a matter for reasonable doubt.

Palencia, Huesca, Lerida, To some of the earlier Spanish universities—such as Palencia, founded about the year 1214 by Alfonso VIII.; Huesca, founded in 1354 by Pedro IV.; and Lerida, founded in 1300 by James II.—the same description is applicable; and their insignificance is probably indicated by the fact that they entirely failed to attract foreign students. Valladolid, founded in 1346 by Pope Clement VI., attained, however, to some celebrity; and the foreign teachers and students frequenting the university became so numerous that in 1373 King Henry II. caused an enactment to be passed for securing to them the same privileges as those already accorded to the native element. But the total number of the students in 1403 was only 116, and grammar and logic, along with jurisprudence (which was the principal study), constituted the sole curriculum. Whatever reputation, indeed, was enjoyed by Spain for nearly five centuries after the commencement of the university era, centred mainly in Salamanca, to which Seville,

in the south, stood in the relation of a kind of subsidiary school, having been founded in 1254 by Alfonso the Wise, simply for the study of Latin and of the Semitic languages, especially Arabic. Salamanca was founded in 1243 by Ferdinand III. of Castile as a "studium generale" in the three faculties of jurisprudence, the arts, and medicine. Ferdinand extended his special protection to the students, granting them numerous privileges and immunities. Under his son Alfonso (above named) the university acquired a further development, and eventually included all the faculties save that of theology. But the main stress of its activity, as was the case with all the earlier Spanish universities, excepting only Palencia and Seville, until the commencement of the 15th century, was laid on the civil and the canon law. But, notwithstanding the favour with which Salamanca was regarded alike by the kings of Castile and by the Roman see, the provision for the payment of its professors was at first so inadequate and precarious that in 1298 they by common consent suspended their lectures, in consequence of their scanty remuneration. A permanent remedy for this difficulty was thereupon provided, by the appropriation of a certain portion of the ecclesiastical revenues of the diocese for the purpose of augmenting the professors' salaries. The earliest of the numerous colleges founded at Salamanca was that of St Bartholomew, long noted for its ancient library and valuable collection of manuscripts, which now form part of the royal library in Madrid.

The one university possessed by Portugal had its seat in mediæval times alternately in Lisbon and in Coimbra, until, in the year 1537, it was permanently attached to the latter city. Its formal foundation took place in 1309, when it received from King Diniz a charter, the provisions of which were mainly taken from those of the charter given to Salamanca. In 1772 the university was entirely reconstituted.

Of the German universities, Prague, which existed as a "studium" in the 13th century, was the earliest, and was at first frequented mainly by students from Styria and Austria, countries at that time ruled by the king of Bohemia. On 26th January 1347, at the request of Charles IV., Pope Clement VI. promulgated a bull authorizing the foundation of a "studium generale" in all the faculties. In the following year Charles himself issued a charter for the foundation. This document, which, if original in character, would have been of much interest, has but few distinctive features of its own, its provisions being throughout adapted from those contained in the charters given by Frederick II. for the university of Naples and by Conrad for Salerno,—almost the only important feature of difference being that Charles bestows on the students of Prague all the civil privileges and immunities which were enjoyed by the teachers of Paris and Bologna. Charles had himself been a student in Paris, and the organization of his new foundation was modelled on that university, a like division into four "nations" (although with different names) constituting one of the most marked features of imitation. The numerous students—and none of the mediæval universities acted in their earlier history a larger concourse—were drawn from a gradually widening area, which at length included, not only all parts of Germany, but also England, France, Lombardy, Hungary, and Poland. Contemporary writers, with the exaggeration characteristic of mediæval credulity, even speak of thirty thousand students as present in the university at one time,—a statement for which Denifle proposes to substitute two thousand as a more probable estimate. It is certain, however, that Prague, prior to the foundation of Leipsic, was one of the most frequented centres of learning in Europe, and Paris suffered a considerable diminution in

her numbers owing to the counter attractions of the great studium of Slavonia.

Cracow, The university of Cracow in Poland was founded in May 1364, by virtue of a charter given by King Casimir the Great, who bestowed on it the same privileges as those possessed by the universities of Bologna and Padua. In the following September Urban V., in consideration of the remoteness of the city from other centres of education, constituted it a "studium generale" in all the faculties save that of theology. It is, however, doubtful whether these designs were carried into actual realization, for it is certain that, for a long time after the death of Casimir, there was no university whatever. Its real commencement must accordingly be considered to belong to the year 1400, when it was reconstituted, and the papal sanction was given for the incorporation of a faculty of theology. From this time its growth and prosperity were continuous; and with the year 1416 it had so far acquired a European reputation as to venture upon forwarding an expression of its views in connexion with the deliberations of the council of Constance. Towards the close of the 15th century the university is said to have been in high repute as a school of both astronomical and humanistic studies.

Vienna, The Avignonese popes appear to have regarded the establishment of new faculties of theology with especial jealousy; and when, in 1364, Duke Rudolph IV. founded the university of Vienna, with the design of constituting it a "studium generale" in all the faculties, Urban V. refused his assent to the foundation of a theological school. Owing to the sudden death of Duke Rudolph, the university languished for the next twenty years, but after the accession of Duke Albert III., who may be regarded as its real founder, it acquired additional privileges, and its prosperity became marked and continuous. Like Prague, Vienna was for a long time distinguished by the comparatively little attention bestowed by its teachers on the study of the civil law.

Fünfkirchen, No country in the 14th century was looked upon with greater disfavour at Rome than Hungary. It was stigmatized as the land of heresy and schism. When, accordingly, in 1367 King Louis applied to Urban V. for his sanction of the scheme of founding a university at Fünfkirchen, although theological learning was in special need of encouragement in those regions, Urban would not consent to the foundation of a faculty of theology; he even made it a condition of his sanction, for a "studium generale" that King Louis should first undertake to provide for the payment of the professors. We hear but little concerning the university after its foundation, and it is doubtful whether it survived for any length of time the close of the century, having been about that period absorbed in all probability in the university of Ofen. The foundation of this university is also involved in considerable obscurity, and its original charter is lost. We only know that it was granted by Boniface IX., at the request of King Sigismund, in the year 1389. In the first half of the 15th century it ceased for a long period to exist, but was revived, or rather founded afresh, by King Matthias Corvinus, an eminent patron of learning, in the last quarter of the century. "The extreme east of civilized continental Europe in mediæval times," observes Denifle, "can be compared, so far as university education is concerned, only with the extreme west and the extreme south. In Hungary, as in Portugal and in Naples, there was constant fluctuation, but the west and the south, although troubled by yet greater commotions than Hungary, bore better fruit. Among all the countries possessed of universities in mediæval times, Hungary occupies the lowest place—a state of affairs of which, however, the proximity of the Turk must be looked upon as a main cause."

The university of Heidelberg received its charter (23d October 1385) from Urban VI. as a "studium generale" (Heidelberg), in all the recognized faculties save that of the civil law,—the form and substance of the document being almost identical with those of the charter granted to Vienna. It was granted at the request of the elector palatine, Rupert I., who conferred on the teachers and students, at the same time, the same civil privileges as those which belonged to the university of Paris. In this case the functionary invested with the power of bestowing degrees was non-resident, the licences being conferred by the provost of the cathedral at Worms. But the real founder, as he was also the organizer and teacher, of the university was Marsilius of Inghen, to whose ability and energy Heidelberg was indebted for no little of its early reputation and success. The omission of the civil law from the studies licensed in the original charter would seem to show that the pontiff's compliance with the elector's request was merely formal, and Heidelberg, like Cologne, included the civil law among its faculties almost from its first creation. No mediæval university achieved a more rapid and permanent success. Regarded with favour alike by the civil and ecclesiastical potentates, its early annals were singularly free from crises like those which characterize the history of many of the mediæval universities. The number of those admitted to degrees from the commencement of the first session (19th October 1386 to 16th December 1387) amounted to 579.¹

Owing to the labours of the Dominicans, Cologne had gained a reputation as a seat of learning long before the founding of its university; and it was through the advocacy of some leading members of the Mendicant orders that, at the desire of the city council, its charter as a "studium generale" (21st May 1388) was obtained from Urban VI. It was organized on the model of the university of Paris, as a school of theology and canon law, and "any other recognized faculty,"—the civil law being incorporated as a faculty soon after the promulgation of the charter. In common with the other early universities of Germany—Prague, Vienna, and Heidelberg—Cologne owed nothing to imperial patronage, while it would appear to have been, from the first, the object of special favour with Rome. This circumstance serves to account for its distinctly ultramontane sympathies in mediæval times and even far into the 16th century. In a report transmitted to Gregory XIII. in 1577, the university expressly derives both its first origin and its privileges from the Holy See, and professes to owe no allegiance save to the Roman pontiff. Erfurt, no less noted as a centre of Franciscan than was Cologne of Dominican influence, received its charter (16th September 1379) from the anti-pope Clement VII. as a "studium generale" in all the faculties. Ten years later (4th May 1389) it was founded afresh by Urban VI., without any recognition of the act of his pretended predecessor. In the 15th century the number of its students was larger than that at any other German university—a fact attributable partly to the reputation it had acquired as a school of jurisprudence, and partly to the ardour with which the philosophic controversies of the time were debated in its midst.

The collegiate system is to be noted as a feature common to all these early German universities; and, in nearly all, the professors were partly remunerated by the appropriation of certain prebends, appertaining to some neighbouring church, to their maintenance.

Throughout the 15th century the relations of the Roman pontiffs to the universities continued much the same, although the independent attitude assumed at the great councils of Constance and Basel by the deputies from the

Relations of the popes to the universities.

¹ The statistics of Hautz (*Gesch. d. Univ. Heidelberg*, i. 177-8) are corrected by Denifle (*Die Entstehung der Universitäten*, p. 385).

universities, and especially by those from Paris, could not fail to excite their apprehensions. Their bulls for each new foundation begin again to indicate a certain jealousy with respect to the appropriation of prebends by the founders. Where such appropriations are made, and more particularly in France, a formal sanction of the transfer generally finds a place in the bull authorizing the foundation; while sometimes the founder or founders are themselves enjoined to provide the endowments requisite for the establishment and support of the university. In this manner the control of the pontiff over each newly-created seat of learning assumed a more real character, from the fact that his assent was accompanied by conditions which rendered it no longer a mere formality. The imperial intervention, on the other hand, was rarely invoked in Germany,—Greifswald, Freiburg, and Tübingen being the only instances in which the emperor's confirmation of the foundation was solicited.¹ But whatever influence the Roman see may have gained by increasing intervention was more than counteracted by those other tendencies which came into operation in the second half of the century. These were of a twofold character:—the first directly modifying the studies themselves, as the results of the discovery of printing and the new spirit awakened by the teaching of the humanists; the second affecting the external conditions, such as the multiplication of schools, and the growing demand for skilled physicians and learned civilians,—circumstances which afforded increased employment for the services of men of academic training. In northern Germany and in the Netherlands, the growing wealth and prosperity of the different states especially favoured the formation of new centres of learning. In the flourishing duchy of Brabant the university of Louvain (1426) was to a great extent controlled by the municipality; and their patronage, although ultimately attended with detrimental results, long enabled Louvain to outbid all the other universities of Europe in the munificence with which she rewarded her professors. In the course of the next century the "Belgian Athens," as she is styled by Lipsius, ranked second only to Paris in numbers and reputation. In its numerous separate foundations and general organization—it possessed no less than twenty-eight colleges—it closely resembled the English universities; while its active press afforded facilities to the author and the controversialist of which both Cambridge and Oxford were at that time almost destitute. It embraced all the faculties, and no degrees in Europe stood so high as guarantees of general acquirements. Erasmus records it as a common saying, that "no one could graduate at Louvain without knowledge, manners, and age." Sir William Hamilton speaks of the examination at Louvain for a degree in arts as "the best example upon record of the true mode of such examination, and, until recent times, in fact, the only example in the history of universities worthy of consideration at all." He has translated from Vernulæus the order and method of this examination.² In 1788 the faculties of jurisprudence, medicine, and philosophy were removed to Brussels, and in 1797 the French suspended the university altogether. When Belgium was formed into an independent state in 1831, the university was re-founded as a Roman Catholic foundation.

Leipsic,

The circumstances of the foundation of the university of Leipsic are especially noteworthy, it having been the result of the migration of almost the entire German element from the university of Prague. This element comprised (1) Bavarians, (2) Saxons, (3) Poles (this last-named division being drawn from a wide area, which included Meissen, Lusatia, Silesia, and Prussia), and, being

represented by three votes in the assemblies of the university, while the Bohemians possessed but one, had acquired a preponderance in the direction of affairs which the latter could no longer submit to. Religious differences, again, evoked mainly by the preaching of John Huss, further intensified the existing disagreements; and eventually, in the year 1409, King Wenceslaus, at the prayer of his Bohemian subjects, issued a decree which exactly reversed the previous distribution of votes,—three votes being assigned to the Bohemian nation and only one to all the rest. The Germans took deep umbrage, and seceded to Leipsic, where, a bull having been obtained from Alexander V. (9th September 1409), a new "studium generale" was founded by the landgrave of Thuringia and the margraves of Meissen. The members were divided into four nations—composed of natives of Meissen, Saxony, Bavaria, and Poland. Two colleges were founded, a greater and a smaller, but designed, not for poor students, but for masters of arts—twelve being admitted on the former and eight on the latter foundation. The first university of northern Germany was that of Rostock, founded by the dukes John and Albert of Mecklenburg, the scheme receiving the sanction of Martin V. in a bull dated 13th February 1419 as that of a "studium generale" in all the faculties excepting theology. The faculty of theology was added in the year 1432. Two colleges were also founded, with the same design and on the same scale as at Leipsic.

No little illustration is afforded by the circumstances attending the foundation of the French universities of the struggle that was going on between the crown and the Roman see. The earliest foundation in the 15th century was that of Poitiers. It was instituted by Charles VII. in 1431, almost immediately after his accession, with the special design of creating a centre of learning less favourable to English interests than Paris had at that time shown herself to be. Eugenius IV. could not refuse his sanction to the scheme, but he endeavoured partially to defeat Charles's design by conferring on the new "studium generale" only the same privileges as those possessed by Toulouse, and thus placing it at a disadvantage in comparison with Paris. Charles rejoined by an extraordinary exercise of his own prerogative, conferring on Poitiers all the privileges collectively possessed by Paris, Toulouse, Montpellier, Angers, and Orleans, and at the same time placing the university under special royal protection. The foundation of the university of Caen, in the diocese of Bayeux, was attended by conditions almost exactly the reverse of those which belonged to the foundation of that at Poitiers. It was founded under English auspices during the short period of the supremacy of the English arms in Normandy in the 15th century. Its charter (May 1437) was given by Eugenius IV., and the bishop of Bayeux was appointed its chancellor. The university of Paris had by this time completely forfeited the favour of Eugenius by its attitude at the council of Basel, and Eugenius inserted in the charter for Caen a clause of an entirely novel character, requiring all those admitted to degrees to take an oath of fidelity to the see of Rome, and to bind themselves to attempt nothing prejudicial to her interests. To this proviso the pragmatic sanction of Bourges was the reply given by Charles in the following year. On 18th May 1442 we find King Henry VI. writing to Eugenius, and dwelling with satisfaction on the rapid progress of the new university, to which, he says, students had flocked from all quarters, and were still daily arriving.³ On 30th October 1452 its charter was given afresh by Charles in terms which left the original charter unrecognized; both teachers and learners were made subject to the civil authorities of the city, while all privileges conferred in the former charter

¹ Meiners, *Gesch. d. hohen Schulen*, i. 370.

² *Dissertations and Discussions*. Append. iii.

³ Bekynon's *Correspondence*, i. 123.

in cases of legal disputes were abolished. From this time the university of Caen was distinguished by its loyal spirit and firm resistance to ultramontane pretensions; and, although swept away at the French Revolution, it was afterwards restored, owing to the sense of the services it had thus once rendered to the national cause.¹ No especially notable circumstances characterize the foundation of the university of Bordeaux (1441) or that of Valence (1452), but that of Nantes, which received its charter from Pius II. in 1463, is distinguished by the fact that it did not receive the ratification of the king of France, and the conditions under which its earlier traditions were formed thus closely resemble those of Poitiers. It seems also to have been regarded with particular favour by Pius II., a pontiff who was at once a ripe scholar and a writer upon education. He gave to Nantes a notable body of privileges, which not only represent an embodiment of all the various privileges granted to universities prior to that date, but afterwards became, with their copious and somewhat tautological phraseology, the accepted model for the great majority of university charters, whether issued by the pope or by the emperor, or by the civil authority. The bishop of Nantes was appointed head of the university, and was charged with the special protection of its privileges against all interference from whatever quarter.² The bull for the foundation of the university of Bourges was given in 1465 by Paul II. at the request of Louis XI and his brother. It confers on the community the same privileges as those enjoyed by the other universities of France. The royal sanction was given at the petition of the citizens; but, from reasons which do not appear, they deemed it necessary further to petition that their charter might also be registered and enrolled by the parlement of Paris.

In Germany, the first of the universities representing the new influences above referred to is that of Greifswald. A wealthy burgomaster, who had graduated as a master of arts at Rostock, was the chief mover; and, his proposal being cordially seconded by the city council, the duke of the province, and certain abbots of neighbouring monasteries, the necessary bull was obtained from Calixtus III. (29th May 1456). The first session was commenced in October of the same year. Three colleges were at the same time founded,—two for masters of arts, as at Leipsic and Rostock, and a third for jurists. The chairs in the different faculties were distributed as follows: theology 3, jurisprudence 5, medicine 1, arts 4,—the number of jurists showing that the study of the civil law still obtained a certain preponderance. The university of Freiburg was founded by the archduke Albert, brother of the emperor Frederick III.,—the papal bull being given 20th April 1455, and the imperial ratification in the following year. The first session was opened in 1460, under the presidency of Matthew Hummel, a privy councillor, and the original numbers soon received considerable additions by secessions from Vienna and from Heidelberg. The endowment was further augmented by an annual allowance from the city council, and by certain canonries and livings attached to neighbouring parishes. In the same year, and probably in a spirit of direct rivalry, was opened the university of Basel. The cathedral school in that ancient city, together with others attached to the monasteries, afforded a sufficient nucleus for a "studium," and Pius II., who, as Æneas Sylvius, had been a resident in the city, was easily prevailed upon to grant the charter (12th November 1459). In the character of its endowments, and in the relative importance attached to the study of the civil law, Basel much resembled Greifswald, but its success throughout the 15th century was marred by the languid character of the

support afforded it by the civic authorities. Before he had signed the bull for the foundation of the university of Basel, Pius II., at the request of duke William of Bavaria, had issued another bull for the foundation of a university at Ingolstadt (7th April 1459). But it was not until 1472 that the work of teaching was actually commenced there. Some long existing prebends, founded by former dukes of Bavaria, were appropriated to the endowment, and the chairs in the different faculties were distributed as follows:—theology 2, jurisprudence 3, medicine 1, arts 6,—arts in conjunction with theology thus obtaining the preponderance. As at Caen, twenty-two years before, an oath of fidelity to the Roman pontiff was imposed on every student admitted to a degree.³ That this proviso was not subsequently abolished, as at Caen, is a feature in the history of the university of Ingolstadt which was attended by important results. Nowhere did the Reformation meet with more stubborn resistance, and it was at Ingolstadt that the Counter-Reformation was commenced. In 1556 the Jesuits made their first settlement in the university.

The next two universities took their rise in the archiepiscopal seats of Treves and Mainz. That at Treves received its charter as early as 1450; but the first academical session did not commence until 1473. Here the ecclesiastical influences appear to have been unfavourable to the project. The archbishop demanded 2000 florins as the price of his sanction. The cathedral chapter threw difficulties in the way of the appropriation of certain livings and canonries to the university endowment; and so obstinate was their resistance that in 1655 they succeeded in altogether rescinding the gift on payment of a very inadequate sum. It was not until 1722 that the assembly of deputies, by a formal grant, relieved the university from the difficulties in which it had become involved. The university of Mainz, on the other hand, was almost entirely indebted to the archbishop Diether for its foundation. It was at his petition that Sixtus IV. granted the charter, 23d November 1476, and Diether, being himself an enthusiastic humanist, thereupon circulated a letter, couched in elegant Latinity, addressed to students throughout his diocese, inviting them to repair to the new centre, and dilating on the advantages of academic studies and of learning. The rise of these two universities, however, neither of which attained to much distinction, represents little more than the incorporation of certain already existing institutions into a homogeneous whole, the power of conferring degrees being superadded. But the university of Tubingen, founded by charter of Sixtus IV. (9th November 1476), represents an entirely new creation. Its real founder was Mathilda, the mother of Count Eberhard of Würtemberg, who appropriated five livings and eight prebends to the endowment. Of the chairs, 3 were for theology, 3 for the canon and 2 for the civil law, 2 for medicine, and 4 for arts. The general financial condition of this university in the year 1541-42, and the sources from whence its revenues were derived, have been illustrated by Hoffmann in a short paper which shows the fluctuating character of the resources of a university in those days,—liable to be affected, as they were, both by the seasons and the markets.⁴

Nearly contemporaneous with these foundations were those of Upsala (1477) and Copenhagen (1479), which, although lying without the political boundaries of Germany, reflected her influence. The charter for Copenhagen was given by Sixtus IV. as early as 1475. The students

³ Paulsen, in speaking of this proviso as one "die weder vorher noch nachher sonst vorkommt," would consequently seem to be not quite accurate. See *Die Gründung der deutschen Universitäten*, p. 277.

Witten-
berg.

The electorates of Wittenberg and Brandenburg were now the only two considerable German territories which did not possess a *studium generale*, and the university founded at Wittenberg by Maximilian I. (6th July 1502) is notable as the first established in Germany by virtue of an imperial as distinguished from a papal decree. Its charter is, however, drawn up with the traditional phraseology of the pontifical bulls, and is evidently not conceived in any spirit of antagonism to Rome. Wittenberg is constituted a "*studium generale*" in all the four faculties,—the right to confer degrees in theology and canon law having been sanctioned by the papal legate some months before, 2d February 1502. The endowment of the university with church revenues duly received the papal sanction,—a bull of Alexander VI. authorizing the appropriation of twelve canonries attached to the castle church, as well as of eleven prebends in outlying districts—*ut sic per omnem modum unum corpus ex studio et collegio prædictis fiat et constituitur*. No university in Germany attracted to itself a larger share of the attention of Europe at its commencement. And it was its distinguishing merit that it was the first academic centre north the Alps where the antiquated methods and barbarous Latinity of the scholastic era were overthrown. The last university founded in Germany prior to the Reformation was that of Frankfort-on-the-Oder. The design, first conceived by the elector John of Brandenburg, was carried into execution by his son Joachim, at whose request Pope Julius II. issued a bull for the foundation, 15th March 1506. An imperial charter, identical in its contents with the papal bull, followed on 26th October. The university received an endowment of canonries and livings similar to that of Wittenberg, and some houses in the city were assigned for its use by the elector.

the Oder.

St Au-
drews.

The first university in Scotland was that of St Andrews, founded in 1411 by Henry Wardlaw bishop of that see, and modelled chiefly on the constitution of the university of Paris. It acquired all its three colleges—St Salvator's, St Leonard's, and St Mary's—before the Reformation,—the first having been founded in 1456 by Bishop James Kennedy; the second in 1512 by the youthful archbishop Alexander Stuart (natural son of James IV.) and John Hepburn, the prior of the monastery of St Andrews; and the third, also in 1512, by the Beaton, who in the year 1537 procured a bull from Pope Paul III. dedicating the college to the Blessed Virgin Mary of the Assumption, and adding further endowments. The most ancient of the universities of Scotland, with its three colleges, was thus reared in an atmosphere of mediæval theology, and undoubtedly designed as a bulwark against heresy and schism. But "by a strange irony of fate," it has been observed, "two of these colleges became, almost from the first, the foremost agents in working the overthrow of that church which they were founded to defend." St Leonard's more especially, like St John's or Queens' at Cambridge, became a noted centre of intellectual life and Reformation principles. That he "had drunk at St Leonard's well" became a current expression for implying that a theologian had imbibed the doctrines of Protestantism. The university of Glasgow was founded as a "*studium generale*" in 1453, and possessed two colleges. Prior to the Reformation it acquired but little celebrity; its discipline was lax, and the number of the students but small, while the instruction was not only inefficient but irregularly given; no funds were provided for the maintenance of regular lectures in the higher faculties; and there was no adequate executive power for the maintenance of discipline. The uni-

Glasgow.

versity of Aberdeen, which was founded in 1494, at first Aberdeen possessed only one college,—namely, King's. Marischal College, founded in 1593 by George Keith, fifth Earl Marischal, was constituted by its founder independent of the university in Old Aberdeen, being itself both a college and a university, with the power of conferring degrees. Bishop Elphinstone, the founder both of the university and of King's College (1505), had been educated at Glasgow, and had subsequently both studied and taught at Paris and at Orleans. To the wider experience which he had thus gained we may probably attribute the fact that the constitution of the university of Aberdeen was free from the glaring defects which then characterized that of the university of Glasgow.¹ But in all the mediæval universities of Germany, England, and Scotland, modelled as they were on a common type, the absence of adequate discipline was, in a greater or less degree, a common defect. In connexion with this feature we may note the comparatively small percentage of matriculated students proceeding to the degrees of B.A. and M.A. when compared with later times. Of this disparity the following table, exhibiting the relative numbers in the university of Leipsic for every ten years from the year 1427 to 1552, probably affords a fair average illustration,—the remarkable fluctuations probably depending quite as much upon the comparative healthiness of the period (in respect of freedom from epidemic) and the abundance of the harvests as upon any other cause:—

The German universities in these times seem to have admitted for the most part their inferiority in learning to older and more favoured centres; and their consciousness of the fact is shown by the efforts which they made to attract instructors from Italy, and by the frequent resort of the more ambitious students to schools like Paris, Bologna, Padua, and Pavia. That they took their rise in any spirit of systematic opposition to the Roman see (as Meiners and others have contended), or that their organization was something external to and independent of the church, is sufficiently disproved by the foregoing evidence. Generally speaking, they were eminently conservative bodies, and the new learning of the humanists and the new methods of instruction that now began to demand attention were alike for a long period unable to gain admission within academic circles. Reformers such as Hegius, John Wessel, and Rudolphus Agricola carried on their work at places like Deventer remote from university influences. That there was a considerable amount of mental activity going on in the universities themselves is not to be denied; but it was mostly of that unprofitable kind which, while giving rise to endless controversy, turned upon questions in connexion with which the implied postulates and the terminology employed rendered all scientific investi-

¹ *Fasti Aberdonenses*, ref. p. xvi.

gation hopeless. At almost every university—Leipsic, Greifswald, and Prague (after 1209) being the principal exceptions—the so-called Realists and Nominalists represented two great parties occupied with an internecine struggle. At Paris, owing to the overwhelming strength of the theologians, the Nominalists were indeed under a kind of ban; but at Heidelberg they had altogether expelled their antagonists. It was much the same at Vienna and at Erfurt,—the latter, from the ready reception which it gave to new speculation, being styled by its enemies “*novorum omnium portus*.” At Basel, under the leadership of the eminent Johannes a Lapide, the Realists with difficulty maintained their ground. Freiburg, Tübingen, and Ingolstadt, in the hope of diminishing controversy, arrived at a kind of compromise, each party having its own professor, and representing a distinct “nation.” At Mainz the authorities adopted a manual of logic which was essentially an embodiment of Nominalistic principles.

Abandonment of logical studies in Italy.

In Italy, almost without exception, it was decided that these controversies were endless, and that their effects were pernicious. It was resolved, accordingly, to expel logic, and allow its place to be filled by rhetoric. It was by virtue of this decision, which was of a tacit rather than a formal character, that the expounders of the new learning in the 15th century, men like Emmanuel Chrysoloras, Guarino, Leonardo Bruni, Bessarion, Argyropulos, and Valla, carried into effect that important revolution in academic studies which constitutes a new era in university learning, and largely helped to pave the way for the Reformation.¹ This discouragement of the controversial spirit, continued as it was in relation to theological questions after the Reformation, obtained for the Italian universities a fortunate immunity from dissensions like those which, as we shall shortly see, distracted the centres of learning in Germany. The professorial body also attained to an almost unrivalled reputation. It was exceptionally select, only those who were in receipt of salaries being permitted, as a rule, to lecture; it was also famed for its ability, the institution of concurrent chairs proving an excellent stimulus. These chairs were of two kinds—“ordinary” and “extraordinary,”—the former being the more liberally endowed and fewer in number. For each subject of importance there were thus always two and sometimes three rival chairs, and a powerful and continuous emulation was thus maintained among the teachers. “From the integrity of their patrons, and the lofty standard by which they were judged,” says Sir W. Hamilton, “the call to a Paduan or Pisan chair was deemed the highest of all literary honours. The status of professor was in Italy elevated to a dignity which in other countries it has never reached; and not a few of the most illustrious teachers in the Italian seminaries were of the proudest nobility of the land. While the universities of other countries had fallen from Christian and cosmopolite to sectarian and local schools, it is the peculiar glory of the Italian that, under the enlightened liberality of their patrons, they still continued to assert their European universality. Creed and court were in them no bar,—the latter not even a reason of preference. Foreigners of every nation are to be found among their professors; and the most learned man in Scotland (Dempster) sought in a Pisan chair that theatre for his abilities which he could not find at home.”²

Events producing divisions in university history.

The Reformation represents the great boundary line in the history of the mediæval universities, and also, for a long time after, the main influence in the history of those new foundations which subsequently arose in Protestant countries. Even in Catholic countries its secondary effects

were scarcely less perceptible, as they found expression in connexion with the Counter Reformation. In Germany the Thirty Years' War was attended by consequences which were felt long after the 17th century. In France the Revolution of 1789 resulted in the actual uprooting of the university system.

The influences of the New Learning, and the special character which it assumed as it made its way in Germany in connexion with the labours of scholars like Erasmus, John Reuchlin, Ulrich von Hutten, and Melancthon, augured well for the future. It was free from the frivolities, the pedantry, the immoralities, and the scepticism which characterized so large a proportion of the corresponding culture in Italy. It gave promise of resulting at once in a critical and enlightened study of the masterpieces of classical antiquity, and in a reverent and yet rational interpretation of the Scriptures and the fathers. The fierce bigotry and the ceaseless controversies evoked by the promulgation of Lutheran or Calvinistic doctrine dispelled, however, this hopeful prospect, and converted what might otherwise have become the tranquil abodes of the Muses into gloomy fortresses of sectarianism. Of the manner in which it affected the highest culture, the observation of Henke in his *Life of Calixtus* (i. 8), that for a century after the Reformation the history of Lutheran theology becomes almost identified with that of the German universities, may serve as an illustration.

Pernicious influences of sectarianism.

The first Protestant university was that of Marburg, Marburg founded by Philip the Magnanimous, landgrave of Hesse, 30th May 1527. Expressly designed as a bulwark of Lutheranism, it was mainly built up out of the confiscation of the property of the religious orders in the Hessian capital. The house of the Dominicans, who had fled on the first rumour of spoliation, was converted into lecture-rooms for the faculty of jurisprudence. The church and convent of the order known as the “Kugelberrn” was appropriated to the theological faculty. The friary of the Barefooted Friars was shared between the faculties of medicine and philosophy. The university, which was the object of the margrave's peculiar care, rapidly rose to celebrity; it was resorted to by students from remote countries, even from Greece, and its professors were of distinguished ability. How much, however, of this popularity depended on its theological associations is to be seen in the fact that after the year 1605, when, by the decree of Count Maurice, its formulary of faith was changed from Lutheran to Calvinistic, its numbers greatly declined. This dictation of the temporal power now becomes one of the most notable features in academic history in Protestant Germany. The universities, having repudiated the papal authority, while that of the episcopal order was at an end, now began to pay especial court to the temporal ruler, and sought in every way to conciliate his goodwill, representing with peculiar distinctness the theory,—*cujus regio, ejus religio*. This tendency was further strengthened by the fact that their colleges, bursaries, and other similar foundations were no longer derived from or supported by ecclesiastical institutions, but were mainly dependent on the civil power.

The Lutheran university of Königsberg was founded 17th August 1544 by Albert III., margrave of Brandenburg, Königsberg, and the first duke of Prussia, and his wife Dorothea, a Danish princess. In this instance, the religious character of the foundation not having been determined at the commencement, the papal and the imperial sanction were both applied for, although not accorded. King Sigismund of Poland, however, which kingdom exercised at that time a protectorate over the Prussian duchy, ultimately gave the necessary charter (29th September 1561), at the same time ordaining that all students who graduated as masters in the faculty of philosophy should rank as nobles of the

¹ For an excellent account of this movement, see Georg Voigt, *Die Wiederbelebung des classischen Alterthums*, 2d ed., 2 vols., 1880

² Hamilton, *Discussions*, 2d ed., p. 373.

Polish kingdom. When Prussia was raised to the rank of a kingdom (1701) the university was made a royal foundation, and the "collegium Fridericianum," which was then erected, received corresponding privileges. In 1862 the university buildings were rebuilt, and the number of the students is now nearly one thousand.

Jena. The Lutheran university of Jena had its origin in a gymnasium founded by John Frederick the Magnanimous, elector of Saxony, during his imprisonment, for the express purpose of promoting Evangelical doctrines and repairing the loss of Wittenberg, where the Philippists had gained the ascendancy. Its charter, which the emperor Charles V. refused to grant, and which was obtained with some difficulty from his brother, Ferdinand I., eventually enabled the authorities to open the university, 2d February 1558. Distinguished for its vehement assertion of Lutheran doctrine, its hostility to the teaching of Wittenberg was hardly less pronounced than that with which both centres regard Roman Catholicism. For a long time it was chiefly noted as a school of medicine, and in the 17th and 18th centuries it was in bad repute for the lawlessness of its students, among whom duelling prevailed to a scandalous extent. The beauty of its situation and the eminence of its professoriate have, however, generally attracted a considerable proportion of students from other countries. Its numbers in 1885 were 566.

Helmstadt. The Lutheran university of Helmstädt, founded by Duke Julius (of the house of Brunswick-Wolfenbüttel), and designated after him in its official records as "Academia Julia," received its charter, 8th May 1575, from the emperor Maximilian II. No university in the 16th century commenced under more favourable auspices. It was munificently endowed by the founder and by his son; and its "Convictorium," or college for poor students, expended in the course of thirty years no less than 100,000 thalers, an extraordinary expenditure for an institution of such a character in those days. Beautifully and conveniently situated in what had now become the well-peopled region between the Weser and the lower Elbe, and distinguished by its comparatively temperate maintenance of the Lutheran tenets, it attracted a considerable concourse of students, especially from the upper classes, not a few being of princely rank. Throughout its history, until suppressed in 1809, Helmstädt enjoyed the special and powerful patronage of the dukes of Saxony.

Aldorf. The "Gymnasium Ægidianum" of Nuremberg, founded in 1526, and removed in 1575 to Altdorf, represents the origin of the university of Altdorf. A charter was granted in 1578 by the emperor Rudolph II., and the university was formally opened in 1580. It was at first, however, empowered only to grant degrees in arts; but in 1623 the emperor Ferdinand II. added the permission to create doctors of law and medicine, and also to confer crowns on poets; and in 1697 its faculties were completed by the permission given by the emperor Leopold I. to create doctors of theology. Like Louvain, Altdorf was nominally ruled by the municipality, but in the latter university this power of control remained practically inoperative, and the consequent freedom enjoyed by the community from evils like those which brought about the decline of Louvain is thus described by Hamilton:—"The decline of that great and wealthy seminary (Louvain) was mainly determined by its vicious patronage, both as vested in the university and in the town. Altdorf, on the other hand, was about the poorest university in Germany, and long one of the most eminent. Its whole endowment never rose above £800 a year; and, till the period of its declension, the professors of Altdorf make at least as distinguished a figure in the history of philosophy as those of all the eight universities of the British empire together. On looking

closely into its constitution the anomaly is at once solved. The patrician senate of Nuremberg were too intelligent and patriotic to attempt the exercise of such a function. The nomination of professors, though formally ratified by the senate, was virtually made by a board of four curators; and what is worthy of remark, as long as curatorial patronage was a singularity in Germany, Altdorf maintained its relative pre-eminence, losing it only when a similar mean was adopted in the more favoured universities of the empire."¹

The conversion of Marburg into a school of Calvinistic doctrine gave occasion to the foundation of the universities of Giessen and of Rinteln. Of these the former, founded by the margrave of Darmstadt, Louis V., as a kind of refuge for the Lutheran professors from Marburg, received its charter from the emperor Rudolph II., 19th May 1607. When, however, the margraves of Darmstadt acquired possession of Marburg in 1625, the university was transferred thither; in 1650 it was moved back again to Giessen. The number of matriculated students at the commencement of the century was about 250; in 1887 it was 484. In common with the other universities of Germany, but with a facility which obtained for it a specially unenviable reputation, Giessen was for a long time wont to confer the degree of doctor *in absentia* in the different faculties without requiring adequate credentials. This practice, however, which drew forth an emphatic protest from the eminent historian Mommsen, has within the last few years been entirely abandoned. The university of Rinteln was founded 17th July 1621 by the emperor Ferdinand II. Almost immediately after its foundation it became the prey of contending parties in the Thirty Years' War, and its early development was thus materially hindered. It never, however, attained to much distinction, and in 1819 it was suppressed. The university of Strasburg was founded in 1621 on the basis of an already existing academy, to which the celebrated John Sturm stood, during the latter part of his life, in the relation of "rector perpetuus," and of which we are told that in 1578 it included more than a thousand scholars, among whom were 200 of the nobility, 24 counts and barons, and three princes. It also attracted students from all parts of Europe, and especially from Portugal, Poland, Denmark, France, and England. The method of Sturm's teaching became the basis of that of the Jesuits, and through them of the public school instruction in England. In 1621 Ferdinand II. conferred on this academy full privileges as a university; in the language of the charter, "in omnibus facultatibus, doctores, licentiatos, magistros, et baccalaureos, atque insuper *potas laureatos* creandi et promovendi."² In 1681 Strasburg became French, and remained so until 1870.

The university of Dorpat (now Russian) was founded by Gustavus Adolphus in 1632, and reconstituted by the emperor Alexander I. in 1802. A special interest attaches to this university from the fact that it has for a long time been the scene of the contending influences of Teutonism and Slavonianism. Situated in Livonia, which at the time of its foundation represented a kind of debatable land between Russia and Poland, its gradual monopoly by the former country has not been without resistance and protests on the part of that Teutonic element which was at one time the more potent in its midst. The study of the Slavonic languages has here received considerable stimulus, and by a decree in May 1887 the use of the Russian language having been made obligatory in all places of instruction through the Baltic provinces, Russian has now taken the place of German as the language of the lecture-room. Dorpat possesses a fine library of over 80,000 volumes, and is also noted for its admirable botanical collection. The

Russian minister has also recently instituted a professorship of the comparative grammar of the Slavonic dialects (now filled by J Baudouin de Courtenay). The general influence of the university has been rapidly extending during the last few years far beyond the Baltic provinces. The number of students, which in 1879 was 1106, in 1886 was 1751.¹ A like contest between contending nationalities has recently met with a final solution at Prague, where a Czech university has been established on an independent basis, the German university having commenced its separate career in the winter session of 1882-83. The German foundation retains its endowments, but the state subvention is divided between the two.

The repudiation on the part of the Protestant universities of both papal and episcopal authority evoked a counter-demonstration among those centres which still adhered to Catholicism, while their theological intolerance gave rise to a great reaction, under the influence of which the mediæval Catholic universities were reinvigorated and reorganized (although strictly on the traditional lines), while new and important centres were created. It was on the tide of this reaction, aided by their own skill and sagacity, that the Jesuits were borne to that commanding position which made them for a time the arbiters of education in Europe. The earliest university whose charter represented this reaction was that of Bamberg, founded by the prince-bishop Melchior Otto, after whom it was named "Academia Ottoniana." It was opened 1st September 1648, and received both from the emperor Frederick III. and Pope Innocent X. all the civil and ecclesiastical privileges of a mediæval foundation. At first, however, it comprised only the faculties of arts and of theology; to these was added in 1729 that of jurisprudence, and in 1764 that of medicine. In this latter faculty Dr Ignatius Döllinger (the father of the historian) was for a long time a distinguished professor. The university of Innsbruck was founded in 1672 by the emperor Leopold I., from whom it received its name of "Academia Leopoldina."

In the following century, under the patronage of the empress Maria Theresa, it made considerable progress, and received from her its ancient library and bookshelves in 1745. In 1782 the university underwent a somewhat singular change, being reduced by the emperor Joseph II. from the status of a university to that of a lyceum, although retaining in the theological faculty the right of conferring degrees. In 1791 it was restored to its privileges by the emperor Leopold II., and since that time the faculties of philosophy, law, and medicine have been represented in nearly equal proportions. In 1886 the number of professors was 74, and of students 869. The foundation of the university of Breslau was contemplated as early as the year 1505, when Ladislaus, king of Hungary, gave his sanction to the project, but Pope Julius II., in the assumed interests of Cracow, withheld his assent. Nearly two centuries later, in 1702, under singularly altered conditions, the Jesuits prevailed upon the emperor Leopold I. to found a university without soliciting the papal sanction. When Frederick the Great conquered Silesia in 1741, he took both the university and the Jesuits in Breslau under his protection, and when in 1774 the order was suppressed by Clement XIV. he established them as priests in the Royal Scholastic Institute, at the same time giving new statutes to the university. In 1811 the university was considerably augmented by the incorporation of that at Frankfort-on-the-Oder. At the present time it possesses both a Catholic and a Lutheran faculty. Its medical faculty is in high repute. The total number of students in 1887 was 1347.

In no country was the influence of the Jesuits on the

universities more marked than in France. The civil wars in that country during the thirty years which preceded the close of the 16th century told with disastrous effects upon the condition of the university of Paris, and with the commencement of the 17th century its collegiate life seemed at an end, and its forty colleges stood absolutely deserted. To this state of affairs the obstinate conservatism of the academic authorities not a little contributed. The statutes by which the university was still governed were those which had been given by the cardinal D'Estouteville, the papal legate, in 1452, and remained entirely unmodified by the influences of the Renaissance. In 1579 the edict of Blois promulgated a scheme of organization for all the universities of the realm (at that time twenty-one in number),—a measure which, though productive of unity of teaching, did nothing towards the advancement of the studies themselves. The eminent lawyers of France, unable to find chairs in Paris, distributed themselves among the chief towns of the provinces. The Jesuits did not fail to profit by this immobility and excessive conservatism on the part of the university, and during the second half of the 16th century and the whole of the 17th they had contrived to gain almost a complete monopoly of both the higher and the lower education of provincial France. Their schools arose at Toulouse and Bordeaux, at Auch, Agen, Rhodéz, Périgueux, Limoges, Le Puy, Aubenas, Béziers, Tournon, in the colleges of Flanders and Lorraine, Douai and Pont-à-Mousson,—places beyond the jurisdiction of the parlement of Paris or even of the crown of France. Their banishment from Paris itself had been by the decree of the parlement alone, and had never been confirmed by the crown. "Lyons," says Pattison, "loudly demanded a Jesuit college, and even the Huguenot Lesdiguières, almost king in Dauphiné, was preparing to erect one at Grenoble. Amiens, Rheims, Rouen, Dijon, and Bourges were only waiting a favourable opportunity to introduce the Jesuits within their walls."² The university was rescued from the fate which seemed to threaten it only by the excellent statutes given by Richer in 1598, and by the discerning protection extended to it by Henry IV.

The "college of Edinburgh" was founded by charter of James VI., dated 14th April 1582. This document contains no reference to a studium generale, nor is there ground for supposing that the foundation of a university was at that time contemplated. In marked contrast to the three older centres in Scotland, the college rose comparatively untrammelled by the traditions of mediævalism, and its creation was not effected without some jealousy and opposition on the part of its predecessors. Its first course of instruction was commenced in the Kirk of Field, under the direction of Robert Rollock, who had been educated at St Andrews under Andrew Melville, the eminent Covenanter. "He began to teach," says Craufurd, "in the lower hall of the great lodging, there being a great concourse of students allured with the great worth of the man; but diverse of them being not ripe enough in the Latin tongue, were in November next put under the charge of Mr Duncan Narne, who, upon Mr Rollock's recommendation, was chosen second master of the college."³ In 1585 both Rollock and Narne subscribed the National Covenant, and a like subscription was from that time required from all who were admitted to degree in the college.

Disastrous as were the effects of the Thirty Years' War upon the external condition of the German universities, resulting in not a few instances in the total dispersion of the students and the burning of the buildings and libraries, they were less detrimental and less permanent than those which were discernible in the tone and temper of these

Halle

communities. A formal pedantry and unintelligent method of study, combined with a passionate dogmatism in matters of religious belief, and a rude contempt for the amenities of social intercourse, became the leading characteristics, and lasted throughout the 17th century. But in the year 1693 the foundation of the university of Halle opened up a career to two very eminent men, whose influence, widely different as was its character, may be compared for its effects with that of Luther and Melancthon, and served to modify the whole current of German philosophy and German theology. Halle has indeed been described as "the first real modern university." It was really indebted for its origin to a spirit of rivalry between the conservatism of Saxony and the progressive tendencies of the house of Brandenburg, but the occasion of its rise was the removal of the ducal court from Halle to Magdeburg. The archbishopric of the latter city having passed into the possession of Brandenburg in 1680 was changed into a dukedom, and the city itself was selected as the ducal residence. This change left unoccupied some commodious buildings in Halle, which it was decided to utilize for purposes of education. A "Ritterschule" for the sons of the nobility was opened, and in the course of a few years it was decided to found a university. Saxony endeavoured to thwart the scheme, urging the proximity of Leipsic; but her opposition was overruled by the emperor Leopold I., who granted (19th October 1693) the requisite charter, and in the following year the work of the university commenced. Frankfurt-on-the-Oder had by this time become a centre of the Reformed party, and the primary object in founding a university in Halle was to create a centre for the Lutheran party, but its character, under the influence of its two most notable teachers, Christian Thomasius and A. H. Francke, soon expanded beyond the limits of this conception to assume a highly original form. Thomasius and Francke had both been driven from Leipsic owing to the disfavour with which their liberal and progressive tendencies were there regarded by the academic authorities, and on many points the two teachers were in agreement. They both regarded with contempt alike the scholastic philosophy and the scholastic theology; they both desired to see the rule of the civil power superseding that of the ecclesiastical power in the seats of learning; they were both opposed to the ascendancy of classical studies as expounded by the humanists—Francke regarding the Greek and Roman pagan writers with the old traditional dislike, as immoral, while Thomasius looked upon them with contempt, as antiquated and representing only a standpoint which had been long left behind; both again agreed as to the desirability of including the elements of modern culture in the education of the young. But here their agreement ceased. It was the aim of Thomasius, as far as possible, to secularize education, and to introduce among his countrymen French habits and French modes of thought; his own attire was gay and fashionable, and he was in the habit of taking his seat in the professorial chair adorned with gold chain and rings, and with his dagger by his side. Francke, who became the leader of the Pietists, regarded all this with even greater aversion than he did the lifeless orthodoxy traditional in the universities, and was shocked at the worldly tone and disregard for sacred things which characterized his brother professor. Both, however, commanded a considerable following among the students. Thomasius was professor in the faculty of jurisprudence, Francke in that of theology. And it was a common predilection in those days with respect to a student who proposed to pursue his academic career at Halle, that he would infallibly become either an atheist or a Pietist. But the services rendered by Thomasius to learning were genuine and lasting. He was the first to set the example, soon

sius and
Francke.

after followed by all the universities of Germany, of lecturing in the vernacular instead of in the customary Latin; and the discourse in which he first departed from the traditional method was devoted to the consideration of how far the German nation might with advantage imitate the French in matters of social life and intercourse. His more general views, as a disciple of the Cartesian philosophy and founder of the modern Rationalism, exposed him to incessant attacks; but by the establishment of a monthly journal (at that time an original idea) he obtained a channel for expounding his views and refuting his antagonists which gave him a great advantage. On the influence of Francke, as the founder of that Pietistic school with which the reputation of Halle afterwards became especially identified, it is unnecessary here to dilate.¹ J. C. Wolf, who followed Thomasius as an assertor of the new culture, was driven from Halle by the accusations of the Pietists, who declared that his teaching was fraught with atheistical principles. In 1740, however, he was recalled by Frederick II., and reinstated in high office with every mark of consideration and respect. Throughout the whole of the 18th century Halle was the leader of academic thought and culture in Protestant Germany, although sharing that leadership, after the middle of the century, with Göttingen. The uni-^{Gottin-}versity of Göttingen (named after its founder "Georgia^{gen.} Augusta") was endowed with the amplest privileges as a university by George II. of England, elector of Hanover, 7th December 1736. The imperial sanction of the scheme had been given three years before (13th January 1733), and the university was formally opened 17th September 1737. The king himself assumed the office of "rector magnificientissimus," and the liberality of the royal endowments (doubling those of Halle), and the not less liberal character of the spirit that pervaded its organization, soon raised it to a foremost place among the schools of Germany. Halle had just expelled Wolf; and Göttingen, modelled on the same lines as Halle, but rejecting its Pietism and disclaiming its intolerance, appealed with remarkable success to the most enlightened feeling of the time. It included all the faculties, and two of its first professors—Mosheim, the eminent theologian, from Helmstädt, and Böhmer, the no less distinguished jurist, from Halle—together with Gesner, the man of letters, at once established its reputation. Much of its early success was also due to the supervision of its chief curator (there were two),—Baron Münchhausen, himself a man of considerable attainments, who by his sagacious superintendence did much to promote the general efficiency of the whole professoriate. Not least among its attractions was also its splendid library, located in an ancient monastery, and now containing over 200,000 volumes and 5000 MSS. In addition to its general influence as a distinguished seat of learning, Göttingen may claim to have been mainly instrumental in diffusing a more adequate conception of the importance of the study of history. Before the latter half of the 18th century the mode of treatment adopted by university lecturers was singularly wanting in breadth of view. Profane history was held of but little account, excepting so far as it served to illustrate ecclesiastical and sacred history, while this, again, was invariably treated in the narrow spirit of the polemic, intent mainly on the defence of his own confession, according as he represented the Lutheran or the Reformed Church. The labours of the professors at Göttingen, especially Putter, Gatterer, Schlözer, and Spittler, combined with those of Mascov at Leipsic, did much towards promoting both a more catholic treatment and a wider scope. Not less beneficial was the example set at Göttingen of securing the appointment of its professors by a less prejudiced and partial body than a university

¹ See Paulsen, *Gesch. des gelehrten Unterrichts*, &c., pp. 348-358.

board is only too likely to become "The great Munchausen, says an illustrious professor of that seminary, 'allowed our university the right of presentation, of designation, or of recommendation, as little as the right of free election; for he was taught by experience that, although the faculties of universities may know the individual's best qualified to supply their vacant chairs, they are seldom or never disposed to propose for appointment the domestic within their knowledge'"¹ The system of patronage adopted at Göttingen was, in fact, identical with that which had already been instituted in the universities of the Netherlands by Douza (see *infra*, p. 850) The university of Erlangen, a Lutheran centre, was founded by Frederick, margrave of Bareuth Its charter was granted by the emperor Charles VII, 21st February 1743, and the university was formally constituted, 4th November. From its special guardian, Alexander the last margrave of Ansbach, it was styled "Academia Alexandrina." In 1791, Ansbach and Bareuth having passed into the possession of Prussia, Erlangen became subject to the Prussian Government The number of the students, which at the commencement of the century was under 300, was 880 in 1887.

Erlangen.

The English and German universities compared.

On comparison with the great English universities, the universities of Germany must be pronounced inferior both in point of discipline and of moral control over the students. The superiority of the former in these respects is partly to be attributed to the more systematic care which they took, from a very early date, for the supervision of each student, by requiring that within a certain specified time after his entry into the university he should be registered as a pupil of some master of arts, who was responsible for his conduct, and represented him generally in his relations to the academic authorities. Marburg in its earliest statutes (those of 1529) endeavoured to establish a similar rule, but without success.² The development of the collegiate system at Oxford and Cambridge materially assisted the carrying out of this discipline. Although again, as in the German universities, feuds were not unfrequent, especially those between "north" and "south" (the natives of the northern and southern counties), the fact that in elections to fellowships and scholarships only a certain proportion were allowed to be taken from either of these divisions acted as a considerable check upon the possibility of any one college representing either element exclusively. In the German universities, on the other hand, the ancient division into nations, which died out with the 15th century, was revived under another form by the institution of national colleges, which largely served to foster the spirit of rivalry and contention. The demoralization induced by the Thirty Years' War and the increase of duelling intensified these tendencies, which, together with the tyranny of the older over the younger students, known as "Pennalismus," were evils against which the authorities contended, but ineffectually, by various ordinances. The institution of "Burschentum," having for its design the encouragement of good fellowship and social feeling irrespective of nationality, served only as a partial check upon these excesses, which again received fresh stimulus by the rival institution of "Landsmannschaften," or societies of the same nationality. The latter proved singularly provocative of duelling, while the arrogant and even tyranni-

¹ Hamilton, *Discussions*, p. 381.

² "Volumus neminem in hanc nostram Academiam admitti, aut per rectorem in album recipi, qui non habeat privatam atque domesticum preceptorem, qui ejus discipulum agnoscat, ad cujus iudicium quisque pro sua ingenii capacitate atque Marte lecturas et publicas et privatas nadiat, a ceteris latere aut raro aut nunquam discedat." Koch expressly compares this provision with the discipline of Oxford and Cambridge, which, down to the commencement of the present century, was very much of the same character (Koch, *Gesch. des akademischen Pädagogiums in Marburg*, p. 11).

cal demeanour of their members towards the unassociated students gave rise to a general combination of the latter for the purposes of self-defence and organized resistance. At all the great German universities both these forms of association are to be found existing at the present day.

The political storms which marked the close of the last and the commencement of the present century gave the death-blow to not a few of the ancient universities of Germany. Mainz and Cologne ceased to exist in 1798; Bamberg, Dillingen, and Duisberg in 1804; Rinteln and Helmstadt in 1809; Salzburg in 1810; Erfurt in 1816. Altdorf was united to Erlangen in 1807, Frankfort-on-the-Oder to Breslau in 1809, and Witteberg to Halle in 1815. The university of Ingolstadt was first moved in 1802 to Landshut, and from thence in 1826 to Munich, where it was united to the academy of sciences which was founded in the Bavarian capital in 1759. Of those of the above centres which altogether ceased to exist but few, however, were much missed or regretted,—that at Mainz, which had numbered some six hundred students, being the one notable exception. The others had for the most part fallen into a perfunctory and lifeless mode of teaching, and, with wasted or diminished revenues and declining numbers, had long ceased worthily to represent the functions of a university. Whatever loss may have attended their suppression has been far more than compensated by the activity and influence of the three great German universities which have risen in the present century. Munich has become a distinguished centre of study in all the faculties; and its numbers, allowing for the two great wars, have been continuously on the increase. The number of its professors in 1887 was over ninety, and that of its students at the commencement of the session 1886-87 3209.

Extinction of German universities during 1798-1815.

Munich.

The university of Berlin, known as the Royal Friedrich Wilhelm university, was founded in 1809, immediately after the peace of Tilsit, when Prussia had been reduced to the level of a third-rate power. Under the guiding influence of Wilhelm von Humboldt, however, the principles which were adopted in connexion with the new seat of learning not only raised it to a foremost place among the universities of Europe, but also largely conduced to the regeneration of Germany. A notable characteristic in the university of Berlin at the time of its foundation was its entire repudiation of attachment to any particular creed or school of thought, and professed subservience only to the interests of science and learning. "Each of the eminent teachers with whom the university began its life—F. A. Wolf, Fichte, Savigny, Reil—represented only himself, the path of inquiry or the completed theory which he had himself propounded. Its subsequent growth was astonishing. In 1813 Berlin had only 36 teachers altogether; in 1860 there were 173 in all,—97 professors, 66 privatdozenten, and 7 lecturers." In 1886 there were 296 teachers and 5357 students; and among the former a large proportion of the names are already of world-wide reputation, while its classical school stands unrivalled in Europe.

Berlin.

The university of Bonn, founded in 1818, and known as the Rhenish Friedrich Wilhelm university, has 88 professors and 1125 students. Equally distinguished as a school of philosophy and a school of theology, it is notable for the manner in which it combines the opposed schools of theological doctrine,—that of the Evangelical (or Lutheran) Church and that of the Roman Catholic Church here standing side by side, and both adorned by eminent names. This combination (which also exists at Tübingen and at Breslau) has been attended with complete success and (according to Dr Dollinger) with unmistakable advantages. When tried, however, a generation before, at Erfurt and at Heidelberg, its failure was not less conspicuous, and Erfurt was ruined by the experiment.

Bonn.

Statistics of German and British universities compared.

Dr Conrad, professor of political science at Halle, has recently made the statistics relating to the German universities the subject of a careful investigation and analysis, which offer some interesting results. The total cost of the universities of the German empire is shown to be much smaller than the total revenues of the English universities and colleges, although the number both of professors and students is much larger, and although 42 per cent. of the total expenditure is upon establishments, such as hospitals, museums, and so forth. But in Germany 72 per cent. of the cost of the universities is defrayed by the state, the students paying, in the shape of fees, only 9.3 per cent. To a great extent, however, the German universities are to be looked upon as professional schools, giving an education which directly fits a man to earn his bread as a clergyman, a lawyer, a judge, a physician, a schoolmaster, a chemist, an engineer, or an agriculturist. Notwithstanding the rapid growth in the numbers of the students, the growth of the professoriate has fully kept pace with it. In 1880 there were 1809 teachers at work in the German universities, more than half of whom (967) were full professors ("ordinarii"),—the proportion of teachers to students being 1 to 11. This is a much higher proportion than that of Oxford and Cambridge, although in them there is a large staff of college lecturers, which is practically more important than the university staff. It is higher again than the proportion of the Scottish universities, where there are only some 105 professors to between 5000 and 6000 students, a proportion of 1 to between 50 and 60 students. The increase in Germany has taken place partly by adding on fresh teachers for the old subjects, such as Latin and Greek, but still more by founding new chairs for new subjects, such as Oriental and Romance languages, geography, and archaeology, and by subdividing departments which have been recently developed, such as those connected with political economy, political science, physiology, and biology. Owing to the great development of natural science, the faculty of philosophy has at some centres increased to such an extent as to equal in numbers all the other faculties put together. This inconvenience has been

differently met at different universities. In those of Switzerland, no further remedy has been devised than that of appointing separate syndicates or boards of management for the two main divisions,—the philosophico-historic and the mathematical and natural-scientific; at Dorpat, Tübingen, and Strasburg, on the other hand, these divisions have been represented by the formation of two distinct faculties; while Tübingen, Munich, and Würzburg have created, in addition, a third faculty under which are grouped the several subjects of political economy, statistics, and finance.

The following table (taken from Conrad) exhibits the average of the total number of matriculated students at the German universities for every five years from 1831 to 1884; it brings the tendency to students form large centres very forcibly before the view. The three largest at German centres—Berlin, Leipzig, Munich—even in the first quinquennium appear as absorbing no less than 35 per cent. of the students, and in the last as many as 42 per cent. At the same time, there has lately been a no less notable increase among the centres of second magnitude. A quarter of a century ago only two universities had more than a thousand students; at present there are nine.

fluctuations of numbers.

In 1878 a comparison of the numbers of the students in the different faculties in the Prussian universities with those for the year 1867 showed a remarkable diminution in the faculty of theology, amounting in Lutheran centres to more than one-half, and in Catholic centres to nearly three-fourths. In jurisprudence there was an increase of nearly two-fifths, in medicine a decline of a third, and in philosophy an increase of one-fourth. During the last few years, however, the faculties of theology have made some progress towards regaining their former numbers.

Universities of United Provinces.

The universities of the United Provinces, like those of Protestant Germany, were founded by the state as schools for the maintenance of the principles of the Reformation and the education of the clergy, and afforded in the 16th and 17th centuries a grateful refuge to not a few of those Huguenot or Port-Royalist scholars whom persecution compelled to flee beyond the boundaries of France, as well as to the Puritan clergy who were driven from England.

Leyden.

The earliest, that of Leyden, founded in 1575, commemorated the gallant and successful resistance of the citizens to the Spanish fleet under Requesens. Throughout the 17th century Leyden was distinguished by its learning, the ability of its professors, and the shelter it afforded to the more liberal thought associated at that period with Arminianism. Much of its early success was owing to the wise provisions and the influence of the celebrated James Douza:—"Douza's principles," says Hamilton, "were those which ought to regulate the practice of all academical patrons; and they were those of his successors. He knew that at the rate learning was seen prized by the state in the academy would it be valued by the nation at large. . . . He knew that professors wrought more even by example and influence than by teaching, that it was theirs to pitch high or low the standard of learning in a country, and that, as it proved easy or arduous to come up with them, they awoke either a restless endeavour after an even loftier attainment, or lulled into a self-satisfied conceit." Douza was, for Leyden and the Dutch, what Münchhausen afterwards was for Göttingen and the German universities. "But with this difference: Leyden was the model on which the younger universities of the republic were constructed; Göttingen the model on which the older universities of the empire were reformed. Both Münchhausen and Douza proposed a high ideal for the schools founded under their auspices; and both, as first curators, laboured with paramount influence in realizing this ideal for the same long period of thirty-two years. Under their patronage Leyden and Göttingen took the highest place among the universities of Europe; and both have only lost their relative supremacy by the application in other seminaries of the same measures which had at first determined their superiority." The appointment of the professors at Leyden was vested in three (afterwards five) curators, one of whom was selected from the body of the nobles, while the other two were appointed by the states of the province,—the office being held for nine years, and eventually for life. With these was associated the mayor of Leyden for the time being. The university of Franeker was founded in 1585 on a somewhat less liberal basis than Leyden, the professors being required to declare their assent to the rule of faith embodied in the Heidelberg Catechism and the confession of the "Belgian Church." Its four faculties were those of theology, jurisprudence, medicine, and "the three languages and the liberal arts."¹ For a period of twelve years (*circa* 1610-1622) the reputation of the university was enhanced by the able teaching of William Ames ("Amesius"), a Puritan divine and moralist who had been driven by Bancroft from Cambridge and from England. His fame and ability are said to have

Franeker.

attracted to Franeker students from Hungary, Poland, and Russia. With like organization were founded—in 1600 the university of Harderwijk, in 1614 that of Groningen, and in 1634 that of Utrecht. The restoration of the House of Orange, and establishment of the kingdom of the Netherlands (23d March 1815), was followed by important changes in connexion with the whole kingdom. The universities of Franeker and Harderwijk were suppressed, while their place was taken by the newly-founded centres at Ghent (1816) and Liège (1816). A uniform constitution was given both to the Dutch and Belgian universities. It was also provided that there should be attached to each a board of curators, consisting of five persons, "distinguished by their love of literature and science and by their rank in society." These curators were to be nominated by the king, and at least three of them chosen from the province in which the university was situated, while the other two were to be chosen from adjacent provinces. After the redivision of the kingdom in 1831, Ghent and Liège were constituted state universities, and each received a subsidy from the Government (see BELGIUM). The university of Brussels, on the other hand, founded in 1834, is an independent institution, supported by the liberal party; while the reconstituted university at Louvain represents the party of Roman Catholicism, and is almost exclusively a theological school for the education of the Catholic clergy. The universities of Belgium are, however, somewhat heterogeneous bodies, and present in their organization a singular combination of French and German institutions. In Holland, the foundation of the university of Amsterdam (1877) has more than repaired the loss of Franeker and Harderwijk, and the progress of this new centre during the ten years of its existence has been remarkably rapid, so that it bids fair to rival, if not to outstrip, both Utrecht and Leyden. The higher education of women has made some progress in the Netherlands; and in 1882-83 there were eighteen women studying at Amsterdam, eleven at Groningen, four at Leyden, and seven at Utrecht.

attracted to Franeker students from Hungary, Poland, and Russia.

In Sweden the university of Lund, founded in 1668 and modelled on the same plan as its predecessor at Upsala, has adhered to its antiquated constitution with remarkable tenacity. At both these universities the mediæval division into "nations" is still in force among the students, the number at Upsala being no less than thirteen. The professoriate at both centres is much below the modern requirements in point of numbers. The university of Christiania in Norway, founded in 1811, and the Swedish universities are strongly Lutheran in character; and all alike are closely associated with the ecclesiastical institutions of the Scandinavian kingdoms. The same observation applies to Copenhagen,—where, however, the labours of Rask and Madvig have done much to sustain the reputation of the university for learning. The university of Kiel (1665), on the other hand, has come much more under Teutonic influences, and is now a distinguished centre of scientific teaching.

In France the fortunes of academic learning were even less happy than in Germany. The university of Paris was distracted, throughout the 17th century, by theological dissensions,—in the first instance owing to the struggle that ensued after the Jesuits had effected a footing at the Collège de Clermont, and subsequently by the strife occasioned by the teaching of the Jansenists. Its studies, discipline, and numbers alike suffered. Towards the close of the century a certain revival took place, and a succession of illustrious names—Pourchot, Rollin, Grenan, Coffin, Demontempuys, Crevier, Lebeau—appear on the roll of its teachers. But this improvement was soon interrupted by the controversies excited by the promulgation

of the bull Unigenitus in 1713, condemning the tenets of Quesnel, when Rollin himself, although a man of singularly pacific disposition, deemed it his duty to head the opposition to Clement XI and the French episcopate. At last, in 1762, the parlement of Paris issued a decree (August 6) placing the colleges of the Jesuits at the disposal of the university, and this was immediately followed by another for the expulsion of the order from Paris. Concurrently with this measure the prospects of the university assumed a more favourable character, the curriculum of its studies was extended, and both history and natural science began to be cultivated with a certain success. These better prospects were, however, soon obscured by the outbreak of the Revolution; and on the 15th September 1793 the universities and colleges throughout France, together with the faculties of theology, medicine, jurisprudence, and arts, were abolished by a decree of the Convention. The Collège de France, when restored in 1831, was reconstituted mainly as a school of adult instruction, for the most part of a popular character, and entirely dissociated from the university. It now numbers thirty-nine chairs, among which is one of the Slavonic languages and literature. The university of France (which succeeded to that of Paris) is at present little more than an abstract term, signifying the whole of the professional body under state control, and comprising various faculties at different centres—Paris, Montpellier, Nancy, &c., together with twenty-seven academical rectorates. Each of these rectorates presides over a local "conseil d'enseignement," in conjunction with which he elects the professors of lycées and the communal schoolmasters, whose formal appointment is then made by the minister of public instruction. There are ecclesiastics in some of the conseils d'enseignement, but the rectorates are all laymen who have graduated in one of the faculties. The great schools have also in no small measure supplemented the work of the universities by their advance in the direction of scientific instruction. Among the number the "École Pratique des Hautes Études" in Paris (31st July 1868) and the "École Polytechnique," which traces its origin as far back as the year 1794, are especially distinguished. The course of instruction at the former is divided into five sections—(1) mathematics, (2) physics and chemistry, (3) natural history and physiology, (4) history and philology, (5) economic science. At the latter the instruction is conceived solely with regard to the application of scientific principles to all branches of the public service, but more especially the military and mercantile. In 1875 the National Assembly passed an Act which enabled the Roman Catholic body to establish free universities of their own, and to confer degrees which should be of the same validity as those of the state university. At Lille and Angers such centres have been already organized. The university of Strasburg, which in the latter part of the last century had been distinguished by an intellectual activity which became associated with the names of Goethe, Herder, and others, was also swept away by the Revolution. It was, however, restored 1st May 1872, after the city had reverted to Germany, and was remodelled entirely on German principles. Since then its success has been marked and continuous.

Universities of Switzerland. Basel. Bern. Zurich. Geneva.

In Switzerland all the higher education is supported mainly by the German and Protestant cantons. The four universities of Basel, Bern, Zurich, and Geneva have an aggregate of some 1400 or 1500 students, and all possess faculties of philosophy, jurisprudence, theology, and medicine. Basel is, however, the chief centre for theology, as is Bern for jurisprudence and Zurich for philosophy. At Geneva the famous academy of the 16th and 17th centuries, long distinguished as a centre of Calvinistic teaching, is now represented by a university (first formed in 1876),

where the instruction is given (mainly in the French language) by a staff of forty-one professors, and where there is a rising school of science. Switzerland almost takes the lead in connexion with female education on the Continent, and in 1882-83 there were 52 women at the university of Geneva, 36 at Bern, and 24 at Zurich.

In Spain the universities at present existing are those of Barcelona, Granada, Madrid (transferred in 1837 from Alcalá), Oviedo, Salamanca, Santiago, Seville, Valencia, Valladolid, and Zaragoza. They are all, with the exception perhaps of Madrid, in a lamentably depressed condition, and mainly under the influence of French ideas and modelled on French examples. But in Portugal, Coimbra, which narrowly escaped suppression in the 16th century as a suspected centre of political disaffection, is now a flourishing school. Its instruction is given gratis; but, as all members of the higher courts of judicature and administration in the realm are required to have graduated at the university, it is at the same time one of the most aristocratic schools in Europe. There are five faculties, viz., theology, jurisprudence, medicine, mathematics, and philosophy. Of these, that of law is by far the most flourishing, the number of students in this faculty nearly equalling the aggregate of all the rest. There is a valuable library, largely composed of collections formerly belonging to suppressed convents. As a school of theology Coimbra is distinctly anti-ultramontane, and the progressive spirit of the university is shown by the fact that the rector has been instructed by the government to devise a scheme for the admission of women.

Universities of Spain and Portugal.

In Italy the universities are numerically much in excess of the requirements of the population, there being no less than sixteen state universities and four free universities. Very few of these possess theological faculties, and in no country are theological studies less valued. Education for the church is almost entirely given at the numerous "seminaries," where it is of an almost entirely elementary character. In 1875 a laudable effort was made by Bonghi, the minister of education, to introduce reforms and to assimilate the universities in their organization and methods to the German type. His plans were, however, to a great extent reversed by his successor, Coppino.

Italy.

In Austria the universities, being modelled on the same of system as that of Prussia, present no especially noteworthy features. Vienna is chiefly distinguished for its school of medicine, which enjoyed in the last century a reputation almost unrivalled in Europe. The other faculties were, however, suffered to languish, and throughout the first half of the present century the whole university was in an extremely depressed state. From this condition it was in a great measure restored by the exertions of Count Thun. The number of the matriculated students in 1887 was 4893, and that of the professors 138; among the latter the names of Zschokke, Maassen, Sichel, Jellinek, and Büdinger are some of the most widely known. The university of Olmütz, founded in 1581, was formerly in possession of what is now the imperial library, and contained also a valuable collection of Slavonic works which were carried off by the Swedes and ultimately dispersed. It was suppressed in 1853, and is now represented only by a theological faculty. The university of Graz, the capital of Styria, was founded in 1586, and is now one of the most flourishing centres, containing some 1200 students. The Salzburg university of Salzburg, founded in 1623, was suppressed in 1810; that of Lemberg, founded in 1784 by the emperor Joseph II., was removed in 1805 to Cracow and united to that university. In 1816 it was opened on an independent basis. In the bombardment of the town in 1848 the university buildings were burnt down, and the site was changed to what was formerly a Jesuit convent. The fine library and natural history museum were at the same time

Austria-Hungary. Vienna.

Olmütz.

Lemberg.

almost entirely destroyed. The university at the present time numbers over a thousand students. The most recent foundation is that of Czernowitz, founded in 1875, and numbering about 300 students. The universities of the Hungarian kingdom are three in number:—Budapest, originally founded at Tynau in 1635, now possessing four faculties— theology, jurisprudence, medicine, and philosophy (number of professors in 1885 180, students 3117); Kolozsvár (Klausenburg), now the chief Magyar centre, founded in 1872 and also comprising four faculties, but where mathematics and natural science supply the place of theology (number of professors in 1877 64, students 391); Zágráb (Agram), the Slavack university, in Croatia, founded in 1869 but not opened until 1874, with three faculties, viz., jurisprudence, theology, and philosophy. The chief centre of Protestant education is the college at Debreczin, founded in 1531, which in past times was not unfrequently subsidized from England. It now numbers over 2000 students, and possesses a fine library.

Russia possesses, besides Dorpat (*supra*, p. 845), seven other universities. (1) Helsingfors, in Finland, was originally established by Queen Christina in Åbo (1640), and removed in 1826 to Helsingfors, where the original charter, signed by the celebrated Oxenstierna, is still preserved. It has four faculties, 38 professors, and 700 students. (2) Moscow is really the oldest Russian university, having been founded in 1755; it includes the faculties of history, physics, jurisprudence, and medicine; the professors are 69 in number, the students about 1660. (3) The university of St Vladimir at Kieff, originally founded at Vilna in 1803, was removed from thence to Kieff in 1833; the students number about 900, and the library contains 107,000 volumes. (4) Kazan (1804) includes the same faculties as Moscow; the students are about 450 in number, and it has a library containing 80,000 volumes. (5) Kharkoff (1804) numbers 600 students, and its library 55,000 volumes. (6) St Petersburg (1819) includes the four faculties of history, physics, jurisprudence, and Oriental languages, and numbers 1500 students. (7) Odessa, founded in 1865, represents the university of New Russia. Generally speaking, the universities of Russia are not frequented by the aristocratic classes; they are largely subsidized by the Government and the annual fees payable by students are less than £7 a head. In 1863 the statutes of all the universities were remodelled; and since that time there has been a tendency to impress upon them a more national character, as distinguished from mere imitation of those in Germany.

The university of Athens (founded 22d May 1837) is modelled on the university systems of northern Germany, on a plan originally devised by Professor Brandis. It includes four faculties, viz., theology, jurisprudence, medicine, and philosophy. The professors (ordinary and extraordinary) are upwards of 60 in number, the students about 1500. There is also a school of pharmacy, chemistry, and anatomy, and a library of 130,000 volumes, with 800 manuscripts.

The history of the two English universities during the 16th and following centuries has presented, for the most part, features which contrast strongly with those of the Continental seats of learning. Both suffered severely from confiscation of their lands and revenues during the period of the Reformation, but otherwise have generally enjoyed a remarkable immunity from the worst consequences of civil and political strife and actual warfare. Both long remained centres chiefly of theological teaching, but their intimate connexion at once with the state and with the Church of England, as "by law established," and the modifications introduced into their constitutions, prevented their becoming arenas of fierce polemical contentions like

those which distracted the Protestant universities of Germany.

The influence of the Renaissance, and the teaching of Erasmus, who resided for some time at both universities, exercised a notable effect alike at Oxford and at Cambridge. The names of Colet, Grocyn, and Linac, illustrate this influence at the former centre; those of Bishop Fisher, Sir John Cheke, and Sir Thomas Smith at the latter. The labours of Erasmus at Cambridge, as the author of a new Latin version of the New Testament, with the design of placing in the hands of students a text free from the errors of the Vulgate, were productive of important effects, and the university became a centre of Reformation doctrine some years before the writings of Luther became known in England. The foundation of Christ's College (1505) and St John's College (1511), through the influence of Fisher with the countess of Richmond, also materially aided the general progress of learning at Cambridge. The Royal Injunctions of 1535, embodying the views and designs of Thomas Cromwell, mark the downfall of the old scholastic methods of study at both universities; and the foundation of Trinity College, Cambridge, in 1546 (partly by an amalgamation of two older societies), represents the earliest conception of such an institution in England in complete independence of Roman Catholic traditions. Trinity (1554) and St John's (1555) at Oxford, on the other hand, founded during the reactionary reign of Mary, serve rather as examples of a transitional period.

In the reign of Elizabeth Cambridge became the centre of another great movement—that of the earlier Puritanism, St John's and Queens' being the strongholds of the party led by Cartwright, Walter Travers, and others. Whitaker, the eminent master of St John's, although he sympathized to some extent with these views, strove to keep their expression within limits compatible with conformity to the Church of England. But the movement continued to gather strength; and Emmanuel College, founded in 1584, owed much of its early prosperity to the fact that it was a known school of Puritan doctrine. Most of the Puritans objected to the discipline enforced by the university and ordinary college statutes—especially the wearing of the cap and the surplice and the conferring of degrees in divinity. The Anglican party, headed by such men as Whitgift and Bancroft, resorted in defence to a repressive policy, of which subscription to the Acts of Supremacy and Uniformity, and the Elizabethan statutes of 1570 (investing the "caput" with larger powers, and thereby creating a more oligarchical form of government), were the most notable results. Oxford, although the Puritans were there headed by Leicester, the chancellor, devised at the same time a similar scheme, the rigid discipline of which was further developed in the Laudian or Caroline statutes of 1636. It was under these respective codes—the Elizabethan statutes of 1570 and the Laudian statutes of 1636—that the two universities were governed until the introduction of the new codes of 1858. During the Commonwealth the Puritan occupation and administration, at either university, were accompanied by little injury to the colleges, and were far less prejudicial to learning than the Royalist writers of the Restoration would lead us to suppose. William Dell, who was master of Caius College from 1649 to 1660, advocated the formation of schools of higher instruction in the large towns, a proposal which was then looked upon as one of but faintly masked hostility to the older centres.

During the 17th century Cambridge became the centre of another movement, a reflex of the influence of the Cartesian philosophy, which attracted for a time considerable attention. Its leaders, known as the Cambridge

Platon-
ism

Platonists, among whom Henry More, Cudworth, and Whichcote were especially conspicuous, were men of high character and great learning, although too much under the influence of an ill-restrained enthusiasm and purely speculative doctrines. The spread of the Baconian philosophy, and the example of a succession of eminent scientific thinkers, among whom were Isaac Barrow, master of Trinity (1673-77), the two Lucasian professors, Isaac Newton (prof 1669-1702) and his successor William Whiston (prof 1702-11), and Roger Cotes 'Plumian' prof 1707-16), began to render the exact sciences more and more an object of study, and the institution of the tripos examinations in the course of the first half of the 18th century established the reputation of Cambridge as a school of mathematical science. At Oxford, where so similar development took place, and where the statutable requirements with respect to study and exercises were suffered to fall into neglect, the degeneracy of the whole community as a school of academic culture is attested by evidence too emphatic to be gainsaid. The moral tone at both universities was at this time singularly low, and the rise of Methodism, as associated with the names of the two Wesleys and Whitehead at Oxford and that of Berridge at Cambridge, operated with greater effect upon the nation at large than on either of the two centres where it had its origin. With the advance of the present century, however, a perceptible change took place. The labours of Simeon at Cambridge, in connexion with the Evangelical party, and the far more celebrated movement known as Tractarianism, at Oxford, exercised considerable influence in developing a more thoughtful spirit at either university. At both centres, also, the range of studies was extended: written examinations took the place of the often merely formal *intra voce* ceremonies; at Cambridge classics were raised in 1824 to the dignity of a new tripos. The number of the students at both universities was largely augmented. Further schemes of improvement were put forward and discussed. And in 1850 it was decided by the Government to appoint commissioners to inquire what additional reforms might advantageously be introduced. Their recommendations were not all carried into effect, but the main results were as follows — "The professoriate was considerably increased, reorganized, and re-endowed, by means of contributions from colleges. The colleges were emancipated from their mediæval statutes, were invested with new constitutions, and acquired new legislative powers. The fellowships were almost universally thrown open to merit, and the effect of this was not merely to provide ample rewards for the highest academical attainments, but to place the governing power within colleges in the hands of able men, likely to promote further improvements. The number and value of scholarships was largely augmented, and many, though not all, of the restrictions upon them were abolished. The great mass of vexatious and obsolete oaths was swept away, and, though candidates for the M.A. degree and persons elected to fellowships were still required to make the old subscriptions and declarations, it was enacted that no religious test should be imposed at matriculation or on taking a bachelor's degree."¹

In 1869 a statute was enacted at Cambridge admitting students as members of the university without making it imperative that they should be entered at any hall or college, but simply be resident either with their parents or in duly licensed lodgings.

The entire abolition of tests followed next. After several rejections in parliament it was eventually carried as a Government measure, and passed the House of Lords in 1871.

In 1877 the reports of two new commissioners were followed by further changes, the chief features of which were the diversion of a certain proportion of the revenues of the colleges to the use of the university, especially with a view to the encouragement of studies in natural science; the enforcement of general and uniform regulations with respect to the salaries, selection, and duties of professors, lecturers, and examiners; the abolition (with a few exceptions) of all clerical restrictions on headships or fellowships; and the limitation of fellowships to a uniform amount.

That these successive and fundamental changes have, on the whole, been in unison with the national wishes and requirements may fairly be inferred from the remarkable increase in numbers during the last quarter of a century, and especially at Cambridge, where the number of undergraduates, which in 1862 was 1526, was in 1887 no less than 2979. In the academic year 1862-63 the number of matriculations was 448, and in 1886-87 1009.

Scarcely less influential, as a means of recovering for the two universities a truly national character, has been the work which both have been carrying on and by the institution of local examinations and of extension lectures. Of these two schemes, the former was initiated by both Oxford and Cambridge in the year 1858; the latter had its origin at Cambridge, having been suggested by the success attending a course of lectures to women delivered by Mr (now Professor) James Stuart, in 1867, in Liverpool, Manchester, Sheffield, and Leeds. By the former the standard of education throughout the country has been raised, both in public and in private schools. By the latter, instruction of the character and method which characterize university teaching has been brought within the reach of students of all classes and ages throughout the land.

So long ago as the year 1640 an endeavour had been made to bring about the foundation of a northern university for the benefit of the counties remote from Oxford and Cambridge. Manchester and York both petitioned to be made the seat of the new centre. Cromwell, however, rejected both petitions, and decided in favour of Durham. Here he founded the university of Durham (1657), endowing it with the sequestered revenues of the dean and chapter of the cathedral, and entitling the society "The Mentor or Provost, Fellows, and Scholars of the College of Durham, of the foundation of Oliver, &c." This scheme was cancelled at the Restoration, and not revived until the present century; but on the 4th July 1832 a bill for the foundation of a university at Durham received the royal assent, the dean and chapter being thereby empowered to appropriate an estate at South Shields for the establishment and maintenance of a university for the advancement of learning. The foundation was to be directly connected with the cathedral church, the bishop of the diocese being appointed visitor, and the dean and chapter governors; while the direct control was vested in a warden, a senate, and a convocation. A college, modelled on the plan of those at the older universities, and designated University College, Durham, was founded in 1837, Bishop Hatfield's Hall in 1846, and Bishop Cosin's Hall (which no longer exists) in 1851. The university includes all the faculties, and in 1865 there was added to the faculty of arts a school of physical science, including pure and applied mathematics, chemistry, geology, mining, engineering, &c. In 1871 the corporation of the university, in conjunction with some of the leading landed proprietors in the adjacent counties, gave further extension to this design by the foundation of a college of physical science at Newcastle-upon-Tyne, designed to teach scientific principles in their application to engineering, mining, manufactures, and agriculture.

Students who had passed the required examinations were made admissible as associates in physical science of the university. There is also a medical college which stands in similar relations to Durham, of which university Codrington College, Barbados, and Fourah Bay College, Sierra Leone, are likewise affiliated colleges.

Univer-
sity of
London.

The university of London had its origin in a movement initiated in the year 1825 by Thomas Campbell, the poet, in conjunction with Henry (afterwards Lord) Brougham, Mr (afterwards Sir) Isaac Lyon Goldsmid, Joseph Hume, and some influential Dissenters, most of them connected with the congregation of Dr Cox of Hackney. The scheme was originally suggested by the fact that Dissenters were practically excluded from the older universities; but the conception, as it took shape, was distinctly non-theological. The first council, appointed December 1825, comprised names representative of nearly all the religious denominations, including (besides those above mentioned) Zachary Macaulay, George Grote, James Mill, William Tooke, Lord Dudley and Ward, Dr Olinthus Gregory, Lord Lansdowne, Lord John Russell, and the duke of Norfolk. On 11th February 1826 the deed of settlement was drawn up; and in the course of the year seven acres, constituting the site of University College, were purchased, the foundation stone of the new buildings being laid by the duke of Sussex 30th April 1827. The course of instruction was designed to include "languages, mathematics, physics, the mental and the moral sciences, together with the laws of England, history, and political economy, and the various branches of knowledge which are the objects of medical education." In October 1828 the college was opened as the university of London. But in the meantime a certain section of the supporters of the movement, while satisfied as to the essential soundness of the primary design as a development of national education, entertained considerable scruples as to the propriety of altogether dissociating such an institution from the national church.

King's
College.

This feeling found expression in the foundation and incorporation of King's College (14th August 1829), opened 8th October 1831, and designed to combine with the original plan instruction in "the doctrines and duties of Christianity, as the same are inculcated by the United Church of England and Ireland." This new phase of the movement was so far successful that in 1836 it was deemed expedient to dissociate the university of London from University College as a "teaching body," and to limit its action simply to the institution of examinations and the conferring of degrees,—the college itself receiving a new charter, and being thenceforth designated as University College, London, while the rival institution was also incorporated with the university, and was thenceforth known as King's College, London. In the charter now given to the university it was stated that the king "deems it to be the duty of his royal office to hold forth to all classes and denominations of his faithful subjects, without any distinction whatsoever, an encouragement for pursuing a regular and liberal course of education." The charters of the university of London and of University College, London, were signed on the same day, 28th November 1836. In 1869 both the colleges gave their adhesion to the movement for the higher education of women which had been initiated elsewhere, and in 1880 ladies were for the first time admitted to degrees.

Victoria.

The Victoria University took its origin in the institution known as the Owens College, Manchester,—so called after a wealthy citizen of that name to whom it owed its foundation. The college was founded 12th March 1851, for the purpose of affording to students who were unable, on the ground of expense, to resort to Oxford or Cambridge an education of an equally high class with that given at those

centres. The institution was, from the first, unsectarian in character. In July 1877 a memorial was presented to the privy council praying for the grant of a charter to the college, conferring on it the rank of a university, to be called the "university of Manchester." The localization implied in this title having met with opposition from the Yorkshire College at Leeds, it was resolved that the university should be called the "Victoria University." Under this name the foundation received its charter 20th April 1880. "The characteristic features of the Victoria University, as compared with other British universities, are these—(a) it does not, like London, confer its degrees on candidates who have passed certain examinations only, but it also requires attendance on prescribed courses of academic study in a college of the university; (b) the constitution of the university contemplates its (ultimately) becoming a federation of colleges; but these colleges will not be situated, like those of Oxford and Cambridge, in one town, but wherever a college of adequate efficiency and stability shall have arisen. University College, Liverpool, and the Yorkshire College, Leeds, having fulfilled these requirements, have become affiliated with the university. The university, like the older bodies in England and Scotland, is at once a teaching and an examining body, and there is an intimate *rapproch* between the teaching and the examining functions. To give it a general or national character, the governing body consists partly of persons nominated by the crown and partly of representatives of the governing and teaching bodies of the colleges and of the graduates of the university. External examiners are appointed, who conduct the examinations in conjunction with examiners representing the teaching body. The graduates of the university meet its teachers in convocation to discuss the affairs of the university. Convocation will elect future chancellors, and a certain number of representatives on the court" (Thompson, *The Owens College, &c.*, p. 548). Like the Johns Hopkins University in America, the Victoria University has instituted certain fellowships (styled the Berkeley fellowships) for the encouragement of research.

In Scotland the chief change to be noted in connexion with the university of St Andrews is the appropriation in 1579 of the two colleges of St Salvator and St Leonard to the faculty of philosophy, and that of St Mary to theology. In 1747 an Act of Parliament was obtained for the union of the two former colleges into one. Glasgow, in the year 1577, received a new charter, and its history from that date down to the Restoration was one of almost continuous progress. The restoration of Episcopacy, however, involved the alienation of a considerable portion of its revenues, and the consequent suspension of several of its chairs. In 1864 the old university buildings were sold, and a Government grant having been obtained, together with private subscriptions, the present new buildings were erected from the joint fund. The faculties now recognized at Glasgow are those of arts, theology, jurisprudence, and medicine. At Aberdeen an amalgamation, similar to that at St Andrews, took place, by virtue of the Universities Act of 1858, of the two universities of King's College and Marischal College. In conjunction with Glasgow, this university returns a member to parliament. The peculiar constitution of the college at Edinburgh, as defined by its charter (the government being vested entirely in the lord provost, magistrates, and council, as patrons and guardians), involved the senate in frequent collisions with the town council. The latter, being a strictly representative body, included elements with which the senate of the university sometimes found it difficult to work harmoniously, and its disposition to dictate was strongly resented by the distinguished metaphysician and professor Sir William Hamilton. On the other hand, the council sometime

sity of
Edin-
burgh.

exercised a beneficial discretion by appointing professors of ability whom the senate might have regarded as ineligible on the ground of their religious tenets. The Disruption of 1843 emancipated the lay professors from subscription to the Established Church of Scotland, and resulted in many of the important changes which were subsequently introduced in the Universities Act of 1858. On the 28th October 1859 the town council, notwithstanding that their powers were already terminated, by the provisions of the Act, availed themselves of a technical right to appoint a principal,—their choice falling upon Sir David Brewster. The great landmark in the history of the Scottish as in that of the English universities is represented by the remodelling of the several constitutions of these bodies in the year 1856. The commissioners of 1858-62 left the university of Edinburgh in the possession of constitutional autonomy, with its studies and degrees regulated by ordinances. The students also received the rectorial franchise, but were not, as at Glasgow and Aberdeen, divided into nations. In arts the B.A. degree was abolished, the M.A. representing the only degree in this faculty, as at the other Scottish universities. The course of study was divided into three departments:—(1) classics; (2) mathematics, including natural philosophy; (3) mental science and English literature. In each department, it was required that there should be an additional examiner besides the professor, so that the candidates should not be entirely examined by their own teachers. It was also provided that, instead of one examination for the degree at the end of a student's course, examinations in each of the departments might be passed separately. In the twenty years beginning with 1863, 1400 M.A. degrees have been conferred, as against 250 in the twenty years preceding. In the faculty of medicine, the original single degree of doctor of medicine gave place to three classes—bachelor of medicine (M.B.), master in surgery (C.M.), and doctor of medicine (M.D.). In 1866 it was further laid down that these should no longer be demanded from candidates for the lower degrees of M.B. and C.M., and, on the other hand, that the degree of M.D. should not be conferred on persons not showing any evidence of medical study after leaving the university, but that a thesis should be invariably required. Since the enactment of these ordinances the number of the medical students has increased from about 500 to over 1700. In the faculty of law the title of the degree was to be LL.B., and it was to be conferred only on those who had already graduated as M.A. But the minor degree, that of "bachelor of law" (B.L.), might be conferred if the candidate had attended one course of lectures in the faculty of arts, and passed a preliminary examination in (1) Latin, (2) Greek, French or German, and (3) any two of the three subjects—logic, moral philosophy, and mathematics. The chair of public law, which had fallen into abeyance in 1832, was reconstituted, and the chair of universal civil history was converted into a professorship of history and constitutional law. The degree of doctor of laws was left, as before, a purely honorary degree. Chairs of Sanskrit, engineering, geology, commercial and political economy, education, fine art, and the Celtic languages have also been founded. By the Representation of the People (Scotland) Act, 1868, the universities of Edinburgh and St Andrews were empowered to return jointly a member to the House of Commons.

A parliamentary return for the ten years ending 30th March 1883 showed that the sums voted annually by parliament or chargeable on the consolidated fund to the four universities had amounted during that period to £65,821 for Aberdeen, £85,906 for Edinburgh, £66,182 for Glasgow, and £33,111 for St Andrews. In addition to these sums Edinburgh had received £80,000 and Glasgow £20,000 in the form of special grants in aid.

Parliamentary grants to Scottish universities.

Trinity College, Dublin, was founded in 1591, under the auspices of Sir John Perrot, the Irish viceroy. A royal charter nominated a provost and a minimum number of three fellows and three scholars as a body corporate, empowered to establish among themselves "whatever laws of either of the universities of Cambridge or Oxford they may judge to be apt and suitable; and especially that no other persons should teach or profess the liberal arts in Ireland without the queen's special licence." The first five provosts of Trinity College were all Cambridge men, and under the influence of Archbishop Loftus, the first provost, and his successors, the foundation received a strongly Puritan bias. Prior to the year 1873 the provostship, fellowships, and foundation scholarships could be held only by members of the Church of Ireland; but all such restrictions were abolished by Act 36 Vict. c. 21, whereby the requirement of subscription to any article or formula of faith was finally abrogated. As at present constituted, the ordinary government is in the hands of the provost and senior fellows in conjunction with the visitors and council,—the supreme authority being the crown, except so far as limited by Act of Parliament.

The first departure in Ireland from the exclusive system of education formerly represented by the foundation at Dublin, dates from the creation of the Queen's University, incorporated by royal charter 3d September 1850. By this charter the general legislation of the university, together with its government and administration, was vested in the university senate. In 1864 the charter of 1850 was superseded by a supplementary charter, and the university reconstituted "in order to render more complete and satisfactory the courses of education to be followed by students in the colleges"; and finally, in 1880, by virtue of the Act of Parliament known as the University Education (Ireland) Act, 1879, the Queen's University gave place to the Royal University of Ireland, which was practically a reconstitution of the former foundation, the dissolution of the Queen's University being decreed so soon as the newly constituted body should be in a position to confer degrees; at the same time all graduates of the Queen's University were recognized as graduates of the new university with corresponding degrees, and all matriculated students of the former as entitled to the same status in the latter. The university confers degrees in arts (B.A., M.A., D.Litt.), science, engineering, music, medicine, surgery, obstetrics, and law. The preliminary pass examinations in arts are held at annually selected centres,—those chosen in 1885 being Dublin, Belfast, Carlow, Cork, Galway, Limerick, and Londonderry. All honour examinations and all examinations in other faculties are held in Dublin. The Queen's Colleges at Belfast, Cork, and Galway were founded in December 1845, under an Act of Parliament "to enable Her Majesty to endow new colleges for the advancement of learning in Ireland," and were subsequently incorporated as colleges of the university. Their professors were at the same time constituted professors in the university, and conducted the examinations. But in the reconstruction of 1880 the chief share in the conduct of the examinations and advising the senate with respect to them was vested in a board of fellows, elected by the senate in equal numbers from the non-denominational colleges and the purely Catholic institutions. The colleges retain, however, their independence, being in no way subject to the control of the university senate except in the regulations with respect to the requirements for degrees and other academic distinctions. On the other hand, the obligation formerly imposed of a preliminary course of study at one or other of the colleges before admission to degrees was abolished at the foundation of the Royal University, the examinations being now open, like those of the university

of London, to all matriculated students on payment of certain fees.

There is at present no university of Wales, although the bestowal of a royal charter before long is confidently anticipated. The oldest college, that of St David's at Lampeter, possesses the right of conferring degrees. It was founded in 1822 for the purpose of educating clergymen in the principles of the Established Church of England and Wales, mainly for the supply of the Welsh dioceses. The number of the professors in 1887 was 8, and the number of the students 120. The next college in order of foundation is Aberystwith. It was founded 9th October 1872, but possesses no charter, and is mainly supported by the Dissenting bodies. The staff of professors numbers 13, and the students number 150. The University College of South Wales and Monmouthshire at Cardiff was founded in 1883. The number of professors in 1887 was 9, lecturers 4, demonstrators 2; number of students 140. The University College of North Wales at Bangor received its charter 4th June 1885, its object being to "provide instruction in all the branches of a liberal education except theology." Its staff consists of a principal, 8 professors or lecturers, and 2 demonstrators; the number of the students is 127. There is also a hall of residence for women students. At each of these three last-named colleges students proceeding to degrees have to go through either a London, Edinburgh, Glasgow, or Dublin course of study, but at Edinburgh, Glasgow, and Dublin a certain proportion of the term of residence ordinarily required is remitted in their favour.

In India, the three older universities all date from 1857,—that of Calcutta having been incorporated January 24, Bombay July 18, Madras September 5, in that year. At these three universities the instruction is mainly in English. "A university in India is a body for examining candidates for degrees, and for conferring degrees. It has the power of prescribing text-books, standards of instruction, and rules of procedure, but is not an institution for teaching. Its governance and management are vested in a body of fellows, some of whom are *ex officio*, being the chief European functionaries of the state. The remainder are appointed by the Government, being generally chosen as representative men in respect of eminent learning, scientific attainment, official position, social status, or personal worth. Being a mixed body of Europeans and natives, they thus comprise all that is best and wisest in that division of the empire to which the university belongs, and fairly represent most of the phases of thought and philosophic tendencies observable in the country. The fellows in their corporate capacity form the senate. The affairs of the university are conducted by the syndicate, consisting of a limited number of members elected from among the fellows. The faculties comprise arts and philosophy, law, medicine, and civil engineering. A degree in natural and physical science has more recently been added" (Sir R. Temple, *India in 1880*, p. 145). The Punjab university was incorporated in 1883,—the Punjab University College, prior to that date, having conferred titles only and not degrees. The main object of this university is the encouragement of the study of the Oriental languages and literature, and the rendering accessible to native students the results of European scientific teaching through the medium of their own vernacular. The Oriental faculty is here the oldest, and the degree of B.O.L. (bachelor of Oriental literature) is given as the result of its examinations. At the Oriental College the instruction is given wholly in the native languages. In 1887 the senate at Cambridge (mainly on the representations of Mr C. P. Lbert, formerly vice-chancellor of the university of Calcutta) adopted resolutions whereby some forty-nine collegiate institutions already affiliated to the latter body were affiliated to the university of Cambridge, their students thus becoming entitled to the remission of one year in the ordinary statutable requirements with respect to residence at Cambridge. It is at these institutions, and the colleges of the first or second grade in the other presidencies, that the instruction is given.

In Australia, the university of Sydney was incorporated by an Act of the colonial legislature which received the royal assent 9th December 1851, and on 27th February 1853 a royal charter was granted conferring on graduates of the university the same rank, style, and precedence as are enjoyed by graduates of universities within the United Kingdom. Sydney is also one of the institutions associated with the university of London from which certificates of having received a due course of instruction may be received with

a view to admission to degrees. There are four faculties, viz., arts, law, medicine, and science. The design of the university is to supply the means of a liberal education to all orders and denominations, without any distinction whatever. An Act for the purpose of facilitating the erection of colleges in connexion with different religious bodies was, however, passed by the legislature during the session of 1884, and since that time colleges representing the Episcopalian, Presbyterian, and Roman Catholic Churches have been founded. In 1885 the total number of students attending lectures in the university was 206. The university of Melbourne, in the colony of Victoria, was incorporated and endowed by royal Act 22d January 1853. This Act was amended 7th June 1881. Here also no religious tests are imposed on admission to any degree or election to any office. The council is empowered, after due examination, to confer degrees in all the faculties (excepting divinity) which can be conferred in any university within the British dominions. It is also authorized to affiliate colleges; and Trinity College (Church of England) was accordingly founded in 1870 and Ormond College (Presbyterian) in 1879. The founding of a university for Queensland is at the present time in contemplation. The university of Adelaide in South Australia (founded mainly by the exertions and munificence of Sir Walter Watson Hughes) was incorporated by an Act of the colonial legislature in 1874, in which year it was further endowed by Sir Thomas Elder. In 1881 letters patent were granted by the English crown whereby degrees conferred by the university were constituted of equal validity with those of any university of the United Kingdom. The faculties in the university are those of arts, medicine, law, science, and music. The number of matriculations since the foundation amounted in 1886 to 284, the number of undergraduates in that year being 90.

The university of New Zealand, founded in 1870, and reconstituted in 1874 and 1875, is empowered by royal charter to grant the several degrees of bachelor and master of arts, and bachelor and doctor in law, medicine, and music. Women are admitted to degrees. To this the Auckland University College, Nelson College, Canterbury College, and the university of Otago stand in the relation of affiliated institutions. This last-named institution was founded in 1869 by an order of the provincial council, with the power of conferring degrees in arts, medicine, and law, and received as an endowment 100,000 acres of pastoral land. It was opened in 1871 with a staff of three professors, all in the faculty of arts. In 1872 the provincial council further subsidized it by a grant of a second 100,000 acres of land, and the university was now enabled to make considerable additions to the staff of professors and lecturers, to establish a lectureship in law, and to lay the foundations of a medical school. In 1874 an agreement was made between the university of New Zealand and that of Otago, whereby the functions of the former were restricted to the examination of candidates for matriculation, for scholarships, and for degrees; while the latter bound itself to become affiliated to the university of New Zealand, to hold in abeyance its power of granting degrees, and to waive the claim which it had advanced to a royal charter. As the result of this arrangement, the university of Otago became possessed of 10,000 acres of land which had been set apart for university purposes in the former province of Southland. In 1877 a school of mines was established in connexion with the university.

In Canada the McGill College and University at Montreal was founded by royal charter in 1821 (amended in 1852) on the foundation of the Honourable James McGill, who died at Montreal 19th December 1813. A number of colleges and schools throughout the province stand in the relation of affiliated institutions. The university is Protestant but undenominational. It includes the faculties of arts, applied sciences, medicine, and law. In 1885 the total number of students, including women, was 526. The university of Toronto was originally established by royal charter in 1827, under the title of King's College, with certain religious restrictions, resembling those at that time in force at the English universities, but in 1834 these restrictions were abolished, and in 1849 the designation of the university was changed into that of the university of Toronto. In 1873 further amendments were made in the constitution of the university. The chancellor was made elective for a period of three years by convocation, which was at the same time reorganized so as to include all graduates in law, medicine, and surgery, all masters of arts, and bachelors of arts of three years standing, all doctors of science, and bachelors of science of three years standing. The powers of the senate were also extended to all branches of literature, science, and the arts, to granting certificates of proficiency to women, and to affiliating colleges. The work of instruction is performed by University College, which is maintained out of the endowment of the provincial university, and governed by a council composed of the residents and the professors. Its several chairs include classical literature, logic and rhetoric, mathematics and natural philosophy, chemistry and experimental philosophy, history and English literature, mineralogy and geology, metaphysics and ethics, meteorology and natural history, and lectureships on Oriental literature, German, and French. Other universities and colleges with power to confer

Other Canadian universities. degrees are the Victoria University at Cobourg (1836), supported by the Methodist Church of Canada; Queen's University, Kingston (1841), representing the Presbyterian body; and the university of Trinity College, Toronto, founded in 1851 on the suppression of the faculty of divinity in King's College. Lennoxville is a centre for university instruction in conformity with Church of England principles.

Cape of Good Hope. In Africa, an Act for the incorporation of the university of the Cape of Good Hope received the royal assent 26th June 1873, the council being empowered to grant degrees in arts, law, and medicine.

Universities of the United States. In the United States of America university education has received a great extension, without, however, exercising in Europe that reflex influence discernible in so many other relations. The report of the commissioners of education for 1883-84 gives a list of no less than 370 degree-giving universities or colleges; but of these a large proportion are sectarian, others represent only a single faculty, and nearly nine-tenths have been founded within the last thirty-five years. Although a higher education has unquestionably been thus very widely diffused, the undue multiplication of centres has, in some provinces, lowered the standard of attainment and led to a consequent depreciation in the value of university degrees. This tendency it was sought to counteract in the State of Ohio, some twenty-five years ago, by an organization of the different colleges. The instruction given is, in most cases, almost gratuitous, the charge to each student being less than 30 dollars a year. This cheapening of a higher education is not, however, attended with quite the same results as in Germany (where lads with little aptitude for a professional career are thus attracted to the professions), the rapidly increasing population and the wider scope for mechanical or agricultural pursuits probably exercising a beneficial counteracting influence. The distinguishing characteristics which belong to these numerous centres are described by the president of the Johns Hopkins University, in an address delivered at Harvard in 1886, as suggestive of four different classes of colleges,—(1) those which proceed from the original historic colleges, (2) those established in the name of the State, (3) those avowedly ecclesiastical, (4) those founded

by private benefactions. To the first class belong Harvard College and Yale College with their offshoots. Of these two, the former was founded in 1638 at Cambridge, Massachusetts, by a former fellow of Emmanuel College at Cambridge in England, and represented the Puritan tenets for which the parent society was at that time noted; the latter was founded in 1701 by the combined action of a few of the ministers of the State, a charter being given in the same year by the colonial legislature. It was for a long time chiefly supported by the Congregationalists, but is now unsectarian. The total number of students at Harvard in 1882 was 988, at Yale 692. The university of Pennsylvania was founded in 1751 by Thomas Penn and Richard Penn, on the lines of a scheme drawn up by Benjamin Franklin, and was from the first placed on a basis comprising all denominations. It is distinguished by the liberality with which it has opened its courses of instruction to the inhabitants of the city generally; the degree of Ph.D. is conferred on all comers after due examination. At Haverford and Lafayette Colleges, and also at the Lehigh university, "advanced degrees" are offered "only for higher study, prolonged beyond the collegiate course," instead of being conferred as a matter of routine after a certain term of years. The Johns Hopkins University, also an unsectarian body, was founded at Baltimore in 1867, and is already a school of established reputation, and especially resorted to by those designing to follow the profession of teachers. It is also distinguished by the possession of fellowships, to be held only by students intending to pursue some especial line of original research. Other steadily growing centres are Columbia College in New York, founded in 1754; the Cornell University, also unsectarian, recently enriched by the acquisition of a considerable endowment; Brown's University in Providence; and those of Princeton, Michigan, Virginia, and California. At Amherst College, where the number of students in 1882 was 339, the experiment has recently been made of partially dispensing with examinations during the course of

study, where the students give evidence of having made satisfactory progress. Considerable modifications have also taken place in the courses of study, nearly all the colleges having now adopted the system of "parallel courses," and the principle of selection between these. Female education has received in America an extension which it has attained in no other country, and one of the colleges (that of Wellesley) numbers several hundred students. Since the war of 1861 a greatly increased attention has been given throughout the universities to physical training and athletic exercises, and excellent gymnasia, constructed on German models, have been erected.

The accompanying table (p. 857), prepared by the council of education for the year 1883-84, shows the distribution of these centres in the different States, together with their numbers, revenues, libraries, and the estimated value of their endowments.

Authorities.—On the earlier history and organization of the mediæval universities, the student should consult F. C. von Savigny, *Gesch. d. römischen Rechts im Mittelalter*, 7 vols., 1826-51; for the university of Paris, Du Boulay, *Historia Universitatis Parisiensis*, 6 vols., Paris, 1665, Crevier, *Hist. de l'Université de Paris*, 7 vols., Paris, 1761, and C. Jourdain, *Hist. de l'Université de Paris ou d'Yves et au XIII^e Siècle*, Paris, 1852; of these the work of Du Boulay (Boulay) is one of great research and labour, but wanting in critical judgment, while that of Crevier is little more than a readable outline drawn from the former. The views of Du Boulay have been challenged on many important points by P. H. Denifle in the first volume of his *Die Universitäten des Mittelalters bis 1400* (1885), and more particularly on those relating to the organization of the early universi-

ties. The work of Meiners, *Gesch. d. Entstehung u. Entwicklung der hohen Schulen unsers Erdtheils*, 4 vols. (1802-3), must be regarded as almost superseded as a general history, and the same may be said of Huber's work on the English universities, *Die englischen Universitäten* (Casel, 1839-40), translated by F. W. Newman, 3 vols. (1845). Much useful criticism on both the English and the Continental universities will be found in Sir W. Hamilton's *Discussions*, &c., 1853. For the German universities, the works of Zarncke, *Die deutschen Universitäten im Mittelalter* (Leipsic, 1857), and Peisner, *Gesch. d. gelehrten Unterrichts auf den deutschen Schulen und Universitäten* (Leipsic, 1885), will be found the most trustworthy,—the former for the mediæval, the latter for the modern period. To these may be added two articles by Paulsen in vol. xlv. of Von Sybel's *Historische Zeitschrift*—(1) "Gründung" and (2) "Organisation u. Lebensordnungen d. deutschen Universitäten im Mittelalter"; Tholuck, *Das akademische Leben des 17. Jahrhunderts*, 2 vols. (Halle, 1853-54); Von Raumer, *Gesch. d. Pädagogik*, vol. iv. (4th ed., 1872); Dolch, *Gesch. d. deutschen Studententhums* (1858); Sebel, *Die deutschen Universitäten* (2d ed., 1874); and Dr J. Comair, *The German Universities for the last Fifty Years*, translated by Hutchinson, with preface by James Bryce, M.P. (Glasgow, 1885). For Oxford, there are the laborious collections by Anthony Wood, *History and Antiquities of the University and of the Colleges and Halls of Oxford*, edited with continuation by Rev. J. Gutch, 5 vols. (1786-96), and *Historia et Fasti Oxonienses*, edited by Di P. Bliss, 4 vols. (1813-20); also the publications of the Oxford Historical Society; *A History of the University of Oxford from the Earliest Times to 1530*, by H. C. Maxwell Lyte (1886); and *Statutes of the University of Oxford compiled in 1635 under Authority of Archbishop Laud*, ed. Griffiths (Oxford, 1888). For Cambridge, the researches of C. H. Cooper, greatly surpassing those of Wood in thoroughness and impartiality, are comprised in three series: (1) *Annals of Cambridge*, 4 vols. (1842-52); (2) *Athenæ Cantabrigienses, 1500-1600*, 2 vols. (1858-61); (3) *Memorials of Cambridge*, 3 vols. (new ed., 1884). The *Architectural History of the University of Cambridge and of the Colleges*, by the late Robert Willis, edited and continued by J. Willis Clark, 4 vols. (1886), is a work of admirable thoroughness and completeness. To these may be added *Cambridge in the Seventeenth Century; Lives of Nicholas Ferrar and Matthew Robinson*, by Prof. John E. B. Mayor, 2 vols. (1855, 1856); and Baker's *History of the College of St John the Evangelist, Cambridge*, edited by Mayor, 2 vols. (1869); also J. B. Mullinger, *History of the University of Cambridge from the Earliest Times to Accession of Charles I.*, 2 vols. (1873-5). For both universities see the *Documents* issued by the Oxford and Cambridge Commissions of 1838; also the Wood, Hearne, Tanner, and Rawlinson MSS., and the Cottonian, Harleian, Lansdowne (especially Kennett and Stuype), Baker, and Cole collections.

UNTERWALDEN is one of the Forest cantons of Switzerland, ranking as sixth in the Confederation. It is composed of two valleys through which run two streams both called the Aa, and which are called Obwald and Nidwald from their position with regard to the great forest of the Kernwald in which they are situated. In old documents the inhabitants are always described as "homines intramontani," whether "vallis superioris" (Obwald) or "vallis inferioris" (Nidwald). The total area of Obwald is 183.3 square miles, 154.2 of which are classed as productive (forests 37.6), while of the remainder 3.8 are covered by glaciers and 4.3 by lakes. The area of Nidwald is 112.1 square miles, 84.1 being productive (forests 27.7); of the rest the cantonal bit of the Lake of Lucerne covers 12.8. The highest point in the canton is the Titlis (10,627 feet) in Obwald.

The census of 1880 returned the population of Obwald as 15,356, an increase of 941 on 1870, and that of Nidwald as 11,992, an increase of 291. In both the women have a small majority over the men. The native tongue of practically the whole population is German (15,254 in Obwald, 11,869 in Nidwald), and they are nearly all Roman Catholics (15,078 in Obwald, 11,901 in

Nidwald). Till 1814 the canton was in the diocese of Constance; since that time it has (like Uri) formed legally part of no diocese, though it is provisionally administered by the bishop of Chur. The capital of Obwald is Sarnen (4039 inhabitants), Kerns (2500) being the only other place which is more than a village; that of Nidwald is Stanz (2210). The population is purely agricultural and pastoral. In Obwald the forests are remarkable, in Nidwald the fiery energy of the inhabitants. In educational matters the standard is not very high, but is being gradually raised. At the head of the Nidwald valley (but legally in Obwald) stands the great Benedictine monastery of Engelberg, founded in 1121. There are no railways, but one is being made from Lucerne through Obwald over the Brüning Pass to Meyringen in Bern.

Historically Obwald was part of the Aargau, and Nidwald of the Zurichgau. In both there were many great landowners (specially the abbey of Murbach and the Hapsburgs) and few free men; while the fact that the Hapsburgs were counts of the Aargau and the Zurichgau further delayed the development of political freedom. Both took part in the risings of 1245-47, and in 1248 Sarnen was threatened by the pope with excommunication for opposing its hereditary lord, the count of Hapsburg. The alleged cruelties committed by the Hapsburgs do not, however, appear in history till

Justinger's *Chronicle*, 1420 (see TELL). On April 16, 1291, Rudolph the future emperor bought from Murbach all its estates in Unterwalden and thus ruled this district as the chief landowner, as count, and as emperor. On 1st August 1291 Nidwald formed the "Everlasting League" with Uri and Schwyz (this being the first known case in which its common seal is used), Obwald joining a little later on. In 1304 the two valleys were joined together under the same imperial ban, and in 1309 Henry VII. confirmed to them all the liberties granted by his predecessor—though none are known to have been granted. However, this placed Unterwalden on an equal political footing with Uri and Schwyz; and as such it took part in Morgarten fight (also driving back an invasion over the Brunig Pass) and in the renewal of the Everlasting League at Brunnen (1315), as well as at Sempach (1386), and in driving back the Gessler or English freebooters (1375). For physical reasons, it was difficult for Unterwalden to enlarge its territories. Yet in 1368 it required Alpach, and in 1378 Heggiswyl. So too Obwald shared with Uri in the conquest of the Val Leventina (1403), and in the purchase of Bellinzona (1419), as well as in the loss of both (1426). It was Nidwald that, with Schwyz and Uri, finally won (1500) and ruled (till 1798) Bellinzona, Riviera, and Val Blegno; while both shared in conquests of Aargau (1415), Thurgau (1460), and Locarno, &c. (1512), and in the temporary occupation of the Val d'Osola (1410-14 to 1417-22). In the Burgundian war Unterwalden, like the other Forest cantons, long hung back through jealousy of Bern, but came to the rescue in time of need. In 1481 it was at Stanz that the Confederates nearly broke up the League for various reasons, and it was only by the intervention then of the holy hermit Nicholas von der Fide (of Sachseln in Obwald) that peace was restored, and the great federal agreement known as the compact of Stanz concluded. Like the other Forest cantons, Unterwalden clung to the old faith at the time of the Reformation, being a member of the "Christliche Vereinigung" (1529) and of the Golden League (1586).

In 1798 Unterwalden resisted the Helvetic republic, but, having formed part of the short-lived Tellgau, became a district of the canton of the Waldstätten. Obwald submitted at an early date, but Nidwald, refusing to accept the oath of fidelity to the constitution mainly on religious grounds, rose in desperate revolt (September 1798), and was only put down by the arrival of 15,000 armed men and by the storming of Stanz. In 1803 its independence as a canton was restored, but in 1815 Nidwald refused to accept the new constitution, and federal troops had to be employed to put down its resistance, the punishment inflicted being the transfer to Obwald of the jurisdiction over the abbey lands of Engelberg (since 1421 "protected" by both valleys), which in 1798 had fallen to the lot of Nidwald. Since that time the history of Unterwalden has been like that of the other Forest cantons. It was a member of the "League of Sarnen" (1832), to oppose the reforming wishes of other cantons, and of the "Sonderbund" (1843); it was defeated in the war of 1847; and it voted against the acceptance of the federal constitution both in 1848 and in 1874. It forms at present two half cantons, each sending one representative to the federal "assembly of states." In local matters the two valleys are independent. In each the supreme authority is the "Landsgemeinde" (meeting on the last Sunday in April), composed of all male citizens of twenty (Obwald) or eighteen (Nidwald) years of age, while the cantonal council, which drafts measures and sanctions the expenditure of sums below certain fixed small amounts, is composed in Obwald of 80 members (including the executive council) elected by the people for 4 years, and in Nidwald of 48 (besides the executive council) chosen in the same way for 6 years. The executive council is in both cases elected by the "Landsgemeinde"; in Obwald it consists of 3 officials and 4 ordinary members, and in Nidwald of 6 officials and 5 ordinary members,—the official members being chosen every year, the ordinary every 4 or 3 years respectively. The existing constitution of Obwald is that of 1867; that of Nidwald is dated 1850, and was amended in 1877-78.

It is very remarkable that in both valleys the old "common lands" are still in the hands of the old guilds, and "gemeinden" consist of natives, not merely residents, though in Obwald these contribute to the expenses of the new "political communes" of residents, while in Nidwald the latter have to raise special taxes. In Engelberg (which still retains some independence) the poor are greatly favoured in the division of the common lands and their proceeds, and unmarried persons (or widowers and widows) receive only half the share of those who are married.

See J. Dusinger, *Die Geschichten des Volkes von Unterwalden*, 2 vols., 1827-28.

UNYORO, a kingdom of Central Africa, bounded on the N. and E. by the Nile, on the W. by the Albert Nyanza, and on the S.E. by the kingdom of Uganda. Its area is about 1600 square miles. The country is very fertile, well-watered, and thickly wooded; for the most part it is hilly in character, especially on the borders of the Albert Lake and in the neighbourhood of Massindi and

Kiroto, where the mountains have an altitude of from 5000 to 6000 feet. The population is about 1,500,000. The Wanyoro are of a dark reddish-brown colour, and are fully clothed, but are not so fine in physique, nor so high in intellectual development as their neighbours the Waganda, to whom, however, they appear to be very nearly related. The reigning family in Unyoro belongs to the Wabuma tribe, and is probably the oldest reigning Wabuma family in this part of Africa. The country is governed on the feudal system. Numerous tribes to the east and north of the Nile, and also on the western side of the Albert Nyanza, pay a small tribute to the Wanyoro. The latter possess large herds of cattle, and are very good herdsmen. The land, too, is cultivated to a considerable extent,—bananas, sweet potatoes, and dhubra being grown in large quantities. Coffee and tobacco are cultivated to a small extent. The people are very superstitious, and the numerous medicine men and women reap a rich harvest from their credulity. The Wanyoro huts are dome-shaped, small, and extremely filthy and full of vermin, although the people themselves are cleanly. Polygamy is universal, even the poorest man possessing two or three wives. Notwithstanding this, the people are fairly moral; but Unyoro is remarkable amongst Central African tribes for the existence of a definite class of courtesans. The Wanyoro are moderately skilful workmen, and their iron-work, pottery, and wood-work are both neat and tasteful. The only article they export is salt, which is obtained in considerable quantities at Kibiro on the shores of Lake Albert.

See Baker's *Albert Nyanza*, Felkin and Wilson's *Uganda and the Egyptian Soudan*, and various papers in *Petermann's Mittheilungen* by Emin Pasha.

UPANISHADS. See SANSKRIT, vol. xxi. p. 280, and BRAHMANISM.

UPAS, a Javanese word meaning poison, and specially applied by the Malays and people of western Java to the poison derived from the gum of the anchar tree (*Antiaris toxicaria*), one of the *Artocarpææ*, which was commonly used in Celebes to envenom the bamboo darts of the natives. The name of the upas tree has become famous from the mendacious account (professedly by one Foersch, who was a surgeon at Samarang in 1773) published in the *London Magazine*, December 1783, and popularized by Erasmus Darwin in "Loves of the Plants" (*Botanic Garden*, pt. ii.). The tree was said to destroy all animal life within a radius of 15 miles or more. The poison was fetched by condemned malefactors, of whom scarcely two out of twenty returned. All this is pure fable, and in good part not even traditional fable, but mere invention.

For a scientific account of the *Antiaris*, see Horsfield's *Plantæ Javanicæ Rariores* (1838-52) and Blume's *Rumphia* (Brussels, 1836), and for the legend Yule, *Anglo-Indian Glossary*, p. 726 sq.

UPPER SIND FRONTIER, a district of British India, forming the northernmost portion of the province of Sind, in the Bombay presidency. It comprises an area of 2139 square miles, and lies between 27° 56' and 28° 27' N. lat. and between 68° and 69° 44' E. long. It is bounded on the N. and W. by the Derajat districts of the Punjab and the territory of Khelat, on the S. by Shikarpur district, and on the E. by the Indus. In the north-east the country is hilly; the remainder consists of a narrow strip of level plain, one half being covered with jungle and subject to inundation, from which it is protected by artificial embankments. The land is watered by canals from the Indus, of which the chief is the Begari (85 miles in length), navigable throughout by large boats, and the Desert Canal, which irrigates the country west of Kashmir. The district contains several thriving timber plantations. The wild animals comprise an occasional tiger and hyænas; wild hogs and jackals abound; foxes are occasionally met

with; and antelopes, hog-deer, and a species of *sámbar* deer are found in the dense jungle tracts adjoining the Indus. The climate is remarkable for its dryness and for its extraordinary variations of temperature. The average annual rainfall at Jacobabad is less than 5 inches. There are numerous roads of all descriptions, and the Frontier Military Railway from Sukkur *via* Jacobabad to Sibi crosses the district.

The census of 1881 returned the population as 124,181 (males 70,166, females 54,015),—Hindus numbering 9894, Mohammedans 109,183, and Christians 230. The chief town is Jacobabad, with a population of 7365. In 1885-86 the cultivated area was estimated at 361,415 acres, of which 137,149 were cropped, and of these again 8163 were cropped more than once. The principal crops are wheat, joar, bajra, rice, barley, mustard-seed, and a little cotton and gram. Salt, lacquered work, leathern jars, embroidered shoes, woollen carpets, and saddle-bags are the principal manufactures. The internal trade is principally in grain, the greater part of which is sent to the Punjab, and the transit trade from Central Asia into Sind crosses the district, bringing wool and woollen goods, fruits, carpets, and horses.

UPSALA, a city of Sweden, the seat of its oldest university and residence of the archbishop of Sweden, is situated on the small river Fyris, 42 miles north of Stockholm. In spite of its position in a vast and fertile plain, Upsala was a rather insignificant little town till the opening of railway communication in 1866. The population, which in 1840 was only 5100, had at the end of 1885 increased to more than 20,000 (with students, scholars, and others, 23,000). The industries of the place are still unimportant, but its trade by sea (navigation being open for six or seven months of the year) and by rail is somewhat livelier. Upsala owes its fame to its university, which was founded in 1477. In 1624 Gustavus Adolphus endowed it with 300 farms, the revenue of which formed its entire income for more than two hundred years. Parliament now contributes nearly the half of its whole revenue (393,300 crowns, or about £21,800, in 1885). The professors numbered 58 in 1887, with 61 "doceats" and assistant teachers, and there were 1928 students. The last-named are divided into 13 "nations" (based on the old ecclesiastical division of the country), almost every one of which possesses a house of its own, with a hall, reading-rooms, and library. About £7200 is distributed yearly in "stipendia" or scholarships. The new university house, above the cathedral, on the site of the former archbishop's castle, is in the Renaissance style, and was built in 1879-87. It has a great hall capable of holding 2000 persons, eleven lecture-rooms, &c. The vestibule, lighted from above by three large cupolas, and surrounded by open galleries, is particularly fine. The library building (called *Carolina Rediviva*, in remembrance of the Carolina which formerly existed near the cathedral) was erected in 1819-41. The library, which has a right to a copy of every book printed in Sweden, at present (1887) contains 250,000 volumes and 11,000 MSS., among which is the famous *Codex Argenteus* of Ulfilas's translation of the Gospels. The "Gustavianum," built by order of Gustavus Adolphus for a university house, is now wholly occupied by the zoological institution. The botanical garden (which

formerly belonged to the castle) was presented by Gustavus III. to the university in 1787,—the former garden (in the northern part of the city), where Rudbeck and Linnæus worked, and where the residence of the latter is still to be seen, having been found too small and inconvenient. The medical faculty possesses a hospital and anatomical, chemical, and pathologico-physiological institutions; and about a mile from the town there is a magnificent lunatic asylum. The astronomical and meteorological institutions, as well as those of chemistry and physics, have also special buildings, all of recent date. The Royal Society of Sciences, established in 1710 by Eric Benzelius, the younger, occupies a house of its own, and has a valuable library. Of the buildings the cathedral, founded in the latter part of the 13th century and completed in 1435, is the most remarkable. The material is brick, but the proportions are uncommonly noble and harmonious; the length is 390 feet, and the height inside 88. It has suffered considerably from repeated fires, but since 1886 an extensive restoration has been going on. The castle, on the summit of a long ridge above the town, was founded in 1548 by Gustavus I., but not finished till a century later, when it was often used as a royal residence. It was destroyed by fire in 1702, and for more than forty years remained a ruin. At present only a small part of it is habitable, and that part is chiefly used by the provincial government, and as a residence of the governor. Apart from the cathedral and a few insignificant houses, there are no remains from the mediæval period, the city formerly having consisted almost entirely of wooden houses.

The name of Upsala originally belonged to a place nearly 2 miles to the north of the present city, which is still called Old Upsala. This Upsala, mentioned as early as the 9th century, was famous throughout Scandinavia for its splendid heathen temple, which, gleaming with gold, made it the centre of Svithiod, then divided into a great number of kingdoms; three huge grave mounds or barrows still commemorate old times. In the same place the first cathedral of the bishops of Upsala was also erected (about 1100). On the destruction of this building by fire, the inconvenient situation caused the removal in 1273 of the archiepiscopal see to the present city, then called Ostra Aros,¹ but within a comparatively short time it came to be generally called Upsala. During the Middle Ages the cathedral and the see of the archbishop made Upsala a kind of ecclesiastical capital. There the kings were crowned, after the election had taken place at the Mora stones, 10 miles south-east of Upsala. As early as the 14th century, however, Stockholm became the proper residence of the king. In 1567 Erik XIV. murdered in the castle five of the most eminent men of the kingdom, three of them belonging to the family of Sture. In 1593 was held the great synod which marks the final victory of Protestantism in Sweden; in the same year the university was restored by Charles IX. In the castle Christina, daughter of Gustavus Adolphus, resigned her crown to Charles X. in 1654. In 1702 nearly the whole city, with the castle and the cathedral, was burnt down. Among the teachers of the university who have carried its name beyond the boundaries of their own country, the following (besides Linnæus) deserve to be mentioned:—Olof Rudbeck the elder, the author of the *Atlantica* (1630-1702); Torbern Bergman (1735-1784), the celebrated chemist; and Erik Gustaf Geijer (1783-1847), the historian.

¹ The name first occurs in Snorro Sturluson in connexion with the events of the year 1018; it signifies "the mouth of the cæster-river."

T

TAAFFE - TALLAHASSEE.

TAAFFE, COUNT EDWARD FRANCIS JOSEPH, in the Austrian peerage, and Viscount Taaffe of Corren, and baron of Ballymote, Sligo, in the Irish peerage, born in the city of Prague in 1833. He was brought up in companionship with the present Emperor Francis Joseph. The count is a descendant of that powerful nobleman of the same name who proceeded from Ireland and made a great name in the Germanic Empire. He was appointed governor of Salzburg in 1863. In 1867 he became Austrian minister of the interior and vice-president of the Cisleithan ministry. At the latter end of 1869 he served as minister president. In 1871 he accepted the office of governor of the Tyrol and Vorarlberg. In 1880 he was summoned to form a new cabinet, over which he still presides. The distinguishing feature of Count Taaffe's clerical and federalistic administration has been to give greater weight to the Slav nationalities, especially the Czechs and the Poles, as well as to the clericals, in the public affairs of the empire, and to conciliate the divergent nationalities comprising the kingdom.

TABBY, or **TABBYING**, another name for watering fabrics. It is usually applied to stuffs or worsted cloths instead of silks.

TABERNACLES, FEAST OF (Vulg. *Feria Tabernaculorum*), a Hebrew feast of seven days' duration, beginning on the 15th day of the 7th month (Tishri), and instituted principally in memory of the nomad life of the people in the desert, and the booths or tents used on their march. Besides this signification it also had an agricultural one, like the other two pilgrimage festivals, the Passah and the Feast of Weeks. It was emphatically the Feast of "Ingathering," that is, the close of the labors of the field—the harvest of all the fruits, of the corn, the wine, and the oil. During this feast, the great bulk of the people were enjoined to dwell in booths, which were made of olive, pine, myrtle, palm and other branches, and were erected on the roofs of houses, and in the courts and streets.

TABLEAUX VIVANTS (living pictures), representations of works of painting and sculpture, or of scenes from history or fiction, by living persons. They are said to have been invented by Madam de Genlis when she had charge of the education of the children of the duke of Orleans. They have long been common in theaters, and have more recently become an amusement of private circles.

TACAHOUT, the native name of the small gall formed on the Indian tamarisk (*Tamarix gallica*, var. *Indica*). Since the discovery of photography, this gall has become of considerable importance as a source of gallic acid, of which it contains a large proportion. The French chemists import considerable quantities; and the same gall, under the name of *mabe*, is imported by the British chemists from India.

TACITURNITY, in the law of Scotland, a mode of extinguishing an obligation by mere silence, and making no claim upon it for a long time. It is a

distinct ground, and embraces a shorter period than the ordinary prescription or limitation; for if a creditor never apply for payment or performance of the obligation, a presumption arises either that there never was such an obligation, or that he has abandoned it.

TACKING OF MORTGAGES, in the law of England, a practice that sometimes occurs in the course of mortgage securities, when one person acquires more than one mortgage over the same estate. Thus, though mortgages, according to the general rule, rank according to the order of date, yet, if a third mortgagee, who became so without notice of a second incumbrance, purchase the same mortgage even after notice of the second mortgage, so as to acquire a legal title, and if he holds them both in his own right, he can tack the one to the other, and so obtain priority for the third mortgage over the second mortgage. This is on account of an old technicality, scarcely intelligible to any but lawyers.

TACONIC SYSTEM, an extensive series of rocks in the United States, described by Dr. Emmons. They consist of two divisions, the upper having a thickness of 25,000 feet, and containing lower Silurian fossils; and the lower, with 5,000 feet of thickness, in which, as yet, no fossils have been found, but which is generally considered to be the equivalent of the Cambrian rocks of Britain.

TAILZIE, the ancient term in the law of Scotland to denote a deed creating an entailed estate.

TAJ MAHAL, a costly tomb built in Cawnpore, India, by the Emperor Shah Jehan, as a burial place for his favorite wife. It is said to have taken 20,000 workmen seventeen years to complete the structure, and its cost was estimated at \$15,000,000. A tourist who saw it in 1891, wrote: "To describe the 'Taj' is an impossibility. You are dazzled, surprised, bewildered and inspired to think that such work could ever have been done by human hands. It is like a glimpse of paradise, something never to be forgotten, and, as you leave this tomb of tombs and this palace of palaces, and go out once more into the bright sunshine, it seems that you have witnessed some beautiful vision, or taken a trip to the so-called 'fairy land.'"

TALBOT, perhaps originally a name equivalent to bloodhound, but afterward applied to a race of hounds, now extinct, or nearly so, which seem to have been kept for show rather than for use. The Talbot was of a pure white color, with large head, very broad muzzle, long pendulous ears, and rough hair on the belly. The white St. Hubert dog was either the Talbot or a nearly allied breed. The Talbot is the badge of the ancient House of Shrewsbury (surname Talbot), and the crest of some of the princely houses of Germany.

TALLADEGA, a prosperous town of Alabama, the seat of the Institution for the Deaf, Dumb and Blind.

TALLAHASSEE, a city, the capital of Florida, and the county-seat of Leon county, pleasantly situated on the Jacksonville, Pensacola and Mobile Railroad, in northern Florida. The city is regu-

larly laid out, and is the center of a considerable local trade. It has several excellent private schools. Population in 1890, 2,933.

TALLOW TREE, the name given in different parts of the world to trees of different kinds which produce a thick oil or vegetable tallow, or a somewhat resinous substance, which, like tallow, is capable of being used for making candles. The Tallow Tree of Malabar (*Vateria Indica*) is a very large tree of the natural order *Dipterocarpaceæ*. It has leathery leaves four to ten feet long, and panicles of white, fragrant flowers, with five petals. The stem is often sixteen feet in circumference. By incisions in the stem, East Indian copal is obtained; and by boiling its seeds, there is extracted a firm, white, vegetable tallow, which, as it has no unpleasant smell, is particularly suitable for making both candles and soap.—The Tallow Tree of China (*Stillingia sebifera*) belongs to the natural order *Euphorbiaceæ*. The candles made of it are beautifully white. This tree has been introduced into North America, is cultivated about Charleston and Savannah, and is almost naturalized in the maritime parts of Carolina. It presents a very beautiful and remarkable appearance at the approach of winter, when the leaves become bright red, and the pericarps falling off, leave the white seeds suspended by threads.

TALLY, the name given to the notched sticks which, till a recent period, were used in England for keeping accounts in Exchequer, answering the double purpose of receipts and public records. They were well seasoned rods of hazel or willow, inscribed on one side with notches indicating the sum for which the tally was an acknowledgment, and on two opposite sides with the same sum in Roman characters, along with the name of the payer and the date of the transaction.

TALMAGE, THOMAS DE WITT, born in New Jersey in 1832. He entered the legal profession, but, after a short period, prepared for the ministry at the New Brunswick Theological Seminary. His first pastorate was at Belleville, N. J.; he afterward removed to Philadelphia, where his rising fame induced the church at Brooklyn to make strenuous efforts to obtain his services as their minister, and he preached his first sermon there in March, 1869. The great success which attended Dr. Talmage's preaching necessitated the enlargement of the Tabernacle in 1871, but it was burned a year later. However, a still larger and finer structure was soon built, but this was also burnt down in 1889. A new church was built, at a cost of about \$400,000, and dedicated in 1891. Dr. Talmage visited England in 1889, and afterward made a tour in Palestine and on the Continent. He is the author of several volumes of sermons and other religious works. *From Manger to Throne* was published after his return from the Holy Land.

TALUS, a term employed in geology to designate the sloping heap which accumulates at the base of a rock or precipice, from fragments broken off by the weather, or materials in any way carried over it. The term is also applied to the slope of a wall which diminishes in thickness as it rises.

TAMAQUA, a city of Pennsylvania. Population in 1890, 4,672. See *Britannica*, Vol. XXIII, p. 40.

TAMARA SPICE, a favorite mixture of condi-

ments used by the Italians. It consists of powdered cinnamon, cloves, and coriander seeds in equal parts, and half the same quantity of aniseed and fennel-seed powdered.

TAMARIN (*Midas*), a genus of South American monkeys, small and beautiful, with short muzzle, prominent forehead, long nails, which, except on the hinder thumbs, are formed like claws, the tail longer than the body, not prehensile, and covered with hair so as to resemble the tail of a squirrel. The **SILKY TAMARIN**, or **MARAKINA** (*M. rosalia*), is the best known of the genus. It is of a golden yellow color, with fine, silky hair, which it is exceedingly careful to keep free from stain. It is often brought to Europe, but is very tender, and seldom lives long. It is a very gentle and playful creature.

TAMBOUR, a frame originally made round, upon which muslin or other material is stretched for embroidering. Tambour-work was extensively employed for the decoration of large surfaces of muslin, etc., for curtains and similar purposes; but pattern-weaving has been brought to resemble it so closely that it is being rapidly superseded.

TAMBOURINE, a very ancient musical instrument of the drum species, much used by the Biscayan and Italian peasants at their festivities, and sometimes introduced into orchestral music where the subject of the piece is connected with a people who use it, as the Basques, gypsies, or peasants of the Abruzzi.

TAMMANY SOCIETY, a noted political organization of the Democratic party in New York. The society in New York city was organized in 1789. Early in its history it began to be used as a political engine, and in time became the most effective instrument in the hands of the leaders of the Democratic party of the city and state of New York. Much reproach was brought upon the society by the famous "Ring," which for some years ruled in its councils, and which nearly proved its ruin; but a reorganization was afterward effected, and the regular meetings of the association continue to be held in Tammany Hall. See **POLITICAL PARTIES** in these Revisions and Additions; also *Britannica*, Vol. XVII, p. 463.

TAMPA, a town and an important shipping port of Florida, on the Gulf coast. It is interested in the manufacture of lumber.

TAMPICO, or **SANTA ANNA DE TAMAULIPAS**, a seaport of Mexico, in the state of Tamaulipas, on the Panuco, five miles from its mouth, in the Gulf of Mexico. At the mouth of the river is a dangerous bar, and the harbor is unsafe. Hides, tallow, bones and salted meat are exported to Great Britain and the United States.

TAMPION, the wooden plug placed in the mouth of a piece of ordnance to preserve it from dust and damp. In naval gunnery, the tampion is the wooden bottom for a charge of grapeshot.

TAM-TAM, an Indian musical instrument, resembling the tambourine, but larger and more powerful, and oval instead of round. It has been occasionally introduced into orchestral bands.

TAN-BALLS, tan-bark pressed into balls or lumps, which harden on drying, and serve for fuel in many parts of England.

TANEY, ROGER BROOKE, chief-justice of the United States, born in Calvert county, Md., in 1777, died in Baltimore, Md., in 1864. After studying

law he was admitted to the bar in 1799, and soon obtained a large practice. He removed to Baltimore in 1823. In 1831 President Jackson made him United States attorney-general, and in December, 1835, Jackson nominated him chief-justice of the United States. In the *Dred Scott* decision (see Britannica, Vol. XXIII, p. 772) Chief-Justice Taney decided that a negro slave had no standing in a United States court, and that he had "no rights which a white man was bound to respect." This decision, rendered in March, 1857, roused in the North a fierce and determined antagonism to the domination of the slave power. Taney died on the same day on which the State of Maryland abolished slavery, Oct. 12, 1864.

TANK-WORMS. The mud in Indian tanks has been found to abound in *Filaria*, some of which closely resemble the guinea-worm infesting the human body. Although there is no positive evidence, there is extreme probability that these tank-worms are the origin of the guinea-worm. Dr. Carter, who has had much personal observation of the guinea-worm in India, "argues, and apparently with good reason, *No tank-worm, no guinea-worm.* Persons who bathe in water in which the former is found may expect to have the latter." Mr. Bastian, who has written an excellent paper on the anatomy of the guinea-worm, states that there is an undoubted anatomical relation between it and the tank-worm. The real difficulty in the theory is that these tank-worms are widely diffused, while the guinea-worm is restricted in its localization.

TANTUM ERGO, the hymn uniformly sung in the Roman Catholic Church, at benediction with the Holy Sacrament. These are the first words of the penultimate strophe of the hymn *Pange Lingua*. The *Tantum Ergo* is the most popular of all the Eucharistic hymns of the Roman Catholic Church.

TANZIMAT, or **TANSIMAT**, the plural of the Arab word *tansim*, generally signifying "regulations," but in a special sense denoting the organic laws established by the Hatti-Sherif of Gulhane, in accordance with which the administration of the Turkish empire is carried on. These organic laws, the first attempt at constitutional government in Turkey, were published by Sultan Abdul-Medjid in 1844. But the tanzimat was a dead letter, or nearly so, except in connection with the army; so that on Sept. 7, 1854, the sultan found it necessary to publish a new ordinance, in which the complete carrying out of the tanzimat in all respects was commanded; and a commission was appointed to see that this was done.

TAPPAN, ARTHUR, a New York merchant and abolitionist, born at Northampton, Mass., in 1786, died at New Haven, Conn., in 1865. He was widely known as a patron of religious and patriotic organizations, tract, bible and other societies, endowed Lane Seminary at Cincinnati, a professorship at Auburn Theological Seminary, and built Tappan Hall at Oberlin; assisted in founding the "Journal of Commerce" and the "Emancipator," and was first president of the Anti-Slavery Society.

TAR. For general information on this subject see Britannica, Vol. XXIII, pp. 57-59. In the United States nearly all the wood-tar comes from North Carolina. It is there produced by the smothered burning of the wood and dead limbs of

the pitch pine. A tar-kiln is commenced by scooping out of the ground a saucer-shaped foundation, making a hole in the middle, and thence running a wooden spout outside the rim of the foundation. The wood is split into billets three or four feet long and about three inches in diameter. The billets are stacked in the center hole and piled upward, each upper stick lapping a little over, thus giving the finished pile the appearance of an inverted cone. Logs of wood and green twigs are then piled around, and the whole covered with earth. The fire is lighted at the top eaves, and the distilled tar runs out through the spout. A kiln yields 50, 100, or more barrels of tar, according to its size. Large iron retorts have been used, but the product is not sufficiently greater or more cleanly to pay for increased cost.

Coal-tar was for a long time a troublesome product of gas-works, no useful application of it being known to any great extent. Later it was used as a covering to protect iron-work exposed to the weather; and the pitch obtained by distillation was found, when mixed with earthy matters, to be a good substitute for the natural product. asphaltum, used for artificial pavement, water-tight covering for roofs, etc. Finally tar distillers learned to extract from it crude naphtha, and also light oily fluids. The pitch, by continued distillation, was made to yield more oily matters. Crude naphtha is now purified with it; by taking one-tenth its bulk with concentrated sulphuric acid, adding when cold 5 per cent. of peroxide of manganese, and distilling off the upper portion a rectified naphtha is obtained, which easily dissolves India rubber. Mixed with wood-naphtha it produces a powerful solvent of various resinous substances useful in making varnishes. Still further purified, the liquid benzole is obtained, used extensively as an illuminating agent. The light essential oils, as well as the heavier ones, possess antiseptic properties, which render them valuable for preserving wood from decay. Among the other products obtained from coal-tar are carbolic acid and the aniline colors.

TARASCON, a town of France, whose inhabitants Alphonse Daudet made the subjects of his charming extravaganza, *Tartarin de Tarascon*, a most amusing satire on the characteristics of the natives of the south of France, which he followed up with a second part, *Tartarin sur les Alpes*, and a third, *Port Tarascon*, published in 1890. See Britannica, Vol. XXIII, p. 60.

TARAZONA, a town of Spain, in the province of Zaragoza, fifty-two miles northwest of the city of that name, on the Queyles, a tributary of the Ebro. It is the see of a bishop, and contains a cathedral, a bishop's palace, and a Moorish *Alcazar*. Population upward of 6,000, mainly engaged in agriculture.

TARBAGATAI, a frontier town of Chinese Turkestan, 170 miles east of the eastern extremity of Lake Balkash, at the foot of the mountains of the same name, in a plain watered by the Imil, with extensive meadows and pasture-grounds in the vicinity. The inhabitants consist of 3,000 exiled Chinese, 1,000 of a Chinese garrison, and a number of Mongolian merchants. The trade with Russia is important.

TARGOWITZ, or **TARGOWICZA**, in Russia, a small town in the government of Kiev, on the

borders of Kherson, the scene (May, 1792) of a confederation of the five Polish nobles who were adverse to the constitution of May 3, 1791. They were incited to this traitorous conduct toward their country by Catharine II., and after their conduct had been fully unveiled, they were declared traitors to their country, and only escaped death by precipitate flight to Russia, where they were munificently rewarded for the treason which had given the czarina a pretext for executing the second partition of Poland.

TARIFF LEGISLATION IN THE UNITED STATES. The first tariff act was signed by President Washington on July 4, 1789. The new government had just been established, and the object of the law was to put money into the empty treasury of the republic. Alexander Hamilton was the author of the measure, which was modeled on the 5 per cent. import duty that the Congress of the Confederation had tried in vain to impose. This first law imposed specific duties on forty-seven articles and ad valorem rates of $7\frac{1}{2}$, 10, $12\frac{1}{2}$ and 15 per cent. on four commodities or small groups. The unenumerated goods were compelled to pay 5 per cent.

The second tariff act passed the House by a vote of 39 to 13, and passed the Senate without a division. It was approved by the President on Aug. 10, 1790. This act was longer than its predecessor, and the scale of duties was higher. Then followed the act of May 2, 1792, which became operative in the following July. It raised the duty on unenumerated merchandise to $7\frac{1}{2}$ per cent. and that on many articles paying $7\frac{1}{2}$ to 10 per cent. Another tariff bill was passed on June 7, 1794, going into effect on July 1. It imposed numerous rates in addition to those already payable, some of them specific and others $2\frac{1}{2}$ and 5 per cent. ad valorem. Additional tariff measures were enacted on March 3 and July 8, 1797, and on May 13, 1800. These acts imposed additional rates, and there was a further increase of $2\frac{1}{2}$ per cent. on March 26, 1804, on all imports then paying ad valorem rates.

The whole industrial situation of the country was changed suddenly and radically in 1807-8. Napoleon's Berlin and Milan decrees were followed by the English orders in council, and Mr. Jefferson's administration retaliated for the outrages on our commerce by the celebrated embargo in December, 1807. This was followed by the non-intercourse act in 1809, and by the declaration of war against England in 1812. During the progress of hostilities all commercial intercourse with Great Britain was, of course, suspended, and all import duties were doubled as a war measure.

This is known as the "Tariff of 1812." It passed the House of Representatives by a vote of 76 to 48, and received the sanction of the Senate by 20 votes in its favor to 9 against it. Amendments to it were adopted on Feb. 25, and again on July 29, 1813. On Feb. 15, 1816, the additional duties imposed by the act of 1812 were repealed, and additional duties of 42 per cent., to take effect on July 1, were substituted, but the law did not go into operation. From 1812 to 1816 the average rate on all imports was 32.73 per cent., the range being from 6.84 per cent. in 1815 to 69.03 in 1813.

THE LOWNDES-CALHOUN BILL.

The next great tariff measure is known as the

Lowndes-Calhoun bill of 1816. The desire to protect the industries that had sprung up during the period of restriction and war was very strong in the country, and they were granted clear concessions in the measure bearing the name of the great South Carolinian. It was approved April 27, 1816, took effect the following July, and may be said to be the first of the protective tariffs. It was not wholly set aside until 1842, under the administration of Mr. Polk. The ad valorem duties under it ranged from $7\frac{1}{2}$ to 33 per cent. The unenumerated goods paid 15 per cent., the manufacturers of iron and other metals generally 15 per cent., the majority of woolen goods 25 per cent., cotton goods 25 per cent., "with clauses establishing 'minimums'"—that is, in reckoning duties, 25 cents per square yard was to be deemed the minimum cost of cotton cloth; unbleached and uncolored yarn, 60 cents, and bleached or colored yarn, 75 cents per pound. These rates became practically prohibitory on the cheaper goods. The law was amended April 20, 1818, and again on March 3, 1819. It had the support of New England and the Middle States, but the South was opposed to it. From 1817 to 1820 the average rate on imports was 26.52 per cent.; from 1821 to 1824, 35.02 per cent., and from 1821 to 1824, on dutiable goods only, 36.88 per cent. This general increase of duties was due to the necessity of providing for the interest on the heavy debt incurred by the second war with England.

The CLAY TARIFF followed in 1824. The vote in the House was close—107 to 102; and there was a majority of only 4 in the Senate—25 for to 21 against it. New England and the South voted against the measure, while on the other side were ranged the West and Middle States. It received the president's signature on May 22, 1824, and went into effect July 1. It remained in force in almost its entirety until 1842. It raised the duty on woolen goods from 25 to 30 per cent. for one year, and then to $33\frac{1}{2}$ per cent. There was a "minimum" of 30 cents per square yard on cotton cloth. Wool over 10 cents a pound was rated at 20 per cent. until June 1, 1825, then 25 per cent. for one year, and then 30 per cent. The average rate on all imports from 1825 to 1828 was 47.17 per cent. and on dutiable goods 50.29 per cent.

THE "TARIFF OF ABOMINATIONS."

The "Tariff of Abominations," as it is called, was approved May 19, 1828, and went into operation part the following July and part in September. In the House 105 members voted for it and 94 members, mostly from New England and the South, against it. In the Senate the vote was 26 to 21. It had special reference to iron, wool and manufactures of wool. The duty on wool was 4 cents per pound and 40 per cent. for one year; then 4 cents and 45 per cent. for a year; then 4 cents and 50 per cent. Somewhat lower duties were provided for in an act passed on May 24, 1828, again in May, 1830, and still again on July 13, 1832. The average duty on all goods from 1829 to 1832 was 47.81 per cent., and on all dutiable articles 51.55 per cent.

The Modifying Tariff of 1832 was intended "to correct the inequalities of that of 1828." It was passed by the Whigs, or National Republicans, and levied high duties on cotton and woolen goods and other articles to which protection was meant to be

applied. The vote in the House was 132 to 65 and in the Senate 32 to 16, the votes in favor of it coming from all sections of the country. The New England vote in the House was a tie. It was approved on July 14, and took effect on March 3, 1833. The existing duties were superseded by the act, some of them reduced and a few raised. In a separate act of the same date, railroad iron was made free. Under its operation, the average rate on imports in 1832-33, during the ten months it was in force, was 28.99 per cent., and dutiable articles 38.25 per cent.

The Compromise Tariff of 1833 provided for taking off one-third of the duties each year, until a uniform rate on all of 20 per cent. should be reached. It passed the House by 119 to 85, and the Senate by 29 to 16. New England then joined the Middle States in voting for high protective duties. It was approved on March 2, 1833, the day before the Tariff of 1832 went into operation, and took effect on Jan. 1, 1834. The terms of the compromise were that all duties which in the Tariff of 1832 exceeded 20 per cent., should have one-tenth of the excess over 20 per cent. taken off on Jan. 1, 1834; one-tenth more on Jan. 1, 1836, again one-tenth in 1838, and another one-tenth in 1840; so that by 1840, four-tenths of the excess over 20 per cent. would be disposed of. Then on Jan. 1, 1842, one-half of this remaining excess was to be taken off, and on July 1, 1842, the other half of the remaining excess was to go. There would, therefore, after July 1, 1842, have been a uniform rate of 20 per cent. on all articles. The average duty on all imports from 1834 to 1842 was 19.25 per cent., and on dutiable articles 34.73 per cent.

THE TARIFF OF 1842.

The Tariff of 1842 was passed by the Whigs as a party measure, and was avowedly a protective measure. It took effect at once, on August 30, 1842, changed all existing rates, was amended in March, 1843, and died December 1, 1846. New England and the Middle States gave it strong support. The South was earnest in opposition and the West was a tie. The average rate on all imports under it was 26.92 per cent. and on dutiable articles 33.47 per cent.

The Polk-Walker Tariff of 1846 is one of the most noteworthy acts in the fiscal history of the country. In his inaugural address President Polk said: "In the general proposition that no more money shall be collected than the necessities of an economical administration shall require all parties seem to acquiesce. I have heretofore declared to my fellow-citizens that in my judgment it is the duty of the government to extend, as far as it may be practicable to do so, by its revenue laws and all other means within its power, fair and just protection to all the great interests of the Union, embracing agriculture, manufactures, the mechanic arts, commerce and navigation. I have also declared my opinion to be in favor of a tariff for revenue; and that, in adjusting the details of such a tariff, I have sanctioned such moderate discriminating duties as would produce the amount of revenue needed, and at the same time afford reasonable protection to our home industries."

The following table gives the averages of the tariff duties since 1791:

TARIFF AVERAGES.

| | PER CENT. |
|------------------------|-------------|
| From 1791 to 1812..... | 19.58 |
| From 1812 to 1817..... | 32.73 |
| From 1817 to 1825..... | 26.52 |
| From 1825 to 1829..... | 47.17 |
| From 1829 to 1832..... | 47.81 |
| From 1832 to 1834..... | 28.99 |
| From 1834 to 1843..... | 19.25 |
| From 1843 to 1847..... | 26.92 |
| From 1847 to 1858..... | 23.20 |
| From 1858 to 1862..... | 15.66 |
| From 1862 to 1884..... | 34.16 |
| From 1884 to 1890..... | 45.50 |
| From 1890 to ————..... | about 60.00 |

Robert J. Walker, of Mississippi, who was President Polk's Secretary of the Treasury, laid down these principles as a basis for revenue reform in his celebrated report of 1845:

"No more money shall be collected than is needed for economical administration.

"The duty on no article should exceed the lowest rate which will yield the largest revenue.

"Below such rate discrimination may be made, or for imperative reasons an article may be made free.

"Luxuries should be taxed at the minimum rate for revenue.

"Duties should be all ad valorem, and never specific.

"Duties should be so imposed as to operate as equally as possible throughout the Union, without respect to class or section."

The bill framed on this basis was approved by Mr. Polk on July 30, 1846. It passed the House by 114 to 95, the East being in opposition and the West and South in support. The vote in the Senate on a third reading was a tie, and Vice-President Dallas gave the casting vote in the affirmative. The Senate on the final passage stood 28 to 27. This act superseded the Whig tariff, and remained in force until 1861. It swept away specific and compound duties. It divided all dutiable merchandise into eight classes, which introduced greater simplicity into the whole system of customs regulations. The average duty on all imports was, from 1847 to 1857, 23.20 per cent., and on dutiable articles 26.22 per cent.

The tariff of 1857, which was the next in order, made a still further reduction in duties. It was approved on March 3, 1857, took effect on July 1, and remained in force until April 1, 1861. New England united with the South in giving it 123 votes to 72 in the House, and in the Senate 33 to 12. The average duty on all goods, from 1858 to 1861, was 15.66 per cent., and on dutiable articles 20.12 per cent.

THE MORRILL TARIFF.

The Morrill Tariff of 1861 differed from all its predecessors in that it provided for a general system of compound and differential duties, specific and ad valorem, and also made a distinction between goods imported from different parts of the world. It passed the House on May 11, 1860, by a vote of 105 to 64, and the Senate on February 20, 1861, by a vote of 25 to 14. From the first, through all the cumbersome legislation that has followed in its wake, it has been avowedly protective. It was frequently changed during the War of the Rebellion, ostensibly for purposes of revenue. At an early period in its history the number of rates ran up to over two thousand. From 1861 to 1869 every year pro-

duced some enlargement of the original scheme. In 1870 there was some modification of rates, generally in the line of reduction. Tea and coffee, taxed since 1861, were then put on the free list, and the duties on cotton and woolen goods, wool, iron, paper, glass and leather were lowered about 10 per cent. The free list was somewhat enlarged, but the reduction was rescinded in the act of March 3, 1875. The duty on quinine was abolished on July 1, 1879. The average duty on all imports, from 1862 to 1883, was 34.16 per cent., and on dutiable articles 42.74 per cent.

THE "COMMISSION TARIFF."

This was passed by the House on March 3, 1883, by a vote of 152 to 116, and passed the Senate on March 2, the vote being 32 to 31. This was the tariff which was in force until October 6, 1890, when it was superseded, except as to tobacco and tin plate.

THE M'KINLEY TARIFF.

The present tariff, familiarly called "The McKinley Tariff" (from the name of the chairman of the congressional committee having the matter in charge in the House of Representatives), passed the House in October, 1890, by a vote of 152 to 81, and the Senate by a vote of 33 to 27, and was approved by President Harrison, 1890.

The following table gives the leading articles of merchandise and the import duties on them by the McKinley tariff:

Alcohol, 10 per cent. ad valorem.
 Aluminium, unmanufactured, 15c. per lb.
 Aniline Colors or Dyes, 35 per cent.
 Animals for breeding purposes, free.
 Bagging for cotton, 1 6-10 and 1 8-10c. per lb.
 Bags, grain, 2c. per lb.
 Barley, 30c. per bushel.
 Beads, ornamental, 10 per cent.
 Beef, Mutton and Pork, 2c. per lb.
 Beer, Ale, not in bottles, 20c. per gallon.
 Beer, Porter and Ale, in bottles, 40c. per gallon.
 Bindings, cotton, 40 per cent.
 Bindings, flax, 50 per cent.
 Bindings, wool, 60c. per lb. and 60 per cent.
 Blankets, value not over 30c. per lb., 16 1-2c. per lb. and 30 per cent.
 Blankets, value 30c. and not over 40c., 22c. per lb. and 35 per cent.
 Blankets, value 40c. and not over 60c., 33c. per lb. and 35 per cent.
 Blankets, value 60c. and not over 80c., 38 1-2c. per lb. and 40 per cent.
 Blankets, value over 80c. per lb., 38 1-2c. per lb. and 40 per cent.

 Gloves, suedes and schmaschen, embroidered, 50c. doz., not less than 50 per cent.
 Gloves, suedes, lined, \$1 doz., not less than 50 per cent.
 Gloves, suedes, lined and embroidered, \$1.50 doz., not less than 50 per cent.
 Glucose, 3 4c. per lb.
 Glue, value not over 7c. per lb., 1 1-2c. per lb.
 Gold, manufactures of, not jewelry, 45 per cent.
 Hair of hogs, curled for mattresses, 15 per cent.
 Hair manufactures n. o. p., 33c. per lb. and 40 per cent.
 Hair Braids and ornaments, 60c. per lb. and 60 per cent.
 Hair, human, unmanufactured, 20 per cent.
 Hams, 5c. per lb.
 Handkerchiefs, linen, 55 per cent.
 Handkerchiefs, silk, 60 per cent.
 Hay, \$4 per ton.
 Hemp Cordage, untarred, 2 1-2c. per lb.
 Hemp Cordage, tarred, 3c. per lb.
 Hides, raw, dried, salted, pickled, free.
 Hogs, \$1.50 per head.
 Honey, 20c. per gallon.
 Hoops, iron or steel, for baling purposes, 1 3-10c. per lb.
 Hops, 15c. per lb.
 Horn, manufactures of, 30 per cent.
 Horses, Mules, value under \$150, \$30 per head
 Horses, Mules, value over \$150, 30 per cent.
 India-rubber, manufactures, 30 per cent.
 India-rubber, vulcanized, 35 per cent.
 India-rubber, wearing apparel, 50c. per lb. and 50 per cent.
 Instruments, philosophical, metal, 45 per cent.
 Iron, manufactures of, n. o. sp., 45 per cent.
 Iron Screws, 1-2 inch or less in length, 14c. per lb.
 Iron Tinned Plates, 2 2-10c. per lb.
 Ivory manufactures, n. o. p., 40 per cent.
 Jewelry, 50 per cent.
 Jute, burlaps, 1 5-8c. per lb.
 Jute, cotton bagging, 1 6-10 and 1 8-10c. per lb.
 Jute, other bagging, 2c. per lb.
 Knit Goods, wearing apparel, value not over 30c. lb., 33c. per lb. and 40 per cent.
 Knit Goods, wearing apparel, value 30c. and not over 40c. 38 1-2c. per lb. and 40 per cent.
 Knit Goods, wearing apparel, value 40c. and not over 60c. 44c. per lb. and 50 per cent.
 Knit Goods, wearing apparel, value 60c. and not over 80c. 44c. per lb. and 50 per cent.
 Knit Goods, wearing apparel, value over 80c. lb., 44c. per lb. and 50 per cent.
 Knit Goods, silk, 60 per cent.
 Knives, carving, \$1 to \$5 per doz. and 30 per cent.
 Laces, cotton, 60 per cent.
 Laces, linen, 60 per cent.
 Lard, 2c. per lb.
 Lead, pigs, bars, 2c. per lb.
 Lead, type metal, 1 1-2c. per lb.
 Leather manufactures n. o. p., 35 per cent.
 Lime, 6c. per 100 lbs.
 Linen manufactures n. o. p., 50 per cent.
 Linen, wearing apparel, 55 per cent.
 Linen Thread, 45 per cent.
 Linseed Oil, 32c. per gallon.
 Macaroni, 2c. per lb.
 Malt, 45c. per bushel.
 Matches, friction, boxed, 10c. per gross.
 Mats, cocoa and rattan, 8c. per sq. ft.
 Matting, jute, 6c. per sq. yd.
 Mathematical Instruments, glass, 60 per cent.
 Meerschaum Pipes, 70 per cent.
 Mica, ground, 35 per cent.
 Milk, fresh, 5c. per gallon.
 Milk, condensed, 3c. per lb.
 Molasses, free (after April 1, 1891).
 Muffs, fur, 35 per cent.
 Musical Instruments, metal, 45 per cent.
 Music Boxes, 45 per cent.
 Nails, cut, 1c. per lb.
 Nails, horseshoe, 4c. per lb.
 Needles, sewing, free.
 Newspapers, Periodicals, free
 Oat Meal, 1c. per lb.
 Oil Cloths for floors, value over 25c. per sq. yd. 15c. per sq. yd. and 30 per cent.
 Oil, olive, 35c. per gallon.
 Oil, whale and seal, 8c. per gallon.

 Wines, champagne, 1 pint and not over 1 quart, \$8 per doz.
 Wines, champagne, over 1 quart, 85 and \$2 50 per gallon.
 Wines, still, in casks, 50c. per gallon.
 Woods, cabinet, sawed, 15 per cent.
 Wool, first and second class, 11 and 12c. per lb.
 Wool, third class, n. o. p., 50 per cent.
 Wool or Worsted Yarns, value not over 30c. per lb., 27 1-2c. per lb. and 35 per cent.
 Wool or Worsted Yarns, over 30c. and not over 40c., 33c. per lb. and 35 per cent.
 Wool or Worsted Yarns, over 40c., 38 1-2c. per lb. and 40 per cent.
 Woolen and Worsted Clothing, 49 1-2c. per lb. and 60 per cent.
 Woolen manufactures, n. o. p., value not over 30c. per lb., 33c. per lb. and 40 per cent.
 Woolen manufactures, value 30c. and not over 40c., 38 1-2c. per lb. and 40 per cent.
 Woolen manufactures, value 40c. and not over 60c., 44c. per lb. and 50 per cent.
 Woolen manufactures, value 60c. and not over 80c., 44c. per lb. and 50 per cent.
 Woolen manufactures, value over 80c., 44c. per lb. and 50 per cent.

NOTE.—Personal or household effects of persons arriving in the United States, in use over one year, or of American citizens dying abroad, free. Duty must be paid on all watches but one. Articles and tools of trade, when in actual use, free.

RECIPROCITY SECTION OF THE TARIFF LAW.

In the present or McKinley tariff law, a special section (numbered section 3 in the tariff bill), was inserted, providing for the encouragement of "reciprocal trade" between the United States and other countries. The following is the text of the section relating to reciprocity:

Sec. 3. That with a view to secure reciprocal trade with countries producing the following articles, and for this purpose, on and after the first day of July, 1892, whenever, and so often as the president shall be satisfied that the government of any country producing and exporting sugars, molasses, coffee, tea and hides, raw and unneured, or any of such articles, imposes duties or other exactions upon the agricultural or other products of the United States, which in view of the free introduction of such sugar, molasses, coffee, tea and hides into the United States he may deem to be reciprocally unequal and unreasonable, he shall have the power and it shall be his duty to suspend, by proclamation to that effect, the provisions of this act relating to the free introduction of such sugar, molasses, coffee, tea and hides, the production of such country, for such time as he shall deem just, and in such case and during such suspension duties shall be levied, collected and paid upon sugar, molasses, coffee, tea and hides, the product of or exported from such designated country, as follows, namely:

All sugars not above number thirteen Dutch standard in

color shall pay duty on their polariscopic tests as follows, namely:

All sugars not above number thirteen Dutch standard in color, all tank bottoms, syrups of cane juice or of beet juice, melada, concentrated melada, concrete and concentrated molasses, testing by the polariscope not above seventy-five degrees, seven-tenths of one cent per pound; and for every additional degree or fraction of a degree shown by the polariscopic test, two hundredths of one cent per pound additional.

All sugars above number thirteen Dutch standard in color shall be classified by the Dutch standard of color, and pay duty as follows, namely:

All sugar above number thirteen and not above number sixteen Dutch standard of color, one and three-eighths cents per pound.

All sugar above number sixteen and not above number twenty Dutch standard of color, one and five-eighths cents per pound.

All sugars above number twenty Dutch standard of color, two cents per pound.

Molasses testing above fifty-six degrees, four cents per gallon.

Sugar drainings and sugar sweepings shall be subject to duty either as molasses or sugar, as the case may be, according to polariscopic test.

On coffee, three cents per pound.

On tea, ten cents per pound.

Hides, raw or unneured, whether dry, salted or pickled, Angora goat-skins, raw, without the wool, unmanufactured, asses' skins, raw or unmanufactured, and skins, except sheepskins with the wool on, one and one-half cents per pound.

TARIFF OR CUSTOMS RATES IN THE UNITED KINGDOM.

In former years the tariff rate list of Great Britain and Ireland embraced more than a thousand articles of merchandise. At present the list includes only *nineteen*, as follows:

| | £ | s. | d. |
|--|---|----|----|
| Beer, mum and spruce, the original specific gravity not exceeding 1215 deg., per barrel of 36 galls | 1 | 6 | 0 |
| Beer, exceeding 1215 deg., per barrel of 36 galls | 1 | 10 | 6 |
| Beer and Ale, worts of which were before fermentation of a specific gravity of 1055 deg., per barrel of 36 galls | 0 | 6 | 6 |
| And so in proportion for any difference in gravity. | | | |
| Cards (Playing) per doz. packs | 0 | 3 | 9 |
| Chickory, raw or kiln-dried cwt. | 0 | 13 | 3 |
| Chickory, roasted or ground lb. | 0 | 0 | 2 |
| Chickory and coffee mixed lb. | 0 | 0 | 2 |
| Chloral hydrate lb. | 0 | 1 | 3 |
| Chloroform lb. | 0 | 3 | 0 |
| Coccol lb. | 0 | 0 | 1 |
| Cocoa husks and shells cwt. | 0 | 2 | 0 |
| Cocoa or Chocolate, ground, prepared or in any way manufactured lb. | 0 | 0 | 2 |
| Coffee (raw) cwt. | 0 | 14 | 0 |
| Coffee (kiln-dried, roasted or ground) lb. | 0 | 0 | 2 |
| Collodion gall. | 1 | 4 | 0 |
| Ether, acetic lb. | 0 | 1 | 9 |
| Ether, butyric gall. | 0 | 15 | 0 |
| Ether, sulphuric gall. | 1 | 5 | 0 |
| Ethyl, iodide of gall. | 0 | 13 | 0 |
| Fruit (almonds and dates free) dried cwt. | 0 | 7 | 0 |
| Naphtha or methylic alcohol (puri.) proof gall. | 0 | 10 | 4 |
| Plate (gold) every oz. Troy | 0 | 17 | 0 |
| Plate (silver) Troy | 0 | 1 | 6 |
| Soap, transparent, in the manufacture of which spirit has been used lb. | 0 | 0 | 3 |
| Spirits, or strong waters proof gall. | 0 | 10 | 4 |
| Spirits, Perfumed spirits and Cologne water liquid gall. | 0 | 16 | 6 |
| Spirits, Liqueurs, Cordials, or other preparations containing spirit in bottle, if not to be tested for ascertaining the strength liquid gall. | 0 | 14 | 0 |
| Tea lb. | 0 | 0 | 6 |
| Tobacco, unmanufactured, containing 10 per cent or more of moisture lb. | 0 | 3 | 2 |
| Tobacco, containing less than 10 per cent lb. | 0 | 3 | 6 |
| Tobacco, cigars lb. | 0 | 5 | 0 |
| Tobacco, Cavendish or Negrohead lb. | 0 | 4 | 6 |
| Snuff, not more than 13 lbs. (in 100 lbs.) moisture lb. | 0 | 4 | 6 |
| Snuff, containing more than 13 lbs. lb. | 0 | 3 | 9 |
| Tobacco, other manufactured lb. | 0 | 4 | 0 |
| Tobacco, Cavendish or Negrohead, manufactured in bond from unmanufactured tobacco lb. | 0 | 4 | 0 |

| | £ | s. | d. |
|--|---|----|----|
| Varnish (cont. spirit), same as spirits. | | | |
| Wine, not exceeding 30 deg., proof spirit | 0 | 1 | 0 |
| Wine, exceeding 30 deg., but not exceeding 42 deg. | 0 | 2 | 6 |
| Wine, for each additional degree of strength beyond 42 deg. | 0 | 0 | 3 |
| Sparkling Wine, imported in bottle | 0 | 2 | 6 |
| Sparkling Wine, when the market value is proved not to exceed 15s. per gall. | 0 | 1 | 0 |

These duties are in addition to the duty in respect of alcoholic strength.

TARNOW, a town of Austrian Galicia, near the right bank of the Dunajec, a navigable tributary of the Vistula, forty-nine miles east of Cracow by the Vienna and Lemberg Railway. It is the seat of a Catholic bishop, contains a theological college, and a beautiful cathedral, in which are numerous monuments of marble, surmounted by statues, enriched with *bassi rilievi*, and rising to from sixty to seventy feet in height. Several industries are actively carried on, and there is a good general trade. Population (including suburbs), 16,400.

TARPEIAN ROCK (Lat. *Rupes Tarpeia*, or *Mons Tarpeius*), the name originally applied to the whole of the Capitoline Hill, but latterly confined to a portion of the southern part of the hill, the following being the legend commonly related in connection with it. In the time of Romulus, Tarpeia (a vestal virgin), the daughter of Sp. Tarpeius, governor of the Roman citadel on the Capitoline, covetous of the golden ornaments on the Sabine soldiery, and tempted by their offer to give her what they wore on their left arms, opened a gate of the fortress to the Sabine king, Titus Tatius, who had come to revenge the rape of the Sabine women. "Keeping their promise to the ear," the Sabines crushed Tarpeia to death beneath their shields, and she was buried in the part of the hill which bears her name. Subsequently, it was not unusual for persons condemned on the charge of aspiring to restore the monarchy, or of treason to the state generally, to be hurled from the Tarpeian Rock—e. g., the famous Manlius, the savior of the capitol during the invasion of the Gauls.

TARRYTOWN, a town of New York. Population in 1890, 3,901. See *Britannica*, Vol. XII, p. 331.

TARSNEY, JOHN C., member of Congress, born in Michigan in 1845. He attended the common schools until August, 1862, when he enlisted in the 4th Regiment Michigan Infantry, then serving in the Fifth Army Corps; joined the regiment in the field, near Antietam, immediately after the battle of that name; was slightly wounded at the battle of Fredericksburg, and was severely wounded and taken prisoner at the battle of Gettysburg; remained a prisoner of war at Belle Isle, Andersonville, and Millen until the latter part of November, 1864, when, being exchanged, he rejoined his command in front of Petersburg, and participated in the campaign which followed, ending in the surrender at Appomattox; was mustered out of the service in June, 1865, when he entered the High School at Hudson, Mich., and remained in that school until the fall of 1866, when he entered the Law Department of the University of Michigan, from which he graduated March, 1869; practiced law at Hudson, Mich., until 1872, when he removed to Kansas City, Mo.; was city attorney of Kansas City in 1874 and 1875, since which time he has followed the profession of law; was elected to Congress in 1889, and re-elected in 1891.

TASCHEREAU, ELZEAR ALEXANDER, cardinal and archbishop of Quebec, born in 1820, and educated at the Seminary of Quebec. He was ordained priest in 1842, and for twelve years filled the professorship of philosophy in Quebec Seminary, and studied the canon law in Rome for two years. He was made rector of Laval University in 1863. Eleven years later he became archbishop, and in 1887 was created first Canadian cardinal. He unsuccessfully opposed in 1887 the incorporation of the Jesuit Order in Canada.

TASMANIA, one of the Australian states. (For general article see *Britannica*, Vol. XXIII, pp. 72-75.) The accredited reports of 1889 placed the area at 26,215 square miles, or about 16,778,000 acres, of which 15,571,500 acres are the area of Tasmania proper, the rest being the area of a number of small islands which form two main groups, northeast and northwest. Population in 1889, 151,480, an increase for the year of 3.75 per cent. The population of Hobart, the capital, in 1881 was 21,118, and of Launceston 12,752. At this writing the new census (of 1891) had not been reported.

CONSTITUTION. The parliament of Tasmania, under the acts of 1871 and 1885, consists of a Legislative Council and a House of Assembly. The Council is composed of eighteen members, elected by all natural born or naturalized subjects of the Crown who possess either a freehold worth £20 a year, or a leasehold of £80, or are barristers or solicitors on roll of Supreme Court, medical practitioners duly qualified, and all subjects holding a commission or possessing a degree. Each member is elected for six years. The House of Assembly consists of thirty-six members, elected by all whose names appear on valuation rolls as owners or occupiers of property, or who are in receipt of income of £60 per annum (of which £30 must have been received during last six months before claim to vote is sent in), and who have continuously resided in Tasmania for over twelve months. The Assembly is elected for five years. The number of electors for the Legislative Council in 1889 was 6,420, or 4.31 of the total population, and for the House of Assembly 26,054, or 17.50 of the total population. The legislative authority vests in both Houses, while the executive is vested in a governor appointed by the Crown. The governor is, by virtue of his office, commander-in-chief of the troops in the colony; he has a salary of £5,000 per annum. He is aided in the exercise of the executive by a cabinet of responsible ministers, consisting of four members, as follows: Premier and Chief Secretary, Hon. Philip Oakley Fysh; Treasurer, Hon. Bolton Stafford Bird; Attorney-General, Hon. Andrew Inglis Clark; Minister of Lands and Works, Hon. Alfred Pillinger. Each of the ministers has a salary of £900 per annum. The position of premier has a salary of £200 per annum in addition. The ministers must have a seat in either of the two Houses. The present governor (1891) is Sir G. C. Hamilton, appointed in 1887.

EDUCATION. There were, in January, 1891, sixteen high schools or colleges in Tasmania, with an average attendance of 1,297; 229 public elementary schools, with 17,948 scholars on roll; and 88 private schools, with 3,542 scholars. Education is compulsory. There were also 596 children attending ragged schools. Two technical schools

were started in 1888 at Hobart and Launceston. The higher education is under a university, who hold examinations and grant degrees, being at present merely an examining body. Elementary education is under the control of a director working under a ministerial head. There are several valuable scholarships from the lower to the higher schools.

REVENUE, EXPENDITURES, DEBT, AND TRADE. The revenue in 1891 was estimated at £808,346, and the expenditures at £793,206. The public debt on January 31, 1890, was £5,019,050 (raised, chiefly, for the construction of public works), consisting of 3½ and 4 per cent. debentures. There are large customs duties, those in 1889 amounting to £309,762, or over 19 per cent. of the imports. The imports of 1889 were valued at £1,611,035, the exports £1,459,857. In 1889, 842 vessels (of 458,247 tons) were entered. For Religion and Railways see those topics in these Revisions and Additions.

TASMAN SEA, the new name adopted by the Australasian Association (at their third annual meeting held in Christchurch, New Zealand, Jan. 15, 1891) for the sea between Australia and New Zealand.

TASSISUDON, the capital of Bhotan, on the right bank of the Godadda, an affluent of the Brahmaputra. Many of the inhabitants, whose number has not been ascertained, are employed in manufacturing paper, and in making brass images and ornaments for their places of worship.

TATTA, a town of Sind, on the right bank of the Indus, and at the head of the delta of that river, sixty-four miles east of Kurrachi. In former times Tatta was a most flourishing town, and manufactured fabrics of silk and cotton—a branch of industry that has almost wholly disappeared. The only noticeable structure is the mosque of Shah-Jehan, built of brick, and is now falling into decay; but the vast cemetery of Tatta deserves mention. It has an area of six square miles, contains, it is calculated, at least a million tombs, and has room for not less than four millions. Population of Tatta, about 10,000.

TAUCHNITZ, KARL CHRISTOPH TRAUOGOTT, a famous German printer and bookseller, born at Grossspardau, near Leipzig, in 1761, died in 1836. In 1809 he began the issue of a series of editions of the classic authors, the elegance and cheapness of which gave them a European circulation. By offering a prize of a ducat for every error pointed out, he was able to bring out, in 1828, an edition of Homer of extraordinary correctness. He was the first to introduce (1816) stereotyping into Germany; and he also applied it to music, which had not been attempted before. In the latter years of his busy life he stereotyped the Hebrew Bible, and the Koran in the original Arabic. On his death the business was continued by his son, **KARL CHRISTIAN PHIL. TAUCHNITZ**.—A nephew of the elder Tauchnitz, **CHRISTIAN BERNH. TAUCHNITZ**, also set up a publishing establishment in Leipzig, combined with printing. Among the most noted of his undertakings is the issue of "British Authors" (begun 1842), so well known to all English travelers on the continent, of which upward of 1,000 volumes had appeared in 1870.

TAUNTON, a city of Massachusetts. Popula-

tion in 1890, 25,448. See Britannica, Vol. XXIII, p. 83.

TAXICORNES, a family of coleopterous insects, of the section Heteromera, having the body generally square; the thorax either concealing or receiving the head; the antennæ short; and the legs adapted for running. Most of them are found in fungi and beneath the bark of trees. They are widely distributed over the world.

TAYLOR, ABNER, member of Congress from Illinois, born in Maine. He has been in active business all his life, as contractor, builder, and merchant; the only office he ever held was that of member of the State Legislature for one term; was a delegate to the national Republican convention in 1884; was elected to Congress in 1889, and re-elected in 1891.

TAYLOR, ALFRED ALEXANDER, member of Congress, born in Tennessee in 1849. He was educated at Pennington, N. J.; read law, and was admitted to the bar in 1870; was elected to the Legislature in 1875; was nominated for governor of Tennessee in 1886, and was defeated by his brother, Robert L. Taylor; was elected to Congress in 1889, and re-elected in 1891.

TAYLOR, COL. CHARLES H., an American journalist, born in Charlestown, Mass., July 14, 1846. He began industrial life doing chores and learning to set type on the *Massachusetts Ploughman*, at a salary of \$2 per week. Later he changed to the office of the *Boston Traveler*, remaining there until 1861, when he enlisted in the 38th Massachusetts Union Regiment. A year and a half later he was wounded in battle and discharged, returning to the office of the *Traveler* where he was placed on the reportorial staff. By diligent application and overtime work he soon succeeded in mastering shorthand as well as becoming a more facile writer for the press. In 1866 he was sent to report a meeting of the Anti-Slavery Society. Believing that the speeches would prove to be of special interest to the public he reported them in full, including that of William Lloyd Garrison. His report being declined by the Boston press, Mr. Taylor forwarded it to the *New York Tribune*, where it was accepted, and a check for it returned by the next mail, with an invitation to become the regular Boston correspondent of the *Tribune*. His articles in the *Tribune* awakened notable attention and brought him the ensuing year a return of \$4,000. In 1872 he was a member of the House of Representatives, and in 1873 was elected Clerk of the House, a position which he held for eleven years. During this time he became manager of the *Boston Globe*, the paper having, when he took charge of it, a circulation of 12,000 copies. Under his management and enterprise the circulation rapidly increased, and in 1890 reported a guaranteed daily issue of 155,937 copies, with a Sunday issue of 147,707 copies. Colonel Taylor's son, C. H. Taylor, jr., a graduate of Harvard University, inherits his father's talent for journalism, and gives promise, in that line, of a most successful future.

TAYLOR, EZRA B., member of Congress, born at Nelson, Ohio, July 9, 1823. He was admitted to the bar in 1845; except while on the bench and in the army has practiced his profession ever since; was elected to fill a vacancy in Congress in 1879, and has since been continuously re-elected; his present term expires in 1893.

TEKELI, EMERIC, Count, a celebrated Hun-

garian patriot, descended from a noble Lutheran family, born at the castle of Kasmark, in the county of Zips, in 1656, died at Constantinople in 1705. His wife, Helena, the widow of Ragotsky, was celebrated all over Europe for her beauty, but was no less distinguished for her heroic gallantry, as was proved by her obstinate defense of her castle of Mongatz against an army of Imperialists.

| Total | | 842,812 | | |

The number of telegraphic messages annually transmitted may be estimated at 300,000,000.

The greatly increased mileage since 1880 is principally due to the fact that in 1881 the Western Union Telegraph Company absorbed by purchase all the lines of the American Union and the Atlantic and Pacific Telegraph Company, the former having previously in operation over 12,000 miles of line, and the latter 8,706 miles. Capital stock of the Western Union \$86,200,000.

The Western Union has exclusive contracts with several International Cable Companies, operating eight Atlantic cables, and guarantees 5 per cent. annual dividends on the stock of the American Cable Company; amount, \$14,000,000.

Besides the above, there are many new lines of Telegraph, which have complied with the United States Telegraph Act of 1866, and are operating wires with or without connection with railway companies.

The Mutual Union Telegraph Company, of the United States, established in 1881, has about 8,000 miles of line, 60,000 miles of wire, 1,200 offices, and has extended its lines north and south, operating already from Boston to Chicago, St. Louis, Washington, etc. Capital stock, \$2,500,000. This line is now leased and operated by the Western Union Telegraph Company.

The Baltimore and Ohio Railroad Telegraph,

having lines coëxtensive with its railway system and branches, besides many newly extended wires south and west, constituting 6,711 miles of line and 54,087 miles of wire, was purchased for \$5,000,000 in 1887 by the Western Union Company, which now owns and operates it.

The Bankers and Merchants' Telegraph Company, New York, organized March 23, 1881, has about 4,000 miles of line, 28,300 miles of wire, and is in operation to many leading points. Capital authorized, \$3,000,000. Debt about \$7,500,000, as stated in August, 1884. Sold in foreclosure, July 31, 1885, and now operated by the United Lines of Telegraph.

The American Rapid Telegraph Company, New York to Boston, Philadelphia, Baltimore, Washington, Buffalo, etc., with capital stock of \$4,000,000. Has been leased by the Western Union Company.

The Postal Telegraph and Cable Company, of New York, organized June 21, 1881, has about 1,500 miles of line, and 4,500 miles of wire in operation, from New York to Chicago, etc., and owns what are claimed to be very valuable patents in improved wires and telegraphy. Authorized capital stock, \$21,000,000, of which about \$7,000,000 has been issued. Now operated by the United Lines of Telegraph.

The aggregate mileage of telegraph lines in the United State open for public business exceeds 190,000 miles, besides railway, government, private, and telephonic lines, length not ascertainable.

TELEOSAURUS, a genus of fossil crocodiles, whose remains occur in the oölitic rocks. They are found associated with marine fossils, and the peculiar modification of their skeleton seems to have specially fitted them for an aquatic life. Both surfaces of the vertebræ were slightly concave, the hind legs were large and strong, and the anterior portion of the body gradually tapered into the long and slender jaws, which were armed with numerous equal and slender teeth, slightly recurved, and admirably adapted for the capture of fishes, with which the oölitic seas abounded. No less than twenty species have been described.

TELEPHONES, IN THE UNITED STATES. The following are the latest statistics made public by the American Bell Telephone Company, which practically monopolizes the telephone business in the United States:

| | 1888. | 1889. | 1890. |
|---------------------------------|---------|---------|---------|
| Exchanges | 739 | 742 | 757 |
| Branch offices..... | 452 | 452 | 471 |
| Miles of wire on poles..... | 127,839 | 142,631 | 154,009 |
| Miles of wire on buildings..... | 10,225 | 10,266 | 11,484 |
| Miles of wire underground..... | 8,009 | 17,038 | 27,117 |
| Miles of wire submarine..... | 365 | 536 | 603 |
| Total miles of wire..... | 146,438 | 170,471 | 193,213 |
| Total circuits..... | 132,004 | 143,687 | 156,780 |
| Total employes..... | 6,183 | 6,310 | 6,758 |
| Total subscribers..... | 158,712 | 171,454 | 185,003 |

The number of instruments in the hands of licensees under rental at the beginning of 1890 was 44,861. The number of exchange connections daily in the United States is 1,240,147, or a total per year of over 400,000,000. The average num-

ber of daily calls per subscriber is 6.13. The company received in rental of telephones in 1889, \$2,657,361. It paid its stockholders in dividends in 1889, \$1,838,913.

The Bell Company and its subsidiary companies represent about \$80,000,000 of capital; the Long-Distance Telephone Company about \$5,000,000.

TELEPHONING LONG DISTANCES. In April, 1891, a telephone line was opened for public use between Paris and London, a distance of 297 miles. There has been telephoning over much greater distances in the United States since 1883, when conversation was carried on between New York and Cleveland, a distance of 650 miles, and since then communication has been obtained between Boston and Chicago (1,000 miles). At the time of the great blizzard of 1888, the only direct means of communication between Boston and New York for several days was over along distance telephone wire, which withstood the storm that prostrated all the other lines. A charge of two dollars is made for three minutes' use of the wire between the English and French capitals. For general article on the telephone see Britannica, Vol. XXIII, pp. 127, 135.

TELESCOPES. For general subject see illustrated article in Britannica, Vol. XXII, pp. 135-154. Alvan Clark & Sons, of Cambridgeport, Mass., constructed in 1860 a telescope of eighteen and one-half-inch aperture, then the largest refractor known. It was originally intended for the University of Mississippi, but, being prevented by the Civil War from reaching its destination, it was purchased by the Chicago Astronomical Society and mounted at the Dearborn Observatory. In 1873, the Clarks completed a twenty-six-inch refractor for the U. S. Naval Observatory at Washington, the contract price for which was \$46,000. At the same time they made for Mr. Leander McCormick an objective of a slightly larger aperture, which they mounted in 1883 at the University of Virginia. In 1879 the Clarks entered into a contract with the Russian government to furnish an objective glass of thirty inches, and in 1880 with the trustees of the Lick Observatory for one of thirty-six inches. The glass for these large lenses comes either from Birmingham, England, or from Paris, France. The makers experienced great difficulties in obtaining disks of the requisite degree of purity, particularly in the case of the thirty-six-inch crown-glass disk, which involved nearly three years' labor and nineteen failures, before a suitable piece was obtained. Of smaller objectives the Clarks have made a great number, some sixty or more, between the apertures six and twelve inches.

The mounting for the thirty-inch Pulkowa (Russian) objective was made by a firm of Hamburg, Germany, and that for the Lick lens by Warner & Swasey, of Cleveland, Ohio. The eye end of the Lick telescope is provided with a fine position micrometer made by Tauth & Co., and a stellar spectroscope made by Brashear. For use as a photographic telescope, a third (crown) lens of thirty-three-inch clear aperture is mounted in front of the objective, its application shortening the focal length of the telescope by ten feet. It is very desirable to have means by which the ordinary visual objective can be readily transformed into a photographic objective, in order to correct the

chromatic aberration. The third (photographic) lens is removed when direct observations are to be made.

Following is a list of the largest reflecting telescopes, and another list of the largest refracting telescopes of the world:

LIST OF THE LARGEST REFLECTORS IN THE WORLD.

| Observatory or Owner. | Aperture. | | Constructed by |
|---------------------------------------|--------------|-----|--------------------------|
| | Centimeters. | In. | |

TELLER, HENRY M., United States senator, born in Alleghany county, N. Y., May 23, 1830. He studied law, was admitted to the bar in New York, and has since practiced; removed to Illinois in 1858, and thence to Colorado in 1861; was elected to the United States Senate (on the admission of Colorado as a state), and took his seat Dec. 4, 1876; was re-elected Dec. 11, 1876, and served until April 17, 1882, when he was appointed Secretary of the Interior by President Arthur, and served until March 3, 1885; was again elected to the United States Senate, and took his seat March 4, 1885. His present term expires in 1897.

TEMBU, ABATEMBU, or TAMBOOKIE, the name of an important tribe of Kaffirs, occupying the region east of the present boundary of the Cape Colony, where it forms the eastern limit of the district of Queenstown, formed by Sir Harry Smith, in 1849, 1850, a rather elevated plateau, from which flow the headwaters of the Kei, Bashee, Tsomo, and other important rivers. They number about 90,000 souls, and are of a less warlike and predatory nature than the adjoining tribes of the Amaxosa and Amagaleka Kaffirs. They have located themselves in the unoccupied country east of the White Kei and Tsomo Rivers, a good pastoral region, but rather bare of wood.

TEMPERANCE REFORM. See TEMPERANCE SOCIETIES, in Britannica, Vol. XXII, pp. 158-160.

TEMPERANCE TEMPLE. This temple, now approaching completion, is one of the notable buildings of Chicago. The corner-stone was laid in the presence of a large audience Nov. 1, 1890, with imposing ceremonies, conducted by Miss Frances Willard, president of the Women's National Christian Temperance Union, and her associates in the executive administration of that society. The edifice is to cost \$1,100,000, and is to be completed by May 1, 1892. Its foundation measures 190 feet on LaSalle street, and 96 feet on

Monroe street. The edifice is thirteen stories high, including ten stories from the ground level to the cornice, and three stories above that line. The subjoined accredited description has been kindly furnished for insertion:

TEMPERANCE TEMPLE.

It will be a steel, fire-proof building, the first two stories being faced with a rich, dark red granite, and the remaining stories to the cornice with a fine pressed brick, made to order, of a new and corresponding tint. The architecture is described as French Gothic. The LaSalle street front bears a very striking resemblance to the Adams street front of the Pullman Building. Its general ground plan is somewhat in the shape of the letter H. The building consists of two immense wings united by a narrower middle portion, called a vinculum. In this wing there will be a central court, 70 feet long and 30 feet deep, on the LaSalle street front, and a similar court 18 feet deep on the west side of the building, designed to admit light and promote ventilation, as well as a feature of beauty. The LaSalle street front will be made continuous by a lofty stone arch, which will span the court and form the main entrance. The four corners presented to LaSalle street will receive a rounded turret treatment, and the intermediate windows in the front of each wing will be grouped under a broad arch on the next story. The steep roof is broken into terraces, marking the three stories above the cornice, each of which has its strikingly beautiful gothic windows. From the roof of the vinculum rises a graceful gold bronze fleche to the height of 70 additional feet, surmounted with a symbolical figure of a woman with face upturned and arm outstretched, as if in prayer. The architectural effect of the whole design, therefore, is not a little temple-like.

In the interior this great building will be fully as much like a temple of mammon as a temple of

temperance. The basement will probably contain a restaurant. The first floor has already been rented to three banks, with the exception of a large room at the southwest corner of the building and a broad hall leading to it from an entrance on Monroe street, near the northern corner of the building. This reserved room is to be called Willard Hall. It is to be the trysting place of the temperance advocates of the world. It is to be beautified with fountains, statuary, paintings and relics, and from it is to ascend daily for all time to come the incense of prayer for the abatement of the liquor evil. Even the broad hallway leading to it is to be lined with marble and emblazoned with memorials of the temperance conflict. A considerable portion of the upper floors, not yet selected, will be used for the other work of the Women's Christian Temperance Union; but, with these exceptions, everything, from cellar to garret, is to be rented for business purposes. To add to its eligibility, every conceivable modern convenience will be provided, and, among other things, eight great elevators.

This enterprise, under the auspices of the Women's National Christian Union, was specially conducted by the Women's Building Association, of which Mrs. Matilda B. Carse was the head. The association proposes to raise the money, or, as it claims, has already raised it, by the sale of \$600,000 worth of stock, and a loan of \$500,000, for which bonds have been issued, secured on the property. But the stockholders are under obligations to sell their stock to the association at any time within twelve years, and in this way the women intend to own the whole outfit in a short time. The process of raising money for this purpose is going on incessantly through the "Union Signal," which is pressing into service many women and children in the United States as collectors and contributors. There is no doubt of ultimate success in this colossal financial venture. The building, when completed, is expected to bring a revenue of \$250,000 per annum.

TEMPLATE, a mold in wood or metal, showing the outline or profile of moldings, from which mold the workmen execute the molding.

TEMPLEMORE, a market town of the county of Tipperary, province of Munster, Ireland, situated on the right bank of the River Suir, nine miles north of Thurles. Although without manufactories of any note, Templemore has some considerable share of inland traffic. It is a station on the Great Southern and Western Railway, seventy-nine miles distant from Dublin. The public buildings, one of which is an extensive barrack, are substantial, but without any noteworthy architectural character. The population in 1871 was 3,443, of whom almost all were Roman Catholics.

TENDA COL DE, a pass over the maritime Alps.

TENDER, in naval language, a small vessel appointed for the service of a larger one. Steam gunboats are most commonly employed as tenders.

TENEDOS (Turk. *Bogulshu-Adassi*), an island belonging to Turkey, in the northeast of the Ægean Sea, off the coast of the Troad, about seventeen miles south of the western entrance to the Strait of the Dardanelles. It is about five miles long by two broad, rocky, but not unproductive, with a population of more than 6,000, who are partly Greeks and

partly Turks. The chief town, also called Tenedos, or Bogdsha, on the northeast coast, is the seat of a Greek bishop and Turkish aga, and carries on an active trade in wine.

TENES, a rising seaport of Algeria, 100 miles west of the city of Algiers. It is happily situated for commerce, is the entrepot for Orleansville, and the depot for the supply of the army with provisions. It is at once fortunate in the agricultural resources of its territory, in its mineral wealth, and its position in respect to transit-trade. The population of the commune is about 8,000.

TENNESSEE, State of. For general article on Tennessee, see Britannica, Vol. XXIII, pp. 176-179. The census of 1890 reports the area and population as follows: Area, 42,050; population, 1,767,518, an increase during the decade of 225,159. Capital, Nashville, with a population of 76,168. The following table gives the population of the cities and towns of the State, which in 1890 had each over 8,000 inhabitants; also their population in 1880, and their ratio of increase:

| CITIES AND TOWNS. | 1890. | 1880. | Increase | Per Cent. |
|-------------------|--------|--------|----------|-----------|
| Chattanooga | 29,100 | 12,892 | 16,208 | 125.72 |
| Jackson | 10,039 | 5,377 | 4,662 | 86.70 |
| Knoxville | 22,535 | 9,693 | 12,842 | 132.49 |
| Memphis | 64,495 | 33,592 | 30,903 | 92.00 |
| Nashville | 76,168 | 43,350 | 32,818 | 75.70 |

AREAS AND POPULATION BY COUNTIES. The land areas in square miles, and the population, severally, of the counties of the state were as follows in 1890:

| COUNTIES. | Area sq. m. | Population 1890. | Population 1880. |
|------------|-------------|------------------|------------------|
| Anderson | 360 | 15,128 | 10,820 |
| Bedford | 520 | 24,739 | 26,025 |

The governor's salary is \$4,000.

BRIEF HISTORIC OUTLINE. Tennessee was early claimed by North Carolina as a part of her territory. In 1757 Fort Loudon was erected on the Tennessee River. The North Carolina people settled in the Holston River region. Other early settlers came from Virginia and South Carolina. In the Revolutionary War the settlers joined the patriots, and in 1776 fought with and signally defeated the Indians. Early in 1785 the settlers in East Tennessee formed a state government of their own, naming their new state Franklin or Frankland, and holding their first legislature later in the same year. On June 1, 1796, a state constitution was adopted, and the new state was admitted into the Union. Knoxville became the capital. An ordinance of secession was adopted. Numerous severe battles were fought during the Civil War. In April, 1865, the legislature ratified the Thirteenth Amendment, and July 15th the Fourteenth Amendment.

Progress of population in Tennessee by decades: In 1790, 35,691; 1800, 105,602; 1810, 261,727; 1820, 422,771; 1830, 681,904; 1840, 829,210; 1850, 1,002,717; 1860, 1,109,801; 1870, 1,258,520; 1880, 1,542,359; 1890, 1,767,518.

For numerous other items of interest relating to the State of Tennessee, see the article UNITED STATES in these Revisions and Additions.

TENNIEL, JOHN, artist, born in 1820. Showing the possession of artistic taste at an early age, he may be considered as entirely self-taught. He was a successful candidate in one of the cartoon competitions for the decoration of Westminster Hall, and painted a fresco for the Palace at Westminster. His illustrations of books, although not comprising many, have always been characterized by great taste. When *Alice in Wonderland* made its appearance, some portion of the notice it obtained may fairly be attributed to his illustrations of the book. In 1851 he joined the staff of "Punch," with which newspaper he has since been connected, and for which he draws the cartoon. Many of his sketches have obtained world-wide notice by this means, among the most famous of his recent cartoons being one that appeared in March, 1890, entitled *Dropping the Pilot*. The original of this sketch, which had reference to the resignation of Prince Bismarck, was purchased by the Earl of Rosebery and presented to the ex-chancellor.

TENNYSON, ALFRED, BARON (creat. 1884), the son of Rev. George Clayton Tennyson, rector of Somersby, Lincolnshire; born at Somersby, England, in 1809. He was educated at Cambridge, where he gained the Chancellor's medal for his poem in blank verse, *Timbuctoo*; married Emily, daughter of Henry Selwood, of Peasmore, and niece of Sir John Franklin; has been Poet Laureate since 1850. He published in 1830 his first volume, *Poems Chiefly Lyric*; followed by *Poems; The Princess*—which contains what many consider the finest of his lyrics; *Fears, Idle Tears; May Queen*, and *Locksley Hall; In Memoriam*—a tribute to the memory of Arthur Hallam, son of the historian; this fine poem was at first published anonymously. His other chief works being *Maud; Idylls of the King; Enoch Arden; The Holy Grail; The Window, or the Songs of the Wren; Gareth and Lynette; Queen Mary; Harold; The Cup; The Promise of May; The Cup and the Falcon;*

Becket; Tiresias; Locksley Hall; Sixty Years After—which attracted a great deal of attention; *Jubilee Ode*, published in 1887. Lord Tennyson has for many years resided at Freshwater, in the Isle of Wight; Aldworth; or at Rundhurst, Sussex. Almost simultaneously with the publication, in 1889, of *Asolando*, by Robert Browning, a volume of poetry by Lord Tennyson was issued, entitled *Demeter*, and containing some very choice poems. Among its contents was *Crossing the Bar*, which, by its exquisite music, excited great admiration.

TENTACULITES, a genus of obscure annulated tapering shells, found abundantly in some strata of Silurian age. They are generally referred to annelids, but the structure of the shell seems to exhibit greater affinities to recent pteropodous molluscs.

TENTERDEN, a municipal borough and market-town in the Weald of Kent, eighteen miles south-east of Maidstone. The church, which contains portions of Early English, is surmounted by a massive and lofty perpendicular tower. Tradition asserts, that a quantity of stones, which had been got together for the purpose of strengthening the sea-wall of the Goodwin Sands, were employed in the building of this tower, and that when the next storm came, the district of Goodwin Sands, which had formerly belonged to the mainland, was submerged. Thus arose the popular saying, that "Tenterden steeple was the cause of the Goodwin Sands." Population in 1871, 3,669.

TERCE (Lat. *tertia*—i. e., *hora*, the third hour), one of the "Lesser Hours" of the Roman Breviary, so called from the time of the day for which it is fixed.

TERCE, in the law of Scotland, the interest or estate which a widow has in the land of her deceased husband at common law. This amounts to a life rent of one-third of such estates.

TERENTIUS AFER, PUBLIUS, the comic poet, born at Carthage, 195 B.C. By birth or purchase, he became the slave of the Roman senator, P. Terentius Lucanus, who, out of regard to his handsome person and unusual talents, educated him highly, and finely manumitted him. On his manumission, he assumed, of course, his patron's *nomen* Terentius. His first play was the *Andria*, written in his twenty-seventh year, but not acted till 166 B.C. Its success was immediate. He is supposed to have died in his thirty-sixth or thirty-seventh year, leaving one daughter. Six comedies are extant under the name of Terentius, which are perhaps all he produced, namely: *Andria, Hecyra, Heauton-timoumenos, Eunuchus, Phormio* and *Adelphi*. In conjunction with Plautus, Terentius, on the revival of letters, was studied as a model by the most accomplished play-writers. His language is pure and almost immaculate.

TERHUNE, MARY VIRGINIA, an American authoress, known by her pen name as MARION HARLAND, daughter of Samuel Hawes, a merchant of Virginia, and wife of Edward Terhune, D.D., of Brooklyn, born in Amelia county, Va., about 1830. She began to write for the newspapers at the age of fourteen, and at sixteen published in a magazine a sketch entitled *Marrying from Prudential Motives*, which was copied in England, translated for a French magazine, retranslated for a London periodical, and copied again in its altered form in the United States. Besides many novels, she has

written a number of popular works on housekeeping; was for some time editor of "Babyhood"; has edited special departments of "Saint Nicholas" and "Wide Awake"; and was the founder, in 1888, of the "Home-Maker."

TERMINUS, a Roman divinity, supposed to preside over public and private boundaries. Originally, he appears to have been the same as Jupiter himself, but gradually he was recognized as a separate and distinct god. Hardly any religious conception is more thoroughly characteristic of the Romans, that land-loving, law-reverencing people, than the conception of Terminus, whose worship was practiced down to a late period.

TERRA-FIRMA, a term frequently employed to denote continental land as distinguished from islands. But it was at one time more specially applied — first, to all the mainland of Italy which acknowledged the supremacy of Venice; and secondly, to the extensive tract of South America, bounded by the Pacific Ocean, Peru, the Silvas of the Amazon, the Atlantic Ocean, and the Isthmus of Panama, which mostly belonged to the Spaniards during the last century. In a still more restricted sense, the term was applied by the Spaniards to the Isthmus of Panama itself.

TERRE HAUTE, a city of Indiana. Population in 1890, 30,217. See *Britannica*, Vol. XXIII, p. 195.

TERRELL, a town of Texas, in Kaufman county, a thriving trading and shipping point.

TERRY, MISS ELLEN, an English actress, born at Coventry in 1848. She made her first appearance on the stage during Charles Kean's Shakespearian revivals in 1858, playing the parts of Mamillius in *The Winter's Tale* and Prince Arthur in *King John*. When only fourteen she was a member of Mr. Chute's Bristol company, which included Mrs. Kendal, Mrs. Labouchere, Kate Bishop, and several other now prominent members of the profession. She made her debut in London, in 1863, as Gertrude in *The Little Treasure*, and until 1864, played Hero in *Much Ado About Nothing*, Mary Meredith in *Our American Cousin*, and other secondary parts. In that year she married and left the stage, but reappeared again in 1867, in *The Double Marriage* at the New Queen's Theater, London. She afterward joined Mr. and Mrs. Bancroft at the Prince of Wales' Theater, where she acted the part of Portia. In 1878 she made her first appearance at the Lyceum, and has since, in conjunction with Mr. Irving, played in the longest runs ever known of *Hamlet*, *The Merchant of Venice*, *Romeo and Juliet*, and *Much Ado About Nothing*. She has also appeared as Viola in *Twelfth Night*, Henrietta Maria in *Charles I.*, Camma in Tennyson's tragedy of *The Cup*, and Ruth Meadows in *Eugene Aram*. She achieved immense success as Marguerite in W. G. Wills' play of *Faust*. She accompanied Mr. Irving on his American tour in 1887, and afterward reappeared at the Lyceum in *Faust*, and at the same theater played as *Lady Macbeth* and in *Dead Heart*. In 1890 she appeared as Luey Ashton in *Ravenswood*, with great success.

TERRY, WILLIAM L., member of Congress, born in Anson county, N. C., Sept. 27, 1850. He removed, with his parents, to Mississippi in 1857, and to Arkansas in 1861; was educated at Bingham's Military Academy, North Carolina, and

Trinity College, North Carolina, graduating in 1872; entered the profession of law in November, 1873; was an officer of Arkansas state troops in 1874; was elected a member of the City Council of Little Rock in 1877, and a state senator in 1878, serving as president of the Senate; was city attorney of Little Rock eight terms. Was a delegate to the Democratic National Conventions of 1884 and 1888. In 1890 was elected a representative from the Fourth Congressional District of Arkansas to the LII. Congress.

Tewfik, Mohammed Tewfik Pasha, Khedive of Egypt, eldest son of Ismail Pasha, born in 1852. He was made president of council by his father upon dismissal of Nubar, in 1878, and worked for a few weeks loyally with his colleagues, Sir Rivers Wilson and M. de Bignieres, but resigned rather than be party to the *coup d'etat*. On deposition of Ismail he was proclaimed Khedive by Sultan's firman, in 1879; gave loyal support to Dual Control, 1879-82. He was unable to resist rebellion of Arabi, but refused to take refuge in British ships. After bombardment of Alexandria he entered into negotiations with the English, and proclaimed amnesty to all who would return to obedience. This being ineffectual, after Tel-el-Kebir Tewfik returned to Cairo. He behaved with great courage during the outbreak of cholera in 1883, when, accompanied by his wife, he visited the sick in spite of the remonstrances of ministers. After 1884 he usually acted under the influence of Sir E. Baring. Though a Mohammedan, Tewfik was strongly opposed to the Moslem institutions of polygamy and slavery. He died in 1892.

TEXARKANA, a town, the county seat of Miller county, Ark., an important railway center, situated about one-half in Arkansas, and the rest in Texas. It is an important point on the southern line to the Pacific coast. The post-office is in the state of Arkansas. Population in 1890, 3,486.

TEXAS STATE OF. For general article on Texas, see *Britannica*, Vol. XXIII, pp. 202-206. The census of 1890 reports the area and population as follows: Area 265,780; population, 2,235,523, an increase during the decade of 643,774. Capital, Austin, with a population of 14,476. The following table gives the population of the cities and towns of the state, which in 1890 had each over 8,000 inhabitants; also their population in 1880, and their rate of increase:

| CITIES AND TOWNS. | 1890. | 1880. | Increase | Per Cent. |
|-------------------|--------|--------|----------|-----------|
| Anstlin..... | 14,476 | 11,013 | 3,463 | 31.44 |
| Dallas..... | 38,067 | 10,358 | 27,709 | 267.51 |
| Donison..... | 10,958 | 3,975 | 6,983 | 175.67 |
| El Paso..... | 10,338 | 763 | 9,602 | 1,304.62 |
| Fort Worth..... | 23,076 | 6,663 | 16,413 | 246.33 |
| Galveston..... | 29,084 | 22,248 | 6,836 | 30.73 |
| Houston..... | 27,557 | 16,513 | 11,044 | 66.88 |
| Laredo..... | 11,319 | 3,521 | 7,798 | 221.47 |
| Paris..... | 8,254 | 3,980 | 4,274 | 107.39 |
| San Antonio..... | 37,673 | 20,550 | 17,123 | 83.32 |
| Waco..... | 14,445 | 7,295 | 7,150 | 98.01 |

The census report of several other cities and towns are as follows: Brenham, 4,683; Corpus Christi, 4,378; Corsicana, 8,278; Gainesville, 6,563; Marshall, 7,196; Palestine, 5,834; Sherman, 7,322; Tyler, 6,908; Navasota, 5,610.

AREAS AND POPULATION BY COUNTIES. The land areas in square miles, and the population, severally, of the counties of the state were as follows, in 1890:

| COUNTIES. | Area, sq. miles. | Pop. 1890. | Pop. 1880. |
|---------------|------------------|------------|------------|
| Anderson | 1,000 | 20,923 | 17,395 |

GOVERNORS OF TEXAS. The following is a complete list of the governors of the state, with the periods and dates of service:

PROVISIONAL GOVERNOR BEFORE THE DECLARATION OF INDEPENDENCE OF MEXICAN CONTROL.

Henry Smith, 1835-36.

PRESIDENTS UNDER THE REPUBLIC.

| | |
|-----------------------------|---------------------------|
| David G. Burnet, 1836-36. | David J. Burnet, 1840-41. |
| Sam Houston, 1836-38. | Sam Houston, 1841-44. |
| Mirabeau B. Lamar, 1838-40. | Anson Jones, 1844-46. |

GOVERNORS OF THE STATE.

| | |
|-------------------------------|-----------------------------|
| J. P. Henderson, 1846-47. | J. W. Throckmorton, 1866-67 |
| Geo. T. Wood, 1847-49. | Edward M. Pease, 1867-70. |
| P. Hansborough Bell, 1849-53. | Edmund J. Davis, 1870-74. |
| Edward M. Pease, 1853-57. | Richard Coke, 1874-76. |
| H. G. Runnels, 1857-59. | Richard Hubbard, 1876-79. |
| Sam Houston, 1859-61. | Oram M. Roberts, 1879-83. |
| Edward Clark, 1861-61. | John Ireland, 1883-87. |
| Francis B. Lubbock, 1861-63. | Lawrence S. Ross, 1887-91. |
| Pendleton Murray, 1863-65. | James S. Hogg, 1891-93. |
| A. J. Hamilton, 1865-66. | |

The governor's salary is \$4,000.

BRIEF HISTORIC CHRONOLOGY. De La Salle, a Frenchman, landed at Matagorda Bay in 1687, and erected Fort St. Louis. He was soon after murdered by some of his own men, and his colony failed. Capt. Alonzo de Leon, a Spaniard, established a mission and trading post on the site of the fort in 1690. This settlement was also abandoned. In 1714 Capt. de St. Denis succeeded in establishing three missions on the Rio Grande. In 1735 a French colony was established on Red River, against the protest of the Spaniards. After the Louisiana purchase by the United States a controversy with respect to the boundary line took place with Texas, Spain claiming land east of the Sabine River, and the United States claiming the land west of the Rio Grande. In the treaty of 1819, in which Spain ceded Florida to the United States, the latter guaranteed to Spain her territory west of the Rio Grande. Mexico became independent of Spain in 1820. The Texan war with Mexico began Oct. 2, 1835, and, on Nov. 12, 1835, a provisional government was formed. Several bloody battles followed. On March 17th the Texans adopted a republican constitution, and elected David G. Burnet president of the Republic of Texas. The decisive battle was fought at San Jacinto. April 21st, Gen. Sam Houston leading the Texans to success. The United States acknowledged the independence of Texas in March, 1837. Annexation of Texas to the United States was voted by Congress, Dec. 27, 1845, and accepted by Texas, Feb. 19, 1846. Texas followed the rest of the South in the Civil War of 1860-65. In March, 1870, Texas was formally restored to the Union. In February, 1876, a new state constitution was adopted.

Progress of population in Texas by decades: In 1850, 212,592; 1860, 604,215; 1870, 818,579; 1880, 1,591,749; 1890, 2,235,523.

For numerous other items of interest relating to Texas, see the article United States in these Revisions and Additions.

THALLOGENOUS PLANTS, those acetyledonous plants which exhibit the greatest simplicity of structure, consisting of a mere thallus with reproductive organs. Of this description are *Algae*, *Characeae*, *Fungi* and *Lichens*.

THANN, a town of Alsace, in the former French department of Haut-Rhin, prettily situated at the foot of a hill, crowned by the ruins of

the castle of Engelburg, thirteen miles northwest of Mulhouse. It contains a superb Gothic church, surmounted by a spire of delicate open work upward of 300 feet high. Cotton cloths, chemicals and machinery are manufactured. Population in 1871, 8,052.

THEOLOGICAL SEMINARIES IN THE UNITED STATES. According to the latest report of the U. S. commissioner of education the theological schools in the United States were, in 1887, as follows:

| RELIGIOUS DENOMINATIONS. | No. of Schools. | No. of Instructors. | No. of Students |
|----------------------------------|-----------------|---------------------|-----------------|
| Baptist | 19 | 107 | 1,014 |
| Free Baptist | 2 | 11 | 78 |
| Roman Catholic | 17 | 150 | 663 |
| Lutheran | 17 | 69 | 1,057 |
| Methodist Episcopal | 16 | 107 | 645 |
| Methodist Protestant | 2 | 10 | 26 |
| Methodist Episcopal, South | 2 | 20 | 207 |
| German Methodist Episcopal | 1 | 3 | 39 |
| Wesleyan Methodist | 1 | 5 | 20 |
| Presbyterian | 14 | 81 | 749 |
| Cumberland Presbyterian | 2 | 19 | 327 |
| United Presbyterian | 2 | 19 | 65 |
| Reformed Presbyterian | 1 | 3 | 22 |
| Protestant Episcopal | 12 | 68 | 286 |
| Congregational | 11 | 66 | 378 |
| Universalist | 3 | 22 | 61 |
| Unitarian | 1 | 7 | 30 |
| Christian | 6 | 18 | 236 |
| Reformed | 5 | 15 | 73 |
| Reformed (Dutch) | 1 | 6 | 22 |
| Associate Reformed | 1 | 6 | |
| Unsectarian | 4 | 30 | 152 |
| United Brethren | 2 | 9 | 65 |
| Jewish | 1 | 9 | |
| Evangelical Association | 1 | 4 | 9 |
| German Evangelical | 1 | 3 | 82 |
| Total | 145 | 867 | 6,306 |

In the following list we give the names and locations of these schools, together with the dates of their organizations.

THE BAPTIST THEOLOGICAL SCHOOLS are (The dates tell when founded):

1. Hamilton Theological Seminary, at Hamilton, N. Y., 1820.
2. Newton Theological Institution, at Newton Centre, Mass., 1825.
3. Rochester Theological Seminary, at Rochester, N. Y., 1850.
4. The Southern Baptist Theological Seminary, at Greenville, S. C., 1859.
5. The Baptist Union Theological Seminary, at Morgan Park, Ill., 1866.
6. The Atlanta Theological Seminary, at Atlanta, Ga., 1867.
7. Richmond Theological Seminary, at Richmond, Va., 1867.
8. Crozer Theological Seminary, at Upland, Delaware county, Pa., 1867.
9. Shurtieff College, at Upper Alton, Ill., 1827.
10. Wayland Seminary, at Washington, D. C., 1865.
11. Shaw University, at Raleigh, N. C., 1865.
12. Roger Williams University, at Nashville, Tenn., 1865.
13. William Jewell College, at Liberty, Mo., 1868.
14. The Benedict Institute, at Columbia, S. C., 1871.
15. Jackson College, at Jackson, Miss., 1877.

16. Indian University, at Muskogee, Indian Territory, 1880.
17. The Selma University, at Selma, Ala., 1871.
18. Bishop College, at Marshall, Texas, 1881.
19. Leland University, at New Orleans, La.

FREE-WILL BAPTISTS.

1. Hillsdale College, at Hillsdale, Mich., 1852.
2. Bates College Theological Seminary, at Lewiston, Me., 1870.

ROMAN CATHOLIC THEOLOGICAL SCHOOLS.

1. Theological Department of St. Sulpice and St. Mary's University, Baltimore, 1791.
2. Theological Department of Mount St. Mary's College, Emmitsburg, Md., 1808
3. Theological Department of Viateur's College, Bourbonnais Grove, Ill.
4. St. Vincent Seminary, Germantown, Philadelphia, 1818.
5. Theological Seminary of St. Charles Borromeo, at Overbrook, Pa., 1832.
6. St. Vincent's Theological Seminary, at Cape Girardeau, Mo., 1843.
7. St. Mary's Theological Seminary, at Cleveland, Ohio, 1849.
8. St. Meinrad's Theological Seminary, at St. Meinrad, Ind., 1854.
9. St. Joseph's Theological Seminary, at Troy, N. Y., 1864.
10. St. Charles Borromeo Theological Seminary, at Carthagen, Ohio, 1864.
11. Seminary of St. Francis of Sales, at St. Francis, Wis., 1855.
12. Diocesan Seminary of the Immaculate Conception, at South Orange, N. J., 1856.
13. College and Seminary of our Lady of Angels, at Suspension Bridge, N. Y., 1856.
14. St. Bonaventure's Seminary, at Alleghany, N. Y., 1859.
15. St. John's University, Collegeville, Minn., formerly St. John's Seminary, St. Joseph, Minn., 1857.
16. Ecclesiastical Department of the Monastery of St. Thomas Villanova, at Villanova, Pa., 1842.
17. Preston Park Theological Seminary, at Louisville, Ky., 1870.

LUTHERAN THEOLOGICAL SEMINARIES.

1. The Theological Seminary of the general Synod, at Gettysburg, Pa., 1826.
2. The Theological Seminary of the Synod of Ohio, at Columbus, Ohio, 1830.
3. The Theological Seminary of the South, at Newberry, S. C., 1830.
4. The Theological Seminary of the Evangelical Lutheran Church, at Philadelphia, 1864.
5. Concordia Seminary, at St. Louis, Mo., 1830.
6. Wittenberg College, at Springfield, Ohio, 1845.
7. Wartburg Seminary, at Mendota, Ill., 1856.
8. The Missionary Institute, at Selinsgrove, Pa., 1858.
9. Augustana Seminary, at Rock Island, Ill., 1860.
10. Hartwick Seminary, in Otsego county, N. Y., 1815.
11. Augsburg Seminary, at Minneapolis, Minn., 1869.
12. Luther Seminary, at Madison, Wis., 1876.
13. The Evangelical Lutheran Theological Seminary, at Milwaukee, Wis., 1878.

14. The Red Wing, at Red Wing, Minn.
15. The Theological Seminary at Afton, Minn., 1881.
16. Concordia College, at Conover, N. C., 1883.
17. The Theological Seminary at Saginaw, Mich.

METHODIST EPISCOPAL SEMINARIES.

1. De Pauw University, at Greencastle, Ind., 1837.
2. The Theological Department of Boston University, at Boston, Mass., 1876.
3. Garrett Biblical Institute, at Evanston, Ill., 1856.
4. Wallace College (German), at Berea, Ohio, 1864.
5. Central Tennessee College, at Nashville, Tenn., 1866.
6. The Gilbert-Haven School of Theology, at New Orleans, La., 1866.
7. The Drew Theological Seminary, at Madison, N. J., 1867.
8. The Centenary Biblical Institute, at Baltimore, Md., 1867.
9. The German-English College, at Galena, Ill., 1868.
10. A Swedish Theological Seminary, at Evanston, Ill., 1870.
11. A German College, at Mount Pleasant, Iowa, 1873.
12. The Gammon School of Theology of Clark University, at Atlanta, Ga., 1883.
13. McKendree College, at Lebanon, Ill.
14. Central Wesleyan College (German), at Warrenton, Mo., 1864.
15. Vanderbilt University, at Nashville, Tenn., 1872.
16. Trinity College of M. E. Church South.
17. Wilberforce University (African), at Wilberforce, Ohio, 1853.
18. Livingstone College (African), at Salisbury, N. C.

WESLEYAN METHODIST SCHOOL.

The Wheaton Theological Seminary, at Wheaton, Ill., 1881.

PRESBYTERIAN THEOLOGICAL SEMINARIES.

1. Princeton Theological Seminary, at Princeton, N. J., 1812.
2. Union Theological Seminary, at Hampden Sidney College, Va., 1812.
3. Auburn Theological Seminary, at Auburn, N. Y., 1819.
4. The Western Theological Seminary, at Alleghany, Pa., 1827.
5. Lane Theological Seminary, at Cincinnati, Ohio, 1829.
6. Union Theological Seminary, at New York city, 1836.
7. Danville Theological Seminary, at Danville, Ky., 1853.
8. The German Theological Seminary of the Northwest, at Dubuque, Iowa, 1852.
9. The McCormick Theological Seminary, No. 1060 N. Halsted st., Chicago, Ill., 1856.
10. The German Theological Seminary of Newark, at Bloomfield, N. J., 1868.
11. San Francisco Theological Seminary, at San Francisco, Cal., 1871.

12. Biddle University, for colored students, at Charlotte, N. C., 1868.

13. Lincoln University, near Oxford, Pa., 1871.

14. An Institute for Training Colored Ministers, at Tuscaloosa, Ala., 1877.

CUMBERLAND PRESBYTERIANS.

1. The Cumberland University, at Lebanon, Tenn., 1852.
2. Trinity University, at Tebuacana, Texas, 1871.

UNITED PRESBYTERIANS.

1. The U. P. Theological Seminary, at Xenia, Ohio, 1860.
2. The Theological Seminary of the U. P. Church, at Alleghany City, Pa., 1825.

PROTESTANT EPISCOPAL SEMINARIES.

1. The General Theological Seminary, in New York City, 1819.
2. The Prot. E. Theological Seminary of Virginia, near Alexandria, Va., 1823.
3. The Theological Seminary of the P. E. Church in the Diocese of Ohio, at Gambier, Ohio, 1824.
4. The Episcopal Theological School of Massachusetts, at Cambridge, 1867.
5. The Kansas Theological School, at Topeka, Kans., 1874.
6. The Berkeley Divinity School, at Middletown, Conn., 1850.
7. The Seabury Divinity School, at Faribault, Minn., 1860.
8. St. Andrew's Divinity School, at Syracuse, N. Y., 1876.
9. The Divinity School of the P. E. Church, in Philadelphia, Pa., 1862.
10. Griswold College, at Davenport, Iowa, 1859.
11. The Theological Department of the University of the South, at Suwanee, Tenn., 1856.
12. Wheeler Hall, Chicago, Ill., 1885.

CONGREGATIONAL THEOLOGICAL SEMINARIES.

1. Andover Theological Seminary, at Andover, Mass., 1808.
2. Bangor Theological Seminary, at Bangor, Me., 1819.
3. Yale Theological Seminary (department of Yale University), New Haven, Conn., 1755.
4. The Theological Institute of Connecticut, at Hartford, Conn., 1834.
5. Oberlin Theological Seminary (department of Oberlin College), at Oberlin, Ohio, 1834.
6. The Chicago Theological Seminary, at Chicago, Ill., 1854.
7. The Pacific Theological Seminary, at Oakland, Cal., 1869.
8. Fisk University, at Nashville, Tenn., 1869.
9. Straight University, at New Orleans, La., 1869.
10. Talladega College, at Talladega, Ala., 1869.
11. The German Theological Seminary, at Crete, Neb., 1878.

UNIVERSALIST SCHOOLS.

1. Canton Theological School, at Canton, N. Y., 1858.
2. Divinity School of Tufts College, at College Hill, Mass., 1869.
3. Theological Department of Lombard University, at Galesburg, Ill., 1881.

A UNITARIAN SEMINARY.

The Meadville Theological School, at Meadville, Pa. 1844.

CHRISTIAN (DISCIPLES OF CHRIST) SCHOOLS.

1. Eureka College, Eureka, Ill., 1855.
2. Oskaloosa College, Oskaloosa, Iowa, 1856.
3. The Christian Biblical Institute, at Stanfordville, N. Y., 1869.
4. The College of the Bible, at Lexington, Ky., 1865.
5. Drake University, at Des Moines, Iowa, 1881.
6. Union Christian College, at Merom, Ind., 1862.

REFORMED (GERMAN AND DUTCH) THEOLOGICAL SCHOOLS.

1. The Theological Seminary of the Reformed Church, at Lancaster, Pa., 1871.
2. Heidelberg Theological Seminary, at Tiffin, Ohio, 1851.
3. Mission House, at Franklin, Wis., 1860.
4. Ursinus College, at Freeland, Pa., 1870.
5. Dutch Reformed School of Rutgers College, at New Brunswick, N. J., 1810.
6. The Western Seminary, at Holland, Mich., 1866.

THE UNITED BRETHREN (in Christ) have a Union Biblical Seminary, at Dayton, Ohio, since 1881; and

THE UNITED BRETHREN, otherwise called MORAVIANS, have a Theological Seminary, at Bethlehem, Pa., 1838.

THE SWEDENBORGIANS have a Theological School, at Waltham, Mass., since 1866; and

THE JEWS have the Hebrew Union College, at Cincinnati, Ohio, since 1875.

UNDENOMINATIONAL is the Theological Department of the Howard University, at Washington, D. C., opened 1870.

METHODIST PROTESTANT SEMINARIES.

1. The Theological Department of Adriaan College, Mich., opened 1878; and
2. Westminster Theological Seminary, at Westminster, Md., opened 1882.

THEOSOPHY, an assumed knowledge of things divine, directly obtained from God through spiritual intercommunion. It claims a special insight into the divine nature. While mysticism and other theological doctrines start from known phenomena and deduce therefrom certain conclusions concerning God, theosophy, on the other hand, starts with a supposed or pretended insight into the nature of God, directly revealed to its adherents, and explains from this standpoint the phenomena of the outer world. We find claims of such direct inspiration among the Hindus, Persians, Arabs, Greeks (the later Neo-Platonists), Jews (the Cabbalists), and Christians. It was widely proclaimed in the twelfth century, and held to in some form by many so-called Christians. In later times we had Paracelsus, Jacob Boehme, Schelling, Franz von Baader and others (about these see the article THEOSOPHY in *Britannica*, Vol. XXIII, pp. 278-9).

The Theosophical Society of New York was started in 1877 by Madame Helene P. Blavatsky (née Hahn), born in St. Petersburg, Russia. She was married to a man named Blavatsky while she was a school-girl, but left her husband a few weeks afterward. She came to New York about 1873,

after she had traveled widely, as she claimed, from 1850 till 1870, among the priests in the East who professed to hold, and eventually revealed to her, the secret of theosophy. In New York City she joined Col. Henry S. Olcott, a former spiritualist and successful lawyer; with his assistance she founded the Theosophical Society of New York. William Q. Judge, who was for years before that time a mystic, joined the two partners in 1877. Blavatsky performed some things which are said to be wonderful. Gen. Abner A. Doubleday, U. S. A.; Charles Lotheran, the journalist; Mitchell, of the New York "Sun"; Curtis, of the New York "World"; Prof. Alexander Wilder, the anthropologist; Donovan, the sculptor; half a dozen Catholic priests, and a score of other well-educated people, are ready to-day to testify to certain wonderful happenings in the flat occupied by Mme. Blavatsky and Col. Olcott. These people assert that Blavatsky's performances there transcended all the recognized laws of nature. No one present could explain the phenomena displayed before his eyes. Newspaper articles attracted the attention of the whole country to her doings, especially in 1878, when her society became an accomplished fact.

A curious thing about Mme. Blavatsky was the fact that she would look old one day and young the next. Nobody knew her exact age. But sometimes in the forenoons she appeared like a woman of seventy, while in the evenings she never looked older than thirty-five.

It is said that the Theosophical Society numbered about 2,000 members in the United States, in May, 1891, and it is also said that these members are admitted for money, and that the society is kept alive by means of dues and compulsory subscriptions.

In 1879 Mme. Blavatsky broke up her household and started for India to revive theosophy among the Hindus. Some respectable people in India accused her of imposture. Dr. Hodgson had been sent out some years previous by the London Society for Psychic Research. He spent three months in finding out whether Mme. Blavatsky was a humbug or not. Information obtained from her housekeeper with regard to evident impostures convinced him that she was a humbug, and he stated so publicly. Upon this the woman left India and turned up in London, England, where she was instrumental in reviving theosophy considerably. Being a woman of very unusual education, she succeeded in convincing people who did not believe in supernaturalism that she had powers which they were unable to explain, and her system of wonderful performances or displays she called theosophy. She died in London, May 8, 1891.

THERAPIA, or TARAPIA, a village of European Turkey, province of Rumili, situated on the Bosphorus, twenty-one miles northeast of Constantinople, at the head of a large and beautiful bay of the same name. It is one of the most charmingly picturesque spots in the neighborhood of the Turkish capital, and all summer has a climate deliciously cool. Therapia is the residence of the French and English embassies, and many of the Frankish merchants have villas here.

THERMOMETER. See *Britannica*, Vol. XXII, pp. 288-293.

THERSITES, son of Agrius, whom Homer, in the *Iliad*, makes the noblest and most impudent talker of the Greeks before Troy. His name in antiquity was a synonym for dastardly and malevolent impudence. The later poets say that he was slain by Achilles for calumniating him.

THESSALONIANS, EPISTLES TO THE. See *Britannica*, Vol. XXII, pp. 297-298.

THIRTY TYRANTS OF THE ROMAN EMPIRE, the collective title given to a set of military usurpers who sprung up in different parts of the empire during the fifteen years (A.D. 253-268) occupied by the reigns of Valerian and Gallienus, and amid the wretched confusions of the time, endeavored to establish themselves as independent princes. The name is borrowed from the Thirty Tyrants at Athens, but in reality historians can only reckon nineteen.

THOLEN, an island in the Netherlands, province of Zeeland, bounded on the south by the Easter Scheldt. It contains about 34,000 acres of rich land, and is defended from floods by strong dykes, whose borders are planted with trees. Population, 14,078. Wheat, rye, barley, oats, beans and potatoes are extensively grown. The annual produce of madder reaches a million of pounds weight, and of flax, 400,000. Horses, cattle, sheep and swine are kept in large numbers. Tholen, the chief town, with a population of 2,540, is situated in the southeast corner of the island.

THOMAS, ORMSBY B., member of Congress, born in Vermont in 1832. He removed to Wisconsin in childhood, was admitted to the bar in 1856; was a member of the Wisconsin Assembly in 1862, 1865 and 1867, of the state Senate in 1880-81, and member of Congress from 1885 to 1891.

THOMAS, WILLIAM L., born in 1830. In early life he studied engraving in Paris and Rome, under his brother, the late Mr. G. H. Thomas. He visited America and started the first illustrated American paper. On returning to England he entered into business as a wood-engraver. In 1869 the "Graphic" was launched under Mr. Thomas' direction, and he is managing director and art editor of it. He is a member of the Royal Institute of Painters in Water Colors. The foundation of the "Daily Graphic," under the artistic management of Mr. Thomas, took place in 1890.

THOMASTON, a town and port of Maine, on the St. George River, fifteen miles from the coast, and eighty miles northeast of Portland. Its extensive granite quarries are worked by the convicts of the state prison; 300,000 casks of lime are exported annually. There are five churches and two public libraries. Population in 1870, 3,092.

THOMPSON, ALBERT, member of Congress, born at Brookville, Pa., Jan. 23, 1842. He studied law, was admitted to the bar in 1864, and has since practiced; was elected probate judge of Scioto county, Ohio, in 1869; was elected common pleas judge of the Seventh Judicial District of Ohio in 1881; served in the Union army as a lieutenant of volunteers; was promoted to captain, and served until 1863, when he was discharged for wounds received in battle; was a member of Congress from 1885 to 1891.

THOMSON, SIR WILLIAM, was born at Belfast in 1824. He was educated at Glasgow and Cambridge, where he graduated as second wrang-

ler, and was elected to a fellowship. He was appointed professor of natural philosophy in the University of Glasgow in 1846. Was editor of the "Cambridge and Dublin Mathematical Journal" in 1846, to which he contributed valuable additions to the mathematical theory of electricity. It is in connection with submarine telegraphy that Sir William Thomson's labors in electrical science are best known. He has also made important additions to the science of magnetism. His mathematical insight is seen to the greatest advantage in his investigation of the nature of heat. He was made president of the British Association in 1871; and was knighted in 1866. He is joint author with Professor Tait of the well-known treatise on *Natural Philosophy*. He was created grand officer of the Legion d'Honneur in 1889.

THORN, CONFERENCE OF. One of those efforts to explain away the differences between the several bodies of Christians, with a view to religious reunion, of which the seventeenth century furnishes more than one example. The originator of this movement was the king of Poland, Ladislaus IV., who proposed his project for the consideration of a synod of the bishops of his kingdom, held at Warsaw in 1643. The conference met in October, 1645, and was opened in a spirit of moderation; but it soon lapsed into disputation and controversy, and at length broke up without any result, Nov. 21, 1645.

THORN-APPLE (*Datura*), a genus of plants of the natural order *Solanaceae*, having a tubular five-lobed calyx, a large funnel-shaped five-lobed flower, a two-laminated stigma, and an imperfectly four-celled, prickly, or unarmed capsule. The species of this genus are annual herbaceous plants, rarely shrubs or trees; and are in general very narcotic, and productive of excitement or delirium. The common Thorn-apple, or Jamestown Weed (*D. stramonium*), is an annual plant, with smooth stem and leaves, white flowers, and erect prickly capsules, a native of the East Indies, brought by the gypsies to Europe, where it is now very generally to be met with, as also in Asia, the north of Africa, and North America. It contains a peculiar narcotic alkaloid, *daturine*, and is one of the most powerful narcotic acrid poisons; but its leaves and seeds are employed, although rarely, in medicine.

THREE KINGS, FEAST OF THE, a famous mediæval festival, identical with *Epiphany* or *Twelfth Night*, and designed to commemorate the visit of the three magi or wise men of the East (transformed by the mingled ignorance and reverence of the middle ages into great kings) to the infant Savior. But the name is more particularly given to a kind of dramatic or spectacular representation of the incidents recorded in the second chapter of Matthew—as, the appearance of the wise men in splendid pomp at the court of Herod, the miraculous star, the manger at Bethlehem, the solemn and costly worship of the Babe—which was long very popular. In 1336, a peculiarly gorgeous representation was got up at Milan by the Preaching Friars.

THREE RIVERS, a town of Michigan, in St. Joseph county. It has an extensive water power, and produces a variety of manufactures. Population in 1890, 3,122.

THROW, the term applied in mining to the

amount of dislocation in a vertical direction, produced by a fault in the strata.

THUNDERING LEGION, THE, a legion of the Roman army which is the subject of a well-known miraculous legend, stating that, during Marcus Aurelius' war with the Marcomanni (A. D. 174), his army was supplied with water in answer to the prayer of Christian soldiers; this rain being also turned upon the enemy in the shape of a fearful thunder-storm, under cover of which the Romans attacked and utterly routed them.

THURIFER, the ministering attendant in the Roman Catholic Church, at solemn mass, vespers, and other solemn ceremonies, whose duty it is to carry the *thurible*, or incense-vessel, and either to minister incense himself, or to present the thurible to be used for that purpose by the officiating priest. The office of thurifer is one of those which belong to the so-called "Minor Order" of *Acolyte*.

THURMAN, ALLEN G., an American statesman, born in Virginia in 1813. He was admitted to the bar in 1835; was judge of the Supreme Court of Ohio, in 1851; was chief justice from 1854 to 1856; and United States senator from 1869 to 1881.

THURSDAY (Swed. *Thursday*, Ger. *Donnerstag*), the fifth day of the week, so called from Donar or Thor, who as god of the air, had much in common with the Roman Jupiter, to whom the same day was dedicated (Lat. *Jovis diei*, Fr. *Jeudi*).

THURSTON, SIR JOHN BATES, governor of Fiji, high commissioner and consul-general for the Western Pacific, born in 1836. He spent the early part of his life at sea; became consul at Fiji and Tonga in 1866, and acquired the confidence and good-will of the native king and chiefs of Fiji; was their "chosen and special" adviser to confer with the British commissioners as to the cession of Fiji; was colonial secretary and auditor-general of Fiji in 1874, and five years later became the secretary to the high commissioner for the Western Pacific. Has administered the government on various occasions, and has been appointed on several commissions requiring tact and knowledge of the natives. He was governor of Fiji and high commissioner in 1887.

THYMELEACEÆ, a natural order of exogenous plants, of which the Mezereon and Spurge Laurel are familiar examples. This order consists chiefly of shrubs, with a few herbaceous plants, and contains about 300 species, natives chiefly of the warm and temperate climates. Poisonous properties prevail in the order. The bark is in general very caustic, and that of some species is used as a vesicatory, and for other medicinal purposes.

THYRSUS, in botany, a panicle, in which the flower-stalks are short, and the flowers are thus close together, so that the panicle is dense. It is a very common form in inflorescence. The use of the term is, however, somewhat vague.

TICHVIN, a town of Great Russia, in the government of Novgorod, 468 miles southeast of St. Petersburg, on the Tichvinka, which, together with the canal of the same name, connects the Volga with the Baltic. It contains numerous churches, but is best known for its monastery, which contains a "thaumaturgical," or miracle-working machine of the Virgin. The inhabitants are chiefly employed in the transit-trade by land and water. Population, 6,387.

TICKING, a strong cloth used chiefly for making beds, mattresses and paillasses. Formerly it was always manufactured of linen, but cotton is now largely used for this purpose. A very general character of ticking is that it is woven in stripes of two colors, blue and white.

TICONDEROGA, a town of New York. See *Britannica*, Vol. XXIII, p. 352.

TIE, in music, an arch drawn over two notes on the same degree, uniting them so that they are played or sung in one single note of the same value.

TIEL, the seat of an arrondissement in the Netherlands, province of Gelderland, picturesquely situated on the right bank of the Waal. The fortifications have been demolished and formed into beautiful walks. The principal buildings are the town house, court house, chamber of trade and the great Reformed Church of St. Martin. Tiel has a good haven and large trade in agricultural produce and cattle. In 1864, 319 ships discharged grain, earthenware, lime, wood, coal, bricks, salt, etc. The principal industries are copper founding, brick making, tanning, book printing, paper making, beer brewing, etc. Population, 7,748.

TIEN-TE (celestial virtue), the name given to the Tae Ping-Wang (king of universal peace), the pretender to imperial authority in China, and the head of the mighty insurrection which for sixteen years convulsed that country. The insurrection was under the direction of five chiefs, independent of each other, but all acknowledging the supremacy of Tien-te; and as, according to the plan of the rebellion, China, after being delivered from its Manchoo rulers, was to be divided among those chiefs; each of them assumed beforehand the title and insignia of "king."

TIERS ÉTAT (Fr. third estate), the third branch of the French estates, which consisted of representatives of the trading inhabitants of the towns, and of the peasantry in the country. The *tiers état* played an important part in the opening scene of the Revolution.

TIFFIN, a city of Ohio. Population in 1890, 10,801. See *Britannica*, Vol. XXIII, p. 385.

TIGER-FLOWER (*Tigridia pavonia*), a plant of the natural order *Iridaceæ*, the only known species of its genus, which is distinguished by the three outer segments of the perianth being larger, and by the filaments being united into a long cylinder. It is a native of Mexico, but hardy enough to endure the climate of Britain, and is much cultivated in flower gardens for the singularity and great beauty of its flowers, which are, however, very evanescent. The root is a scaly bulb.

TILBURY FORT, in Essex, situated on the north bank of the Thames, opposite Gravesend. Originally erected in the time of Henry VIII. as a block-house, it was converted (1667) into a regular fortification after the bold expedition of De Ruyter into the Thames and Medway. It is of a rectangular form, built chiefly of brick, with a massive stone portal, and is surrounded by a deep and wide fosse, which can easily be filled with water. Batteries of heavy ordnance are placed so as to command the river and the reach below; there are also piers for the landing of troops, stores, etc. The banks of the Thames being here very flat, the ground around the fort is during floods and

high tides laid under water, and the atmosphere of the place is in consequence far from salubrious.

TILESTONES, the uppermost group of the Silurian period, consisting of a reddish, thin-bedded, slightly micaceous sandstone, which in some places attains a thickness of 1,000 feet. It is now ascertained that the fossils agree in great part specifically, and in general character entirely, with those of the underlying Upper Ludlow Rocks, and they are accordingly considered to be the newest group of the Upper Silurian division. The Tilestones are well seen at Kington in Herefordshire, and at Downton Castle near Ludlow, where they are quarried for building purposes.

TILLET, BENJAMIN, one of the leaders of the great Dock Strike in England, and general secretary of the Dock, Wharf, Riverside and General Laborers' Union, born in Bristol in 1859. Before he was eight he worked in a brickyard, and at twelve served six months on a fishing-smack. He was then apprenticed to a bootmaker, but ran away and joined the navy, from which he was discharged invalided after a short service. After several voyages in merchant vessels he settled at the docks, and gradually formed the Dockers' Union, which has now some 23,000 members. He gave valuable evidence before the Parliamentary Commission on Pauper Immigration, and before the Lords' Committee on the Sweating System. He is a ready speaker, and during the strike showed much talent in the organization of labor. Was invited to speak at the Church Congress of 1890, but, owing to his not being a member of the Established Church, he withdrew from the appointment.

TIMBREL (Spanish *tamburil*), a small musical instrument, of the drum species, in use in ancient times, which was carried in the hand, and was apparently not unlike the modern tambourine, with or without bells.

TIME, STANDARD, is explained in the article on **HOROLOGY** in these Revisions and Additions.

TINCTURES, solutions of vegetable and animal drugs, and sometimes of mineral substances in spirituous liquids. The spirit most commonly employed is proof-spirit; sometimes rectified spirit is used; and occasionally ether.

TINEIDÆ, a family of small moths, the smallest insects of the lepidopterous order. The body is long and slender, the wings entire, often narrow, mostly convoluted in repose. Many of them are very brilliantly colored. Many deposit their eggs in animal substances, on which the larvæ feed, making cases for themselves out of the substance they feed on. The clothes moths are a familiar example.

TINKER'S ROOT (*Triosteum perfoliatum*), a shrubby plant of the natural order *Caprifoliaceæ*, a native of North America, the root of which is used as an emetic and mild cathartic. It derives its name from Dr. Tinker, who first brought it into notice.

TINNITUS AURIUM, the Latin translation of, and the ordinary medical term for, ringing in the ears. In most cases it is an unimportant symptom, depending on some local temporary affection of the ear, or on some disturbance of the digestive system with which the part of the brain, from which the auditory nerve springs, sympathizes, or which excites the cerebral circulation; but as it is also a common symptom of organic

disease of the auditory nerve, it may indicate a dangerous condition, or may be a prelude to complete deafness. Hence, although commonly of no consequence, it is a symptom that, especially if permanent, must be carefully watched.

TINOS, or **TINO** (anc. *Tenos*), an island in the Grecian Archipelago, belonging to the group of the Cyclades, and lying southeast of the island of Andros, fifty-three miles off the coast of Bœotia. It is eighteen miles long, eight miles in extreme breadth, has an area of eighty-one square miles, and a population of 21,171. The Tenians were conspicuous among the ancient Greeks for their industry, and they still maintain their preëminence in that respect. The island is carefully cultivated, well watered, has a delightful climate, and is very productive in silk, wine, barley and fruits. Silk gloves and stockings are manufactured; and the inhabitants have made themselves famous as workers in marble, which is found in the island. In the modern town of Tinos, or St. Nicholas, is a cathedral built of white marble, and famous as a resort for pilgrims.

TINSEL OF THE FEU, in the law of Scotland, an irritancy or forfeiture of a feu-right caused by the failure to pay the feu-duty for two whole years. A statute of 1597 authorized, in such a case, the superior to take steps to obtain a decree of declarator that the feu was forfeited; but the vassal might, any time before decree, purge the irritancy by paying the arrear. Tinsel of the Superiority is a similar remedy which a vassal has against the superior who has not got himself infest, so as to be in a position to complete the vassal's title. In such a case, the tenant may under the statute 1474, charge the superior, that if he do not within forty days obtain infestment, he shall lose the tenant or vassal for his (the superior's) lifetime, and thereby all the casualties that may fall to the superior from the act or delinquency of such vassal.

TIREE, one of the Inner Hebrides, included in Argyleshire, twenty miles northwest of Iona. It is thirteen miles long, and over six miles in extreme breadth. The surface is low, rising in the north to little more than twenty feet, and in the south to about 400 feet above sea-level. The absence of trees and shrubs gives to the island a bleak appearance. Upward of 5,000 acres are under tillage, while 10,700 acres are in pasture or wasteland. Some interest attaches to the island from the number of Scandinavian forts which dot the shores, and from the standing-stones, ruined churches, and ancient graves which occur in the interior. Population, in 1871, 2,834, who support themselves by rearing cattle, fishing, and exporting poultry.

TIRNOVA, a town of European Turkey, in Bulgaria, on the Jantra, thirty-five miles southeast of Sistova. There are numerous mosques, churches, and synagogues; dyeing is carried on, and silk and coarse cloth are manufactured. Population variously stated at from 12,000 to 16,000.

TISANE, **TISAN**, or **PTISAN**, an infusion made of certain herbs, leaves, or flowers, used as tea for medicinal purposes. It is a very favorite form of remedy in the domestic medicine of France.

TITULAR, one who enjoys the bare title of an office, without the actual possession of that office. Thus, the English kings styled themselves kings of France from the time of Henry IV. down to the

year 1800; and previous to the recent changes in Italy, the king of Sardinia, as well as the king of Naples, was titular king of Jerusalem. In English Ecclesiastical Law, a titular is a person invested with a title, in virtue of which he holds a benefice, whether he performs its duties or not. In the law of Scotland the term has received another acceptation. There are many titular dignities in the Roman Catholic Church; but the class of them which is chiefly noticeable is that which has grown out of the separation between the eastern and western churches.

TITUSVILLE, a city of Pennsylvania. Population in 1890, 8,073. See Vol. XXIII, p. 420. and XVIII, p. 713.

TOAD. See Britannica, Vol. XXII, pp. 422-423.

TOAST, the name given to bread dried or scorched before the fire. So early as the sixteenth century toasted bread formed a favorite addition to English drinks. Sack was drunk with toast, and so was punch. The practice of drinking healths is one so natural that it is impossible to say when it began. Certain it is, however, that it received an artificial development owing to the prevalence of convivial habits in the seventeenth century. It became the custom to describe a woman whose health was so drunk as herself "a toast." Whatever may be the origin of the use of the word "toast" in this sense, we now apply it not only to any person, but also to any sentiment mentioned with honor before drinking. The French have adopted the word "toast," making it masculine when applied to a man or a sentiment, but feminine when applied to a woman.

TOCHER, in the law of Scotland, an ancient name for the marriage-portion given by a father on the marriage of his daughter. It is settled according to the wish of the father, or as may be agreed with the intended husband of the daughter.

TOD (derivation unknown), a weight of wool, now unused; it was fixed at twenty-eight pounds avoirdupois in 1671.

TODDY, the name given in the East Indies to the fermented juice of various palms from which arrack is distilled. The name has been adopted in Britain for a mixture of whisky, sugar and hot water, which forms the national drink of Scotland and Ireland.

TOLEDO, a city of Ohio. Population in 1890, 81,434. See Britannica, Vol. XXIII, p. 436.

TOLSTOÏ, COUNT LYOF NIKOLAÏVITCH, usually called Count Leo Tolstôï, the most eminent living Russian novelist; born in 1828, at Yasnaïa Poliana, in the government of Toula, where he still lives. He entered the army at the age of twenty-three, and served in the Caucasus and at Sebastopol. He first made literary reputation by his vivid sketches from Sebastopol. Leaving the army soon after the close of the Crimean war, he devoted himself to literature. His *War and Peace*, a tale of the invasion of Russia by Napoleon in 1812, is regarded by Russians as his masterpiece; but his *Anna Karenina*, which appeared in 1876, is better appreciated abroad. Matthew Arnold reviewed it enthusiastically a few months before his death; and George Meredith says that Anna, the beautiful but unfaithful wife, who ends her guilty passion by suicide, is the most perfectly depicted female character in all fiction. *The Cossacks* is his only other novel. He wrote much on education,

and published many short tales and reminiscences of childhood and youth. The last six years of his life he has devoted to religious teaching. He makes "Resist not evil" the keystone of the Christian faith, and insists that the literal interpretation of the Sermon on the Mount is the only rule of the Christian life. His religious views are set forth in *Christ's Christianity*; Count Tolstôï married in 1861, and has nine children living. Published in 1889 *My Religion*. Translations of his *Kreutzer Sonata* appeared in 1890, and the views contained therein on the social question were the subject of much attention.

TOMAHAWK, a light war-hatchet of the North American Indians. The early ones were rudely made of stone, ingeniously fastened to their handles by animal sinews, or cords of skin. European traders supplied hatchets of steel, the heads of which were made hollow, for a tobacco-pipe; the handle of ash, with the pith removed, being the stem. These hatchets are used in the chase and in battle, not only in close combat, but by being thrown with a wonderful skill, so as always to strike the object aimed at with the edge of the instrument. The handles are curiously ornamented. In the figurative language of the Indians, to make peace, is to bury the tomahawk; to make war, is to dig it up.

TOMATO (*Lycopersicum esculentum*), a plant of the natural order *Solanaceæ*, formerly ranked in the genus *Solanum*, and known as *S. Lycopersicum*. The genus *Lycopersicum* is distinguished by a 5-6-parted calyx, a wheel-shaped, 5-6-cleft corolla, five stamens, and a 2-3-celled berry with hairy seeds. The tomato is an annual, from 2 to 6 feet in height, requiring support when tall. The leaves are unequally pinnate, the leaflets cut; the flowers numerous, followed by berries, which are various in shape and color—generally red and yellow—in different varieties. The plant is a native of the tropical parts of America, but is now much cultivated in all parts of the world suitable for it, as the South of Europe and the United States. The fruit is much used for sauces, catsup, preserves, confectionery and pickles. The unripe fruit makes one of the best of pickles. Tomatoes appear with almost every dish in Italy. The use of them is rapidly increasing in different countries.

TON, a suffix of frequent occurrence in the names of Anglo-Saxon settlements. It seems to be from the same root as the Gothic *tains*, meaning a twig, the Ang-Sax. *tynan*, to hedge, and the Ger. *zaun*, a hedge. Hence, a *ton* or *ton* was a place surrounded by a hedge, or rudely fortified by a palisade. Originally, it meant only a single homestead or farm, and this use of it is still common in Scotland. In modern English, in the form of *town*, it is applied to a collection of houses.

TONGA BAY, a small inlet on the east coast of Africa, bounded on the north by Cape Delgado, and extending inland in a north direction. Coconut trees and jungle line the shores of the bay, and at its head is the village of Tonga, important from its frontier position. Cape Delgado was the northern limit of the Portuguese colonial possession of Mozambique; and the village of Tonga, which is situated north of the parallel of latitude of the Cape, was long possessed by the seyid of Zanzibar. In 1887 it was forcibly occupied by the Portuguese.

TONGA, KINGDOM OF. For general article on Tonga, see Friendly Isles in Britannica. The Tonga Archipelago includes three adjacent groups of Islands, namely, Tonga, Haapai and Vavau; total area, 374 square miles; population, about 21,000, including 400 foreigners. Present king, George Tubau. The heir presumptive is Taupa Hau, great-grandson of the king. There is a legislative assembly, composed one-half of nobles nominated by the king, and the other half of representatives elected by the people.

TONICITY, MUSCULAR. The contractility of muscles shows itself under two distinct forms—*Irritability* and *Tonicity*, which are alike distinct in the mode of their action and in the conditions requisite for their exhibition. Irritability is most manifest in the voluntary muscles and in the heart, which, when in activity, exhibit powerful contractions, alternating with relaxation; while Tonicity is shown in a moderate and permanent contraction, which, instead of being consequent upon stimulation through the nerves, as in irritability, is especially excited by change of temperature in the tissue itself, and is mainly shown in the involuntary or nonstriated muscles.

TONQUIN. For general article on Tonquin, see Britannica, Vol. XXIII, pp. 439-443. The territory was annexed to France in 1884. It is divided into fourteen provinces, with 8,000 villages, and a population estimated at 9,000,000. There are 400,000 Roman Catholics. Chief town, Hanoi, an agglomeration of many villages, with a population of 150,000. Revenue (1888) of Tonquin and Annam 17,321,000 francs, expenditure 17,034,620 francs. There were 11,475 French troops in 1889, besides 6,500 native soldiers. The chief cultures are rice, sugar-cane, silk-tree, cotton and various fruit trees and tobacco. There are copper and iron mines of good quality. The chief industries are silk, cotton, sugar, pepper and oils. The imports were valued in 1888 at 23,881,012 francs, and the exports at 6,988,249 francs. The expenditure of France for Annam and Tonquin in the budget of 1891 was 10,450,000 francs.

TOOMBUDRA (correctly, **TUNGA-BHADRO**), an important tributary of the Kistnah or Krishna, rising in the southwest of Maisur (Mysore), and, after a northeast course of from 350 to 400 miles, joining the Kistnah twenty-five miles below Karnul.

TOON, or TOONA (*Cedrela Toona*), a tree of the natural order *Cedrelaceæ*, one of the largest timber trees of India. Dr. Hooker measured one which was thirty feet in girth at five feet above the ground. The leaves are pinnate, the flowers small, in panicles, with a honey-like smell, the petals erect, and approaching each other so as to form a sort of tube. The tree ascends to the height of 4,000 feet on the Himalaya Mountains, and is found to the furthest south of the East Indies. It is sometimes called *Bastard Cedar*. The wood is soft, but is used for furniture. The bark is a powerful astringent, and is used in dysentery, diarrhoea, etc.

TOP, in a ship, the platform at the head of each lower-mast. It is supported on the trestle-trees and cross-trees, and serves to give a wider base to the top-mast shrouds. It is also used for working the upper sails.

TOPEKA, a city of Kansas. Population in 1890, 31,007. See Britannica, Vol. XXIII, p. 446.

TOPHANE (correctly *Top-haneh*), a suburb of Constantinople, forming a continuation of Galatea along the northern shore of the Bosphorus.

TOR (Celtic, "a projecting rock"), a word "found in the names of Mount Taurus and the Tors of Devonshire (Yes Tor, Brent Tor, etc.), and Derbyshire (Mam Tor, Chee Tor, etc.) The higher summits of the *Tyr*-(ol) are called *Dic Taur-en*."

TORGET, a small island off the northwest coast of Norway. It serves as a landmark to sailors, is the haunt of numerous water-fowl, but is chiefly noteworthy for its lofty rock called Torghatten (the Hat of Torget), which rises to the height of 756 feet above sea-level, and is pierced through, near the top, by a cave or passage 80 feet wide and 1,300 feet long.

TORLONIA, a princely Roman family, remarkable for their wealth, and for their extraordinarily sudden rise from the very lowest condition. They trace their origin to a poor "cicerone," called Giovanni Torlonia, born in 1754, who gained a reputation in his profession, and became afterward an agent of the French emissaries who were sent to excite the Roman populace to revolution, and on the failure of this project was left with considerable funds in his hands; he afterward became a merchant, gradually rising to the position of a stock-broker, usurer, and money-dealer; and by acquiring mortgages over the properties of the impoverished Roman princes, and by various other ventures, amassed an immense fortune. He was made a grandee of Spain, and duke of Bracciano by the pope. His three sons have allied themselves with princely families of the highest rank.

TORNADOES and cyclones are both whirlwinds of violent gyrations. In the tornade the movement is principally vertical, and the ground area of the storm is comparatively small. Tornadoes range from the water spout of the ocean, and the whirling sand-storm of the desert down to the little dust-whirls which are so common in our streets. Cyclones move with great velocity in a horizontal direction, whereas, the horizontal motion of tornadoes is slow. But their circular and upward motion is very fast, so that their gyrations produce funnels of water, sand, dust, etc., often of great height. In the United States these whirling funnels are sometimes seen pendent from a mass of black clouds. Their whirling motion is always from right to left, and often maintained for several hours. Tornadoes generally arise just after the hottest part of the day, when the atmosphere has its greatest instability. The months of greatest frequency are April, May, June and July. The destruction in a tornado may be caused either by the surface wind, which is forced in on all sides to feed the ascending current in the tornado-funnel, or by the gyrating winds of the funnel itself when sufficiently low to come within the reach of buildings and trees. In the latter case no structure, however strongly built, is able to withstand the enormous force of a good-sized tornado.

In the United States some 3,000 persons have been killed, and as many injured, by these storms during the last century. The loss of property by this destructive agency reaches scores of millions of dollars. They occur most frequently in the states bordering the northern Mississippi and the lower Missouri. Here the warm and very moist winds from the Gulf meet with currents of cold air

from the north, and this produces very unstable atmospheric conditions. Tornadoes never occur west of the one hundredth meridian.

Gen. Greeley's list of destructive tornadoes is given, in part, in the following table, some of the less destructive ones being omitted:

| STATE. | Date. | Persons | | Houses Destroyed. | Value of Loss. |
|-------------------|------------------|---------|----------|-------------------|----------------|
| | | Killed. | Injured. | | |
| Mississippi | May 7, 1840.... | 317 | 109 | ... | \$1,260,000 |
| Mississippi | June 16, 1842.. | 500 | ... | ... | ... |

Many of these tornadoes extended through several states, that of April 14, 1886, for instance, traveled 350 miles, from Council Bluffs, Iowa, to Sauk Rapids, Minn., which town it destroyed. That of April 18, 1880, utterly wrecked the town of Marshfield, Mo. Many other towns and villages have been partly or wholly destroyed. The forests of the Mississippi Valley often present great lanes of broken-down and torn-up trees, indicating the tracks of tornadoes in the past. The Atlantic States, while less frequently visited by this destructive agent, are by no means exempt from its visitations. Several examples given in the above table were in the east, that of Aug. 3, 1885, passing through the city of Camden, N. J., where it made frightful havoc. A more recent disaster of this kind was that of Jan. 9, 1889, in which a violent tornado struck the city of Reading, Pa., fortunately only on its outskirts, utterly wrecking a silk-mill and a railroad paint-shop, with a loss of twenty-four persons killed and ninety-eight injured. An accompanying tornado passed over Western Pennsylvania on the same day, and did great damage in the oil-fields, tore down the suspension bridge at Niagara, and wrecked an unfinished building at Pittsburgh, with considerable loss of life.

TORNEA, a river, important as forming part of the boundary line between Russia and Sweden. It rises in Lake Tornea, in Sweden, and flows southeast and south between Russia and Sweden, entering the Gulf of Bothnia at its northern extremity, after a course of 250 miles. At its mouth is the small town of Tornea.

TORNEA, a town in Finland, situated on the peninsula of Svensar, at the mouth of the Tornea, in the government of Uleaborg. The population, which is about 800, is principally engaged in the exchange-trade with the more northern and scantily-inhabited districts of Finland and Sweden,

of which Tornea is the active center, as the most northerly town in the Russian Empire; deals, salt-fish, tar, hemp, reindeer skins and other peltries being brought to Tornea to be exchanged for tobacco, spirits, manufactured goods, etc. Tornea is often visited in summer by travelers anxious to witness the singular spectacle of the sun remaining above the horizon both night and day at the summer solstice. Tornea was several times taken by the Russians from Sweden before its final cession at the peace of Frederikshamn, in 1809, when it was ceded, together with the whole of Western Finland, to Russia.

TORO, or TORRO, an ancient but decayed town of Spain, in the modern province of Zamora, standing on the right bank of the Douro, twenty-one miles east of Zamora. It contains numerous religious houses, most of which have been allowed to fall into a state of decay; and has brandy distilleries and brick and tile works. Population, 7,000.

TORONTO, a city of Canada. Population in 1891, 181,200. See Britannica, Vol. XXIII, pp. 447-49.

TORPEDO WARFARE. For general article on torpedoes and the use of torpedoes in naval warfare, see Britannica, Vol. XXIII, pp. 449-51. It is only required that attention should here be called to such new types of torpedoes as are now engaging the attention of naval experts, and which seem likely to prove of practical value hereafter.

In the United States, Secretary Tracy, of the navy, appointed in 1891, a naval torpedo board for experimenting with, and superintending the construction of, such types, automobile or fish torpedoes, as may give promise of fulfilling all the requirements of the navy. The competitive tests of the various patterns are to be made at Newport, and hence that station, in this respect, promises for some time to be one of more than usual interest. The development of torpedo appliance in this country may be said to have just commenced.

Of explosives in general they all belong to one of two classes—mechanical mixtures or chemical compounds. Of the many kinds of high explosives there are gun-cotton, dynamite No. 1, explosive gelatine and forcite gelatine. But the vessels from which it is proposed to send these to kill and to destroy are of various patterns. The expenditure of liberal appropriations, both in this country and abroad, have resulted in a large series of experiments, more or less successful, with air torpedoes—including rockets and dynamite shells; ground and buoyant mines; spar, towing and submarine shells; controllable torpedoes, and automatic, automobile and fish torpedoes. One of the results is that all of the ships which constitute the cavalry of the sea, are fitted with torpedoes, and also with torpedo nettings to protect them from the torpedoes of an enemy. And to-day we have torpedo boats of the first and second classes, torpedo dispatch vessels, torpedo cruisers, etc., and many more about to be constructed. Those of the automobile type which have been extensively experimented with are the Whitehead, the Brennan, the one invented by Capt. John A. Howell of the navy, the one invented by Lieutenant Hall of the navy, the Sims-Edison and the Patrick. There are sev-

eral others, but those mentioned have attained the best results and most prominence.

The Howell torpedo is one of the most complete submarine, or automobile torpedoes yet perfected. In fact it is considered the ideal torpedo, with a capacity for a charge sufficient to insure the disabling or annihilation of the ship attacked, and send every soul on board before his Maker. It is

THE HOWELL TORPEDO.

self-contained, and so simple in its mechanism that the ordinary enlisted men readily become familiar with its method of operation. It is easy to repair and overhaul without special tools or appliances—although it is less liable than almost any of the others to become disabled or get out of order; it possesses a motive power easily applied and always available, and it is easily adapted for frequent exercises. In fact, it can be fitted and effectively employed from every type of ship. The speed, size, charge and accuracy of action are equal to the best results that have been obtained with the Whitehead torpedo. In fact, no other automatic torpedo, of the same size, has reached so great a speed. Its initial speed is now twenty-three knots for the 8-foot pattern, weighing 325 pounds, including seventy pounds of explosive, or greater than that carried by any but the largest Whitehead.

The general form of the Howell torpedo is that of a spindle, the central portion being cylindrical. The shell is constructed entirely of brass or bronze, a material which is not corroded by contact with sea water. Its characteristic feature is the heavy fly-wheel by which it is propelled, and by which, at the same time, it gives a directive force that renders unnecessary any device for steering the torpedo in the horizontal plane. The fly-wheel is of steel and weighs about 130 pounds, and rotates on frictional wheels. It is geared to two shafts, one on each side of the torpedo, which carry the propellers; and when set to revolving at a considerable speed it will continue to rotate for several hours, if no additional load is applied. The propellers revolve in opposite directions, thus preventing the rolling motion of the torpedo. This forms the whole driving mechanism of the torpedo, which is, in principle, the same as that of the Whitehead.

To control the submersion recourse is had to a horizontal rudder, which is operated automatically by mechanism whose action is controlled by a combined pendulum and hydro-pneumatic cylinder, the piston of which moves with the varying external pressures at various depths. The discharging gear for sending the torpedo from the ship toward the enemy, consists of a frame or derrick extending from the ship's side, under which the torpedo is hung by clutches and studs on its shell. The torpedo is so arranged that it can be conveniently slung from the deck, and on being detached from the derrick, it does not drop vertically into the water, but is swung outward in the arc of a circle, being detached automatically by a check-line and trigger on reaching the vertical below the pivot. This gives it an impulse without changing the angle of its longitudinal axis with the surface of the water. The mechanical success of the

weapon seems assured. In the last few years it has been subjected to trial before several naval boards, whose reports summed up maintain the following elements of superiority for it over some other types: It is a much cheaper weapon; for the same size and weight it carries a heavier charge; it does not possess the element of danger contained in the air flash, the rupture of which (by accident or hostile shot) has already been shown to be destructive to life and property; its track is not betrayed, in day-time and clear weather, by air bubbles. The explosive charge, which is of gun-cotton, is placed in the forward end of the torpedo, and is fired by a detonating cap placed under a percussion firing-pin. The outer end of the firing-pin is provided with fan-shaped corrugated horns, which receive the impact blow, and are so shaped and arranged as to prevent glancing or sliding along on the object struck. The force of the blow shears off the soft metal-pin and thus permits the firing-pin to be driven down on the detonator by the spring.

The navy department recently ordered thirty of the Howell torpedoes to be made, together with their launching carriages. Since then the principal improvements made in the torpedo are mechanical, and, though the form is the same as that before used, the body of the torpedo, of spun brass, is much improved in workmanship. It is made in four sections, and motion is communicated to the fly-wheel by means of a clutch coupling driven by a steam turbine motor. The following are the dimensions agreed upon after a series of tests: Length of body of torpedo, 9 feet; length over all, including propeller, 9½ feet; extreme diameter, 14.2 inches; displacement, 410 pounds; weight of explosive charge, at least, 72 pounds; minimum speed, 22½ knots. The effective working range of the torpedo will not be less than 400 yards, and the mean speed for that range not less than 22½ knots per hour. The torpedoes are to be of good material, so as to be easily handled and manipulated, as would be necessary in actual naval service, and this without undue risk or injury; and it must be so fitted as to be readily used for practice and exercise, and recovered at the end of the run, and be made ready for another run speedily and without elaborate preparation.

Like other fish torpedoes, that designed by Lieut. M. E. Hall, of the navy, has the shape of a spindle of revolution, carrying the charge in the nose, with a percussion apparatus. The principal features of this torpedo are its diving mechanism, the

THE LIEUTENANT HALL TORPEDO.

pectoral fins, the device for overcoming the net-defenses of vessels of war, and a special automatic engine that utilizes the full expansion force of the motive power. The pattern of the torpedo shown in the cut has the following weights, dimensions, etc.: Length, 15 feet; extreme diameter, 14½ inches; weight, 575 pounds; diameter of engines, 4 inches; length of stroke, 4 inches; diameter of propellers, 10 inches; revolutions a minute, 2,100; gun-cotton charge, 80 pounds.

The cut shows a side view of the torpedo and its three sections—the forward cone (A), the air-flask

(B) attaching the buoyant grapnel (L). At the end of the forward cone or compartment (A) the firing-rod (a) is fitted loosely into the sleeve (b), and actuated by a spring connected with the trigger (c) upon contact with the object of attack. The rib of the trigger is broken off by impact. Should the torpedo graze a vessel's bilge the trigger would be tripped, and the firing-rod would be impelled by the spring against the plunger (d), detonating the gun-cotton charge, as before, by means of the primer and detonator. When attacking a vessel protected by netting, the float (L) is drawn aft by the resistance of the water, and tows aft and above the torpedo until it fouls the net that the torpedo passes under. Then the pull upon the tow-line (e) trips the trigger (c), and explodes the torpedo in close proximity to the ship.

The magazine E contains eighty pounds of gun-cotton in a copper case, which is pivoted at its after end (g) and suspended by hangers (g g) at its forward end, permitting a slight swinging movement, which automatically steers the torpedo. It has been well proved that when a ship heels over to a brisk wind the lee bow becomes buried, and has a greater displacement than the weather one. This pressure under the lee bow throws her into the wind unless counteracted by the helm. This force is utilized in the Hall torpedo in the following manner: A sea striking the torpedo in launching drives it to leeward, at the same time, owing to its slight stability it causes her to roll. As the torpedo is symmetrical and circular in section there would be no unbalanced pressure under the lee bow, hence the pectoral fins have been introduced. These are actuated by lugs upon the swinging magazine (E) which take against flexible brass plates and act upon the torpedo so as to bring her upon an even keel, so to speak. For instance, if a wave should strike the torpedo on the port bow, she rolls to starboard, and being deflected in this direction the starboard pectoral fin is forced out by the swinging magazine, causing an unbalanced pressure under the lee bow and forcing the torpedo back to her course. In other words, the torpedo has a flexible bow which is automatically distended on one side or the other, as required to keep her on her course. As soon as the torpedo regains an upright position the magazine is centered by the springs (K).

The air-flask (B) has a capacity of nine cubic feet and contains air under a pressure of 1,200 pounds a square inch. The throttle (l) is automatically opened as the torpedo is discharged, permitting air to reach the engine.

The engine chamber and the immersion chamber are in the after cone. An automatic two-cylinder double-casting trunk-engine actuates the screws by means of the lever gears (n, n, n, n,) the exhaust air escaping through the hollow screwshafts, which are provided with cheek-valves (p p) to prevent the entrance of sea-water at the end of the run. Aft the engine-case is the immersion chamber containing the diving mechanism. The diving-valve is actuated by a float, the position of which depends upon the amount of water in the chamber. Water enters freely until it reaches the bottom of the telescopic tube, after which it can only enter by compressing the im-

prisoned atmospheric air within the chamber. By extending the tube a greater pressure will be required to fill the chamber than when the tube is contracted; hence, in the former case the torpedo will dive deeper than in the latter case. The reaction of the air upon the water raises or depresses the tail of the torpedo, causing it to dive or to rise to the surface. The motive-power is steam, which, together with a suitable quantity of water heated to 550 degrees, is stored in a flask or generator. As the pressure is reduced by the consumption of the steam, the heated water gradually vaporizes, furnishing a continuous supply.

The Patrick torpedo is an invention of J. N. H. Patrick, and has been thoroughly tested, to the satisfaction of both the United States and the French governments. It has reached a stage which, in the judgment of experts, renders it a valuable weapon for use in actual warfare. It consists of two fourteen-foot copper cylinders, held by bars three feet apart. The upper cylinder is filled with lampblack and carries signal flags. The lower cylinder is filled with the firing charge. The machinery is propelled by carbonic acid gas. Recent experiments with it by the Navy Torpedo Board at Newport were reported as eminently successful. The conditions of the test were that the torpedo should make a speed of twenty knots for one mile, maneuvering and firing under the conditions of service, to be readily, certainly and completely accomplished by the manipulator of the operating apparatus, the center of the explosive charge to be at least three feet below the surface of the water when exploded.

When the torpedo was in motion only the two flags and the foaming water, turned up by the rapidly revolving propeller, could be seen. The torpedo was first headed for the training-ship Jamestown, then turned to the north, and run for a quarter of a mile in that direction. A sharp turn was then made in toward shore and the torpedo returned to the starting point, forming a course the shape of an ellipse, and about a third of a mile in its largest diameter. Several trials of the torpedo were made, to test the efficiency of its motive power. The torpedo is shaped like a spindle, tapering at each end. It is about forty feet in length, and its greatest diameter is twenty-four inches. Its displacement is 5,163 pounds, and the magazine charge of dynamite is 200 pounds. The torpedo proper is sustained by a float which is practically indestructible by mechanical gun-fire during the short time that it would be exposed. The float is also of the fusiform, and is made of sheet-copper, one-eighth of an inch thick, filled with lampblack. The propeller and rudder work in solid water, and the former cannot easily be fouled nor the cable grappled. The explosion also takes place about three feet under the water.

In the application of the motive power, as in many other details, the torpedo differs from other models. The propeller is two-bladed, and is fixed on a hollow shaft through which the governing cable is paid out, the controlling battery being 100 cells of bichromate. The acid, drawn in liquid form from the bottom of the flask, is taken through copper piping in the bottoms of the heaters. These heaters are copper cylinders which contain the diluted sulphuric acid, each having a cylindrical trough in the top holding the lime. This

trough is divided into two parts, kept closed by a series of hooks on a common rod, the rod being connected with a piston in a cylinder outside the heater. The cable performs the functions of starting, stopping, starboarding and porting the helm, and firing the charge.

In considering the problem of the transmission of power, the electric current has long occupied attention, and has been in use for controlling and directing torpedoes about twenty years. The first application of electricity for propelling torpedoes was in 1877 by Mr. Sims, and after some preliminary experimenting with a small pulling boat, he completed a cigar-shaped torpedo propelled and controlled by electricity. It not being successful in point of speed, a larger boat was built, since when the perfection of the torpedo, or rather the efficient generation of application of power, by the dynamos on shore and the motor on board, has been completed. A great increase in speed is claimed for the Sims-Edison torpedo. As

THE SIMS-EDISON TORPEDO.

will be seen by the illustration, the apparatus consists of two parts, the "float" and the submerged "fish," a steel frame connects the two, being inclined at the bow and very sharp, so as either to cut through obstructions, or dive under them, as indicated by the dotted lines in the cut. Both the float and fish are of sheet copper. The former is about thirty feet long and filled with cotton, which renders it impervious to the water, and even if struck repeatedly by small projectiles it would still sustain its burden. It is broad at the top and narrow at the bottom, so that the buoyancy increases rapidly with immersion. The fish, which carries a 200-pound charge of explosive, is submerged about three and three-quarter feet, and can be exploded at will or by concussion against the object of attack. The fish, or torpedo hull, is cylindrical, with conical ends.

As may be seen in the cut the fish has four compartments with water-tight bulkheads, and, as each compartment is separate from the other, it can be taken apart when necessary for storage, and can be put together again in fifteen minutes ready for immediate service. The forward compartment carries the explosive, the next compartment is empty, the third carries the cable and the fourth carries the electric motor and steering gear. Its total weight, including a forty horsepower motor and 6,000 feet of cable, is 4,364 pounds. The motor is two-pole, series-wound and its resistance at rest is 6.53 ohms. The Edison generator is capable of 1,500 to 1,600 revolutions, with 1,300 volts at terminals and twenty-five ampères normal capacity. On the official trial the motor drove the boat at a speed of over twenty-one miles an hour and on a short run reached twenty-two miles an hour. The cable is compound, having a small insulated conductor in the center for the steering current produced by a battery on shore, and an annular conductor for the motor current. Steering is effected by a powerful electro-magnet, into which is switched

the main current by means of a strong polarized relay actuated by the current of the shore battery through the central conductor of the cable. Two keys, or one pole-changing key and switch, under the hand of the officer on shore, control the relay of the fish, and the rudder is thus thrown to one side or the other at will at any moment. The result is that while at full speed the boat may have its course changed in any desired direction at any moment.

The charge is exploded electrically, hence there is no probability of premature discharge. The moment that the torpedo has reached and is pushing against the object of attack can be exactly determined day or night by a simple ammeter in the circuit showing by its great change of reading when the motor is affected by the stoppage of the boat. Besides the many advantages possessed by such a torpedo for coast and harbor defense, it has a special value as an instrument of offensive warfare on the high seas, as nearly all the war vessels are fitted with dynamos and engines for them. By carrying a generator for torpedo service, each vessel in commission can have one or more of the Sims-Edison torpedoes fastened by 100-foot hawsers furnished with electro-magnetic snap-hooks, the electric cable communication being then maintained permanently with the generator. The torpedo can thus travel along within a convenient distance controlled by the navigator of the war-ship. In action the war-vessel could approach the enemy within a distance of two miles, stop and send the torpedo on ahead, guiding it to the certain destruction of the hostile vessel.

Another recent invention of a torpedo controlled by electricity is that of Lieutenant N. T. Halpine, of the navy. It has a very noticeable feature not

DISCHARGING AN AERIAL TORPEDO.

possessed by any other. In all other torpedoes of the "controlled" types it has been impossible to have experimental drills without destroying the fish or hull; and as this was a matter of much expense, the drills have been conducted without using an explosive charge. In Lieutenant Halpine's torpedo this difficulty has been overcome. The forward part of the torpedo has a bell-mouth opening, into which the explosive charge is fitted in its own case, and is there held until the object of

attack is reached, when it is detached and that part of the hull which contains the mechanism is left at a safe distance. The explosive charge can then be fired at will and the torpedo proper, or the hull, can be run to the starting point. The power used can be either compressed air, electric or other motor, working on a screw propeller.

There are other automobile or fish torpedoes, especially the Whitehead, Brennan, Victoria, Schwartzkopff, that possess much merit; but they are so nearly like the Howell, the Hall, the Patrick and the Halpine that it is not necessary to describe them here. John L. Lay, the inventor of the first controllable torpedo that reached the phase of an actual service weapon, has recently produced a new weapon in England and he claims for it a speed of sixteen knots with a range of two miles.

A new invention of a submarine torpedo boat, or as this sort of weapon is frequently referred to, the controllable torpedo, has recently appeared at Detroit, and if it accomplishes all that the inventor maintains for it, Jules Verne's dream of the *Nautilus* promises to be realized. The boat is, in appearance, like a double-pointed cigar. It is forty feet in length, sixteen feet deep from top to bottom, and its extreme breadth, from the midship point, is nine feet. The motive power is to be a storage battery of electricity, connected with a screw propeller on each side; and the vessel can be submerged by simply turning a switch at the shore station. The inventor of this "devilish weapon" declares that the machinery can be so adjusted as to sink the boat to any depth and send her along at a speed of ten miles an hour with ease. And should any of the machinery become deranged the torpedo would immediately rise to the surface by the stopping of the propeller, which alone keeps her submerged. The inventor has an air chamber provided, the capacity of which is sufficient, with the aid of chemicals, to purify the air for two men for twenty-four hours.

TORQUES, a species of gold ornament, worn around the neck, and much in use in ancient times, both among Asiatic and North European nations. It consisted of a spirally-twisted bar of gold, bent round nearly into a circle, with the ends free, and terminating in hooks, or sometimes in serpents.

TORRINGTON, a municipal borough and market-town of the county of Devon, on an eminence sloping to the Torridge, ten miles southwest of Barnstaple. The inhabitants are for the most part employed in agriculture and glove-making. The name of Torrington emerges frequently during the great Civil War; and the capture of the town by Fairfax in 1646, on which occasion the church, with 200 prisoners, and those who guarded them, were blown into the air by gunpowder, proved fatal to the king's cause in the west. Population in 1871, 3,529.

TORRINGTON, a township of Connecticut, on the Naugatuck River. It has important manufactures of woolen goods, plated goods, hardware, machinery and needles. Population in 1890, 6,000.

TORSO (Ital.), strictly, a trunk, such as the trunk of a tree, but specially applied to an ancient statue of which only the body remains. Of such imperfect relics of classic art, the most famous is the *Torso of Hercules*, a masterpiece of manly

beauty discovered in the Campo del Fiore, at the beginning of the sixteenth century, and placed, by order of Pope Julius II., in the Vatican.

TORTOISE, TURTLE. See Britannica, Vol. XXII, pp. 455-460.

TORTUGAS (Sp. Turtles), a group of ten low coral islets or keys, also called the Dry Tortugas, belonging to the United States, at the entrance of the Gulf of Mexico, 120 miles southwest of Cape Sable, the southern point of Florida. There has been a lighthouse erected on Bush Key; and refractory soldiers, and prisoners connected with the War of Secession, have been employed in erecting a fort, called Fort Jefferson.

TORULA CEREVISIÆ, or the Yeast Plant, one of those fungi which are connected with the process of fermentation. This plant, which is also known under the names of *Saccharomyces*, *Mycoderma cerevisiæ*, and *Cryptococcus fermentum*, may be readily observed by examining a little yeast under the microscope, when it will be seen in the form of round or oval corpuscles, varying in diameter from the 800th to the 400th of a line, and many having smaller corpuscles in their interior. They grow by protrusion of gemmules, and germinate sometimes on one, and sometimes on several spots of the primitive fungus cells. These shoots throwing off new gemmules, the yeast-plant gradually forms single or branching rows of oblong cells, connected together like beads. This peculiar arrangement of the cells, and the fact that they are not acted on by acetic acid, is characteristic of the plant.

TOSHACH, the name given among Celtic nations to the military leader of a clan or tribe, whose functions were in early times separated from those of the supreme judicial officer. When the office of toshach, originally elective, became hereditary, according to the principle of divided authority characteristic of Celtic communities, it remained permanently in the eldest cadet of the clan.

TOTIPALMÆ, Cuvier's name for a group of birds, of the order *Palmipedes*, having the hind toe connected with the other toes by a web. Pelicans, cormorants, frigate-birds, gannets, and darters belong to this group. All the *Totipalmæ* are marine; they feed on fishes, molluscs and other marine animals, and are excellent swimmers and divers. Many of them have long wings, and are birds of powerful flight.

TOTNES, or TOTNESS, a municipal and formerly a parliamentary borough and market-town of Devonshire, situated on the slope of a steep hill, on the right bank of the River Dart, about ten miles from its mouth. It is a place of great antiquity, has an interesting church of the fifteenth century, and some curious antique houses. The River Dart is navigable for vessels of 200 tons up to the town, which has some little shipping trade. The borough, which comprised also the suburb of Bridgetown, was disfranchised for corrupt practices by the Reform Bill of 1867. Steamers ply during the summer months between Totnes and Dartmouth. It is a station on the South Devon railway. Population in 1871, 4,073.

TOUCH-WOOD, the wood of willows and some other trees softened by decay. It is sometimes used as tinder for obtaining fire, from the readiness with which a spark ignites it.

TOULA, or TULA, an important manufacturing

town of Great Russia, capital of the government of the same name, on the Upa, an affluent of the Oka, 110 miles south of Moscow. Its churches, arsenal, theater, industrial museum, cathedral and the ancient Kremlin are the principal buildings. Toula is an ancient town, and has suffered severely from Tartar invasion, and during the wars of the commencement of the seventeenth century. Iron works founded here under Czar Alexis Michailovitch have acquired a well-merited reputation. Cutlery, locks, tea-urns and bells are made in great perfection; and bristles are prepared in large quantities both for home consumption and export. Population, 56,496.

TOURAINE, one of the former provinces of France, of which the capital was Tours, and which was bounded on the north by the province of Orleansais, on the east by Berri, on the south by Poitou, and on the west by Anjou. It was about sixty miles in length, and nearly the same number of miles in breadth; it now appears on the map as the department of Indre-et-Loire.

TOURGÉE, ALBION W., an American lawyer and novelist, born in Ohio, in 1838. He served with credit throughout the Civil War, being twice wounded; practiced law in North Carolina; became judge of the North Carolina Superior Court in 1868, and assisted in the preparation of a *Code of Civil Procedure for North Carolina*. He has written a number of novels, including *A Fool's Errand*.

TOWN-ADJUTANT, TOWN-MAJOR, officers on the staff of a garrison. They are often veteran officers, too much worn for field-service. The pay depends on the magnitude of the trust. The town-major ranks as a captain; the adjutant as a lieutenant. The duties of these officers consist in maintaining discipline, and looking after the finding of the batteries, etc.

TOWNSEND, CHARLES CHAMPLIN, member of Congress, born at Allegheny City, Pa., in 1841. He received a common-school education; is a manufacturer; served two years in the army during the rebellion as a private, and afterward as adjutant; and was elected to Congress, 1889.

TOWNSEND, HOSEA, member of Congress, born in Ohio, in 1840. He entered Western Reserve College, Ohio, in 1860; left school to enter the army in 1861; was promoted to lieutenant, and resigned in 1863, on account of disability; was admitted to the bar, and commenced the practice of law in Tennessee in 1865; was elected to the Legislature of that state in 1869, and served one term; removed to Colorado in 1879, and was elected to Congress in 1889, and re-elected in 1891.

TRACHOMA (derived from the Greek *trachus*, rough), the term employed in ophthalmic surgery to designate a granular condition of the mucous covering of the eyelids, often accompanied with haziness and vascularity of the cornea. It is one of the most serious *sequelæ* of purulent ophthalmia.

TRACY, BENJAMIN F., secretary of the navy, born at Owego, N. Y., in 1830. He studied law; was elected to the New York Assembly in 1861; was a colonel of volunteers; was in the battle of the Wilderness, and was brevetted brigadier-general; became United States district attorney for the eastern district of New York in 1866; judge of the New York Court of Appeals in

1881; secretary of the navy in 1889. In February, 1890, Mrs. Tracy and Miss Mary Tracy, the wife and youngest daughter of the secretary, lost their lives by a fire which destroyed their Washington residence.

TRADUCIANISM, one of the theories adopted for the purpose of explaining the production of the soul in the procreation of the human species. The theory known as traducianism, is ascribed to Tertullian as its first author. He taught that souls are propagated by souls, as bodies by bodies, and by the same or a simultaneous process. The discussion of these theories in the fourth and fifth centuries, was much promoted by the controversies on Manichæism.

TRAMMEL-NET. A kind of net resembling the drift-net used in the herring-fishery, but anchored and buoyed at each end, the back-rope supported by small cork-floats, and the foot-rope kept close to the ground by weights. The length varies from 20 to 300 yards.

TRANS-ANDINE RAILWAY, the first railway across the continent of South America. It runs from Buenos Ayres to Valparaiso, some 870 miles. In 1890 there were 640 miles finished at the Buenos Ayres and 82 at the Valparaiso end, while about a third of the rest was practically complete. The Andes range is crossed at Cumbre Pass, which is 13,045 feet above the sea level, and at this point the railway follows a tunnel about three miles long at an elevation of 10,450 feet, the grades for a considerable distance being 1 in 12½, so that a rack rail is employed. The opening of the whole route is expected to take place in 1892. Eight tunnels are being bored through the Andes in connection with the line, of a total length of nearly ten miles. Electricity and water are employed in novel fashion, and work on the tunnels goes on at twenty-six points.

TRANSITION, a term employed at first by Werner to designate rocks having a mineral character intermediate between the highly crystalline, or metamorphic rocks and ordinary sedimentary deposits.

TRANSITORY ACTION, in the law of England, is used, in contradistinction to local action, to denote that the particular action may be tried in another county than that in which the occurrence arose.

TRANSKEIAN TERRITORIES. For these countries of South Africa, see Britannica, Vol. XXIII, pp. 516-519. The area of Cape Colony, in 1889, was estimated at 233,430 square miles. This includes an area of 15,283 square miles in the Transkeian Territories, and of Walfish Bay, in Damara-land.

The estimated population in 1889 of Cape Colony proper, including Griqualand West, was 1,048,628; and of its dependencies, Transkei, East Griqualand, and Tembuland, 410,195; total 1,458,823. In 1880 it was 1,136,986. The total white population is estimated at about 350,000. The colony is divided into seventy divisions, and its dependencies into sixteen districts.

The various Transkeian territories are grouped under their chief magistrates as follows, with population in January, 1889: Griqualand East, comprising Port St. John's, Noman's Land, and the Gatberg, with nine subordinate magistrates (area 7,511 square miles, population 121,138, of

whom 3,921 Europeans): Tembuland, comprising Tembuland proper, Bomvanaland, and Emigrant Tembuland, with seven magistrates, including resident magistrate (area 4,055 square miles, population 159,325, of whom 5,515 Europeans); Transkei, comprising Fingoland, the Idutywa Reserve, and Gealekaland, with six magistrates (area 2,535 square miles, population 136,395, of whom 1,000 Europeans). These districts are subject to the "Native Territories Penal Code." Pondoland, population 200,000, with a resident commissioner appointed by the Cape government. Walfish Bay has an area of 430 square miles.

The capital of the colony, Cape Town, had a population in 1889 of 41,704, excluding military and shipping. The probable population of Cape Town and suburbs is 70,000. Port Elizabeth had a population of 13,049 in 1875, 15,926 in 1889; Kimberley, 13,590 in 1875, 28,663 in 1889; Beaconsfield, 21,619 in 1889; Graham's Town, 6,903 in 1875, 8,261 in 1889; King William's Town, 5,195 in 1875, 5,386 in 1889; Woodstock, 5,720; East London, 5,903; Graaff Reinet, 5,622; Stellenbosch, 5,055.

A large proportion of the white inhabitants are of Dutch, German, and French origin, mostly descendants of the original settlers.

TRANSLATION OF MINISTERS, in the law of Scotland, the removal of a minister from one parish benefice to another.

TRANSOMS, in artillery, the bars or bolts by which the two sides—technically called "cheeks"—of a gun-carriage are held together. In a ship, beams across the sternpost, at right angles to that timber fastened in the same way as the floors upon the keel.

TRANSPOSE, in music, to change a piece of music in performance from the key in which it is written to another key. To play at sight an accompaniment for such an instrument as the piano-forte or organ, transposed from one key to another, requires considerable artistic skill. To the singer, transposal presents no difficulties.

TRASS, a tufaceous deposit of the extinct volcanoes of the Eifel, near Coblenz, resembling the Puzzolana of Naples. Its base consists almost entirely of pumice, in which are imbedded fragments of basalt, burnt shale, slate, sandstone, etc., and even numerous trunks and branches of trees. Its formation is accounted for by supposing an eruption to have taken place, with copious evolution of gases, in a lake-basin, and a flood of the mud thus formed to have swept away whatever came before it. Large areas are covered by the trass, which has choked up valleys, now partially re-excavated.

TRAVERSING PLATFORM, an arrangement for the more rapid and easy movement of cannon in battery. The gun is either mounted on an ordinary truck-carriage, or on rollers under its trunnions. The truck or rollers work in and out on two parallel iron rails, which rails are mounted on the traversing carriage, and are sixteen feet or more in length. Wheels at each end of this platform, or more frequently if the weight of the gun be very great, are placed at right angles to the direction of the rails, and run on circular tramways, which have their center in the embrasure through which the gun is fired. The rails incline upward toward the rear, to moderate the gun's recoil. The advantages are, that the leverage for

turning the gun is increased by the platform's length, while the circular rails diminish the resistance; that the gun is easily run out for firing on the upper rails; that by its own recoil it runs itself in again for loading; and that a much smaller embrasure is required to give a good compass to the muzzle.

TRAVESTY, a term applied in literature to denote a burlesque representation of something previously executed in a serious and lofty manner. It differs from Parody in, that while the latter changes the subject-matter and the *dramatis persone*, but mockingly imitates the style of the original, the former leaves the subject-matter partially, and the *dramatis persone* wholly, unaltered; producing a purely comic effect by the substitution of the mean, the frivolous, and the grotesque in action or speech, for the serious, the noble, or the heroic.

TRAVNIK, a town of European Turkey, capital of the province of Bosnia, on the Lasva River, forty-five miles northwest of Bosna-Serai. Its numerous mosques and the castle, which dates from the middle ages, are the principal edifices. It contains 12,000 inhabitants, almost all Mohammedans. The principal branch of industry is the manufacture of sword-blades.

TREASON. See Britannica, Vol. XXII, pp. 525-530.

TREASURY. The United States Treasury Department was established by act of Congress Sept. 2, 1789, and numerous amendments have since so augmented its business, that it is now the largest and most important of all the executive departments of our government. It is presided over by a Secretary who is nominated by the President and confirmed by the Senate. This officer has the duty of managing the United States revenues under the laws of Congress. Two Assistant Secretaries of the Treasury are also appointed by the President and confirmed by the Senate. There are also in the office of the secretary a Chief Clerk and nine Division Chiefs, upon whom devolves the general direction of the routine business and operations of the office.

In addition to the officers connected with the secretary's office proper, there are in the treasury department the following officers:

1. The First Comptroller examines all accounts settled by the first auditor, except those relating to receipts from customs. He also countersigns all warrants drawn by the secretary of the treasury.

2. The Second Comptroller examines all accounts settled by the second, third and fourth auditors. He also countersigns all requisitions drawn on the secretary of the treasury by the secretaries of war and of the navy.

3. The Commissioner of Customs examines all accounts settled by the first auditor relating to receipts from customs, and certifies to balances arising thereon to the register of the treasury.

4. The First Auditor examines all accounts accruing in the treasury department (except those arising under the internal revenue laws), certifies the balance, and transmits the accounts to the first comptroller, or to the commissioner of customs, who have respectively the revision thereof.

5. The Second Auditor examines and settles the accounts relating to the pay and clothing of the

army, ordnance service, subsistence of officers, bounties to soldiers, hospital stores, and contingent expenses of the war department, and also those relating to Indian affairs.

6. The Third Auditor examines all accounts relating to the subsistence and transportation of the army, all accounts of the war department, other than those assigned to the second auditor, and all accounts relating to army pensions.

7. The Fourth Auditor receives and settles all accounts relating to navy pensions and accounts pertaining to the naval service.

8. The Fifth Auditor receives and examines all accounts relative to the diplomatic and consular service, accounts relating to the census, the national museum and the contingent expenses of the patent office.

9. The Sixth Auditor examines all accounts relating to the postal service, and reports to the postmaster-general all balances found on settlement of such accounts.

10. The Treasurer of the United States receives and disburses all public moneys that may be deposited in the treasury at Washington, and the sub-treasuries at New York, Boston, Philadelphia, Baltimore, New Orleans, San Francisco, St. Louis, Chicago and Cincinnati, and in the national bank United States depositories.

11. The Register of the Treasury is the official bookkeeper of the United States. He prepares a yearly statement which shows every receipt and disbursement of the public money; signs and issues all the United States bonds; registers all warrants drawn by the secretary of the treasury upon the United States treasurer and transmits statements of balances due to individuals after the settlement of their accounts by the first comptroller, or the commissioner of customs, upon which payment is made.

12. The Comptroller of the Currency has the control of the national banks.

13. The Director of the Mint has general supervision of all the mints and assay offices of the United States.

14. The Solicitor of the Treasury is the law officer of the department. He takes cognizance of all frauds or attempted frauds on the customs revenue, and has supervision over suits for the collection of moneys due to the United States, excepting those due under the internal revenue, and over all suits relating to national banks, in which the United States and its agents are parties.

15. The Commissioner of Internal Revenue has general superintendence of the collection of all internal revenue taxes, and the enforcement of all internal revenue laws.

16. The Superintendent of the Coast and Geodetic Survey is charged with the survey of the Atlantic, Gulf and Pacific coasts of the United States, including the coasts of Alaska: the survey of rivers to the head of tide-water or ship navigation; deep-sea soundings; temperature and current observations along the said coasts; magnetic observations and gravity research; determination of heights by geodetic leveling, and of geographical position by lines of transeontinental triangulation.

17. The Supervising Inspector-General of Steam Vessels superintends the administration of the

steamboat inspection laws, presides at the meetings of the board of supervising inspectors, receives all reports, and examines all accounts of inspectors.

18. The Supervising Surgeon-General supervises the marine hospitals and other relief stations of the service; takes care of sick and disabled seamen, both from the merchant vessels of the United States, and from the revenue-marine and light-house services; purveys medical and other supplies; assigns medical officers to the United States hospitals, and examines requisitions, vouchers, property returns, and manages all matters pertaining to the United States hospital service.

19. The General Superintendent of the Life-Saving Service supervises the organization and government of the employes of the service; prepares regulations therefor; fixes the number and compensation of surfmen to be employed at the several stations; supervises the expenditure of all appropriations made for the service; examines the accounts of disbursements of the district superintendents, and the property returns of the keepers of the several stations; prepares estimates for the support of the service; compiles statistics of marine disasters, and makes an annual report of the expenditures for the maintenance of the life-saving service and of the operations of said service during the year.

20. The Chief of the Bureau of Statistics collects and publishes the statistics of our foreign commerce; makes monthly statements of imports and exports, especially of breadstuffs, provisions, petroleum, and cotton; makes annual reports on navigation, and monthly reports on immigration, and the total values of foreign commerce.

21. The Chief of the Bureau of Engraving and Printing designs, engraves, prints, and finishes all the securities and other similar work of the government printed from steel plates (except postage stamps and postal notes), embracing United States notes, bonds, and certificates, national bank notes, internal revenue and customs stamps, treasury drafts and checks, disbursing officers' checks, licenses, commissions, patent and pension certificates, and portraits of deceased members of Congress and other public officers authorized by law.

22. The Light-House Board is composed of two officers of the navy of high rank, two officers of the corps of engineers of the army, and two civilians of high scientific attainments, together with an officer of the navy and an officer of engineers of the army as secretaries. Under the superintendence of the secretary of the treasury this board discharges all administrative duties relating to the construction, illumination, inspection, and superintendence of light-houses, light-vessels, beacons, buoys, and their appendages.

It is seen from the foregoing details that the transaction of the immense and varied business of the United States treasury department is distributed among a series of responsible officers. The clerical and other forces employed in the various offices and bureaus number 15,697, of whom 2,852 are in bureaus in Washington, D.C., 4,450 in the customs service, 3,303 in the internal revenue service, 948 in the mints and assay offices, 225 in the several sub-treasuries, and 3,919 in the life-saving, marine hospital, steamboat inspection, and revenue marine bureaus, and in the various public

buildings and other branches of the department located throughout the country.

TREATY. For information on the general subject of treaties, see *Britannica*, Vol. XXII, pp. 530-532. In the United States the treaties are negotiated by the executive department and confirmed by the Senate. When so confirmed, they are part of the law of the land. The principal treaties in which the United States are vitally interested are:

1819. Declaration of the rights of neutrals, as adopted by the United States and accepted by Great Britain.

1838. Maine boundary dispute, between Great Britain and the United States, settled by Lord Ashburton and Daniel Webster.

1842. Anglo-American Convention to check the slave trade.

1843. Arbitration on pecuniary disputes between the United States and Mexico (under the King of Prussia).

1846. Treaty between Great Britain and the United States, fixing the forty-ninth parallel as boundary, and confirming Vancouver Island to Great Britain.

1850. Clayton-Bulwer Treaty, Great Britain and United States (neutrality in Central America).

1853. Arbitration between Great Britain and the United States (Florida bonds).

1853. Arbitration between the United States and Mexico.

1854. Washington Treaty, between Great Britain and the United States (Fisheries and Commerce).

1858. Convention between the United States and Japan (opening certain ports).

1858. Arbitration between the United States and Chili (under the King of the Belgians).

1859. Arbitration between the United States and Paraguay, New Granada, and Costa Rica.

1863. A detailed Code of Instructions drawn up for the United States armies in the field, laying down valuable principles of international law.

1863. Arbitration between the United States and Peru.

1864. Convention of Geneva on behalf of the sick and wounded in war. Red cross adopted.

1864. Arbitration between Great Britain and the United States about Puget Sound.

1865-6. Slaves emancipated in the United States.

1869. International Telegraphic Conference and Treaty at Berne.

1871. Arbitration agreed to between Great Britain and the United States on the Alabama Claims. The award was made in June, 1872.

1871. Arbitration between the United States and Mexico.

1871. International Telegraph Conference at Rome.

1872. St. Juan Arbitration between Great Britain and the United States (under the emperor of Germany).

1874. Dispute between Switzerland and Italy referred to the United States minister at Rome.

1874. International Postal Treaty at Berne. Postal Union established.

1874. International Conference and Declaration of Brussels on the Laws and Customs of War.

1875. International Telegraph Conference at St. Petersburg.

1875. International Postal and Metric Conference at Paris.

1879. Telegraphic Convention in London.

1883. Convention at Paris on the protection of industrial property.

1885. International Telegraph Conference at Berlin.

1885. First International Congress on Inland Navigation at Brussels.

1885. African Conference at Berlin. The new Congo State sanctioned.

1886. Conference at Tokio for the revision of Japanese Treaties. New provisions in regard to foreign residents.

1887. Conventions between China and France, and China and the United States.

1887. Joint Commission at Washington to arrange the Fishery Disputes between the United States, Great Britain and Canada.

1888. Fisheries Treaty concluded by the Washington Commission; rejected by the United States Senate.

1888. Convention for the Neutralization of the Suez Canal signed at Constantinople by representatives of the powers.

1888. International Trades Union Congress in London.

Up to 1873 the United States government adjusted its relations to the North American Indians by means of treaties. Since 1873 this method has been discontinued, and acts of Congress have taken the place of treaties as means of adjusting such relations.

TREBLE, the highest part in harmonized music, which in general contains the melody, and is sung by a soprano voice. The treble or G clef is placed on the second line of the staff, indicating that the note G occupies the line encircled by its lower curve. It is one of the two clefs in use in music for keyed instruments.

TREE, the name given to those plants which live for many years, and have woody stems and branches, the stem being generally single, and bearing a head of branches and twigs; whereas shrubs have generally a number of stems springing from one root. The terms tree and shrub are not, however, of very exactly defined signification; and many shrubs, under certain circumstances, assume the form of trees, either naturally or by the help of art; while trees are, in other circumstances, converted into shrubs.

TREES OF LIBERTY. The custom, peculiar to almost all the nations of Europe, celebrating the beginning of spring and various festivals by setting up green boughs, led, during the War of Independence in the United States, to the habit of planting poplars and other trees as the symbol of growing freedom. This example was imitated during the French Revolution. These trees, crowned with the cap of liberty, were soon to be found in every village, while the people danced round them, singing revolutionary songs, and regarded them as the rendezvous of the patriots. This custom was regulated by a decree of the convention, and diffused over foreign countries by the republican armies. During the Reign of Terror, thousands lost their lives under the pretext of having injured a tree of liberty. During the empire, this custom, like all others that had originated during the republic, was completely

suppressed. After most of the trees of liberty had fallen during the conflicts in the streets of Paris, in June, 1848, government issued an order for their removal from all places where they impeded traffic. Before the end of the year, they had entirely disappeared. Numerous trees of liberty were likewise erected in Italy during the revolution of 1848 and 1849, but fell again as the different insurrections were quelled.

TRENTON, a town, and the county-seat of Grundy county, Mo., on the Crooked Fork of Grand River. It contains a number of machine shops and flour and woolen mills. Population in 1890, 5,011.

TRENTON, a city of New Jersey. Population in 1890, 57,458. See *Britannica*, Vol. XXIII, p. 552.

TREVELYAN, SIR GEORGE OTTO, born in 1838. He represented Tynemouth in 1865-68, and commenced his official parliamentary career in 1869 as Lord of the admiralty; and, in Mr. Gladstone's ministry, became secretary to the admiralty. After holding the office of chief secretary for Ireland, Sir George was appointed chancellor of the duchy of Lancaster (with a seat in the cabinet) in 1884, and held the office of secretary for Scotland for a month in 1886. Sir George, being unable to agree with Mr. Gladstone's Irish policy, resigned his position in the government, but on the conclusion of the Round Table Conference, at which he represented the Unionist party, he announced that his opposition to the points of disagreement with regard to the Home Rule movement had been overcome, and he rejoined his colleagues on the Front Opposition bench. Sir George has gained distinction in the world of letters by his *Life of Lord Macaulay*, his uncle. He is also the author of some humorous poetry, entitled *The Ladies in Parliament*.

TRÉVES, HOLY COAT OF. For general article on Tréves, see *Britannica*, Vol. XXIII, pp. 552-53. After an interval of forty-seven years another great pilgrimage was made in the midsummer of 1891, to Tréves, Prussia, to obtain a personal view of the alleged "seamless coat" of Jesus Christ, which, at the time of his crucifixion, passed into possession of the Roman soldiers, and which had last been exhibited in 1844 to pilgrims, estimated to number over 1,500,000. The story of this coat which at intervals has awakened excited attention for several centuries, is that it was discovered, or rather found, by St. Helena, the innkeeper's daughter, who became the wife of one Caesar and the mother of another. On her return from Palestine, early in the fourth century, she deposited the garment in the basilica out of which grew the Cathedral of Tréves, a city which, in those days, was the capital of Belgic Gaul, and the residence of the later Roman emperors. In course of time this lordly church was so filled with relics that when the barbarians in the fifth century, and the Normans in the ninth, played havoc with the town, the treasures were concealed in crypts, and there they remained for so long a period that the existence of some of them was forgotten. This is the legend. More authentic records tell us that the holy coat was discovered, or rediscovered, in the year 1196, and then solemnly exhibited to the uncritical gaze of the pious. Contrary to the wont of most other treasures of a similar kind, which are

exhibited pretty frequently—the "great relics" in Aix-la-Chapelle being an exception—the holy coat was not seen again for more than three centuries, an interval that is full of suggestiveness in the case of a town crowded, as the archiepiscopal capital of Tréves then was, with crafty priests and skillful weavers.

At all events, it was not shown until 1512, when the multitudes flocking to venerate it were so great that Leo X. determined that it should be produced every seventh year. But, meantime, Tetzels and his sale of indulgences had made their mark, and the great festival of the holy coat ceased to be observed with any regularity, profitable though the occasion undoubtedly was to the church and townsmen of Tréves. In 1810 it was again exhibited, and in spite of the slowness of traveling, and notwithstanding Napoleon's prohibition against the working of miracles, 227,000 people went to the memorable sight. For thirty-four years nothing more was heard of the coat, and the secret of its hiding place was confided to so select a body of the cathedral clergy that it was feared that it had again been lost. Indeed, so silent were the authorities regarding this greatest of their relics that as late as 1841, there were doubts whether it really existed. All that the attendants of the church could say was that it was walled up in the high altar, and would appear once more on the centenary of its exhibition in 1744.

In 1844, accordingly, Bishop Arnoldi produced the coat. It was then a loose garment with wide sleeves, very simple in shape, of coarse material, dark brown in color, and entirely without seam or decoration. According to one of the many descriptions and figures of it published at the time it measured from the extremity of each sleeve five feet four inches, the length from the collar to the lowermost edge being five feet two inches. In parts it was tender or threadbare, and some stains on it were reputed to be those of the Redeemer's blood, though nothing was said as to the patchwork character of the tunic. On this, as on previous occasions, miracles were reported to have been wrought by it in the shape of cures, the nature of the best authenticated being closely akin to those known nowadays as faith healing. Since the Middle Ages no such pilgrimage had been known, and no mediæval shrine could have attracted the same number of people in the same space of time, for it is said that 1,500,000 devotees visited the high altar on which the coat was placed. They came from all quarters, many from long distances, traveling on foot, preceded by their village priests and by surpliced boys bearing banners. All the inns and lodging houses of the town were crammed, and not a vacant room which the owners were willing to let, could be had after the first week for either love or money. But it was summer, and there was little hardship in sleeping on staircases, in out-houses, or even in the streets and squares, with the pilgrim wallets for pillows. Every morning at early dawn, the eager sight-seers took up their posts by the cathedral doors, until a line of more than a mile in length was formed, so that it was difficult for any, save the head of the procession, to reach the coat much under three hours. The heat, dust and fatigue exhausted many, who fainted by the way, while the pent-up excitement of others gave way to

hysteria as they made their oblations before the sacred object.

At the close of the exhibition, among those who disapproved of the whole affair was Johann Ronge, a Roman Catholic priest, who, in October, 1844, made a vigorous attack on Bishop Arnoidi for encouraging those acts of adoration to what he declared was at best a relic of the most doubtful authenticity. As this declaration was against a canon of the church, and in contempt of more than one papal bull, the recalcitrant churchman was promptly excommunicated by the chapter of Breslau. The result, however, was a schism so wide that in six months there were twenty-seven congregations who professed themselves of Ronge's way of thinking.

In midsummer, 1891, a committee of experts, chosen by the Roman Catholic Bishop of Trèves, made a private examination of the garment and vouched for its genuineness, "though it is rather moldier and more mildewed than when last permitted to see the light of day." That is to say, they vouch that the coat is the same one which was exhibited in 1844, the seals still being intact. We need hardly observe that it was impossible for them, or for anybody else, to produce a scintilla of proof that it was the seamless coat for which the Roman soldiers cast lots on Calvary nearly nineteen centuries ago. Roman Catholic tradition affirms that the coat possesses a miraculous power, enabling it to defy the ravages of time. Unfortunately, however, the pious citizens who had been requested to examine it did not bear out this explanation by their report. On the contrary they declare that the garment shows traces of having been renewed, several patches on it being embedded in a piece of linen or cotton cloth of a later manufacture.

In 1891, after extensive preparations, the exhibition opened August 20th. A cable telegram received on that date describing the opening ceremonies, reads as follows:

"The garment known as the holy coat was exposed to view this morning in the cathedral at Trèves. Two Knights of Malta, in full costume, with drawn swords in their hands, stood on either side of the shrine inclosing the holy-coat case, which was surrounded by tall lighted candles in handsome candlesticks and surmounted by a large gold cross. There was an impressive scene in the sanctuary during the celebration of high mass, over a hundred priests assisted in the ceremonies.

"The bishop declares that the only aim of the exhibition is 'to revive the faith in and the love toward our Divine Saviour,' and fervently exhorts the Church to the end that the period of exhibition may be 'a season of grace for all.' This grace, he urges, is to be petitioned for 'through fervent prayer and works of Christian penance.' The feast should be celebrated in the spirit of our forefathers. 'Not out of curiosity, not for amusement, did they come to our cathedral; but they followed the impulse of grace, to profess their faith, to show to God their love and gratitude by venerating His holy coat.'

"The holy coat is distinctly visible in the body of the cathedral, and is much more plainly seen than upon the former occasion of its exhibition. The old silken covering being almost entirely worn

away, it appears to-day to be of a brownish yellow color."

During the exhibition of the "Holy Coat," which closed in October, 1891, it was estimated that over 2,000,000 people visited Trèves.

TRIDACNIDÆ, a family of lamellibranchiate molluscs, having the shell open, the valves equal, the foot small, and furnished with a byssus. *Tridacna gigas* is remarkable for its great size, exceeding that of any other bivalve. The shell of a single specimen has been known to weigh more than 500 lbs. The valves are sometimes used in Roman Catholic churches for holy-water vessels. They are also used as an ornament for grottoes and fountains. They are deeply furrowed and beautifully grooved. This great mollusc is a native of the East Indies, and is used for food.

TRIDENT, in classic mythology, the symbol of Neptune's sovereignty over the sea. It consisted of a staff, armed at one end with three short prongs, with double barbs at the points, resembling the *fusina* used by the Italians in catching large fish, particularly the sword-fish, from which we may perhaps infer that Neptune was originally the god of fishermen.

TRIENNIAL PRESCRIPTION, in the law of Scotland, a limit of three years imposed on all creditors to bring their actions to recover a certain class of debts and damages, such as actions to recover merchants' accounts, servants' wages, house rents (where the lease is verbal), debts due to tradesmen, lawyers and doctors. So actions to recover damages for wrongful imprisonment must be brought within three years.

TRIGONOCARPON, a common fruit in the coal-measures, occurring in all the strata except the underclays and limestones. Some six or eight species have been established, which differ from one another in size and shape—some being as small as a pea, and others as large as a walnut. They are marked, when preserved in the round, with three longitudinal ridges, and from this character the name was derived. They have never been found attached to any plant. It was at first thought that they were palm fruits, but Dr. Hooker, from the examination of several specimens which exhibit structure, has shown that they are not unlike the structure of *Salisburia*, a drupe-bearing coniferous tree, a native of China and Japan.

TRIKHALA, or TRIKALA, a town of Europe, in Greece, thirty-three miles southwest of Larissa. It manufactures cotton and woolen stuffs, and has a large transit trade with Epirus and Albania. The neighboring plains, which are watered by the Salembria (ancient *Peneus*), are rich in all sorts of fruits. Population, (1889), 12,662. Trikhala is the *Trikka* of Homer, and was celebrated in the classic ages for its temple of Æsculapius.

TRILOGY, the name given by the Greeks to a group of three tragedies, either connected by a common subject, or each representing a distinct story. A satyric drama was customarily added as a termination, whence the whole was sometimes termed a *tetralogy*. Every tragic poet that wished to take part in a poetic contest had to produce a trilogy along with a satyric drama at the Dionysiac, Lenaean and Anthesteriæc festivals. We possess only one perfect specimen of the classic trilogy, the *Orestia* of Æschylus, which embrace

the *Agamemnon*, the *Chaphora* and the *Euménides*.

TRIMMER, a political term in use in the reigns of Charles II. and William III., originally applied to certain politicians of Charles' time, of whom the chief was Charles Montagu, earl of Halifax, who held opinions half-way between the extreme Whigs and Tories. Halifax adopted the name Trimmer as a title of honor, maintaining that everything good was a medium between extremes. The same term was applied more generally by Dryden and other writers of the same period to all who, professing to be friends to monarchy, were at the same time enemies to the duke of York, and who were equally obnoxious to the court and to the fanatical republicans.

TRIMURTI, the name of the Hindu triad, or the gods Brahma (masculine), Vishnu and Siva, when thought of as an inseparable unity, though three in form. When represented, the Trimurti is one body with three heads: the middle head, that of Brahma; at its right, that of Vishnu; and at its left, that of Siva.

TRINIDAD, a town, the county-seat of Las Animas county, Colorado; on Purgatory River. It is the seat of Rice Institute and other educational institutions, and exports large quantities of wool. Population in 1890, 5,500.

TRINITY, a river of Texas, formed by the union of two streams, West Fork and Elm Fork, which rise near the northern boundary of the state, and unite 150 miles southeast, the main stream flowing thence 550 miles in the same general direction to Galveston Bay, about forty miles north of the city of Galveston. It is navigable 300 to 500 miles.

TRINITY, a river of California, rising near the coast-range, and flowing through a country of rich gold-mines, into the Klamath River.

TRINODA NECESSITAS, three species of contributions, to which, in Anglo-Saxon times, all the lands of England, whatever their tenure, not excepting those of the church, were subject, namely, *Bryge-bot*, for keeping the bridges and highways in repair; and *Burg-bot*, for keeping the fortresses in repair; and *Fyrd*, for maintaining the military and naval force of the kingdom.

TRIO, in music, a composition for three voices or for three instruments. The same term is also applied to a movement in $\frac{3}{4}$ time in a different key, which follows a minuet or other movement, and always leads back to the previous movement in the original key.

TRIPLE ALLIANCE, the name first given in 1879, to a stipulation of mutual support between Germany, Austria and Italy. It was a defensive agreement of mutual support, for the ostensible purpose of preserving the peace of Europe, but for the real purpose of preventing Russia and France from making any efforts to encroach upon the present boundary allotment of the European states. The alliance was for a term of six years. In 1885 it was renewed for another term of six years; and it now (1891) has been extended for another six years' term.

The motive for this third alliance is obvious. Germany has nothing to gain and much to lose from another war. She does not care to add to her territories, and in the event of a great struggle there would probably be serious trouble in Alsace

and Lorraine. On the other hand, both Russia and France have definite ends to be reached. Russia is always working in the Balkan region for additions to her territory, and always moving on patiently, but with unbroken determination, toward Constantinople. France is inspired with a determination to recover her lost territory or be revenged. It is believed that the arrangement between Russia and France involves a distinct understanding by which France is to be allowed supremacy in the Mediterranean, and Russia to have a perfectly free hand in the East. It must be remembered also that while the populations of Austria, Italy and Germany desire peace no less earnestly than their rulers, there is in France strong popular feeling against Germany, and in Russia a latent desire for war, which at any moment may be fanned into a flame. The war initiated by Germany or Austria would be a dynastic war, but a war initiated by either France or Russia might be a popular war. The practical bearing of this fact lies in the possibility of the war being precipitated by an outburst of popular feeling in either of these two countries. So far as the members of the Triple Alliance are concerned, war will not be precipitated save by the concurrent action of the sovereigns at the head of the states. What Italy has to gain from this alliance is not very clear. Her only apparent gain is in prestige; as a member of the alliance she ranks as a great power, and since the bold move of Cavour in sending Italian troops to the Crimea this has been part of her policy: a policy that has resulted in the autonomy of the Italian people.

The chief beneficent result of the Triple Alliance lies in the fact that in a way it insures for the time the peace of Europe. A war to-day would mean a struggle between two groups of powers who would divide all Europe between them. Not since the days of Napoleon has Europe witnessed so gigantic a strife as would follow the outbreak of hostilities; and this fact has a tendency to make statesmen and rulers sober by making them conscious of tremendous responsibilities. On the other hand, the Triple Alliance is the direct source of a number of very unfortunate influences. It involves a military force on all sides of nearly ten millions of men, and it represents the most frightful burden of taxation known in history. This enormous body of men must not only be supported and paid, but in great numbers they are taken out of every field of productive work, and the world loses just so much by their absence. The situation involves more loss of productive force and a heavier outgo to sustain unproductive hands, than any previous condition in the history of the world. This is a very serious fact in the economic situation. Moreover, the alliance, extended now for a third term of six years, makes it impossible to take the first step toward the disarmament of Europe. It fastens the *status quo* more heavily than ever upon all the great nations. There are apparently but two ways of escape from the appalling burdens which Europe is now bearing. A great war might so thoroughly weaken and disable one or two of the disputants as to destroy the present equilibrium and relieve the others of the dangers and fears which now surround them; or, by consensus of opinion, a reduction of the different armaments. Sooner or later

the burden will be too heavy to be borne: it is already wearing into the hearts and souls of men; but the Triple Alliance makes it impossible to reduce the burden or to relieve the situation.

TRIPLET, in music. When a note is divided into three in place of two parts—as when a minim is divided into three crotchets, a crotchet into three quavers, etc.—the group is called a triplet, and it is usual to place the figure 3 over it.

TRIPOD, any article of furniture supported on three feet. Three-legged caldrons and bronze altars more especially came under this denomination in classical times; many of them are of exquisite workmanship, and richly decorated. The sacrificial tripod in its earliest form resembled the caldron, with the addition of three rings at the top to serve as handles. Of this description seems to have been the tripod at Delphi, from which the Pythian priestess delivered her oracles. Tripods of a similar form were given as prizes at the Pythian games; and at Athens, a tripod was considered an appropriate reward for a successful choragus. Some beautiful tripods were found at Pompeii; and there are several very interesting specimens in the British Museum.

TRIPOLI, a mineral substance employed in polishing metals, marble, glass, etc., so named because it was originally brought from Tripoli in Africa. It is a siliceous rock, composed of very minute particles, somewhat loosely held together, so as to yield readily to the nail, and to crumble down in water like rotten-stone.

TRITON, in Greek mythology, a son of Poseidon and Amphitrite, who dwells with his parents in a golden palace at the bottom of the sea. He usually figures as an attendant on his father, riding over the Mediterranean on a horse or other sea-monster, and soothing the turbulent waves by blowing his shell-trumpet—his “wreathed horn,” as Wordsworth calls it. The later poets speak of Tritons, in the plural, as a race of subordinate sea-deities, who were frequently represented in works of art.

TROMSOE, a small island on the northwest coast of Norway, in Finmark, between the island Kvalø and the mainland. It is four miles long and about a mile and a half broad. On the eastern side of the island is the small but thriving town of the same name, the seat of a bishop. Russian vessels from Archangel and the White Sea visit this town, and bring corn, which they exchange for dried fish. Population, about 3,000.

TRON, or **TRONE WEIGHT**, the most ancient system of weight used in Scotland, so called from *trone*, a species of heavy beam or balance set up in the market-place, and employed for the weighing of heavy wares. The weights employed in the public markets formed the most convenient reference, and consequently tron weight became the standard. The tron pound contained twenty ounces, but from the custom of giving “one in” to the score, was always reckoned at twenty-one ounces; this was the most general value; but it varied in the different market-towns between this and twenty-eight ounces. The later tron stone or standard weight contains sixteen tron pounds, each pound sixteen tron ounces, and each tron ounce sixteen drops; the tron pound is estimated to be equivalent to 1.3747 pounds avoirdupois.

TROOP, in cavalry, the unit of formation, forming the command of a captain, consisting usually of sixty troopers, and corresponding to a company of infantry. The officers of a troop are the captain, lieutenant and cornet. Two troops form a squadron.

TROPE (Gr. *tropos*, a “change,” a “turning”), the name of a figure of speech which does not appear to differ from metaphor.

TROPHY, a memorial of victory erected on the spot where the enemy had turned to flight. Among the Greeks (with the exception of the Macedonians, who erected no trophies), one or two shields and helmets of the routed enemy, placed upon the trunk of a tree, served as the sign and memorial of victory. After a sea-fight, the trophy consisted of the beaks and stern-ornaments of the captured vessels, set up on the nearest coast. In early times the Romans never erected trophies on the field, but decorated the buildings at Rome with the spoils of the vanquished. Of this practice we have a familiar instance in the *rostra* or beaks set up in the forum. In later times pillars and triumphal arches were employed to commemorate victories. Besides these, in modern times, the humiliation of an enemy is rendered lasting by such devices as the bridge of Jena, of Waterloo, and by the distribution of captured cannon.

TROUT, the popular name of many species of the genus *Salmo*, as characterized by Cuvier. The name is given to some of the silvery species migrating to the sea, and to all the yellow species, which constantly inhabit fresh waters. Trout are found in almost all the lakes and rivers of the temperate and colder parts of the Northern hemisphere. The Common Trout (*Salmo fario* or *Salar Ausonii*) is widely diffused in the Eastern hemisphere. It is found even in very small streams, and almost to their mountain sources, but attains its largest size where there is considerable depth of water and abundance of food. The head of the Common Trout is large; the eye large; the general form symmetrical, stouter than that of the salmon, the convexity of the outline of the back nearly similar to that of the belly; the tail is slightly forked; the teeth numerous and curved. The color is yellow, but the tint varies much in the trout of different waters, sometimes passing into greenish-black or violet. On the back and upper part of the sides there are spots of black and red; the belly is silvery white. The fins are light-brown; the dorsal fin and tail with numerous darker brown spots. America has numerous species. One of them, the Common Brook Trout or Speckled Trout (*Salmo fontinalis*), is similar to the Common Trout. It abounds in the streams of Canada, and in the northern and middle parts of the United States. The North American Lake Trout (*Salmo conifinis*) inhabits the deepest waters of the great lakes, and sometimes attains a weight of more than sixty pounds. It is dark-colored, mottled with grayish spots. The finest species in quality, as well as largest in size, is the Mackinaw Trout, or Namaycush (*Salmo amethystus*, or *namaycush*). It is found in Lake Huron, Lake Superior and the more northern lakes. The Red-bellied Trout (*Salmo*, or *Fario erythrogaster*) of the lakes of New York and Pennsylvania, sometimes two and one-half feet in length, is deep greenish on the

back, lighter on the sides, which are spotted with red, the belly orange-red.

TROUVERE, the name given in Northern France to the same kind of courtly or polished poet who, in Southern France was called a Troubadour.

TROY, a city of New York. Population in 1890, 60,956. See Britannica, Vol. XXIII, p. 590.

TROY, a town, the county-seat of Miami county, Ohio, on Great Miami River and Miami Canal. It has abundant water-power, flour-mills, wagon-factories, and an extensive trade. Population in 1890, 4,590.

TRUCKEE, a village in Nevada county, Cal., near the crest of the Sierra, at an elevation of about 6,000 feet. It has extensive saw-mills and lumber manufactories, run by the water-power of the Truckee River. It is in the vicinity of Donner Lake and Lake Tahoe. In winter snow falls to a great depth.

TRUCK FARMING IN THE UNITED STATES. The United States census statistics taken in 1890, showed that over \$100,000,000 was invested in truck farming, and that after paying all freights and commissions, trucking received about \$75,000,000 for the produce of 1889. The total cost of labor, manures, seeds, etc., amounted to about \$24,000,000, leaving about \$52,000,000 as net profit. The acreage covered by the truck crops aggregated 535,000 acres. Over 200,000 men, about 10,000 women and 15,000 children were employed, receiving for their labor nearly \$10,000,000. Seventy-six thousand horses and mules, and \$9,000,000 worth of machines and other implements were required.

Truck farming is not market gardening as this special business is carried on, but it is ordinary farming devoted to the heavier class of products upon a much less extensive system than the truly garden culture of the grower of vegetables and fruits, who is especially a market gardener. Truck farming is market farming as distinguished from the higher culture of the gardener who confines himself to a few acres in the immediate vicinity, or within the actual bounds of a large town or a city. The market gardener works on land which costs \$2,000 or \$3,000 an acre, or for which he pays as annual rent a sum equal to the whole value of an acre of a suburban farm. The market farmer works on a farm and devotes only a part of his time and labor to the truck which he grows. He is usually a dairyman or a fruit grower, and devotes less or more of his available land to the heavier class of vegetables which can be grown in fields. The following list of products will give an idea of his crops:

| | Aeres. |
|--------------------------------|---------|
| Asparagus | 37,970 |
| Beans | 12,707 |
| Cabbage | 77,094 |
| Kale | 2,962 |
| Spinach | 20,195 |
| Irish potatoes | 28,046 |
| Beets | 2,420 |
| Celery | 15,381 |
| Cucumbers | 4,721 |
| Watermelons | 114,381 |
| Other melons | 28,477 |
| Peas | 56,162 |
| Sweet potatoes | 28,621 |
| Tomatoes | 12,802 |
| Miscellaneous vegetables | 82,601 |
| Total | 524,540 |

Truck farming is carried on in the vicinity of every city, town and village of the whole United States. In some states, as in Florida, New Jersey, the eastern part of Pennsylvania, Illinois for the whole length of the state, in Maryland, North Carolina, and in New York, especially in Long Island, in Michigan and even in Kansas, whence celery is now shipped to New York City, this industry covers certainly a million acres of land. Sweet corn alone occupies around the city of New York at least 10,000 acres of land, and one small town near that city alone has sent out every evening for years past no less than 150 wagons loaded with this kind of truck in the height of the season. The list of the districts in which this business is carried on is thus given, with the annual value of the produce:

| DISTRICTS. | Aeres. | Value of Products. |
|--------------------------------|---------|--------------------|
| New England..... | 6,838 | \$ 3,184,218 |
| New York and Philadelphia..... | 108,135 | 21,102,521 |
| Peninsular..... | 25,714 | 2,413,648 |
| Norfolk..... | 45,375 | 4,692,859 |
| Baltimore..... | 37,181 | 3,784,696 |
| South Atlantic..... | 111,441 | 13,183,516 |
| Mississippi Valley..... | 36,180 | 4,982,567 |
| Southwest..... | 36,889 | 4,979,783 |
| Central..... | 107,414 | 15,432,223 |
| Northwest..... | 1,083 | 204,791 |
| Mountain..... | 3,833 | 531,976 |
| Pacific Coast..... | 14,357 | 2,024,345 |
| Total..... | 534,450 | \$76,517,143 |

Every village of two hundred or three hundred people offers a market for farm products of this kind and small fruits. In most of these small communities it is supposed that the villagers grow their own supplies in their own gardens. Experience in this direction has shown that this is far from being the exact case, and that on the contrary the village gardens are rarely productive enough to satisfy their owners; that the crops grown are late, and not of fine quality, and that if vegetables and fruits fresh from the farms are offered they will be eagerly taken. A case in point may be referred to. A farmer, whose land adjoined a village of about 500 people, had a surplus of strawberries in his garden which he wished to dispose of. He picked a dozen quarts and sent a boy into the village to sell them. In an hour the boy had returned, and wanted more. That day more than 100 quarts were sold. Some of the purchasers wanted cream, and the demand for this was supplied at a price equal to twice the value of the butter. The result was that a market was found for asparagus, early cabbages, cauliflowers (not one of which was grown in the village), tomatoes, and other truck, and gradually the farmer was obliged to put several acres of his land in these crops to meet the demands of this little village. The income from this source became larger than that from the rest of the farm, which had been previously wholly devoted to the dairy.

But it is not only the residents of villages who will purchase truck of this kind. A milk dairyman may sell to farmers along his route many products which they do not grow. Celery, asparagus, cauliflowers, early cabbages, and sweet corn may find many purchasers among farmers who

think these trifes are beneath their notice, and give their attention to the large crops. Some of the most prosperous farmers belong to this class of truckers, giving their sole attention to potatoes, muskmelons, tomatoes, celery, onions, cabbages, etc., and thus make their small farms turn out from \$200 upward per acre, and, becoming known for the excellence of their products, their honesty in dealing, and the certainty of supply, make permanent business connections, and sell their products without the least difficulty. This subject is well worth the attentive study of farmers who are complaining of the paucity of their profits.

TRULLAN, the name (derived from the hall—*Gr. trouillos*—of the palace in which the Fathers assembled) given to the council, also called *Quin-sixt*.

TRUST COMPANIES, financial corporations which are authorized to receive money on deposit and pay interest thereon, and also to receive securities and other personal property from individuals or corporations, and loan money on real estate and collateral or personal securities. They may also act as the fiscal agents of states, municipalities or corporations, and in such capacity receive and disburse money, and transfer, register, and countersign certificates of stocks, bonds, or other evidence of indebtedness. They also act as trustees under mortgages given by corporations, and accept and execute any other municipal or corporate trusts not inconsistent with law. The charters of such companies are obtained through the state Legislature, and as a rule contain the broadest of powers. But in the state of New York, since 1887, they are organized under a general law, which, however, is not applicable to companies previously chartered by special acts of the Legislature. The affairs of trust companies are managed by directors or trustees, elected annually by their stockholders. These officials are generally forbidden from borrowing the moneys or securities of the corporation. The capital of these companies varies from \$100,000 to \$2,000,000, and must be invested in bonds and mortgages, or designated public securities.

TRUSTS. Organizations for the control of several corporations under one direction by the device of a transfer by the stockholders in each corporation of at least a majority of the stock to a central committee or board of trustees, which issues in return to such stockholders respectively, certificates showing in effect that, although they have parted with their stock and the consequent voting power, they are still entitled to dividends or to their share in the profits—the object being to enable the trustees to elect directors in all the corporations, to control and suspend at pleasure the work of any of them, and thus to economize expenses, regulate production, and defeat competition. In a looser sense, the term "trust" is applied to any combination of establishments in the same line of business for securing the same ends, by holding the individual interests of each subservient to a common authority for the common interests of all. It is against public policy for a stockholder to divest himself of his voting power; hence, such a transfer of stock, if made, is revocable at the pleasure of the maker. So far as the object of such a combination is shown to be the control of prices of, and the prevention of competition in, the necessities

or conveniences of life, it is held to be a criminal act upon the principles which rendered engrossing and forestalling punishable; and a corporation, which by corporate act, surrenders its powers to the control of a trust, thereby affords ground for a forfeiture of its charter by the state.

ANTI-TRUST LEGISLATION BY CONGRESS. The LI. Congress of the United States adopted an important Anti-Trust Act, as follows:

The act provides that every contract, combination in the form of trust or otherwise, or conspiracy, in restraint of trade or commerce among the several states, or with foreign nations, is hereby declared to be illegal. Every person who shall make any such contract or engage in any such combination or conspiracy shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 2. Every person who shall monopolize, or attempt to monopolize, or combine or conspire with any other person or persons, to monopolize any part of the trade or commerce among the several states, or with foreign nations, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 3. Every contract, combination in form of trust or otherwise, or conspiracy, in restraint of trade or commerce in any territory of the United States or of the District of Columbia, or in restraint of trade or commerce between any such territory and another, or between any such territory or territories and any state or states or the District of Columbia, or with foreign nations, or between the District of Columbia and any state or states or foreign nations, is hereby declared illegal. Every person who shall make any such contract or engage in any such combination or conspiracy, shall be deemed guilty of a misdemeanor, and, on conviction thereof, shall be punished by fine not exceeding five thousand dollars, or by imprisonment not exceeding one year, or by both said punishments, in the discretion of the court.

Sec. 4. The several Circuit Courts of the United States are hereby invested with jurisdiction to prevent and restrain violations of this act; and it shall be the duties of the several district attorneys of the United States, in their respective districts, under the direction of the attorney general, to institute proceedings in equity to prevent and restrain such violations. Such proceedings may be by way of petition setting forth the case and praying that such violation shall be enjoined or otherwise prohibited. When the parties complained of shall have been duly notified of such petition, the court shall proceed, as soon as may be, to the hearing and determination of the case; and pending such petition and before final decree, the court may at any time make such temporary restraining order or prohibition as shall be deemed just in the premises.

Sec. 5. Whenever it shall appear to the court before which any proceeding under Section 4 of this act may be pending, that the ends of justice require that other parties should be brought before the court, the court may cause them to be summoned, whether they reside in the district in which the court is held or not, and subpoenas to that end may be served in any district by the marshal thereof.

Sec. 6. Any property owned under any contract or by any combination, or pursuant to any conspiracy (and being the subject thereof) mentioned in Section 1 of this act, and being in the course of transportation from one state to another, or to a foreign country, shall be forfeited to the United States, and may be seized and condemned by like proceedings as those provided by law for the forfeiture, seizure and condemnation of property imported into the United States contrary to law.

Sec. 7. Any person who shall be injured in his business or property by any other person or corporation by reason of anything forbidden or declared to be unlawful by this act may sue therefor in any Circuit Court of the United States in the district in which the defendant resides or is found, without respect to the amount in controversy, and shall recover threefold the damages by him sustained, and the costs of suit, including a reasonable attorney's fee.

Sec. 8. That the word "person," or "persons," wherever

used in this act shall be deemed to include corporations and associations existing under or authorized by the laws of either the United States, the laws of any of the territories, the laws of any state, or the laws of any foreign country.

The above bill, when reported by a committee of conference, passed both houses without a division.

TRYSAIL, a small fore-and-aft sail, mounted by a cutter or schooner in a storm, when the wind is too violent for her to carry her ordinary canvas.

TUBICOLE, an order of *Annelida*, having a tubular shelly covering, into which the animal can retreat, but from which, when undisturbed and disposed to activity, it projects its head and gill-tufts. The genus *Serpula* is a good example.

TUCKER, HENRY ST. GEORGE, member of Congress, born in Virginia in 1853. He was educated at Washington and Lee University, graduating in 1875; has practiced law continuously since; was elected to Congress in 1889, and re-elected in 1891.

TUCSON, a city of Arizona. Population in 1890, 5,095. See Britannica, Vol. XXIII, p. 604.

TUDOR STYLE, in architecture, a rather indefinite term applied to the late Perpendicular, and the transition from that to the Elizabethan.

TUESDAY, the third day of the week, so called from *Tuesday*, the day of Tiw or Tiu, the old Saxon name for the god of war. The day bears a corresponding name in the other Germanic dialects.

TUFTS COLLEGE. See COLLEGES AND UNIVERSITIES IN UNITED STATES in these Revisions and Additions.

TULIP TREE, often called **TULIP POPLAR**, (*Liriodendron tulipifera*), a beautiful tree of the natural order *Magnoliaceae*, a native of the United States, having a stem sometimes 100 to 140 feet high, and 3 feet thick, with a grayish-brown cracked bark, and many gnarled branches. The leaves are ovate, and three-lobed; the flowers solitary at the extremities of the branchlets. The bark has a bitter, aromatic taste, and in some parts of the basin of the Mississippi it forms considerable tracts of the forest.

TUNBRIDGE-WARE, a pretty kind of manufacture in wood, carried on at Tunbridge Wells. It consists of small articles, such as ladies' work-boxes, etc., which are covered with a veneer characteristic of this industry; it is formed by building up a geometric pattern with very small strips of wood of a triangular or square shape in transverse sections; these are carefully glued together so as to form a solid mass, from which thin transverse veneers are cut, and are used to cover the articles made. This trade was formerly of much greater importance than at present.

TUNIS, a country of northern Africa. For general article on Tunis see Britannica, Vol. XXIII, pp. 619-623. Tunis was acquired by France in 1881. It has an estimated area of 45,000 square miles, and a population of about 1,500,000.

TUNNELS IN AMERICA. Among the prominent tunnels in this country we mention the following:

1. The **HOOSAC TUNNEL**, on the railway from Boston, Mass., to Troy, N. Y., is four and three-fourths miles long, reaching through the Hoosac Mountain, which is a part of the Green Mountain Range. It was begun in 1862 and finished in 1880.

This tunnel cost the state of Massachusetts about eighteen millions of dollars; but the state sold it in 1887, together with forty-four miles of railroad, to the Fitchburg Railroad Company for five millions of dollars in bonds and five millions of dollars in stock.

2. A **TUNNEL THROUGH THE CASCADE RANGE**, in the state of Washington, 9,850 feet long, was built from 1886 to 1888, for a single track railroad.

3. The **BIG BEND TUNNEL** of Butte county, Cal., is two miles long, and was built from 1882 to 1887, in order to reach some auriferous regions in the valley of the Feather River. It diverts the water of this river from its present channel and carries it through a mountain.

4. The **CHICAGO TUNNEL**, built from 1864 to 1876, runs from the foot of a land-shaft at Chicago two miles under Lake Michigan to the foot of a shaft in the lake. The lake-shaft is protected by a pentagonal crib or breakwater, forty feet high. This tunnel supplies the city of Chicago with water.

5. The **SUTRO TUNNEL**, built from 1869 to 1879, runs 20,000 feet into the mountain in which the Comstock mine is situated, near the town of Virginia City, Nev. It drains and ventilates a number of important mines.

6. A **TUNNEL AT PORT HURON**, Mich., some miles above Detroit, under the St. Clair River, is one and one-fourth miles in length, and large enough for a single track railroad.

7. A **TUNNEL UNDER THE HUDSON RIVER**, connecting New York City with New Jersey, is in the course of construction, and approaches completion now (October, 1891).

TUPELO (*Nyssa*), a genus of trees of the natural order *Cornaceae*, natives of North America, chiefly of the middle and southern parts of the United States; having simple alternate leaves, mostly entire, greenish inconspicuous flowers at the extremity of long stalks, the fruit a drupe. *N. multiflora* attains a height of 60 to 70 feet. It is often called Sour Gum Tree. *N. tomentosa*, the Large Tupelo is a lofty and beautiful tree, remarkable for the extraordinary enlargement of the base of the trunk, which is sometimes 8 or 9 feet in diameter, while at no great height the diameter diminishes to 15 or 20 inches. The fruit resembles a small olive, and is preserved in the same way by the French settlers in America. *N. candidans* or *capitata*, the Ogechee Lime or Sour Gum Tree, is a small tree, of which the fruit is very acid, and is used like that of the lime. The wood of all the species is soft, that of the large tupelo remarkably so.

TUPELO, a prosperous and growing town of Mississippi, in the eastern part of the state, on the line of the Mobile and Ohio Railroad.

TUPPER, SIR CHARLES, high commissioner for Canada in London, born at Amherst, Nova Scotia, July, 1821. He was educated in Edinburgh for the medical profession, and was the first president of the Canadian Medical Association. He entered politics, and became prime minister of his native province in 1864; was a strong advocate of confederation, and wrote a "Letter to the Earl of Carnarvon on the Union question," in 1866; became cabinet minister of the Dominion in 1870, and held office with Sir John Macdonald till 1873; was one of the leaders of the Conservative opposition

till 1878, when he was again appointed minister. As minister of railways he took the chief part in advocating throughout Canada the construction of the Canadian Pacific Railway, and took charge of the measure in parliament. He received his present appointment in 1884. Accompanied Mr. Chamberlain to Washington as Canadian representative during the fishery negotiation in 1888, and for his services was created a baronet.

TUPPER, MARTIN F., an English author, born in 1810, died in 1889. His principal work was *Proverbial Philosophy*.

TURKEY, EMPIRE OF. For general article on Turkey see *Britannica*, Vol. XXIII, pp. 648-657. The latest estimated area and population of Turkey are as follows: Area (including states nominally subject), 1,652,542 square miles: population, 33,360,000, viz.:

| | Square Miles. | Population. |
|-----------------------|---------------|-------------|
| Turkey in Europe..... | 63,850 | 4,790,000 |
| Turkey in Asia..... | 729,170 | 16,133,900 |
| Turkey in Africa..... | 398,873 | 1,000,000 |
| Bulgariat..... | 37,860 | 3,154,375 |
| Bosniat..... | 23,570 | 1,504,091 |
| Samos..... | 210 | 41,156 |
| Egypt..... | 400,000 | 6,817,265 |
| Total..... | 1,653,533 | 33,440,787 |

The estimated populations of the other largest towns are as follows: Adrianople, 100,000; Salonica, 60,000; Monastir, 45,000; Scutari, 30,000; Janina, 20,000; Smyrna, 200,000; Damascus, 200,000; Bagdad, 180,000; Aleppo, 120,000; Erzeroum, 60,000; Kaisarieh, 60,000; Mosul, 45,000; Sana, 50,000; Sivas, 48,000; Mecca, 45,000; Trebizond, 45,000; Adana, 45,000; Diarbekir, 40,000; Broussa, 35,700; Angora, 30,000; Van, 30,000; Jeddah, 30,000; Jerusalem, 28,000; Konieh, 25,000; Chios, 25,000; Bitlis, 25,000; Canea, 15,000; Tripoli, 30,000.

ETHNOLOGICAL STATISTICS. In the European provinces under immediate Turkish rule, Turks (of Finno-Tataric race), Greeks and Albanians are almost equally numerous, and constitute 70 per cent. of the population. Other races represented are Serbs, Bulgarians, Roumanians, Armenians, Magyars, Gypsies, Jews, Circassians. In Asiatic Turkey there is a large Turkish element, with some four million Arabs, besides Greeks, Syrians, Kurds, Circassians, Armenians, Jews and numerous other races. The following are the returns for Constantinople, arranged in order of religious beliefs, viz.:

Mussulmans, 384,910; Greeks, 152,741; Armenians, 149,590; Bulgarians, 4,377; Roman Catholics (native), 6,442; Greek Latins, 1,082; Protestants (native), 819; Jews, 44,361; Foreigners, 129,243. Total, 873,565.

CONSTITUTION AND GOVERNMENT. The legislative and executive authority is, under the supreme authority of the Sultan, exercised by two high dignitaries, the "Sadr-azm," or Grand Vizier, the head of the temporal government, and the "Sheik-ul-Islam," the head of the church.

* Tripoli.

† Including Eastern Roumelia.

‡ Including Herzegovina and Novibazar, a tributary principality.

Both are appointed by the Sultan, the latter with the nominal concurrence of the "Ulema," a body comprising the clergy and chief functionaries of the law, over which the "Sheik-ul-Islam" presides, although he himself does not exercise priestly functions. Connected with the "Ulema" are the "Mufti," the interpreters of the Koran. The Ulema comprise all the great judges, theologians and jurists, and the great teachers of literature and science who may be summoned by the Mufti. The principal civic functionaries bear the titles of Effendi, Bey or Pasha.

Forms of constitution, after the model of the West European States, were drawn up at various periods by successive Ottoman governments, the first of them embodied in the "Hatti-Humayoun" of Sultan Abdul-Medjid, proclaimed Feb. 18, 1856, and the most recent in a decree of Sultan Abdul-Hamid II., of November, 1876. But the carrying out of these projects of reform appears entirely impossible in the present condition of the Ottoman empire.

The Grand Vizier, as head of the government and representative of the sovereign, is president of the Medjliss-i-Hass, or Privy Council, which corresponds to the British Cabinet. The Medjliss-i-Hass consists of the following members, besides the Prime Minister, namely: 1. The Sheik-ul-Islam; 2. The Minister of the Interior; 3. The Minister of Foreign Affairs; 4. The Minister of War; 5. The Minister of Finance; 6. The Minister of Marine; 7. The Minister of Commerce; 8. The Minister of Public Works; 9. The Minister of Justice; 10. The Minister of Public Instruction; 11. The Minister of Evkaf (*foundations pieuses*); 12. The President of the Council of State; 13. The Grand Master of Artillery.

The whole of the empire is divided into vilayets, or governments, and subdivided into sanjaks, or provinces, and kazas, or districts. A vali, or governor-general, who is held to represent the sultan, and is assisted by a provincial council, is placed at the head of each vilayet. The provinces and districts are subjected to inferior authorities, under the superintendence of the principal governor. The division of the country into vilayets has been frequently modified of late for political reasons. All subjects, however humble their origin, are eligible to, and may fill, the highest offices in the state.

Under the capitulations, foreigners residing in Turkey are under the laws of their respective countries, and are amenable for trial (in cases in which Turkish subjects are not concerned), to a tribunal presided over by their consul. Foreigners who own real property, are amenable to the Ottoman civil courts in questions relative to their landed property.

PRESENT REIGNING SULTAN AND FAMILY. Abdul-Hamid II., born Sept. 22, 1842, the second son of Sultan Abdul-Medjid. He succeeded to the throne on the deposition of elder brother, Sultan Murad V., Aug. 31, 1876.

Children of the Sultan.—I. Mehemed-Selim Effendi, born Jan. 11, 1870. II. Zekié Sultana, born Jan. 12, 1871. III. Naïmé Sultana, born Aug. 5, 1876. IV. Abdul-Kadir Effendi, born Feb. 23, 1878. V. Ahmed Effendi, born March 14, 1878. VI. Naïlé Sultana, born 1883. VII. Mehemed Burhaneddin Effendi, born 1885.

Brothers and Sisters of the Sultan.—I. Mohammed Murad Effendi, born Sept. 21, 1840; proclaimed Sultan of Turkey on the deposition of his uncle, Sultan Abdul-Aziz, May 30, 1876; declared by the council of ministers to be suffering from idiocy, and deposed from the throne Aug. 31, 1876. II. Djémilé Sultana, born Aug. 18, 1843; married, June 3, 1858, to Mahmoud-Djelal-Eddin Pasha, son of Ahmet Feti Pasha. III. Mehemed-Reshad Effendi, born Nov. 3, 1844; heir-apparent to the throne. IV. Medihié Sultana, born Nov. 21, 1851; married to the late Mahmud Pasha, son of Halil Pasha. V. Suleiman Effendi, born Nov. 21, 1860. VI. Fehimé Sultana, born Jan. 26, 1861. VII. Wahieddin Effendi, born Jan. 12, 1862.

The present sovereign of Turkey is the thirty-fourth, in male descent, of the house of Othman, the founder of the empire, and the twenty-eighth sultan since the conquest of Constantinople. By the law of succession obeyed in the reigning family, the crown is inherited according to seniority by the male descendants of Othman, sprung from the Imperial Harem. The harem is considered a permanent state institution. All children born in the harem, whether offspring of free women or of slaves, are legitimate and of equal lineage. The sultan is succeeded by his eldest son, but only in case there are no uncles or cousins of greater age.

It has not been the custom of the sultans of Turkey for some centuries to contract regular marriages. The inmates of the harem come, by purchase or free will, mostly from districts beyond the limits of the empire, the majority from Circassia. From among these inmates the sultan designates a certain number, generally seven, to be "Kadyn," or ladies of the palace, the rest, called "Odalik," remaining under them as servants. The superintendent of the harem, always an aged lady of the palace, and bearing the title of "Haznadar-Kadyn," has to keep up intercourse with the outer world through the guard of eunuchs, whose chief, called "Kyzlar-Agassi," has the same rank as the grand vizier, but has the precedence if present on state occasions.

The civil list of the Sultan is variously reported at from one to two millions sterling. To the imperial family belong a great number of crown domains, the income from which contributes to the revenue. The finances of the civil list have of late been put into order, but are still reported to be insufficient to cover the expenditure of the court and harem, numbering altogether over five thousand individuals. The amount charged to the budget of 1880 was P. 62,747,116 for the palace, and P. 23,750,212 for the crown princes. Total, about £785,000, or \$3,925,000.

REVENUES, EXPENDITURES AND NATIONAL DEBT. The revenue for 1889 was estimated at \$92,500,000; expenditures, \$107,000,000. The total national consolidated debt in 1888 was \$450,543,900, drawing about 4 per cent. interest.

ARMY AND NAVY. The standing army in 1891 was composed of 264 battalions of infantry, 189 squadrons of cavalry, 104 batteries field artillery, 36 batteries mountain and 29 battalions garrison artillery, 4 battalions infantry train, 14 battalions of artificers, 3 battalions fire brigade, 22 companies of engineers, 2 sanitary companies, and 1 telegraph company, with a total numerical force of 9,810 officers and 149,000 men

According to the existing system, the army consists of the nizam or regular army, two bans of redif or landwehr, and the mustahfiz or landsturm. Non-Mahomedans are not liable to military service, but have to pay an exemption tax, about six shillings per head per annum, levied alike on males of all ages. Military service is compulsory on all able-bodied Mahomedans who have reached the age of twenty. By the recruiting law of 1887 military service is rendered obligatory for all the Mussulman population of the empire, excepting only Constantinople and its suburbs, which still retains its privilege of exemption from military service.

The conscripts are divided into two classes:

1. Those who can claim no reason for exemption.
2. Those who are infirm, sole supports of families, or who are exempt for various special reasons.

The first class is again divided into two classes, called first and second levies (tertib).

As many men as are required to fill the ranks of the standing army are taken for the first levy, and go through twenty years' service, six with the nizam and first reserve (Ikhtiyats), eight years in the redif, and six in the mustahfiz or landsturm.

The men of the second levy have to undergo six to nine months' drill with a nizam battalion in the first year of their service, and thirty days' drill at their homes in every subsequent year. They are also liable on emergency to be called to join the nizam. Thus all the able-bodied Mahomedan population will receive a fair amount of military training, and it is expected that when the system is in working order, the Ottoman government will be able to put at least 800,000 trained men into the field.

The navy on Jan. 1, 1891, consisted of fifteen large armor-clad ships, a river monitor, two river gun-boats, twenty-seven sea-going torpedo boats, two submarine boats, one torpedo school-ship, two frigates, one spar-decked corvette, eleven dispatch vessels and yachts, and six dispatch boats.

The largest armor-clad ships of the Turkish navy are the two frigates, the Mésoudiyé and the Hamidieh. These two frigates were built on somewhat similar designs, but the Hamidieh is the smaller. The Mésoudiyé is 332 feet long, with extreme breadth of 59 feet. She is constructed on the central battery principle, and has on the main deck a 12-gun battery, 148 feet long, the armor-plates of which are 12 inches thick at, and 10 inches thick above, the water-line. The bow also is strongly fortified, and fitted with a ram of great strength, adapted to pierce an opponent below the armor in the most vulnerable part. Forward, under the fore-castle, were two 6½-ton guns, firing ahead, and under the poop aft was one gun of the same caliber, but these have been removed for smaller Krupp guns.

For the navy of Turkey the crews are raised in the same manner as the land forces, partly by conscription, and partly by voluntary enlistment. The time of service in the navy is twelve years, five in active service, three in the reserve, and four in the redif. The nominal strength of the navy is 6 vice-admirals, 11 rear-admirals, 208 captains, 289 vice-captains, 228 lieutenants, 187 ensigns, and 30,000 sailors, besides 9,460 marines. The budget of 1880 estimates the expenses for the maintenance of the navy at \$81,154,650 piastres.

CUSTOM DUTIES. All articles of import into Turkey are taxed 8 per cent. ad valorem, except tobacco and salt, which are monopolies; there is also an export duty of 1 per cent. on native produce if sent abroad, but of 8 per cent. if sent from one part of the empire to another.

Turkey negotiated in 1890 a new treaty of commerce with Great Britain and some of the other powers, and it proposed removing the export custom duty of 1 per cent., and building bonded warehouses in some of the principal seaport towns of the empire.

Articles destined for schools, churches, embassies, consulates, as well as agricultural machines and the plant for railways are free of duty.

The imports in 1889 aggregated \$87,554,940; the exports, \$61,539,595. The balance of trade, therefore, was against Turkey to the amount of \$26,015,345.

COMMERCE AND SHIPPING. The mercantile navy of the Turkish empire, according to Lloyd's Register, in 1890 consisted of 94 steamers (each of 100 tons or upward) of 71,607 gross tons, and 813 sailing vessels of 158,170 tons.

In 1888-89 (March to February) the Ottoman ports of the Mediterranean and Black Sea were visited by 177,150 vessels of 31,319,354 tons, those of the Red Sea by 3,612 vessels of 435,309 tons, and those of the Persian Gulf by 1,261 vessels of 179,607 tons. Constantinople alone was visited by 36,057 vessels of 11,001,875 tons.

In 1888-89 (March 1 to February 28) 15,819 vessels of 10,460,363 tons entered the Dardanelles; of these 6,444 vessels of 7,034,837 tons were British.

In 1889, 554 vessels of 272,019 tons entered the port of Tripoli.

TURKMANSHAI, a village of Azerbaijan, sixty-five miles southeast of Tabriz, the place where, on Feb. 22, 1828, was concluded the treaty between Persia and Russia, by which the former resigned to the latter the provinces of Erivan and Nakhchevan.

TURNAU, a walled town of Bohemia, circle of Jung-Bunzlau, on the east bank of the Iser, fifty miles northeast of Prague. It has a church, built in 1825, which is reckoned one of the most beautiful in Bohemia. Turnau has manufactories of cotton, woolens, and more particularly of artificial gems, which are exported in great quantities to the United States. Population, 4,700. Here was fought (July, 1866) a battle between the Prussians and Austrians, in which the former were victorious.

TURNER, CHARLES H., member of Congress, born in New Hampshire in 1861. He removed to New York in 1879; was employed for six months on the elevated railroad; drove an ice-wagon for two years; entered the class of 1886 in Columbia College, and pursued a course of two years; after leaving college re-engaged in the ice business, and continued therein till he became a candidate in 1888 for state senator; was a member of Congress from 1889 to 1891.

TURNER, ERASTUS J., member of Congress, born in Pennsylvania in 1846. He attended college at Henry, Illinois, from 1856 to 1860; enlisted in a regiment of Iowa infantry in 1864, and remained till the close of the war; was a student at Adrian College, Michigan, from 1866 to 1868; was admitted to the bar in 1871; removed to Kansas in 1879; was elected a member of the Legislature in

1881 and re-elected in 1883; was elected secretary of the Kansas Board of Railroad Commissioners April 1, 1883, which position he resigned August 1, 1886, to accept the nomination for Congress; was a member of Congress from 1887 to 1891.

TURNER, HENRY G., born in North Carolina March 20, 1839. He was elected to Congress in 1881, and has been continuously re-elected; his present term expires in 1893.

TURNER, SHARON, the Anglo-Saxon historian, born in London, Sept. 24, 1768, died in 1847. After years of hard reading and patient collection of materials he published, 1799-1805, a *History of the Anglo-Saxons*, in three volumes, a work, with all its imperfections, that has given its author a permanent place in English literature. He also wrote numerous other historical works.

TURNPIKE STAIR, a turret stair revolving round a central newel.

TURPIE, DAVID, United States senator, born in Ohio in 1829. He studied law and was admitted to practice at Logansport, Ind., in 1849; was appointed by Governor Wright, whom he succeeded in the Senate, judge of the Court of Common Pleas in 1854, and was judge of the Circuit Court in 1856; in 1853, and also in 1858, he was a member of the Legislature of Indiana; in 1863 was elected a senator to Congress for the unexpired term of Jesse D. Bright, and immediately succeeding Joseph A. Wright, who served by appointment of the governor; was elected a member of the House of Representatives of the General Assembly of Indiana, and served as speaker of that body, 1874-5; in 1878 was appointed one of the three commissioners to revise the laws of Indiana, serving as such three years; in August, 1886, was appointed United States district attorney for the state of Indiana, and served as such until March 3, 1887; was elected to the United States Senate Feb. 2, 1887, and took his seat March 4, 1887. His term of service will expire March 3, 1893.

TURPIN, LOUIS W., member of Congress, was born in Charlottesville, Va., Feb. 22, 1849. He removed to Alabama in 1858; was self-educated. In politics is a Democrat, and was tax assessor of Hale county, Ala., seven years; was elected a representative from the Fourth Congressional District of Alabama to the Fifty-first Congress, but was unseated by the House of Representatives. In 1890, was elected from the same district to the Fifty-second Congress.

TURPIS CAUSA, a phrase in the law of Scotland borrowed from the Roman law, to express an immoral consideration on which some contract or obligation is founded. The rule is, that when an immoral contract is broken, no court of law will assist either party to enforce it.

TUSCALOOSA, a prosperous manufacturing city of Alabama. It has fine water-power, and is the seat of the State University, two female colleges, and several other excellent private schools. Population in 1890, 5,486.

TUSCAN ORDER OF ARCHITECTURE, one of the five classic orders, being a Roman modification of the Doric style with unfluted columns, and without triglyphs. It is the simplest of the orders.

TUSCARORAS, a tribe of North American Indians, who, at the settlement of North Carolina, had fifteen towns on the Tar and Neuse Rivers,

and 1,200 warriors. In 1711 they began a war with the settlers, and after a series of savage encounters were defeated, and joined the Iroquois in New York, where they became allies of the English, and where about fifty families still reside on an Indian Reservation in the western part of the state.

TUSKEGEE, a prosperous town of Alabama, the seat of a female college, an orphans' home, and of the Alabama High School for boys; also of a normal school for colored teachers. Population in 1890, 2,600.

TUTTLINGEN, a town of Württemberg, on the right bank of the Danube, twenty miles southwest of Sigmaringen. It has manufactories of knives, needles, cloth, cotton, hosiery, linen and silk, and carries on some trade in corn. Population, 7,031. Tuttlingen is historically notable as the scene of a battle in 1643, during the Thirty Years' War, in which an Austro-Bavarian force, under Hatzfeld and Mercy, defeated the French.

TUTTY-POWDER, an impure oxide of zinc, found in the chimneys of the furnaces in which the ores of that metal are roasted. It has some value in medicine.

TWILL, a woven fabric, whose warp is raised one thread and depressed two or more threads for the passage of the filling. This gives the structure a curious appearance of diagonal lines.

TWO RIVERS, a town of Wisconsin, on Lake Michigan. It produces a variety of manufactures, principally of wood. Population in 1890, 2,870.

TYBEE, an island and sound at the mouth of the Savannah River, Georgia. The sound is a bay of the Atlantic, extending from Tybee Island on the South to Hilton Head on the north, opening to Port Royal entrance by Cooper's River, Wall's Cut, Lazaretto Creek, and other channels. The island is six miles long by three wide, and was occupied in 1861 by General Sherman, who erected batteries for the reduction of Fort Pulaski, which capitulated April 11, 1862.

TYE, CHRISTOPHER, an English musician of note, born at Westminster in 1500. He was educated in the King's Chapel, and held the office of musical instructor to Edward VI. when Prince of Wales. He received the degree of Musical Doctor from the university of Cambridge in 1545, and from Oxford in 1548. Under Elizabeth, he was organist to the Chapel Royal, and produced various services and anthems, some of which are yet in repute among musicians. Dr. Tye's general scholarship was considerable.

TYLER, a growing town and railroad junction in Smith County, Texas, the seat of the United States and state courts for northeastern Texas. It is an important fruit market. Population in 1890, 6,908.

TYLOR, EDWARD BURNETT, president of the British Anthropological Society, and keeper of the Oxford University Museum, born at Camberwell, 1832, and educated at the school of the Society of Friends, Tottenham. He has greatly distinguished himself by his researches in the history of man and civilization. His best known works are his *Handbook on Anthropology*, and *Primitive Culture: Researches into the Development of Mythology, Philosophy, Religion, Art and Custom*.

TYNDALL, JOHN, born Aug. 21, 1820, at Leighlin Bridge, Carlow, Ireland. He was first

educated at a national school. In 1839 he left school to join the Irish Ordnance Survey. In 1851 he went to Berlin, and continued his researches under Professor Magnus. He soon returned to England, and was elected F. R. S. in 1852. In 1853 he was invited to give a Friday evening discourse at the Royal Institution. He was appointed Professor of Natural Philosophy 1853, but resigned in 1858. It was in 1849 that Professor Tyndall first visited the Alps, purely for the sake of recreation. The result of these visits and his investigations are contained in the *Philosophical Transactions* for 1851, also in his *Glaciers of the Alps*. In 1863 his work, *Heat Considered as a Mode of Motion*, was published, and this at once put him in the forefront as a physicist. In 1866 he relieved Professor Faraday at Trinity House, and on the latter's death succeeded him as superintendent of the Royal Institution. In 1874 he delivered the famous Belfast address as president of the annual meeting of the British Association. A political correspondence took place in the early part of 1890 between Professor Tyndall and Sir W. Harcourt.

TYPEWRITERS. For general article see *Britannica*, Vol. XXIV, pp. 697-8. The archives of the British Patent Office show that the first patent upon a writing machine was granted Jan. 7, 1714, to Henry Mill, a skilled engineer, who died about the year 1770. As no drawings accom-

THE FIRST TYPEWRITER.

panied the specification, the machine cannot now be described. It is believed that it was for embossing letters for the blind. The next invention in this field was a French device for stamping embossed letters upon paper for the use of the blind; it appeared about 1784. Until 1841 there is no record in the English Patent Office of any other writing machines. But from that date a number of devices, all more or less impracticable, made their appearance, and more than a hundred inventions of writing machines have been patented in England, not one of which has done its work in a satisfactory manner.

American records show that, in 1843, Charles Thurber, of Worcester, Mass., took out a patent for a writing machine, followed by an improvement two years later. The Thurber machine wrote, but so slowly that it remained a curiosity and nothing more. The accompanying cut shows its operation. The keys are small steel rods, four inches long, with common types inserted in the lower end, and bearing buttons on the top with the corresponding letters marked on them. The

keys are placed in a vertical position around the rim of a horizontal brass wheel, sixteen inches across, which turns about a central post, and each

SMITH PREMIER.

key-rod is surrounded by a spiral spring, which raises it after it has been pressed down upon the paper.

Mr. A. Ely Beach, now one of the proprietors of the "Scientific American," obtained a patent in 1856 for a machine intended to print embossed letters for the use of the blind. It covered a principle afterward developed into success. All the printing was done at one point, the center of a circle, and the machine was made with type-bars converging as the spokes of a wheel.

Soon afterward Dr. Samuel W. Francis adopted the pianoforte action and arranged his hammers, each with the face of a letter, in a circle, throwing them up as piano-hammers act, each one striking at a common center. A silk ribbon saturated with ink was made to pass under the paper very much as is now done, and was so adjusted as to move with each impression.

THE CRANDALL.

Several other early patents were issued, among them one to Fairbanks, in 1848, and another to Oliver T. Eddy, of Baltimore.

In 1867 a writing machine called "The Type Writer," was patented by C. Latham Sholes, Samuel W. Soulé, and Carlos Glidden, of Milwaukee, Wis. Neither of them knew what had previously been done in the same line, except that Mr. Sholes had seen an article in the "Scientific American," copied from "London Engineering," in which was described a writing machine called the "pterotype," invented by John Pratt, of Centre, Ala.,

but then residing near London, England. The "Scientific American" article was followed by the suggestion that whoever would make a successful writing machine would not only secure a fortune, but would confer a blessing upon mankind. Sholes and Soulé were printers who had been engaged for some time in perfecting a machine for numbering the pages of blank books, and for printing serial numbers on bank notes. Mr. Glidden, who was a man of means, happened to be working at a patent plow in the machine shop frequented by Sholes and Soulé. He took great interest in the paging machine. One day he said to Sholes, "Why can't a machine be made that will write letters and words instead of simply figures?"

When the "Scientific American" article appeared, Mr. Glidden showed it to Sholes, and, Soulé having joined them, the three went to work upon the invention. Soulé suggested pivoted types set in a circle, and Sholes suggested the letter-spacing device. In September, 1867, the first

THE BARLOCK.

machine was finished, and letters written with it were sent to acquaintances and friends.

Mr. James Densmore, then of Meadville, Pa., who received one of these letters, was so impressed by it that by return mail he asked to become interested in the enterprise. In reply he was offered a quarter interest if he would pay all the expenses up to date. He accepted the offer, and when he saw the machine, in March, 1868, he pronounced it good for nothing except to show that the idea was feasible. His faith, however, was unshaken, and Soulé and Glidden having dropped out of the enterprise, he assumed all expenses, and urged Sholes to remedy certain defects which he pointed out. No less than twenty-five or thirty experimental typewriters were made, each one a little better than its predecessor. As fast as finished they were placed in the hands of different experts, among others James O. Clephane, a stenographer of Washington, D. C., who by hard use destroyed one after another till the patience of Sholes was exhausted. But Densmore insisted that as the machine must be made so that anybody could use it, such tests were a blessing and not a misfortune.

Progress was made slowly until in 1873 the machine was taken by E. Remington & Sons, of Ilion, N. Y., when it received the attention of a number of skilled machinists, who put into practical shape much that had been merely suggested by the original inventors. When the machine appeared upon the market, it was first offered chiefly to professional men—lawyers, clergymen and newspaper men; and apparently its greatest field of usefulness, the offices of mercantile houses, was almost overlooked. It was not until 1882 that

its real possibilities became apparent: until then the machine had been, so to speak, on trial. There had been some defects that interfered with its rapid growth and favor. From 1882 until the present time, its history is one long record of suc-

CALIGRAPH.

cesses, abroad as well as at home, and these successes are due perhaps not so much to the fading away of prejudices as to actual improvements in the machine itself.

In the Remington Typewriter the type arms or bars, each bearing a lower-case letter and its corresponding capital, are thrown up by pianoforte lever action. Each impression causes the frame carrying the rollers which hold the paper sheet to move one space. The types are of tempered steel and are practically indestructible. The perfection of its mechanical construction is attested by the immense amount of daily work which the machine does without strain, and by the fact that experts can work the keys so fast as to give clear impres-

THE REMINGTON.

sions of a letter at the rate of thirteen to a second. Among the improvements of recent years have been the introduction of capital and lower-case letters in the same machine without increasing the number of keys—a radical and vast improvement—the strengthening of the machine, the addition of some parts, the elimination of others. The noise made by the old machine has been greatly lessened, and its liability to get out of order reduced.

The most remarkable achievement of the typewriter, the chief reason of its success and popularity, has been the saving of time effected in business offices. According to innumerable tests and to the experience of nine out of ten of our active business houses, the typewriter, as compared with the pen, saves forty minutes an hour, or, to carry out the calculation, five hours and twenty minutes in a business day. In a country like ours, where time means money, it is very easy to estimate how many times the typewriter must pay for itself every year in a busy office. Last summer, in England, Miss Emiline S. Owen, who went over to show Englishmen what could be done with the Remington typewriter, wrote for three minutes at a speed of ninety-nine words a minute, the same matter having been previously written out in long-hand by Mr. Thomas Allen Reed, one of the most rapid longhand writers in the world, at the unprecedented rate of sixty-five words per minute, the best that he could do.

THE NATIONAL.

Mr. E. D. Easton, one of the leading legal stenographers of Washington, in his summary of what the typewriter has done for him, says that in the Guiteau case two operators and machines answered for getting up the copy, one each for an associate reporter and himself. Something like 21,000 folios were transcribed, at a saving over the old method of about four cents per folio, or \$840 in three months. In the Star Route cases, which lasted about a year, there were in the neighborhood of 70,000 folios written. The two machines and operators saved about three thousand dollars.

In a recorded test made in New York city some time ago, Miss M. E. Orr wrote an article containing 384 words from dictation, in the presence of witnesses, in four minutes and twenty-nine seconds, without error. The average was eighty-five words per minute. Others have written at the rate of more than one hundred words per minute. At many public institutions, in the United States, such as the Cooper Institute and the Young Women's Christian Association, in New York city, there are free classes in typewriting. There are over two hundred machines in use in the several business colleges and shorthand schools, for purposes of instruction, in New York city alone. Typewriting is now taught in some of the public schools, and it is, probably, only a question of time when it will be in many of them.

TYPH-FEVER, a term now coming into use to designate continued low fever. The best marked varieties of this affection are known as typhus and typhoid fevers, which in typical cases are easily distinguished from each other, but not infrequently it is difficult to decide whether the disease should be classed as typhus or typhoid fever; hence, the general term typh-fever is a very convenient one

in doubtful cases. All the typh-fevers belong nosologically to the miasmatic order of zymotic diseases.

TYRNAU, a town of Hungary, county of Ober-Neutra, on the River Trna, about thirty miles

northeast of Presburg. It has so many churches and convents that it has been nicknamed "Little Rome." Tyrnau has manufactories of cloth, linen, wood, etc., and a tolerably lively general trade, especially in wine.

U

UEA—ULULATION.

UEA, or **UVEA**, a circle of islets in the South Pacific Ocean. See *Britannica*, Vol. XV, p. 30.

UGANDA, or **BUGANDA**, the largest and most powerful of the East Africa equatorial states. See *Britannica*, Vol. XXIII, pp. 717-18.

The sovereign, who bears the official title of Kabakawa Buganda (Emperor of Uganda) and Overlord of Unyoro, Buzongora, Karagwe, Buzinza, Usoga, etc., is theoretically an autocrat, but his power is restricted by custom and by the Lukiko, a sort of privy council, composed of the Katikiro (chief judge) and the Aba-Saza (great chiefs), who, however, are all appointed by the king himself, as are also the Batongole (court officials), and even the under officers of the five great territorial lords of Lubiro (in the center about the capital), Kyagwe (in the east), Bulemezi (in the northwest), Budu (in the west), and Singo (in the north). Another important functionary is the Gabunga (head admiral), who commands a fleet of several hundred canoes on Lake Victoria. The territorial lords are hereditary feudal chiefs, enjoying almost royal privileges. The revenue is collected by the Basolonzi, or tax-gatherers, chiefly in the form of brass and copper wire, bark cloth, and cowrie shells. The capital, which was at Banda in 1862, has since then been shifted, with the royal caprice, to Rubaga, Nabulagala, and Mungo, which was the royal residence in 1891.

UHLANS, light cavalry of Asiatic origin, introduced into the north of Europe along with the colonies of Tartars who established themselves in Poland and Lithuania. They were mounted on light, active Tartar horses and armed with saber, lance, and, latterly, with pistols. The Prussian Uhlans won great renown in the Franco-German war of 1870-71 by their bravery and marvelous activity. The Prussians applied the term, rather loosely, however, including all their light cavalry, under the designation.

UJEIN, one of the seven sacred cities of Hindustan, in Sindia's dominions, of which it was formerly capital, on the right bank of the Sipra, thirty-five miles northwest of Indore. It is surrounded by walls with round towers, is six miles in circumference, contains the grand palace of the Sindia family, several mosques and mausoleums, an observatory, and an antique gate, supposed to date from before the Christian era. An active trade is carried on in cloths, opium, etc. The number of the inhabitants is not ascertained.

UJHELY-SATORALYA, a market town of Hungary, 105 miles northwest of Pesth. It stands on the Hagyalya Mountains, contains several churches and a gymnasium, and is noted for its wine culture. Population, 7,200.

UKASE, or **UKAS**, a term applied in Russia to all the orders or edicts, legislative or administrative, emanating from the government. The ukases either proceed directly from the emperor, and are

then called *imenny nkas*, or are published as decisions of the directing senate. Both have the force of laws until they are annulled by subsequent decisions.

ULODENDRON, a singular genus of coal-plants, found on stems which occur chiefly in the roof-shales. The stems are covered with small rhomboidal scars, as in *Lepidodendron*, formed by the bases of leaves or scales; but they differ remarkably from that genus in having a double series of large oval or circular markings, arranged linearly on the opposite sides of the trunk. These markings are variously interpreted as representing the cicatrices produced by the bases of cones, by branches, or by leaf-stalks. It is, like many of the coal-fossils, an extremely enigmatical plant; and it is difficult to determine its position in the vegetable kingdom.

ULRIC, ST., bishop of Augsburg, venerated as one of the Fathers of the German Church, born at Augsburg about the year 890; died in 973. His father, Hupald, was one of those counts of Dillingen who play so important a part in mediæval German history. He was educated at the celebrated Benedictine monastery of St. Gall in Switzerland, and returned to his native diocese of Augsburg, where he received holy orders. In accordance with the usage of his times, he made a pilgrimage to Rome, and soon after his return was consecrated bishop of Augsburg, on the death of Hiltine in the year 923. Bishop Uric bore an important part in the public affairs of the empire during the reign of Henry I. and his son Otho; and he was the guiding spirit of the several councils in Germany which, in the tenth century, labored at the work of reformation.

ULSTER BADGE. On the institution of the order of baronets in England by James I., a sinister hand, erect, open and couped at the wrist gules, the armorial ensign of the province of Ulster, was made their distinguishing badge, in respect of the order having been intended for the encouragement of plantations in the province of Ulster.

ULTIMATUM, in diplomacy, the final conditions or terms offered by one government for the settlement of its disputes with another; the most favorable terms which a negotiator is prepared to offer, whose rejection will generally be considered to put an end to negotiation.

ULTIMUS HÆRES, in the law of Scotland, the crown which is the last heir after all the kin have become exhausted, and succeeds to the property of those who die without leaving next of kin, or who, being bastards, have no next of kin.

ULULATION, a howling, or loud lamentation; a wailing. It sometimes happens that articulate sounds or cries which resemble and perhaps imitate those of animals, or are a mere shrieking and howling, form the sole or chief symptom and characteristic of a morbid mental state. The act is

automatic, and may be regarded as indicative of grave changes in the physical and moral nature. In the Middle Ages, during great religious excitement, and those mental epidemics which involved large communities, such phenomena appear to have been of frequent occurrence. It appears that in the eighteenth century, a family of five sisters, in the county of Oxford, were affected with a modification of hysteria, during which they howled or barked like a dog; and that, about the same period, a large religious community of females in France, one and all, and at the same hours, shrieked or howled like cats; and were only reduced to sobriety and to silence by the presence of military.

ULUNDA, or LUNDA, a native feudal state of Africa, the largest and most populous empire in the Congo basin, comprising most of the territory lying between the Kwango and Kasai. Its ruler bears the official title of Muata Yanvo, and is the fourteenth in descent from the founder of the dynasty in the seventeenth century. He is the suzerain of about 300 monas and muenes, that is, vassal chiefs and kinglets, who pay tribute in kind—ivory, lion and leopard skins, corn, cloth, salt, etc.—so long as the central power is strong enough to enforce it. Its present area cannot be estimated at much less than 100,000 square miles, with a population perhaps not exceeding 2,000,000.

The succession goes to one of the sons of the two chief wives, chosen by four official electors and confirmed by the Lukoshesha, or "Mother of the Kings and Peoples." The Lukoshesha, whose election is made in the same way from the daughters of the two chief wives, and ratified by the king, is exempt from his jurisdiction and "above all law," holding her own court, ruling over her own territories, and enjoying independent tribute.

The *Mussamba*, or royal residence, is displaced at every succession, within a certain limit. The dominant people in the empire are the Ka-Lunda, a negroid race of Bantu speech. They import woven goods and ironware from the south, and copperware from the southeast, and have also long had dealings with the Portuguese half-breeds from the west and the Arab slave-hunters from the east. The chief exports are ivory and slaves. But trade languishes, being regarded as a royal monopoly, and burdened with many restrictions.

ULUNDA, or LUNDA, a territory of Africa, in the Lake Moero district, which about the middle of this century was ruled over by the powerful Muata Kazembe, heir of the Morupwe dynasty, the most potent in South Central Africa during the sixteenth century. The present Muata Kazembe retains a mere semblance of authority, and is now the vassal of Msidi (Msiri), founder of the new kingdom of Garenganze (Katanga), in the region between the Luapula and Lualaba, head streams of the Congo within the limits of the Congo Free State, and continuous southward with British Zambesia (Barokeland and Mashukulumbweland).

UM, a Kaffir or Zulu word signifying river, and used as a prefix in the names of most of the rivers on the southeast coast of Africa, from the Great Kei, where the names of Hottentot origin appear to cease, nearly as far to the northeast as the Sofala coast, where the names Imhambane, Imbampoor, have the same prefix in a corrupted state. The Hottentot word Kei has the same meaning, and is still preserved in the Kei and

Keiskamma rivers, and other streams on the east coast of the Cape Colony.

UMBILICAL CORD. In botany, the connecting link between the placenta of the ovary and the ovule, through which pass the vessels that nourish the ovule until it ripens into seed. In some plants the ovules are so closely connected with the placenta that no umbilical cord can be said to exist; in others it is of considerable length.

UMBRELLA TREE. A small magnolia tree (*Magnolia umbrellata*), whose large leaves are crowded on the summit of the flowering branches in umbrella-like circles. Its range is from south-east Pennsylvania along the Alleghenies to central Alabama, and westward through Kentucky and Tennessee to northeast Mississippi. It also occurs in Arkansas. Like all the magnolias it is a handsome tree, bearing large, white, highly-scented flowers, and a rose-colored fruit.

UMPIRE. In law, a third person appointed by two arbitrators in the event of their differing in opinion. When the reference or arbitration has devolved upon the umpire, his award or umpirage becomes final and binding upon the parties.

UNALASHKA, an island belonging to the United States, in the North Pacific, one of the Fox Islands, in lat. 55° 52' N., and 166° 32' W. It is seventy-five miles long, and in some parts twenty miles broad, has a rugged, mountainous surface, and is thinly peopled. Ships are here supplied with all necessaries except wood.

UNDINES, the name given, in the fanciful system of the Paracelsists, to the elementary spirits of the water. They are of the female sex. Among all the different orders of elementary spirits, they intermarry most readily with human beings. Baron de la Motte Fouque has made this Paracelsist fancy the basis of an exquisite tale, entitled *Undine*.

UNION, or TOKELAU, a group of three clusters of islets in the Pacific Ocean. The principal are: Fakaapo or Bowditch, Mikubimo or Duke of Clarence, and Atafu or Duke of York. They lie between 8° 30' and 11° S. lat., and 171° and 172° W. long. The group, which has been annexed to Great Britain, is of importance, chiefly, as a stage in the proposed telegraph route between British Columbia and Australia, and as a coaling station for steamers along the same route.

UNION CITY, a town of Pennsylvania, about twenty-two miles southeast of Erie. It has manufacturing of leather, flour, barrels, furniture and carriages, and contains an extensive oil refinery. Population in 1890, 2,255.

UNION COLLEGE, a college in Schenectady, N. Y., incorporated in 1795, chiefly by the efforts of General Philip Schuyler. It was named Union from its being established by the coöperation of several religious denominations. Its first president was John Blair Smith of Philadelphia, who was succeeded in 1799 by Jonathan Edwards, the younger; but its great prosperity and usefulness were secured under the presidency of Rev. Eliphalet Nott, from 1804 until his death in 1866. By his zeal, enterprise, and large benefactions, it was endowed and furnished with spacious buildings, a large library, and extensive cabinets of natural history. Dr. Nott was succeeded by Dr. Laurens P. Hickok, the distinguished metaphysician. In 1869, Dr. Aiken of Princeton was called

to the presidency. He resigned in 1871, when Dr. Eliphalet N. Potter, son of Bishop Alonzo Potter, and grandson of Dr. Nott, was made president. Under his administration the institution increased in funds and students. In its general aims it has been greatly enlarged by a connection with the Law and Medical Colleges at Albany, and, together with them, bears the name of Union University, of which the president of Union College is the chancellor. President Potter resigned in 1884, and Hon. J. S. Landon was appointed president *ad interim*. Harrison Edward Webster, LL.D., was elected president in 1888.

UNIONTOWN, a borough, the county-seat of Fayette county, Pa. It manufactures cement and woolen goods. Population in 1890, 6,358.

UNITED LABOR PARTY, a political organization which grew out of the Central Labor Union in New York city. This union was established in 1881-82. In 1886 it appointed a com-

mittee to prepare a plan of political action. On Sept. 23, a city convention was held, at which 176 labor organizations were represented. It nominated Henry George as mayor and adopted his doctrine of nationalizing all the land in the United States. In the mayoralty contest George was defeated, Abram S. Hewitt being elected.

The state convention of the United Labor Party at Syracuse, N. Y., nominated George for secretary of state, and also resolved in favor of many measures of particular importance to laboring men, as fewer hours of work, free schools, etc. In the election of November, 1887, George was again defeated. In October, 1888, the party nominated James J. Coogan for mayor of New York city. He obtained a much smaller vote than George ever did. This sudden dwindling in numbers showed that the United Labor Party has no real bond of coherence, and that it cannot maintain its existence as a factor in city or state politics.

UNITED STATES OF AMERICA

For general article on the United States see *Britannica*, Vol. XXIII, pp. 729-830. The article is so elaborate and comprehensive—covering the history, constitution and government, geography, topography, productions and statistics down to 1888—that in these Revisions and Additions, it is required that such supplementary matter shall be given as may be needed to bring the record down to the latest possible date, and also to furnish such epitomized historic, political, and statistical information as may be found most convenient and helpful.

TERRITORY OF UNITED STATES IN 1776.

An examination of the map of the United States in the year 1776 shows the boundaries of tracts of territory as follows:

At the northeast, but south of the river St. Lawrence, Massachusetts begins with the former Sagadahoc Territory and Province of Maine, continues over its present area to New York, while, westward of Pennsylvania, broadening from the latitude of its present southern boundary to that of Lake Winnipiseogee in New Hampshire, it reaches a western limit on the Mississippi River.

New York has its present area, and north of Massachusetts has a boundary on New Hampshire which extends between New York and the north-eastern spur of Massachusetts.

Rhode Island appears as on the maps of to-day.

Connecticut has its present area, while beyond Pennsylvania it extends to the Mississippi River.

Pennsylvania has no corner, as now, between New York and Lake Erie.

New Jersey, Delaware, and Maryland, present forms familiar to modern maps.

Virginia reaches to the Mississippi River, and northward to the western territory of Connecticut.

North Carolina and Georgia in full width, and South Carolina in a narrow belt, unfold the land to the common Western River.

On the south of Georgia peninsula, East Florida tends westward to the river Appalachicola, and West Florida asserts a disputed northern limit at the parallel of the mouth of the Yazoo River in the west land of Georgia.

Quebec, reaching southward over the southern trapping-grounds of the Hudson's Bay Company and over the western lands of Massachusetts, Connecticut, and Virginia, claims to cover the whole territory between the Ohio and Mississippi rivers and the great lakes.

Between the Mississippi River and the Stony Mountains lies Louisiana, a Spanish dependency.

Beyond, to the Pacific, stretches the vast expanse of the older Spanish America.

At the extreme northwest there points toward the opposing continent a peninsula whose forbidding coast has been hitherto but a few times visited by European navigators.

ORIGINAL PUBLIC LAND OF THE UNITED STATES.

The Confederation asserted jurisdiction over all of that portion of the present territory of the United States east of the Mississippi River, from the present British possessions on the north, to Florida on the south. The concessions from the States to the Confederation, divided this region into two distinctive portions: one along the coast, whose

soil was so vested in the 13 States in severalty, another, inland, whose soil and exclusive jurisdiction were possessed by the Confederacy.

These States and Federal domains were separated by an irregular line along the present western boundaries of the States of New York, Pennsylvania, West Virginia, North Carolina, and Georgia. Westward of this line, and separated into two parcels by the territory of the present State of Kentucky, lay the original *public domain* of the young Confederation, comprising 406,952 square miles, while the aggregate area of the 13 States was but 420,802 square miles.

ORIGINAL TERRITORIAL GOVERNMENT.

Plans for the erection of governments on this domain early engaged the attention of the Congress of the Confederacy. Coincident with the cession by Virginia, Jefferson, its delegate in Congress, anticipating prompt cessions from the remaining States, reported from a committee a plan of government for the whole public territory. This plan required seventeen new States, each covering about two degrees of latitude, arranged in two tiers separated by meridians, each tier containing eight States, the 17th State to be east of the eastern tier and between the Ohio River and the western boundary of Pennsylvania.

The famous proviso was included in this report, and read as follows: "After the year 1800 there shall be neither slavery nor involuntary servitude in any of the said States other than in the punishment of crimes whereof the party shall be duly convicted."

When the proviso was put to vote three States were unrepresented; three, Maryland, Virginia, and South Carolina, voted *nay*; North Carolina was divided; the four New England States, with New York and Pennsylvania, voted *aye*. Failing to receive the additional vote necessary to complete a majority, the proviso was stricken out of the report, and the report thus amended was adopted. This ordinance was in no instance applied in the erection of a government.

Again (July 13, 1787), soon after the region northwest of the Ohio River had been transferred to the Confederation by the cessions of New York, Virginia, Massachusetts, and Connecticut, another ordinance was enacted, erecting "the territory northwest of the Ohio River." To this ordinance were appended six articles, the last of which provided for the future formation, on the land within the territory, of "not less than three nor more than five States," as follows: the western State between the Mississippi, Ohio, and Wabash Rivers and a north line from Port Vincent, on the latter river, to British territory; the middle State between the last recited line, the Ohio River, and a north line from the mouth of the Great Miami to the border line; the eastern State, between the last described line, the Ohio River, the State of Pennsylvania, and the national boundary.

Authority was reserved to create two States in that part of the territory north of the latitudinal parallel of the southern extremity of Lake Michigan. It will be noted that the meridional boundaries between those projecting States, which were plotted on the river Ohio, now separate the States of Illinois, Indiana, and Ohio, while the northern part of the original territory has included the en-

ture States of Michigan and Wisconsin and furnished part of the territory of the State of Minnesota.

Article VI, of the Ordinance of 1787, was as follows:

"There shall be neither slavery nor involuntary servitude in the said territory otherwise than in punishment of crimes whereof the party shall have been duly convicted: Provided, always, that any person escaping into the same, from whom labor or service is lawfully claimed in any one of the original States, such fugitive may be lawfully reclaimed and conveyed to the person claiming his or her labor or service, as aforesaid."

This inhibition of slavery, save that it was immediate, is in the very terms of the defeated proviso in the first, or Jeffersonian project.

At the submission of this ordinance to vote eight States were represented in Congress, and all voted for the measure. The passage of the article was possibly secured by the appendix of the proviso respecting the return of fugitives from slavery, and by the tacit understanding that slavery would be permitted in the public domain south of the Ohio River.

ORIGINAL AREA OF THE UNITED STATES.

Meanwhile, and prior to the last two of the cessions by the States, the independence of the States forming the Confederacy had been recognized by Great Britain in the Provisional Treaty of Peace signed at Paris, Nov. 30, 1782, and in the definite Treaty of Peace between Great Britain and the United States, concluded at Paris, Sept. 3, 1783. By the second article of the treaty the boundaries of the territory of the United States were declared.

In substance, they ran from the mouth of the St. Croix River to its head and thence due north, from the source of the St. Croix River, to the Highlands; along the said Highlands which divide those rivers that empty themselves in the river St. Lawrence from those which fall into the Atlantic Ocean, to the northwesternmost head of the Connecticut River, and down that river to and westward along the 45th parallel to and along the middle of the Ontario, Erie, Huron, Superior, and Long Lakes, and their water connections, "to the most northwestern point of the Lake of the Woods, and thence, on a due west course, to the river Mississippi;" thence, down the middle of that river to and along the 31st parallel, to and along the middle of the river Appalachicola to its junction with the Flint River, and thence straight to the head of and down the River St. Mary's to the Atlantic Ocean, and included all islands within 20 leagues of the Atlantic coast.

The western and southern boundaries of this original area of the United States were confirmed by treaty with Spain, the contiguous owner, Oct. 27, 1795. The northern line was the subject of protracted and difficult negotiations with Great Britain. The Treaty of London, Nov. 19, 1794, included provisions for determining the river St. Croix and its source and the source of the Mississippi River.

By treaty of Ghent, Dec. 24, 1814, three Commissions were authorized: one to settle the title to islands off the coast of Maine; another to determine the boundary from the source of the river St. Croix to the river St. Lawrence; and a third to lay the line from the river St. Lawrence to the western point of Lake Huron, and also, as a separate duty, thence to the most northwestern water of the Lake of the woods.

The first Commission, Nov. 24, 1807, awarded Moose, Dudley, and Frederick Islands to the United States, and all other islands in Passamaquoddy

Bay, and also the Isle of Grand Menan, to Great Britain.

The third Commission defined their portion of the boundary line in their decision dated at Utica, New York, June 18, 1822.

The second Commission failed to agree, and, after repeated attempts, all disputes affecting this boundary of the Treaty of 1783 were adjusted by the Webster-Ashburton Treaty, of Washington, August 9, 1842, where may be found designated the present line from the Atlantic Ocean to the St. Lawrence River, and from the western terminus of the work of the Utica Commission to the westernmost water of the Lake of the Woods, and thence, confirming the Treaty of Oct. 20, 1818, due south to the 49th parallel.

It will be seen that the United States commenced its career as an acknowledged government with the landed area which it now possesses east of the Mississippi River and north of the State of Florida and, westward of that State, north of the 31st parallel, being an extent of 827,844 square miles.

CESSION BY FOREIGN POWERS TO THE UNITED STATES.

The French Cession.—Spain having held during 37 years the Province of Louisiana, which she had received (1763) from France, receded it Oct. 1, 1800, to France, and France, April 30, 1803, ceded it to the United States.

After this accession negotiations with Great Britain were begun to determine its northern boundary. In 1807 an agreement was reached, but not formally perfected, and, the war of 1812 intervening, the settlement of the boundary was deferred to Oct. 20, 1818, when, by convention, it was extended from the northwestern point of the Lake of the Woods to and along the 49th parallel to the Stony (Rocky) Mountains. The line was extended no farther westward, among other reasons, in order that no offense might be given to Spain, which asserted title by discovery to the whole Pacific slope of the continent. Yet it was agreed, to prevent collisions, and without prejudice to the claims of the parties or of outside powers, that any country claimed by either party to the convention should be free to both parties during ten years.

The part of the eastern boundary of this cession, on the Mississippi River as far south as the 31st parallel and its southeastern boundary on the Gulf of Mexico, were undisputed. But the remainder of the eastern and the whole of the western boundary was in controversy between the United States and Spain, and the western limit at the north, as asserted by France and maintained by the United States and Spain.

The western limit at the north, as asserted by France and maintained by the United States, was the Pacific Ocean. Spain, however, claimed title, by prior discovery on the northwestern coast, as far eastward as the Rocky Mountains; and held that, as against such discovery, the title of France rested solely on discovery and exploration of the Mississippi River, covered no more than the basin drained by that river and its tributaries, and consequently ended westerly at the Rocky Mountains.

At the southwest the United States maintained an extent of the French cession, including the country east of the Rio Grande. But Spain having long kept a line of garrisons in that region, held the French territory to have been bounded by the Sabine River.

These conflicting demands were satisfied by treaty at Washington, Feb. 22, 1819. By this

authority the border line between Spanish possessions in the southwest and the territory of the United States ran from the Gulf of Mexico up the western bank of the Sabine River to the 31st parallel of north latitude, thence north to and along the Red River, to and along the 23d meridian (100th Greenwich), to and along the southern bank of the Arkansas River to its source, and thence due north to and along the 42d degree of north latitude to the Pacific Ocean. This line in this discussion will be regarded as having been the southwestern boundary of the Province of Louisiana.

On the east the Treaty of 1763 had confined the French cession to the Mississippi River as far south as the 31st parallel, whence eastward various boundaries have been asserted.*

Under the construction of the cession adopted by the United States, the Province of Louisiana is now covered by those portions of the States of Alabama and Mississippi which lie south of the 31st parallel by the entire States of Louisiana, Arkansas, Missouri, Iowa, Nebraska, and Oregon, and by that part of the State of Minnesota west of the Mississippi River, and all that part of the State of Kansas on the north of the Arkansas River and east of the 23d meridian (100th Greenwich); by the Dakotas, Washington, Idaho, and Montana, the part of Colorado east of the Rocky Mountains and north of the Arkansas River, by that part of Wyoming north of the 42d parallel and east of the meridian of the source of the River Arkansas, and by what is known as the Indian Country.

This accession of area for which the United States paid, in principal and interest, more than \$23,500,000, added (adopting the United States view of the cession) 1,171,931 square miles to the public domain, extended the United States from ocean to ocean, and completed its possession of the central river and basin of the continent.

The Spanish Cession.—The next addition to the area of the United States was contributed by Spain. At the time of the conclusion of the definitive treaty of peace between the United States and Great Britain (Sept. 3, 1783), Great Britain ceded to Spain the Provinces of East and West Florida without definition of their boundaries. Hence arose two opponent constructions of the treaty, affecting the Province of West Florida. Great Britain held the northern boundary of the province which she ceded to be the 31st parallel from the Appalachicola to the Mississippi River, and by a simultaneous treaty acknowledged the territory north of that parallel to belong to the United States, which government also adhered to a boundary on the 31st parallel.

In opposition, Spain claimed that, by the treaty, the province of West Florida was ceded, and that

on the day of the treaty the province remained as extended May 15, 1767, by Great Britain, including the same rivers as bounded the original province and northward from the 31st parallel to that of the mouth of the Yazoo River. This country Spain took into possession and held until, by authority of joint resolution of Congress, Jan. 15, 1811, and acts of the same date and of March 3, 1811, passed in secret session and first published in 1818, the United States took it into possession.

On Feb. 22, 1819, the controversy was ended by the treaty of Washington, whereby Spain ceded to the United States its provinces of East and West Florida. In accordance with the construction maintained by the United States respecting the southeastern limit of the French cession and the northern limit of the Spanish cession, the latter added the territory of the present State of Florida, 59,268 square miles, to the area of the United States at a cost of nearly six and one-half millions of dollars. By the same treaty Spain agreed to that line between her western American possessions and the United States which has herein been adopted as the southwestern boundary of the French cession, and ceded to the United States all her claims to any territory east or north of that line.

After this cession by Spain, Great Britain and the United States had only their own rights to consider in the settlement of the northwestern boundary. Hitherto the line had rested on the 49th parallel of north latitude at the Rocky Mountains. By article 1, of the treaty of 1846, it was stipulated that the boundary should be extended from the Rocky Mountains westward along the same (49th) parallel "to the middle of the channel which separates the continent from Vancouver's Land, and thence southerly through the middle of said channel and of Fuca's Strait to the Pacific Ocean." The British government claimed that the "channel" of this article of the treaty is the so-called Straits of Rosario. The United States maintained it to be the Canal de Haro. The question was submitted to the arbitrament of William I, Emperor of Germany, who gave decision Oct. 21, 1872, in favor of the Canal de Haro. Thus it required nearly ninety years for the national boundary at the North to traverse the continent.

The Texan Annexation.—The next expansion of the limits of the United States was southwestward. The United Mexican States, having achieved their independence of Spain, under the treaty at Cordova, Feb. 24, 1821, by treaty of Mexico, Jan. 12, 1828, ratified that boundary with the United States of America which had been acknowledged (1819) by Spain, when possessed of their territory.

Subsequently the people of "Texas and Coahuila," one of the United States of Mexico, revolted from the authority of that republic, and in convention, March 2, 1836, declared the independent Republic of Texas. By an act of the legislature of that Republic, passed Dec. 19, 1836, its boundaries were declared to be on the north and east of the old line settled (1819) by the United States and Spain, and on the south and west from the mouth of the river Sabine and three leagues from the coast to the mouth of and up the Rio Grande to its source, and thence due north to the 42d parallel of north latitude. By joint resolution of March 3, 1837, the United States of America acknowledged the independence of the Republic of Texas; by joint resolution of Dec. 29, 1845, the republic, with the limits just now recited, was declared to be one of the United States of America. This was an annexation of 376,163 square miles of territory, making the total area of the United States 2,435,176 square miles.

*The United States construed the cession of France (1803) to include all the region between the 31st parallel and the Gulf of Mexico, and between the Mississippi River, and the Perdido River, now the western boundary of the State of Florida.

The ground of this construction seems to have been the original Province of Louisiana extended eastward to the Perdido, and that if France, as its cession to Spain, had not actual possession, it yet had a possessory right reaching to the Perdido, which it ceded to Spain, (1763), which Spain re-ceded to France (1800), and which France (1803), ceded to the United States. On the other hand Spain asserted that Louisiana had its boundary at the south-east as expressed in the Treaty of 1763 between Great Britain and France, namely, "The River Iberville and Lake Maurepas and Poutchartrain," the waters skirting the so-called "Island of New Orleans" westerly and southerly from the river Mississippi to the Gulf of Mexico, and that the successive transfers had carried that province with that eastern boundary into the possession of the United States. Under this construction of the cession of 1803 it embraced, east of the Mississippi only the small "Island of New Orleans."

The Mexican Cessions.—The old Spanish provinces of Texas and Coahuila were separated by the river Nueces. At the institution of the Mexican Republic these provinces were united as the State of "Texas and of Coahuila." The river Nueces was, however, still regarded as the future boundary between the probable separate States of Texas and Coahuila as contemplated by the Constitution of the United Mexican States.

On the annexation of the Republic of Texas to the United States of America, Mexico insisted that Texas only—and not Coahuila—had revolted, and consequently that its proper western boundary lay on the river Nueces.

On the contrary, the Texan Republic has asserted a wider revolt and the western boundary on the Rio Grande. The United States annexed Texas as bounded on the west by the Rio Grande, and maintained that boundary.

The ensuing war was concluded by a treaty (Feb. 2, 1848), wherein the United States of Mexico ceded to the United States of America all claims to the area asserted by the former Republic of Texas, and to the vast tract of land west of the Rio Grande, and of a meridian from its source to the 42d parallel of north latitude south of that parallel, east of the Pacific Ocean, and north of the present boundary of the United States, excepting the Mesilla Valley south of the river Gila.

The latter territory, known as "The Gadsden* Purchase," was ceded by Mexico, Dec. 30, 1853.

The money consideration passing from the United States for the first Mexican cession was \$15,000,000, and for the second cession, \$10,000,000. The first cession (exclusive of the "Texan annexation") added 545,783 square miles, and the second cession, 45,535 square miles, to the area of the United States, and increased it to an aggregate of 3,026,494 square miles.

The Russian Cession.—Russia, by treaty of March 30, 1867, ratified June 20, 1867, for consideration of \$7,200,000, ceded her territory in America, which has been named Alaska.†

Alaska is separated from the main territory of the United States by that western part of the British possessions which lies between the parallels of 54 degrees 40 minutes and 49 degrees north latitude, its southernmost point being nearly four hundred miles distant from the northern boundary of Washington. Its area is estimated at 577,390 square miles.

TERRITORIAL CESSIONS BY THE SEVERAL STATES.

When the Confederation was formed by the original thirteen colonies the cessions of their ter-

ritory (shown on the map, and authorized by the articles of agreement) were not immediately made. Congress in an address, dated April 18, 1783, and later by resolution, dated April 29, 1784, urged that they be made speedily, as a source of common revenue and for the promotion of harmony between the States. The following is a chronological historic outline of the dates when the States severally acceded to the request of Congress:

New York authorized a cession in Feb. 1780, and executed it March 1, 1781. It was renewed by deed, April 19, 1785. The claims ceded were titles acquired by treaties with the six Nations of Indians, and covered the whole territory from the lower of the Great Lakes southward across the valley of the river Ohio as far as the Cumberland Mountains. Oct. 29, 1782, the cession was accepted by the United States.

Virginia offered to cede, by Act of Jan. 2, 1781; Congress, by Act of Sept. 13, 1783, agreed to accept the cession as offered. Thereupon Virginia, by Act of Nov. 20, 1783, authorized its delegates in Congress to complete the transfer, which was done by deed, March 1, 1784. The deed conveyed all the title and claims of the State of Virginia to territory northwest of the Ohio River. Virginia, by virtue of conquest of her militia, asserted titles as far north as Lake Erie and Michigan, but due recognition of the ancient charter boundary of the Colony of Connecticut places the northern limit of the cession on the 41st parallel of north latitude, and permits it to comprise only those parts of the States of Ohio, Indiana, and Illinois situated south of that parallel.

Massachusetts, Nov. 13, 1784, authorized a cession by her delegates in Congress; April 18, 1785, Congress agreed to accept the cession, and April 19, 1785, it was executed. It included all title of the State of Massachusetts to territory west of the present western boundary of the State of New York, and covered the land from the State of Pennsylvania to the Mississippi River, and giving the full extent of the first charter of the colony between the latitude of the southern boundary of the western extremity of the present State of Massachusetts and the latitude of a league north of the inflow of Lake Winnipiseogee in the State of New Hampshire.

Connecticut, Oct. 10, 1780, having offered to cede with restrictions which were unsatisfactory to the United States, on the second Thursday of May, 1786, again authorized a cession; May 26, 1786, Congress expressed readiness to accept the cession as proposed, and Sept. 14, 1786, the cession was accomplished by the execution of a deed and its acceptance by Congress. This cession embraced the soil and jurisdiction of the territory east of the river Mississippi, between the latitudinal parallels of 41 degrees and 42 degrees 2 minutes, and west of a meridian one hundred and twenty miles west of the present western limit of the State of Pennsylvania. Connecticut, by Act of Oct., 1797, authorized the release to the United States of jurisdiction over the land between the eastern boundary of her former cession and the present western boundary of the State of Pennsylvania. This transfer was consummated May 30, 1800. The State retained the right of soil in the same territory, which lying in the present State of Ohio between 41 degrees and 42 degrees 2 minutes, and reaching from the western boundary of the State of Pennsylvania westward one hundred and twenty miles, has ever since been known as "The Western Reserve of Connecticut." In 1792 the State conveyed five hundred thousand acres in the western part of this reserve to certain of its citizens as compensation for their

* So called after Gen. James Gadsden, United States Minister to Mexico.

† On the east this cession has limit on the line which by treaty between Great Britain and Russia (1825) separated their territory. It begins at the southernmost point of Prince of Wales Island, which is on the parallel of 54 degrees 40 minutes, runs northward along Portland Channel to the junction of the 56th parallel of north latitude with the continent, and thence along the summits of the mountains parallel to the coast to and along the 141st meridian to the Arctic Ocean. But where the crest of the mountains skirting the coast from the specified parallel to the meridian is more than ten marine leagues from the ocean, there the boundary is a line not more than ten marine leagues from the coast and parallel to its windings. The remainder of the boundary of this Russian cession originated in the treaty by which the cession was made. It commences in the Arctic Ocean on the 64th meridian of west longitude (141st Greenwich), descends Bering Straits midway between the islands of Krusenstern and Radmanov to 65 degrees 35 minutes (142 degrees 30 minutes Greenwich), just south of the nearest points of Asia and America, continues between the Island of St. Lawrence and Cape Chonkotski to the 95th meridian (172d Greenwich), thence midway between Attou and Copper Islands to 116 degrees (167 east longitude from Greenwich), and thence coastwise to include the Aleutian Isles.

property destroyed by fire and pillage during the Revolution. Sept. 9, 1795, the State alienated the remainder of this reserve for \$1,200,000. This sum was appropriated as a fund whose annual interest is pledged to the support of schools.

South Carolina, August 19, 1787, by her delegates in Congress, authorized by a previous Act of the State Legislature, executed a deed of cession which the United States accepted by Act of April 2, 1790. The deed conveyed the area of the present State of Tennessee.

North Carolina, by Act of Dec. 22, 1789, authorized a cession which was accepted April 2, 1790. The deed conveyed the area of the present State of Tennessee.

Georgia, by articles of agreement, dated April 24, 1802, ceded to the United States her claims to the whole territory between her western boundary and the Mississippi River; while the United States at the same time ceded to Georgia all of that portion of South Carolina cession lying eastward of the western boundary of Georgia. This cession conveyed all the land now in the States of Alabama and Mississippi, except the portion along the northern boundaries which was included in the South Carolina cession.

The agreement included, among others, provisions for: 1st, payment, out of proceeds from the sale of the land in the cession, of \$1,250,000 to the State of Georgia as a reimbursement of its expenses in relation to the territory ceded; 2nd, the appropriation of 500,000 acres, or the proceeds of at most that quantity of land, to satisfy the claims against the lands of the cession; and 3d, extinguishment of the Indian title to specified parts of the cession. It resulted that the United States, in addition to the cession to Georgia, paid not far from \$3,000,000 for this cession from Georgia.

DECLARATION OF INDEPENDENCE.

The following is the full text of the world-renowned *Declaration of Independence*, adopted by the Continental Congress, in session in Independence Hall, Philadelphia, Pa., July 4, 1776. The resolution in favor of Independence was adopted July 2, 1776. It was then placed in the hands of a committee, of whom Thomas Jefferson was chairman, who duly formulated and engrossed the document which was finally read, unanimously approved, and adopted on July 4, 1776:

IN CONGRESS, July 4, 1776.

The Unanimous Declaration of the Thirteen United States of America.

When, in the course of human events, it becomes necessary for one people to dissolve the political bands which have connected them with another, and to assume among the powers of the earth the separate and equal station to which the laws of nature and of nature's God entitle them, a decent respect to the opinions of mankind requires that they should declare the causes which impel them to the separation.

We hold these truths to be self-evident—that all men are created equal: that they are endowed by their Creator with certain unalienable rights; that among these are life, liberty, and the pursuit of happiness. That to secure these rights, governments are instituted among men, deriving their just powers from the consent of the governed; that when any form of government becomes destructive to these ends, it is the right of the people to alter or to abolish it, and to institute a new government, laying its foundation on such principles, and organizing its powers in such form, as to them shall seem most likely to effect their safety and happiness. Prudence, indeed, will dictate that governments long established should not be changed for light and transient causes; and accordingly, all experience hath shown that mankind are more disposed to suffer, while evils are sufferable, than to right themselves by abolishing the forms to which they are accustomed. But when a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them under absolute despotism, it is their right, it is their duty, to throw off such government, and to provide new guards for their future security. Such has been the patient sufferance of these colonies, and such is now the necessity which constrains them to alter their former systems of government. The history of the present king of

Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute tyranny over these States. To prove this, let facts be submitted to a candid world.

He has refused his assent to laws, the most wholesome and necessary for the public good.

He has forbidden his governors to pass laws of immediate and pressing importance, unless suspended in their operation till his assent should be obtained; and, when so suspended, he has utterly neglected to attend to them.

He has refused to pass other laws, for the accommodation of large districts of people, unless those people would relinquish the right of representation in the legislature—a right inestimable to them, and formidable to tyrants only.

He has called together legislative bodies at places unusual, uncomfortable, and distant from the depository of their public records, for the sole purpose of fatiguing them into compliance with his measures.

He has dissolved representative houses repeatedly, for opposing, with manly firmness, his invasions on the rights of the people.

He has refused, for a long time after such dissolutions, to cause others to be elected; whereby the legislative powers, incapable of annihilation, have returned to the people at large, for their exercise; the state remaining, in the mean time, exposed to all the danger of invasion from without and convulsions within.

He has endeavored to prevent the population of these States; for that purpose obstructing the laws of naturalization of foreigners; refusing to pass others to encourage their migration hither, and raising the conditions of new appropriations of lands.

He has obstructed the administration of justice by refusing his assent to laws for establishing judiciary power.

He has made judges depend on his will alone for the tenure of their offices, and the amount and payment of their salaries.

He has erected a multitude of new offices, and sent hither swarms of officers to harass our people and eat out their substance.

He has kept among us in times of peace standing armies without the consent of our legislature.

He has affected to render the military independent of, and superior to, the civil power.

He has combined with others to subject us to a jurisdiction foreign to our constitution and unacknowledged by our laws; giving his assent to their acts of pretended legislation.

For quartering large bodies of armed troops among us:

For protecting them, by a mock trial, from punishment for any murders which they should commit on the inhabitants of these States:

For cutting off our trade with all parts of the world:

For imposing taxes on us without our consent:

For depriving us, in many cases, of the benefits of trial by jury:

For transporting us beyond the seas, to be tried for pretended offenses:

For abolishing the free system of English laws in a neighboring province, establishing therein an arbitrary government, and enlarging its boundaries, so as to render it at once an example and fit instrument for introducing the same absolute rule into these colonies:

For taking away our charters, abolishing our most valuable laws, and altering fundamentally the powers of our governments:

For suspending our own legislatures, and declaring themselves invested with power to legislate for us in all cases whatsoever.

He has abdicated government here by declaring us out of his protection, and waging war against us.

He has plundered our seas, ravaged our coasts, burnt our towns, and destroyed the lives of our people.

He is at this time transporting large armies of foreign mercenaries to complete the work of death, desolation, and tyranny, already begun, with circumstances of cruelty and perfidy scarcely paralleled in the most barbarous ages, and totally unworthy the head of a civilized nation.

He has constrained our fellow-citizens, taken captive on the high seas, to bear arms against their country, to become the executioners of their friends and brethren, or to fall themselves by their hands.

He has excited domestic insurrections among us, and has endeavored to bring on the inhabitants of our frontiers the merciless Indian savages, whose known rule of warfare is an undistinguished destruction of all ages, sexes, and conditions.

In every stage of these oppressions we have petitioned for redress in the most humble terms; our repeated petitions have been answered only by repeated injury. A prince whose character is thus marked by every act which may define a tyrant, is unfit to be the ruler of a free people.

Nor have we been wanting in attention to our British brethren. We have warned them, from time to time, of attempts, made by their legislature, to extend an unwarrantable jurisdiction over us. We have reminded them of the circumstances of our emigration and settlement here. We have appealed to their native justice and magnanimity, and we have conjured them by the ties of our common kindred to disavow these usurpations, which would inevitably interrupt our connections and correspondence. They, too, have been deaf to the voice of justice and consanguinity. We

must, therefore, acquiesce in the necessity which denounces our separation, and hold them, as we hold the rest of mankind—enemies in war—in peace, friends.

We, therefore, the representatives of the United States of America, in general congress assembled, appealing to the Supreme Judge of the world for the rectitude of our intentions: Do, in the name and by the authority of the good people of these colonies, solemnly publish and declare, that these United Colonies are, and of right ought to be, free and independent states. That they are absolved from all allegiance to the British crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved; and that, as free and independent states, they have full power to levy war, conclude peace, contract alliances, establish commerce, and to do all other acts and things which independent states may of right do. And for the support of this declaration, with a firm reliance on the protection of Divine Providence, we mutually pledge to each other our lives, our fortunes, and our sacred honor.

Adams, Benjamin Franklin, John Jay, and Henry Laurens on the part of the United States.

Congress proclaimed cessation of hostilities, April 11, 1783, and ratified the preliminary treaty with Great Britain, April 15. The Congressional proclamation was read to the army, April 19.

The last international act in the revolution was consummated Sept. 23, when a definitive treaty was signed by David Hartly, on the part of Great Britain, and by Benjamin Franklin, John Adams, and John Jay, on the part of the United States. The treaty fully conceded the independence of the American States, secured boundaries extending north to the great lakes and west of the Mississippi, restored the two Floridas to Spain, and accorded the Americans an unlimited right of fishing on the banks of Newfoundland.

During the war, Great Britain sent 112,584 troops for land-service and over 22,000 seamen to America, and the Colonists had 230,000 Continental soldiers and 56,000 militia under arms.

By a general order of Congress the army was disbanded, Nov. 3, a small force being retained at West Point, N. Y., under command of General Knox, until the organization of a peace establishment.

The British army evacuated New York City Nov. 25; General Knox moved his troops down from West Point and halted in the Bowery, and as the British marched to Whitehall he followed and took possession of Fort George, the artillery on the Battery saluting the United States flag, and the citizens giving Governor Clinton and the principal civil officers of the State who accompanied General Knox an enthusiastic reception.

Washington summoned his officers to meet him at his quarters, corner of Pearl and Broad Streets, New York, Dec. 4, and then amid copious tears and prolonged sobs, he took an affectionate farewell of each. The ceremony over, he proceeded direct to Annapolis, Md., where Congress was in session, and returned to it, Dec. 23, the commission it gave him over eight years before. He rendered an account of his expenses as Commander-in-Chief, amounting to about \$74,480, but declined to receive any compensation for his services, and sought the retirement of his farm.

ARTICLES OF CONFEDERATION.

In the history of the United States there have been three differently constituted Congresses: "The Continental Congress," "The Congress of the Confederation," and "The Congress of the United States." The Congress of the Confederation represented the States under the compact, or Constitution, known as "The Articles of Confederation," the full text of which was as follows:

Articles of Confederation and perpetual Union between the States of New Hampshire, Massachusetts Bay, Rhode Island and Providence Plantations, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, Virginia, North Carolina, South Carolina, and Georgia.

ARTICLE 1. The style of this confederacy shall be "The United States of America."

ART. 2. Each State retains its sovereignty, freedom, and independence, and every power, jurisdiction, and right, which is not by this confederation expressly delegated to the United States in Congress assembled.

ART. 3. The said States hereby severally enter into a firm league of friendship with each other for their common defense, the security of their liberties, and their mutual and general welfare; binding themselves to assist each other against all force offered to, or attacks made upon them, or any of them, on account of religion, sovereignty, trade, or any other pretense whatever.

ART. 4. The better to secure and perpetuate mutual friendship and intercourse among the people of the different States in this Union, the free inhabitants of each of these States, paupers, vagabonds, and fugitives from justice excepted, shall be entitled to all privileges and immunities of free citizens in the several States; and the people of each State shall

GOVERNMENTAL RECOGNITION OF THE INDEPENDENCE OF THE UNITED STATES.

France acknowledged the Independence of the American Colonies Feb. 6, 1778, and signed a treaty of Alliance and Commerce with the American Embassy. The alliance clause was regarded and treated by England as a declaration of war by France, and the two nations immediately began to prepare for hostilities.

Holland.—Great Britain declared war against Holland, Dec. 20, 1780, on learning that Holland was engaged in negotiating a commercial treaty with the colonies. Holland recognized the independence of the colonies, April 19, 1782.

Great Britain.—In the early part of 1782 several earnest attempts were made by the British parliament to terminate the war against the colonies, but the king and ministry persisted in their efforts toward subjugation. On March 4, the commons resolved, "That all who advise the king to continue the war shall be regarded as public enemies." The administration of Lord North came to an end March 20, and a strong peace party succeeded. The summer of 1782 was largely spent in correspondence and negotiations. Preliminary peace articles were signed at Paris, Nov. 30, by Richard Oswald, on the part of Great Britain, and by John

have free ingress and regress to and from any other State, and shall enjoy therein all the privileges of trade and commerce, subject to the same duties, impositions, and restrictions, as the inhabitants thereof respectively; provided that such restrictions shall not extend so far as to prevent the removal of property imported into any State to any other State, of which the owner is an inhabitant; provided also, that no imposition, duties, or restriction shall be laid by any State on the property of the United States or either of them.

If any person guilty of or charged with treason, felony, or other high misdemeanor, in any State, shall flee from justice and be found in any of the United States, he shall, upon demand of the Governor or Executive power of the State from which he fled, be delivered up and removed to the State having jurisdiction of his offense.

Full faith and credit shall be given in each of these States to the records, acts, and judicial proceedings of the courts and magistrates of every other State.

ART. 5. For the more convenient management of the general interests of the United States, delegates shall be annually appointed in such manner as the Legislature of each State shall direct, to meet in Congress on the first Monday in November in every year, with a power reserved to each State to recall its delegates, or any of them, at any time within the year, and to send others in their stead for the remainder of the year.

No State shall be represented in Congress by less than two, nor by more than seven members; and no person shall be capable of being a delegate for more than three years in any term of six years; nor shall any person, being a delegate, be capable of holding any office under the United States, for which he, or another for his benefit, receives any salary, fees, or emoluments of any kind.

Each State shall maintain its own delegates in a meeting of the States, and while they act as members of the committee of the States.

In determining questions in the United States in Congress assembled, each State shall have one vote.

Freedom of speech and debate in Congress shall not be impeached or questioned in any court or place out of Congress; and the members of Congress shall be protected in their persons from arrests and imprisonments during the time of their going to and from and attendance on Congress, except for treason, felony, or breach of the peace.

ART. 6. No State, without the consent of the United States in Congress assembled, shall send any embassy to, or receive any embassy from, or enter into any conference, agreement, alliance or treaty, with any king, prince, or state; nor shall any person holding any office of profit or trust under the United States, or any of them, accept of any present, emolument, office, or title of any kind whatever, from any king, prince or foreign state; nor shall the United States in Congress assembled, or any of them, grant any title of nobility.

No two or more States shall enter into any treaty, confederation, or alliance whatever, between them, without the consent of the United States in Congress assembled, specifying accurately the purposes for which the same is to be entered into, and how long it shall continue.

No State shall lay any imposts or duties which may interfere with any stipulations in treaties entered into by the United States in Congress assembled, with any king, prince, or state, in pursuance of any treaties already proposed by Congress to the courts of France and Spain.

No vessel of war shall be kept up in time of peace by any State, except such number only as shall be deemed necessary by the United States in Congress assembled for the defense of such State or its trade; nor shall any body of forces be kept up by any State in time of peace except such number only, as in the judgment of the United States in Congress assembled, shall be deemed requisite to garrison the forts necessary for the defense of such State; but every State shall always keep up a well-regulated and disciplined militia, sufficiently armed and accoutred, and shall provide and have constantly ready for use, in public stores, a due number of field-pieces and tents, and a proper quantity of arms, ammunition, and camp equipage.

No State shall engage in any war without the consent of the United States in Congress assembled, unless such State be actually invaded by enemies, or shall have received certain advice of a resolution being formed by some nation of Indians to invade such State, and the danger is so imminent as not to admit of a delay till the United States in Congress assembled can be consulted; nor shall any State grant commissions to any ships or vessels of war, nor letters of marque or reprisal, except it be after a declaration of war by the United States in Congress assembled, and then only against the kingdom or state, and the subjects thereof, against which war has been so declared, and under such regulations as shall be established by the United States in Congress assembled, unless such State be infested by pirates, in which case vessels of war may be fitted out for that occasion, and kept so long as the danger shall continue, or until the United States in Congress assembled shall determine otherwise.

ART. 7. When land forces are raised by any State for the common defense, all officers of or under the rank of colonel, shall be appointed by the legislature of each State respectively, by whom such forces shall be raised, or in such manner as such State shall direct, and all vacancies shall be filled up by the State which first made the appointment.

ART. 8. All charges of war, and all other expenses that shall be incurred for the common defense or general welfare, and

allowed by the United States in Congress assembled, shall be defrayed out of a common treasury, which shall be supplied by the several States in proportion to the value of all land within each State granted to or surveyed for any person, as such land and the buildings and improvements thereon shall be estimated according to such mode as the United States in Congress assembled shall from time to time direct and appoint.

The taxes for paying that proportion shall be laid and levied by the authority and direction of the legislatures of the several States, within the time agreed upon by the United States in Congress assembled.

ART. 9. The United States in Congress assembled shall have the sole and exclusive right and power of determining on peace and war, except in the cases mentioned in the sixth article—of sending and receiving ambassadors—entering into treaties and alliances; provided, that no treaty of commerce shall be made whereby the legislative power of the respective States shall be restrained from imposing such imposts and duties on foreigners as their own people are subjected to, or from prohibiting the exportation or importation of any species of goods or commodities whatsoever—of establishing rules for deciding in all cases what captures on land or water shall be legal, and in what manner prizes taken by land or naval forces in the service of the United States shall be divided or appropriated—of granting letters of marque and reprisal in times of peace—appointing courts for the trial of piracies and felonies committed on the high seas, and establishing courts for receiving and determining finally appeals in all cases of captures; provided that no member of Congress shall be appointed a judge of any of the said courts.

The United States in Congress assembled shall also be the last resort on appeal in all disputes and differences now subsisting or that hereafter may arise between two or more States concerning boundary, jurisdiction, or any other cause whatever; which authority shall always be exercised in the manner following: whenever the legislative or executive authority or lawful agent of any State in controversy with another shall present a petition to Congress, stating the matter in question, and paying for a hearing, notice thereof shall be given by order of Congress to the legislative or executive authority of the other State in controversy, and a day assigned for the appearance of the parties, by their lawful agents, who shall then be directed to appoint by joint consent commissioners or judges to constitute a court for hearing and determining the matter in question; but if they cannot agree, Congress shall name three persons out of each of the United States, and from the list of such persons each party shall alternatively strike out one, the petitioners beginning, until the number shall be reduced to thirteen; and from that number not less than seven nor more than nine names, as Congress shall direct, shall, in the presence of Congress, be drawn out by lot; and the persons whose names shall be so drawn, or any five of them, shall be commissioners or judges, to hear and finally determine the controversy, so always as a major part of the judges, who shall hear the cause, shall agree in the determination; and if either party shall neglect to attend at the day appointed, without showing reasons which Congress shall judge sufficient, or being present shall refuse to strike, the Congress shall proceed to nominate three persons out of each State, and the secretary of Congress shall strike in behalf of such party absent or refusing; and the judgment and sentence of the court, to be appointed in the manner before prescribed, shall be final and conclusive; and if any of the parties shall refuse to submit to the authority of such court, or to appear, or defend their claim or cause, the court shall, nevertheless, proceed to pronounce sentence or judgment, which shall, in like manner, be final and decisive, the judgment or sentence and other proceedings being in either case transmitted to Congress, and lodged among the acts of Congress for the security of the parties concerned: provided, that every commissioner, before he sits in judgment, shall take an oath, to be administered by one of the judges of the supreme or superior court of the State, where the cause shall be tried, "well and truly to hear and determine the matter in question, according to the best of his judgment, without favor, affection, or hope of reward;" provided, also, that no State shall be deprived of territory for the benefit of the United States.

All controversies concerning the private right of soil, claimed under different grants of two or more States, whose jurisdiction as they may respect such lands and the States which passed such grants are adjusted, the said grants or either of them being at the same time claimed to have originated antecedent to such settlement of jurisdiction, shall, on the petition of either party to the Congress of the United States, be finally determined, as near as may be, in the same manner as is before prescribed for deciding disputes respecting territorial jurisdiction between different States.

The United States in Congress assembled shall also have the sole and executive right and power of regulating the alloy and value of coin struck by their own authority, or by that of the respective States—fixing the standard of weights and measures throughout the United States—regulating the trade and managing all affairs with the Indians not members of any of the States; provided that the legislative right of any State within its own limits be not infringed or violated—establishing and regulating post-offices from one State to another throughout all the United States, and exacting such postage on the papers passing through

the same, as may be requisite to defray the expenses of the said office—appointing all officers of the land forces in the service of the United States excepting regimental officers—appointing all the officers of the naval forces, and commissioning all officers whatever in the service of the United States—making rules for the government and regulation of the said land and naval forces, and directing their operations.

The United States in Congress assembled shall have authority to appoint a committee to sit in the recess of Congress, to be denominated "a committee of the States," and to consist of one delegate from each State; and to appoint such other committees and civil officers as may be necessary for managing the general affairs of the United States, under their direction—to appoint one of their number to preside, provided that no person be allowed to serve in the office of president more than one year in any term of three years to ascertain the necessary sums of money to be raised for the service of the United States, and to appropriate and apply the same for defraying the public expenses—to borrow money or emit bills on the credit of the United States, transmitting every half year to the respective States an account of the sums of money so borrowed or emitted—to build and equip a navy—to agree upon the number of land forces, and to make requisitions from each State for its quota, in proportion to the number of white inhabitants in such State; which requisition shall be binding, and thereupon the legislature of each State shall appoint the regimental officers, raise the men, and clothe, arm, and equip them, in a soldier-like manner, at the expense of the United States; and the officers and men so clothed, armed, and equipped, shall march to the place appointed, and within the time agreed on by the United States in Congress assembled; but if the United States in Congress assembled shall, on consideration of circumstances, judge proper that any State should not raise men, or should raise a smaller number than its quota, and that any other State should raise a greater number of men than the quota thereof, such extra number shall be raised, officered, clothed, armed, and equipped, in the same manner as the quota of such State, unless the legislature of such State shall judge that such extra number cannot safely be spared out of the same; in which case they shall raise, officer, clothe, arm, and equip as many of such extra number as they judge can be safely spared. And the officers and men so clothed, armed, and equipped, shall march to the place appointed, and within the time agreed on by the United States in Congress assembled.

The United States in Congress assembled shall never engage in war, nor grant letters of marque and reprisal in time of peace, nor enter into any treaties or alliances, nor coin money, nor regulate the value thereof, nor ascertain the sums and expenses necessary for the defense and welfare of the United States or any of them, nor emit bills, nor borrow money, nor agree upon the number of vessels-of-war to be built or purchased, or the number of land or sea forces to be raised, nor appoint a commander-in-chief of the army and navy, unless nine States assent to the same; nor shall a question on any other point, except for adjourning from day to day, be determined, unless by the votes of a majority of the United States in Congress assembled.

The Congress of the United States shall have power to adjourn to any time within the year, and to any place within the United States, so that no period of adjournment be for a longer duration than the space of six months; and shall publish the journal of their proceedings monthly, except such parts thereof relating to treaties, alliances, or military operations, as in their judgment require secrecy; and the yeas and nays of the delegates of each State on any question shall be entered on the journal, when it is desired by any delegate; and the delegates of a State, or any of them, at his or their request, shall be furnished with a transcript of the said journal, except such parts as are above excepted, to lay before the legislatures of the several States.

ART. 10. The committee of the States, or any nine of them, shall be authorized to execute, in the recess of Congress, such of the powers of Congress as the United States in Congress assembled, by the consent of nine States, shall from time to time think expedient to vest them with; provided that no power be delegated to the said committee, for the exercise of which, by the articles of confederation, the voice of nine States in the Congress of the United States assembled is requisite.

ART. 11. Canada, acceding to this confederation, and joining in the measures of the United States, shall be admitted into, and entitled to all the advantages of, this Union, but no other colony shall be admitted into the same unless such admission be agreed to by nine States.

ART. 12. All bills of credit emitted, moneys borrowed, and debts contracted by or under the authority of Congress, before the assembling of the United States, in pursuance of the present confederation, shall be deemed and considered as a charge against the United States, for payment and satisfaction whereof the said United States and the public faith are hereby solemnly pledged.

ART. 13. Every State shall abide by the decision of the United States, in Congress assembled, on all questions which, by this confederation, are submitted to them. And the articles of this confederation shall be inviolably observed by every State, and the Union shall be perpetual; nor shall any alteration at any time hereafter be made in any of them, unless such alteration be agreed to in a Congress of the

United States, and be afterwards confirmed by the legislature of every State.

And whereas it has pleased the great Governor of the world to incline the hearts of the legislatures we respectively represent in Congress, to approve of and to authorize us to ratify the said articles of confederation and perpetual union; *know ye*, that we, the undersigned delegates, by virtue of the power and authority to us given for that purpose, do, by these presents, in the name and in behalf of our respective constituents, fully and entirely ratify and confirm each and every of the said articles of confederation and perpetual union, and all and singular the matters and things therein contained; and we do further solemnly pledge and engage the faith of our respective constituents, that they shall abide by the determinations of the United States in Congress assembled, on all questions which, by the said confederation, are submitted to them; and that the articles thereof shall be inviolably observed by the States we respectively represent; and that the Union be perpetual.

In witness whereof, we have hereunto set our hands, in Congress. Done at Philadelphia, in the State of Pennsylvania, the ninth day of July, in the year of our Lord one thousand seven hundred and seventy-eight, and in the third year of the independence of America.

EARLIEST CONGRESS OF THE UNITED STATES.

First Continental Congress, 1774.—In May, 1774, the Sons of Liberty of New York, first proposed a *General Congress of the American Colonies*. They forwarded this proposition through Connecticut to Boston, and through Philadelphia to every colony in the South. On June 17, the Legislature of Massachusetts appointed the first day of September, 1774, as the time, and Philadelphia as the place for holding the Continental Congress. Samuel Adams, John Adams, Thomas Cushing, and Robert Treat Paine were chosen delegates. One colony after another elected deputies soon afterward. On Monday, Sept. 5, the members of the Congress moved in a body into a plain but spacious hall offered by the carpenters of Philadelphia. Peyton Randolph, late speaker of the assembly of Virginia, was unanimously chosen chairman. The body named itself "the Congress," and its chairman "The President." Eleven colonies represented; Georgia and North Carolina had no delegates there at first. There were 55 members present, each colony having sent as many as it pleased.

It was resolved that each colony should have one vote, and that the doors should be kept shut during the time of business. The members bound themselves by their honor to keep the proceedings secret.

On the nomination of John Adams, Jacob Duché, an Episcopal clergyman, was chosen chaplain. In the middle of September North Carolina sent its delegates to Congress.

On October 8, 1774, this Congress resolved: "We approve the opposition of the inhabitants of the Massachusetts Bay to the execution of the late acts of parliament; and if the same shall be attempted to be carried into execution *by force*, in such case, all America *ought* to support them in their opposition." This measure hardened George the III. to listen to no terms; he was bent on enforcing the obnoxious acts in Massachusetts, and extending them to Connecticut and Rhode Island.

On October 10, Congress declared "that every person who should accept or act under any commission or authority denied from the regulating act of parliament, changing the form of government and violating the charter of Massachusetts, ought to be held in detestation."

In October Congress resolved unanimously, "from the first day of December, 1774, not to import any merchandise from Great Britain and Ireland." All the members bound themselves to this measure by an association. They further covenanted: "We will neither import, nor purchase any slave imported after the first day of December next, after which time we will wholly discontinue the slave trade, and will neither be concerned in it ourselves nor will we hire out our vessels, nor sell our commodities or manufactures to those who are concerned in it."

This first American Congress brought forth another measure, which was without an example: It recognized the political authority of the people. It addressed the people of the provinces from Nova Scotia to Florida, the people of Canada, the people of Great Britain; and laid its grievances before the people, while it refused to petition parliament. On October 26, 1774, this Congress adjourned, after it had embodied its decision in a petition to the king. This petition was very conciliatory, asking for nothing but peace, liberty and safety.

Second Continental Congress.—On May 10, 1775, the Second Continental Congress met at Philadelphia. John Hancock presided. All the thirteen colonies were now represented. Blood had been shed at Lexington and Concord, Mass., and Ticonderoga, N. Y., the key of the gateway to Canada, was on the same day taken from the British by the "Green Mountain Boys" under Ethan Allen. The representatives met as a Congress of War, in the name of a united people struggling for independence. This Congress was a revolutionary body. But, instead of establishing a centralized government, it relied on the colonial governments for executive acts. This Congress appointed Ward, Charles Lee, Schuyler, and Putnam as major-generals, and Gates as adjutant-general. It adopted the forces around Boston as the "American Continental Army," and formulated rules and articles of war for it. It chose George Washington as general-in-chief, June 17, 1775. The battle of Bunker Hill took place on the same day. At that time Congress began to issue bills of credit or "Continental currency." These bills soon began to depreciate, in spite of being declared legal tender. By successive issues of such bills, however, Congress contrived to maintain the army for some years.

In July, 1775, it adopted the last petition to the king, beseeching him to consider the complaints of the colonists, and to repeal the acts which they had found intolerable. Instead of an answer the king called, by proclamation, "on all good subjects to give information of such persons who were aiding and abetting the American rebellion." He sent 25,000

men to America under General Howe. British ships cannonaded Gloucester, Bristol, Falmouth, and other defenseless American seacoast towns, Gen. Washington raised on Jan. 1, 1776, the distinctive standard of the thirteen united American colonies.

In November, 1775, Congress appointed Franklin, Jay, and three other delegates a committee "to maintain intercourse with friends of the colonies in Great Britain, Ireland, and elsewhere." At the same time (Nov. 25) Congress ordered that British war vessels or transports should be open to capture. On March 26, 1776, it declared all British vessels lawful prize. On April 6, it opened all American ports to the vessels of all other nations than Great Britain. In June, 1776, Congress appointed a committee, consisting of Thomas Jefferson, of Virginia, John Adams, of Massachusetts, Benjamin Franklin, of Pennsylvania, Roger Sherman, of Connecticut, and Robert R. Livingston, of New York, to draw up a resolution of independence. The result was the Declaration of Independence, which see. The date of its adoption is the date of the legal existence of the United States. On Dec. 12, 1776, the Second Continental Congress adjourned.

Third Continental Congress.—This Congress met at Baltimore, Dec. 20, 1776, and lasted until the articles of "Confederation" went into operation March 1, 1781. On Nov. 15, 1777, it adopted a resolution favoring a federal government. On December 16, of the same year the United States were recognized by France, and on the 6th day of February, 1778, Benj. Franklin succeeded in concluding a treaty of alliance with France.

Confederated Congress.—On the second day of March, 1781, the "Congress of the Confederation" assembled. On the same day the federal government was accepted by the delegates from all the States. The treaty of peace with Great Britain was signed at Paris on Sept. 3, 1782, and ratified by Congress on Jan. 4, 1784. John Adams was sent as the first American ambassador to Great Britain and was received by the king on June 1, 1785. A new federal constitution was signed by a convention of States on Sept. 17, 1787, and the same was ratified by the people on May 23, 1788. On March 4, 1789, the first Congress of the United States of America assembled, and on April 30 of the same year G. Washington was inaugurated as the first President.

EARLY TREATIES WITH THE UNITED STATES.

Great Britain, 1795.—Great popular indignation in the United States against England, because of her persistent refusal to negotiate a commercial treaty with this country, began to be reflected in congressional legislation in 1794. Mr. Madison on January 4, introduced resolutions in the House, declaring it expedient to increase the duties on the tonnage of vessels of nations which had no commercial treaties with the United States, and on their manufactures of leather, metals, wool, cotton, hemp, flax, and silk, and to reduce the tonnage duties on vessels of nations having such treaties; and to increase the duty on importations from the West Indies in foreign vessels from the ports from which Americans were excluded. The following is the further historic record: "A notable debate is had on the resolutions, but the House comes to no decision. A report, made in response to a resolution declaring that a naval force adequate to the protection of the commerce of the United States against the Algerine corsairs ought to be provided, is taken up Feb. 5, and a bill providing for the construction of 6 frigates, 4 of 44 guns, and 2 of 36 each, is passed by

both Houses and signed by the President. Mr. Sedgwick proposes, March 12, to raise a military force of 15,000 men and to authorize the President to lay an embargo on foreign vessels for 40 days; his resolutions are lost, but the subject is again brought up, 26, when a substitute is adopted laying an embargo for 30 days on all vessels in the ports of the United States bound to any foreign place. A bill is also passed for fortifying certain ports and harbors. Mr. Smith declares that provisions ought to be made for the indemnification of all citizens of the United States, whose vessels or cargoes have been seized and confiscated by any of the belligerent powers, upon which Mr. Dayton moves a resolution for the sequestration of all debts due from American citizens to British subjects, and to compel their payment into the treasury as a fund for the proposed indemnification. Mr. Clark introduces a more stringent resolution, April 7, to prohibit all commercial intercourse with Great Britain, so far as respects the products of Great Britain and Ireland, until her government shall make compensation for injuries sustained by citizens of the United States from British armed vessels, and until the western posts are vacated. The House strikes out the western-posts clause and passes the resolution, but the Senate defeats it by the casting vote of the Vice-President."

While Congress was thus fanning the war flame the President determined on an effort at negotiation, and, April 16, nominated Chief Justice Jay as Envoy Extraordinary of the United States to Great Britain. He was instructed to labor for restitution for spoiliations of American commerce, the fulfillment of the treaty of peace, and, if successful in this for a treaty of commerce. Mr. Jay embarked on his mission May 13, 1794.

The President received, March 7, a copy of a treaty of amity, commerce, and navigation, concluded by Chief Justice Jay and Lord Granville, Nov. 19, he submitted it to the Senate in special session, June 8, after violent debates it was ratified by a vote of 20 to 10 (June 24). The treaty secured indemnity to American Merchants for the seizure of their property by British vessels, and pledged a surrender of the western posts by June 1, 1796.

Indian Tribes.—About 1,100 chiefs and notable warriors, of the western Indian tribes met United States Commissioners at Greenville, Aug. 3, 1795, and signed a treaty of peace, ceding a large tract of land to the United States.

Algiers.—A treaty of peace was signed between the United States and Algiers, Sept. 5, 1795, by which all American captives were released from imprisonment upon the payment of an annual tribute to the Dey.

Spain.—The long pending disputes between the United States and Spain were settled by treaty signed Oct. 27, 1795, in which Spain conceded the claims of the United States in the matter of the Florida boundary and the right to the free navigation of the Mississippi River. Compensation was to be made to American citizens for property illegally seized by Spanish cruisers.

France.—In February, 1796, the French minister of foreign affairs informed the United States Minister, James Monroe, that the French Directory considered the alliance between the United States and France ended by the Jay treaty; that the French minister to the United States was to be recalled; and that a special envoy was to be sent to make the announcement. A few days later, Mr. Monroe was served with a long list of complaints preferred by the French government against the United States. The President recalled Mr. Monroe,

Sept. 9, appointing Charles C. Pinckney, of South Carolina, in his place; their letters were presented Dec. 9. Two days afterward, Mr. Monroe was informed by the French minister of foreign affairs that the Directory would no longer recognize a minister from the United States until after a reparation of the grievances demanded of the American government.

In 1797 the hitherto friendly relations of the United States with France were interrupted. The treaty negotiated by Jay between the United States and England had given offense to France. The French Directory issued decrees against American commerce, on the alleged ground of a violation by the United States of her neutral stand between England and France. Ships flying the American flag were captured by French cruisers, and condemned, in alleged violation of treaty provisions and international law. Gerry, Marshall, and Pinckney were sent to France as special envoys to remonstrate and negotiate a new treaty.

In 1798 the troubles between the two countries were still unadjusted. The dispatches from the special envoys of the United States were made public and indicated that Talleyrand, the French prime minister, refused to treat with them until a bribe had been tendered to the French Directory. The names of the three agents of Talleyrand who attempted to secure the bribe were designated in the despatches as X. Y. L. The publication of these despatches produced great excitement, and were quickly followed by the return of two of the special envoys, without having negotiated any settlement of difficulties. The country was aroused to a high pitch of resentment against France, and Congress voted appropriations for increasing the Navy and Army. During the greater part of this year, although there had been no formal declaration of war between the countries, France and the United States maintained a small naval warfare against each other in the waters around the West Indies; vessels were captured and their crews taken prisoners. Hostilities ceased toward the end of the year. Congress passed an Act suspending all commercial relations with France.

In 1799, Napoleon Bonaparte, who had overthrown the French Directory, offered satisfactory terms to the United States, and peace ensued.

In 1803 the United States purchased from France the Territory of Louisiana, paying therefor the sum of \$15,000,000. This treaty bore date April 30. The territory thus acquired included that now embraced in several western States, and extended as far north as to the present Canadian boundary.

Tripoli.—On June 3, 1805, a treaty of peace was concluded between Tripoli and the United States.

Great Britain.—In 1807 Great Britain began the offensive search of United States vessels and seizing persons and goods suspected of being contraband of her wars with other nations. During that year the British frigate *Leopard* stopped the United States frigate *Chesapeake* at sea, and took from her several sailors. The United States passed, December 21st, the Embargo Act, forbidding any vessel from the United States from entering a foreign port.

In 1809 Congress removed the embargo from affecting all countries except Great Britain. June 18th, 1812, war was declared against that country.

In 1814 Great Britain offered, January 6th, to treat for peace, and commissioners of peace were appointed on both sides. The naval warfare between the two countries, however, continued until December 24th, 1814, when a treaty of peace was signed between Great Britain and the United States at Ghent, Belgium.

CONVENTION FOR ADOPTING THE CONSTITUTION OF THE UNITED STATES.

In May, 1785, a committee of the Federal Congress in session in New York, made a report recommending an alteration of the Articles of Confederation, but no action was taken on it, and it was left to the State legislature to take the initiative in this matter.

In January, 1786, the Virginia legislature passed a resolution providing for the appointment of "five commissioners who, or any three of them," should meet such commissioners as should be appointed by other States of the Union, at a time and place to be agreed upon, to take into consideration the following topics:

"The trade of the United States."

"A uniform system in commercial regulations; and report to the several States such plan of action as they might consider best for adoption by the Confederated Congress. The commissioners, after correspondence, appointed the 1st Monday in September as the time, and Annapolis, Md., as the place of meeting.

At the meeting in Annapolis only five States were represented, namely, Virginia, Delaware, New York, New Jersey and Pennsylvania, the commissioners appointed by Massachusetts, New Hampshire, North Carolina, and Rhode Island failed to attend. Under the circumstances of so partial a representation, the commissioners present agreed upon a report (drawn by Mr. Hamilton, of New York), expressing their unanimous conviction that it might essentially tend to advance the interests of the Union if the States by which they were respectively delegated would concur, and use their endeavors to procure the concurrence of the other States, in the appointment of commissioners to meet at Philadelphia on the second Monday of May following, to take into consideration the situation of the United States; to devise such further provisions as should appear to them necessary to render the Constitution of the Federal Government adequate to the exigencies of the Union; and to report such an act for that purpose to the United States in Congress assembled as, when agreed to by them and afterwards confirmed by the legislatures of every State, would effectually provide for the same.

Congress, on Feb. 21, 1787, adopted a resolution in favor of a convention, and the legislatures of those States which had not already done so (with the exception of Rhode Island) promptly appointed delegates.

On May 25, seven States having convened, George Washington, of Virginia, was unanimously elected President, and the consideration of the proposed constitution was commenced. On Sept. 17, 1787, the constitution as engrossed and agreed upon was signed by all the members present, except Mr. Gerry, of Massachusetts, and Messrs. Mason and Randolph, of Virginia. The president of the convention transmitted it to Congress, with a resolution stating how the proposed Federal Government should be put in operation, and an explanatory letter.

Congress, on Sept. 28, 1787, directed the Constitution so framed, with the resolutions and letter concerning the same, to "be transmitted to the several legislatures in order to be submitted to a convention of delegates chosen in each State by the people thereof, in conformity to the resolves of the convention."

On March 4, 1789, the day which had been fixed for commencing the operations of government under the new Constitution, it had been ratified

by the conventions chosen in each State to consider it, as follows:

- Delaware, December 7, 1787;
- Pennsylvania, December 12, 1787;
- New Jersey, December 18, 1787;
- Georgia, January 2, 1788;
- Connecticut, January 9, 1788;
- Massachusetts, February 6, 1788;
- Maryland, April 28, 1788;
- South Carolina, May 23, 1788;
- New Hampshire, June 21, 1788;
- Virginia, June 26, 1788;
- New York, July 26, 1788.

The other States did not ratify the new Constitution until after the meeting of the first session of the new Congress, and hence did not participate in its legislation. Of these States, North Carolina ratified the Constitution, Nov. 21, 1789; Rhode Island, May 29, 1789; and Vermont, Jan. 10, 1791.

CONSTITUTION OF THE UNITED STATES.

The following is the complete text of the Constitution of the United States, as adopted by the Federal Constitutional Convention held in Philadelphia and duly engrossed and signed, Sept. 17, 1787, and subsequently ratified by the legislatures of the several States:

WE, the people of the United States, in order to form a more perfect Union, establish Justice, insure Domestic Tranquillity, provide for the Common Defense, promote the General Welfare, and secure the Blessings of Liberty, to ourselves and our posterity, do ordain and establish this CONSTITUTION FOR THE UNITED STATES OF AMERICA.

ARTICLE I

SECTION 1. All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and House of Representatives.

SEC. 2. The House of Representatives shall be composed of members chosen every second year by the people of the several States, and the electors in each State shall have the qualifications requisite for the electors of the most numerous branch of the State legislature.

No person shall be a representative who shall not have attained the age of twenty-five years, and been seven years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State in which he shall be chosen.

[Representatives and direct taxes shall be apportioned among the several States which may be included within this Union, according to their respective numbers, which shall be determine by adding to the whole number of free persons, including those bound to service for a term of years, and excluding Indians not taxed, three-fifths of all other persons.]* The actual enumeration shall be made within three years after the first meeting of the Congress of the United States, and within every subsequent term of ten years, in such manner as they shall by law direct. The number of representatives shall not exceed one for every thirty thousand, but each State shall have at least one Representative; and until such enumeration shall be made the State of New Hampshire shall be entitled to choose three, Massachusetts eight, Rhode Island and Providence Plantations one, Connecticut five, New York six, New Jersey four, Pennsylvania eight, Delaware one, Maryland six, Virginia ten, North Carolina five, South Carolina five, and Georgia three.

When vacancies happen in the Representation from any State, the executive authority thereof shall issue writs of election to fill such vacancies.

The House of Representatives shall choose their Speaker and other officers, and shall have the sole power of impeachment.

SEC. 3. The Senate of the United States shall be composed of two Senators from each State, chosen by the Legislature thereof, for six years; and each Senator shall have one vote.

Immediately after they shall be assembled in consequence of the first election, they shall be divided as equally as may be into three classes. The seats of the Senators of the first class shall be vacated at the expiration of the second year, of the second class at the expiration of the fourth year, and of the third class at the expiration of the sixth year, so that one third may be chosen every second year; and if vacancies happen by resignation or otherwise, during the recess of the Legislature of any State, the Executive thereof may make temporary appointments until the next meeting of the Legislature, which shall then fill such vacancies.

*The part here enclosed in brackets was afterward amended by the 2nd section of the Fourteenth Amendment.

No person shall be a Senator who shall not have attained the age of thirty years, and been nine years a citizen of the United States, and who shall not, when elected, be an inhabitant of that State for which he shall be chosen.

The Vice-President of the United States shall be President of the Senate, but shall have no vote, unless they be equally divided.

The Senate shall choose their other officers, and also a President *pro tempore*, in the absence of the Vice-President, or when he shall exercise the office of President of the United States.

The Senate shall have the sole power to try all impeachments. When sitting for that purpose, they shall be on oath or affirmation. When the President of the United States is tried, the Chief Justice shall preside; and no person shall be convicted without the concurrence of two-thirds of the members present.

Judgment in cases of impeachment shall not extend further than to removal from office, and disqualification to hold and enjoy any office of honor, trust, or profit under the United States; but the party convicted shall nevertheless be liable and subject to indictment, trial, judgment, and punishment according to law.

SEC. 4. The times, places, and manner of holding elections for Senators and Representatives shall be prescribed in each State by the Legislatures thereof; but the Congress may at any time by law make or alter such regulations, except as to the place of choosing Senators.

The Congress shall assemble at least once in every year, and such meeting shall be on the first Monday in December, unless they shall by law appoint a different day.

SEC. 5. Each House shall be the judge of the elections, returns, and qualifications of its own members, and a majority of each shall constitute a quorum to do business; but a smaller number may adjourn from day to day, and may be authorized to compel the attendance of absent members, in such manner and under such penalties as each House may provide.

Each House may determine the rules of its proceedings, punish its members for disorderly behavior, and, with the concurrence of two-thirds, expel a member.

Each House shall keep a journal of its proceedings, and from time to time publish the same, excepting such parts as may in their judgment require secrecy; and the yeas and nays of the members of either House on any question shall, at the desire of one-fifth of those present, be entered on the journal.

Neither House, during the session of Congress, shall without the consent of the other, adjourn for more than three days, nor to any other place than that in which the two Houses shall be sitting.

SEC. 6. The Senators and Representatives shall receive a compensation for their services, to be ascertained by law and paid out of the Treasury of the United States. They shall in all cases, except treason, felony, and breach of the peace, be privileged from arrest during their attendance at the session of their respective Houses, and in going to and returning from the same; and for any speech or debate in either House, they shall not be questioned in any other place.

No Senator or Representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States which shall have been created, or the emoluments whereof shall have been increased, during such time; and no person holding any office under the United States shall be a member of either House during his continuance in office.

SEC. 7. All bills for raising revenue shall originate in the House of Representatives; but the Senate may propose or concur with amendments as on other bills.

Every bill which shall have passed the House of Representatives and the Senate shall, before it become a law, be presented to the President of the United States; if he approve he shall sign it, but if he shall return it, with his objections, to that House in which it shall have originated, who shall enter the objections at large on their journal and proceed to reconsider it. If after such reconsideration two-thirds of the House shall agree to pass the bill, it shall be sent, together with the objections, to the other House, by which it shall likewise be reconsidered, and if approved by two-thirds of that House, it shall become a law. But in all such cases the votes of both Houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the journal of each House respectively. If any bill shall not be returned by the President within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a law, in like manner as if he had signed it, unless the Congress by their adjournment prevent its return, in which case it shall not be a law.

Every order, resolution, or vote to which the concurrence of the Senate and House of Representatives may be necessary (except on a question of adjournment) shall be presented to the President of the United States; and before the same shall take effect, shall be approved by him, or being disapproved by him, shall be repassed by two-thirds of the Senate and House of Representatives, according to the rules and limitations prescribed in the case of a bill.

SEC. 8. The Congress shall have power To lay and collect taxes, duties, imposts, and excises, to pay the debts and provide for the common defense and

welfare of the United States; but all duties, imposts, and excises shall be uniform throughout the United States;

To borrow money on the credit of the United States;

To regulate commerce with foreign nations, and among the several States, and with the Indian tribes;

To establish a uniform rule of naturalization, and uniform laws on the subject of bankruptcies throughout the United States;

To coin money, regulate the value thereof, and of foreign coin, and fix the standard of weights and measures;

To provide for the punishment of counterfeiting the securities and current coin of the United States;

To establish post-offices and post-roads;

To promote the progress of science and useful arts, by securing for limited times to authors and inventors the exclusive right to their respective writings and discoveries;

To constitute tribunals inferior to the Supreme Court;

To define and punish piracies and felonies committed on the high seas, and offenses against the law of nations;

To declare war, to grant letters of marque and reprisal, and make rules concerning captures on land and water;

To raise and support the armies, but no appropriation of money to that use shall be for a longer term than two years;

To provide and maintain a navy;

To make rules for the government and regulation of the land and naval forces;

To provide for calling forth the militia to execute the laws of the Union, suppress insurrections, and repel invasions;

To provide for organizing, arming, and disciplining the militia, and for governing such part of them as may be employed in the service of the United States, reserving to the States respectively the appointment of the officers, and the authority of training the militia according to the discipline prescribed by Congress;

To exercise exclusive legislation in all cases whatsoever, over such district (not exceeding ten miles square) as may, by cession of particular States and the acceptance of Congress, become the seat of the Government of the United States and to exercise like authority over all places purchased by the consent of the Legislature in which the same shall be, for the erection of forts, magazines, arsenals, dockyards, and all other needful buildings:—And,

To make all laws which shall be necessary and proper for carrying into execution the foregoing powers, and all other powers vested by this Constitution in the Government of the United States, or in any department or officer thereof.

SEC. 9. The migration or importation of such persons as any of the States now existing shall think proper to admit shall not be prohibited by the Congress prior to the year one thousand eight hundred and eight, but a tax or duty may be imposed upon such importation, not exceeding ten dollars for each person.

The privilege of the writ of habeas corpus shall not be suspended, unless when in cases of rebellion or invasion the public safety may require it.

No bill of attainder or ex post facto law shall be passed.

No capitation or other direct tax shall be laid, unless in proportion to the census or enumeration hereinbefore directed to be taken.

No tax or duty shall be laid on any article exported from any State.

No preference shall be given by any regulation of commerce or revenue to the ports of one State over those of another; nor shall vessels bound to, or from, one State, be obliged to enter, clear, or pay duties in another.

No money shall be drawn from the treasury, but in consequence of appropriations made by law; and a regular statement and account of the receipts and expenditures of all public money shall be published from time to time.

No title of nobility shall be granted by the United States; and no person holding any office of trust or profit under them, shall, without the consent of the Congress, accept of any present, emolument, office, or title, of any kind whatever, from any king, prince, or foreign State.

SEC. 10. No State shall enter into any treaty, alliance, or confederation; grant letters of marque and reprisal; coin money, emit bills of credit; make anything but gold and silver coin a tender in payment of debts; pass any bill of attainder, ex post facto law, or law impairing the obligations of contracts; or grant any title of nobility.

No State shall, without the consent of the Congress, lay any imposts or duties on imports or exports, except what may be absolutely necessary for executing its inspection laws; and the net produce of all duties and imposts, laid by any State on imports or exports, shall be for the use of the Treasury of the United States; and all such laws shall be subject to the revision and control of the Congress.

No State shall, without the consent of Congress, lay any duty of tonnage, keep troops, or ships of war, in time of peace, enter into any agreement or compact with another State, or with a foreign power, or engage in war, unless actually invaded, or in such imminent danger as will not admit of delay.

ARTICLE II.

SECTION 1. The executive power shall be vested in a President of the United States of America. He shall hold his office

during the term of four years, and, together with the Vice-President, chosen for the same term, be elected as follows:

Each State shall appoint, in such manner as the Legislature thereof may direct, a number of electors, equal to the whole number of Senators and Representatives to which the State may be entitled in the Congress; but no Senator or Representative, or person holding an office of trust or profit under the United States, shall be appointed an elector.

[The electors shall meet in their respective States and vote by ballot for two persons, of whom one at least shall not be an inhabitant of the same State with themselves. And they shall make a list of all the persons voted for, and of the number of votes for each, which list they shall sign and certify, and transmit sealed to the seat of the government of the United States, directed to the President of the Senate. The President of the Senate shall, in presence of the Senate and House of Representatives, open all the certificates, and the votes shall then be counted. The person having the greatest number of votes shall be the President, if such number be a majority of the whole number of electors appointed; and if there be more than one who have such majority, and have an equal number of votes, then the House of Representatives shall immediately choose by ballot one of them for President; and if no person have a majority, then from the five highest on the list the said House shall in like manner choose the President. But in choosing the President the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. In every case, after the choice of the President, the person having the greatest number of votes of the electors shall be the Vice-President. But if there should remain two or more who have equal votes, the Senate shall choose from them by ballot the Vice-President.]*

The Congress may determine the time of choosing the electors, and the day on which they shall give their votes; which day shall be the same throughout the United States.

No person except a natural born citizen, or a citizen of the United States at the time of the adoption of this Constitution, shall be eligible to the office of President; neither shall any person be eligible to that office who shall not have attained to the age of thirty-five years, and been fourteen years a resident within the United States.

In case of the removal of the President from office, or of his death, resignation, or inability to discharge the powers and duties of the said office, the same shall devolve on the Vice-President, and the Congress may by law provide for the case of removal, death, resignation, or inability, both of the President and Vice-President, declaring what officer shall then act as President, and such officer shall act accordingly until the disability be removed, or a President shall be elected.

The President shall, at stated times, receive for his services a compensation which shall neither be increased nor diminished during the period for which he shall have been elected, and he shall not receive within that period any other emolument from the United States, or any of them.

Before he enter on the execution of his office he shall take the following oath or affirmation:

"I do solemnly swear (or affirm) that I will faithfully execute the office of President of the United States, and will, to the best of my ability, preserve, protect, and defend the Constitution of the United States."

SEC. 2. The President shall be commander-in-chief of the Army, and Navy of the United States, and of the militia of the several States, when called into the active service of the United States; he may require the opinion, in writing, of the principal officer in each of the executive departments upon any subject relating to the duties of their respective offices, and he shall have power to grant reprieves and pardons for offenses against the United States, except in cases of impeachment.

He shall have power, by and with the advice and consent of the Senate, to make treaties, provided two-thirds of the Senators present concur; and he shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law; but the Congress may by law vest the appointment of such inferior officers, as they think proper, in the President alone, in the courts of law, or in the heads of departments.

The President shall have power to fill up all vacancies that may happen during the recess of the Senate, by granting commissions which shall expire at the end of their next session.

SEC. 3. He shall from time to time give to the Congress information of the state of the Union, and recommend to their consideration such measures as he shall judge necessary and expedient; he may, on extraordinary occasions, convene both Houses, or either of them, and in case of disagreement between them with respect to the time of adjournment, he may adjourn them to such time as he shall think proper; he shall receive ambassadors and other public ministers, and he shall take care that the laws be faithfully

*This clause of the Constitution has been annulled; see 12th Article of the Amendments.

executed, and he shall commission all the officers of the United States.

SEC. 4. The President, Vice-President, and all civil officers of the United States, shall be removed from office on impeachment for, and conviction of, treason, bribery, or other high crimes and misdemeanors.

ARTICLE III.

SEC. 1. The judicial power of the United States shall be vested in one Supreme Court, and in such inferior courts as the Congress may from time to time ordain and establish. The Judges both of the Supreme and inferior courts shall hold their offices during good behavior, and shall at stated times, receive for their services a compensation which shall not be diminished during their continuance in office.

SEC. 2. The judicial power shall extend to all cases, in law and equity, arising under this Constitution, the laws of the United States, and treaties made, or which shall be made, under their authority; to all cases affecting ambassadors, other public ministers, and consuls; to all cases of admiralty and maritime jurisdiction; to controversies to which the United States shall be a party; to controversies between two or more States; between a State and citizens of another State; between citizens of different States; between citizens of the same state claiming lands under grants of different States, and between a State or the citizen thereof, and foreign States, citizens, or subjects.

In all cases affecting ambassadors, other public ministers, and consuls, and those in which a State shall be a party, the Supreme Court shall have original jurisdiction. In all the other cases before mentioned, the Supreme Court shall have appellate jurisdiction, both as to law and fact, with such exceptions and under such regulations as the Congress shall make.

The trial of all crimes, except in cases of impeachment, shall be by jury; and such trial shall be held in the State where the said crime shall have been committed; but when not committed within any State, the trial shall be at such place or places as the Congress may by law have directed.

SEC. 3. Treason against the United States shall consist only in levying war against them, or in adhering to their enemies, giving them aid and comfort. No person shall be convicted of treason unless on the testimony of two witnesses to the same overt act, or on confession in open court.

The Congress shall have power to declare the punishment of treason, but no attainder of treason shall work corruption of blood or forfeiture except during the life of the person attained.

ARTICLE IV.

SEC. 1. Full faith and credit shall be given in each State to the public acts, records, and judicial proceedings of every other State. And the Congress may by general laws prescribe the manner in which such acts, records, and proceedings shall be proved, and the effect thereof.

SEC. 2. The citizens of each State shall be entitled to all privileges and immunities of citizens in the several States.

A person charged in any State with treason, felony, or other crime, who shall flee from justice, and be found in another State, shall on demand of the executive authority of the State from which he fled be delivered up, to be removed to the State having jurisdiction of the crime.

No person held to service or labor in one State, under the laws thereof, escaping into another shall, in consequence of any law or regulation therein, be discharged from such service or labor, but shall be delivered up on claim of the party to whom such service or labor may be due.

SEC. 3. New States may be admitted by the Congress into this Union; but no new State shall be formed or erected within the jurisdiction of any other State; nor any State formed by the junction of two or more States, or parts of States, without the consent of the Legislatures of the States concerned as well as the Congress.

The Congress shall have power to dispose of and make all needful rules and regulations respecting the territory and other property belonging to the United States; and nothing in this constitution shall be so construed as to prejudice any claim of the United States, or of any particular State.

SEC. 4. The United States shall guarantee to every State in the Union a republican form of government, and shall protect each of them against invasion, and, on application of the Legislature or of the Executive (when the Legislature cannot be convened), against domestic violence.

ARTICLE V.

The Congress, whenever two-thirds of both Houses shall deem it necessary, shall propose amendments to this Constitution, or on the application of the Legislatures of two-thirds of the several States, shall call a convention for proposing amendments to the Constitution, which, in either case, shall be valid, to all intents and purposes, as part of this Constitution, when ratified by the Legislatures of three-fourths of the several States, or by Convention in three-fourths thereof, as the one or the other mode of ratification may be proposed by the Congress; provided that no amendment which may be made prior to the year one thousand eight hundred and eight, shall in any manner affect the first and fourth clauses in the ninth section of the first article, and that no State, without its consent, shall be deprived of its equal right of suffrage in the Senate.

ARTICLE VI.

All debts contracted and engagements entered into, before the adoption of the Constitution, shall be as valid against the United States under this Constitution as under the Confederation.

This Constitution, and the laws of the United States which shall be made in pursuance thereof; and all treaties made, or which shall be made, under the authority of the United States, shall be the supreme law of the land; and the Judges in every State shall be bound thereby, anything in the Constitution or laws in any State to the contrary notwithstanding.

The Senators and Representatives before mentioned, and the members of the several State Legislatures, and all executive and judicial officers, both of the United States and of the several States, shall be bound, by oath or affirmation, to support this Constitution; but no religious test shall ever be required as a qualification to any office or public trust under the United States.

ARTICLE VII.

The ratification of the Convention of nine States shall be sufficient for the establishment of this Constitution between the States so ratifying the same.

Done in Convention by the Unanimous Consent of the States present the Seventeenth Day of September, in the Year of our Lord one thousand seven hundred and Eighty-seven, and of the Independence of the United States of America the Twelfth. In Witness whereof We have hereunto subscribed our Names.

GEO. WASHINGTON,
Presidt. and Deputy from Virginia.

FIRST TEN AMENDMENTS—1791.

ARTICLE I.

Congress shall make no law respecting an establishment of religion, or prohibiting the free exercise thereof; or abridging the freedom of speech or of the press; or the right of the people peaceably to assemble, and to petition the Government for a redress of grievances.

ARTICLE II.

A well-regulated militia being necessary to the security of a free State, the right of the people to keep and bear arms shall not be infringed.

ARTICLE III.

No soldier shall in time of peace be quartered in any house without the consent of the owner, nor in time of war, but in a manner to be prescribed by law.

ARTICLE IV.

The right of the people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures, shall not be violated, and no warrants shall issue but upon probable cause, supported by oath or affirmation, and particularly describing the place to be searched, and the persons or things to be seized.

ARTICLE V.

No person shall be held to answer for a capital or otherwise infamous crime, unless on a presentment or indictment of a Grand Jury, except in cases arising in the land or naval forces, or in the militia when in actual service in time of war or public danger; nor shall any person be subject for the same offense to be twice put in jeopardy of life or limb; nor

shall he be compelled in any criminal case to be a witness against himself nor be deprived of life, liberty, or property, without due process of law; nor shall private property be taken for public use without just compensation.

ARTICLE VI.

In all criminal prosecutions the accused shall enjoy the right to a speedy and public trial, by an impartial jury of the State and district wherein the crime shall have been committed, which district shall have previously been ascertained by law, and to be informed of the nature and cause of the accusation; to be confronted with the witnesses against him; to have compulsory process for obtaining witnesses in his favor, and to have the assistance of counsel for his defense.

ARTICLE VII.

In suits at common law, where the value in controversy shall exceed twenty dollars, the right of trial by jury shall be preserved, and no fact tried by a jury shall be otherwise re-examined in any court of the United States than according to the rules of the common law.

ARTICLE VIII.

Excessive bail shall not be required, nor excessive fines be imposed, nor cruel nor unusual punishments inflicted.

ARTICLE IX.

The enumeration, in the Constitution, of certain rights shall not be construed to deny or disparage others retained by the people.

ARTICLE X.

The powers not delegated to the United States by the Constitution, nor prohibited by it to the States, are reserved to the States respectively, or to the people.

ELEVENTH AMENDMENT—1798.

ARTICLE XI.

The judicial power of the United States shall not be construed to extend to any suit in law or equity, commenced or prosecuted against one of the United States by citizens of another State, or by citizens or subjects of any foreign State.

TWELFTH AMENDMENT—1804.

ARTICLE XII.

The Electors shall meet in their respective States and vote by ballot for President and Vice-President, one of whom, at least, shall not be an inhabitant of the same state with themselves. They shall name in their ballots the person voted for as President and in distinct ballots the person voted for as Vice-President, and they shall make distinct lists of all persons voted for as President, and of all persons voted for as Vice-President, and of the number of votes for each, which lists they shall sign and certify, and transmit sealed to the seat of the Government of the United States, directed to the President of the Senate:—The President of the Senate shall, in presence of the Senate and House of Representatives, open all the certificates and the votes shall then be counted;—The person having the greatest number of votes for President shall be the President, if such number be a majority of the whole number of Electors appointed, and if no such person have such majority, then from the persons having the highest numbers not exceeding three on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President, the votes shall be taken by States, the representation from each State having one vote: a quorum for this purpose shall consist of a member or members from two thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in case of the death or other constitutional disability of the President. The person having the greatest number of votes as Vice-President shall be Vice-President if such number be a majority of the whole number of Electors appointed, and if no person have a majority, then from the two highest numbers on the list, the Senate shall choose the Vice-President; a quorum for the purpose shall consist of two thirds of the whole number of Senators, and a majority of the whole number shall be necessary to a choice. But no person constitutionally ineligible to the office of President shall be eligible to that of Vice-President of the United States.

THIRTEENTH AMENDMENT—1865.

ARTICLE XIII.

SECTION 1. Neither slavery nor involuntary servitude, except as a punishment for crime, whereof the party shall have been duly convicted, shall exist within the United States, or any place subject to their jurisdiction.

SEC. 2. Congress shall have power to enforce this article by appropriate legislation.

FOURTEENTH AMENDMENT—1868.

ARTICLE XIV.

SECTION 1. All persons born or naturalized in the United States, and subject to the jurisdiction thereof, are citizens

of the United States and of the State in which they reside. No State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the laws.

SEC. 2. Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, including Indians not taxed. But when the right to vote at any election for the choice of Electors for President and Vice-President of the United States, representatives in Congress, the executive and judicial officers of a State, or the members of the Legislature thereof, is denied to any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, or in any way abridged, except for participation in rebellion or other crime, the basis of representation therein shall be reduced in the proportion which the number of such male citizens shall bear to the whole number of male citizens twenty-one years of age in such State.

SEC. 3. No person shall be a Senator or Representative in Congress, or Elector of President or Vice-President, or hold any office, civil or military, under the United States, or under any State, who, having previously taken an oath as a member of Congress, or as an officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same, or given aid or comfort to the enemies thereof. But Congress may, by a vote of two thirds of each House, remove such disability.

SEC. 4. The validity of the public debt of the United States, authorized by law, including debts incurred by payment of pensions and bounties for services in suppressing insurrection or rebellion shall not be questioned. But neither the United States nor any other State shall assume or pay any debt or obligation incurred in aid of insurrection or rebellion against the United States, or any claim for the loss or emancipation of any slave, but all such debts, obligations, and claims shall be held illegal and void.

SEC. 5. That Congress shall have power to enforce, by appropriate legislation, the provisions of this article.

FIFTEENTH AMENDMENT—1870.

ARTICLE XV.

SECTION 1. The right of citizens of the United States to vote shall not be denied or abridged by the United States, or by any State, on account of race, color, or previous condition of servitude.

SEC. 2. Congress shall have power to enforce this article by appropriate legislation.

RATIFICATION OF THE CONSTITUTION AND AMENDMENTS.

The Constitution was adopted by a Convention of the States held in Philadelphia, Pa., Sept. 17, 1787; and it was subsequently adopted by the several State Legislatures at the dates and in the order following:

- Delaware, December 7, 1787.
- Pennsylvania, December 12, 1787.
- New Jersey, December 18, 1787.
- Georgia, January 2, 1788.
- Connecticut, January 9, 1788.
- Massachusetts, February 6, 1788.
- Maryland, April 28, 1788.
- South Carolina, May 23, 1788.
- New Hampshire, June 21, 1788.
- Virginia, June 26, 1788.
- New York, July 26, 1788.
- North Carolina, November 21, 1789.
- Rhode Island, May 29, 1790.

The State of Vermont, by convention, ratified the Constitution, January 10, 1791, and was, by an act of Congress of February 18, 1791, "received and admitted into this Union as a new and entire member of the United States of America."

Ratification of First Ten Amendments.

The first ten amendments (with two others which were not adopted by the requisite number of States—see Constitution) were submitted to the State Legislatures by a resolution of Congress which was adopted by that body at its first session, Sept. 25, 1789, and was ratified by the several Legislatures as follows:

- New Jersey, November 20, 1789.
- Maryland, December 19, 1789.
- North Carolina, December 22, 1789.
- South Carolina, January 19, 1790.
- New Hampshire, January 25, 1790.
- Delaware, January 28, 1790.
- Pennsylvania, March 10, 1790.
- New York, March 27, 1790.
- Rhode Island, June 15, 1790.
- Vermont, November 3, 1791.
- Virginia, December 15, 1791.

The acts of the State Legislatures ratifying the Amendments were transmitted by the Governors to the President of the United States, and by him communicated to Congress. The Legislatures of Massachusetts and Connecticut, do not appear by the record to have ratified them.

The Eleventh Amendment.—The eleventh article of amendment was submitted to the State Legislatures by a resolution of Congress passed March 5, 1791, at the first session of the 3d Congress; and Jan. 8, 1798, at the second session of the 5th Congress, it was declared by the President, in a message to the two Houses of Congress, to have been adopted by the Legislature of three-fourths of the States, there being at that time sixteen States in the Union.

The Twelfth Amendment.—The twelfth article was submitted to the Legislatures of the several States, there being then seventeen States, by a resolution of Congress passed Dec. 12, 1803, at the first session of the 8th Congress; and was ratified by the Legislatures of three-fourths of the States, in 1804, according to a proclamation of the Secretary of State, dated, Sep. 25, 1804.

The Thirteenth Amendment.—The thirteenth article was submitted to the Legislatures of the several States, there being then thirty-six States, by a resolution of Congress passed Feb. 1, 1865, at the second session of the 38th Congress, and was ratified, according to a proclamation of the Secretary of State, dated Dec. 18, 1865, by the Legislatures of the following States:

- Illinois, February 1, 1865.
- Rhode Island, February 2, 1865.
- Michigan, February 2, 1865.
- Maryland, February 3, 1865.
- New York, February 3, 1865.
- West Virginia, February 3, 1865.
- Maine, February 7, 1865.
- Kansas, February 7, 1865.
- Massachusetts, February 8, 1865.
- Pennsylvania, February 8, 1865.
- Virginia, February 9, 1865.
- Ohio, February 10, 1865.
- Missouri, February 10, 1865.
- Indiana, February 16, 1865.
- Nevada, February 16, 1865.
- Louisiana, February 17, 1865.
- Minnesota, February 23, 1865.
- Wisconsin, March 1, 1865.
- Vermont, March 9, 1865.
- Tennessee, April 7, 1865.
- Arkansas, April 20, 1865.
- Connecticut, May 5, 1865.
- New Hampshire, July 1, 1865.
- South Carolina, November 13, 1865.
- Alabama, December 2, 1865.
- North Carolina, December 4, 1865.
- Georgia, December 9, 1865.

The following States not enumerated in the proclamation of the Secretary of State also ratified this amendment:

- Oregon, December 11, 1865.
- California, December 20, 1865.
- Florida, December 28, 1865.

New Jersey, January 23, 1866.

Iowa, January 24, 1866.

Texas, February 18, 1870.

The Fourteenth Amendment.—The Fourteenth Article of Amendment to the Constitution was submitted to these State Legislatures by a Congressional resolution passed by the 39th Congress, June 16, 1866. The Secretary of State issued a proclamation, dated July 28, 1868, declaring that the proposed Fourteenth Amendment had been ratified, in the manner hereafter mentioned, by the legislatures of thirty of the thirty-six States, namely:

Connecticut, June, 30, 1866.

New Hampshire, July 7, 1866.

Tennessee, July 19, 1866.

New Jersey, September 11, 1866 (and the legislature of the same State passed a resolution in April, 1868 to withdraw its consent to it).

Oregon, September 18, 1866.

Vermont, November 9, 1866.

Georgia rejected it, November 13, 1866, and ratified it July 21, 1868.

North Carolina rejected it December 4, 1866, and ratified it July 4, 1868.

South Carolina rejected it December 20, 1866, and ratified it July 9, 1868.

New York ratified it January 10, 1867.

Ohio ratified it January 11, 1867 (and the legislature of the same State passed a resolution in January, 1868, to withdraw its consent to it).

Illinois ratified it January 15, 1867.

West Virginia, January 16, 1867.

Kansas, January 18, 1867.

Maine, January 19, 1867.

Nevada, January 22, 1867.

Missouri, January 26, 1867.

Indiana, January 29, 1867.

Minnesota, February 1, 1867.

Rhode Island, February 7, 1867.

Wisconsin, February 13, 1867.

Pennsylvania, February 13, 1867.

Michigan, February 15, 1867.

Massachusetts, March 20, 1867.

Nebraska, June 15, 1867.

Iowa, April 3, 1868.

Arkansas, April 6, 1868.

Florida, June 9, 1868.

Louisiana, July 9, 1868.

Alabama, July 13, 1868.

Georgia again ratified the amendment February 2, 1870.

Texas rejected it November 1, 1866, and ratified it February 18, 1870.

Virginia rejected it January 19, 1867, and ratified it October 8, 1869.

The amendment was rejected by Kentucky, January 10, 1867; by Delaware, February 8, 1867; by Maryland, March 23, 1867; and was not afterward ratified by either State.

The Fifteenth Amendment.—The fifteenth article was submitted to the Legislatures of the several States, there being then thirty-seven States, by a resolution of Congress passed February 27, 1869, at the first session of the 41st Congress; and was ratified according to a proclamation of the Secretary of State dated March 30, 1870, by the Legislatures of the following States:

Nevada, March 1, 1869.

West Virginia, March 3, 1869.

North Carolina, March 5, 1869.

Louisiana, March 5, 1869.

Illinois, March 5, 1869.

Michigan, March 8, 1869.

Wisconsin, March 9, 1869.

Massachusetts, March 12, 1869.

Maine, March 12, 1869.

South Carolina, March 16, 1869.

Pennsylvania, March 26, 1869.

Arkansas, March 30, 1869.

*New York, April, 14, 1869.

Indiana, May 14, 1869.

Connecticut, May 19, 1869.

Florida, June 15, 1869.

New Hampshire, July 7, 1869.

Virginia, October 8, 1869.

Vermont, October 21, 1869.

Alabama, November 24, 1869.

Missouri, January 10, 1870.

Mississippi, January 15—17, 1870.

*Ohio, January 27, 1870.

Georgia, February 2, 1870.

Iowa, February 3, 1870.

Nebraska, February 17, 1870.

Texas, February 18, 1870.

Rhode Island, January 18, 1870.

Kansas, January 18—19, 1870.

Minnesota, February 19, 1870.

†New Jersey ratified this amendment February 21, 1871. Subsequent to the proclamation of the Secretary of State.

California, Delaware, Kentucky, Maryland and Tennessee rejected this amendment.

RELATION OF THE PRESIDENT OF THE UNITED STATES TO NATIONAL LEGISLATION.

The Constitution enacts that the President shall from time to time give to Congress information of the State of the Union, and recommend to their consideration such measures as he shall deem necessary and expedient; he may, on extraordinary occasions, convene both houses, or either of them, and in case of disagreement between them with respect to the time of adjournment he may adjourn them to such time as he shall judge proper.

"Every bill which shall have passed the House of Representatives and the Senate shall, before it becomes a law, be presented to the President of the United States; if he approve, he shall sign it; but if not, he shall return it with his objections to that house in which it shall have originated. * * * * If any bill shall not be returned by the President within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a law, in like manner as if he had signed it, unless the Congress, by their adjournment, prevents its return, in which case it shall not be a law." There is a similar provision in regard to "every order, resolution, or vote to which the concurrence of the Senate and House of Representatives may be necessary (except on a question of adjournment.)"

Where a House bill is allowed to become a law by the failure of the President to return it, it is usual for him to notify the House of that fact: and so also where he approves a bill, giving also the date of approval.

Where the President is prevented by adjournment from returning a bill with his objections, it is usual for him at the next session to communicate to the house where it originated his reasons for not approving it.

Art. 12, Amendments to the Constitution, requires that the certificate of electoral votes in the respective States for President and Vice-President shall be opened by the President of the Senate in the presence of the Senate and House of Representatives, and the vote shall then be counted.

*New York withdrew her consent to the ratification January 5, 1870.

†Ohio had previously rejected the Amendment, May 4, 1869.

†New Jersey had previously rejected the Amendment.

Congress shall be in session on the second Wednesday in February succeeding every meeting of the electors, and the certificates, or so many of them as have been received, shall then be opened, the votes counted, and the persons to fill the offices of President and Vice-President ascertained and declared agreeable to the Constitution.

It is further provided by the 12th Article of Amendments to Const., that if no person have a majority of the electoral votes for President, "then, from the persons having the highest numbers, not exceeding three, on the list of those voted for as President, the House of Representatives shall choose immediately, by ballot, the President. But in choosing the President the votes shall be taken by States, the representation from each State having one vote; a quorum for this purpose shall consist of a member or members from two-thirds of the States, and a majority of all the States shall be necessary to a choice. And if the House of Representatives shall not choose a President, whenever the right of choice shall devolve upon them, before the fourth day of March next following, then the Vice-President shall act as President, as in the case of the death or other constitutional disability of the President."

In anticipation of the choice of President devolving upon it, the House of Representatives of the second session, Eighteenth Congress, adopted a set of rules for its government in said election.

PROVISION FOR CONDUCTING THE PRESIDENTIAL ADMINISTRATION IN CASE OF THE DEATH OF THE PRESIDENT AND VICE-PRESIDENT.

The act of Congress entitled "An act to provide for the performance of the duties of the office of President in case of the removal, death, resignation, or inability both of the President and Vice-President," approved January 19, 1886 (1st sess. 49th Congress), Statutes, vol. 24 page 1, enacts:

That in case of removal, death, resignation, or inability of both the President and Vice-President of the United States, the Secretary of State, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of the Treasury, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of War, or if there be none, or in case of his removal, death, resignation, or inability, then the Attorney-General, or if there be none, or in case of his removal, death, resignation, or inability, then the Postmaster-General, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of the Navy, or if there be none, or in case of his removal, death, resignation, or inability, then the Secretary of the Interior, shall act as President until the disability of the President or Vice-President is removed or a President shall be elected: *Provided*, That whenever the powers and duties of the office of President of the United States shall devolve upon any of the persons named herein, if Congress be not then in session, or if it would not meet in accordance with law within twenty days thereafter it shall be the duty of the person upon whom said powers and duties shall devolve to issue a proclamation convening Congress in extraordinary session giving twenty days notice of the time of meeting.

SEC. 2. That the preceding section shall only be held to describe and apply to such offices as shall have been appointed by the advice and consent of the Senate to the offices therein named, and such as are eligible to the office of President under the Constitution, and not under impeachment by the House of Representatives of the United States at the time the powers and duties of the office shall devolve upon them respectively.

SEC. 3. That sections 146, 147, 149, and 150 of the Revised Statutes are hereby repealed.

PRESIDENTIAL CABINET ADMINISTRATIONS.

The following is a full list of the Presidential Administrations of the United States from the date of the adoption of the Constitution to Jan. 1, 1892.

First Administration.

President: George Washington, of Virginia.
Vice-President: John Adams, of Massachusetts.

Secretaries of State: Thomas Jefferson, of Virginia, Sept. 26, 1789; Edmund Randolph, of Virginia, Jan. 2, 1794; Timothy Pickering, of Massachusetts, Dec. 18, 1795.

Secretaries of the Treasury: Alexander Hamilton, of New York, Sept. 11, 1789; Oliver Wolcott, of Connecticut, Feb. 3, 1795.

Secretaries of War: Henry Knox, of Massachusetts, Sept. 12, 1789; Timothy Pickering, of Massachusetts, Jan. 2, 1795; James McHenry, of Maryland, Jan. 27, 1796.

Secretaries of the Navy. No navy department was organized during Washington's administration.

Postmasters-general: Samuel Osgood, of Massachusetts, Sept. 26, 1789; Timothy Pickering, of Massachusetts, Nov. 7, 1794; Joseph Habersham, of Georgia, Feb. 25, 1795.

Attorneys-general: Edmund Randolph, of Virginia, Sept. 26, 1789; William Bradford, of Pennsylvania, Jan. 27, 1794; Charles Lee, of Virginia, Dec. 10, 1795.

Second Administration—1797 to 1801.

President: John Adams, of Massachusetts.

Vice-President: Thomas Jefferson, of Virginia.

Secretaries of State: Timothy Pickering, continued in office; John Marshall, of Virginia, May 13, 1800.

Secretaries of the Treasury: Oliver Wolcott, continued in office; Samuel Dexter, of Massachusetts, Dec. 31, 1800.

Secretaries of War: James McHenry, continued in office; Samuel Dexter, of Massachusetts, May 13, 1800; Roger Griswold, of Connecticut, Feb. 3, 1801.

Secretaries of the Navy: George Cabot, of Massachusetts, May 3, 1798, declined; Benjamin Stoddert, of Maryland, May 21, 1798.

Postmaster-general: Joseph Habersham, continued in office.

Attorney-general: Charles Lee, continued in office.

Third Administration—1801 to 1809.

President: Thomas Jefferson, of Virginia.

Vice-Presidents: Aaron Burr, of New York, from 1801 to 1805; George Clinton, of New York, from March 4, 1805.

Secretary of State: James Madison, of Virginia, March 5, 1801.

Secretaries of the Treasury: Samuel Dexter, continued in office; Albert Gallatin, of Pennsylvania, Jan. 26, 1802.

Secretary of War: Henry Dearborn, of Massachusetts, March 5, 1801.

Secretaries of the Navy: Benjamin Stoddert, continued in office; Robert Smith, of Maryland, Jan. 26, 1802; Jacob Crowninshield, of Massachusetts, March 2, 1805.

Postmasters-general: Joseph Habersham, continued in office; Gideon Granger, of Connecticut, Jan. 26, 1802.

Attorneys-general: Levi Lincoln, of Massachusetts, March 5, 1801; Robert Smith, of Maryland, March 3, 1805; John Breckinridge, of Kentucky, Jan. 17, 1806; Cæsar A. Rodney, of Delaware, Jan. 20, 1807.

Fourth Administration—1809 to 1817.

President: James Madison, of Virginia.

Vice-Presidents: George Clinton, of New York, died April 20, 1812; Elbridge Gerry, of Massachusetts, March 4, 1813—died Nov. 23, 1813.

Secretaries of State: Robert Smith, of Maryland, March 6, 1809; James Monroe, of Virginia, April 2, 1811.

Secretaries of the Treasury: Albert Gallatin, continued in office; George W. Campbell, of Tennessee, Feb. 9, 1814; Alexander J. Dallas, of Pennsylvania, Oct. 6, 1814.

Secretaries of War: William Eustis, of Massachusetts, March 7, 1809; John Armstrong, of New York, Jan. 13, 1813; James Monroe, of Virginia, Sept. 27, 1814, acting secretary; William H. Crawford, of Georgia, March 3, 1815.

Secretaries of the Navy: Paul Hamilton, of South Carolina, March 7, 1809; William Jones, of Pennsylvania, Jan. 12, 1813; Benjamin W. Crowninshield, of Massachusetts, Dec. 17, 1814.

Postmaster-general: Gideon Granger, continued in office; Return J. Meigs, of Ohio, March 17, 1814.

Attorney-general: Caesar A. Rodney, continued in office; William Pinckney, of Maryland, Dec. 11, 1811; Richard Rush, of Pennsylvania, Feb. 10, 1814.

Fifth Administration—1817 to 1825.

President: James Monroe, of Virginia.
Vice-President: Daniel D. Tompkins, of New York.
Secretary of State: John Quincy Adams, of Massachusetts, March 5, 1817.

Secretary of the Treasury: William H. Crawford, of Georgia, March 5, 1817.

Secretaries of War: Isaac Shelby, of Kentucky, March 5, 1817, declined the appointment; George Graham, of West Virginia, April 7, 1817; John C. Calhoun, of South Carolina, Oct. 8, 1817.

Secretaries of the Navy: Benjamin W. Crowninshield, continued in office; Smith Thompson, of New York, Nov. 9, 1818; John Rogers, of Massachusetts, Sept. 1, 1823; Samuel L. Southard, of New Jersey, Sept. 16, 1823.

Postmaster-general: Return J. Meigs, continued in office; John McLean, of Ohio, June 26, 1823.

Attorneys-general: Richard Rush, continued in office; William Wirt, of Virginia, Nov. 13, 1817.

Sixth Administration—1825 to 1829.

President: John Quincy Adams, of Massachusetts.
Vice-President: John C. Calhoun, of South Carolina.

Secretary of State: Henry Clay, of Kentucky, March 7, 1825.

Secretary of the Treasury: Richard Rush, of Pennsylvania, March 7, 1825.

Secretaries of War: James Barbour, of Virginia, March 7, 1825; Peter B. Porter, of New York, May 26, 1828.

Secretary of the Navy: Samuel L. Southard, continued in office.

Postmaster-general: John McLean, continued in office.

Attorney-general: William Wirt, continued in office.

Seventh Administration—1829 to 1837.

President: Andrew Jackson, of Tennessee.
Vice-Presidents: John C. Calhoun, of South Carolina—resigned Dec. 28, 1832; Martin Van Buren, of New York, March 4, 1833.

Secretaries of State: Martin Van Buren, of New York, March 6, 1829; Edward Livingston, of Louisiana, May 24, 1831; Louis McLane, of Delaware, March 29, 1833; John Forsyth, of Georgia, June 27, 1834.

Secretaries of the Treasury: Samuel D. Ingham, of Pennsylvania, March 6, 1829; Louis McLane, of Delaware, Aug. 8, 1831; William J. Duane, of Pennsylvania, May 29, 1833; Roger B. Taney, of Maryland, Sept. 23, 1833—not confirmed by the Senate; Levi Woodbury, of New Hampshire, June 27, 1834.

Secretaries of War: John H. Heaton, of Tennessee, March 9, 1829; Lewis Cass, of Michigan, Aug. 1, 1831—resigned Nov. 1836.

Secretaries of the Navy: John Branch, of North Carolina, March 9, 1829; Levi Woodbury, of New Hampshire, May 23, 1831; Mahlon Dickerson, of New Jersey, June 30, 1834.

Postmaster-general: William T. Barry, of Kentucky, March 9, 1829. Previous to this date the postmaster-general had not been recognized as a member of the president's cabinet. Amos Kendall, of Kentucky, May 1, 1835.

Attorneys-general: John McPherson Berrien, of Georgia, March 9, 1829; Roger B. Taney, of Maryland, Dec. 27, 1831; Benjamin F. Butler, of New York, June 24, 1834.

Eighth Administration—1837 to 1841.

President: Martin Van Buren, of New York.
Vice-President: Richard M. Johnson, of Kentucky.
Secretary of State: John Forsyth, continued in office.

Secretary of the Treasury: Levi Woodbury, continued in office.

Secretary of War: Joel R. Poinsett, of South Carolina, March 7, 1837.

Secretaries of the Navy: Mahlon Dickerson, continued in office; James K. Paulding, of New York, June 20, 1838.

Postmasters-general: Amos Kendall, continued in office; John M. Niles, of Connecticut, May 18, 1840.

Attorneys-general: Benjamin F. Butler, continued in office; Felix Grundy, of Tennessee, July 7, 1838; Henry D. Gilpin, of Pennsylvania, Jan. 10, 1840.

Ninth Administration—1841 to 1845.

President: William Henry Harrison, of Ohio. Died April 4, 1841, when John Tyler, the Vice-President, became President.

Vice-President: John Tyler, of Virginia.
Secretaries of State: Daniel Webster, of Massachusetts, March 5, 1841—resigned May 8, 1843; Hugh S. Legaré, of South Carolina, May 9, 1843, died June 20, 1843; Abel P. Upshur, of Virginia, July 24, 1843—killed by the bursting of a cannon, Feb. 28, 1844; John Nelson, of Maryland (acting secretary), Feb. 29, 1844; John C. Calhoun, of South Carolina, March 6, 1844.

Secretaries of the Treasury: Thomas Ewing, of Ohio, March 5, 1841—resigned Sept. 11, 1841; Walter Forward, of Pennsylvania, Sept. 13, 1841—resigned March 1, 1843; Caleb Cushing, of Massachusetts, rejected by the Senate; John C. Spencer, of New York, March 3, 1843; George M. Bibb, of Kentucky, June 15, 1844.

Secretaries of War: John Bell, of Tennessee, March 5, 1841—resigned Sept. 11, 1841; John McLean, of Ohio, Sept. 13, 1841, declined; John C. Spencer, of New York, Oct. 12, 1841; James M. Porter, of Pennsylvania, March 8, 1843, rejected by the Senate; William Williams, of Pennsylvania, Feb. 15, 1844.

Secretaries of the Navy: George E. Badger, of North Carolina, March 5, 1841—resigned Sept. 11, 1841; Abel P. Upshur, of Virginia, Sept. 13, 1841; David Henshaw, of Massachusetts, July 24, 1843, rejected by the Senate; Thomas W. Gilmer, of Virginia, Feb. 15, 1844—died Feb. 28, 1844; John Y. Mason, of Virginia, March 14, 1844.

Postmasters-general: Francis Granger, of New York, March 6, 1841—resigned Sept. 12, 1841; Charles A. Wickliffe, of Kentucky, Sept. 13, 1841.

Attorneys-general: John J. Crittenden, of Kentucky, March 5, 1841—resigned Sept. 11, 1841; Hugh S. Legaré, of South Carolina, Sept. 13, 1841; John Nelson, of Maryland, July 1, 1843.

Tenth Administration—1845 to 1849.

President: James K. Polk, of Tennessee.
 Vice-President: George M. Dallas, of Pennsylvania.
 Secretary of State: James Buchanan, of Pennsylvania, March 5, 1845.
 Secretary of the Treasury: Robert J. Walker, of Mississippi, March 5, 1845.
 Secretary of War: William L. Marcy, of New York, March 5, 1845.
 Secretaries of the Navy: George Bancroft, of Massachusetts, March 10, 1845; John Y. Mason, of Virginia, Sept. 9, 1846.
 Postmaster-general: Cave Johnson, of Tennessee, March 5, 1845.
 Attorneys-general: John Y. Mason, of Virginia, March 5, 1845; Nathan Clifford, of Maine, Oct. 17, 1846; Isaac Toucey, of Connecticut, June 21, 1848.

Eleventh Administration—1849 to 1853.

President: Zachary Taylor, of Louisiana. Died July 9, 1850, and was succeeded by the Vice-President.
 Vice-President: Millard Fillmore, of New York.
 Secretaries of State: John M. Clayton, of Delaware, March 7, 1849—resigned July 10, 1850; Daniel Webster, of Massachusetts, July 20, 1850—died Oct. 24, 1852; Edward Everett, of Massachusetts, Dec. 9, 1852.
 Secretaries of the Treasury: William M. Meredith, of Pennsylvania, March 7, 1849—resigned July 10, 1850; Thomas Corwin, of Ohio, July 20, 1850.
 Secretaries of War: George W. Crawford, of Georgia, March 7, 1849—resigned July 10, 1850; William A. Graham, of North Carolina, July 20, 1850—resigned July 15, 1852; John P. Kennedy, of Maryland, July 22, 1852.
 Secretaries of the Interior (a new office): Thomas Ewing, of Ohio, March 7, 1849—resigned July 10, 1850; James A. Pearce, of Maryland, July 20, 1850; T. McKenney, of Pennsylvania, Aug. 15, 1850, and died soon afterwards; Alexander H. H. Stuart, of Virginia, Sept. 12, 1850.
 Postmasters-general: Jacob Collamer, of Vermont, March 7, 1849—resigned July 10, 1850; N. K. Hall, of New York, July 20, 1850—resigned Aug. 1852; Samuel D. Hubbard, of Connecticut, Aug. 31, 1852.
 Attorneys-general: Reverdy Johnson, of Maryland, March 7, 1848—resigned July 10, 1850; John J. Crittenden, of Kentucky, July 20, 1850.

Twelfth Administration—1853 to 1857.

President: Franklin Pierce, of New Hampshire.
 Vice-President: William R. King, of Alabama. Died April 18, 1853.
 Secretary of State: William L. Marcy, of New York, March 5, 1853.
 Secretary of the Treasury: James Guthrie, of Kentucky, March 5, 1853.
 Secretary of War: Jefferson Davis, of Mississippi, March 5, 1853.
 Secretary of the Navy: James C. Dobbin, of North Carolina, March 5, 1853.
 Secretary of the Interior: Robert McClellan, of Michigan, March 5, 1853.
 Postmaster-general: James Campbell, of Pennsylvania, March 5, 1853.
 Attorney-general: Caleb Cushing, of Massachusetts, March 5, 1853.

Thirteenth Administration—1857 to 1861.

President: James Buchanan, of Pennsylvania.
 Vice-President: John C. Breckenridge, of Kentucky.
 Secretaries of State: Lewis Cass, of Michigan, March 6, 1857—resigned Dec. 14, 1860. Jeremiah S. Black, of Pennsylvania, succeeded him.
 Secretaries of the Treasury: Howell Cobb, of Georgia, March 6, 1857—resigned Dec. 10, 1860; Philip F. Thomas, of Maryland—resigned Jan. 11, 1861; John A. Dix, of New York.
 Secretaries of War: John B. Floyd, of Virginia, March 6, 1857—resigned Dec. 29, 1860; Joseph Holt, of Kentucky, Dec. 30, 1860.
 Secretary of the Navy: Isaac Toucey, of Connecticut, March 6, 1857.
 Secretary of the Interior: Jacob Thompson, of Mississippi, March 6, 1857—resigned Jan. 8, 1861.
 Postmasters-general: Aaron V. Brown, of Tennessee, March 6, 1857—died March 8, 1859; Joseph Holt, of Kentucky, July, 1859; Horatio King, of Maine, Feb. 12, 1861.
 Attorneys-general: Jeremiah S. Black, of Pennsylvania, March 6, 1857; Edwin M. Stanton, of Ohio, Dec. 1860.

Fourteenth Administration—1861 to 1869.

Presidents: Abraham Lincoln, of Illinois, died April 15, 1865. Andrew Johnson, of Tennessee, succeeded Abraham Lincoln, April 15, 1865.
 Vice-Presidents: Hannibal Hamlin, of Maine; Andrew Johnson, of Tennessee, March 4, 1865—died July 31, 1875.
 Secretary of State: William H. Seward, of New York, March, 1861.
 Secretary of the Treasury: Salmon P. Chase, of Ohio, March, 1861; William P. Fessenden, of Maine, Sept., 1864; Hugh McCulloch, of Indiana, March, 1865.
 Secretaries of War: Simon Cameron, of Pennsylvania, March, 1861; Edwin M. Stanton, of Ohio Jan., 1862.
 Secretary of the Navy: Gideon Welles, of Connecticut, March, 1861.
 Secretaries of the Interior: Caleb B. Smith, of Indiana, March, 1861—resigned Dec. 1862; John P. Usher, of Indiana, Jan., 1863; James Harlan, of Iowa, May, 1865; O. H. Browning, of Illinois, July, 1866.
 Postmasters-general: Montgomery Blair, of Maryland, March, 1861; William Dennison, of Ohio, Oct., 1864; Alexander W. Randall, of Wisconsin, July, 1866.
 Attorneys-general: Edward Bates, of Missouri, March, 1861; James Speed, of Kentucky, Dec., 1864; H. F. Stansberry, of Kentucky, July, 1866.

Fifteenth Administration—1869 to 1877.

President: Ulysses S. Grant, of Illinois.
 Vice-Presidents: Schuyler Colfax, of Indiana; Henry Wilson, of Massachusetts, March 4, 1873.
 Secretaries of State: Elihu B. Washburne, of Illinois, March 5, 1869; Hamilton Fish, of New York, March 11, 1869.
 Secretaries of the Treasury: George S. Boutwell, of Massachusetts, March 11, 1860; William A. Richardson, of Massachusetts, March 17, 1873; Benjamin H. Bristow, of Kentucky, June 2, 1874; Lot M. Morrill, of Maine, June 21, 1876.
 Secretaries of War: John A. Rawlins, of Illinois, March 11, 1869; William T. Sherman, of Ohio, Sept. 9, 1869; William W. Belknap, of Iowa, Oct. 25, 1869.
 Secretaries of the Navy: Adolph E. Borie, of Pennsylvania, March 5, 1869; George M. Robeson, of New Jersey, June 25, 1869.

Secretaries of the Interior: Jacob D. Cox, of Ohio, March 5, 1869; Columbus Delano, of Ohio, Nov. 1, 1870; Zachariah Chandler, of Michigan, Oct. 19, 1875.

Postmasters-general: John A. J. Creswell, of Maryland, March 5, 1869; James W. Marshal, of Pennsylvania, July 3, 1874; Marshall Jewell, of Connecticut, Aug. 24, 1874; James N. Tyner, of Indiana, July 12, 1876.

Attorneys-general: Ebenezer R. Hoar, of Massachusetts, March 5, 1869; Amos T. Akerman, of Georgia, June 23, 1870; George H. Williams, of Oregon, Jan. 10, 1872; Edwards Pierpont, of New York, May 15, 1875; Alphonso Taft, of Ohio, May 22, 1876.

Sixteenth Administration—1877 to 1881.

President: Rutherford B. Hayes, of Ohio.
Vice-President: William A. Wheeler, of New York.
Secretary of State: William M. Evarts, of New York, March 12, 1877.

Secretary of the Treasury: John Sherman, of Ohio, March 8, 1877.

Secretaries of War: George W. McCrary, of Iowa, March 12, 1877; Alexander Ramsey, of Minnesota, Dec. 10, 1879.

Secretaries of the Navy: Richard W. Thompson, of Indiana, March 12, 1877; Nathan Goff, Jr., of West Virginia, Jan. 6, 1881.

Secretary of the Interior: Carl Schurz, of Missouri, March 12, 1877.

Postmasters-general: David M. Key, of Tennessee, March 12, 1877; Horace Maynard, of Tennessee, June 2, 1880.

Attorney-general: Charles Devens, of Massachusetts, March 12, 1877.

Seventeenth Administration—1881.

President: James A. Garfield, of Ohio—died Sept. 19, 1881, when Vice-President Chester A. Arthur, of New York, became president.

Vice-President: Chester A. Arthur, of New York, succeeded to the presidency Sept. 19, 1881.

Secretaries of State: James G. Blaine, of Maine, March 5, 1881; F. T. Frelinghuysen, of New Jersey, Dec. 12, 1881.

Secretaries of the Treasury: William Windom, of Minnesota, March 5, 1881; Charles J. Folger, of New York, Oct. 27, 1881.

Secretary of War: Robert T. Lincoln, of Illinois, March 5, 1881.

Secretary of the Navy: William H. Hunt, of Louisiana, March 5, 1881.

Secretary of the Interior: Samuel J. Kirkwood, of Iowa, March 5, 1881.

Postmasters-general: Thomas L. James, of New York, March 5, 1881; Timothy O. Howe, of Wisconsin, Dec. 20, 1881.

Attorneys-general: Wayne McVeagh, of Pennsylvania, March 5, 1881; Benjamin Harris Brewster, of Pennsylvania, Dec. 16, 1881.

Eighteenth Administration—1885 to 1889.

President: Grover Cleveland, of New York.
Vice-President: Thomas A. Hendricks, of Indiana.
Secretary of State: Thomas F. Bayard, of Delaware, March 5, 1885.

Secretary of the Treasury: Charles S. Fairchild, of New York, March 5, 1885.

Secretary of War: William C. Endicott, of Massachusetts, March 5, 1885.

Secretary of the Navy: William C. Whitney, of New York, March 5, 1885.

Secretary of the Interior: Lucius Q. C. Lamar, of Wisconsin, March 5, 1885.

Postmaster-General: William F. Vilas, of Wisconsin, March 5, 1885.
Attorney-General: Augustus H. Garland, of Arkansas, March 5, 1885.

Nineteenth Administration—1889 to 1893.

President: Benjamin Harrison, of Indiana.
Vice-President: Levi P. Morton, of New York.
Secretary of State: James G. Blaine, of Maine.

Secretary of the Treasury: William Windom, of Minnesota, died Jan. 29, 1891;* John N. Foster, of Ohio.

Secretary of War: Redfield Proctor, of Vermont.
Secretary of the Navy: Benjamin F. Tracy, of New York.

Secretary of the Interior: John W. Noble, of Indiana.

Postmaster-General: John Wanamaker, of Pennsylvania.

Attorney-General: William H. Miller, of Indiana.

Sec'y of Agriculture: Jeremiah M. Rusk, of Illinois.

FORMATION OF STATES AND TERRITORIES.

Alabama—From territory ceded to United States by South Carolina and Georgia. Admitted Dec. 14, 1819.

Arkansas—From territory ceded by France. Admitted June 15, 1836.

California—From territory ceded by Mexico. Admitted Sept. 9, 1850.

Colorado—From portion of territory ceded by France and Mexico. Admitted Aug. 1, 1876.

Columbia, District of—From territory ceded by Maryland and Virginia. Established as seat of government July 16, 1790. Alexandria retroceded July 1846.

Connecticut—One of the thirteen original States. Ratified Constitution Jan. 9, 1788.

Delaware—One of the thirteen original States. Ratified Constitution Dec. 7, 1787.

Florida—From territory ceded by Spain. Admitted March 3, 1845.

Georgia—One of the thirteen original States. Ratified Constitution Jan. 2, 1788.

Idaho—From Territory of Idaho. Admitted July 3, 1890.

Illinois—Out of territory ceded by Virginia. Admitted Dec. 3, 1818.

Indiana—From territory ceded by Virginia. Admitted Dec. 11, 1816.

Iowa—From part of Wisconsin Territory. Admitted Dec. 28, 1846.

Kansas—Composed of territory ceded by France and the State of Texas. Admitted Jan. 29, 1861.

Kentucky—From the territory of Virginia. Admitted June 1, 1792.

Louisiana—From territory ceded by France. Admitted April 8, 1812.

Maine—Out of part of territory of Massachusetts. Admitted March 15, 1820.

Maryland—One of the thirteen original States. Ratified Constitution April 28, 1788.

Massachusetts—One of the thirteen original States. Ratified Constitution Feb. 6, 1788.

Michigan—From territory ceded by Virginia. Admitted Jan. 26, 1837.

Minnesota—From territory ceded by France. Admitted May 11, 1858.

Mississippi—From territory ceded by Georgia and South Carolina. Admitted Dec. 10, 1817.

* Secretary Windom immediately after closing a lengthy and very able speech at a banquet of the New York Chamber of Commerce, suddenly expired Jan. 29, 1891, aged 63.

- Missouri*—From territory ceded by France. Admitted Aug. 10, 1821.
 - Montana*—Territory of Montana. Admitted Nov. 8, 1889.
 - Nebraska*—From territory ceded by France. Admitted March 1, 1867.
 - Nevada*—From territory obtained from Mexico. Admitted Oct. 31, 1864.
 - New Hampshire*—One of the thirteen original States. Ratified Constitution June 21, 1788.
 - New Jersey*—One of the thirteen original States. Ratified Constitution Dec. 18, 1787.
 - New York*—One of the thirteen original States. Ratified Constitution July 26, 1788.
 - North Carolina*—One of the thirteen original States. Ratified Constitution Nov. 21, 1789.
 - North Dakota*—From Territory of Dakota. Admitted Nov. 2, 1889.
 - Ohio*—Out of territory ceded by Virginia. Admitted Nov. 29, 1802.
 - Oregon*—From territory included in treaty with France, 1803, and Spain, 1819, and Great Britain, 1846. Admitted Feb. 14, 1859.
 - Pennsylvania*—One of the thirteen original States. Ratified Constitution Dec. 12, 1787.
 - Rhode Island*—One of the thirteen original States. Ratified Constitution May 29, 1790.
 - South Carolina*—One of the thirteen original States. Ratified Constitution May 23, 1788.
 - South Dakota*—From Territory of Dakota. Admitted Nov. 2, 1889.
 - Tennessee*—Out of territory ceded by North Carolina. Admitted June, 1796.
 - Texas*—Independent republic. Admitted Dec. 29, 1845.
 - Vermont*—From part of the territory of New York. Admitted March 4, 1791.
 - Virginia*—One of the thirteen original States. Ratified Constitution June 26, 1788.
 - Washington*—From Territory of Washington. Admitted Nov. 11, 1889.
 - West Virginia*—Formed out of a portion of the State of Virginia. Admitted Dec. 31, 1862.
 - Wisconsin*—From part of the territory of Michigan. Admitted May 20, 1848.
 - Wyoming*—From Territory of Wyoming. Admitted July 10, 1890.

APPORTIONMENTS OF CONGRESSIONAL REPRESENTATIONS.

The Constitution (Sec. 2, of Fourteenth Amendment) provides that "Representatives shall be apportioned among the several States according to their respective numbers, counting the whole number of persons in each State, excluding Indians not taxed." This provision amended the first paragraph of clause 3, Section 2, of Article 1 of the original Constitution. Congress, under authority of the quoted clause of the Constitution passed the Census Act of March 1, 1790; the Act of Feb. 25, 1791, providing that Kentucky and Vermont should have two Representatives each until the next apportionment; and the Act of April 14, 1792—this last being the first Apportionment Act passed under the Census of 1790. This Act fixed the total number of Representatives at 105, distributed as shown in the 2d column of the table. The subsequent apportionment Acts under several successive Censuses bore dates and made provision as

to ratios of representation and numbers of Representatives as follows:

Second Census (1800).—Act of Jan. 14, 1802, ratio 1 to 33,000; number of Representatives, 141.

Third Census (1810).—Act of Dec. 21, 1811; ratio of representation, 1 to 35,000; number of Representatives, 181.

Fourth Census (1820).—Act of March 7, 1822; ratio of representation, 1 to 40,000; number of Representatives, 212.

Fifth Census (1830).—Act of May 22, 1832; ratio of representation, 1 to 47,700; number of Representatives, 212.

Sixth Census (1840).—Act of June 25, 1842; ratio of representation, 1 to 70,680; and "1 additional member for each State having a fraction greater than one moiety of said ratio;" number of Representatives, 223. Under the following named Supplement Acts, additional Representatives were assigned until after the next Census and Apportionment as follows; namely: Act of May 29, 1842, 3 for Wisconsin; Act of Dec. 29, 1845, 2 for Texas; Act of Aug. 4, 1846, 2 for Iowa; and Act of Sept. 9, 1850, 2 for California.

Seventh Census (1850).—Under the Census Act of May 23, 1850, the House was to be composed of 293 members to be apportioned among the States as follows, viz:

SEC. 25. *And be it further enacted*, That so soon as the next and each subsequent enumeration of the inhabitants of the several States, directed by the Constitution of the United States to be taken, shall be completed and returned to the office of the Department of the Interior, it shall be the duty of the Secretary of the Interior to ascertain the aggregate representative population of the United States, by adding to the whole number of free persons in all the States, including those bound to service for a number of years, and excluding Indians not taxed, three-fifths of all other persons, which aggregate population he shall divide by the number two hundred and thirty-three, and the product of such division, rejecting any fraction of a unit, if any such happen to remain, shall be the ratio or rule of apportionment of Representatives among the several States under such enumeration; and the said Secretary of the Department of the Interior shall then proceed, in the same manner, to ascertain the representative population of each State, and to divide the whole number of the representative population of each State by the ratio already determined by him, as above directed, and the product of this last division shall be the number of Representatives apportioned to such State under the then last enumeration; *Provided*, That the loss in the number of members caused by the fractions remaining in the several States on the division of the population thereof shall be compensated for by assigning to so many States having the largest fractions one additional member each for its fraction as may be necessary to make the whole number of Representatives two hundred and thirty-three; *And provided also*, That, if, after the apportionment of the Representatives under the next or any subsequent census, a new State or States shall be admitted into the Union, the Representative or Representatives assigned to such new State or States shall be in addition to the number of Representatives hereinabove limited, which excess of Representatives over two hundred and thirty-three shall only continue until the next succeeding census.

The ratio of representation under this census was fixed at 1 to 93,420; and under following Acts two additional Representatives were assigned as follows: Under Act of Feb. 26, 1857, one for Minnesota, and under Act of Feb. 14, 1859, one for Oregon.

Eighth Census (1860).—Act of March 4, 1862, fixed the number of members of the House after March 3, 1863, at 241, the eight additional members being assigned one each to Pennsylvania, Ohio, Kentucky, Illinois, Iowa, Minnesota, Vermont, and Rhode Island. The ratio of Representatives was fixed at 1 to 127,381.

Ninth Census (1870).—Act of Feb. 2, 1872, provided that after March 3, 1873, the House should be composed of 293 members. The remainder of the Act was as follows:

SECTION 2. That in each State entitled under this law to more than one Representative, the number to which said

States shall be entitled in the Forty-third, and each subsequent Congress, shall be elected by districts composed of contiguous territory, and containing as nearly as practicable an equal number of inhabitants, and equal in number to the number of Representatives to which said States may be entitled in Congress, no one district electing more than one Representative; *Provided*, That in the election of Representatives to the Forty-third Congress in any State which by this law is given an increased number of Representatives, The additional Representative or Representatives allowed to such State may be elected by the State at large and the other Representatives to which the State is entitled by the districts as now prescribed by law in said State, unless the Legislature of said State shall otherwise provide before the time fixed by law for the election of Representatives therein.

SEC. 3. That the Tuesday next after the first Monday in November, in the year 1876, is hereby fixed and established as the day, in each of the States and territories of the United States, for election of Representatives and Delegates to the Forty-ninth Congress; and the Tuesday next after the first Monday in November, in every second year thereafter, is hereby fixed and established as the day for the election, in each of said States and Territories, of Representatives and Delegates to the Congress commencing on the fourth day of March next thereafter.

SEC. 4. That if, upon trial, there shall be a failure to elect a Representative or Delegate in Congress in any State, District, or Territory, upon the day hereby fixed and established for such election, or if, after any such election, a vacancy shall occur in any such State, District, or Territory, from death, resignation, or otherwise, an election shall be held to fill any vacancy caused by such failure, resignation, death, or otherwise, at such time as is or may be provided by law for filling vacancies in the State or Territory in which the same may occur.

SEC. 5. That no State shall be hereafter admitted to the Union without having the necessary population to entitle it to at least one Representative according to the ratio of representation fixed on this bill.

SEC. 6. That should any State, after the passage of this act, deny or abridge the right of any of the male inhabitants of such State, being twenty-one years of age, and citizens of the United States, to vote at any election named in the amendments to the Constitution, article fourteen, section two, except for participation in the rebellion or other crime, the number of Representatives apportioned in this act to such State shall be reduced in the proportion which the number of such male citizens shall have to the whole number of male citizens twenty-one years of age in such State.

Under this Census the ratio of Representatives was 1 to 131,425.

By the act of May 30, 1872, entitled "An act supplemental to an act entitled 'An act for the apportionment of Representatives to Congress among the several States according to the Ninth Census,'" the representation in the House of Representatives was further increased as follows, viz:

That from and after the third day of March, eighteen hundred and seventy-three, the following States shall be entitled to one Representative each in the Congress of the United States in addition to the number apportioned to such States by the act entitled "An act for the apportionment of Representatives to Congress among the several States according to the Ninth Census," approved February second, eighteen hundred and seventy-two, to wit: New Hampshire, Vermont, New York, Pennsylvania, Indiana, Tennessee, Louisiana, Alabama, and Florida, and be elected by separate districts, as in said act directed; *Provided*, That in the election of Representatives to the Forty-third Congress only, in any State which by this law is given an increased number of Representatives, the additional representative allowed to such State may be elected by the State at large, unless the legislature of said State shall otherwise provide before the time fixed by law for the election of Representatives therein.

Tenth Census (1880).—The act of Feb. 25, 1882, enacted as follows:

SECTION 1. That after March 3, 1883, the House of Representatives shall be composed of 325 members, to be apportioned as follows: [See in table under column 1880, next page.]

SEC. 2. That whenever a new State is admitted to the Union, the Representative or Representatives assigned to it shall be in addition to the number 325.

SEC. 3. That in each State entitled under this apportionment the number to which such State may be entitled in the forty-eighth and each subsequent Congress shall be elected by districts composed of contiguous territory, and containing as nearly as practicable an equal number of inhabitants, and equal in number to the Representatives to which such State may be entitled in Congress, no one district electing more than one Representative; *Provided*, That unless the Legislature of such State shall otherwise provide before the election of such representatives shall take place as provided

by law, where no change shall be hereby made in the representation of a State, the Representatives thereof to the forty-eighth Congress shall be elected therein as now provided by law. If the number as hereby provided for shall be larger than it was before this change, then the additional Representative or Representatives allowed to said State under this apportionment may be elected by the State at large, and the other Representatives to which the State is entitled by the districts as now prescribed by law in said State; and if the number hereby provided for shall in any State be less than it was before the change hereby made, then the whole number to such State hereby provided for shall be elected at large, unless the Legislature of said States have provided or shall otherwise provide before the time fixed by law for the next election of Representatives therein.

All acts and parts of acts inconsistent herewith are hereby repealed.

The ratio of representation under the Tenth Census was 1 to 151,912.

The act of February 22, 1889, providing for the admission of the States of Montana, North Dakota, South Dakota, and Washington, increased the representation in the House to three hundred and thirty members, which was further increased by the acts of July 3 and 10, 1890, admitting the States of Idaho and Wyoming, to three hundred thirty-two members.

Eleventh Census (1890).—The Act of Congress fixing the ratio of representation for ensuing Quadrennium at 1 to 173,901; the total number of Representatives at 356; and the number of Representatives for the States severally shown in the last column of the Table of Assignments to the several States.

ELECTION AND RIGHTS OF TERRITORIAL DELEGATES TO CONGRESS.

Every Territory shall have the right to send a Delegate to the House of Representatives of the United States, to serve during each Congress, who shall be elected by the voters in the Territory qualified to elect members of the legislative assembly thereof. The person having the greatest number of votes shall be declared by the governor duly elected, and a certificate shall be given accordingly. Every such Delegate shall have a seat in the House of Representatives, with the right of debating, but not of voting.

The first election of a delegate in any Territory for which a temporary government is hereafter provided by Congress shall be held at the time and places and in the manner the governor of such Territory may direct, after at least sixty days' notice, to be given by proclamation; but at all subsequent elections therein, as well as at all elections for a Delegate in organized Territories, such time, places, and manner of holding the election shall be prescribed by the law of each Territory.

The Speaker shall appoint from among the Delegates one additional member on each of the following committees, viz.: Coinage, Weights and Measures; Agriculture; Military Affairs; Post-Offices and Post-Roads; Public Lands; Indian Affairs; Territories; Private Land Claims, and Mines and Mining; and they shall possess in their respective committees the same powers and privileges as in the House, and may make any motion except to reconsider.—RULE XII.

In the organization of the House, the names of Delegates are called over after those of members, and before taking their seats the same oath or affirmation is administered as in the case of members.

The right of a Delegate to submit a resolution is recognized by RULE XII, and it is also competent for him to submit any motion which a member may make, except the motion to reconsider, which is dependent on the right to vote.

NUMBER OF REPRESENTATIVES IN CONGRESS ASSIGNED TO STATES AND TERRITORIES.

The following table shows the number of Representatives to Congress assigned to each of the United States previous to 1790, and from 1790 to 1890:

| States and Territories. | Before census. | 1790. | 1800. | 1810. | 1820. | 1830. | 1840. | 1850. | 1860. | 1870. | 1880. | 1890. |

* Admitted into the Union after the apportionment under which they are here arranged was made, but before the succeeding census.

† Previous to March 3, 1820, Maine formed part of Massachusetts, and was called *The District of Maine*, and its representatives were numbered with those of Massachusetts. By compact between Maine and Massachusetts, Maine became a separate and independent State, and by an act of Congress of March 3, 1820, was admitted into the Union as such—the admission to take place on the 15th of the same month. On April 7, 1820, Maine was declared entitled to seven Representatives, to be taken from those of Massachusetts.

‡ Territory—Not yet admitted to full representation in House.

NOTE.—Ratios of representation: 1790 and 1800, 1 to 33,900; 1810, 35,000; 1820, 40,000; 1830, 47,700; 1840, 70,680; 1850, 93,420; 1860, 127,000; 1870, 131,425; 1880, 151,912; 1890, 1 to 173,912.

STATE CONSTITUTIONS AND STATE GOVERNMENTS.

By the constitutions of all the States except New York, Pennsylvania, Ohio, Wisconsin, Kansas, and Delaware, the powers of government are divided into three distinct departments—the legislative, executive, and judicial.

There is in each State and Territory a legislature. In twenty it is called the *General Assembly*; in Oregon and all the Territories, the *Legislative Assembly*; and in New Hampshire and Massachusetts, the *General Court*, consisting of a senate (in the Territories a council) and a house of represen-

tatives, called in New York, Wisconsin, California, Nevada, and Florida the *Assembly*; in Maryland, Virginia, West Virginia, the *House of Delegates*, and in New Jersey the *General Assembly*.

In all the States there is a governor, who is the executive authority, and there is also generally a lieutenant-governor. But when there is no lieutenant-governor the president of the senate succeeds if the governor dies or becomes incapable. His powers are similar to those of the President of the United States. The following are some of the qualifications required in the various States:

No person, in eleven States, can be a governor unless he is a citizen of the United States; in three, he must have been so for two years; in five, for five years; in Florida, nine years; in four, ten years; in one, twelve years; in Georgia, fifteen years, and in New Jersey and Mississippi, twenty years. He must also have been resident for periods varying from one year to ten.

In some States the governor must not be less than twenty-five years of age, in most thirty years, and in two (Kentucky and Missouri), thirty-five.

In Delaware he is not eligible a second time for office. In Tennessee he is not eligible for more than six years in any term of eight. So in Oregon, for not more than eight years in any period of twelve years; in Indiana, for not more than four years in any term of eight.

By the constitutions of seven States, the governor is not eligible for reelection for any two successive terms, unless the office devolved upon him. In Georgia he is not eligible for four years after the second term.

In Massachusetts, he must be possessed of a freehold estate, in his own right, of the value of \$5,000. He is elected directly by the people, and, not like the President, through a college of electors. His term of office varies from four years in sixteen States to three years in three States, two years in eighteen States, and a year in two States (Massachusetts and Rhode Island).

Both the senate and the house are in all States elected at the general election day, and vacancies in either house are generally filled in the same way by special election; but in New Hampshire and Maine vacancies are so filled by election only in the house; a vacancy in the senate is filled by joint ballot of the legislatures; so in Massachusetts vacancies in the Senate are filled by special election, upon the order of a majority of the senators elected.

A senator, by the constitution of most States, is elected for four years; in New Jersey for three years, in several for two years, and in two (Massachusetts and Rhode Island) for one year.

Half the senators are in many States elected at each general election, the other half holding over; but in two, one-third are elected at each general election, the others keeping their seats.

Representatives are usually elected for two years, but in Louisiana they are elected for four years, and in Massachusetts, Rhode Island, New York and New Jersey their tenure of office is only for one year. As a rule no person can be a State senator who is not a citizen of the United States, and in Maine he must have been thus qualified for four years.

Residence in the State is also required for terms varying from one year in eight States to four years in five, six years in one (Kentucky), and seven years in one (New Hampshire), besides which he must have been usually resident in the senatorial district for which he is a candidate for various periods ranging from one year to three months, and in Illinois and Louisiana for two years.

To be eligible as a State senator a candidate must have paid a State and county tax within one year of election. By the constitution of Delaware no person can be a senator who is not possessed of a freehold estate of 200 acres, of a personal or mixed estate of the value of \$5,000.

By the constitutions of fourteen States, no person can be a representative in the lower house of the State legislature who is not a citizen of the United States, and in Maine he must have been so for five years. And in many he must have been resident in the State for a certain period, varying from one year in seven of the States to five years in two (Illinois and Louisiana). In nine of the States he must also be a qualified elector of the State, and in nearly, if not quite all, he must have been resident in the district for which he is chosen for a period varying from sixty days in Iowa to two years in Illinois and Louisiana.

In thirteen States a representative loses his seat if he ceases to reside in the district, and in six he must be a qualified elector in such district.

In fourteen States a candidate must be twenty-one years of age at the time of his election, in three, twenty-four (Delaware, Kentucky, and Missouri), and in Colorado twenty-five.

In Massachusetts the constitution forbids any property qualification for the State Legislature or council.

The following persons are disqualified from sitting in the State legislature:

In Nebraska any person interested in a contract with or an unadjusted claim against the State.

In Delaware, any person concerned in any army or navy contract.

In West Virginia, any salaried officer of a railroad.

In Kansas and Georgia, every person convicted of embezzlement of the public funds.

In Delaware, every person who has served as a State treasurer, before his accounts have been settled and discharged.

In Georgia, any person who has not paid his legal taxes.

In West Virginia and South Carolina, any person who has been convicted of bribery, perjury, or other infamous crime, or who has not accounted for public money intrusted to him.

In most States provision is made by the constitution that members of the legislature shall receive compensation. In several it cannot be increased or diminished during the term for which they are elected, and in two (Missouri and Texas) it cannot be altered at all by the legislature at any time, the amount being fixed by the constitution.

In fourteen States no member of Congress is eligible for the State legislature.

Members of the legislature are, by the constitutions of most of the States, required to make oath to support the National, and the State (if in a State) constitutions, and in one (Arkansas) to support the Union, and in five that they have not bribed anybody, and in four that they will not accept a bribe for giving or withholding a vote, or for doing any duty relating to their office, and in three (Kentucky, Texas, and Nevada) that they have not been concerned in a duel.

The mode of election is in twelve States by ballot; but in Kentucky all election by the people must be *viva voce*, except that dumb persons may vote by ballot. By the constitution of nearly all, the person having the highest number (in a plurality) of votes is declared duly elected; but in Rhode Island, in all elections held by the people, a majority of votes cast is necessary to a choice. (Kentucky now has the Australian ballot.)

By the constitution of Illinois (each district voting for three representatives) each voter may cast as many votes for each candidate as there are State representatives to be elected, or may distribute his votes among the candidates as he sees fit.

In nearly all the States and Territories election day is fixed by the constitution or statutes for the first Tuesday after the first Monday in November; (1) biennially in the even years in twenty-one States; (2) biennially in the odd years in three States; (3) annually in nine States; the remainder vary as to their day.

The right of suffrage is given to every male citizen of the United States aged twenty-one or who has declared his intention of becoming a citizen.

Under the head of "Qualifications of Voters" will be found a table giving the requirements of the constitutions of the several States in respect to suffrage. It is believed to be substantially accurate, but will be verified before republication in the next edition, and additional matter given.

By the constitution of all the States, except Nebraska and Oregon, an impeachment is first made by the House of Representatives, and is tried by the Senate sitting as a court under oath, except in New York, when it is tried by the Senate and the judges of the court of appeals.

Two-thirds of the Senators *elected* must, in fifteen States, concur for conviction; and in nineteen, two-thirds of the Senators *present*. In New Hampshire, Massachusetts, Alabama, and Mississippi a vote of a quorum is sufficient; but in Nebraska the impeachment is first made by the Legislature in joint convention upon resolution in either house, and a majority of elected members must concur; and it is then tried by the judges of the Supreme court.

The effect of impeachment is, by the constitutions of all but Maryland and Oregon, merely to remove from office, and in all the States, except five, to disqualify the person impeached from holding any other State appointment.

A person impeached, whether convicted or not on the impeachment, is nevertheless liable, by the constitutions of all the States, except Indiana and Maryland, to indictment, trial, and punishment according to law.

By the constitutions of thirty-two States either house may (8) expel any of its members by a vote of two-thirds of the elected members, and in Vermont, by a majority vote of a quorum. But in twenty-five States no member can be expelled a second time for the same cause, nor in Vermont, Michigan, or Arizona for any cause known to his constituents before his election.

In Michigan and Arizona the reason for expulsion must be entered in the journal, with the names of the members voting.

In Pennsylvania, Arkansas, Colorado, and Alabama a member expelled for corruption is not thereafter eligible for either house.

Each house has in thirty of the States power to punish its members for disorderly conduct; and in many, either house may punish any person, not a member, for disorderly or contemptuous conduct, such punishment not to extend beyond the final adjournment of the session, and in others, by different terms of imprisonment, varying from thirty days to twenty-four hours.

The constitutions of all the States provide that each house shall be the judge of the qualifications, elections, and returns of its members.

In most cases it is provided that each house shall choose its own officers, except in certain cases the

president of the senate, which place is filled (1) in eighteen States by the lieutenant-governor, (2) in Rhode Island by the governor or lieutenant-governor or the secretary of state. In all other States it is enacted that each house shall determine the rules of its own proceedings.

By the constitutions of nearly all of the States a majority of elected members in either house constitutes a quorum, but in five two-thirds are necessary. In New Hampshire a majority is a quorum in the house, but when less than two-thirds are present a two-thirds vote is necessary to any act or proceeding, and in the senate thirteen are necessary to a quorum, and when less than sixteen are present a vote of ten is necessary, and in Massachusetts sixteen members constitute a quorum in the senate and one hundred in the house. But a smaller number than a quorum may, in thirty-two States, adjourn from day to day and compel the attendance of absent members. Freedom of speech is guaranteed by the constitutions of most of the States, as well as freedom from arrest in all cases except treason, felony, and breach of the peace during the session of the legislature, and in going and returning. In Michigan, Wisconsin, California, and Arizona the privilege from arrest (except as above) lasts during the whole of the time that they are members of the legislature.

In most of the legislatures it is provided by the constitutions that the proceedings shall be open to the public, except on such occasions as may, in the opinion of the house, require secrecy.

The regular session of the legislature is in one State (Rhode Island) twice a year; in Massachusetts, New York, New Jersey, and South Carolina, once a year; and in others every two years, in the even or the odd year as the case may be.

There are, however, often adjourned sessions held in the intervening year, except in Pennsylvania, where they are prohibited. The length of the session is limited in many of the States, thus: In Indiana the limit is sixty-one days; in Colorado and Georgia, forty days; in six States and two Territories, sixty days; in Maryland, ninety days; in Alabama, thirty days; West Virginia, forty-five days.

Extra sessions on extraordinary occasions may be convened by the governor, but no such extraordinary session can be called in the Territories without the approval of the President of the United States. In Virginia an extra session is convened on the application of two-thirds of the members; in West Virginia, on application of three-fifths of the elected members, except on extraordinary occasions.

In West Virginia, Kentucky, and Georgia the ordinary session may be continued by a two-thirds vote, and in Virginia the session may be continued for thirty days beyond the time limited, upon the concurrence of three-fifths of the members.

By the constitutions of all the States, neither house can adjourn without the consent of the other for more than three or two days (as the case may be).

In most States, if the two houses disagree with respect to the time of adjournment, the governor may adjourn the legislature to such time as he thinks proper, with certain limitations, such as not beyond the first day of the regular session in fifteen States; for not more than ninety days in New Hampshire, Massachusetts, and Delaware, and not exceeding four months in Pennsylvania, and Kentucky; no limit being given in Vermont and Georgia.

Amendments to the constitution of a State may be proposed by the State legislature for confirma-

tion by the people of the State (except in Kentucky and New Hampshire), or the citizens may be asked to decide on the advisability of holding a convention for the revision of the constitution. If a convention is decided upon, the amendments made by it are referred for ratification or rejection to the vote of the people.

LENGTH OF CONGRESSIONAL SESSIONS.

As stated elsewhere the Congressional terms are for two full years beginning at noon, March 4, of each alternate year; the Congressional sessions generally begin on the first Monday in December of each year, and continue until formal adjournment, which cannot be later than noon of March 4, of each second year. The following table gives the numbers of the several Congresses, and the number and dates of the sessions during each Congressional term.

| Congress. | Time of Session. |
|-----------|---|
| 1st | 1st Session From March 4, 1789, to Sept. 29, 1789 |
| | 2d From January 4, 1790, to August 12, 1790 |
| | 3d From December 6, 1790, to March 3, 1791 |
| 2d | 1st From October 24, 1791, to May 8, 1792 |
| | 2d From November 5, 1792, to March 2, 1793 |
| 3d | 1st From December 2, 1793, to June 9, 1794 |
| | 2d From November 3, 1794, to March 3, 1795 |
| 4th | 1st From December 7, 1795, to June 1, 1796 |
| | 2d From December 5, 1796, to March 3, 1797 |
| 5th | 1st From May 15, 1797, to July 10, 1797 |
| | 2d From November 13, 1797, to July 16, 1798 |
| 6th | 3d From December 3, 1798, to March 3, 1799 |
| | 1st From December 2, 1799, to May 14, 1800 |
| 7th | 2d From November 17, 1800, to March 3, 1801 |
| | 1st From December 7, 1801, to May 3, 1802 |
| 8th | 2d From December 6, 1802, to March 3, 1803 |
| | 1st From October 17, 1803, to March 27, 1804 |
| 9th | 2d From November 5, 1804, to March 3, 1805 |
| | 1st From December 2, 1805, to April 21, 1806 |
| 10th | 2d From December 1, 1806, to March 3, 1807 |
| | 1st From October 26, 1807, to April 25, 1808 |
| 11th | 2d From November 7, 1808, to March 3, 1809 |
| | 1st From May 22, 1809, to June 28, 1809 |
| 12th | 2d From November 27, 1809, to May 1, 1810 |
| | 1st From December 3, 1810, to March 3, 1811 |
| 13th | 2d From November 4, 1811, to July 6, 1812 |
| | 1st From December 2, 1812, to March 3, 1813 |
| 14th | 2d From May 24, 1813, to August 2, 1813 |
| | 1st From December 6, 1813, to April 18, 1814 |
| 15th | 2d From September 19, 1814, to March 3, 1815 |
| | 1st From December 4, 1815, to April 30, 1816 |
| 16th | 2d From December 2, 1816, to March 3, 1817 |
| | 1st From December 1, 1817, to April 20, 1818 |
| 17th | 2d From November 16, 1818, to March 3, 1819 |
| | 1st From December 6, 1819, to May 15, 1820 |
| 18th | 2d From November 13, 1820, to March 3, 1821 |
| | 1st From December 3, 1821, to May 8, 1822 |
| 19th | 2d From December 2, 1822, to March 9, 1823 |
| | 1st From December 1, 1823, to May 27, 1824 |
| 20th | 2d From December 6, 1824, to March 3, 1825 |
| | 1st From December 5, 1825, to May 22, 1826 |
| 21st | 2d From December 4, 1826, to March 3, 1827 |
| | 1st From December 3, 1827, to May 26, 1828 |
| 22d | 2d From December 1, 1828, to March 3, 1829 |
| | 1st From December 7, 1829, to May 31, 1830 |
| 23d | 2d From December 6, 1830, to March 3, 1831 |
| | 1st From December 5, 1831, to July 16, 1832 |
| 24th | 2d From December 3, 1832, to March 3, 1833 |
| | 1st From December 2, 1833, to June 30, 1834 |
| 25th | 2d From December 1, 1834, to March 3, 1835 |
| | 1st From December 7, 1835, to July 4, 1836 |
| 26th | 2d From December 5, 1836, to March 3, 1837 |
| | 1st From September 4, 1837, to Oct. 16, 1837 |
| 27th | 2d From December 4, 1837, to July 9, 1838 |
| | 1st From December 3, 1838, to March 3, 1839 |
| 28th | 2d From December 2, 1839, to July 21, 1840 |
| | 1st From December 7, 1840, to March 3, 1841 |
| 29th | 2d From May 31, 1841, to Sept. 18, 1841 |
| | 1st From December 6, 1841, to August 31, 1842 |
| 30th | 2d From December 5, 1842, to March 3, 1843 |
| | 1st From December 4, 1843, to June 17, 1844 |
| 31st | 2d From December 2, 1844, to March 3, 1845 |
| | 1st From December 1, 1845, to August 10, 1846 |
| 32d | 2d From December 7, 1846, to March 3, 1847 |
| | 1st From December 6, 1847, to August 14, 1848 |
| 33d | 2d From December 4, 1848, to March 3, 1849 |
| | 1st From December 3, 1849, to Sept. 30, 1850 |
| 34th | 2d From December 2, 1850, to March 3, 1851 |
| | 1st From December 1, 1851, to August 31, 1852 |
| 35th | 2d From December 6, 1852, to March 3, 1853 |

| Congress. | | Time of Session. | |
|-----------|-----|-------------------------|--------------------|
| 33d | 1st | From December 5, 1853, | to August 7, 1854 |
| | 2d | From December 4, 1854, | to March 3, 1855 |
| 31th | 1st | From December 3, 1855, | to August 18, 1856 |
| | 2d | From August 21, 1856, | to August 30, 1856 |
| 35th | 1st | From December 1, 1856, | to March 3, 1857 |
| | 2d | From December 7, 1857, | to June 14, 1858 |
| 36th | 1st | From December 6, 1858, | to March 3, 1859 |
| | 2d | From December 5, 1859, | to June 25, 1860 |
| 37th | 1st | From December 3, 1860, | to March 2, 1861 |
| | 2d | From July 4, 1861, | to August 6, 1861 |
| 38th | 1st | From December 2, 1861, | to July 17, 1862 |
| | 2d | From December 1, 1862, | to March 3, 1863 |
| 39th | 1st | From December 7, 1863, | to July 4, 1864 |
| | 2d | From December 5, 1864, | to March 3, 1865 |
| 40th | 1st | From December 4, 1865, | to July 28, 1866 |
| | 2d | From December 3, 1866, | to March 2, 1867 |
| 41st | 1st | From March 4, 1867, | to March 30, 1867 |
| | 2d | From July 3, 1867, | to July 20, 1867 |
| 42d | 1st | From November 21, 1867, | to Dec. 2, 1867 |
| | 2d | From December 2, 1867, | to July 27, 1868 |
| 43d | 1st | From December 7, 1868, | to March 3, 1869 |
| | 2d | From March 4, 1869, | to April 23, 1869 |
| 44th | 1st | From December 6, 1869, | to July 15, 1870 |
| | 2d | From December 5, 1870, | to March 3, 1871 |
| 45th | 1st | From March 4, 1871, | to April 20, 1871 |
| | 2d | From December 4, 1871, | to June 10, 1872 |
| 46th | 1st | From December 2, 1872, | to March 3, 1873 |
| | 2d | From December 1, 1873, | to June 23, 1874 |
| 47th | 1st | From December 7, 1874, | to March 3, 1875 |
| | 2d | From December 6, 1875, | to August 15, 1876 |
| 48th | 1st | From December 4, 1876, | to March 3, 1877 |
| | 2d | From October 15, 1877, | to Dec. 3, 1877 |
| 49th | 1st | From December 3, 1877, | to June 20, 1878 |
| | 2d | From December 2, 1878, | to March 3, 1879 |
| 50th | 1st | From March 18, 1879, | to July 1, 1879 |
| | 2d | From December 1, 1879, | to June 16, 1880 |
| 51st | 1st | From December 6, 1880, | to March 3, 1881 |
| | 2d | From December 5, 1881, | to August 8, 1882 |
| 52d | 1st | From December 4, 1882, | to March 3, 1883 |
| | 2d | From December 3, 1883, | to July 3, 1884 |
| 53d | 1st | From December 1, 1884, | to March 3, 1885 |
| | 2d | From December 7, 1885, | to August 6, 1886 |
| 54th | 1st | From December 6, 1886, | to March 3, 1887 |
| | 2d | From December 5, 1887, | to Oct. 20, 1888 |
| 55th | 1st | From December 3, 1888, | to March 3, 1889 |
| | 2d | From December 2, 1889, | to Oct. 1, 1890 |
| 56th | 1st | From December 1, 1890, | to March 3, 1891 |
| | 2d | From December 7, 1891, | to March 3, 1892 |
| 57th | 1st | From December 5, 1892, | to March 3, 1893 |
| | 2d | From December | |

The first table shows the list of the "extra sessions" called by Congress itself:

| When convened. | Congress. | Session. | Date of pas- sage of act. |
|---------------------------------------|-----------|----------|------------------------------|
| March 4, 1789 | 1st | First | *1788, Sept. 13 |
| 1st Monday in Jan., 1790 | 1st | Second | 1789, Sept. 29 |
| 4th Monday in Oct., 1791 | 2nd | First | 1791, Mar. 2 |
| 1st Monday in Nov., 1792 | 2nd | Second | 1792, May 5 |
| 1st Monday in Nov., 1794 | 3rd | Second | 1794, May 30 |
| 1st Monday in Nov., 1797 | 5th | First | 1797, Mar. 3 |
| Changed to 2d Monday in Nov. 1797. | 5th | Second | †1797, July 1 |
| 3d Monday in Nov., 1800 | 6th | Second | 1800, May 13 |
| 1st Monday in Nov., 1803 | 8th | First | 1803, Mar. 3 |
| 1st Monday in Nov., 1804 | 8th | Second | 1804, Mar. 26 |
| 1st Monday in Nov., 1808 | 10th | Second | 1808, Apr. 22 |
| 4th Monday in May, 1809 | 11th | First | 1809, Jan. 30 |
| 4th Monday in Nov., 1809 | 11th | Second | 1809, June 24 |
| 1st Monday in Nov., 1812 | 12th | Second | 1812, July 6 |
| 4th Monday in May, 1813 | 13th | First | 1813, Feb. 27 |
| 1st Monday in Dec., 1813 | 13th | Second | 1813, July 27 |
| Last Monday in Oct., 1814 | 13th | Third | 1814, Apr. 18 |
| 3d Monday in Nov., 1818 | 15th | Second | 1818, Apr. 18 |
| 2d Monday in Nov., 1820 | 16th | Second | 1820, May 13 |
| March 4, 1867 | 40th | First | †1867, Jan. 22 |
| March 4, 1869 | 41st | First | †1867, Jan. 22 |
| March 4, 1871 | 42nd | First | †1866, Jan. 22 |

*The First Session of the First Congress was convened in accordance with the following resolution of the Continental Congress, adopted Sept. 13, 1788, namely:

"Resolved, etc., That the first Wednesday in January next be the day for appointing electors in the several States which before the said day shall have ratified the said Constitution; that the first Wednesday in February next be the day for the electors to assemble in their several states and vote for a President; and that the first Wednesday in March next be the time, and the present seat of Congress the place, for commencing proceedings under the said Constitution.

†Repealed the act of March 3rd, 1797.
‡The act of Jan. 22, 1867, provided that in addition to the regular times of meeting of Congress, there shall be a meeting of the Congress of the United States, and of each succeeding Congress thereafter, at 12 o'clock meridian, on the fourth day of March, the day on which the term begins for which the Congress is elected. That act was repealed by the act of April 20, 1871. (17 Statutes 12.)

NOTE.—To determine the years covered by a given Congress, double the number of the Congress, and add the product to 1789; the result will be the year in which the Congress closed. Thus, the 35th Congress = 70 ÷ 1789 = 1859, that being the year which terminated the 35th Congress, on the 4th of March. To find the number of a Congress sitting in any given year, subtract 1789 from the year; if the result is an even number, half that number will give the Congress, of which the year in question will be the closing year. If the result is an odd number, add one to it, and half the result will give the Congress, of which the year in question will be the first year.

EXTRA CONGRESSIONAL SESSIONS.

The Congressional term is for two years beginning at noon on March 4 every odd year, and terminating at noon on March 4, of the next odd year. The general elections for members of the House of Representatives take place the first Tuesday after the first Monday in November of even years severally preceding the opening of the Congressional term. In case of vacancies, however, the election may occur at other dates but in all cases the term closes at noon of March 4, of the odd years.

The sessions of Congress open on the first Monday of December in every year unless they are by law specially appointed for a different date. In the foregoing list of dates for the several Congresses, the dates of the "extra sessions" are not specifically given. For greater convenience of reference they are properly classified in the following tables showing the dates when convened, the number of the Congress in which they took place, with the number of the session in that Congress, and the date of the passage of the act providing for the holding of the extra session."

List of Extra Sessions of Congress Convened by the President.

The President * * * may, on extraordinary occasions, convene both Houses or either of them.

| Congress. | Session. | | When convened. | Cause. |
|-----------|-----------|----------|----------------|--|
| | Congress. | Session. | | |
| V..... | First | ... | May 15, 1797 | Suspension of diplomatic relations with France. |
| VIII..... | First | ... | Oct. 17, 1803 | Cessions of Louisiana by Spain to France. |
| X..... | First | ... | Oct. 26, 1807 | Relations with Great Britain. |
| XII..... | First | ... | Nov. 4, 1811 | Relations with Great Britain. |
| XIII..... | Third | ... | Sept. 19, 1814 | War with Great Britain. |
| XXV..... | First | ... | Sept. 4, 1857 | Suspension of specie payments. |
| XXXVII.. | First | ... | May 31, 1841 | Condition of finances and revenue. |
| XXXIV.... | Second | ... | Aug. 21, 1856 | Failure of previous session to make appropriations for Army. |
| XXXVII.. | First | ... | July 4, 1861 | Insurrection in certain Southern States. |
| XLV..... | First | ... | Oct. 15, 1877 | Failure of previous session to make appropriations for Army. |
| XLVI..... | First | ... | Mar. 18, 1879 | Failure of previous session to make appropriation for legislative, executive and judicial and Army expenses. |

List of Special Sessions of the Senate from 1789 to 1889, Called by the President.

| No. | Commencement. | Termination. | Days. |

| 33 | March 4, 1889. | April 2, 1889. | 30 |

ADMISSION TO THE FLOOR OF THE HOUSE OF REPRESENTATIVES.

The following is the rule of the House prevailing in 1891, with regard to the admission of persons to the floor occupied by the members of Congress :

RULE XXXIV.—The persons hereinafter named, and none other, shall be admitted to the hall of the House or rooms leading thereto, viz: The President and Vice-President of the United States and their private secretaries, Judges of the Supreme Court, Members of Congress and Members elect, contestants in election cases during the pendency of their cases in the House, the Secretary and Sergeant-at-Arms of the Senate, heads of Departments, Foreign Ministers, Governors of States, the Architect of the Capitol, the Librarian of Congress and his assistant in charge of the Law Library, such persons as have, by name, received the thanks of Congress, ex-Members of the House of Representatives who are not interested in any claim or directly in any bill pending before Congress, and clerks of committees when business from their committees is under consideration; and it shall not be in order for the Speaker to entertain a request for the suspension of this rule or to present from the chair the request of any member for unanimous consent.

The first rule for the admission within the hall of other than members was adopted Jan. 7, 1802, and was confined to "Senators, officers of the General and State Governments, foreign ministers and such persons as members might introduce." Jan. 11, 1802, an attempt was made to amend so as to exclude persons "introduced by members," which failed. Nov. 8, 1804, a proposition was made to confine the privilege to *Senators*, which also failed. Dec. 17, 1805, *officers of State governments* were excluded. Feb. 1, 1808, a proposition was made to admit ex-members of Congress and the judges of the Supreme Court. After a good deal of debate it was rejected. Feb. 11, 1809, the rule was enlarged so as to admit judicial officers of the United States, as also ex-members of Congress. Feb. 25, 1814, those who had been heads of Departments were admitted. Feb. 10, 1815, officers who had received the thanks of Congress were included; Jan. 12, 1816, the Navy commissioners; Feb. 21, 1816, governors of States and Territories; and on March 13, 1822, the President's secretary. Jan. 26, 1833, the rule was further

enlarged by admitting "such persons as the Speaker or a member might introduce," and Dec. 10, 1833, the House, by a vote almost unanimous, rescinded that amendment. Dec. 23, 1857, soon after removing into the new hall in the south wing of the Capitol extension, the privilege of admission was restricted to "members of the Senate, their secretary, heads of Departments, President's private secretary, the governor for the time being of any State, and judges of the Supreme Court of the United States." March 19, 1860, it was adopted in its present form, excepting the last clause, a proposition to admit ex-members having been rejected. The last clause, adopted March 2, 1865, was intended to prevent persons not entitled to the privilege of the hall from occupying the cloak and other adjoining rooms. Jan. 29, 1878, the House adopted the following resolution, by yeas 155, to nays 92, viz: "*Resolved*, That the rule in regard to the admission of persons to the privileges of the floor be enforced, and the Speaker is requested to discontinue the practice of issuing passes, which has been indulged in by common consent."

In the revision of the rules in the second session 46th Congress, the words "contestants in election cases during the presidency of their cases in the House" were added, so as to authorize the then existing practice, and in the first session of the 48th Congress the word "Congress" was stricken and the words "House of Representatives" inserted, so as to restrict the privilege of the floor to ex-members of the House of Representatives.

VETO POWER OF THE PRESIDENT, AND THE SUBSEQUENT CONGRESSIONAL LEGISLATURE RELATING THERETO.

When a bill, having passed both houses, shall be presented to the President of the United States, "if he approve he shall sign it, but if not he shall return it, with his objections, to that house in which it shall have originated, who shall enter the objections at large on their Journal and proceed to reconsider it. If, after such reconsideration, two-thirds of that house shall agree to pass the bill, it shall be sent, together with the objections, to the other house, by which it shall likewise be reconsidered, and if approved by two-thirds of that house it shall become a law. But in all such cases the votes of both houses shall be determined by yeas and nays, and the names of the persons voting for and against the bill shall be entered on the Journal of each house, respectively. If any bill shall not be returned by the President within ten days (Sundays excepted) after it shall have been presented to him, the same shall be a law, in like manner as if he had signed it, unless the Congress by their adjournment prevent its return, in which case it shall not be a law."

A similar provision is made in the case of orders, resolutions, or votes presented to the President for his approval.

Whenever a bill is returned to the House with the objections of the President, it is usual to have the message containing his objections immediately read, and for the House to proceed to the reconsideration of the bill; or to postpone its consideration for a future day; but not where less than a quorum is present. A veto message and a bill may be referred, or the message alone, and the bill may be laid on the table.

The main question in the consideration of a vetoed bill is, "Will the House on reconsideration agree to pass the bill?"

The "two-thirds" by which a vetoed bill must be approved before it can become a law with the signature of the President, has been construed, in

both houses to mean "two-thirds of the members present."

A motion to proceed to the consideration of a vetoed bill with the objections of the President, is a privileged question under the Constitution.

A vote on the passage of a vetoed bill cannot be reconsidered. A motion to discharge a committee from the further consideration of a veto message, is a privileged question.

Whenever a bill, order, resolution, or vote is returned by the President with his objections, and on being reconsidered is passed by two-thirds of each of the two houses of Congress, and thereby becomes a law, or takes effect, it shall be received by the Secretary of State from the President of the Senate, or the Speaker of the House of Representatives, in whichever house it shall last have been approved, and he shall carefully preserve the originals.

When the President does not approve a bill, and is prevented, by the adjournment of Congress from returning it with his objections, it is usual for him to inform the house in which the bill originated, at the next session, of his reasons for not approving it.

QUALIFICATIONS OF VOTERS IN THE SEVERAL STATES.

Under the Constitution of the United States "all persons born or naturalized in the United States, and subject to the jurisdiction thereof are citizens of the United States and of the States wherein they reside;" and "no State shall make or enforce any law which shall abridge the privileges or immunities of citizens of the United States; nor shall any State deprive any person of life, liberty, or property without due process of law, nor deny to any person within its jurisdiction the equal protection of the law." In all the States except Wyoming, the right of suffrage is limited to male citizens twenty-one years of age, with the further exception that in Colorado, Massachusetts, and a few other States women are permitted to vote at school district elections. There is a great lack of uniformity in the suffrage laws of the several States, as the following will show:*

ALABAMA.—The voter must be a citizen, or have declared his intention to become a citizen; must have been in the State one year, in the county three months, and in the voting precinct one month. Indians, idiots, and men convicted of crime cannot vote.

ARKANSAS.—Citizens, or those who have declared their intention to become such, except Indians, idiots, and criminals, may vote after a residence of one year in the State, six months in the county, and one month in the voting precinct. Registration is prohibited, as being a bar to suffrage.

CALIFORNIA.—Only actual citizens can vote, after having been one year in the State, ninety days in the county, and thirty days in the voting precinct. Registration is required by law; and Chinese, Indians, idiots, and convicts are excluded.

COLORADO.—Citizens, or those who have declared their intention to become such, may vote after a residence of six months in the State, persons in prison only being excluded. Registration is required by the constitution.

CONNECTICUT.—Actual citizens, except those unable to read, and convicts, can vote after a residence of one year in the State and six months in the county and voting precinct. Registration is required by law.

DELAWARE.—Actual county taxpayers, except convicts, the insane, paupers and idiots, may vote after a residence of one year in the State and one month in the county.

FLORIDA.—Citizens of the United States, or those who have declared their intention to become such, except betters on elections, duellists, idiots, the insane, and criminals, can vote after a residence of one year in the State and six months in the county. Registration is required by the constitution.

GEORGIA.—Actual citizens, except nontaxpayers, criminals, idiots, and the insane, can vote after a residence of one year in the State and six months in the county.

IDAHO.—Every male citizen of the United States twenty-one years old, who has resided in the State for six months

and in the county where he offers to vote thirty days next preceding the day of election, is a qualified elector, except those under guardianship, idiotic or insane persons, or persons convicted of felony, embezzlement of public funds, bartering or offering to barter his vote, or of an infamous crime. Bigamists and polygamists are also excluded.

ILLINOIS.—Actual citizens, except convicts, may vote after a residence of one year in the State and ninety days in the county and thirty days in the voting precinct. Registration is required by law.

INDIANA.—Citizens or those who have declared their intention so to become, except fraudulent voters and bribers, may vote after a residence of six months in the State, sixty days in the county, and thirty days in the voting precinct.

IOWA.—Actual citizens, except criminals, idiots, and the insane may vote after a residence of six months in the State and sixty days in the county. Registration is required by law.

KANSAS.—Citizens, or those who have declared their intention to become so, except rebels, convicts, idiots, and the insane, can vote after a residence of six months in the State and thirty days in the voting precinct. Registration is required in cities only.

KENTUCKY.—Under the State law free white male citizens, except convicts can vote after a residence of two years in the State, one year in the county, and sixty days in the voting precinct; but the exclusion of colored citizens being in conflict with the Federal Constitution, the law limiting the suffrage to white citizens is of no effect.

LOUISIANA.—Citizens, or those who have declared their intention to become such, except criminals, idiots, and the insane, can vote after a residence of one year in the State, six months in the county, and thirty days in the voting precinct.

MAINE.—Actual citizens, except paupers and Indians not taxed, may vote after a residence of three months in the State. Registration is required.

MARYLAND.—Actual citizens, except criminals, those guilty of bribery, and the insane, can vote after a residence of one year in the State and six months in the county. Registration is required.

MASSACHUSETTS.—Citizens, except paupers, illiterates, nontaxpayers, and persons under guardianship, can vote after a residence of one year in the State and six months in the voting precinct. Registration is required.

MICHIGAN.—Citizens, or those who have declared their intention of becoming such, except duellists, can vote after a residence of three months in the State and ten days in the voting precinct. Registration is required.

MINNESOTA.—Citizens, or those who have declared their intention to become so, except convicts, lunatics and idiots, can vote after a residence of four months in the State and ten days in the voting precinct. Registration is required.

MISSOURI.—Citizens, or those who have declared their intention to become so, except United States soldiers, paupers, criminals, and lunatics, can vote after a residence of one year in the State and sixty days in the county. Registration is required in cities only.

MISSISSIPPI.—Actual citizens, except criminals, idiots, and lunatics, can vote after a residence of six months in the State and one month in the county. Registration is required.

MONTANA.—Every male citizen of the United States twenty-one years or over, who shall have resided in the State one year immediately preceding the election at which he offers to vote, and in the town, county, or precinct such time as may be prescribed by law, shall be a qualified elector, except idiots or insane persons. Women shall have the right to vote at any school district election.

NEBRASKA.—Citizens, or those who have declared their intention of becoming so, except United States soldiers, convicts, and idiots, can vote after a residence of six months in the State. Registration is required.

NEVADA.—Citizens, or those who have declared their intention so to become, except criminals, idiots, and lunatics, can vote after a residence of six months in the State and thirty days in the county. Registration is required.

NEW HAMPSHIRE.—Actual citizens, except paupers, can vote after a residence of six months in the town. Registration is required.

NEW JERSEY.—Actual citizens, except criminals, paupers, lunatics, and idiots, can vote after a residence of one year in the State and five months in the county. Registration is required in cities of 10,000 inhabitants and over.

NEW YORK.—Actual citizens, except convicts, and election betters and bribers, may vote after a residence of one year in the State, four months in the county, and thirty days in the voting precinct. Registration is required in cities of 10,000 inhabitants or over.

NORTH CAROLINA.—Actual citizens, except convicts, can vote after a residence of twelve months in the State and ninety days in the county. Registration is required.

NORTH DAKOTA.—Every male person of twenty-one years or upward who have resided in the State one year, in the county six months, and in the precinct ninety days next preceding any election, shall be deemed qualified electors; citizens of the United States, persons of foreign birth who have declared their intention of becoming citizens, and Indians who have severed their tribal relations. No person who is under guardianship, *non compos mentis*, or insane, nor any person convicted of treason or felony.

OHIO.—Actual citizens, except idiots and lunatics, can vote after a residence of one year in the State, thirty days in the

*Transferred in full text from the Manual and Digest of the House of Representatives, Jan. 1, 1897.

county, and single men after being twenty days in the voting precinct.

OREGON.—Citizens, or those who have declared their intention of becoming so, except Chinamen, United States soldiers, convicts, lunatics, and idiots, may vote after a residence of six months in the State.

PENNSYLVANIA.—Actual citizens, except non-taxpayers and political bribers, can vote after a residence of one year in the State and two months in the voting precinct. Registration is required.

RHODE ISLAND.—Actual taxpaying citizens, who possess property to the value of \$134, can vote after a residence of one year in the State and six months in the towns. Registration is required.

SOUTH CAROLINA.—Actual citizens, except United States soldiers, duelists, paupers, criminals, lunatics, and idiots may vote after a residence of one year in the State and sixty days in the county. Registration is required.

SOUTH DAKOTA.—Citizens of the United States of the age of twenty-one years and upward, or those who have declared their intention of becoming citizens, and who have resided in the State six months, in the county thirty days, and in election precinct ten days next preceding any election are qualified voters.

TENNESSEE.—Actual citizens, except non-payers of poll tax, may vote after a residence of twelve months in the State and six months in the county.

TEXAS.—Citizens, or those who have declared their intention of becoming so, except United States soldiers, criminals, idiots, lunatics, and paupers, can vote after a residence of one year in the State and six months in the county and voting precinct. Registration is prohibited by the constitution.

VERMONT.—Actual citizens, except bribers, can vote after a residence of one year in the State. Registration is required.

VIRGINIA.—Actual citizens, except United States soldiers, non-payers of capitation tax, duelists, convicts, idiots, and lunatics, can vote after a residence of twelve months in the State and three months in towns. Registration is required.

WASHINGTON.—All male persons of the age of twenty-one or over, citizens of the United States, who have lived in the State one year, and the county ninety days, and in the city, town, ward, or precinct thirty days immediately preceding the election at which they offer to vote, shall be entitled to vote, except Indians not taxed, idiots, insane persons, and persons convicted of infamous crimes (unless restored to their civil rights).

WEST VIRGINIA.—Actual citizens, except convicts, paupers, and lunatics, can vote after a residence of one year in the State and six months in the county. Registration is prohibited by the constitution.

WISCONSIN.—Citizens, or those who have declared their intention of becoming so, except duelists, bribers, betters, convicts, lunatics, and idiots, may vote after a residence of one year in the State.

WYOMING.—Suffrage not to be denied or abridged on account of sex. Every citizen of the United States twenty-one years of age and upward who has resided in the State one year and in the county wherein such residence is located sixty days next preceding any election, shall be entitled to vote at such election, except idiots, insane persons, and persons convicted of infamous crimes, and also such persons as shall not be able to read the constitution of the State.

CHAPLAINS OF THE UNITED STATES SENATE AND HOUSE OF REPRESENTATIVES.

The Chaplains of the Senate and House of Representatives are elected by a *viva voce* vote at the commencement of each Congress, their official terms to continue "until their successors are chosen" and their salaries to be \$1,500 per year.

The practice which had prevailed for several years, of the election by each house of a chaplain, who should open their daily sessions with prayer, alternating weekly between the House and Senate, was suspended during the 35th Congress. At the first session of that Congress a resolution was adopted by the House, which directed "that the daily sessions of that body be opened by prayer, and requesting the ministers of the gospel in this city (Washington) to attend and alternately perform this solemn duty." The clergymen of Washington generally responded to this request, and for the remainder of the Congress performed the duty of chaplains.

At the first session of the 36th Congress the old practice of the election of a chaplain by each house was revived, and it was at that time decided that a proposition to proceed to such election presented a question of privilege.

Until the revision of the rules in the 2d session of the 46th Congress, there was no *Rule* relating to the election of chaplain.

SUPREME COURT OF THE UNITED STATES.

The United States Supreme Court is composed of a Chief Justice and eight Associate Justices, appointed by the President of the United States subject to the approval of the United States Senate. The Associate Judges have precedence according to the dates of their commissions, or, when the commissions of two or more of them bear the same date, according to their ages. In each case of a vacancy in the office of Chief Justice, or of his inability to perform the duties and powers of his office, those duties shall devolve upon the Associate Justice who is first in precedence until such disability is removed, or, another Chief Justice is appointed and duly qualified.

The salary of the Chief Justice is \$10,500 per annum, and of each Associate Justice \$10,000.

The Chief Justices besides their duties in annual sessions of the Supreme Court in Washington, have assigned to them each his own judicial circuit, these circuits having in addition, their own circuit judges.

The following is a complete list of the Justices of the United States Supreme Court, the names of the Chief Justices are in *italics*.

| Names. | Service. | | Born | Died. |
|--|-----------|-------|------|-------|
| | Term. | Years | | |

| Utah | Biennial | 2d Mon. Jan. | 60 days | 12 | 24 | 2 | 2 | |

* Unless extended by special vote.
 † In Ohio and a few other States, where the legislative sessions are biennial, the legislature holds "adjourned sessions," practically amounting to annual meetings.
 ‡ The Rhode Island legislature is required to meet annually the last Tuesday in May, at Newport, and an adjourned session to be holden annually at Providence.
 || Unless extended by special vote.

F. stands for Federalist; R., Republican; O., Opposition; C., Coalition; D., Democratic; N. R., National Republican; A.-M., Anti-Mason; W., Whig; L., Liberty; F. S., Free Soil; F. D., Free Democrat; C. U., Constitutional Union; I. D., Independent Democrat; D. & L., Democratic and Liberal; T., Temperance; G., Greenback; P., Prohibition; A., American; P. P., People's Party; U. L., United Labor.

* Previous to the election of 1804 each elector voted for two candidates for President; the one receiving the highest number of votes, if a majority, was declared elected President; and the next highest Vice-President.

† Three States out of thirteen did not vote, viz.: New York, which had not passed an electoral law; and North Carolina and Rhode Island, which had not adopted the Constitution.

‡ There having been a tie vote, the choice devolved upon the House of Representatives, which selected Jefferson.

§ No choice having been made by the Electoral College, the choice devolved upon the House of Representatives, which selected Adams on first ballot.

** No candidate having received a majority of the votes of the Electoral College, the Senate elected R. M. Johnson Vice-President, who received 33 votes; Francis Granger received 16.

SPEAKERS OF THE HOUSE OF REPRESENTATIVES.

The following is a complete list of the Speakers of the House of Representatives from the organization of the 1st Congress until the close of the 51st Congress, in 1891, giving the State which the Speaker represented, and the length of time of his services as Speaker. The names of the Speakers *pro tem* are not included.

| Name. | State. | Congr'ss. | Term of Service. |

THE UNITED STATES COURT OF CLAIMS.

The Court of Claims of the United States was established by Congressional Act of Feb. 24, 1855.

Members of Congress are not allowed to practice in the Court of Claims. The Act of Congress, approved March 3, 1887, enacted that "the Court of Claims shall have jurisdiction to hear and determine" the following matters:

First. All claims founded upon the Constitution of the United States or any law of Congress, except for pensions, or upon any regulation of any Executive Department, or upon any contract, expressed or implied, with the Government of the United States, or for damages, liquidated, or non-liquidated, in cases not sounding in tort, in respect of which

claims the party would be entitled to redress against the United States either in a court of law, equity, or admiralty if the United States were suable: *Provided, however,* That nothing in this section shall be construed as given to either of the courts herein mentioned jurisdiction to hear and determine claims growing out of the late civil war, and commonly known as "war claims," or to hear and determine other claims which have heretofore been rejected or reported on adversely by any court, department, or commission authorized to hear and determine the same.

Second. All set-offs, counter-claims, claims for damages, whether liquidated or unliquidated, or other demands whatsoever on the part of the Government of the United States against any claimant against the Government in said court: *Provided,* that no suit against the Government of the United States shall be allowed under this act unless the same shall have been brought within six years after the right accrued for which the claim is made.

SEC. 2. That the district courts of the United States shall have concurred jurisdiction with the Court of Claims as to all matters named in the preceding section where the amount of the claim does not exceed one thousand dollars, and the circuit courts of the United States shall have such concurrent jurisdiction in all cases where the amount of such claim exceeds one thousand dollars and does not exceed ten thousand dollars. All causes brought and tried under the provision of this act shall be tried by the court without a jury.

SEC. 3. That whenever any person shall present his petition to the Court of Claims alleging that he is or has been indebted to the United States as an officer or agent thereof, or by virtue of any contract therewith, or that he is the guarantor, or surety, or personal representative of any officer, or agent, or contractor so indebted, or that he or the person for whom he is such surety, guarantor, or personal representative has held any office or agency under the United States, or entered into any contract therewith, under which it may be or has been claimed that an indebtedness to the United States has arisen and exists, and that he or the person he represents has applied to the proper Department of the Government requesting that the account of such office, agency, or indebtedness may be adjusted and settled, and that three years have elapsed from the date of such application and said account still remains unsettled and unadjusted, and that no suit upon the same has been brought by the United States, said court shall, due notice first being given to the head of said department and to the Attorney-General of the United States, proceed to hear the parties and to ascertain the amount, if any, due the United States on said account. The Attorney-General shall represent the United States at the hearing of said cause. The court may postpone the same from time to time whenever justice shall require. The judgment of said court or of the Supreme Court of the United States, to which an appeal shall lie, as in other cases, as to the amount due, shall be binding and conclusive upon the parties. The payment of such amount so found due by the court shall discharge such obligation. An action shall accrue to the United States against such principal, or surety, or representative to recover the amount so found due, which may be brought at any time within three years after the final judgment of said court. Unless suit shall be brought within said time, such claim and the claim on the original indebtedness shall be forever barred.

SEC. 4. That the jurisdiction of the respective courts of the United States proceeding under this act, including the right of exception and appeal, shall be governed by the law now in force, in so far as the same is applicable and not inconsistent with the provisions of this act; and the course of procedure shall be in accordance with the established rules of said respective courts, and of such additions and modifications thereof as said courts may adopt.

SEC. 5. That the plaintiff in any suit brought under the provisions of the second section of this act shall file a petition, duly verified, with the clerk of the respective court having jurisdiction of the case, and in the district where the plaintiff resides. Such petition shall set forth the full name and residence of the plaintiff, the nature of his claim, and a succinct statement of the facts upon which the claim is based, the money or any other thing claimed, or the damages sought to be recovered, and praying the court for a judgment or decree upon the facts and law.

SEC. 6. That the plaintiff shall cause a copy of his petition filed under the preceding section to be served upon the district attorney of the United States in the district wherein suit is brought, and shall mail a copy of the same, by registered letter, to the Attorney-General of the United States, and shall thereupon cause to be filed with the clerk of the court wherein suit is instituted an affidavit of such service and the mailing of such letter. It shall be the duty of the district attorney upon whom service of petition is made as aforesaid to appear and defend the interests of the Government in the suit, and within sixty days after the service of the petition upon him, unless the time should be extended by order of the court made in the case, to file a plea, answer, or demurrer on the part of the Government, and to file a notice of any counter-claim, set-off, claim for damages, or other demand or defense whatsoever of the Government in the premises: *Provided,* That, should the district attorney neglect or refuse to file the plea, answer, demurrer, or defense as required, the plaintiff may proceed with the case

under such rules as the court may adopt in the premises; but the plaintiff shall not have judgment or decree for his claim, or any part thereof, unless he shall establish the same by proof satisfactory to the court.

SEC. 7. That it shall be the duty of the court to cause a written opinion to be filed in the cause, setting forth the specific findings by the court of the facts therein and the conclusions of the court upon all questions of law involved in the case, and to render judgment thereon. If the suit be in equity or admiralty, the court shall proceed with the same according to the rules of such courts.

SEC. 8. That in the trial of any suit brought under any of the provisions of this act, no person shall be excluded as a witness because he is a party to or interested in said suit; and any plaintiff or party in interest may be examined as a witness on the part of the Government.

Section ten hundred and seventy-nine of the Revised Statutes is hereby repealed. The provisions of section ten hundred and eighty of the Revised Statutes shall apply to cases under this act.

SEC. 9. That the plaintiff or the United States in any suit brought under the provisions of this act, shall have the same rights of appeal or writ of error as are now reserved in the Statutes of the United States in that behalf made, and upon the conditions and limitations therein contained. The modes of procedure in claiming and perfecting an appeal or writ of error shall conform in all respects, and as near as may be, to the statutes and rules of court governing appeals and writs of error in like cases.

SEC. 10. That when the findings of facts and the law applicable thereto have been filed in any case as provided in section six of this act, and the judgment of decree is adverse to the Government, it shall be the duty of the district attorney to transmit to the Attorney-General of the United States certified copies of all the papers filed in the cause, with a transcript of the testimony taken, the written findings of the court, and his written opinion as to the same; whereupon the Attorney-General shall determine and direct whether an appeal or writ of error shall be taken or not; and when so directed the district attorney shall cause an appeal or writ of error to be perfected in accordance with the terms of the statutes and rules of practice governing the same: *Provided*, That no appeal or writ of error shall be allowed after six months from the judgment of decree in such suit. From the date of such final judgment or decree interest shall be computed thereon, at the rate of four per centum per annum, until the time when an appropriation is made for the payment of the judgment or decree.

SEC. 11. That the Attorney-General shall report to Congress, and at the beginning of each session of Congress, the suits under this act in which a final judgment or decree has been rendered, giving the date of each, and a statement of the costs taxed in each case.

SEC. 12. That when any claim or matter may be pending in any of the Executive Departments which involves controverted questions of fact or law, the head of such Department, with the consent of the claimant, may transmit the same, with the vouchers, papers, proofs and documents pertaining thereto, to said Court of Claims, and the same shall be there proceeded in under such rules as the court may adopt. When the facts and conclusions of law shall have been found, the court shall reports its findings to the Department by which it was transmitted.

SEC. 13. That in every case which shall come before the Court of Claims, or is now pending therein, under the provisions of an act entitled "An act to afford assistance and relief to Congress and the Executive Departments in the investigation of claims and demands against the Government," approved March third, eighteen hundred and eighty-three, if it shall appear to the satisfaction of the court, upon the facts established, that it has jurisdiction to render judgment or decree thereon under existing laws or under the provisions of this act it shall proceed to do so, giving to either party such further opportunity for hearing as in its judgment justice shall require, and report its proceedings therein to either house of Congress or to the Department by which the same was referred to said court.

SEC. 14. That whenever any bill, except for a pension, shall be pending in either house of Congress providing for the payment of a claim against the United States, legal or equitable, or for a grant, gift, or bounty to any person, the house in which such bill is pending may refer the same to the Court of Claims, who shall proceed with the same in accordance with the provisions of the act approved March third, eighteen hundred and eighty-three, entitled "An act to afford assistance and relief to Congress and the Executive Departments in the investigation of claims and demands against the Government," and report to such house the facts in the case and the amount, where the same can be liquidated, including any facts bearing upon the question whether there has been delay or laches in presenting such claim or applying for such grant, gift, or bounty, and any facts bearing upon the question whether the bar of any statute of limitation should be removed or which shall be claimed to excuse the claimant for not having resorted to any established legal remedy.

SEC. 15. If the Government of the United States shall put in issue the right of the plaintiff to recover the court may, in its discretion, allow costs to the prevailing party from the time of joining such issue. Such costs, however, shall include only what is actually incurred for witnesses, and for

summoning the same, and fees paid to the clerk of the court.

SEC. 16. That all laws and parts of laws inconsistent with this act are hereby repealed.

THE CAPITAL OF THE UNITED STATES.

As stated elsewhere, the first Continental Congress met in Carpenter's Hall, Philadelphia, Sept. 5, 1774. The hall was a plain edifice (still standing) and provided fairly well in respect of accommodations for a small deliberative body.

The second Continental Congress also met in Philadelphia, and adjourned Dec. 12, 1776, to Baltimore, where its third session began Dec. 20, 1776. On Nov. 1, 1784, the Confederate Congress assembled in Trenton, N. J. On Jan. 11, 1885, it assembled in New York City. The first National Congress was also held in New York, commencing March 4, 1789.

In 1789 Maryland ceded to the United States the territory now known as the District of Columbia, for its use by the Government as the National headquarters. This gift was supplemented in 1789 by the Virginia Legislature, by the cession, for the same purpose, of 40 square miles (including Alexandria), on the opposite side of the Potomac River. These two tracts, selected by President Washington, and having jointly an area of 100 square miles (10 miles square), were accepted by the Government and designated "The District of Columbia."

This selection was made by Congress in 1790 after a spirited controversy, in which the most vigorous effort was made to locate the National Capital in some other portion of the country. Indeed, the contest was only settled by a compromise in which the Northern Congressmen consented to vote for the new Capital, and the Southern members consented to vote for the Federal assumption of the debts of the two States ceding the territory.

[In 1846 Congress ceded to Virginia that portion of the district which she had transferred to the Federal Government.]

The Act of Congress, locating the Federal district, passed June 28, 1790, contained the following clause: "That a district of territory, on the river Potomac, at some place between the mouths of the Eastern Branch of the Connegacheague, be, and the same is hereby accepted for the permanent seat for the Government of the United States."

The same act provided also that Congress should meet in Philadelphia until the first Monday in November, 1800, when the Government should be removed to the District of Columbia.

In 1791, under Washington's supervision, the National Capital was planned and laid out on its present site. The President desired it to be called Federal City, but on Sept. 9 of that year, it was named Washington.

On Sept. 18, 1793, President Washington laid the cornerstone of the Capitol building with Masonic ceremonies.

In 1800 the seat of Government was transferred to Washington. The north wing of the Capitol only was completed, but it was fitted up for both Houses. The President's residence was completed externally. The city of Washington at that date was described as having "one good tavern and very few houses in any one place, most of them being very small huts, and the War Office and Treasury Building burned down."

A bill for a monument to President Washington passed the House of Representatives in 1800, but after being amended in the Senate, was postponed. Fifty years later it was commenced by funds raised by private subscriptions.

The Capitol Building.—The Capitol fronts the east, and stands on a plateau ninety feet above the level of the Potomac, in latitude $38^{\circ} 53' 20.4''$ north and longitude $77^{\circ} 00' 35.7''$ west from Greenwich.

The southeast corner-stone of the original building was laid on Sept. 18, 1793, by President Washington, aided by the Freemasons of Maryland. It was constructed of sandstone, painted white, from an island in Aquia Creek, Virginia, under the direction of Stephen H. Hallett, James Hoban, George Hadfield, and afterward of B. H. Latrobe, architects. The north wing was finished in 1800 and the south wing in 1811, a wooden passage-way connecting them. On August 24, 1814, the interior of both wings was destroyed by British incendiaries, but they were immediately rebuilt. In 1818 the central portion of the building was commenced under the architectural superintendence of Charles

deep, with porticos of 22 columns each on their eastern fronts, and with porticos of 10 columns on their ends and on their western fronts. The entire length of the building is 751 feet 4 inches, and the greatest depth, including porticos and steps, is 324 feet. The area covered by the entire building is 153,112 square feet.

The dome is crowned by a bronze statue of Freedom, modeled by Crawford, which is 19 feet 6 inches high, and weighs 14,985 pounds. The height of the dome above the base-line of the east front is 287 feet 11 inches; the height from the top of the balustrade of the building is 217 feet 11 inches; and the greatest diameter at the base is 135 feet 5 inches.

The rotunda is 95 feet 6 inches in diameter, and its height from the floor to the top of the canopy is 180 feet 3 inches.

THE NATIONAL CAPITOL.

Bulfinch, and the original building was finally completed in 1827. Its cost, including the grading of the grounds, alterations and repairs, up to 1827, was \$2,433,844.13.

The corner-stone to the extensions of the Capitol was laid on July 4, 1851, by President Fillmore, Daniel Webster officiating as orator of the day. Thomas U. Walter was architect, and subsequently Edward Clark, under whose direction the work was completed in November, 1867. The material used for the extensions is white marble from the quarries at Lee, Mass., with white marble columns from the quarries at Cockeysville, Md.

The dome of the original central building was constructed of wood, but was removed in 1856 to be replaced by the present stupendous structure of cast iron, which was completed in 1865. The entire weight of iron used is 8,909,200 pounds.

The main building is 352 feet 4 inches long in front and 121 feet 6 inches deep, with a portico 160 feet wide, of 24 columns on the east and a projection of 83 feet on the west, embracing a recessed portico of 10 coupled columns. The extensions are placed at the north and south ends of the main building, with connecting corridors 44 feet long by 56 feet wide, flanked by columns. Each extension is 142 feet 8 inches in front, by 238 feet 10 inches

The Senate Chamber is 112 feet in length, by 82 feet in width, and thirty feet in height. Its galleries will accommodate 1,000 persons.

The Representatives' Hall is 130 feet in length, by 93 feet in width, and 30 feet in height.

The Supreme Court room was occupied by the Senate until December, 1859, the court having previously occupied the room beneath, now used as a law library.

[The Library of Congress was burned by the British in 1814, and was partially destroyed by an accidental fire in 1851. The present center hall was finished in 1853, and the wing halls were finished in 1867. The Library of Congress occupies the entire western projection of the central Capitol building. The original Library was commenced in 1800, but was destroyed with the Capitol in 1814, during the war with England. It was afterward replenished by the purchase of the library belonging to ex-President Jefferson, by Congress, embracing about 7,000 volumes. In 1851 it contained 55,000 volumes, and by an accidental fire in that year the whole collection was destroyed, except 20,000 volumes. It was rebuilt in 1852, when \$75,000 was appropriated in one sum to replenish the collection. The library is recruited by regular appropriations made by Congress, which average about \$11,000 per annum; also by additions received by copyright, by exchanges, and from the Smithsonian Institution.] A new edifice of ample dimensions, and of beautiful architectural design, is now in process of erection near the Capitol, into which the Congressional Library will be early transferred.

The basement story of the Capitol contains 73 rooms, of which 24 are in the "House Wing," 26 in

the "Main Wing," and 23 in the "Senate Wing." Many of the rooms are designated severally for the use of the various committees.

The principal story of the Capitol contains 48 rooms. Of these 17 are in the "House Wing," and include the hall of the House of Representatives; the "Main Wing" has 12 chief rooms, including the "Old Hall of Representatives," now used as a "Statuary Hall" (to which each State has been invited to contribute 2 statues of its most distinguished citizens); the "Congressional Library" (subdivided into various departments); the "Supreme Court-room," and the "Rotunda."

The "Senate Wing" contains 19 chief rooms, including the "Senate Chamber," the "President's Room," "Vice-President's Room," etc., etc.

The attic story embraces 42 rooms, designated chiefly for committees, documents, and as "lobbies."

The diagrams on page 1556 furnish a clear view of the two chief legislative halls.

EXPORTS TO AND IMPORTS FROM VARIOUS COUNTRIES.

The following table shows for the year 1889-90 the values of the exports of domestic merchandise to and the imports from the following countries, according to the United States returns:—

| Country. | Home Exports to 1889-90. | Imports from 1889-90. |
|------------------------------------|--------------------------|-----------------------|
| Great Britain and Ireland | \$444,459,009 | \$186,488,966 |
| Germany | 84,315,215 | 98,837,683 |
| France | 49,013,004 | 77,672,311 |
| British North America | 38,514,454 | 39,396,980 |
| Belgium | 26,140,377 | 9,336,482 |
| Netherlands | 22,487,588 | 17,029,233 |
| Spain | 12,736,273 | 5,288,537 |
| Italy | 12,974,249 | 20,330,051 |
| Russia | 10,661,531 | 3,409,879 |
| British Australasia | 11,168,081 | 4,277,676 |
| Cuba | 12,669,509 | 53,801,591 |
| Mexico | 12,666,108 | 22,690,915 |
| British West Indies | 8,074,433 | 14,865,018 |
| Brazil | 11,902,496 | 59,378,756 |
| Argentine Republic | 8,322,627 | 5,401,697 |
| Colombia | 2,522,351 | 3,575,253 |
| Portugal | 3,291,789 | 1,418,309 |
| China | 2,943,790 | 16,260,471 |
| Hayti | 4,101,464 | 2,421,221 |
| Japan | 5,227,186 | 21,103,324 |
| Central America | 5,104,275 | 8,052,444 |
| British East Indies | 4,655,256 | 20,804,319 |
| Hong Kong | 4,134,641 | 969,745 |
| Africa | 3,778,076 | 1,501,038 |
| Hawaii | 4,606,900 | 12,313,908 |
| Venezuela | 3,984,280 | 10,966,765 |
| Denmark | 5,037,290 | 238,508 |
| Chili | 3,219,465 | 3,183,249 |
| Dutch East Indies | 1,799,306 | 5,791,250 |
| Guianas | 2,439,184 | 4,918,736 |
| Uruguay | 3,210,412 | 1,754,903 |
| Austria-Hungary | 945,703 | 9,531,378 |
| Turkey in Europe, Asia, and Africa | 176,386 | 4,622,779 |
| Philippine Islands | 122,276 | 11,592,626 |
| Switzerland | 22,170 | 14,441,950 |

NATIONAL DEBT OF THE UNITED STATES.

The official statement of the Public Debt of the United States showed the following summaries on the morning of November 1, 1891:

| | |
|-----------------------------------|-------------------------|
| Interest-bearing Debt. | \$585,026,720 00 |
| Debt on which interest had ceased | 6,209,230 26 |
| Debt-bearing interest | 389,074,025 85 |
| Total Debt. | \$980,309,976 11 |
| Cash in Treasury | \$740,530,258 68 |
| Demand Liabilities | 600,858,238 64 |
| Net Balance in Treasury. | \$139,671,920 01 |

The cash in Treasury consisted of gold, \$263,774,741.81; silver, \$410,116,967.91; paper currency and certificates, \$45,763,786.76; other deposits, \$20,874,762.12; total, \$740,530,258.68.

The Demand Liabilities was for gold, silver, and currency certificates, treasury notes, fund for redemption of National Bank notes, outstanding checks, balance of disbursing offices and agencies, etc.

Deducting the net balance in Treasury, \$139,671,920.04, from the total debt (\$980,309,976.11) leaves the net debt Nov. 1, 1891, at \$840,638,056.07.

ASSESSED VALUATION OF PROPERTY IN THE UNITED STATES.

The assessed valuation of real and personal property in the several States and Territories for 1880 and 1890, together with the increase of the assessed valuation during the last decade, is shown in the following table:

| States and Territories. | Total assessed valuation. | | Increase of assessed valuation. |
|-------------------------|---------------------------|-------------------------|---------------------------------|
| | 1880. | 1890. | |
| Total | \$16,902,993,543 | \$24,249,589,804 | \$7,246,596,261 |
| Alabama | 122,867,228 | 197,080,441 | 74,213,213 |
| Arizona | 9,270,214 | 21,434,767 | 12,164,553 |
| Arkansas | 86,409,364 | †172,408,497 | 85,999,133 |
| California | 584,578,036 | 1,071,102,327 | 486,524,291 |
| Colorado | 74,471,693 | 188,911,325 | 114,439,632 |
| Connecticut | 327,177,385 | 358,913,966 | 31,736,581 |
| Delaware | 59,951,643 | †74,134,401 | 14,182,758 |
| District of Columbia | 99,401,787 | 153,907,541 | 53,905,754 |
| Florida | 30,938,309 | 76,926,938 | 45,988,629 |
| Georgia | 239,472,599 | 377,366,784 | 137,894,185 |
| Idaho | 6,440,876 | 25,581,305 | 19,140,429 |
| Illinois | 1786,616,394 | 1727,416,252 | †59,200,142 |
| Indiana | 727,815,131 | 782,872,126 | 55,056,995 |
| Iowa | 398,671,251 | †478,318,248 | 79,646,997 |
| Kansas | 160,891,689 | 290,593,711 | 129,702,022 |

*The assessed valuation of Oklahoma not being given, the population of that territory is omitted in calculating the assessed valuation per capita for 1890 of the United States.
†Annual report of 1889.

‡The state board of equalization declares that in 1880 the assessed value was 50 per cent, and in 1890 only 25 per cent, of the true value, hence the reduction.

§Decrease.

¶Assessment of 1886: assessment made every 5 years.

UNITED STATES CENSUS.

The act of Congress providing for taking the eleventh (1890) and subsequent censuses was approved by President Cleveland March 1, 1888. It provided that the census should be taken June 1, 1890, and on successive days, and create the office of Superintendent of the Census with an annual salary of \$6,000. Subsequently Robert P. Porter, of New York, was appointed Superintendent by President Harrison, and later a list of professional experts was selected and charged with supervising severally the various departments of the work. Their names appear in their reports embraced in the several volumes included in the General Census Report.

The work of enumerating and tabulating the people and preparing the numerous reports for the press requires many months, and at this writing (October, 1891,) has been reported to the public only in part. The first volume, it is expected, will give all the data as to population by States, counties and towns, nativity, color, etc.; volume two, health and physical condition, vital and mortality statistics; volume three, public schools, illiteracy, pauperism and crime, and churches and religious denominations; volume four, trades and professions; volume five, survivors of the late war; volume six, wealth, taxation, public indebtedness, and estimated values of property; volume seven, indebtedness of business corporations and individuals, including mortgage indebtedness; volume eight, agricultural statistics; volume nine, manufactures; volume ten, mines and mining; volume eleven, fish and fisheries; volume twelve, transportation, railways, navigation, telegraphs and telephones; volume thirteen, insurance.

PRODUCTION OF GOLD AND SILVER IN UNITED STATES.

The total production of gold and silver in the country was as follows during each of the years from 1885 to 1889:—

| Year. | Gold. | Silver. | Total. |
|-------|--------------|--------------|--------------|
| 1885 | \$31,081,000 | \$51,600,000 | \$83,401,000 |
| 1886 | 35,000,000 | 51,000,000 | 86,000,000 |
| 1887 | 33,100,000 | 53,441,300 | 86,541,300 |
| 1888 | 33,175,000 | 59,195,000 | 92,370,000 |
| 1889 | 32,800,000 | 64,646,464 | 97,446,464 |

The precious metals are raised mainly in California for gold; and Colorado, Arizona, Utah, Nevada, and Montana for silver. The total value of gold deposited at the mints and assay offices from 1793 to 1887 is estimated at \$1,334,609,150, and the silver at \$423,655,811.

In 1889-90 gold (domestic product) to the value of \$49,228,823, and weighing 32,430,151 standard ounces, were deposited.

For other mining and mineral statistics see the several topics in these Revisions and Additions.

IMPORTS AND EXPORTS OF MERCHANDISE.

The following table shows the total values of imports and exports of merchandise for the years named severally ending June 30:—

| Years. | Imports of Merchandise. | Exports of Merchandise. |
|--------|-------------------------|-------------------------|
| 1879 | \$445,777,775 | \$698,340,790 |
| 1886 | 655,436,136 | 665,964,529 |
| 1887 | 632,319,768 | 703,022,923 |
| 1888 | 223,957,114 | 683,892,104 |
| 1889 | 745,131,652 | 730,282,609 |
| 1890 | 789,222,228 | 845,293,828 |

IMPORTS AND EXPORTS OF GOLD AND SILVER.

The following table gives the total value of gold and silver bullion and specie imported into the United States, and the value of that exported, being the product of the States, in the years ended June 30, 1879 and 1886-90:—

| Year. | Imports of | | Exports of | |
|-------|--------------|--------------|--------------|--------------|
| | Domestic | Foreign | Domestic | Foreign |
| 1879 | \$20,296,000 | \$24,997,441 | \$24,997,441 | \$24,997,441 |
| 1886 | 38,593,656 | 72,463,410 | 72,463,410 | 72,463,410 |
| 1887 | 60,170,792 | 35,997,691 | 35,997,691 | 35,997,691 |
| 1888 | 59,337,986 | 46,414,183 | 46,414,183 | 46,414,183 |
| 1889 | 28,963,073 | 96,641,533 | 96,641,533 | 96,641,533 |
| 1890 | 33,976,326 | 52,148,420 | 52,148,420 | 52,148,420 |

RELATIVE RANK OF STATES AND TERRITORIES IN
RESPECT OF POPULATION.

The subjoined lists show the relative order of rank of the forty-four states and of four territories in 1890; also the order and rank of the states and territories in 1880. Indian Territory and Alaska are not included. The District of Columbia is included in both lists:

| 1890. | 1880. |
|-----------------------|--------------------------|
| 1 New York. | 1 New York. |
| 2 Pennsylvania. | 2 Pennsylvania. |
| 3 Illinois. | 3 Ohio. |
| 4 Ohio. | 4 Illinois. |
| 5 Missouri. | 5 Missouri. |
| 6 Massachusetts. | 6 Indiana. |
| 7 Texas. | 7 Massachusetts. |
| 8 Indiana. | 8 Kentucky. |
| 9 Michigan. | 9 Michigan. |
| 10 Iowa. | 10 Iowa. |
| 11 Kentucky. | 11 Texas. |
| 12 Georgia. | 12 Tennessee. |
| 13 Tennessee. | 13 Georgia. |
| 14 Wisconsin. | 14 Virginia. |
| 15 Virginia. | 15 North Carolina. |
| 16 North Carolina. | 16 Wisconsin. |
| 17 Alabama. | 17 Alabama. |
| 18 New Jersey. | 18 Mississippi. |
| 19 Kansas. | 19 New Jersey. |
| 20 Minnesota. | 20 Kansas. |
| 21 Mississippi. | 21 South Carolina. |
| 22 California. | 22 Louisiana. |
| 23 South Carolina. | 23 Maryland. |
| 24 Arkansas. | 24 California. |
| 25 Louisiana. | 25 Arkansas. |
| 26 Nebraska. | 26 Minnesota. |
| 27 Maryland. | 27 Maine. |
| 28 West Virginia. | 28 Connecticut. |
| 29 Connecticut. | 29 West Virginia. |
| 30 Maine. | 30 Nebraska. |
| 31 Colorado. | 31 New Hampshire. |
| 32 Florida. | 32 Vermont. |
| 33 New Hampshire. | 33 Rhode Island. |
| 34 Washington. | 34 Florida. |
| 35 Rhode Island. | 35 Colorado. |
| 36 Vermont. | 36 District of Columbia. |
| 37 South Dakota. | 37 Oregon. |
| 38 Oregon. | 38 Delaware. |
| 39 District Columbia. | 39 Utah (Ter.). |
| 40 Utah (Ter.). | 40 Dakota (Ter.). |
| 41 North Dakota. | 41 New Mexico (Ter.). |
| 42 Delaware. | 42 Washington (Ter.). |
| 43 New Mexico (Ter.). | 43 Nevada. |
| 44 Montana. | 44 Arizona (Ter.). |
| 45 Idaho. | 45 Montana (Ter.). |
| 46 Oklahoma (Ter.). | 46 Idaho (Ter.). |
| 47 Wyoming. | 47 Wyoming (Ter.). |
| 48 Arizona (Ter.). | |
| 49 Nevada. | |

It will be seen that, as in 1880, New York still led the list in 1890, and was followed by Pennsylvania. Ohio and Illinois had exchanged places. Of the other changes in the list the most marked were those of Texas, which had risen from No. 11 to No. 7; Kentucky, which dropped from 8 to 11; Minnesota, which had risen from 26 to 20; Nebraska, which had risen from 30 to 26; Maryland, which dropped from 23 to 27; Colorado, which had risen from 35 to 31; Vermont, which had dropped from 32 to 36; Washington, which had risen from 42 to 34; Delaware, which had dropped from 38 to 42; Nevada, which had dropped from 43 to 49, and Arizona, which had dropped from 44 to 48.

CENTER OF POPULATION* OF THE UNITED STATES.

The center of population is the center of gravity of the population of the country, each individual being assumed to have the same weight. The method of determination used, in order that the result might be comparable with that obtained in 1880, was in brief as follows:

The population of the country was first distributed by "square degrees," as the area included between consecutive parallels and meridians has been designated. A point was then assumed tentatively as the center, and corrections in latitude and longitude to this tentative position were computed. In this case the center was assumed to be at the intersection of the parallel of 39° with the meridian of 86° west of Greenwich. The population of each square degree was assumed to be located at the center of that square degree, except in cases where it was manifest that this assumption would be untrue, as, for instance, where a part of the square degree was occupied by the sea or other large body of water, or where it contained a city of considerable magnitude which was situated "off center." In these cases the position of the population of the square degree was estimated as nearly as possible. The distance of each such center of population of a square degree, whether assumed to be at the center of the square degree or at a distance from the center, from the assumed parallel, and from the assumed meridian, were then computed. The population of each square degree was then multiplied by its distance from the assumed parallel of latitude, and the sum of the products, or moments, north and south of that parallel made up. Their difference, divided by the total population of the country, gave a correction to the latitude. In a similar manner the east and west moments were made up, and from them a correction in longitude was obtained.

In 1790 the center of population was at 39° 16.5' north latitude and 76° 11.2' west longitude, which a comparison of the best maps available would seem to place about twenty-three miles east of Baltimore. During the decade of 1790 to 1800 it appears to have moved almost due west to a point about eighteen miles west of the same city, being in latitude 39° 16.1' and longitude 76° 56.5'.

From 1800 to 1810 it moved westward and slightly southward to a point about forty miles northwest by west from Washington, being in latitude 39° 11.5' and longitude 77° 37.2'. The southward movement during this decade appears to have been due to the annexation of the territory of Louisiana, which contained quite extensive settlements.

From 1810 to 1820 it moved westward and again slightly southward to a point about sixteen miles north of Woodstock, Virginia, being in latitude 39° 5.7' and longitude 78° 33'. This second southward movement appears to have been due to the extension of settlement in Mississippi, Alabama and eastern Georgia.

From 1820 to 1830 it moved still westward and southward to a point about nineteen miles southwest of Moorefield, in the present State of West Virginia, being in latitude 38° 57.9' and longitude 79° 16.9'. This is the most decided southward movement that it has made during any decade. It appears to have been due in part to the addition of Florida to our territory and in part to the great extension of settlements in Louisiana, Mississippi, and Arkansas, or generally, it may be said, in the southwest.

* Furnished by Henry Gannett to the Census Department, Washington, D. C., Feb. 18, 1891.

POSITION OF THE CENTER OF POPULATION.

| Years. | North latitude. | West longitude. | Approximate locations by important towns. | Westward movement during preceding decade. |
|--------|-----------------|-----------------|--|--|
| 1790 | 39° 16.5' | 76° 11.2' | 23 miles east of Baltimore, Maryland | |
| 1800 | 39 16.1 | 76 56.5 | 18 miles west of Baltimore, Maryland | 41 miles. |
| 1810 | 39 11.5 | 77 37.2 | 40 miles northwest by west of Washington, District of Columbia | 36 do. |
| 1820 | 39 5.7 | 78 33.0 | 16 miles north of Woodstock, Virginia | 50 do. |
| 1830 | 38 57.3 | 79 16.9 | 19 miles west-southwest of Moorefield, West Virginia | 39 do. |
| 1840 | 39 2.0 | 80 18.0 | 16 miles south of Clarksburg, West Virginia | 55 do. |
| 1850 | 38 59.0 | 81 19.0 | 23 miles southeast of Parkersburg, West Virginia | 55 do. |
| 1860 | 39 0.4 | 82 48.8 | 20 miles south of Chillicothe, Ohio | 81 do. |
| 1870 | 39 12.0 | 83 35.7 | 48 miles east by north of Cincinnati, Ohio | 42 do. |
| 1880 | 39 4.1 | 84 39.7 | 8 miles west by south of Cincinnati, Ohio | 58 do. |
| 1890 | 39 11.9 | 85 32.9 | 20 miles east of Columbus, Indiana | 48 do. |

From 1830 to 1840 it moved still further westward, but slightly changed its direction northward, reaching a point sixteen miles south of Clarksburg, West Virginia, being in latitude 39° 2' and longitude 80° 18'. During this decade settlement had made decided advances in the prairie states and in the southern portions of Michigan and Wisconsin, the balance of increase settlement evidently being in favor of the northwest.

From 1840 to 1850 it moved westward and slightly southward again, reaching a point about twenty-three miles southeast of Parkersburg, West Virginia, in latitude 38° 59' and longitude 81° 19', the change of direction southward being largely due to the annexation of Texas.

From 1850 to 1860 it moved westward and slightly northward, reaching a point twenty miles south of

Chillicothe, Ohio, this being in latitude 39° 0.4', longitude 82° 48.8'.

From 1860 to 1870 it moved westward and sharply northward, reaching a point about forty-eight miles east by north of Cincinnati, Ohio, in latitude 39° 12', longitude 83° 35.7'. This northward movement was due in part to waste and destruction in the South consequent upon the civil war, and in part probably to the fact that the census of 1870 was defective in its enumeration of the Southern people, especially of the newly-enfranchised colored population.

In 1880 the center of population had returned southward to nearly the same latitude which it had in 1860, being in latitude 39° 4.1', longitude 84° 39.7'. This southward movement was due only in part to an imperfect enumeration at the South in

1870. During the decade between 1870 and 1880 the Southern States made a large positive increase, both from natural growth and from immigration southward.

During the past decade the center of population has moved northward into practically the same latitude which it occupied in 1870. It has moved westward 53' 13", or forty-eight miles, being less by ten miles than its movement during the preceding decade, six miles greater than the movement between 1860 and 1870, and slightly less than the average westward movement since the first census, its present position being in latitude 39° 11' 56" and longitude 85° 32' 53". The most salient point of its progress during the past decade is the northward which has been made, which is doubtless due to the great development in the cities of the Northwest and in the State of Washington, and in no small degree to the increase of population in New England.

The center of the area of the United States excluding Alaska is in Northern Kansas, in approximate latitude 39° 55' and approximate longitude 98° 50'. The center of population is therefore about three-fourths of a degree south and more than seventeen degrees east to the center of area.

The table and map, on page 1563, show the movement of the center of population since 1790.

WHITE AND COLORED POPULATION OF THE SOUTH.

The Southern States, in which comparisons are usually made between the white and colored population, embrace seventeen states and the District of Columbia. The abnormal increase of the colored population in what is known as the "Black Belt" during the decade ending in 1880 led to the popular belief that the negroes were increasing at a much greater rate than the white population. This error was a natural one, and arose from the difficulty of ascertaining how much of the increase shown by the Tenth Census was real, and how much was due to the omissions of the census of 1870. The census reports of the Southern States and of the District of Columbia, by decades for the last half century, are given in the subjoined table:

| Years. | Population. | | Number of colored to 100,000 white. | Per cent. of increase. | |
|-----------|-------------|-----------|-------------------------------------|------------------------|----------|
| | White. | Colored. | | White. | Colored. |
| 1790..... | 1,271,488 | 689,884 | 54,258 | | |
| 1800..... | 1,702,980 | 918,336 | 53,925 | 33.94 | 33.11 |
| 1810..... | 2,208,785 | 1,272,119 | 57,594 | 29.70 | 38.52 |
| 1820..... | 2,831,560 | 1,653,240 | 58,486 | 28.20 | 29.96 |
| 1830..... | 3,660,758 | 2,187,515 | 59,757 | 29.28 | 32.32 |
| 1840..... | 4,632,530 | 2,701,901 | 58,325 | 26.55 | 23.51 |
| 1850..... | 6,222,418 | 3,442,238 | 55,320 | 34.32 | 27.40 |
| 1860..... | 8,203,852 | 4,216,241 | 51,393 | 31.84 | 32.49 |
| 1870..... | 9,812,732 | 4,555,990 | 46,429 | 19.61 | 8.06 |
| 1880..... | 13,530,408 | 6,142,360 | 45,397 | 37.89 | 34.82 |
| 1890..... | 16,868,205 | 6,996,166 | 41,475 | 24.67 | 13.90 |

It will be seen that in 1890, there were in the states under discussion 6,996,166 colored inhabitants, and in 1880, 6,142,360. The colored element increased during the decade at the rate of 13.90 per cent. The white population of these states in 1890 numbered 16,868,205, and in 1880, 13,530,408. They increased during the decade at the rate of 24.67 per cent, or nearly twice as rapidly as the colored element. In 1880 the proportion of white to persons of color in these states was in the relation of 100,000 to 45,397. In 1890 the proportion of the latter class had diminished, being then as 100,000 to 41,475. During the last decade the colored

race has not held its own against the white in a region where the climate and conditions are, of all those which the country affords, the best suited to its development.

Referring again to this table, it is seen that in but three decades, that is, from 1800 to 1830, during a part of which time the slave trade was in progress, has the colored race increased more rapidly than the white. Since 1830 the white people have steadily increased at a more rapid rate than the colored. This increase has not been effected by the aid of immigration, for with the exception of Kansas and Missouri these states have received comparatively few immigrants either from foreign countries or from the Northern States.

Similarly the proportion of the colored inhabitants to the white increased somewhat between 1800 and 1830, but since that time it has steadily diminished. In 1830, when this proportion was at its maximum, there were nearly six colored inhabitants to ten white, but this proportion has been reduced to a trifle more than four at the present date, or by nearly one-third of its amount.

The Census Department states that the deficiencies of the Ninth Census are so apparent in this table that any extended reference to them is wholly unnecessary.

Of the total colored population in 1890 there were 2,581 Chinese, 100 Japanese, and 8,207 ("civilized" and counted) Indians, leaving of the African race 6,996,166.

POPULATION OF THE STATE OF CALIFORNIA BY RACE.

In 1890 a special count by race was made by the United States Census Office, for the State of California in order to separate the Chinese and Indians from the rest of the population, as required by the laws of that State, for the purposes of State apportionment. The results of this special count showed that, for the State as a whole, the white population had increased from 767,181 in 1880, to 1,111,558 in 1890, an increase of 344,377, or 44.89 per cent. The colored population in the State showed an increase during the decade of 5,419, or 90.05 per cent, while there had been a decrease in the Chinese of 3,451, or 4.59 per cent. The whole number of Indians in the State was less in 1890 than in 1880 by 3,922, or a decrease of 24.10 per cent. The number of Japanese in 1890, as compared with 1880, was large, although relatively small as compared with the whole population. The number of Japanese returned in 1890 was 1,099, as against 86 in 1880. The total population of the State for 1890 was 1,208,130, as compared with 864,694 for 1880, the increase being 343,436, and the per cent of increase 39.72.

POPULATION WITH REFERENCE TO MEAN ANNUAL TEMPERATURE.

In the following table from census reports of 1890 (furnished by Henry Gannett, of Washington, D. C., from data contributed by Gen. A. W. Greeley and other officers of the U. S. Weather Bureau) the 1st column shows the degrees of temperature; the 2d, 3d, and 4th columns a distribution of population in accordance with the isothermal lines, subject to the supposition that the entire population of the country was at each date 100,000 persons, or, in other words, these columns show the percentage of the population which was at the date designated living between the various isothermal lines, the computation being carried out to the thousandth of 1 per cent. The 5th and 6th columns show the change in the number from census to census under the same assumption that the entire population

POPULATION WITH REFERENCE TO MEAN ANNUAL TEMPERATURE.

| Degrees of Temperature. | Number in 100,000 Inhabitants. | | | Change in Number 100,000. | | Number in 100,000 Above Each Group. | | | Density of Population. | | | Increase in Density of Population. | |
|-------------------------|--------------------------------|--------|--------|---------------------------|-----------|-------------------------------------|---------|---------|------------------------|--------|--------|------------------------------------|-----------|
| | 1890. | 1880. | 1870. | 1880-'90. | 1870-'80. | 1890. | 1880. | 1870. | 1890. | 1880. | 1870. | 1880-'90. | 1870-'80. |
| Below 40 | 1,653 | 1,155 | 919 | 498 | 236 | 1,653 | 1,155 | 919 | 4,699 | 2,635 | 1,612 | 2,064 | 1,023 |
| 40 to 45 | 8,180 | 7,413 | 7,119 | 767 | 294 | 9,833 | 8,568 | 8,098 | 12,515 | 9,105 | 6,722 | 3,410 | 2,388 |
| 45 to 50 | 27,423 | 27,324 | 28,986 | 99 | -1,662 | 37,256 | 35,892 | 37,024 | 28,610 | 22,866 | 18,650 | 5,744 | 4,216 |
| 50 to 55 | 31,583 | 32,396 | 33,182 | -813 | -786 | 68,839 | 68,288 | 70,206 | 31,024 | 25,545 | 20,113 | 5,479 | 5,342 |
| 55 to 60 | 13,775 | 14,230 | 13,723 | -455 | 507 | 82,614 | 82,518 | 83,929 | 22,780 | 18,888 | 14,005 | 3,892 | 4,883 |
| 60 to 65 | 9,865 | 9,982 | 9,152 | -117 | 830 | 92,479 | 92,500 | 93,081 | 17,893 | 14,532 | 10,240 | 3,361 | 4,293 |
| 65 to 70 | 6,279 | 6,262 | 5,662 | 17 | 600 | 98,758 | 98,762 | 98,743 | 14,161 | 11,334 | 7,881 | 2,827 | 3,452 |
| 70 to 75 | 1,210 | 1,216 | 1,242 | -6 | -26 | 99,968 | 99,978 | 99,985 | 7,493 | 6,015 | 4,702 | 1,478 | 1,293 |
| Above 75 | 32 | 22 | 15 | 10 | 7 | 100,000 | 100,000 | 100,000 | 3,597 | 2,009 | 1,034 | 1,588 | 975 |

was 100,000. The 7th, 8th, and 9th columns show the number of inhabitants, the total population being assumed at 100,000, living under temperate conditions below each of the several groups. The 10th, 11th, and 12th columns show the density of population, i. e., the number of inhabitants per square mile in each of the several groups, while the last two columns show the increase in density.

A glance at above table will show that in 1870, 1880, and 1890 more than half the population was living under a temperature between 45 and 55 degrees, and that between 45 and 60 degrees were found from 70 to 75 per cent of the inhabitants. Only a trifle over one per cent were living where the temperature was greater than 70 degrees, while in the region whose mean annual temperature was above 75 degrees the number of inhabitants was trifling. The number of inhabitants to the square mile not only expresses the density of population, but also gives a comparative measure of the absolute number and the increase in absolute number. The greatest density is and has been since 1870, where the temperature ranges from 50 to 55 degrees. From this as a maximum it diminishes rapidly both with an increase and decrease of temperature. The most rapid proportional increase in population has taken place at the two extremes, where it has trebled during the twenty years intervening between 1870 and 1890, while in the same time it has increased but about 50 per cent in the most densely-settled group.

The average annual temperature of the territory of the United States, excluding Alaska from consideration, is 53 degrees. The average annual temperature under which the people of the country live, taking into account the density of settlement, is practically the same.

DISTRIBUTION OF POPULATION IN ACCORDANCE WITH TOPOGRAPHIC FEATURES.

The following table based on an exceedingly instructive subdivision of the territory of the United States into areas differing in the character of their surface, their products, and their climate, and classifying the population in accordance therewith, has been condensed from a department of the Census of 1890 prepared by Henry Gannett, Geographer and Agent of the Census Department. The classification covers the population of the official census of 1890, 1880, and 1870.

| Regions. | Population in Thousands. | | | Density of Population per sq. mile in 1890. |
|------------------------------------|--------------------------|-------|-------|---|
| | 1890. | 1880. | 1870. | |
| Coast swamps | 1,809 | 1,569 | 1,284 | 91.5 |
| Atlantic plain | 8,784 | 711.3 | 5,546 | 74.4 |
| Piedmont region | 7,858 | 6,660 | 5,468 | 69.5 |
| New England hills | 2,290 | 2,171 | 1,995 | 40.7 |
| Appalachian Mountain region | 2,849 | 2,386 | 1,959 | 49.3 |
| Cumberland - Allegheny plateau | 5,749 | 4,787 | 3,940 | 59.3 |
| Interior timber region | 11,292 | 9,891 | 7,976 | 44.3 |
| Lake region | 3,578 | 2,507 | 1,722 | 25.1 |
| Ozark Mountain region | 1,041 | 734 | 473 | 22.3 |
| Alluvial region of the Mississippi | 885 | 683 | 460 | 23.6 |
| Prairie region | 13,048 | 9,777 | 6,715 | 28.3 |
| Great Plains | 737 | 232 | 73 | 1.4 |
| North Rocky mountains | 153 | 50 | 29 | 1.1 |
| South Rocky mountains | 247 | 192 | 78 | 2.1 |
| Plateau region | 110 | 81 | 29 | 0.7 |
| Basin region | 403 | 252 | 149 | 1.4 |
| Columbian mesas | 210 | 91 | 29 | 1.9 |
| Sierra Nevada | 146 | 136 | 111 | 4.9 |
| Pacific valley | 135 | 248 | 166 | 9.1 |
| Cascade range | 179 | 54 | 30 | 5.5 |
| Coast ranges | 810 | 552 | 328 | 14.3 |

Topographical Description.—Coast Swamps.

These swamps are found along the South Atlantic and Gulf coasts, extending inland to varying distances, in some places as much as a hundred miles. They have the greater breadth in North Carolina and Louisiana, but border the coast nearly all the way from southeast Virginia to the mouth of the Rio Grande, Texas. Upon the Atlantic coast the surface of these swamps, while exceedingly level, has ample slope for drainage, and accordingly as the land becomes valuable their borders are being drained and converted into farms. In the Carolinas a considerable area of them is utilized for rice plantations. In the main they are well timbered, principally with cypress and juniper, among which is a luxuriant growth of cane. The population of this region is mainly of the colored race, the climate being very unhealthy for the white race.

Atlantic Plain.

The Atlantic plain comprises the strip of land lying between the Coast swamps and the fall line throughout the Atlantic States south of New York and the Gulf States as far as the Mississippi River. It is characterized by a level surface, a low elevation, scarcely reaching two hundred feet above the sea, is underlaid by recent sedimentary rocks, and except where they have been removed by the hands of man is covered with pine forests.

Piedmont Region.

This region comprises a strip of country extending from Main to Alabama, lying between the fall line on the east and the Blue Ridge on the west. It is underlaid by metamorphic rocks and forested with a mixed growth of broad and narrow leaf trees. The lower portion is comparatively level, being broken only by the beds of streams, but in the neighborhood of the Blue Ridge and throughout New England it is hilly.

New England Hills.

This name has been applied to the hill country in the upper part of New England, including all of the upper part of Maine, the White Mountains of New Hampshire, the Green Mountains of Vermont, and the Adirondacks of New York, all of which is a broken, mountainous country, ranging in elevation from one to six thousand feet, and covered with forests.

Appalachian Mountain Region.

This region includes the Blue Ridge and the Appalachian valley lying immediately north and west of it, and extends from New Jersey to Alabama and Georgia. The Blue Ridge, consisting of a single range throughout Pennsylvania, Maryland, and Virginia, expands in North Carolina into a very complex mass of mountains, and there reaches its maximum elevation, namely, 6,700 feet.

The Appalachian valley is drained in New Jersey and Pennsylvania by the Delaware and Susquehanna rivers, in Virginia by the Potomac, the James, and Kanawha rivers, and in Tennessee mainly by the Tennessee River. It is traversed by numerous ranges, some of them assuming the dignity of separate mountain ranges, and all of them running closely parallel to one another and to the general direction of the valley.

Cumberland-Allegheny Plateau.

Rising from the northwest border of the Appalachian valley is an escarpment extending more or less continuously from northeastern Pennsylvania down through Maryland, Virginia, and Tennessee into Alabama. From the summit of this escarpment a plateau stretches with a general northwestern slope. This plateau is everywhere deeply scored by streams with a general northwesterly direction. These streams have cut the plateau into a mass of very irregular ridges and gorges, making it one of the most intricate mountain regions on the globe. The entire region is densely covered with forests, the hand of man having removed but a very small part of them.

Interior Timbered Region.

This region comprises southern Ohio and Indiana, the western half of Kentucky and Tennessee, and the northeastern part of Mississippi, together with small areas in adjoining states. It possesses no characteristic features beyond the fact that except in the settled regions it is covered with forests.

Lake Region.

A narrow strip of country bordering on the Great Lakes has been segregated under this name. It includes small parts of New York, Pennsylvania, and Ohio, and most of Michigan, Wisconsin, and northern Minnesota. Owing to the proximity of large bodies of water this region has many of the characteristics of a coast climate. The atmosphere being moist, the winters are abnormally warm and the summers abnormally cool. This region contains great pine forests, which are still serving as a main source of supply of that timber.

Ozark Mountain Region.

This region is located in northwest Arkansas, southwest Missouri, and the eastern part of Indian territory. In Arkansas it is made up of a succession of narrow ranges 2,000 to 3,000 feet high having a generally east and west trend, separated by somewhat broad valleys. Further to the northeast, in Missouri, the hills become merely a confused mass, without order or system.

Alluvial Region of the Mississippi.

This region extends in a rapidly widening strip from Cairo, at the mouth of the Ohio, to the coast swamps in Louisiana, into which it merges without any sharp line of demarcation. It includes parts of the states of Missouri, Arkansas, Mississippi, and Louisiana, besides a trifling area in Kentucky and Tennessee. Much the larger portion of it is marshy, and is below the level of the waters in the rivers. The dry land lies mainly along the immediate banks of the streams, having been formed by deposition from overflows. With the exception of the cultivated land this region is entirely covered with forests. The soil is of the highest degree of fertility, but the climate is hostile to the white race, and by far the larger proportion of its inhabitants are of the colored race.

Prairie Region.

This region comprises a small portion of western Indiana, most of Illinois and Iowa, southern Wisconsin and Minnesota, northern Missouri, eastern Dakota, Kansas, and Nebraska, and extends in a broad belt down through the Indian territory and Texas.

On the east it merges by insensible degrees into the forest-clad regions, and on the west by equally insensible degrees into the Great Plains. It is a region of transition from the one to the other. Its climate is such that without protection forests can not thrive. Before the advent of man various unfavorable conditions, among which forest fires were the most prominent, prevented the growth of forests in this region.

Its surface is level or slightly undulating, and was, in its natural state, covered with luxuriant grasses, but timber growth was scarce, and was confined almost entirely to the bluffs and the borders of streams. With the protection afforded by man the growth of forests has increased in this region, until now it presents a landscape, diversified by a tree growth, whose extent is constantly increasing. It is the granary of the country.

Great Plains.

Merging with the prairie region by insensible degrees are the Great Plains, extending from approximate longitude 99° to the foot of the Rocky Mountains, and from the Canadian border to the Rio Grande. It is a region devoid of timber, except in the narrowest strips along certain

streams, but sparsely covered with bunch grass, changing in the more arid regions to sage, artemisia, cactus, and yucca. Its surface is a monotonous, billowy expanse, broken only here and there by lines of cliffs and buttes.

Throughout this region the rainfall is insufficient for the needs of agriculture, and irrigation is necessary for the cultivation of the soil. The supply of water in the flowing streams is sufficient to irrigate only a small part of the land, and the extent to which settlement is possible will in the future become therefore a question of the abundance of water and not of land.

Cordilleran Region.

The Cordilleran region is naturally subdivided into districts, which differ from one another in certain features and have other features in common. Except in the extreme northwest, in Washington, Western Oregon, and Northwest California, the climate is arid and the rainfall is insufficient for agriculture. This aridity of climate and deficiency of rainfall increase southward and reach a maximum in Southern Nevada, California, and Arizona. The prevalence of forests accompanies the rainfall. Upon the northwest coast and inland as far as the Cascade range in Oregon and Washington the country is densely covered with forests of great trees. This forest belt extends inland through Northern Washington and Idaho into the mountainous region of Montana, and thence southward, accompanying the mountain ranges into the Yellowstone Park. Elsewhere no forests are found except upon the mountains, and in the more arid regions of the south even the mountains are bare to their summits. The valleys produce only the vegetation characteristic of an arid region. Where the rainfall is abundant bunch grass is found, but as the rainfall diminishes and the dryness of the atmosphere increases, the vegetation of the valleys changes to artemisia, cactus, yucca, and other desert plants.

Rocky Mountain Region.

This region, including the easternmost portion of the Cordilleran system, comprising Western Montana, Eastern Idaho, Western Wyoming, Central Colorado and New Mexico, with a little of Texas, is composed of a series of ranges separated by valleys of greater or less breadth, trending parallel to one another a little west of north and east of south. It is naturally subdivided into two parts. The northern part extends from Canada southeastward into Central Wyoming; thence for a distance of a hundred miles or thereabouts the mountain ranges disappear, leaving in their place only broad plateaus. The ranges reappear in Southern Wyoming and extend thence southward. In the northern part the mountains range from nine to thirteen thousand or more feet in altitude, rising from a base of four or five thousand feet. In the southern part the base is much higher, rising in Colorado to six or eight thousand feet, with high mountain valleys reaching 10,000 feet above the sea, while many of the ranges exceed 14,000 feet in altitude. Both the general level of the country and the mountain ranges diminish in altitude southward.

Plateau Region.

This region comprises most of the drainage basin of the Colorado River above the mouth of the Virgin in Southern Nevada. It is a region of great plateaus, whose surfaces are level or slightly inclined, and which terminate with great lines of

cliffs, in some cases thousands of feet in height. From the mountains which border this range on the east, north and west, these plateaus descend by a succession of gigantic steps from an elevation of twelve thousand feet down to one or two thousand feet above the sea. Every stream is in a cañon, and as the rainfall is light and spasmodic a great majority of these cañons are dry during the greater part of the year. In many regions these cañons are so abundant as to have reduced the plateau to a mere skeleton, or the process of erosion may have gone still further, so that nothing is left of the upper plateau but fragments in the form of mesas and buttes.

The higher plateaus in the neighborhood of the mountains are green and forested from the abundant rainfall. The lower plateaus, on the other hand, have only the sparsest vegetation or are absolutely sterile.

Basin Region.

In the interior of the Cordilleran region is an area comprising practically all of Nevada, Western Utah, part of Eastern California, and Southern Oregon, which has no drainage to the sea. It is a closed basin. The only discharge of its waters is by sinking into the thirsty soil or by evaporation into the thirsty atmosphere. This is the most desert part of the country, with the exception of the course of the lower Colorado and Gila rivers. The rainfall is scanty, even upon the mountains; so scanty, indeed, that there are but two or three running streams of any magnitude within it. Its surface is diversified by many ranges of mountains having a general parallel trend, rising from flat valleys filled with alluvium. These ranges divide the basin into numerous minor basins, in each of which water collects and sinks. In the eastern part the largest basin is that known as the Great Salt Lake, into which several small streams flow from the Wasatch Mountains. In the western part the principal basin is that of the Humboldt River. The elevation of the floor of the basin ranges from 6,000 feet near its middle line, downward, reaching in Death Valley, in Eastern California, an elevation of 200 feet below the level of the sea.

Columbian Mesas.

The drainage basin of the Snake River, in Idaho, Oregon, and Washington, together with a part of the basin of the Columbia, in the latter state, has been in great part covered by eruptions of basalt, which, bursting out of the soil at various points, has spread over the country, forming a fable-land.

Sierra Nevada.

Separating the Great Basin from the California valley, in eastern California, is a broad, heavy forest-covered range of mountains with long slopes to the west and an abrupt ascent to the east.

Pacific Valley.

West of the Cascade range and the Sierra Nevada and stretching from Puget sound to southern California is a valley drained in Oregon by the Willamette and in California by the Sacramento and San Joaquin rivers. In its southern part, south of the latitude of the Bay of San Francisco, the climate is such that irrigation is necessary, while north of it the rainfall is sufficient, and in Oregon and Washington is more than sufficient for the farmer's needs. Where the rainfall is insufficient this valley is treeless, but farther north, and especially in Oregon and Washington, it is covered with dense forests.

Cascade Range.

Stretching northward in line with the Sierra Nevada, but distinguished sharply from it by the character of its formation, is the Cascade range. It is a series of extinct volcanoes, rising from a high plateau of volcanic rock. This range is densely forested.

Coast Ranges.

Separating this valley from the Pacific is a succession of ranges trending parallel with the coast and known as the Coast ranges. In southern California the valleys among these ranges are of the highest degree of fertility and produce grapes and tropical fruits in profusion. Farther north the country is but little settled or even explored.

DISTRIBUTION OF POPULATION WITH REFERENCE TO MEAN ANNUAL RAINFALL.

In 1890 Mr. Gannett obtained (from reports furnished chiefly through the Weather Bureau from nearly 2,000 stations) data from which he platted upon a map of the United States the curves of mean annual rainfall, at intervals of ten inches, sketched in accordance with their indications, and supplemented by his knowledge of the relief of the country and its known influence upon rainfall. From the map thus prepared the counties falling between the different curves of mean annual rainfall were drawn off in lists. In cases where the county was cut in parts by a curve, due weight was given in the partition of the county to any inequality in distribution of population. The population was then distributed by counties in accordance with the lists. The result is shown in the table below.

In this table the first column shows the grades, expressed in inches of rainfall; the second, third, and fourth columns, the number of inhabitants found in each grade in 1890, 1880, and 1870, assuming that the total population at each of the above periods was one hundred thousand, or, in other words, the percentage of the population in each of these grades at the periods under consideration, carrying the figures out to the thousandth of 1 per cent; the fifth and sixth columns show the increase or decrease in number; the seventh, eighth, and ninth columns show the number of inhabitants in each one hundred thousand above each grade, and therefore are cumulative columns; the tenth, eleventh, and twelfth columns show the density of population in each grade in 1890, 1880, and 1870, and the last two columns show the increase in population per square mile.

It will be noticed that the main body of the population of the country inhabits the region in which the annual rainfall is between 30 and 50 inches, three-fourths of the inhabitants or thereabouts being found there. On either side, as the rainfall increases or diminishes, the population diminishes rapidly. It will be seen further that the arid region of the west, where the rainfall is less than 20 inches—a region which comprises two-fifths of the entire area of the country—contains at present less than 3 per cent of the population.

The greatest density of population is in the area enjoying from 40 to 50 inches of annual rainfall, the average of this region being 59 inhabitants to the square mile. Next to that is the area having from 30 to 40 inches, where the density is 43.1. The density of population has increased rapidly in these regions. It is apparent, however, that the most rapid increase, as expressed by density of population, is where the rainfall ranges from 20 to 30 inches; that is in the eastern portion of the Great Plains ranging from Texas to the Dakotas, where the density has increased in twenty years from 1.6 to 8.1.

The average annual rainfall upon the surface of the United States, as deduced from the map previously mentioned, is 29.6 inches. The average annual rainfall with relation to the population, deduced by giving weight to each area of country in proportion to the number of its inhabitants, was, in 1870, 42.5 inches; in 1880 it had diminished to 42 inches, and in 1890 to 41.4 inches, the diminution being caused mainly by the settlement of the Great Plains and the arid regions of the west.

DISTRIBUTION OF POPULATION IN ACCORDANCE WITH MEAN RELATIVE HUMIDITY OF ATMOSPHERE.

On the coast of Oregon and Washington, the atmosphere is more highly charged with moisture than elsewhere within our territory. The high mountain regions of the Appalachian and to a considerable extent those of the Rocky mountain ranges also have a moist atmosphere. The moisture is less in the Piedmont region east of the Appalachians and in the upper Mississippi valley. Passing across the prairie and the great plains, the amount of moisture in the atmosphere diminishes still more, while the minimum is reached in the Great Basin, in Utah, Nevada, southern Arizona, and southeastern California. In a general way, the amount of moisture in the atmosphere increases and decreases with the rainfall, but this is not always the case. The upper lake region, with an atmosphere as moist as that of Washington city, has a much smaller rainfall. The coast of

| Inches of Rainfall. | Number in 100,000 Inhabitants. | | | Change in Number in 100,000 Inhabitants. | | Number in 100,000 Above Each Grade. | | | Population per square mile. | | | Increase in Population per square mile. | |

southern California, with a deficient rainfall, has as moist an atmosphere as the Atlantic coast.

In the following table the first column defines the classes of population grouped by percentages of saturation of the atmosphere in the sections in which the people reside; the second gives the number of inhabitants in each class expressed in round thousands; the third, the percentage of increase during the last decade; the fourth, the percentage of total population; the fifth, the density of population, or the population per square mile in each class.

| Class. | Pop. in Class. | Per Cent. of Increase. | Per Cent. of Total Population. | Density. |
|---------------|----------------|------------------------|--------------------------------|----------|
| Below 50... | 2,309,000 | 341.10 | 0.49 | 1.14 |
| 50 to 55..... | 433,000 | 114.36 | 0.69 | 1.44 |
| 55 to 60..... | 291,000 | 117.16 | 0.46 | 1.35 |
| 60 to 65..... | 888,000 | 97.72 | 1.39 | 2.89 |
| 65 to 70..... | 22,969,000 | 19.14 | 36.68 | 31.46 |
| 70 to 75..... | 34,067,000 | 24.28 | 54.40 | 40.07 |
| 75 to 80..... | 3,341,000 | 39.03 | 5.34 | 14.21 |
| Above 80... | 344,000 | 72.00 | 0.55 | 5.55 |

A glance at this table shows that nearly all the population breathe an atmosphere containing 65 to 75 per cent. of its full capacity of moisture; that is, the atmosphere is from two-thirds to three-fourths saturated. In 1890, 57,036,000 out of 62,622,250 were found in this region. The number of inhabitants living in a drier atmosphere was at the date of the census comparatively trifling, numbering in 1890 less than two millions. In the moister atmosphere were found larger numbers scattered along the Gulf coast and the shores of Washington and Oregon.

DISTRIBUTION OF POPULATION IN RESPECT OF LATITUDE AND LONGITUDE.

The following diagrams show the distribution of population of the United States with respect of latitude and longitude at the dates severally of the last three censuses. They were prepared for the report of the census of 1890 by Henry Gan-

nett, Geographer and Special Agent of the Census Department.

Naturally the greater density of population in a square degree is governed by the location of the larger cities. Thus the two square degrees between latitudes 40° and 41° and longitudes 73° and 75°, comprising New York, Brooklyn, Jersey City, and other large cities, contain 3,653,000 inhabitants. The square degree between latitudes 42° and 43° and longitudes 71° and 72°, comprising Boston and its suburbs, has 1,233,000 inhabitants;

that between latitudes 39° and 40° and longitudes 75° and 76°, in which is most of Philadelphia, has 1,414,000, while that between latitudes 41° and 42° and longitudes 87° and 88°, in which is situated most of Chicago, contains 950,000 people.

AREA AND POPULATION OF DRAINAGE BASINS OF THE UNITED STATES.

The following table was prepared by Henry Gannett, Geographer and Special Agent of the Census Department:

| Drainage Basins. | Approximate area in square miles. | Population 1890. | Population per square mile. |
|-----------------------------|-----------------------------------|------------------|-----------------------------|
| Atlantic Ocean..... | 2,178,210 | 60,220,763 | 27.6 |
| New England coast..... | 61,830 | 4,486,813 | 72.6 |
| Saint John river..... | 7,800 | 53,381 | 6.8 |
| Penobscot river..... | 8,934 | 113,179 | 12.7 |
| Kennebec river..... | 10,102 | 236,553 | 23.4 |
| Merrimac river..... | 4,864 | 616,594 | 126.8 |
| Connecticut river..... | 11,269 | 782,216 | 69.4 |
| Housatonic river..... | 1,953 | 251,701 | 130.2 |
| Middle Atlantic coast..... | 83,020 | 11,482,411 | 138.3 |
| Hudson river..... | 13,366 | 1,094,126 | 81.9 |
| Delaware river..... | 12,012 | 2,561,113 | 213.2 |
| Susquehanna river..... | 27,655 | 1,965,184 | 71.1 |
| Potomac river..... | 14,479 | 870,135 | 60.1 |
| South Atlantic coast..... | 132,040 | 4,248,466 | 32.2 |
| James river..... | 9,684 | 495,910 | 51.2 |
| Cape Fear river..... | 8,310 | 239,399 | 28.8 |
| Neuse river..... | 5,299 | 216,933 | 40.9 |
| Peece river..... | 17,098 | 600,277 | 35.1 |
| Roanoke river..... | 9,237 | 404,281 | 43.6 |
| Santee river..... | 14,696 | 607,098 | 41.3 |
| Savannah river..... | 11,402 | 446,569 | 39.2 |
| Altamaha river..... | 14,109 | 473,967 | 33.6 |
| Great Lakes..... | 175,340 | 7,009,839 | 40.0 |
| Saint Lawrence river..... | 13,636 | 474,158 | 34.8 |
| Lake Ontario..... | 12,387 | 1,006,668 | 81.3 |
| Lake Erie..... | 17,207 | 2,179,269 | 126.7 |
| Lake Huron..... | 18,839 | 439,393 | 23.3 |
| Lake Michigan..... | 45,876 | 2,507,562 | 54.7 |
| Lake Superior..... | 17,830 | 155,271 | 8.7 |
| Red river..... | 39,577 | 247,518 | 6.3 |
| Gulf of Mexico..... | 1,725,980 | 32,993,234 | 19.1 |
| Peninsula of Florida..... | 48,900 | 435,603 | 8.9 |
| Apalachicola river..... | 18,918 | 699,713 | 37.0 |
| Mobile river..... | 43,436 | 1,425,649 | 32.8 |
| Tombigbee river..... | 18,896 | 611,338 | 32.4 |
| Alabama river..... | 23,820 | 784,099 | 32.9 |
| Pascagoula river..... | 8,980 | 129,084 | 14.4 |
| Pearl river..... | 8,670 | 175,698 | 20.3 |
| Sabine river..... | 20,440 | 172,656 | 8.4 |
| Trinity river..... | 17,960 | 449,718 | 25.0 |
| Brazos river..... | 59,646 | 512,621 | 8.6 |
| Colorado river..... | 41,220 | 183,524 | 4.5 |
| Nueces river..... | 18,944 | 41,633 | 2.2 |
| San Antonio river..... | 16,352 | 169,847 | 10.4 |
| Rio Grande..... | 128,792 | 156,150 | 1.2 |
| Mississippi river..... | 1,240,039 | 27,411,522 | 22.1 |
| Yazoo river..... | 12,794 | 415,406 | 32.5 |
| Illinois river..... | 29,013 | 1,867,935 | 64.4 |
| Rock river..... | 9,792 | 532,117 | 54.3 |
| Wisconsin river..... | 12,280 | 259,778 | 21.2 |
| Chippewa river..... | 8,892 | 141,529 | 15.9 |
| Saint Croix river..... | 7,576 | 92,854 | 12.3 |
| Minnesota river..... | 16,000 | 327,852 | 20.5 |
| Cedar river..... | 12,492 | 393,021 | 31.5 |
| Des Moines river..... | 14,652 | 423,128 | 28.9 |
| Ohio river..... | 201,720 | 10,986,777 | 54.5 |
| Tennessee river..... | 43,897 | 1,384,733 | 31.5 |
| Cumberland river..... | 18,573 | 720,012 | 38.8 |
| Kentucky river..... | 7,425 | 291,022 | 39.2 |
| Green river..... | 9,065 | 358,804 | 39.6 |
| Licking river..... | 3,658 | 221,478 | 60.5 |

The areas of the respective drainage basins were determined with care, and adjusted to suit the total area of the United States, exclusive of Alaska.

URBAN POPULATION OF THE UNITED STATES.

In the census reports of the United States the urban population has been understood as that included in cities which have each 8,000 inhabitants and over. While this limit is now recognized as too high (the 4,000 limit being generally regarded as the better one), it has been continued for the convenience of comparisons with the figures of the previous census reports.

The urban population returned in 1890 is 29.12 per cent. of the total population of the whole country. The following are the corresponding figures for the several censuses:

| Census Years. | Population of the United States. | Population of cities. | Inhabitants of cities in each 100 of the total population. |
|---------------|----------------------------------|-----------------------|--|
| 1790 | 3,929,214 | 131,472 | 3.35 |
| 1800 | 5,308,483 | 210,873 | 3.97 |
| 1810 | 7,239,881 | 356,920 | 4.93 |
| 1820 | 9,633,822 | 475,135 | 4.93 |
| 1830 | 12,866,020 | 864,509 | 6.72 |
| 1840 | 17,069,453 | 1,453,594 | 8.52 |
| 1850 | 23,191,876 | 2,897,586 | 12.49 |
| 1860 | 31,443,321 | 5,072,256 | 16.13 |
| 1870 | 38,558,371 | 8,071,875 | 20.93 |
| 1880 | 60,155,783 | 11,818,547 | 22.57 |
| 1890 | 62,622,250 | 18,235,670 | 29.12 |

It will be seen that the proportion of urban population has increased gradually during the past century from 3.35 up to 29.12 per cent. or from one-thirtieth up to nearly one-third of the total population. The increase had been quite regular from the beginning up to 1880, while from 1880 to 1890 it made a leap from 22.57 up to 29.12 per cent. thus illustrating in a forcible manner the accelerated tendency of our population toward urban life. The number of cities having each a population of more than 8,000 increased from 6 in 1790 to 286 in 1880, whence it leaped to 443 in 1890.

In 1870 there were only 14 cities reporting each a population of 100,000 or over; in 1880 there were 20; and in 1890 the number had increased to 28. In 1880 New York was the only city whose population had reached a million; now there are three, namely: New York, Chicago, and Philadelphia. The list and relative rank of the cities having each a population of 100,000 in the census years of 1870, 1880, and 1890 are shown as follows:

| Rank | 1890. | | | 1880. | | | 1870. | | | Population. | | Increase. | |
|------|---------------------|---------------------|-----------------|-------------------|-------------------|-------------------|-----------------|-----------------|-----------------|-------------|---------|-----------|-----------|
| | | | | | | | | | | 1890. | 1880. | Numbr. | Per Cent. |
| 1 | New York, N. Y. | New York, N.Y. | New York, N. Y. | Philadelphia, Pa. | Philadelphia, Pa. | Philadelphia, Pa. | Brooklyn, N. Y. | Brooklyn, N. Y. | Brooklyn, N. Y. | 26,178 | 8,086 | 23,092 | 748.28 |
| 2 | Chicago, Ill. | Chicago, Ill. | Chicago, Ill. | St. Louis, Mo. | St. Louis, Mo. | St. Louis, Mo. | Baltimore, Md. | Baltimore, Md. | Baltimore, Md. | 20,448 | 17,180 | 2,868 | 16.60 |
| 3 | Philadelphia, Pa. | Brooklyn, N. Y. | Brooklyn, N. Y. | Chicago, Ill. | Chicago, Ill. | Chicago, Ill. | Boston, Mass. | Boston, Mass. | Boston, Mass. | 448,477 | 362,839 | 85,638 | 23.60 |
| 4 | Brooklyn, N. Y. | Chicago, Ill. | Chicago, Ill. | Boston, Mass. | Boston, Mass. | Boston, Mass. | Cincinnati, O. | Cincinnati, O. | Cincinnati, O. | 8,561 | 3,310 | 5,251 | 168.64 |
| 5 | Saint Louis, Mo. | Boston, Mass. | Chicago, Ill. | Baltimore, Md. | Baltimore, Md. | Baltimore, Md. | Cincinnati, O. | Cincinnati, O. | Cincinnati, O. | 10,514 | 9,197 | 1,317 | 14.32 |
| 6 | Boston, Mass. | St. Louis, Mo. | Chicago, Ill. | Baltimore, Md. | Baltimore, Md. | Baltimore, Md. | Cincinnati, O. | Cincinnati, O. | Cincinnati, O. | 48,266 | 27,643 | 21,223 | 76.78 |
| 7 | Baltimore, Md. | Baltimore, Md. | Chicago, Ill. | Cincinnati, O. | Cincinnati, O. | Cincinnati, O. | Cincinnati, O. | Cincinnati, O. | Cincinnati, O. | 11,424 | 8,722 | 2,702 | 50.98 |

The Superintendent of the Census of 1890 in closing his special report on the urban population, says: In defining what constitutes a city in each case the Census Office has consistently maintained the policy of including only such population as lives within the charter limits, because no other defined limits exist. In many cases, however, this does not give to the city all the population which naturally belongs to it. There may be populous suburbs, which are to all intent and purposes parts of the city, whose inhabitants transact business within the city, who are served by the same post-office, etc., but who, living without the charter limits, are not included in the city's population. Of this our greatest city, New York, is a forcible example. Within a radius of fifteen miles of the city hall on Manhattan Island the people are in effect citizens of New York, so far as their business and social interests go, although politically they live in different cities, counties and states. This body of population, the commercial metropolis of the country, contains a population considerably in excess of 3,000,000, or two-thirds that of London, which is, similarly, a congeries of municipalities. Next to London, New York and its suburbs form the largest city of the globe. Other cases are those of St. Paul and Minneapolis, whose corporate limits join one another, and Bristol, Tenn., and Bristol, Va., two corporations whose line of division follows the middle of the main street of the city, and which have a joint population of 6,229. Texarkana, Tex., and Texarkana, Ark., is a similar case. Knoxville, Tenn., has large suburbs immediately adjoining, whose population would, if added, increase it to very nearly 40,000 inhabitants.

The rate of growth of many of these cities, especially those situated west of the Mississippi River, has been amazing. Chicago has added over half a million to her inhabitants, thus more than doubling her size in ten years. Minneapolis, St. Paul, Omaha, Kansas City, and Denver have expanded to triple or quadruple their former size, while all over the west smaller cities have sprung up as if by magic.

POPULATION AND AREA OF FIFTY CITIES OF THE UNITED STATES BY SQUARE MILES AND ACRES.

In the following lists nineteen other cities would have been included had it not been for the lack of data not reported to the Census Department in time for use in the tabulated summaries prepared

by that department. The missing figures except for population (for which see page 465 of these Revisions and Additions) were from Pittsburg, Pa., Jersey City, N. J., Louisville, Ky., Kansas City, Mo., Providence, R. I., Allegheny, Pa., Albany, N. Y., Columbus, O., Richmond, Va., Paterson, N. J., Scranton, Pa., Atlanta, Ga., Memphis, Tenn., Wilmington, Del., Dayton, O., Troy, N. Y., Grand Rapids, Mich., and Reading, Pa.

The total population of the fifty cities (as shown in table on opposite page) in 1890 was 10,095,370. The area in square miles, and the density of population are given for convenience of comparison.

Washington, District of Columbia, is considered as a city proper; that is, it includes the area and population inclosed within the actual municipal boundaries, and not those of the District of Columbia.

The area of New York includes the islands in the East River, (having an aggregate of 520 acres) belonging to the twelfth, nineteenth, and twenty-third wards. There being no way to separate the population of these islands from that of the city proper, the area must be included in the whole.

The area given for Fall River comprises all except portions of the 6th and 9th wards, the area of which the city engineer reported to the Census Agent had never been measured.

Of the fifty cities included in the foregoing tables, twenty-two have a population of over 100,000 each and a total of 8,737,648, or 13.95 per cent. of the total population of the United States.

The average density of population in these twenty-two cities is 10,190.03 to the square mile, or 15.92 to the acre. There are, however, enormous differences in the ratios of population to area included in the city limits of these various cities. This ratio, stated in round numbers as persons to the acre, ranges from 4 in St. Paul, 5 in Minneapolis, 9 in Omaha, 10 in New Orleans and Buffalo, 11 in Chicago and Denver, 12 in Saint Louis, to 59 in New York, 48 in Brooklyn, 31 in Washington, and 30 in San Francisco. For the other larger cities, the figures for population per acre are, in round numbers, Baltimore, 24; Boston, 20; Cincinnati and Milwaukee, 19 each; Cleveland, Detroit, Indianapolis, and Newark, 16 each; Nashville, 14; Rochester and Philadelphia, 13 each.

These ratios, however, give no information as to the difference in density of population in the actually built-up portions, as will be seen by comparisons of the density figures for wards in some of these cities. Thus, in New York City the number of persons per acre ranges from 474 in ward ten to 3 in ward twenty-four; in Chicago, from 116 in ward sixteen to 2 in wards twenty-eight and thirty-three; in Philadelphia, from 163 in ward three to 1 in ward twenty-three; in Brooklyn, from 198 in ward sixteen to 6 in ward twenty-six; in Boston, from 204 in ward eight to 3 in ward twenty-three; in Baltimore, from 141 in ward ten to 3 in ward twenty-two; in Cincinnati, from 162 in ward thirteen to 3 in ward thirty; in Buffalo, from 60 in ward two to 1 in wards twelve and thirteen; in New Orleans from 56 in ward ten to 2 in ward nine; in Milwaukee, from 43 in ward two to 7 in wards seventeen and eighteen; in Newark, from 64 in ward fifteen to 4 in ward ten; in Minneapolis, from 38 in ward six to 1 in ward ten; in Saint Paul, from 42 in ward four to 1 in wards two and ten; in Rochester, from 59 in ward thirteen to 4 in ward fifteen.

ARMY AND NAVY OF THE UNITED STATES.

For the latest statistics of the Army and Navy see those articles in these Revisions and Additions.

There were in 1891 ten navy yards and stations, namely: Brooklyn, Portsmouth, Charleston, League Island, New London, Washington, Norfolk, Pensacola, Mare Island, and Port Royal. Of these Brooklyn, Portsmouth, Norfolk, Mare Island, and Port Royal are used as construction yards. At Washington there is a manufactory for the completion of heavy ordnances.

CONGRESSIONAL CEMETERY OF THE UNITED STATES.

By the Act of May 12, 1876, it is provided that "hereafter, whenever any deceased Senator or member of the House of Representatives shall be actually interred in the Congressional Cemetery, so called, it shall be the duty of the Sergeant-at-Arms of the Senate, in the case of a Senator, and of the Sergeant-at-Arms of the House of Representatives, in the case of a member of the House, to have a monument erected, of granite, with suitable inscriptions, and the cost of the same shall be a charge upon and paid out either from the contingent funds of the Senate or the House of Repre-

sentatives, to whichever the deceased may have belonged, and any existing omissions of monuments or inscriptions, as aforesaid, are hereby directed and authorized to be supplied in like manner; and all laws upon the subject of monuments in the Congressional Cemetery are hereby repealed."

SEED FARMS IN THE UNITED STATES.

The production of seeds was the first time made a subject of census inquiry in 1890. The report prepared by J. H. Hale under the direction of M. Whitshed, special agent in charge of the Department of Horticulture, was made after personal application for the statistics, of seed farm proprietors and dealers throughout the United States. It showed that there were in the United States in the census year 596 farms, with a total of 169,851 acres, devoted exclusively to seed growing, of which 96,567 1/4 acres were reported as producing seeds. Of these, 12,905 acres were devoted to beans, 1,268 to cabbage, 919 to beets, 10,219 to cucumbers, 71 to celery, 15,004 to sweet corn, 16,322 to field corn,

4,663 to squashes, 7,971 to peas, 5,149 to muskmelons, 662 to radishes, and 4,356 to tomatoes. The 596 seed farms reported represent a total value of farms, implements, and buildings of \$18,325,935.86, and employed in the census year 13,500 men and 1,541 women. 258 of these farms are in the North Atlantic division, with an average of 185 acres per farm. In the North Central division there are 157 seed farms, with an average of 555 acres per farm. The seed farms in Iowa and Nebraska average 695 acres, several being nearly 3,000 acres in extent.

SHIPPING ON THE GREAT LAKES.

The total number of vessels on the great lakes of the United States, Jan. 1, 1890, was 2,744; total gross tonnage 924,472; estimated carrying capacity, 1,254,271 tons; commercial valuation, \$48,809,750.

The following table gives the classes of vessels severally, their tonnage, and their commercial value:

| Classes. | No. | Ton- nage. | Com'cial Value. |
|---|-----|---------------|--------------------|
| Steam Vessels. | | | |
| Side-wheel passenger..... | 67 | 30,270 | 2,815,500 |
| Propellers carrying both passengers and freight..... | 307 | 143,983 | 10,967,900 |

| Yawls..... | 1 | 17 | 300 |

Of these vessels there were on Lake Superior 167; on Lakes Huron and St. Clair, 726; Lake Michigan, 1,003; Lake Erie, 664; Lake Ontario, 131, and St. Lawrence River and Lake Champlain, 92.

NURSERIES IN THE UNITED STATES.

The material from which the following summaries were made were reported direct from the nurserymen by filling up blanks sent out from the Census Office in 1890. The tabulations show that there are in the United States 4,510 nurseries, valued at \$41,978,835.80 and occupying 172,806 acres of land, with an invested capital of \$54,425,669.51, and giving employment to 45,657 men, 2,279 women, and 14,200 animals, using in the propagation and cultivation of trees and plants \$990,606.04 worth of implements. Of the acreage in nurseries 95,025.42 were found to be used in growing trees, plants, shrubs, and vines of all ages; and the figures, based upon the best estimate of the nurserymen, make the grand total of plants and trees 3,386,855,778, of which 518,016,612 are fruit trees, 685,603,396 grapevines and small fruits, and the balance nut, deciduous, and evergreen trees, hardy shrubs, and roses. The largest acreage is devoted to the production of apple trees, viz.: 20,232.75 acres, numbering 240,570,666 young trees, giving an average of 11,890 per acre, while the plum, pear, and peach have, respectively, 7,826.5, 6,854.25, and 3,357 acres, producing 88,494,367, 77,223,402, and 49,887,894 young trees, or an average of 11,307, 11,266, and 14,861 trees to the acre.

The following shows the acreage and average number of trees or plants grown per acre, severally, and the total plants of each kind in the United States in 1890:

| Trees or Plants. | Number of acres. | Average No. grown per acre. | Total num- ber grown. |
|--|------------------------------------|-----------------------------------|--------------------------|
| Apple..... | 20,232 ³ / ₄ | 11,890 | 240,570,666 |

HORSES, MULES AND ASSES ON FARMS.

The following United States census summaries for 1890 include the number of these animals employed only on farms which contain each three acres and over, and show that in the states and territories there were on hand, June 1, 1890, 14,976,017 horses, 2,246,936 mules, and 49,109 asses; that in 1889 there were foaled 1,814,404 horses, 157,105 mules and 7,957 asses; that there were sold in the same year 1,309,557 horses, 329,995 mules, and 7,271 asses, and that there died from all causes 765,211 horses, mules, and asses during the same period.

The increase of horses from 1880 to 1890 is shown to be 44.59 per cent, as against 44.95 per cent between 1870 and 1880. The increase of mules from 1880 to 1890 was 26.66 per cent.

Of the aggregate number of horses and mules in the whole country, June 1, 1890, 86.95 per cent were horses and 13.05 per cent were mules. The North Atlantic group of states had the smallest proportion of mules, 2.41 per cent, while the South Atlantic group had the largest proportion, 32.04 per cent, as against 67.96 per cent of horses.

The census summaries by states and groups of states are as follows:

| States and Territories. | Horses. | Mules. | Asses. |
|---------------------------------|------------|-----------|--------|
| The United States..... | 14,976,017 | 2,246,936 | 49,109 |

PRODUCTION OF COTTON IN THE UNITED STATES.

The manufacture of cotton in the United States has been rapidly growing in recent years. At the census of 1880 there were found to be 756 manufactories for materials solely for cotton, with a capital of \$208,280,445, the number of spindles was 10,653,435 (12,000,000 in 1882); of looms, 225,759; hands employed, 174,659; cotton consumed, 1,570,344 bales (750,343,981 lbs.), valued at \$86,945,728; producing materials valued at \$192,000,000.

The following are some statistics of cotton:

| Year. | Production. | Imports. | Exports. | Ret'n'd for Home Consumption. |
|-------|---------------|-----------|---------------|-------------------------------|
| | lbs. | lbs. | lbs. | lbs. |
| 1880 | 2,771,797,596 | 3,547,792 | 1,822,295,843 | 953,049,106 |
| 1884 | 2,757,544,422 | 7,019,492 | 1,863,926,466 | 900,637,448 |
| 1885 | 2,742,966,011 | 5,115,680 | 1,893,268,732 | 854,812,959 |
| 1886 | 3,182,305,659 | 5,072,334 | 2,059,314,405 | 1,128,063,588 |
| 1887 | 3,157,378,443 | 3,924,531 | 2,170,173,701 | 991,129,273 |
| 1888 | 3,439,172,391 | 5,497,592 | 2,264,324,798 | 1,180,345,185 |
| 1889 | 3,457,308,499 | 7,973,039 | 2,385,004,628 | 1,060,376,910 |

The value of cottons of domestic manufacture exported from the United States were from \$4,071,882 in 1875 to \$11,639,591 in 1885, and \$10,212,644 in 1889.

LIVE STOCK RANGES.

On the ranges of Texas, the Indian Territory, Colorado, the western portions of Kansas, Nebraska, Wyoming, the Dakotas, Montana, Idaho, the eastern portions of California, Oregon and Washington, Nevada, Utah, Arizona and New Mexico there were found in June 1890, 517,128 horses, 5,433 mules, 14,109 asses, or burros, 6,828,183 cattle, 6,676,902 sheep, and 17,276 swine. The sales of horses in 1889 amounted to \$1,418,205; of cattle, \$17,913,712; of sheep, \$2,669,663, and of swine, \$27,132. The total number of men reported upon ranges in care of this stock is 15,390. This industry is found to be more generally prosperous at this time than for several years previous.

COAL PRODUCT WEST OF MISSISSIPPI RIVER.

The following table furnishes the census summaries for 1890:

| States and Territories. | Mines. | Productions. | Value. | Price at Mint. |
|----------------------------|--------|--------------|--------------|----------------|
| Grand total..... | 569 | 16,067,500 | \$24,413,262 | \$1.52 |
| Trans-Mississippi Valley | 449 | 10,051,229 | 1,271,622 | 1.42 |
| Dakota and Nebraska..... | 5 | 30,307 | 46,331 | 1.53 |
| Kansas..... | 127 | 2,230,763 | 3,294,754 | 1.48 |
| Indian Territory..... | 10 | 752,832 | 1,323,806 | 1.76 |
| Iowa..... | 172 | 4,061,704 | 5,392,220 | 1.33 |
| Missouri..... | 123 | 2,567,823 | 3,478,058 | 1.35 |
| Arkansas..... | 8 | 279,584 | 395,836 | 1.42 |
| Texas..... | 4 | 128,216 | 340,617 | 2.66 |
| Rocky Mountain region. | 98 | 4,836,368 | 7,486,004 | 1.55 |
| Montana..... | 8 | 363,301 | 881,523 | 2.43 |
| Wyoming..... | 15 | 1,388,947 | 1,748,618 | 1.26 |
| Colorado..... | 53 | 2,360,536 | 3,605,622 | 1.53 |
| New Mexico..... | 18 | 486,983 | 872,785 | 1.79 |
| Utah..... | 4 | 236,601 | 377,456 | 1.60 |
| Pacific Coast..... | 22 | 1,179,903 | 2,655,636 | 2.25 |
| California and Oregon..... | 10 | 186,176 | 451,881 | 2.43 |
| Washington..... | 12 | 993,724 | 2,203,755 | 2.22 |

In *North and South Dakota* the ascertained coal areas lie in the western counties, between a line running from the Turtle Mountains in the north through Burleigh County to the southern borders of the Black Hills and the western boundary line. The product is a fair grade of lignite or brown coal, suitable for heating and steam, and in some localities it is adapted for the manufacture of gas. The output in 1889 was 28,907 short tons valued at \$41,431.

In *Kansas* the coal measures cover an area of about 10,000 square miles, underlying the entire eastern portion of the state. The coals are bituminous and are found to be excellent for coking, steam, gas, smelting, and domestic purposes. The coal deposits are known to extend into twenty counties, and in 1890 mining operations were carried on in Leavenworth, Franklin, Neosho, Cherokee, Bourbon, and Osage Counties. The output is rapidly increasing. The veins vary from one to five feet.

In the *Indian Territory* the only carboniferous coal west of the Mississippi river extend across the boundaries of Kansas, Missouri, and Arkansas, underlying almost the entire eastern half of that territory. The present developments of importance are along the line of the Missouri, Kansas and Texas Railway, in the Choctaw Nation Reservation, and are conducted by the Osage Coal and Mining Company at McAlester and the Atoka Mining Company at Lehigh.

The quality of the coal now being mined in this territory is excellent for steam and heating purposes, and is well suited for gas and coking. The beds from which the product is obtained range from three to five feet in thickness, and comprise the two lower veins, which are here found to be of much greater thickness and freer from bone and other impurities than in any other part of the field. Competent authorities assert that the coals now being mined in the Indian Territory are superior to any found west of the Appalachian field.

In *Iowa* nearly half the State is underlain with coals. The northern extremity of the great coal field occupies the southern portion of the State, extending across the southeastern counties of Nebraska, thence southward through Kansas, Missouri, Arkansas, Texas, and Indian Territory. Coal is produced in twenty-six counties, and is of a quality generally well adapted for steam and heating purposes. No canal or gas coal is found in the State.

In *Missouri* coal is found in thirty-nine counties, the deposit being a part of what is known as the Fourth Field underlying portions of Nebraska, Iowa, Kansas, Missouri, Arkansas, and Indian Territory. The geological surveys of the State have not as yet clearly defined the outcroppings of the beds in the several counties, but mining operations have been conducted to a greater or less extent in the territory lying north of the Missouri River from the western boundary to the Mississippi River, and in the counties lying south of the Missouri River, between Kansas City and Jefferson City, and along the western boundary to Jasper and Dade counties. The principal developments are within Adair, Audrain, Barton, Bates, Caldwell, Callaway, Grundy, Henry, Johnson, Lafayette, Macon, Montgomery, Putnam, Randolph, Ray, and Vernon counties.

The character of the coal is semi-bituminous, and is adapted for steam and heating purposes, as well as for smelting.

In *Arkansas* the coal deposits are located in the western part of the State upon either side of the

Arkansas River, extending between Forth Smith and Little Rock. Mining operations have been conducted in Sebastian, Franklin, Logan, Crawford, Johnson, and Pope counties. The coals of Arkansas are variable in quality, and are adapted for steaming, coking, and gas manufacture, and domestic purposes. Coal mining in this State may be said to have begun about the year 1870, but it did not assume commercial importance until about the year 1883.

In *Texas* the principal coal lies in the northern portion of the State, extending southwest from the Red River in Montague county, to the Colorado River. This basin is a continuation of the great Fourth or Western field, of which it forms the southern extremity. It is said to underlie the whole or portions of twenty-five counties, and embraces an area of 12,000 square miles. The only operation of importance in this field, in the year 1889 was that of the Tebas and Pacific Coal Company in Erath county. The field next in importance in this State lies along the Rio Grande, underlying Webb, Dimmit, Zavalla, Uvalde, Medina, and Maverick counties, known as the Nueces coal field, and embraces about 3,700 square miles. The quality here is variable, differing materially from that of the Central field, the lower measures yielding a fair semi-bituminous product, while the upper measures are somewhat lignitic. The principal developments in this field are Santo Tomas, in Webb county, and Eagle Pass, in Maverick county.

An extended area, bounded by lines drawn from Clarksburg, in Red River county, southwesterly to the Rio Grande, and thence northeast to the Sabine River, in Sabine county, is said to contain important deposits of lignite. No developments have thus far been reported in this field, except those of the North Texas Coal and Mining Company in Raines county.

The *Rocky Mountain coal regions* are embraced in *Colorado, Wyoming, Montana, Utah, and New Mexico*. Although indications of lignite deposits have been found in Nevada, Idaho, and Arizona, no effort at development has yet been made beyond desultory prospecting. Lignite, bituminous, and anthracite coals are found in the region under consideration. The latter, however, so far as known, is confined to Gunnison and Pitkin counties, in Colorado, and the quality is said to compare favorably with the anthracite of eastern Pennsylvania. The bituminous coals comprise some excellent qualities of coking and gas coals. During the decade since the Tenth Census the development of coal mining in the states and territories named has been intelligently and vigorously prosecuted.

In *California*, although coal deposits of more or less importance have been discovered in many of the counties of the State west of the Sierras from Siskiyou, in the vicinity of Mount Shasta, in the north, to San Diego in the south, no mining operations upon a commercial scale have been prosecuted except in Amador and Contra Costa counties. Coal was discovered in the Mount Diablo district in 1852, but productive mining was not prosecuted until after the year 1860. This district now furnishes the major portion of the product of the State. The coals of California, so far as at present known, are all lignitic in character, generally inferior to the coals of Washington and Oregon, and can not compete with the better coals supplied by sea from British Columbia and Australia.

In *Oregon* outcroppings of coal have been found in nineteen counties, both east and west of the Cascade Range, but mining operations are reported only in Coos county. These mines are located at

Marshfield, on Coos Bay, and are operated by the Oregon Coal and Navigation Company. The Coos county field is claimed to cover an area of several hundred square miles, and is a fair quality of lignite. The product is shipped mainly to San Francisco.

In Washington the mining of coal began in 1850-51 in the vicinity of Bellingham Bay, in the extreme northwestern part of the Territory (now a State), but operations there were discontinued in 1879, and have not been resumed. Several important coal areas have since been opened up, both on the western and eastern slopes of the Cascade Range, the most important of which are in the vicinity of Puget Sound, in King, Pierce, and Thurston counties, and in Yakima county, near the Attanam River. Outcroppings have been found in other localities, notably at Ellensburg, and in Lincoln and Spokane counties, and also in White Salmon River, in Cascade county. The coals of this State embrace lignite, semi-bituminous, and bituminous varieties, adapted for coking, gas, steam, and domestic purposes. Some specimens of a very fine grade of coal, resembling anthracite, are reported as having been taken from Cowlitz pass, in Yakima county. The total area of the coal deposits of Washington has not yet been fully determined, but there is no doubt that almost inexhaustible supplies are at hand, not only for the future demand of its own population, but sufficient to furnish a basis for profitable traffic for transportation to the entire Pacific coast.

QUICKSILVER MINES AND REDUCTION WORKS.

The quicksilver mines and reduction works of the United States were limited in 1889 to California and Oregon. In California there were three mines in Lake county, four in Napa county, and one each in Merced, San Benito, Santa Clara, and Sonoma. There was also a non-productive mine in Siskiyou and another in Trinity county.

In Oregon there were three non-productive mines in Douglas county.

During the year there were 26,464 flasks, or 2,024,469 pounds, or 1,012 tons of quicksilver produced in California. About 20 flasks were produced in Oregon. This yield was much less than usual owing to litigation and other causes.

At eleven active establishments there were expended \$219,622 for supplies, \$626,289 for wages, and \$35,490 for other expenses, embracing taxes, rent, interest, etc., making a total of \$881,401, showing that 71 per cent. was paid for wages, 25 per cent. for supplies, and 4 per cent. for all other expenses. Of the amount paid for wages the office force absorbed \$34,966, and there was paid to foremen, mechanics, miners, furnace hands, and laborers, \$591,323. The total cost was \$881,401; total market value, \$1,190,500; profit, \$309,099. The total capital invested in mines, buildings, machinery, etc., was estimated at \$1,331,114. The sale prices averaged about \$45 per flask.

STATISTICS FOR EARLIER PERIODS.—The earliest records relating to production of quicksilver in California for 1860, cinnabar having been first discovered there in 1845, and but very little quicksilver was produced prior to 1850, when active work was commenced at New Almaden. Outside of California quicksilver has been produced in two localities in the United States; in Oregon, to the extent of 2,000 flasks, and in Utah, where about 200 flasks were reported.

The production of quicksilver in the United States and in all other countries for ten years is shown by flasks in the following table:

| Year. | Total of all mines, United States. | Abundant mine, Spain. | Idria mine, Austria. | Italian mines. | Total foreign mines. | Grand total, yearly. |
|-----------|------------------------------------|-----------------------|----------------------|----------------|----------------------|----------------------|
| 1880..... | 59,926 | 45,322 | 10,510 | 3,410 | 59,242 | 119,168 |
| 1881..... | 60,851 | 44,989 | 11,333 | 3,760 | 60,082 | 120,933 |
| 1882..... | 52,732 | 46,716 | 11,663 | 4,110 | 62,489 | 115,221 |

PRODUCTION OF IRON ORE IN THE UNITED STATES.

The census of 1890 showed that during the year closing Dec. 31, 1889, the production of iron ore in the United States amounted to 14,518,041 long tons, the yield being from twenty-six States and two Territories.

Michigan was by far the largest producer of iron ore in the census year 1889, a total of 5,856,169 long tons having been mined, the value of which was \$15,800,521 at the mines, an average of \$2.70 per ton. The tonnage from Michigan therefore represents 40.34 per cent. of the total, while the aggregate value is 47.38 per cent. of that of the entire country.

The credit of holding second rank lies between the States of Alabama and Pennsylvania, the former, from the figures collected, having apparently a slightly greater output than the latter. This uncertainty is owing to the fact that the reports obtained from two of the larger Alabama mines covered operations commencing May 1, 1889, and ending May 1, 1890, and no detailed record of the amount of ore produced and labor employed during the three months of 1890 was obtainable. The position of Pennsylvania is also affected by the refusal of one large producer to supply absolute figures, but it will be noted that in the shipments or apparent consumption of iron ores Pennsylvania takes precedence of Alabama.

Alabama is therefore placed second as a producer of iron ore, with 1,570,319 long tons, valued at \$1,511,611, an average of 96 cents per ton. These figures represent 10.82 and 4.53 per cent., respectively, of the total output and value.

Pennsylvania closely follows Alabama, its output being 1,560,234 long tons, valued at \$3,063,534, an average of \$1.96 per ton, and 10.75 and 9.19 per cent., respectively, of the total output and value.

The other State which produced over 1,000,000 tons in the present census year was New York, which is credited with 1,247,537 long tons, valued at \$3,100,216, an average of \$2.49 per ton, the figures representing, respectively, 8.59 and 9.30 per cent. of the total output and value.

These four States, therefore, produced a total of 10,234,259 long tons, or 70.49 per cent. of the entire output of the iron-ore mines of the United States, while the value of the ore aggregates \$23,475,882, or 70.39 per cent. of the total valuation.

The tabulated statement which follows is taken from actual returns, made to the Census Department and verified in every way possible except by individual visitations to all of the iron-ore mines. The figures of production are possibly below the actual results, for in some localities farmers gather ore at odd times and sell to blast fur-

naces in small lots. Wherever this amount could be obtained it is included in the table.

| States and Territories. | Number of mines producing. | Amount produced. Long tons. | Total value of production. | Value per long ton. |
|---|----------------------------|-----------------------------|----------------------------|---------------------|
| Total..... | 592 | 14,518,041 | \$33,351,978 | \$2 30 |

| Tennessee..... | 11 | 73,028 |
| Texas..... | 18 | 217,835 |
| Utah..... | 2 | 27,568 |
| Vermont..... | 16 | 195,066 |
| Virginia..... | 11 | 159,023 |
| Washington..... | 8 | 231,287 |
| West Virginia..... | 8 | 93,856 |
| Wisconsin..... | 79 | 813,963 |
| Other states (a)..... | 6 | 77,935 |
| Total..... | 1,954 | \$19,095,179 |

The total value given in the above table is exclusive of that known as white marble. The latter would add \$3,488,170, increasing the total to \$22,583,349.

The production of limestone in the United States for the census year 1889 was as follows: For building purposes, 92,289,896 cubic feet, valued at \$5,405,671; converted into lime, 18,474,668 barrels, valued at \$8,217,015; stone for burning into lime, 478,082 tons, valued at \$184,024; flux for furnaces, 3,894,337 tons, valued at \$1,569,312; for street work, 46,491,622 cubic feet, valued at \$2,383,456; for bridge, dam, and railroad work, 26,679,012 cubic feet, valued at \$1,289,622; miscellaneous uses, 549,875 cubic feet, valued at \$46,079, making a total value of \$19,095,179. The expenditures were as follows: For wages, \$10,121,985; for supplies and materials consumed, \$4,227,246; other expenses of quarries, \$743,483, making a total of \$15,092,714. The capital invested in the industry amounted to \$27,022,325; of this sum \$14,771,200 was in land, \$4,988,207 in buildings and fixtures, \$4,541,623 in tools, implements, etc., and \$2,711,295 in cash.

SURVEYS OF PUBLIC LANDS OF THE UNITED STATES.

I. Historical Note.*

After the close of the Revolutionary War, the eastern colonies surrendered to the General Government their several claims to the lands north of the Ohio, and west of Pennsylvania, as far as to the Mississippi River. Connecticut, however, retained the northeastern corner of Ohio, now called the "Connecticut," or "Western Reserve." Virginia also reserved a large tract in the southern part of the State, between the Scioto and the Miami rivers. Georgia relinquished her claim to Alabama and Mississippi. Subsequently Florida, the Louisiana Purchase, Texas, California, and Arizona were acquired either by treaty or by purchase. See TERRITORIAL CESSIONS OF THE STATES in these Revisions and Additions.

As early as 1785 provision was made by Congress for a uniform system of surveys of all public lands. The present system was adopted in 1786. Thomas Jefferson is generally credited with its authorship. "Lot 16" of every township was set apart for the maintenance of public schools. Since 1852, sections 16 and 36 in every township are given to the school fund. They are called *School Sections*. The surveys are not extended across Indian Reservations, nor over any lands which are not the property of the United States.

There was no system adopted in allotting the lands of the original States. Each tract was described by *metes and bounds*, and often in a manner so vague as to present various conflicting claims.

II. The Township and its Subdivisions.

The public lands of the United States are generally laid out in *townships* and *sections*. These townships and sections are designated by a simple and uniform system of numbering.

A *township* is six miles square, and consequently contains thirty-six square miles, or 23,040 acres. Its

*Originally and chiefly prepared for Swinton's Geography, and inserted in these Revisions and Additions, through the kindness of the American Book Exchange, New York, 1891.

boundaries are *meridians* on the east and west, and *parallels of latitude* on the north and south.

A township is divided into 36 *sections*, each one mile square "as nearly as may be." A section contains 640 acres.

The sections of a township are always numbered in the order indicated by Diagram 1.

Section 1 is always in the northeast corner of the township, and the numbers run alternately west and east. Sections are divided as indicated in Diagram 2.

The government surveyors mark the corners of townships, sections, half-sections, and quarter-sections (except the corner in the center of the section) with stakes, stones, or mounds of turf, after a uniform system. In some of the later surveys eighths and sixteenths are also measured.

III. Numbering of Townships.

Townships are legally designated by numbers instead of names. All surveys begin by establishing a *true meridian*, along which the surveyors

Diagram 3.

measure from some selected point, marking each half-mile point with a "quarter stake," and each mile point with a "section corner." At each six-mile point a "township corner" is marked. This line is called a *principal meridian*.

Through this selected starting-point upon the principal meridian, a true parallel of latitude is run, and measured from the meridian. The half-mile, mile, and six-mile corners are marked as upon the meridian. This is called a *base-line*.

In the later surveys, additional parallels, called *correction-lines* are measured at distances of twenty-four or thirty miles apart, and also true meridians forty-eight miles apart, called *guide meridians*. The principal meridians, guide-meridians, base-lines, and correction-lines, are *astronomical lines*. All other lines are run with chain and compass, and are subject to two errors,—one from the variation of the needle, and the other from the impossibility of making perfectly accurate measurements with the chain. The sections are never surveyed by the same surveyors that mark the townships.

Townships are numbered north and south from the base-line. A row of townships running north and south is called a range. Ranges are numbered east and west from the principal meridian.

This is illustrated by diagram 3.—Each square represents a township. Numerals on the base-line indicate ranges east and west of the principal meridian. Numerals on the principal meridian indicate townships north and south of the base-line. The southwest township on this diagram is described as "Township 5 South, of Range 4 West," or "T. 5 S., R. 4 W."

North of the *base-line* the correction-lines occur every four townships, or twenty-four miles; south of the *base-line*, every five townships, or thirty miles. This is on account of the greater convergence of the meridians as we proceed north. In a survey of Central British America, to secure equal accuracy, correction lines would need to be laid out every two or three townships.

In locating townships they are always described as north or south of the *base-line*.

Sometimes a *new base-line* is located in passing from one state to another. For instance, on the fourth *principal meridian* the south boundary line of Wisconsin forms a new base-line for surveys in that state.

To locate any given township, as, for instance, Township 16 North of Range 9 East, count eastward from the principal meridian along the base-line until the ninth range is reached; then count northward in that range until its sixteenth township is reached.

To locate a township accurately when its number and range are given, it is necessary to know from what meridian it is reckoned, and where its base-line crosses that meridian.

IV. Location of Meridians.

There are thirty meridians governing the surveys of public lands in the United States, as follows:

The *first principal meridian* divides the states of Ohio and Indiana, having for its base the Ohio River, the river being coincident with 84° 51' of longitude west from Greenwich. This meridian governs the surveys of public lands in the state of Ohio.

The *second principal meridian* coincides with 86° 28' of longitude west from Greenwich, starts from the confluence of the Little Blue River with the Ohio, runs north to the northern boundary of Indiana, and governs the surveys in Indiana and a portion of those in Illinois.

The *third principal meridian* starts from the mouth of the Ohio River and extends to the northern boundary of the State of Illinois, and governs the surveys in said state east of the meridian, with the exception of those projected from the second meridian, and the surveys on the west to the Illinois River. This meridian coincides with 89° 10' 30" of longitude west from Greenwich.

The *fourth principal meridian* begins in the middle of the channel of the mouth of the Illinois River, in latitude 38° 58' 12" north and longitude 90° 29' 56" west from Greenwich, and governs the surveys in Illinois west of the Illinois River and west of the third principal meridian lying north of the river. It also extends due north through Wisconsin and northeastern Minnesota, governing all the surveys in the former and those in the latter state lying east of the Mississippi, and the third guide meridian (west of the fifth principal meridian) north of the river.

The *fifth principal meridian* starts from the mouth of the Arkansas River, and with a common base-line running due west from the mouth of the Saint Francis River, in Arkansas, governs the surveys in Arkansas, Missouri, Iowa, Minnesota west of the Mississippi, and the third guide meridian north of the river, and in North and South Dakota east of the Missouri River. This meridian is coincident with 90° 58' longitude west from Greenwich.

The *sixth principal meridian* coincides with longitude 97° 22' west from Greenwich, and, with the principal base-line intersecting it on the 40th degree of north latitude, extends north to the intersection of the Missouri River and south to the 37th degree of north latitude, controlling the surveys in Kansas, Nebraska, most of North and South Dakota lying west of the Missouri River, Wyoming and Colorado, excepting the valley of the Rio Grande del Norte, in southwestern Colorado, where the surveys are projected from the New Mexico meridian.

The *Michigan meridian*, in longitude 84° 19' 09" west from Greenwich, with a base-line on a parallel seven miles north of Detroit, governing the surveys in Michigan.

The *Tallahassee meridian*, in longitude 84° 18' west from Greenwich, runs due north and south from the point of in-

tersection with the base-line at Tallahassee, and governs the surveys in Florida.

The *Saint Stephen's meridian*, longitude 88° 02' west from Greenwich, starts from Mobile, passes through Saint Stephen's, intersects the base-line on the 31st degree of north latitude, and controls the surveys of the southern district in Alabama and of the Pearl River district lying east of the river and south of township 10 north in the state of Mississippi.

The *Huntsville meridian*, longitude 86° 31' west from Greenwich, extends from the northern boundary of Alabama as a base, passes through the town of Huntsville, and governs the surveys of the northern district in Alabama.

The *Choctaw meridian*, longitude 89° 10' 30" west from Greenwich, passes two miles west of the town of Jackson, in Mississippi, starting from the base-line twenty-nine miles south of Jackson, and terminating on the south boundary of the Chickasaw cession, controlling the surveys east and west of the meridian and north of the base.

The *Washington meridian*, longitude 91° 05' west from Greenwich, seven miles east of the town of Washington, in Mississippi, with the base-line corresponding with the 31st degree of north latitude, governs the surveys in the southwestern angle of the State.

The *The Saint Helena meridian*, 91° 05' west from Greenwich, extends from the 31st degree of north latitude, as a base, due south, and passing one mile east of Baton Rouge, controls the surveys in the Greensborough and the southeastern districts of Louisiana, both lying east of the Mississippi.

The *Louisiana meridian*, 92° 20' west from Greenwich, intersects the 31st degree north latitude at a distance of forty-eight miles west of the eastern bank of the Mississippi River, and, with the base-line coincident with the said parallel of north latitude, governs the surveys in Louisiana west of the Mississippi.

The *New Mexico meridian*, longitude 106° 52' 09" west from Greenwich, intersects the principal base-line on the Rio Grande del Norte, about ten miles below the mouth of the Puerco River, on the parallel of 34° 19' north latitude, and governs the surveys in New Mexico, and the valley of the Rio Grande del Norte, in Colorado.

The *Great Salt Lake meridian*, longitude 111° 53' 47" west from Greenwich, intersects the base-line at the corner of Temple Block, in Salt Lake City, Utah, on the parallel of 40° 46' 04" north latitude, and governs the surveys of Utah.

The *Boise meridian*, longitude 116° 20' west from Greenwich, intersects the principal base between the Snake and Boise rivers, in latitude 43° 25' north. The initial monument, at the intersection of the base and meridian, is nineteen miles distant from Boise City, on a course of south 29° 30' west. The meridian governs the surveys in Idaho.

The *Mount Diablo meridian*, California, coincides with longitude 121° 54' west from Greenwich, intersects the base-line on the summit of the mountain from which it takes its name, in latitude 37° 53' north, and governs the surveys of all central and northeastern California and the entire State of Nevada.

The *San Bernardino meridian*, California, longitude 116° 56' west from Greenwich, intersects the base-line at Mount San Bernardino, latitude 34° 06' north, and governs the surveys in Southern California lying east of the meridian and that part of the surveys situated west of it which are south of the eighth standard parallel south of the Mount Diablo base-line.

The *Humboldt meridian*, longitude 124° 11' west from Greenwich, intersects the principal base-line on the summit of Mount Pierce, in latitude 40° 25' 30" north, and controls the surveys in the northwestern corner of California lying west of the coast range of mountains and north of township 5 south of the Humbolt base.

The *Willamette meridian* is coincident with longitude 122° 44' west from Greenwich, its intersection with the base-line is on the parallel of 45° 30' north latitude, and it controls the public surveys in Oregon and Washington.

The *Montana meridian* extends north and south from the initial monument established on the summit of a limestone hill, eight hundred feet high, longitude 111° 40' 54" west from Greenwich. The base-line runs east and west from the monument on the parallel of 45° 46' 27" north latitude. The surveys for Montana are governed by this meridian.

The *Gila and Salt River meridian* intersects the base-line on the south side of Gila River, opposite the mouth of Salt River, in longitude 112° 15' 46" west from Greenwich, and latitude 32° 22' 57" north, and governs the public surveys in Arizona.

The *Indian meridian* intersects the base-line at Fort Arbuckle, Indian territory, in longitude 97° 15' 56" west from Greenwich, latitude 34° 31' north, and governs the surveys in that territory.

The *Wind River Meridian* governs the subdivisional surveys within the Shoshone Indian Reservation, in Wyoming.

The *Uinta special base and meridian* govern the surveys of the Uinta Indian Reservation, in Utah.

The *Navajoe special base and meridian* control the surveys of the Navajoe Indian Reservation, in New Mexico and Arizona.

The *Black Hills meridian* is coincident with the west boundary of South Dakota, on the 27° of longitude west from Washington, and intersects the base-line in the parallel of 44° north latitude; it governs the surveys in the southwestern corner of South Dakota.

The *Grand River meridian* and base-line govern the subdivisional surveys for allotment to the Ute Indians, in Western Colorado.

The *Cimarron meridian*, coincident with the eastern boundary of New Mexico, or 103° meridian on longitude west from Greenwich, intersects the base-line on the parallel 36° 30' north latitude (the north boundary of Texas), and governs the surveys in the strip of public lands inclosed between Kansas and Colorado on the north, the Indian territory on the east, Texas on the south, and New Mexico on the west.

I. *Convergence of Meridians.*

In consequence of the convergence of meridians, townships accurately surveyed are not perfect squares, but are longer upon the southern than upon the northern boundary.

If the township corners upon a base-line are exactly six miles apart, the townships surveyed northward grows less and less as the distance from the base-line increases, and those surveyed southward grow larger. Hence the necessity of standard parallels, or *correction-lines*, to prevent the errors from becoming so great as to destroy the value of the system.

Upon these *correction-lines* the township corners are carefully placed at distances of six miles apart.

The convergence of meridians is greater in the higher latitudes; but at latitude 42° it is about half a rod to a mile. Supposing the surveys to be perfectly accurate, and the correction-lines to be twenty-four miles apart, the convergence of the meridians will then be about twelve rods, and there will be a double set of township corners, as illustrated in the following diagram, in which the convergence of the meridians is greatly exaggerated to make it evident to the eye.

Explanation.—In consequence of the convergence of meridians, a line run due north from a strikes the correction-line at *b* instead of at *a*. Double township corners are consequently established at *b* and *a*, and so on, their distance apart increasing with their distance from the principal meridian.

Lands are legally advertised in the following way:—

"The south-east quarter of the south-east quarter of the north-west quarter of section thirty-five in township twenty-nine north, of range seven east of the fourth principal meridian, containing ten acres more or less."

The above is often abbreviated thus:—

"The S. E. $\frac{1}{4}$ of the S. E. $\frac{1}{4}$ of the N. W. $\frac{1}{4}$ Sect. 35, T. 29 N., R. 7 E. of the 4th p. m."

Supposing the annexed drawing to represent the Section 35 described, the star (*) shows the position of the lot advertised.

The proper description is found by consulting the records of the land-offices, or the deed by which the title was originally conveyed by the government.

These records are presumed to be correct, and the only appeal from them is to the commissioner of the General Land Office, the Secretary of the Interior, and ultimately to the President of the United States.

Diagram 5.

VI. Public Land Sales and Grants.

The immense extent of land, forming part of the United States, as yet chiefly uninhabited and uncultivated, is held to be National property, at the disposal of Congress and the Executive of the Republic. The public lands of the United States which are still undisposed of lie in nineteen States and six Territories, including Alaska. The public lands are divided into two great classes. The one class have a dollar and a quarter an acre designated as the minimum price, and the other two dollars and a half an acre, the latter being the alternate sections, reserved by the United States in land grants to railroads, etc. Titles to these lands may be acquired by private entry or location under the homestead, pre-emption, and timber-culture laws; or, as to some classes, by purchase for cash. The homestead laws give the right to 160 acres of a-dollar-and-a-quarter lands, or to 80 acres of two-dollar-and-a-half lands, to any citizen or applicant for citizenship over twenty-one who will actually settle upon and cultivate the land. The title is perfected by the issue of a patent after five years of actual settlement. The only charges in the case of homestead entries are fees and commissions.

Another large class of free entries of public lands is that provided for under the Timber-Culture Acts of 1873-78. The purpose of these laws is to promote the growth of forest trees on the public lands. They give the right to any settler who has cultivated for two years as much as five acres in trees to an 80-acre homestead, or, if ten acres, to a homestead of 160 acres, and a free patent for his land is given him at the end of three years instead of five.

In the middle of 1889 there were 1,815,504,147 acres of public lands in the States and Territories, of which 981,631,984 had been surveyed. Of the total area of the United States, 1,400,000 square miles, or 896,000,000 acres, were unoccupied at the census of 1880. Upwards of 88 million acres of land are settled under the Homestead and Timber-Culture Acts. In 1889 there were 6,029,231 acres taken up under the Homestead Act, and 3,735,305 under the Timber-Culture Act.

In 1888, 5,317,906 acres were sold for cash, and the total number of acres of public lands disposed of during that year was 30,116,684, the money received being \$13,547,137. Of the public lands in 1889, 369,523,600 acres were in Alaska unsurveyed. It is provided by law that two sections, or 640 acres of land, in each "township," are reserved for common schools, so that the spread of education may go together with colonization.

The power of Congress over the public territory is exclusive and universal, except so far as restrained by stipulations in the original cessions.

PRESIDENTS OF THE EARLY AMERICAN CONGRESSES.

The following is a full list of presidents of Congress up to the date of the adoption of the National Constitution, with the dates severally of their administrations:*

| | |
|------------------------------------|---------|
| Peyton Randolph, of Virginia | 1774-75 |
| Henry Middleton, of South Carolina | 1775-76 |
| John Hancock, of Massachusetts | 1776-77 |
| Henry Laurens, of South Carolina | 1777-78 |
| John Jay, of New York | 1778-79 |
| Samuel Huntington, of Connecticut | 1779-80 |
| Thomas McKean, of Pennsylvania | 1780-81 |
| John Hanson, of Maryland | 1781-82 |

* Kindly furnished for these Revisions and Additions by Prof. D. Gray, A. M., of Trenton, N. J.

| | |
|------------------------------------|---------|
| Elias Boudinot, of New Jersey | 1782-83 |
| Thomas Mifflin, of Pennsylvania | 1783-84 |
| Richard Henry Lee, of Virginia | 1784-86 |
| Nathaniel Gorham, of Massachusetts | 1786-87 |
| Arthur St. Clair, of Pennsylvania | 1787-88 |
| Cyrus Griffin, of Virginia | 1788-89 |

John Hancock signed first as President of the Congress the Declaration of Independence.

Elias Boudinot signed as president the definitive treaty of peace.

Thomas Mifflin received as president Washington's commission when he resigned it in 1783; while

Richard Henry Lee presented the immortal resolution which declared the colonies to be free and independent States.

CHRONOLOGICAL HISTORIC OUTLINE OF THE UNITED STATES.

| | |
|---|---------------|
| Coast of Florida discovered by Ponce de Leon | 1512 |
| California discovered by Grijalva's expedition | 1535 |
| Louisiana conquered by De Soto | 1540 |
| Raleigh establishes first settlement in Virginia | 1585 |
| Jamestown, Virginia, founded by Lord de la Warr | 1607 |
| New Amsterdam—now New York—built by the Dutch | 1614 |
| New Jersey settled by the Dutch | 1614 |
| Settlement of New England begun by Captain Smith | 1614 |
| Landing of the pilgrims at Plymouth Rock, | Dec. 25, 1620 |
| Delaware settled by Swedes and Dutch | 1614-1627 |
| Massachusetts settled by Sir H. Rosewell | 1628 |
| Maryland settled by Lord Baltimore | 1633 |
| Connecticut settled by Lords Say and Brooke | 1635 |
| Rhode Island settled by Roger Williams | 1635 |
| Connecticut (composed then of Hartford, Windsor, and Wethersfield) adopted a liberal constitution, the first written constitution in history | Jan. 1, 1639 |
| Roger Williams organized at Providence, R. I. the first Baptist Church in America | 1639 |
| Rhode Island establishes a democratic constitution | 1641 |
| An unsuccessful "Plan" was formulated to unite all the American-English colonies into one confederacy | 1644 |
| Maryland Assembly passed an act giving complete toleration to all Christians | 1649 |
| The Connecticut Assembly prohibited the use of tobacco to persons under the age of 20 | 1650 |
| New Amsterdam (New York City) was incorporated | 1652 |
| Many Quakers suffering persecution in England began to migrate to the American colonies but were persecuted in Massachusetts from this date | 1657 |
| An Indian church was organized in Natick, Mass | 1660 |
| The General Court of Massachusetts published a declaration of rights, claiming self-government, and denying the right of Appeals to England | June, 1661 |
| John Elliot published his translation of the New Testament into the Massachusetts Indian dialect | 1661 |
| The Virginia Assembly voted its members a salary of 250 pounds of tobacco each day and passed severe laws against "Quakers, Baptists, and other Dissenters" | 1662 |
| Execution for alleged witchcraft began in Connecticut | 1663 |
| New York taken by the English | 1664 |
| The first settlement in Michigan (Mission Sault de Ste Marie) established | 1668 |

| | | | |
|---|----------------|---|----------------|
| South Carolina settled by the English.... | 1669 | The peace of Utrecht was signed by England, France and Spain..... | 1713 |
| George Fox, founder of the Quakers, visited the American Colonies..... | 1671 | [France ceded to Britain, Acadia, Hudson Bay and its borders, and Newfoundland, and admits Britain's su- premaccy in the American fisheries; the Assiento Treaty is transferred to England, which undertakes to carry to the Spanish West Indies 4,800 negroes a year for 30 years, paying on 4,000 a duty of \$33.33 per head, and for all over 4,000 a duty of \$16.67 a head; during the 30 years not far from 30,000 are taken from Africa by the English annually, as against 15,000 a year for the previous 20 years. The population of the Eng- lish colonies was about 400,000.] | |
| Marquette and Joliet discovered and descend- ed the Wisconsin, Des Moines, Mississippi, and other Western rivers..... | 1673 | A public bank was opened in Massachusetts.. | 1716 |
| New York surrendered to a Dutch Squadron, July..... | 1673 | Georgia settled by General Oglethorp.... | 1717 |
| Peace concluded between England and Hol- land, the American colonies being ceded back to England..... | Feb. 1674 | War was declared between France and Spain (lasting till 1721)..... | 1719 |
| King Philip's war—Philip defeated and killed..... | 1676 | The first newspaper was started in Philadel- phia..... | 1719 |
| Pennsylvania settled by William Penn..... | 1682 | The South Sea and Mississippi Bubble Compa- nies burst and spread ruin..... | 1720 |
| Louisiana settled by the French..... | 1682 | The Boston "Courant" was started by James Franklin, a brother of Benj. Franklin..... | 1721 |
| William Penn published a frame of govern- ment for Pennsylvania..... | 1682 | The "Gazette," a weekly, was started in New York (the first paper in New York)..... | 1725 |
| Philadelphia founded (there being "three or four little cottages")..... | 1683 | The French built Fort Niagara..... | 1728 |
| A printing press was set up in Philadelphia where there were 600 houses..... | 1686 | Sir William Keith, ex-governor of Pennsylva- nia, suggested the extension of the <i>stamp duty</i> system to the American Colonies..... | 1728 |

| | | City of Washington chosen capital..... | July 8, 1792 |
| | | Re-election of Washington..... | March 4, 1793 |
| | | John Adams, 2d President..... | March 4, 1797 |
| | | Washington dies..... | Dec. 14, 1799 |
| | | Seat of government removed from Philadel- phia to Washington..... | 1800 |

Thomas Jefferson, 3d President. March 4, 1801
 Louisiana bought from the French. 1803
 American ports closed to British. July, 1808
 Importation of slaves abolished. Jan. 1, 1807
 James Madison, 4th President. March 4, 1809
 War with Great Britain—1812-14—begins.
 June 18, 1812
 Buffalo burned by the British. Dec., 1813
 Treaty of peace signed at Ghent. Dec. 24, 1814
 James Monroe, 5th President. March 4, 1817
 Center foundation of the capitol, Washington, laid. Aug. 24, 1818
 Florida ceded by the Spanish to the United States. Oct. 24, 1820
 John Quincy Adams, 6th President. 1825
 First passenger railway—Stockton to Darlington, Eng. 1825
 Death of the two ex-Presidents Adams and Jefferson. July 4, 1826
 Convention with Great Britain concerning indemnity for war of 1812-14. Nov. 13, 1826
 General Jackson, 7th President. March 4, 1829
 Ports re-opened to British commerce. Oct. 5, 1830
 Commercial panic. 1832
 Great fire at New York. Dec. 16, 1835
 National debt paid off. 1836
 Martin Van Buren, 8th President. March 4, 1837
 Steamer Caroline burned by the British, Dec. 29, 1837
 Telegraph perfected by Morse. 1837
 Great Western steamship arrives at New York. June 17, 1838
 American banks suspend cash payments, Oct., 1839
 Gen. Harrison, 9th President, March 4: dies April 4, 1841
 John Tyler, Vice-President, becomes 10th President. 1841
 Resignation of all the ministers except Webster. Sept. 11, 1841
 Sewing machines invented by Elias Howe about. 1841
 James Knox Polk, 11th President. March 4, 1845
 War declared against the United States by Mexico. June 4, 1845
 Gen. Taylor, 12th President, March 4, 1849; dies July 9, 1850
 Millard Filmore, Vice-President, becomes 13th President. July 10, 1850
 California admitted a State. Aug. 15, 1850
 Fugitive slave bill passed. August, 1850
 Henry Clay dies. June 29, 1851
 J. F. Cooper, American novelist, dies Sept. 14, 1851
 Part of the Capitol at Washington and the whole of the library of Congress destroyed by fire. Dec. 24, 1851
 Daniel Webster dies. Oct. 24, 1852
 Commodore Perry's expedition to Japan. 1852
 Gen. Franklin Pierce, 14th President, March 4, 1853
 Crystal Palace opens at New York. July 14, 1853
 Astor library, New York, opened. Jan. 9, 1854
 Commercial treaty between Japan and United States. March 23, 1854
 Reciprocity treaty between Great Britain and the United States. June 7, 1854
 James Buchanan, 15th President. March 4, 1856
 Commercial panic in New York. August, 1857
 Atlantic telegraph completed. August, 1858
 Massacre at Mountain Meadows, Utah, Sept. 18, 1858
 Prescott, the historian, dies. Jan. 28, 1859
 Insurrection at Harper's Ferry. Oct. 16, 1859
 Abraham Lincoln chosen as candidate for the Presidency at Chicago. May 16, 1860
 Great Eastern arrives at New York. June 23, 1860
 Prince of Wales visits Washington. Oct 3, 1860
 South Carolina secedes from the Union, Dec. 20, 1860

New York and other Northern States protest against secession. Jan. 4, 1861
 Kansas admitted as a State. Jan. 21, 1861
 Secession by Convention—Mississippi, Jan. 8; Alabama and Florida, Jan. 11; Georgia, Jan. 19; Louisiana, Jan. 26; Texas, by Legislature. Feb. 1, 1861
 Morrill Tariff Bill passed. March 2, 1861
 Abraham Lincoln, 16th President. March 4, 1861
 Southern Commissioners not received by the President at Washington. March 12, 1861
 Slavery abolished in District of Columbia, April 4, 1861
 Treaty between Great Britain and the United States for the suppression of the slave-trade, April 7, 1861
 President Lincoln proclaims the blockade of the ports of the seceding States. April 10, 1861
 War begins; Major Anderson refuses to surrender Fort Sumter to the secessionists, April 11, 1861
 President Lincoln calls for volunteers and informs foreign powers of his intention to maintain the Union by force of arms, May 4, 1861
 Queen Victoria commands her subjects to be neutral during the war. May 13, 1861
 Commodore Farragut ascends the Mississippi, May, 1861
 Neutrality announced by the French Emperor, June 10, 1861
 Congress authorizes a war loan of \$250,000,000, July 17, 1861
 First Battle of Bull Run. July 21, 1861
 McClellan assumes command of the Army of Potomac. Aug. 20, 1861
 McClellan commander-in-chief of Federal Army. Nov. 1, 1861
 Mason and Slidell taken off the British steamer by Captain Wilkes. Nov. 8, 1861
 President Lincoln issues a proclamation confiscating the property and emancipating the slaves of all Confederates found in arms after 60 days. July 26, 1862
 Ex-President Martin Van Buren dies. July, 1862
 President Lincoln proclaims freedom to the slaves. Jan. 2, 1863
 Grant's successful campaign in Tennessee, May, 1863
 Made commander-in-chief. March 8, 1864
 Lincoln re-elected President. Nov., 1864
 Nevada admitted to the Union. 1864
 Congress abolishes slavery. Feb. 2, 1865
 Lincoln and Johnson inaugurated. March 4, 1865
 Battle of Five Forks, April 1; Lee retreats, April 2, 1865
 Richmond and Petersburg evacuated by the Confederates, and occupied by Grant, April 3, 1865
 Lee surrenders. April 9, 1865
 President Lincoln shot in Ford's Theater, Washington, by Wilkes Booth, April 14; dies. April 15, 1865
 Andrew Johnson, Vice-President, 17th President. April 17, 1865
 Confederates surrender, the war is over, April 26, 1865
 Solemn fast observed for death of President Lincoln. June 1, 1865
 Armies on both sides rapidly disbanding, June, 1865
 Southern prisoners of war released on parole, July 20, 1865
 National thanksgiving for peace. Nov. 2, 1865
 Habeas Corpus Act restored. Dec. 1, 1865
 Eighty-five members of the Southern States excluded from Congress. Dec., 1865

*Brazil, some months since, entered into a treaty by which many American articles are admitted free. Flour is made free and pork is admitted at a nominal duty.

Cuba and Porto Rico have reduced the duty on flour from \$5 80 a barrel to \$1 (which gives us the market), besides putting nearly one hundred articles of American production on the free list.

San Domingo has made a reciprocity treaty with flour and pork upon the free list, besides a large number of other articles. Other treaties for reciprocity are in progress.

Germany without negotiating a formal treaty, has removed the prohibition on pork, and our Government, in consideration thereof, has left her sugar on the free list. This opens to us an entirely new market, and \$15,000,000 to \$20,000,000 of American pork will be consumed per annum where not a pound has been taken for ten years. [See Baine's Letter.]

UNIVERSALISM, a belief that all mankind will eventually be redeemed from sin and suffering and brought back to holiness and God. See **RELIGIOUS DENOMINATIONS** in these Revisions and Additions.

UNIVERSAL LEGATEE, a legatee to whom the whole estate of a deceased party is given, subject only to the burden of other legacies and debts. It nearly corresponds to residuary legatee in England.

UNIVERSITIES. SEE **COLLEGES AND UNIVERSITIES IN UNITED STATES** in these Revisions.

UNNA, a small town of Prussia, in Westphalia, nineteen miles northwest of Arnsherg. It was formerly fortified, was one of the Hanse towns, and played a role in the history of the *Femgerichte*. About a mile to the north are the famous salt-works of Konigsborn, which yield 120,000 cwts. of salt annually. Population in 1872, 6,915, who are employed in weaving linen and hosiery and in brewing and distilling.

UNYORO, a kingdom of Central Africa. See *Britannica*, Vol. XXIII, p. 859.

Kabba Regga, the present sovereign of Unyoro, bears the official title of "King of Kitwara," being the direct representative and lineal descendant of the dynasty of Wa-Huma (Galla) conquerors, who formerly ruled over the vast empire of Kitwara, now broken up into the states of Unyoro, Uganda, Karagwe, Ruanda, and other territories. Kabba Regga holds sway, directly or indirectly, over the region inclosed east and north by the middle and lower course of the Somerset Nile, separating it from the former equatorial province of Egyptian Sudan. On the southeast is Uganda, and it stretches westward to Lake Albert Nyanza, beyond which are the subject or vassal territories of Awamba, Ukonju, Uzungora and Uhaiyana. Islam has been accepted by most of the Wa-Huma (Galla) chiefs.

The royal residence, formerly at Masiindi, on an affluent of Lake Albert Nyanza, was removed, in 1877, to Nyamoga, which occupies a central position in the region inclosed between the lake and the great bend of the Somerset Nile below Mruli. Other stations are Koweira and Magungo, both, till recently, held by the Khedival governor, Emin Pasha, and M'bakovia (Baker's Vacovia), on Lake Albert Nyanza, the center of a large salt industry.

UPHAM, CHARLES WENTWORTH, an American author, born at St. John, New Brunswick, in 1802; died at Salem, Mass., in 1875. He came to Boston in childhood, and graduated at Harvard in 1821. From 1824 till 1845 he was pastor at Salem. In 1853-4 he served in the United States Congress. He wrote *Lectures on Witchcraft* and biographies of *Gen. Fremont*, *Francis Peabody*, and *Timothy Pickering*.

UPHAM, THOMAS COGSWELL, author, born at Deerfield, N. H., in 1799; died in New York city in 1872. He graduated at Dartmouth and Andover colleges, and became in 1825 professor of philosophy in Bowdoin College, which post he held for forty-two years. During this time he published *Elements of Mental Philosophy* (3 vols.), *Life and Opinions of Madame Guyon*, *Life of Faith*, *Divine Union*, and *Letters from Europe, Egypt and Palestine*.

UPLAND, a borough of Pennsylvania, two miles west of Chester. It manufactures cotton goods, and is the seat of Crozer Theological Seminary. Population in 1890, 2,286.

UPPER SANDUSKY. A village, the county-seat of Wyandot county, Ohio. It produces a variety of manufactures. Population in 1890, 3,568.

UPTON, EMORY. An American general, born at Batavia, N. Y., in 1839; died at San Francisco, Cal., in 1881. He graduated at West Point in May, 1861. During the Civil War he fought at Bull Run, where he was wounded; in the battle at Rappahannock Station, Va. (1863), and in the Wilderness campaign of 1864, especially at Spottsylvania, where he was again wounded while leading the assaulting column of twelve regiments of his corps. For this he was appointed, on the spot, brigadier-general of volunteers. He was present at the siege of Petersburg, in the defense of the capital in July, 1864, and in the Shenandoah campaign, where, while commanding a division of infantry at the battle of Opequan, he was again severely wounded. In April, 1866, he was mustered out of the volunteer service. In 1870-75 he was commander of cadets in the United States military academy. In 1875-77 he was sent on a tour of inspection of the armies of Europe and Asia, and on his return he was assigned to the artillery school at Fortress Monroe, where he wrote his official report, published in 1878. In 1880 Upton

became colonel of the 4th artillery, and soon afterward joined his regiment at the Presidio, San Francisco, Cal. He died there by his own hand, caused by despondency from chronic catarrh. He published a standard work on *Infantry Tactics* (1867), and the United States government has published his *Armies of Asia and Europe* (1878).

URAL, a river of Russia, called *Rimna* by the ancients, later, *Jaik*, and since 1875, by its present name. It rises in the southern section of the Ural Mountains, near the east frontier of the government of Orenburg, flows south through the district of Troitzk, past the town of Virehni-Uralsk, to its confluence with the Kasil, in which region its course is over hilly meadows, and its current is very rapid, owing to its narrow and uneven bed. At the town of Orsk, the river bends westward, and runs in that direction to the mouth of the river Tchagan; thence it flows directly south, and falls into the Caspian Sea. It is generally deep enough for navigation; but owing to the scarcity of wood for ship-building, and to the number of sand-banks that bar the river, no navigation can be carried on. This loss, however, is compensated by its fisheries, which yield to the Cossacks settled along its banks an annual revenue of 600,000 rubles (\$468,750). The Ural has long served as the frontier separating Russia from the Kirghis Steppes, and many forts have been erected, and a settlement of Cossacks—known as the Ural Cossacks—established along the river. The direct length of the Ural is estimated at 550 miles; with windings, 1,040 miles. The principal affluents are the Kasil and Sakmara on the right, and the Or and Ilek on the left.

URBANA, a city of Ohio. Population in 1890, 6,499. See Britannica, Vol. XXIV, p. 9.

URBI ET ORBI (Lat., to the city and the world), a form used in the publication of papal bulls, for the purpose of signifying their formal promulgation to the entire Catholic world, as well as to the city of Rome. By the canon law, one of the conditions required in order that any new law shall be held to have force is "promulgation;" but a celebrated controversy arose in the seventeenth century as to the kind of promulgation which should be regarded as sufficient. In ancient times the practice of the popes had been to send copies of their bulls to the primates, metropolitans, and other ecclesiastical heads of the several churches, to be by them communicated to their suffragan bishops; but in progress of time, the practice of publicly proclaiming or of posting up the decree in the Campo dei Fiori in Rome was substituted for this transmission; and decrees addressed *Urbi et Orbi*, and published in this way, were held to be thus sufficiently promulgated to the various churches, and to be thenceforth full of force.

URE, ANDREW, M. D., a distinguished chemist, born at Glasgow in 1778, died in London, Jan. 2, 1857. He was educated at Glasgow University, subsequently prosecuted his medical studies at Edinburgh, and returned to Glasgow, where he received the degree of M. D., in 1801. The literary works for which he is chiefly distinguished are his *Dictionary of Chemistry* and *Dictionary of Arts, Manufactures and Mines*.

URIM AND THUMMIM (Heb.), a mysterious contrivance in or on the high-priest's breast-plate, either consisting of the four rows of precious stones

upon which the names of the twelve tribes were engraved, or of two images personifying most probably—"Truth" and "Revelation." The etymology of the two words, which, derived from Arabic roots, would indicate "Brilliant Amulet," "Perfect Light," etc., is in reality no more satisfactory than the account of the manner in which the contrivance was used for oracular purposes, or of the time when, in reality, it ceased to act. It is never mentioned after Solomon's time.

URSON (*Erythizon dorsatum*), a quadruped nearly allied to the Porcupine, and often called the Canada Porcupine. The genus *Erythizon* differs from the *Hystrix* (Porcupine) in the flatter head, the shorter and not convex muzzle, the longer tail, and having the quills short and half hidden in the hair. The Urson is about the size of a small hare. It is found as far south as Virginia and Kentucky, and as far north as lat. 67°. Its quills are dyed by the Indian women, and worked into ornamental articles of various kinds.

URUGUAY, REPUBLIC OF. For general article see Britannica, Vol. XXIV, pp. 14-16. The area in 1887 was estimated at 72,110 square miles, with a population of 614,257, which it was stated should be increased to 651,112 to allow for omissions in the census. A later count (in 1888) returned the total population at 687,194. The following table gives the area, population and density by provinces or states in 1887:

| PROVINCE. | Area in sq. miles. | Population. | Density per square mile. |
|---------------------|--------------------|-------------|--------------------------|
| Salto..... | 4,863 | 25,027 | 5.12 |
| Artigas..... | 4,392 | 12,000 | 2.73 |
| Paysandu..... | 5,115 | 28,417 | 5.55 |
| Rio Negro..... | 3,269 | 14,265 | 4.36 |
| Soriano..... | 3,560 | 26,133 | 7.34 |
| Colonia..... | 2,192 | 35,405 | 16.15 |
| San Jose..... | 2,687 | 21,147 | 7.87 |
| Flores..... | 1,744 | 15,295 | 8.77 |
| Montevideo..... | 256 | 185,211 | 723.50 |
| Canelones..... | 1,833 | 68,359 | 37.28 |
| Maldonado..... | 1,584 | 16,564 | 10.45 |
| Rocha..... | 4,280 | 17,549 | 4.11 |
| Cerro-Largo..... | 5,753 | 19,697 | 3.42 |
| Treinta y Tres..... | 3,686 | 15,748 | 4.27 |
| Minas..... | 4,844 | 22,535 | 4.65 |
| Tacuarembó..... | 8,074 | 22,363 | 2.76 |
| Rivera..... | 3,790 | 18,966 | 5.00 |
| Florida..... | 4,673 | 27,173 | 5.80 |
| Durazno..... | 5,525 | 22,403 | 4.05 |
| Total..... | 72,110 | 614,257 | 8.51 |

CONSTITUTION AND GOVERNMENT. Under the constitution the legislative authority is in a Senate and House of Representatives, which meet in annual session, extending from Feb. 15 to July 15. In the interval of the session, a permanent committee of two senators and five members of the Lower House assume the legislative power, as well as the general control of the administration. The representatives are chosen for three years, in the proportion of 1 to every 3,000 inhabitants of male adults who can read and write. The senators are chosen by an Electoral College, whose members are directly elected by the people; there is one senator for each department, chosen for six years, one-third retiring every two years. There were in 1890, fifty-three representatives and nineteen senators.

The executive is vested in the president of the republic, who is elected for the term of four years.
