Given the complexity of this highly organized structure, however, Leopold argued that humans should disturb or change ecosystems slowly and with great humility. Preservation of life-forms in all their diversity is the first general rule that we ought to follow because not even ecologists understand how this complex system operates. Because this complex structure has developed through millions of years of evolution, human interference with it ought always to be humble and constrained. Any change in the system requires that many other elements adjust themselves to it. When this occurs slowly, as it does through evolution, the system is self-regulating. When change is introduced abruptly and violently, as it typically is through human intervention, the potential for disaster is genuine. Thus, we should tread lightly on the ecosystem.

It is also wise to assume that native plants and animals are best suited for a particular locale. As a result, we can speculate that Leopold would support the preservation of biological diversity and oppose habitat destruction and monoculture agriculture. The Land Ethic makes it ethically permissible to hunt individual animals as long as the "integrity, stability, and beauty" of the population are preserved. In fact, in the many cases in which an overpopulation threatens the stability of the herd or the integrity of an entire ecosystem within which the animals live, we might even have an obligation to selectively kill individual animals. On the other hand, introducing nonnative species is courting disaster. The Land Ethic would warn against reliance on chemical pesticides, herbicides, and fertilizers.

There are several elements of the Land Ethic that make it an attractive philosophical option. First, the Land Ethic offers a fairly comprehensive environmental perspective. It appears to offer a decision process for most, if not all, environmental and ecological issues. Unlike the animal welfare movement, it can offer normative guidance for issues as diverse as wilderness preservation, pollution, conservation, energy, resource depletion, and so forth.

Second, it can also avoid many of the counterintuitive conclusions that burden the individualistic biocentric approach. We do not need to be overly concerned with seemingly insignificant issues such as killing a mosquito, cutting a tree, or hunting and fishing. The continued healthy functioning of the system is the primary concern.

Finally, the land ethic is thoroughly nonanthropocentric. Humans are said to have no privileged status in the ecological community. They are, in Leopold's image, reduced from conquerors to mere community members. Not only does this shift accord natural objects and systems moral standing; it is also more consistent with the teachings of ecology. For many environmentalists, this is the single most important prerequisite for a sound environmental perspective.

Criticisms of the Land Ethic

Two general challenges can be raised against Leopold's Land Ethic. The first challenge focuses on what philosophers have called the "naturalistic fallacy," and the second focuses on the nature of ecological wholes that deserve moral consideration.

A central challenge to any attempt to ground ethical values in natural facts is the claim that a logical gap exists between statements of fact and judgments of value, between *is* and *ought*. Identified in recent decades as the naturalistic fallacy, the conclusion that something is good or right based solely on a description of what is natural is rejected by many philosophers as fallacious. Leopold's famous dictum, "A thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community. It is wrong when it tends otherwise," would seem to be an example of exactly this type of reasoning.

The Land Ethic appears to bridge this gap by using a type of teleological reasoning reminiscent of the Aristotelian tradition. Teleological ethics holds that every being has its own natural end or purpose and that by attaining this end or purpose, beings are doing what is naturally good. By attributing such characteristics as health and stability to ecosystems, the Land Ethic treats ecosystems as having a natural end or purpose. From a natural scientific description of the normal development of an organic whole, with its own identifiable integrity and stability, we are to draw conclusions about what is good or bad, right or wrong, and healthy or unhealthy for elements of that system. Predators are good and ought to be protected, for example, because they contribute to stable populations within the system and, thus, to its health. Eliminating exotic species or reintroducing native species is right because it maintains the natural integrity of the ecosystem.

But note that one question always remains: Why *should* we value the overall integrity or stability of the system itself? We could appeal to the role that that particular ecosystem plays in the overall stability and integrity of some larger organic whole. Thus, like a heart, a wetland performs a function for some organic whole. Accordingly, we ought to preserve the integrity and stability of an ecosystem because, in doing so, we are promoting the good of some larger whole of which the ecosystem is a part.

Following this line, we would eventually argue, as Leopold sometimes does, that the earth itself should be considered an organic whole. But even if this were scientifically valid, this line of reasoning simply pushes the open question back a step. Why value the integrity and stability of this larger organic whole? Because instrumental and individualistic reasons (for example, that the larger whole should be valued because it preserves the well-being of its constituent parts such as human beings) are not part of the Land Ethic, we would have to argue that some teleological goal exists for the entire system. Here the teleological model seems to break down. Neither ecology nor philosophy has produced a plausible account of what the earth's telos might be.

The other option is for the Land Ethic to argue that an ecosystem, like an individual organism, goes through developmental stages. The normal developmental progression would thereby provide a basis, as it does in human medicine, for evaluating the health and well-being of that system. Unfortunately, this is logical only if we assume the validity of an organic model of ecosystems, wherein every locale has a single climax stage toward which ecological succession aims, and each ecosystem is separate and unique. But given that most ecologists have long since abandoned the organic model, use of this option is weakened. There does not seem to be a single ecosystem that develops through time. For example, over time the biological populations of a field might go through a series of ecological transformations from weeds to perennials and grasses, to shrubs, to pine forests, to oak forests. What would the "integrity and stability" of this system be? Should we seek to preserve the field as home to prairie grasses and shrubs, as a pine forest, or stay out altogether and let whatever happens happen? The important point is that we can meaningfully ask these questions. Hence, the leap from ecological fact to ethical value remains an open question. Abandoning the organic model of ecosystems in favor of a less metaphorical food chain or energy circuit model does not rescue the Land Ethic. Why is the preservation of the integrity and stability of a food chain or energy circuit good or right?

We can summarize the philosophical point of these challenges. The Land Ethic's normative conclusion ("a thing is right when it tends to preserve the integrity, stability, and beauty of the biotic community") seems to be derived, in some way, from the facts of ecology. Even assuming that a factual and meaningful basis exists for attributing integrity, stability, and beauty to ecosystems, how these facts are connected to the value conclusion remains an open question. If we speak of ecological functions in an Aristotelian teleological sense as aiming toward some goal, either as parts within a larger whole or as a whole with its own goals, we might have some basis for reaching normative conclusions. But the Darwinian account of natural selection casts serious doubts on the meaningfulness of teleological explanations in biology. In this account, members of an ecosystem do not function the way they do because of some forward-looking goal or purpose toward which they are aiming. Components of an ecosystem function the way they do because functioning in this way has, in the past, proved adaptive.

We should be careful to avoid overstating the force of these criticisms. The point is not that we cannot support ethical judgments by appeal to naturalistic facts. The point is that in defending something as right or wrong, we need to do more than simply say that it is normal or natural. Ecological facts, in themselves, do not "prove" that ecological integrity and stability are ethical values. Nevertheless, developing environmental policy in ignorance of ecological facts would seem perverse. Thus, while the facts of ecological science do not prove the normative conclusions of the Land Ethic, they do provide sound evidence for environmental policy.

A second group of challenges to the Land Ethic centers on its holism. Two separate concerns underlie these challenges: Can a meaningful account of ecological wholes be defended, and are the ethical implications of holism acceptable?

One problem for any ecocentric ethics, and for the Land Ethic more specifically, is that ecologists do not agree on proper scientific methods, models, and conclusions. Ecology has not become a single, unified science, and therefore, attempts to draw normative conclusions from ecology face serious challenges. In particular, the Land Ethic seems to rely on highly contentious models and metaphors of ecological wholes.

As the science of ecology developed in the early decades of the 20th century, ecologists often referred to ecosystems as *superorganisms* and *communities*. Such terms suggest teleological, goal-directed, stable, cooperative, and unified structures. In this situation, normative concepts such as health, integrity, and stability seem readily applicable. But as ecology has developed as a science, such models have been rejected increasingly as overly metaphorical and anthropomorphic. Replacing an ecological model using "biotic community," with biochemical cycles of water, nitrogen, carbon, and photosynthesis, makes drawing normative conclusions from scientific evidence less plausible. After all, what practical conclusions could be drawn from the normative commitment to preserve the health or integrity of the nitrogen cycle?

Furthermore, some ecologists see more change than stability, more chaos than integrity in ecosystems. The Land Ethic appears to endorse ecological models of stable and enduring ecosystems. To the degree that the facts of ecology raise questions about these models, the persuasiveness of the Land Ethic's normative conclusions are in doubt.

The second concern with the Land Ethic's holism is the ethical unease that the Land Ethic may condone sacrificing the good of individuals to the good of the whole. If we do define right and wrong in terms of the biotic community, it would seem possible to sacrifice individual members—for example, individual human beings—for the good of the community. For example, Leopold seems willing to condone hunting individual animals to preserve the integrity and stability of the biotic community. But because he also describes humans as equal members of that community, he would seem to be committed to the permissibility of hunting humans if doing so would preserve the integrity, stability, and beauty of that community.

Various critics have offered versions of this challenge. Some have called ethical holism totalitarian and "environmental fascism." These are serious charges, particularly when humans are treated as equal members of ecological communities. If they cannot be answered by defenders of the Land Ethic, we will have good reason to look elsewhere for a satisfactory environmental ethic.

Thus, serious philosophical challenges to the Land Ethic remain. Nevertheless, Leopold's work holds promise for philosophical reflection on the environment. The greatest contribution of the Land Ethic lies in focusing attention on ecosystems and relationships—in short, in taking ecological wholes as worthy of serious moral consideration.

Implications for Public Policy and Business

Three aspects of the Land Ethic make it an attractive basis for public and business policy directions. First, the reliance on ecological science provides a rational and objective basis for policy prescriptions. Although ecology may be unable to offer unequivocal prescriptions, it does provide a strong foundation on which to develop sound environmental policy. Science provides the best starting point from which any consensus might emerge among various and competing points of view.

Second, the Land Ethic provides a middle ground between those who seek to preserve natural areas from any human intrusion and those who would value natural objects as mere resources to be exploited for human use. The emphasis on ecological holism means that the integrity of the ecosystem can be preserved while still directing some resources for human use. Limits to the economic use of resources can be established, but their very use is not prohibited by the Land Ethic.

Finally, the Land Ethic also offers the possibility of practical advice in ways in which some environmental perspectives do not. Concepts such as the stability and integrity of ecosystems offer practical guidance for deciding the range and limits to which ecological systems can be managed. Furthermore, as business and political institutions become increasingly concerned with sustainability, the Land Ethic can offer an ecologically grounded ethical framework for conceptualizing sustainability. Ecosystem health, stability, and integrity would seem a plausible approach for translating the language of sustainability into ecological terms.

LEADERSHIP

Leadership is any process of leaders influencing followers. A leader, sometimes likened to a magnet, is one to whom others look for guidance. Influence is the ability or capacity to get another person to do or believe X rather than Y. One vital source of influence is formal authority to command, held for example by business executives. An individual not possessing any formal authority may acquire moral influence equivalent to informal authority through persuasion, example, or ideas. Varying sources and means of influence, together with the morality of ends and means of influence, are key dimensions of leadership. Where control of important resources overlaps with formal or informal authority, it is an aspect of leadership.

This entry will first explain the prevailing prescriptive theory of leadership. Subsequent sections comment on examples of business leadership, ethics of leadership, methods for effective leadership, competing conceptions of leadership, the relationship between leadership and management, and the roles of emotional intelligence and charisma. The conclusion guides the reader to the classical literature on leadership.

The Prescriptive Theory of Leadership

Prescriptive theory emphasizes good leadership as a calculated process of leaders honorably influencing followers to achieve group welfare gains. Leadership in democratic societies should be "servant leadership," defined as service on behalf of others. Organizational or societal success requires executives with effective leadership skills and strong moral values, and also widespread distribution of such skills and values in the sense of "empowerment" of followers. General Norman Schwarzkopf, commander of U.S. forces during the 1991 Gulf War, characterizes this prescriptive theory of leadership in terms of a combination of competence and character. Good leadership has the connotation of successful outcomes achieved through effective and moral means. Bad leadership has the connotation of ineffectiveness or unethical means resulting in unsuccessful outcomes for the group. Pragmatic leadership has the connotation of flexibility rather than of tolerance for unethical means to obtain moral ends.

Success, effectiveness, and ethics may not automatically coincide. A successful leader improves group welfare; an unsuccessful leader does not. Evaluation of success involves goal legitimacy and the definition of a time horizon over which success occurs. A competent leader is effective at influencing followers. Ethical leadership means that individuals of high moral standards seek ethically desirable ends through ethically acceptable means. Unethical leadership involves an amoral or immoral leader who acts for purely personal benefit regardless of consequences to others. An amoral person has no moral standards, no sense of right or wrong. An amoral leader simply calculates personal returns and risks. An immoral person has low or corrupt moral standards. An unethical leader may be just as effective at influence as a moral leader. An effective leader may be successful or unsuccessful depending on circumstances beyond his or her control. The prescriptive theory predicts that over time, moral leadership will outperform unethical leadership in terms of influence, effectiveness, and successful group outcomes.

William James's 1880 essay on leadership makes a distinction between leadership in thought and action. Action leadership has immediate impact. It occurs in response to prevailing conditions. Action leadership can be thought of as acting directly. A business executive is engaged in action leadership. Thought leadership has long-term consequences. It can be thought of as acting indirectly. An artist or scientist is engaged in thought leadership.

Action leadership occurs directly through formal or legal authority (i.e., command) or through informal (i.e., moral) authority in dyads, groups, teams, formal organizations or their subunits, communities, and societies. Formal leadership involves a position or office in which resides lawful authority to act. Executives and managers hold such positions. Informal leadership may be exercised unofficially by individuals or groups acting through moral authority. In formal leadership, an individual fulfills a socially sanctioned role. In informal leadership, an individual establishes a role accepted by others as legitimate. Informal leadership relies on persuasion, example, or ideas. The intentional exercise of influence overlaps markedly with the art of politics. Much of leadership is essentially the activity of a politician. Leadership and management in business may be regarded as involving as much politics as does behavior in government.

Thought leadership occurs indirectly through the power of example or idea in the sense of best or *avant garde* achievements in artistic, educational, intellectual, scientific, or technical spheres. Followers are individuals or groups who look to those achievements for guidance. Indirect leadership might be officially sanctioned (e.g., a poet laureate or a national academy) or informally exercised through accomplishments (e.g., recognized by a Nobel Prize or best-seller status). In his 1844 essay on "Politics," Ralph Waldo Emerson ascribes a moral essence to influence: The motivational power of an idea has no boundaries. John Maynard Keynes argues similarly at the end of *The General Theory of Employment, Interest, and Money* (1934) that ideas are extremely powerful and often influence behavior without the knowledge of the actor.

Contrasting Business Leadership Examples

There has been a dramatic shift in perception and understanding of action leadership since James M. Burns's pathbreaking book *Leadership* in 1978. The long-established conception had been of hierarchical authority, whether socially legitimate or not, and intentionally manipulative practices in nondemocratic settings. This tradition was associated with Niccolò Machiavelli's *The Prince,* on Renaissance statecraft, in which the end is held to justify the means. *The Prince* was a study of amoral leadership illustrated by Cesare Borgia. *The Prince* is superficially a manual of statecraft but one written to explicate the methodology of seeing through deceptions to realities: One must first understand the ways in which one can be misled. Burns emphasizes fundamental changes in leadership for modern democratic settings. Consent of the governed implies accountability of elected and appointed leaders. Today's literature includes a large body of work on the leadership styles of U.S. presidents.

The basic shift in perception was followed by studies of new styles of business leadership that emerged in the 1980s and 1990s. Much of the recent interest in leadership arises with strong if disputable evidence that change and transformation in businesses can have large financial payoffs. The earlier tradition stemming from Machiavelli had been that leader-guided change, illustrated by a few successful founders of new political orders, is risky.

The very model of a modern business leader is widely held to be John F. (Jack) Welch, who took over as the youngest ever chairman and CEO of General Electric (GE) in 1981. He is likely the most studied business executive of modern times. A large literature on Welch includes books he has published. A chemical engineer with a Ph.D. (University of Illinois, 1960), Welch joined GE on graduation. He was dissuaded from quitting in 1961 (over bureaucratic red tape, an indifferent boss, and a measly $1,000 raise) by a perceptive young executive who personally promised Welch a better working environment. Twelve years later, Welch wrote in his annual performance review that his goal was to become CEO of GE.

The present assessment of Welch following his retirement is, however, more mixed or controversial. During his tenure as CEO of GE, he was clearly a very effective leader and highly successful at increasing shareholder value. Welch has a strong claim to be an early innovator in the shareholder value maximization movement of the 1980s and 1990s. The market value of GE rose from $12 billion in 1981 to $280 billion in 2001 (about 23-fold). Welch restructured the GE portfolio (ruling that each business must be first or second in its industry), oversaw a shift from products to GE

Capital and services as the key profit drivers, adopted the Six Sigma quality process, and built a strong management team throughout the company. That Welch is an effective business executive is beyond dispute, although the Welch "formula" described above has not proved automatically transferable to all other business situations.

It is difficult to judge whether Welch is a good leader in the broadest sense because doubts have been raised about the sources of GE's success under Welch, GE's sustainability after Welch's departure, and the ethics of some of Welch's actions. Christopher Byron targeted four well-known CEOs for criticism: Jack Welch of GE, Dennis Kozlowski at Tyco, Ron Perelman at Revlon, and "Chainsaw" Al Dunlop at Sunbeam. The general criticism is personal misconduct and womanizing. Welch reduced the GE workforce substantially and instituted a "rank-and-yank" evaluation system in management. Both steps have been criticized. Whether Welch is successful or simply lucky is also now disputed. Market value dropped roughly in half during the general stock market decline after Welch's retirement. Byron argues that Welch was no more than lucky: He took charge of GE at the trough of the deepest bear market since the Great Depression to that point and remained in charge through the longest bull market in U.S. history. A combination of luck and financial engineering may explain as much as leadership vision and strategy.

A dramatic contrast to Welch's business accomplishments, cited by Rakesh Khurana, is the reported failure of Michael Armstrong as CEO of AT&T. Armstrong came to AT&T from outside in 1997, with 31 years at IBM and 4 years heading Hughes Electronics. On the day his appointment was announced, the firm's market value rose by $4 billion in anticipation of outstanding performance. On taking charge, Armstrong initiated an aggressive acquisition strategy aimed at turning AT&T into an omni-Internet corporation including cable TV and cellular phones. The cost of this strategy was a 10-fold increase in debt from $6.7 billion to $67 billion. Much of the acquisition assets were subsequently divested at huge losses. By December 2000, AT&T had cut its dividend for the first time, and the stock had fallen from a $69 peak in 1999 to $18 (having hit a bottom of $10). On July 17, 2002, the AT&T board announced that Armstrong was leaving to become chairman of Comcast's cable TV business—sold by AT&T at a $13 billion loss.

The Ethics of Leadership

Notorious corporate scandals of recent years have focused attention on the ethics of leadership. Many of these scandals involve criminal fraud by top executives. Stakeholder management unavoidably involves value judgments concerning fairness. The leadership at Enron, Parmalat, Royal Ahold, Tyco, and WorldCom failed this simple standard. The organizational or social cost of unethical as well as just plain ineffective leadership can be enormous. There has been great turnover recently in the top leadership at Boeing because of procurement scandals and personal misconduct.

Arthur M. Schlesinger Jr., Pulitzer Prize winning historian, wrote an introductory essay, "On Leadership," to a series of short volumes titled *World Leaders: Past & Present.* Schlesinger contrasts modern democratic leadership with absolutist tyranny. Means boil down to a choice between "authoritarian" command rooted in the threat of force and persuasion rooted in "democratic" consent of followers. Ends define the purpose for which authority is sought by leaders. Schlesinger uses William James's 1880 notion of leadership as the inspiration and mobilization of masses of people by individuals—a talent James regarded as genius. The thesis is that leadership—for ethical or unethical purposes—transforms history and demonstrates that individuals can make a difference through free choices. This leadership proposition is the antithesis of various forms of historical determinism such as historical inevitability or class determinism. Determinism in any form abolishes the idea of individual moral responsibility and leaves masses susceptible to a cult of leadership. The relationship of leadership and ethics is, however, a matter of continuing dispute.

One school of thought, echoing Machiavelli, argues that leadership is simply a tool for influence. Leadership may be ethical or unethical—servant leadership or power wielding—independently of effectiveness and success. The unethical leader treats people always as instruments and never as ends—the exact opposite of Immanuel Kant's most fundamental principle of ethics. Nevertheless, one can learn useful lessons in effective leadership techniques from the totalitarian likes of Hitler, Lenin, Mao, Mussolini, and Stalin—or Saddam Hussein. On July 18, 1979, on the fifth day of his "presidency" of Iraq, Saddam Hussein held a meeting of more than 300 Baath Party senior personnel. The discovery of a "plot" to overthrow the new regime was revealed, and one of the alleged "instigators"—returned from the torture chamber and promised his life—"confessed" the details. Some 66 individuals were arrested on the spot, and were executed some 2 weeks later. Saddam asked the others to volunteer for service on the firing squads; the confessed "instigator" was executed as an Israeli spy—as distinguished from participation in the plot.

The opposing view of leadership—shaped by the rise of modern democratic institutions—is fundamentally different. In the longer run, unethical leaders tend to become the victims of their own excesses. Leadership unavoidably concerns ethics and values. Ethical (i.e., servant) leadership is influencing others for their own benefit. Ends and means are subject to moral standards. Henry (Lord) Acton emphasized in the late 19th century that kings and popes were not by position elevated above morality and that if not subject to law in their own time, they were subject to historical judgment passed subsequently. The proper task of leadership is defined as improvement of human welfare and is always based on a servant leadership model. Franco Bernabè, the CEO and Ph.D. economist who transformed Eni from a corrupt state-owned Italian energy enterprise into a cleaner and much more effective privatized company, has commented that business leadership is about humanity and morality.

Effective and Ineffective Leadership Methods

Effectiveness connotes strategies and tactics for influence. Every adult has an intuitive understanding of the general meaning of leadership and practical experience of its effects if not its actual exercise through personal authority. Societies, communities, and organizations everywhere generally have leadership functions and roles. A leader is someone "in charge" of or "responsible for" an informal group or a formal organization (or subunit) or spurring an intellectual movement by example if not deliberate intention. The military and police and fire services, the Roman Catholic Church, and corporations have formal hierarchies of command defining who has formal authority to act. The term *leadership* typically appears in a standard dictionary as a variant of *leader* or *lead*. The relevant senses of *lead* include the following: conducting, directing, escorting, or guiding; influencing or inducing; to be ahead of or at the head of; command; example or precedent; principal role; and prerogative to make the first play.

Leadership is the art and science of intentionally influencing others to change behavior, beliefs, or both in some desired direction. Any person leads as he or she influences others in some manner. Such influence may be direct, for example, by command or persuasion, or indirect, through successful example or intellectual development. Leadership is stimulation of followers in some manner: Why and how are the decisive questions. In the approach of Chester Barnard and Richard Neustadt, leadership is influencing others to comply and/or cooperate. Leadership involves both action initiative and acceptance of moral responsibility for outcomes affecting the welfare of others. Leadership skills play a vital role at all levels in an organization—from individual participant at the lowest rank to chief executive.

The leadership process is highly situational, being dependent on the leader, the followers, and the circumstances. A theory of situational leadership, closely related to varying styles of leadership, seeks to link leader (i.e., the influencer) and followers (i.e., the influencees). The theory basically argues that effective leaders must and can vary their approach to situations. One variant of situational leadership theory, associated with the Center for Leadership Studies, focuses on follower readiness for personal responsibility and exercise of initiative in relation to task characteristics to generate a leadership style profile and a leadership adaptability measure. The approach generates a two-by-two matrix in which relationship of leader to follower is high or low and task behavior is high or low. The leadership profile moves from telling to selling to participating to delegating.

The role of the leadership is to direct a group or unit or organization in the absence of a satisfactory science of management. Edward C. Banfield argued, therefore, that preparation for leadership concerns both effective skill development (and skills can be studied) and "wisdom" concerning sound choices (and is more highly dependent on character and experience). An organization is both a system of relationships (*administrative management*) and a system of concrete activities (*administrative tasks*). Banfield suggests four inherent limits on a science of management: (1) Decisions involve unique cases rather than regularities; (2) these decisions are "difficulties" coped with rather than "problems" solved as if they are "puzzles"; (3) management science is descriptive of regularities rather than prescriptive of specific actions and choices; and (4) the descriptions are contingent on circumstances or conditions not controllable by an executive. The essence of leadership is the art of sound judgment concerning goals, duties, future probabilities, and possibilities. Education for leadership is therefore difficult at best. Banfield argues that executive direction of an organization is an art or skill, rather than a matter of technical knowledge, and that sound judgment cannot be taught by case studies. Feel of the situation based on background knowledge and experience is the indispensable knack.

In a 1931 lecture at the Harvard Business School, the philosopher Alfred North Whitehead argued that "foresight" is the fundamental requirement of the businessperson. His definition of this foresight is capacity to develop generalities from details and to anticipate future developments despite insufficient information and changing conditions. This necessary foresight is a function of deep understanding of present realities and future trends. Foresight is unavoidably a creative act of the individual mind, which can be better prepared in advance of a decision situation.

An outstanding example illustrating the issues in defining successful and effective leadership is Sir Ernest Shackleton's escape from Antarctic disaster. Sir Edmund Hillary, conqueror of Mount Everest, has commented that in disaster Shackleton is the man on whom to rely for survival. Success in this disaster meant that Shackleton brought his polar expedition back without the loss of a single man—a criterion for servant leadership and moral character. In doing so, he had to handle a virtual mutiny due to loss of confidence in his leadership and then motivate his personnel to have confidence in survival and his recommended actions. The expedition had the most minimal resources for survival in a harsh environment with no prospect of outside relief. Shackleton (1874–1922) entered the merchant marine at age 16 and advanced rapidly on ability, exhibiting what can be described as dogged determination and audacity, while learning how to lead subordinates. Shackleton, knighted in 1909 for an earlier Antarctic expedition that reached furthest south before Roald Amundsen's successful push to the South Pole, took another expedition south just as World War I opened. In January 1915, his ship, HMS *Endurance*, became trapped in the unusually heavy and early ice—with no radio contact—and then sank 11 months later, first snapped and then swallowed by the ice; the crew abandoned ship in October 1915. Shackleton subdued what amounted to a virtual mutiny over the question of his formal and informal authority to command on loss of the ship, which was ill-designed for ice conditions. One can say that he lacked foresight, in the sense of not anticipating what could go wrong. But he steadfastly instilled discipline, inspired confidence, and ultimately saved everyone. The crew eventually moved northward in lifeboats to Elephant Island. Shackleton then sailed a small lifeboat through mountainous seas to South Georgia Island, and with two companions on foot, he crossed a mountain barrier—peaks to 10,000 feet and unexplored glaciers—from south to north with virtually no mountaineering equipment to reach a whaling station in May 1916. On the fourth attempt, he managed to reach Elephant Island with a rescue ship in August 1916.

A contrast to Shackleton's success is the failure of two commercial expeditions to the summit of Mount Everest on May 10, 1996, when two experienced leaders, Rob Hall and Scott Fischer, and three customers died, and others were seriously injured. Both expeditions summitted well behind schedule and had to descend in the dark through a severe and unexpected blizzard. Foresight was plainly missing. The vital lesson, according to Michael Roberto, is that leadership must always balance competing forces. There were three kinds of interacting adverse effects at work. Cognitive biases in individuals, exacerbated by the effects of low oxygen at high altitude, included the sunk cost effect (escalation to commitment), overconfidence bias, and "recency" effect (recent weather had tended to be favorable). Poor group dynamics led to expeditions that were not effective teams because of lack of open and candid discussions and defective shared beliefs. A fatal problem was the lack of a fixed rule for turning back when running behind schedule. Layered onto cognitive biases and poor group dynamics was system complexity such that the interaction of multiple causes rather than a single cause resulted in tragedy.

The large and expanding literature on leadership is highly diffuse. Much of the diffuseness turns on prescriptions of best practices for effective leadership—especially in difficult circumstances. Some of the diffuseness is due to differences between exceptional leadership and more widely distributed adequate leadership. The functions of the executive are different from what is required by distributed leadership. One of the vital tasks of the executive is to empower others. Another vital task is to cultivate leadership talent and skills throughout an organization. Robert Katz delineated three phases or stages in the career progression of executives, beginning with purely technical competence, moving through human relations skills (i.e., group leadership, peer cooperation and influence, and people insight), and culminating in conceptual skills (i.e., strategic insight and organizational overview).

There are various prescriptions for successful leadership. A couple of examples will serve here. Donald Phillips's analysis of Lincoln's leadership during the American civil war divides the lessons into four sets. One set deals with Lincoln's handling of people addressed through "management by walking around," building alliances, and persuasion methods. A second set describes Lincoln's character in terms of integrity, no malice toward others, willing acceptance of criticism, and tolerance for paradox. A third set on "endeavor" provides specific action recommendations on being decisive, being led by others, being goals and results oriented, and finding "Grant" (a satisfactory field commander who can beat Lee). A fourth set concerns communication of vision (with substantive content) through public speaking, conversation and storytelling techniques, and preaching to reaffirm the vision.

Richard Mahoney, former CEO of Monsanto—responsible for the firm's transformation—suggests six rules for people management: (1) having an attractive and understandable mission or theme; (2) "buy in" by and personal role for "good" people (i.e., possessing competence and character); (3) encouraging what we might term *empowerment*, so there are no excuses for failure; (4) giving financial and psychic rewards for success; (5) punishing recurrent failure; and (6) finding and installing individuals with leadership capability at all key points.

Competing Conceptions of Leadership

Leadership appears to reside in three basic elements of the individual actor: mind, will, and emotional intelligence. The mind can be better prepared, the will can be better tempered, and emotional intelligence can be acquired. Leadership concerns simultaneous interaction or interdependence of several factors. These factors would include strategic foresight and insight, vision or direction setting, character and values, people and political skills, emotional intelligence (EQ), and the ability to vary style according to the situation at hand.

There are three competing conceptions of leadership in the literature. One conception is based on trait theory. In this conception, leadership effectiveness results from personal traits or attributes. Leaders are born, not made. A second conception is based on great events theory. In this conception, great events call upon individuals who may not be exceptional in traits but who respond successfully to circumstances. Leaders emerge from events. The third, and prevailing, conception is transformational leadership. In this conception, individuals can and do learn effective skills of leadership. John Kotter argues that effective leadership skills can be learned.

Dwight D. Eisenhower, Allied supreme commander in the European theater of operations during World War II and then U.S. Army chief of staff and president of the United States, arguably illustrates both traits and styles. As reported by Stephen Ambrose from Eisenhower's unpublished memoirs draft, Eisenhower carefully studied leadership as a skill. Eisenhower became noted in the interwar army as an organizer, planner, and trainer—although he had no combat experience whatsoever, having been in a training command in the United States during World War I. Eisenhower worked for Chief of Staff Douglas A. MacArthur in Washington, D.C., and then in the Philippines. British Field Marshal Bernard L. Montgomery, with whom Eisenhower had many policy and personality clashes, commented nevertheless that Eisenhower possessed great charisma. Fred Greenstein characterized Eisenhower's presidential style as hidden hand, meaning that Eisenhower operated indirectly to exercise influence.

A reasonable linking of these three conceptions is that individuals with strong leadership traits and leadership experience should perform well in great events. That particular linking does not automatically exclude other possibilities. One should distinguish in this regard between competent leadership and exceptional leadership. The former can be learned by virtually everyone; the latter may be partly dependent on innate traits of unusual individuals. Truly exceptional leadership may be in very thin supply relative to demand and need. Exceptional individuals (e.g., Washington, Bolivar, Lincoln, Gandhi, FDR, Mao Zedong, and JFK) arguably supplemented effective skills with valuable and scarce personal traits. Scientifically, it may be less important to establish that leadership is important than to determine when it is important—as a highly contingent practice.

Leadership and Management

Much of the material above has focused on the formal roles of executives and managers in organizations. There is continuing debate in the literature concerning the appropriate relationship between "leadership" and "management." One reason for the debate is that an executive or manager may not be effective at leading, while leadership may arise elsewhere in an organization or community. Another reason for the debate is that the prescriptive theory of leadership has tended to emphasize vision and direction setting as inspirational and motivational tools, in contrast to the arguably more mundane tasks of management, such as budgeting, personnel evaluation, problem solving, and so forth.

Robert Danzig, who rose to general manager of the Hearst Corp., argues that management "skills" can be learned but that leadership "traits" are inherent qualities that can be polished to "powers." He lists first charisma and then perseverance, followed by seven other traits not necessarily in any order of priority: character, energy, enthusiasm, innovation, inspiration (i.e., ability to motivate others), passion, and quality. Norman Augustine, commenting that there is no single style of effective leadership, identifies seven common "qualities": competence, courage, inspiration, integrity, perseverance, selflessness, and vision.

One school of thought holds that leadership is quite different from management. In a business context, the CEO leads; the COO manages. General Colin Powell, former chairman of the Joint Chiefs of Staff and secretary of state, has defined leadership as an art of being more effective and successful than would be predictable in the circumstances from a science of management. The difference lies in the motivation of people to outperform predictable expectations. Another school of thought argues that leadership and management are substantially the same and that indeed the distinction is misleading. The COO leads as well as manages; the CEO manages as well as leads. The dispute is partly bound up with the question of "charisma" and related personal traits—whether leadership is strictly a natural quality or a set of skills that can be learned by virtually anyone.

The first school—that leadership is different and superior—is directed at change in organizations through skills for inspiration and vision. John Kotter treats leadership and management as complementary systems of human action. Leadership focused on inspiration and motivation is concerned mostly with change and transformation, while management focused on command and control is concerned mostly with coordination and complexity.

The contrasting school of thought blurs this proposed dividing line between leadership and management. Henry Mintzberg argues that the distinction is dangerous. The argument is one strand of Mintzberg's critique of business school education. Business schools focus on analysis of functions—to the neglect of management. This focus results in emphasis on technique and formula. Mintzberg argues that the essence of management is the synthesis of multiple, specialized functions into a "vision" or "system" for the overall enterprise. Mintzberg is particularly critical of the notion equating people to "human resources."

"Empowerment" of employees or followers more generally is a popular but arguably ambiguous notion. Chris Argyris concludes that virtually nothing useful about the art and science of empowerment is known. The word "empowerment" has two linked meanings. One meaning is enabling others—with resources, preparation, and opportunities. This meaning suggests that prepared and motivated individuals or groups voluntarily accept responsibility. The other meaning—perhaps more difficult to implement in business settings—is democratic participation, in the sense of increased devolution of authority in a previously hierarchical organization. This meaning suggests that responsibility links to initiative. Empowerment thus connotes both responsibility and initiative. Jack Welch sought during his tenure as CEO to increase responsibility and initiative within the GE management ranks in terms of both enablement and devolution.

Emotional Intelligence

One cannot overemphasize the importance of Shackleton's unflagging confidence in success, an optimism emphasized by Eisenhower in the unpublished draft of his memoirs. Confidence or optimism is an aspect of EQ. Daniel Goleman has been instrumental in spreading the notion of EQ, developed in psychology as the core element of outstanding leadership. If "intelligence quotient" (IQ) is innate, EQ is a learned skill—however difficult learning may prove for a particular individual. EQ is the difference between outstanding leadership and adequate leadership. Goleman conceptualizes EQ as the combination of self-management skills (self-awareness, self-regulation, and motivation) and ability to work with others (empathy and social skills—or ability to influence others). An individual possesses some variable combination of IQ, technical skills, and EQ. Goleman fits EQ to the well-known situational theory of leadership. This theory argues that leadership style is not a function of personality (mood or temperament) but of strategic choice. The high-EQ individual develops the learned ability to vary style according to situation. Goleman suggests six alternative styles: coercive, authoritative, affiliative, democratic, pace setting, and coaching. Mood may remain the primal driver.

Cult of Charismatic Leadership

Rakesh Khurana argues that an unhealthy cult of the charismatic CEO has developed out of the long period of corporate wealth creation during the 1980s and 1990s. This cult is predictable from Schlesinger's comments on leadership, and dictators like Stalin and Hussein cultivate such cults intentionally. In Khurana's view, the cult in business conflates the CEO personally with the success or failure of the firm. Prominent examples cited by Khurana include Jack Welch at GE and Lee Iacocca at Chrysler. At GE, while not to dismiss Welch's contributions, especially in setting the corporate change process in motion, much credit must be given to the 300,000 employees and to the success of GE Capital, headed by Vice Chairman Lawrence Bossidy (who went on to lead Allied Signal and take over Honeywell). Chrysler was saved by a $2 billion federal loan guarantee and United Auto Workers givebacks.

The proper definition of charisma is any special charm or allure that inspires allegiance or devotion. David Hawke, in his biography of John D. Rockefeller, founder of the Standard Oil monopoly, argues that Rockefeller deliberately eschewed charisma in favor of quiet manipulation. Rockefeller was a master practitioner of flattery and clubbiness. He made some calculated decisions to operate with greater subtlety in influence—a variation on Greenstein's description of Eisenhower's approach.

Thomas Carlyle viewed history as largely the activities of "great men" (*Heroes, Hero Worship, and the Heroic in History*)—illustrated in his works on Cromwell and Frederick the Great. For the 19th century, Napoleon Bonaparte was a kind of cult figure. Emerson published profiles of six *Representative Men* including an essay on Napoleon as "man of the world" (the other five were a philosopher, Plato on Socrates, a mystic, Swedenborg, a skeptic, Montaigne, a poet, Shakespeare, and a writer, Goethe). The word "representative" deliberately contrasted with Carlyle's "hero" concept. Napoleon, a commoner, was both despot and inspiration to devoted commoners against the rich and aristocrats. Emerson argued that Napoleon was ultimately indistinguishable from the old nobility. Napoleon's character defects ultimately led to his downfall. Carlyle and Emerson differed in their views concerning democracy. Perhaps in his views of *The French Revolution* and the costs of industrialization, as set forth in *Chartism,* Carlyle was antidemocratic and admired medieval society, as evident in *Past and Present.* Emerson was concerned rather with the possible excesses of democracy, a theme reiterated in modern times about the superficially democratic forms of totalitarianism.

Conclusion

Leadership is the subject of increasing study looking for useful prescriptions. This attention reflects the rising perception that the combination of effective leadership and ethical leadership is crucial to the success of organizations and societies. These concepts are analogous to General Schwarzkopf's ideas of competence and character. Leadership is a process. In today's democratic contexts, success means outcomes for group welfare. Effectiveness means influencing followers for their own benefit. Both ends and means are subject to moral standards. There is a continuing dispute in the literature concerning whether innate traits, great events, or transformational skill development are the keys to effective leadership.

A growing literature draws leadership lessons from various well-known historical figures, such as Alexander the Great, Attila the Hun, and Cortez the conqueror of the Aztecs, and from high-performing athletes and coaches focused on teamwork. Kellerman suggests the following basic works for the student of leadership: (1) Machiavelli's *The Prince* on amoral leadership; (2) Carlyle's *On Heroes;* (3) Freud's works *Group Psychology and the Analysis of the Ego, Civilization and Its Discontents,* and *Moses and Monotheism* on the leader as father figure dominating a social group; (4) Arendt's *The Origins of Totalitarianism* on what is in reality the functional interdependence of tyrant and followers; (5) Barnard's *The Functions of the Executive* on the leader as organizer of incentives for cooperation; (6) *The Federalist Papers* contributed by Hamilton, Madison, and Jay on servant leadership; and (7) Martin Luther King Jr.'s "Letter from Birmingham Jail" and Betty Friedan's *The Feminine Mystique* on the leader as liberator.

LEGAL ETHICS

Legal ethics refers to those norms that regulate the members of the legal profession in the practice of law. The concept refers to two distinct yet interrelated kinds of norms: first, those principles and rules specified in the professional codes of conduct and the various statutes that formally govern the practice of law; and second, those moral or public interest norms and principles, not necessarily codified, that *ought* to govern the practice of law.

The first meaning refers to actual ethics codes as well as state and federal statutes that regulate the practice of law. An example of such practical regulation of the legal profession includes the American Bar Association's Model Rules (or some variation on these) adopted by the state bar associations. Practical regulation of the statutory type includes a wide variety of legislatively enacted and common-law adopted rules and procedures governing everything from the treatment of witnesses and disclosure of evidence to the handling of client funds and the confidentiality of client declarations.

The second meaning draws on the relation between the practice of law and the public good. This sense of legal ethics refers to the normative regulation of legal practice toward the creation or maintenance of a just society or the attainment of some public good. For example, when the public good requires the conviction of the guilty, and a lawyer knows that his or her client is guilty, at the very least, the lawyer ought to convince the client to plead guilty rather than run the risk of him or her being acquitted. This obligation runs counter to the practical requirements of both the Bar Association Model Rules and statutory requirements, which specify that the principal duty of an attorney is to provide a vigorous defense of the client's interests.

From this brief consideration, it should be apparent that the practical and the normative regulation of legal practice may not only work at cross purposes (client's private interest vs. public good), but even when their purposes are harmonious, they may demand that the practicing attorney follow incompatible or mutually exclusive courses of action.

Practical Regulation of the Legal Profession

The legal profession is a self-regulating profession. In many countries, the privilege of self-regulation is typically extended to a variety of professional organizations. However, self-regulation does not entail the complete absence of governmental regulation. This is generally true for the practice of law where good professional practice is established through a combination of self-imposed ethics codes and externally imposed governmental statutes or regulations. In the United States, as in most common-law countries, the practice of law is strictly regulated through a combination of individual state bar association ethics codes and state and federal legislation.

For an ethics code to be binding on legal practitioners within any jurisdiction, it must first be approved by the highest court in that jurisdiction. The regulation of the practice of law is typically delegated by the courts to the ethics committee of the state bar association. Each state also governs the professional practice of law through the regulatory mechanism of legislative statute. Each state has statutory regulations governing professional legal conduct and enforces these through various criminal penalties for serious breaches. With respect to the regulation of legal practice, it is the high court that has the final enforcement and punitive authority over legal practitioners. As a result, breaches of ethical conduct by legal practitioners may bring punitive measures enforced both by the legal profession itself and by the courts. Punishment for ethical violations may range from monetary fines or private reprimands, to public reprimands, suspension of licenses, or even prison sentences for gross violations.

The Normative Functions of Legal Ethics

Law and justice have an ancient connection. A failure of law is reasonably understood as a miscarriage of justice. Laws that violate requirements of justice, as, for example, the legally sanctioned though arguably unjust segregation laws of the southern United States, ought to be revised or removed from the statutes. This connection between law and justice is often extended to include the practice as well as the making of law. According to some legal scholars, one of the principal means for justice to be obtained within a given society is to ensure not only that its laws are morally justifiable but that they are employed and enforced in such a way as to ensure that the public good obtains in each case. This is especially so, it is argued, for common-law legal systems, in which precedent plays a central role.

For other legal scholars, the problem of the proper relation of the practice of law to the public good is more complex. Not least among the ethical problems lawyers face are those found in the adversarial system itself. It has been argued by some legal scholars, most notably David Luban and Deborah Rhode, that the practice of law ought to be governed by higher moral standards than those determined merely by client interests. At issue here is a competing view of the lawyer and a more complex understanding of the relation between individuals and the public good. While lawyers typically work for individual clients, the practice of law affects all members of society, not exclusively the affairs of individual clients. Where lawyers act, all are affected. A legal ruling obtained for a client applies to everyone. As such, it is argued, lawyers should always and only act in ways that can be understood as good for everyone, not merely good for the client. This use of one's legal skills entails a special responsibility to ensure that one's professional actions serve the broader public by ensuring that the application of the law is directed toward the public good. In this view, the normative regulation of legal practice by standards assessed in terms of the public good brings the whole legal endeavor closer to justice, in both individual cases and the practice of law generally.

Lawyers' obligation to be guided in their professional conduct by the public good is clearest in the case of prosecutors, public attorneys, and other government lawyers. Even the staunchest proponents of the adversarial method and the obligations of lawyers to advocate zealously for their clients' interests concede that prosecutors and other government lawyers have a special duty to ensure that their professional conduct adheres to broader claims of the public good. The duty of a prosecutor is to ensure that a conviction, once won, is also consistent with the public good, as far as the law will allow and requires. The special duties of prosecutorial and governmental lawyers derive from the special authority inherent in the prosecutor's role as representative and advocate of the state's interest. In democratic systems, the state's interest ought to be directed toward the public good.

This tension between professional conduct under existing practical regulations and professional conduct according to normative principles can be most clearly seen through an example. Consider the lawyer whose client is a major corporation and whose charge is to negotiate a settlement with the U.S. Environmental Protection Agency over allegations of dumping toxins into a nearby river. The children in the neighboring town have developed incurable leukemia as a result of the toxins, and most of the affected families have no medical coverage and no means to ensure their own legal rights. As an advocate of his or her client's interest, the lawyer may feel that in the cause of professional duty the client's interests should be pursued exclusively within the context of the adversarial system. As a fellow citizen, however, the lawyer may feel that his or her duty is to ensure that polluting companies fairly compensate those who are harmed by the pollution.

A similar tension arises in the case where a corporate lawyer must act to secure his or her client's interest in winning a hostile takeover bid for a competing manufacturer. If the client's interests prevail, the corporate board will close the competitor down, maximizing profits, yet laying off hundreds of employees. In the narrower view of legal ethics, the lawyer's duty is to ensure that the hostile takeover succeeds and the client's interests prevail. In the broader normative view of legal ethics, the lawyer may take his or her obligation to be to ensure that the hostile takeover fails or includes provisions to keep the competitor's facility operating. The public good is better served, he or she may argue, when more people are employed in good jobs than when corporate earnings are maximized in each endeavor.

One objection to this understanding of legal ethics is that no lawyer, in his or her everyday practice, can live up to the demand that they advocate for their client's interests *and* serve the public good simultaneously, since the public good is often contrary to the specific and particular interests of the client. In this view, it would be an unreasonable constraint on a lawyer's ability to practice when that practice must always and only be oriented toward social justice or the public good.

Alternatively, for advocates of a narrower normative regulation of legal practice, such as Freedman, a more fitting standard for ethical legal practice would be limited to the zealous defense of the client's interests within an adversarial system of justice. This emphasis on zealous defense within an adversarial system as the best standard for the normative regulation of legal practice firmly embraces the assumption underlying the adversarial system of law: Through the vigorous contestation of individual interests by opposing sides of a legal dispute, the truth of every matter will be revealed and the public good will be achieved. The only ethical challenge, according to this view, would be to ensure fair procedures for contesting competing interests. This position on the relation of legal practice to the public good finds its philosophical justification in legal pragmatism and the legal positivist tradition. In both these views, what makes legal practice legitimate or "right" are the actual standards and rules recognized and accepted by legal practitioners as those that govern their practice. No appeal is made to principles or standards external to the legal system itself, such as the public good or social justice.

According to advocates of the broader normative regulation of law, instances of moral conflict such as those demonstrated in the preceding cases reveal the limits of effective ethical regulation through ethics codes and statutes alone. According to this view, ethics codes and statutes that do not require practitioners to adhere to universal moral principles or standards of the public good are inadequate as codes of *ethics.* The metaclaim underlying this argument is that there ought to be no normative distinction between good professional conduct and good moral conduct. Just as good conduct ought to be aimed toward justice in our everyday relations with others, so also the actions of the lawyer should be guided by the same universal standard of justice. In these and similar situations in which the tension between professional duty and moral duty (understood in terms of the public good) is resolved in favor of professional duty, the worry is that society will be taken further and further from a just and good society, toward one where the law serves the few whose interests are zealously defended at all costs.

Legal Ethics and Business Ethics

What does legal ethics have to do with business ethics? The answer to this question exposes a twofold relationship between the practice of law and the conduct of business. First, the private practice of law is almost uniformly conducted as a business. Either lawyers operate as partners or associates in law firms structured along a corporate model, or they establish their practices privately as individual small-firm owners. Whichever form the business structure takes, almost universally the private practice of law is undertaken as a business enterprise. Exceptions to this business model of the law firm are few and consist of nonprofit public service lawyers, who provide legal services for those who cannot afford their own private practitioners, and government lawyers, who practice law on behalf of the public's interests, as either prosecutors or investigators.

Insofar as the lawyer while practicing law does so as a businessperson, he or she must also be bound by the professional obligations regulating all other business activities. The various Bar Association Codes of Ethical Conduct clearly regulate lawyers in their business practices. Among the business ethics concerns contained in such codes are prohibitions against fraudulent, excessive, or anticompetitive billing practices; regulation of the collection and use of client funds; and prohibitions against conflicts of interest between clients or between clients' interests and those of the lawyers or their firm. When we consider legal practice to be a business in its own right, its practitioners are in many ways no different from businesspersons, entrepreneurs, and corporate managers.

Second, business and legal ethics converge most frequently in the practice of those areas of law that directly regulate corporations: corporate law, tax law, antitrust law, privacy law, and environmental law. Why these areas of legal practice? Corporations are, on one hand, creations of law. It is the law itself that allows the formation and transformation of corporations, defines their rights and responsibilities, and determines their status as legally recognized entities. On the other hand, corporations act in the world; they conduct business by producing, selling, transporting, and acquiring goods. They undertake these activities because they also hire and fire personnel, train employees, manage their workforces, and provide employees with benefits of various sorts. Corporations are regulated by a variety of laws that determine what business they may conduct, how they may conduct it, and for what purposes.

In this way, the practice of corporate law is very much a practice that bridges legal ethics and business ethics. The example provided by the Enron bankruptcy case illustrates the point: Many of the engineers behind the ethically suspect (if not illegal) schemes were corporate lawyers. Furthermore, as corporations are regulated by increasingly complex regional, national, and international laws, lawyers serve as indispensable consultants to the business enterprise. Lawyers in such practices must be attentive not only to the ethical obligations they have as lawyers (legal ethics) but also to the ethical obligations their corporate client may have (business ethics). When we consider that the practice of law is an important part of the regulatory structure of society and that businesses are subject to regulation and legislation that affect their ability to operate, we can see that the practice of law becomes an important element in the normative regulation of business.

Legal Rights

Legal rights are rights attributed by law. A "right" is an entitlement, which can operate as either an opportunity to do something or a restriction to prevent individuals from interfering with the rights of others. There is a set of rights, considered "natural rights," which are considered universal—that is, they exist in nature—and are not contingent on particular beliefs. In contrast, while there is overlap sometimes between natural and legal rights, this is not always the case; legal rights exist by virtue of the laws that establish them and are not inherently connected to moral rights.

In the United States, the Constitution establishes fundamental rights in its first 10 amendments, called the Bill of Rights. It is here that rights such as free speech and due process are articulated. Additional federal, state, and local legislation sets up other legal rights as defined by each jurisdiction.

While legal rights pertain to individuals generally in civil society, a number of the more significant conflicts arise as pertaining to workplaces and interaction through commerce.

Public/Private Distinction

The protection of rights in the United States is influenced by the so-called public/private distinction. The public/private distinction dates back to the founding of this country. In response to the impositions placed on the colonies by England, political leaders of the newly freed colonies recognized that the formation of a central government over these colonies was unlikely without significant provisions to safeguard the rights of individuals from action by the government. The Bill of Rights thus operates to provide this protection; in fact, its presence played a central role in convincing the colonies to accept a central form of government. In other words, the rights identified in the Constitution are rights that exist vis-à-vis the individual's interaction with the government. This is significant in that it means that these rights are protected only for the individual's interaction with the government—not for his or her interaction with other citizens or organizations.

The public/private distinction is the name given for this because of the view, on which it is grounded, that life can be divided into two separate domains: the "public" and the "private." The public domain exists where the government (or its agents or agencies) is involved; the private domain exists where the government is absent. The primary contribution of this distinction lies in its effect on employment. While the same sort of work takes place in both types of environments, the nature of the employment relationship and the rights that are accorded to employees vary significantly. Employment in local, state, and national government departments and their agencies, considered "public," is governed by the Constitution and the Bill of Rights. Employment in non-government-owned entities, such as for-profit corporations, considered "private," is not subject to the Constitution, Bill of Rights, or many other legal provisions. While the distinction is arguably artificial, it is real according to the operation of laws in the United States.

This means that in determining legal rights in a workplace, it is first necessary to determine whether that workplace is public or private. If the workplace is considered public, it is governed by all the laws in the United States that pertain to the individual's interaction with the state. This means that rights such as free speech and due process apply. If, on the other hand, the workplace is considered private, it is restricted only by that legislation, such as the Civil Rights Act of 1964, explicitly intended to apply to both the public and private domains.

Rights of Corporations

Corporations are fictitious entities, also known as legal persons, created solely by operation of law. They are legal persons separate and apart from their human organizers because the law creates them as such. As a result, they are treated as separate individuals subject to, and entitled to, many of the same legal provisions applicable to individuals. They are not, however, entitled to many of the rights that protect individuals from the government. While the law maintains the fiction of the separate existence of a corporation for many purposes, the distinction can be destroyed if the corporation behaves in a manner inconsistent with the statutory scheme under which it was created. Since corporations are largely creatures of state laws, the manner in which their distinct corporate existence can be destroyed depends on the laws of the particular state in which they are faced with such a challenge.

Jurists have confronted numerous questions regarding the applicability of constitutional provisions to corporations. In many instances, courts have found that corporations are included among legal persons intended to be protected. Rights and responsibilities attributed to corporations tend to correspond to the constitutional protections afforded to human persons. Corporations are not guaranteed protection as human persons, but they are afforded protection similar to human persons. For example, courts have extended protection to corporations for behavior encompassed by the First, Fourth, Fifth, and Fourteenth Amendments.

The due process rights of corporations have been protected, as well as their rights to freedom from illegal searches and seizures. In addition, courts have determined that corporations have citizenship, even though they are not biological individuals. Corporations can also sue, or be sued, in their own name. Perhaps most important, the chief function of a corporation is to provide individual shareholders of the corporation with protection from liabilities imposed on corporations; as a general rule, individual shareholders do not incur liabilities or debts for which the corporation is itself liable absent special circumstances.

Where courts have refused to recognize the rights of corporations, it is regarding provisions such as double jeopardy and self-incrimination, where it would serve injustice, not justice, to treat corporations as legal persons, for these rights are reserved for human beings. Such decisions underscore the meaningful differences between corporations and biological persons.

Litigation

Protecting legal rights in the United States is frequently accomplished through the court system. A person who believes he or she has been aggrieved by the actions or inactions of another may institute legal proceedings to seek a judicial determination of those rights. The plaintiff, or person seeking to enforce legal rights, can force the defendant, from whom the legal right is allegedly owed, to answer in a court of law as to the charge that the plaintiff's legal rights have been abridged. The court, through the judge or a jury, permits both parties to present their case before determining (1) if a legal right exists, (2) if it has been breached, and if so, (3) the extent to which the plaintiff may recover for the failure of the defendant to fulfill its legal obligation.

There is no shortage of litigation in the United States. While many people argue that American society is overly litigious, there is little doubt that civil litigation—a form of settling disputes regarding legal rights—is a much more advanced and appropriate approach to dispute resolution than force. Furthermore, in an egalitarian society in which judicial independence is highly valued, such a system encourages resolution of disputes concerning legal rights in a manner that is designed to be consistent in its disregard for immaterial factors that might otherwise lead to unequal treatment of citizens. Though financial hurdles and practicalities continue to exist, individuals can and do successfully enforce their legal rights against powerful individuals and corporations through a system that is designed to be blind as to the litigants and aware only of the pertinent facts related to the legal rights for which enforcement is sought. Fairness extends in both directions and provides protection to large corporations from juries that might seek a redistribution of wealth based not on a sound analysis of a legal right but on an improper desire to compensate individuals from conveniently available sources of funds.

Conclusion

Legal rights are, therefore, the rights that accrue to human persons and legal persons (corporations) by operation of federal, state, or local law, or by virtue of their interaction in commerce and the common law that has developed to control this interaction. The specific rights that exist often vary depending on whether the employment relationship exists in the public or private sector. Regardless, both individuals and corporations have protected rights by virtue of legislation, and these rights are considered legal rights.

Lemon Laws

A purchaser of a car expects that the car will be free of material defects. Lemon laws have been enacted by all 50 states and the District of Columbia to protect such purchasers when their newly purchased vehicle experiences one or more defects that have not been repaired within a reasonable period. The defects must result in the vehicle not conforming to the manufacturer's warranty to be eligible for lemon law protection. Court cases have concluded that an effective lemon law should reduce the inconvenience and frustration that a consumer faces in a lawsuit. They should provide a method of achieving satisfaction directly from the manufacturer by creating a framework establishing when vehicles should be repurchased or replaced by the manufacturer.

Prior to the 1970s, recourse for purchasers of new cars with defects was available through the Uniform Commercial Code and the legal doctrine of warranty. A warranty is a contractual promise by a seller regarding the quality, character, or suitability of the goods sold to the buyer. A warranty holds a manufacturer responsible, or liable, for the manufacture of a product that is defective. However, many manufacturers provided warranties that were insufficient to restore the vehicle to its proper working condition, leaving consumers without a viable remedy that fully rectified the defect and made the consumer whole after purchasing a vehicle with one or more material defects. In 1975, Congress enacted the Magnuson-Moss Warranty Act designed to protect purchasers from such unfair consumer warranties. This is a federal statute that makes breach of warranty a violation of federal law.

This remedy failed to address all the issues for automobile owners, and by 1981, complaints about automobile dealers were the most frequent complaints received by the Federal Trade Commission. In response, states expanded on the protection provided by the Magnuson-Moss Warranty Act by enacting their own lemon laws specifically protecting the purchasers of cars in each state. The Connecticut legislature enacted the first lemon law, and eventually all the states followed suit. Each state's lemon law varies as to its scope and coverage, but there are similarities among the laws. Early court cases held that the newly enacted lemon laws did not create a new cause of action against the dealer who sold the car but rather clearly placed the liability solely on the manufacturer who built the vehicle in the first place. Since that time, some courts have determined that there is a cause of action against dealerships but not against distributors or private parties. The specific law of the applicable state should be researched if someone is experiencing problems with his or her vehicle, regardless of the seller. There are states that include the sellers of used or leased cars in their lemon law statutes.

If a vehicle makes a clicking noise while being driven, the cigarette lighter breaks off in the owner's hand, or the paint on the vehicle is faded, but it still reliably conveys passengers from point A to point B, the car needs repair but is not a lemon. Conversely, if the car stalls on the way to work, the driver's seat wobbles, or the passenger door flies open, the vehicle may be a lemon. The determination of whether a vehicle is materially nonconforming to the warranty can be based on an objective or a subjective standard. Often, consumers are subjectively dissatisfied with their vehicles, but if the court applies an objective standard, such consumers may not be entitled to relief. States vary as to whether a subjective or an objective standard is applied in determining whether the nonconformity is material.

For a vehicle to be considered a lemon, the manufacturer has to have been given an opportunity to fix the defect. In fact, depending on the applicable state's laws, the manufacturer is allowed three or four attempts to fix the vehicle before it is determined to be a lemon. In most states, 10 different defects during the vehicle's warranty period will not be sufficient to brand the car a lemon under the relevant lemon law statute. Conversely, a single defect is sufficient to trigger lemon law protection, provided the operation of the vehicle is compromised for the statutory length of time.

Asymmetric Information

Automobile purchasers typically possess less information about the vehicle that they are purchasing than the seller of the vehicle. The sellers of vehicles, both new and used, are more likely to be aware of potential problems with the vehicle than the purchaser. This asymmetry of information could cause the market for automobiles, especially used automobiles, to break down. As demonstrated by George A. Akerlof, markets with extreme asymmetric information could simply cease to exist or, at the very least, function poorly. In both cases, the asymmetry of information gives rise to a rationale for the government to intervene to provide a method to obtain a balance of power between the buyers and sellers of automobiles. One of the methods for achieving that balance in the automobile market is through lemon laws.

Structure of the Law

Although each state's lemon laws vary, they tend to be structured similarly. Generally, a vehicle that continues to have a defect that substantially impairs that vehicle's use, value, or safety is considered to be a lemon. The vehicle qualifies as a lemon if it has been repaired for the same defect three or four times required by the relevant state's lemon law statute within the vehicle's warranty period, the repairs have not successfully fixed the defect, and there has been a sufficient period of time for which the vehicle was out of commission. However, application of the foregoing principles differ by state. Current Arkansas law, for example, deems a vehicle with only one unsuccessful repair a lemon, provided that the problem is likely to cause death or serious bodily injury within the longer of 24 months or 24,000 miles. At issue would be the determination of whether the problem is likely to cause death or serious bodily injury within the specified period.

Purchasers that have abused, neglected, or undertaken an unauthorized modification of their vehicle are not eligible for lemon law protection. Unauthorized modification would consist of any change to the vehicle that the dealer or manufacturer did not perform or recommend. For example, if a vehicle was making an annoying clicking noise while driven and the purchaser took it to a shop where the brake system was repaired to stop the clicking noise, the vehicle would no longer be eligible for coverage under the lemon laws.

Some statutes state that if the vehicle is out of service for 30 calendar days it qualifies as a lemon, while others require it to be inoperable for 30 business days. Certain statutes further qualify the time out of service requirement by allowing the 30 calendar days to be nonconsecutive; but they should fall within a particular time or mileage period such as the shorter of 18 months or 18,000 miles. Others give the time period for the nonconsecutive calendar days as 12 months or within the warranty period. Again, it is imperative that the relevant state statute be researched to determine the rules applicable to each consumer's situation.

Documentation and Notification

Determining whether a particular vehicle is potentially a lemon is the threshold requirement to establishing liability under a lemon law. Next, the consumer must protect his or her rights by obtaining and maintaining the proper documentation of the issues and repairs and then notifying the manufacturer of the defect or defects. Frequently, a car is not suspected of being a lemon until the vehicle is out of warranty, at which time it is too late to begin the documentation process. Consumers must retain repair documentation beginning with an initial repair to preserve their rights under the lemon law statutes. Consumers should ensure that they and the repair shop document complaints, and they should retain all receipts. The time that a vehicle is out of commission should be documented precisely to establish applicability of the lemon law statute. Documentation should include notes of all conversations including dates, times, and those involved, as well as odometer readings.

Each state provides its own notice requirements in its lemon law statute. Some states require written notification to the automobile manufacturer, while others are more specific and require notice via certified mail. In any case, it is advisable for the consumer to notify the manufacturer's headquarters and any local office and also to send a copy of the written notice to the dealer where the vehicle was purchased. Under some state statutes, notice to the manufacturer serves to give that manufacturer one final chance to remedy the vehicle nonconformity.

Applicable Vehicles

At their inception, lemon laws applied primarily to the initial purchase of a particular vehicle. This resulted in a situation in which a purchaser of a new vehicle that required 6 repairs of a failing engine was able to obtain lemon law protection, while another consumer who had leased an identical vehicle on the same day with identical engine problems would have no recourse under such statute. Similarly, a purchaser of a previously owned vehicle with 1,000 miles on the odometer and still within its warranty period was also precluded from obtaining relief under lemon law statutes. Some states now include used and leased cars in their lemon law statutes, while other states have separate laws for used vehicles. In addition, demonstrator vehicles under the original warranty are also included in the parameters of vehicles covered under the lemon law statutes of many states. Some states still do not provide lemon law protection for used, leased, or demonstrator vehicles. Motorcycles and motor homes are other products for which some states have provided lemon law protection against defects. However, other state legislatures have chosen to exclude such products.

Motor homes, if protected at all, may be covered by statute only for the nondwelling portion of the home.

Arbitration

In the event of a dispute between the manufacturer and the vehicle owner regarding repair or replacement of a vehicle, most states' lemon law statutes require such disputes to be arbitrated. Arbitration is the process of resolving a dispute or a grievance outside of the court system by presenting it to an impartial third party or panel for a decision. Arbitration under lemon law statutes is usually binding on the manufacturer, but not on the consumer. Typically, it is handled by panels set up by auto companies. Arbitration terms required under the lemon law statutes are typically set forth in the vehicle's written warranty. Several states offer their own arbitration programs for lemon law complaints. State lemon laws have withstood federal constitutional challenges that the statute violated due process by requiring manufacturers to submit to compulsory arbitration.

Governing Law

Due to the mobile nature of vehicles, the issue of which state's laws apply in lemon law disputes has been an ongoing matter of controversy. Courts have held that a vehicle must have been purchased within the state in order for that state's lemon law to apply, while other courts have concluded that as long as the vehicle was registered in their state that state's lemon law could be applied. Additional cases have determined that state lemon law provisions apply as long as the car was either purchased or registered in that particular state. One court even allowed a lemon law action under their state's laws when the repairs had been attempted in that state. Clearly, the law is somewhat unsettled as to who qualifies under each state's applicable lemon laws.

Additional Lemon Laws

Currently all states provide lemon law protection for defective automobile purchases. However, many states have recognized that although cars are one of the most expensive purchases that consumers will make, other consumer products are worthy of lemon law protection as well. Computers represent a significant consumer expenditure, are prone to serious defects, and have become almost as ubiquitous as automobiles. There have also been lemon law statutes proposed and, in some cases, enacted for other consumer products. For example, Arkansas has enacted a lemon law statute for wheelchairs.

Lesbian Ethics

Lesbian ethics advocate the creation and maintenance of community among lesbians, independent from male-defined social structures, policies, attitudes, and laws. Lesbian approaches to ethics are varied and do not subscribe to a systematic set of rules but rather support practices that enable women to break away from patriarchal dominance, including patriarchal ethical theories. Traditional ethical theory articulates rules by which men can live together, respecting each other's rights and property, fulfilling duties that accompany particular social roles, and adhering, with some exceptions, to commonly shared norms such as honesty, protection of human life, and promise keeping.

Lesbian ethicists recognize that traditional ethical theory supports the status quo of structures that are sexist, racist, ageist, classist, and heterosexist, to name a few of the isms that lesbian approaches attempt to overcome. Heterosexualism, the embrace of male-dominated social practices and institutions, is seen to validate oppression. For example, definitions of property rights long excluded, and in many parts of the world still do exclude, women from equal consideration. Indeed, women have been and still are more often defined as property than as property holders. Similarly, definitions of justice and "doing what is right" often mirror male traditions of obligations and social norms, such as family honor and filial duty.

The experience of acknowledging oneself as a lesbian often requires women to step outside the bounds of commonly accepted and familiar social relationships with which they have been raised. Even if their immediate families are accepting and understanding of their sexual identity, there are strong social messages of disapproval, condemnation, hatred, and fear. Finding one's own strength and self-acceptance in this milieu is challenging, at best. These common experiences fueled the emergence and articulation of lesbian ethics, which champions truly liberated choice.

Self-understanding is the natural starting place for lesbian ethics, suggests philosopher Sarah Hoagland, because as women fully understand themselves and their relations with others, they open the door to their own agency. One important role for such agency is social transformation. As with all feminist ethics, lesbian ethics expresses a strong commitment to work to create a society that fully supports women's rights. However, lesbian ethics go beyond liberal feminist arguments in seeking a moral revolution to replace patriarchal social structures rather than simply amending them. Lesbian ethics advocate not merely broader support for women but a community in which women, inclusive of lesbians, fully control and shape their lives.

Lesbian ethics are sometimes criticized for spending more time discussing what they aren't and what they are in rebellion against than what they are. There is little discussion of whether the society aspired to by lesbian ethics is one that has room for both hetero- and homosexual relations. In this way, the visions of lesbian ethics are perhaps utopian and incomplete. However, given the reality of heterosexual dominated society, the contribution of lesbian ethics provides a unique opportunity to explore the potential of women's creativity and choice apart from the man-made world.

Leveraged Buyouts

A leveraged buyout (LBO) is an acquisition strategy whereby a company is purchased by another company (typically an investment firm) using borrowed money (bonds or loan). LBOs have played an important role in the restructuring of corporate America in the 1980s.

In numerous cases, LBOs have been used by managers to buy out shareholders (a process then called MBO, management buyout) to gain control over the company (both ownership and decision making), which raises ethical problems of conflicts of interest.

Of the many firms associated with LBOs (such as The Carlyle Group, The Blackstone Group, Forstmann Little & Company, Hicks, Muse, Tate & Furst), the New York City–based private equity firm Kohlberg Kravis Roberts & Co (KKR) is the most well known for two reasons: First, KKR pioneered the LBO approach to buyouts, and second, the most famous LBO in American history was the takeover of RJR Nabisco by KKR in 1988 (for the record amount of $25 billion). The story was later chronicled and popularized in a 1990 book by award-winning journalists Bryan Burrough and John Helyar (*Barbarians at the Gate: The Fall of RJR Nabisco*) and in a 1993 film (starring James Garner), which introduced many readers and viewers to the world of hostile takeovers and financial speculations in corporate America.

Empirical evidence shows that many LBOs, like other types of buyouts, have resulted in significant improvements in firms' performance (using a range of indicators from cash flow to return on investment), which can be explained by a combination of factors including tax benefits, strengthened management, internal reorganization, and change in corporate culture. On the other hand, LBOs, because of the leverage aspect, are controversial because they may cause disruptions and economic hardship in the company purchased: Its assets serve as collateral for the borrowed money, the purchasing company (often a holding whose only purpose is corporate ownership and control) intending to repay the loan by using the future profits and cash flows from the purchased company or, failing that, by selling its assets (i.e., dismantling the company). Besides, LBOs have represented a moral hazard: In the context of the savings and loan debacle of the 1980s, their investors' gains (through junk bonds) were eventually paid by taxpayers. LBOs also raise further issues of ethics, notably about conflicts of interest between managers or acquirers and shareholders, insider trading, stockholders' welfare, excessive fees to intermediaries, and squeeze-outs of minority shareholders (who may well receive a good price for their shares, an average of 30% to 40% more than the market price, but do not eventually benefit from the massive financial rewards of shrewd postbuyout strategies).

The use of LBOs started to decline in the late 1980s for two reasons: First, companies started to develop preventive strategies and defensive tactics (with "poison pills" meant to deter hostile bids, typically giving current shareholders particular rights to buy additional shares or to sell shares with severe economic penalties on the hostile LBO acquirer); second, changes in the legislation made such takeovers more difficult (e.g., with Delaware's merger moratorium law or Ohio's control share acquisition law). The rise of litigations against leveraged bids (for instance with allegations of violations of antitrust and securities laws) also contributed to the dearth of LBOs. At the start of the 21st century, there have been some LBOs again, especially in the high-technology sector, with cable and software companies becoming the targets of private equity firms; if some scholars and specialists predict a new wave of LBOs, it is nonetheless unlikely to be accompanied by the greed and aggressiveness of the 1980s.

Liability Theory

Theories of liability are intended to explicate the conditions under which a party can be held legally responsible for harms to others caused by said party's activities. Harms for which a party can be held liable include personal injury, property damages, and certain intangible harms such as mental anguish and loss of future earnings. Questions of liability occur in many business contexts, including most prominently cases in which a distinct harm is brought about to an individual through the use of a company's product. Theories of product liability provide guidelines for determining the extent and level of redress available to injured persons. By providing consumers with a means of seeking redress for harms caused by unsafe products and companies with an incentive to produce safe products, product liability law can be seen as providing a socially efficient means of addressing issues of product safety. In the United States, the law of product liability generally falls under civil law and is governed by the common law of torts as well as the Uniform Commercial Code. While different theories of product liability have governed the law of product liability in the United States historically, the theory of strict liability is currently applicable to cases involving product liability claims in most jurisdictions.

The theory of strict liability holds that the manufacturer of a product can be held liable for harms caused by the defective nature of that product even if the manufacturer was not negligent in the production of that product. Thus, for instance, under the doctrine of strict liability, a person injured by a defective product need not prove that the company had knowledge of or was at fault for the defect that resulted in the harm in question. According to the standard of strict liability, if the product was defective in a manner that created an unreasonable danger, and this was the cause of the injury at issue, the manufacturers can be held responsible even if they exercised due care in producing the product. Under some circumstances, assemblers, distributors, and retailers of products may also be held strictly liable for damages caused by defective products.

Proponents of the theory of strict liability have offered a number of justifications for the doctrine. On utilitarian grounds, proponents argue that holding manufacturers strictly liable provides them with an incentive to produce safer and more reliable products than they would otherwise. Similarly, proponents of strict liability often maintain that even when neither party is morally at fault for the harms caused by defective products, businesses are better able to bear the costs of injuries than are the harmed individuals. Furthermore, some proponents of the theory have argued that since proving negligence is extremely difficult in cases of product defects, requiring such proof in cases of product liability places an unreasonable burden of proof on the harmed individuals. In this vein, they often argue that when standards of negligence were the rule, a large number of individuals went uncompensated for their injuries.

On the other hand, opponents of the theory argue that the application of the doctrine of strict liability is unfair as well as harmful to the economy. Such critics hold that it is unfair to hold manufacturers responsible for defects in products even when they followed all reasonable precautions in producing those products. Furthermore, opponents claim that the application of the standard of strict liability inhibits product innovation and places a stifling economic burden on businesses as well. In regard to the latter claim, many of these critics point to the increasing costs of litigation and insurance premiums for business firms in the United States over the course of decades, since standards of strict liability became the norm, as illustrative of this problem. As such, in recent years, there has been a push by opponents of strict liability for tort reform in many jurisdictions that includes a return to standards of due care and negligence in cases of product liability.

Though the notion of strict liability is often conflated with that of absolute liability, it is important to note that the two concepts are not equivalent. Whereas the idea of absolute liability precludes all defenses for a resultant injury, the notion of strict liability does not imply that manufacturers must compensate for any injury brought about through the use of their products. For one, as noted above, in order for strict liability to apply, the injury in question must be caused by a product defect, either of manufacture, design, or warranty. Second, claims of strict liability can generally be avoided if it can be shown that the product was substantially altered or used by the injured party in an unintended and unanticipated way. Finally, it is important to accent that the burden of proof clearly rests with the plaintiff in cases of strict liability, as it is up to the plaintiff to demonstrate that the product in question was in fact defective in the manner claimed.

While the theory of strict liability applies by and large to issues concerning the responsibility of businesses for the products they produce, the concept of limited liability is generally used to refer to the liability that the owners of a business have in relationship to the activities of the business itself. The doctrine of limited liability states that the owners of a business are liable only to the extent that they have contributed to the business. A limited liability entity is, thus, one in which the contributing investors or partners can only be held responsible for the obligations of the business to the extent of the value of their investment in that business. Thus, under a limited liability structure, the investors or partners are not held personally responsible for the debts or obligations of the business, and their personal assets are thereby protected. Proponents of the doctrine of limited liability argue that by limiting the risk to individual investors, the limited liability structure encourages investment in business, which is conducive to an efficient economy. In this regard, the rise of the modern limited liability corporation has been seen by many as an essential element in the development and expansion of capitalist economies.

LIBERALISM

Liberalism is a philosophy, a political theory, a theory of education, an idea in economics, and a religious idea, all of which ultimately are grounded in the liberty of individuals and the free associations they create. Fundamentally, what liberalism values is the liberation of humanity from what liberalism holds are coercive elements of customs and traditions, as well as the authority of class privilege, aristocracy, and coercive ecclesiastical or political power, so that ethical, social, economic, and theological progress is possible. To serve the goal of progress in these areas, liberalism promotes political/legal systems that preserve the liberty and equal dignity of individuals while otherwise limiting governmental restraint, so that individuals and their voluntary associations are free to pursue ends that they hold will contribute to making a better future. Liberalism is a major philosophical, political, and religious current in Western thought and has been, and continues to be, foundational to the West's public institutions as well as many of its social institutions.

The Idea of Liberalism

The idea of liberalism antedates the use of the term *liberalism.* It developed in the philosophical and religious traditions of the West, specifically in one trend in Christian theology and political philosophy, as well as in the humanism of Enlightenment philosophy, which had its roots in Europe's Renaissance and was very influential in 18th-century political thought. Underlying these theological, philosophical, and humanistic trends is the belief that human beings' basic nature is good and that human beings have a tremendous capacity for knowledge and reason, even though that nature and capacity can be corrupted by power or by coercive elements in government and society. When liberated, however, human beings are able to improve themselves and their world continually as they reach toward, even if never ultimately reaching, perfection.

Thus, liberalism's focus is the good that is possible in this world and not the salvation of souls for the eternity of the next. That is, liberalism is a "secular" mode of thought in the original meaning of the word "secular." Originally, "secular" did not mean "nonreligious," as it does in popular discourse today. Rather, "secular" pertained to those things that are time bound and, therefore, not of that other eternal world but are of importance to the "this-worldly" pursuits of the here and now. Consequently, secularism in this sense does not oppose religion, but rather emphasizes the "this-worldly" pursuits of religion and other endeavors. Nevertheless, because liberalism involves liberation of the people and their free associations from governmental constraints and the coercive elements of custom and tradition (including religious traditions and their institutions), liberalism emphasizes the need for government to remain unentangled with religion and vice versa.

Consequently, liberalism holds that government's role is not to constrain human beings in order to limit their potential to sin. That had been the traditional Christian political theory's justification for government's domination of the people in coordination with ecclesiastical authorities. Rather, liberalism promoted the revolutionary notion that human beings can be trusted with liberty. The idea is that even though there may be missteps along the way, when human beings are free, they naturally and ultimately, through experience and reasoned reflection, progress toward human flourishing. This leads in turn to greater and greater degrees of happiness in this world, and ultimately to an unfolding revelation of the true and the good. Hence, change is possible and is good as it can lead to progress toward that better world of tomorrow; that is, the "golden age" is in the future and not in the past.

Theological Liberalism

Although its impulses can be found elsewhere, theological liberalism's first impulse in the West was the liberation of the individual to question the constraints of religious doctrine and authority. Here, religious inquiry, free from outward constraints, turns to inner motivations and the ascendancy of humanity as thinking beings. Thus, human beings use reason as they challenge and are challenged by religious dogma in an effort to discover the essence of faith, an understanding of ultimate reality, and human beings' relationship to God—all with the potential to realize a more authentic faith than that offered by tradition taken only on faith. Accordingly, theological liberalism holds that religion should be interpreted in light of experience as well as the best contemporary reasonable thought.

Although the concept of progress was implicit in these early developments, theological liberalism's later acceptance of scientific developments, such as Darwin's theory of evolution, and the influences of the Industrial Revolution resulted in theological liberalism's more explicit embrace of the notion of progress in the realm of religion. The idea is that through a continuing process of taking account of experience and submitting that to reasoned reflection, human beings produce new understandings and profound experiences. As a consequence, human beings' potential to move ever closer toward God is increased.

Liberalism as a Political Tradition

Although liberalism seeks to free individuals and their free associations from the constraints of tradition, liberalism did not wholly reject tradition. Rather, it spoke from within it to the future where a better world is possible. Therefore, liberalism itself can be thought of as a tradition. One of the first to articulate that tradition in the arena of government was John Locke (1632–1704), a British philosopher who wrote about the potential for human understanding through empirical observation and about the foundations of a governmental structure and political ethic that would ensure the freedom of the people.

Locke's works reveal that it is difficult, if not impossible, to divorce political liberalism from its roots in theological liberalism. In fact, Locke held that reason itself is "natural revelation." Accordingly, Locke's political philosophy begins with basic beliefs about humanity's state of being in the "state of nature." Locke held that human beings are, by nature, free and equal because they are created that way by God. They are free in that their actions are not predetermined; that is, they have free will. They are equal, not in their talents or abilities, but because they have equal dignity before God as God's highest creations. Locke concludes therefore that this natural, God-given state of humanity should be respected to the greatest degree possible when societies and governments are formed. That is, government should not thwart the essential nature of humanity, as God intended, by unduly limiting human beings' ability to exercise their free will or by disregarding the inherent worthiness of all human beings.

Central to Locke's approach was the idea that society cannot fulfill its potential to foster human flourishing and happiness, and ultimately the search for the true and the good in the world, if the people are not free to pursue their own religious beliefs. Each human being is, then, his or her own moral agent responsible directly to God. Hence, although Locke did not advocate tolerance of atheists, religious tolerance for people of all faiths (even Catholics, Muslims, Jews, highly controversial Protestant sects, heretics, and heathens, all of whom were deemed highly suspect by others) was foundational to Locke's articulation of liberalism. This is consistent with liberalism's "secular," that is, this-worldly, focus on improving the political and social conditions through which the true and the good can be pursued.

In turn, Locke emphasized a free and open public forum where, as he stated, "truth" is "left to shift for herself." The idea was that in the process of exchanges in the public forum, the participants, presenting and considering a variety of perspectives, would arrive at new understandings. These then would be tested again as the conversation would progress continually toward better and better ideas about how human beings can flourish as they engage in the search for ultimate truth and goodness in their pursuits for happiness in the world. And if ultimate truth and goodness do not result, at the very least there would be a sort of equilibrium of competing views, thus limiting the potential for any one view to dominate the others.

This "natural law" political philosophy led Locke to conclude that there are two fundamental principles for a government of a free people whose equal dignity is served. The first is that no one may harm another in his or her life, liberty, or property. The second is that the laws of society should be consistent as to every member of society and therefore not be based on the hypocrisy of any custom or tradition that privileges some of the people over others. That is, no one may deny to others what one is not willing to deny oneself—Locke's reversed statement of the golden rule—at least not through the instrumentalities of the state.

Accordingly, Locke held that government should be limited, its purposes being to preserve the people's natural rights, to provide a fair and unbiased judge of disputes (i.e., a political and legal system that serves the people's natural rights), and to ensure the general welfare of the people in a way that does not infringe on the people's natural rights. In this regard, Locke was an early proponent of trade, a free press, and, as already stated, religious toleration, as well as the "just bounds" between government and individual conscience.

Locke's works are the classic statement of liberalism, which became the foundation for political liberation in the West, but were especially influential as a basis for the popular cry for liberty that led to the American Revolution, the Declaration of Independence, and the United States Constitution.

In addition to Lockean "natural rights" liberalism, liberalism developed what is known as "utilitarianism." The general idea is that the moral worth of actions and practices should be determined solely by reference to whether their consequences are "good," which has been defined variously over time. That is, this general idea, known as the principle of "utility," is that the good should be maximized, while the bad should be minimized to the extent possible in any given circumstance. Utilitarianism's early proponents include Jeremy Bentham (1748–1832), James Mill (1773–1836), and John Stuart Mill (1806–1873). The original basic concepts include Bentham's commitment to individualism ("everybody to count for one, nobody for more than one") and the greatest happiness principle (that morality should be based on what produces general happiness or pleasure). In this regard, John Stuart Mill offered the general rule that "actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness."

These ideas also found their voice in politics and political economy, no less so than in John Stuart Mill's own pivotal and still influential work, *On Liberty*. That work emphasized the sovereignty of the individual over authority (including the authority of the majority) because, he believed, respect for individual autonomy would lead to utility. Although Mill later favored democratic socialism, his work and that of other utilitarian thinkers continue to inspire those who espouse the idea that the greatest degree of social benefits (i.e., social utility) and economic benefits (i.e., economic utility) can be achieved through an ongoing process of exchange among free but interdependent individuals.

As liberalism developed, it became as much a method and a process as an ideal. In other words, it became at once the means to liberation of oneself and one's community from the limitations and coercions of tradition, custom, privilege, aristocracy, and unwarranted governmental restraints, and at the same time the goal of liberation itself.

Liberalism's Schism

Liberal politics gradually took hold in the West. Government was to be reformed so as to ensure the liberty of each individual to as great a degree as possible while at the same time providing the circumstances for respecting the freedom of others. Fundamentally, political liberalism came to emphasize individual liberty, adherence to the rule of law (as opposed to reliance only or primarily on the judgment of designated leaders), representative democracy (with popular sovereignty checked by adherence to individual rights), checks and balances of governmental power, and private property. Individual liberty led, in turn, to the demand for universal suffrage so as to free disenfranchised citizens (e.g., the unpropertied, women, and minorities), so that they too could become full participants in the progression of society. Liberalism also led to the call for universal education so that ordinary people would be capable of exercising their right of popular sovereignty, free from unexamined assumptions, customs, and traditions. Such education was to ensure that the people would have the knowledge needed for them to remain free from the coercive power of a state aligned with society's powerful aristocrats, plutocrats, and religious authorities.

However, liberalism developed a schism in response to some of the effects of the booms and busts of the 19th century's economy and the Industrial Revolution, both of which were believed by the vast majority to have produced severe hardships on masses of people, while the profits of a few grew exponentially. On one hand, there were those who argued that the effects of a political system based on liberty must not only ensure a method and process for the continual enhancement of liberty of action and belief but also be cognizant of the goal of liberty. On the other hand, there were those who held that government's role is to ensure individual liberty but that government should be very limited otherwise. That is, the liberal process should unfold without making corrections to outcomes.

Those who focused on the goal of liberty held that if the method for liberty results in outcomes that are liberty-limiting, then adjustments must be made, and government can be effective in making such adjustments. That is, liberty should not entail only "negative rights," which involve what government may *not* do in order that liberty can be ensured, but should also consist of "positive rights," which involve what government *can* do to promote liberty. Consequently, this thrust in politics led to the call for democratic reforms and "progressive" legislation that would promote not only political reforms, but also economic reforms, as well as reforms in education. John Dewey (1859–1952), who helped organize the American Civil Liberties Union and promoted liberal public education, among other things, was a prominent figure in this movement.

Many argued for a safety net of welfare programs that seek to provide basic economic security because economic security and stability were held to be essential for the exercise of liberty. This view also led to the support of trade unions to balance the relative powerlessness of a nominally "free" laborer with the superior power of a free employer. Overall, those holding this view promoted a stronger government to address such liberty-limiting outcomes.

These trends in "liberal" politics became amplified in a significant American religious movement in the late 19th century and early 20th century: the "social gospel movement." Social gospel movement proponents, in particular their main spokesman Walter Rauschenbusch (1861–1918), held that unrestrained capitalism, which had arisen in the wake of free market economics, thwarts the ability of the masses to prosper through their own labor and, therefore, is unjust. As a result of these social forces, the people are led to despair, and they are steered toward sinful behavior, such as alcoholism, thievery, and prostitution. Consequently, the social gospelers argued in favor of "social salvation" to augment individual responsibility. This took the form of social reforms, which proponents believed would help usher in the Kingdom of God on Earth.

A complementary trend from another direction came from the famed economist John Maynard Keynes (1883–1946) in the early 20th century. Keynes provided an economic theory that challenged the prevailing free market economics of the time. He advocated government intervention at the "macroeconomic" level to address economic anomalies in the market, which he held had produced the economic insecurities of recessions and depressions. Keynes's work was a significant influence on the Great Depression era (1930s) "New Deal" economic policies of Franklin Delano Roosevelt. These economic policies, among other things, resulted in the Social Security system, the Securities and Exchange Commission, and a series of programs designed to provide relief to those most negatively affected by what were widely viewed as abuses by big business in an unregulated market economy.

In addition to concern over potential liberty-limiting outcomes of an unregulated market economy, another complementary trend developed midcentury regarding "distributive justice." Proponents rejected a concept of liberty that favors those fortunate in the distribution of chance characteristics (such as one's innate talents or abilities) or chance social circumstances (such as being born to well-educated and wealthy parents). John Rawls (1921–2002), a main proponent of this trend in liberalism, argued that an economic system that favors the lucky and disadvantages the unlucky is ultimately unjust. In any event, it is not one the people would choose if they considered the matter from the perspective (which he called the "original position") of all others, especially the least fortunate or, in his terms, least advantaged. He argued that distributive justice demands that inequalities in the distribution of society's social goods should favor the least advantaged in society. Another to contribute to this trend is Ronald Dworkin (b. 1931), who has argued that liberty must be framed in terms of the equal concern for individuals who are in unfortunate social circumstances due to no fault of their own.

Conversely, those liberals who focused on a free process (without regard to ends) contended that examinations or corrections of outcomes and limitations on private institutions involve governmental encroachments that limit freedom. That is, liberty was held to be primarily a method, a way to ensure liberty of action and belief, rather than a goal. This approach stands in the tradition of economic liberalism.

Economic Liberalism

Economic liberalism is grounded in the classical statement of liberalism where government is to be limited so as to preserve the people's natural rights, thus ensuring that the people remain free from governmental restraints. Consequently, economic liberalism developed the idea of liberal, that is, free, trade, which further developed into liberal, that is, free, market capitalism.

Economic liberalism, perhaps better termed *liberal political economy*, has its own original proponent: Adam Smith (1723–1790), known as the "father of economics." Smith provided the classic articulation of liberal economics. Smith's idea was as much a moral approach to economic activity as it was a practical one:

Everyone should pursue his or her own self-interest in a competitive environment to produce the greatest good in terms of the wealth maximization of individuals and nations. Smith contended that economic interactions in a free market (which can be viewed as analogous to Lockean liberalism's free and open debate) would lead to overall public welfare. The reason is that it would involve an equitable distribution of wealth, based on the merits of effort, ability, and talent, thus producing an equilibrium of competing interests. The then current system had sustained an entrenched aristocracy of wealth and privilege, which in turn made the poverty of the masses inevitable and unrelenting. The consequence of economic liberalism, however, was believed to be decreased poverty with the result that the masses would not have to resort to immoral behavior (i.e., thievery and prostitution) to survive. Others, such as David Ricardo (1772–1823), later built on this tradition, which has become the prominent approach to economic activity in the West, albeit with modifications of various kinds and degrees in various countries.

The ideas undergirding economic liberalism antedate Smith, however, in that the impulse for economic liberty developed with the rise of the bourgeoisie in Europe. The bourgeoisie were the trader and merchant class that developed a middle way of obtaining material sustenance as against medieval feudal society's serfdom on the one side and aristocracy on the other. Just as many sought reforms that would free individuals from political and religious constraints, the rising business class sought freedom from governmental economic restraints, which severely encroached on the ability to develop economic viability and stability that would not be dependent on others' inherited positions or wealth.

As a consequence, economic liberalism developed as a major component of liberalism. However, when the schism of liberal thought referenced above developed, economic liberalism was in alignment with the view that liberalism is a method for liberation whose wealth-maximizing outcomes are intrinsically fair, and, therefore, adjustments of outcomes are not warranted and ultimately involve an unjust redistribution of wealth. Accordingly, economic liberalism emphasizes individual rights to private property and freedom of contract (regardless of power differentials between bargaining parties) and holds that a loss of economic freedom ultimately leads to a loss of political freedom. From this perspective, governmental interventions for social reasons that promote "positive rights" are inherently counter to liberty and, moreover, have the potential to lead to an authoritarian governmental system.

Friedrich A. Hayek (1899–1992), a main proponent of economic liberalism, argued that attempts to ensure a measure of economic equality through governmental social programs would lead down a "road to serfdom," which liberalism originally had been designed to counter. As a consequence, such attempts would thwart the potential of natural economic exchanges to produce the wealth of nations that liberal economics promised to yield. Following this line of thinking, another main proponent, Milton Friedman (1912–2006), with his wife Rose D. Friedman (b. 1910), argued against government intervention in economic concerns. Among other things, the Friedmans are famous for the argument that the Great Depression was caused by government intervention rather than by the failure of the free market and also for their advocacy of free market approaches to social issues, such as access to adequate K–12 schools. Robert Nozick (1938–2002), who also wrote in this vein, countered John Rawls's ideas about "distributive justice," specifically. Nozick argued that redistribution of wealth is inherently unjust and that an economics of free exchange within a context of equitable laws is just, even if it produces wide disparities in the distribution of wealth.

Liberalism and Education

Although "liberal arts" education may be construed as the means for transmitting the customs and traditions of society, education in the tradition of liberalism, in its strict sense, is education for freedom. First, it is a method that involves free inquiry that questions existing, entrenched modes of thinking and societal institutions whose foundations usually lie in the often blindly accepted "truths" of society's dominant traditions. Liberal education in this sense is not education focused merely on transmitting the learning and information of such traditions, be they philosophical, political, religious, or otherwise. Rather, the goal of liberal education is to use critical inquiry based on reason and experience to examine the prior assumptions and outcomes of such traditions. This is not only to unravel those prior assumptions and outcomes to determine whether they serve the search for the true and the good and ultimately human happiness in this world but also to build on whatever is found there that serves that goal. Second, liberal education goes beyond servile functional education that involves "how-to" mechanical, technical, or professional training for vocational purposes, such as for law or business. Rather, liberal education serves to prepare individuals for full participation in the free and open debate that a liberal society framed by liberal governing institutions ensures.

Liberalism Today

In the West, those referred to as "liberals" and those referred to as "conservatives" include many who are inheritors of the tradition of liberalism. The current struggle between these "liberal" and "conservative" inheritors can be understood as an argument involving two opposing views about the best way to promote the ideals of liberalism. On one hand, "conservative" inheritors of the tradition of liberalism (which includes libertarians in its strictest form) contend that governmental interventions should be severely limited because they always encroach on liberty. This view, which includes economic liberalism, has a tendency toward anarchism. While some hold that tending toward anarchism produces a greater potential to ensure liberty, others argue that such an approach leads inevitably to the rise of a powerful force or forces, for example a new aristocracy of wealth and monopoly or of religious ideology, which inevitably results in the limitation of the liberty of others.

On the other hand, "liberal" inheritors of the tradition of liberalism contend that the role of government is to preserve liberty, which requires government to take corrective action as regards outcomes that limit liberty, such as severe economic inequities. That is, state measures are needed to ensure that social and economic freedoms are available to all. This view has a tendency toward socialism. Some hold that tending toward socialism produces a greater potential to ensure liberty. However, others argue that such an approach leads inevitably to an ever-expanding government, which ultimately limits the liberty of the people as it encroaches on many aspects of people's lives in the exercise of governmental privileges.

Furthermore, the challenges of the liberalism of the mid- and late 20th century to entrenched modes of thought, customs, and traditions, particularly in the realm of education, have resulted in an anomaly. Critics argue that liberal ideology's conclusions regarding things such as the relativity (as opposed to the absolutism) of morality, the virtues of religious pluralism, multiculturalism, secularism, and liberal redistributive economic policies have become entrenched in the ivory towers of our first and finest institutions of learning. The charge comes interestingly from conservative traditionalists, among others, who argue that liberalism has become so ingrained and ensconced in many places in the academy that it has closed the door to open debate, which it originally was designed to ensure. Critics further contend that a significant strain of liberalism has turned its method of critical inquiry on everything, including the philosophical and moral bases of liberalism. This has resulted in the deconstruction of liberalism's own foundations without a counterbalancing reconstruction—to the point where it has begun to undermine its own tradition and, therefore, liberty itself.

In the meantime, conservative traditionalism has rushed to fill what it perceives to be the moral vacuum bequeathed by liberal liberalism. Consequently, conservative traditionalism in turn challenges many assumptions of liberal liberalism. These include the assumptions that religious pluralism, multiculturalism, and secularism equate with liberty and that human beings are inherently good (as opposed to sinful). Accordingly, conservative traditionalism endeavors to stem the tide of what it views as the libertine tendencies of liberal politics, public policy, and education, which do not address what conservative traditionalists hold are fundamental social values in such areas as sexual behavior, marriage, and the beginning and end of human life. In so doing, conservative traditionalism invokes traditional Christian theological justifications for the promotion of public policies, thus challenging liberalism's traditional secular roots and, in turn, the separation of church and state. To confuse matters more, in the United States conservative traditionalism has joined with conservative economic liberalism in a political alliance that some find anomalous in that the ultimate assumptions, methods, and goals of each are at odds.

In the meantime, theological liberalism appears to have lost its voice. Although a new religious "left" has arisen, it bears little resemblance to the original tradition of theological liberalism. Instead, it promotes theological, generally biblical, justifications for a more magnified socialist-trending liberal liberalism. In so doing, it evokes and expands on the social gospel movement of an earlier era, while it, too, strains the "just bounds" between church and state.

All these trends call into question whether the terms *liberal* and *conservative* hold any meaning of substance in today's economic, religious, and political debates.

Overall, it remains to be seen whether liberalism's championing of individual liberty (as against the centralizing tendencies of governmental institutions) can be counterbalanced with public policies that thwart potential liberty-limiting abuses by private institutions (such as powerful and potentially dominating business enterprises, which themselves have centralizing, i.e., monopolizing, tendencies) without undermining liberalism's original "secular" aspirations. Those aspirations were to produce a society that frees human beings to promote human flourishing, seek happiness in this world, and participate in the search for the true and the good to make possible a better world for tomorrow.

LIBERTARIANISM

Libertarianism is a social and political philosophy in the Western liberal tradition committed to the advancement of personal liberty. It is distinguished from egalitarianism by its views on property rights and the use of force. Although the term *libertarianism* first appeared in political discourse in the 1950s, its conceptual framework was firmly established in the 18th and 19th centuries by political economists and philosophers in the "classical liberal" tradition, most notably John Locke and John Stuart Mill. Despite marginal theoretical disagreement, most libertarians agree that the principles of self-ownership and nonaggression are foundational.

The most influential 20th-century libertarian theorists are in the Lockean deontological (rights-based) moral tradition. Robert Nozick and Murray Rothbard defend liberty via rights, independent of utilitarian considerations. Other recent scholars are in the teleological (consequentialist) moral tradition of John Stuart Mill. Milton Friedman and F. A. Hayek argue that increased personal liberty also produces greater individual happiness and social utility than highly centralized government. In the 20th century, libertarian theory was also shaped by outside influences such as Ayn Rand's objectivist philosophy.

Self-Ownership

For Lockean libertarians, all rights are property rights rooted in John Locke's principle of self-ownership, or the idea that we own ourselves in the same sense that we may own property (natural resources and/or artifacts). Self-ownership limits what others can do to our selves and our property without our consent. Entitlement to property is based on historical principles or how that property was originally acquired. Lockeans argue that initial ownership of natural resources results from a person mixing his or her labor with that unowned resource. So, if we own our selves, then we have a right to the fruits of our labor. The institution of involuntary slavery, for example, is universally morally wrong because it violates the principle of self-ownership and involuntarily deprives individuals of their natural right to what they produce.

Once natural resources come under initial ownership, entitlement to those natural resources and the subsequently created artifacts may be transferred to others, if and only if the contract is informed and consensual. Once legitimate ownership is established, neither other individuals nor the government may coercively seize that property. Most libertarians reject all governmental policies that coercively redistribute property based on some patterned, or preferred, end state such as merit, need, equality, or utility.

Recent debate concerning the original status of natural resources has spawned a form of libertarianism known as "left libertarianism," which, in contrast to "right libertarianism," argues that natural resources are not initially unowned, but owned collectively by society in some egalitarian manner as public property. Therefore, those who want to acquire natural resources must secure consent or reimburse society for their use. Despite scholarly disagreement between left and right, libertarians remain committed to both self-ownership and nonaggression.

Nonaggression

Libertarians argue that nonaggression provides the universal foundation for morality and legality. Unprovoked physical aggression is construed as a violation of property rights via self-ownership. Libertarians follow John Stuart Mill and distinguish between other-regarding acts, which violate the rights of others without their consent, and self-regarding acts, which do not. The inviolable bounds of personal liberty lie within the sphere of self-regarding actions. Self-defense is the only justification for violation of the nonaggression axiom.

Rights impose duties not to kill others or to deprive them of their liberty or property. According to libertarianism, the nonaggression axiom imposes a negative right to life, which posits a duty not to kill others or deprive them of their liberty or their property. There are no positive rights that obligate us to assist others and therefore, there is no "positive right to life." If there were a positive right to life, as some left libertarians suggest, both left and right would agree that it would be more efficiently secured by individual charity and nongovernmental organizations than by tax-supported redistributive welfare.

The nonaggression axiom applies to both individuals and governments. Libertarians disagree over the implications of the nonaggression axiom for the nature and scope of the state as it limits government's ability to raise revenue via coercive taxation or raise an army via involuntary conscription. Most libertarians today are "minarchists," who support limited government that protects citizens (via an all-volunteer army) from external threats posed by aggressive nations and from internal threats (via a criminal justice system) posed by murderers and thieves. Some radical libertarians are "anarchists" or "anarcho-capitalists," who argue that all governments invariably violate the nonaggression axiom or that all governmental functions can be more efficiently served by private individuals, voluntary, nongovernmental associations, and the free market.

Libertarianism, Social Issues, and Global Affairs

Libertarians hold that most social problems are caused by intrusive government and therefore prefer to empower individuals to make their own decisions and solve their own problems. Most are free market capitalists opposed to any government redistributive programs intended to serve the public good, such as urban planning, social welfare, socialized medicine, affirmative action, minimum wage laws, or public schools.

Libertarians resist any attempt by individuals or governmental central planners to coercively impose any one moral or religious view as a legal obligation. Therefore, they stand opposed to restrictive governmental policies toward marriage, birth control, pornography, and recreational drugs. Views on abortion, stem cell research, and cloning are contingent on whether one can reasonably extend self-ownership to zygotes, fetuses, and clones.

In terms of foreign policy, libertarians hold firm to the nonaggression axiom and therefore declare war only in self-defense. In global economic affairs, right libertarians embrace free market economic policies and laissez-faire government, which limits the role of government (national and international) to protecting consumers against theft and fraud. Most are against governmentally enforced monetary policy, protective tariffs, and antisweatshop legislation. Most libertarians say that foreign aid, when appropriate, is best provided by individuals and private nongovernmental organizations rather than by government.

On the contemporary political landscape, libertarians are classified as "social liberals" and "economic conservatives." Their primary critics are communitarians, egalitarians, and utilitarians. Left libertarians hope to bridge the gap between right libertarianism and egalitarianism via a collectivist natural resource policy and, therefore, draw fire from both sides.

Life Settlements

A life settlement represents the sale of an existing insurance policy to a third party. In a life settlement, as contrasted with other relationships, the third party does not have an insurable interest in the life of the insured: that is, the purchaser does not have an "interest" in the continuing life of the insured in the manner of a traditional beneficiary, who is usually related to the insured (spouse, sibling, child, etc.). Most types of life insurance can qualify in life settlement transactions.

The emergence of life settlements, particularly in light of newer variations that appear to treat insurance as an instrument for financial investment, has generated considerable controversy. On one hand, there is compassion for the types of individuals who have a legitimate need for cash, which they can get by selling their policies to third parties through life settlement transactions. At the same time, however, there is significant concern regarding the commodification of life insurance and the ripple effect across the industry caused by allowing investors to prey on the gap between the prices insurance companies can afford to pay to buy back policies and the value that policyholders seek for this exchange.

Life Insurance

Life insurance is a product of a special nature. Whereas individuals often invest in gifts for one another, life insurance in and of itself is a gift—not merely a product that becomes a gift through types of purchases. The purpose of life insurance is to enable individuals to provide dependents with financial protection on death. Public policies have developed to promote investment in life insurance. Tax benefits, for example, are promoted.

Insurable Interest

Traditionally, according to laws in the United States, an "insurable interest" has been considered a prerequisite for the purchase of life insurance. An insurable interest is an interest held by a beneficiary that offsets that individual's interest in the premature death of the insured, which would result in an early windfall for the beneficiary. In other words, by law, insurance is not sold to strangers, because of the risk that the beneficiary might choose to facilitate an early death in exchange for the financial benefits. It is believed that family members have a deterrent in their affection for their relatives, which is considered "insurable interest"—that is, an interest in keeping the insured alive. Insurable interest is a hedge against beneficiaries trying to cash in prematurely on the commercial value of the insurance.

Market Need

Opportunities for life settlements occur where the insured finds present-day cash more valuable than the anticipated death benefit in the future for the beneficiaries. Through a life settlement, the insured receives cash through the sale of the policy to a third party. Policies tend to include a specified cash surrender value, which represents the amount that the company will pay to buy back the policy. Life settlements are attractive because the value the insured receives through the transaction, while less than the anticipated death benefit, is more than the company's cash surrender value.

Viaticals

A distinction is usually made between a life settlement and a viatical. The latter is traditionally used to refer to financial transactions involving the sale of an insurance policy by an insured who is chronically or terminally ill. Life settlements are typically used to refer to the sale of a policy by an individual who is not ill.

Viaticals are considered the predecessor of life settlements. This instrument emerged in the 1990s as an option for terminal patients, such as victims of AIDS. Through a viatical settlement, the insured is permitted to engage in a sale transaction absent an insurable interest. The reason for viaticals stemmed from the recognized need of these sorts of individuals to be able to access cash, for their investment in life insurance generally antedated their knowledge of their own special medical needs. Providing for their last days supersedes their desire to invest in the future of their loved ones.

Consequences

After the insured sells the policy, the proceeds are the insured's to disperse as he or she deems appropriate. The proceeds of the insurance policy are tax deductible up to the amount already paid in premiums. The remainder of the proceeds are taxed at the individual's normal rate. After completion of the sale, the insured loses all rights and obligations connected with the policy. While the insured is no longer responsible for the premiums, his or her beneficiaries will not receive any disbursement of income from this policy at the death of the insured. The third party—often a firm of some sort—now becomes the beneficiary of the insurance policy.

Concerns arise in that the insured remains connected to the third party through the policy. The third party can require the insured to undergo medical examinations, and that third party can gain access to information about the insured's medical condition and other personal information through ownership of the policy. This raises multiple challenges to personal freedom and privacy.

Controversy

There are several reasons why an insured would be interested in selling his or her insurance policy. These reasons can range anywhere from the belief that the policy is no longer needed or desired to the need for liquid capital to pay for unforeseen costs. Some insured people claim that their premium payments have become too much of a burden or that their estate planning needs have changed since they purchased the policies.

Some people are concerned with the recent increase in life settlements. These people believe that selling a life insurance policy to an individual or institution who lacks an "insurable interest" in the insured results in a challenge to the essential purpose of life insurance and the important role that this financial instrument plays in society. This role has grown increasingly important in this time of declining trust in the pension funds provided by the government and private employers and in the future of social security. Simply put, the purpose of life insurance was to provide financially for the insured's dependents in the event of his or her death. In this way, the purchase and maintenance of a life insurance policy is considered an altruistic act. Resources that the insured could have spent during his or her own lifetime are instead put away to secure the future of loved ones.

Life settlements arguably distort the essential purpose of life insurance when what begins as an altruistic act is turned into a vehicle for investment. This investment becomes particularly attractive since it leverages the tax benefits that the government bestows on life insurance to encourage more people to purchase life insurance. These tax benefits were designed to incentivize actions to relieve the public of the burden of taking care of dependents left destitute by the death of their primary financial support. Life settlements thus jeopardize the tax benefits on which these investments rely.

At the same time, life settlements do fill a need in society that the companies are not able to address efficiently. The fact of the matter is that life settlement firms can afford to pay more than the companies that issued the policies. In many ways, life settlements represent a sort of win-win situation.

The real problem is linked to related instruments that further the distance between the ultimate beneficiaries and insurable interest. Recent years, in particular, have witnessed the proliferation of new instruments that turn insurance into a financial investment instrument. An array of related products exists, all of which share in common eventual stranger ownership of life insurance polices. They are known by acronyms, that is, COLI (company-owned life insurance), IOLI (investor-owned life insurance), STOLI (stranger-owned life insurance), and so on. These are becoming increasingly controversial as their lack of a relationship to insurable interest is challenged.

This is not to say that the only legitimate policyholder is a blood relative. On the contrary, companies have for many years protected their investment in senior executives through what is known as "key man" policies. It is believed that the reliance of the companies on these top executives creates a sort of acceptable insurable interest. What about companies who want to insure janitors? Clearly, janitors do not influence business in the ways that senior executives do.

Conclusion

The future of life settlements remains uncertain. Life settlements continue to serve as an attractive alternative, particularly for aging policyholders. Although companies initially balked at the emergence of this new market, many are finding that life settlements do not represent a significant challenge to how they do business. While concerns are increasing regarding other forms of stranger-owned life insurance, many insurance companies are turning the emergence of this new life settlements market into an opportunity to streamline how they do business. While they are not willing or able to pay policyholders more than the cash surrender value, many appreciate the willingness of settlement firms to step in and assist their customers where they are not in a position to do so. The financial services industry is one that remains committed to customers.

Litigation, Civil

Civil litigation, more commonly called a "lawsuit" or "civil action," describes the formal process of resolving disputes between individuals, businesses, governments, and other groups through the court system. It would most likely translate from its Latin roots as "to carry on a lawsuit between citizens." Civil litigation is initiated by one party, called the plaintiff, to protect particular personal or property rights (guarantees enforceable under the law) against another party, called the defendant, who allegedly violated said rights in contradiction of a duty. Litigation seeks to enforce rights by obtaining a court order that precludes violation of said right, in the form of an injunction prohibiting such behavior, or by winning a judgment that compensates one for injury to said rights, in the form of monetary damages. Civil actions commonly involve breach of contracts or harm to personal or real property by an intentional or negligent act. Although other specialized areas of law like bankruptcy, divorce, probate, and tax may technically fall outside the precise definition of civil litigation, they are all considered to be included within it. The previous distinction between actions at law and actions in equity, traced to the separate courts used in England on which U.S. law is based, have been essentially eliminated. Conversely, a criminal action varies from a civil action in that it is brought by government on behalf of the rights of all society (and the victim) that have been violated through the commission of a crime and punishes the perpetrator via fines, incarceration, or even death in some states. Rules of civil procedure regulate the lawsuit process.

Social and Ethical Implications

The costs associated with civil litigation raise serious concerns about its role in society and in business.

Attorney fees, costs for experts and other expenses, and the final monetary judgment, which is sometimes in the millions, even billions, of dollars can have a crippling effect on a business. Lawsuits distract attention from productivity, invade privacy, and harm reputations and relationships. Yet civil litigation appears essential to protect the rights of consumers and businesses alike. Tort reform has been proposed as a tool to limit high judgments that might devastate a business. Adversaries to such reform claim that it will diminish consumer protection rights since without the threat of severe penalties, businesses will not be as conscientious and cautious because they will be able to more easily pass on these lower court judgments to the consumer in the form of higher product prices.

Civil litigation attempts to resolve differences in a manner that protects and promotes business and social relationships. For both to operate effectively, there must be some confidence that personal and economic rights and interests will be protected. Law is a critical component of business since almost every aspect of production is regulated in some fashion. In civil litigation, the courts apply the law, the official designations of the enforceable rights and duties, to the specific circumstances between the parties in coming to a decision or judgment. The term *common law* refers to the judge-made law in written reported decisions. These previous judicial decisions are followed as precedent in guiding current and future decisions under the doctrine of *stare decisis* (let the decision stand). Thus, the litigation process and the law provide a predictability and consistency on which business and social relationships can depend and strategize.

Law, although distinct from ethics, often encompasses social morality within its enforceable legal principles. The protection of rights and enforcement of duties is at the basis of law and of certain deontological ethical systems. In these ways, law is a major influence on and reflection of society's ethics and values. Without the enforcement of morality in the form of lawsuits, many rights would arguably go unprotected and duties unperformed. Law facilitates that moral minimum that society deems necessary to adequately function. Alternative dispute resolution (ADR) is a system to resolve disputes outside the usual judicial system and includes arbitration and mediation, among other components.

The civil litigation (or lawsuit) process includes three different stages that help the court to accurately resolve the disagreement in a fair and impartial manner. These three stages of a lawsuit are generally referred to as pretrial, trial, and posttrial, with very distinct actions occurring during each stage. All are designed, in part, to administer justice, fairly and impartially. A major limitation to such fairness is the access to resources that the different parties have for preparation of their respective cases.

Stages of a Lawsuit

Pretrial

The pretrial stage of civil litigation involves the following activities: consultation with an attorney, filing of pleadings and pretrial motions with the court, discovery of relevant information from the opposing party, and conferences with the judge. Although one may initiate litigation without the representation of an attorney (called pro se), it is uncommon beyond some of the small claims courts. Thus, the party seeking protection of or redress for injury to a particular right usually seeks legal representation from a lawyer (also called an attorney), as will the opposing party in the action. The attorney and client discuss the circumstances giving rise to the dispute and methods to resolve it, including the pros and cons of availing themselves of the court system. If litigation is chosen, the party determines which court system would be both available and advantageous to the lawsuit. The federal and state court systems are the two options. Each court system generally has three levels (some smaller states only have two), although additional courts may be added for special types of cases. For every state, there exist the trial courts (where lawsuits initially begin), the intermediate appellate courts, and the highest or state supreme courts, although a different designation may be used in a few states (e.g., in New York and Maryland, the highest court is called the court of appeals). Meanwhile, the federal court system has U.S. district courts (at least one within every state), 13 U.S. circuit courts of appeals, and one U.S. Supreme Court.

A court must have *jurisdiction* over a dispute (i.e., the authority to render a legally binding judgment) for it to be considered properly before that court. Courts need both *subject matter jurisdiction* (over the type of dispute) and *territorial jurisdiction* (over the person or property involved). *Concurrent jurisdiction* means that both the federal and state courts have the authority to hear and resolve said dispute, which exists when a federal question is at issue or a dispute over $75,000 involves people from different states (diversity of citizenship).

Once the appropriate court has been determined, the plaintiff, the party with standing (i.e., the protected right at stake), initiates the case by filing the necessary written documents with the court, called pleadings. The *complaint* or *petition,* the initial pleading that begins the lawsuit, puts forth why the court has jurisdiction, the facts surrounding the controversy, and the request for a remedy. The court, through a *service of process* and *summons,* then notifies the defendant that he or she is a party sued and named in the lawsuit. The defendant will then file a pleading called an *answer* that responds to the allegations in the complaint, and possibly a *counterclaim* that would list any allegations that the defendant has against the plaintiff. A variety of *motions* (i.e., written or oral requests for the judge to do something in connection with the case) are presented during the pretrial, trial, and posttrail stages of a lawsuit. Motions to dismiss the case for judgment on the pleadings or for summary judgment are the most common at the pretrial stage. The court either grants or denies said motions after allowing both parties to submit their arguments.

As the pretrial stage continues, the plaintiff and defendant use different methods of *discovery* to obtain information about the case from each other. Depositions (oral questions and answers to parties and witnesses that are officially recorded as sworn testimony), interrogatories (written questions to parties that are similarly answered), requests for documents, for objects, or for entry upon land, requests for admissions (to agreed-on facts), and requests for a physical or psychological exam are the primary forms of discovery. The information and method used for discovery needs to be relevant to the dispute and not overly burdensome. For example, requests for examinations would only be appropriate when the physical or mental condition of one of the parties is in question. Pretrial conferences between the judge and parties also occur to simplify the case, to set a trial schedule, to review and rule on any motions, and even to discuss a possible settlement. If the lawsuit is not dismissed in accordance with any motion or settlement, the case will then proceed to the trial stage.

Trial

The trial stage of civil litigation begins with jury selection and ends with a judgment, with opening statements, the presentation of evidence and witnesses, and closing arguments occurring in between. The Seventh Amendment provides the right to a jury trial in a civil case worth more than $20 in the federal court system. The right to a jury can be waived by both parties, resulting in the lawsuit being heard and decided solely by the judge. Jury selection (or voir dire, which means "to speak the truth") involves the questioning of potential jurors by each party's attorney to gauge their adequacy and impartiality for service on the jury. Potential jurors may be challenged and dismissed for cause with the approval of the judge or peremptorily without a reason (these latter challenges are limited in number). For instance, a potential juror who could not be impartial because he or she was a relative of one of the parties could be challenged for cause. The number of jurors required varies from 6 to 12 with additional alternates, depending on the rules and requirements of the particular court.

Once the jury has been seated, the attorneys for each party have the opportunity to give *opening statements,* which provide a limited statement of the facts they intend to establish, evidence to be presented, some reference to the law, and the ultimate remedy that they seek. The plaintiff puts on his case first by calling witnesses to testify in open court, along with any type of documentary evidence or expert witnesses. The courts have rules of evidence that govern what type of information may be presented and how. Even the questioning of witnesses is governed by rules as to the type of testimony (no hearsay, e.g., unless an exception) and the type of questioning (no leading questions to your own witnesses). One party may challenge by objection the admissibility of a question, testimony, or evidence presented by either party. The court either sustains or overrules said objections. The questioning by an attorney of one party's own witness is called direct examination. Opposing counsel then has the opportunity to ask questions during cross-examination. A second round of questioning occurs in the same order: redirect examination followed by re-cross-examination. When the plaintiff is done putting forth the case, the defendant's attorney has the chance to move for a directed verdict (or judgment as matter of law in federal courts) on the argument that not enough evidence was presented to support the plaintiff's case, even though such motions are rarely granted. The lawsuit moves forward with the defendant's attorney similarly presenting witnesses and evidence in support of the defendant's position. After both parties have rested their initial cases, the plaintiff is given an opportunity to offer a rebuttal, and then the defendant receives the chance to dispute new evidence in a rejoinder. *Closing arguments* are then made by each attorney in a manner that highlights essential facts, critical evidence, applicable law, and the reasons for receiving a verdict or judgment in their favor.

In a jury trial, the jury is given *jury instructions* with charges as to the relevant law and facts. The jury's role is to determine the facts and then to apply the law as given by the judge to said facts in coming to a verdict. The jury goes to a separate jury room to deliberate the case. The plaintiff needs to prove his or her case by a preponderance of the evidence, which is the standard of proof in civil litigation (as opposed to the beyond-a-reasonable-doubt standard of criminal cases). There are a few civil cases that require clear and convincing evidence. The jury determines the verdict in favor of the plaintiff or defendant by unanimous vote, unless otherwise allowed by the courts. The jury's failure to reach the required consensus is called a hung jury, which results in a mistrial. The court then prepares to enter a judgment in accordance with the jury's decision. The litigation now moves from the formal trial stage into posttrial activity.

Posttrial

Before the judge enters the final trial judgment, the losing party is entitled to file posttrial motions for a new trial or for judgment n.o.v. (notwithstanding the verdict). The judge may rule in favor of the motion if convinced of error by the jury. A new trial may be awarded due to misconduct by the jury or attorneys, newly discovered evidence, or judicial mistake. In a judgment n.o.v., the judge's decision replaces the jury's verdict based on the judge's determination that the jury's conclusion was unreasonable in light of all the evidence.

The plaintiff or defendant is entitled to appeal (challenge) the judgment or rulings on any pretrial, trial, or posttrial motions. The party appealing the trial court's decision must first file a notice of appeal with the trial court, which then sends all the relevant materials to the appellate court that has jurisdiction over such reviews. Written briefs are filed by each party, by the appellant or petitioner who filed the appeal, and by the appellee or respondent, arguing their respective positions about alleged error of laws made at the trial level (but not about facts or other evidence). Oral arguments by each party's attorney are given before a panel of judges (often three at the intermediate appellate level). After considering the record on appeal, the briefs, and oral arguments, the appellate court issues a written opinion affirming, reversing, or modifying the trial court's decision in accordance with the majority of the court panel. They may also remand the case to the trial court for further proceedings in light of their decision. The written decision may include majority, dissenting, and concurring opinions. There also exists the possibility of appealing the case another time to the next level of courts: the state or U.S. Supreme Court (or even another time from the state supreme court to the U.S. Supreme Court). However, these appeals are discretionary, meaning completely up to the court based on importance and other factors. The losing party appeals to this higher appellate court for a *writ of certiorari* or other similar order, which when issued brings the case up to the court with all its relevant materials. This court then allows new briefs and oral arguments to be presented before rendering its judgment.

Once all possible appeals have been exhausted, the lawsuit is prohibited from being relitigated under the doctrine of res judicata. This allows the successful party to move toward *enforcement* of the litigation judgment. The different remedies include monetary damages (money award), specific performance of a contract obligation, or a temporary or permanent injunction (court order requiring or prohibiting a certain type of activity). Damages may be compensatory, punitive, or nominal. The losing party would pay out of available assets. If the losing party does not pay, then the winning party may need to go back to court to get a *writ of execution,* which directs the sheriff or other authority to seize property in satisfaction of the unpaid judgment.

Conclusion

Civil litigation is essential to the stability of business relationships and social interaction. Without the ability to rely on and enforce certain personal and property rights, such professional and personal relations would be stilted or insecure. Law is also the primary expression of society's ethical and moral values. Although law may only provide society with a moral minimum, its reach into all facets of business and social relationships is extensive. Thus, law informs and influences the behavior of business and of the many stakeholders that constitute society.

Living Wage

A living wage refers to the amount of money a full-time employee needs to either afford the basic necessities in life or exceed the poverty threshold. It is based on the principle that people working full-time should make enough money to financially support their families. Most living wage initiatives are local municipal ordinances lobbied by the American Federation of Labor–Congress of Industrial Organizations and the Association of Community Organizations for Reform Now (ACORN). As of January 2006, 134 municipalities in the United States have legislated living wage ordinances.

Living wage proponents maintain that the minimum wage should lift people out of poverty; but that is not the case in the United States. In 2005, a full-time worker paid the minimum wage of $5.15 an hour would have annual earnings of $10,712. The poverty threshold, determined by the federal government, for an adult with two children was $16,090, equivalent to an hourly living wage of $7.74. More than 30 million Americans working full-time, representing more than 20% of the labor force, earn below-poverty-level wages. Women account for nearly 60% of the total.

Source of the Problem

During the late 1800s, labor unions, socialists, and progressive religious leaders began lobbying the federal government to establish a minimum living wage rate for employees. When President Franklin Roosevelt proposed the first federal minimum wage law in 1938, the guiding principle was a fair day's pay for a fair day's work. His administration initially recommended a minimum wage of 40 cents an hour, but that was reduced to 25 cents an hour to achieve congressional approval. The minimum wage was not indexed to inflation or to a poverty threshold.

The minimum wage's purchasing power peaked in the mid- to late 1960s and has since declined steadily. The current federal minimum hourly wage of $5.15 would be $8.88, had it been indexed to inflation in 1968. Proponents of a higher minimum wage, frustrated with opposition from federal and state politicians, focused their lobbying efforts at the level of local municipalities and particular employers, such as school boards, colleges, and universities.

Advocates invoked the term *living wage* rather than *minimum wage*, because it highlighted the inadequacy of the current minimum wage and had greater moral resonance with the public. Living wage advocates argued that it was unethical for people working full-time to be paid a wage that kept them entrenched in poverty. A full-time job should be a ticket out of poverty, they argued.

Opposition to a Living Wage

Neoclassical economists and many business owners oppose a legally mandated living wage. Arguments against the living wage are very similar to those against increasing the minimum wage. The most common arguments are the following:

- Wages should be determined by labor market supply and demand, not by politicians, government bureaucrats, or voters.
- Cities will lose the valued services of businesses that choose not to pay a living wage.
- Some small businesses cannot maintain profitability with higher labor costs.
- Businesses will have to raise prices for products and services to compensate for the higher wages, leading to local inflation.
- Cities will have to raise taxes to pay for the higher-priced services.
- Businesses will hire fewer low-skilled employees due to the higher wage rates.
- City businesses will relocate just beyond the ordinance's jurisdiction to avoid paying the higher wages, which would reduce the city's or county's tax

base, result in higher taxes for those that remain, and increase local unemployment.

- Businesses within a city paying high wages are at a competitive disadvantage to businesses operating just beyond the ordinance's jurisdiction due to higher labor costs.
- Artificially high wages will encourage some people to drop out of school because of the better short-term economic opportunities.

The latest research has shown that a modest increase in minimum wages does not negatively affect employment levels. However, many of the living wage amounts recently approved by local municipalities, such as Santa Fe's 2006 $9.50 citywide living wage, are substantially higher than the $5.15 federally mandated minimum wage.

Calculating a Living Wage

Living wage proponents typically recommend indexing the minimum wage to the poverty threshold. Some advocates argue that the federal poverty threshold is currently underestimated, so the index should be more than 100%.

In the 1960s, food accounted for approximately one third of an average family's budget, and this became the benchmark for the poverty threshold formula. The federal government annually determines the poverty threshold by multiplying the cost of the minimal amount of food needed to sustain different household sizes by a factor of 3. This formula continues to be used, even though food now accounts for only one fifth of an average family's budget due to increases in health care, child care, and other basic living expenses. If the 2005 poverty threshold for an adult with two children were adjusted accordingly—multiplying food cost by a factor of 5 rather than a factor of 3—a living wage would be $12.89 hourly ($26,811 annually) rather than the current $7.74 hourly calculation ($16,090 annually).

Growth of the Living Wage Movement

The living wage movement originated in 1994 when a coalition of churches and labor unions successfully lobbied the Baltimore city council to pass a living wage that was more than one dollar higher than the federal or state minimum wage. The coalition pursued what they considered to be a politically winnable strategy by limiting living wage requirements to private companies providing city services rather than all city government employees or all employees within the city. They argued that the city government should not contract services from private employers who pay below-poverty-level wages.

Baltimore's living wage, which took effect in 1996, benefited more than 2,000 employees. All private service contractors doing business with the Baltimore city government—firms providing food, health care, maintenance, security, and so on—were required to pay their workers a wage equivalent to the poverty threshold for a family of four, which at the time was $6.10. The Baltimore policy spread quickly to other local municipalities. Milwaukee, Wisconsin, passed a living wage ordinance in 1995, followed by Jersey City, New Jersey, Portland, Oregon, and New York City in 1996.

In 2002, New Orleans residents overwhelmingly approved the first-ever citywide living wage, which was $1 above the federal minimum wage. Exempted from this legislation were city employees and businesses with less than $500,000 in annual revenue. Seven months later, the local ordinance was voided by the Louisiana Supreme Court on the grounds that only states and the federal government had the constitutional right to establish minimum wage laws. By 2006, 134 jurisdictions had enacted living wage ordinances and another 115 were considering them.

Living Wage Ordinance Differences

Living wage advocates have focused on influencing the smallest political unit—namely, local municipalities. In 2005, living wage amounts ranged from $7.73 an hour in Philadelphia to $13.20 in Sonoma, California. The wage differentials are a function of a variety of factors, including regional cost-of-living estimates, what it is indexed against, and health care considerations. Living wage ordinances also differ according to the range of businesses or employees covered.

Range of Businesses or Employees

Most living wage ordinances are aimed at city or county government service contractors. Some ordinances cover all service contractors, while others cover only particular types of service contractors. Exemptions are also made based on the size of the contract (less than $25,000 in Brookline, Massachusetts) or number of employees (less than 10 in Bloomington, Indiana).

Some municipalities have extended the living wage to a contractor's subcontractors (Fairfax, California; Syracuse, New York), nonprofit organizations (Philadelphia; Sonoma, California), and businesses with city leases (Sebastopol, California). Lakewood, Ohio's living wage ordinance applies to any business receiving tax incentives, loans, or other forms of city assistance worth at least $75,000.

Some living wage ordinances also cover city government employees, such as those in Cincinnati, Orlando, Philadelphia, and Sacramento. Efforts are being made to cover a broader range of employers residing within a city's jurisdiction. The Santa Monica, California, city council passed a living wage ordinance in 2001 that applied to all employers in the city's coastal tourist district with annual revenues of more than $5 million.

Indexing Considerations

Local municipalities have indexed living wage rates to minimum wage rates (Philadelphia), the Consumer Price Index (Sonoma, California; Syracuse, New York), and the federal poverty level (Durham County, North Carolina; Lawrence, Kansas; Lincoln, Nebraska). Philadelphia's living wage is indexed at 150% of the minimum wage. In Lawrence, Kansas, the living wage is indexed at 130% of the federal poverty threshold.

Health Care Considerations

Some municipalities establish two living wage rates: one for employers who provide health care benefits and another for those who do not. In Port Hueneme, California, the living wage is $9 an hour if health care benefits are provided and $11.50 if not. In Bloomington, Indiana, employers covered by the ordinance may deduct up to 15% of the $10 hourly living wage if they provide health care benefits. Private contractors hired by Orlando, Florida's city government must either provide a bona fide health program or pay 20% more than the living wage.

Other Employee Benefits

Some living wage ordinances address other employee policies. City service contractors in Oxnard, California, must provide employees 96 hours of paid leave annually. Those in Sonoma, California, must provide 12 compensated days off and 10 uncompensated days off.

Living Wage Expansions and Setbacks

Living wage advocates initially focused on local municipal ordinances because many state and federal legislators opposed increasing the minimum wage. City governments also tended to be dominated by Democrats, rather than Republicans, who were more prone to accept government intervention in the free market system. Initially, local politicians would only support the ordinances if city employees and other key business constituencies were excluded. As a result, living wage advocates limited the scope of local ordinances to companies that had contracts to provide city services. After these initial political victories, advocates lobbied to extend the living wage citywide.

In 2002, Santa Fe, New Mexico's city council enacted a living wage for all service contractors and city employees. The following election cycle, the Santa Fe city council extended its living wage to every business in the city with at least 25 employees, with the wage gradually increasing from $8.50 in 2004 to $10.50 in 2008. Opponents challenged the law's legal standing, but it was upheld by both a state court and an appeals court. In 2003, San Francisco also mandated a living wage for all city businesses with at least 10 employees.

Living wage opponents have lobbied state legislatures and filed lawsuits to overturn these local initiatives. In Wisconsin, the city of Madison passed a citywide minimum hourly wage of $5.70 in 2004. The following year three other cities in the state—Milwaukee, Eau Claire, and La Crosse—did likewise. Each Wisconsin city intended to gradually increase its minimum wage to that of a living wage. However, in 2005, the Wisconsin legislature repealed all four citywide minimum wage laws for violating the state's constitutional right to establish minimum wage laws within its jurisdiction.

ACORN has responded by directing more effort to lobbying federal and state governments. In 2004, voters in Florida passed a ballot initiative to increase the state's minimum wage by $1 to $6.15, an amount still below the poverty threshold. Living wage advocates are choosing hourly wage amounts that they believe to be winnable in elections, though their eventual aim is to index minimum wages to the poverty threshold.

Locke, John (1632–1704)

John Locke was a British philosopher who stands foremost among the founders of what we now call "classical liberalism." His most important teachings on government and economics are set forth in his *Second Treatise of Civil Government,* and they begin from the view that the individual is naturally free, equal, and sovereign and possesses rights to life, liberty, and "estate." From such a beginning Locke concludes that the just powers of governments are limited and derive from the consent of the governed; that labor naturally constitutes a claim to ownership; and that the natural world, without labor, has very little value.

Locke is well known to Americans for having first made the philosophic case for a number of the doctrines that were later presented in the Declaration of Independence as "self-evident truths," and his *Letters on Toleration* advanced the case for religious toleration. In showing what knowledge is, and both its possibility and its limits, Locke's *Essay Concerning Human Understanding* also prepares the way for a fresh look at reigning moral and political opinions.

Whereas many in the West now tend to take Locke's core positions for granted, he faced the challenge of establishing them against once-powerful rivals. He had first, for example, to bury the view that political authority descends by divine right, which he did in his *First Treatise of Civil Government.* With this task accomplished, Locke turned in his *Second Treatise* to argue that people have rights by nature and that they authorize governments only to protect these rights. The individual is clearly prior to civil government, not vice versa.

Like Hobbes before him, Locke began by imagining people in a prepolitical condition, "the state of nature," as a way of exploring and highlighting the relationship between human nature and civil society. Unlike Hobbes, Locke appears to teach that this original anarchic condition is not a state of war, but he nevertheless joins "the justly descried Hobbes" in presenting civil government as the "the proper remedy for the inconveniences of the state of nature." He traces these "inconveniences" especially to the lack of any consistent enforcement of law (for one can possess rights even in circumstances in which they are not likely to be respected) and to the stinginess of nature prior to its transformation by human labor.

Locke makes it unmistakably clear that he cannot abide Hobbes's defense of absolute monarchy, which he calls "no form of civil government at all." Since people create government to escape the perils of the state of nature, they cannot be supposed to consent to the establishment of governments that, granting them no rights or protections, put them in a condition even more perilous than the state of nature. From Locke's emphasis on limiting government to protect the individual, it was but a short step to Montesquieu's defense of the separation of powers as a way of securing these limits.

One of Locke's most novel and influential doctrines is his teaching that there is no private property in the state of nature until someone mixes his or her own labor with something natural: When no one owns something, it is labor that constitutes the decisive claim to possession. Part of this teaching argues that without labor, nature is very stingy indeed, so our original condition was harsh and insecure. The key to a more comfortable existence is to encourage labor, which contains the potential of transmuting nature's stinginess into limitless abundance. Above all, it is the invention of money that makes this possible. Only after people consent to value something imperishable, like gold, does it become reasonable for people to work for more than they need in the short term: No one would farm much land, for example, without the prospect of trading the produce for some durable good. Money liberates human productivity and thus fuels the transformation of our impoverished natural condition. It does so, at least, if people are granted the right to possess money in unequal amounts, and Locke argues that their very consent to give value to money implies consent to the unequal wealth that is its natural consequence.

Long-Term Capital Management

Long-Term Capital Management (LTCM) was a hedge fund founded in 1994 by John Meriwether. Meriwether was a well-known bond trader and the former vice chairman at Salomon Brothers. After leaving the firm in 1991 following its Treasury bond scandal, he assembled a group of LTCM principals who were both academics and noted traders. Two such academicians, Myron Scholes and Robert C. Merton, were top economic theorists. In 1997, Scholes and Merton received the Nobel Memorial Prize in Economics for their work in stock options. LTCM began trading after it had received minimum investments from 80 initial investors, approximately $1.3 billion of investor capital. The fund experienced unprecedented growth, with returns as high as 40%, until its demise in 1998.

LTCM used complex quantitative models to determine the timing and estimated return of domestic and foreign bond trades. Also called convergence trades, LTCM sought bonds that were not priced accurately relative to one another. Each transaction realized a very small profit, so LTCM significantly leveraged its trades to make a profit. It would conduct a series of financial transactions that purchased lower priced bonds with long positions while selling short the more expensive, liquid bonds. LTCM used this arbitrage technique to achieve aggressive rates of return.

The Demise of LTCM

At the beginning of 1998, LTCM had equity of $5.0 billion and assets of approximately $129 billion, and it had borrowed $125 billion. In May and June of 1998, LTCM's net returns fell to −6.42% and −10.14%, respectively, reducing its capital by $461 million. In addition, Salomon Brothers, a large stakeholder in LTCM, withdrew from the arbitrage business in July 1998. When the Russian government defaulted on its government bonds in August and September that same year, investors began to panic. By the end of August, the fund had lost $1.85 billion in capital. As a result, LTCM and its investors experienced a "flight to liquidity." In an attempt to transfer assets from a risky market into more secure instruments, they began to purchase U.S. treasury bonds. The Federal Reserve Bank of New York organized a bailout of $3.5 billion to avoid a collapse of the entire financial market. The total losses were estimated at $4.6 billion.

Conclusion

LTCM was responsible for one of the biggest financial disasters of its kind. The founders began amassing investors without thoroughly testing their investment practices in actual market conditions. Liquidity issues were immense, to the extent that without a bailout of some sort, a systemic market crisis affecting all investors would have resulted. The societal implications would have been significant. Before opening the fund to investors, LTCM had an ethical obligation to business and society to test its theories in the markets and to more accurately estimate the liquidity, leverage, and volatility risks.

LOVE CANAL

Love Canal, a small community near Niagara Falls, New York, entered into our national memory starting with a front-page story in the *New York Times* on August 1, 1978. In that story, it was noted that Hooker Chemical Company had dumped toxic wastes into the ground up until 1953. The article addressed the incidence of birth defects in children in the area. Lois Gibbs, a resident, became a national spokesperson for all those who lived in Love Canal.

Love Canal was named after a Mr. William Love, who attempted to build a canal connecting two levels of Niagara Falls in 1890. His plan ultimately failed, and the only actual accomplishment was the building of a canal about 1 mile long, 15 feet wide, and 10 feet deep. The City of Niagara Falls began using it to dump chemical wastes as early as 1920, and the U.S. Army used the site to bury wastes from chemical warfare experiments. In 1942, Hooker Chemical Company (an arm of Occidental Petroleum) expanded the use of the site and, in 1947, bought the land for its own use. By 1952, the site was filled to capacity with approximately 21,800 tons of toxic wastes.

The local school board was seeking out new land for school buildings as a consequence of population growth. The school board pressed Hooker for the property and the firm refused on several occasions. The community threatened to take over the land by eminent domain and the firm finally agreed to sell the property for $1. The company warned the community of the dangers of the site, of the risks involved with the toxic wastes, and included a 17-line explanation in the agreement outlining the dangers and transferring all liability for the site to the City of Niagara Falls. This transfer of liability has often been ignored in public comment and debate. In the building of the school, the cap directly on top of the waste site was broken through (several drill bits were broken in the process). This breaking of the cap allowed water to seep into the site and toxic chemicals to leach out into the surrounding area.

Starting in 1978, Lois Gibbs, the then president of the Love Canal Homeowners' Association, led the community effort to obtain information about health concerns and to get redress for the situation. The association was opposed by Occidental and by government at all levels. Eventually, in 1980, as a result of extraordinary publicity, President Jimmy Carter declared it a federal emergency and had the residents evacuated from Love Canal. More than 800 families were eventually relocated and reimbursed for their residences. Occidental Petroleum spent more than $200 million on the cleanup.

This incident was used to further national public interest in hazardous waste sites and led to the passage of federal legislation, commonly referred to as the Superfund, to clean up toxic and hazardous waste sites nationwide.

LOYALTY

Loyalty is a prominent concept in business literature and practice. Discussions of loyalty most often center on employee loyalty to organizations but also include loyalty to particular persons and groups within organizations, customer loyalty to products and brands, and investor loyalty to corporations. Loyalty is generally understood as devotion to a person, group, cause, or ideal. Accounts differ, however, regarding which ethical framework best characterizes loyalty, who is (or should be) loyal to whom, and loyalty's relationship to whistle-blowing, self-interest, and reciprocity. Also of critical concern are situations when one loyalty conflicts with another, and the impact that has on personal integrity.

Loyalty and Ethical Theory

In ethical analyses, loyalty has been characterized as a duty, a virtue, and a complex of virtues. Because it is recognized as devotion to some object, loyalty has also been characterized as a passion—even a type of love—often in combination with duty or virtue. While the designation of its theoretical home may be unsettled, loyalty is arguably linked to all these concepts in that it involves a complex of passions, and loyal persons will perform certain duties and possess certain virtues.

When understood as a duty, loyalty is conceived as an obligation that a person owes to another person, group, or cause. For example, loyalty might be reflected in an employee's duty to maintain trade secrets or a customer's duty to continue purchasing a certain brand. In the business context, the obligation is rooted in such things as reciprocity for pay and other benefits provided by an employer or supervisor; oaths, often in the form of written contracts, in which a person pledges fidelity to an organization; and expectations built over time based on a person's continuing service to an organization or a customer's continuing practice of purchases. For an apparently loyal action truly to be an act of loyalty, however, it must proceed from loyal motives. If loyalty itself is a duty, then it requires an obligation to act from feelings of devotion, not just an obligation to act in certain ways that serve the object of loyalty, and to avoid acting in other ways that fail to serve it. For example, honoring a nondisclosure agreement would not reflect loyalty if it was motivated by fear of reprisal rather than devotion to an organization or particular members of it, and continuing to purchase a particular brand would not reflect loyalty if the customer planned to change as soon as an alternative became available.

The importance of motive in discerning whether actions are truly loyal leads many scholars to view loyalty as a virtue rather than as a duty. Loyalty can be found in various contemporary catalogs of virtues, in which it is often described in Aristotelian fashion as the golden mean between the extremes of disloyalty and blind loyalty. Some virtue theorists, however, contend that loyalty is not a typical virtue, because it involves more than one character trait, unlike classic virtues such as courage or temperance. A loyal person would need to be courageous, trustworthy, and cooperative, among other things, and so need to possess several virtues. Thus, these scholars view loyalty as deserving special classification as a "super virtue"—distinct but necessarily working closely with several "standard" virtues.

Even the "super virtue" designation may be insufficient, however. Focusing on motive leads some scholars to describe loyalty as a passion in relation to corresponding virtues and duties but not as a virtue or duty in itself. Rather than the traditional one-to-one correspondence between passions and virtues (or vices), loyalty contributes to multiple virtues (and possibly vices) and obviously to a multitude of ends. Because loyalty extends beyond the self to some object of devotion, it is a social passion, and even a type of love. It is this passion that motivates people, shaping their characters and leading them to engage in certain actions.

Self and Other

Whether understood as a duty, virtue, or passion, loyalty extends beyond the self to some object of loyalty, creating a strong attachment between the self and this other. These attachments, in many respects, define individuals and their own sense of self. In interpersonal loyalties, such as might be seen between coworkers or between an employee and a manager, attachments can take the form of personal relationships and become quite strong. When considering attachments to larger groups, the level of intimacy is less and clearly decreases in relation to a group's size. In these cases, the attachment is a more general sense of membership rather than relationship, and it is this sense of membership that provides the basis for loyalty, linking individual identity with that of the group. To be loyal, an employee would need to feel like a part of the organization through a matrix of relationships and identify himself or herself with the organization, typically with a positive association. A sense of membership minimizes the psychological compartmentalization or segmentation that often happens when there is a profound separation of the workplace from the rest of one's life. Within very large organizations, however, the sense of attachment necessary for loyalty may be more readily achieved among smaller groups and, even then, only for a limited period of time (e.g., the duration of a shared project). Organizational size, thus, may diminish the possibility for loyalty to corporations as a whole but not necessarily to individuals and smaller groups within them. There are, of course, different possible levels of membership in terms of commitment and identification (not necessarily in terms of job status), and the degree of loyalty would vary with them. Other types of business loyalties would also be based on relationships with individuals or some sense of attachment to the larger organization or its products. For example, customers may develop affective ties with particular sales managers or associate a particular brand with their own sense of identity.

This emphasis on attachments to others stands in stark contrast to the common focus on self-interest in business because loyalty apparently calls for individuals to sacrifice their interests for the sake of others, as opposed to seeking their own good. It is a mistake, however, to associate loyalty primarily with self-sacrifice, because the objects of loyalty are a critical part of a person's self-identity. While loyal people often do sacrifice various interests, their time, and sometimes even their lives to serve some person, group, or cause, loyalty is not strictly altruistic. The loyal person's self-interest is tied up with that of the object of loyalty. Something is not strictly in the interests of a company, boss, or coworker, but also in one's own interests. Loyalty is not simply a matter of sacrifice for others, although loyal individuals may make sacrifices. They do so, however, for themselves and their interests in conjunction with the interests shared with others, not strictly for others and interests that are external to the self. Personal investment gives individuals a stake in the object of loyalty. The necessary dichotomy between loyalty and self-interest is a false one as long as self-interest is not narrowly construed. Loyalty involves self-interest, broadly conceived. Nonetheless, it does not necessarily involve reciprocity. The loyal person may not necessarily receive any benefits directly. Instead, he or she may simply be satisfied with serving a group or cause and contributing to its success.

Objects of Loyalty

Loyalty is devotion to a particular object; but it is arguably a duty, virtue, or positive passion only if its object is worthy of such devotion. If the object is unworthy, then devotion to it is a form of blind loyalty and so is a vice or a negative passion. A knowingly corrupt colleague, boss, or organization would be unworthy of loyalty, and so devotion to such objects would receive negative moral evaluation. Loyalty thus requires good judgment. This crucial judgment about objects is a different sort of judgment from what is usually associated with virtues. Typically, the possessor of certain virtues, for example, courage and temperance, does not judge whether or not to be courageous or tempered. Rather, he or she judges how best to display courage or temperance in particular contexts. Here, the individual must decide whether or not to be loyal. Even after judging the end as good and worthy of loyalty, however, one must still consider the particular means by which one demonstrates loyalty. The second form of blind loyalty is using unethical means to serve good ends. Recognizing an end as worthy of loyalty does not license any means of serving it. Furthermore, one can sometimes remain loyal to the object by rejecting the typical means of being loyal. For example, raising objections to, or refusing to follow, a boss's directive because it would be detrimental to a project or to the organization could indicate loyalty to a larger goal or group.

Of particular interest in the business ethics literature is whether corporations are ever proper objects of loyalty and so whether employee loyalty is ethical or even prudent. The answer to this question very much depends on one's understanding of corporations. Viewing the corporation as essentially an instrument or bureaucratic institution focused solely on financial performance generally leads to finding loyalty inappropriate. Viewing corporations, at least potentially, as teams or communities where there is a sense of membership and shared values leads to discerning whether a particular corporation is worthy of loyalty. Some corporations may be worthy whereas others would not.

Loyalty and Personal Integrity

The business context is not, of course, the only place where loyalty can be found. People are loyal to other persons, groups, and causes, and these loyalties are also part of their identities. Loyalties to family, friends, religion, town, country, coworkers, and corporation, among others, may happily coexist with one another but likely will compete, at least periodically if not more often. When they do compete, one is forced either to balance the competing loyalties in some fashion or, in extreme cases, to choose between them. In extreme cases where one or more other loyalties outweigh loyalty to coworkers, boss, or corporation, whistleblowing can be an appropriate response.

Integrity, a personal sense of wholeness, is important to the task of balancing one's loyalties and the potentially painful task of choosing between them. That is not to say that all loyalties are equal and so must receive identical treatment; some undoubtedly are more important than others. Generally speaking, business loyalties should be less than some loyalties, but perhaps more than some others. This balancing must be worked out in concrete cases, however. It is only then that a person of integrity can discern which loyalty takes priority.

While the need for such balancing or choosing may cause one to question the desirability of loyalty in business, the inability to have loyalty in the business context itself can damage a person's integrity. The impossibility of loyalty would make for a divided self and could potentially compromise one's other loyalties to religion, family, friends, and so forth.

M

MACHIAVELLIANISM

Machiavellianism refers in common parlance to the ready and systematic seizing of every advantage for oneself without regard to the rights or claims of other individuals or of the larger society. The Machiavellian is scornful of claims of conscience or morality and is restrained only by the need to be careful about breaking laws and violating mores, lest one get caught, not by any belief that a profitable action can be wrong. In the business world, the Machiavellian is prepared, as needed, to cook the books, advertise falsely, cut corners on product quality, sell pirated goods, and—where possible—cheat employees or damage the environment. In politics, the Machiavellian will add military force to weapons used in the quest for every advantage, fair or unfair.

Machiavellianism gets its name by association with the most notorious of the chief maxims associated with the Florentine philosopher, Nicolò Machiavelli (1469–1527). Machiavelli was the author of plays, poems, a sweeping history of his native city, a dialogue on warfare, and two of the most arresting works of political philosophy ever written. As happens with most "-isms" added to the name of a great thinker, Machiavellianism inevitably entails a dilution and distortion of his thought.

Machiavelli stated quite openly that his moral and political teachings were radical, and he even likened the novelty of his discoveries to those of the explorers who were in his day discovering unknown seas and continents. What he discovered, as he put it in *The Prince*, is to base thoughts and actions not on how people ought to live but on how they actually do live. His stated reason for so changing the foundation of ethics is that otherwise one achieves ruin rather than preservation. Machiavelli here presents himself as the ultimate realist in a world populated by naïfs, so it is no surprise that the naïfs would counterattack and denounce him as an enemy of morality: Machiavellianism is a pejorative term.

Machiavelli contributed to the emergence of Machiavellianism by cultivating the art of expressing shocking propositions in very crisp phrases (such as "Men are quicker to forget the death of a father than the loss of a patrimony," "It is better to be feared than loved," or "A prince never lacks legitimate reasons to justify breaking his word"). Furthermore, he often amplified such memorable maxims by illustrations, and this helped solidify his reputation as a teacher of evil. A favorite example is that of Cesare Borgia, whom Machiavelli describes as first appointing a certain thug to terrify a turbulent part of his domain and then, once his henchman's severe punishments have brought the population into submission, having him chopped into pieces in the town square. Machiavelli's apparent enthusiasm for Cesare Borgia's stunning use of treachery and murder not surprisingly helps cast Machiavellianism as the ultimate in the cynical rejection of moral decency for political gain.

Since people commonly turn their moral outrage against those still alive and threatening, however, the term as commonly used has become diluted: It is applied in newspaper pieces to annoying political opponents who strike one as unscrupulous. Standards have slipped even here. William Shakespeare's Richard III would be a better example of what Machiavellianism requires, for he did not scruple to kill, deceive, or otherwise dispose of all those who stood between him and the throne, young children included. And yet he failed. Machiavelli wrote not to encourage evil but to foster success.

Although Machiavelli himself never quite used the phrase, and although variants of it were used well before him, "The end justifies the means" is the maxim most associated with Machiavellianism. When taken somewhat literally and used defensively, this maxim is invoked to suggest that an important result or end excuses an action one would otherwise condemn. It is true, one might say, that deceit is reprehensible, but political necessities can be pressing. Perhaps a little lie is needed to defend against an expected attack. In this case, the legitimate end of defense is thought to justify the lie that secures it. When Machiavelli is defended, he is so especially on the grounds that he knew well what it took to secure political stability and republican government. After a millennium with little of the former and none of the latter, such knowledge was precious.

But Machiavellianism implies strong disapprobation, and when "the end justifies the means" is used as an attack, it implies the charge that someone holds *any and every means* to be justified by his or her ends, that someone shows no hesitation to employ means that are outrageously shocking and does so for an end that is simply unworthy. Perhaps all governments sometimes must cut some moral corners, but the so-called Machiavellian ruler is not scrupulous about minimizing such occasions. True, the non-Machiavellian ruler admits: Defense and order cannot always be secured by, say, the principles of the Sermon on the Mount. But should all ethical restraint therefore be abandoned? And if exceptions must sometimes be granted for national defense, must they be granted as well for imperial aggrandizement or for the advancement of a party or individual?

It is partly its generality that makes "The end justifies the means" a blunt instrument for moral analysis, for it is important to distinguish among different ends and means. But it is also important to ask whether certain actions can properly be considered to be means at all. Is compassion, generosity, or honesty properly considered a "means"? Does the anti-Machiavellian not consider these to be characteristics or virtues that are good in and of themselves?

However much a vulgarization of Machiavelli's thought, Machiavellianism does help identify these important questions: Should actions be judged by some intrinsic quality, or by their effect? Is honesty, for example, a virtue or a policy? Should it be encouraged because it is useful or because it is admirable? And if there are virtues that deserve our admiration as ends in themselves, what is their relation to the requirement of success in business or politics?

—Wayne Ambler

MacIntyre, Alasdair (1929–)

Alasdair MacIntyre, whose work revived virtue ethics, placing it in the mainstream of contemporary philosophical discussion, was born in Glasgow and received his M.A. from the University of Manchester. He has held a number of university appointments in both the United Kingdom and the United States, including Oxford, Vanderbilt, and Duke, and is currently Senior Research Professor of Philosophy at the University of Notre Dame.

MacIntyre's philosophical work encompasses a broad spectrum, but he is primarily known for his work in ethics. He believes that the study of ethics must be interdisciplinary, using the insights of the social sciences, since morality cannot be adequately understood in isolation from particular societies. His most influential work is *After Virtue,* in which he argues that morality in the modern world consists of a series of fragments from disparate and often contradictory traditions. MacIntyre calls for a return to an earlier understanding of morality based on the virtues. Virtues are stable character traits, such as courage and integrity, that help a person to live a life that promotes human flourishing. People develop virtues in the context of particular practices. A practice is a cooperative human activity (such as chess, farming, or medicine) through which human beings gain goods internal to the practice. Internal goods, as opposed to external goods such as money or status, can only be gained from participating in a practice, and are discovered by identifying the ends essential to that practice. In medicine, for example, an internal good is helping a sick person in need.

Practices have histories that form various traditions. At the broad level of societal practice, morality makes sense only within a particular tradition with its own view of the proper ends of the good human life. There can be no coherent tradition-independent morality. MacIntyre denies that this leads to relativism. In *Whose Justice? Which Rationality?* he argues that although there is no tradition-independent rationality, there are criteria through which individuals can compare their own tradition with another to determine which one is superior. MacIntyre believes that the tradition arising from Aristotle and Thomas Aquinas is better than the alternatives, a view he develops in *Three Rival Versions of Moral Inquiry.*

MacIntyre's views on business ethics reflect the position that modern corporate culture has helped fragment human life into multiple, often self-contradictory, roles. For example, business managers must necessarily focus on efficiency in running a corporation, but these same managers would not have such a focus in their family lives. An emphasis on efficiency may also conflict with long-term goods for society (e.g., a clean environment).

Despite MacIntyre's skepticism about corporate culture, ethicists such as Robert Solomon who hold a positive view of corporate culture have applied virtue ethics to contemporary business. Solomon understands business to be a practice in the MacIntyrean sense, and discusses the way virtues, such as friendliness, loyalty, and shame, can help stakeholders gain what he terms the goals internal to business.

MAJORITARIANISM

Majoritarianism is the advocacy of the idea that the majority of the population should have the final say in determining the outcome of public policy (e.g., there is a movement aimed at making the English language not only the national language of the United States but the only language used in public). There are, of course, various ways of "slicing up" the population that would give different identities to the majority.

Majoritarianism must be distinguished from majority rule. In a political system that operates through majority rule, the ultimate power on matters of public policy resides with the vote cast by more than half of those eligible to vote. The majority of those eligible to vote is not identical with the majority of residents in a country. It is conceivable that the views of the majority of the population may be expressed in some instances by other institutional arrangements or persons designated to speak on behalf of the majority.

From the time of classical Greek philosophers such as Plato and Aristotle down through the 18th century, including the founders of the United States such as James Madison, majoritarianism has had a pejorative connotation. It was routinely presumed that the majority of the population was constituted by the poor and the ignorant. It was also presumed that the majority, when given the power and opportunity to do so, would tyrannize over any and all minorities. The latter view was of great concern in the 19th century to J. S. Mill and Alexis Tocqueville, the latter of whom coined the phrase *tyranny of the majority.*

Starting in the 18th century, majoritarianism began to acquire a positive connotation. To begin with, it was argued that any individual or group less than the majority was also capable of tyranny. The classical view that only some individuals had the intellectual and moral virtue that enabled them to determine the common good as opposed to the interests of a particular faction was challenged by the Enlightenment view expressed by Jean-Jacques Rousseau and others that through proper education everyone is capable of making that kind of decision.

There are four important issues raised by majoritarianism. First, is the purpose of majority rule a negative formality to block tyranny by one faction or is it a positive way of arriving at an objective social truth? That is, is the social good a set of procedural norms for protecting the independent interests of individuals (Madison) or is there a social good that substantively encompasses all individual goods (Rousseau's "General Will")? Second, can the interests or rights of minorities (including individuals) be protected through formal legal and political structures (e.g., a constitution) or can they be protected only through some shared cultural values at some other level? Third, is majoritarianism a concept that applies only on the political level or does it permeate every institution? For example, should religious organizations have authoritarian structures or should they have democratic structures? Is the purpose of a business firm to produce a product or service that is ultimately profitable to shareholders or should a firm be organized to give voice to all stakeholders? Should these decisions be left to the individual institutions or should they be made democratically by society as a whole? There are paradoxes connected with voting as noted by Kenneth Arrow. Finally, do the terms *majority* and *minority* capture some important conceptual distinction or are they merely a political rhetoric?

Managed Competition

Managed competition is a relatively new organizational paradigm for the provision of medical services that tries to capture the benefits, while avoiding the limitations, of both competitive and cooperative models. To best understand this concept, five main topics will be addressed. They include (1) defining managed competition, (2) contextualizing managed competition in the health services industry, (3) origins of managed competition, (4) advantages of managed competition, and (5) disadvantages of managed competition.

Defining Managed Competition

Managed competition is a marketing and management strategy used to obtain maximum value for consumers and employers. It relies on competitive rules that were established through macroanalysis of interactions among consumers/employees, employers, health service providers, and public and private funding agencies.

The sponsor of a managed competition scheme develops a planned system that requires establishing rules of equity, as well as efficiency. Participating plans are selected and enrollment processes are regulated. This strives to achieve a balance between demand, cost, and risk considerations within fixed comprehensive health insurance service packages for consumers.

Managed competition offers employees a choice of several different health insurance plans or delivery systems. The employer contributes a set fixed-monetary amount established by sponsors set at or below the price of the low-cost plan. Employees then make their choice from among the plans offered that best meets their needs and pay any price differential with pretax dollars. This creates incentives for employees to make tough economic choices and introduces price competition among insurance providers.

Contextualizing Managed Competition in the Health Services Industry

In the 1970s, the American federal government developed the Medicare and Medicaid programs as limited entitlement plans intended primarily for retirees and the indigent. These systems essentially comprised government-funded social medical insurance. The more affluent obtained employer-provided private insurance programs, for the most part. Both of these approaches to improving medical coverage have benefits, as well as limitations.

One advantage of the single-payer government medical insurance model lies in its ability to spread or "socialize" the risk of the occasional high-cost procedure over a relatively large contributor base. Another benefit is that the single government payer gives the consumer considerable leverage in price and service negotiations with prospective medical care providers and systems.

The single-payer social insurance health care approach does have potential deficiencies. It poses a "moral hazard" that consumers may be tempted to overuse nominally "free" medical services paid for by the government as a universal social entitlement. Scarce tax dollars could be wasted, thereby undermining the financial soundness of the social insurance fund for all. The question is this: Should health care be regarded as a public good freely available to all citizens? Or, is it a private consumer good that can most efficiently and effectively be provided by private entities responding to price mechanisms and profit incentives?

Conversely, private or free market medical insurance delivers services to those with the means to afford them. It is relatively expensive, since competing, duplicative insurance providers lose potential economies of scale in purchasing and medical administration. It can also be portrayed as restrictive and inequitable, since comparative wealth allocates the quality and quantity of medical services provided. In 2006, an estimated 45 million Americans lacked any or meaningful health coverage; yet Americans paid twice as much per capita as Canadians and the French for health service. Some private health insurers, driven by the profit motive, tend to cherry-pick healthy clients and exclude high-risk customers with preexistent conditions.

Origins of Managed Competition

Alain C. Enthoven, Ph.D., is recognized as the father of managed competition. He was the Marriner S. Eccles Professor of Public and Private Management, Emeritus, at Stanford University. He was also a core faculty member at the Center for Health/Center for Primary Care and Outcomes Research, also at Stanford.

Enthoven was one of the original founders of the Jackson Hole Group, a think tank focusing on human resource action, community relations, and health care policy reform. His academic research in public policy administration targeted the financing and delivery of health care. Enthoven's goal was a health care delivery system using market-based incentives to create medical costs efficiencies, promote accountability, and better guarantee the quality of health care for consumers.

Advantages of Managed Competition

Under managed competition, patients with illnesses would choose plans that focus on their specific ailments, while healthy patients might instead seek out the plan that provides the best primary care services. Plans would be encouraged to form partnerships with others to create the best possible array of services. Becoming more efficient with fewer errors, achieving modernization, and eliminating waste are primary goals in managed competition.

When using a managed competition system, employers offer many different plans and employees can choose the one that best suits them individually. This is a major advantage for cash-strapped employers insuring their employees on a budget.

Government regulation plays an important role in managed competition plans. Regulations convey specific guidance and motivation for health care plans to provide the best care possible. However, governmental presence is relatively modest in this market-driven medical insurance system.

Disadvantages of Managed Competition

Managed competition may not be best suited to providing health care to people with illnesses that are expensive to treat. Because medical practices would try to greatly decrease costs to be the lowest-priced plan, they will be more selective about which consumers they wish to cover in an effort to provide the cheapest rates.

Managed competition encourages plans to specialize in one area of the medical field. The problem with specialization is that there is no incentive for physicians to focus on costly, undersupported illnesses. If health insurance plans attracted a large number of people needing expensive treatments, they might lose money and end up exiting the market. Also, there would be an incentive to underserve the indigent sick and overserve the healthy and wealthy. In addition, this concept puts patients with chronic illnesses at risk because of the high costs of multiple treatments and long-term care.

There is concern that managed competition pits service providers against one another to provide the least expensive coverage. When budgets are cut to reduce cost (a typical competitive tactic), the quality of services could potentially deteriorate as well, since decreased funds would be available for medical care. A hybrid approach that combines government-supported social insurance coverage to socialize the risk of catastrophic illnesses, as well as support indigent and elderly patients, with managed competition to provide gap coverage for the normally healthy may offer the best combination of fairness and cost effectiveness in the provision of medical services.

Management, Ethics of

When discussing management ethics, it is natural to focus on the management of business as many schools of management have done. However, nearly all organizations need managers-universities, not-for-profits, sports teams, and government agencies. Thus, management ethics covers a wider terrain than business ethics. Although the emphasis in this entry will be on the ethical management of a business, many of the comments here are generalizable to ethical management in general.

Managing for Shareholder Wealth

The starting point for ethical management should be role morality. Role morality is the morality of one's station and its duties. The duties of one's station are determined by the purpose of the organization. Suppose we take the traditional starting point for the purpose of a corporation. Milton Friedman's position is the standard: that business has only one responsibility, which is to use its resources to increase its profits, engaging in free and open competition without deception or fraud. Under this view the manager is the agent of the stockholders who are the owners of the firm. As an agent of the stockholders the ethical obligation of the manager is to do the bidding of the stockholders, which normally is to make as much money as possible while following the basic rules of society, according to both the law and ethical custom. Many people do not see making money for stockholders as a *moral* obligation, and professors of finance seldom teach it as a moral obligation, but Friedman's position is a moral position nonetheless.

It should also be pointed out that violation of this simple moral requirement is behind many of the scandals that have afflicted business and behind many of the criticisms of business with respect to corporate governance. Excessive executive compensation and lavish executive perks are a violation of the ethical obligation of managers to increase the profits of stockholders. Many of the accounting scandals of the 1990s and 2000s were the result of managers manipulating earnings so that they could get their stock options or bonuses. These managers were not working for the stockholders and violating the law and ethics on behalf of the stockholders. Rather they were violating the law and ethical custom for their own selfish gain.

The qualifications that Friedman makes to the obligation of managers to increase shareholder wealth are significant, however. Even if the manager is the agent of the stockholders, he or she cannot be asked to make profits in a way that the law deems illegal or that violates ethical custom. The term *ethical custom* can have narrow or a broad application. Friedman specifically rules out anticompetitive practices and deception and fraud. However, some in Friedman's camp do allow bluffing. Albert Carr pointed out that the ethics of business is more like the ethics of poker than the ethics of ordinary morality. There is still no consensus as to what should be included under Friedman's term *ethical custom*.

One item that is not included in ethical custom for Friedman is philanthropic giving from profits or the use of profits to help solve social problems: that is, using profits for social responsibility. If a manager uses the profits for philanthropy or social responsibility, he or she is taking the money that belongs to the stockholders and using it for other purposes without their permission. Friedman characterizes this as a kind of taxation without representation. However, Friedman is assuming that the stockholders do not want corporations to engage in philanthropy or help solve social problems. However, the stance of individual corporations with respect to philanthropy and social responsibility is well known. For example, the stockholders of the Target Corporation are well aware or reasonably should be aware of the fact that Target is one of the more generous companies with respect to corporate giving. Target stockholders either are willing to sacrifice some of their profits for the public good or, more likely, believe that Target's record of charitable giving will result in a competitive advantage that yields even more profit in the long run.

An Alternative to the Stockholder View: Sustainable Management Practice

It is important to realize that Friedman's view of the obligations of managers has a particularly American flavor to it. There is a consensus in capitalist countries that increasing shareholder or owner wealth is a moral obligation of managers; however, American managers focus on that one obligation while the consensus in other capitalist countries is that there is more to the purpose of a corporation than lawfully and ethically making money. The European Union has as its official policy that the corporation must practice sustainable management. (A term that is often used synonymously with "sustainable management" is Corporate Social Responsibility Europe or CSR Europe. This latter terminology seems to be giving way to the former, however.) Sustainable management or management in accord with Corporate Social Responsibility broadens the duties of the manager. On the European view, sustainable management requires financial success but it also requires obligations to protect the environment and to be socially responsible. In Europe, "social responsibility" is not understood in terms of philanthropy but rather is understood in terms of respecting human rights. The Europeans have even come up with the notion of triple bottom line accounting that broadens the traditional accounting determination of financial success to include measurements of environmental responsibility and social responsibility. Triple bottom line accounting is still in its early stages of development, and it is unclear how successfully quantitative triple bottom line accounting can become.

The position of the European Union on the ethical responsibilities of managers is similar to that taken by the United Nations in its United Nations Global Compact. An international effort affiliated with the United Nations Global Compact is the Global Reporting Initiative that is designed to present common international principles for bottom line accounting.

The philosophy that will govern capitalist countries in Asia is still evolving. The Japanese are moving away from a more collective and paternalistic set of management practices, but in doing so, they seem to prefer the model of sustainability rather than Friedman's maximization of profit model. Academicians in China are working with a notion of corporate social responsibility for their society.

There is now a debate regarding the eventual financial viability of the two models. Many Americans believe that the more narrowly focused emphasis on stockholder wealth is ultimately the more successful model. Much of the rest of the world seems to disagree. One implication of this debate is that when one specifies the ethical obligations of managers one must be clear what one takes the primary function or purpose of the firm to be.

Stakeholder Management

Whether one is an adherent of Friedman's increase shareholder wealth philosophy or an adherent of the sustainability philosophy, one will hear many references to stakeholder management. To fully understand management ethics, we need to be clear about the obligations that managers have to corporate stakeholders. In the U.S. academic literature, stakeholder management is often positioned as an alternative to Friedman's stockholder theory. As an alternative to Friedman, the theory requires that the moral obligation of the manager is to balance the interests of the legitimate stakeholders of the business. (It should be noted that any organization such as a university or charity can use stakeholder analysis.) On a narrow definition of stakeholder, a stakeholder, or more accurately stakeholder group, is defined as a group that can affect the firm's survival. On a broader definition, a stakeholder is a group or individual that is affected by the behavior of the firm. On the narrow definition, the traditional stakeholders are stockholders, customers, employees, suppliers, managers, and the local community. Some add government, media, and nongovernmental organizations (NGOs) to the list.

Stakeholder theory is still a work in progress. It is not a moral theory in its own right. The range of legitimate stakeholders is still a matter of controversy, and there is no acceptable methodology for balancing the interests of stakeholders. However, when taken as an alternative to Friedman's stockholder view, each legitimate stakeholder has the right to have its interests taken into account, and it is the obligation of the manager to do so.

It is not enough to consider the interests of the stakeholders simply to increase the wealth of the stockholders. To do so would simply use a stakeholder as a means to the wealth of another. Each stakeholder has legitimate interests of its own, which deserve ethical treatment in their own right.

It should be noted that nearly all companies, including American ones, use stakeholder language. In Europe, the discussion centers on stakeholder dialogues. Such dialogues are a device that managers use to achieve sustainability. Despite the difficulty faced in determining stakeholder interests and in balancing them, a number of the largest companies in the world, such as BP and Shell, use a rather broad definition of stakeholder analysis to guide management practice.

Stakeholder theory has important heuristic uses as one considers management ethics. Every organization has stakeholders, and one effective way of looking at the ethical obligations of managers is to do a stakeholder analysis. In this way, there is a generic principle of management ethics that applies to all types of management. That is, management has an obligation to consider the interests of legitimate stakeholders and to achieve a balance in honoring those interests. At that point, management ethics becomes specific to the organization. A major research university has a different function and a different set of stakeholders than that of a major corporation. Thus, the obligations of a university president are different from the obligations of a typical business CEO. Even within business, management ethics may require different obligations depending on the kind of business one is engaged in. For example, an entrepreneurial firm that is dependent on venture capital has a broader range and perhaps a more stringent set of obligations to the provider of venture capital than a manager has to stockholders in a Fortune 500 company. Both the amount of risk to capital and the magnitude of the risk to the venture capitalist are usually sufficient to distinguish the venture capitalist from the ordinary stockholder.

Of course, some stakeholders are common to almost any organization. Nearly all organizations have employees as well as clients. In the university, the clients are students and in business the clients are customers. All but self-sufficient organizations have suppliers. Universities, corporations, and not-for-profit medical facilities all depend on suppliers. And all organizations exist in the natural environment and in a local community. Organizations also have different stakeholders, that is, stakeholders of one organization may not be stakeholders for another organization. Public companies are unique from both partnerships and single proprietorships and from other nonbusiness organizations in the fact that public companies have stockholders as stakeholders. Discussion of the obligations of business managers to these basic stakeholders follow.

The Ethical Grounding of a Manager's Role Obligations

The fact the stakeholder theory is a theory of management and not an ethical theory should be emphasized. Even our general principle of ethical stakeholder management described above needs to be justified. In other words, it is not enough to limit management ethics to my station and its duties. Role obligations need to be consistent with and justified by higher-order or more universal moral concepts. Otherwise, the role obligations of a mafia don becomes an example of management ethics. Effectiveness in carrying out one's role is not sufficient to establish the morality of one's carrying it out.

Organizations are made up of persons. Respect for persons is a central moral principle both in the world at large and in moral theory. Management ethics requires that those managed are treated with respect. Given this universal, the moral task of the managers is to implement respect for persons in the organizational setting in which they find themselves.

Since organizations are collectivities, ethical managers must consider the good of the entire organization. This requires that the individuals within an organization function as a team. One of the great challenges to ethical managers results when he or she needs to sacrifice the need of an individual for the good of the organization. Coaches of athletic teams often face this dilemma. But corporate CEOs do as well. Sometimes the survival of the business requires layoffs. Ethical management requires that when an individual interest is sacrificed for the organizational good, the individual must be treated with respect. Even when layoffs are justified and necessary, there is a right way (respectful way) and a wrong way (disrespectful way) of laying someone off.

Ethical management also involves certain attitudes and dispositions. Let us refer to these as the virtues of ethical management. What is to count as the appropriate virtues of the ethical manager is a matter of great controversy. Some managers believe that employees are basically self-motivated and trustworthy and thus should be mentored rather than bossed. Others believe that employees present agency problems, that is, they will always loaf and take other actions to advance their own interests rather than the interest of the organization. Such managers think that free riding on the part of employees is a serious problem. In the context of employee conduct in the real world, it is hard to say which attitude toward managing employees is the correct one. It may be that a mentoring relationship is morally appropriate in some business contexts and that a monitoring relationship is the morally appropriate attitude to take in other contexts.

At this point we can say that management ethics involves respecting the persons whom one manages, taking into account the good of the collective entity that one manages for and cultivating those managerial virtues that increase the likelihood that the manager will indeed respect persons and promote the good of the organization. A general ethical principle for ethical management is that managers consider the interests of legitimate stakeholders in management decisions.

The Ethical Treatment of Employees

Respect for persons is the fundamental moral principle for managing people. What does that entail in the typical business? Many would argue that respect for persons requires some participation and voice on the part of the employee. Certain laws and managerial norms stand in the way of employee participation and voice. One is the legal doctrine of employment at will. Employment at will indicates that in the absence of a contract and in the absence of illegal discrimination, both the employer and the employee are free to sever the employment relationship at any time for any reason—good reason, bad reason, or reason immoral. Some defenders of employment at will point out that since both the employer and the employee can exercise employment at will, any ethical issues are eliminated or at least greatly lessened. Critics of employment at will point out that it is easier for the manager to find another employee than for the employee to find another job. As a legal matter, the relationship may be symmetrical, but as a matter of fact it is not symmetrical. Critics also point out that severing a relationship for a bad reason or reason immoral is always prima facie wrong. Even the courts have gone part way to recognizing the critics' point by allowing a public good exception to the employment at will doctrine.

Another danger to the ethical treatment of employees is created by paying excessive attention to hierarchies within the organization. Hierarchies are often represented in organization flowcharts that show who reports to whom. As devices to show reporting relationships they may raise no ethical red flags. However, when they reflect how decisions are made in the organization, they can become morally problematic. If one is lower in the hierarchy, that should not mean that he or she should simply follow orders and have no voice in the decision-making process. There is also a danger that those at a higher position will hoard information and keep subordinates in the dark. Indeed not only will subordinates be kept in the dark, but they will be deceived as well.

There are a number of management practices that counteract these dangers. Labor unions and employment contracts serve as an antidote to employment at will. It should be noted in passing that the United States is fairly unique among industrialized countries in subscribing to employment at will. With respect to hierarchies, a number of enlightened management practices are designed to undermine hierarchies. Quality circles, team building, and participative management all represent steps in the direction of participation and voice for employees. One of the more comprehensive practices is open book management. Open book management eliminates information asymmetry by providing all financial information to all employees. In so doing, each employee will see how the business runs;

in other words, the employees will think like owners. And from the perspective of management ethics, they will take more responsibility and thus exercise participation and voice.

Employees have a right to be concerned with an important change in the marketplace. By the mid-20th century, employees believed that they had a social contract with management that, when honored, justified loyalty to management and the business firm. Even within the doctrine of employment at will, it was assumed that a good worker would continue with the firm until retirement. In some industries, as many as three generations within the same family would have worked in the firm. As well as a living wage employees would receive health insurance and a pension. In other words, an element of corporate paternalism was expected even though the United States had nothing like the Japanese system of guaranteed lifetime employment. As the 20th century came to an end, there had been massive upheaval in labor markets in part caused by global competition. Downsizing became all the rage. Others lost their jobs due to outsourcing. Some layoffs were also caused by efforts to please the short-term traders on Wall Street. Too often, employees were seen simply as a cost rather than human capital. Where layoffs from the impacts of globalization are probably morally justified, layoffs to please Wall Street are ethically suspect. These layoffs are simply using some as a means for the financial ends of others. In some industries, the layoffs were in the tens of thousands. In addition, the paternalism disappeared. Early into the 21st century, employees were asked to contribute much more to their health insurance if they were fortunate enough to receive employer subsidized insurance at all. Defined pensions were dropped and workers had to save for their retirement from their salaries. The fortunate ones received a percentage of their salaries as a benefit although the individual employee was responsible for investing the funds. The size of the pension a worker was to receive was not guaranteed. Employers referred to this change as the "New Social Contract." It was hardly a contract since the employees had no say in its terms. The terms of the contract are also perceived by many to be unfair.

As a result of these changes employees need to change their expectations. Employees should not expect lifetime employment or paternalistic benefits; they need to manage their careers and make their own financial decisions. They also need to take more responsibility for managing their health care and their retirement. However, as a result of these changed expectations, the old notion of loyalty has practically disappeared. To many it seems that market considerations are now the only determinant of what employees receive in terms of salary and benefits. Ethical notions such as past promises, fair distribution from the gains of productivity, and loyalty seem far less relevant that they were a few years ago. Many ethicists believe that this change in expectations is patently unfair to employees.

Managing Ethical Obligations to Customers

Since customers are so essential to the success of a business enterprise, you might think that managers would consider their obligations to customers to be paramount. On occasion a company, especially in advertisements, will talk that way, such as proclaiming that "the customer is number one." For instance, the Johnson & Johnson Credo ranks the customer first among its stakeholders. Despite this endorsement of the importance of the customer, there are a number of important issues regarding the treatment of customers that deserve the attention of the ethical manager.

Customers are often in a situation of high information asymmetry with respect to the products they buy. That is, the seller of the product knows much more about the product than the customer. In such situations, there is always a temptation for the salesperson to sell the customer something more expensive than is needed. This temptation is especially acute when the sales staff is on commission. What are the obligations of the sales manager with respect to how his or her sales staff should deal with situations of high information asymmetry?

One might argue that the customer has the obligation to search out the information that will close the information gap. In its most extreme form, this is the philosophy of "Let the buyer beware." That philosophy is neither legally nor ethically suited to a world where the products are so complex. On the other hand, a moral requirement that sales managers operate under a principle that provides the customer with whatever information he or she would want is much too broad. There is no obligation for a sales manager to tell a customer that a competitor has the same product on sale at a lower price. Some middle ground is the ethically appropriate answer here.

Surely sales people should not lie or deceive. If a customer asks if a 32″ flat panel TV will work in an apartment, the sales person should not try to sell him a 58″ TV on the grounds that the 32″ one is too small.

To help define the ethically appropriate line in providing information to customers, two things need to be considered. First, how are salespeople compensated? An overemphasis on commissions will tempt salespeople to sell the most expensive product even if it is not needed. Second, would finding the ethical solution to this dilemma be more likely if salespeople thought of themselves as professionals rather than traditional salespeople? Putting salespeople exclusively on salary and expecting them to behave like professionals might go far in overcoming the problem of customer information asymmetry.

Vulnerable consumers ethically require more help in overcoming information asymmetry. Unfortunately, this ethical obligation is breached by the unscrupulous, who play on the information asymmetry you find in the elderly and in the uneducated. It is common to find senior citizens paying for sealed driveways or roofs they do not need. However, the ethical issues here involve more than deception. Target marketing is an accepted and even essential way of doing business. However, when a vulnerable population is targeted, ethical issues arise. The beer industry was rightly criticized for targeting inner city blacks with ads for malt liquor. Marketing managers need to be especially sensitive when their customers might be considered vulnerable and thus harmed by the product being marketed.

Other ethical issues in the treatment of customers concern fairness. Does being a good customer permit special treatment? Often it does. We seem to accept the fact that frequent flyers are entitled to special perks. However, it is alleged that good customers get special treatment when they call a credit card company or a bank regarding a problem. That is, these customers get a live person quickly or have a shorter wait time. Is that fair? Indeed, the whole system of automated phone answering devices is highly unpopular with customers. It seems to take forever to get to the option that applies to you and even when you get there you might not be able to resolve the problem. Automated check-out lines in grocery stores and discount stores as well as automatic check-in lines that the airlines have introduced shift the transaction costs from the seller to the buyer. What is the fair burden for dividing the transaction costs? These and similar issues deserve the attention of the ethical sales and marketing manager.

The Ethical Management of the Supply Chain

Managers have always had ethical obligations to their suppliers. However, recently there have been demands in some industries that managers have an ethical responsibility for their suppliers. This distinction can be illustrated by some examples.

With respect to ethical obligations to suppliers, it seems as if managers have an obligation to keep their word, for example, by honoring their contracts. Many would argue that faithful suppliers with a long history of supplying high-quality products at a reasonable price deserve loyalty and should not be instantly dropped when the manager can get a competitive product for a slightly lower price. Unfortunately, the real world is departing rather sharply from the ethical ideal. Suppliers are always being pressured to lower their price and to "renegotiate" contracts in order to keep the business. Loyalty to suppliers seems to be a thing of the past as long-term suppliers are instantly dropped if a competitor comes in at a slightly lower price. The ethical manager has a difficult balancing act to perform—on the one hand, responding to the demands of the market and on the other being fair to faithful suppliers with a long and good track record with the company.

Recently, the ethical manager has been required to take responsibility for ensuring that their suppliers behave ethically. This has been particularly true in the apparel and sportswear industry where the distributors of these products such as Nike and the Gap were criticized because of the sweatshop conditions that had existed at a number of their suppliers. Activists and nongovernmental agencies have demanded that the distributors of these products require their suppliers to provide safe working conditions and a living wage. They have demanded that distributors provide the names of their suppliers so that those suppliers could be subjected to independent inspections.

This demand that managers police their suppliers and require certain forms of behavior is controversial. There is no question that working conditions in the sweatshops are bad—indeed very bad—when compared with manufacturing facilities in industrialized countries. On the other hand, some economists have argued that sweatshops are a necessary step in economic development and that well-intentioned steps to improve sweatshops only make the economic situation worse. Beyond the debate about economics, there is also an ethical issue about responsibility.

Normally, we are only held responsible for our conduct; we are not held responsible for the conduct of others. But this is not always the case. In theory, the managers of bars and taverns are required by law and ethics not to serve or continue to serve obviously drunk customers. Indeed, on occasion these managers have been sued when a drunk customer has driven away only to be involved in an accident that injures or kills another. Some states and municipalities have passed laws holding gun manufacturers responsible in certain cases when gun owners commit a crime, especially a crime in which the victim is killed by a gun. Opponents of extending responsibility in this way are trying to pass a national law that would invalidate such attempts by states and municipalities to hold gun manufacturers liable.

Despite the controversy surrounding these cases, the public has accepted without much debate a moral requirement on sportswear and apparel distributors to take responsibility for their suppliers. Perhaps part of the reason for the willingness to extend responsibility here is because the sweatshop issue has been construed as a human rights issue; the sweatshop manufacturers are seen to be violating internationally accepted human rights. If that allegation is correct, then a serious moral wrong is taking place because the violation of human rights is a serious moral wrong. The argument then goes that major international corporations in the apparel and sportswear industry should not take advantage of the victims of human rights violations to make a profit. Indeed, under the European Union model of corporate social responsibility, managing a business consistent with human rights and in a way that supports human rights is a moral requirement. When framed in that way, the leap to taking responsibility for your suppliers does not seem like such a great leap.

Management's Obligations to the Community and the Environment

Business does not take place in a vacuum. It is contextually located in a community or communities, which in turn are located in the natural environment. There are those who say that a business provides jobs—the very lifeblood of a community. It also usually pays taxes to the community just as individuals do. As a result, there is no further obligation to the community—in the form of charitable giving or in the form of helping to resolve social problems. Indeed, those who follow the view of Milton Friedman believe that it is morally wrong for managers to assist in these ways.

Despite the view of the Friedmanites, some form of corporate social responsibility is accepted as an obligation—at least on the part of the large companies. But is such an obligation justified? Some have argued for such an obligation on the basis of the great financial resources that these large companies possess. Others have made an argument on the great power that large corporations have. With great power and great resources goes great responsibility, and part of that responsibility involves philanthropy and other activities that benefit the public good.

Another way to establish a managerial obligation to the community is to challenge the "we provide jobs and pay taxes" argument. The "pay taxes" piece is especially vulnerable since many companies get states or localities to compete for the business and the most common way that states and localities compete is to give tax breaks. Even the "create jobs" piece of the argument has been recently challenged. Wal-Mart, for example, has been criticized for paying such low wages and providing so few benefits that many of its employees need Medicaid or other forms of public assistance. The business press has taken notice and now refers to the pushing of health and pension costs on the public as another form of corporate outsourcing. To the extent that these arguments are correct, the firm has an obligation to the community on grounds of fairness.

However the theoretical arguments play out, most companies at least make gestures to a responsibility to the community. Small businesses support charitable events in their communities and large companies have foundations or designated programs for charitable giving and community service.

Concern with the effects of business activity on the environment is now a focus of managerial ethics. The first step in environmental stewardship occurred when businesses realized that there were huge cost savings in waste and energy reduction. Although great progress has been made here, the international traveler cannot help but notice that the United States is behind other industrialized countries in taking easy steps to reduce stress on the environment. In Europe and Japan, for example, sheets in hotels are not changed every day unless requested, escalators do not run day and night even when no one is using them, and lights in hallways and elevators turn off automatically when no one is there. Also when you leave your hotel room and take your key, the lights go out.

The real challenge for managerial ethics involves business decisions that help the environment and perhaps even profits in the long run but that hurt profits in the short run. The most acute example here is in the automobile industry. Car makers, especially GM and Ford, make the best profit margins on SUVs and have marketed these cars very successfully. However, these vehicles have low gas mileage and other problems. Should GM have even produced the Hummer—a monster gas guzzler? Do the automobile companies have a duty to educate consumers about the cost to the environment when purchasing SUVs? One of the great challenges for managerial ethics is in developing a business strategy that is both profitable and environmentally responsible.

Ethical Leadership

One of the tests of management ethics is whether one is both an effective manager and an ethical manager. Management ethics is more than effective management. This moral fact has important consequences in any discussion of leadership. Ethical leadership is more than effective leadership and thus not everyone who manages a company successfully can be considered a moral leader. Just what that something else besides effectiveness entails is a matter of great controversy in leadership study and practice.

Honoring the role obligations that fall on all managers such as putting the good of the organization above their own interests as well as honoring the obligations of managers to the various stakeholders are key parts of management ethics. So is moral imagination. Moral imagination involves looking at business decisions and strategy from different points of view. It involves creative attempts to be profitable and ethical. This is the challenge that faces the automobile industry as well as many other industries. In the long run being effective is not sufficient; being effective while being ethical is what successful management is all about.

Mandeville, Bernard (1670–1733)

Bernard Mandeville was Dutch and English. One of the first modern thinkers to address the relationship between morals and economics, Mandeville is renown for his claim that a prosperous society could be brought about only by self-interested, not virtuous, individuals. Born in or near Rotterdam and trained in medicine at the University of Leiden, Mandeville emigrated to England in the last decade of the 17th century. His thesis, that private vices generate public benefits, first appeared in his poem, “The Grumbling

Hive: Or Knaves Turn'd Honest," published in 1705. The poem was reissued, in 1714, as *The Fable of the Bees* and included an essay on the origin of morals and a series of additional remarks on the poem. With another edition of 1723, Mandeville became famous, if not notorious; subsequent editions of the *Fable* included a second volume with six dialogues. He published a variety of other works, including, in 1732, *An Enquiry into the Origin of Honour.*

In "The Grumbling Hive," Mandeville depicts a society of self-interested bees whose trade generates a large and bustling commercial society. In the early 18th century, the reigning opinion held that self-denying virtue—entailing action contrary to a natural passion and in accordance with reason—was essential to the public good. Mandeville contended, in the poem and in the extended editions of the *Fable*, that we are motivated by self-interested passions, not reason. Through the division of labor, we pursue material gain. Our desires for goods and finery (condemned by some as luxury) provide employment and our trades generate wealth. The standard of living rises, the population grows, and the poor enjoy a better life than did the wealthy of previous generations. Note that Mandeville does not claim that any instance of vice is beneficial, only that which is consonant with a rule of law establishing justice. It is the duty of the politician to secure a legal framework that will serve as the foundation for commercial interaction.

Mandeville's provocative claims provide the basis of much of the 18th-century discussion of morals and society, influencing and challenging David Hume, Jean-Jacques Rousseau, and Adam Smith, among others. Today his writing raises a variety of significant issues for ethicists. Not only does his thought raise the question of whether business and self-denying ethics occupy distinct spheres, it also includes an evolutionary account of how norms might emerge out of social interaction. In his attempt to puncture hypocrisy, he also suggests that one must keep in mind both the practical consequences of ideals and whether some goods (such as self-denying virtue) are compatible with others (such as the benefits of commercial growth). Finally, Mandeville is among the first to move away from an anthropomorphic conception of society, according to which all social order must result from someone's intention. The idea of unintended emergence reminds the ethicist that society is complex, that the empirical application of principles demands careful attention, that our reason may be limited, and that good intentions are not sufficient for beneficial outcomes.

Manipulation, Financial

The financial manipulation of stock market quotations consists in the altering of the ordinary course of supply and demand. This is done through devices that stimulate or depress stock prices, thus seriously distorting the market by not letting share prices be fixed naturally in free market exchange. In manipulation, something, or someone, intervenes in the mechanism of price setting, thereby taking unfair advantage at the expense of the rest of the investors.

Manipulation is an extremely serious action because it causes prejudice to the integrity of the financial markets and, in a particular manner, that of the stock market itself. The damage is done both by hindering clean play and by simultaneously blocking the meeting of institutional goals. In the case of the financial markets, manipulation obstructs the effective mass ordering of shares on a totally equal basis, reducing in this way the financial market's goal of being a source of financing. As for the stock market, objective and impersonal price setting breaks down, thus frustrating the market goal of being a privileged indicator of the pace of the economy. When this happens, justice suffers and market efficiency is cut down.

Different ways of manipulating stock market quotations exist, but the most commonly used methods come to three: manipulation through quasi-monopoly, manipulation brought on by falsehoods, and manipulation by placing shares on the market above their real value. Following are a few relevant examples.

Suppose that a large bank controls several portfolio companies and it decides to use an important part of its own shares and a substantial amount of money in cash to dictate the quotation price of its shares. When market control has been obtained, the bank would be in favored position to buy back its own shares at a cut-rate price by going through its subsidiaries. Once the price had gone up, they would sell them, making high profits at the cost of the investing public. This would be a case of manipulation by quasi-monopoly.

Another example along the same line is "muscle play," which basically consists of taking advantage of a false oligopolistic position at a concrete moment. This muscle play aims at the creation of such a considerable price change that the losses resulting from creating this movement are less than the profits generated by the end result. There have been cases in which, in the last minutes of taking orders at a specific stock market, and at a moment of clear euphoria and a rising trend, a single operator made the index drop by more than 2%, with a large-scale operation. Although considerable losses occurred, the motive behind this apparently peculiar behavior became clear: A powerful institutional investor forced the index to drop so as not to face payments caused by the expiry of certain contracts made with another entity on the aforementioned index.

Manipulation through falsehoods can take a number of forms: false rumors; unfounded news of the impending crisis of a specific listed company; imaginary appointments, resignations, or contributions; false financial documents such as general balance sheets and past or future profit and loss accounts; supposedly expected profits or dividends; the discovery of mines, or granting of nonexistent patents for unreal inventions; and effective quotations. This last is the most efficient "rumor." While it is assumed by the investing public that the publishable share price is correct, in reality it is the result of imaginary sales and purchases, of washed and matched sales. The motive behind this falsehood is to modify or produce changes with a frequency that in reality should not exist, but which benefit the image of the share in question.

With respect to the third group of manipulative practices, special mention should be made of sales made under high-pressure methods. This is usually done by dealing with low price shares or those quoted on a parallel market. Investors receive telephone calls with persuasion methods that are frequently accompanied by swindle, fraud, deceit, or the inexact presentation of facts. This type of manipulation causes incautious investors to lose considerable amounts of money.

The manipulation of share quotations is a type of dishonest speculation because the manipulator is not taking advantage of price fluctuations, he or she is causing them. For this reason, if the manipulation consists of the voluntary alteration of fair share pricing, it must be considered, in general terms, not only as illegal but also as an immoral practice. And the manipulator is taking part in an unethical practice if he or she knows the fair price of a financial asset and modifies it without reason, causing the share quotation to be far from its true value.

However, a case could be made of certain "manipulation" being ethically correct if, for example, someone initially forecasts the potential of a share following the logic that the price will move in a foreseen direction. The investor does not take the future into direct account but, in this way, effectively accelerates the change in the share quotation. In this example, the shares have not been manipulated, and the share quotation will have taken longer to rise or fall. Here, then, the investors are not manipulators and would be helping the market to correctly evaluate the fair price. The ethically wrong action would be to use unfair means or to place a value on quotation levels much higher or much lower than the share's base price.

What is in play in the world of finance has enormous importance, not only because of the resulting negative economic consequences, but above all because, if market abuses are not counteracted, the investing public risks giving up on the system for loss of confidence. Adverse effects on the economy and the common good would soon be noted.

Evidently, authorities and regulators should continue their attempts to suppress these bad practices by all legal means. But at the same time the financial community should accept self-regulation in line with accepted ethical standards and binding professional practice.

MAQUILADORAS

A maquiladora is an assembly or manufacturing plant, in most cases along the border between two countries, which receives imported materials and equipment duty-free, assembles the product, and then exports the product back to the originating country with very low or no tariffs. The word *maquiladora* comes from the Spanish word *maquilar*, which means *to assemble*, and was first used to describe plants established under a special program on the Mexican side of the U.S.-Mexican border. The term and concept have since spread to areas in other countries where trade barriers are reduced on imported materials to assemble goods for export.

Mexico's maquiladora program was established in 1965 to create jobs for Mexican workers after the end of the Bracero program, which had allowed Mexican workers to find temporary agricultural-based employment in the United States during and after World War II. When that program was terminated in 1964, Mexico designed the maquiladora program to encourage manufacturing along its northern border and thus provide jobs for Bracero workers and the rural poor. In the beginning, maquiladoras could only locate within approximately 12 miles of the U.S. border and only served the purpose of labor-intensive job creation and foreign currency flow.

In the 1970s, U.S. companies began to develop the concept of the "twin plant," where they would locate capital-intensive operations on the U.S. side of the border and labor-intensive operations on the Mexico side of the border to capitalize on the low-priced labor. Well-known city pairs include El Paso, Texas, and Ciudad Juarez, Mexico; San Diego, California, and Tijuana, Mexico; and McAllen, Texas, and Reynosa, Mexico.

In 1986, Mexico joined the General Agreement for Tariffs and Trade, which changed the country's complex import policies and tariffs. Over the next 4 years, Mexico's tariffs dropped by 45%, which attracted a new wave of foreign investors and pushed maquiladora employment up to a growth rate of nearly 20% per year. Later, in 1994 with the initiation of the North American Free Trade Agreement (NAFTA) with Canada and the United States and the severe peso devaluation, maquiladora operations continued to expand to take advantage of even cheaper labor as well as more favorable trade terms.

As competition increased, some international firms began to increase the technical sophistication of work that took place within their maquiladora operations. While labor-intensive tasks remained the norm, maquiladora operations expanded to incorporate research and design along with high-tech assembly and manufacturing. By 2001, maquiladora exports represented almost half of Mexico's exports, and maquiladora employment had increased to employ 3% of the country's total workforce.

Since 2001, Mexico's maquiladora sector has struggled to remain competitive due to the U.S. recession in 2001, a stronger peso, and increased global competition. Between 2001 and 2002, 420 maquiladora plants closed in Mexico, and nearly 229,000 jobs were eliminated. A "permanent establishment" clause, added to Mexican tax laws in 1998 when limits on domestic consumption of maquiladora production were phased out, meant that these plants now had to pay taxes on assets and income in Mexico. The maquiladoras also lost their duty-free privileges with non-NAFTA countries in 2001 with the onset of NAFTA Article 303. The Mexican government created sectoral promotion programs to protect duty-free benefits of non-NAFTA component imports, but extensive paperwork makes participation difficult. The Mexican maquiladora industry also faces increasing competition from low-cost operations in China, the Caribbean, and Latin America.

Supporters of maquiladora programs point out the economic benefits of job creation in poor countries and the increase in consumer welfare because the cost of goods is lower. Critics of maquiladora programs are concerned about moving jobs from higher-cost developed countries and then exploiting workers in developing countries by paying low wages and exposing them to dangerous working conditions. Air and water pollution and other types of environmental degradation are more prevalent in maquiladora areas because environmental regulations are often not enforced and because low tax revenue cannot support municipal treatment facilities.

Marginal Utility

In economics, marginal utility refers to the additional utility derived by a consumer from the purchase of one more unit of a good. More formally, it is the rate of change of utility with respect to changes in the quantity of goods purchased (the first derivative). The concept is crucial in economic theory because decisions about how much of a given good to purchase are thought to be made *on the margin*; that is, the agent asks himself or herself, with respect to each additional unit of any good (whether oranges in the grocery bag or dollars of life-insurance coverage), whether his or her expected utility from purchasing it is sufficient to justify its cost. He or she may also consider whether a substitute expenditure elsewhere, on a different good, would produce superior benefits in terms of utility.

Over a wide range of goods, marginal utility is *diminishing*. That is, the utility gained from each additional unit is less than that gained from the previous unit. Mary, for example, may get considerable utility from owning one bicycle. She is apt to get some, but less, utility out of purchasing a second. It is not as vital to her transportation or recreational needs as the first, but could add convenience because, for example, it could be used as a backup when the first bicycle breaks down or could be lent to visiting friends. But the marginal utility of Mary's acquiring a third bicycle is apt to be rather small. When the cost to Mary of buying another bicycle exceeds her expected utility from it, she will stop buying bicycles. (Up until that point, Mary has actually gained something from each transaction, since her marginal utility in each case has exceeded the price she's had to pay. The amount by which a consumer's marginal utility exceeds the price is known as consumer surplus.)

Money, too, has diminishing marginal utility. The move from being penniless to having 10 dollars entails a much more significant increase in utility than the move from having a million dollars to having a million and 10 dollars, even though 10 dollars are added in each case.

Diminishing marginal utility is used by some ethicists to justify wealth redistribution, especially via progressive income taxation. The argument is that any transfer of X dollars from a rich person to a poor person will increase overall social welfare. This is because the diminishing marginal utility of money guarantees that the decrease in welfare experienced by a wealthy person losing X is smaller than the increase in welfare experienced by a poor one gaining X. This argument is not fully persuasive, however, since the price-distortion brought about by taxation may result in deadweight loss—loss of social productivity—that offsets the welfare gain from the transfer.

Market Bubbles

In a *market bubble*, a term that came into common use during the South Sea Bubble of 1720, the price of a commodity rises far higher than estimates of a commodity's difficult-to-specify "real value." The rise is not like a sharp inflationary increase, in that the price of the commodity does not move with the market, but, rather, in response to extraordinary demand. This rise usually occurs after a new product or technology or social opportunity appears and slopes upward rapidly under a demand that appears more like a social contagion than a market exchange. The commodity is perceived by buyers as unique, scarce, and nonsubstitutable. The price rises to a level far higher than that at which the commodity was recently and/or customarily sold. Purchases of higher-valued types of the commodity expand to lower-valued types as the market becomes less discriminating in order to supply the huge demand for the commodity.

The possibility of growth in the commodity's value is overestimated, partly due to lack of experience with the newly sought-after commodity. Demand is fed by speculation, as the possibility of quick wealth draws new participants into the market. The bubble generates social excitement, which spreads from investor to investor via personal contacts. Wealth floods into the market for the commodity, being drawn typically out of other investments perceived in comparison with the bubble commodity as underperforming. Investment in the bubble slows as fungible wealth is exhausted, and the costs of extracting wealth to purchase the bubble commodity begin to accelerate.

Events Leading to Bursting a Bubble

The bubble bursts when one or more of several possible events occur: First, wealth available to purchase the bubble may become relatively unavailable, whether due to actual availability or to extraction cost, so that demand slackens from potential purchasers. Because the run-up occurs over such a relatively short period, there is little chance for the market itself to expand. Although in the initial, slower run-up many new entrants may arrive, in the bubble's later stages, the market participants who are present and would invest are already fully engaged in the bubble. At least from the perspective of the practical limits seen in historical contexts, it is not feasible to bring in more distant participants to replace those who are "topped out." Thus, as the capital supply slackens or becomes too costly, demand plummets and the bubble collapses.

Second, qualities of the commodity may be shown as not unique, not scarce, and/or substitutable. Or the commodity itself may be revealed as different in character from its social perception, or even to be false or nonexistent, as in a scam. Indeed, the commodity's market may be revealed publicly as a bubble, sparking immediate divestiture of holdings and market collapse. Thus, the bubble may collapse if the special, demand-producing character of the commodity changes.

Third, natural or scheduled deadlines may cause investment to slacken as the deadlines near; market investors begin to exit to capture their gains, demand evaporates, and the price goes into free fall. This was one reason for the collapse of Tulipomania (see below).

Fourth, market intervention by government or other powerful actors may establish coercively backed rules that slow price increases, increase the costs of market exchange, or exclude certain actors from the market (e.g., purchasers using essentially borrowed funds in extreme margin purchases).

As the price falls, holders of the commodity quickly perceive that the peak price is past and rush to sell in order to recover as much profit as possible. The commodity price falls very rapidly as buyers leave the market. Paper gains are wiped out, and the commodity falls to levels far below that at which most participants entered the market, given that it was the rapid rise that drew in most participants. As a result, most purchasers of the commodity suffer high losses. It is possible for prices of the commodity to recover, however, to near prebubble levels.

Bubbles are a form of market failure and have been subject to considerable debate in economics because of their apparent violation of what would be expected in efficient markets. There have been attempts to reconcile bubble behavior with efficient markets (see, e.g., Peter

Garber's work), but most scholars argue that more than traditional economic theory is needed to adequately explain them.

Contingencies of a Bubble

Note that bubbles require several unusual circumstances to hold: First, the commodity's value is determined by socially reinforced perceptions of its special character, whether or not such character can be objectively measured in some way. Buyers perceive a shortage, whether or not the commodity is in short supply, and their judgments are reinforced by personal contacts with others who share this view. In other words, the market is driven entirely by perceptions reinforced by personal contacts, rather than by signals that accurately feed back commodity and market statuses.

Second, attempts to purchase the commodity grow in a frantic, panic-stricken fashion. The dynamic is not only rapid, but accelerating. Buyers act as in a mania, driven by fear of shortage, fear of losing the profit from the quick price run-up, fear of being left behind, or fear of having to face remorse at losing the opportunity for great wealth. Thus, actors behave with what may be termed *emotional biases*, as well as with the cognitive biases that defined the special characters of the commodity and its apparent scarcity in supply.

Third, the success of the bubble depends on the availability of wealth to drive the expansion into the commodity. This means that a substantial amount of disposable, convertible, or otherwise fungible wealth must be available at low cost to market entrants.

Fourth, the bubble draws in many market newcomers who seek quick wealth from the rapid price rise. These market neophytes do not have experience in evaluating market signals properly, and many have entered as a result of information transmitted by acquaintances. As a result, the new participants are ill informed about commodity characteristics. Indeed, they may care little about what they are buying because they entered the market to make a quick buck, not to acquire and hold the commodity. Thus, driven by greed, they hold the commodity too long before converting their profit, and get caught in, and contribute to, the fall.

Fifth, the dynamics of the bubble as well as the nature of many entrants raise issues about the ethical character of such markets. Some bubbles, such as the South Sea Bubble of 1720, were chiefly manipulations, having little or no value behind their securities. Others featured scams, product misrepresentations, and/or questionable marketing practices. In essence, the run-up was fueled by widespread deceit. Markets are considered normatively desirable at least partly because they respond to consumer choice—they feature *consumer sovereignty*. But how can markets be considered normatively acceptable if they treat consumers not as sovereigns whose choices must be respected, but as duped and deluded "fools" whose choices may be driven by contagion, shaped by market timing, and reflecting not commodity choice but a mindless greed that proceeds ignorant of the commodity's actual characteristics? Indeed, Edward Chancellor explicitly compares the speculation inherent in market bubbles with the behavior of carnival fools. Thus, the existence of bubbles raises important normative questions about the performance of markets.

Market bubbles have occurred periodically for centuries. Examples include the Tulipomania in the Netherlands in the 1630s, the South Sea Bubble in England in the early 18th century, the technology bubble in the United States in the 1990s, and the real estate or housing bubble in the United States in the early 21st century. Because all market bubbles burst, the suggestion by government policy makers that a bubble is under way can be sufficient to cause sudden stock market drops or even to collapse the bubble, potentially with disastrous effects. Thus, Alan Greenspan, chairman of the board of governors of the Federal Reserve in the United States, famously described market conditions in a 1996 dinner speech as a case of "irrational exuberance." Stock markets all over the world plummeted several percentage points after his speech. Thus, economic policy makers refrain from suggesting that markets seem to be becoming bubbles. As the real estate bubble of the early 21st century grew, it was common for analysts to instead decry the level of "froth" in the market, a description that avoided an outright labeling of the market as a bubble.

Tulipomania

As an illustration of a market bubble, consider the case of Tulipomania. Introduced from Turkey, tulips were a novel, colorful flower well-suited to the low lands of Holland. Interest in them grew steadily in the early 17th century. Growers had succeeded in producing enough of the flower to create expanding markets, with prices of common bulbs falling to levels that made them accessible to tradesmen, farmers, and laborers. The flower bulbs could be divided to generate more of highly desirable types, although the most desirable varieties, which we now understand to have been produced by a plant virus, remained scarce.

Holland was then at the end of a long recession, which turned into an economic boom by the early 1630s. Incomes in the country were the highest in Europe. While wealthy individuals continued to invest in joint stock trading companies and other vehicles focused on steady appreciation of wealth, the less well-off looked to quicker means of becoming rich. Banks were not used for savings by those with smaller amounts to invest, so other outlets for appreciation became attractive. Thus, the availability of savings for investment coincided with the rising interest in tulips. In addition, the bubonic plague was rampant in Holland during the peak period of the bubble—for example, it killed one eighth of the population of Haarlem in less than 2 years. This produced a labor shortage and, consequently, rising wages, making even more funds available for investment in tulips. Mike Dash, in his chronicle of the bubble, *Tulipomania*, suggests that an attitude of "fatalism and desperation" may have also contributed to the extreme behavior of the tulip traders.

Traditionally, tulip traders had traded only from June to September, as the flowers themselves could be seen in bloom. The bulbs were then traded, "lifted," and, eventually, as the season determined, planted again. As demand grew, this sequence was abandoned. By the fall of 1635, an active futures market, called the *windhandel*, or wind trade, in tulip bulbs had developed. Bulbs were traded on paper, rather than in physical form. In addition, personal credit agreements based on the future deliveries were made. Trades were turned over many times, and prices skyrocketed. Tulip dealers set contracts for bulb delivery in the spring that featured promises by purchasers to pay at a certain price at a certain date. A purchaser assumed that he could buy tulips at already high prices, paying a deposit to guarantee that price, to be paid when the bulbs were lifted in the spring. He assumed that the price would at that time be much higher, so that the bulbs could be sold, the dealer paid off, and the purchaser pocket the difference (or be compensated for the new, higher price). Although the tulip futures market was outlawed, being considered dangerous and even, according to Dash, immoral, it continued to flourish.

During 1636, the soaring market drew many new and inexperienced entrants, whose investments continued to fuel the futures market. One estimate is that the tulip trade between 1633 and 1637 totaled about 40 million guilders at a time when the whole Dutch East India Company was valued at 6.5 million. A single high-quality tulip bulb could sell for several thousand guilders. At the time, 3,000 guilders could purchase all of the following: 8 fat pigs, 4 fat oxen, 12 fat sheep, 24 tons of wheat, 48 tons of rye, 2 hogsheads of wine, 4 barrels of eight-guilder beer, 2 tons of butter, 1,000 pounds of cheese, a silver drinking cup, a pack of clothes, a bed with mattress and bedding, and a ship.

The tulip bubble burst in February 1637. Tulips fell suddenly in value to 5% and even 1% of their former trading level, and many markets simply ceased to function. Demand for bulbs had outstripped the supply—only low-quality bulbs, with absurdly high prices, were new to the market. At the same time, prices had exceeded the availability of capital to meet those levels. And chains of futures purchases meant that buyers were unable to meet their obligations by selling their contracted purchases at higher prices, so that the chains collapsed. The collapse occurred in advance of, and partly also in anticipation of, the lifting of the bulbs in the spring, as traders realized that the settlements that would be necessary then would be impossible.

Thus, the tulip bubble reflected many of the characteristic features of bubbles: The bubble in this novel commodity grew rapidly, drawing in novice participants who had funds available to invest. In this case, regulation of the futures market was ineffective. As quality tulips became less available, the commodity being sold became less unique. The huge existing investments left fewer funds available to purchase less desirable tulips. The looming deadline of the spring lifting in 1637 helped trigger an early collapse.

Of high interest in today's economy is the fact that such bubbles, if not in tulips, then in some other commodity, may be expected in the future.

—Barry M. Mitnick

Market Failure

The concept of market failure refers to the numerous ways in which real markets fail to display the characteristics and performances of theoretical or perfect markets and/or to generate social outcomes that are analytically superior to those produced by other means of societal allocation. The modern conception of ideal market exchange and its perceived benefits dates at least to the classic work of Adam Smith in *The Wealth of Nations* (1776).

Characteristics of a Perfect Market

The concept of a "perfect market" is an abstraction. A perfect market is an exchange system featuring many buyers and sellers; actors who pursue rational self-interest with completely free choice and stable preferences; perfect information held by all the actors; goods that are all private in character in that their consumption can be excluded from consumption by other potential consumers; exchange among the buyers and sellers that is costless; actors who begin their market exchanges with resource endowments that can neither increase nor change in quality or capability over time nor have any special characters or values (but can be used only to fund the exchanges); actors who are solitary and self-contained in that they act as atomistic, disconnected entities with no internal complexity and no external, dependent relationships such as stakeholder ties; no technology effects such as those that would cause markets of different sizes to behave differently so that trading in goods at different scales produces different behaviors; no by-product costs or impacts from the exchange, so the market itself is self-contained and has no memory or history, among other characteristics.

In contrast, real-world markets can violate any of these conditions. They can have few sellers and/or few buyers; consumers can be inconsistent in their choices and be influenced by other actors and historical patterns; false or incomplete product information can flood the market; buyers can collude with one another; the supply of goods can be joint, not private, in that once supplied to one consumer they are at the same time consumable by other consumers; there are many, and many kinds of, transactions costs in the market; actors can possess widely varying endowments of resources that can be transformed in quality and value by innovation and technology, yet for some actors may be too little or of such type or quality as to prevent those actors from using them to conduct any market exchanges or participate meaningfully in the market; production in the market produces unintended by-product effects not priced in the market; technology can cause rational market actors to collude and/or combine so that the market itself collapses into a single actor; information about all aspects of the market and its actors can be unevenly distributed and costly to elicit; market actors are often internally complex, as in firms, and intricately interdependent with stakeholders who affect or are affected by the actor, that is, the firm; and so on.

Pareto Optimality

Perfect markets are held to be desirable because they can produce the exchange condition that economists label *Pareto optimality*, after the Italian economist Vilfredo Pareto (1848–1923). In the exchanges leading to Pareto optimality, market participants have employed their endowments to make exchanges with other participants in response to their self-interest and their perfect knowledge of available exchanges. Participants are driven by the benefits of each exchange to continue to trade until they can no longer—either they have exhausted their endowment or, what is equivalent, there is no available trade that will make them better off. In other words, there is no trade available that will make at least one actor better off while leaving the other actors indifferent to the exchange. Such a condition is, in essence, the best of all possible worlds available to market participants at that position in the sense that they cannot move to any state where they would be better off. Movement toward that condition is also desirable—any trade that makes at least one actor better off while no other actor is harmed is a *Pareto efficient* transaction.

Now, being at a Pareto optimum does not mean that every actor is at his or her own optimum possible through market trade, that is, that the result is globally optimal—there can be many possible positions of the market in which no further trades are possible without making at least one actor worse off. In other words, trade could have brought the actors to other, perhaps better positions that would also have been Pareto optimal in that no further exchange would be rational. An abstract, perfectly competitive market can produce a Pareto optimum, but cannot guarantee that each and every actor in that market will be in a globally optimal position when that optimum is reached.

The obvious problem is that, just as perfect markets are an abstraction that the real world can only approximate in rare instances, so would a perfect market that has traded its way to Pareto optimality be more abstract than real. Although one can easily think of situations in real market exchange that would be Pareto efficient, and perhaps see trading systems that trade their way to an end point in which no further trades are volitionally possible, one cannot consider the result Pareto optimal in any global sense. The absence of trading opportunities does not mean that the cessation of trade has resulted in the best of all possible worlds for all actors, especially given that the market in which trading occurred was not perfect. And trading to a Pareto end means only that in available trades market actors took maximal benefit from the endowment with which they began trading, not that the condition of the world at the end of the trade was in any larger sense optimal.

To the extent to which the normative defense of markets rests on the perfect market's display of Pareto optimal outcomes, the judgment of market success or failure depends on an essentially procedural criterion. The optimal end point has value only in the way it was reached and in the absence of possibility of actor benefits beyond the end point. Nothing whatsoever is said regarding the relative desirability of actual end states. Nothing matters about which actors are benefited in what ways, but only that no further enhancement of those benefits will be chosen by the market actors. Thus, markets fail in the sense of being unable to function in ways that produce outcomes that in and of themselves may be recognized as invariably more desirable than those produced by other societal means of allocation.

The Stakeholder Paradox

Setting aside the notion of whether markets produce desirable outcomes, one can examine whether the essential characteristics of markets by themselves provide support for the value of markets. One such characteristic is *consumer sovereignty.* Under consumer sovereignty, markets are understood to be driven by the choices made by market participants, consumers. No authority dictates market exchange or exchange values, that is, prices. In essence, markets are decentralized exchange systems that defer to the freely expressed judgments of market actors. Normative value may be attached to consumer sovereignty to the extent that any principle of freedom of choice has normative content. Thus, no matter their outcomes, markets may be judged desirable simply because they are economic systems that permit free choice.

But market participants are not all individuals. In the modern economic world, many economic actors are, of course, corporate actors. The criterion for the success of such an actor is typically given as the maximization of its value. That is, the firm as corporate "person" is operated in the market so as to provide maximal benefit to its owners by maximizing the value of their holdings in the firm.

A paradox, here called the *stakeholder paradox*, follows: Markets are held desirable because they permit free choice to their participants (consumer sovereignty) and because they permit the unfettered pursuit of shareholder value. But the two principles—consumer sovereignty and maximization of shareholder value, in essence, shareholder sovereignty—do not necessarily coincide. The unregulated pursuit of one can be invidious to the realization of the other.

Consider, for example, the case of the diabetes drug Rezulin, which was marketed by Warner-Lambert (later acquired by Pfizer). Rezulin's side effects led to the deaths of more than 60 people who took the drug—all, of course, quite literally, consumers. Warner-Lambert kept the drug on the market well past the time at which the lethal side effects were recognized, and it kept the drug on the market because it was extremely profitable. Warner-Lambert earned more than $1 billion from the drug until it was finally obliged to withdraw it, less its costs from the legal actions of surviving family members. Even after subtracting the costs of the civil actions, the drug provided an enormous profit to Warner-Lambert and, of course, ultimately, value to its shareholders and those of its corporate heir, Pfizer.

Thus, the interests of consumers and of shareholders do not necessarily coincide. In other words, the normative world of markets is not the same as the normative world of firms. Nor would the general argument be in essentials different if one were to substitute other stakeholders, such as employees or the local community, for consumers. The stakeholder paradox prescribes that normative principles that are generated in support of one stakeholder cannot be sustained in preference to those generated in support of any other. One cannot necessarily apply a moral principle derived from and/or applied to market behavior to the behavior of any other stakeholder, and vice versa. Thus, the performances of markets, and of their corporate participants, firms, fail to generate support for any overarching normative principle or principles that would support the general desirability of markets.

Some Forms of Market Failure

There are a number of ways in which the behavior of empirical markets diverges from that expected in perfect markets. In example, three classes of such failure are identified below: market failures related to the characteristics of goods traded in markets, market failures related to the characters of market participants, and market failures related to market structures and performances.

Characteristics of Goods

Pure *public or collective goods* are goods such that their consumption is joint or "nonrival," and "nonexcludable". Thus, once provided to one consumer, they are provided to others, without diminution due to the consumption of others (i.e., their consumption is nonrival). National defense is one example. Furthermore, the good cannot be excluded from consumption by others. An example is air pollution—once provided to one consumer, it is provided to all, and it is not feasible to exclude some from consuming it. Goods vary in their degrees of jointness/nonrivalness and excludability. As the economist Mancur Olson described, public policies act like public goods—once the benefit of the policy is available to one citizen, it is available to all. Markets fail to provide optimal levels of public goods, because potential contributors to the supply of such goods judge that they can be *free riders* on the contributions of others—they will enjoy the good whether or not they contribute because of its public character. Hence, positively valued public goods will be inappropriately priced, or priced not at all, and be in chronic undersupply. And negatively valued public goods, such as air pollution, will not be part of market exchange.

The demand for public goods, particularly in view of their artificially low apparent market price, can generate *congestion* effects. Congestion can mimic the effects of rivalry or exclusion, as high demand for the good interferes with consumption of the public good.

Goods also vary in the extent to which consumers can evaluate their characteristics, including their quality. Markets will fail to perform adequately because the normal forces of supply and demand will fail to operate if consumers cannot make choices based on full or correct information regarding the goods they are purchasing. *Search goods* are goods that require consumers to invest in their detection or evaluation in advance of purchase. Absent payment of search costs, consumers will either fail to purchase goods or purchase goods that may not have the characteristics that the consumers would prefer. Or they may rely on simplifying and economizing heuristics, such as brand, product reputation, or ratings or product referrals. These may not, however, actually direct the consumer to the optimal purchase.

Experience goods can only be evaluated after purchase. But postpurchase evaluation increases the chances for consumer error. Because consumers essentially precommit to a particular good before being able to make their own judgment of how well it meets their preferences, it becomes more difficult for consumers to acquire more highly preferred goods. If the good does not measure up, consumers are faced with paying the perhaps considerable costs of exchange or replacement of the good. Consumers can attempt to deal with the issue by seeking out reports of the experiences of others, such as product ratings, or purchase warranties as a form of insurance against products that turn out to be of low quality.

Credence or *trust* or *postexperience* goods are those goods whose qualities are not evident even after consumption. In essence, the consumer must trust in their performance. Prescription drugs that have long-term negative side effects fall into the category of credence goods, as do those prescribed by physicians when the patient is unable to detect either the illness or its resolution. An example is medication against high blood pressure or against high cholesterol. The problems may have been detectable only by the physician; while taking the drugs, the patient feels no different than before. Markets cannot provide the appropriate evaluations to consumers; consumers must often seek out skilled agents to interpret their need for the goods as well as the performance of the good.

Characteristics of Market Participants

Markets can be unable to provide appropriate judgments of the performance of agents in agent-principal relationships; flows of information can be asymmetric. In *adverse selection*, the principal can observe the agent's behavior, but is unable to judge whether that behavior is optimal in the agency relationship, that is, whether the agent is serving the principal with the quality expected. The context often offered is that of employment, in which an agent has expertise not shared by the principal who engaged him or her. The principal is consequently unable to judge whether the agent is doing work of highest quality, because he or she cannot evaluate it directly. Kenneth Arrow termed the problem of being unable to judge quality, the problem of *hidden information.* According to Barry Mitnick, the problem of adverse selection actually conflates two kinds of problems. One, *adverse claims*, relates to the difficulty encountered by principals in trying to evaluate the qualities of prospective agents. The second, *adverse performance*, relates to the different problem of evaluating an agent's performance when he or she is being supervised within an agency relationship, such as an employment relation. The methods and measures used by the principal are different across these cases.

A second general agent-principal problem, termed *moral hazard*, occurs when the principal could judge the optimality of the agent's behavior, but cannot observe it so as to be able to apply that expertise. The most common examples are taken from insurance contexts. The existence of insurance leads agents to reduce the care with which they treat insured objects. Insurers can tell the difference between careful and careless behavior, but cannot observe the insured to see if his or her actions are consistent with good care. Arrow thus terms the problem of being unable to observe, a problem of *hidden action.*

In general, market participants may be unable to appropriately evaluate the risks of market actions or may display any of a number of biases of social cognition in evaluating their market participation and/or the qualities of the goods they seek in the market (see, e.g., the work of such scholars as Amos Tversky, Daniel Kahneman, and Baruch Fischhoff). The market by itself cannot compensate for these effects.

Characteristics of Market Structure or Performance

Markets often cannot take account of the production of goods or effects that are generated as unintended by-products of the primary task of producers. These goods are termed *externalities.* Often these goods have negative impacts, and so escape market pricing—no one wants to purchase them. The most common example is environmental pollution. Positive externalities can also be produced and can experience problems with market inclusion because their origin may be unplanned and unstructured. Thus, creation of a public park may have the unintended by-product effect of increasing the value of nearby houses. But the market has no means of capturing that added value, other than in the increased selling price of the houses. In that case, the benefit of the park is transferred to increased income for the sellers of the house. The municipality cannot recover the benefit bestowed on the homeowners from the placement of the park (except, perhaps indirectly, via house transfer taxes tied to selling price and increased property taxes).

A second structural problem for markets stems from the transaction, information, and bargaining costs attending market interactions. Market participants may make suboptimal choices because of the costs of extracting information from the market; it may not be rational for such participants to pay the cost of getting complete information because the costs of extracting information and assuring its quality exceed the benefits of doing that.

A third problem for markets that comes from structural or performance characteristics arises when buyers or sellers combine so that markets collapse into monopsony (one buyer) or monopoly (one seller). Such market structure problems can, of course, be the result of deliberate manipulation unrelated to underlying market defects, as when entrepreneurs create cartels to control pricing and reap monopoly profits. A condition of *natural monopoly* occurs when average cost declines with increasing demand for the product or service. In essence, producers can economize by combining their production, reducing the average cost of producing a unit of the product or service. The rationale for public utility regulation rests on fears that unregulated utility markets will collapse to natural monopolies as producers see the advantages of building only a single distribution network rather than several, parallel, competing ones. It is the technical characteristic of the product or service that structures cost so that only one system makes economic sense. As a result, the market cannot be sustained, and, indeed, rational market exchanges will result in collapsing the market to a monopoly. The resulting single producer can then extract monopoly profits from consumers with no alternative market choices.

A fourth market problem is reflected in business cycles, as the economy cycles between boom and recession. Markets cannot manage such cycling on their own. Such cycles require the intervention of central banks and other economic policy actions to shape the cycling in ways that produce healthy, sustained market competition.

General Issues in Market Failure

In general, markets have no mechanisms for incorporating public or community interests; they are good in attending to the wants of consumers but poor in balancing interests across society. Markets ignore disparities in original endowments; they have no means of redistributing society's wealth to aid the least advantaged. Markets have no mechanisms for resolving disputes or conflicts of interest other than the raw application of economic power. Indeed, one prerequisite to a successful market system is a government that can establish, operate, and defend a legal system that protects private property and establishes limited liability for corporate investors. Finally, markets cannot protect employees lacking market power from exploitation. After all, one rationale for government regulation is to create a governmental protector or agent to serve interests who have no ability to protect themselves.

Thus, although markets are the centerpiece of Western economic systems, and are commonly valued for their mimicking of the democratic values of free choice, both their normative principles and their behavioral characteristics can fail to provide the satisfactory rationales as well as performances that are essential in a modern, complex society.

Market for Corporate Control

The market for corporate control (MFCC) is a market in which one or a set of investors may attempt, and sometimes succeed, in securing management control of a firm from another set of investors through the trading of shares. This may be done, for example, by friendly or hostile takeovers by means of a tender offer, or by mergers or acquisitions negotiated by the board. It is mainly relevant for public listed corporations; shareholders in unlisted corporations often have restrictions on how they may dispose of those shares (such as a veto power by other shareholders).

The MFCC serves as an external corporate governance mechanism by ensuring that management acts to maximize shareholder value through efficient use of a corporation's resources irrespective of whether current shareholders are satisfied with management's performance. If shareholder value is not being maximized, new investors can, in theory, create value for themselves by taking control and putting in place managers who they believe can maximize shareholder value, or by one organization taking over or merging with another to create value through, for example, transfer of core competencies or increased market power. Although, in general, the MFCC creates shareholder value, the evidence suggests that the shareholders of the target company often gain a larger portion of this value than the shareholders of the acquiring company.

All public corporations are subject to the MFCC, including those that are efficiently and ethically managed: It is not just a mechanism for disciplining ineffective management. As the MFCC encourages managers to do what they should already be doing, control does not have to be transferred for the mechanism to be effective: The threat of the transfer is an equally effective, and in some cases a more effective, corporate governance mechanism.

The MFCC is more effective as a corporate governance mechanism in countries where shareholdings are dispersed and there is high liquidity, such as in the United States and the United Kingdom, but generally less effective in countries where there is often a controlling shareholder, such as in Germany, or a controlling group of interconnected shareholders, such as the Japanese *keiretsu*. In such instances, the role of the MFCC is replaced by direct monitoring of management. Even where the Anglo-American model of corporate governance is entrenched, the MFCC may not be effective; in Kenya, for example, there has not been a single hostile takeover since the stock exchange was founded in 1954, and in 2005 the turnover ratio was only 7.9%.

There are three broad groups of ethical issues raised by the MFCC. The first group relates to the social consequences of changes of control. The MFCC effectively forces managers to maximize shareholder value even when this is at the expense of other stakeholders. For example, if a firm pays wage rates above those of its competitors, or engages in activities such as education or health care, protecting the environment above regulatory minima, or philanthropy, then it is effectively transferring value from shareholders to other stakeholders. Although this may be ethical business practice, the MFCC punishes such behavior: Those taking control of the firm do so to increase shareholder value not by creating additional value but by transferring value back to shareholders through reducing wages and cutting programs. Changes of control may also result in relocation or rationalization of operations, which may have devastating impacts on local communities. An even larger impact may result from especially Western corporations using their advantages in, for example, technology and access to cheaper financing to take control of corporations in developing countries and then expatriating profits, thereby undermining the economic development of such countries.

The second group of ethical issues relates to the tactics used in the MFCC, especially those used to thwart it, as they may have negative side effects. To make changes of control more difficult, a corporation may, for example, (1) incorporate in a jurisdiction in which legislation makes hostile takeovers more difficult; (2) put in place the so-called shark repellents such as poison pills (e.g., a conditional rights issue) and golden parachutes (massive severance packages for directors and senior managers in the event of a takeover); (3) take over a competitor to make the merged corporation too large for the potential acquirer, or if the potential acquirer is a competitor, make antimonopoly regulator approval more difficult; (4) act to artificially inflate the share price through market failures such as the exploitation of information asymmetries, making it more difficult for outsiders to finance the purchase; (5) use different share classes, for example, a family-owned corporation may give family members (or any corporation may give as remuneration to current directors and managers) shares with voting but not economic rights; (6) have large, but not controlling, shareholders act together to effectively control the corporation, which in some jurisdictions is illegal; or (7) sell the corporation to a friendly suitor (the "white knight" defense). There are also opportunities for unethical behavior on the part of the outsiders, especially for "greenmail," in which a raider begins purchasing shares and threatens a takeover, and then offers to sell the shares to other shareholders or management at a premium if they wish to retain control.

The third group of ethical issues relates to the fiduciary duties of managers in change-of-control situations. The managers of a corporation have an obligation to act in the corporation's best interests. Some changes of control are in a corporation's best interest, and managers have a duty to facilitate them even if it means that they will personally suffer negative consequences, including loss of employment. In other instances, the change is not in the corporation's best interests, and managers must try to prevent it even though, for example, they may have personally profited from it such as by a golden parachute. It is unethical for managers to acquire another corporation simply to increase their own prestige and remuneration if it does not increase their own corporation's value. Hostile takeovers raise ethical issues if proper due diligence cannot be undertaken, because in that case the shareholders of a company cannot properly evaluate the risk that is involved.

Although the MFCC is useful as a corporate governance mechanism in only a small number of countries, and even in those countries appears to be more effective as a threat than when effected, it plays an important corporate governance role in those countries by helping to ensure that managers consistently act to maximize shareholder value. Nevertheless, it raises many ethical issues that need to be addressed through legislation and regulation, listing rules, corporations' constitutions, and shareholder activism.

Market for Lemons

George Akerlof developed the idea of the market for lemons to explain problems related to information asymmetries in markets. "Lemons" refer to used cars that are of poor quality. If there are two types of cars on the market—those of high quality ("cherries") and those of low quality ("lemons")—and the buyers and sellers can easily determine which category a cars falls into, then both types of cars will be sold and high-quality cars will sell for a higher price than low-quality cars. In the real used-car market, however, there is an information asymmetry problem because the sellers of cars know more about the quality of cars than the potential buyers. Because the quality of a used car may be difficult and costly for the buyer to determine (and the seller may still have an information advantage due to actual experience with the car), the buyer will want to avoid the risk of paying a high price for a low-quality car. To do this, the buyer will assume that all cars are of an average quality. This assumption will cause the demand curve for high-quality cars to shift down (decreasing the supply of high-quality cars), but cause the demand curve for low-quality cars to shift upward (increasing the supply of low-quality cars). Over time, this shifting of the demand curves will continue to occur until only low-quality cars are sold. This is a market failure because there is no longer a choice of cars of various quality levels for the consumer to choose from. Instead, only sellers of "lemons" will be participating in the market.

The above analysis can also apply to the markets for health insurance, financial credit, and other markets with information asymmetry problems. In health insurance, for example, the buyers of insurance will have an advantage over sellers with respect to information on the quality of the buyer's health. As a result, unhealthy buyers purchase insurance at the price of an "average" buyer, which then forces up the price of insurance and causes healthy buyers to choose not to be insured (which further increases the proportion of unhealthy buyers as holders of insurance). Over time, the market fails. This problem is referred to as adverse selection.

Potential solutions to the lemons problem include signaling and developing a positive reputation. Signaling involves actions that allow sellers to distinguish their high-quality products from sellers of low-quality products, although buyers cannot determine the level of quality until after they make a purchase. For example, sellers of high-quality cars could offer a warranty or money-back guarantee on their car because they know that buyers will rarely need to use the warranty or guarantee after a purchase. Sellers of low-quality cars, on the other hand, could not afford to offer such warranties, because buyers would exercise those rights and create additional costs for the seller. Thus, the presence of a warranty may provide a useful signal to buyers as to the true quality of the car and they will no longer make the assumption that all cars are of average quality. Likewise, if the seller develops a positive reputation, then buyers may be willing to trust the seller's statements as to the quality of the car and avoid the market for lemons problem.

MARKETING, ETHICS OF

Marketing ethics is the systematic study of how moral standards are applied to marketing decisions, behaviors, and institutions. Because marketing is a process inherent to most organizations, marketing ethics should be viewed as a subset of business ethics; thus, much of what is written about business ethics applies to marketing ethics as well. At the outset, it is also useful to distinguish between *positive* and *normative* marketing ethics. Positive marketing ethics looks at marketing practices from the standpoint of "what is." For example, specifying the percentage of organizations that have codes of ethical marketing practice or tracking the number of violations that deal with *deceptive advertising* would be examples of positive marketing ethics. In contrast, normative marketing ethics deals with how marketing *ought* to operate according to some moral standard or theory. The sort of moral standards (or theories) applied to marketing situations involve the usual moral frameworks commonly applied when evaluating business ethics (e.g., utilitarianism, duty-based theories, virtue ethics). When the words "marketing ethics" appear in the general media or business press, the reports typically describe a marketing strategy, tactic, or policy that some constituency feels is "unfair" or "exploitive" or "deceptive." Often, the subsequent discussion turns to how marketing practices might become more consumer-friendly, socially compatible, or put in philosophical terms, how marketing might be *normatively* improved.

Normative marketing practices might be defined as those that emphasize transparent, trustworthy, and responsible personal and/or organizational marketing policies and actions, and exhibit integrity as well as fairness to consumers and other stakeholders. In the true spirit of normative ethical standards, this definition provides certain virtues and values (e.g., trust, fairness) to which marketing practitioners ought to aspire. However, the definition also raises myriad questions. What do we mean by transparent? Does that mean no trade secrets are ever allowed? What is the essential nature of integrity? Does it mostly involve keeping organizational promises to customers or is it broader than that? What is the nature of fairness, and who decides what standard of fairness is to be applied? Should it be consumers, the company at focus, regulatory agencies, or a broader cross-section of society? What stakeholder interests should be taken into consideration, and how should they be weighted? As one can see from these questions, the area of normative marketing ethics is likely to generate considerable controversy because there are differing views among various parties about what constitutes "proper" behavior in marketing.

General Perspectives

Because marketing is the organizational process focused directly on exchange, ethical issues in marketing have existed since the inception of trade. The Roman philosopher Cicero counseled merchants to avoid raising prices too high in times of shortage, lest they alienate their customers, who might shun them when supplies were more abundant. However, the analysis of marketing ethics from a more systematic and analytical standpoint has only begun to develop in the past 40 years. Since the mid-1960s, the literature on marketing ethics has grown substantially. A recent 2005 ABI/Inform literature search using the term *marketing ethics* as its search query generated a list of more than 400 citations to the literature—all of which presumably addressed marketing ethics in some scholarly form or fashion. While cynics view the term *marketing ethics* as an oxymoron, no doubt due partly to the frequent questionable activities of some used car dealers, advertising copyrighters, and telemarketers, there exist clear and articulated standards of proper behavior that are "peer endorsed" by marketing practitioners. In other words, marketing managers themselves have expressed their opinions as to the ideal obligations inherent in the honest and forthright conduct of marketing. Perhaps the best known of these codes of conduct is the American Marketing Association's (AMA's) "Statement of Ethical Norms and Values for Marketers." This document—endorsed by the largest professional organization of marketing practitioners in the world—and available for review at www.marketpower.com (search: code of ethics) specifically states that marketers serve not only their company enterprises but also act as stewards of society in creating, facilitating, and executing the efficient and effective exchange transactions that are part of a greater economy. The AMA statement recognizes the duties that marketers have to all stakeholders (e.g., customers, employees, investors, channel members, regulators, and the host community) as they discharge their job responsibilities. This document explicitly warns that marketers must not knowingly do harm in executing their selling responsibilities, that marketers have a duty to foster trust in the marketing system, and that they should embrace basic marketplace values, including truth telling, genuine service to customers, avoidance of practices acclaimed to be unfair, and an adherence to honest and open communications with clients. Significantly, it states that marketing organizations have responsibilities of "citizenship" just as individuals do. Documents such as the AMA Statement represent hard evidence that there are bedrock ethical standards and values that have been agreed on by numerous marketing practitioners.

Of course, the extent of practitioner compliance with these values is another issue. Over the years, surveys of marketing managers report that the vast majority of practitioners discharge their job responsibilities in a lawful and meritorious manner. Nonetheless, every year brings its share of horrific and controversial marketing blunders. Current issues in the news involving marketing practices have to do with price-gouging when gasoline shortages occur (as they did in the wake of Hurricane Katrina) and stealth marketing techniques such as surreptitiously gathering information about consumer patterns when they surf shopping sites on the Web. In general, national opinion polls of the public suggest that marketers have plenty of room to improve their ethical performance before it conforms to public expectations. Perhaps the "truth" about marketing lies somewhere between the practitioners view that marketers are predominantly "good guys" and the public perception of marketers as suspect purveyors of sometimes dubious goods and services.

While the above-mentioned statement of AMA of "norms and values" is partly inspirational in nature, there has also been substantial effort expended by marketing academics and ethics scholars to develop pragmatic models of marketing behavior that delineate the factors that shape and affect ethical (or unethical) marketing decisions. An example of such a work (*positive* marketing ethics) would be the Hunt-Vitell model of marketing ethics—a framework that has been subjected to extensive empirical testing. This complex model takes into account various factors such as (1) environmental dimensions in industry and the organization influencing ethical actions, (2) the recognition by decision makers of an ethical problem and its likely consequences, (3) the teleological and deontological norms used by marketing decision makers that might affect their selection of various alternative choices, (4) the type of ethical judgments made in various situations, (5) the formation of any intentions attributable to the marketing practitioners at focus, and (6) a measure of the outcomes of actual behavior. The purpose of weighing the myriad factors involved in real-world marketing decisions associated with ethical questions is that it helps specify the gaps between what the actual behavior of marketing practitioners *is* versus how far managers need to go in order to be in conformance with various marketing ideals. Empirical studies, using models such as Hunt-Vitell, have suggested, for example, that the standards managers use to address ethical questions vary considerably (e.g., some are utilitarian; some derive their perspectives from religious traditions). Moreover, the response to ethical issues by managers depends on the issue being addressed. For instance, the majority of managers might be very concerned that clandestine competitive intelligence gathering is growing in their industry but most may not be bothered by "puffery" (advertising exaggeration). Yet both practices are subject to ethical debate in the public realm. It is in the conduct of such systematic *ethics research* that the positive and normative aspects of marketing come together because marketers can learn what to "fix" based on what is actually going on.

Marketing Practice

At the heart of marketing ethics are decisions that marketing practitioners make about ethical questions. Ethical questions most often arise in marketing when a stakeholder group or some segment of the public feels that the actions taken by some (or many) marketers might be judged to be morally inappropriate. Currently, for instance, many consumers feel that *spam* advertising over the Internet is far too prevalent and/or that product rebates have too often been intentionally made to be difficult to redeem. Similarly, other ethical questions occur when marketing managers believe that they might be compromising their own personal values in the quest for increased organizational profit. In such situations, marketers are often evaluating whether they should take *business* actions that they feel ought *not* to be done from the standpoint of *personal* ethics that they hold—the essence of an ethical dilemma. Most managers cannot avoid facing such tough issues because the majority of marketing professionals report confronting such ethical questions at some point in their careers. These "ethical" branch points can pertain to a host of marketing issues such as selling cigarettes to teenagers, the promotion of violence-oriented video games, pricing products at a level that exploits unsuspecting consumers, bluffing in negotiations with long-time suppliers, writing intentionally misleading ad copy, and so on. If the marketing actions that are taken happen to be in violation of the law, these are also typically characterized as unethical. However, our focus in this entry is particularly on actions that are *not* illegal but that are criticized as "improper" according to some ethical value or norm. Therefore, marketing ethics is mostly focused on marketing behaviors that are not prohibited by the law but perhaps should not be indulged due to certain moral considerations. And thus, marketing ethics is often concerned with actions that are currently legal but still might be judged improper according to some invoked moral standard. For instance, NASCAR has every legal right to have their automobiles sponsored by and festooned with the logos of brewers, distillers, and other alcoholic beverage makers. Whether it is ethical to link speeding race cars to alcohol beverages given the significant "driving while intoxicated" problem that exists in the United States is a matter for debate.

Most generic areas of marketing practice provoke substantial ethical comment and discussion. These areas include marketing segmentation, marketing research, product development, pricing, distribution, personal selling, and advertising. In the paragraphs below, a sampling of marketing issues, often suggesting ethical questions from these areas of marketing practice, is briefly reviewed to illustrate both the nature and the scope of marketing ethics in the conduct of business operations.

Market Segmentation

One of the basic strategies of marketing campaigns involves the division of the mass market into "segments" followed by the development of specific offerings to appeal to the selected "target market." Ethical questions especially surround the target marketing of segments that include potentially vulnerable populations such as children, the elderly, the impoverished, and marketing illiterates. The "ethical issue" at focus here centers on whether marketers have too much "power" over certain groups who are not prepared to independently participate in the marketplace.

For example, children are a $25+ billion market in the United States alone for products such as toys, sugared cereal, DVDs, and video games. One major ethical question involves the extent to which marketers can freely treat children as "consumers in training" (mini adults) subject to pretty much the same promotions as the rest of the (adult) market. For young children (less than 8 years old), there is the issue of whether they even understand the difference between (for instance) television advertising and the programming itself. For older kids, the ethical issues might focus more on the appropriateness of certain products (violent video games), or the degree to which young teenagers might be susceptible to particular kinds of provocative fashion or lifestyle advertising. The key issue involved in targeting children turns on whether marketers should be held to a higher standard care and caution when marketing to children. One illustration of emergent constraints when approaching children involves the passage of the Children's On-line Privacy Protection Act of 1998 that was promulgated because of significant parental concerns regarding the collection of market research information data over the Internet from children younger than 13. Essentially, this federal legislation, inspired by numerous ethical questions raised by the general public, prohibits the collection of any personal information by market researchers from "under 13s" without verifiable permission from parents allowing it.

Similar questions about vulnerability to marketing scams occur with regard to older consumers—especially those more than 80 years of age. Such seniors are living longer, and as they grow older, they become less confident in their decision-making ability and become potential targets for the fraudulent sales of financial services, vacation packages, insurance annuities, and prescription drug plans—to name only a few product categories. As the baby boomers grow older and make up a larger percentage of the population, the focus on the appropriateness of marketing practices to this senior segment will only increase in prominence. Various scams that exploit seniors (e.g., sweepstakes that promise winnings but are designed only to sell magazines) are reported in the press almost weekly.

Marketing Research

Since marketing decisions are often data driven, market research techniques and outputs are frequently used by marketing practitioners. Market researchers themselves often have considerable training in methodological and statistical techniques, and one might surmise that because of their greater education, they exhibit a higher degree of ethical professionalism than other marketing practitioners. Certainly, it is true that various professional organizations related to the practice of marketing research such as the Council for Survey Research, the Market Research Society and the European Society of Marketing and Opinion Research have developed detailed codes of ethics addressing common conflicts that occur in the execution of marketing research. These "conduct codes" of these professional organizations can be accessed at their Web sites and provide a modicum of guidance for marketing researchers when facing common situations that occur as part of the research process. These codes stress that tactics such as protecting respondent confidentiality when it is promised, not misrepresenting the identity of the research sponsor, properly disclosing research procedures, and many other professional practices should be adhered to.

Additional ethical issues arise owing to the fact that marketing research often involves contact with the general public, usually through the use of surveys that are increasingly being conducted online. Because marketing research activity relies heavily on publicly submitted information, some of which is personally sensitive, marketing research is ripe for ethical abuse or misuse. As survey research has become digitized, researchers have gathered substantial records about consumer product and service usage as well as their satisfaction. As a result, the issue of *consumer privacy* is at the forefront of marketing research ethics. It is hoped that the coming decade will yield definitive answers about the extent of privacy protection that consumers can expect when shopping online. Second, most marketing research is conducted by for-profit organizations to aid decision making within corporations. As a result, the profit motive may cause researchers or their clients to compromise the objectivity and precision of the research that is undertaken. Researchers inherently want to provide support for the outcomes their sponsors hope to find. Clients basically want the research they conduct to tell the best possible story about their company and their products. It should not be surprising then that marketers sometimes fall to the temptation of misusing market research information by manipulating or exaggerating the results.

Product Management Ethics

Ethical issues surrounding the management of products are central to marketing because the marketing process generally begins with a product (broadly defined to include goods, services, or ideas). The most common ethical concerns in this area pertain to the safety of products. Earlier, in the brief discussion concerning the AMA practitioner norms and values, the notion of "never knowingly doing harm" was introduced as a central ethical percept. Certainly, this prescription directly applies to the area of products. That products are safe "for their use as intended" is a basic consumer expectation and is embodied in common law within the concept of "implied warranty." While the sale of safe products is a fundamental marketing expectation, many consumers remain skeptical as to whether they are likely to receive this protection. A 2005 Yankelovich/MONITOR poll of consumers found that 61% agreed that even long-established companies cannot be trusted to make safe, durable products without the government setting basic industry standards. Indeed, a minimal base line of consumer protection in this area is assured via regulation by the U.S. Consumer Product Safety Commission, which has the general mandate to oversee product safety in the United States. Other government agencies also oversee specialized areas of product category such as the U.S. Department of Agriculture, the Food and Drug Administration, and the U.S. Department of Justice, which has specific jurisdiction for alcohol, tobacco, and firearms.

Despite all these protections, perennial ethical questions about product safety continue to be asked: How safe should products be? How safe is safe enough? When products harm consumers in the course of normal usage, who should be held liable? Too often marketers fail the safety test. For example, each Christmas season various consumer advocacy groups identify and publicize toys that are potentially dangerous to young children unless used with extreme care and under adult supervision. And, exactly where to draw the line in automobile safety is a never-ending debate. Should SUVs, which American consumers both love and demand, roll over as often as they do? Should side air bags, which consumers generally are reluctant to pay for as "add-ons," be mandatory because they can prevent serious injuries?

Another growing area of concern is product counterfeiting. Product counterfeiting involves the unauthorized copy of patented products, inventions, and trademarks or the violation of registered copyrights (often for the purposes of making a particular product look like a more popular branded leader). Common examples of product counterfeiting include fake Rolex watches, knockoff Levi jeans, and illegally pirated video and audio tapes of popular movies and music. It is estimated that product counterfeiting costs American companies $450 billion in sales each year. Product counterfeiting is unethical and, in most markets around the world, illegal as well. Counterfeiting is unethical because it involves an attempt to unfairly capture the "goodwill" created by one company's brand equity and unfairly transfer it to a knockoff product without royalty payment to the originating party. Simply put, counterfeiting is a form of intellectual theft. Interestingly, the majority of college students in the United States find "downloading" music from the Internet without paying to be a mostly harmless and ethical practice. With the expansion of China's economy and the many knockoff products that seem to originate there, product counterfeiting will be a major ethical issue for organizations in the early part of the 21st century.

Another instance of common ethical concern involves products that create problems for the physical or natural environment. Examples would include product packaging that is not biodegradable; products that use inordinate scarce resources such as large sports utility vehicles (e.g., the Hummer) along with their unusually low fuel mileage; various chemicals and detergents that pollute the land, air, and groundwater when improperly disposed of; and medical wastes that are sometimes dumped into oceans or lakes because the proper disposal of such material is burdensome for the user. Contributing further to all this is an increasingly "disposable lifestyle" in many developed countries that generates waste-handling problems, a residue of the convenience-oriented mentality—fueled by marketing. For example, the average American generates approximately 4 pounds of garbage a day of which 30% represents product packaging. The fundamental ethical issue connecting all these ecological examples is that of *externalities.* Basically, externalities are costs that are imposed on the society as a whole that are not paid for by the original producer or consumer. To take an obvious example, when beer bottles and soft drink cans are littered in public parks or recreational areas, the cleanup of that packaging represents an "externality." As a response to all this, a "green marketing" movement has developed, which puts a premium on product marketing and programs being compatible with environmentally protective principles. To this end, some organizations have embraced the Coalition for Environmentally Responsible Economies (CERES) principles—some of which speak directly to marketing-connected issues. In general, these principles involve adhering to an environmental ethic of strong commitment to ecological excellence as well as human health and safety. The CERES principles, which can be accessed online, are yet another normative code of conduct to help guide marketing actions in particular areas of operations.

Pricing

Perhaps no area of managerial activity is more difficult to assess fairly and to prescribe normatively in terms of morality than the area of pricing. The given price of a product or service commonly results from the confluence of three factors: *demand*, *competition*, and *cost.* Each of these factors can be central to ethical questions about pricing fairness. For example, when high demand puts pressure on supply, such as the desperate need for construction materials after a natural disaster, there may be a temptation for sellers to price-gouge. Or in an attempt to gain dominant market share, strong competitors may use predatory pricing (below cost pricing) to drive economically challenged sellers from the marketplace. In a business-to-business setting, a vendor may simply mislead a client concerning what "actual costs" have been incurred especially if they are operating under a "cost plus" pricing contract. While there is agreement that sellers are entitled to some profit margin above their full cost, how high prices can be and still be "fair" has been debated since medieval times. According to theologians such as Thomas Aquinas, the "just price" was often conceived of as the (debatable) amount above cost that the merchant needed to charge in order to maintain his or her business and to provide for his or her family. Charging more than that was to commit the grievous sin of avarice.

There is presently considerable regulation that helps establish some minimum behaviors for "fair pricing" (e.g., *price-fixing* by sellers, sometimes called "collusion," is illegal; similarly, "price discrimination" to different distributors by sellers without economic justification is also contrary to commercial law). Nevertheless, the concept of ethical pricing seems destined for considerable future debate. One current practice in the news has to do with the pricing strategy engaged in by the so-called pay day loan stores (i.e., those lending businesses that provide instant cash advances in lieu of unpaid, but earned, wages). These operations charge extremely high interest rates mostly to the impoverished segment of the market. A second dubious pricing instance involves some forms of adjustable rate mortgages that can often trigger significantly higher repayment rates for a variety of dubious reasons. And, a third questionable pricing scheme centers on “rent-to-own” furniture/appliance stores whose cumulative rate schemes often translate to payment totals far in excess of the total cost of the items rented. In each of these instances, it is argued that the pricing is “exploitive” because the high rates take advantage of certain unwary or desperate consumers.

Distribution

The distribution element of marketing involves the entire supply chain from manufacturer through wholesalers and distributors (including retailers) on to the final consumer. At each point in the supply chain, because there are economic interactions between these various parties, the potential for ethical issues to occur is quite common. Perhaps the most overarching issue within the channel of distribution supply chain has to do with the question of *power and responsibility* within the channel itself. Often one organization within the channel has greater economic leverage than other channel members, and with that economic leadership comes a potential for ethical abuse. A current example of this situation might be the enormous economic power that Wal-Mart possesses over its suppliers. Due to their dependence on Wal-Mart’s access to the market, suppliers must conform to Wal-Mart’s various contract requests or face losing a distribution outlet that serves tens of millions of customers. One perhaps encouraging lesson of marketing history is that channel members who abuse their power eventually lose it, often through the enactment of new government regulations that restrict and constrain certain competitive practices.

Another common concern within channel relationships has to do with “gift giving” that sometimes mutates into bribery. A long-standing business custom is to entertain clients and to give modest gifts to business associates. Such practices can cement important economic relationships. The pervading ethical question, of course, is, “When does a gift become a bribe?” Historically, for example, pharmaceutical companies have offered medical doctors lavish entertainment and gifts. The drug companies have argued that these amenities are not being provided to influence physician prescription decisions, but rather simply to inform them of the availability of new branded drugs. Consumer advocates contend that such practices are forcing consumers away from less-expensive generic drug alternatives and contribute directly to escalating health care costs. Not surprisingly, one of the best ways for channel members to deal with such potential ethical questions is to develop clear guidelines that address some of the typically questioned practices that exist within their particular industry. For instance, some companies restrict their employees from giving or accepting anything worth more than $20 in a given year when dealing with a business partner. In this manner, managers are given at least minimal guidance as to what constitutes acceptable and nonacceptable gift-giving practices.

Personal Selling and Sales Management

Sales positions are among the most typical marketing jobs. Ethical conflicts and choices are inherent in the personal selling process because sales reps constantly try to balance the interests of the seller they represent with the buyers that they presumptively serve. Moreover, sales reps seldom have the luxury of thoughtfully contemplating the ethical propriety of their actions. This is because sales reps operate in relative isolation and in circumstances that are dynamic with their business transactions frequently conducted under great time pressures. Even when sales reps electronically submit real-time sales reports of their client calls, such “outcome-oriented” paper evaluations contribute to a perceived clinical distance between sales managers and their representatives. Business case history tells us that sales people seem to be most prone to acting unethically if one (or more) of the following circumstances exist: when competition is particularly intense; when economic times are difficult placing their vendor organization under revenue pressure; when sales representative compensation is based mostly on commission; when questionable dealings such as gifting or quasi-bribes are a common part of industry practice; when sales training is nonexistent or abbreviated; or when the sales rep has limited selling experience.

Sales managers in particular bear a special responsibility for questionable selling practices because they are in a position both to oversee their sales staff and to influence content and implementation of sales policies. Ethically enlightened sales managers should regularly review their sales literature before distribution to minimize the possibility that inflammatory (to competitors) material is inadvertently circulated. They should counsel their sales people not to repeat unconfirmed trade gossip. They should strive to maintain a sales environment free of sexual harassment. They ought to encourage their sales people never to make unfair or inaccurate comparisons about competitive products and avoid claiming the superiority of their own product/service offerings unless it is supported by scientific facts or statistical evidence documented or prepared by an independent research firm. Despite best efforts of marketers, the area of sales will continue to have its share of ethical controversies. Sales are the most common entry-level position into the field of marketing and also the job position in marketing about which the general public feels most suspicious.

Advertising

Advertising is a significant economic force in the world economy, with global ad spending projected to be well over $300 billion in calendar year 2005. The visibility and marketplace influence of advertising is so great that many consumers think of advertising as synonymous with marketing. Various critics charge that advertising is biased, needlessly provocative, intrusive, and often offensive. Yet most surveys suggest that the majority of consumers, on the balance, find advertising both entertaining and informative. While some types of advertising involve outright transgressions of the law (e.g., deceptive advertising containing intentional errors of fact), a great deal of advertising controversy involves practices that are perfectly legal but still raise moral questions. For example, promoting handguns in magazines with a substantial teenage readership, the featuring of bikini-clad Paris Hilton suggestively soaping down a car in an ad campaign for hamburgers, and implied health claims for products that may not be especially healthy (e.g., low-carb beer) are instances of controversial (but legal) advertising approaches. Over the years, many lists of citizen concerns about the ethics of advertising have been put together. Often included on those lists are questions about the appropriateness of tobacco and alcohol advertising, the use of stereotypical images in advertising (e.g., Hispanic gardeners, hysterical housewives), the increased amount of negative (i.e., attack) political advertising, and various attempts to exploit children as buyers. The last issue is particularly sensitive to the public and, since the early 1970s, the Children's Advertising Review Unit, established by the Better Business Bureau, has monitored advertising directed to children less than 12 years and has sought the modification or discontinuance of ads that were found to be inaccurate or unfair in some fashion.

One of the more curious features of ethics in advertising is that the involvement of several parties (i.e., ad sponsor, ad agency, and the media) in the creation of advertising has probably led to a *lower* ethical standard in the practice of advertising than one might expect. The presence of multiple parties, none of whom has full responsibility, has created the default position of "leaving it to the others" to articulate and enforce an appropriate ethical standard.

Implementing Marketing Ethics

Of course, at the heart of marketing ethics is the issue of how to improve the ethical behaviors of organizations as they discharge their marketing tasks and responsibilities. There are several elements of successful implementation that have been regularly articulated in the business ethics literature and successfully applied to marketing. Good ethics begins with a chief marketing officer (CMO) who must not only publicly embrace core ethical values but also live them. It is often said that the organization is but a lengthened shadow of the person at the top; this is no less true of the marketing organization. Implied also, then, is that the CMO is supported in the endeavor to maintain strong ethical values in marketing operations by the chief executive officer (CEO) of the corporation. Put another way, a key role of the leadership of any company wanting to travel the high ethical road is to keep publicly voicing the importance of ethical conduct in the discharge of their business affairs. Such ethical exhortations involve espousing the core ethical values identified in the corporate mission statement. These values should be made operational in a code of conduct that addresses the specific ethical issues that are most common to a particular company or industry sector. For instance, the Internet sellers must explicitly address privacy policies for their shoppers, vintners should comment on the question of responsible drinking, and so forth. Furthermore, it is important that any such marketing code be dynamic and periodically revised. Caterpillar Corporation, a manufacturer of heavy construction equipment, has revised its code of conduct five times since the mid-1970s. Moreover, any organizational code or statement of norms must also be communicated well enough that all employees can verbalize its essential values. It is equally important that managerial and employee behavior in the organization be monitored, including that of the CMO, so that conformance to company values is checked on in a pragmatic way. One tool for doing this is the usage of a periodic *marketing ethics audit* to systematically check company compliance with ethics policies and procedures. When ethical violations occur, proportionate punishment must be meted out. Similarly, when organizational managers perform in an ethically exemplary fashion, appropriate rewards also should be provided. This last step testifies to something beyond financial results leading to recognition in the organization. Details of executing all these steps have been exhaustively treated in the business ethics literature and modified for a marketing context. Johnson & Johnson and Ford are examples of organizations that conduct audits of their social performance that includes the evaluation of multiple marketing dimensions.

Conclusion

At the end of the day, the most vexing ingredient in the recipe for better ethical behavior by marketers remains the force of will to always keep ethics at the heart of a company's purpose. The pressure on individual organizations to maintain and improve their profitability and to grow revenues is incessant. The nature of marketing management is to provide needed consumer goods and services by undertaking risk that, if calculated properly, is rewarded with financial profit. Ethical operations, at least in the short run, can be detrimental to that profitability because they often include some economic cost. Keeping ethical marketing at the forefront of operations is an exceedingly difficult challenge given the constant pressures on marketing managers to remain financially successful and growing.

Market Power

Market power describes the capability of either a buyer or a seller to negotiate, bargain, and make exchanges that are more aligned to their own preferences than to the preferences of the other. A market, where goods and services are bought and sold, is a social institution where benefits and costs are distributed. Market power is the means for market participants to appropriate more benefits for themselves while providing less benefit and transferring more cost to others.

Buyers and sellers negotiate, bargain, and make their exchanges in the market. In a free market, where each exchange is a voluntary transaction between a self-interested buyer and a self-interested seller, buyers or sellers can demonstrate their market power by making credible threats to abandon, or "walk away from," a bargaining or negotiating interaction. When buyers and sellers can choose whether to enter into agreements, successful exchanges depend on their ability to negotiate terms that satisfy their individual needs.

Explicit communication of a threat to walk away from the exchange is not necessary if one party to the negotiation can recognize the presence of market power without being told. Such recognition, or tacit communication, can arise from patterns in the economic relationships among sellers and buyers. A market relationship in which the seller is dominant may arise from a single, large organization that has a monopoly over supply, or from interorganizational cartel relationships in which several suppliers coordinate their activities to exercise power over smaller and more fragmented buyers. Conversely, a single buyer may be a monopsony or a large organization that accounts for almost all demand. In the absence of monopsony, many smaller buyers may form cooperative relationships to pool their demand and achieve market power over sellers.

Sometimes, market power may be explicitly exercised outside of the direct exchange process. For example, buyers may apply activist techniques that mobilize media, popular opinion, public policy, and other stakeholders to influence the market behavior of suppliers.

For sellers with a surplus of goods and services, unsold products are a cost burden—costs to store the inventory, costs of production equipment not generating revenue, and costs of aging products that may spoil or become obsolete. In this situation, buyers may not need to explicitly threaten sellers in order to exercise market power in negotiations. The relationship of supply and demand motivates sellers to give up their bargaining power so that they can attract relatively scarce buyers for their relatively abundant supply.

Reaching an agreement on a fair price when supply exceeds demand may be an interesting ethical dilemma. If the supplier knows that supply exceeds demand, does honesty require that they inform the potential buyer? If buyers know, is it fair for them to use their market power to demand a price so low that the seller risks going bankrupt? Interestingly, the principle of economic efficiency is *yes* to both questions. The laws of supply and demand are fundamental engines of free markets, but the engine only works as intended when buyers and sellers have accurate and timely information. Furthermore, society is most productive over the long term when inefficient businesses stop operating and their resources are redeployed to other productive activities. The exercise of market power to serve long-term social progress, however, imposes responsibilities to care for the welfare of those sellers without market power in the short term. Typical examples of such short-term care include public unemployment and retraining insurance.

When demand exceeds supply, there is a shortage of goods and services. In this situation, sellers do not have the capacity to satisfy all potential customers, and they can trade with customers willing to pay a high price, while refusing to sell to buyers not willing to pay the seller's preferred price. Some events such as natural disasters or terrorist attacks can cause demand in some local areas to far exceed available supply for short periods of time. Most societies think it highly unethical and unfair for sellers to use their market power to charge high prices in these emergency situations. Many governments have outlawed the use of such market power.

There are macroeconomic circumstances in which the use of bargaining power in free markets usually is considered fair. For example, if the macroeconomic business cycle is in a period of declining sales, then each customer is precious and sellers must give more and more net benefit to customers in order to capture a potential sale. Conversely, if the macroeconomic business cycle is in a period of increasing sales, then sellers are more likely to abandon negotiations with customers who are too demanding.

Free market advocates consider it fair for buyers and sellers to exercise their market power, as long as the power is exercised honestly and in accordance with law. Milton Friedman, an American economist and Nobel Prize winner, wrote in the tradition of Adam Smith (*Wealth of Nations*, 1776) that the exercise of honest and voluntary exercise of market power is the only socially responsible business behavior. Advocates of more planned economies, however, often consider the mismatched market power among buyers and sellers conducive to fraud, abuse, and chaotic distribution of goods and services throughout society. Also, advocates for poor people, such as Dr. Martin Luther King Jr. during the 1960s in the United States, are concerned that the lack of market power means an unfair distribution of goods and services that perpetuates conditions of poverty from generation to generation. Public policy may respond to such concerns with socialism, the ownership of industry by government to control market power for equitable distribution of goods and services throughout society.

In addition to micro- and macroeconomic conditions, there are unique characteristics of buyers and sellers that may give rise to market power in negotiations and bargaining. If a large portion of a seller's total wealth is the outcome of a potential agreement with just one buyer, then the seller must comply with the preferences of that one customer or risk the loss of significant wealth. If the buyer has a choice of many sellers from whom to purchase, then each seller must be very responsive to the buyer's preferences or risk losing the sale. Buyers also gain power if they can switch from one seller to another with little or no cost, such as a customer who can buy this year from a different clothing store than last year at the same shopping mall. In all these situations, the buyer has more market power in the relationship with the seller. Sellers, almost like a hostage, depend on the buyer's integrity for their welfare.

Conversely, a seller has market power in a relationship with a buyer if the goods and services provided by that seller are not available from alternative sources. In this situation, the buyer must acquiesce to the seller's preferences or risk having no supply. Buyers must depend on a virtuous seller who will not abandon them for a better deal elsewhere.

Market Socialism

Socialism is an economic philosophy developed in 19th-century Europe that diagnosed many social ills—poverty, inequality, injustice, and unemployment—as consequences of the capitalist system's private ownership of the means of production. There are many forms of socialism, all of which eliminate private ownership of capital and replace it with collective ownership. These many forms, all focused on advancing distributive justice for long-term social welfare, can be divided into two broad types of socialism: nonmarket and market.

The historical collapse of nonmarket socialism in the 20th-century history of the Soviet Union, Eastern Europe, and China was due, in part, to their inefficiencies caused by information problems of centrally planned complex economies, motivational problems of self-interested people in societies purporting to transcend individualism, innovation problems of change-resistant bureaucracies, and social problems of individual liberty subordinated to coercive, repressive, and corrupt central planning. After the rise and fall of these nonmarket socialist systems, some who remain committed to the ideals of socialism believe that it may be revitalized as a feasible alternative to capitalism if they are perceived to be more accepting of democratic institutions and successful market economies. The proponents of market socialism claim that it is such a viable alternative.

Market socialism has its emphasis on workers' rights and distributive justice for long-term social welfare that is true to socialism's ideals. Rather than central planning, however, production and exchange decision making is located in worker-owned enterprises that transact with local buyers and profit-seeking sellers whose negotiations are informed by the market's prices for goods and services.

In practice, the implementation of market socialism replaces private ownership with worker collectives and profit sharing. Collectives are vested with business decision-making authority that workers exercise in a democratic process. In small firms, decision making might be "one worker-one vote." In large complex businesses, there may be a general manager appointed by elected representatives of the workers. Market socialism is sometimes called economic democracy because of this style of decision making.

Market socialism claims to resolve the flaws of capitalism that motivated original socialist philosophers to seek a better alternative. These flaws include alienation of the worker class, wealth disparities, and unequal distribution of critical goods to the poor who cannot afford market prices. It is not clear, however, what enterprise-level mechanisms will resolve these issues and introduce a compassion for community without the need for some social intervention. Workers must still satisfy their tasked performance objectives whether the business is owned by a workers' collective seeking profit from its investment in labor or owned by private shareholders seeking profit from their investment in labor. Similarly, profit under market socialism remains vulnerable to the forces of market competition, and businesses need to adjust their costs and capacity to fit with these forces. Employees may lose their jobs in times of adjustment and need to apply for new employment with other profit-seeking businesses. In these circumstances, market socialism applies democratic social institutions to guide industrial policy when social needs are not satisfied by enterprise-level decision making. For example, socially owned banking institutions allocate capital funds to worker collectives in areas needing stimulus and growth, even while worker collectives plan and operate production according to the incentives of market-based prices.

Socialist philosophy argues that the goal of production is to serve the community and not to create profit for private interests. Market socialism calls for government at all levels to play a major role in resolving these issues. For example, the national government creates and controls a social investment fund that distributes funds to regional government entities. Each region makes decisions concerning the appropriate level of funding for its constituent community governments; each local community government transfers these funds to public banks; and each public bank makes commercial investments to worker-owned businesses in the local community to increase employment and entrepreneurship. These businesses remain free to use their market power to maximize their profits legally.

Market socialism is premised on a moral philosophy grounded in positive utilitarianism. It assumes that the greater good for a society is knowable, and an economic structure can be designed to create greater good than social harm. This is opposed to institutional social philosophies that argue that institutions (such as capitalism) are embedded in the richness of a society's culture as it unfolds over time. Hayek argued that not all the antecedents and consequences of such embedded systems can be known, and there are unintended consequences when social engineers change institutions. A principle of caution suggests that societywide economic change should not be undertaken when the consequences are largely uncertain. The comparative historical experiences of economic transformation in the former Soviet Union and China provide evidence both for the likelihood of serious unintended consequences and for the advantages of caution.

Israeli kibbutzim are examples of market socialism in modern Western society. Kibbutzim are collectively owned communities that operate modern enterprises and sell their products in both domestic and export markets. Another successful experience with market socialism is found in the system of land-grant universities of the United States. State governments provide these institutions of higher learning with financial and land capital in order for them to educate citizens for productive participation in the community. At the same time, as they are capitalized by government, land-grant universities still must respond to market forces of supply and demand for professors, students, and economically valuable skills and knowledge. These institutions are important public mechanisms that, nevertheless, must work closely with the free market to create and distribute social welfare throughout segments of society that purely private universities cannot serve.

Market socialism blends ethical principles just as it combines different economic philosophies. It starts with a compassion for building just communities and then, because of the need for operational viability, allows for business to be governed by self-interested economic efficiency. Its roots remain in a socialism that has historically been antagonistic to the market system. The moral travel of market socialism to embrace the economic behavior of markets is a reaction to the historical failure of the central planning forms of socialism. Still, market socialism seeks to remedy the deficiencies that many see arise in capitalist systems—disparate wealth, unjust distribution, unemployment, shortages of social services, and alienation.

Marx, Karl (1818–1883)

Karl Marx applied historical and scientific analysis to economic history and concluded that class struggle would lead to a dictatorship of the proletariat as a transition to the development of a classless society governed by the principles of communism. Marx responded to the suffering and injustices he observed and experienced during adulthood by participating in subversive political activities aimed at overthrowing existing political and economic power structures.

The Formation of a Radical

Karl Marx grew up as the second son of nine children in Trier, Prussia, a city now in the western part of Germany. His paternal and maternal grandfathers were both Jewish rabbis. His father converted the entire family to Lutheranism, the state's dominant religion, when Marx was 6 years old, to continue practicing law in the civil service. Marx studied law at the University of Bonn and philosophy at the University of Berlin, where he became attracted to the writings of Kant and Hegel. He obtained his doctorate from the University of Jena in 1841.

Although a brilliant philosophy student, Marx was denied a teaching position because of his Jewish heritage and atheistic religious beliefs. He became a journalist for a liberal newspaper in Cologne and attended socialist meetings. His articles criticized the Prussian monarchy, proposed the abolishment of private property, and encouraged a working class revolution. Marx and his wife, the daughter of Prussian nobility, moved to Paris after the Prussian government threatened to arrest him for treason. There Marx helped create a political journal in exile.

Marx and Engels

In 1844, Marx declared himself a communist and formed a lifetime friendship with Friedrich Engels, another Prussian writer living in Paris. Engels, an heir to a business fortune, published *The Condition of the Working Class in England* in 1845, a seething critique of the negative impacts of the Industrial Revolution on individuals and society. That same year, Marx and Engels published *The Holy Family*, a critique of the Young Hegelians. Marx began writing *Economic and Philosophic Manuscripts*, about the communist solution to capitalist alienation, and *The German Ideology*, about his materialist conception of history, although neither would be published until after his death.

Marx was expelled from France in 1845 for his revolutionary writings. Jobless, he relocated his family to Belgium, where they lived in poverty. Marx joined the revolutionary Communist League whose goals included violently overthrowing capitalism. In February 1848, he and Engels published *The Communist Manifesto* as the political organization's statement of faith. In their call to arms, Marx and Engels argued that capitalism inevitably would be replaced by socialism and then communism.

Marx was arrested and expelled from Belgium in 1848 for supplying revolutionaries with money to purchase weapons. He and Engels reentered Germany as it experimented with democratic reform. They were arrested for inciting a revolt, acquitted, but then deported. Marx went back to Paris to participate in revolutionary activities but was expelled from France again. In 1849, Marx settled in London, England. He lived in slum conditions with his wife and children. Only three of his seven children survived to adulthood.

Engels accepted a job with his father's Manchester, England, textile firm and subsidized Marx's living expenses and revolutionary writings. Marx earned minimal income as the international reporter for an American newspaper and spent most of his days reading and writing in the British Museum's Reading Room. With Marx and his wife in continual ill health, his mother-in-law sent a servant to assist them. The maid gave birth to his illegitimate son, whom he abandoned. In 1859, Marx published *A Contribution to the Critique of Political Economy*, which outlined how economic forces influenced the law, politics, religion, art, and philosophy. After nearly two decades of living in poverty, Marx inherited money and moved his family into a mansion.

In 1867, Marx published the first volume of *Das Kapital*, his economic magnum opus that integrated his economic, philosophic, historical, and scientific thoughts. Three years later Engels sold his portion of the family business and paid Marx a generous annual pension. Marx continued to study, argue with intellectuals, write, and struggle with his many illnesses until his death in 1883 at the age of 65. Engels published the long-awaited second volume of *Das Kapital* 2 years later and the third and final volume in 1894, a year before his own death. The three volumes served as the intellectual foundation for Marxist thought over the next century.

Marxism

Essentially, Marxism replaces the private pursuit of capital with the collective ownership of production and distribution of goods and services. German philosopher and political economist Karl Marx (1818–1883) developed this revolutionary theory of socioeconomic power relations based on his radical socialist critique of capitalism. Communism is considered inevitable as the only way for the majority to completely rid itself from what is regarded as the essentially exploitative nature of capitalism.

While he was deeply influenced by German idealist philosopher G. W. F. Hegel and Scottish political economist Adam Smith, Marx rejected as much of their thinking as he embraced. He replaced Hegel's theory of human history, as an evolving dialogue between opposing ideas (dialectical idealism), with his own "dialectical materialism," whereby ideas are shaped by material and social forces instead of the other way around. He thus followed Smith in analyzing the material implications of the free flow of capital, while rejecting Smith's view of human nature as essentially acquisitive. For Marx, human nature is much more malleable and dependent on prevailing socioeconomic frameworks. Accordingly, Marxists hold that capitalism encourages people to become individualistically competitive and profit seeking, while socialism encourages them to become more cooperative and less selfish. Marx held that capitalism was politically and economically unsustainable and would inevitably lead to a more equitable and beneficent socialism, in which the means of production are controlled by the democratic state. And ultimately, this socialism would lead to a worker-controlled communism in which all property is collectively owned.

Although capitalism is still growing on a global scale, it has been tempered in many ways that Marx predicted. Indeed, no successful economy today is anything close to pure laissez-faire capitalism, and several of the world's largest economies remain semisocialist, for example, France, Germany, Italy, and Canada. China is a notable exception since it is not democratic. History has shown that while every socialist economy has privatized its markets to a certain degree, every successful capitalist economy has regulated them to a certain degree. Thus, each of the world's top 10 economies has sought to find its own ideal mix of capitalist and socialist elements. For example, all the dominant capitalist nations have instituted a minimum wage, antitrust legislation, union rights, graduated income tax, social security, unemployment insurance, public education, and so on. These are initiatives that Marxism endorses and predicts.

Conspicuously absent in the United States is universal medical coverage—present in all the other nine largest economies, and Marxists would expect it to arise here as well. Interestingly, globalization has resulted in some U.S. companies losing competitive edge partly as a consequence of bearing most of the health care costs of their employees. And some foreign job importers such as Toyota have publicly stated that they chose Canada over the United States to save on health care costs even when most of their sales are in the U.S. market.

There are many other examples of Marxist principles that arguably benefit business, and we will consider a few examples of U.S. corporations successfully implementing them, often without relying on government. But first we must understand the essential elements of the Marxist critique of capitalism itself.

Marxist Critique of Capitalism

Although Marx was deeply influenced by Adam Smith's economic analysis of human behavior and society, he rejected three of his central claims:

1. Human acquisitiveness is the driving force of economic development.
2. When individuals are left to pursue their own economic interests, they unwittingly produce the greatest good for all.
3. Employer and employee benefit equally from the invisible hand of the free market.

Marx deconstructs the capitalist framework to expose what he sees as the fatal flaws of these guiding assumptions. Addressing the third, Marx attempts to show that the capitalist employer exploits and alienates the employee from the value of the work itself. Concerning the second, Marx holds that unbridled profit seeking leads to oppressive oligopolies, that is, corporate rule of the state. And it is these systems that, according to Marx, artificially promote and reinforce self-interested attitudes, especially in the ruling classes. Thus, Marxism in general sees capitalism as a self-propagating value system, paradoxically containing the seeds of its own destruction at the hands of the inevitable working-class revolt. Whereas capitalism sees capital as a means of liberation, Marxism sees it as a tool of oppression. Marxism thereby examines the function of capital from a dialectical materialist point of view, that is, as an evolving power struggle between the working and upper classes.

Exploitation and Alienation

According to Marx, employer and employee in a capitalist system never meet on equal terms. Employers always possess sufficient capital to dictate the terms of the contract to their advantage. Most often, the workers need jobs to merely survive, while the employer-capitalists are not in such desperate need, as they usually possesses enough capital to offer employment and can thus wait longer than the workers to shape the terms of the contract to their advantage. This creates a power struggle between the bourgeoisie (capitalist upper class) and the proletariat (workers). Essentially, the bourgeoisie owns capital, while the proletariat has little to sell but its own labor.

Although Smith similarly acknowledged that employer and employee do not meet on equal terms, he nevertheless held that a laissez-faire economy continually stimulates new and competitive demand for labor, thus supplying improved working conditions throughout society. In this way, only the fewest possible number of workers are ever forced to remain in exploitive positions, as the free market systematically provides myriad employment alternatives for the greatest number of workers. Smith also predicted that worker unions would form to help combat corporate trusts intended to lower pay and benefits to workers across industries.

But Marx held that a dynamic free market combined with unionization is insufficient to dispel widespread exploitation. For Marx, capitalism is itself essentially exploitive to the worker. According to his analysis, the employer-capitalists are always able to exploit workers by paying them less than the true value of their labor. In fact, it is only through such an arrangement, he argued, that profits may accrue. And as the capitalists increase their profits, the more they can exploit the workers. Thus, the goal for the capitalists is to cheapen labor, while the goal for the workers is to increase its value. This establishes a hostile and dysfunctional relationship in which each party works against the interests of the other.

The consequence of this paradigm for the worker is that the work itself becomes fundamentally dehumanizing or alienating—as Marx puts it. As workers become debased through an exploitive relationship, they begin to see the product of their labor as an external objective, standing over and above their own interests. Thus, the worker receives less and less intrinsic satisfaction through the work, seeing it only as a means to satisfying other needs. Work thereby becomes unrewarding. As Marx puts it in the *1844 Manuscripts*, "Its alien character is clearly shown by the fact that as soon as there is no physical or other compulsion it is avoided like the plague. External labor, labor in which man alienates himself, is a labor of self-sacrifice." Indeed, the "American dream" for many is to eventually obtain a life of leisure through the self-sacrifice of long hard years of work, be it fulfilling or not. The reality, of course, Marxists claim, is that few ever achieve this goal. As wealth becomes concentrated in the hands of the bourgeoisie, the median household income barely keeps up with inflation. Although American workers once enjoyed the world's highest median standard of living, they are now far behind most of the developed world with respect to wages, benefits, health insurance, pensions, paid vacation days, and educational opportunities.

For Marx, fulfilling work is a basic human right, which should be protected by all civilized societies. And so long as workers remain alienated, they cannot be truly free. Citizens may have the political and social freedoms of speech, religion, and governance, but remain economically exploited and alienated. A full and good life is one that includes a profession that one can thrive in by exerting a significant degree of control over both the product itself and the act of production. Essentially, it is control over the means and ends of production that makes work intrinsically fulfilling as an instrument of freedom and self-actualization. And without intrinsically fulfilling work, Marxists believe that life lacks real meaning, and true happiness is thus never achieved. Hence, Marxists hold that even very well-paid workers remain self-alienated in a capitalist context since they have little or no say in what gets produced or how it gets produced. Since production is entirely motivated extrinsically by competition for profit, intrinsic motivation is hence systematically undermined as workers become demoralized by a routinized alienation of what they may not even be fully aware. This is the paradigm of "false consciousness," in which workers are ignorant of their own exploitation or alienation as a result of living in a stultifying capitalist culture and ideology. Marxists often see religion as facilitating this false consciousness by lulling workers to accept their bleak fate as determined by God. For as Marx famously put it, "Religion is the sigh of the oppressed creature, the heart of a heartless world, just as it is the spirit of a spiritless situation. It is the opium of the people" (*Critique of Hegel's Philosophy of Right*). Incidentally, Marx would have found it telling that a large majority of today's U.S. citizens espouse some form of religion.

Criticisms of Marxist Political Economy

Although many of Marx's concepts retain contemporary relevance, much of his theory of political economy is thought to have become dated, even by mainstream contemporary Marxists. Perhaps the clearest example is his notion that labor is the only force that can create surplus value. This seems false as mechanization has created much more value by actually minimizing labor. Furthermore, Marxists tend to overlook the fact that capitalists take on substantial risk via investment, thereby also creating value. Thus, the capitalist would seem to have a natural right to the fruits of investment independent of the labor employed.

Another strong criticism is that of the inefficiency (or impossibility) of socialist price setting. There is now empirical evidence that as an economy grows and diversifies it becomes nearly impossible to determine appropriate prices. Indeed, doing so tends to stifle productivity by creating artificial barriers to competition. If, for example, all four-door sedans are set at a certain retail price, this stifles ingenuity by making it unnecessary for manufacturers to seek ways to lower production costs and increase efficiency. Furthermore, as the number of products increases, it becomes increasingly difficult and ultimately impossible for a government to both track and determine the prices of all goods and services. Setting certain prices too high or too low could have disastrous effects on supply and demand, ultimately causing major shortages of consumer goods.

Another criticism of Marxism is the prediction that capitalism would lead to social democracy, which would ultimately lead to communism. Although we have indeed seen evidence of the first trend, we have not seen any of the second. A crucial intermediate step for this to occur might be for unions themselves to purchase companies. Yet this has not occurred. This is a difficult phenomenon for the Marxist to explain beyond pointing out that unions do not usually own enough capital to purchase their own companies and that purchasing other smaller companies would go beyond their role as negotiators between workers and owners. Still, it would seem that if widespread communist revolt is inevitable, this would be an obvious way to achieve it. While there are only a small number of large American cooperatives such as Recreational Equipment Inc. (REI), they can indeed demonstrate superior productivity. For example, REI boasts extremely low employee theft rates even without using security cameras. This would seem to indicate increased worker loyalty at a time when employee theft has become a major burden in most American retail companies.

Recent Marxist Thought

Prominent contemporary Marxists such as Seymour Melman maintain that U.S. capitalism fosters two basic types of alienation:

1. Alienation by design
2. Unpremeditated alienation

Alienation by design describes practices intended to accumulate managerial profits and power at the expense of workers. For example, production is shut down as facilities are offshored to underdeveloped countries, where a more compliant nonunion labor force may be secured. This creates anxiety in the American labor force and makes workers less likely to seek increased compensation and control. Furthermore, there is a declining interest in capital goods production, often referred to as deindustrialization. As American managers increasingly seek profits either outside manufacturing or by offshoring, a paucity of capital goods is created. This produces unintended consequences that Marxists refer to as "unpremeditated alienation." For example, as the U.S. population increased over the latter half of the 20th century, the number of U.S. factories declined dramatically, while dependency on imports increased proportionally. Marxists contend that the result is large labor forces and communities increasingly dependant on narrowly focused government projects such as military-industrial facilities, which when closed leave their labor forces with useless skills and ruined communities. Furthermore, corporate welfare generally becomes rampant, thus helping shut out smaller competitors.

Still, many critics argue that Marxism has become irrelevant in the United States, pointing to a rise in "worker capitalism" now that close to half of households own stock or mutual funds. This increase is largely the effect of employee stock options and 401(k) retirement plans widely introduced at American corporations. Such critics claim the result is that today's American workers have a stake in a new "ownership society" via a greater orientation toward the future. According to this view, workers are now more likely to support lower taxes and cuts in capital gains taxes, while sharing a rising skepticism of unions and government entitlement programs. This ownership society, they argue, causes workers to get more involved in managing their own accounts and more educated about the global marketplace.

Marxists agree that stock options and 401(k) plans can benefit workers. However, they counter that these trends are not truly "disalienating," nor do they dispel the specter of exploitation. Since the great majority of stocks are tied up in retirement plans, workers generally cannot access them to become genuine capitalists—that is, deriving most of their income from invested capital. And employee stock options are rarely significant enough to turn workers into genuine capitalists, although a few exceptions have occurred, which have enabled some workers to retire at a young age. Marxists would hold that if a company gave workers majority control of its stock, it would make all the difference. But unless that occurs, workers do not have genuine control over the means and ends of production. Until then, they remain alienated and perhaps even exploited.

Marxists would reject the very notions of "worker capitalism" and "ownership society" for the reasons stated above. The only ownership society possible for Marxists is one in which the means and ends of production are held in common. So long as control of production is in the hands of the genuine capitalists, workers remain merely externally motivated and lacking freedom. They are primarily oriented toward a possible future of increased wealth, and thus not toward the present and more immediate and certain future. Of course, this increased focus on obtaining a wealthy future is seen as a virtue for free market advocates whose ideas tend to encourage acquisitiveness. But since Marxists view human nature as malleable, they maintain that stock option programs can actually exacerbate alienation by reinforcing acquisitiveness and selfishness while adding only the illusion of control over production via a modicum of stockholder participation.

Furthermore, Marxists argue that exploitation can also be exacerbated by stock options since low-paid workers, say, at retail giants, which already supply relatively low wages and benefits, are effectively providing workers with a stake in keeping costs down, thereby deepening their own exploitation. Hence, workers in a capitalist society may be duped into considering themselves liberated, when in fact they are reinforcing the nature of their own labor as an external and alien autonomous power.

Whether this paradigm will continue to stifle union membership or eventually stimulate revolt is an open question. Marx did not foresee the degree to which consumerism might be fueled by the mass media and a marketplace flooded by goods derived from cheap foreign labor and migrant workers. The result of these trends is that Americans are empowered much more as consumers than as workers. However, companies focused on the longer term may increasingly discover that, as Marxists have long held, disalienating employment practices can improve quality and increase profits in the long run. There are much data to support this, which will be discussed in the following section.

Contemporary Disalienating Business Practices

Certain companies have launched novel and creative two-tiered investment plans Marxists would praise. One example is Google giving greater voting rights to employee and managerial shareholders, say, 10 to 1. Hence, all external shareholders possess only one tenth of full voting rights per share enjoyed by the internal shareholders. A small yet growing number of U.S. corporations continue to implement similar disalienating policies that promote productivity and efficiency.

Some give employees a significant share of decision-making power. For example, at Saturn, a division of General Motors, productivity is measured as a group or "work unit" instead of individually. Workers are hence responsible for managing major functions, including designing, timing, and scheduling of tasks, record keeping, budget analysis, developing and delivering production, training, repairing, and cleaning. In most other corporations, employees can make recommendations but managers are exclusively responsible for decisions. However, when employees are given significant authority and responsibility, companies can often yield consistently high productivity.

Another common disalienating practice, instituted at Whole Foods Market, is giving each new worker in each division a trial period after which the other employees and supervisor collectively determine whether that worker should stay. Such examples have consistently shown that, when implemented effectively, disalienating practices can significantly and continually boost motivation, loyalty, efficiency, and productivity, while decreasing absenteeism and turnover. A pioneering federal government study at the Hawthorne Electric Company in the early 1920s initially demonstrated this phenomenon, which is now commonly referred to as the "Hawthorne effect." Subsequent studies corroborate and deepen the Hawthorne results.

Conclusion

Marx's central thesis that capitalism fosters worker exploitation and alienation via a fundamentally hostile relationship with owner-capitalists may not be inescapable. Indeed, contemporary examples abound in which workers in a capitalist system have become significantly disalienated, thereby helping to obtain increased competitiveness and sustained profitability for their companies. Although such examples are still very much in the minority, it is perhaps not inconceivable that they may become more common if the field of business ethics continues to grow. After all, Marx's theory of human history as an evolving dialogue between the bourgeoisie and proletariat views human nature as shaped by this dialogue. Thus, the peoples of capitalist nations such as the United States may gradually become somewhat less acquisitive and self-interested as the socioeconomic benefits of collaboration and disalienation become increasingly difficult to ignore. If this occurs, Marx will be at once vindicated and refuted.

Maternal Ethics

Maternal ethics are an approach to formulating ethical theory by holding the mother-child relationship to be central. The paradigm for understanding ethical conduct is thus a relationship between unequals who are vested in each other's well-being rather than that of two autonomous self-interested males. Maternal ethics advocate replacing the economic man of rational choice theory with a mothering person. The mothering person may be either a man or a woman, the term being ostensibly as gender neutral as economic man.

Feminist philosopher Virginia Held acknowledges without apology that her development of maternal ethics relies on an idealized view of mothering, explaining its use as parallel to the practice of relying on an idealized view of rational contractors. The concept of rational contractors was in itself a major step forward from the patriarchal household, which was once seen as the model for society. Thus, to sufficiently understand and apply the concept of the mothering person, one must look to the postpatriarchal family as a model of the noncontractual society. Held explicitly contrasts her work with that of John Rawls and David Gauthier whose influential theories are premised on the assumption of mutual noninterest between contracting parties. In the postpatriarchal family, women and men both take an active role in mothering and are freed from the traditional stereotypes of gendered roles and expectations.

The unique relationships between mothers and children are characterized as natural, that is, occurring in nature, nonvoluntary, mutually interested, mutually supportive but not always equally so, expressing a willingness to care for each other in times of need and dependence, gradually facilitating independence, irreplaceable, and permanent. In this type of relationship, the parties are vulnerable to each other's demands just as mothering persons are vulnerable to the needs and demands of their children. By this vulnerability they become practitioners and teachers of a morality of caring that would serve well, Held argues, if we could broaden the lessons of home to the marketplace and society at large.

Of course, not all relationships are like mother-child relationships. Indeed, critics argue that the mother-child relationship is completely unique, and few mothers or children long for the same obligations to be replicated in public spheres. Other types of relationships with greater parity may offer more apt paradigmatic characteristics. Held anticipates this criticism, readily admitting that no one relationship is likely to fit all instances. Indeed, maternal ethics need not be seen merely as a substitute for other ethical conceptions, but can also be adopted as a supplement or corrective to other narrow views. Considering the mother-child relationship as paradigmatic is one approach to facilitate thinking about a different, more caring, more mutually invested way of building our society and creating the future. The contrast with current assumptions of how two people will interact, assumptions that underlie contemporary economic theories and policies, is dramatic. The exercise of this contrast is one of the goals of maternal ethics. It encourages people to ask the questions: How would I act differently if I cared about this other person as I care for my daughter? How would I act differently if I felt a need to provide for this person as I do for my mother? The answers to such questions could lead to radical reconsideration of behavioral, economic, and ethical theory.

The concepts underlying maternal ethics fit readily with the values of sustainability and are particularly relevant to business from this perspective. Holding mothering relationships as paradigmatic leads to an assumption of long-term responsibility, to decisions made with an awareness of their impact on multiple generations, and weighing the sustenance of the "other" as much if not more than the immediate benefits to oneself. While these precepts are not the ones routinely associated with profit-maximizing behavior, they lead to business conduct that has been recognized as supportive of consumers, employees, and communities, as well as laying the ground work for an ecofriendly business. A business basing its ethical norms on maternal ethics would rely less on the model of disinterested rational contractors than is currently popular in Western capitalism. Although a market mechanism could still be embraced, its form would likely be shaped by participating members' expectations of longer mutual commitments and the internalization of many of the externalities of business processes.

Another arena ripe for maternal practice is world politics. It is not a coincidence, points out Sara Ruddick, that women who have been so fully responsible for bearing and raising children are drawn to peace activism. Women's role in protecting life extends naturally to resisting the practice of war. Peaceful women are also a myth, paralleling the myth of violent men, containing both truth and misrepresentation. The claim that women are by nature peaceful is too facile a generalization, acknowledges Ruddick, given an abundance of historical examples of women supporting and contributing to the waging of war. But mothers, the custodians of the promise of birth, know a unique hope for the life they have created. The work of mothering, whether it is done by men or women, the caring, nursing, protecting, guiding into the world that is required to support human life, is work that is designed to sustain our race. It is inherently peace making. As such, it holds the potential for transforming global politics of war and peace. Women and men have been drawn into war, sometimes willingly, sometimes in the name of peace. Indeed mothering is often interwoven with the hatreds and loyalties fostering militarism, as Ruddick thoroughly presents. But a feminist maternal practice of peace could be an essentially moral voice in the ongoing struggle to end war.

Recognizing mothering work as essential in our society is a feminist effort, in that it valorizes the role of mothers. However, it is not an effort that all feminists support, in that it contributes to the image of women as quintessentially caring, nurturing, and devoting their lives to the raising of children.

Critics of maternal ethics theory argue that focusing on and idealizing women's role as mothers is subversive to the feminist goal of freeing women from gender stereotypes. Emphasizing maternity as caring practice is to put women back into an essentialist box of feminine abilities and will only result in further limiting a broad social acceptance of women as equal to men in leadership skills and intellectual capacity. Advocates of maternal ethics maintain that recognizing and valuing the mothering work that women have long been responsible for is a means of liberating both men and women to make independent choices about their contributions in the private and public arenas.

Maximum Sustainable Yield

In economics, agriculture, and the study of ecosystems, the maximum sustainable yield (MSY) typically denotes the maximum amount of a resource that can be used or removed from a system without affecting the system's ability to maintain itself and replenish or renew the resource at current levels in a sustainable manner. In economics, MSY refers to the theoretical equilibrium yield or the amount that may be harvested at a steady equilibrium state without significantly affecting the reproduction processes. It is calculated using the intrinsic growth rate of the resource stock and the environmental carrying capacity. MSY can be estimated from surplus production models such as the Gordon-Schaefer production function.

H. Scott Gordon argued in 1954 that economic rent from a common resource, such as open-access fishing waters, could not be captured by society. A common resource was prone to overharvesting because no one owner sets limits to maximize the long-term average yield. These concerns in the 1950s and 1960s led to changes in the international law of the sea and the development of exclusive economic zones.

Usually used in reference to fisheries or other aquaculture, MSY is the largest catch, long-term average yield, of fish or other resource that can be harvested under given ecological conditions without weakening the ecosystem's ability to maintain that level of species. For a situation where the population of the resource fluctuates over time, the amount of resource that can be harvested varies. MSY is also called maximum equilibrium catch, maximum sustained yield, sustainable catch, long-term potential catch, or potential yield.

The United Nations Convention on the Law of the Sea of 10 December 1982 referred to MSY in the conservation and management of stocks (Article 61 Conservation of the living resources, Section 3). The European Environment Agency recommends using MSY as a quality indicator for fisheries and aquaculture. MSY can also be used for evaluating strategies to rebuild a resource; for example, stocks can be rebuilt to a level that will produce at least MSY for prevailing environmental conditions. MSY can be confused with optimum sustainable yield (OSY), where OSY is the level of effort that maximizes the difference between total revenue and total cost. This level of effort maximizes the economic profit, or rent, of the resource being used. It usually corresponds to an effort level lower than that of MSY.

MSY as an indicator of the sustainable use of renewable resources has been important in the development of sustainable business practices, balancing economic and ecological factors. Beyond applications in fisheries and aquaculture, MSY is considered in sustainable business practices from the procurement of resources, to the production, use, and disposal of resources. Although MSY usually addresses one species within a system and a specific carrying capacity and does not incorporate economic or social values and balances, it is a useful concept to study common resources in terms of production costs and environmental carrying capacity.

Sustainable agriculture is the concept of plant and animal production practices considered in an integrated system according to the U.S. Food, Agriculture, Conservation, and Trade Act of 1990. Addressing the natural environment, economic health, and social equity, sustainable agriculture has a systems perspective, involves interdisciplinary research and education, and contends with stewardship of natural and human resources.

Meaningful Work

It is commonly said that there are some people who work to live and others who live to work. The first category is purported to include those who work for material survival as well as those for whom work is a means to other meaningful ends. The second category is purported to include those for whom work itself is a meaningful end, although it might also include those who are seemingly compelled by forces beyond their control to be so-called "workaholics." In many periods of history, including in our contemporary industrialized societies, more of the average worker's waking hours have been spent at work than anywhere else. The topic of meaningful work explores the importance of spending that time well, including the aims of and influences on meaningful work, the forms of meaningful and meaningless work, and the value of meaningful work among other meaningful ends.

The Meaning of "Meaningful"

Meaningful work signifies something of value. We may have varying opinions of the value of meaningful work relative to other valuable things, but we can agree that something in the work itself is obviously valuable to one who desires it and that it is also valuable to one who claims to have it (if it were not, it would be meaningless to claim to have it). Alternatively, work can have meaning without signifying something of value. All work signifies something (or many things); for example, submitting a trade order signifies the intent to trade, drawing a blueprint signifies the plan of a building that may be built, hauling away waste in a dump truck signifies that that waste will rest someplace else, and so on. Work means something in the life of every worker (an unpleasant necessity, a pleasant distraction, a way to earn a living, a chance to be productive), but not every meaning signifies something meaningful. The trader may have a passion for playing the bond market game, derive satisfaction from forging relationships with customers, or regard work as instrumental to the intrinsically important role of financially supporting a family; the architect may appreciate design, construction, or the interplay of art and engineering; the truck driver may enjoy working with a team, accomplishing a complex and socially beneficial cleanup task, or operating heavy machinery. Which of these meanings is meaningful is at least partially a matter of an individual's will and ability to make work meaningful regarding that individual's self-interest and perception. Nozick associates meaningful work with individual self-esteem and says it includes the chance to apply our abilities to a project we consider to be valuable to an overall objective that we consider in carrying out our particular tasks. According to this subjective conception, the aim of meaningful work is individual fulfillment, or self-realization.

Of course, work that is subjectively meaningful is not often wholly within the control of the individual. The capability to engage in work that satisfies our individual objectives and talents, at least for any sustained period of time, depends in part on market conditions and associated demand for such work, as well as the organizational conditions under which we work. To the extent that our ability to pursue self-realization through work can be promoted or impaired by social institutions, whether of the public or private sector, we may ask whether there are practical, moral requirements on those institutions to provide conditions within which meaningful work can be meaningfully pursued and practiced—for example, free choice to enter, honest communication, fair and respectful treatment, intellectual challenge, considerable independence to determine work methods, democratic participation in decision making, moral development, due process and justice, nonpaternalism, and fair compensation. This conception of meaningful work thus concerns the alleged objective obligations of institutions to preserve conditions under which meaningful work is possible, that is, where individuals are reasonably capable of pursuing their meaningful work interests.

Although as individuals we may value having a choice about the kind of work we do, as members of society we have no choice but to work, or for at least some of us to work. The idea of a work ethic—that *any* commitment to hard work is morally good—is associated with the necessity of work to life. As Nozick's characterization and the examples above suggest, some workers may find seemingly ordinary tasks meaningful insofar as they contribute to a perceived greater or necessary good. On this view, whether or not social institutions have a moral obligation to support individuals' pursuit of meaningful work, individuals may perceive a moral duty to perform work that meaningfully promotes social well-being. According to this conception of meaningful work, the value of it may be instrumental, in terms of service to others. Some individuals who have the capability of performing meaningful work knowingly or unwittingly squander the opportunity in favor of something else—slothfulness, leisure, whiling away the time, or even doing work they perhaps perceive to be fun but ultimately meaningless, as if it were a cheap toy. Failure to seize the opportunity for meaningful work may be considered a moral failure to live up to one's own potential (self-realization) and to contribute according to one's ability (service to others).

Tying meaningfulness to service, of course, raises the further complication of measuring social benefit. One way in which to determine what work is most socially beneficial is to look to indicators of economic value in the free market. The perfect market would not only tell us via market demand what work was needed but would also reward workers in proportion to their market contribution. However, the economic fact of market imperfection renders the market a subjectively arbitrary measure of social value, meaning that the most meaningful work, by other, nonmarket measures, is not always rewarded as such. Part of the challenge of reconciling the value of meaningful work with other forms of value lies in the various uses of "meaningful" to characterize meaningful work. What is meaningful may aim at individual self-realization or at service to others, while the achievement of either aim through work is affected by institutional conditions and potentially distorted by market measures. Moreover, these aims are intertwined, sometimes in harmony and sometimes in cacophony. For example, if we neglected social needs to pursue our subjective interests, we might either starve ourselves or enslave others to do the "dirty work" for us—outcomes that are not unfamiliar in human history. Performing work that meaningfully responds to society's needs may support our objective conception of meaningful work while distracting us from pursuing our own interests. Much work that is seemingly necessary is potentially dull and dangerous, rendering it potentially impossible to provide basic institutional conditions for meaningful work. Leaving such work to others may seem to advance our own chances for meaningful work while negatively affecting the opportunities of others. Although it is clear that meaningful work is something of value, it is also clear that there is no uniform conception of precisely what that value is.

The Meaning of "Work"

Self-realization and service to others are not always competing objectives. Adam Smith's familiar ideal would be for the individual pursuit of self-interest to result in what is good for the society. Karl Marx' associated concern about division of labor suggests that more efficient forms of institutional production can detract from individual fulfillment when workers are alienated from the products of their labor. Achieving some degree of coincidence between what an individual perceives to be meaningful and what society demands generally requires some compromise, and thus work that optimizes this coincidence is often referred to with the religiously mystical terms "calling" and "vocation." With a calling (or vocation), an individual seems to be made for precisely the work that society needs to have done. A calling is intrinsically meaningful to the worker while being also instrumentally meaningful to others, so much so that individuals have found callings in the direst of working conditions, amid war, disease, and injustice (examples might include Anne Frank, Mother Teresa, and Martin Luther King Jr.).

Whereas a calling may be considered the highest form of work, "labor" is the term used by Hannah Arendt and others to characterize the lowest form of work, in which the institution fails to satisfy the objective conditions that make possible the pursuit of meaningful work. When work is done for someone else, particularly someone else who is higher on the institutional pyramid, and according to prescribed methods that prioritize economic productivity over individual moral autonomy, it is actually, in Arendt's estimation, unproductive. By her claim that labor leaves nothing behind, she means that the product of unproductive labor is made to be consumed but not to sustain human flourishing of the individual worker or of society in general (e.g., beyond dire working conditions, another problem with sweatshops may be that the outcomes of labor may not allow for any sense of pride in the worker for nonperfunctory participation in the creation of a valuable, well-made product).

Much work seemingly falls between these two extremes and has been termed, by various theorists, "workmanship," "profession," or "career." Such work may as often as not be exciting and fulfilling or dull and unfulfilling, but it may nonetheless be done out of choice, for years on end, because it offers such instrumental benefits as reliable compensation as well as such other job satisfactions as career advancement, perfection of a skill that may further enable discretionary choice as to how work is done, and a sense of belonging to a work community. In fact, the labor-workmanship-calling distinctions are often blurry, but the hierarchy provides a useful way of thinking about the various ways in which workers relate to their work and to the social institutions within which and/or in the interest of which they work.

The Value of Meaningful Work

There is more to the importance of meaningful work than to say that we each ought to pursue our callings. If we all pursued what we perceived to be our callings, much necessary work might be left undone. (Would enough people claim waste collection as a calling to keep our streets and sidewalks clean? When the World Trade Center fell after the September 11 terrorist attacks, many contractors were well compensated for their waste collection efforts, but many others came from around the country to offer their services for free.) That is, we may be biased and/or mistaken about what is our calling, vulnerable to the belief that we may be more suited to work activities that we happen to enjoy when our services may in fact be better spent elsewhere. The fact that one person's labor can be another person's calling leads back to the common assumption that meaningful work is first and foremost about subjective preferences for work that seems intrinsically valuable and/or valuable in relation to an individual's other meaningful ends. However, it is important not to discount the importance of instrumental social benefits to a well-rounded definition of meaningful work.

Even in the absence of a standard definition of meaningful work, there are nevertheless practically important reasons to understand the general ways in which the aims of meaningful work are conceptualized, in terms of self-realization or of service to others, and how institutional and market factors influence these aims. One incentive for managers to gain an understanding of the idea of meaningful work is to permit them to improve employee motivation. Work motivation theory contributes to personnel strategies for attracting and retaining talented and productive workers who might otherwise leave their employers in pursuit of better work. By understanding workers' motivations—whether they focus principally on skills used, compensation, work-life flexibility, meaningfulness, or other features of a job—employers can influence employees' job satisfaction through job design, promotion and compensation structures, goal-setting, recognition, and other means. In other words, work motivation theory provides an instrumental incentive for institutions to care about what individuals perceive to be meaningful work. In parallel, workers who work for reasons other than the intrinsic meaningfulness of work often perceive work as an instrument to enable them to pursue other meaningful ends (e.g., paying for an education or taking family vacations).

Another reason to understand meaningful work is that policy makers can appreciate the relationship between the economic value of work and other forms of value. The familiar economic goal of job creation does not by itself fulfill the ethical goal of *meaningful* job creation. Moreover, laborers' opportunity for self-realization is not well served when meaningful work merely refers to minimum standards for working conditions. In comparison, subjectively meaningful work is a luxury item. The view that meaningful work promotes self-realization is often the privilege of only those in contemporary affluent economies who are comparatively materially well-off and have the opportunity to search for something more than material satisfaction from work.

Finally, understanding meaningful work can help individuals achieve balance in their lives and the lives of others. We define work in terms of its opposite, nonwork. Contemporary notions of work-life balance are predicated on the belief that there are other goods in life that cannot be pursued at work. Even in affluent societies, workers ironically work very hard to develop new technologies and initiatives in order to work less. The more we perceive the value of our own work to coincide with other meaningful ends, and the more we make that coincidence possible in the work of others who work for us, the less the "work to live, live to work" distinction seems out of balance.

—Christopher Michaelson

Media and Violence

"Violence" and "media" are familiar elements of modern life. Because the perception of violence is somewhat subjective and the universe of media is quite broad, definitions for each will establish parameters for the ensuing discussion. *Violence* is the use of illegal, unjustified, unnecessary, or extreme force to injure a person or damage something. *Media* are the various means of mass communication, including television, radio, print publications, video games, music videos, films, and the Internet together with the people involved in their production, distribution, and sales as a business sector and commercial market. While the specific genres of violence and media technology may have changed over time, public concerns about representational violence, particularly as a form of entertainment, are long standing. Ethical concerns focus on the possible link between media violence and aggressive behavior, its social impact, the impact of media regulation on free speech rights, and the locus of responsibility for moderating media violence in the interest of social order.

Violence in the media has been a subject of active public debate for generations. When novels were first introduced, concerned husbands and parents worried that young women would be corrupted by the dramatic portrayals of romance, adventure, and transgressive behavior. The introduction of each new media technology has been accompanied by publicly voiced fears about its effect on people who misuse it. These fears are met with equally insistent proponents of free speech contending that media violence is more a reflection of society's violence than a cause of it. The controversy over media and violence reveals a deep cultural ambivalence about violence and uncertainty about the ethics of freedom.

Critics of media portrayals of violence point to hundreds of research studies in claiming that exposure to television, video games, the Internet, and other media violence leads to aggressive behavior in children, both in the short term and throughout their lives. Others question the quality of the research findings, the conclusions, and the assertion that American society is dangerously violent. This ongoing debate over media violence has involved the U.S. Congress, the American Academy of Pediatrics, the Federal Trade Commission, and a host of other high-profile organizations in the United States and the world. Although the primary focus of this concern is on children, a general anxiety about violence and its impact on society is prevalent as a theme of public discourse.

Violence and Representation

Human beings are a violent species—perhaps no more so than other creatures, but humans are uniquely capable of thinking and reflecting about the violence in their lives. As far as we know, cockroaches, prairie dogs, and snakefish do not lose sleep over the suffering they cause by asserting their dominance in the food chain. Humans, on the other hand, are disturbed by violence and by the fact that they depend on violence for their survival. Part of the human reflection on violence is its representation in ritual and art. It could be argued that modern movies, video games, and television are to the 20th century what sacrificial rituals, gladiator games, and tragic drama were to ancient peoples. Aristotle examined the role of *catharsis* in ancient drama as a means of cleansing or purifying the soul through representation of conflict. Modern anthropologists have observed that humans seem inclined to ritualize the suffering they cause and endure through representation. Bettelheim has examined the role of fairy tale representational violence in the development of young children. In these respects, modern media violence may be functionally similar to other forms of representational and ritual violence. Perhaps modern media violence is more unsettling and provocative because it lacks the authoritative context of religion or tradition. It may also be disturbing that representational violence appears to be entertaining. However troubling, cultural representation of violence is more likely to be experienced by modern people, especially the young, through mass media than through traditional forms such as religion or classical art.

Consider an ordinary day in the life of an American child or teenager. It might, for example, begin with a media music wake-up call—rap, hip hop, or pop music with themes of sexualized violence against women, drug trafficking, and street violence. Breakfast is accompanied by seemingly innocuous cartoons—the Road Runner or Looney Tunes with repeated incidents of gratuitous violence complete with sound effects—or perhaps music videos depicting surreal images of sexual violence, gang warfare, or milder forms of degradation. The schoolbus or carpool ride may involve an iPod soundtrack of more pop, hip hop, and rap. Despite the best attempts of school officials to control Internet surfing, the school computer lab and library offer opportunities to explore Web sites featuring pornography, weapons, and Internet game sites simulating war, gang violence, sexual predators, and a host of violent themes. Media entertainment continues to fill the ride home, homework time, and hanging out in the family room. Researchers estimate that by the time the average American child graduates from high school, he or she has witnessed 18,000 homicides and thousands more assaults, rapes, bombings, explosions, car wrecks, and fights. Media entertainment saturates the lives of children with representational violence.

It may be useful to consider the unique qualities of representational violence and its impact on the human brain. Cognitive scientists have discovered that the human brain uses two information processing systems operating in tandem to manage the continuous stream of environmental data. One system is rational, analytical, deliberative, and slow—best suited for nonthreatening situations in which there is plenty of time to develop accuracy and clarity. The other system works fast and reflexively using automatic emotionally driven response mechanisms triggered by unusual environmental cues (harsh noise, sudden movement, attractive or repugnant objects) to identify perceived threats and opportunities. Representational media focus on the emotionally stimulating triggers to attract and sustain attention. The speed, erratic pace, noise, and visual "pop" of violence (and sex and food) immediately engage the brain's emotional response. In traditional cultures, representational violence is staged through episodic drama and ritual events understood as marked off from everyday life by boundaries of time and space. The emotional responses triggered by religious rites, transitional rituals—and even bedtime stories or going to the movies—are contained within boundaries that the human brain quickly learns to distinguish from normal life. Psychologists and anthropologists argue the positive benefits of these activities that help people manage the cumulative weight of anxieties and fears that plague human consciousness.

In a media-saturated society, people become habituated to their brains functioning in crisis mode for several hours a day for years and years. Some researchers are understandably concerned about the impact of this phenomenon, particularly on young children. Much of the focus of the attention has been on the impact of sex and violence in the media. More recently, some attention has shifted to the relationship between media culture and obesity. Although some concern has been expressed about the "dumbing down" of media culture, little of this attention is actually focused on the problem of emotionally habituated brain function. Most of the public's concern about media violence is focused on its possible correlation with aggression, violence, and crime and on the need to control its presumed social impact.

The Social Impact of Media Violence

What is the relationship between media violence and everyday life? Does exposure to media violence make people more violent? Does media violence create a more violent society? Should media violence be a public safety concern? Some groups of parents, researchers, and child protection advocates, insisting that there must be some effect from the thousands of murders that American children see over a lifetime of daily television and media exposure, propose censorship strategies. Some researchers counter with arguments that modern society is comparatively less violent than previous historical periods. Public interest groups have raised first amendment concerns about initiatives to restrict free expression. Media and communications experts promote media literacy rather than censorship as the key to developing a healthy adaptation to a media culture. The media industry advocates self-regulation as the best means of achieving a balance between free speech rights and child protection. Given the speed with which media technologies have been developed, it will take time to develop public policy consensus among these groups of competing interests.

Thousands of studies have been conducted to determine the link between television violence and aggression, particularly among children. One of the first studies of children and media violence, initiated in the 1960s by Leonard Eron in Hudson, New York, concluded that children who watched violent television programs were more aggressive at school. Since that time, media technologies have expanded to music videos, video games, Internet browsing, and iPods that could consume almost every moment of waking time in a person's day with content frequently described as violent, immoral, and degrading. Critics of media violence cite the homicide and rising male teenage arrest rates in the United States—dramatically higher than most First World nations—as evidence that American children, who watch more television than any other children in the world, are being incited to violence by television.

Public concern about violence escalated during the 1990s after a number of high-profile mass murders in American schools. In each instance, the perpetrators were middle-class boys in middle-class schools, prompting investigators to search for causal factors for violence in an environment thought to be free of the poverty, crime, and drugs associated with urban ghetto violence. Alarmed parents, educators, health providers, and child welfare advocates were quick to explore alienation, isolation, personality disorders, and family dynamics as possible contributors to the sudden outburst of violence. Media violence was also an obvious environmental factor seized by some as a corrupting influence.

The American Academy of Pediatrics (AAP) has been active in publishing statistics and developing guidelines for physicians and parents in addressing the issue of media violence for children in their care. The AAP identified several negative consequences of media violence for children: increased aggressiveness and antisocial behavior, increased fear of becoming victimized by violence, desensitization to violence, and increased appetite for violence. Parents were urged to limit and monitor media violence exposure and help children develop media literacy skills by talking with them critically about what they were seeing and experiencing.

In response to concerns voiced by members of Congress and Clinton Administration officials, the Federal Trade Commission conducted a study of the media entertainment industry in the1990s and issued a report in 2000, concluding that there was little effort on the part of film, recording, and electronic game producers to restrict access to violent material. While the media and entertainment industry was able to identify content inappropriate for children, the rating systems and parental warnings failed to reflect the industry's own assessment of appropriateness, and in fact, the industry actively promoted and marketed inappropriate products to children. While the report recommended self-regulatory efforts by the entertainment industry, it did not include specific legislative or governmental action to address the problem. Since the 2000 report was issued, however, the FTC has continued to monitor the media and entertainment industry, reporting some progress toward improved self-regulation. Focus for action has since shifted to coalitions of national child welfare organizations aimed at developing local and state initiatives.

In 2001, Bushman and Anderson published their meta-analysis of media violence and its impact on society, finding that the results of over a thousand studies, including those of major professional societies such as the AAP and the American Psychiatric Association, pointed to a causal connection between media violence and aggressive behavior in some children. Acknowledging the importance of the qualifier "some children," they compared the effect of media violence with the link between smoking and lung cancer: Not everyone who smokes gets cancer and there are other factors that cause cancer; the short-term effects are relatively innocuous, but the cumulative effects can be extremely severe; the tobacco industry has historically denied scientific evidence supporting claims of tobacco's harmful effects; and new media have been influential in shaping public opinion on the dangers of smoking. Drawing on these parallels, Bushman and Anderson linked analysis of scientific findings about media violence to news reporting of it and found that as the scientific community began clarifying and documenting the significance of the association between media violence and aggressive behavior, media reports and public concern became measurably weaker on the issue. When public opinion is not galvanized around an issue it is difficult to organize public policy initiatives with enough traction to have an impact. In a more recent publication, Anderson and Bushman suggest that results of ongoing studies of human aggression would support two effective approaches to reducing media-related aggression: reducing exposure to media violence and changing attitudes toward media violence. The second approach aligns with a growing initiative to promote media literacy as a means of teaching children to understand and critically evaluate the role of media in their lives, its functional dynamics, and its influence on their choices and behavior.

First Amendment Considerations

Despite a general consensus that media violence is an issue of undeniable public concern, first amendment rights advocates in the United States have taken a dim view of censorship as a viable means of protecting the public from media violence. Commitment to first amendment rights of free press, artistic expression, and speech have spurred legal scholars' involvement in the media violence debate, although some members of the legal community can be found on both sides of the issue of censorship for the protection of youth. First amendment advocates have cited the opinions of Supreme Court justices and legal rulings that declare the primacy of first amendment rights as the foundation of democratic systems of government. Librarians, writers, and artists have joined lawyers and jurists in claiming that the roots of violence reached far beyond the media, exhorting Americans to find solutions to the problem of community violence that would not erode the constitutional rights of expression so cherished as fundamental values for a free, democratic society. First amendment protection is a guarantee that the broadest range of perspectives, positions, and experiences will be included in the deliberative process of building public opinion and political will.

First amendment principles applied to media violence echo similar constitutional struggles of the past. First amendment advocates point out that censorship may seem to be an easy answer to an immediate perceived problem of media violence, but it does not address its complex root causes. In fact, it may enhance the appeal of violence for people with a distorted attraction to the "forbidden." Furthermore, it is not the role of the government to evaluate the merits of free expression, that is, the right and duty of each citizen in a free society. This responsibility of citizenship is framed as a recognition that value judgments are inherently subjective; rather than define a standard of value for the society, individuals in a free society are capable of defining for themselves what constitutes good or bad portrayals of violence in the media and exercising their power of choice accordingly in purchasing or using media products. It is also a fact that violence is a troubling reality in the world of human experience; censoring its portrayal in the media to "sanitize" it does not make it go away or render it less real for those who cannot escape it. Part of citizenship in a free, democratic society is taking responsibility for knowledge about the world and the way it is constructed; if violence is a problem, then perhaps it is incumbent on citizens who understand it to find ways to ameliorate it. Finally, it is individuals, as adult consumers and parents of children, who have a responsibility for decisions about what media are appropriate for themselves and their children. It is especially not the role of government to reduce the normative standard of acceptable media violence to that appropriate for a child. From a first amendment perspective, all the preceding arguments militate against media censorship and for an alternative approach to addressing the problem of media violence.

Media Literacy

One approach to media violence is a movement advocating "media literacy." The concept of media literacy was introduced in school systems in the 1970s. Media literacy empowers people—especially children—to understand and evaluate the media messages that surround them. When children possess the critical thinking skills to question advertising images or news reports, they are able to free themselves from being passive consumers to become active participants in a media culture. Media literacy projects have demonstrated that when they understand that media representations are constructed to "hook" them with a quick rush so that someone can sell an idea, product, or image, even children are able to challenge the message and exercise the power of alternative choice.

Despite its vigorous support, media literacy proponents do not agree about its primary purpose. Some media literacy experts propose an "inoculationist" approach to media education as a means of protecting children from destructive messages. Critics of this approach charge that it creates a hierarchy of privilege among media representations and products with someone inevitably determining what is "safe" or "not safe." They suggest a more rigorously nuanced approach to media that equips young people with the skills for establishing their own value judgments based on critically applied standards drawn from the context of their own communities, life experience, and values. Several states, local governments, school systems, and community organizations have been involved in media literacy projects that have developed a common body of concepts.

The Association for Media Literacy, formed in the 1970s by Canadian and American media literacy educators, defines several basic concepts of media literacy. First, all *media are constructions* that do not present reality but simulate it. Related to this concept is the observation that *media construct reality*; the constructed images, plots, and characters of the media are elements used by media consumers in the construction of their own reality. Also, *audiences negotiate meaning in media*; media engagement involves subjective interpretation and negotiation of its elements.

Because media producers constitute a major industry with collateral markets, *media have commercial implications.* There are no ideologically neutral media representations; *media contain ideological and value messages* that are not always obvious. People bring their experience with media into real life; *media have social and political implications.* The technology and material conditions of each media determine what makes it a viable product as a coherent media experience; *media form and content are closely related.* The material and technological elements of form and content, in turn, converge interactively with producers and consumers so that *each medium has a unique aesthetic form.* Media literacy offers some hope for an effective alternative to censorship in addressing the cultural problem of media violence.

MEDICAID

Medicaid, which became law in 1965 as part of the Social Security Act, is a social insurance program that pays for basic medical services for the nation's individuals and families who have the least income and resources. It is the biggest health safety net program in the United States, with more than 50 million people enrolled. It accounts for 16% of our nation's spending on health care, at an annual cost of over $300 billion. Unlike Medicare, which was enacted into law at the same time but is federally funded and administered, Medicaid is jointly financed by the federal and state governments. It is the third largest nondefense program in the federal budget after Medicare and Social Security, with 8% of federal outlays in 2004. At the state level, Medicaid is the second largest expenditure, after K–12 education, and it accounts for 16% of state own-source spending.

Medicaid enrollees must meet various financial criteria and belong to one of the "mandatory" eligibility groups, including pregnant women, children and teenagers, parents of dependent children, seniors, and people with disabilities. Private insurance is usually unavailable to Medicaid enrollees. Low-income workers and retirees might not have access to or cannot afford insurance through their current or previous employers. Many private insurance programs also exclude people with disabilities and chronic illnesses.

However, not all uninsured individuals qualify for Medicaid coverage, even if they are poor. Having assets in excess of a few thousand dollars may be enough to disqualify someone. Incidentally, although many immigrants meet various financial/asset criteria and mandatory categories, the Personal Responsibility and Work Opportunity Reconciliation Act of 1996, popularly known as "welfare reform," prevents new immigrants from applying for Medicaid during their first 5 years in the United States.

More than 7 million Medicaid beneficiaries, or 14% of Medicaid enrollees, are low-income seniors and people with disabilities who are also enrolled in Medicare. These "dual eligibles" usually have substantial health needs, comprising 42% of total Medicaid spending. They rely on Medicare to cover basic health services such as physician and hospital care, but depend on Medicaid to pay Medicare Part B premiums for the aforementioned services and copayments to cover prescription drugs and long-term care, which are not covered by Medicare. Now prescription drug coverage for dual eligibles is covered under Medicare Part D.

Federal statutes, regulations, and policies establish broad national guidelines for Medicaid. For example, state Medicaid programs are required to cover the following basic services for the mandatory groups of beneficiaries: (1) in- and outpatient hospital services; (2) physician, midwife, and certified nurse practitioner services; (3) laboratory and X-ray services; (4) nursing home and home health care for adults; (5) early and periodic screening, diagnosis, and treatment for children; (6) family planning; and (7) rural health clinic services. However, the scope and composition of Medicaid programs varies across states. States have substantial flexibility in administering their own program and setting their own guidelines regarding eligibility standards as well as types, amount, duration, and scope of services covered. They can also offer additional services such as prescription drugs and dental care for the mandatory beneficiary groups and other populations with significant needs. The majority of "optional" spending (86%) pays for services to the elderly and people with disabilities. Medicaid is the largest payer of long-term care, public mental health services, and AIDS treatment.

Funding for Medicaid is based on state spending and the statutory formula called Federal Medical Assistance Percentage. The federal government currently pays between 50% and 77% of all the state Medicaid spending with no predetermined limits, with higher matching rates for states with lower per capita incomes. The matching funds provide assistance for coverage of mandatory populations and services, as well as a wide range of optional services and broader population coverage. They also give incentives for states to invest in health care, since Medicaid is the largest source (44%) of all federal revenue to states. Reduction in state Medicaid spending will result in a substantial decrease in federal revenue.

Like private health insurance, Medicaid purchases services from hospitals, physicians, health maintenance organizations (HMOs), and other providers in the private health care marketplace. Each state sets its own reimbursement rates, which have historically been lower than those paid by other insurers. Some physicians are thus unwilling to serve Medicaid beneficiaries, and some HMOs have ended their participation in Medicaid.

While each state has a Medicaid Fraud Control Unit that monitors the safety net program, some of the largest and most complex state Medicaid programs (e.g., New York) have reported cases of service providers exaggerating their billings, charging for services that never occurred, and prescribing unnecessary but expensive drugs to "patients" who sell them on the black market. Such abuse is costing the programs billions of dollars and taking away resources from patients who depend on the programs.

In recent years, in addition to restricting provider payments and intensifying fraud control, many states have reduced services in response to sharp declines in state revenues and large budget shortfalls. In early 2004, the federal government, which faces an annual federal deficit of more than $400 billion, proposed to cap federal Medicaid matching payments and to enforce a state maintenance of effort requirement. Health and Human Services has also approved comprehensive waivers in the past few years that allow states to impose enrollment caps, enrollment fees, or higher copayments. Given that Medicaid is the primary source of health and long-term assistance for individuals with the most complex health care needs and the least amount of resources, some worry that any cost-cutting measure would further disadvantage the nation's most vulnerable population.

Medicare

Medicare is a federally legislated program that provides low-cost hospitalization and medical insurance primarily for American seniors over the age of 65, who currently account for about one third of all health care dollars spent in the United States—more than $300 billion annually. Although a presidential committee considered creating a health insurance program for the elderly as early as 1934, it was not until 1965 that President Lyndon Johnson signed Medicare into law as part of the Social Security Act. Medicaid, a health safety net program for low-income Americans, was enacted the same year. Initially, both programs were the responsibility of the Social Security Administration. As the programs expanded and became more complex, the Health Care Financing Administration (HCFA) was created in 1977 to effectively coordinate and manage them. Further growth of the programs prompted the restructuring of HCFA in 2001, which was renamed the Centers for Medicare and Medicaid Services. This organization has three general divisions. First, the Center for Medicare Management focuses on traditional Medicare programs and government contracts with health care organizations. It sets up Medicare policies, determines reimbursement rates for service providers, and manages Medicare paperwork. Second, the Center for Beneficiary Choices codifies and regulates supplemental programs that provide coverage for services that traditional Medicare plans do not cover. Third, the Center for Medicaid and State Operations coordinates the Medicaid program with state governments.

In 2004, Medicare served approximately 42 million Americans, of which 35.4 million beneficiaries were people over the age of 65 who either paid into Medicare throughout their working lives or enrolled by paying an extra premium. Another 6.3 million beneficiaries were individuals who required dialysis due to end-stage renal disease and low-income people with disabilities who had received Social Security disability benefits for 2 years. In the fiscal year 2004, Medicare benefit payments totaled $295 billion, accounting for 17% of the nation's total health spending, or 2.8% of the gross domestic product. It is the second largest nondefense program in the federal budget (12%), after Social Security.

Five trustees, which include the secretary of the Treasury, the secretary of Labor, the secretary of Health and Human Services, and two private citizens, monitor the finances and report periodically on the economic health and sustainability of the two main Medicare funds. First, the Hospital Insurance program ("Part A" of Medicare) primarily covers inpatient hospital care, hospice care, and care in skilled nursing facilities. This "Part A" program is funded mainly through a payroll tax contributed by employers and employees, each paying 1.45% of the employees' income. Payments into the Hospital Insurance Fund are based on the number of workers paying into the system and are not adjusted each year, so the fund can become insolvent, that is, unable to meet all incurred debts. According to the 2005 Medicare Board of Trustees' projection, spending of Hospital Insurance trust fund assets might exceed income starting in 2012, and the fund's reserves might be exhausted in 2020.

Second, the Supplementary Medical Insurance program ("Part B"), which covers physician services, outpatient hospital care, laboratory tests, physical and occupational therapy, and most home health care, is financed by beneficiary-paid premiums ($78.20 per month in 2005) and general federal tax revenues, the latter of which makes up approximately three quarters of revenues for Part B. This fund is adjusted annually to cover the cost of Part B services and therefore cannot be overdrawn. These two plans do not cover custodial long-term care services, but low-income beneficiaries may also enroll in and receive such coverage from Medicaid ("dual eligibles"), a program that offers health services to Americans of all ages who have limited income and resources.

The majority of Medicare beneficiaries (88%) receive care through doctors and hospitals participating in the Medicare system, but some beneficiaries (12%) enroll in Medicare Advantage ("Part C"), which consists of private Medicare plans such as those offered by health maintenance organizations (HMOs). They stay within a network of doctors and hospitals in return for additional benefits not covered by the traditional fee-for-service Medicare system. The federal government pays a fixed fee to the HMO for each

Medicare beneficiary enrolled in the program. However, in recent years some HMOs have withdrawn from the program, claiming that they do not receive enough reimbursement from the federal government to cover the costs of providing care to Medicare patients.

Medicare paid less than half of the total medical expenses per beneficiary in 2002. Almost 90% of Medicare beneficiaries have some form of supplemental health insurance to help pay for health care services not covered by the Medicare program (e.g., dental services, hearing aids, podiatry services) and to ease the burden of Medicare's relatively high cost-sharing requirements. In addition to Medicare HMOs, beneficiaries often have other private coverage through retiree coverage from their former employer, veterans health benefits, supplemental private coverage (so-called Medigap plans), and Medicaid.

In 2003, the Medicare Prescription Drug, Improvement, and Modernization Act added an outpatient prescription drug benefit to Medicare ("Part D"). This new plan, which came into effect in January 2006, charges beneficiaries a premium set at 25.5% of the cost of the standard drug benefit. General revenues and state payments for dual eligibles contribute the rest of the cost.

The new drug plan, which is estimated to cost the federal government anywhere from $395 billion to $534 billion over the next 10 years, fuels the ongoing concern of the sustainability of Medicare. The Congressional Budget Office projects that Medicare spending will grow by an average of 9% annually between 2004 and 2014, a rate significantly higher than that of the overall economy. It is the fastest growing of all federal benefits programs and will continue to grow rapidly, affected not only by rising health care costs and benefit improvements but also by the eligibility of baby boomers beginning in 2011, longer life expectancy, and a decreasing ratio of workers to beneficiaries.

To maintain the federal government's financial stability while meeting the health care needs of an aging population, some have proposed increasing the role of private plans in Medicare. However, since the overhead costs of the traditional Medicare program (<3%) is substantially lower than that of HMOs (15% of revenues), and that private plans are demanding higher payments, many consumer and senior groups worry that privatization will further increase costs and lower choices for seniors.

Mentoring

Mentoring refers to the process by which a senior person (mentor) takes an active interest in sponsoring the career of a more junior person (protégé). Named for a fabled character in Homer's *The Odyssey* who tutored and looked after the title character's son, mentoring is a process that has been used for centuries as a means of handing down tradition, supporting talent, and securing future leadership. It flourished in the feudal system of the Renaissance as young men served apprentices to gain membership in guilds. Throughout history it is rare to study the career of highly successful individuals and not find the presence of a mentor. Aristotle mentored Alexander the Great, civil rights attorney Charles Hamilton mentored Thurgood Marshall, Gertrude Stein mentored Nobel Prize winning novelist Ernest Hemingway, and master salesman John Patterson mentored IBM founder Thomas Watson.

The popularity of mentoring reflects a confluence of interests of three different parties. Jobholders view mentoring as a means of meeting their career goals. Organizational officials are attracted to mentoring as an effective mechanism for extending their legacy and developing employees. And finally, individuals who are concerned with correcting injustices in existing career systems see mentoring as one tool for doing so. Advocates of mentoring have made it a widespread phenomenon touching the work lives of roughly two in five contemporary employees.

The outcomes of mentoring have been found to be generally positive but by no means equivalent for both partners. Protégés enjoy enhanced career mobility, compensation, and job satisfaction. Mentors are thought to accrue comparatively fewer and "softer" benefits such as career visibility, information acquisition, self-enhancement, and a sense of generativity. Even so, the experience of mentoring apparently makes these benefits more salient, since it makes them more willing to mentor others than individuals who have no mentoring experience.

In spite of these benefits, a number of ethical questions have been raised about the mentoring process. Some have criticized it for being too time-consuming. Others have indicted mentoring for resulting in favoritism and empire building. Along those lines, some have pointed out that mentoring tends to exclude women and people of color and that it is a conservative process that reinforces the status quo. Specific abuses in the mentoring partnership have also been reported. Mistreatment reported by protégés includes tyrannical and manipulative behavior such as revenge, political sabotage, and harassment. Similarly, some mentors report instances of dirty tricks and backstabbing by opportunistic protégés. Research has shown that such events are by no means rare within the mentoring relationship.

Mentor Duties

Based on a conception of mentor as a quasi-professional, Moberg and Velasquez derived the ethical responsibilities of the parties directly involved in the mentoring process. As a quasi-professional, the mentor's superior power implies a greater responsibility to ensure that the relationship not become abusive or otherwise dysfunctional. Specifically, the stringency of the ethical obligations that mentors have to their protégés varies in direct proportion to the power distance between themselves and their protégés. Within this formulation, mentors have seven prima facie ethical obligations: beneficence, nonmaleficence, autonomy, confidentiality, fairness, loyalty, and concern.

A mentor's duties of beneficence and nonmaleficence are consistent with utilitarianism. Beneficence is the obligation to be diligent in providing the goods of the mentoring relationship: knowledge, wisdom, and developmental support. As such, beneficence implies several corollary obligations. First, it implies that the mentor will ensure that he or she has the skills and information needed to provide these goods. Second, it implies that the mentor is duty-bound to be careful about the quality of advice provided. Nonmaleficence binds mentors to avoid exercising their role in a manner that might harm the protégé. This implies a duty to avoid any deleterious effect mentoring can produce. Obviously, this includes disregarding any temptations to engage in petty tyranny, manipulation, or deceit. It also includes disdain for comparatively minor transgressions that might distract the protégé from mastering intended lessons. Nonmaleficence also implies certain obligations that ethicists classify as positive duties, that is, duties to act rather than duties to restrain. One of them is the obligation to intervene and help out in instances when the protégé has followed the mentor's advice but it has turned out poorly. Such an obligation would not cover any situation that goes bad for a protégé. It would be restricted to situations in which the mentor's advice was followed but the results did not work out.

The mentor's duties to autonomy and confidentiality derive from fundamental notions of employee rights. Autonomy entails behaving in a way that enables rather than hinders the protégé's ability to exercise his or her own judgment and reasoning. Autonomy refers not merely to freedom from external constraint but to the development and exercise of a cognitive/volitional ability: the ability to think and act on one's own. The emphasis is on the protégé's ability to determine rationally what is best for himself or herself in the context of a community of others who are similarly disposed. This is a long-standing idea in professional ethics traceable to the work of Immanuel Kant. Respecting the autonomy of protégés translates to several specific mentor obligations. First, mentors should avoid any action that makes the mentoring relationship necessarily compulsory. Second, mentors should openly disclose and explain to protégés any information that they take into account as part of the mentoring process that protégés need to know. Third, mentors should assure that their communication represents education rather than propaganda. And finally, mentors should avoid establishing paternalistic relations with their protégés. Confidentiality implies that the mentor must maintain not only any confidences explicitly requested by the protégé but also anything that the protégé reveals about himself or herself in the course of their working together. Protégé self-revelations should always be assumed to be given with the expectation of confidentiality on the part of the mentor. Just as professionals are required to keep client information confidential except in those cases where it is certain that very serious harm to others will result, so too should mentors in their quasi-professional role.

The mentor's obligations of loyalty and fairness are based on the key requirement of justice—that a person should be given what is due to him or her. In mentoring, loyalty means, first and foremost, the avoidance of any conflict of interest. While mentors need not deny themselves the intrinsic benefits of their partnership, they should assiduously avoid the appearance that their commitment to the relationship is contingent on extrinsic favors or gratuities. Second, a mentor's obligation to be faithful to his or her protégés means making decisions about the relationship that ordinarily place the interests of the protégé in a paramount position. This does not imply that other commitments the mentor might have made are given no weight relative to the protégé's; it only means that ordinarily the protégé's ends are to be given greater weight. The requirement that mentors are fair in the allocation of benefits and burdens extends not only to their protégés but also to others who might otherwise be excluded or affected by the mentoring process. This implies that the problem of fair access is one for which mentors themselves should once again assume responsibility. Mentors ought to be open to mentoring protégés who have characteristics (social class, race, gender, interpersonal attractiveness, etc.) that make them less desirable to other mentors as protégé prospects. It also means that mentors should look for reasons to accept rather than reasons to reject such disadvantaged prospects. It is obvious that no one mentor can neutralize all access injustices by virtue of his or her own fair selection criteria; however, mentors who participate in mentoring relationships tarnished by unjust access are implicitly endorsing an indefensible, some might even say immoral, arrangement.

Concern is a mentor duty that draws from the moral requirement of care implicit in human relationships. Concern is the mentor obligation to exercise a caring but fair partiality toward protégés and their interests. It implies advocating on behalf of their interests and, more generally, providing them the kind of support that will contribute to their development. In these respects, the mentor exhibits a form of partiality toward the protégé, providing benefits and advantages for the protégé that the mentor does not provide for others. This obligation does not relieve the mentor of obligations to third parties and to the organization. The challenge is to be partial toward the protégé without simultaneously being unfair toward others.

Protégé Duties

It would be immoral for protégés to reap the benefits of mentoring without some correspondent obligations. Unless mentors are specifically rewarded by the organization for their actions as mentors, they are due reciprocity from their protégés. Such reciprocity ought to take the form of the duties of veracity, efficiency, and gratitude. Veracity obligates protégés not only be honest with their mentors so the advice and support they receive from them is built on accurate premises. It also binds them to be truthful about any observation they report about what is going on elsewhere in the organization. Among the few benefits mentors receive from mentoring is information from their protégé's network. For protégés to distort or withhold such information from mentors seems to accentuate what is already an inequitable situation. Thus, protégés ought to be forthcoming in all legitimate areas queried by a mentor. This includes frank information about the protégé's perceptions of whether the mentoring relationship is meeting his or her needs. In addition, protégés are obligated to be efficient in all encounters with their mentors. The reason is twofold. Once again, being efficient attenuates the inequity implicit in the relationship. In addition, it should be recognized that a mentor's time is typically at a premium. To reflect this, protégés acquire the duty to make every encounter as efficient as possible. This includes being prepared for each mentoring encounter, keeping the encounter moving, and in general respecting the mentor's time. The third protégé duty is gratitude. To the extent that protégés receive value in excess of the investments they make in the mentoring relationship, they owe their mentor a debt of gratitude.

The most important implication of this analysis is the impossibility of being a direct supervisor and an ethical mentor of the same person. As we have seen, the mentor role carries with it a special loyalty, partiality, and concern for one's protégés. This is contradicted by the moral obligations of the supervisory role to be impartial and fair to all one's subordinates. Therefore, unless one has only one subordinate, it is highly problematic to supervise and ethically mentor the same person. If the term *mentor* is used imprecisely to denote roles that involve only training, performance coaching, or career counseling, then holding both roles relative to the same person is feasible. Otherwise, they are morally contradictory.

Another key implication of this analysis is that some mentoring arrangements are more morally burdensome for mentors than others. Specifically, mentor duties are greatest if the power difference between them and their protégés is large, and this is exacerbated if the organization provides them with no rewards for their mentoring investments. If an organization has a formal mentoring program, it might be prudent to restrict especially burdensome mentoring assignments to those who are committed to high ethical standards.

—Dennis J. Moberg

MERCK & CO., INC.

Merck & Co. Inc., a large U.S. public pharmaceutical company, has faced several important ethical and social responsibility tests over the years. Established in 1891, Merck discovers, develops, manufactures, and markets vaccines and medicines in more than 20 therapeutic categories. The company has approximately 60,000 employees and sells products in approximately 150 countries. Worldwide sales in 2005 were more than $22 billion. The firm has always had a "patient first" approach to doing business as indicated by George Merck, the son of the founder, who stated that Merck tries never to forget that medicine is for the people, not for the profits. This view is currently reflected in the company's values, which states that Merck's business is preserving and improving human life. Although the firm has faced many challenges, two of the more significant ethical and social responsibility issues confronted by Merck include whether to produce and distribute a drug to help cure river blindness and whether to recall its arthritis drug Vioxx.

In terms of the first major issue faced by Merck, river blindness is an eye and skin disease caused by a worm that is transmitted to humans through the bite of a fly. The baby or larval worms then move through the body migrating in the skin and the eye causing itching, severe skin disease, and after repeated years of exposure, blindness. Merck researchers discovered that it was highly likely that by spending tens of millions of dollars they could develop the cure for river blindness. The problem was that the millions of people afflicted by the disease lived in parts of the world (primarily Africa) where they could not afford to pay for the drug. Other pharmaceutical companies, foundations, governments, and health organizations were not interested in paying for the development of the drug. Other concerns related to the risk of side effects for humans that might then affect the sales of Merck's animal drug, or that the human drug might be diverted into the black market, undercutting sales of the animal drug. The company also risked creating a precedent both internally among its researchers and externally among the public that might be difficult to meet in the future in terms of developing other important drugs with little or no financial return expected.

Despite the costs and the risks, Merck, through the leadership of its CEO Roy Vagelos, decided to spend the money. The drug, known as Mectizan, was not only developed but also distributed by Merck for free for years beginning in 1987. The decision did end up having indirect financial benefits for the firm, which according to Dr. Vagelos related primarily to the recruitment of top researchers. In December 2002, the World Health Organization declared river blindness virtually eradicated as a world disease, with the program reaching 40 million people annually in more than 30 countries.

The second major ethical and social responsibility issue places Merck in a potentially more negative light. The issue involves what has been perceived as Merck's delayed decision to recall its arthritis drug Vioxx, despite apparent knowledge of numerous deaths caused by the drug. Merck pulled its $2.5 billion-a-year drug off the market on September 30, 2004, when a study indicated that it doubled the risk of heart attack and stroke in patients who took the drug for more than 18 months. The issue appears similar to that faced by A. H. Robins Company, which was eventually forced into bankruptcy in the mid-1980s after facing lawsuits due to its allegedly defective "Dalkon Shield" intrauterine birth control device.

Plaintiffs claim that Merck knew of the additional risk of heart attacks based on previous clinical studies, but failed to warn doctors and consumers of the risk. From 1999 to 2004, more than 20 million Americans took Vioxx. By the end of 2005, Merck faced close to 10,000 lawsuits in the United States. The firm is also being sued in Europe, Australia, Brazil, Canada, Israel, and Turkey. As of April 2006, Merck had already spent hundreds of millions of dollars to defend four cases, with two wins and two losses (with judgments against Merck for $253 million in Texas and $13.5 million in New Jersey). The company continues to refuse to pursue a global settlement and is appealing the cases it has lost. Some estimate that the company may have to defend more than 100,000 Vioxx lawsuits leading to possible liability of up to $50 billion (U.S.) for Merck, since epidemiologists estimate that 100,000 people might have suffered heart attacks because of the drug. It is still unclear how Vioxx will ultimately affect the future prospects of Merck, and whether Merck will be able to withstand the current legal assault.

Mergers, Acquisitions, and Takeovers

On a general level, merger, acquisition, and takeover refer to a combination of two organizations into one larger entity. Virtually every major public corporation—as a merger partner, acquirer, or target—has been involved in an attempted or realized organizational combination as mergers, acquisitions, and takeovers (MA&Ts) have become a basic staple of corporate strategy. The overarching reason why firms enter into a merger or decide to acquire another company is the belief that the combination will allow the new entity to attain its strategic goals more quickly and less expensively than if the firm attempted to do it by internal growth alone. While proponents argue that well-planned MA&Ts enhance both the value of the firm and the value of the firm to the larger society, critics respond that far too many of these combinations are undesirable and ill-conceived. In these latter instances, MA&Ts are suggested to create far more harm than benefit for an array of internal (e.g., shareholders, managers, employees) and external (e.g., customers, suppliers, unions, local communities) stakeholders, many of which are not directly considered in the decision-making process.

While the terms are often used interchangeably, there are some subtle differences. *Acquisition* refers to any transfer of ownership in which one organization is absorbed by another, *merger* is a combination in which two or more previously autonomous companies form a wholly new firm, and *takeover* refers to those situations where a company or an investment group gains enough shares of stock in a publicly traded company that it can control its governance via a plurality of votes for the board of directors. Merger typically reflects a sense of equality between the two organizations, whereas acquisition and takeover reflect the dominance of the acquiring organization over the target firm.

There are two fundamental sets of concerns raised about corporate MA&Ts: The first focuses on whether the combination will create economic value for shareholders; the second emphasizes the effect the combination will have on the companies' implicit contracts with other stakeholders and the larger society. These issues reflect both process and outcome considerations. From a process perspective, questions are typically raised about the appropriateness and fairness of the actions by the parties involved during combination planning, transaction, and implementation. In terms of outcomes, emphasis is placed on the combination's relative benefit or harm (direct and indirect) for all relevant stakeholders (including shareholders) and about the fairness and social desirability of these outcomes. Debate about these issues often comes down to questions about transparency, distributive justice, and the social role of the corporation and its responsibilities to a broader range of constituencies that go beyond shareholders per se.

Process and Outcome Considerations in Hostile Takeovers

A basic tenet of the free market is that organizational combinations intended to maximize the value of the firms for shareholders have long-term benefits for the larger society. The underlying market for corporate control, that is, the tendency of outside parties (often referred to as "raiders") to try to buy publicly traded companies, exerts a necessary discipline on managers, whose self-interests often diverge from those of the owners. Thus, even hostile takeovers, which imply change and restructuring that can have significant repercussions for the existing management, workforce, local community, and a host of other external stakeholders, can have beneficial effects in terms of stimulating improved economic performance and generating greater returns to shareholders. Many takeovers, for example, reflect the acquisition of underperforming or undervalued businesses that are unrelated to the strategic core of the parent company. The underlying argument is that managers, as agents of the owners, have a fiduciary responsibility to shareholders to sell off such assets and refocus the company on those areas that promise higher efficiency and return.

Critics argue that many takeovers are initiated for the simple purpose of liquidating the target company, especially when there is a gap between the market value of the firm and the breakup value of its assets. A basic proposition of free market capitalism is that market value represents the best estimate of net present value (a way of calculating the value of a net cash flow adjusted for the time value of money) of future cash flows. However, critics contend that beyond a short-term financial return for select shareholders, a liquidating takeover does not have any long-term benefit to other stakeholders or the larger society. These objections are especially directed at buyouts of successful and profitable companies, where the takeover may lead to layoffs and changes in management and can have a variety of negative effects on the firm's local community. Another argument is that the threat of corporate takeover compels managers to show evidence of continuous profitability that can precipitate a neglect of longer-term investments (e.g., in research and development). Although the extant research indicates that such causal dynamics are unclear, this pressure is suggested to undermine long-term capital formation and the competitiveness of the economy.

Takeovers and Defense Tactics

While ethical and social concerns typically focus on the acquirer's motives and actions, target firm management has also come under criticism for a series of questionable tactics intended to discourage unwanted takeovers. Based on an analogy to takeover specialists as "sharks," "shark repellent" refers to an exotic array of tactics that includes golden parachutes, poison pills, greenmail, sandbagging, and "pac-man" and "scorched earth" defenses. "Golden parachutes" promise lucrative benefits and severance payments to current management if they lose their jobs due to a takeover by another company. A related tactic that focuses on employees is referred to as "tin parachutes," which are suggested to be a better takeover defense than golden parachutes due to the fact that the greater numbers of employees can create a larger total payout, even if individual payments are less. "Poison pill" tactics are attempts to dilute the value of the shares held by the bidder by giving existing shareholders (except the bidding company) rights to buy shares of either the target company (referred to as "flip-in provisions") or the acquiring company ("flip-over provisions") at a significant discount, which are triggered by an attempted takeover.

As a spin-off of the term "blackmail," "greenmail" is when a target company repurchases a large block of its stock that is held by an unfriendly company or raider at a substantial premium to stop the takeover attempt. "Sandbagging" is when a target firm attempts to stall the process, often with the hope that a more favorable acquirer (a "white knight") will emerge. A "pac-man" defense is when a takeover target launches a tender offer for the company that was trying to acquire it. If successful, the target company ends up taking over the company that tried to buy it out. Finally, the "scorched earth" defense, which is sometimes referred to as a "suicide pill," involves selling off desirable assets or depleting the cash reserves of the target company by making extensive (and not necessarily profitable) acquisitions, possibly incurring large debt in the process.

While these various tactics may protect the target against an unwanted takeover, they render the company vulnerable to the vagaries of the business cycle, and they can significantly contribute to company debt. They also raise significant concern about the fiduciary duties of the target firm's management to its shareholders. From an agency theory perspective, the underlying question concerns the extent to which these tactics are being used to protect shareholder interests or to preserve the entrenched position of the target firm's executives.

Process and Outcome Considerations in Mergers and Acquisitions

Although criticism is typically placed on hostile takeovers, even "friendly" mergers and acquisitions (M&As) can raise an array of ethical and social concerns. Although M&As are often portrayed as carefully calculated, strategic acts, in practice they can be very costly with disappointing results. M&As typically disrupt organizations, often for years, diverting the time and energy of senior management and making organizational members feel stressed, angry, frustrated, disoriented, and frightened. Workplace ethics are especially vulnerable during such strategic transitions. According to a study by the Ethics Resource Center, employees in organizations undergoing mergers or acquisitions observe misconduct and feel pressure to engage in questionable business practices at rates that are nearly double those in more stable organizations.

Although many of the human problems associated with M&As—the fears and uncertainties, stresses and tensions experienced by employees—and the potentially negative repercussions for a range of external stakeholders cannot be totally eliminated, managers can exert favorable influence on both the integration process and consolidation outcomes. There are several concerns, each with a strong social and ethical component, that capture much of this tension.

Competing Claims and Conflicts of Interest

M&As involve multiple parties, each with separate interests and needs. Historically, this conflict has largely been framed in terms of the merger partners' or acquiring and acquired firms' shareholders. As such, legitimate competing claims have been viewed in terms of the interests of the two groups of shareholders. Accordingly, corporate officials were duty bound to define and pursue the best interests of these individuals. The stakeholder view, in contrast, emphasizes that firms have responsibilities to a broader array of groups that go beyond the immediate interests of shareholders—although the latter continue to occupy a place of prominence among stakeholders.

Although the stakeholder model suggests that a utilitarian orientation (i.e., the greatest good for the greatest number of stakeholders) should help resolve the difficulties posed by such competing claims, the "greatest" good in a merger or acquisition is difficult to determine. While shareholders have one set of concerns, other internal stakeholders such as senior managers and employees, and external stakeholders such as customers and local communities, typically have others. Simply put, what might be in the best interests of one particular stakeholder group might very well conflict with the interests of others.

Executive Compensation and Conflicts of Interest

A reality of MA&Ts is that nonexecutive employees and other stakeholders bear a disproportionate risk for poor corporate results, as senior-level executives often receive multimillion dollar payouts when a merger or acquisition is finalized. In most instances, senior-level executives are able to renegotiate their contracts, not only limiting their financial risk but creating significant remuneration in the process (e.g., golden parachutes). Such "change-in-control" provisions, which are often part of an executive's employment contract, may not be fully disclosed or understood by the company's compensation committee, and at times are added only weeks or even days before the finalization of the merger or acquisition. Due to the way in which such corporate reward structures are oriented, individual executives can be biased toward "doing a deal" rather than giving sound, unprejudicial advice to the board.

Culture Conflict as a Competing Claim

While the tensions between different interests can readily exacerbate combination-related decisions, the subtle nature of many competing claims further clouds the consolidation process. Cultural differences between organizations, for example, often create barriers to integration and consolidation, especially in mergers of "equals." Organizational members, an important internal stakeholder group, tend to feel that the culture of the merged organization should be closer to "their" culture (i.e., organizational philosophy, values and beliefs, ways of carrying out tasks) than that of their merger partner. In essence, such competing perceived rights and the resulting collision between different styles, orientations, and values create postcombination difficulties and can distract managers and employees from attending to critical business-related activities.

Secrecy Versus Deception

Tensions typically arise in communication between the managed release of information in an open, honest, and timely manner, and the controlled release of information to distort the truth and manipulate people. When faced with a merger or acquisition, managers are faced with difficult decisions concerning the nature and timing of communication to employees and other relevant publics. While Securities and Exchange Commission (SEC) rules limit what can be told and when it can be released (e.g., insider trading concerns), critics argue that executives often use such constraints to deceive and manipulate employees.

This issue raises concerns about information and property rights. Questions often focus on the extent to which the proposed transaction and its implementation have been carried out in a transparent and honest manner and whether parties with a legitimate right to information relating to the transaction have been given equal access to relevant and appropriate information in a timely manner. Open communication channels are an important factor in minimizing people's fears and creating an informed understanding of the organizational combination.

Insider Trading

Insider trading is when someone makes an investment decision based on information that is not available to the general public. Nonpublic information on an impending merger or acquisition gives "insiders" an unfair advantage to other investors who do not have access to such knowledge. Such illegal insider trading also includes providing others with nonpublic information, and company directors and executives, brokers, and even friends and family members acting on such information can be guilty. For the SEC to prosecute someone for insider trading, however, they must prove that the defendant had a fiduciary duty to the company and/or intended to personally gain from buying or selling shares based on this information. Insider trading is legal once the material information has been made public, at which time the insider has no direct advantage over other investors. The SEC still requires insiders to report all their transactions—and since insiders have insights into the workings of their company, investors often look at these reports to see how insiders are legally trading their stock.

Employee Participation and the Management of Grief, Loss, and Termination

M&As often differ in the extent to which organizational members are forced into accepting certain situations or provided a true opportunity to take part in discussions and decisions. In many instances, precombination planning and execution are tightly controlled by senior-level management, and the resulting change is typically done *to* organizational members rather than *by* them. The ways in which subsequent employee grief, loss, and termination are handled exert a significant impact on employee attitudes and behaviors.

During the initial stages of a merger or acquisition, employees typically experience conflicting emotions ranging from shock, anger, disbelief, and helplessness to hope, excitement, and raised expectations. Following a merger or acquisition, there is typically a "mourning" period, similar to when a member of an extended family dies, as the erosion of familiar work surroundings and the exit of colleagues and friends signals the "end of what was." From a managerial perspective, it is important to assist employees during this transition, helping them deal with such feelings and the new realities of the combined organization. The handling of employee terminations and staff reductions also sends signals about management's values to the employees. Yet research suggests that most people involved in a merger or acquisition feel that termination decisions are handled arbitrarily and ineffectively.

The Ethical and Social Impact of Mergers, Acquisitions, and Takeovers

The level of respect for organizational members and other key stakeholders as individuals is an important dimension of the MA&T process. Historically, the relationship between employer and employee has been governed by the employment-at-will doctrine: The employment contract can be terminated at will by either party at any time for any reason. Although this perspective has been challenged by public policy questions based on the greater good, it has led to the rather narrow view that employees only have those rights that they are able to negotiate with their employers. Employees and other key stakeholders, however, are not mere abstractions and, as individuals, have a moral right to be treated fairly, with respect and dignity.

To a large extent, the ethical and social impacts of MA&Ts are dependent on the extent to which these considerations are appropriately dealt with. While hostile takeovers, especially those characterized as liquidation strategies, are criticized for creating significant disruption and often fail to lead to the proposed level of efficiency and effectiveness, even friendly, collaborative combinations can precipitate disruption, dislocation, and upheaval. It is generally agreed that corporations are responsible for their actions and they have an implicit obligation to their relevant internal and external stakeholders. Thus, to minimize employee trauma and adverse effects on other relevant stakeholders (e.g., customers, local communities), organizations and their management should ensure fairness and due care throughout the M&A process, from precombination planning, through the transaction itself, to postcombination integration.

Such due care includes social impact analyses that present a coherent rationale for the combination, a 3- to 5-year business plan on how the combined business will be operated, and an assessment of the effects of the combination on key stakeholders. These analyses should explicitly address the underlying wealth creation strategies and their ramifications for primary stakeholders (e.g., employees, customers, suppliers) and their broader social impacts (e.g., the effect on the local community). Challenges include balancing costs and benefits across different social levels (e.g., local community vs. regional economic concerns) and time periods (e.g., near term vs. long term, current generation vs. future generations). Early planning and due diligence (i.e., the careful assessment a reasonable person should take before entering in an agreement or transaction with another party) should go beyond financial and legal analyses and include assessments of strategic compatibility, differences in corporate culture, operating style, organizational standards, and business practices. If companies do not address whether and how they will manage these inevitable differences from the outset, they will have to deal with conflict without agreed-on processes, tools, standards, or principles by which to guide smooth resolution.

Clearly, M&As can be risky strategies, but internal development can be just as risky and even more time-consuming. From an ethical and social vantage point, MA&Ts can favorably contribute to the firms involved, their stakeholders, and the larger society if all relevant stakeholders are considered and treated fairly and justly, ensuring that their rights are upheld. Focus should be placed on the extent to which the proposed combination will favorably affect the value of the firms and create more benefit than harm for the organizations' shareholders and other internal and external stakeholders and the larger society.

MERITOCRACY

The term *meritocracy* refers to the practice of rewarding or allocating according to those who are excellent or deserving. The etymology of the word comes from the Latin *merere*, which means to receive one's share as pay for work done. Thus, in its simplest form meritocracy can be seen as a way to reward producers. For example, it is often the case that some of the higher-compensated employees in a company are the top salespeople who are paid on commission. Most companies are happy to provide a competitive rate of commission to salespeople who produce for them. Given this incentive, there are many salespeople who are very talented and work very hard to earn handsome incomes—especially in such industries as financial services, real estate, and big-ticket manufacturing and services contracts.

On the next level, things become a little more difficult. How is it that we judge "merit" or "deserts"? This is the more difficult question and links the question of meritocracy with that of distributive justice. Three views will be examined: (1) the traditional position (represented by Daniel Bell), (2) a social welfare–based position (represented principally by John Rawls), and (3) a deserts-based position (represented principally by this author).

The Traditional Position

Daniel Bell says that meritocracy is made up of those who have earned their authority through individual achievement. This is a functionally based understanding. In a sales contest, a company might offer a vacation to Hawaii to anyone selling 50,000 widgets in the latest financial quarter. Under the traditional position, if Andy sells 50,000 widgets, then Andy merits or deserves the vacation. The traditional interpretation of meritocracy is behind much of American and global business assumptions. This is because of the strong link to classical models of capitalism. These models suggest a reward formula to each according to his valued work. Thus, within the rules of fair competition, a person is rewarded more if he produces tangible output that the society values. It is not the case that any means of production are allowable (since, at the extreme, one could kill another and snatch *his* output). Therefore, within the framework of rewarding according to work is a caveat that all the applicable rules of competition have been obeyed.

Implicit in classical models of capitalism is also a vision of useful synergy between various production engines within the society. Behind Andy's vacation reward, for example, is the notion that the company's functional standards should be seen in the context of larger interdependent markets. No single business can be accurately separated out. In macroeconomic terms, the traditional model supports distributing according to social usefulness (which fits the relatively unfettered operation of capitalism à la Friedrich A. Hayek or Milton Friedman). In theory, those who will acquire the most resources will be those who offer a social benefit to those who are able to compensate them for said benefit. In practice, the traditional understanding of meritocracy operates through a dynamic interaction between business and society.

The state steps in to establish fair rules and then acts as a referee only when someone breaks the rules. Apart from that, each person gets what she can with whatever resources she has at her disposal (such as her IQ or her hard work).

The Social Welfare–Based Position

For John Rawls, the question of distributive justice is rather different. He is not content to say that any person begins at some point in the process of acquisition and then is merely constrained by a set of rules and procedures to ensure fairness. Rather, the socioeconomic position of the agent is also considered.

Let's return to Andy and the sales contest. In the traditional position, the only thing we had to consider was whether there were clear rules and that these rules were being followed by everyone in the sales force. This is because what is important is whether someone sells 50,000 widgets or not. If you do, you get the trip. If you don't, you stay at home.

What Rawls wants to ask is *why* Andy is such a good salesman and whether there is some level on which justice might redistribute outcomes for others not as gifted as Andy. Rawls bases his query on *how* the agent is presented with her distribution of talents and social position. His conclusion is that these distributions are accidental and arbitrary. It is an accident that someone is born with whatever natural traits he may possess. For example, let us consider two traits only: being a fast runner and being a fast talker (meaning a persuasive salesman). Now if Sam is a fast runner, he is so because he was born with certain physical traits that made him that way, such as an efficient Krebs cycle in respiration, lung capacity, and so forth. If Jamal is a fast talker, this may also be due to certain natural attributes such as neural wiring that permits quick thinking and an ability to be single minded and not subject to hormonal interference (such as might cause anger or upset). Neither Sam nor Jamal can claim credit for their natural abilities that were given to them by parents in a natural genetic lottery. Thus, if these natural abilities are the basis of societal reward, then in a strong sense neither Sam nor Jamal *deserve* what they have achieved. In this case, the question is raised whether a meritocracy based on natural abilities is thus unfair. Some might contend, for example, that even if we do not deserve our natural abilities it is not unfair if we reap the rewards of those abilities because the system of reward is independent of the system of deserts.

However, Rawls makes the case that social position is also random and arbitrary. For example, if you put Sam the fast runner into a hunting society, he may garner the most goods because his speed makes him a better hunter. However, if you put him into the information-based service society, then speed is irrelevant. He will not be rewarded. The same may be said of Jamal in reverse order (viz., he would do poorly in the hunting society but would prosper in the information-based service society). Neither Sam nor Jamal could help growing up in the society in which they were born. It was an accident. Thus, the fact that their natural abilities may or may not be rewarded in that society is also an accident. To be rewarded based merely on an accident is not deserved. Thus, a meritocracy that is based on reward from undeserved social position is similarly unfair.

Therefore, both natural abilities and social position may not be the basis of distributive justice because they are unfair. The naturally advantaged are not to gain merely because they are more gifted. The rectification of these disparities in Rawls is his difference principle that makes all inequalities subject to the stipulation that the least advantaged will benefit from them.

There is some dispute on how Rawls's difference principle is supposed to work, but in our example of Andy, the salesman, Rawls might argue that part of the sales contest reward be distributed to the losers in the contest and to the secretaries and to the maintenance crew. Of course, if Andy now has to settle for a vacation to Long Island (say he lives in New Jersey) instead of a trip to Hawaii, he might not be so keen to work those extra weekends to sell the widgets. Thus, a probable outcome of Rawls's position is lower productivity since full merit reward is being modified for social welfare concerns.

The Debate Reconsidered

How do these two positions, the traditional approach and the social welfare–based approach, view each other? The traditional approach responds to Rawls that distributive justice does not require that each agent *deserve* everything she has obtained, merely that she has played by the rules (enforced by the government). As Robert Nozick once famously said, it need not be that the foundations underlying desert are themselves deserved, *all the way down.* Under this account, it is irrelevant to justice whether one deserves one's natural or social advantages. They are what one is given. So long as one goes forth from the starting point and obeys all the rules, then justice is upheld. However, Rawls would demur by claiming that natural talents are collectively held. If this is so, then the least advantaged has some claim on the goods possessed by those who are society's winners because of natural talent or social position.

Those evaluating the arguments supporting the above positions should note that much depends on the understanding of the agent and her role in society. If the agent is primarily seen as a largely separate, autonomous entity acting for herself as much as possible, then the traditional position will seem most appealing. The individual cannot help how she begins life. Why make her "pay" for her positive talents and advantages? If one begins at a fundamental position of a Lockean state of nature, then it is after all one's use of natural resources that would determine ownership. For Locke, the process of making a valid property claim depends on one actually using what is claimed. If one fails to use the land or ceases to use the land, then there is no valid claim. (This "use" principle is also behind the concept of adverse possession that entitles one to engage in a valid taking of another's property if the owner is not using it and does not defend it.) The "use" principle is based on a presupposition that it is individual effort that counts the most. Hobbes complicates the picture even further by suggesting that all agents are different but equal. If one person has natural advantage A to the *n*th degree then another will have a different but equally as effective natural advantage B to a degree such that both can compete on an equal footing. If one finds these depictions of the state of nature fundamentally correct, then the individualistic position again seems most plausible.

However, if one sees the individual as contextually linked in a kingdom of ends, then the story plays out differently. For the social welfare advocate to make her case, it is necessary to conceptualize society as radically interdependent. The ideas of John Donne in *Meditation XVII* or Martin Luther King Jr. in *Letter From a Birmingham Jail* describe a society in which there are no largely separate individuals. Each person in a society is connected to every other person such that the proposition that natural assets are collective is entirely plausible. Second, Rawls's difference principle can be seen as a response to the question of moral luck. How much should one's personal happiness depend on factors outside one's control? How much should our judgment of others depend on luck (natural talents or social position)? If it seems *wrong* for luck to be determinant without recompense from the community, then you are probably on the side of social welfare.

The Deserts-Based Position

Joel Feinberg has said that desert without a basis is simply not a desert. Feinberg then calls for some sort of basis so that if a person is deserving of some sort of treatment, he must, necessarily, be so in virtue of some possessed characteristic or prior activity.

The traditional position asserts that reward is based on merit and merit is based on achievement (as per Andy and the sales contest). The deserts position agrees with this in part. Both concur that merit is based on achievement, but the traditional position measures achievement as an outcome only. The deserts position measures achievement on the basis of work done by the individual without the advantage of any preferment. Thus, if you were a manager for the ABC Widget Corporation and your northeast sales staff was dominated by a producer named Andy who has family connections that allow him uniquely to always lead the company in sales, then if you wanted to have a sales contest that would motivate producers and increase production, you should make the sales contest based on bettering your last year's rolling average by some percentage. Such a sales contest would reward those who improve from where they are and mute the undeserved advantages Andy has due to family. Thus, in hiring and compensation practices, advocates of the deserts position strive to look at how far each individual has gone and strive to encourage and reward personal growth (and not just absolute outcomes).

In contrast to Rawls's social welfare conception, the deserts position judges merit on past actions and not on some sort of social, utopian goal. The traditional meritocracy model might ask, for example, "Who do you want doing your newly mandated Sarbanes-Oxley corporate audits each year—a person who has graduated from a top business school or someone who went to a midtier or lower-tier school and was probably admitted under Affirmative Action?" The assumption under the traditional model is that the former person has reached some higher level of technical competency and therefore merits the contract. Those advocating the deserts model would ask further questions about both candidates. It might be the case that the latter candidate has had to work very hard for everything he's gotten while the former candidate got into school because his family has always given a lot of money to the school. The former candidate's status of achievement may not be indicative of how well he might perform over the long haul. Since so much has been given to him, and since the latter candidate has already demonstrated an ability to overcome adversity, the deserts model would suggest hiring the mid- or lower-tier graduate (because of his previous degree in the school of hard knocks).

Obviously, this is a case at the extremes. However, it is put forth to make an abstract point about merit. Like the social welfare–based approach, the deserts model recognizes that some people have natural and environmental advantages that can include some or all of the following when it comes to the ability to compete for society's goods:

- Adequate food, clothing, shelter, and protection from unwarranted bodily harm
- Basic educational opportunity
- Being treated with dignity and love for who you are
- A nurturing home environment
- Parental models for patterning behavior (that the society views positively)
- Freedom from disabling disease whether it be mental or physical
- Inside connections affecting admission to universities and to the professions
- Affluence

Obviously, this list could go on and on. But when Mr. B speaks with hubris about how he has become a partner in the accounting firm, it may be important to know that Mr. B's father is the senior partner in the firm and got B his job in the first place (and has been holding B's hand all his life). This is the life of preferment that allows parents to present to their children an easy road. All the child has to do is not to screw up too badly and he's set for life.

This preferment list need not merely include socioeconomic factors. Race and gender may also be factors. According to the deserts-based model, this is *not* success by merit; it is success by unmerited preferment. Thus, the deserts-based approach contends that it combines the definition of merit (from the traditional model) with the concern for the distribution of natural and social advantage (the social welfare–based approach).

Conclusion

The question of how we are to think about meritocracy is an important one for business and society. Management strategies that follow one of the above approaches will be markedly different from those that adopt another model. Thus, it is important for businesspeople to come to terms with a particular model of meritocracy and make it their own. It will guide their worldview and management style. It is, of course, a separate question as to which model of meritocracy will most significantly increase the bottom line (since there are many ways to do that these days—including the so-called triple bottom line assessment that included ethics and environmental awareness as two additional categories that stand beside the standard depiction of monetary profit and loss). However, the question is an important one for everyone in society (including the business community) to assess in order to create the best systems of goods allocation (distributive justice).

METAETHICS

The most inclusive way of understanding metaethics is as an investigation into the nature of moral judgments: judgments about the morality or immorality of actions, institutions, states of affairs, or whatever. What makes this formulation inclusive is that it describes both of the two areas of ethical inquiry that metaethics is generally understood as encompassing. These two areas are, first and most narrowly, the meaning of moral language; second and more broadly, the nature and possibility of moral knowledge. (Talk of "judgments" covers both because it can refer to both the words used in making a judgment and what is claimed in making that judgment.) Used to refer to the first area of ethical inquiry, metaethics is employed in what might be called its *linguistic* sense. (As it is still words and their meanings involved, for convenience, this description will apply even when, as sometimes occurs, the talk is of a "conceptual" or "logical" analysis rather than a linguistic one.) Used to refer to the second area, metaethics is employed in what might be called its *epistemological* sense (albeit that it covers ontological issues about *what* is known as well as more properly epistemological issues about *how* it is known). Used in either of these two senses, the prefixing of *meta* to *ethics* implies something above and beyond ethics as normally understood (*meta* being Greek for, among other things, "after").

As a term, *metaethics* entered the philosophic lexicon sometime in the 1950s or 1960s through the work of those philosophers, labeled "linguistic philosophers" by opponents, for whom an analysis of language was the first and most important recourse in solving philosophical problems. Fittingly enough then, in this its introductory stage, metaethics was used in only its linguistic sense. With the decline of linguistic philosophy after its 1950s and 1960s heyday, the epistemological sense came to be added to the linguistic. And today, although exclusively linguistic definitions can still be found, metaethics is more usually defined as a combination of its linguistic and epistemological senses.

Scope

Characterized in the linguistic sense, metaethics concerns what is meant when it is said that something is "good," "bad," "right," "wrong," and so on. Characterized in the epistemological sense, it concerns overlapping matters such as whether there is any sort of factual basis to moral judgments, whether moral judgments are capable of being true or false, whether we can ever know what is moral or immoral, and so on. On either characterization, in practice it is the same issues that emerge as metaethical with the only difference being whether, in terms of a purely linguistic definition, they are seen as problems of an entirely linguistic sort or whether, in terms of the now more usual combinatory definition, they are seen as both linguistic and epistemological in nature with the difference being simply a matter of the direction from which they are approached—that is to say, as a search for what is meant in uttering moral judgments or as a search for the epistemological basis to such judgments.

The resulting list of issues is best understood as a series of opposing standpoints stemming from differing views of the meaning and/or epistemological basis of moral judgments. They are, for the most part, standpoints that can be characterized in terms of an opposition between those who say there is some kind of "objective basis" to moral judgments and those who deny this by saying that they are in some sense or other "merely subjective." More particularly, we have on what can be called the "objectivist" side of the argument a position labeled "realism" (the claim that there are facts to make moral judgments true or false) from which follows another position labeled "cognitivism" (the claim that moral judgments can be known to be true or false). Contrariwise, on what can be called the "subjectivist" side, we have a denial of both these standpoints in the shape of positions labeled "irrealism" and "noncognitivism," respectively (with irrealism denying that there are facts that can make moral judgments true or false and noncognitivism denying that such judgments can be known to be true or false).

Consequent Distinctions

As was indicated in noting the meaning of the word *meta*, implicit in the idea of metaethics as a distinctive area of ethical inquiry is that, in terms of what is being examined and explained, it is the most fundamental area of such inquiry. Thus, a necessary accompaniment to the distinguishing of metaethics as an area is its distinguishing from other areas concerned with less fundamental matters demanding a lower level of explanation. And here two such areas have come to be recognized: one labeled "normative ethics" and the other "applied ethics."

As presently conceived of, normative ethics is about what it is that makes actions and arrangements moral or immoral and, as a consequence, judgments as to their morality or immorality, true or false. It is concerned with this in general rather than in particular circumstances or particular instances. It is concerned, therefore, with accounts of the nature of the ethical given by theories such as utilitarianism, which says that we should aim to optimize human welfare, and Kantianism, which says that we should do whatever duty dictates.

In contrast, and as the title would suggest, applied ethics is very much concerned with particular circumstances or instances. It comes in two forms: a broad form concerned with the ethics of particular sorts of activities and a narrower one focusing on particular issues. Thus, in its broader form, applied ethics denotes specialist subject areas such as business ethics, medical ethics, research ethics, and so on. While in its narrower form it denotes an inquiry conducted outside a specialist subject framework into contentious issues such as abortion, capital punishment, pornography, and so on.

Talk of applied ethics came after talk of normative ethics. As originally conceived of, normative ethics covered both theoretical accounts of the nature of the ethical such as utilitarianism, and so on, as well as what we now distinguish as applied ethics. This reflects the fact that what was seen as essentially distinguishing metaethics from other and less fundamental areas of ethical inquiry is that it is *non*normative. That is to say, an area of inquiry that is *not* about determining what is moral or immoral ("normative" being a word for just such a determining). In contrast, those less fundamental areas distinguished as normative ethics and applied ethics were both, in their different ways, seen as *normative.* So while metaethics was conceived of as a kind of value-free analysis and, therefore, neutral with regard to determining what is moral or immoral, normative ethics and applied ethics were not. Consequently, the role assigned to metaethics with respect to determining morality or immorality is as a necessary preliminary. Its role, in short, is to sort out ethical language and/or epistemological issues regarding objectivity and subjectivity *before* any such determining by normative ethics and applied ethics takes place: a demarcating of roles traditionally summed up by saying that metaethics concerns question *of* or *about* ethics, whereas the other two concern questions *in* ethics.

To this was generally added a demarcation of roles between normative and applied ethics based on the former determining morality or immorality in general, while the latter does so only in particular circumstances or instances. For what this difference suggested is a division of labor in which normative ethics supplies the criteria for deciding what is moral or immoral and the job of applied ethics (and the thing being "applied") is simply to bring those criteria to bear on particular circumstances and instances.

What emerges from this notion of metaethics as a distinctively nonnormative area of ethical inquiry functioning as a necessary preliminary to the two normative ones is, in terms of explanatory dependence, a decidedly hierarchical view of such inquiry. At the top is metaethics as an area that has to be sorted out before the other two areas are engaged in for otherwise they will be subject to all kinds of errors and confusions. In the middle is normative ethics as the area needing to be sorted out before it can be decided what to do in particular circumstances or instances. And at the bottom is applied ethics as the area dependent on normative ethics for the theories providing it with criteria for determining just what things are good or bad, right or wrong.

Criticisms

Well established though it is, this notion of metaethics as a specifically nonnormative area of ethical inquiry standing over and above normative areas is not without its critics. Their criticisms come in two main forms, one of which is more global in character than the other.

The less global is to question just how much of difference there is between metaethics and normative ethics. It can be argued, for instance, that the supposedly metaethical distinctions between realism and irrealism or cognitivism and noncognitivism are nothing more than a decision to (respectively) opt for or reject normative theories such as utilitarianism and Kantianism. And if so, then rather than constituting distinct areas of ethical inquiry, what has been distinguished as metaethics and normative ethics are merely parts of an interconnected theorizing about ethics for which the only heading needed is the very general one of "ethical theory."

Unlike the above, the more global criticisms do not just argue for a dissolving of the distinction between metaethics and normative ethics. They argue against the whole hierarchical and, in particular, top-down approach to ethical inquiry implied by the distinction. They do this by questioning the assumption of an explanatory dependence of normative ethics on metaethics and even, among the more radical of these critics, of applied ethics on normative ethics ("explanatory dependence" being the notion set out at the end of the previous section that explanations in normative ethics depend on metaethical ones and explanations in applied ethics on normative ones). Arguably, they say, dependence could also operate in the reverse direction. Thus, it is claimed that positions classified as "metaethical" can both arise from and be supported by stances on issues classified as belonging to normative ethics. And for some, the same is even true with respect to the relationship between normative ethics and what is classified as applied ethics, with applied ethics being both the test bed for theories of the nature of the ethical and their possible source. In short, although there are certainly different levels of generality with respect to explanations in ethics, there are not, at least not in any merely top-down way, different levels of explanatory dependence from theories of a high-level metaethical sort to those of a midlevel normative ethical sort and on to those of a bottom-level applied ethics sort. Not surprisingly then, these more global critiques of the concept of metaethics invariably come from those skeptical of the usefulness of the more abstract sort of theorizing about ethics and/or viewing applied ethics as the most potentially revealing way of approaching ethical issues.

Connections to Business Ethics

The way connections between metaethics and areas of applied ethics such as business ethics is viewed depends on whether, or to what extent, the top-down model of their relationship talked about above is accepted. For those who wholly accept the model, work in business ethics will be seen as predicated on theoretical assumptions provided by normative ethics and, ultimately, metaethics. Take, for instance, the much-discussed Ford Pinto case. Here it is said that a proposed solution to the problem of an unsafe design of motor car (the Ford Pinto) was to balance the monetary cost of changing to a new and safer design against actuarial estimates of the monetary cost of those deaths and injuries that were likely to result from staying with the existing and unsafe design. As it is being assumed that comparing the relative monetary cost of the two opposing options offers a definitive answer to the problem of what to do, then in terms of the top-down model this is a solution predicated on the metaethical assumption of an objectivist view of morality and, more specifically, a normative ethical theory of a utilitarian sort whereby right and wrong are determined by the extent to which there is an optimizing of human welfare (with, in this case, welfare being measured by a balance of relative monetary costs). So in these terms, a defense or rejection of that proposed solution would be by appeal to findings belonging to higher levels of ethical inquiry in the shape of normative ethics and metaethics that are beyond the purview of an applied area such as business ethics. Conversely, those skeptical of this top-down approach would have a less rigidly demarcated view of the situation. So while not denying the obvious truth that ethical inquiry can be conducted at different levels of generality with respect to the questions being asked, they would view ethical inquiry as a more or less integrated whole with fluid boundaries between different levels of generality and an explanatory dependence that is just as much from the less general to the more general as vice versa. Thus, for those skeptical of the notion of metaethics as a distinct and ultimate area of ethical inquiry, offering a solution to a problem within an area of applied ethics such as business ethics (be it the Ford Pinto case or anything else) is just as much a question of putting the perhaps overly abstract theories of normative ethics and metaethics to a practical test as it is of looking to those areas for theoretical guidance.

METALLGESELLSCHAFT

In the early 1990s, Metallgesellschaft AG, a German conglomerate that had evolved from a traditional metals company into a provider of risk management services, was one of Europe's most successful businesses with approximately $15 billion in annual sales. However, that success was marred when, in December 1993, MG Refining and Marketing Inc. (MGRM), a subsidiary of Metallgesellschaft AG, revealed that it had lost $1.5 billion from trading in energy derivatives.

The tale of MGRM's troubles starts with their marketing strategy. MGRM committed to sell to their customers set quantities of fixed-price petroleum products every month for up to 10 years. These contracts proved to be very popular. Each MGRM contract contained a sell-back option allowing MGRM's customers to terminate the contracts early if the next-to-expire (i.e., "front-month") New York Mercantile Exchange (NYMEX) futures contract was greater than the fixed price at which MGRM was selling the oil product.

To manage the risk from these contracts, MGRM established large futures and swap positions in gasoline, heating oil, and crude oil as hedges. These positions involved about 155 million barrels of underlying oil products. It is not clear that there was anything conceptually wrong with MGRM's hedging strategy. But it is clear that MGRM had not adequately communicated its intentions to its parent company and financial backers. In late 1993, MGRM's futures positions lost money as spot energy prices fell, requiring the immediate cash outflows to meet margin calls. Presumably, their other assets involved in the hedge were increasing in value in a way that offset those outflows, but these increasing values could not be turned into cash flows.

By the end of 1993, the heavy cash outflows required to maintain the hedge program, combined with concern about the credit risk taken on with the large swap position, caused MGRM's parent to change its assessment of the potential risks involved in its customer contracts. After reviewing the program in December 1993, MGRM's parent decided to end MGRM's participation in the hedge program, a decision that proved very costly to the firm.

Because the liquidation was publicly announced in advance, other traders were able to extract a large premium from MGRM. The net result is that MGRM lost on the futures and swap side of the transaction while failing to realize the offsetting gains they had reasonably anticipated. In total, MGRM lost $1.5 billion in the disaster.

METHODOLOGICAL INDIVIDUALISM

Methodological individualism is the doctrine that large-scale social events and conditions, such as wars, social customs, economic recessions, the crime rate, and the state, should be explained or understood wholly in terms of the beliefs, intentions, attitudes, and actions of individual people. It is "methodological" in the sense that it indicates how social scientific inquiry ought to proceed; the "individualism" stems from its insistence that social scientific explanations should, at least ultimately, involve only facts about individual agents. Methodological collectivism or holism, in contrast, contends that at least some social phenomena can be explained only at a macroscopic or holistic level.

Methodological individualism was at issue in many high-profile disputes in sociology, psychology, economics, and the philosophy of history during the late 19th and 20th centuries. An early example is the so-called *Methodenstreit* controversy between members of the German Historical School and the Austrian

School in economics. More recently, Jon Elster has defended methodological individualism as a corrective to Marxists' fondness for functional explanations. Notable proponents of the doctrine include the sociologist Max Weber, the philosopher Karl Popper, and the economist Friedrich A. Hayek. The philosophers G. W. F. Hegel and Karl Marx and the sociologist Émile Durkheim are prominent collectivists. Although few social scientists today identify themselves as methodological collectivists or holists, methodological individualism is at odds with forms of explanation that remain widely used in the social sciences, such as structuralism, pure statistical analysis, and the explanations found in many kinds of sociobiology.

Although methodological individualism, at least as Weber initially formulated it, is an epistemological view about social scientific explanation, it is easily and often confused with other views, partly because it is often found together with other kinds of individualism and atomism. Popper and his student J. W. N. Watkins, for example, seem to defend methodological individualism out of a commitment to metaphysical or ontological individualism, the view that social entities are in reality nothing but aggregates of individual people and their behavior. One need not embrace this metaphysical thesis to be a methodological individualist, however, nor does embracing it commit one to the doctrine. So too, methodological individualism is distinct from political individualism, although Hayek and Popper espouse both doctrines and claim to find important connections between them. Although Thomas Hobbes is often characterized as a methodological individualist, his political individualism is better understood as related to his psychological atomism—his attempt to explain the possession of characteristic human capacities such as thinking and reasoning without appealing to people's relationships with others. Atomism of a different sort holds that social goods should be regarded as wholly constituted by interconnected individual goods, but this position too neither implies nor is implied by methodological individualism.

Weber acknowledges that we often speak of "social collectivities" such as corporations, associations, and states as though they were individual agents, but he contends that in social science research, collectivities should be treated as the product of individuals and their actions. This is because the actions of individuals are, in his words, "subjectively understandable." We can understand the motives and intentions of individuals that lead them to act as they do, and macrolevel social happenings and conditions are adequately explained only when given in these terms. Since the actual motivations of individuals may be unknown or unavailable to the sociologist or economist, however, social scientists must typically invoke a model of rational human action, which for Weber is his theory of ideal types.

Weber influenced Hayek and other members of the Austrian School who have been among the most ardent defenders of methodological individualism. But while Weber's theory of ideal types implies that social events and structures are rationally intended, Hayek in particular emphasizes that large-scale social phenomena are often the spontaneous and unintended effects of human action. What needs theoretical explanation, he argues, is how social order can be the result of individual action without having been designed by anyone. Explanations of money, markets, or the law, for instance, should be given in terms of how the relevant choices appear from the perspectives of individuals and in light of their beliefs, norms, and interests. This view leads Hayek to criticize the approach of the Keynesians whom he regards as attempting to explain macroeconomic conditions (such as total employment or the inflation rate), not in terms of the decisions of individual agents, but in terms of other macroeconomic conditions. Later in his career, however, Hayek apparently abandons his commitment to methodological individualism in favor of evolutionary explanations.

Many philosophers associate methodological individualism most closely with Popper and Watkins. While Weber and Hayek stress the differences between the natural and social sciences, Popper and Watkins stress the structural similarities between these two kinds of inquiry. Likening social science to mechanistic physics, Watkins writes that explaining the pressure inside a gas container in terms of other macro phenomena, such as the volume and temperature of the gas, would give merely a "halfway" or "unfinished" explanation. An appropriately "rock-bottom" account would explain the pressure in terms of the properties of gas molecules. Analogously, explanations of large-scale social phenomena are complete only when they reduce to facts about particular agents. Apparently, the reason why only such "finished" explanations are adequate, in Watkins's view, is that just as a gas is nothing apart from its constituent molecules, social collectives are nothing over and above their individual members.

Methodological individualism has been criticized on various grounds, but the success of these criticisms often depends on how the details of the doctrine are understood. Unfortunately, its proponents and critics have rarely agreed on what, exactly, they are disputing. Kenneth Arrow, for example, criticizes the doctrine on the grounds that economic production uses technical information, some of which is irreducibly social in character. Although this may be a cogent point against some of the economists Arrow has in mind, a methodological individualist need not deny the social nature of the information on which individuals sometimes act. In general, the doctrine is not committed to particular claims about the content or source of individuals' mental states. Many question, though, whether satisfactory social scientific explanations are always to be found at the intentional level. Consider Joseph Heath's example of a debate among social scientists as to why stepparents have a far greater propensity to kill very young children in their care than biological parents. The question is why one group is better able to inhibit aggression toward crying babies, for instance, than another. The answer may be that biological parents simply find their babies "cuter" than stepparents do, although they may be unable to articulate any meaningful basis for such judgments. An evolutionary account that explains parental affection in terms of inclusive fitness and sexual selection may be able to make sense of something that an account in terms of intentional states therefore cannot, insofar as the evolutionary account explains subintentional biases.

Methodologies of Business Ethics Research

The methodologies employed by business ethics scholars are extensively diverse, covering a wide range of theoretical foundations, data collection techniques, and analytical methods. Business ethics research may be characterized by theoretical discussions regarding the application of major ethical theories—utilitarian, justice, and rights, for example—to various knotty ethical dilemmas or situations found in business as well as the empirical exploration of decision-making processes and elements that influence an individual or organization's decisions or actions, such as personal traits, organizational influences, or the context of the ethical situation. In general, business ethics methodologies can be grouped into two analytical categories: normative and descriptive.

Normative Research

Normative business ethics scholarship focuses on assessing or prescribing behavior related to individuals, organizations, or societies from an underlying set of normative or ethical values that determines what is right or wrong. Normative research emphasizes what is right or ought to be. Normative business ethics scholars frame their research questions as abstracts or standards that should be held by all individuals or organizations in general. The methodologies employed emphasize the pursuit of an ethical ideal. This type of research gives rise to analytical frameworks that question basic assumptions, as well as seek resolutions to ethical questions. For example, a classic normative approach to ethical analysis might involve an analysis of the thesis (a particular point of view), antithesis (the opposite or contrasting point of view), with a resulting synthesis (a compromise or new, integrative point of view). Scholars taking this perspective are often trained in philosophy, theology, and other liberal arts disciplines where theoretical foundations provide a framework for interpreting information and framing the preferred outcome or prescribed behavior.

Descriptive Research

Descriptive business ethics scholarship concentrates on describing an individual or organization's actions to explain or even predict behavior. Applied social scientists often place greater emphasis on descriptive business ethics research. Their explorations are not theoretical but more often empirical in the collection of information about an individual or organization. These scholars tend to ground their research in social science theories that enable them to construct testable hypotheses, or questions, that will be answered by the results found in their study. The goal for descriptive research is to explain the behavior of individuals or organizations. Descriptive research might investigate business policies or practices and whether they are influential in organizational members' decisions or actions. Specific to business ethics research is the focus on decision making or behavior in the context of business organizations or business schools where future managers are being trained.

Descriptive research is more practical or pragmatic and less likely to frame the results derived from the data in terms of what ought to be done. *Ethical* is not understood as an "ought" or "should" but more in terms of an adjective describing the context of the behavior, that is, ethical behavior as opposed to marketing behavior. Descriptive business ethics research reports on what is done. For example, in an experimental research investigation, the question may be framed as a causal relationship question, whether X causes Y—that is, does having a code of conduct result in the organization's employees acting in a more compliant or ethical manner? Experiments can be conducted in a laboratory (controlled environment) or field setting. The two primary issues for evaluating experimental research are whether there is internal and external validity. If the experiment is internally valid, there is greater certainty that X caused Y. Internal validity may be higher in laboratory experiments since there can be greater control exerted over the exercise or study. However, there may be concern regarding the study's external validity. External validity has to do with the generalizability of the results, that is, will similar results leading to the same conclusions or proof be found if the study is conducted over and over again with different subjects or in a different setting? The artificiality of a laboratory experiment may reduce external validity, yet conducting the study in the real world, a field setting, might increase external validity.

Another descriptive research focus is on correlational approaches. Rather than being able to manipulate the variables to test a causal relationship, business ethics scholars may seek to discover a correlation between data. One example would be to assess whether there is a difference between experienced managers and inexperienced business school students. Two separate but identical surveys could be distributed to the two populations and the results could be compared to see if there is a correlation between the two groups, or if not, if the differences in their age and work experience might explain why different results were discovered.

Data Collection and Analyses Used

Influenced by whether the research is primarily normative or descriptive, the methodologies used by scholars in business ethics research can range from case studies, protocol interviews, or content analysis of secondary organizational documents to laboratory experimentation, assessment of databases, or survey work using ethical scenarios, statements, or demographic information to collect information. As implied above, applied social scientists would be more likely to use experimental designs or surveys and apply quantitative analysis to the data. The data could be analyzed using simply frequency analysis, *t* tests, or other basic statistical techniques. There is a trend toward more sophisticated data analysis techniques, such as regression analysis and other higher-order investigations, as the population of business ethics scholars become better trained in advanced statistical analysis.

Complimenting the applied social scientist and their quantitative data analysis approaches is a growing number of scholars seeking more in-depth answers to their investigations using qualitative analysis techniques based on data gathered through interviews or assessing information found in case study narratives. Ethnographic research, such as participant observation, may provide for a more in-depth understanding of an individual's decision-making process than quantitative techniques. While some believe that qualitative analysis provides richer, more in-depth analysis of information, there is concern that the data analysis is subject to researcher bias and interpretation. Thus, this methodology necessitates great care in ensuring that the results drawn from the data are reliable and valid.

MILKEN, MICHAEL ROBERT (1946–)

Michael Milken was an executive and a star trader at the now-defunct investment bank, Drexel Burnham Lambert. He received the nickname "junk bond king" for the role he played in making Drexel the leader in the junk bond market. Junk bonds are speculative investments that carry a higher than usual rate of interest (i.e., high yield) because they are associated with a greater risk of default. Junk bond financing fueled the takeover market of the 1980s by making it possible for smaller firms to mount a hostile takeover of much larger firms. Junk bonds and the role that Milken played in popularizing them have defenders and detractors, both of which are passionate. Critics blame junk bonds for the collapse of the savings and loan industry and the debt that mounted in the 1980s, leading to recession in the early 1990s. These critics claim that the 1980s became a decade of greed and that Milken and his junk bonds are responsible for the financial and emotional costs that were incurred. Milken's defenders say that his financial innovations fueled the U.S. economy's rapid growth by providing entrepreneurial firms with the financing they needed. They also argue that leveraged buyouts and mergers made possible by junk bond financing helped make the U.S. economy leaner and more competitive in a global marketplace. His defenders and detractors agree on one thing—junk bonds made Milken a very wealthy man.

In 1989, the then Manhattan U.S. District Attorney Rudy Giuliani charged Milken with 98 counts of racketeering and fraud: Milken was then indicted by a federal grand jury. Facing serious federal charges of insider trading, Michael Milken pled guilty to five lesser securities and reporting violations. He received a 10-year sentence, which was later reduced to 2 years. Milken paid a $200 million fine, paid another $400 million in settlements relating primarily to civil lawsuits, and was banned for life from the securities industry. In 1998, he admitted to acting inappropriately as a strategic business consultant by advising MCI and Revlon on deals. He was fined $47 million for violating his probation. Despite these fines, Milken remained a multimillionaire.

Since his release from prison in 1993, Milken has spent his time as an entrepreneur and a philanthropist. Along with his brother, Lowell, and Oracle Corporation CEO Larry Ellison, Milken formed Knowledge Universe (KU), a more than $1.5-billion holding company that supports a vast array of educational enterprises throughout the world. Since being diagnosed with prostate cancer in 1993, Milken has devoted his philanthropic endeavors to funding cancer research. Since its 1993 founding, Milken's Prostate Cancer Foundation (PCF—formerly named CaPCure) has raised more than $230 million, making it the world's largest private sponsor of prostate cancer research. Rather than relying on basic science, PCF focuses on reducing the wait time for grant funding and funding therapy-oriented solutions. PCF holds researchers accountable for results and requires collaboration among institutions, business, and academe: This businesslike approach to philanthropy is often called venture philanthropy.

Mill, John Stuart (1806–1873)

John Stuart Mill was born in Petonville, England, on May 20, 1806—the first son of James Mill and Harriet Barrow. John Stuart's intellectual journey commenced at an early age with his father as his primary instructor. A demanding and diverse educational process began with Mill grasping Greek and English at age 3 and Latin at age 8. By his middle teenage years, he had completed advanced studies in history, mathematics, and economics. Mill's education was enhanced by annual trips to the estate of Jeremy Bentham—a friend of James Mill—where John Stuart was immersed in Bentham's utilitarian ideas.

At the age of 17, John Stuart began what would become a 35-year career at the East India Company, starting as a clerk and rising to the second highest position in the company's London-based office. Mill enjoyed his career as it provided a sufficient amount of time for his true passion of learning, thinking, and writing. In his early 20s, Mill found himself suffering from a severe case of depression. Many scholars attribute this depression to the lack of social nurturing, as well as to the friendships that were sacrificed to complete his extensive home schooling. As he began to read the works of Wordsworth, Comte, and Coleridge, his emotional state strengthened, and he was able to set about his life's work of social reform and philosophy.

In 1830, Mill met Harriet Taylor and the two developed a close relationship. Over time, Taylor became an increasingly influential figure in Mill's life and, 2 years after the death of her husband, the two married. The couple collaborated on Mill's writing until her death in 1858. In 1865, Mill was elected to the House of Commons, but failed in his reelection run in 1868. Throughout his life and especially during his time as an elected official, Mill was a strong supporter of the rights of women and wrote a major work on the subject titled *The Subjection of Women* in 1869. John Stuart Mill died in 1873 and was buried next to Harriet Taylor Mill in Avignon.

Today, John Stuart Mill is best known for his writings on utilitarianism, the teleological theory that people are obligated to do those actions that produce both mental and physical happiness and/or avoid mental and physical pain. In 1843, he published his work titled *On Logic*—a well-accepted philosophical work on the use of logic in the field of social science. In 1848, he published *The Principles of Political Economy*—a piece dedicated to the social economic situation of his time. Mill's most famous pieces are *On Liberty* (1859)—a work of normative political theory that defends a principle of liberty—and *Utilitarianism* (1861)—Mill's most famous ethical statement. His *Autobiography* was published in the year of his death, and his only major work dealing with religion—titled *Three Essays on Religion*—was published 1 year later. Many of Mill's writings continue to be used in other areas such as economics, philosophy, political science, and religion.

Miller-Tydings Act of 1937

The Miller-Tydings Act of 1937 exempted retail price maintenance agreements (fair trade provisions) in interstate commerce from federal antitrust laws. Under fair trade laws, manufacturers created resale price contracts with distributors that required their retailers within a given state to sell "fair-traded" products at the same price. Specifically, the Miller-Tydings Act, in effect, amended Section 1 of the Sherman Act. Miller-Tydings made legal contracts or agreements prescribing minimum prices for the resale of commodity products sold and shipped in interstate commerce bearing a label, trademark, brand, or name of the producer or distributor when such products are in free competition under local state law.

During the 1930s, "mom-and-pop" druggists, hardware and appliance merchants, and grocery stores began to experience competition from large chain store operations throughout the United States. The chain stores benefited from economies of scale and were frequently able to sell at prices lower than that of their smaller rivals. In an effort to level the competitive playing field, a number of states passed fair trade laws that heavily taxed chain stores. At the federal level in 1936, Congress enacted the Robinson-Patman Act to prohibit price discrimination by suppliers to small businesses.

Before Miller-Tydings was enacted, various populists suggested that chain stores represented an assault on the economic backbone of American democracy, small businesses. They argued that small businesses needed protection from the predatory pricing practices of ruinous competition. Similarly, some economists and jurists opposed fair trade laws on the grounds that such laws significantly reduced or even eliminated competition (specifically small competitors) from the marketplace. President Franklin D. Roosevelt strongly objected to fair trade provisions on the grounds of potential resentment by consumers who would be faced with escalating prices.

Manufacturers and independent retailers were the main proponents of fair trade laws. Manufacturing firms supported the passage of fair trade laws because they worried that lower prices would negatively affect perceptions of quality by consumers, diminish the value of branded goods, and in turn, ultimately reduce sales. Small independent retailers supported retail price maintenance agreements because such agreements established floor prices that attenuated the bulk-purchasing advantage of large chains.

Congress passed the Miller-Tydings bill on August 17, 1937. The bill was designed to overrule the 1911 U.S. Supreme Court ruling in the Dr. Miles case (*Dr. Miles v. John D. Park & Sons*, 220 U.S. 373), in which the Court held that certain vertical resale price agreements substantially lessened competition as effectively as any horizontal agreement and were in violation of the Sherman Act. Subsequently, by June 30, 1938, resale price maintenance laws had been enacted in every state except Texas, Missouri, Vermont, Delaware, and Alabama.

A 1951 Supreme Court ruling (*Schwegmann Bros. v. Calvert Distillers*, 341 U.S. 384) invalidated nonsigner clauses to fair trade laws. Nonsigner clauses had allowed distributors to take action against parties with whom they had no contractual arrangements that limited fair trade laws. That Supreme Court ruling along with subsequent legislative lobbying efforts by various chain businesses led to the federal repeal of the Miller-Tydings Act of 1937 on January 1, 1976.

Minimum Wage

The minimum wage refers to the lowest wage an employer can legally pay an employee. It is intended to protect the most vulnerable employees from excessive wage exploitation by establishing a wage higher than what the market would otherwise establish. The minimum wage arguably represents the amount of income needed by a full-time employee to maintain a minimally acceptable standard of living.

Some nations establish minimum wage laws for an entire country (Cuba, France, Russia, United Kingdom, United States), while others do so regionally (Canada) or based on industry collective bargaining agreements (Germany, Italy, Sweden). Many countries, including China and India, do not have a minimum wage law.

In these nations, the lowest wage is a function of either the laws of supply and demand or business interests.

Arguments Against the Minimum Wage

Economists are divided on the impact of a minimum wage on labor markets and the economy. Neoclassical economists oppose establishing minimum wage rates and, by extension, any increases to them. They report that artificially raising wages above the law of supply and demand hurts those it is intended to benefit by increasing unemployment, contributing to inflation, and discouraging business investment and growth. The extra labor costs force employers to hire fewer low-skilled employees and/or increase their prices. Some employers offset minimum wage increases by reducing other employee benefits. Minimum wage increases attract middle-class teenagers into the labor market, which creates more competition for low-skilled adults seeking employment.

In response, economists supportive of minimum wage increases report that higher hourly wages have little or no effect on unemployment rates and actually stimulate economic growth by increasing the purchasing power of low-income employees. At the same time, recipients of higher minimum wages reduce their dependence on financial assistance from the government.

Early History of the Minimum Wage

For most of recorded history, minimum wage laws did not exist. In *Wealth of Nations*, published in 1776, the Scottish philosopher and economist Adam Smith observed that employers naturally formed coalitions among themselves to offer low wages. Given the overabundance of low-skilled laborers, they possessed a superior bargaining position. Some employers paid below subsistence wages, an income level insufficient for an employee to purchase food and shelter. In 1845, Irish peasants working full time died of starvation because they did not earn enough money to purchase home-grown oats and grains stored on nearby British ships.

During the late 1800s, the idea of establishing a minimum living wage gained a wide spectrum of support among labor unions, socialists, and leaders of both the Catholic and Protestant social movements. Pope Leo XIII, in his 1891 encyclical *Rerum Novarum* ("On Capital and Labor"), tempered the right of capitalists to own private property with the sentiment that laborers who did not receive an income high enough to escape from poverty were victims of fraud and injustice.

The first minimum wage legislation was passed in New Zealand in 1894, followed by Australia 2 years later, and Great Britain in 1909. All three governments created wage boards to determine the minimum allowable wage in certain extremely low-paying industries.

United States' Legislative History

In the United States, early legislative efforts were aimed at providing minimum wages for women and children. In 1912, the Massachusetts legislature formed a council that requested voluntary compliance to minimum wage rates for women and children employed in certain industries. The following year, seven states enacted stronger minimum wage laws. But in 1923, national progress came to a halt when the U.S. Supreme Court ruled that state-imposed minimum wage laws violated the constitutional right of employers and employees to freely enter into contracts, including wage agreements.

In response to high levels of unemployment and poverty caused by the Great Depression, President Franklin Roosevelt created the National Industrial Recovery Act (NIRA) of 1933 to stimulate business activity. The NIRA encouraged companies to create industrywide codes of fair competition, which included agreements on appropriate prices and wages. The legislation also recommended that consumers purchase products only from businesses that paid their employees at least $12 a week for 35 hours of work. The Supreme Court ruled certain NIRA provisions unconstitutional, but quickly reversed itself in a subsequent ruling after considerable public pressure—including threats from President Roosevelt to restructure the Supreme Court itself.

The Roosevelt Administration issued the Fair Labor Standards Act of 1938, which federally regulated the length of the workweek, overtime rates, child labor, and minimum wages. One of the legislation's guiding principles was a fair day's pay for a fair day's work. The initial legislation proposed that several transportation and agriculture industries pay a minimum of 40 cents per hour. Republicans and Southern Democrats objected to the minimum wage provision until the amount was reduced to 25 cents an hour, or $11 a week. The federal minimum wage has since been extended to additional industries, including public schools, nursing homes, farms, domestic workers, and small retail businesses. Congress did not index the minimum wage to inflation or a poverty threshold and increases it periodically in response to political pressure.

Minimum Wage Features in the United States

In the United States, both states and the federal government have the constitutional right to create a minimum wage. An employee is entitled to whichever is higher. In 2005, the federal minimum wage was $5.15 an hour. Fifteen states had minimum wage rates higher than the federal amount. The state of Washington, which annually indexes its minimum wage to inflation, had the highest amount at $7.35 an hour in 2005.

Some employees are not entitled to the minimum wage. Those exempted from the federal minimum wage include workers with disabilities, full-time students, youth less than 20 years of age for the first 90 consecutive calendar days of employment, tipped employees, and student-learners. For instance, tipped employees can be paid as low as $2.13 an hour if the inclusion of tips at least equals the $5.15 hourly minimum wage rate. If not, then the minimum wage for tipped employees must be proportionately higher.

Approximately 10 million American wage earners—7% of the labor force—are paid a minimum wage. Two thirds of the minimum wage earners are adults, the remainder teenagers. Thirty-three percent are parents with children less than the age of 18. Approximately half work full-time. Fifty-eight percent are women, and 40% have less than a high school diploma.

Recent History of the Minimum Wage

During the 1960s, the federal government's "War on Poverty" established public assistance programs, such as welfare, for all adults living in poverty. In the process, the federal government de-emphasized the minimum wage as the primary means for ensuring that the working poor earned a subsistence income. The minimum wage was increased to $5.15 an hour in 1997 and has remained at that level. In 2005, congressional legislation proposing to gradually increase the minimum wage to $7 an hour failed to gain the necessary political support for passage. If the 1968 minimum wage of $1.60 an hour had been indexed to inflation, the current hourly rate would be $8.88.

Approximately 30 million Americans working full time earn an hourly wage below the poverty threshold. In 2005, the federal poverty threshold for a single parent with two children was $16,090. Annual earnings for a full-time employee paid a minimum hourly wage of $5.15 was only $10,712, insufficient to cover living expenses such as housing, food, health care, child care, and transportation. If the minimum wage was indexed to the federal poverty threshold it would be $7.74 an hour. Some local municipalities have approved a variety of "living wage" ordinances that enable the full-time working poor to earn enough income to maintain a minimally acceptable standard of living.

Minorities

Minorities can be defined depending on specific context, but generally minorities make up either a subgroup that does not form a majority of the total population, or a group that, while not necessarily a numerical minority, is disadvantaged or otherwise has less political or economic power than a dominant group. The most prevalent form of minority groups, that is, ethnic minorities, comprised less than 20% of the United States in 1980, and yet the projections are that by 2040, half of all Americans will be those now referred to as "minorities."

Minorities can also be classified by gender, disability, age, religion, sexual orientation, and other criteria. Although the ratio of men to women is balanced in most societies, given the lower economic status and lack of opportunities of the latter group has led some to equate them with minorities. Similarly, the elderly, while considered an influential group in many traditional societies, have been reduced to a minority role in terms of their economic and social contributions. Finally, the Disability rights movement has contributed to an understanding of people with disabilities as a minority group.

Minorities in the Workplace

Companies and governments are aggressively pursuing a strategy to ensure that minority groups do not continue to face unfair barriers to achievement in the workplace, in the labor market, and in education. Supportive diversity climates are maintained by providing realistic job previews and healthy work environments. Affirmative action, the idea that minorities should be given special privileges to facilitate equal access, is however a controversial issue. While proponents argue that a diversified environment is a desired positive outcome, critics argue that such actions result in reverse discrimination and a sense of victimization of the majority.

Marketing to Ethnic Minorities

In an increasingly global world, businesses are recognizing the need to reach out to minority groups. Companies such as AT&T, Sears Roebuck, and Coca Cola were some of the pioneers of such practices. The three major ethnic minority groups in the United States—Hispanics, African Americans, and Asians—currently account for almost 30% of the population, and they cumulatively account for 20% of the total spending power in the country. In 2004, corporate America did not effectively market to this segment of the market, since only 2% of the more than $200 billion spent on advertising was allocated to the ethnic media. In a study sponsored by the Association of National Advertisers (ANA) in 2004, an overwhelming 89% of the advertisers said that they were practicing multicultural marketing while 85% were involved in specifically creating separate ads for separate ethnic markets. The greatest challenge faced by the agencies cited in the study was the measurement of results (38%), funding (34%), and a lack of market research (13%).

The 2005 Yankelovich *MONITOR* Multicultural study found that 70% of blacks and 53% of Hispanics are very concerned about marketers' methods and motives. Furthermore, 50% concur that most marketing has no relevance for them and that they wanted marketers to be more attentive, in a sensitive and culturally appropriate manner. The results also suggested that for Hispanic consumers, marketers should use both Spanish and English to facilitate the infusion of the brand message with cultural familiarity and relevance. In many countries, companies such as L'Oreal, Alberto-Culver, and Proctor and Gamble–owned Wella have introduced several ethnic minority–specific products in categories such as cosmetics and hair care.

Drawing a Fine Line Between Patronizing and Targeting

While targeting minorities is encouraged to enable them as consumers to have greater access to products available to mainstream customers and to offer greater efficiencies to marketers, doing so has a sinister connotation, when minorities are perceived as "vulnerable." This has even a worse connotation if the products that are being targeted are potentially harmful. For example, many consumer activists and federal officials took action in the last decade when internal documents from R. J. Reynolds and Brown & Williamson Tobacco Corporation showed how these companies had targeted minority youths, particularly with their menthol brands. Similarly, C. Heilman Brewing drew fire when it extended its Colt 45 malt liquor line with Power master, a high-test malt, toward African American consumers. In other cases, politically incorrect marketing strategies have come under scrutiny, for example, when a high alcohol content malt liquor, "Crazy Horse," named after a famous Sioux Indian warrior, was marketed to Native Americans in the early 1990s.

On the contrary, avoiding minority groups, also known as "redlining," by denying bank loans and insurance policies primarily to minority households has also come under a lot of criticism. Retail redlining, when major firms do not serve customers in minority neighborhoods, because of unprofitable operations, has also been severely criticized by federal agencies and activist groups. Related research, as well as television newsmagazines such as *Dateline* and *20/20,* has shown that African Americans wait longer for customer service in the retail industry than customers of other races. Balancing the demands of hiring and treating minorities fairly, marketing customized products without patronizing or exploiting vulnerabilities, and providing attentive customer service are some of the major challenges that firms face today with regard to their minority stakeholders.

Minority Shareholders

Minority shareholders are shareholders of a corporation who own less than 50% of the voting rights and who individually are unable to control the corporation. Minority shareholder status is related to the proportion of voting power held by a shareholder, not by the proportion of shares held: Some share classes may have no or limited or multiple voting rights.

The key ethical issue is that, because they are in the minority, they have an ineffective voice in corporate governance and those in the majority may operate the firm for the majority's advantage and to the unfair detriment of the minority. This acts as a disincentive for small shareholders to invest in equity markets. Minority shareholders themselves may also act unethically by acting as free riders—that is, they rely on majority shareholders to invest resources in monitoring management and benefit from that monitoring without making a proportionally similar investment.

The Organisation for Economic Co-operation and Development (OECD) Principles of Corporate Governance makes it clear that protection of minority shareholders from abuse is part of good corporate governance. Examples of abuse include transfer of value to companies owned by controlling shareholders through asset sales or unusually favorable supplier or customer contracts; new stock issues, especially of nonstandard share classes (shares with voting rights only are useless to minority shareholders); and for nonlisted companies, placing restrictions on the sale of shares, which prevents minority shareholders from liquidating their holdings. Minority shareholders who seek income from their investment may be harmed by the refusal of the majority to pay dividends.

Minority shareholder rights may be protected either *ex-ante* (prevention) or *ex-post* (cure or compensation). *Ex-ante* protections may be found in the legislative and regulatory framework for minority shareholder protection, a corporation's constitution, and stock exchange listing rules. Examples include whether shareholders can force the convening of a General Meeting, and, if so, whether this requires the signatures of a minimum number of shareholders, or shareholders with a minimum proportion of voting rights; whether proxy voting is permitted or personal attendance at General Meetings is required; whether a supermajority is required for specified resolutions; and whether controlling shareholders are required to buyout minority shareholders at an independently determined price in the event of delisting. *Ex-post* protection is provided mainly through the court system, either by means of court orders preventing certain actions or by means of tort action for compensation for wrongful harms; in extreme cases, a court may dissolve the corporation. The extent to which this is effective is related to whether regulatory bodies have sufficient resources to monitor and take action and whether litigants have ready and affordable access to corruption-free courts.

Minority shareholders are in a particularly vulnerable position in developing countries, where the agency problem (which results from the separation of ownership and control) has materialized as one between majority and minority shareholders rather than one between owners and managers. This often results from either a prevalence of family-owned businesses, typical in Asia, or foreign companies setting up majority-owned subsidiaries to meet government requirements. The outcome is poorly developed equity markets in many countries, including many in sub-Saharan Africa, which negatively affects the country's economy as a whole. Because the United States has a low ownership concentration and high *ex-post* protection compared with other countries, such issues have far less impact there; nevertheless, they remain a significant issue for some family-controlled businesses.

Missions and Mission Statements

A mission guides a person or an organization in the direction that it wishes to proceed. A personal mission statement can help focus one's goals and life. A mission is generally best articulated in a formal, written mission statement. An organization's mission statement is designed as a broadly phrased statement of the firm's long-term goals; it distinguishes the firm from others in its industry and specifies the scope of the operations in terms of the firm's product or market. It spells out goals, is a statement of aspirations, and focuses one's actions. The mission expresses the vision of the firm's founders or strategic planners and also communicates the image that they seek to project. It often also indicates the principal customer or client needs that the firm will satisfy. Thus, the mission statement describes the firm's products, services, market, customers needs, and technology such that it also reflects the values and goals of the top managers, and ideally all the members of the firm. The mission statement defines the firm's overall plan in a succinct and engaging manner and with a tone that reflects the climate of the business itself.

A mission statement seeks to answer the following questions: What is the problem or the need that the organization is trying to address? What makes this organization unique? Who benefits from the work of the organization? Why does this organization exist? What customer or client needs do we fulfill? What sets our organization apart from our competitors? A mission statement should be brief, clear, and concise; it should be short enough that it can be easily remembered by the people in the organization. A mission statement should also be inspiring, free of jargon, and achievable. Members of the organization must be able to support the mission.

Through the mission statement, the managers and associates in the firm attempt to clearly articulate their long-term goals and what makes their organization special and worthy of people's attention. A mission statement thus expresses the values of the members of the organization. A mission statement focuses the efforts of all in the organization so that all are more likely to be "on the same page"; this better enables the firm to survive and to achieve long-term profitability and growth. This statement can then serve as a basis for shared expectations, long-range planning, deciding priorities, and performance evaluations.

A mission statement that is developed systematically and is comprehensive is an invaluable tool in directing and implementing policy. A mission statement thus serves as a guide to top managers when they make strategic decisions on the deployment of the organization's resources. Without it a manager may make decisions on the basis of one's biases and concern for "turf." A clearly stated mission statement enables a manager to focus on the long-range goals of the organization as a whole and not on the manager's particular priorities or preferences. Such a mission statement also provides a sense of shared expectations for people in the organization. It is important to give such guidance today, given global operations and people working in different countries and cultures. Thus, the mission statement specifies values and goals and provides a unity of direction that is intended to include many nations, peoples, and generations.

From outside the organization, one can view a mission statement as an instrument for learning about the goals of the organization, as well as its likely planning strategies. For a potential employee or customer, a mission statement may be a principal reason why one might seek or reject joining the firm as an employee or purchasing the firm's product or service. Thus, a mission statement communicates a description of the firm to prospective employees, customers, and other stakeholders, so that they may decide if they want to be involved with the firm.

Without a mission, a person or an organization risks wasting valuable time and resources by engaging in activities that do not contribute to attaining their goals. Indeed failing organizations often waste much of their time and effort on actions that have little long-term benefit for the organization. Once an organization grows beyond the few people who can have daily face-to-face contact, it becomes important to specify and write out the firm's mission and code of conduct.

Developing a mission statement for an organization forces the founders, top managers, and board of directors to articulate the goals of the firm in a clear, cohesive way. In a process that acknowledges the contribution of all people in the organization, these goals are then commented on by associates in the firm and are ultimately made clearer, more accurate, and more complete by an interactive process. Individuals in the organization also achieve a heightened sense of purpose when they reflect on and internalize the goals of the organization. The mission statement can be amplified by following it with important, more specific goals and objectives of the organization. Thus, the mission statement itself can be kept relatively brief—ideally, a few sentences that can be remembered—but additional important items can also be included.

More than 90% of large firms possess a mission statement and a code of business conduct. Formulating a mission statement can be a valuable experience for the members of the group that is seeking to clarify their goals, although it is not always easy. The completed mission statement might seem to be deceptively simple, since a mission statement can be as brief as a sentence or two. But to distill the meaning of the organization or the group into those concise, meaningful sentences requires discipline, insight, patience, and cooperation.

To develop a mission statement, leaders of the group often ask such questions: Who are we? What do we do? Why do we do it? What should we be doing? What do we stand for? Then someone takes the key points and attempts to draft a mission statement. The draft is sent back to the group for their comment in order to clarify the statement. It may then go through several rounds of revisions. Moreover, organizations generally update their mission statements periodically with a similar iterative process.

The process of coming to a consensus on the mission statement is generally a learning experience for the group. Some firms begin the drafting process during a retreat of the board. This is appropriate for a board, since the broad goals of the organization are a major responsibility of the board. But a group cannot efficiently write a mission statement together; quibbling over words can waste much time. The process will proceed better by circulating a draft written by one person, perhaps the founder, or a top manager who took notes during an initial group session. For the mission to be successful and for everyone in the organization to own that mission, it is essential that each person have some opportunity to participate in formulation. Conducting workshops, whereby all in the organization are able to comment on the mission, helps focus workers' efforts, gain cooperation, and build morale among the group.

There is not a clear distinction between a mission statement and a vision statement. A mission statement relates an organization's purpose, while some describe a vision statement as a "vision of the future." One attempt to distinguish is to call the vision the destination and the mission the journey.

Often a mission statement precedes a firm's ethics statement and sometimes the terms *mission statement, ethics statement*, and *code* are used interchangeably. Some firms, such as Johnson and Johnson (J&J), call their mission statement a Credo. J&J's Credo was the foundation that enabled top management to effectively deal with the tragedy of the poisoning of Tylenol pills. By the CEO James Burke's own account, he acted on J&J's Credo, which stated that their first responsibility was to the doctors, nurses, and patients, all those who used their products. They were open about the problem and mounted a costly and successful recall of all products. As a result, the firm and the product survived and prospered.

Some firms have set out their basic principles in a values statement, which sets forth the basic values on which the firm is based. The values statement often follows a firm's mission statement, and these values often make reference to the founder(s) actions and guiding principles that have made the firm a success.

A mission statement should be more than just a document posted on the wall or placed in orientation literature; it should be a living document that influences people in the organization in all their major decisions. As a living document, it should be revised and updated regularly. To demonstrate that the mission is not mere public relations, stories of how the mission has been achieved can be included as supplements.

Firms that have a clear and strong mission statement tend to outperform their competitors in the marketplace, according to empirical studies. Among those firms identified as strong on their mission are 3M, American Express, General Electric, IBM, J&J, Ford, Marriott, Nordstrom, Procter & Gamble, and Sony. Each of these firms has a clear mission statement. Each also is outstanding in its industry, is widely admired by businesspeople, has made an indelible imprint on the marketplace and the world, and was founded before 1950. Moreover, each of the firms that have a well-articulated mission tends to be more thorough in their orientation and various methods of communicating their vision and mission. Firms with a strong mission more carefully nurture and select senior managers and more often select their chief executives from within the firm.

Mission statements often stress the superior quality of the product or service offered. Mission statements also generally include elements such as the importance of integrity, respect for the individual worker, service to the customer, and responsibility to the community. It is important that the mission provide a foundation for the existing and desired ideology and that the members of the firm have integrity in acting out that mission. However, each mission is unique and thus reflects the industry, market, and values of the people within the firm.

In many cases, firms do not live up to their own stated mission. Mission statements are sometimes platitudes and public relations gestures, that is, statements that are designed to make the firm look reputable and responsible to its outside constituencies. If a mission is too general, it is ineffective because it does not describe the particular firm. Mission statements are sometimes too ideal; that is, since they are aspirational, they are not realistic. However, mission statements are statements of ambition, so it is not surprising if those aspirations are not always perfectly achieved.

Collections of some of the best business mission statements have been gathered and analyzed. These researchers have also provided some background on the individual firms and how those mission statements were developed. Organizations that are presented include AES, Bayer, Cadbury Schwepps, Caterpiller, Comerica, Cummins Engine, Donnelly, Ford, General Motors, Herman Miller, Hershey, Hewlett Packard, Hong Kong Ethics Development Center, Hyatt, J&J, Kroger, Levi Strauss, Marriott, Procter & Gamble, Sears, Starbucks, TRW, UNUM, and Whirlpool.

Nonprofit organizations (NGOs) are less likely to develop a mission statement, partially because members feel that their mission is already clear to stakeholders. In addition, funding agencies generally do not contribute to the general purpose of an NGO, but to specific projects, so there is less incentive to spend the time and energy to develop a mission statement. Moreover, a mission may seem to limit an NGO if a new project and funding is available. Nevertheless, the same rationale for a mission statement is true for

NGOs: to provide direction, coherence, and a goal by which to judge individual and organizational achievement and success. Moreover, since NGOs do not enjoy the automatic feedback of profit and loss, it is even more important to fashion a mission statement and to set goals.

Mixed Economy

A mixed economy is typically a market system of resource allocation, commerce, and trade in which the government intervenes to disrupt the "invisible hand" of free market forces. Examples of such intervention may include state-owned enterprises (such as public health or education systems), regulations, subsidies, tariffs, and tax policies. Alternatively, a mixed economy may emerge when a socialist government makes exceptions to the rule of state ownership to capture economic benefits from private ownership and free market incentives. In addition to a variety of forms, mixed economies have come about from a variety of motives and historical causes.

The British Corn Laws of the early 1800s, for example, were government interventions in the free market to protect native agricultural interests by limiting imports. The negative consequences of foreign protectionist responses and higher food and labor costs at home led to an invigorated laissez-faire and free trade movement. However, at roughly the same time, abuses of factory workers led to government intervention to reform child and female labor conditions.

In developed Western economies after the Industrial Revolution and before the Great Depression of 1929–1933, most political economists and governments believed that social prosperity progressed best in economic systems composed of free markets whose social and monetary order was protected by the actions of governmental and banking institutions. This belief was profoundly shaken by the system's twin catastrophic failures that we call the Great Depression—failing first to prevent the global economic collapse and then failing to recover communities from the horrendous human tragedies of unemployment and poverty wrought by the collapse. The New Deal, a series of interventionist legislation and government programs in the United States, was championed by President Franklin Delano Roosevelt to head off social unrest caused by the widespread unemployment of the Great Depression in the 1930s.

In the mid-20th century, many people agreed that the Great Depression arose from fundamental flaws in the free market theory of equilibrating supply and demand, and that this meant that the free market alone would be incapable of recovering from the Great Depression. In developed Western economies, the historical development of the mixed economy is the evolutionary change of the free market concept as it adapted to avoid the risks of widespread social unrest and potential revolutionary socialist or Marxist change. Social democratic programs that arose in continental Europe at this time created coalitions of business interests with major social groups to improve social welfare without jettisoning private property and the market economy. This mixed economic approach included economic planning, high tariffs, guarantees of group rights, and social welfare programs.

Mixed economies also arose in many countries that formerly had centrally planned and socialist economies. The mixed economies in modern China and Russia, for example, evolved from communist systems that were too inefficient to compete in the modern global economy. The recent social experience of the Chinese and Russian people is a profound testament to the personal difficulties and turmoil that people endure when a country makes a transition to a mixed economy.

As the historical examples above suggest, mixed economies have public, private, legislative, judicial, and regulatory components, but there is not a single ideal, standard, or typical set of economic features, and the mix may vary from country to country. Components in the mix may include government subsidies, fees, taxes, set-aside programs and regulations, state-owned enterprises, mandatory social security, or national health programs.

Common to all mixed economies is their combination of some free market principles of private contracting with some socialist principles of state ownership or planning, and some government-controlled economic incentives and disincentives that intervene with purely market-generated costs and benefits in individual calculations of rational utility.

Many economists and political philosophers have argued in favor of government action to enforce the ordinary rules of law in economic matters. For example, Adam Smith, and later Friedrich Hayek, noted the important role of government in assisting the functioning of markets by preventing violence and fraud, protecting property and public safety, enforcing contracts, and providing public infrastructure and utilities that would otherwise be unprofitable. In a mixed economy, however, there is a presumption that government must go beyond this limited role to improve distributive justice in society. Adam Smith wrote that intervention violated the ethical principle that indicates that economic efficiency is the best long-term path to social progress. Hayek also objected to such government intervention because he believed it to be economically inefficient, but even more important in his view is the inevitable tendency for the mixed economy to be politically abusive of individual liberty. Despite these philosophical and moral objections, almost all modern economic systems in the world today are mixed economies. While the modern global economy limits government intervention in free trade, it retains mechanisms for social welfare exceptions to the free market rule. At times, politicians have attempted to invoke such exceptions for reasons of parochial interest or political expediency.

Public policy making in mixed economies frequently must balance the concern for individual liberty with the need for a fair, equitable, and just society. Balancing these concerns with integrity and procedural justice requires the participation of diverse social segments as stakeholders in an ongoing and dynamic search for a fair and appropriate separation between utilitarianism and the tyranny of the majority. This is an extremely difficult public policy task that is made more challenging because the preferences of each social segment are based on individual and subjective definitions of utility that are often not easy to calculate, communicate, or compare across groups. For this reason, the success of the mixed economy depends on the integrity of governmental and social support for ethical principles of compassion, empathy, and respect for individual and minority rights. Without such support, the mixed economy can become a system of coercive government manipulated by powerful stakeholders.

Monetary Policy

Monetary policy is the control that a country's central bank or government exercises over the money supply and credit or, alternatively, over a short-term interest rate. Along with fiscal policy, it is the most important policy for achieving macroeconomic stability. Stability is usually taken to mean low and stable inflation, real interest rates compatible with reasonable levels of saving and investment, sufficient financing of economic activity, and a stable and competitive exchange rate.

Implementing monetary policy is the job of the central bank (such as the Federal Reserve in the United States, the European Central Bank in the euro zone, the Bank of England, and the Bank of Japan): a public financial institution that specializes in controlling the money supply, credit, and interest rates. Ultimate responsibility for deciding monetary policy objectives and strategy used to belong to government, although nowadays there is a broad consensus that it is better assigned to a central bank that is independent of the executive (the central banks mentioned above, and many others, are independent).

The goals of monetary policy may vary widely, but there is a broad consensus that its main objective should be to achieve and maintain a low, stable, and predictable rate of inflation for a sufficiently extended period. In many cases, there is a second objective: to maintain the real gross domestic product growth at a rate close to its potential rate or employment at a level close to full employment. The European Central Bank, for example, pursues only the first of those two goals, whereas the U.S. Federal Reserve System pursues both at once. The debate about which of the two strategies is preferable remains open, and the solution is likely to depend on each country's economic, social, historical, and institutional circumstances. In either case, monetary policy is a means for government to intervene in the economic system to enable its smooth functioning.

Important ethical issues for monetary policy relate to the short-term trade-off between employment and inflation. A decision to reduce inflation can result in higher unemployment. Many argue that this shifts burdens unfairly to the poor. In contrast, a loose monetary policy designed to stimulate employment may adversely affect those on fixed incomes, such as retirees. Thus, monetary policy has implications for social justice and welfare. Consequentialist ethical approaches are useful to understand and balance these implications. Distributive justice is a consequentialist approach that focuses attention on the fairness with which the impacts of monetary policy are distributed throughout the society. Utilitarian approaches focus on the amount of net benefit that monetary policy creates.

How Monetary Policy Works

A country's central bank is the provider of the most liquid of financial assets (the ones that can be converted into money most easily, at no cost), namely, cash (coin and notes in circulation) and the assets that banks use to meet their liabilities to the central bank and conduct transactions with one another (the so-called bank reserves, which tend to be mainly deposits held at the central bank). When the monetary authority creates those liquid assets and makes them available to banks, it is in effect encouraging them to extend more credit and thus is stimulating the growth of demand and prices: Monetary policy, in this case, is expansionary. Conversely, when the central bank withdraws liquidity, monetary policy is contractionary.

The central bank has at its disposal certain instruments for creating (and withdrawing) liquidity. The Federal Reserve, for example, conducts daily open market operations, which consist of buying (selling) public debt to the banks, which has the effect of increasing (decreasing) the liquidity available to them. The European Central Bank, meanwhile, grants loans to banks for weekly periods.

The monetary authorities also have other instruments at their disposal, such as the discount window in the United States (a way for banks to obtain additional liquidity when they need it), required reserves (whereby banks are forced to hold a certain proportion of their liabilities in the form of deposits at the central bank), or foreign market interventions (buying or selling foreign exchange, thus increasing or reducing the amount of liquidity in the economy).

What the monetary authority actually does, therefore, is modify the composition of banks' portfolios by changing a very short-term interest rate (such as the federal funds rate in the United States, or the refinancing rate in the euro zone). Banks react to that increase (reduction) of liquidity by extending more (less) credit to their customers, while lowering (raising) the interest rate on those loans. In doing so, they change the saving, consumption, investment, and borrowing decisions of households and companies: A drop in interest rates will encourage them to spend and borrow more, while the opposite will occur if interest rates increase. Ultimately, monetary policy will end up affecting the level of demand, production, and employment, as well as the price level. Eventually, through the inflows and outflows of capital, monetary policy also affects exchange rates and the country's balance of payments.

Monetary policy is not always an effective mechanism to change demand and production. The central bank may increase the liquidity available to financial institutions, but then find that the banks are unwilling to lend more to their customers, or that the banks' customers do not want to borrow more. As John Maynard Keynes put it, "You can lead a horse to water but you can't make him drink." In any case, for monetary policy to be effective banks should comply with, rather than evade, its restrictions.

Monetary policy may be used to achieve moderate and stable growth in prices, and over the long term it tends to be effective in controlling inflation. While the prices of goods and services may rise or fall for all sorts of reasons in the short term, over a longer period of time inflation is always a monetary phenomenon in the sense that prices can only increase overall if there is an increase in the money supply.

Design and Implementation of Monetary Policy

Monetary policy is a powerful instrument to influence demand, production, and employment. It also can have undesirable effects, including higher inflation, a bigger current account deficit, or financial instability. Like the Hippocratic Oath in medicine, monetary policy should not cause harm.

There is a passive and an active way of using monetary policy. Passive use of monetary policy is aimed at creating favorable conditions for the economy: sufficient growth in the money supply to finance the level of economic activity, without creating excess liquidity that might fuel inflation, while keeping interest rates stable and not too high and exchange rates competitive and likewise stable.

Some economists and politicians think that focusing monetary policy on a goal of low and stable inflation is damaging for the poor if it is likely to mean higher interest rates and lower job creation. Nevertheless, there is a broad consensus that there is not a long-term trade-off between an inflationary monetary policy and the permanent growth of gross domestic product and employment; and potential short-term trade-offs will be transitory. An approach to manage monetary policy that achieves a low and stable inflation rate complements the effectiveness of other policies to grow production and employment that over the long term are likely to improve public welfare and reduce poverty.

An active monetary policy intends to correct economic imbalances, such as high inflation, a serious current account deficit, a sudden capital flight, or a recession. In a country that has experienced rising prices for a long period, the monetary authorities may want to lower inflation expectations as quickly as possible. This risks a major impact on the value of assets and debts, and thus on the distribution of wealth and income. Monetary policies, therefore, must balance activism with fairness.

Monetary policy may be thought of as impersonal because it affects large sectors of society such as banks, companies, and households rather than specific agents. If the impact of monetary policy on a certain sector of society needs to be corrected, or if redistributive effects are intended, it is more efficient to use another mechanism, such as fiscal policy, that more directly allocates government financial resources and taxes.

Monetary policy acts through the financial markets by changing the expectations and decisions of the economic agents and influencing the value of their assets and liabilities. In recent years, monetary policy measures have tended to be announced in advance, so that the agents can anticipate the impending changes and adapt to them. It is desirable, therefore, that the central banks have a transparent communication policy.

The monetary policy of central banks needs to be credible and to inspire confidence even in politically volatile situations. There are several means to achieve this. One approach is to make the central bank an independent body whose mission is prescribed by a law or constitution that government cannot easily change. Another approach is to appoint central bank governors and boards, the monetary policy decision makers, for long terms of office that buffer them from political pressures. In these ways, monetary policy is more likely to be managed with integrity and to earn a reputation for responsible service to the public welfare.

MONKEYWRENCHING

Monkeywrenching denotes nonviolent disobedience and sabotage carried out by environmental activists against those they perceive to be ecological exploiters. The term was made popular through its use by Edward Abbey in the novel *The Monkey Wrench Gang* of 1975, and has, since about 2000, very occasionally been used to indicate other forms of anticapitalist global activism, including culture jamming (see *Notes From Nowhere*). An equivalent term is *ecotage* and a contrasting term is *ecoterrorism.* The latter term is often a misnomer, properly applicable to rogue examples or individuals because monkeywrenching is typically motivated by a regard for preservation of life and is ordinarily restricted to two forms: either to nonviolent disobedience or to sabotage that does not directly endanger others.

Familiar civil disobedience scenarios include activists in vessels who place themselves between harpoon and whale or who chain themselves to earthmoving equipment, thus placing themselves at risk of injury if work activity should continue. Julia Butterfly Hill's tree-sitting effort is the most famous case. Hill remained for 738 days without pause in one prominent redwood tree in northern California beginning in December 1997. In collaboration with the protest organization Earth First!, Hill successfully secured the tree against logging by the Pacific Lumber Company until the parties reached a long-term preservation agreement.

The second approach for monkeywrenching involves destruction of unattended property by guerilla methods. Scuttling whaling vessels, cutting fishing nets, and contaminating the fuel of unattended earthmoving equipment are familiar examples. No annual value for damages can reasonably be estimated. Recent actions have greatly extended the category of environmental exploiter and the variety of targets. In August 2003, a San Diego condominium construction site was burned (damage valued at $20 million), and more than 100 energy-inefficient passenger automobiles were set ablaze at four Los Angeles dealerships in one night ($2 million). Arsonists left messages indicating alliance with the California-based Earth Liberation Front. The closely associated Animal Liberation Front engages in related actions against exploiters of animals; the independent Sea Shepherd Society focuses on the marine habitat.

Monkeywrenching broaches terrorism, as opposed to nuisance and economic harm, in some instances. A clear example is tree spiking, in which metal or ceramic spikes are driven deep within trees for the purpose of damaging chainsaws or blades at sawmills. Spiking has been credited with halting or delaying some U.S. Forest Service logging contracts, and with the serious injury of at least one sawmill worker. It has also been tried as a legal option for deterring illegal deforestation in Indonesia. Following a spiking, spikers usually mark trees or anonymously alert companies and government agencies of their activities. But markings on trees, along with the knowledge that a stand has been spiked, may be lost over the very many years that a forest stands. Consequently, any spiking is likely to pose significant irremediable long-term danger.

Monkeywrenchers have themselves suffered illegal sabotage and death. The most famous case is the 1985 bombing of the Greenpeace ship *Rainbow Warrior* in Auckland Harbor by members of the French Secret Service.

MONOPOLIES, DUOPOLIES, AND OLIGOPOLIES

Monopolies, duopolies, and oligopolies all represent market structures that deviate from perfect competition and in which production decisions by any single firm directly affect the sales or selling price of other firms. In these types of markets, the limited number of sellers that exist maintain some control over the price of the goods or services sold, and these goods or services are either unique or significantly differentiated from other potential competitors in the market. As with all market structures that deviate from perfectly competitive markets, firms in these markets will tend to restrict output in their efforts to increase prices above marginal cost and thereby reduce the efficiency of the marketplace. The loss in efficiency in the markets is associated with a misallocation of society's resources and a deadweight economic loss.

Under monopoly, a single firm produces the entire market supply of a good or service. The effective market for a monopoly can either be localized or considerably broader. A number of factors can result in the barriers to entry that allow a single producer of a good or service to exist over time. Exclusive patents or licenses, the existence of large economies of scale, large start-up costs, and ownership of essential resources can all result in the establishment and maintenance of monopoly power in a market. Often these barriers to entry are classified as natural or artificial. Natural barriers to entry occur when technology or other cost structures make the minimum efficient size of the firm large relative to the market. Artificial barriers to entry exist by virtue of restraints that are imposed either by other firms already in the market, by government policies, or by a combination of these factors and are typified by circumstances such as exclusive patents or ownership of existing resources. Several monopolies or near-monopolies have existed or currently exist: U.S. Steel during the 1920s, Alcoa in the 1940s, United Shoe Machinery Company in the 1950s, AT&T through the 1980s, and Inco during most of the 20th century. More recent cases where firms have been argued to be monopolists or near-monopolists include Microsoft, De Beers, and the National Collegiate Athletic Association. Similarly, many local markets still exhibit local monopolies for cable television and many utilities.

Under conditions associated with natural monopoly, the average total cost of production is declining over the relevant range of production. Under such circumstances, a producer can always lower the average cost of a good by producing a larger quantity. As a result, the costs of production will not support the existence of more than one producer—whichever producer is capable of producing the greatest amount can afford to sell at a lower price than its competitors. For many years, conventional thinking regarded industries such as many utilities (e.g., telephone service, electricity, natural gas) and the U.S. Postal Service (with respect to delivery of first-class mail) as natural monopolies.

Regardless of whether a monopoly maintains its status through natural or artificial means, the effects of monopoly on key economic variables are essentially the same. Similar to competitive markets, a monopolist will produce output at the point where the marginal revenue from an additional sale will equal the marginal cost of producing an additional unit of output. However, unlike competitive markets where the market price of a good equates to the marginal revenue that the seller receives from an additional sale, in a monopoly market the marginal revenue is less than the price. (Graphically, the marginal revenue curve will be below the demand curve; see Figure 1.) Price exceeds marginal revenue in a monopoly market because when the seller lowers price to increase the quantity demanded, the seller must lower the price not only on the additional unit sold but also on all units sold by the firm.

Monopolists, by virtue of being the sole seller in a market, face a demand structure that is identical to the market demand for the good. (In competitive markets, individual sellers will face a demand structure that differs from the market demand for the good.) The supply schedule for monopolists is essentially nonexistent. Traditionally, the supply curve represents a schedule showing the quantities producers will supply at a given price. However, the pure monopolist will not face a supply curve because there is no unique relationship between price and quantity supplied. Instead, the price and quantity supplied will depend on demand. This is because the values in the demand schedule will determine the values in a marginal

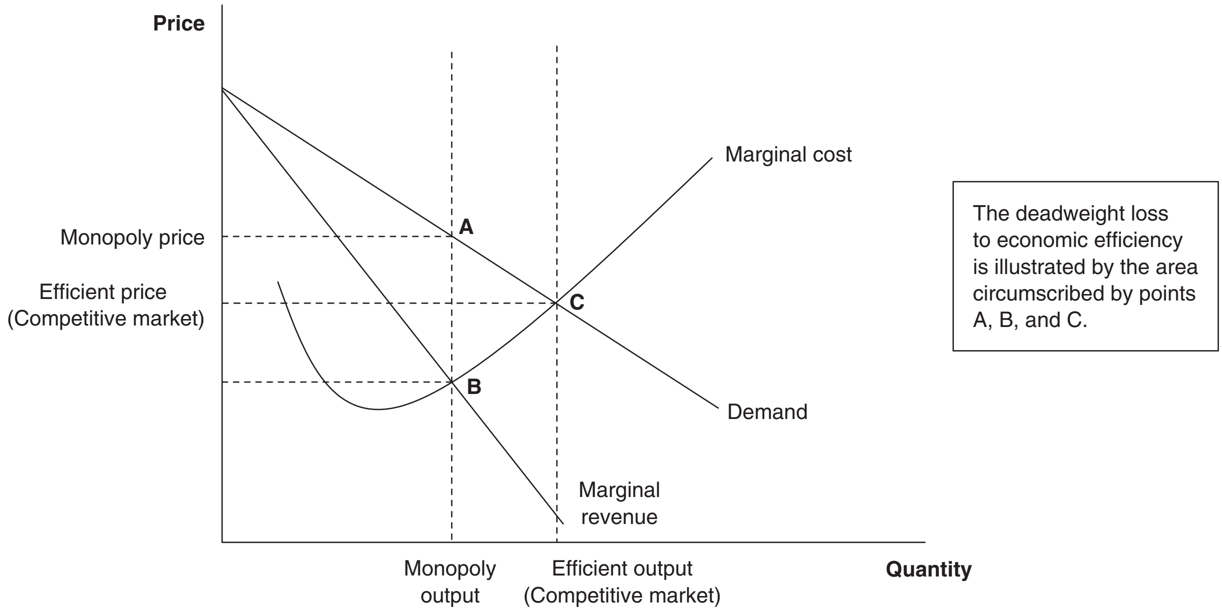

Figure 1 Monopoly and Perfect Competition Compared

revenue schedule and thus determine output. Because marginal cost and price are not equated by the monopolist when determining output, different demand conditions can result in the same quantity of output produced but sold at a different price. As a result, there is no unique price associated with a particular output decision and thus no supply curve for the monopoly firm.

As with competitive markets, the demand schedule will determine price in a monopoly setting. By virtue of being the only seller in the market and thus facing the market demand (to sell additional units the firm must lower price and face a downward sloping demand curve), the firm is a "price maker." The monopoly firm will thus have the power to set the price of the good in the market, and the price the monopolist will charge will be the market price that will result in all output being sold. Because the monopoly firm will produce at an output level where the marginal cost of production for the last unit equals the marginal revenue gained from selling that unit, and the marginal revenue schedule is less than the corresponding price on the demand schedule, the monopoly firm will produce a lower level of output and charge a higher price than a competitive firm.

Contrary to some popular beliefs, the monopoly firm does not charge the highest price possible. The goal of the monopoly firm, as well as competitive firms, is to maximize total profits. The monopoly firm will charge the highest price possible that will result in all output being sold, but there will be many possible prices above that level. A lower level of output would allow a higher price to be charged, but would result in the marginal revenue from the last unit of output exceeding the marginal cost and the firm could still generate additional profits by increasing output and lowering price.

Similarly, popular beliefs that monopolies seek to maximize per unit profits and are always guaranteed economic profits are not supportable. The monopoly firm will seek to maximize total profits, which occurs at the output level when marginal revenue equals marginal cost, rather than the maximum per unit profit, thus equating to the output when marginal cost is at a minimum. Depending on the cost structure involved, monopolists may operate in the short run at a loss. While the monopoly position of the firm does allow it to realize normal or better profits compared with a competitive firm, nothing is inherent in the structure of a monopoly market to guarantee economic profits, or even normal profits. In the long run, like a competitive firm, the monopolist will not operate if it persistently operates at a loss or is unable to cover its fixed costs.

A monopoly firm may also not realize maximum profits because of X-inefficiency, the situation where a firm fails to produce any given output at the lowest average cost. Firms in a monopolistic market are more able to pursue other goals, such as firm growth or avoidance of business risk, which may conflict with cost minimization, or to indulge in other activities that may not minimize costs, such as cronyism or nepotism. Because of the absence of competitive pressures, the monopoly firm may simply not remain vigilant about remaining internally efficient and monitoring costs. When these circumstances occur, the monopolist is likely to incur greater production costs than would be present in a competitive market, and while the monopolist would still enjoy some level of monopoly profits, the X-inefficiency will reduce those profits from levels suggested by cost-minimization strategies.

From a societywide perspective, the higher price and restricted output have an effect on the welfare of society. From the consumer standpoint, the monopoly situation is a loss, particularly compared with a competitive outcome, because they face both higher prices and less output. From the firm's perspective, the monopoly situation is superior to the competitive outcome, largely because of the existence of economic profits. However, the net of the two effects results in a loss to society as a whole.

Total surplus is used to determine the net effect of a monopoly on overall economic well-being. Consumer surplus, measured by the difference between what consumers would be willing to pay for a good minus the amount actually paid, and producer surplus, measured by the amount producers receive for a good minus the cost of producing it, are combined to measure total surplus. As a result, total surplus can be viewed as the value of the good to consumers minus the cost of producing it. Competitive markets allocate resources in a way that maximizes total surplus in an economy. However, because the monopoly firm restricts output below what would occur in a competitive market, the monopolist fails to produce an output and charge a price that maximizes total surplus. Contrary to some popular beliefs, the loss in welfare created by the monopoly situation does not result from the higher profits the monopoly receives, but from the reduced output associated with the monopoly decision. The economic profits of the monopoly do not represent an economic loss to the economy, but the misallocation of resources created by the restricted output does create such a loss.

Public policy toward monopoly is somewhat contradictory. The government serves to protect certain institutions that can be effective in creating barriers to entry. Government protection of ownership rights, particularly through patents and licenses, can be an effective barrier to entry in many markets. However, government policy has also recognized the economic loss from monopoly and has attempted to address some of its effects in various ways. Government policy has generally followed one of four courses of action: (1) attempts to make markets more competitive, (2) regulation of monopoly behavior, (3) turning monopolies into public enterprises, or (4) letting monopolies continue (doing nothing). Each of the first three courses of action can be, and have been, implemented through a variety of means. The most common approach for firms believed to exhibit the characteristics of natural monopoly has been price and output regulation. A general weakness of all three approaches has been the information demands necessary to determine or enforce the socially optimal price and output, particularly given that the firm controls the information or may not even have the necessary information available. Each approach has its relative strengths and weaknesses, and the need for and effectiveness of government action has been and will continue to be a subject of debate.

Price discrimination can alter the extent of any deadweight loss associated with monopoly behavior. Price discrimination exists when the seller is able to charge different buyers different prices for the same good. Perfect price discrimination is unlikely, because it requires the monopolist to know the amount of each consumer's willingness to pay and successfully charge that price to the consumer. However, when price discrimination is possible, the monopolist will generally increase output because selling additional units of the good no longer requires lowering the price received on other sales of the good. In perfect price discrimination, the monopolist could afford to produce at the level where price (demand) equaled marginal cost. From a total surplus perspective, the result would be the same as in a competitive market; however the distribution of the surplus would be changed—the seller would capture the entire surplus. To the extent that price discrimination occurs but is less than perfect, output is likely to be greater than under a monopoly with no price discrimination but less than under perfect competition. As such, the deadweight loss would be less and the monopoly would capture a smaller portion of consumer surplus, although total surplus would still be greater than under a monopoly without price discrimination.

Oligopoly is a market structure in which only a few sellers control most or all of the market and sell similar or identical products. Duopoly is a special case of oligopoly, where only two sellers exist. As with monopoly, oligopolies are essentially "price makers" rather than "price takers" and will attempt to restrict output and increase price above what would arise under perfect competition. However, the presence of other sellers tends to complicate the pursuit of monopoly prices, output, and profits. Oligopolies are sometimes classified as either pure (perfect) or differentiated (imperfect). In pure oligopolies, sellers produce identical products, while in differentiated oligopolies the products are essentially the same, but each firm's product has a unique "identity" to consumers. Regardless of whether the oligopoly is pure or differentiated, the production decisions of each firm affect all other firms and the market price of the product.

In an oligopoly, a firm's price and output not only depend on that firm's decisions but also on other firms' decisions. Game theory has been a particularly useful approach to modeling decisions under oligopoly. As with other market structures, the firm will choose to produce at an output where marginal revenue equals marginal cost, and, as under monopoly, the demand schedule will determine marginal revenue. However, the presence of competitors changes the nature of the marginal revenue schedule. If a firm lowers price in an effort to increase market share, competitors are likely to match the price change. However, if the firm increases prices in an effort to increase profits, rivals are unlikely to match the price changes and some of the firm's customers will choose to purchase from the rivals. This asymmetric behavior results in a discontinuity in the marginal revenue schedule.

The two primary effects of the marginal revenue and demand schedules facing a firm in an oligopoly are as follows: (1) Market prices tend to become somewhat rigid and (2) changes in the cost structure for a firm may have no impact on a firm's production decisions. The first effect stems from the dilemma that creates this discontinuity: Individual firms in an oligopoly cannot lower prices, primarily because of fears of retaliation from competitors, and they cannot increase prices for fear of losing sales. The second effect results from the discontinuity in the marginal revenue schedule because the discontinuity generates a range where marginal costs may vary but the optimal, profit-maximizing output remains the same.

The interdependence of firms in an oligopoly, combined with the goal of each firm to maximize profits and exert as much monopoly power as possible, creates strong incentives for individual producers to collude when making price and output decisions. Such collusion may either be overt (the Organization of Petroleum Exporting Countries [OPEC] is an example) or covert, depending on the presence of legal restrictions on collusion, and may be formal (complete with contracts or other written policies) or informal. A group of firms colluding in such a fashion is termed a *cartel*. Game theory demonstrates that under some conditions it can be very difficult to enforce collusive agreements, particularly if the decisions in the "game" are not repeated. A stable market outcome reached under an oligopoly is termed a *Nash equilibrium* and represents the outcome that occurs when individual firms interacting with each other each choose the best strategy given the strategies that the other firms have chosen.

Not surprisingly, the competitive forces in an oligopoly result in greater output and lower market prices than under a monopoly market, but the market concentration results in less output and higher prices than under a competitive market. As the number of firms in an oligopoly increase, the ability of each firm to influence the market declines and successful collusion between sellers becomes more difficult, causing market outcomes to more closely resemble those of a competitive market. As with monopoly markets, the more restricted the output becomes and the less flexible the pricing becomes, the greater is the deadweight loss to the economy from the oligopoly.

One distinguishing characteristic of oligopolistic markets is the extent of nonprice competition. Price changes, let alone price competition, are difficult if not outright counterproductive in a market characterized by oligopoly. As a result, firms frequently engage in nonprice competition meant to distinguish the firm's product from other goods in the market. To the extent that a firm in an oligopoly can create "uniqueness" for its product, the firm can behave more like a monopoly. Advertising and quality/design differences are the primary means by which firms in an oligopoly will attempt to distinguish their products from those of competitors. One of the key motivations for nonprice competition is that, unlike with price changes, competing firms can find it difficult to duplicate the actions of rivals. Oligopolistic markets are prevalent in a number of economic sectors. For example, according to the 2002 Economic Census, manufacturing of cigarettes, petrochemicals, house slippers, beer, light bulbs, household laundry equipment, and motor vehicles are all sectors where the four largest firms produce more than 80% (and in some cases more than 90%) of industry shipments in the United States. Many of these sectors have reflected this degree of concentration for decades. Similarly, on the retail side, the top four firms in sectors such as office supplies, discount department stores, warehouse clubs, and general book stores all account for nearly 80% or more of sales.

As with monopolies, public policy toward oligopolies varies, but a substantial framework exists to discourage cooperation. The Sherman Antitrust Act of 1890 and the Clayton Antitrust Act of 1914 have been used for more than a century to outlaw collusive activity and prohibit mergers that would lead to excessive market power or monopoly for a firm. The proper scope of these laws, particularly in the context of technological changes, international trade, or other business practices that may have legitimate purposes unrelated to the reduction of competition, has been and will continue to be a subject for debate.

MONOPSONY

Monopsony is the "flip side" of monopoly. In monopoly, a firm is the sole seller of product to a group of consumers. Thus, the monopolist faces a downward sloping demand curve for its product. Every unit of output the firm produces reduces the market price for its good. This implies that the more goods the monopolist sells, the lower the monopolist's price. This in turn implies that selling an additional unit may be costly to the monopolist, and possibly result in a reduction of revenue at the margin (or "marginal revenue") to the monopolist. Thus, a monopolist will set output so that price is higher and quantity lower than the competitive outcome. This, in turn, creates deadweight loss, as not all the goods that could increase welfare in society will be sold.

In contrast, a monopsonist is the sole buyer of a particular input that it uses. For example, assume that trees are difficult to ship relative to milled wood. The only lumber mill in a geographic region might well have monopsony power over the foresters in this region. A monopsonist may well (and often does) face a perhaps perfectly elastic demand for its product in the outside world. But its market power over the relevant input that it purchases is similar to the power that a monopolist holds over the product that it monopolizes, as well as the deadweight loss generated by that market power.

Given this situation, what determines how much product (here trees) the miller will choose to purchase? Every tree the miller purchases raises the market price of trees. So purchasing one tree involves not only an additional payment to the owner of that tree but also more payments to the owners of other trees who sell to the monopsonist miller. So the miller will purchase trees so that the marginal cost of the purchase (which is above the market price) equals the marginal return, which (absent production costs) will equal the market price of milled wood from a particular tree in the "outside" market. As with the exercise of monopoly power, the exercise of monopsony power will reduce social welfare, as not all the inputs that could increase welfare in society will be sold.

Note that this story depends critically on a local input that has two conditions. First, there must be an upward sloping supply curve for the input. In other words, there needs to be an economic rent attached to the inputs used. Without this condition, there is no need to restrict purchases to stop the price of the product from rising. If the supply curve is perfectly elastic ("flat"), the monopsonist can have all the product it wants at the opportunity cost of the suppliers. Second, the input has to be more costly to transport in its "unfinished" state than in its "processed" state. Otherwise, the input suppliers could use transportation to reach downstream markets just as easily as the monopsonist.

By itself, monopsony does not violate Milton Friedman's ethical dictate that a firm should maximize its profits, subject to the rules of its society. At least in the United States, a "naturally occurring" monopoly (or monopsony) is not against the law. Broader ethical concerns can arise, however, from the monopsonist's ability to hold input prices below the competitive level. This monopsony harms the input suppliers, who are often small stakeholders in the relevant resource (say, forestry), to the benefit of the monopsonist, who is often a large corporation.

Monopsony Antitrust Cases

There are a series of monopsony antitrust cases, three of which are discussed here. *Mandeville Island Farms v. Crystal American Sugar,* 334 U.S. 219 (1948) appears to be the classic monopsony cartel case. Three and only three refiners in Northern California refined beets into sugar. These three refiners were found liable for colluding to lower the price they paid for beets. The monopsony power of the refiners stemmed from the fact that processed sugar is far easier to transport than unrefined beets. Also note that there is no assumption that the refiners have market power in the output market (here, for sugar).

A variant of the collusive purchasing story is bid rigging among potentially competitive buyers, as was present in *U.S. v. Portac,* 869 F. 2d 1288 (1989). In 1985, the U.S. Forest Service auctioned off approximately 8.1 million board feet of timber in Washington State. Three companies bid in the auction, with two of the companies submitting the minimum bid, and the third firm winning the auction with a bid $20.50 above the minimum. The three firms then split up the timber among themselves.

In *U.S. v. Rice Grower Association of California,* 1986 U.S. Dist. LEXIS 30507; 1986-2 Trade Cas. (CCH) P67, 288 (1986), the U.S. Justice Department successfully unraveled a merger between two rice millers in the central valley of California. The Justice Department was able to sustain its geographic market definition, as the only other rice millers in the United States were located in the southeast part of the country. The merger had created a firm with more than 50% of the relevant market and reduced the number of important competitive "players" from four to three, thus potentially increasing the monopsony power in the market.

In these monopsony antitrust cases, we see economic agents working to create monopsony power so that they can enrich themselves, while causing harm to input suppliers. This certainly violates Friedman's rule of ethics, as well as broader rules. Such action, by reducing purchases of socially valuable inputs, also acts to reduce total welfare in the economy. In addition, it may also have important distributional consequences.

Monopsonistic Labor Markets

Monopsonistic labor markets are a continuing topic in economic research. The basic theory is that a particular employer has a monopsony over labor in a specific region. The counterargument is that in the long run labor is mobile so that the employer must offer competitive wages to keep its employees. In some sense, this debate revolves around how long the "long term" must be.

Recent interest in this issue was spurred by the development of a new approach for addressing the issue. In this approach, search costs preclude workers from finding their optimal employment, generating monopsony power for employers. While firms also have search costs, they are able to offer recruits wages below those recruit's marginal products because it is more costly for the recruits to wait for another position than it is for the firm to wait for another valuable recruit to arrive in its labor pool. This phenomenon may be driven in part by recruits' liquidity constraints. Simply put, it can be very costly for an individual worker to wait for a further job offer to come about. The firm, on the other hand, may be able to do without the worker in the short run through a variety of substitutions available to it.

There are, however, some theoretic problems with this model. In particular, it assumes that the larger a firm becomes, the more costly at the margin recruiting becomes for this firm. Such a problem could in theory be alleviated by having decentralized hiring in large firms. In addition, the model does not consider issues of market concentration, which is central to issues of monopsonization (and monopolization) in input markets.

Here again, from the Friedman point of view, there is nothing particularly unethical going on, as firms are simply taking advantage of their position. In the longer run, however, firm's profits may suffer because they gain a reputation for "exploiting" their workforce. Once more, broader ethical concerns can arise, from the monopsonist's ability to hold input prices (here wage rates) below the competitive level. Indeed, what may be even more troubling is that firm's ability to do this depends on the employee's liquidity level, which in turn implies the less liquid an employee, the lower is his or her salary.

Monopsony in Athletic Markets

Perhaps the most famous issues of monopsony involve arrangements between various sports teams to limit the salaries of athletes. Leagues represented the only important purchaser of the labor of professional athletes. By using league rules to restrict competition for players between teams, leagues could generate monopsony power for themselves and their teams and capture economic rents from players.

Beginning in the 1970s with baseball, however, athletes and their unions have been able to reduce the degree of monopsony power held by franchise owners. Today, at least in the major U.S. sports, while many players draw large salaries, owners have managed to reach agreements with player unions that reduce player salaries by the means of salary caps and "taxes" on "excess" team payrolls. The rationale for these restraints is that they serve to protect league "competitive balance." Whether such restraints do have such a purpose, or are merely another way to exercise monopsony power, remains a difficult question to answer.

More clear, however, is the role of monopsony in highly popular collegiate sports (football and basketball) in the United States. For example, six or seven times each fall 109,000 people, after paying a significant amount of money for tickets, file into the football stadium on the author's campus to watch "student-athletes" perform on the gridiron. The athletes who perform, however, receive only a small fraction of the revenues (in terms of room, board, and academic scholarships that their coaches often make difficult to use fully) arising from their performance.

The lion's share of the revenues goes to the universities themselves. The universities are able to exercise monopsony power over the athletes through their membership in the National Collegiate Athletic Association (NCAA). The NCAA is able to effectively enforce monopsony power in cartel-like fashion by sanctioning universities that are caught violating the rules by giving more than scholarships to players.

The ethical implications of monopsony in professional sports markets are none too certain. It is difficult to take sides in the negotiations between billionaire owners and unions representing millionaire players over how the rents in professional sports should be distributed. The ethical implications of college sports monopsony, however, are far clearer.

The NCAA, acting to create monopsony for its member schools, takes rents away from 18- to 22-year-old athletes, many of whom come from poor backgrounds, and redistributes it to the member schools. This has all the negative ethical ramifications discussed above, with the perhaps further onus of taking advantage of young poor people.

It is in the NCAA's enforcement of these rules that the true ethical difficulties of monopsony arise. Given the rents at stake, it is not surprising that that many universities attempt to break the rules by giving athletes more support that the NCAA rules allow. Although such schools, when caught, are broadly thought of as "cheaters," from an economic point of view, it might be more accurate to describe these universities as "cartel breakers."

Perhaps it is easier to understand the ethical problems of the NCAA rules on a personal level. Consider the not atypical story of a not-terribly-well-compensated university assistant coach scouting a potential recruit in a small town who lives in deep poverty. It is only natural in those circumstances for the assistant coach to want to do something small for the recruit, such as buy him a good meal or a pair of sneakers out of the coach's own pocket. Yet, as the NCAA has made clear, any school whose coaches are caught engaging in such "unethical" behavior will face serious sanctions, including the loss of scholarships and perhaps important television revenues.

—Andrew Kleit

Montreal Protocol

The Montreal Protocol on Substances That Deplete the Ozone Layer is an international treaty that has guided the gradual phaseout of production of chlorofluorocarbons (CFCs), halons, and other chemicals suspected of thinning the ozone layer. Restoration of the ozone layer is necessary to protect humans, animals, and plants from exposure to dangerous amounts of ultraviolet (UV) radiation. The Montreal Protocol was negotiated in 1987 and went into effect in January 1989. Revisions that have strengthened the Protocol have occurred regularly since 1990 as new scientific, environmental, and technical information has become available.

Each industrialized signatory nation agreed to reduce production of ozone-depleting substances (ODS) during the 1990s except for essential uses for which no substitutes could be found. Developing nations were given a longer timetable and financial assistance to phase out production. Each country created its own approach to achieving reductions. The United States relied on an accelerating tax on CFCs, while the European Union used regulations to restrict and then ban production, imports, and exports. By 2003, more than 90% of the production of certain ODS in industrialized countries was achieved, and more than 60% in developing countries.

The earth is protected from the sun's UV radiation by stratospheric ozone that screens out about 99% of UV. ODS do not wash out in the lower levels of the atmosphere, but drift up to higher levels of the stratosphere and eventually break down from UV exposure and release chlorine atoms that in turn cause ozone (O_3) to break down. The "hole" in the ozone layer over the Antarctic was documented in 1985, and other "holes" have subsequently been found over the Arctic, the Caribbean, and parts of Europe. Increased UV radiation is associated with greater incidences of skin cancer, cataracts, suppression of the immune system, and other health problems.

CFCs are the most widely known ODS to the general public for two reasons. First, CFCs were implicated as potential hazards in the mid-1970s, and their use in aerosol spray cans was banned in the United States in 1978. Second, CFCs were used in refrigeration systems, including air-conditioning in homes and vehicles, under brand names such as Freon, produced by DuPont Corporation. ODS are also used in foam insulation, industrial cleaning solvents, fire extinguishers, and some herbicides. Although ODS manufacturers opposed further restrictions in the early 1980s, by 1986 they reactivated research programs to find substitutes and supported the Montreal Protocol in 1987.

The United States began to regulate CFCs and other ODS in the 1990 revision to the Clean Air Act. The market incentive approach to environmental regulation was used to efficiently achieve the regulatory goal of eliminating ODS. Rather than taking a command-and-control approach by simply imposing a production ban by a certain date, the Environmental Protection Agency established an accelerating tax on CFC production. This escalating CFC tax sends clear price signals to consumers to look for alternatives and provides incentives to producers to create substitutes because the market for substitutes will become larger over time. At the same time, sales of CFCs were restricted to certified professionals who had to use prescribed equipment to capture and recycle the emissions. An early deadline for phasing out CFC production in the United States was set for 2000, but it was subsequently moved to 1996 because of the speed with which substitute products were developed and marketed. Some early substitutes were known to have lower levels of ozone-depleting potential or contribute to global warming, but these are being replaced by the next generation of substitutes.

Assistance to developing nations to meet the goals of the Montreal Protocol is provided by the Multilateral Fund for the Implementation of the Montreal Protocol. The fund received $2 billion from industrialized nations by 2003 to give grants for converting manufacturing processes, setting up national Ozone Offices, and supporting other tasks in developing nations. Two United Nations agencies and the World Bank administer the Fund.

The Montreal Protocol is widely viewed as a success in protecting the global commons. A few essential uses continue to require production of small quantities of ODS, for example, metered dose inhalers for asthma. However, estimates in 2003 indicate that the ozone layer will be restored between 2050 and 2065, depending on how quickly older ODS-using equipment is retired, and how quickly developing countries reduce ODS production and use.

The Montreal Protocol was used as a model for the Kyoto Protocol, which deals with increasing amounts of greenhouse gases that are purported to be causing global warming. The Montreal Protocol has been much more successful in meeting its goals and deadlines because of the nature of the problem, the costs of achieving ODS reduction targets, and the number of actors that would be significantly affected. Ozone depletion was assessed by scientists more quickly and with more certainty about the relationship between ODS and the thinning ozone layer. The aggregate costs of meeting Montreal Protocol targets were much lower per capita than for the Kyoto targets. Finally, ozone-depleting substances were largely produced by a few large corporations in a few industrialized countries, so cooperation and monitoring were more easily achieved.

Moral Agency

Moral agency presumes that human beings are capable of choice and morally accountable for their actions, as well as the consequences of those actions. Closely related to the theory of self, moral agency embodies the ability to self-regulate and self-sanction one's behavior; it is part of living in community. Individuals have the capacity for making moral judgments and taking actions in keeping with a moral code. People who function as moral agents are able to consider the relationship between means and ends. They balance their intentions and actions with probable consequences and determine whether the ends justify the means. In general, theories of moral agency do not hold an individual responsible for the unintentional consequences of an action.

To some degree, moral agency is dependent on the social position or political representativeness of an individual. People who hold high social or political positions are often held to a higher moral standard than average community members might be. Whatever their status, though, all members of a community are expected to adopt the community's standards of right and wrong. They are expected to observe their own behavior, assess the degree to which the behavior adheres to the community's moral standards, and correct their conduct accordingly. Redemption, or forgiveness of a person's transgressions, is often contingent on the perpetrator's admission of guilt.

However, when a society's rules oppress, disenfranchise, or marginalize specific groups, individuals often step forward to challenge what they perceive to be the injustice or immorality of those standards. Sometimes, these individuals belong to the oppressed group; sometimes, they do not. These people question the status quo and assert the need for change. While they may be viewed initially as dissidents or trouble-makers, these people may become the leaders and agents of sweeping social change. In the Unites States, the Abolition, Women's Suffrage, and Civil Rights movements were founded when individuals or small groups of people called for change; although initially scorned, many of those early social change advocates are now viewed as heroes.

Moral standards are usually based on a combination of cultural, religious, and philosophical concepts and principles, which are used to determine whether a particular action is right or wrong. However, in the 20th century, Western culture individualized the definition of morally correct behavior, diminishing the hegemony of some established religions and other traditional moral authorities as the arbiters of morality.

To function as a moral agent, a person must understand the responsibility one has to behave morally. They must be able to feel shame, guilt, or remorse when they violate the moral code, proportionate to the magnitude of the violation. This requires a fairly well-developed sense of empathy and compassion: Moral agents are able to fully humanize their fellow citizens. They are also able to predict the probability of various outcomes of their actions and understand the relative desirability of each probable outcome. Under ideal circumstances, moral agents are able to postpone a decision long enough to consider the consequences before taking action. They operate free of coercion and are able to choose any possible course of action. They understand the potential outcomes of their actions. In addition, moral agents are able to exert the following pressures on their own behavior.

Rationality

Moral agents are able to reason and make self-interested decisions. This rationality is comparable with the legal concept of *mens rea*—moral agents know what they are doing; their choices are deliberate.

Trust

Moral agents occupy a position of trust that is recognized by their respective communities. However, there must be a rational basis for this trust. That is, the community must not have a sufficient reason to determine a person unable to function as a moral agent.

Moral agency is mitigated by social and personal constructs. For example, sleepers are not morally responsible because they are unaware of how their somnolent actions conflict with their moral beliefs. People with diminished mental capacity may not be able to control their own behavior, deliberate about possible courses of action, or understand the consequences of their behavior. Children can only be granted moral agency to the degree they are able to recognize the connection between cause and effect. They can only be held accountable to the degree of their understanding. In short, moral agency is imputed to people who are awake, sane, sanguine, sober, and possess either the knowledge or ability to acquire sufficient knowledge to assess a given situation, evaluate possible courses of action, and choose what they perceive to be the optimum course of action for all concerned.

Coercion may mitigate moral agency. People under the direct or perceived threat of death or significant harm may not be responsible for their own behavior, even if they would have moral agency in other situations. People in specific situations, such as war, or institutions, such as prison, may be more likely to behave in morally reprehensible ways; their culpability may be altered by their circumstances. In times when major catastrophes devastate a society's physical infrastructure, the norms that preserve social order may devolve to a state of nature, in which behaviors that would otherwise be considered immoral or criminal, such as stealing food, water, or medicine, become necessary to ensure survival. In this state of nature, it becomes proper to take what is necessary to preserve and protect one's life, while stealing obvious luxuries is still considered inappropriate.

The lack of sufficient, relevant, trustworthy information may also affect an individual's responsibility for the unintentional outcomes of their behavior. To function as moral agents, people must have both access to credible information and sufficient intellectual ability to digest that information and apply it to the situation at hand.

Moral agency imparts minimum obligations on individuals. It requires people to act as follows:

- Acknowledge the relationship between people, their actions, and the community's relative well-being
- Aid those in distress to the degree allowed by one's personal circumstances. The capacity to act determines the level of responsibility one has for taking action
- Choose between conflicting but equally important imperatives

- Comply with the laws of their communities and the professional standards of their occupations
- Disclose their limitations, conflicts of interest, and barriers to satisfactory performance
- Feel satisfaction at morally correct behavior for its own sake, with no need to be rewarded for doing the right thing
- Fight against consensus decision making when its effect is to push those with different points of view out of the public discourse
- Practice self-reflexivity. Moral agents are expected to analyze their own positions relative to a situation, balance objective and subjective ideas, and determine the course of action that would foster the greatest inclusivity and community building
- Prevent the suffering and death of others, the mistreatment of animals, and the wasteful or unnecessary depletion of scarce natural resources
- Reject moral disengagement—the rationalization of behavior that conflicts with moral standards of conduct by dehumanizing victims, or blaming them for their plight so that harmful actions become palatable
- Separate from otherwise righteous ideologies when those ideologies advocate morally reprehensible behavior in the name of their cause

Collectivization of moral agency is possible when individuals act in concert to achieve a specific goal. In this case, each member of the group is equally responsible for the outcomes of the group's behavior. Organizations are causally responsible for the coordinated actions of their members. Communities have a collective moral responsibility to care for people with disabilities, people who are elderly, widowed, orphaned, or poor, and people who are unable to care for themselves.

Moral agency follows individuals into their roles as employees, managers, and executives. Theoretically, the same rules would apply for granting moral agency to people inside corporations as outside their boundaries. In their roles as fiduciaries of their employers, however, sometimes socially responsible behavior contradicts the traditional definition of fiduciary responsibility as the maximization of shareholder wealth. In these instances, it is difficult to determine which duty rules: the duty of the individual to behave in the best interests of the company's shareholders or the duty to behave responsibly as a member of the larger community. The employee may feel coerced into acting in the interests of shareholders to the exclusion of larger community needs, especially if choosing in favor of the community cost the employee his or her job, or led to professional, economic, or other sanctions. Most communities acknowledge an employee's right to refuse any direction from a superior to indulge in lawbreaking or immoral conduct, but the fear of repercussions may force the employee to comply. The degree to which the employee perceives a threat may render the employee unable to function as a moral agent.

The corporation possesses moral agency. To the degree that it is a legal entity, corporations are certainly expected to obey all pertinent laws and regulations. When the corporation fails to follow the law, the responsibility for this failure rests on the individual members of the corporation, with special burdens placed on those with decision-making authority. Recent court cases in which CEOs and other corporate officers received heavy fines or prison sentences for their actions as officers certainly indicate that when corporations fail to execute moral agency, its leaders are held responsible.

Moral Distress

Moral distress is the anguish and suffering caused when an individual's personal ethics conflicts with and, at times, is compromised by job requirements, administrative directives, managerial decisions, workplace policies, and so on. It is an issue that many face in today's workforce. While this notion was developed to explain a specific type of job-related stress and trauma experienced by health care workers, specifically nurses, psychologists, doctors, social workers, educators, and business professionals are now reporting similar experiences. There are related incidents also found in the area of family law and mediation regarding parents and child custody issues.

Definition and Characteristics

The notion of moral distress emerged in the early 1980s when Jameton, writing for nurses, drew a distinction between moral uncertainty, moral dilemmas, and moral distress. The first deals with instances when an individual is not sure what particular moral principle or value is applicable in the situation at hand. The second refers to problems when several moral principles or values are relevant, and the individual must choose between perspectives and their consequences. The third, moral distress, describes the reality of knowing the ethically correct action to take and feeling moral responsibility, but being unable to act in accordance with personal views due to organizational constraints. In such situations, individuals are faced with having to choose between their own integrity or participating in wrongdoing. Wilkinson expanded the understanding of this phenomenon by adding that there is a psychological dimension, a psychological disequilibrium created by disrespecting personal beliefs. First in 1995 and again in 2001, Corley published a Moral Distress Scale. It identified frequently occurring issues that were problematic for nurses, as well as severe morally distressing situations.

The ethics of care, among other ideas, has influenced the understanding of moral distress. In 1995, Liaschenko furthered the discussion of moral distress by describing nurses as "artificial persons" who find themselves in a stressful, complex situation. They are healing professionals and patient advocates who at times inflict pain against their will due to supervisory directives, institutional policies, and bureaucratic practices. In 2000, Penticuff and Waldren noted that the work setting, both actual and perceived, affects the ethical choices made by nurses.

Moral distress is a multidimensional phenomenon that can affect a person physically, emotionally, spiritually, and socially. Consciously knowing the appropriate action to take, but being unable to act, can damage a person's sense of integrity and authenticity. Long-term moral distress can result in the loss of moral integrity, causing the individual to not behave according to professed values and convictions, nor be able to effectively deal with moral conflicts.

During times of moral distress, frustration, anxiety, anger, and guilt are common emotions, because individuals often feel powerless, afraid of repercussions, or reluctant to act. These feelings occur during the period known as initial distress. Some individuals after identifying the divergence between their personal views or values, and those of the workplace, have the self-assurance, courage, and interpersonal skills to seek to resolve the difference. Others do not. The latter is referred to as reactive distress. If the distress becomes too acute, it can cause illness, relationship breakups, the loss of a job, and even the abandonment of a career. Moral distress is detrimental to the nursing profession because highly qualified individuals are leaving the profession or are not choosing to enter it.

Internal and external factors create morally distressing situations. Personal characteristics such as low self-esteem, religious views, lack of professional confidence, deficient interpersonal and conflict resolution skills, and fear are factors in an individual's ability to clarify and handle ethical differences. External reasons include industry standards, administrative directives, governmental regulations, managerial practices, inadequate time and human resources, legal ramifications, personal financial impact, and organizational culture and politics.

Moral Distress and the Workplace

Moral distress is an emerging concern beyond the health care field, because such stressful, anxiety-causing workplace situations are not isolated to medical and life science professions. Instances are coming to light in areas such as family law, business, and higher education. Some specific issues are as follows.

Family law and mediation experts are beginning to recognize the moral distress that some experience when children are mandated by the court to spend time with an unqualified parent. It is traumatic for a parent to routinely hand over a child to a parent who may not provide the level of care deemed necessary.

With the emphasis on ensuring ever-increasing higher profits, business and financial professionals sometimes find themselves faced with using questionable marketing, management, reporting, and accounting practices. Plus, repeated job redefining and layoffs are now standard methods used to reduce organizational operational costs. A growing number of companies are choosing to reduce their workforce, while increasing the workload of remaining employees. Staff reduction practices usually do not consider how repeated layoffs affect workers' health and careers. More and more managers are being charged with devising work assignments that are excessive and overwhelming. They are also being asked to conduct repeated layoffs in a "business-as-usual" manner while not considering an employee's loyalty, professional skills, economic condition, work history, and so on. These management professionals, when placed in this situation, sometimes feel that they must choose between personal integrity and retaining their jobs. While at times they may feel troubled and guilty about the ramifications these practices have on employees and their families, they usually rationalize the validity of these methods by believing that the required action is how profitable businesses are conducted.

In higher education, morally distressing issues can arise around the tenure process, admissions policies, and instructional quality. As institutions struggle to sustain themselves economically, enrollment standards and practices can become compromised. In some instances, department chairs are being requested to admit students who are not adequately qualified. Faculty members feel the burden to keep student retention high so that they are viewed as effective instructors committed to the university or college. Professors and staffs feel caught between enabling their university or college to stay financially viable and providing students honest feedback on their academic work so that they can receive a quality education.

The research conducted on the moral distress experienced by nurses has laid the groundwork for analyzing, understanding, and addressing this phenomenon in others areas of the workplace. Present scholarship verifies its existence, describes its basic nature, and outlines aspects of its devastating effects. Various professional organizations, such as the American Association of Critical-Care Nurses (AACN), recognize it as a serious issue, are beginning to educate their members about it, and are taking practical steps to address it. Future researchers can use this material to examine the following business sector–related questions: What moral conflicts do managers experience when they knowingly assign excessive workloads to cut costs and increase profits? What is the impact on managers' sense of moral integrity when they are required to repeatedly lay off employees without consideration of how this affects employees' well-being? What is the effect on employees when they have to routinely rationalize that work is more important than spending time at home with family and friends?

Reducing Workplace Moral Distress

Much still needs to be done to enable employees to consistently identify and handle the moral distress they experience. Four factors are critical in reducing workplace moral distress: organizational culture and values, leadership integrity, professional voice and code of ethic development, and professional association involvement. The development of an ethical organizational culture is vital in setting workplace expectations, instilling accepted values, devising appropriate policies, and supporting dialogue about divergent ethical views. More democratic work environments can provide employees avenues to discuss concerns about organizational practices, administrative policies, and supervisory directives without fear of negative repercussions. Professional associations can be effective vehicles for professional development of their members, as well as advocates for the creation of ethical work environments. Besides monitoring member behavior and articulating a code of ethics, they can provide leadership programs that enable the development of ethical decision-making skills, as well as training opportunities to enhance professional self-image, confidence, and conflict resolution skills. The latter service enables individuals to develop their self-esteem and professional voice to effectively discern moral distress situations, affirm their own feelings and values, and choose to take care of themselves by developing an appropriate action plan to resolve the stressful situation.

Thus, addressing workplace moral distress is about establishing and maintaining organizational integrity, and providing a safe and meaningful work environment for employees. It is about fostering professional voice and accountability so high-quality client and customer service is ensured. Last, it is about creating institutions and practices that do not harm the professional, the client, or the community in which they reside.

Moral Education

Moral education in a business and society context involves learning to make consistently correct moral judgments as a guide to behavior that is self-regulated instead of externally coerced in the realm of commerce. The literature on this enterprise is largely a product of scholarly projects in business degree programs at select universities and colleges. Moral education in this context is inextricably bound up with the mission of higher education in general and the university in particular. From its Greek origins, the university has been associated with the pursuit of knowledge for its own sake as well as the practical development of personal intellect and character. According to Darryl Reed, the medieval university extended this mission by preparing students for certain professions, most notably the clerical, medical, and legal, while emphasizing public service to the community or state. Business schools, shaped by both Greek and medieval traditions, typically require that students take liberal arts coursework as preparation for the more technical, professional education delivered in business degree programs. Given this tradition, it can be said that moral education involves three interrelated aspects: imparting knowledge that explains the nature of the business and society relationship, developing the personal intellect and character of students, and encouraging graduates of business schools to become socially useful practitioners.

The first aspect of moral education can be framed in terms of a social contract between business and society. A common interpretation of this contract derived from utilitarian ethics is that society grants legitimacy to business as an institution because of its potential to serve the greater good. According to William C. Frederick, this potential involves two major value processes: *economizing* or the ability of business organizations to convert inputs to outputs efficiently through competitive behaviors and *ecologizing* or the capability to forge symbiotic, integrative linkages between organizations and their communities that function adaptively to sustain life. Because business firms are embedded in communities, they are subject to various stakeholder expectations, also inherently value laden. For instance, social activists who pressure a firm for the proper disposal of toxic waste typically assert a community's right to a healthy environment that sustains life. At the same time, the costs of toxic waste disposal may adversely affect the economic performance of a firm, its ability to compete with other firms in the industry, and financial returns to its shareholders. As this example shows, ecologizing and economizing values can be in tension and subject to trade-offs. Historically, the government's role in business and society has been justified by the goal of ameliorating the negative spillover costs of business, such as toxic waste, with public policy that seeks to balance such value tensions. A moral education necessarily sheds light on these institutional roles in terms of the values and ethics at stake and the distribution of benefits and costs to various groups in society.

Ideally, the second aspect of moral education, the practical development of intellect and character, is enhanced by the first. That is, students who grasp the nature of the business and society relationship may also develop the potential to reason at higher levels of moral development or at least comprehend the decision-making models that incorporate such reasoning. In terms of Lawrence Kohlberg's widely applied theory, there are three levels of moral development, each embodying two sequential stages of learning. Specifically, the preconventional level involves a focus on self based on a reaction to punishment and seeking of rewards in Stages 1 and 2, respectively. If individuals learn to move beyond this self-centeredness to consider the expectations of others, then they are able to reason at the conventional level, conceptualized as Stage 3 or conformity to family and peer group conceptions of right and wrong and Stage 4 or an adherence to the rule of law and custom. In comparison, a person who can reason on the postconventional level of Stage 5 is able to focus on humankind in terms of moral principles, including human rights, social contract, and constitutional precepts, that are broader than those embodied in immediate referent groups or a particular society's customs and laws. Stage 6, the apex of moral reasoning in Kohlberg's framework, is denoted by an ability to define right and wrong in terms of principles of justice, fairness, and rights that can be generalized to the entire humankind. In terms of postconventional reasoning, moral education may help prepare students for the dilemmas in international business environments, where multinational corporations operate in developing countries that lack the legal or customary protections afforded to workers and consumers in more advanced industrial economies.

Another model of moral character has been developed by Carol Gilligan, who argues that boys and girls follow different paths to moral development, with girls valuing the quality of personal relationships and caring for others' well-being more than adhering to rules and principles. Differences notwithstanding, the common denominator of theories of moral development is the ability to advance from self-centered to other-regarding reasoning. Using Kohlberg's theory, James Rest found strong evidence that subjects tend to advance in cognitive processes of moral reasoning as long as they continue in formal education. Put differently, education has the potential to influence moral development and hence the personal intellect and character of students.

Finally, education that enhances moral reasoning should help produce socially useful practitioners who are able to factor values and ethics into their decisions while striving to economize, respond constructively to community concerns, and adhere to the law, public policy, and government regulation. According to Diane Swanson, it is particularly important that executive managers exhibit these abilities and require that other employees follow suit, given the power vested at the top of corporate hierarchy. Education meant to prepare practitioners for these inherently moral roles would incorporate corporate social responsibility in the curriculum, including topics such as the law, public policy, and governmental regulation; environmental sustainability; management and stakeholder relationships; value-based leadership and corporate culture; organizational ethics, compliance programs, and codes of conduct; moral reasoning; personal values and ethics; and the nature of ethical dilemmas or value trade-offs. Moreover, education aimed at encouraging students to reason at the highest level of moral development would emphasize the value-based utilitarianism that justifies the social contract between business and society as well as other ethical principles relevant to the good of humankind, including deontology or duty-based ethics, ethics of care, human rights, and justice and fairness.

Moral Hazard

Moral hazard is the risk one party has when dependent on the virtuous, or moral, behavior of others. These risks increase when there is no effective way to control that behavior. To distinguish moral hazard from all cases in which people misbehave, moral hazard problems arise in situations in which two or more parties form an agreement or contractual relationship, and the arrangement itself creates the incentives for misbehavior. For example, for a person to have an incentive to exceed the posted speed limit so that he or she can be home in time to watch a favorite television show would not be an example of moral hazard. However, if one's employer agrees to pay all misdemeanor moving violations that he or she would incur when using a company car, then that would create a moral hazard problem by giving one an incentive to take an action (speeding) that harms the employer (paying for speeding violations). Because moral hazard problems arise within the context of agreements or contractual relationships, they are also a type of post-contractual information problem.

Suppose there is an arrangement between an individual and another person or entity, such as an organization, in which the individual agrees to behave in a certain way, perform a specified task, or provide a specific product. The potential for a moral hazard problem arises when the following conditions exist. First, there is uncertainty regarding the moral character of contracting parties. Second, the interests or objectives of the individual are not aligned with the interests or objectives of the person or organization with whom he or she made the agreement. Third, the agreement creates incentives for the individual to act in such a way so as to benefit himself at the expense of the person or organization he or she has agreed to help. Finally, it is costly, difficult, or impossible for the person or organization to fully monitor the activities of the individual. The problem of monitoring is critical. If contracting parties could effectively observe or monitor the activities of their partners, then moral hazard problems would be almost entirely eliminated.

Costly Monitoring

Monitoring is difficult because of contractual incompleteness and asymmetric information.

Contractual Incompleteness

A contract is incomplete if it does not specify an action for a potential contingency or if the action stated for a contingency is ambiguous. There are four reasons why contracts are incomplete: Some events cannot be identified or predicted at the time the contract is established; there might be too many contingencies to account for in the contract; it is often difficult to measure and evaluate the performance of contracting parties; and enforcing contractual compliance is costly. These problems are compounded when the contractual agreement is complex, exchange is infrequent, or the gains from trade are relatively small.

For example, suppose a person contracts with a carpenter to build a home. The contract might specify the style of home to build, the type and quality of materials to be used in construction, the date the home should be completed, and the payment the buyer will make to the builder. The contract might also stipulate what would happen if inclement weather makes it difficult for the builder to finish the home on time. However, there might be some events, unforeseen at the time the contract is established, that make it difficult for the builder to complete the project. For instance, a labor strike in another industry might make it impossible for the builder to obtain needed supplies. Incomplete contracts can create moral hazard problems if persons governed by the contract are able to exploit the deficiencies of the contract for their own personal gain. For instance, the builder could claim certain events, unverifiable to the buyer, have occurred that make it impossible for him or her to complete the project on time so that he or she can take time off for personal reasons. Or, the builder could use less costly materials because he or she knows the buyer is not able to distinguish perfectly between high- and low-quality materials.

Asymmetric Information

Asymmetric information means some people have relevant information not available to others. An example is the used car market. Sellers of used cars generally know more than buyers about the quality of the cars they sell. Asymmetric information is a problem if people have an incentive to use their private information to defraud others. Asymmetric information is manifested either before or after the exchange has been established. Asymmetric information problems arising before an exchange is formalized are known as adverse selection. Asymmetric information problems arising after an exchange is formalized are defined as moral hazard.

Moral hazard arising from asymmetric information is manifested as either hidden action or hidden information problems. In a hidden action problem, the person taking an action knows more than others about what he or she did or what the effect of his or her action is. Hidden action problems are the quintessential example of moral hazard problems, because moral hazard is most often thought about in terms of behavior. For instance, an insurance company might not know if persons with an insurance policy are taking precautions to avoid an insured mishap. An employer might not know if an employee is working hard or shirking. Citizens might not know if the trips their elected officials are taking are necessary for the discharge of their public duties. A person might drive a rented car more aggressively than a car he or she owns. In a hidden information problem, persons with private knowledge might not fully or truthfully disclose the information to others entitled to it, or they might use their private knowledge to benefit themselves at the expense of others. For example, an employee might not accurately disclose information requested by a superior, a corporate executive might not fully disclose the financial health of the company to employees or investors, a mechanic might report a car needs extensive repairs when in fact it requires only minor service, or a physician might order more medical tests than are necessary given the patient's expected medical condition.

Examples of Moral Hazard Problems

The problems of contractual incompleteness and asymmetric information are pervasive. Therefore, any transaction has the potential of creating a moral hazard problem. This means that most agreements and contractual relationships give rise to social and ethical problems for the people who enter into the agreements. Because monitoring is costly, an ethical problem for persons or organizations faced with the decision to monitor is whether they should tolerate some degree of waste, fraud, or abuse. Government regulation and trust can substitute for costly monitoring, although these are imperfect and costly to implement as well. For the person for whom the agreement creates an incentive for misbehavior, an ethical problem is whether to pursue one's own interest or subordinate it to the interest of the person creating the agreement. Social norms for behavior, such as "Do not lie, cheat, or steal" or "Don't bite the hand that feeds you," are often necessary to complement institutional and organizational solutions to moral hazard problems.

Insurance, employment, and professional (agency) relationships, as well as a case study of the savings and loan scandal of the 1980s, provide contexts for a more careful exploration of moral hazard problems and the ethical dilemmas they create.

Moral Hazard in Insurance Markets

The insurance industry provides the most effective illustration of the problem of moral hazard. In fact, the term *moral hazard* is thought to have originated in the insurance industry. People buy insurance to protect themselves from unseen or unanticipated risks. For instance, homeowners risk losing a home to a fire, and automobile owners face the risk of being in an accident that damages the car and causes injuries to themselves or others. Most people are risk averse, meaning they prefer not to face the risk but would rather transfer risk to others in exchange for a payment. Insurance companies are willing to take risk by providing insurance coverage because they can pool the risks of many individuals, assuming the risks are independent (meaning one person's risk of an accident does not affect another person's risk). In the absence of insurance coverage, most people will take some precautions to minimize the chance of an accident. The problem with insurance coverage is that once a buyer obtains insurance, he or she has an incentive to change his or her behavior because he or she knows someone else, in this case the insurance company, bears the risk of his or her behavior. For example, if people have an automobile insurance policy that pays for repairs in the event of an accident, then they have less incentive to drive carefully. They might, in fact, be reckless in their behavior because they know that they will not have to bear the cost of repairing their car. In the extreme case, people might have an incentive to cause accidents in order to collect insurance money. The insurance company thus faces the hazard it will have to pay out more in claims than originally expected. This problem becomes acute if, as is usually the case, the insurance company cannot fully monitor the insured to ensure their behavior is in accordance with policy guidelines.

A normative duty for those who are insured to resist the incentive to be reckless and to exercise adequate care in the actions they take will moderate the effects of moral hazard caused by insurance. Moreover, insurance companies can establish policies to reduce the incentives the insured face to engage in risky behaviors. For instance, deductibles and copays shift some of the cost of accidents to the insured. Also, some insurance companies have policies that do not pay if there is evidence that accidents are willfully caused or are caused by negligence on the part of the insured. Societies also create laws to prohibit the willful causing of accidents. For instance, people who are convicted of arson may have to pay fines or serve time in jail.

Moral Hazard in Employment and Organizational Settings

Moral hazard problems are pervasive in organizational settings, particularly in employment. One reason is that employment contracts are notoriously incomplete. Employment contracts offered to new hires often specify nothing more than a starting wage and date employment begins; contracts offered to supervisors or senior-level executives are usually more extensive, but even these contain boilerplate language. Work schedule and employment responsibilities are often negotiated later, and company policies are relegated to a company handbook. The incompleteness of employment contracts gives employers or even employees an incentive to take advantage of each other. For instance, an employer might shift work responsibilities to employees after they are hired or have worked for a period of time.

Another reason moral hazard is pervasive in employment is that it is impossible for firm owners or managers to fully monitor what workers do. Accordingly, workers have an incentive to shirk, that is, to give less than complete effort in their employment responsibilities and to free ride on the efforts of coworkers. Some workers might even steal from their employers by taking home office supplies, for instance. Furthermore, many employees bring specialized knowledge with them at the time they are employed. Other employees acquire specialized knowledge about the company, industry, production processes, activities, and competencies of coworkers as a result of their being employed. Because of the vast quantity and complexity of information created and available within organizations, it is not possible for owners or managers to know everything occurring within a company or everything relevant to making the organization function effectively. Thus, much information in organizations becomes private information. A hidden information problem arises when workers do not have an incentive to disclose relevant information to their superiors or when they have an incentive to distort information they do disclose.

There is a relationship between moral hazard and the nature of compensation within organizations. Ideally, workers are paid based on the effort they contribute to the company. Workers who contribute little ought to be paid little, while workers who work hard and contribute a lot ought to be paid a lot. In reality, firms do not usually pay workers based on their contributed efforts because of the difficulty managers have in determining precisely how hard workers work or what workers contribute. Thus, workers may shirk, or they may report a greater level of effort expended than they actually worked to increase their income.

Most firms have some form of incentive compensation or performance payments designed to align the interests of workers with those of the organization and to motivate workers to work hard. Because of the difficulty in observing and verifying individual efforts directly, so that pay can be tied to effort, most performance payments are tied to proxies of effort, such as number of units of output produced (piece rates in manufacturing), number of units sold or total sales (commissions for salespeople), stock prices, or productivity improvements.

Although incentive compensation is established to mitigate moral hazard problems, they can create new moral hazard problems. The motivation behind incentive plans is if workers perform well for the organization, then such efforts should affect the measurable indicators—sales would increase or stock prices might rise. However, incentive plans may work too well. Workers may focus too closely on the measurable indicators, taking actions to manipulate the indicators rather than benefit the company. For example, an executive paid in company stock might have an incentive to take actions that increase the stock price, at least in the short run. He could do this by reporting income to be earned in future periods as income earned in the current period, or by delaying the posting of expenses or failing to fully account for company expenses or liabilities. Most of the accounting scandals beginning with Enron Corporation in the late 1990s are examples of moral hazard problems writ large created by incentive compensation plans designed to mitigate moral hazard behavior of company leaders!

Moral Hazard in Professional, or Agency, Relationships

Moral hazard problems can arise when one person contracts with another to act in his or her behalf or to make decisions or recommendations for him or her. For example, a person might hire a lawyer to represent him in court, a person might visit a physician because she is sick, or someone might take a car to a mechanic or call a plumber to fix a leaky facet. These arrangements are collectively referred to as principal-agent or agency relationships. Specifically, an agency relationship exists when one person, the principal, contracts with another person, the agent, to take some action on the principal's behalf. In the examples cited above, the lawyer, physician, mechanic, and plumber would be an agent of the person hiring them.

People usually contract with professionals because of the expertise they possess. Moreover, once the agency relationship is established, the agent might also acquire knowledge relevant to the principal. Unless the interests of the principal and agent are perfectly aligned, which rarely happens, the agent might have an incentive to use his private information unethically to benefit himself at the expense of the principal and others. For example, if a physician wants to minimize the possibility of being subjected to a malpractice suit, she may order more medical tests, prescribe more prescriptions, or recommend more extensive or expensive procedures than are medically necessary, resulting in higher medical expenses for the patient and his insurance provider. Similarly, lawyers and accountants might overcharge their clients, or mechanics and plumbers might recommend unnecessary repairs. These problems could be eliminated if agents adhere to ethical principles of personal virtue, honesty, the golden rule of behaving toward others as you would have them behave toward you, respect for the rights of others, compassion, and commutative justice by rendering nothing less than the service expected by the client.

As with all cases of moral hazard, the root cause of moral hazard problems arising in agency relationships such as these is the difficulty a principal has in monitoring the agent. If the principal can know what the agent does or can obtain the private knowledge possessed by the agent, then most moral hazard problems could be solved. There are many organizational and institutional innovations that have evolved to help with the monitoring problem. For example, patients obtain second opinions before consenting to a medical procedure recommended by a doctor or dentist. Law enforcement personnel, government regulators, and even journalists routinely inspect and report on the services provided by mechanics, plumbers, and other service professionals. In addition, many clients seek referrals from friends and associates, suggesting reputations are a means of mitigating moral hazard behavior. Clients who are dissatisfied with services provided will usually tell others or make reports to local business bureaus.

Moral Hazard in the Savings and Loan Industry

Like a bank, a savings and loan association accepts deposits from patrons and makes loans and other investments with the money. Unlike banks, savings and loans are restricted in the types of investments they can make; they are limited to making loans primarily for residential mortgages and commercial real estate investments. To compete with banks, which could offer more attractive savings rates because of their greater flexibility in making investments, savings and loans during the 1980s sought riskier, higher-yielding investments by investing in high-risk commercial real estate projects as well as corporate "junk bonds." In other cases, managers at savings and loans committed outright fraud in their accounting of deposits and loans. When the real estate market collapsed in the late 1980s, savings and loan associations that had been overly aggressive in their investing and financial accounting were forced to declare bankruptcy.

The cause of the savings and loan scandal was moral hazard created by the combination of federal deposit insurance and lax oversight of the investment and accounting behavior of savings and loan associations. Bank deposits are insured by the government by the Federal Deposit Insurance Corporation, and until 1990, deposits at savings and loan associations were insured by the Federal Savings and Loan Insurance Corporation (FSLIC). Banks generally enjoyed greater federal regulation of their activities to reduce the likelihood banks would have to require a deposit insurance bailout. Savings and loan associations were not as heavily regulated as banks, however. Because savings and loan associations felt pressure to find riskier investment opportunities to remain competitive with traditional banks, the combination of lax oversight and the presence of insurance for deposit holders gave managers an incentive to be overly aggressive in their business activities. The result was a classic moral hazard problem creating the following ethical dilemma for managers: They could have operated their businesses according to sound lending practices but at the risk of losing market share to banks, or they could have gambled to remain profitable. The outcome is now history. More than 500 savings and loan associations declared bankruptcy and turned to the FSLIC for relief. The FSLIC did not have sufficient reserves to handle the billions of dollars of liabilities the bankruptcies created, forcing the government agency to turn to taxpayers for relief and damaging the savings and loan industry.

Moral Imagination

The moral imagination is the mental capacity to create or to use ideas, images, and metaphors, not derived from moral principles or immediate observation, to discern moral truths or develop moral responses. Some defenders of the idea also argue that ethical concepts, embedded in history, narrative, and circumstance, are apprehended best through metaphorical or literary frameworks. A variety of thinkers have invoked conceptions of the moral imagination, including 18th-century writers and philosophers, as well as contemporary philosophers and business ethicists.

In his *Theory of the Moral Sentiments*, first published in 1759, Adam Smith described an imaginative process essential not only to understanding the sentiments of others but also to moral judgment. Through an imaginative act one represents to oneself the situation, interests, and values of another, generating thereby a feeling or passion. If this passion were the same as that of the other person (a phenomenon Smith refers to as "sympathy"), then a pleasing sentiment would result, leading to moral approval. As individuals across society engage their imaginations, an imaginative point of view emerges that is uniform, general, and normative. This is the viewpoint of the impartial spectator, the standard perspective from which to issue moral judgments.

Edmund Burke was perhaps the first to use the phrase, "moral imagination." For Burke, moral concepts have particular manifestations in history, tradition, and circumstance. In a passage in *Reflections on the Revolution in France*, published in 1790, he suggests that the moral imagination has a central role in generating and recollecting the social and moral ideas that, when crystallized into custom and tradition, complete our human nature, stir the affections, and connect sentiment with understanding. In the early 20th century, and with a nod to Burke, Irving Babbitt proposed the moral imagination as the means of knowing—beyond perceptions of the moment—a universal and permanent moral law. Assuming a distinction between the one and the many, Babbitt contended that the absolutely real and universal unity could not be apprehended; rather, one must appeal to the conceptual imagination to develop insight into stable and permanent standards to guide one through constant change. That the conceptual imagination might be cultivated through poetry, myth, or fiction was an idea of Babbitt later taken up by the traditionalist social critic, Russell Kirk.

In recent years, philosophers and business ethicists have shown a renewed interest in the moral imagination. Mark Johnson contends that moral understanding uses metaphorical concepts embedded in larger narratives and requires ethical perception. For example, ethical deliberation is not the application of principles to specific cases but involves concepts whose adaptable structures represent types of situations and modes of affective response. Furthermore, moral conduct demands that one cultivate one's perception of the particularities of individuals and circumstances and develop one's empathetic abilities. To these ends, literature has an essential role. In business ethics, Patricia Werhane has suggested that the moral imagination is necessary to ethical management. Beginning with the recognition of the particularity of both individuals and circumstances, the moral imagination allows one to consider possibilities that extend beyond given circumstances, accepted moral principles, and commonplace assumptions.

In general, and despite its varying and sometimes vague elaboration, the moral imagination has relevance for business practice. An imaginative capacity allows for the consideration of the effects of actions on multiple stakeholders, attuning managers, for instance, to the particulars of individual experience in the workplace. More generally, the moral imagination may reveal that business practices do not reduce to bare principle or pure theory but are embedded in history and society. Nonetheless, critical questions remain. Is the moral imagination merely an instance of the general ability to form new images and concepts? Does the contemporary appeal to the moral imagination allow for ethical objectivity? And can the moral imagination be cultivated only by first defeating the human propensity to center one's concerns on the self?

Morality, Public and Private

Contemporary scholars such as Linda Treviño and Al Gini have studied the relationship between the private moral behavior of managers and their ability to satisfy their public moral responsibilities. On the one hand, it seems natural to hold that the moral standards used to evaluate an individual's private behavior ought to be separated from the standards used to evaluate one's behavior in professional roles, representing organizations with public stakeholders. On the other hand, this tendency to separate private from public moral evaluations raises some problems associated with the ways in which private conduct can interfere with the satisfaction of public responsibilities.

There are two reasons that are cited to justify the separation of private moral standards from those that are public. First, it is sometimes said that private conduct should not affect our moral assessment of the actions of individuals in their public roles. This is so because what one does in private is not necessarily related to what one does at work or in professional life. Second, public standards of conduct are neither reducible to, nor expressive of, standards of private moral conduct. This reason is less practical and more conceptual; it maintains that the actual content of public moral standards is distinct from the content of private moral standards, which are more parochial and reflect individual choice or tradition.

Separating private from public standards of morality assumes that we can differentiate private roles from public ones. What one does at home, the nature of one's familial or personal relationships, and one's religious affiliation are matters relating to private moral choice. These choices not only represent an individual's sense of self but also reflect the norms that an individual has implicitly and explicitly endorsed. These norms, in turn, indicate an individual's attitudes toward conduct such as sexual relations, truth telling, child rearing, alcohol consumption, and charity. They also convey more comprehensive convictions regarding things such as religion and spirituality. One's public identity, in contrast, involves the roles and responsibilities one assumes in representing or working for organizations that serve a broad range of stakeholders with divergent interests. As a civil servant, elected representative, or a manager of a corporation, one inhabits a public sphere, composed of a plurality of individuals and groups with sometimes different private moral commitments.

The fact that the members of a public organization do not universally share private moral convictions provides advocates of the separation thesis with good reason to avoid using private moral norms to evaluate the conduct of individuals in public life. Private moral norms are controversial, subject to protracted disagreement, and either irrelevant or ineffectual in accomplishing the goals of public organizations. Moreover, what individuals do in private, as a matter of personal choice, often has little impact on their ability to serve the public in their professional lives. Thus, it is natural to advocate standards of public conduct that express broad-based, publicly acknowledged values, such as fairness, honesty, trustworthiness, autonomy, impartiality, and welfare, rather than more parochial moral norms that proscribe a range of behavior that is not always relevant to fulfilling the roles and responsibilities of a public figure. This way of distinguishing private from public moral norms also implies that public organizations should not require individuals to set aside or unduly sacrifice their private moral convictions in assuming public roles.

The separation of private from public morality is open to some important qualifications and objections, both practical and philosophical. First, there are numerous situations when private moral conduct can affect the morally relevant interests of stakeholders in a public organization. Consider some of the issues related to drug testing in the workplace. The use of marijuana can be a thoroughly private choice, reflecting an individual's endorsed norms of behavior. When its use, however, begins to impair performance at work or poses risks to other employees, it begins to affect an organization's ability to operate for the welfare of its stakeholders. Accordingly, some organizations have implemented drug testing procedures to detect drug use and, if need be, terminate employees whose private decisions interfere with the welfare of others. A drug testing program that administers tests with just cause and offers due process to employees is a good example of how public moral norms take priority when found to be in conflict with norms of private behavior.

Even private behavior that has less obvious impact on the welfare of stakeholders has been a source of controversy in business. Harry Stonecipher, former CEO of the aerospace giant Boeing Company, was forced to resign his post in 2005 after it was discovered that he had an extramarital affair with a female manager. Although this manager was not his direct subordinate, Boeing's board asked for Stonecipher's resignation because if such conduct were to be publicly uncovered, it would reflect poorly on Boeing's commitment to high moral standards. One might say that this should remain a case where private conduct should remain private and not affect the board's assessment of Stonecipher's professional conduct; however, to the extent that the affair was internal to Boeing and could have jeopardized an already tenuous public perception of Boeing's commitment to high moral standards, the board felt strongly that Stonecipher could not effectively fulfill his responsibilities as CEO. This case illustrates the deep connection between private moral choice and its public implications.

Second, and more fundamentally, some authors have noted that private conduct is never easy to disentangle from the attitudes and behaviors exhibited in public. Robert Solomon, for instance, has argued that moral conduct in business depends crucially on the virtue of integrity, a kind of holism that unifies one's moral commitments in both private and public roles. This Aristotelian position finds moral character to be more seamless than the separation thesis would suggest; the decisions made by individuals in their private lives reflect how they respond to situations in public settings. Who one is in private affects who one is in public. One need only consult cases such as that of former Tyco International CEO Dennis Kozlowski to find anecdotal evidence that an individual's tendency toward excess in private life can thwart the moral aim of public organizations to improve the welfare of its stakeholders. Managers who are inclined to steal or be deceitful in their private lives are those who are comfortable doing so in their roles as managers. There are times and places where private moral attitudes facilitate (or impede) the realization of public moral norms.

Moral Leadership

Moral leadership in a business and society context involves directing corporate activities toward socially responsible ends. The premise for this type of leadership is that corporations are granted power and status in society because of their ability to serve the greater good. William Frederick conceives of this ability broadly as economizing and ecologizing, the former referring to the ability to efficiently convert inputs to outputs through competitive behaviors and the latter to forging cooperative, collaborative linkages with society that function adaptively to sustain life. Because the economizing function of the firm is widely recognized, executive managers are sometimes referred to as stewards of society's scarce resources, which are transformed into goods and services in the business sector, subject to government regulation and social norms. Given this role, Archie Carroll proposes that firms should first and foremost fulfill their economic and legal obligations to society while also attending to various stakeholder expectations of ethical conduct over and above the letter of the law. Moreover, corporations are increasingly expected to give back to society in the form of philanthropy or programs targeted for the betterment of community. The enactment of these forms of corporate social responsibility, sometimes referred to as "corporate citizenship," and the balancing of their tensions and trade-offs is largely under the influence of the executive manager or chief executive officer who sets the moral tone for an organization's conduct in society through his or her span of control over the formal and informal organization. In both equally important realms, the executive has access to several mechanisms for directing organizational conduct toward constructive social ends, beginning with the formal or structural organization.

Morally Leading the Formal Organization

The chief executive officer can guide a firm toward responsible corporate conduct vis-à-vis the formal organization by directing other managers along the chain of command structure to attend to concerns expressed by internal and external stakeholders, the former including employees and investors and the latter consumers, suppliers, the media, government agencies, and other groups in society that can affect or are affected by the firm's activities. The issues raised by these groups are often articulated in terms of moral expectations, as when employees claim the right to fair treatment, investors expect honest and transparent financial statements, consumers assert entitlements to safe products, and social activists exert pressure for sustainable business practices. If the executive manager establishes formal policies that direct other managers, especially those in the office of external affairs, to listen to, document, and attend to these concerns in a timely way, then it is possible for the firm to develop collaborative relationships with stakeholders instead of adversarial or neglectful postures. From this point of view, it can be said that moral leaders seek to ensure that firms perform their economic function in society while also addressing stakeholder issues efficiently and effectively so that the benefits of corporate impacts are maximized while harmful outcomes are prevented or minimized.

Some advocates of business social responsibility hold that executives who seek to maximize the benefits of corporate actions will also give back to community in the form of corporate philanthropy whenever possible, perhaps in collaboration with not-for-profit organizations. For example, executives might encourage employees to give to the local United Way while also donating corporate funds to that agency. A moral leader might also set a personal example of donating his or her time to not-for-profit community endeavors while encouraging other employees to do the same, perhaps by providing them with organizational incentives. Increasingly, such philanthropy is deemed strategic if it contributes not only to broad social goals but also to firms' long-run economic performance by enhancing corporate reputations and increasing community goodwill.

An organization's ability to respond to internal and external expectations of responsibility also depends on the executive's ability to direct employee behavior toward other constructive purposes, notably compliance with the law and important ethical norms that go beyond the law. The formal mechanisms available to executives include soliciting oversight from an ethics committee made up of board members and other senior managers and the services of an ethics officer and his or her staff in formulating and implementing legal and ethics compliance programs, ethics codes of conduct, hiring procedures that screen potential employees for ethical standards, and ethics orientation and training sessions. Another formal mechanism for encouraging desirable employee conduct is the implementation of an anonymous reporting system or ethics hotline by which workers can disclose their concerns—such as suspicions of unsafe products, dangerous work conditions, sexual harassment, or questionable financial accounting—with anonymity or due protection. If managers follow through by rectifying questionable practices or situations in a timely manner, then it is possible that some legal and ethical problems can be avoided or ameliorated while, at the same time, employee commitment to high moral standards is strengthened. Employing the services of an ombudsperson is yet another formal mechanism by which executives can signal that employee concerns will be dealt with objectively and ideally before ethical issues escalate into legal problems. Moral leadership might also involve participating in industrywide "best practices forums" aimed at establishing and maintaining collective ethical self-governance among peer firms. In terms of evaluation and control, executives may institute an ethics audit as a means for assessing the effectiveness of ethics programs, policies, and procedures and identifying deviations from established standards.

Morally Leading the Informal Organization

Formal programs can be viewed as ineffective or as "window dressing" if employees are not convinced of upper management's commitment to moral leadership. Such commitment or lack of it can be evident in a firm's informal organization or culture. In fact, Edgar Schein asserts that the most important thing a leader does is to create and manage organizational culture, which he or she defines as a system of shared assumptions and beliefs, often taken for granted, and based on learned products of group experience. This learning ultimately reflects values or beliefs about what employees "ought to do." According to Schein, the organization's founder can significantly affect these beliefs by embedding certain values in the culture early on. Moreover, Schein identifies five primary mechanisms that the executive manager has access to for shaping and reinforcing culture on an ongoing basis: (1) what he or she pays attention to, measures, and controls; (2) how he or she reacts to critical incidents and crises; (3) his or her deliberate role modeling, teaching, and coaching; (4) his or her criteria for allocation of rewards and status; and (5) his or her criteria for recruitment, selection, promotion, retirement, and excommunication. While these mechanisms are often expressed formally, they can be more powerful informally in that employees ultimately learn what behavior is expected of them by what leaders do, not simply by what they say or endorse as formal statements, policies, programs, and procedures.

For example, if the formal corporate code of conduct stresses honesty, but the chief executive officer models unethical behavior or attends to, mentors, promotes, and rewards employees known for shady or nontransparent dealings, then the unspoken message to employees is that honesty is not really valued in the culture. Accordingly, formally espoused programs, policies, and procedures advocating honesty will likely be "decoupled" from actual behavior, meaning that the executive will actually encourage the development of a culture marked by dishonesty and a lack of transparency. The ideal scenario in terms of moral leadership is for executives to use mechanisms for shaping and reinforcing cultures that establish and maintain an organization's ability to respond affirmatively to stakeholder expectations of corporate social responsibility while directing employees to enact conduct befitting such an organization and providing them with a personal model or example of such behavior. Theoretically, the resulting type of organization can be described in terms of two ethical climates: benevolence or concern for others and integrity or adherence to principled rules and procedures.

Some Proposed Attributes of Moral Leadership

Although there is no one generally accepted theory of moral leadership, there is a preponderance of research suggesting that moral leaders inculcate or exhibit certain attributes. Some of this literature emphasizes the importance of other-regarding behavior in lieu of self-aggrandizement. For instance, decision making based on the felt sentiment of helping others first is the basis for servant leadership, which would seem to be a particularly fitting motivation for executives who lead corporations in philanthropic efforts aimed at the betterment of community. Another perspective based on Lawrence Kohlberg's model of moral development suggests that managers capable of articulating and defending their decisions in terms of what is good for society as a whole while applying principles of justice, rights, and social welfare universally to others exhibit the highest level of moral reasoning and, by extension, are capable of moral leadership in action. Virtue ethics implies that moral managers are those who have imbibed certain character traits, such as fairness, honesty, and benevolence, while the literature on integrity suggests that moral leaders are able to use such characteristics coherently to establish publicly their trustworthiness and ability to make balanced judgments in the face of moral complexity. According to a dialogic perspective, this ability depends partly on being able to respect, listen to, and give voice to various stakeholder concerns. In a similar vein, other research emphasizes that a necessary condition for moral leadership is the cognitive ability to factor values and ethics consciously into decision making.

Moral Luck

Moral luck seems to appear when circumstances beyond a person's control influence our moral attributions of praise and blame. For example, consider the apparent role of moral luck in some of the worst failures in corporate history. If not for a run-up in resource prices, corrections for overpriced technology stocks, and the specter of terrorism, they might never have occurred. Deceptive accounting, employed to give the illusion of steadily increasing profitability, might have been unwound. It is possible, if not probable, that such improprieties occur with some regularity in more forgiving external circumstances, rendering them almost harmless. One executive, imprudent though fortunate, presides over relatively inconsequential misconduct. Is this executive any less blameworthy than another, whose similar inattentiveness is exacerbated by chance circumstances beyond the executive's control, resulting in corporate failure, unemployment, and loss of investor capital? Both executives may be held formally responsible for their action or inaction, but only the latter becomes the object of public disgrace and faces comparatively severe legal charges. How is it possible to reconcile the widely shared intuition that morality and moral judgments involve responsibility for our own actions with the undeniable fact that the moral life is vulnerable to luck for which we cannot be held responsible?

Types and Illustration

That there could be such a thing as moral luck challenges modern moral theory, which has tended to characterize morality as immune to luck. The claims that goodwill is independent of worldly contingencies, and that moral worth depends solely on the volition of an autonomous moral agent, have been attributed to Kant. The associated belief that moral value is wholly within our control, such that neither good fortune can augment it nor misfortune can take it away, is widely held among laypersons and moral theorists alike. Thus, when Bernard Williams coined the term *moral luck*, he expected it to be perceived as a contradiction in terms that threatened the modern conception of morality as a unique and supreme form of value. Aristotelian ethics, by comparison, has been characterized as more accommodating of the vulnerability of the good life to factors beyond our control, sensitive to the ways in which reversals of external fortune, and even internal human irrationality, may inhibit our ability to pursue the good life or to introduce conflicts of values that make a good choice impossible. Despite the perceived contrast between Kantian and Aristotelian ethics, it has been asserted that both theories recognize the problem of moral luck and the associated difficulty of reconciling attribution of moral responsibility with recognition of the influence of luck on human life.

Thomas Nagel distinguishes between four types of moral luck, none wholly within human control, which influence our own and others' judgments about persons' moral decisions and character. To illustrate them, consider the case of a pharmaceutical executive, deliberating whether and how to allocate resources to develop a potential cure for a disease whose victims may be unable to pay for it. Constitutive moral luck—who we are as a function of our natural makeup—arises in that the choice for this executive appears because it is in the natural makeup of a pharmaceutical company to have the capacity to produce treatments for disease. Circumstantial moral luck—the situations that chance introduces that bring about moral challenges—arises because the opportunity to develop a cure comes from the presence of the affliction and the chance that this company may have a research advantage on this type of disease. Causal moral luck—the antecedent circumstances that may determine who we are and the decisions we make—arises when an unexpected discovery in the research laboratory leads a research scientist to present the executive with the case for a possible cure. Finally, resultant moral luck— the consequences of our decisions and actions—will arise after a decision has been made about whether to go ahead with research and development. The outcomes subject the executive and the company to moral praise or blame, depending significantly on whether the drug is or might have been successful and accordingly how shareholders perceive the use of their capital.

The foregoing examples illuminate why the problem of moral luck may be particularly relevant in business. The moral judgments at issue are not purely about whether the executives are good or bad people or made good or bad choices. More salient to the professional environment, they are about whether the executives should be praised or blamed—and how their decisions should be justified, rewarded, or punished—if they cannot be held wholly responsible for the conditions that influenced their choices. How they are judged is critically important, in that success can bring benefits in the form of enhanced personal and company reputation and consequently shareholder value, whereas failure may potentially contribute to adverse market consequences and even formal sanctions. Business ethics is inevitably tied to monetary, legal, and other ramifications that involve judgments on the part of investors, legal officials, and other stakeholders about the degree to which a party should be held responsible for decisions and outcomes.

Responses to the Problem

On one hand, it would seem unfair to hold individuals fully responsible for their moral choices when they are not responsible for many of the conditions influencing those choices. On the other hand, some commentators have gone so far as to claim that accepting the existence of moral luck implies acceptance of determinism, in which case we could not hold individuals responsible for their moral choices at all. Williams and Nagel conclude that moral luck is an unresolved, and perhaps insoluble, problem for modern moral theory. We may want and expect our moral judgments to be unadulterated by seemingly irrelevant luck, and yet we cannot deny that almost nothing a person does, moral or otherwise, is wholly within that person's control.

Those unwilling to accept this conclusion have attempted to reject the problem by claiming the following:

- Our intuitions are philosophically mistaken: It is true that our moral judgments often fail to separate luck from that for which the moral agent is directly responsible. However, if we were sufficiently reflective, we would adjust our moral judgments to factor out luck.
- Our intuitions are psychologically mistaken: Our willingness to morally blame others for the bad outcomes of their negligence is based on an unjustifiable psychological bias that our own negligence will not produce similarly bad outcomes and that we are not similarly subject to moral blame. If we recognized and shed this bias, we would reject the problem.
- Moral luck is incoherent: It does not make sense to characterize our identity as subject to (constitutive) moral luck. To exempt individuals from moral praise or blame because they do not have control over some elements of who they are involves a category mistake, because those elements that may be outside of an individual's control are nevertheless a part of that individual's self as a moral agent subject to moral praise and blame.

Anticipating some of these challenges, Nagel says that our supposedly mistaken intuitions return involuntarily, again and again, despite our attempts to rationalize them away.

Why should we be content to leave the problem of moral luck unresolved? For Williams, part of the answer is that our very identity depends on a web of interaction between that which is within and outside of our control. Those who would wish to set aside moral value as a special kind of value that is uniquely immune to factors beyond our control are left with a sterile moral core that reflects none of the human variety arising from our chance of interactions with the world. Although luck can be an obstacle to the good life, Martha Nussbaum attributes to Aristotle the observation that features of the good life are also dependent on it: health, friends, loved ones, emotion, and compassion, among others. The existence of moral luck may complicate our capacity to make moral judgments, because we cannot separate morality from who we are, what we experience, and cause and effect. In short, moral luck challenges the supposed distinction between the moral and the nonmoral. But the problem of moral luck valuably teaches us to look at morality from the perspective of a long-term moral investor, who examines moral decision making in the particular context of its surrounding conditions while evaluating morality in the general context of the decision maker's complete life.

Moral Point of View

The moral point of view is the impartial, universalizable perspective that each person is capable of assuming. Here the term *person* is used in a technical sense to denote rational, self-governing being. When we take the moral point of view, we seek to adjudicate disputes rationally, we assume that other persons are neither more nor less important than ourselves, and we assume that our own claims will be considered alongside those of others in an impartial manner. These three components of the moral point of view are respectively concerned with rationality, universalizability, and impartiality.

The moral point of view is *rational* in the sense that it involves the application of reason rather than feeling or mere inclination. Moral issues frequently invoke a strong emotional response in individuals. The attempt to justify a moral stance by appeal to reasons that may be considered and evaluated by other persons facilitates a process whereby individuals with distinctly different emotional responses to a moral issue may seek mutual understanding and, perhaps, agreement. In business, the fact that one person wields more economic power, for example, than another person cannot by itself outweigh the needs for both parties to offer a rational basis for their competing moral perspectives.

The moral point of view is *universal* in the sense that the principles or propositions ascertained therefrom apply to all persons and to all relevantly similar circumstances. Thus, if a moral principle or proposition is valid, no persons are exempt from its strictures. The notion of universalizability has particular relevance in the era of economic globalization. It requires that we regard all persons as equal in dignity and as such that we respect them in our business dealings wherever they may live or work.

The moral point of view is *impartial* in the sense that principles or propositions ascertained therefrom apply to persons irrespective of arbitrary considerations. This impartiality may involve the application of a specific principle that purposively ignores the circumstances of individual lives, or it may involve an unbiased evaluation of the particular reality of individual persons and an assessment of the needs and preferences of individual persons in light of the needs and preferences of others. In any case, it requires that characteristics such as a person's race, sex, nationality, and economic circumstances, for example, cannot be regarded as a legitimate basis for treating persons differently than other persons when there are no good reasons for thinking such considerations relevant. Impartiality is especially important in human resource management, where such considerations may interfere with the fair evaluation of employees and with their promotion or dismissal.

It is important to note that the moral point of view does not exclude partiality. Favoring the interests of one party over another is justified when there are overriding reasons for ranking the specific interests of one party over another. This is especially so when one has familial, professional, or contractual responsibilities. This point is of obvious relevance to business managers who have distinct moral and legal obligations to their employers. The challenge of the ethical manager is to determine when the interests of his or her employers trump those of other stakeholders and when the interests of those stakeholders override the interests of his or her employers.

The idea of the moral point of view may seem commonplace, but it is an idea with deep theoretical foundations. In the 18th century, Immanuel Kant, the great Enlightenment philosopher, argued that one should always treat other persons as an end unto themselves and never as a means only. Persons are free and rational creatures, and as such, argued Kant, all persons have intrinsic value that must be respected. This means that the desires, goals, and aspirations of persons other than ourselves must be given due consideration. Kant did not merely assert that persons are entitled to due consideration, but he provided a compelling argument for that conclusion. The interests of all persons ought to be given due consideration because persons have dignity. For Kant, a being that has dignity is beyond price. Persons have a dignity that mere objects lack. They have dignity because they are autonomous, responsible beings capable of rational activity; in other words, they are moral beings. Reason requires that any moral principle must be rational in the sense that it is universal. The fact that persons have this capability means that they possess dignity. As a matter of consistency, anyone who recognizes himself or herself as a moral being must ascribe dignity and accord due respect to anyone who, like himself or herself, is a moral being.

The capacity to act from the moral point of view differentiates persons from nonhuman animals and causes persons to be morally responsible for their actions. Anyone can forsake the moral point of view in the interest of the pursuit of profit. However, one who does so acts more like an animal than like a person. The ethical manager is one who makes a profit while acting from the moral point of view.

Moral Principle

Moral principles are general statements that provide guidance in evaluating the moral appropriateness of past or future actions, general categories of behavior, individual character, and social and political institutions. A distinctive feature of moral principles is their intended aim of providing *practical* guidance. Principles direct or obligate moral agents to *act* or *respond*, either in general ways or in concrete situations where certain circumstances obtain.

Moral principles take various forms and vary in the type of practical guidance that they provide. The principle that one should "do no harm to others" functions as a *general proscription* covering a wide range of activities from how one ought to treat their neighbor to how much a manufacturer should invest in product safety. Although formally similar, *general prescriptions* establish conduct or arrangements that ought to be pursued as opposed to avoided. The principle "negotiate in good faith" instructs agents to exhibit transparent intentions when they choose to engage in negotiated agreements. Other principles function less like general recommendations or prohibitions and more like *statements of conditional obligation.* The principle that "No one should profit from wrongdoing" is an example of a principle that specifies the conditions under which it is permissible to pursue certain activities, for example, profit seeking, and, implicitly, when it is unacceptable to do so. Finally, moral principles can also take a *procedural* form when they specify how individuals or organizations should go about responding to certain types of problems. The oft-cited *Principles of Stakeholder Management* authored by the Clarkson Centre of Business Ethics provides a good illustration of this approach to principled moral thinking. The Clarkson *Principles* put forth a number of practical recommendations that do not endorse or prohibit specific kinds of action but indicate the methods that managers ought to use to go about addressing moral problems. For instance, principles such as "Managers should openly communicate with stakeholders about their respective concerns and contributions" and "Managers should work cooperatively with other entities to ensure that harms arising from corporate activities are minimized" are essentially procedural in that they focus a manager's attention neither on specific outcomes nor types of behavior; rather, the principles recommend methods of responding that are intended to generate morally acceptable managerial decisions, whatever those may turn out to be.

The intended generality of moral principles makes their application in concrete circumstances a challenging task. To receive practical guidance from principles, agents need to engage in an elaborate process of judgment whereby the particularities of a specific circumstance are assessed in relation to the semantic content of a principle. The Clarkson *Principles* state that managers should distribute the benefits and burdens of corporate activity fairly among different stakeholders. To apply this principle in a specific circumstance, for example, in dealing with wage and benefit cuts for employees, an agent would need to address an array of pertinent questions. What are the unique burdens experienced by this group of employees? Are these risks in proportion to the benefits they have historically received? What trade-offs with other stakeholders need to be made if no wage and benefit cuts are made? What is a fair distribution of benefits and risks given that these employees have voluntarily accepted their position? Prior experience and sensitivity to all relevant facts help address these questions and, ultimately, enable a judgment about what changes to wage and benefit policies are called for by the principle.

Principles provide what some have called reasons to act in certain ways. Inevitably, however, principles may conflict with one another, specific circumstances may provide exceptions to the recommended course of action, and the principle itself may simply underdetermine possible responses in specific cases. The application of principles through the exercise of judgment is something that has prompted ethicists to emphasize that moral principles, while important in justifying particular moral decisions, do not determine with any precision what ought to be done in specific cases. This line of thought owes much of its history to the ancient Greek philosopher Aristotle who famously remarked in his *Nicomachean Ethics* that principles are only mostly true. Moral principles are therefore contrasted with moral rules that do purport to give exact, unambiguous guidance in specific circumstances.

Moral Realism

Moral realism is the metaethical view that there are moral facts and moral properties and that the existence of these facts and instantiation of these properties is essentially independent of any subjective stance. This view commits moral realists to three logically independent theses. Moral antirealists deny one or more of these theses.

First, moral realism is a form of *cognitivism.* Cognitivism is the view that moral judgments express beliefs that are capable of being true or false. Realists see moral judgments as beliefs that are true or false depending on whether they accurately represent moral facts. In contrast, *noncognitivists* (expressivists) maintain that the function of moral discourse is either to express the affective states—such as the emotions or desires—of the speaker and to persuade others to share them (emotivism) or to prescribe universal rules of conduct (prescriptivism). Noncognitivists deny that there are moral facts against which the truth of moral judgments can be checked and that there are moral properties that determine the moral qualities of persons and actions. Moreover, since the noncognitive states that are expressed by moral judgments themselves have no truth-value, moral judgments are not capable of being true or false.

Second, realism is a *success theory.* Realists maintain not only that moral judgments are beliefs possessing truth-values but also that some of these beliefs are true in virtue of correctly reporting moral facts. Advocates of the so-called error-theories, such as J. L. Mackie, are cognitivists—they agree that moral judgments are beliefs possessing truth-values; however, they maintain that *all* moral beliefs are systematically and uniformly *false.* This is because they deny that there are moral facts or properties of the sort required to render our moral judgments true. Moral discourse, on this view, rests on a colossal error; it presumes the reality of certain facts and properties that simply do not exist.

Third, realism entails a form of *objectivism.* Objectivism here is the view that moral facts are essentially independent of any subjective stance and that moral properties such as goodness and rightness can be explained without any essential reference to what any (real or hypothetical) moral agent or agents approve of, desire, would assent to under certain conditions, and so on. Realists believe that moral judgments are true or false independent of what anybody thinks of them. *Moral constructivists*, in contrast, maintain that the moral domain *is* constructed out of the subjective stance of some (real or hypothetical) moral agent or agents, and, hence, the truth conditions of moral judgments *do* essentially depend on that subjective stance. Different normative and metaethical theories, each committed to a constructivist account of morality, hold opposing views about what the proper subjective stance is: Egoism claims that morality is constructed out of individual attitudes or preferences, contractarianism out of the principles endorsed by deliberators situated in special circumstances of choice, ideal observer theories out of the responses of a suitably characterized ideal observer, Kantianism out of the pronouncements of the rational will, relativism out of the conventions of social groups, and so forth. Realists and constructivists both endorse the reality of moral facts and properties; they disagree about whether these facts and properties are essentially independent of a subjective stance. *Moral nihilists* deny the existence of moral facts and properties altogether.

Realists disagree about whether the view is best construed as a form of ethical naturalism or nonnaturalism. *Naturalists* claim moral properties are natural properties—properties that figure in the natural or social sciences. Moral facts and properties, according to naturalists, fit within an ontology whose contents are fixed exclusively by the outcomes of scientific investigation. Reductive naturalists (e.g., Peter Railton) claim that moral properties are reducible to other natural properties that are the subject matter of the sciences. Nonreductive naturalists, such as the "Cornell realists" (e.g., Richard Boyd, David Brink, and Nicholas Sturgeon), deny that moral properties are reducible to any other natural properties, but argue that moral properties are natural properties in their own right.

Nonnaturalists (e.g., Jonathan Dancy, John McDowell, G. E. Moore, Russ Shafer-Landau, and David Wiggins) see moral facts and properties as different in kind from natural facts and properties. Nonnaturalists maintain that moral properties are irreducible and *sui generis.* This commits nonnaturalists to a more complex ontology, admitting (at least) two kinds of properties—natural and moral—and, hence, (at least) two kinds of facts.

Arguments for Realism

Realists employ three complementary strategies in defending their view: offering positive considerations on behalf of realism, offering criticisms of antirealist views, and responding to objections designed to undermine realism's plausibility. This section reviews two arguments employing the first and second strategies, the first directed against noncognitivism and the second against constructivism.

The Argument From Moral Phenomenology

Realists argue that their view comports well with commonsense moral phenomenology, whereas noncognitivism requires very serious revisions to our understanding of what occurs when moral agents engage in moral deliberation, argumentation, and judgment.

We ordinarily talk of moral truths, taking at face value judgments such as "It is true that deliberate cruelty is morally wrong," and we regularly attribute moral beliefs to agents. We issue moral judgments in the indicative mood, assuming that moral predicates are meaningful and can be used to describe the subjects of which they are predicated. We also think that we can err about our moral beliefs; hence, we engage in deliberation and argumentation about moral matters, which takes the same logical form as other kinds of argument and appears to be an attempt to determine a matter of fact. All this is in perfect accord with realism, but none of this would make sense if noncognitivism were true.

The Argument From Arbitrariness

Realists argue that fixing moral truths relative to a subjective stance makes morality arbitrary in an unacceptable way. Some metaethical views aligned with constuctivism (e.g., relativism) and some normative theories that are species of constructivism (e.g., egoism) maintain that moral truths are fixed by the *actual* attitudes of certain subjects. But these attitudes, realists point out, often conflict with deeply held moral convictions. Other normative theories that are species of constructivism (e.g., contractarianism, ideal observer theories, and Kantianism) sidestep this difficulty by requiring some form of idealization for the subjective attitudes that go toward fixing moral truths. But these theories, realists argue, face a dilemma: Either the conditions defining idealization are moralized or they are not. If they are moralized, then these theories really abandon constructivism, since they acknowledge the existence of moral principles that are conceptually and ontologically prior to the construction process. If they are not moralized, then, once again, it is unclear why the outcomes of the construction process should be definitive of morality.

Arguments Against Realism

Antirealists challenge realism on metaphysical, epistemological, and psychological grounds. This section rehearses a few classic antirealist arguments and indicates some lines of response developed by realists.

The Argument From Disagreement

The antirealist argument from disagreement is premised on the existence of widespread, intractable interpersonal and intercultural moral disagreement. Antirealists argue that moral disagreement is more readily explained by the hypothesis that moral judgments are subject dependent than by the hypothesis that they are attempts to express objective truths. Moral antirealists often contrast the degree of consensus within the natural sciences and moral inquiry. Scientific inquiry has generated a substantial degree of consensus, supporting the claim that there are scientific facts. Pervasive moral disagreement is good evidence for thinking that, in contrast, there are no such moral facts.

Some realists challenge the evidence as presented, pointing out that there really is significant moral consensus within and across societies and that the scientific community itself is deeply divided on certain matters. Realists also argue that a great deal of moral disagreement arises from disagreement about *non-moral* facts or errors in reasoning. Other realists accept the evidence as presented, but challenge the inference to antirealism. Many realists argue that there are salient differences between moral and scientific inquiry, which explain why there is more widespread disagreement in the former. For example, moral judgments, unlike scientific judgments, are overtly normative; consequently, they can threaten our self-interest and ideological commitments in ways that scientific judgments do not. Realists also note that moral disagreement is characteristic of the type of disagreement found in philosophy more generally, but this disagreement is not thought to imply that there are no facts of the matter about various philosophical issues. For example, persistent disagreement between theists and atheists is not thought to entail that there simply is no fact about whether God exists.

The Argument From Queerness

J. L. Mackie's antirealist argument from queerness has two parts: one metaphysical, the other epistemological. Mackie argues that if there were moral facts and properties, then they would be very queer things, utterly different from the ordinary facts and properties that we encounter in our everyday experience. Plato's Forms, Mackie suggests, give us a dramatic picture of what objective values would be. They would be sui generis entities: facts or properties such that the mere apprehension of them by a moral agent would necessarily supply both a reason for action and sufficient motivation to act. Ordinary facts are not intrinsically action guiding in this way, they are normatively inert.

Moral facts and properties would be so metaphysically anomalous, Mackie concludes, that we have good reason to reject realism. Mackie's corresponding epistemological worry is that if we were to be aware of moral facts and properties so construed, then it would have to be by way of some special faculty of moral perception or intuition, which, again, would be utterly different from our ordinary ways of knowing everything else.

Realists respond by challenging one or more of Mackie's assumptions about the nature of moral facts and properties. Naturalists reject the assumption that moral facts and properties would have to be sui generis*:* They claim either that moral properties are identical to certain natural properties or that moral properties supervene on certain natural properties. Both naturalists and nonnaturalists have denied Mackie's assumption that moral facts or properties must be intrinsically action guiding.

The Argument From Explanatory Necessity

Like Mackie, Gilbert Harman argues that we have good reason to exclude moral facts and properties from our ontology. Harman maintains that we are justified in postulating a type of fact or property to the extent that it is required to explain what occurs in the world. Scientific facts play just this sort of explanatory role. For example, consider a physicist who, seeing a vapor trail in a cloud chamber, immediately judges that a proton has passed by. The best explanation for the physicist's observation requires the assumption that a proton really did pass by; hence, we are justified in postulating proton facts. Harman asks us to contrast this case of scientific judgment with a case of moral judgment. Consider someone who, seeing a group of hoodlums pour gasoline on a cat and ignite it, immediately judges that the action is morally wrong. Harman argues that a full explanation of the appraiser's judgment does not require any assumptions about moral facts, such as that deliberate cruelty is really wrong: A complete explanation requires only assumptions about nonmoral facts—most important, natural facts about the appraiser's psychology. Harman concludes that moral facts and properties are explanatorily superfluous, so that, barring their reduction to respectable nonmoral, scientific facts and properties, there is simply no justification for postulating moral facts and properties.

Some realists reject Harman's methodological constraint, denying that explanatory necessity is the test of existence. Other realists accept this constraint, but argue that moral facts and properties *do* frequently play an ineliminable role in the explanation of actions and beliefs. For example, the fact that Hitler was morally depraved explains (in part) his actions. The realist argues that it is false that if Hitler were *not* morally depraved, then he still would have acted precisely as he did. That this counterfactual is false indicates that the putative moral fact does play an essential explanatory role.

The Argument From Moral Motivation

A long-standing objection to realism is that it cannot account for moral motivation. The argument underlying this objection runs, in short: Necessarily, moral judgments motivate; but beliefs by themselves cannot motivate; hence, moral judgments cannot be beliefs. The first premise expresses motivational judgment internalism—the view that, necessarily, if one sincerely judges an action to be right, then one is motivated (to some extent) to act in accordance with that judgment. The second premise is an implication of the Humean theory of motivation, which holds that motivation requires *both* beliefs and desires. The conclusion is a statement of noncognitivism and, hence, entails antirealism. Noncognitivists point out that their view can easily account for moral motivation, since they take moral judgments to be expressions of noncognitive states that are essentially motivating.

Realists reject one (or both) of the argument's premises. Realists rejecting internalism opt for externalism—the view that the connection between moral judgment and motivation is not conceptual and necessary but only contingent. These realists argue that the amoralist—an individual who endorses the rightness of an action without thereby being motivated to perform it—is conceptually possible. Realists advancing an anti-Humean theory of motivation reject the argument's second premise, arguing that some beliefs are sufficient by themselves to motivate.

Moral Reasoning

Moral reasoning is a form of practical reasoning wherein one attempts to give or find reasons for morally approving or disapproving actions. All reasoning involves premises that lead to a conclusion. A premise is a judgment, expressible in a statement, which contains two elements. The first is the subject, and the second is what logicians call a predicate. The predicate is what is asserted about the subject. There are two types of reasoning, practical and theoretical, and they each have their own characteristics. In theoretical reasoning one "argues" from two descriptive premises such as "All humans are mortal" and "Socrates is human" to a descriptive conclusion "Therefore, Socrates is mortal." However, the practical syllogism, as Aristotle noted, is an argument whose conclusion recommends an action or at least provides a judgment that a certain action ought to be performed. Furthermore, one of the premises is usually a value or attitudinal judgment (normative), while the other is a definitional or factual judgment. For example, Peter either pays Paul more or thinks he should pay Paul more (conclusion) because he thinks paying a pittance is unfair (value judgment), and he is paying Paul a pittance (definitional or factual depending on the criteria of pittance). So the practical reasoning either leads to the action of Peter paying Paul more or at least the assertion that Paul should be paid more.

Human Actions

The primary subject matter of our ethical judgments and hence of moral reasoning is deliberate human actions. While human actions are the subject of practical reasoning, not all human actions are subject to *moral* reasoning because some human actions lack ethical or moral import. One can deliberately decide to wear a red rather than a blue tie or to eat mashed potatoes with one's fingers, but these actions do not have ethical import. They do, however, involve aesthetic considerations about what kind of tie goes with what shirt or etiquette decisions about the propriety of eating potatoes with one's fingers. To have moral import, an action must involve harming or helping another person or oneself. This harm may be serious or not so serious as is recognized in religions with the distinction between mortal and venial sins and in law with the distinction between degrees of homicide or petty and grand larceny, or crimes and misdemeanors.

Moral reasoning in this framework is the activity of evaluating the moral rectitude of human actions. We perform the evaluation by giving reasons in support of or against the actions. Since moral judgments are normative, they involve dealing with values, emotions, desires, and subjective preferences. Because of these subjective and emotional elements many argue that ethical reasoning is personal and that each individual's judgment merely expresses one's feelings about certain actions and cannot be validated rationally (see subjectivism). However, it seems impossible for human beings not to judge, and sound judgment requires sound reasoning.

Justifying Reasons

Taking a commonsense point of view toward ethical reasoning provides a perfectly straightforward procedure for evaluating moral actions—investigate whether there are any *good reasons* in support of an action or whether there are reasons against such an action. Consider how one would usually handle a situation where someone on whom one was depending breaks his or her promise. For example, suppose one had a commitment from a subcontractor to do a job on a certain date and the contractor calls to say he or she won't be there. The normal response is, "You promised." Suppose they reply, "So? I just don't feel like keeping my promise." Not feeling like keeping a promise is not a *good reason* for breaking it. Promises after all are made precisely because people might not feel like doing what they promised to do. We expect promises to be kept, *unless there is a good reason not to.* If everyone always felt like doing what one promised we wouldn't need promises.

Suppose, however, that the subcontractor replies, "I can't be there because I was just in an accident." Since "ought" implies "can," that is a good reason for not keeping the promise. Another good reason for breaking the promise might be that he or she just discovered that to do the job would violate EPA regulations. Thus, the belief that he or she was not obliged under those circumstances to keep his or her promise may be justified. Furthermore, it may be the case that one is also obliged to release the subcontractor from his or her promise. Justification is the process of giving reasons for doing something. Moral reasons are used to justify moral judgments as observation is used to justify factual judgments.

The Moral Reasoning Process

Moral reasoning occurs when the following basic questions are asked about an action:

- Is the action beneficial for the actor or society? The primary rule of ethics is "Do good and avoid harm."
- Is the action fair or just? The principle of justice, which logical reasoning requires us to recognize, is that the same (equals) should be treated the same (equally). Of course, there is often disagreement about who and what are equal, but unless there is some relevant difference, all persons should be treated equally.
- Has an explicit or implicit commitment been made? This question asks if any promises to perform a proposed action have been made. Since any lasting relationship rests on implied promises and expectations of guaranteed behavior in spite of the contingencies of the future, that relationship contains an implied promise that should be kept. Since professional roles involve implied promises, this provides a ground for the obligation to fulfill one's role.

An example from a business context can show how this reasoning process operates. If an individual is planning to produce some commodity that brings a profit to the company, a commission to that person benefits society and doesn't in the process treat anyone unfairly or violate some promise or commitment, there are none but good reasons in support of it and it should be done. However, if that person is tempted to falsely declare profits in a financial statement developed for a merger, and he or she sees (1) that it is not beneficial to the company, its executives, or the general society; (2) that the action would be deceptive and hence unfair; and (3) that it would violate the relationship of trust that one's corporation has with the community, there are only reasons against performing the action.

This model of moral reasoning provides a decision procedure for determining what to do and what not to do. Ask the questions of common morality. If there are good reasons for performing the action such that it benefits an individual, and society, and does not violate justice or a commitment, do it. If on the other hand an action does not benefit society or an individual, is unfair, and requires breaking a commitment, then do not do it.

Moral Reasons and Ethical Theory

The reasons we have just examined not only constitute the common rules of morality, they underlie most of current ethical theory. Ethical theory is theory about which kinds of reasonings are definitive in the face of an ethical dilemma—a situation that arises when there is a good reason in support of the action and a good reason against the action. Ethical theories are the court of last resort, and each provides an overriding principle to be used in resolving a conflict of reasons. Hence, an *ethical theory prescribes* a principle that provides the overriding justifying reason for pursuing any course of action. In contemporary thought, there are two main theoretical approaches—consequentialist and principled.

Utilitarianism is a consequentialist approach that maintains that "those actions should be done that bring about the greatest good for the greatest number of people." Producing good is the basic reason for justifying an action or practice. The principled approach is called a "deontological" approach. Deontological theory gives precedence to considerations of fairness, rights, and commitment over consequentialist reasoning and claims that the "End (read consequences) doesn't justify the means."

In many situations, there is no conflict of reasons and what is good for an individual is also good for society while also being fair and in accord with one's commitments. At these times, we have every reason to perform an action and all the competing theories' principles would be fulfilled. But in cases where there are conflicting reasons, dilemmas can result and there can be dramatic disagreement about which principle to follow and which reason takes precedence.

Utilitarianism

The principle maxim of utilitarianism was best expressed by John Stuart Mill. "Actions are right in proportion as they tend to promote happiness, wrong as they tend to produce the reverse of happiness." In asserting this proposition, Mill was arguing against those who gave primacy to self-interest, the egoists (see Egoism). Mill claimed that "the happiness" is "not the agent's own greatest happiness, but the greatest amount of happiness all together." A recent formulation of utilitarianism reads, "Do that action that will bring about the greatest good for the greatest number of people," and in this and other formulations, utilitarianism uses a cost-benefit approach.

A major problem facing utilitarians is what counts as good. John Stuart Mill and Jeremy Bentham, the founders of utilitarianism, were hedonists who equated the good with happiness, and happiness with pleasure. But there is disagreement among utilitarians: "Pluralists" think there are a number of intrinsic goods; "eudaemonists" think happiness defined as well-being is the only intrinsic good; and finally "hedonists" think happiness is identical to pleasure. Others despair of identifying objective goods and appeal to individual preferences, or "satisficers," that is, whatever individual people prefer or think will satisfy them. In business and economics, the notion of an objective good has been dropped in favor of individual preferences, and those are judged by demand. But that assumes that what people prefer (want) is what they need (good). Anyone who does cost-benefit analysis will recognize that determining what will count as a cost and what will count as a benefit is a difficult matter. (For the other problems facing utilitarianism, see the entry on Utilitarianism.) Another difficulty with utilitarianism is that it seems to vindicate the principle that the end (consequence) justifies the means (the action).

The philosopher W. D. Ross raised a further, very important objection to utilitarianism, which he calls its "essential defect." Ross claims that utilitarianism ignores special commitments since it fails to recognize the highly personal character of duty. Utilitarianism, according to Ross, is indifferent concerning who is to benefit from the good that our actions create. With its emphasis on quantity of people experiencing "the good," Mill undermines the moral importance that human beings naturally place on relationships, for example, the almost universal importance of perceived obligation to benefit and look out for one's family.

Deontological Ethical Theory

This notion of relationships that Ross introduces raises the rational considerations of the deontologist and includes notions of fairness and commitment. Deontologist comes from the Greek word *deontos* meaning "what must be done" and sometimes translated as "obligation" or "duty." The foremost deontologist was the 18th-century philosopher Immanuel Kant, who offered several formulas to help decide in what one's duty consists: (1) "Act so that you can will the maxim of your action to become a universal law." (2) "Act so as never to treat another rational being merely as a means." In sum, he argues that one should be consistent in one's ethical reasoning and one should not use other people on account of their inherent dignity. Kant derives his moral imperatives from commonsense morality, so it is has been claimed that the principle that leads to Kant's position is the golden rule, "Do unto others as you would have them do unto you." The golden rule implies that everyone is fundamentally equal, and what is good for one should be good for all who are similar (the universalizability claim), and also recognizes that all rational beings are autonomous individuals and thus should be treated with equality and dignity (the ends not means claim).

Two major difficulties are raised with respect to Kant's theory. The first difficulty is that the application of the categorical imperative does not allow for exceptions. For example, if one were to universalize the maxim, "Everyone can lie if lying is in their self-interest," one would find that, when applied universally, this maxim involves the will in a contradiction. It is evident that for a lie to achieve the purpose of the liar, which is to be believed, it is necessary that the majority of statements people make are true. This is the case if the majority of statements people made were false, the liar's lie would not be believed. Thus, since no one tells the truth if everyone lies, the necessary condition for lying, truth telling, is impossible and hence to universalize lying is to make it impossible. Kant indicates that this is a will contradiction, that is, willing two impossible things at once, which is unreasonable and violates practical reason. Hence it follows that lying is never acceptable, nor is promise breaking or many other activities. However, there are times when great good can be done by lying, as Plato reminds us with his notion of the noble lie. The second difficulty is that Kant provides no solution for a situation in which there is a conflict of duties. This difficulty has been recognized by Ross and many other Kant scholars, and since one of the principal requirements of a moral theory is its ability to resolve moral dilemmas, Kant's silence on this point is especially problematic.

There is a claim that Aristotle has provided us with a third alternative for ethics called virtue ethics. But virtue ethics deals less with what actions should be performed than with what sorts of character human beings should possess. Ideal moral reasoning for Aristotle consists in practical wisdom that tells us how to do the right thing at the right time in the right way for the right reasons. But to determine the "right" actions and the "right" circumstances, it is necessary to reason about the nature of human persons and what constitutes the good life or human flourishing. Once these considerations have been completed, we are able to use a practical syllogism to achieve the good that we all seek.

Cognitive Moral Development Theory

An important contribution to the literature on moral reasoning has been made in the 20th century by moral psychologists such as Laurence Kohlberg who have argued that there is a process of cognitive moral development, wherein one develops through three stages of moral reasoning: (1) from a preconventional level where one is concerned with self-interest; (2) to a conventional level where societal norms and laws provide the moral guides for action; (3) to a postconventional level where one uses more general and abstract reasoning to make decisions beyond what are demanded by custom and law. Development to the postconventional stage is not guaranteed but comes about through the creation of disequilibrium about moral issues when one realizes that the conventional reasons need to be examined in light of the higher principles. Kohlberg identifies the principles used in higher reasoning by designating that an autonomous individual is an individual who reasons in such a way that he or she is looking at issues from either a utilitarian or deontological perspective.

Moral Rules

Rules are statements that prescribe or proscribe any of the following: factual claims, inferences, decision procedures, courses of action, or behavior. Rules, thus, either form a normative standard for what we should believe or what we ought to do. There are rules in games, such as the rule governing the movement of the queen in chess; rules in mathematics, such as the process of multiplication; and rules in a host of practical matters, such as law and morality, that prescribe certain actions or responses depending on the particular circumstances that obtain.

Moral rules are rules that are designed to prescribe or proscribe well-defined actions or behavior in order to uphold some moral value. The rule "abide by the terms of a written contract" prescribes certain actions, that is, those demanded by the written terms and conditions of the contract, and implicitly proscribes certain actions, that is, those that are inconsistent with the written terms and conditions of the contract. This rule is a moral rule in virtue of the fact that it is designed to direct action so as to properly respect the moral values of honesty and trustworthiness. There are also examples of moral rules that describe what moral attitude we ought to take toward an individual under certain conditions. For instance, someone might hold that "she who neglects the terms of her written contract is dishonorable." As a matter of practice, however, moral rules typically take the form of statements that identify practical guidelines for appropriate and inappropriate conduct rather than guidelines about the moral qualities of someone's character.

One source of ongoing discussion among ethicists concerns the kind of practical direction that moral rules provide. A natural way of thinking about moral rules assumes that they are all-or-nothing in that they rigidly determine what one ought to do in all relevant circumstances. The rule "Abide by the terms of a written contract" compels obedience when certain conditions are met, wherever they obtain. When a contract with specific terms is signed by two parties, the rule would bind each party to act in very specific ways, simply in virtue of the meaning of the rule. There may be exceptions to such moral rules; however, these exceptions can be logically built into the content of the original rule. It may be said that someone ought to abide by the terms of a written contract so long as they have not been voluntarily released from those terms by the other party. This important exception would serve to clarify the rule in question by stipulating the conditions under which someone may permissibly not abide by the terms of a contract that they have signed. On this all-or-nothing conception, moral rules have a practical character similar to the rules of a game. Chess has very specific, context-sensitive rules regarding the movement of pieces based on all the contingencies that could transpire within a particular match. Similarly, an all-or-nothing moral rule stipulates all the relevant exceptions and conditions for its application and, as a matter of logic, will compel certain actions when an entire range of specific conditions are considered.

Many find this conception of moral rules unsatisfactory. First, viewing moral rules as game rules fails to acknowledge the inevitable indeterminacy of certain concepts contained within a rule. What would it mean to fail to abide by the terms of a contract? The temptation to articulate these terms in greater and greater detail would be strong; nevertheless, questions about the meaning of these new, detailed provisions would inevitably surface again. A comparable problem emerges even for games. Rules regarding balls and strikes in baseball assume forms of judgment on the part of the umpire regarding the strike zone as to whether a particular pitch has traveled through the zone. This problem suggests that all-or-nothing rules are not nearly as mechanical in their application as one might first think. The fact that judgment is involved in applying rules implies that not all rules function in the same way—some may be more mechanical than others. Moral rules are characteristically less mechanical than other rules because, as we will see below, they often include the use of contestable terms.

Even granting that complete precision could be reached; however, a second related problem surfaces. The moral guidelines that individuals and organizations use to direct their actions do not take the form of all-or-nothing, mechanical rules. It is very rarely the case that we look to rules to define the entire scope of permissible and impermissible conduct. This is what has led some to draw a distinction between moral *rules*, on the one hand, and moral *principles* on the other. In practice, this distinction is not always observed; however, philosophers have noted that while rules tend to be used in ways that formulaically determine action, principles articulate an underlying moral commitment that holds for the most part, without determining what ought to be done in particular circumstances. Principles neither admit of exception nor purport to give unambiguous direction in all relevant circumstances. Without necessitating actions or decision in any one direction, principles serve to call agents' attention to certain indeterminate norms that indirectly express an allegiance to abstract values such as fidelity, honesty, justice, and benevolence.

Principles such as "Respect the property of others," "Do no intentional harm," "No one should profit from wrongdoing," and "Stakeholders should receive benefits in proportion to their contributions" are examples of the kind of indeterminate, yet extremely important commitments that shape individual and organizational action. A few points of comparison with moral rules are instructive. First, as has been suggested, the commitments that principles express convey prima facie reasons to act in general ways (and refrain from acting in other ways) without necessitating any particular course of action. Rules, unlike principles, do not identify a general course of action under ideal conditions, but they are often intended to provide absolute, precise guidance. Second, principles require moral agents to assign comparative importance to principles when one or more principles are relevant in a particular case. One can imagine situations where two or more principles provide conflicting prima facie reasons. In such cases, the agent is forced to exercise judgment as to which principle is most salient and which principle is less important in the circumstances at hand. Mechanical rules do not suffer from this problem. An apparent conflict of rules is simply that—an *apparent* conflict. If the rules are truly formulaic, then one would expect such conflicts to dissolve once more nuanced sets of conditions or exceptions are uncovered and built into the rules. One rule would simply become inapplicable once these details emerge. Principles, however, never lose their applicability even if they are silenced by the circumstances or judged less important than another principle. Third, the boundary between moral rules and principles is not always sharp. Although there are clear logical differences between rules and principles along the lines already discussed, the substance and practical intention of a general moral statement can serve to qualify it as a rule, a principle, or simultaneously both. Consider the statement that "no prices should be set that unreasonably take advantage of the economic position of consumers." This statement could be treated as a moral rule pertaining to the general issue of fairness in pricing: Marketing managers are required to avoid prices that unreasonably take advantage of the economic position of consumers wherever and whenever these conditions exist. Note that the phrase "unreasonably take advantage of" is inherently less determinate than the rule requiring individuals to abide by the terms of a written contract. The pricing rule calls for a judgment regarding reasonableness in pricing given the economic situation of the relevant consumer group. Thus, even if we treat the prohibition on unreasonable pricing, logically speaking, as a rule, it functions more like a principle due to its reliance on a phrase that is substantively less determinate.

These considerations naturally lead to a final observation, which is that principles justify the validity of rules. Principles are the grounds on which rules are revised and sometimes criticized. A rule that requires the operations managers of multinational corporations to adhere to all local health and safety regulations may function well in establishing a specific, determinate guideline relating to the relative safety of its employees in foreign countries. Compliance with this rule, however, may still fall short of the corporation's principled commitment to protect the health and well-being of its employees. Some local health and safety regulations are simply inadequate for all technologies and production processes. In such circumstances, the principle may call for a revision to the rule or the implementation of different policies designed to uphold the spirit of the principle.

This priority relation between principles and rules has been implicitly endorsed by an array of different organizations and corporations. The American Institute of Certified Public Accountants' (AICPA's) Code of Conduct sharply differentiates the rules and principles governing the conduct of accountants. The Code directly states that rules (or technical standards) are to be exactly followed by their members, unless countervailing or ambiguous circumstances surface that make the application of the rule unclear. Where there have been questions regarding the meaning and applicability of a rule, the AICPA has offered interpretations to further clarify the scope and significance of the rules in order to enable the rules to have a more complete and determinate form. The AICPA acknowledges that its rules cannot anticipate every possible future circumstance; as a result, the rules are interpreted in light of more abstract principles regarding professionalism, public interest, integrity, objectivity, and due care. The rules regarding conflicts of interest, for instance, have been identified and developed as standards designed to compel action consistent with the principle of objectivity. Individual corporations have also developed comparable approaches. The casual clothing giant Levi Strauss & Co. has a statement of *Values and Vision* that sets out abstract, principled commitments to empathy, originality, integrity, and courage. It has also developed a document titled *Terms of Engagement* that outlines specific standards with regard to global sourcing and operations. This rule-based document prohibits the use of child labor, products made with forced labor, the formation of contracts with suppliers that pay subminimum wages, as well as other practices that undermine Levi Strauss's responsibility to the fair treatment of employees. Levi Strauss explicitly states that these *Terms of Engagement* are an attempt to specify actions that are consistent with the company's *Values and Vision.*

The application and implementation of principles raises a host of other practical complications. It should be clear from the preceding remarks that principles require moral judgment on two different levels. First, in evaluating past decisions, current problems, or existing practices, moral agents need to be able to identify and classify all the particular, relevant facts before understanding which principles are appropriate in evaluating moral performance. Many have argued that cultivating this kind of moral vision is necessary for principles to have any practical impact on the way that agents reason about what to do in any specific case. Principles provide only very general grounds on which particular moral decisions are inferred. For a principle advocating the fair distribution of benefits and burdens among stakeholders to be relevant, it requires that an agent be aware of the situational markers of unfairness. Following those who have been inspired in various ways by the moral thought of Aristotle, this necessitates sensitivity, care, experience, and training. Second, agents need to creatively explore the meaning and significance of a principle in determining what they will do in the future. What does a commitment to fairly share the benefits and burdens mean for wage, benefit, and compensation policies? How does this principle affect the way in which information is shared among stakeholders? What mechanisms are in place to monitor and assess the relative benefits and burdens of each stakeholder? These questions are part of an overall process of judgment that transforms an indeterminate principle into an action-guiding directive.

Moral Sentimentalism

Moral sentimentalism is the view that human sentiments—feelings, emotions, or other affective states—are fundamental to an account of moral evaluation, awareness, and motivation. According to sentimentalists, objects of moral evaluation—actions, motives, and character—are morally right or wrong (or virtuous or vicious) depending on whether we feel approval or disapproval toward them. (A weak form of sentimentalism maintains that the moral status of actions, motives, and character is determined *in part* by our sentiments but that other considerations are also relevant to fixing their moral status.) Many sentimentalists maintain that the moral evaluation of motives or character is prior to the moral evaluation of actions, but not all sentimentalists agree that this is the case. Sentimentalists do agree that our awareness of what morality requires is not primarily a matter of cognition—that is, a matter of knowing something—but is rather a matter of feeling something. These feelings of moral approval and disapproval, sentimentalists claim, are essential to moral motivation.

While all sentimentalists agree that moral evaluations depend on our sentiments, there is disagreement about the nature of this dependency relationship. The simplest form of sentimentalism maintains that to judge that a moral property applies to an object is just to feel the associated sentiment. A more sophisticated form of sentimentalism regards moral properties as dispositional properties. In this approach, to judge that a moral property applies to an object is to say that the object tends to produce a certain sentiment in normal human observers under normal conditions. Some sentimentalists modify this dispositionalist account by appealing to the affective responses of a hypothetical, ideal (fully informed and impartial) observer; they claim that to attribute a moral property to an object is to hold that an ideal observer would have a certain affective response to the object. The leading contemporary forms of sentimentalism are varieties of second-order sentimentalism. According to this type of sentimentalism, to judge that a moral property applies to an object is to deem it appropriate to feel an associated sentiment toward that object. For example, one might claim that an act is morally wrong if, and only if, it is appropriate for the agent who performed the action to feel guilt for having done it and for other people to feel anger or resentment at the agent for having done it.

Sentimentalism is opposed to moral rationalism (or intellectualism)—the view that moral evaluation, knowledge, and motivation are grounded in reason, as opposed to sentiment. According to rationalists, reason determines the proper ends of action, and moral knowledge is a matter of rational cognition. Moreover, rationalists typically maintain that moral knowledge taken by itself is capable of providing sufficient motivation for action. Traditional forms of rationalism include intuitionism, which sees moral truths as indemonstrable, self-evident principles, and Kantian approaches, which see moral precepts as grounded in a general theory of practical reasoning.

While sentimentalists maintain that morality is fundamentally a matter of feeling, they typically allow that reason plays some role in morality. This role is normally limited to reasoning related to ascertaining and discerning facts, and means-end (instrumental) reasoning: The ultimate ends of action are fixed by moral sentiments, and reason identifies the best means for achieving these ends given the circumstances at hand. Similarly, while rationalists deny that sentiments define morality, they usually do not entirely deny feeling a role in morality. Rationalists see moral feeling as the product or result of our cognitive awareness of the moral status of an object, and such resultant feeling can help move us to pursue (or avoid) that object. Again, according to the sentimentalist, an action is right, a motive is virtuous, or a character is admirable because we feel approval toward it, whereas according to the rationalist, we feel approval because we rationally recognize that the act is right, the motive virtuous, or the character admirable.

Sentimentalism is allied with certain other metaethical theses. It is a form of moral antirealism. This is because sentimentalism is a form of constructivism: It claims that the moral domain is constructed out of the subjective stance of some (real or hypothetical) moral agent(s), and hence, the truth conditions of moral judgments essentially depend on that subjective stance. Sentimentalism is also often characterized as a form of projectivism—the view that moral properties are not real or genuine properties of things in the world but are projections of our own sentiments or emotions onto the world. Some sentimentalists—the so-called expressivists—are noncognitivists; they maintain that the function of moral discourse is not to report or describe the feelings of agents but to express these feelings.

Sentimentalism is attractive to its adherents for several reasons. The view is historically and theoretically aligned with empirical and naturalistic approaches to moral theory and philosophy more generally. By grounding morality in human nature, sentimentalism promises to explain morality in a manner consistent with the scientific worldview. Sentimentalism accords with the increasingly common view that moral values essentially depend on human valuing, which is inextricably related to our affective states. Sentimentalism also provides a simple account of how moral judgments motivate us to act. Sentiments play a relatively straightforward motivational role; so, if moral judgments are grounded in sentiments, it is easy to see how these judgments move us to act. Sentimentalists have long argued that reason alone is motivationally impotent, and so it is unclear how moral judgments construed as rational principles could move us to act.

For their part, critics have raised a variety of problems for sentimentalist approaches to morality. Perhaps the most fundamental difficulty involves reconciling sentimentalism with the rational aspects of moral evaluation. Moral deliberation and argumentation are governed by norms of justification. We advance and defend our moral judgments with reasons, and we routinely argue about their correctness. It is unclear, however, how the purely affective states that supposedly fix morality can be rationally justified in the relevant way. Opponents of sentimentalism also typically argue that moral principles are, by nature, necessary and objective, while sentiments, even if universal, are contingent and subjective. Sentimentalism, critics charge, makes morality a wholly arbitrary matter.

Sentimentalism is compatible with a wide variety of approaches to normative and applied ethics, so sentimentalists can, and do, approach business ethics in many different ways. Generally speaking, those sentimentalists who think that actions—either specific instances or general types—are the fundamental objects of moral assessment maintain that business practices involving deception, cheating, exploitation, physical harm, and so forth, are morally wrong because of the disapprobation that we tend to feel toward these practices. Those sentimentalists who consider motives or character traits to be the fundamental objects of moral assessment claim that certain motives (e.g., the unconstrained pursuit of profit) and certain character traits (e.g., selfishness) are morally bad because of the disapprobation that we tend to feel toward them. In this general approach, the business practices mentioned above are morally wrong because they exemplify these motives or character traits.

Historical Development

Historically, moral sentimentalism is most closely associated with the moral sense school of ethics that flourished in Britain during the first half of the 18th century. Anthony Ashley Cooper, Third Earl of Shaftesbury (1671–1713), is typically regarded as the founder of this school—he was the first to use the term *moral sense*—although there are rationalistic elements to his moral philosophy that are not consistent with sentimentalism. The doctrine of the moral sense was systematically developed by Francis Hutcheson (1694–1746) and refined by David Hume (1711–1776). Although he rejected their idea of a moral sense, Adam Smith (1723–1790) was strongly influenced by Hutcheson and Hume, and his moral philosophy represents an important form of sentimentalism.

Thomas Hobbes (1588–1679) set the agenda for early-modern British moral philosophy, and both moral sentimentalism and rationalism originally developed in reaction to his views. In *Leviathan*, Hobbes defended a secular form of voluntarism: He maintained that moral distinctions are determined by the sovereign's will, and hence, in a state of nature—a situation prior to or without government—morality is nonexistent. He also maintained that good and evil are relative to the desires of individuals and that humans are motivated primarily by selfish desires.

The rationalist line of response to Hobbes was initiated by the Cambridge Platonists, Ralph Cudworth (1617–1688) and Henry More (1614–1687). Cudworth and More defended a traditional form of moral intuitionism—the view that moral truths, such as logical and mathematical truths, are grounded in an eternal and immutable order that is apprehended a priori through rational reflection. Hence, they rejected Hobbes's voluntarism, maintaining that morality is grounded in reason and not the will. Samuel Clarke (1675–1729) extended the Cambridge Platonists' analysis by adding the idea that what reason apprehends is a relationship of "fitness" or "unfitness" between circumstances and actions. According to Clarke, the right action in a given set of circumstances is the fitting one, and our knowledge that an action is fitting motivates us to do it. Early-modern British ethical rationalism culminated in the work of Richard Price (1723–1791). Price abandoned Clarke's idea that moral concepts are analyzable into something further such as fitness, arguing that moral concepts are simple and irreducible. Price did not think that one can know by direct rational intuition what one should do in specific circumstances; rather, he believed that what is self-evident to reason are general principles about what considerations are morally relevant—for example, it is self-evident that, other things being equal, one ought to be truthful. Many elements of Price's intuitionism reappear later in the moral philosophy of H. A. Prichard and W. D. Ross.

The sentimentalists employed a different strategy in responding to Hobbes, challenging in the first instance his characterization of humans as selfish, unsociable beings. Shaftesbury argued that experience teaches us that other-regarding (disinterested) sentiments, such as benevolence, sympathy, and gratitude, which move us to promote the good of others for their own sake, are just as fundamental to our nature as are self-regarding motives. Virtue, Shaftesbury thought, consists in achieving balance between one's self-regarding and other-regarding motives. What is more, we naturally approve of, or take pleasure in the contemplation of, virtue, and this pleasure induces us to pursue it. Where the rationalists saw a likeness between morality and mathematics, Shaftesbury—like many subsequent sentimentalists—saw moral judgment as analogous to aesthetic judgment. Shaftesbury occasionally referred to the faculty of moral judgment as the "moral sense," but he did not explain its origins or workings. Providing an account of the moral sense was the central aim of Hutcheson's moral philosophy.

Hutcheson firmly situated his sentimentalism in John Locke's (1632–1704) empiricist theory of knowledge. According to Locke, all our ideas originate in experience—reason itself cannot be the source of any new ideas—and experience is acquired through either sensation ("external sense") or reflection ("internal sense"). Locke attributed our ideas of colors, sounds, odors, and so on, to the external senses, and he attributed our ideas of mental operations and feelings to reflexive senses. Hutcheson argued that our moral ideas are unique and irreducible; hence, he concluded that they must originate in a distinct reflexive sense—a moral sense. Our moral ideas are feelings of approval and disapproval, and they are elicited by our observations of people acting from certain motives. When we observe someone act from the motive of benevolence, we naturally and spontaneously feel approval. A contrary feeling of disapproval arises when we observe someone acting selfishly. Our moral judgments are grounded in these feelings: We judge benevolence to be virtuous simply because we feel approval toward it. So, moral judgment, on Hutcheson's view, rests on an affective response to the world rather than a rational cognition of it.

Hutcheson leveled a number of fundamental objections against ethical rationalism, but Hume launched an all-out assault on rationalism that was remarkable for both its argumentative and rhetorical power. One of Hume's most forceful and influential arguments against ethical rationalism is premised on the view (generally referred to as "motivational judgment internalism") that there is an internal (semantic or conceptual) connection between moral judgments and motives for action such that, necessarily, one is motivated (to some extent) to act in accordance with one's sincerely held moral judgments. But, Hume argued, reason alone cannot move us to act. Reason can show us how to best satisfy our desires, but it cannot move us to action independent of these desires. Since reason is in this manner "the slave of the passions," moral judgments cannot be grounded in reason alone.

Like Hutcheson, Hume concluded that morality is "more properly felt than judged of," but he modified sentimentalism in several important ways. Where Hutcheson took the sentiments of moral approval and disapproval to be brute facts of human nature—and, hence, subject to no further explanation—Hume explained the moral sentiments in terms of sympathy, our natural propensity to feel what others are feeling. Spectators take sympathetic pleasure (or pain) in the happiness (or unhappiness) that certain character traits tend to produce for those possessing them or others, and this sympathetic pleasure (or pain) gives rise to the particular kind of pleasant (or unpleasant) feeling that constitutes moral approval (or disapproval). Genuine moral approval and disapproval occurs only when the spectator considers a person's character from a "general" or "common" point of view—that is, when the spectator considers how a person's character affects people in general, and independent of the spectator's own self-interest. By introducing the notion of a general point of view, Hume allows for a certain degree of objectivity in moral judgment: The general point of view provides a standard for correcting aberrant moral judgments.

Hutcheson thought that the object of moral approval is always some form of benevolence, but Hume distinguished between "natural" virtue (e.g., benevolence) and "artificial" virtue (e.g., justice). Explaining why we approve of justice is more difficult than explaining why we approve of benevolence, since sometimes justice demands that we act in ways that do less good than we otherwise could. Hume explained that the conventional rules of justice provide stability and security in conditions where goods are scarce and people are too often selfish. Maintaining the system of justice is necessary to the survival of society and, hence, to the well-being of every individual. Moral approval of justice, then, depends ultimately on sympathy with the happiness of society in general.

Hutcheson and Hume have long been regarded as forerunners of utilitarianism. Indeed, Hutcheson was the first to express the principle of utility—"That action is best which procures the greatest happiness for the greatest numbers," which was later developed by Jeremy Bentham (1748–1832) and John Stuart Mill (1806–1873). But it is important to note that both Hutcheson and Hume regarded moral judgments about motives and character to be prior to moral judgments about actions, and, moreover, these moral judgments depend on our natural and spontaneous affective reactions to these objects and not on thoughts about consequences.

Adam Smith took it for granted that Hutcheson and Hume had established that morality is a matter of sentiment. Like Hume, Smith took moral approval and disapproval to be grounded in the operation of sympathy. For Smith, sympathy involves imaginative identification—the ability to imagine oneself in another's situation so as to be able to consider whether the agent's motives are proper given the situation. Smith also follows Hume in maintaining that moral appraisal involves a disinterested point of view, which Smith refers to as the standpoint of the "impartial spectator." But Smith went beyond Hume in employing this idea to explain the origins and workings of conscience. Although he was committed to sentimentalism, Smith did reject certain aspects of the moral sense theory. Most fundamentally, where Hutcheson and Hume thought that moral approval (and disapproval) involves one particular type of feeling, Smith maintained that there is in fact a variety of moral sentiments. Among these different moral sentiments are the sense of propriety, the sense of virtue, the sense of merit, and the sense of duty.

Recent Developments

Sentimentalism waned in the late 18th and 19th centuries. Bentham and Mill stressed the utility of actions and social policies, and this supplanted the moral sense theorists' emphasis on our sentiments. Sentimentalism was revived in the 20th century, however, and some of today's most important projects in moral philosophy employ a sentimentalist approach.

A. J. Ayer developed the emotive theory of ethics as an adjunct of logical positivism. Emotivism is the view that moral judgments express, rather than describe, the speaker's sentiments of approval or disapproval. According to Ayer, moral judgments—like aesthetic judgments—are not statements but are exclamations, which are neither truth nor false; hence, emotivism is a form of noncognitivism (and antirealism). In Ayer's analysis, one's judging that eating meat is wrong is like one's shouting, "Boo to eating meat!" In so judging, one is not simply describing one's negative feelings toward eating meat; rather, one is evincing these feelings.

Criticisms of Ayer's emotivism led to the development of more sophisticated forms of expressivism. Like Ayer, Simon Blackburn and Allan Gibbard agree that moral judgments do not express beliefs but rather some noncognitive mental state. But where Ayer thought that moral judgments express our sentiments of approval and disapproval, Blackburn maintains that moral judgments express our dispositions toward our sentiments of approval and disapproval, and Gibbard maintains that moral judgments express our acceptance of a system of norms that governs feelings such as guilt, remorse, resentment, blame, and anger. For second-order sentimentalists such as Blackburn and Gibbard, making a moral judgment is not simply a matter of feeling a certain way toward an object; it is a matter of approving or endorsing the way that one feels. To judge that a moral property applies to an object is to regard as appropriate one's feelings toward that object. On Blackburn's projectivist account of morality, to say that honesty is a virtue is to express a stable, favorable disposition toward one's own (and others') feeling of approval toward honesty: It is to express a favorable "second-order" sentiment toward a "first-order" sentiment. According to Gibbard, to judge that stealing is wrong is just to say that it is rational for the agent who stole to feel guilt at having done so and for others to feel anger at the agent's having stole. But, on Gibbard's analysis, to say that it is rational for the agent and others to have these feelings is not to state a fact; rather, it is to express acceptance of a system of norms that warrants these feelings.

The revival of virtue ethics has been one of the most important trends in recent moral philosophy. Initially, contemporary virtue ethicists were encouraged primarily by the thought of Aristotle. However, modern-day virtue ethicists have increasingly looked for inspiration to the 18th-century British sentimentalists. A prime example is Michael Slote, whose "agent-based" moral theory grounds evaluations of actions in more fundamental evaluations of sentiments that reflect a general concern for humanity. On Sloate's analysis, an act is right if, and only if, it comes from a virtuous motivation involving benevolence or caring. These motives are virtuous just because they are admirable, and not because they are central to human flourishing or because they tend to generate happy consequences.

Another important trend in recent moral philosophy involves attempts to articulate a distinctively feminine morality, and many have argued that sentimentalism accords with the moral experience of women far better than rationalism. Annette Baier, for example, reads Hume as a protofeminist. She argues that his sentimentalism anticipated many of the central themes of the feminist ethics of care described by Carol Gilligan. Where rationalists such as Kant see emotions and feelings as subversive to morality, Hume recognized that they are indispensable to it. Like the ethics of care, Hume's sentimentalism grounds morality in other-regarding sentiments that are developed and exhibited primarily in interpersonal and social relations, and maintains that we are not guided by moral rules so much as by a natural and direct concern for the well-being of others. Baier's own ethics of trust builds on these Humean foundations.

Moral Standing

Moral standing is a concept that relates to what ethicists call "moral considerability." Here, the moral status of an entity is determined by considering whether that entity deserves to have their well-being taken into account within the context of moral decision making. To ask if an entity has moral standing is to ask whether that entity should be considered in the moral judgments that people make and the moral decisions that they take, and whether that entity should count as a morally valued being and whether it can make moral claims on other moral beings. Hence, this concept has to do with the value or worth that is bestowed on an entity. Whether the entity under consideration is determined to have intrinsic or instrumental value will often play a role in how that entity is morally treated or regarded by people. The question of moral standing is one that has been raised primarily within the context of the philosophical debate about animal rights, although it has had a role to play in other ethically controversial areas (Does or should a fetus have moral standing?). The moral standing of animals is important to determine; if they don't have any moral standing or worth, then it would be permissible to treat them in whatever ways one wishes. If animals do have moral standing, though, then perhaps using them in medical experimentation or eating them may be ethically problematic.

Ethicists have taken several positions about how to determine the moral standing and inherent worth of an entity. Aristotle set a tone that still reverberates today with his teleological view of nature that sees the world as a hierarchy where the lower levels of plants and animals have value only in relation to the purposes of humans. Kant later held a similar view when he claimed that we have no moral duties to animals. This view has been called an "anthropocentric view" because it puts humans above all other entities and holds that all and only humans are morally considerable.

There are two kinds of anthropocentrism that ethicists have recognized. "Strong anthropocentrism" argues that only humans have intrinsic value and all nonhumans have only instrumental value as determined by human ends. "Weak anthropocentrism" holds that while humans count most in moral matters, nonhumans do have some moral status and humans do have certain duties to animals to reduce their suffering and treat them humanely.

Others have objected to anthropocentrism and have offered their own positions. It is often claimed that anthropocentrism commits "speciesism," a form of bias toward the human species that unfairly discriminates against other species. Some have appealed to the concept of sentience to determine which entities have or should not have moral standing. Sentience is often defined as having the quality of awareness or the state of consciousness and self-consciousness. Some define it as relating to sensation, perception, ideation, or feeling.

In this account, then, a sentient, self-aware being possesses and has moral value, while nonsentient ones do not. Still others suggest that a "biocentric view" is even more plausible in that it gives moral status to both human and nonhuman entities alike. Finally, "environmental holism" has been suggested by those who want to see moral standing granted to species and ecosystems such that it would be morally culpable to engage in activities that are environmentally degrading.

The concept of moral standing can be important in the area of environmental management and helpful in sorting out the obligations of businesses to the environment. It may be used to form the basis of a management philosophy or be useful to enlightened organizations that desire to understand what their moral duties might be in the environmental arena since determining the moral worth of entities, animals, species, and ecosystems might serve as a solid self-regulatory principle in ethical business decision making.

Most Favoured Nation Status

Most favoured nation (MFN) status provides that for all countries that are members of the World Trade Organization (WTO), all foreign suppliers should be treated equally and without discrimination in respect of all tariffs and other charges and the rules and formalities connected with imports and exports. In effect, MFN says that within the WTO, a member country cannot have any favorite countries for which it cuts a special trade deal.

Alternatively, a member country cannot punish another member country by giving it a worse trade deal. The basic premise is that a member country cannot treat any one member less favorably than any other member on the conditions of goods or services entering its country. MFN ensures that each member country is afforded the same terms of trade.

MFN is at the heart of the WTO's rules for international commerce and has been part of the modern world trade system since the inception of the General Agreement on Tariffs and Trade (GATT) in 1947. With the beginning of the WTO in 1994, member nations were bound by MFN commitments for goods (GATT, Article I), services (General Agreement on Trade in Services [GATS], Article II), and intellectual property (Trade-Related Aspects of Intellectual Property Rights [TRIPS], Article 4).

MFN has been a very powerful way of liberalizing the world trading system. It has two wide-ranging effects. First, in certain cases, it multilateralizes bilateral or "minilateral" (a few countries) negotiations. Generally, the toughest trade talks are between major supplier countries and major consumer countries. That is, if India is a major supplier of software and the European Union (EU) is a major consumer of such software, their negotiators will spend a long time considering the terms of trade, including other India-EU international commerce. Likewise, India may be a major importer of foods. Once a deal is struck, say the EU decides to cut its tariffs on imported software by 50% and to allow Indian software engineers (service providers) easier access into the EU, while in return, India lowers its tariff 20% on imported wheat, corn, and wine, all other members states of the WTO receive the benefits of the deal. In this case, other nations that export software, such as the United States, Israel, Japan, and others, now can enjoy a 50% reduction in the tariff levels into the EU. Likewise, countries such as Argentina and Brazil that export high quantities of grains and Australia, New Zealand, and the United States that export large volumes of wine now have the lower rate into India. These other nations in effect take a "free ride" from the hard work of the Indian and European negotiators and enjoy the outcome of the negotiations in the form of new opportunities for their country's products and services into these markets. So in effect, MFN takes something that is bilateral (India-EU) and makes it multilateral by extending the benefits to all member states.

There is a second element of MFN related to bilateral or minilateral negotiations. The starting point, here, is a multilateral negotiation among the 149 member states (as of December 2005) of the WTO. While it may be useful to get each country's input as to how to handle each product, service, intellectual property, foreign direct investment, labor, environmental, and other issues, it is very difficult for the 149 members to have such discussions on each item of trade. If inclusion was mandated, the sheer volume of work and number of items would more than likely grind the WTO to a stop. MFN simplifies matters by allowing those countries that have a big stake in a sector or in another trade area (say the general receipt of foreign direct investment or intellectual property rules over medicines for epidemic diseases) to come together in smaller-sized groups. There is much give and take in these smaller negotiations because trade negotiators generally have a mercantilist view that if they reduce a tariff they are "giving up something" and therefore must "get something in return" such as better access into the foreign market. That said these smaller negotiations generally have a greater chance to succeed than negotiations among all the countries together. MFN assures that every member state enjoys the fruits of these smaller-scale negotiations.

The existence of MFN eliminates the need to create rules of origin that are necessary in preferential trade arrangements such as free trade zones. Rules of origin are used to identify the country of origin of goods subject to tariff treatment. These rules are particularly complex for products with components from several countries. Without MFN, a country needs to maintain a tariff code indicating different rates for different countries. Indeed, many nations used to maintain such tariff schedules by product and by country. With MFN, any product or service originating in any of the 149 member states is subject to the same treatment. This is a major simplification for both national authorities and for businesses trying to make sales, purchase, and investment decisions.

There are some exceptions to MFN. Countries can enter into free trade or preferential trade arrangements such as customs unions and free trade areas that discriminate between their members and outsiders. For example, after the North American Free Trade Agreement, Mexican apparel producers enjoyed better market access into the United States than firms from El Salvador or the Dominican Republic. In addition, some developed countries administer programs called Generalized System of Preferences where they maintain low tariffs for certain products from certain developing nations. Countries may also grant special deals to certain nations for reasons of national security, public health, and safety and morals, contrary to the MFN. For instance, many countries disallow trade of certain technologies to certain countries for reasons of national security. For public health reasons, some countries practice differential treatment of foreign health care providers, depending on the country in which they studied or practiced medicine.

MFN simplifies the policy world of international trade tremendously for companies. First, the MFN world creates a single trade rule such as a tariff on a product for a given country, regardless of where it is made. This allows the company to manufacture in a particular location for reasons other than preferential tariff treatment by a national authority. Second, MFN makes it easier to focus political efforts for a company. The political activities generally follow the largest trading or investment relations so that companies can aim their political activities accordingly. For example, if a French pharmaceutical company has an intellectual property issue with the piracy and parallel importation of generic drugs, it needs to direct its political efforts toward the large producing and trading nations of generics such as India and Brazil.

Motives and Self-Interest

Voluntary human actions—those actions with which ethics is primarily concerned—typically arise as an agent seeks to satisfy a desire. Satisfying desires, moreover, is typically in an agent's interest. Thus, there seems to be a rather straightforward connection between identifying an action as voluntary and identifying that action's motivation (i.e., the desire for the sake of which the action is being pursued) as self-interested.

Additional support is lent to this line of thought by considering that human agents are, on the one hand, members of a species that seeks to secure its own survival and, on the other hand, social creatures. Insofar as humans seek to secure their own survival, they are motivated to act in ways to satisfy their desires for food, shelter, and security. Insofar as humans are social creatures, they are motivated to act in ways to secure their position within their group, primarily by engaging in behavior that others will regard as praiseworthy and by avoiding behavior that others will regard as shameful or otherwise blameworthy.

Sophisticated versions of this line of thought distinguish between agents' consideration of their short-term and long-term (or rational) self-interest. In terms of both what is introspectively available to each of us and how we best understand behavior we observe in others, the evidence suggests that voluntary agents often act out of a consideration of long-term self-interest. Thus, such agents often pursue courses of action that generate no immediate results, calculating that a short-term sacrifice is acceptable in the pursuit of some greater goal. For example, businesses invest significant capital in research and development, where the returns on these investments are realized later, if at all.

The strongest version of the line of thought that links action to the pursuit of self-interest claims that all human action is motivated by some consideration of what is in the agent's own best interest. This position, known as psychological egoism, asserts that every action—from the most obviously greedy act to the most apparently altruistic act—ultimately must be understood in terms of an agent's pursuit of self-interest. This is often cited in support of the normative position known as ethical egoism: If the only acts that are psychologically possible are selfish acts, then—given the plausible principle that *ought* implies *can*—the only acts that an agent ought to perform are selfish acts.

While the self-interested motivation of actions is clearest with respect to actions avowedly undertaken to satisfy the agent's desires, questions arise when attempting to identify the self-interested motivation of apparently selfless acts. For example, employees who blow the whistle on corruption within the firm often face significant harm: reputational losses, difficulties maintaining employment with the firm, and so on. Moreover, such employees often assert that their decision to blow the whistle was motivated simply out of a sense of duty (to shareholders, to the public).

When confronted with an agent who has just performed an apparently selfless act, and who insists that the act was done with absolutely no consideration of self-interest, psychological egoists often respond by positing some subconscious motivation for the act. In the case of a whistle-blower, for example, it might be suggested that the decision to act was motivated by a subconscious desire to be regarded as a hero, to secure a lucrative book deal, or even just to sleep contentedly, free of the pangs of conscience.

At this stage, what was supposed to provide a descriptive account of the actual operations of human psychology seems to become nothing more than an assertion of a putatively conceptual truth. Psychological egoism was supposed to gain its support from the empirical investigation of human psychology, perhaps buttressed by the findings of evolutionary psychology (e.g., explanations of apparently altruistic actions in terms of gene fitness, or kin selection). However, as a scientific theory, it should be responsive to all the evidence, including apparently falsifying evidence. To the extent that psychological egoism resists the evidence provided by apparently selfless acts, it risks credibility.

—David Levy

Multiculturalism

Multiculturalism is understood as a term that stands for accommodation of diverse cultural groups and their practices within a mainstream culture and society.

Such accommodation is needed to make all minority cultures feel at home in a dominant culture that may at times be perceived by minority groups to be oppressive of or insensitive toward their cultural heritage and tradition. Because cultural diversity has come to be recognized as a value to be prized, making a society rich in ideas and options, multiculturalism is a goal actively pursued by all liberal societies. Besides cultural richness, commitment to the multicultural ideal is also seen as a sign of a liberal society's commitment to equality, including equality of all groups and cultures. Of course, problems crop up in implementing the policy of multiculturalism because it requires a nuanced balancing of several competing claims on several fronts. The claims of equality present both a conceptual challenge and practical problems of implementation as social policies.

Politics of Difference

The dominant liberal ideology in the West makes individuals the epicenter of justice and equality, not groups or cultures. Committed to individual autonomy, state neutrality, and procedural fairness, the liberal ideal finds it problematic to single out any group or culture for special rights or privileges. Yet minority groups and cultures are getting progressively vocal in demanding special recognition to establish a strong identity. One implication of this demand, for them, is to be granted special rights and recognition to make up for the discrimination and marginalization they encounter in the majority culture. They fear that if equality is understood as equal recognition, along with the same rights and entitlements for all individuals and groups regardless of their differences, then the majority norm in the guise of impartial standard for everybody would in effect reward the dominant groups and perpetuate the status quo, overlooking the significant differences that give minority cultures their distinct identity.

This "politics of difference" is rooted in the emerging identity politics of multiculturalism. To work out the nuanced balance between the twin fronts of egalitarianism and multiculturalism is the big challenge in today's liberal democracy. Egalitarianism is the idea that social justice should be based on the principle of equality and impartiality, without any special favor to any group or individuals. However, critics point out that multicultural accommodation in a pluralistic society may require giving minority cultures greater protection and more immunities in especially those areas where their religious and cultural commitments related to their identity may seem to be at stake. For instance, it may mean that government should avoid undue legal restrictions on the right of children in public schools to wear clothing symbolizing their religious identity, such as girls wearing head scarves as a part of their cultural or religious commitment. Defenders of multicultural accommodation argue that an impartial liberal theory is not incompatible with distinct principles of affirmative equality with regard to the members of marginalized groups. Thus, what may seem like partiality is not really partiality but a variation of the same liberal equality principle. Others try to defend this move with a slightly different argument. They claim that if there is a legitimate reason for partiality, then it can be justified on impartial grounds. Thus, even if granting special rights and immunities would seem like a form of partiality, this is still compatible with the principle of state neutrality. Accordingly, defenders of multiculturalism point out that the policy of special recognition in some exceptional cases is perhaps the only way to assure equality in practice, along with it being a good policy of promoting tolerance and diversity in our pluralistic society.

Conflicting Equalities

The issue of multicultural accommodation makes uneasy alliances and bitter divisions. The secular, cosmopolitan liberal ideology based on the principle of universal rights favors individual autonomy, whereas the nonliberal, communitarian segments of the liberal West value the situated identity of the individual understood as a member of a group or a community. Thus, the multicultural demands of special recognition create a tension of "conflicting equalities" between individual rights and group rights, which is a dilemma in liberalism itself. Liberal attitudes in America toward multiculturalism have varied from benign neglect or indifference to confusion and tension. Quite common was the liberal insensitivity toward religious and cultural differences among groups as well as a general lack of interest in global concerns. In reaction to such shortcomings, these attitudes have now been tempered by an acceptance of cultural rights and differences, although the problem of conflicting equalities between individual rights and group rights is a source of perpetual tension in liberalism. Nowhere is this uneasiness more pronounced than when liberalism is confronted by oppressive cultural practices of illiberal groups.

Feminism and Multiculturalism

Feminists too display the liberals' tension and confusion over the issue of multiculturalism. A broad base of feminist theorists questions the liberal premise of individuals as autonomous selves. Feminists claim that the idea of an embedded self in multiple networks of relations and dependence is closer to reality and a good starting point of understanding the feminist concerns about women's subjugation. Accordingly, they would, in general, favor the particularist identity of an individual over the liberal notion of a monadic self. This would seem to bring them closer to the defenders of multiculturalism in their understanding of and appreciation for the cultural rights and differences of minority groups. Yet, confronted by cultural practices oppressive to women, feminists tend to display the same dilemma as the liberals toward multiculturalism. Consequently, both feminists and liberals today are more challenged than ever to look at the dynamics of multiculturalism.

Both feminists and the liberals are divided on the issue. While both camps claim to be respectful of the autonomy of diverse cultures and still claim to be firmly committed to the idea that demands of multiculturalism should not override the dictates of certain fundamental rights, there are two broadly different approaches in both camps. Cosmopolitans among them, taking the individual as the yardstick of their measure for justice and rights, are guided by a universal human rights perspective. Citing empirical studies that seem to show that the claim is in fact overblown that there are incommensurable differences across cultures on issues of human rights, they are hopeful that the universal mandates of human rights would override the claims of oppressive practices in the name of cultural autonomy.

The other group points out that the issue cannot be resolved through mandates or directives from the top down but can be assuaged through public deliberation and negotiations at the grassroots level, especially within cultural and religious communities themselves. They emphasize the role of deliberative democracy in addressing the contending issues of egalitarian representation in a pluralistic society. Claiming themselves to be both feminists and liberals, they take cosmopolitan theorists to task by showing the limitations of what they call the a priori liberal approaches to the problem, manifested in a prepolitical commitment to certain nonnegotiable rights. They argue that the issue of democratic representation in a pluralistic world is essentially a political one, requiring a strategic response not a liberal normative resolution, because the conflict, regardless of its appearance, is not a clash of liberalism versus illiberalism. For them, an a priori normative framing at the foundational level tilts the discourse in favor of liberalism, resulting in the marginalization and alienation of minority groups (and individuals) that differ from the mainstream liberal ideology. So they try to offer a resolution to the liberal cosmopolitan dilemma of respecting individual rights and cultural pluralism by reframing the conflict through the lens of deliberative democracy.

Multiculturalism and Universal Human Rights

The debate on multiculturalism both within a pluralistic liberal society and on the global scene raises critical questions regarding the viability of the notion of universal human rights and of liberalism itself. The ideal of human rights guarantees certain basic liberties to all individuals regardless of their race, class, gender, and religious affiliations. The Universal Declaration of Human Rights enshrined in the United Nations' charter affirms this ideal. Nearly all nations have pledged to abide by the charter to promote and safeguard human rights for all their citizens. The gradual emergence of global human rights culture in the past 50 years has been one of the undeniable trends of modern globalization. Despite all this, the idea of human rights is a hotly contested and politicized concept in the world today. This raises the question whether the claim of universal human rights is a viable concept or whether the problem lies in the differences in interpretation and enforcement across nations and cultures. If it is the latter, then the issue is a practical problem in the application of rights, requiring a careful analysis of the rights, specific cultural practices and national traditions, forms of constitutional commitments in the democratic framework of countries, and the key provisions and treaties in international law. Along with the empirical investigation grounded in the global realities of politics, law, and culture, it would also require certain conceptual reframing of the human rights discourse to accommodate demands of human rights with tolerance for cultural and national practices.

One such attempt by theories of rights that provide for a cosmopolitan framework is to strive to make room for local variations consistent with alternative versions of democratic decision making. In view of the standard critique of abstract cosmopolitanism—that its message of universal egalitarianism is unrealistic and utopian in a fragmented world—this "situated" version of cosmopolitanism looks more credible. In fact, some rights-based cosmopolitan theorists have done promising work to find a middle ground between abstract universalism and cultural specificity to validate the contextuality of the egalitarian human rights ideal within a democratic setting. Appealing to realities of current global practice, they emphasize the actual vitality of cross-cultural discourse concerning human rights and the heterogeneity of religious and cultural communities that tend to be treated as uniformly committed to restrictive views. This is an approach whereby abstract cosmopolitanism committed to universal egalitarianism becomes situated and negotiable by adopting some version of deliberative democracy.

Another example to negotiate a middle path between mandates of rights and weight of culture and self-determination is the one proposed by the "capabilities approach." Initiated by Harvard economist Amartya Sen and developed by both Sen and the University of Chicago ethicist Martha Nussbaum, this approach is claimed as a better starting point for understanding fundamental constitutional entitlements than rights-based approaches have proven to be. This they consider a promising strategy for the task of exploring issues of social justice in a modern constitutional democracy as well as for respecting cultural pluralism. Implied in these various alternative nuances is the claim that endorsing cultural differences does not mean that cultural relativism is true.

But if the concept of universal human rights is claimed to be a flawed concept, then it would require a philosophical investigation into the nature of rights itself to decide whether shared human values in today's global world can be the basis of universal conceptions of human rights and whether basic human rights can be defended from a universal moral point of view that is neither imperialistic nor relativistic. Thus, the national discourse on multiculturalism and the international politics of cultural tolerance have certain features in common. Of course, the international arena is guided by international law based on the sanctity of national sovereignty that prohibits intrusion or intervention in the internal affairs of a country, but the gradual redefinition of national sovereignty due to the forces of an aggressive global economy, the changing global ecology, and the emergence of a human rights culture have increasingly called into question the moral relevance of a strictly construed national and cultural autonomy. Consequently, any undue restriction of rights in the name of local culture is difficult to sustain in a globally vigilant and interconnected world.

Conclusion

As economic globalization has built bridges through cultural differences, it has had problems in demarcating appropriate boundaries. The egalitarian commitment to justice and human rights and the democratic ideal of legitimacy through self-rule and autonomy are often manifested in the tension between individual rights and group rights. Because both rights are in a continual state of flux and readjustment due to the shifting nature of the forces of globalization, to work out the right balance in theory is not easy. Thus, although the debate on multiculturalism and democratic accommodation is on the forefront of the liberal consciousness, the problem of moral evaluations of cultural practices that may conflict with human rights concerns offers no easy resolution. Because the norms of cultural well-being may not always coincide with those of individual autonomy, today's global business cannot be too aggressive in promoting a consumer culture of self-gratification that may clash with cultural norms.

Multinational Corporations (MNCs)

The term *multinational corporation* (MNC) can be defined and described from differing perspectives and on a number of various levels, including law, sociology, history, and strategy as well as from the perspectives of business ethics and society. Certain characteristics of MNCs should be identified at the start since they serve, in part, as their defining features. Often referred to as "multinational enterprises," and in some early documents of the United Nations they are called "transnational organizations," MNCs are usually very large corporate entities that while having their base of operations in one nation—the "home nation"—carry out and conduct business in at least one other, but usually many nations, in what are called the "host nations." MNCs are usually very large entities having a global presence and reach. Names and company logos such as those of Coca Cola, Exxon Mobil, Mitsubishi, and Royal Dutch Shell are good examples. Today, however, we are also witnessing a rapid growth of smaller- and medium-sized enterprises that also conduct business in multiple nations and also have a global presence and reach. Hence, MNCs can be understood as either large or smaller corporate entities that operate on a global scale even though most people think of the MNC as a huge conglomerate with business offices, plants, or facilities worldwide.

MNCs have also undergone great structural changes over the years and they engage in many different and varied kinds of businesses. In addition to the basics of the production, manufacturing, and trading of goods, today MNCs can be found working within a host of business activities that include the delivery of services such as banking or communications both locally and globally, knowledge-based industries, foreign investment and currency exchange, maintaining branch offices or feeder plants in host countries, the extracting of natural resources, the assembly of products in one region (e.g., the maquiladora program in Mexico and elsewhere) for sale in another region, and various forms of technology transfer, among quite a few others. Hence, a picture of the typical MNC is difficult to draw, since there are so many variables and characteristics that can be depicted in the contemporary version of the MNC.

The First MNC

The first publicly held MNC is generally recognized to have been the *Verenigde Oostindische Compagnie* or VOC, which was chartered in 1602. The Dutch East Indian Company was a venture that risked the capital of not only Dutch citizens but also "Zuid-Nedelanders," who are now Belgians, and Germans as well. What these first shareholders had invested their money in was an enterprise formed from the merger of a set of Dutch spice trading and marketing companies that came together in the late 16th century. Competing primarily with traders from Spain and Portugal, these individual groups needed to establish a corporate entity, and this organization was based primarily on diverse geographic "chambers" of the Netherlands that included the geographical areas of Amsterdam, Rotterdam, Delft, and Zeeland, among others. Each chamber had a set of "directors" that selected a "board of directors," which in turn then chose a set of "executive directors."

The company established or took over many trading routes and managed the commerce between the east and the west by establishing its East Indian headquarters at Batavia on Java (now Jakarta, Indonesia). Trading beachheads were set up on the Moluccas, the Banda Islands, Ceylon (now Sri Lanka), Japan, and China. In 1652, the first white colony on African soil was founded by the company as a resupply camp at the Cape of Good Hope, which eventually became Cape Town, South Africa. Various spices such as nutmeg, cloves, cinnamon, and pepper, and tea, silk, foodstuffs, and Chinese porcelain were among the goods shipped from the far-off lands to be sold to wealthy Europeans who could afford the exotic offerings from the Orient.

The growth and development of the Dutch East Indian Company was not accomplished overnight and was not without its corporate ups and downs. Not only did it have to outmanage its European competitors from Spain, Portugal, and later England, it had to overcome losses thanks to its battles with pirates, the extremes of ocean weather, and deadly diseases. To meet its numerous financial obligations, it was necessary to issue both short- and long-term bonds in order to raise enough working capital to stay afloat, as it were. In the end, though, the Dutch East Indian Company flourished for nearly 200 years and became the world's richest and most powerful company.

It amassed quite a few assets, including 150 trading vessels and 50 warships that it needed to protect its sea routes and, at one point, it saw its shares rise 1,200% in value. It was granted many special privileges such as the ability to enter into treaties and alliances on behalf of the Netherlands government, to build forts, and even to mint its own coin. In short, the world's first MNC seems to have been something of a standard setter for all such organizations, at least when it comes to accumulating great power that rivals nation-states and in setting the tone for the process of what we now call globalization.

Unfortunately, the VOC set lower standards for itself when it came to management practices. While it had a long history, it was not so illustrious. The VOC actively leveled competitors sometimes by sheer force, and it became a monopoly in the world spice market until 1799, when it was liquidated due to mismanagement. As a result of its unethical practices, the Dutch called VOC's experiment in international business *V(ergaan) O(nder) C(orruptie)*, which roughly translates as "sunk under corruption."

The Benefits of MNCs

Although they had such beginnings, one thing is clear about MNCs—the world would be quite a different place without them and the major contributions to global progress that they have made over the course of time since the Dutch East Indian Company. Successful worldwide distribution of goods and services; the expansion of employment opportunities, especially for the world's poorest people; pronounced economic growth through concerted foreign direct investment; and the creation of pure and practical knowledge through research and development and the global implementation of technological breakthroughs—these and other advances are often cited as concrete examples of the many benefits of MNC business expansion. On the global economic scene, MNCs have expended some $66 billion per year since 1990 on direct foreign investments. It is claimed such MNC economic activities have done much to spur economic growth as measured by increases in gross domestic product (GDP) especially in Western economies, to provide higher levels of material well-being worldwide, thereby generally raising standards of living. While it is the case that the less economically developed nations do not have percentage increases in per capita incomes at the same rates as the more economically developed nations, it is the case that there are income increases worldwide and these are projected to continue barring unforeseen or calamitous events. Indeed, empirical studies by the World Bank and others have shown that as more openness to international trade increases, so too does per capita income and the income of the most poor.

There have been many contemporary social commentators and many ethicists over the course of the history of ethics that have claimed that strong international commerce leads to conditions of peace and security. The interlocking of national economies through free and fair trade made possible largely by MNC business activities makes large-scale war a less likely option for nation-states. As a result, many nations now pursue a general policy of open trade that has led to the establishment of several international free trade conventions and the creation of the World Trade Organization (WTO), which serves as an international regulatory body. The WTO has been embraced by many as a prime example of global cooperation, although there are others who see it as something of a threat to the idea of national sovereignty.

It is also clear that MNCs provide the context within which major strides in industrial research and development take place. MNCs have done much to further advances in pure and applied science, for example. This can be witnessed in several major industries. One of the more prevalent forms that this takes is in the area of information technology (IT), and IT serves as a good example of how MNC practices can benefit many in the world. It is often said that today is the Age of Information, and this depiction is due to the fact that IT has become so prevalent and far-reaching in modern life. It would likely be a very different world if some of the major MNCs did not stimulate applied research in IT and support its development. Another good example of how MNC capital investment has changed the world for the better is in the area of medical research. Basic medical research into the causes of diseases, pharmaceutical practices that provide safe remedies for so many medical ills, and the invention of miraculous life-saving medical devises—these would likely not have become realities today, if it were not for the initial push in these areas provided by large MNCs. There is little doubt that life expectancies have been increased thanks to MNC-sponsored medical research, for example. In short, MNCs can be credited with having changed the nature of human life through their concerted efforts in the areas of research and development, a change that only they could likely accomplish, given their business activities of turning profits into capital available for investments geared to the progressive improvement of the human condition.

MNCs, Power, and Globalization

While many reap the tangible benefits of large MNCs and are literally alive today only because of the reinvestment of capital by MNCs that made such benefits possible, there are some who nonetheless find it necessary to raise important questions of an ethical nature about how MNCs operate. For example, the question of MNC power is a very pressing one, and it is closely related to the concerns that have arisen in reaction to "globalization." The governments of the European Union and the United States (among others) and a number of nongovernmental organizations (NGOs) along with an array of amorphous groups—some radical and some not—have expressed alarm about the way in which multinational corporate organizations have grown and about the threats posed by global multinational capitalism. Many of the more radical groups have demonstrated their anger at the accumulated power of MNCs by taking their concerns to the streets in the form of violent demonstrations in cities around the world. A brief survey of the reaction to the role that MNCs have played in the globalization process is thus useful.

According to the advocates of "critical theory" and other postmodern social critics, globalization should be seen as something like a world-historic process in which a great transformation and dismantling of cultures, institutions, and nation-states is unfolding. In these accounts, we can take note of at least three kinds of "globalization." First, an "international" conception of the idea of globalization can be identified where the nation-state is still the central focus of analysis, and so globalization in this first sense is measured by the basic alterations of or to nation-states and their power. Second, the "transnational" idea of globalization points to an array of practices and institutions that have become or are becoming transnational. In this account, the contemporary MNC would be taken as a major "transnational institution." Here, such institutions gain prominence and share the focus of the theoretical constructs that deal with the process of globalization.

Finally, there is what has been called the "globalist" conception where the nation-state is seen as a weak, if not a nonexisting, force in the world and where other institutions, such as MNCs, have supplanted them. In these critical accounts, then, of the processes of globalization, capitalism in the form of the spread of the MNC is a major—for some it is *the* major—force in the unfolding of the globalization process. The antiglobalization movement holds that the transnational power of MNCs is supplanting the power that formerly was seated in the nation-state and transforming the globe thereby.

The power of capital is rapidly displacing political power, and the ongoing unfolding of this displacement is a defining feature of globalization according to this movement. Indeed, for many in the movement, this displacement is just one among many that goes into the creation of the postmodern experience. So the antiglobalization movement is essentially a call for reform—in some cases radical reform—which wants a reining in of the accumulated power now being exercised by MNCs around the planet. The recent protests in major world cities by the divergent groups that make up the antiglobalization movement are primarily protests against corporate power and a call for its moderation that may be brought about by policies regulating the behavior of MNCs at the international level. But such reform policies and regulations face various hurdles before they might become a reality. Not the least of these has to do with a theoretical consideration of the ethical legitimization of these international regulatory policies, and today many business ethicists who specialize in the field of "international corporate responsibility" (ICR) have been working to provide a theoretical foundation to such policies.

The MNC, Business Ethics, and Society: International Corporate Responsibility

From the perspective of business ethics and society, the MNC often becomes an object of scrutiny by academic specialists who teach and write about business ethics and business and society issues. As alluded to above, various practices of MNC have been pointed to as questionable or even unethical because of the harms they perpetrate on society. There are a number of ethical issues, problems, and dilemmas that have to do with MNC practices, and several classic case studies involving specific MNCs have been analyzed and discussed in the literature of business ethics. As a result of this academic attention, a branch of business ethics has emerged in which the ethics of MNCs and the ethics of international business practices are central. Again, this subdiscipline has been called the international corporate responsibility (ICR).

ICR, taken as a conceptual movement, explores whether MNCs have been cognizant of and have included the rights of stakeholders, and their responsibilities and their obligations to them, in their business strategizing. Questions that an ICR specialist might address include whether international businesses have conscientiously monitored their labor practices, respected the integrity of local cultures and the basic human rights of the individuals within those cultures, carefully measured and reported the environmental impact that they might have, or contributed fairly to the well-being of their "host countries." ICR takes many forms, and those interested in it have much work both in the conceptual clarification of the main ideas of ICR and in continuing empirical studies of how organizational responsibility is or is not fulfilled by MNCs.

Bribery, Business Gifts, and the Foreign Corrupt Practices Act (FCPA)

One of the more recurring ethical issues that can be found in the area of ICR has to do with the question of bribery and gift giving in international business. This issue presents managers in MNCs with difficult business decisions based on the uncertainties of cultural relativism. It may be the case that in their home country the exchange of gifts between business associates is considered unethical and, in some cases, such exchanges may be construed as illegal bribes. However, in many host countries business gift giving is a culturally expected part of doing business and business relationship building. In fact, in some countries the failure to give gifts may lead to the loss of business transactions since the host may take the absence of a gift as an insult and in some contexts the value of a gift is expected to be high.

Gift giving in international business transactions is thus a problem of relativism and is often expressed in the precept "When in Rome, do as the Romans do." This old adage suggests that the phenomenon of cultural relativism is real and that there may be more than one ethical standard according to which people need to gauge their actions. Moreover, it suggests to managers in MNCs that they need to be mindful of any differences in host country business practices that depart from their own and that sometimes these might conflict with their own home country business ethics and basic values. In this case, gift giving may appear to be a form of bribery that corrupts the level playing field of business or it may just appear to be an accepted and normal part of business relationships—it all depends on your view from the host or the home country and the respective values that stand behind that view.

In the United States, the Foreign Corrupt Practices Act (FCPA) was adopted as a regulatory law to address the question of whether or when business payments should be considered a bribe and, therefore, a form of illegal corruption. According to the Department of Justice, in the mid-1970s, the Securities and Exchange Commission found that more than 400 U.S.-based companies had made questionable payments in excess of $300 million to foreign government officials, politicians, and political parties. The FCPA now makes it illegal to make such payments to high-level foreign officials for the purpose of obtaining or retaining business. Past MNC practices included the bribery of highly placed foreign officials to secure some type of favorable action by their foreign government as well as the so-called "facilitating" or "grease" payments that were made to ensure that governmental functionaries discharged certain "ministerial or clerical duties." These would include, again according to the Justice Department, routine bureaucratic tasks, such as obtaining permits or licenses; processing papers, such as visas and work orders, providing phone service, power, or water supply; the approval of the loading and unloading of cargo; and inspections associated with the performance of a contract or the transit of goods.

The FCPA does not prohibit U.S. MNCs from making such facilitating payments, and for many this continues to make the issue of bribery murky. Many ethicists and others concerned with matters of corruption have argued that the FCPA exception granted to facilitating payments that "grease the wheels of industry" is based on the recognition that other countries are not prohibiting their MNCs from making such payments and that this would give them an unfair business advantage over U.S.-based MNCs. Even so, goes one argument, such payments are bribes by any other name and are unethical and questionable per se regardless of how many countries fail to prohibit them. Just because many do it, it does not follow that it is morally right to do it. This "grease payment" controversy has swirled around the FCPA for quite some time, and there is no end to this debate in sight.

Nonetheless, the effects of the FCPA on the way American firms do business have been far reaching. Once again, according to the Justice Department, several firms that paid bribes to foreign officials have been the subjects of criminal and civil enforcement actions, resulting in large fines and suspension and debarment from federal procurement contracting, and in some cases, their employees and officers have gone to jail. To avoid such consequences, many MNCs have implemented internal policies, codes of international business ethics, and detailed compliance training programs intended to prevent and to detect illegal international business payments.

Host Country Obligations

Another problem with MNCs that is often cited centers on the role that they sometimes play in their host countries, which also happen to be developing nations, or less economically developed countries. Here the MNC is often thought of as a large hulking intruder that exploits both natural and human host country resources for its own monetary interests and profit by turning the public goods of the poorer nations into private gain for its shareholders. These concerns about the presence of MNC in the less economically developed countries were underscored with the unfolding of a number of highly publicized international events that are now classic case studies used by business ethicists in their research and writings about MNCs. For example, one such event was the 1984 Union Carbide (now part of Dow Chemical Company) toxic gas leak of methyl isocyanate (MIC), a highly toxic substance used in making the widely used pesticide Sevin, at Bhopal, India. To this day, the pictures of Indian women and children who were killed or left alive with crippling injuries continue to grip people who visit the numerous Web sites dedicated to the victims of Bhopal.

The tragedy at Bhopal remains the world's single worst industrial accident. Although the estimated numbers fluctuate widely depending on the source, some estimates are that of the 520,000 people exposed to MIC, 3,800 died immediately and more than half a million people were seriously injured. Some have held that the accident was due to a negligent attitude on the part of Union Carbide toward its Indian subsidiary, in general, and toward its facility at Bhopal, in particular. There were six major accidents at this site in the previous 6 years, for example. Moreover, many claim that Union Carbide was reluctant to meet its obligations to the victims of Bhopal as it engaged in what seemed like a legal standoff with the Indian government (which itself came under great criticism for its distribution of compensation to the citizens of Bhopal). As of 1994, Union Carbide had only fulfilled $3.1 of its $470 million legal obligation to the victims of Bhopal. This case has become a lesson in reputation management for MNCs on how not to respond to accidents that they are perceived to have caused.

Another case example occurred in 1995, when there was reaction from around the world to the hangings of Ken Saro-Wiwa and eight other Ogoni activist leaders in Nigeria. The Netherlands-based Royal Dutch Shell (and British Petroleum to a lesser extent) was alleged to have been a major supporter of Nigeria's military dictatorship and its attempts to silence the Ogoni people. The Ogoni had protested what it called an "ecological war" being waged against its homelands in the Niger River delta by the large MNC oil companies that were operating oil wells, gas flares, and pipelines that the Ogoni found offensive and destructive. While Shell and other MNCs were making large profits by sending crude to the oil-thirsty West, the Ogoni people remained stuck in their cycle of poverty and misery. It appeared that their land was being exploited against their will without any compensation being given to them. In reaction, they mounted a large demonstration in January 1993, organizing 300,000 people to gather and march in a country that had banned all forms of political free speech. This protest movement ultimately led to the November 1995 hangings of Saro-Wiwa and the other Ogoni leaders. Shell was criticized as an accomplice to these hangings given that it seemed to be propping up the military dictatorship with its economic largess. In response to the critical worldwide outpouring of voices raised against them after the death of Saro-Wiwa, Shell mounted a major ethics overhaul by reexamining its corporate policies and strategies with respect to its obligations to the people of less economically developed countries.

Also in 1995, Shell's *Brent Spar* controversy burst on the scene, creating yet another public relations and reputation nightmare for the MNC. *Brent Spar* was an old and decaying oil storage platform in the North Sea. Greenpeace and other vocal NGOs protested Shell's plan to disassemble the platform and dispose the parts and the oil still contained in the platform directly into the ocean. Greenpeace wanted Shell to consider a reclamation plan by bring the platform to shore and dismantling it there. Shell thought this recycling effort was much too expensive. As a result of the standoff, Shell was condemned globally for putting economic values ahead of environmental ones. After there was some violence at Shell gas stations in Germany and after Greenpeace had occupied the rig twice, Shell reconsidered its decision and towed the platform to Norway, where it was recycled for use in the construction of a ferry terminal. But, in a twist to this case, Greenpeace was forced to admit it had made a mistake about the amount of waste oil that the platform contained and was thought to be damaging to the ocean environment, if dumped in the North Atlantic per Shell's plans. As a result, about 6 months after the platform had been moved to Norway, Greenpeace sent Shell a formal letter in which they apologized for this mistaken calculation. Brent Spar is a good MNC case to demonstrate that NGOs aren't always correct in their critiques of MNCs and that the careful observer of the dance that goes on between NGOs and MNCs should keep in mind that all groups, like all humans, are fallible.

Another event that brought the issues of ICR home to many U.S. citizens was the numerous allegations of child labor and sweatshop conditions that were attributed to international business concerns and large MNCs in the apparel industry such as Nike, Adidas, Reebok, Benneton, Disney, Gap, and Levi Strauss. One of the most publicized cases was that of Kathie Lee Gifford's line of sportswear, which was shown to have been produced in sweatshops both abroad and in the United States. For example, at Global Fashions, a Honduran factory that made her clothing, it was alleged that 5-year-old girls earned 31 cents an hour and worked 75 hours per week.

A representative list of case studies of the questionable practices of MNCs could become rather long. In addition to many documented cases of sex discrimination, instances of fraud, and other financial improprieties, this list would include publicized examples such as the Nestlé infant food formula controversy; the Mitsubishi salt factory and the gray whales habitat incident at Laguna San Ignacio, Mexico; the intellectual property rights controversy of pharmaceutical MNCs and AIDS drugs produced in Africa; MNCs such as Wal-Mart (in 2005 it was the world's largest MNC) and Levi Strauss and the propriety of business dealings with China given its human rights record; the French-based MNC Total and Unocal oil pipeline built with forced labor provided by the military dictatorship in Myanmar; former president of Mexico Raul Salinas and alleged money laundering at Citibank; and so on.

What these case examples seem to demonstrate and thematize is the recurring exploitation of developing countries in which a giant and powerful MNC seemingly engages in self-serving activities that use and/or misuse the human or natural resources of the countries that had hosted them. They raise the question of how MNCs should determine their moral obligations to their host countries. Critics have argued that such practices are not only immediately damaging to the environment or harmful to people but that they also lead to a kind of geopolitical condition that has been labeled the "dependency theory," a political position that is often framed as the "development of underdevelopment." The intent and the claim here are to demonstrate that the more economically developed countries have kept the less economically developed countries of the world in a perpetual state of reliance or dependence on them. According to this account, the less economically developed nations have had the surplus of their productive efforts siphoned off by the greed and profit-taking activities of MNCs and, because of this, they have no ability to reinvest into their own economic development, thereby stifling any potential economic growth and continuing the cycle of misery and poverty in these nations.

These cases raise the question about the bona fide duties and obligations that MNC have to host countries and how these should be carried out. Answers to this responsibility question have been formulated by individuals such as business ethicists who are interested in the crafting of an answer based on particular ethical theories. Other individuals have a more practical concern and wish to see MNCs take concrete action to implement responsible behaviors. These latter individuals often form NGOs that have set as their mission the promotion and spotlighting of issues having to do with ICR. This movement has grown dramatically over the course of the past several years, and in addition to the previously mentioned Greenpeace, one can cite several leading NGOs that have made MNC watching and critiquing the main part of their trade. A shortlist would include Social Accountability International (the United States), CSR Europe (Belgium), International Business Leaders Forum (the United Kingdom), the Global Reporting Initiative (the Netherlands), The Copenhagen Centre (Denmark), and SustainAbility (the United Kingdom).

Cultural Imperialism

Those who have been critical of the process of globalization as outlined above often also criticize MNCs for their role in that process, which they refer to as "cultural imperialism." Cultural imperialism can be defined as the imposition, supplanting or erosion of one culture and its characteristic practices—language, customs, mores, values, and so on—by another culture that is considered the dominating one, because it is the culture of a larger and more powerful nation or region that can easily make such impositions on other cultures.

In the area of communications studies, "cultural imperialism theory" has sprung up as an academic specialty and it includes the study, analysis, and discussion of central concepts such as "media imperialism," "cultural dependency and domination," "cultural synchronization," and "electronic colonialism." Herbert Schiller, who is often cited in this field, may have been among the first to establish the term *cultural imperialism*. He meant for it to describe and explain the way in which MNCs, especially those in the media industry and based in the more economically developed countries, have dominated the less economically developed countries.

In general, the term has been used more often than not in a derisive manner. Most theorists seem to hold that the effects of cultural imperialism are deleterious. They claim that history has many examples to demonstrate how cultural imperialism operates and that the cultural imperialism of today's globalization will result in the same kind of destruction that befell past cultures. The examples most used in this context are those of empire-building cultures that spread through the ancient world and the more recent effort to colonize the "New World" by the Western European powers. The argument goes that just as the past dominant cultures supplanted and replaced the cultures of the lands that they "conquered" (sometimes to the point of extinction), so too today is there such a replacement of cultures being affected by "multinational capitalism" that is transforming the globe into one primary culture, namely, Western culture as defined by the customs, practices, and values of the United States and Western Europe. Soon all the people of the world will be in the same culture that is typified by the drinking of Coca Cola, the eating of McDonald's hamburgers, and the watching of movies made in Hollywood.

It should be noted, though, that theories of cultural imperialism are not without their detractors. Many find that as a theory it is lacking on epistemological grounds, because it relies on pure descriptive analysis and has no genuine explanatory import or power of predictability that are characteristics of a good scientific theory. Others have argued that the "discipline" lacks conceptual precision and that its main ideas are more like assumptions than actualities. Finally, critics have held that the theory is primarily motivated by the ideological leanings of its proponents and should be readily dismissed as a form of political rhetoric and polemic.

But in any case, the term has become a fairly common one outside of academia, and it can be found as having a certain cachet in newspaper editorials, magazines, blogs, and the popular literature of the day. In this context, too, the meaning is clear that what is meant is a globalizing, ethnocentric movement where market capitalism that is exported by the large MNCs primarily from the United States and Western Europe is hard at work in the dismantling and disassembly of the cultures of the world and replacing them with new and different customs, mores, and values. But, there has been a movement in some countries to resist the leveling effects of cultural imperialism (even in the West, France stands out as such an example), and there are many who reject the basic assumption of cultural imperialism and the thesis that what globalization and market capitalism have to offer is inherently corrosive or undermining of culture. These counter-critics argue that due to the efforts of MNCs and globalization, the standard of living of most people around the world has improved since World War II. Moreover, they say that many "modern miracles"—communication technology, the global distribution of goods, and ongoing increases in the longevity of the lives of people as well as their basic medical and health conditions—would not have been possible without the economies of scale that MNC can bring. In short, for this group, MNCs have been a boon to the world and not a burden. There is little doubt that this debate between the advocates and the detractors of MNCs over the relative merits of these organizations will continue well on into the foreseeable future.

Monitoring MNCs

Given the kinds of ethical issues and problems generated by MNC practices, it is not surprising that there have been a number of attempts to monitor MNC behavior and to establish measures that might serve as counters to the power that MNCs seem to have accumulated as major geopolitical players on the world's stage. A survey of these monitoring attempts would include the establishment of voluntary codes of conduct by MNCs, the movement to institute a system of measuring and reporting the responsibility of an MNC with respect to the environmental and social impacts of its practices in host countries, and the pressure of different groups that has been brought to bear on MNCs over the years to take stock of their practices and include and institutionalize more ethical awareness. This last item also refers to the activities of such world-renowned organizations as the Organisation for Economic Co-operation and Development (OECD) and the United Nations that have introduced influential programs called the "Guidelines for Multinational Corporations" and "The Global Compact," respectively.

Among the first and earliest attempts to monitor and bridle the power of MNCs was a self-regulatory effort on the part of MNCs themselves to set up codes of corporate conduct and compliance training programs. In the 1970s, only some MNCs had designed and adopted such codes, but today nearly all the Fortune 500 companies have them. The overall goal of these tools is to institutionalize ethics, to alert managers and employees of their obligations as associates in an MNC, and to create a climate of compliance with the requirements of the code. Many organizations go one step further and have mandatory training programs for managers and employees that familiarize them with code content and other aspects of their work, especially if they will become expatriate employees.

Most MNC voluntary codes of conduct contain typical planks or provisions dealing with host country operations that include or cover areas such as

- respect for the traditions, customs, and values of the host country;
- obeying host country laws and regulations;
- noninterference in the domestic affairs of the host country;
- institution of fair labor and employment standards;
- establishment of environmental obligations to the host country;
- a commitment to transparency in business dealings;
- pledges to avoid corrupting behavior (bribery or gift giving);
- the avoidance of tax evasion by price-transferring practices;
- expressions to enter into fair contracts and to renegotiate any existing unfair arrangements; and
- statements of philanthropic intent where the social and economic goals of the host country are recognized and promises to contribute to them are made.

In addition to the institutionalization of MNC ethics through code enforcement undertaken by individual MNCs themselves, there have been other forms of self-regulation that have been implemented and offered by industry trade groups or associations. For example, the Chemical Manufacturing Association—the chemical industry trade association now named the American Chemistry Council—set up several initiatives dealing with ways to alert the public to potential threats and to create safeguards within the industry especially after the Bhopal incident. Community Awareness and Emergency Response (CAER) programs give the public access to important information on hazardous chemicals, and the Responsible Care program attempts to reduce workplace accidents and increase health and safety awareness as well as to promote good environmental practices. This latter program likewise standardizes performance and improvement measures on the part of MNCs in the chemical industry.

Measuring and reporting performance and impact is another major monitoring area in which MNCs have been active, sometimes at the behest of groups external to them. A set of NGOs and academic research centers in the field of international business ethics have been quite vocal in expressing their views that MNCs should be engaging in the public reporting of their practices that have an effect not only on bottom-line results but also on society and the environment. One of the more prominent academic groups that is active in this area is the Centre for Social and Environmental Accounting Research (CSEAR) that is housed at the University of Glasgow. According to its mission and working with the general assumption that accounting and accountability should go hand in hand, some of the topics covered in research reports, discussion papers, and scholarly treatises at CSEAR deal with issues such as the economics of sustainability; environmental management; the actual process of social, ethical, and environmental reporting by MNCs; social and environmental cost internalization by markets and organizations; the relationship between social and environmental disclosure and share price performance; and the articulation of the standards for social and environmental reports.

The Global Reporting Initiative (GRI), housed in Amsterdam, is a good example of an international sustainability reporting institution from the ranks of NGOs. It is affiliated with the United Nations serving as one of the United Nations Environment Programme (UNEP) Collaborating Centres. Its stated mission is to develop and disseminate globally applicable sustainability reporting guidelines. These Guidelines are for voluntary use by organizations in their reporting on the economic, environmental, and social dimensions of their activities, products, and services. The GRI incorporates the active participation of representatives from business, accountancy, investment, environmental, human rights, research, and labor organizations from around the world. The GRI guidelines

- present reporting principles and specific content to guide the preparation of organization-level sustainability reports;
- assist organizations in presenting a balanced and reasonable picture of their economic, environmental, and social performance;
- promote comparability of sustainability reports, while taking into account the practical considerations related to disclosing information across a diverse range of organizations, many with extensive and geographically dispersed operations;
- support benchmarking and assessment of sustainability performance with respect to codes, performance standards, and voluntary initiatives; and
- serve as an instrument to facilitate stakeholder engagement.

A final monitoring activity that should be highlighted is provided by major groups external to MNCs. One such group is the OECD. The OECD is an international agency that supports programs designed to facilitate trade and development. Established in 1961 to replace the Organization for European Economic Co-operation, the OECD is composed of 30 member countries and has active relationships with 70 additional countries, civil society organizations, and NGOs. The OECD member countries produce two thirds of the world's goods and services, and the agency is designed to craft international conventions and agreements, decisions, and recommendations that promote a global economy. The OECD "Guidelines for Multinational Enterprises" was finalized and agreed to by the member countries in June 2000.

These Guidelines are considered recommendations to MNCs made by OECD governments; they are addressed to companies and not to their governments. Hence, these provisions cannot be taken as binding international law, but rather as a voluntary code of conduct to guide MNC practices. The document contains provisions to address some of the ethical and legal concerns that OECD member nations had in response to the kinds of behavior on the part of MNCs that are outlined above. Comprised of various planks, the Guidelines have the overall goal to encourage the positive contributions that multinational enterprises can make to economic and social progress worldwide. The Guidelines themselves are divided into eight chapters and each deals in detail with typical sorts of MNC practices. These chapters are arranged according to the following categories: general policies, information disclosure, competition, financing, taxation, employment and industrial relations, environment, and science and technology.

Similar in nature, if not in scope, to the OECD Guidelines are the 1977 "Tripartite Declaration of Principles Concerning Multinational Enterprises and Social Policy" from the International Labour Organization (ILO). The ILO devised a set of principles regarding the social aspects of multinational enterprises, for the use of governments, employee organizations, and MNCs themselves. The main scope and focus of this document is employment: safe working conditions, job security, equal opportunity in employment, and fairness in industrial relations between labor and management. Again, the provisions of the ILO principles are voluntary in nature.

A last organizational monitoring system to note is the United Nation's "Global Compact" that became an international reality in 1999. The Global Compact begins with 10 principles that deal with human rights, labor, the environment, and anticorruption and are based on other documents taken from both within and outside of the United Nations such as "The Universal Declaration of Human Rights," The ILO's "Declaration on Fundamental Principles and Rights at Work" and the United Nation's "Convention Against Corruption." The Global Compact asks MNC (as well as domestic companies) to embrace, support, and enact, within their sphere of influence, the several values found in the 10 principles. Now, many hundreds of companies from all over the world and international labor and civil society organizations are participants in the Global Compact. The Global Compact Office is supported by six UN agencies.

Although, the Global Compact is yet another voluntary program, there was a recent policy announcement at the United Nations requiring corporate participants in the Global Compact to disclose to their stakeholders the progress that they are achieving in implementing the 10 principles. Hence, this program may transform itself into a hybrid that will combine the performance and measurement approach with an effort to entice MNCs to engage in ethical practices voluntarily. It can be hoped that such a new approach to an old problem might be successful to further the aims of MNC business ethics and be of some beneficence to the global society.

Multinational Marketing

Multinational marketing involves the domestic firm extending its products into multiple foreign markets. Multinational marketing examines the discrete differences between domestic and foreign markets. These foreign markets in many cases operate differently than the domestic markets. Firms have to account for another tier of marketing attributes to understand the foreign market. Several factors make the environment for multinational marketing more complex. The marketer has to initially recognize that each country is a sovereign entity. Basically, the country decides how it is to be run without any direct intervention from another country. The country is run in a manner that accommodates the government's political interest. The government has an overbearing influence over the environmental factors that affect a firm marketing in a foreign country. First and foremost, a firm must obtain permission from the government to either produce and/or sell a good in the country. So for a firm to be engaged in multinational marketing, it must know how to operate within another type of framework. The factors that shape this new framework can be broken down into categories that involve but are not limited to social, political, legal, economic, governmental, cultural, language, customs, and topological factors. These factors help institutionalize the characteristics of the country, and the firm must adapt to these principles by learning how these factors affect the delivery of marketing goods to consumers.

In many ways, marketing products globally is the same as marketing them at home. Regardless of which part of the world the firm sells in, the marketing program must be centered on a sound product or service that is properly priced, promoted, and distributed to a carefully selected target market. In other words, the marketing manager has the same controllable decision variables in both domestic and nondomestic markets. Although the development of a multinational marketing program may be the same in either domestic or nondomestic markets, special problems are encountered during the implementation of marketing programs in nondomestic markets. These problems often arise because of the environmental differences that exist among various countries that marketing managers may be unfamiliar with.

In examining the differences between countries, the marketer must focus on how the consumer buying behavior is affected by the environmental forces. Many of these factors create distance between how the firm currently markets versus what can be done in the new environment. The environmental factors change the buying behavior and pressure the firm into revisiting its strategy for marketing in a new market. Sometimes the market changes so much that the firm has to rethink its entire strategic approach to entering the market. Although the traditional marketing mix factors of price, place, promotion, and product still reign as the most important factors in marketing, their emphasis changes when engaging in multinational marketing. The global factors actually affect how these marketing mix elements are used by the marketer. The global factors in most cases change the good that is delivered to the consumer. This directly limits the firm from being able to extend its goodwill previously established in the good's original form.

For these reasons, most firms tend to establish separate marketing plans for doing business in different countries. This is the essence of what multinational marketing is all about. Creating a separate marketing approach requires the firm to come up with unique strategies to enter heterogeneous foreign markets. The marketer must integrate the marketing mix factors with the global environmental factors to cultivate an effective approach to market in a country. The firm must conduct an extensive analysis of the global factors to determine the strategy for entering the country. In most cases, it is difficult for a firm to standardize the market attributes found in each country. This occurs because each factor is so unique to the country that it creates problems for the firm. The firm has to make a key decision early on in the process whether it is going to be an importer or an exporter. Importers make the good in another location and sell it around the world. Of course, they are subject to tariffs, quotas, duties, and sometimes, licensing restrictions that might alter the good even more. Conversely, they can choose to be an exporter, which means that they produce a good in a country and sell it in that country. A firm that directly invests in a country takes on the highest level of risk associated with multinational marketing. They are subject to potential loss of assets and stringent rules for doing business in the country. If there is a high degree of uncertainty surrounding the country, a firm might decide to be an importer to mitigate the risk.

Language

Distance barriers are created by language or labeling requirements when products are produced using a certain language in advertising the good. Although these changes may be subtle in nature, they can have a huge effect on a good. Firms have to consider what language barriers exist and how they can modify a good's image and goodwill. Firms don't want to lose value that they have created in a product. Although language is a significant barrier, the firm has to find a way to work within new guidelines to maintain value and satisfy country requirements. Also, language barriers can affect the manner in which a firm advertises in foreign markets. Depending on the advertising method, language may limit the effectiveness of the medium of communication. Sometimes the meaning of words changes when put into another language. So the firm has to figure out how to preserve the integrity of the meaning, while using a different language to communicate the message.

Culture

Another factor that the firm has to contend with is culture. Globalization has made accessing foreign markets easier. Culture is a problematic issue for many marketers since it is inherently nebulous and often difficult to understand. One may violate the cultural norms of another country without being informed of this, and people from different cultures may feel uncomfortable in each other's presence without knowing exactly why. For example, McDonald's prided itself on selling standardized hamburgers to a mass market of consumers. When they wanted to expand into the market in India, they would have a problem because beef is not an acceptable food for this culture. The Indian culture views the cow as a sacred animal and, therefore, Indians don't consume beef as a staple daily food as people do in the United States.

In some other cultures, what you see is what you get, and the speaker is expected to make his or her points clear and limit ambiguity. This is the case in the United States—if you have something on your mind, you are expected to say it directly, subject to some reasonable standards of diplomacy. In Japan, in contrast, facial expressions and what is *not* said may be an important clue to understanding a speaker's meaning. Thus, it may be very difficult for Japanese speakers to understand another's written communication. The nature of languages may exacerbate this phenomenon—while the German language is very precise, Chinese lacks many grammatical features, and the meaning of words may be somewhat less precise. English ranks somewhere in the middle of this continuum.

However, the culture that awaits the firms has not drastically changed. The firm must understand the cultural dimensions that exist and determine how differences can affect buying behavior. Culture is the pattern of behavior and thinking that people living in social groups learn, create, and share. Culture distinguishes one human group from another. Foreign culture includes beliefs, rules of behavior, language, rituals, art, technology, styles of dress, ways of producing and cooking food, religion, and political and economic systems. The firm must analyze these traits and compare them with their host country standards. This helps the firm have a better understanding of consumers from that market. Some products are far more vulnerable to cultural differences than others.

For instance, products that are nondurable ("perishable") are extremely sensitive to cultural changes. Some examples of these products include fresh foods, vegetables, clothing, carbonated drinks, dairy products, wines, meats, and other forms of textiles. On the other hand, durable products are less sensitive to cultural changes but may be affected by environmental factors. In European countries, there is a different standard for electricity, which means that the voltage on most consumer electronic devices is different. There are two basic standards for voltage and frequency in the world. One is the North American standard of 110 to 120 volts at 60 Hz, which uses plugs A and B, and the other is the European standard of 220 to 240 volts at 50 Hz, which uses plugs C through M. This environmental change in electricity forces the firm to change the electrical connection to meet the requirements in different countries. Also, automobiles have a different standard because of the various environmental factors pertaining to emission standards.

Political

Understanding the political environment of a country is essential to obtaining permission to access a country to sell goods. Given the sovereign nature of most countries, they have a high degree of discretion in deciding how they choose to be governed. Thus, the political environment of countries is a critical concern for the international marketer, and they should examine the salient political features of global markets they plan to enter. A nation's sovereignty from an international law's point of view is independent and free from external control; enjoys full legal equality; governs its own territory; selects its own political, social, and economic systems; and has the power to enter into agreements with other nations. It is in the extension of national laws beyond a country's borders that much of the conflict in international business arises. Nations can and do abridge specific aspects of their sovereign rights in order to coexist with other countries. The European Union, North American Free Trade Agreement (NAFTA), and MERCOSUR are examples of nations voluntarily agreeing to give up some of their sovereign rights in order to participate with member nations for common, mutually beneficial goals. The ideal political climate for a multinational firm is a stable and friendly environment, but often that is not present. Since foreign businesses are judged by standards as variable as there are nations, the friendliness and stability of the government in each country must be assessed as an ongoing business practice. For example, the European Union limited Chiquita Banana from selling large quantities of bananas there and placed tariffs on the banana as well. By limiting supply and increasing the price the European Union made Chiquita's banana unattractive compared with other bananas in the marketplace.

The most important of the political conditions that concern an international business is the stability or instability of the prevailing government policies. Political parties may change or get reelected, but the main concern for firms is the continuity of the set rules or code of behavior regardless of the party in power. A change in the government does not always mean change in the level of political risks. In Italy, the political parties have changed 50 times since the end of World War II, but business continues to go on as usual in spite of the political turmoil.

The most severe political risk is confiscation, which is the seizing of a company's assets without payment. Less severe is expropriation, which requires reimbursement, for the government-seized investment. A third type of risk is domestication, which occurs when the host country takes steps to transfer foreign investments to national control and ownership through a series of government decrees. A change in the government's attitudes, policies, economic plans, and philosophies toward the role of foreign investment is the reason behind the decision to confiscate, expropriate, or domesticate existing foreign assets. Some products are more politically vulnerable than others, in that they receive more government attention. This special attention may result in positive or negative actions toward the company. Unfortunately, there are no absolute guidelines for marketers to follow whether the product will receive government attention or not.

There are some generalizations that help identify the tendency for products to be politically sensitive. Products that have an effect on the environment exchange rates, national and economic security, and the welfare of the people are more apt to be politically sensitive. For instance, the United States has banned the use of lead-based paint in homes. The Japanese government banned imports of beef from the United States after the discovery of the first case of mad cow disease in Washington State. For products judged nonessential, the risk would be greater, but for those thought to be making an important contribution, encouragement and special considerations could be available.

Economic

The marketer must develop an understanding of the economic factors that will influence the environment. The economic factors involve the size of the economy, the purchasing power parity that exists in the market, stability of the currency, foreign exchange rate, rate of inflation, rate of interest, disposable income in the economy, and the rate of unemployment. These factors determine whether the market is suitable for the firm to enter in order to sell a product. The marketer wants to enter markets that are stable and growing. The factors contribute to explaining the business cycle in a country. The marketer has to look at the current stage of economic development the country is in. It may not be an attractive market for the marketers if they have to allocate a large sum of resources and time to develop the market. The marketer should be able to measure the return from investing in a country.

Ultimately, the firm wants to remove its profits from the country. So looking at forward contracts to guarantee a stable return is essential for multinational firms that decide to invest in a country. This directly ties back to the stability of the country in terms of ensuring that its foreign exchange rate is not undervalued. The marketer should have a good idea of how many months they should take with a forward contract. The more unstable the environment, the longer the contract should be to mitigate risk.

For example, in 2002 when Dell Computer decided to sell computers in China, it found out that the per capita income was some $1,000 compared with $36,000 in the United States. Also, less than 1% of the population had a credit card. The Chinese government controlled the content that was permitted on the Internet as well. So Dell had to revise its strategy for selling its computers over the Internet in the Chinese market.

Legal

One of the greatest areas of concern for the marketer is in the legal area. The marketer wants to protect its intellectual property rights and must look at how developed the rules are in protecting a foreign firm's intellectual property rights. If the country does not allow the firm to enforce its rights effectively in the country, the firm stands the chance of losing a great deal of goodwill in their products. The marketer must examine the rules for advertising as well in the country. Sometimes a country may have specific limits on speech and the manner in which the firm can communicate a message. The country may have rules that limit guest workers and the type of workers that can be used in a country. Understanding the country's laws will help the marketer develop a multinational marketing strategy that works. In most countries, the biggest problem that firms run into is illegal use of their intellectual property rights (i.e., copyright, trademark, trade secret, and patents). Some countries don't have sophisticated rules in place to protect foreign intellectual property rights and thus their infringement is likely. For example, Yaqing, a Shanghai-based soft drink maker, lost a lawsuit last January against Coca Cola and its local bottler over the naming of a new beverage. Yaqing claimed the characters for Coke's Qoo fruit drink—"Ku-er" in Chinese—were too close to those of Yaqing's Kuhai drink. Yet a Shanghai court ruled that the two names were different enough for consumers not to confuse them.

Customs

The firm must examine the role of technology in the foreign country. Technology has allowed marketers to overcome certain barriers that in the past prevented them from entering certain markets. Technology has afforded many firms the ability to operate more efficiently over the long term. So an examination of the role of technologies in the multinational marketing plan is essential in today's environment. The multinational marketing firm pursues different strategies in each of its foreign markets. They could have as many different product variations, brand names, and advertising campaigns as countries in which they operate. Each overseas subsidiary is autonomous. Local marketers are given the authority to make the necessary decisions and are held accountable for their results. In effect, the multinational marketer competes on a market-by-market basis.

Topological

Last, in the process of marketing products in multiple countries, the firm must recognize the subtle differences in the topology of the country. In other words, the terrain and climate of the country will have a great impact on how the firm distributes its products. It might not be conducive to sell products in a similar manner as the United States based on the structure of the environment. In some countries, it is not common to see large shopping malls. It is more common to see smaller stores that sell a broad range of products. Also, the mechanism for reaching customers will be affected by the topology of the country. In some countries, because of the mountains and steep hills it is difficult to reach customers with traditional methods of advertising. For example, using the radio, television, and cable television may be limited in some foreign markets. So this is yet another challenge that the marketer has to consider in developing their marketing plan for each country.

Conclusion

Multinational marketing is a process that firms recognize they need to grasp in order to market in other countries. A continual evaluation of environmental factors is key to understanding these new markets. Firms must develop a careful and detailed approach for reaching consumers in various markets. They must work with the people in each country and find their unique differences to avoid alienating themselves from the market. Firms should not take an ethnocentric approach to examining each market but rather selectively choose a market and examine the environmental factors. After determining the core differences, the firm should establish a strategy for entering the market. These elements are mandatory for a firm to be successful in another country. Unfortunately, there are no shortcuts in learning about another country. But there is enough history available to learn about the country and develop a strategy for doing business in the environment.

N

Nash Equilibrium

Named after its inventor, John Nash (1928–), a Nash equilibrium is a combination of strategies—one for each player—such that each individual's strategy maximizes their payoff against the strategies of the other players.

For example, the game in Figure 1 represents the barroom scene occurring during the "eureka" moment in Nash's biographical film, *A Beautiful Mind.* John and a rival can either approach a blonde or one of her friends. If both approach the blonde, they block each other; each receives a payoff of 0, as illustrated in the northwest cell. If John approaches the blonde and his rival a friend, John's payoff is 3 and his rival's is 1 (the northeast cell). The payoffs in this cell are circled because blonde maximizes John's payoff against the rival's strategy of friend (3 > 2), and friend maximizes the rival's payoff against John's strategy of blonde (1 > 0). Consequently, the strategy combination (blonde, friend) is a Nash equilibrium.

		Rival	
		Blonde	Friend
John	Blonde	0, 0	3, 1
	Friend	1, 3	2, 2

Figure 1 Beautiful Mind Game

Note: John's payoff is listed first; his rival's is listed second.

Equivalently, any collection of strategies is a Nash equilibrium if they are *mutual best replies.* For example, the payoffs in the southwest cell of this game are also circled because friend is John's *best reply* to the rival's strategy of blonde (1 > 0). Similarly, blonde is the rival's best reply—against John's strategy of friend—because 3 > 2.

It is useful to compare Nash equilibrium with an ethical norm, one that is incorrectly identified as the Nash equilibrium in the film itself. According to the golden rule John should approach a friend (doing what he would like his rival to do). Similarly, the rival should approach a friend (because this is what he would like John to do). Yet this outcome—corresponding to the southeast cell—is *not* a Nash equilibrium. Either would approach the blonde if the other approaches a friend.

Nash equilibrium is the predominant solution concept for noncooperative games because one always exists under very general conditions (e.g., irrespective of the number of players or the number of strategies each player possesses). Finding Nash equilibria may require the use of *mixed* (probabilistic) strategies. For example, in a principal-agent game the principal (manager) monitors the agent (worker) at random intervals rather than continuously standing over his or her shoulder. The two most common interpretations of mixed strategy Nash equilibria are epistemic and mass action. The epistemic interpretation treats Nash equilibrium as the prediction of the likelihood of behavior by rational players who have common knowledge about the game. In the mass action interpretation, a Nash equilibrium is the average frequency of behavior within a population of players randomly matched to play the game. This latter interpretation links Nash equilibrium to the biological solution concept of evolutionary stable strategy.

Nash equilibrium has proven to be an essential concept for auction design, such as the Federal Communication Commission's auctioning of spectrum licenses or eBay's initial public offering. The understanding of Nash behavior in competitive price setting is fundamental for detecting cartel behavior and in assessing the credibility of entry-deterring strategies such as predatory and limit pricing. Finally, in principal-agent relationships a fundamental trade-off exists between Nash equilibrium, Pareto efficiency, and budget balancing of managerial incentives and revenues, thereby identifying a further role for ethics in corporate governance.

National Ambient Air Quality Standards (NAAQS)

To control ambient air quality, the Clean Air Act, which was last amended in 1990, requires the Environmental Protection Agency (EPA) to set NAAQS for pollutants that are considered to be harmful to public health and the environment. The Clean Air Act established two types of standards for ambient air quality. Primary standards concern the minimum level of air quality necessary to keep people from becoming ill and are aimed at protecting public health. These primary standards are intended to provide an adequate margin of safety for the public, which has been defined to include a representative sample of so-called sensitive populations such as the elderly, children, and asthmatics. The secondary standards are aimed at the promotion of public welfare and the prevention of damage to animals, plant life, and property generally.

These standards have been set for six principal pollutants known as criteria pollutants. These are carbon monoxide, lead, nitrogen dioxide, particulate matter, ozone, and sulfur oxides. It should be noted that ozone is not directly emitted into the air but is formed by sunlight acting on emissions of nitrogen oxides and volatile organic compounds. There are also two categories of particulate matter: those that are of dimensions 10 μ or less and those of 2.5 μ or less. Each of these has different primary standards. These standards are performance rather than design standards; that is, they set the performance levels to be achieved rather than specifying the equipment that needs to be installed to clean up air pollution.

Because air pollution problems vary from place to place throughout the country, a regional concept was adopted for air pollution control through the establishment of air quality control regions. These air quality control regions are useful units for management and control because each region has individual problems and individual characteristics of pollution control. An air quality control region is defined by the EPA as an area with definite pollution problems, common pollution sources, and characteristic weather. States were given responsibility for drawing up plans called "state implementation plans" to attain the standards for the air quality regions within their boundaries. Individual states may have stronger pollution controls, but none can have weaker pollution controls than those set for the country as a whole.

Ambient air quality is measured by using a pollutant standards index (PSI), which provides the EPA with a uniform system of measuring pollution levels for the major regulated air pollutants. Once these levels are determined, the PSI figures are reported in all metropolitan areas of the country where the population exceeds 200,000 people. These index figures enable the public to determine whether air pollution levels in a particular location are good, moderate, unhealthful, or worse. The PSI places maximum emphasis on acute health effects occurring over very short periods of 24 hours or less rather than on chronic effects occurring over months or years.

The ethical and social issues for business revolve around the inability of the market system to respond to air pollution problems. In most cases, there is no incentive for business to control its air pollution emissions. Air pollution control equipment costs money, and if one company voluntarily incurs these costs, it puts that company at a competitive disadvantage. The quality of the air we breathe is a public good, and when goods such as clean air are indivisible among large numbers of people, the market will not allow for their provision. A system of regulation must be created that makes all businesses adhere to the same standards thus leaving them in the same competitive position as before the regulations were issued.

National Association of Securities Dealers (NASD)

The National Association of Securities Dealers (NASD) is a private, nonprofit, self-regulatory organization to which nearly all brokerage firms doing business in the United States are required to belong. Including more than 5,200 firms with almost half a million employees, NASD's board largely comes from member securities firms. Its purpose is to enforce practices that protect investor rights and help maintain efficient and fair markets. As such, NASD is the largest self-regulatory organization in the country. NASD regulatory activities include supervising and disciplining broker-dealers, analysis and oversight of over-the-counter market activities, and providing arbitration and mediation for most of the disputes in the industry. The NASD is empowered to take disciplinary actions such as imposing fines and even revoking licenses against firms and registered representatives that violate its rules.

Stock market manipulation was a major issue that Franklin D. Roosevelt emphasized in the 1932 election campaign. The Securities and Exchange Act of 1934 then established the legal foundation for self-regulation of the exchange markets. A system was set up under which the New York Stock Exchange, the American Stock Exchange, and other organized exchanges, and through them their member seat holders, would act as self-regulators for the newly created government body, the Securities and Exchange Commission (SEC).

NASD's formation in 1938 resulted from the Maloney Act that amended the Securities Exchange Act and provided for self-regulation of the over-the-counter market. The NASD acts as the enforcer for federal laws and SEC regulations and is in charge of surveillance and oversight of NASDAQ securities trading, formal review of arrangements for underwriting publicly issued securities, and complex requirements for submission of monthly financial statements. Its compliance program includes such safeguards as on-site inspections of member firms, review of advertising to protect investors from inaccurate claims, and testing to ensure that member firm personnel are qualified. NASD members also subscribe to the internal Rules of Fair Practice that proscribe ethics violations, such as recommending speculative securities to customers whose financial status does not warrant it or excessive trading ("churning") intended to generate more commissions.

The NASD is well funded by firm membership fees and assessments of registered representatives and applicants in addition to fines that it levies. In 1968, NASD initiated the electronic automated quote system that grew into the electronic stock market known as the NASDAQ, which eventually outstripped the NYSE in volume. In response to veiled criticism from the SEC that such commission generating activity posed a potential conflict of interest for NASD itself, NASD elected in January 2000 to restructure and exit the trading business. By 2003, NASD had sold its holdings in the NASDAQ operation as well as in the AMEX to private investors. It remains, however, under contract to regulate those markets.

A persistent criticism of NASD is that its enforcement actions hit smaller firms for relatively minor abuses hard while ignoring major problems throughout the industry. Critics suggest that this lukewarm enforcement is emblematic of self-regulatory bodies in which the interests of the consumer become secondary to those of the supposedly regulated industry. In response to this criticism, NASD has stepped up its market surveillance activities in the past few years. At the same time, growing discord between small and large firms within the NASD has led to increasingly contentious board elections. These internal controversies coupled with growing public concern about abuses in the financial market suggest more contentious times for the NASD in the future.

National Federation of Independent Business

The National Federation of Independent Business (NFIB) is the largest political advocacy organization in the United States that represents small and independent businesses. The purpose of the organization is to provide resources to assist small business owners and managers, particularly through its effort to influence public policy at the national and state levels.

The NFIB has a membership of about 650,000. Although smaller than the Chamber of Commerce's membership of 3 million, the NFIB has a reputation in the last decade as being the most influential or powerful of all business lobbying organizations. The NFIB was founded by Wilson Harder in 1943, and he had a major goal then of trying to give small and independent businesses a voice in government decision making. Jack Faris, as the current president and CEO of the NFIB, has led the organization since 1992. Under the leadership of Faris and through an emphasis on grassroots lobbying, the NFIB has been given substantial credit for early and effective actions that helped defeat the Clinton Administration's plans for health care a decade ago.

Since the NFIB has a membership that crosses many business sectors and industries, it pursues a broad set, but limited number, of legislative goals for which consensus of its members is possible. The NFIB assumes a much more conservative political stance on most issues than several much smaller organizations dedicated to lobbying for and addressing small business interests. The National Small Business United created in 1937 is less partisan in its lobbying connections. The even smaller American Small Business Alliance, established in the mid-1990s with the involvement of Silicon Valley and other entrepreneurs, has endorsed more liberal policy alternatives than either the NFIB or National Small Business United. The American Small Business Alliance's support for issues such as a national minimum-wage hike and employer-sponsored day care places it in sharp contrast to typical NFIB positions. Among the NFIB's recent public policy priorities have been tax reduction/simplification, tort reforms and caps for medical liability, changes in health care emphasizing reduced cost, and reduction of unnecessary, excessive, and intrusive regulations.

The NFIB offers its members a variety of information sources and services. Among these benefits are reports on monthly economic trends and business-related forecasts, a ballot on public policy issues that members receive three times a year, a magazine called *MyBusiness* that is published six times each year, and its Web site informing members of its political and legislative priorities and outcomes. The NFIB actively seeks partnerships with business firms that can provide discounted products and services for its members. It has also formed alliances with other political advocacy organizations. One example is its alliance with the Moms in Business Network in 2005.

National Highway Traffic Safety Administration (NHTSA)

The National Highway Traffic Safety Administration (NHTSA) was created by the National Traffic and Motor Vehicle Safety Act of 1966 to set safety standards for motor vehicles and motor vehicle equipment. The Energy Policy and Conservation Act and Clean Air Act Amendments of 1970 also gave the agency the authority to set standards for fuel economy and emissions. This agency is located within the Department of Transportation with the general purpose of protecting the public from unreasonable risk of injury resulting from the usage of motor vehicles and is responsible for developing programs to reduce deaths and injuries as well as economic losses resulting from motor vehicle crashes.

The specific responsibilities of the agency include (1) setting and enforcing mandatory average fuel economy standards for new motor vehicles; (2) regulating the safety performance of new and used motor vehicles and their equipment such as tires; (3) investigating auto safety defects not covered by standards and requiring manufacturers to remedy such defects; (4) setting standards for auto bumpers, auto ratings (e.g., for crashes), and diagnostic auto inspections; and (5) administering the federal odometer law to prevent odometer fraud.

Other responsibilities include helping state and local governments conduct effective local highway safety programs as well as helping them reduce the threat of drunk drivers to local communities; establishing and enforcing regulations related to vehicles and antitheft devices; providing information to consumers on topics related to motor vehicle safety; and encouraging the use of air bags, child safety seats, and seat belts in motor vehicles. The agency also maintains a toll-free hotline where consumers can register complaints about safety, request information about recalls, report alleged defects in auto vehicles, and request publications dealing with highway and traffic safety.

The agency conducts research on traffic safety and the behavior of drivers so that improvements in safety can be accomplished in the most efficient and effective manner. It maintains a research and development program that supports the agency's goal to reduce motor vehicle injuries and fatalities. This program engages in extensive research, development, testing, crash investigation, and data collection and analysis activities. With regard to the latter, it maintains a National Center for Statistics and Analysis that helps gain an understanding of the nature, causes, and injury outcomes of crashes and the strategies and interventions that will reduce crashes and their consequences. NHTSA has also created a Fatality Analysis Reporting System to help interested parties identify safety problems and evaluate initiatives in motor vehicle safety standards and highway safety.

NHTSA began to evaluate its Federal Motor Vehicle Safety Standards in 1975 and, by October 2004, had evaluated the effectiveness of practically all the life-saving technologies that had been introduced in passenger cars, pickup trucks, vans, and sports utility vehicles from approximately the year 1960 through the later 1990s. A statistical model was used that combined these life-saving technologies to estimate the number of lives saved from 1960 to 2002, and, based on this model, the agency estimated that during this time period these technologies saved 328,551 lives. The annual number of lives saved grew steadily from 115 in 1960 to 24,561 in 2002. During the early years, a small number of people used seat belts, while in later years, seat belt usage stood at 75 percent and most cars and trucks were equipped with numerous other safety technologies that helped improve the figures.

National Industrial Recovery Act

Passed by Congress in 1933, the National Industrial Recovery Act (NIRA) was one of several measures that were passed by Congress and supported by the Roosevelt administration that were aimed at helping the nation recover from the Great Depression. The NIRA was a unique experiment in U.S. history as it suspended the antitrust laws that were passed to root out conspiracies and combinations in restraint of trade and sanctioned and supported an alliance of industries. Under the law, companies were required to write industrywide codes of fair competition that effectively fixed wages and prices, established production quotas, and placed restrictions on the entry of other companies into the alliances. These codes were a form of industry self-regulation and represented an attempt to regulate and plan the entire economy to promote stable growth and prevent another depression.

Under the act, employees were given the right to organize unions and could not be required, as a condition of employment, to join or to refrain from joining a labor organization. Prior to this act, the courts upheld the right of employers to do just about anything to prevent the formation of unions. Companies could fire workers for joining unions, force them to sign a pledge not to join a union as a condition of employment, require them to belong to company unions, and spy on them to stop unionism before it got started. Attempts to form unions without government help were thus not very successful, and before the Great Depression, interest in unionism was waning. The NIRA rekindled this interest.

The law created a National Recovery Administration (NRA) to promote compliance with the act on the part of corporations. This administration was chiefly engaged in drawing up industrial codes for companies to adopt and was empowered to make voluntary agreements with companies regarding hours of work, rates of pay, and prices to charge for their products. More than 500 such codes were adopted by various industries, and patriotic appeals were made to the public to encourage wider compliance. Companies that voluntarily complied could display the Blue Eagle emblem in their facilities, signifying NRA participation.

According to most historians, these codes did little to help economic recovery and, by raising prices, actually made the economy worse. Under criticism from all sides, the NRA did not last long enough to fully implement its policies. In a case called the *Schechter Poultry Corporation v. The United States* decided in May 1935, the Supreme Court declared the NIRA unconstitutional because it assigned lawmaking powers to the NRA, which violated the Constitution's allocation of such powers to Congress, and said that the provisions of the poultry code (the case in question) did not constitute a valid regulation of interstate commerce and thus unreasonably stretched the Commerce Clause. Many of the labor provisions in the NIRA, however, were reenacted in later legislation.

Nationalization

Nationalization is the involuntary transfer of private property to government ownership through confiscation, expropriation, or seizure, often with no compensation paid to the private owner. If the asset is transferred through a forced sale, the price is usually nonnegotiable and often set below the fair market value. In rare cases, an asset is confiscated by one level of government from another, as might be the case when a national entity seizes municipal property, for example, to consolidate an industry under national control.

The classic argument for nationalization stems from the idea that some essential services and commodities are so critical to citizen's lives that they cannot be entrusted to private enterprises, with motives (usually profit) that may be at odds with ensuring the general welfare. By nationalizing these assets, the government then assures the protection of key resources and revenue for use in meeting national objectives.

Governments have historically provided a number of specific reasons for engaging in nationalization: closing the gap between extreme wealth and poverty through income redistribution; environmental protection through nationalization of land and water resources; avoidance of wasteful competition by nationalizing and joining enterprises operating in natural monopoly sectors of the economy—such as utility companies—to promote reduced costs; protecting critical national security assets, such as airports, railroads, and telecommunications; and leveraging assets for economically strategic reasons, in the construction industries, for example, and even in commercial development to generate revenue for states or localities.

History of Nationalization

Nationalization is a 20th-century phenomenon that has often occurred when less developed countries decide to assume control of foreign-owned assets deemed strategic. In 1938, for example, the Mexican government expropriated all oil properties belonging to North American corporations, while in 1951 the Iranian parliament voted to take over all assets belonging to the Anglo-Iranian Oil Company. In the latter instance, Britain froze Iranian assets in England and brought a case against Iran to the International Court of Justice at The Hague; the court ruled in favor of Iran by arguing that a contract between a state and a private foreign corporation does not fall under international jurisdiction and that private foreign investors are therefore not protected by international law and must assume the risk of nationalization. The oil nationalization trend started by Mexico and Iran was followed by Venezuela, Saudi Arabia, Iraq, and Kuwait, and by the close of the century, most world oil had been nationalized.

Examples of nationalization in other industries include the nationalization of logistically important sectors (coal, gas, petroleum, railroads, airlines, communications) by the Labour Party in Britain after the Second World War; the Egyptian takeover of Suez Canal operations and infrastructure in 1956 in exchange for compensation to major French and British stockholders; the nationalization of foreign-owned copper mining enterprises in Chile in 1971; and most recently, the confiscation of white-owned farms by President Mugabe's government in Zimbabwe in the late 1990s.

The most dramatic nationalization trend occurred during the period of communist expansion starting early in the 20th century with the Russian revolution, where all industries, down to the retail level, suffered mass nationalization and conversion to state-run enterprises. With a few exceptions, such as Cuba and North Korea, this communist-induced trend had been reversed by the end of the century.

In the United States, nationalization has not been a significant issue, but it does appear periodically. For example, during the Korean War, President Harry S. Truman attempted, unsuccessfully, to seize the steel industry when it appeared that a nationwide strike was imminent.

Ethics and Nationalization

One can approach the ethics of nationalization by considering whether preserving the rights of individual property owners jeopardizes the collective rights of the citizens. In Iran, for example, governments had negotiated agreements (oil concessions) with foreign investors that subsequent administrations determined were unfairly tilted in favor of private interests, keeping valuable national resources in foreign hands, thus threatening Iranian sovereignty in matters of economic and welfare policy. A nationalization decision in this case was justified as the only way to eliminate this threat.

On the other hand, private property owners involved in nationalization cases have typically expended considerable capital and have too much to lose as a result of a government takeover. It seems reasonable that these owners should be compensated at a level commensurate with their investment.

A problem that often arises, however, is that by the time a country is ready for nationalization, it may argue that the owners have already enjoyed a more than adequate return on their investment, that the original contracts and concessions were null and void because they were negotiated by corrupt or otherwise illegitimate regimes, or that, as in the Iranian oil case, the concessions themselves were not legitimate since they bargained over national assets that rightly belonged to the citizenry and were, therefore, not for sale.

Depending on the extent to which owners are perceived, justly or unjustly, as having made exaggerated profits, a government may choose to conduct nationalization as a forced sale appropriation or may opt for outright confiscation. To complicate matters, nationalized assets usually provide a platform for future development and gains on the part of the country, a platform that might not have been available without the capital and effort of the owners. In some cases, the private investment is so extensive that a country cannot afford to pay fair market value without risking bankruptcy, recession, and unmanageable debt. Nevertheless, and difficult as it may be to realize in practice, a nationalization resolution will not be ethically satisfactory unless governments make every effort to provide fair and just compensation to the owners.

The Future

Nationalization can backfire. When a country nationalizes a foreign-owned industry, it increases the expropriation risk to all investors for many years, staunching the flow of capital without which a country can remain underdeveloped regardless of their bounty in natural resources. As the expropriation risk increases, the required return on foreign investments can become unreasonable, and governments with a history of nationalization should expect to be required to negotiate very attractive incentives with new investors to mitigate their risk.

National Labor Relations Board

The National Labor Relations Board (NLRB; referred to here as the Board) was established by the National Labor Relations Act (1935) as its administrative body of three members. The 1947 amendment expanded the NLRB to its present membership of five, appointed by the president and confirmed by the Senate. Functionally, the NLRB comprises several bodies with different roles: The 50 Regional and Area Offices handle routine information requests and initial contacts with labor and management officials; these offices receive requests for elections as well as unfair labor practice (ULP) charges; they conduct representation elections and certify the election outcomes.

The Office of the General Counsel offers general supervisory oversight of the 50 Regional and Area Offices. In addition, it investigates ULP charges and issues complaints where such is warranted. The full Board establishes general policies for the General Counsel and the 50 Offices. In addition, it oversees the administrative law judges, who hold elections under the act. In disputed ULP cases, the General Counsel acts as prosecutor and the Board acts as a judge. However, if either party in the dispute declines to obey the order of the Board, the General Counsel shall go before the U.S. Circuit Court of Appeals seeking an enforcement order, after another hearing. This potentially long delay is one of the complaints about the act and its enforcement, thus allowing the employer to use the act as a chilling effect on employees' actions.

The membership is naturally politically oriented as it collectively attempts to interpret and implement the provisions of the three statutes it administers. Over time, the Board's philosophy has changed from an emphasis on employee rights to employer rights, and decisions of a particular Board have reversed the decisions of previous Boards.

Statutory Coverage

Three statutes, collectively known as The National Labor Relations Act, as amended, were a logical expansion of the principles laid down in the Norris-LaGuardia Act (1932) and the National Industrial Recovery Act (1933). The National Labor Relations Act, 1935 (Wagner Act) primarily set forth rights of employees to join labor organizations and the responsibility of employers to bargain collectively with the employees' chosen labor organization. The Labor-Management Relations Act, 1947 (Taft-Hartley Act) primarily laid down some restrictions on employee rights as had been exceeded in the preceding 12 years. The Labor Management Reporting and Disclosure Act, 1959 (Landrum-Griffin Act) has been generally viewed as a law to protect individual employee rights and addressed some charges of corruption within the unions. Thus, the purview of the NLRB is large.

Overall Assessment of Effectiveness

Naturally labor and management will be critical when they do not win cases with the Board. However, the foremost academic authority on the act, Professor James A. Gross, has charged that the national labor policy favors and protects the powerful to the detriment of the less powerful and maintains that the current national labor policy is a failure, based largely on the administration of the act as well as the lack of enforcement power. Few academicians have written about successes of the Board or the act.

National Origin Discrimination

National origin discrimination is discrimination based on the country from which an individual (or his or her ancestors) comes, or his or her accent, customs, or native language. These factors are also collectively referred to as an individual's ethnicity. The Civil Rights Act of 1964 prohibits discrimination in education, public accommodations, receipt of federal funds, and employment by employers with 15 or more employees on the basis of race, color, religion, gender, and national origin. The legislative history of the Civil Rights Act indicates that it was enacted primarily to address racial discrimination, but discrimination on the basis of national origin or ethnicity has become an increasingly important part of the law and is used with increasing frequency.

Title VII of the Civil Rights Act, which has been the basis of most of the national origin discrimination claims and court cases, prohibits discrimination in employment. Cases have involved discrimination claims based on speaking a language other than English in the workplace, refusal to hire applicants from a certain country or of a certain ethnicity, refusal to promote otherwise qualified employees based on the employee's accent, or harassment based on ethnicity or national origin.

Using national origin or related criteria as the sole basis for failure to hire, promote, or train, or to unnecessarily discipline, harass, or terminate an employee is illegal. Those who have been discriminated against on the basis of national origin may file claims with the Equal Employment Opportunity Commission, the federal agency responsible for enforcing the Civil Rights Act. Evidence of discrimination may be direct or indirect. Direct evidence may involve the employer saying those of a certain national origin or ethnicity will not be hired. Indirect evidence may involve the employer having a neutral policy, which has the impact of excluding employees of a particular national origin at a higher than normal rate, such as a height and weight requirement that disproportionately excludes those of a national origin statistically slighter and/or smaller than the requirement, without there being a business necessity for the requirement.

The prohibition against discrimination on the basis of national origin or ethnicity does not entitle an applicant or employee to a job if not qualified; however, national origin or related issues cannot be the sole basis for refusal to allow a qualified employee to be hired and treated like any other employee. This prohibition also applies to housing, education, public accommodations, and receipt of federal funds.

There has recently been an increase in national origin claims for at least three reasons: (1) after the terrorist attacks of September 11, 2001, on the Pentagon, New York's Twin Towers, and the forced plane crash in Pennsylvania for which Islamic extremists claimed responsibility, there was a backlash in the United States against Middle Easterners and Muslims; (2) the increased influx of immigrants and the negative response to them; and (3) the increased willingness of immigrants to use U.S. law and policies that can protect them. Closely related to this issue after the terrorist attacks on September 11, 2001, is discrimination on the basis of religion, particularly against those who, or whose ancestors, are from the Middle East. In the wake of a dramatic increase in negative and discriminatory actions toward Muslims and Middle Easterners after 9/11, the Equal Employment Opportunity Commission issued cautions reiterating its commitment to vigorously enforcing antidiscrimination laws against Muslims and Middle Easterners.

National Traffic and Motor Vehicle Safety Act

The National Traffic and Motor Vehicle Safety Act was passed by an overwhelmingly Democratic Congress and signed by President Lyndon Johnson in 1966. It required automobile manufacturers to institute safety standards to protect the public from unreasonable risk of accidents occurring as a result of the design, construction, or operation of automobiles. It also included nonoperational safety factors, such as highway design, and it empowered a new agency, the National Highway Traffic Safety Administration (NHTSA) to mandate uniform safety standards.

Although automobile accidents were by 1965 the leading cause of death of Americans under 44, both government and manufacturers had largely ignored the issue. A series of events would unfold that focused national attention on automobile safety and culminated in litigation and automobile recalls in the years following the establishment of the NHTSA. A relatively obscure lawyer named Ralph Nader emphasized the issue of automobile safety in his 1965 book *Unsafe at Any Speed*, which focused on the alleged defects of the Chevrolet Corvair. Extensive congressional automobile safety hearings the following year chaired by Senator Robert Kennedy grabbed the spotlight when they revealed that General Motors secretly employed detectives in an unsuccessful attempt to find personal "dirt" on Ralph Nader. These well-publicized hearings helped instill the idea among consumers that the "caveat emptor" rule no longer sufficed for highly technological products. These hearings created the necessary popular support to pass a federal law that made automobile manufacturers responsible for the safety of their products.

During the next decade, life-saving shoulder-lap belts, collapsible steering columns, strengthened door latches, shatterproof windshields, and protective dashboards became the mandated standard. These new legal requirements led to a record number of product safety lawsuits and many product recalls and, ultimately, to significantly lower traffic death rates. Additional regulation was added in 1975 with a 10-year schedule of required increases in the fuel efficiency of all new cars. Critics from the automobile industry and many free market advocates decried such requirements as overly bureaucratic edicts that restricted consumer freedom and were far too costly for industry.

A 1985 article by Ralph Nader in the *New York Times* asserted that these regulations had already saved more than 150,000 lives and cited a government report that motorists had also saved "a cumulative $90 billion in transportation costs since 1975 from improvements in fuel economy." Many consumer advocates believed that these savings largely resulted from design and engineering changes that Detroit auto makers would never have done without pressure from the NHTSA. Even Henry Ford II in 1977 allowed that the first wave of NHTSA standards had advanced car and highway safety, fuel efficiency, and pollution controls. By 1998, reliable sources estimated that seat belts alone saved at least 10,000 lives a year.

After the heady early years of its existence, NHTSA's regulatory programs slowed considerably, beginning in the late 1970s. Mandates for the second wave of engineering advances such as the air bag were stalled for more than a decade by successive congresses that were increasingly skeptical about regulation and more susceptible to the auto industry's very extensive lobbying activities. There were signs by the middle of the first decade of the 21st century that this might shift again. Significant increases in fuel prices coupled with large numbers of fuel inefficient SUVs prompted a renewal of congressional mandates for increased fuel standards.

National Transportation Safety Board (NTSB)

The National Transportation Safety Board (NTSB) is an independent federal agency responsible for investigating all civil aviation accidents and other significant accidents in railroad, highway, marine, and pipeline transportation. The NTSB's mission is to improve transportation safety. Its accident investigation findings are used to make safety recommendations and improvements that will make transportation safer.

The NTSB was established by Congress and began operation on April 1, 1967. It became a completely independent agency on April 1, 1975. To maintain impartiality, it is not affiliated with any other agency or organization, although it works with other agencies and organizations in accident investigations. Since its founding, the NTSB has investigated more than 124,000 aviation accidents and more than 10,000 surface transportation accidents. The NTSB does not have regulatory or enforcement powers. It makes recommendations based on the facts arising from investigations. Recommendations from accident investigations are based on thorough investigation and may address deficiencies that do not directly pertain to what is ultimately determined to be the cause of the accident. To maintain impartiality, the board's analysis of facts and determination of probable cause cannot be used as evidence in a court of law nor can persons in legal or litigation positions be assigned to accident investigation teams.

The NTSB is governed by a five-person board of directors, who are each nominated by the president and confirmed by the Senate. They serve 5-year terms. One member is designated by the president as chair and another as vice chair for 2 years. The chair requires separate Senate confirmation.

Accident investigations are carried out by the NTSB's "Go Team." The team's goal is to begin investigating major accidents at the scene as quickly as possible. A team consists of anywhere from three to more than a dozen specialists from the board's headquarters staff in Washington, D.C. Each team is supervised by an Investigator-in-Charge and made up of separate investigators who are specialists in each clearly defined portion of the accident investigation. In aviation, these areas include operations, structures, powerplants, systems, air traffic control, weather, human performance, and survival factors.

If it is determined that an investigation involves criminal activity, the attorney general, in consultation with the chair of the NTSB, will notify the board. The NTSB will then surrender lead status on a transportation accident to another agency such as the FBI or the Justice Department.

Since 1990, the NTSB has maintained a "most wanted" list of safety improvements. Because of the agency's reputation for impartiality and thoroughness, more than 82% of its recommendations have been adopted by those in a position to effect change. Examples of items on the current list include improving child occupant protection in automobiles, eliminating hard core drinking and driving, reducing dangers to aircraft flying in icing conditions, and improving audio and data recorders in aircraft.

Natural Assets (Nonuse Values)

Natural assets are the various forms of wealth originating within the natural world. Land, water, the atmosphere, animals, and plants are all examples of natural assets. Natural assets can have both a use value and a nonuse value. The nonuse value of natural assets lies in their intrinsic value apart from any instrumental use as a mere means to other human ends. If, for instance, the Everglades were to be obliterated, this would be understood as a loss not simply because tourism would falter but because something of intrinsic value would have been lost. Tourism would represent one use value of the Everglades, but the Everglades also has a nonuse value, an intrinsic value. Recognizing the intrinsic value of natural assets is crucial to the appreciation of natural beauty, spiritual and moral development, and understanding the place of humans in the world.

Although natural resources are often thought of as publicly available natural assets, in practice, this does not always hold true. Natural resources are not defined as natural assets for an individual unless one also has a right to them. Clean water, for instance, may be a natural resource, but many have no access to clean water and are not necessarily thought to have a right to clean water that they may claim against those who privately own local water rights. So if someone owned the water rights to a local spring, the clean water from the spring would be both a natural resource and a natural asset for the owner. The spring water would be a natural resource but not a natural asset for a neighbor with no rights to the water.

Natural assets serve two crucial functions: providing the raw materials of economic production and serving as the natural sinks needed to maintain ecological homeostasis. As natural sinks, the air, water, and soil absorb and decompose waste. Forests, for example, play a crucial role in carbon sequestration. When wood is burned for fuel, carbon is released into the atmosphere contributing to climatic changes that often have a negative impact on the global ecosystem.

Traditionally, economists have not accounted for nonuse values assigned to natural assets in terms of either intrinsic value or their value as natural sinks. Instead, economists have held that natural assets are just another factor of production for which human-made capital can be substituted indefinitely. Ecological economists try to account for the nonuse value of natural assets by assigning replacement cost values required to make up for the economic benefits otherwise yielded by intact natural sinks. While it is impossible to assign dollar values to the intrinsic value of natural assets, ecological economists argue that assigning economic value to natural assets, such as natural sinks, can go some of the way toward a more accurate assessment. Ecological economists, for example, would assign value to the oysters of Chesapeake bay as the kidneys of the bay that help to prevent algae blooms, rather than assuming that the monetary value of the oysters for the fishing industry is exhaustive.

NATURAL BUSINESS ETHICS

Natural business ethics is the use of theories, concepts, and research from the natural sciences that provide insights into the ethical dilemmas, problems, and issues that occur in business organizations. The natural sciences most frequently involved are ecology, evolutionary biology, evolutionary psychology, cognitive neuroscience, and genetics, with thermodynamics, paleontology, primatology, and related anthropological sciences sometimes being used. In this approach, human behavior is understood to be the outcome of natural evolutionary forces that have produced behavioral traits, cognitive modules, and genetic systems that are positively and adaptively responsive to environmental challenges and opportunities of the earth's ecosystems. Business behavior, including that found in the large-scale business corporation, is a variant of naturally evolved human behavior and subject to the same natural forces, constraints, and opportunities. Going beyond simple descriptive accounts of nature-based business behavior, natural business ethicists draw normative inferences about the moral issues that occur in the corporate workplace, such as fair pricing, discriminatory treatment of employees, stakeholder claims, organizational justice, breach of social contracts, environmental pollution, and so forth.

A broad base of Darwinian evolutionary theory and confirming empirical research constitutes the conceptual foundation of natural business ethics. It includes the following features:

- Organic life evolves within its host environment, with adaptive success dependent on the organism's physical traits and behavioral routines.
- Organic traits and behavioral patterns are the outcome of an organism's genome, that is, its total set of genes, interacting with the host environment.
- Natural selection describes the organism–environment linkage wherein those traits and routines that enable the organism to survive and adapt are favored and conserved, while nonadaptive features are discarded or become adaptively nonfunctional.
- Life-supporting ecosystems consist of a great diversity of cellular forms, plants, animals, and humans, and are affected by meteorological, astronomical, chemical/physical, geological, and oceanic forces. Symbiotic, mutually supportive linkages between diverse organisms occur throughout ecosystems, enhancing the adaptive prospects of ecosystem inhabitants.
- Modern human beings (*Homo sapiens*) and their hominid predecessors (several *Homo* variants) have evolved subject to the organic, genetic, natural selection, and ecosystem processes that have shaped and conditioned all organic life on earth.
- Cognitive neuroscience, paleoanthropology, and comparative primatology describe the evolution of a distinctive human brain capable of forming, using, transmitting, and self-correcting cognitive symbols as adaptive tools for interacting successfully with environmental forces.
- Human cognitive symbols are the basic building blocks of human culture, capable of assuming diverse forms and patterns within geophysical environments of great variety. These sociocultural symbols, also known as memes, are transmitted through learning by being copied from brain to brain over generational time, thus establishing cultural traditions and customs.
- A reciprocal relationship exists between sociocultural symbols and the natural evolutionary processes that gave rise to them, with each dependent on the other. Hence, the nature-nurture, culture-gene interface blends and harmonizes human learning and inherited biological traits, rather than separating and opposing them to one another.

Building on this Darwinian theoretical base, natural business ethicists have proposed that moral issues in business are a mixture of biological and cultural traits, best understood and dealt with by recognizing the natural components involved. Four examples give a flavor of this approach. William Frederick has argued that two nature-based value systems—economic production and a quest for power—drive the behavior of corporate managers toward goals that defeat and contradict the moral needs of employees and their communities by disrupting ecological systems and diminishing social justice. Paul Lawrence posits the presence of four biological drives—to acquire, to bond, to learn, and to defend—underlying all human behavior, which taken together constitute an innate moral system. The resultant moral sense can be used as a template to evaluate the ethical and unethical actions of companies like Enron. Timothy Fort draws on cognitive neuroscience research that shows an upper limit on the number of meaningful relationships that people can have with others, arguing that a person's moral identity therefore depends on working within relatively small-size groups. Large-scale, hierarchical organization that is typical of business corporations can, and often does, diminish the ability of business practitioners to distinguish right from wrong. Evolutionary psychologists Leda Cosmides' and John Tooby's research reveals the presence of ancestral neural modules that favor the formation and enforcement of social contracts; David Wasieleski and William Frederick subsequently developed a model of evolutionary social contracts that demonstrates the moral responsibility of business firms when they contract with employees and host communities.

These recent studies of natural business ethics are a historical extension of much older traditions reaching back to Adam Smith and David Hume, who believed that nature-induced moral sentiments mediate much economic behavior, an idea echoed by contemporary political scientist James Q. Wilson's notion of an innate moral sense for fair play. Related theory and research in organizational ecology, population ecology, organizational complexity, and economic sustainability provide supplemental support for the basic ideas and approaches of natural business ethics.

Natural Capital

Natural capital refers to the ecological resources that are used in economic production and consumption, such as fertile land, elements from the earth's crust, atmospheric gases, bodies of water, and plant and animal species. The concept of natural capital has been developed by advocates of sustainable development to emphasize the dependence of all economic activity on these naturally occurring resources and the ecological systems of life that they support. Natural capital has quantifiable economic value either in terms of its potential to enable the production of goods and services or its ability to be traded as a commodity; however, unlike traditional capital, natural capital is thought to have a kind of primary importance in that its conservation and protection is a necessary condition for the continued availability of other forms of capital and, thereby, economic activity.

Natural Capital and Other Forms of Capital

Economists of the modern period, ranging from Adam Smith, David Ricardo, and Karl Marx, have historically identified three central elements in the production process: land, labor, and capital. Capital in these contexts refers to items such as buildings, plants, tools, and machinery that are used to produce other tradable goods. The ability of firms to produce valuable goods for trade depends on capital maintaining its value over time as an instrument of ongoing production. Capital, in this sense, refers to *manufacturing capital* or capital that is created by humans to engage in production. The origins of the term underscore that capital is centrally an object of human creation, as opposed to something found in nature.

Contemporary economists and management theorists have implicitly maintained that capital should be more broadly understood as those resources that can produce additional market value or competitive advantage. *Financial capital* is perhaps the most common form of capital discussed in contemporary settings, especially as businesses transition from a manufacturing to a service orientation. All financial capital can, in principle, be liquidated for money. Whether such capital takes the form of cash, equity stock, bond notes, or other financial instruments, financial capital enables either the direct use of money for business operation or the acquisition of money through leveraged agreements. Business leaders are also aware of the importance of new ideas and innovative practices in remaining competitive. Such *intellectual capital* can result in valuable patents and responsive product lines or services. Information technology firms have operated under the principle that innovative ideas and the integration of resultant technologies hold the key to developing new service platforms that make timely information available to a range of customers. *Social capital* refers to the advantages made available to organizations through the trust, commitment, and skill offered by its stakeholders.

Whether manufactured, financial, intellectual, or social, capital is intended to be maintained rather than depleted. Indeed, the sound growth of business traditionally takes place only under the assumption that the firm's stock of capital is enhanced rather than diminished. *Natural capital* has traditionally escaped a comparable analysis. A number of observers within economics and business have emphasized that an economy exists only as a part of a larger ecological system. This ecological context of commerce requires that market actors acknowledge both the natural environmental inputs in the production process as well as the ways in which their activities can adversely affect the health and viability of the ecosystem in which they operate. Natural capital, such as water, air, minerals, energy sources, and plant and animal life, are depleted by business; however, like other forms of capital, the continued depletion of these resources threatens the ability of market actors to create value in the future. Where traditional economic analyses have disregarded the natural environmental limitations to market activity, ecological economists have put forth arguments as to why natural resources are, in a fundamental sense, capital that cannot be spent without significant adverse social and economic impacts to human well-being. Global climate change, such as greenhouse gas emissions, deforestation, groundwater toxicity, and destruction of essential wetlands are but a few examples of the social and environmental problems associated with the continued depletion of natural capital.

Natural Capital and Sustainable Enterprise Management

More recent discussions involving natural capital have centered on the ways in which economic activity can be made *sustainable* and thereby preserve the stock of natural capital. Sustainable development implies an elimination of the very idea of economic growth as it has been traditionally understood. As natural resources are extracted, used, and depleted, the balance between ecosystems and the economy is thought to become less stable. The use of naturally occurring energy sources creates by-products that are often rendered unusable for economic or natural purposes. Production processes create waste that transforms naturally beneficial or benign substances into ecologically harmful pollutants. Certain resources, such as trees and fisheries, are used commercially at much higher rates than natural, regenerative mechanisms can create new supplies. Advocates of sustainable development maintain that these problems illustrate why the expansion of markets without accounting for natural capital is ultimately unsustainable. As long as markets operate without regard to environmental scale, that is, the biophysical capacity of the natural environment, growth potentially outstrips the environment's ability to support continued life and, thereby, economic activity.

Sustainable development, hence, is economic activity that continually improves human well-being while remaining at a level that can be indefinitely maintained by the natural environment, thereby permitting future generations to achieve similar levels of well-being. This position requires that market actors think differently about the use of natural capital. First, it requires that natural resources be used as productively as possible to eliminate inefficient or careless use of natural capital. Second, since economic activity has historically produced harmful wastes, it is incumbent on economic actors to minimize such wastes or, as some have argued, do away with the very concept of waste. Third, sustainable development requires the beneficiaries of economic development to reinvest in natural capital. Just as firms and governments need to reinvest in fixed capital from time to time, enhancing the value of natural capital through ecological preservation is a basic tenet of sustainable development.

These principles have shaped the emergence of sustainable enterprise management. While advocates of sustainable development tend to analyze economic trends at an institutional or global level, organizational leaders who take the goals of sustainable development seriously have articulated an array of frameworks that managers can use to change their operations to satisfy the ends of productivity, waste minimization, and reinvestment in natural capital. The nonprofit consultancy The Natural Step, for instance, works with businesses to encourage managers to see how the ends of environmental sustainability and profitability are not only compatible but mutually supportive. The Natural Step puts forth four "system conditions" that are necessary for the sustainable development of market economies. These four conditions are novel, in part, because they also simultaneously serve as guidelines for enterprise management; the patterns of economic activity at the organizational level are thought by The Natural Step to determine the systemwide carrying capacity of the economy. The system conditions are the following: (1) eliminate contributions within the biosphere to increases in concentrations of substances from the Earth's crust (e.g., minerals and metals); (2) eliminate contributions within the biosphere to increases in substances produced by society (e.g., chemicals and air pollutants); (3) eliminate contributions to the physical degradation of the biosphere (e.g., deforestation and overfishing); and (4) eliminate activity that undermines humans' ability to meet their needs worldwide. The first two of these system conditions are designed to address the issues of productivity and waste minimization. The third system condition emphasizes the commitment not to engage in activity that disrupts the normal, regenerative processes that take place in nature. The fourth underscores how sustainable development occurs when economic activity improves well-being for all who make productive contributions.

The catalog retailer Norm Thompson has merged the Natural Step's four system conditions with the goals of environmental protection to guide the development of their Sustainability Action Plan. This strategic vision requires that the managers of Norm Thompson not only consider the impacts of their direct retailing on natural resources and ecologically sensitive processes but also direct their relationships with suppliers and peer organizations. Consequently, Norm Thompson has set goals of a net zero impact on greenhouse gas emissions, elimination of toxic substances from its catalog production and the products it sells, a net zero negative impact on forests (given its reliance on paper for its catalogs), and the achievement of zero waste in its facilities.

These commitments have led to practices ranging from partnerships with the Alliance for Environmental Innovation to use fully recycled (and recyclable) catalog paper of sufficiently high quality to new incentives and timelines for suppliers to use organic, chemical-free cotton. Subsidies are provided to employees to use public transportation. Norm Thompson provides noteworthy leadership among industry associations to reform the practices of clothing manufacturers and catalog retailers. As part of its action plan, Norm Thompson hired a sustainability manager that coordinates all efforts (product development, packaging, publishing, transportation, and outside influence) aimed at environmental sustainability. Management is centrally focused on accounting for the impact of Norm Thompson's business on natural capital; energy consumption is tracked, trends in waste are monitored, changes in product materials are assessed, and suppliers are questioned on their environmental practices.

The Rocky Mountain Institute (RMI) is another organization that has stressed the business case for the proper accounting of natural capital. Several elements have been introduced by RMI founder Amory Lovins and his contributor, Paul Hawken, in their framework, *natural capitalism.* The first is natural resource productivity, or the pledge to make the most efficient use of available natural resources in the development of new products and services. Lovins and Hawken cite the textile firm Interface Corporation as an exemplar in this regard. Interface's steadfast commitment to radical ecoefficiency led the firm to design its production facilities for modular floor covering so that use of electricity would be minimized. The size and shape of cooling pipes, placement of machines, and use of daylight-sensitive lamps were part of systemwide design changes that reduced power requirements by more than 90%. The German chocolate manufacturer Ritter Sport has adopted a similar stance; energy-saving technologies are deployed as long as they do not increase operational costs by more than 10%. This has resulted in an array of unique changes including the ability to control the climate in office buildings from the heat produced by a cogeneration plant adjacent to their chocolate production facilities.

Lovins and Hawken also stress that natural capitalism is committed to adopting biological models of production. In nature nothing is wasted. All by-products are used by other organisms and systems. Biological models of production, thus, emphasize production techniques that are naturally benign; that is, they can be used by the ecosystem without harm, eliminate waste altogether, or are closed-loop, in that they involve partnerships with organizations that can use what would otherwise remain unused waste. It is important to note that the call to eliminate waste is primarily, although not exclusively, a call to eliminate waste that cannot be reintegrated into natural ecological processes. Waste that is toxic or waste that ends up on landfills are wastes that are biologically harmful because they either destroy the ecological purpose, or *telos,* of certain ecosystems or circumvent the reintegration of resources into the natural environment for future use. Nature exhibits waste in some other senses of the term: For example, a bird may drop twigs to the ground in constructing a nest. This simple sense of "waste," however, neither harms other ecosystems nor thwarts the use of any resources by other available natural processes. This is quite different from human activity that, while wasteful in this simple sense of the term, is also wasteful in that it sometimes undermines the ability of natural systems to function according to their ecological purpose.

Natureworks, LLC has made significant headway in developing biopolymers, manufactured from corn and rice, which can be used in place of petroleum-based plastics in food packaging, bottles, and even clothing. Apart from lowering reliance on fossil fuels, Natureworks' biopolymers are more likely to biodegrade, thereby eliminating the inevitable waste that accompanies the best plastic recycling programs. Interface Corporation has made innovative use of flooring made from solenium that has enabled managers to meet their goal of developing flooring that is 100% recyclable into a new product. RMI is a strong advocate of business models that lease services as opposed to selling tangible goods. Efforts by companies like Xerox to lease office equipment that is made with the intention of reusing parts in later models is an example of how leasing products creates incentives to improve their quality and longevity while promoting the goal of making fully recyclable products. These efforts are encouraged by recent efforts to implement frameworks to account for the entire life cycle of products that are bought, made, and sold by businesses.

Lovins and Hawken stress, too, that the protection of natural capital requires that market actors reinvest in the stock of natural capital. This is perhaps the most challenging aspect of sustainable enterprise management, as it moves beyond the intermediate-term competitive advantages obtained through such things as energy efficiency and reduced costs associated with the handling of waste. It requires that individual firms recognize that preserving natural capital is part of the larger preservation of the ecological infrastructure on which economic activity is built. Ritter Sport continues to work very closely with agricultural cooperatives in Central America that train cocoa farmers in tilling and planting techniques that minimize soil erosion or deforestation. This notion of reinvesting in natural capital is centered on improving the long-term viability of market strategies that rely on the use of natural resources for profitable business activity.

Prospects and Challenges

The preservation and reinvestment in natural capital demonstrates how financial, intellectual, and social forms of capital are linked in complicated ways. Efficiency and cost reduction have an impact on the availability of financial capital for future ventures. Both the Natural Step and RMI have pursued enterprise management strategies that emphasize innovation. The three goals of efficiency, waste reduction, and preservation are enabled through regular investment in new, environmentally sustainable technologies. Such technologies can represent novel ways of accomplishing old tasks, for example, the use of solar panels to produce electricity, or can serve as new tools in achieving the goals of resource efficiency, for example, the use of geographic information systems to optimize the location of distribution facilities to reduce the fossil fuel consumption that inevitably accompanies transportation. Serious efforts to protect natural capital also require long-term, creative relationships with an array of stakeholders. This is especially true in situations where novel uses of waste need to be uncovered or competitors within the same industry can work together to find mutually advantageous solutions to common resource use problems. Interface has a long track record of working with municipalities and nongovernmental organizations to "offset" the carbon emitted through their businesses' operation by capping methane gas released from landfills to reuse as a substitute for natural gas; by participating in the construction of new, low-energy housing developments through high-tech building design; and, more simply, by planting trees.

One common and reoccurring objection to sustainable enterprise management is that inadequate assessment tools and incentives exist for businesses to take the steps necessary to protect natural capital. The assessment problem has resulted in a number of elaborate frameworks to monitor and measure a company's net impact on the ecosystems it affects. So, for instance, more companies are seeking the guidance of organizations such as the United States Green Building Council to certify that their building designs meet certain levels of environmental protection, measured in terms of water use, energy consumption, and impact on surrounding ecosystems. Life cycle accounting is a technique that is designed to provide an accurate snapshot of a product's true environmental impact from the beginning to the end of its life cycle. This includes the materials and energy that go into making the product to its impact on, say, the groundwater once it ends up in a landfill. Companies like Interface measure their environmental impact in much the same way in which other companies measure any other expense. All carbon emissions, whether from production facilities, company automobile fleets, or the trucks driven by suppliers to Interface's distribution centers, are monitored and recorded. This helps Interface managers make decisions about where carbon can be trimmed and how much offsetting they must do to meet their goals of being a carbon neutral company. The Global Environment Management Initiative is a nongovernmental organization that has taken the lead in developing both guidelines and metrics for these and other techniques for assessing the impact of more sustainable business management.

The incentives problem is more difficult to the extent that it requires action by more than just business leaders. As Lovins and Hawken admit, there are many good reasons why, from a business perspective, natural capital is not protected. Companies in the United States are rewarded for resource consumption in that raw materials and production inputs purchased from suppliers are treated as expenses for traditional accounting and tax purposes. Moreover, until the market prices reflect the true costs associated with environmental degradation, there is little reason for businesses to voluntarily take on the increased costs associated with sustainable enterprise management when other competitors do not. These facts point to the need for changes in policy that begin to account for the long-term economic value of natural capital and accordingly create mechanisms that direct businesses to adjust their activities to preserve this source of value, just as they would any other form of capital. This may include credits for alternative energy use, tax advantages for comparative reductions in raw materials use, and research and development grants for the use of certain technologies.

Naturalistic Fallacy

The naturalistic fallacy was identified by G. E. Moore (1873–1958) in *Principia Ethica,* where it provides the grounds for his rejection of evolutionary and hedonistic ethics. The fallacy is important to consider in business ethics since evolutionary and hedonist positions are still endorsed by some contemporary theorists in this area.

The fallacy includes a failure to distinguish between identifying a property that good things have in common and providing a general account of moral goodness. This failure prompts a fallacious assumption that by identifying a property shared by good things, one has succeeded in providing an account of goodness. For example, good things may have in common that they are desired or natural. Being desired or being natural, then, would be properties shared by good things. The fallacy is committed in accepting that because good things share either of these properties, *good* means the same as *desired* or *natural*.

The naturalistic fallacy is often conflated with the is-ought fallacy. The is-ought fallacy arises on assuming that a claim concerning what should or ought to be the case follows directly from a claim about what is the case. For example, one would commit the fallacy in assuming that because a business does or can make a profit by price-gouging, a business should or ought to make a profit by price-gouging. While the naturalistic fallacy is related to the is-ought fallacy in that it concerns a faulty assumption that prescriptive claims follow directly from descriptive claims, it is more specific in its focus. The naturalistic fallacy includes only those cases in which it is assumed that because good things all have a certain property in common, the property is the same as goodness.

As its name indicates, the naturalistic fallacy is usually identified in cases in which the property in question is a natural property. However, the same conflation may occur concerning nonnatural properties. For example, the fallacy would be committed in reasoning that since businesses that are good are also those that make a profit, *making a profit* or *profit making* means the same as *good*. While it may well be that businesses having the property of being profit making also have the property of being good, to assume that *profit making* means the same as *good* is to commit the fallacy.

Moore uses his well-known *open-question argument* to support the claim that this is a fallacy. This argument brings into relief a finer point about the linguistic source of the conflation occurring in the fallacy. Assuming that a single property, such as in the example of being profit making above, is the same as being good commits one to claiming that the words *profit making* and *good* have the same meaning. But if two words have the same meaning, then in any claim stating that profit making and goodness are the same, the *is* must assert their identity. For example, the *is* in the statement "profit making is profit making" asserts that profit making is identical with profit making. This statement is uninteresting because it is not informative. In contrast, in the statement "profit making is good," the *is* works to attribute a quality or property of goodness to profit making. This claim is informative, indicating that the word *is* is that of predication rather than identity. As Moore explains this difference, we can see that the *is* in "profit making is good" is not the *is* of identity, because we can ask a significant question about this assertion that we cannot of the other. While it is not a significant question to ask whether profit making is, after all, profit making, to ask whether profit making is, after all, good is to ask a significant question. But this question must remain open; the question always has significance because profit making is not the same as goodness.

Moore argues that evolutionary and hedonistic ethicists fall prey to the naturalistic fallacy. In his heated response to evolutionary ethicists—Herbert Spencer in particular—he points out that the fallacy is committed by Spencer in his attempt to associate ethics with natural selection. Spencer commits the fallacy by assuming that being natural or being evolved is the same as being better or being good. In response to hedonistic ethicists, both egoists and utilitarians, Moore charges that the fallacy arises in their foundational assumption that pleasure is the same as good and their understanding of the *is* in this claim as the *is* of identity rather than of predication.

Natural Law Ethical Theory

This is an ethical theory that holds one or more of the following three claims: (1) moral claims are not social conventions but are based on the objective nature of things; (2) moral right and wrong depend on facts of human nature; and (3) an immoral rule cannot be a valid law.

All three of these claims are found in the writings of ancient and early medieval Greek and Roman thinkers. The view that moral claims are not conventional but are based on the objective nature of things is stated by Aristotle, who notes in the *Nicomachean Ethics* (Book V, Chapter 7) that natural justice consists of moral claims that are "unchangeable and equally valid everywhere and do not depend on whether or not we accept them," while merely legal justice consists of social norms that "have been laid down by rule [and] differ from place to place." The view that moral right and wrong depend on the facts of human nature was advanced by ancient Greek and Roman Stoics, such as Cicero, who claims in *On the Laws* that "the nature of justice must be sought for in the nature of man." And the view that an unjust or immoral rule cannot be a valid law is famously stated by the early medieval bishop St. Augustine who declares in various writings that "an unjust law is not a law."

The medieval theologian St. Thomas Aquinas drew together all three of these claims into a comprehensive natural law theory that is commonly taken as the paradigm example of a natural law theory. Aquinas characterized what he called the "Eternal Law" as the regularities that are exhibited in the behaviors of the things that make up the universe that God created. These regularities, he claimed, are the products of the natures that God instilled in things when he created them. In particular, the regular lawful behaviors of things in the universe are the outcome of the "inclinations" that are built into the nature of each thing and that move each thing toward its proper ends. The "natural law," according to Aquinas, is the eternal law as it applies to human beings. Like all other things in the universe, human beings have inclinations toward their own proper ends, and these inclinations are part of their human nature. Unlike other things, however, the inclinations that orient human beings toward their ends are inclinations that are exhibited in their reasoning processes. In particular, human practical reason is inclined to seek what is good and to avoid what is evil. Aquinas identifies four specific goods that reason perceives as part of the human good and, therefore, as goods that human practical reason is inclined to seek and whose destruction practical reason perceives as evil and, therefore, is inclined to avoid. These four goods are human life, the procreation and care of the young, knowledge of God, and social order. The "precepts" of the natural law, then, consist of the moral claims that derive from the recognition of each of these ends as part of the human good: Human life ought to be sought and its destruction avoided; the procreation and care of the young ought to be sought and its destruction avoided; knowledge of God ought to be sought and its destruction avoided; social order ought to be sought and its destruction avoided. Human laws—that is, the rules promulgated by a ruler—can have the binding force of a valid law, he claimed, only to the extent that they are consistent with the moral precepts of the natural law. A rule that contravenes any of these moral precepts lacks one of the defining characteristics of law and so is not a valid law and has no moral claim on our obedience.

Aquinas's theory clearly embodies all three of the claims of natural law theory. First, moral claims, in his view, are not social conventions but derive from the eternal law that constitutes the objective nature of things. Second, in his theory, moral right and wrong are based on human nature, in particular on the inclinations that constitute human nature. And third, he claims that a valid law, by definition, cannot contravene one of these moral claims. During the centuries that succeeded Aquinas, however, the three strands that he wove together into an integrated natural law theory often came unraveled, and each has been independently developed by various thinkers.

The first strand of natural law theory, that is, the view that morality is not conventional but based on an objective natural order, has been a staple of Western moral theory. Thomas Hobbes, for example, who saw himself as articulating a natural law theory, argued that the laws of nature that constitute the "true moral philosophy" are binding on all men and precede any human social conventions, in particular all political conventions. The laws of nature, Hobbes claimed, command men to seek their self-preservation by entering a social contract through which they submit themselves to a sovereign and thereby create a government. Subsequently, John Locke, who also saw himself as articulating a natural law theory, agreed that the laws of nature consist of moral laws that govern humans prior to the construction of any political institutions. Locke, however, argued that the laws of nature endowed all men with natural rights to "life, liberty, and property" and so these natural rights preceded all political conventions. Contemporary human rights theories, which also claim that moral rights are not conventional but are based on an objective moral order, continue to echo the natural rights claims of Locke. It has been argued that Kantian theory and even utilitarian theory can be considered natural law theories insofar as they advocate the view that morality is not based on conventions but on objective principles.

The second strand of natural law theory—the claim that a valid law, by definition, must be consistent with morality—has also had a long history of discussion. John Austin in his treatise on law, *The Province of Jurisprudence Determined*, notably denied the claim when he argued that the concept of a law, which he defined as the sanctioned command of the sovereign, is distinct from the concept of morality. Austin's view, however, was repudiated by William Blackstone who claimed that laws that "are valid derive all their force, and all their authority" from the natural law. The question of whether the concept of morality "overlaps" the concept of law continues to be a key issue in contemporary jurisprudential debates. The so-called positivist theories of law reject the view that there is a necessary "overlap" between morality and law, while "conceptual naturalist" theories of law accept the overlap thesis. Among contemporary philosophers, John Finnis has recently defended a version of the overlap thesis, arguing that the obligatory force of the law derives from the principles of morality, and so a law that contravenes those principles cannot be obligatory "in the fullest sense" and, therefore, is not fully a law. Ronald Dworkin, who also defends a version of the overlap thesis, has argued that when "hard cases" require judges to interpret the law, the best interpretation will be one that is based on or consistent with the moral principles that best justify society's legal practices.

The third strand of natural law theory, the view that morality is based on human nature—particularly on the orientation of our human nature toward certain human goods—has been developed in numerous versions since Aquinas, particularly by Catholic thinkers. Prominent among these was the 16th-century group of Spanish theologians known as the "School of Salamanca" (including Francisco Suarez and Francisco de Vitoria) who, while acknowledging that the natural law is based on human nature, argued that the natural law obligates only because God commands it, thereby introducing a voluntaristic note into natural law theory. Among contemporary philosophers, Germain Grisez, John Finnis, and Joseph Boyle have defended a "new" natural law theory of ethics that is largely an adaptation of Aquinas's theory of morality. Finnis and Grisez, for example, define the natural law in terms of what human reason perceives is required to achieve those "basic goods" toward which humans are naturally inclined. However, whereas Aquinas suggested that there were four basic goods, Finnis and Grisez have argued in favor of seven basic human goods: life, knowledge, work, aesthetic experience, sociability, practical reasonableness, and religion. An action is morally wrong, they claim, when it directly destroys a concrete instance of these basic human goods. Finnis and Grisez specify several "requirements of reason" to which human beings must adhere in their pursuit of the basic goods: requirements that emerge as the virtues of integrity, fairness, readiness to forgive, cooperation, enthusiasm, fortitude, self-control, and faithfulness.

Although a few natural law thinkers have recently addressed business ethics issues, natural law theory has not been part of the mainstream of contemporary business ethics theory. In fact, apart from a few scattered articles, there have been virtually no attempts to apply natural law theory to issues in business ethics during the past two decades. This was not always the case. Throughout the medieval and early modern periods, natural law theorists discussed the ethical issues encountered in commercial exchanges, including fair pricing, buyer ignorance, fair profits, contracts, and money lending. More recently, several natural law ethicists, including John Ryan during the 1940s, Johannes Messner during the 1950s, and Thomas Garrett and Henry Wirtenberger in the 1960s, wrote several important treatises on the implications of natural law theory for business. Messner, an economist, provided detailed moral analyses of banking, of the modern corporation, and of the price and wage mechanisms of contemporary capitalism, while Ryan addressed the obligations of the employer to the employee. Garrett and Wirtenberger focused their analyses on the everyday issues encountered by the contemporary businessperson. More recently, Manuel Velasquez and Niel Brady have used natural law theory to analyze several contemporary business issues and have argued that natural law theory provides a more useful and more insightful basis for evaluating the ethics of business practices than do other more popular deontological and consequentialist theories.

Perhaps because of its long history, natural law theory has accumulated a significant number of troubling criticisms. First, both relativist theories and subjectivist theories have contested the claim that morality is objective. The diversity of moral views among different cultures and individuals suggests that morality does not have an objective basis. Second, critics have argued that natural law theory asserts that one can move from descriptive claims about human nature to normative claims about human obligations. But such a move, critics allege, is an instance of the is-ought fallacy and so must be rejected. Third, critics claim that natural law theory is committed to a teleological conception of human nature in its claim that morality is based on goods toward which human nature inclines. But evolutionary theory has shown, they argue, that a teleological conception of human nature is untenable. Fourth, critics contend that natural law theory wrongly implies a link between morality and the existence of God, both in its claim that religion is a basic human good and in its claim that moral obligation is a function of a God-given order or, more strongly, of a command of God. They conclude that natural law theory, therefore, wrongly implies that morality requires a commitment to belief in God. Fifth, critics argue that the view that an unjust rule cannot be a valid law is mistaken because the concept of law and its validity can be defined in morally neutral terms. If such a morally neutral definition of law is possible, then it is possible for a rule to count as a valid law and yet be unjust. Sixth, critics have criticized the claim that it is possible to specify a set of human goods whose pursuit is universally binding. As evidence against this claim, critics cite the fact that natural law philosophers have provided conflicting lists of these supposed "universal goods." Indeed, critics argue, given the immense variability in human desires, it is unlikely that one can construct a list of specific goods that would be universally acceptable.

Natural Resources

Natural resources refer to objects, relationships, or capacities of value that exist in a form or environment that originated without human intervention. Businesses, whether providing products or services, typically consume or otherwise rely on natural resources in their conversions from raw materials to finished goods. The value of natural resources derives from different modes of usage: direct consumption, indirect servicing, and/or enjoyment through nonuse. Traditional direct use or consumption of natural resources would include activities such as mining, forestry, and commercial fishing. Examples of indirect use, when natural resources provide a beneficial service, include flood mitigation by wetlands and fisheries production provided by free-flowing rivers. As many indirect-use services are enjoyed without direct cost, their value is generally only appreciated when the service is interrupted, such as when a reduction in fish stocks occurs as a result of restricting river flows through dams and irrigation infrastructure. Nonuse value derives from the personal utility gained through the simple existence of the resource such as a pristine old growth forest or specific charismatic megafauna like whales, elephants, and tigers. Natural resources, such as fresh water, forests, and solar energy, are also classified as renewable if the potential for regeneration exists within a time span relative to a human life span. From deforestation to food production to the global warming phenomenon, natural resource consumption and protection form the basis of some of the most contested social issues today. To thrive in the information age, where the actions of an international supplier can blunt sales at home literally overnight, businesses must be aware of and consciously address their use and treatment of "natural capital."

Externalities and the "Tragedy of the Commons"

An externality is an effect (negative or positive) on someone uninvolved in the action that created it. In a neighborhood park, second-hand cigarette smoke is generally considered a negative externality by non-smokers, while a neighbor who plants a garden that is casually enjoyed by others is an example of a positive externality. Hypothetically, "the commons" refers to those public goods that are not privately owned but that can be individually exploited, such as the neighborhood air in the above example. The concept that individual interests acting on a common resource will invariably lead to the degradation of those assets to the detriment of all is known as "the tragedy of the commons."

In regard to natural resources, pollution of various sorts is often the result of the negative externalities of industrial production and disposal of goods and services. One strategy of addressing this class of externality is to force the producer to internalize the cost of the pollution through financial penalties. By employing so-called pigouvian taxes, the producer would make an optimal or efficient production decision while accounting for the externalities. Theoretically, the resultant taxes would be used to clean up any resulting pollution or compensate those affected by it. Ronald Coase noted that in certain situations, pigouvian taxes would not result in economically efficient outcomes and the so-called Coase theorem posits that externalities can be eliminated if property rights are well-defined, people act rationally, and transactions costs are minimal. In essence, if all affected parties are brought into the transaction at a low cost and clear property rights allow those parties to agree on prices, externalities cease to exist by definition. While perhaps applicable to some situations, others, such as air pollution, fail the Coase theorem's requisite assumptions, and so governmental regulations are often invoked in an attempt to manage the resulting natural resource use and degradation.

Depletion and Sustainable Development

Depletion implies an unavoidable future reduction in natural resource consumption, which then naturally leads to the concepts of conservation and sustainability. The idea of conservation is rather straightforward: consume less today to provide for more consumption tomorrow while maximizing current nonuse and indirect-use value, if any. However, the concept of sustainability and sustainable development is less clearly developed. A widely accepted definition promulgated by the United Nations is as follows: "Sustainable development is development that meets the needs of the present without compromising the ability of future generations to meet their own needs" (*Our Common Future* by the World Commission on Environment and Development, 1987).

The difficulty in fulfilling this commitment lies in the twin unknowns of the needs and especially the abilities of future generations. Specifically, considering finite resources such as oil, any consumption today limits future generations from meeting similar needs at similar costs with current technologies. Sustainability concepts such as Natural Capitalism and The Natural Step advocate not conservation, but rather equivalent consumption while reducing natural resource use to remain within the carrying capacity of the ecosystem through greater efficiencies, waste reduction, reuse of existing resources, and increased use of renewable resources. Specifically, the sustainability concept of Natural Capitalism seeks to fairly value all types of capital including human capital and natural capital and advocates increased levels of economic activity with decreased overall resource degradation through the following:

- *Radical resource productivity:* The natural evolution of capitalist businesses in a competitive market is to increase production efficiencies thereby reducing costs and yielding higher profits. This results in increased resource productivity. Resource productivity is kept artificially low through the use of subsidies, especially those directly targeted at natural resources such as oil and timber, because the reduced prices inhibit the motivation for innovation and investments in efficiency gains.
- *Biomimicry:* Many production processes that we currently rely on, such as metal and glass production, are incredibly energy intensive and produce significant waste streams. Processes have been discovered in nature that accomplish similar things, such as the production of a pearl by an oyster, but that use significantly less energy and raw materials to do so. Exploring and imitating natural processes is one way to vastly increase resource productivity.

- *A service and flow economy:* A shift from production of goods to the sale of services would address many of the pollution and waste externalities currently borne by society. In essence, if ownership of all products was retained by the manufacturers and use was simply leased to customers, it is postulated that the manufacturers would be given incentives to minimize materials use, maximize durability, and design for maintainability and deconstruction; all of which are things that would result in enhanced resource productivity and reduced waste. This concept does not consider the possibility that products may suffer their own tragedy of the commons. That is, if a consumer does not own a product, there is little incentive to take care of it. Rather, the user would most likely attempt to derive maximum utility from the product with little regard to potential future users. This would likely result in premature product retirement or require products to be overengineered for durability: both situations that would reduce resource productivity.
- *Investing in natural capital:* This concept assumes that ecosystems that produce natural resources have been damaged by human activities and thus require investment to maintain output. On an individual scale with clear property rights, such as a family farm, the need for investment in natural capital is clear. If the soil cannot support the seed and the crops fail, the farm fails. On a broader scale, however, no clear framework is proposed for dealing with common resource issues such as air quality or ocean health. One potential mechanism could be to recognize the value of natural capital in the system of national accounts, as explored below, and charge governments with maintaining the balance.

Some argue that taking steps to actively reduce resource consumption in a capitalistic economic system is wholly unnecessary as prices themselves will regulate resource use. The classic energy example begins with whale oil—a common energy source in the 19th century. As whale stocks declined, whale oil became more and more expensive, which provided a market opportunity for entrepreneurs to develop new and cheaper energy sources. Coal and eventually petroleum-based products rapidly replaced whale oil, whose price plummeted and the industry largely collapsed. The same logic would predict that as (and not until) petroleum prices increase due to scarcity or increased demand, new energy technologies will be developed (perhaps fusion and the lauded hydrogen economy) that will eventually eclipse the old and become dominant.

This framework fails to deal with environmental degradation that is a result of short-term profit taking and a lack of human knowledge about the environment. The sardine markets around Monterey, California, in the mid-1950s did not experience an orderly increase in price due to scarcity, which might have led to innovation and the productive stewardship of the fishing grounds rather than the catastrophic collapse of an entire natural resource with long-lasting economic and environmental consequences. This framework also fails to address the issue of generational equity: that is, whether one generation of people should be able to drive a resource to scarcity and thereby prevent later generations from enjoying the same resource.

Representation in the System of National Accounts

The United Nations System of National Accounts, first published in 1953, aims to provide a standardized, systematic, and complete method of accounting for economic activities. Gross Domestic Product (GDP) attempts to capture the total value of final goods and services produced during a specific timeframe according to the formula

$$\begin{aligned}\text{GDP} = {} & \text{consumption} + \text{investment} \\ & + \text{exports} - \text{imports}.\end{aligned}$$

Investment, in this sense, refers to the acquisition of capital goods or goods that are not consumed today but rather used to produce additional goods in the future.

GDP is generally accepted as an indicator of overall health of an economy; yet it does not take into account environmental factors such as natural resource stocks or ecosystem health. For example, if the harvest of a certain fish is reduced to allow greater reproduction and hence larger harvests in the future (a classic investment), GDP is reduced due to the lower consumption today. Conversely, if the fishing harvest is increased, GDP is increased even though the long-term viability of the fishing grounds may be damaged. Proponents claim that by adding environmental factors into the System of National Accounts, a more accurate sense of true economic health can be gleaned from the resulting data. Since 1994, the London Group on Environmental Accounting, an international group operating under the guidance of the United Nations Statistic Division, has been researching and developing standards by which to value and report natural resource assets within the framework of the National System of Accounts. As this work becomes accepted, it is expected that natural resource stocks and general environmental health will be reported, valued, and managed like other capital assets.

Conclusion

All raw materials used in the world's economy are drawn from or rely on natural resources. Energy resources are particularly important fuels in the economic engine with oil, natural gas, and coal, all nonrenewable natural resources, providing for a vast majority of the world's energy consumption. Many of the social and ethical issues surrounding natural resource consumption and conservation are a result of externalities that businesses cannot, or choose not to, address. While the natural course of competitive commerce is to improve productivity and capital efficiency, externalities need to be proactively addressed by businesses to minimize negative environmental impacts and to avoid social reactions that tend to be expensive for all involved. Some natural resources like solar energy are clear, free, and virtually inexhaustible. However, most others are either scarce in occurrence or biologically complex or both and require thoughtful stewardship to ensure optimal and just use both today and in the future.

Natural Resources Defense Council

The Natural Resources Defense Council (NRDC) is an environmental activist organization. While it is considered a special interest group that has an agenda, the depth and scope of the NRDC is far greater than that of most environmental activist groups. The NRDC has not only the support of 1.2 million members but also experts in law and science who work with many different groups to not merely criticize but to lend their expertise to these various groups in helping develop more efficient methods in such areas as renewable energy, coal technology, nuclear energy, and cleaner fuel burning cars. It is venues like this that give the NRDC credibility among various stakeholders in the United States and abroad. For example, the NRDC has partnered with Environmental Entrepreneurs, a national community of professionals and businesspeople who believe in protecting the environment while building economic prosperity. This has resulted in bringing together the business community, government, and the NRDC in bipartisan fashion to help shape state and national policy. Through collaborative efforts with companies like Environmental Entrepreneurs, the NRDC has been able to address issues such as energy, energy efficiency, and water purity, by publishing position papers that not only use NRDC sources but are often supported by the industries they are studying. For example, expanding the ethanol business would not only benefit farmers but also the auto, manufacturing, and trucking industries by providing a cheaper form of energy than gasoline or diesel fuel, as well as reducing U.S. greenhouse gas emissions.

This is not to say that the NRDC enjoys universal respect from the business community; it does not. Some in the business community look at the NRDC as a liability because more often than not their suggestions entail additional capital spending, thus reducing profits. Through its vast world membership, the NRDC mobilizes activists to assist in the protection of forests and marine ecosystems that may be threatened by industrialization or the extraction of natural resources from the areas. In addition, the NRDC has established itself as a legitimate watchdog agency in areas of environmental policy that are generated by our lawmakers. It maintains a legal presence in Washington, D.C., to examine all legislation being put forward that may have an impact on the environment or health of the United States and its citizens. NRDC lawyers have addressed various issues concerning the environment and its protection. They have worked collaboratively with various businesses, with government agencies, and with other special interest groups to monitor the types of environmental legislation introduced by the government and to react if certain legislation runs counter to what is considered prudent and safe. They maintain a comprehensive Web site, which covers a variety of environmental areas and also lists a number of reference links that will allow the user to get an "objective" picture of various environmental issues that the NRDC has chosen to challenge. The links give the user an opportunity to see how members of Congress vote on these issues. The Web site also provides information regarding national and international environmental law and their decisions. There is another link devoted exclusively to providing brief summaries of major federal environmental laws (with links to full text for each law) and related resources.

Negligence

Negligence refers to an actor unintentionally causing harm to another due to the actor's failure to meet the requirements of the applicable standard of care. The standard of care is what an ordinary, reasonable person would have done in that situation. If an actor is found to be negligent, then that actor (the defendant) is liable for any harm that negligence caused the plaintiff. To prove that the defendant was negligent, the plaintiff must show (1) that the defendant owed a duty of care to the plaintiff, (2) that the defendant failed to meet the requirements of that duty, (3) that the breach of the duty was the cause of the harm, and (4) that the plaintiff suffered damages. In some cases, the defendant may be able to establish a defense that absolves him or her from liability to the plaintiff.

The Elements of a Negligence Claim

There are four elements to a negligence claim that the plaintiff must prove to hold the defendant responsible for the plaintiff's damages. First, the plaintiff must show that the defendant owed a duty of care to the plaintiff. A duty of care is the standard of behavior a reasonable, prudent person would follow to prevent causing harm to others. The defendant owes a duty of care to anyone that could foreseeably be harmed by the defendant's actions. For example, if the defendant is driving a car, then the defendant owes a duty to all other drivers on the road to drive in a reasonable manner (e.g., not driving too fast, staying within a lane on the road, obeying all traffic signals). In other situations, the defendant may not owe a duty to the plaintiff. For example, in most jurisdictions in the United States, a defendant that discovers someone in a dangerous situation—that was not caused by the defendant's actions—does not owe a duty to that person to help them. Although there is a duty not to cause harm to others by your actions, there generally is not a duty to provide a benefit to someone else. Thus, a defendant that ignores the pleas for help from a drowning plaintiff would not be liable for negligence because the defendant did not owe a duty to that plaintiff. An exception to this general rule, however, is when the defendant has a duty based on a special relationship with the plaintiff (e.g., the drowning plaintiff is the defendant's infant child).

Second, once it is established that the defendant owed a duty to the plaintiff, the plaintiff must prove that the defendant breached that duty of care. The duty of care is determined by considering what a reasonable person would do in that situation and can be very context specific. For example, although a reasonable person may drive her car at the maximum speed limit on a sunny day, that reasonable person would drive considerably slower on a day with low visibility due to fog. The reasonable person standard is an objective standard that applies to all people in that situation and does not depend on the defendant's actual, subjective beliefs. Professionals, however, typically have a higher standard than lay people. For example, a doctor performing a medical procedure must live up to the standards of a licensed doctor practicing in that area. If the defendant shows a reckless or willful disregard for the standard of care, then he or she may be said to be grossly negligent.

Third, the plaintiff must prove that their injuries were caused by the defendant's breach of the duty of care. This typically requires proof of two forms of causation: "but for" causation and proximate causation. "But for" causation means that the plaintiff's injuries would not have occurred "but for" the defendant's actions. That is, if we take away the defendant's action, would the accident still have occurred? For instance, in an automobile accident, we may ask, "Would the plaintiff still have driven his or her car into the telephone pole even if the defendant had not ignored the stop sign?" Proximate causation refers to the foreseeability of harm caused by the defendant's actions. In general, if the defendant's actions caused an unforeseeable type of harm, then the defendant was not the proximate cause of the injury. For example, in the classic 1928 case of *Palsgraf v. Long Island Railroad Company,* railroad employees attempted to pull a man onto a moving train. During that process, the man dropped an unmarked package containing explosives. The resulting explosion caused the platform to vibrate, which in turn caused a set of scales to fall on Palsgraf and injure her. Palsgraf sued the railroad company for negligence, but the court ruled that the defendant was not negligent because it was not foreseeable that pulling a man onto a moving train (the breach of duty) would cause such an explosion (i.e., there was no proximate causation).

Finally, the plaintiff must show that he or she suffered damages of some sort, including harm to the person or property. As long as the plaintiff was injured in a foreseeable manner (i.e., proximate causation), the defendant is liable for all damages even if the extent of the plaintiff's injuries were unforeseeable. It is commonly stated that the defendant takes her plaintiff as she finds him. For example, although most people would suffer only slight injuries from being knocked to the ground, if the plaintiff has a very rare and severe back condition that is aggravated by the accident, then the defendant is still liable for the full extent of the plaintiff's injuries.

Defenses to a Negligence Claim

Even if the plaintiff can establish all four elements of a negligence claim, the defendant can either reduce his or her liability or escape liability entirely by claiming a defense. In some situations, the defendant may claim that the plaintiff was aware of and assumed the risk of injury from the defendant's negligent conduct. In other situations, the defendant may claim either contributory negligence or comparative negligence (a jurisdiction will have one rule or the other). Under contributory negligence, if the plaintiff's own negligent conduct contributed to causing the accident, then the plaintiff cannot recover any damages from the defendant. Under comparative negligence, on the other hand, a negligent plaintiff can still recover from the defendant, but the plaintiff's recovery is reduced by the amount that her own negligence contributed to causing the accident (e.g., if the plaintiff's negligence was 10% of the cause of the accident, then the defendant will only pay for 90% of the plaintiff's damages).

Negotiation and Bargaining

Negotiation is the process of conferring with others to reach an agreement. Bargaining occurs when there is a dispute over the terms involved. A straightforward allocation of adequate resources would involve negotiation, but if there is a shortage of time, money, or materials, then the parties will bargain over the exact distribution to promote their own best interests. Collective bargaining is a structured process where a group such as a union will negotiate with an employer as a single unit about terms of their employment contract.

The basic conditions for negotiation are that the parties are voluntary participants and there is a positive bargaining zone. Thus, there is no negotiation in mugging at gunpoint or when groceries are offered at a fixed price in the store and there are sufficient paying customers that the storekeeper has no incentive to lower the price. A bargaining zone is a range of exchange where one side is willing to offer and the other is willing to accept. If neither side is willing to extend the zone then there is no room for meaningful negotiation.

There are several other necessary elements for negotiations to be successful. Initially, the parties involved must have the power to settle. Second, all the parties involved need to be willing to take part in the negotiation. If critical parties are absent or if one party is not prepared to bargain in good faith, then there is little hope for a workable agreement. Moreover, the parties need to be psychologically prepared to negotiate; if there is high emotion, inadequate information, or failure to formulate a negotiation strategy, then the parties' negotiations are unlikely to be productive.

The parties must in some way be mutually dependent and have the ability to influence each other. Such influence can be seen as having something the other party desires or having the means to increase benefits for the other side (or conversely the ability to inflict distress). A negotiator needs some form of leverage to provide an incentive to the other side to alter their behavior. Where the power is completely disproportionate, meaningful negotiation with the other party is also unlikely to occur. Parties must also have some sense that delay will result in some adverse action. If only one side is under great time pressure, then the party with time to spare is likely to use that leverage to extract greater substantive gains from the party that is looking for a quick solution. The Paris peace talks to terminate the Vietnam War illustrate this: The Vietcong were able to procrastinate to the point where the Americans made substantive concessions to hasten the negotiation. On a more mundane level, the householder with leaking pipes needs a repair urgently and thus will be in no position to bargain with an available plumber.

If there is a better deal available elsewhere or the psychological stress is not worth the potential benefits, then people will break negotiations. Contemporary negotiation theorists often refer to the point at which someone will walk away by saying that any deal must improve on a party's "best alternative to a negotiated agreement."

Finally, participants must feel that there are settlement options available that will meet their needs. In some cases, one party will not want to create a precedent of compromise or will want to establish a principle, even at the risk of losing the case entirely. Thus, people charged with a criminal offense will often be unwilling to make a plea bargain in order that they can have a public hearing that they believe will lead to complete exoneration. Similarly, tort cases where one party is looking for definitive vindication may not be suitable for negotiation.

Types of Negotiation

In very broad terms, we can classify negotiation as belonging to either of two schools: the so-called positional negotiation and interest-based negotiation. *Positional bargaining* is a negotiation strategy in which the disputant takes a series of positions that represent alternate solutions. It is also referred to as *distributional bargaining* because its primary function is to allocate a limited resource. The positions are rank ordered by the negotiator according to his or her preferred outcomes. The initial position represents the maximum gain, and each subsequent one represents a compromise from that ideal. Each party will have at least two positions: the opening position and the "bottom line." Agreement is reached when the parties' positions converge and they enter an acceptable settlement range between these two extremes. An example of this sort of negotiation would be one between a car salesman and a potential customer. The dealer has a bottom line of $20,000 but feels that the completely naive customer would pay the sticker price of $25,000. The customer is unwilling to pay more than $22,000 but starts at $18,000 to give himself some flexibility in the negotiation. So the customer offers his $18,000 and the salesman demands $25,000, although they both know that they will make concessions toward the other: They subsequently try to concede in as small increments as possible without forsaking the deal. They may come to an agreement in the range of $20,000 to $22,000.

Positional bargaining occurs most typically when the parties are not significantly interdependent and when there is no value placed on a continuing relationship. It also comes into play when there are limits on the negotiation—for example, when there is restricted time or when the items or services are not fungible and are strictly finite. Therefore, at a flea market, for instance, positional bargaining would be the standard way of reaching a settlement on the price of items for sale. The goal of each party is to win as much as possible, where a win for one side is thought of as a loss for the other. A distinct disadvantage of this approach is that it is difficult to alter position while saving face: If a car dealer says that his "bottom line" is $25,000, then it becomes hard for him to subsequently make concessions or justify a new, lower price. Moreover, if prices are somewhat arbitrary, as they are at a flea market, then argument over two proposed prices for a good can quickly descend into a contest of wills, which itself can sabotage a possible settlement. The adoption of positional bargaining fosters gambits, bluffing, extreme posturing, and game-playing in that it is driven mainly by the best individual payoff, however that may be accomplished.

Positional bargaining may be contrasted with *interest-based bargaining*, which focuses on satisfying as many interests or needs as possible for all negotiators (alternatively named *principled bargaining* or *integrative bargaining*). It does this by using a problem-solving approach, which tries not to distribute rewards in a win/lose manner. It has different initial assumptions from positional bargaining in that it recognizes that each party has multiple interests—a concern not only for the substance of the agreement but also for how the way in which settlement is reached affects the parties' feelings about the result. If one side feels railroaded, unheard, cheated, or bluffed, then the process is in some way tarnished and more likely to unravel whatever the substantive agreement may have been. Interests may be combined in a variety of ways, leading to a wide range of possible solutions. Since resources are not seen as limited to the monetary offers alone, more factors can be brought into the negotiation.

Interest-based bargaining is a process involving several stages. As it is still an unusual way of negotiating, parties initially have to learn about and accept the procedure and realize it requires a modicum of trust and disclosure. Then, they have to define what they see as the issues in the case. This might be done by finding out the reasons behind a stated claim that may go beyond getting the best substantive payoff; a person may have a strong interest in perceiving that she has not been cheated or need to feel that her concerns have been heard and attended to. The initial monetary offer may then be framed in terms of these interests, say, precedent in other deals, the maximum that someone can afford, the average price based on research on the Web, or similar reasons.

Each side openly discusses its needs, interests, and concerns. The parties then collaboratively generate options for settlement based on the interests that have been voiced and the criteria that are mutually acceptable. This level of abstraction allows the parties to generate multiple options for settlement. A key element is for the parties to find agreement in principle, for example, that a dealer is entitled to a fair profit or a customer should not pay more for a used car than the blue book value. Thus, parties may agree on, say, the principle of splitting assets equally in a divorce or that a reasonable price for real estate is the middle estimate from three assessors. Many assert that it is easier to argue rationally about the foundation principle than it is to haggle over positions. The various options are then assessed, and some final bargaining occurs.

Consider an example: A worker asks his boss for a raise, and his boss responds that he cannot afford it. In a positional framework, this negotiation is liable to end in stalemate or at least with a disgruntled employee. With an interest-based approach, the two sit down and discover each other's needs and concerns. It could be that the boss would like to pay more but cannot afford to do so on his present margins. The worker is actually looking for money largely as a symbol of recognition for what he perceives to be superior performance. Collaboratively, they generate options that will satisfy both their interests: perhaps some nonfinancial reward for the worker, a delayed bonus contingent on greater projected profits in the future, the opportunity for overtime, and so forth. The investigation into the reasons behind the positions allows both parties more flexibility and creativity in attempting to resolve their differences.

Appropriate Bargaining Styles

Interest-based bargaining has great potential for reaching lasting settlements that satisfy specific interests in a way that promotes trust and good relationships. Interest-based bargaining does seem to offer the best means for disputants to reach agreements that approach Pareto optimality. However, it is not suitable for all disputes; it takes time, a cooperative environment, and a willingness to disclose information that in positional bargaining would often be a closely held secret. It is also quite a complex process requiring trust, skill, creativity, and practice. We are all more familiar with positional negotiation because it is more typical of our everyday encounters; yet we should recognize that it tends to bruise relationships because of the lack of trust and the subterfuge that it encourages. It may also lead to a less than optimal agreement because the full range of interests and potential exchanges remain unstated.

Contemporary research in negotiation has looked at both the rational quantitative dimension of negotiation and the more qualitative issues brought into play by the psychological dynamics and motivations of the parties. It recognizes that it is appropriate for most negotiation to incorporate both distributive and integrative elements. There has also been considerable work dealing with the role of third-party intervention to facilitate optimal outcomes, the ethics of negotiation, and the nature of apparently intractable conflicts.

NEOCONSERVATISM

Neoconservatism was born when a group of liberal and radical New York intellectuals became disenchanted with the political left in the late 1960s. From the perspective of the left, which they attacked, they were conservative and were accused of so being, but because they retained an attachment to many of the liberal goals that had long attracted them and because they were rarely Christian, from the South, or inclined to romanticize the past, they were not traditional conservatives. They were inclined, for example, to praise FDR, but never Barry Goldwater or Russell Kirk. These neoconservatives (also referred to as neocons) agreed with the left that it was critical to end racially based injustice and the chronically disadvantaged position of the poor, but they broke with their leftist comrades over the way to achieve these goals. In general, they argued that in its impassioned pursuit of equality, the left had become blind to other worthy goals, such as a deference to democratic procedures, the liberty of the individual, and the complex social and educational requirements of stable government. In foreign policy, they charged liberals with having forgotten the need to remain strong against the Soviet threat. Neocons charged the liberals of the late 1960s and later with having forgotten the prudent legacy of their own past, so that they might more appropriately be called "paleolibs."

The early neocons agreed with liberals that poverty and racism were massive problems in the United States, for example. But they attacked the left for advancing state-supported affirmative action as a way of promoting these rights, for it would swell the state, limit liberty, and create resentment; similar concerns led them to oppose massive, state-run welfare programs. They agreed with libertarians that government enforcement of a more strict equality threatened individual liberty, and they agreed with fiscal conservatives that the Great Society welfare programs would place huge financial burdens on the economy. More than either of these groups, however, the neocons focused their writing on the indirect social and educational consequences of liberal approaches to solving the problems of racism and poverty. They stressed that it is a problem to encourage dependency on the state, rather than self-reliance, and they held that antipoverty programs sometimes weakened the family, an institution they considered important for society in general and especially important for the educational and economic progress of African Americans.

Early neoconservatives broke with their erstwhile liberal friends and allies over the radical assaults on the universities in the late 1960s as well. They denounced the students and professors who saw fit to protest racism and the war in Vietnam by disrupting classes and radicalizing the curricula. Education, the neocons argued, required a patient exploration of all serious alternatives and would suffer—or cease—if it came to be seen primarily as a means to advance the goals of a disadvantaged group. Hence neocons found themselves in quarrels with those favoring educational reform to advance the rights of women, Afro-Americans, and gays. They considered the "traditional" curricula to be intellectually liberating rather than the politically correct agenda that challenged it.

Free speech is another issue that helped give shape to neoconservatism. As the Supreme Court expanded the protections offered under the First Amendment, neocons argued on constitutional grounds that the Court was rewriting the Constitution, not interpreting it, and they argued on more political grounds that its new rules would be destructive. They maintained, for example, that protecting naked dancing as "speech" would only serve to devalue reasoned speech, and they argued as well that the resultant pornography was a distraction from education and an impediment to the formation of character. And is it consistent with a basically democratic Constitution that nine judges, or their majority of only five, determine such policies? On these issues, the largely secular neocons joined with religious conservatives and disagreed with libertarians. The principle of "consenting adults" is not their mantra, but their reservations are generally rooted in a view of the national interest, not the word of God.

It is common for neoconservatives to address the relationship between character and politics. Free and democratic politics, they argue, requires a responsible citizenry, and a responsible citizenry needs to be formed or encouraged, or at least not discouraged. Defenders of both liberty and equality, neocons worry that when taken to an extreme, one or the other of these principles can undermine the virtues needed in a free and democratic people. The goal of politics is not so simple as granting complete liberty to each person to choose to do what he or she may happen to want, the neocons argue, for what we want both influences and is influenced by the choices of others. They speak of a public culture and a "tone" of society, and they try to keep this in view as they analyze one policy or another. Although often not themselves religious, neocons tend to argue that religion can help form the character traits our nation needs and has long taken for granted.

Neoconservatives tend to support the war in Iraq and the policies of preemption and nation building that underlie it. Francis Fukuyama is an important and telling exception, but neocons are generally prepared to run risks in the hope of building democracies, at least in strategically important locations. They expect these democratic regimes to be more decent and more friendly to the United States than the tyrannies they are expected to replace. In their eyes, the United States of the 1990s was like Hamlet, always finding excuses for inaction in the face of growing threats, and like Gulliver, allowing itself to be tied down by a multitude of international sensitivities.

Neocons tend to be scornful of the opinion that today's UN is a source of wisdom, justice, or strength. While "internationalists" are often outraged at the readiness of neocons to call for U.S. unilateral action, which they see as undermining the UN, traditional conservatives consider neocons naïve for trying to force democracy into places it has never gone before. Neocons are prone to citing the remarkable spread of democracy over the last century, while paleocons are more inclined to note how few and unique are the examples of successful "nation building." Neocons must also face the charge that democratically elected governments may not always turn out to be so friendly to the United States, as the case of Hamas among the Palestinians now suggests.

To see contemporary neoconservatism in action, consult publications such as *The Weekly Standard, The National Interest, The Public Interest, The New Republic,* and *Commentary* and review the Web sites of such think tanks as the Project for the New American Century and The American Enterprise Institute. Neocons are far less numerous than traditional conservatives, libertarians, or liberals, but their influence extends well beyond their ranks. Powerful leaders such as Paul Wolfowitz, Jeanne Kirkpatrick, and Patrick Moynihan are or were neoconservatives, and Ronald Reagan and the two Bush presidents are among the many who have been influenced by them.

The first neoconservatives were left-leaning intellectuals from New York City, and they wrote especially for the journals mentioned above. The key figures in these early years included Irving Kristol (sometimes dubbed the godfather of neoconservatism), Gertrude Himmelfarb, and Norman Podhoretz. As neocons gained increased political influence, their center moved to Washington, D.C., where one now finds such prominent neocons as William Kristol, William Bennett, and Francis Fukuyama. A glance at both these earlier and later neocons suggests that they are defined by at least this one characteristic: They enjoy vigorous argument—even with each other.

Neo-Kantian Ethics

Neo-Kantian ethics refers to any philosophical work that derives from the work of Immanuel Kant. Contemporary scholars in this area seek to advance key insights of Kant with the tools of contemporary analytic philosophy while at the same time avoiding difficulties that may be found in some of Kant's original arguments. Such work is increasingly used to provide a theoretical foundation for business ethics.

There are many active areas of interest in this vibrant field. Regarding ethical motivation, neo-Kantians defend the view that such motivation properly originates within the self, and not from external sources such as God or other fear or concern for the opinions of others. In this view, agents who place profits ahead of moral duties are seen as not merely unethical but irrational. The question of how to understand the import of Kant's famous categorical imperative is another active area of study. The categorical imperative, in its primary formulation, holds that one ought only act on the principles that can be universalized. One prominent view holds that the categorical imperative ought to be properly understood as a side-constraint on action. Actions are permitted insofar as they do not violate such constraints. This view, most notably defended by Barbara Herman, has gained significant traction in recent years. The view is important insofar as it disarms many important, historical criticisms of the categorical imperative, such as the claim that Kantians must constantly apply the categorical imperative if they are to know how to act at any given moment.

Neo-Kantians also seek to better understand what duties are entailed by the Kantian doctrine of respect for persons, which constitutes the second formulation of the categorical imperative. One prominent view holds that a proper understanding of the duty to respect persons yields a core set of basic human rights that must be respected. Such a view has important implications for business ethics. In particular, such a view may indicate that corporate managers have specific duties to employees (including employees in contract factories) regarding health, safety, and working conditions, as well as to other stakeholders. Given this concern with human rights, neo-Kantians tend to associate with a cosmopolitan perspective regarding global justice. In the cosmopolitan view, a system of global socioeconomic justice must be grounded in universal ethical norms. Cosmopolitans see political institutions as a means to ensure respect for such core norms. Nation-states and multinational corporations that contribute to the violation of these norms, or merely tolerate the violations of such norms, are problems that must be overcome.

Kant's ethical philosophy is notorious for having given little weight to the moral status of nonhuman animals and to the natural environment. Some neo-Kantians who are persuaded by the merits of a Kantian perspective on ethical relations among persons are now seeking to provide perspectives on duties toward animals and natural environments. There are a variety of views in this emerging area. According to one such view, nonhuman animals have value in proportion to the extent that they exhibit agency. There is, however, little agreement among neo-Kantians on these questions.

Critics of neo-Kantian ethics argue that if theorists with Kantian sympathies have not yet been able to fully work out some of the most pressing difficulties of Kantian thought, then the Kantian project ought to be given up as untenable.

The aim of neo-Kantian ethics is to demonstrate that simple invocations of old objections to Kant's ethics cannot be a sufficient basis for dismissing Kantian ethics. Neo-Kantian ethicists believe that they provide a firm basis for ethical theorizing about business and about what it means to live a rational life as a businessperson.

Net Present Value

The net present value (NPV) of an investment project is the difference between the present value of the stream of future net (or free) cash flows generated by the project and its current investment costs. Thus, this concept represents an application of cost-benefit analysis to problems in financial economics where net revenues are the benefits. A typical example is the expansion of a firm's manufacturing facilities, which requires the firm to sacrifice funds in the present so that it may increase its sales in the future.

Importance in Financial Management

The fundamental importance of the NPV concept to the financial management of the firm lies in the fact that investment projects with positive NPV increase the wealth of the firm's shareholders by that amount, whereas projects with negative NPV reduce shareholder wealth. Because the paramount objective of the financial manager should be to maximize the wealth of the firm's current shareholders, it follows that management should undertake only investment projects with positive NPV. Unfortunately, sometimes the manager's own objectives may be in conflict with shareholders' wealth maximization, although this problem of diverging objectives may be mitigated by carefully designing the manager's compensation contract.

NPV Arithmetic

To illustrate the mechanics of the NPV technique, assume that the project requires an initial investment of I dollars, the free cash flow in any time period t is C_t, where $t = 1, 2, \ldots, n$, and the required rate of return (discount rate) on the project is r. Then, the NPV is obtained by using the following general formula:

$$\text{NPV} = -I + C_1/(1+r)^1 + C_2/(1+r)^2 + \ldots + C_n/(1+r)^n.$$

To take an example, consider an investment project with I = \$2,000, C_1 = \$1,100, C_2 = \$1,210, and C_3 = \$1,331. Assume, in addition, that the firm's investors require a rate of return of $r = 10\%$ per annum. Then, this project's NPV = $-2{,}000 + 1{,}100/(1 + 0.1)^1 + 1{,}210/(1 + 0.1)^2 + 1{,}331/(1 + 0.1)^3$ = \$1,000. Consequently, by undertaking this project, management is adding \$1,000 to the firm's wealth.

Potential Implementation Problems

Although NPV is an invaluable tool for the financial management of the firm, it may lead to faulty decisions if its implementation is incorrect. Indeed, note from the above general formula that the correct computation of the NPV technique critically depends on choosing an appropriate value for the discount rate (rate of return), r. The appropriate rate, in turn, depends on the risk level of the project. In practice, however, the risk level is often difficult to ascertain with precision. Because of this difficulty, an erroneous choice of discount rate may indicate that a project should be rejected when, in fact, it should be accepted. Of course, the converse may occur as well. These potential errors, if left unchecked, may have a deleterious effect on the value of the firm.

NPV Profile

A useful tool for checking the sensitivity of the NPV to the choice of discount rate, r, is the NPV profile, which provides a visual representation of the NPV of a project for a variety of discount rates. For the numerical example given above, the NPV profile has a downward-sloping shape. Indeed, substituting $r = 0$, 0.1, 0.2, 0.3, 0.4, and 0.5 in the general formula produces NPV = \$1,641, \$1,000, \$527.20, \$167.96, –\$111.88, and –\$334.52, respectively. Recall that the firm's required discount rate is $r = 0.10$, or 10%, so its estimated NPV is \$1,000. However, if the firm is unknowingly mistaken in choosing that value of r, then the NPV profile may visually reassure the firm that even a relatively large error in either direction may not be critical to the accept/reject decision. Indeed, based on the calculations just given, the project produces a positive NPV for any discount rate between $r = 0\%$ and at least $r = 30\%$.

In fact, by refining the discount rate values between $r = 30\%$ and $r = 40\%$, it can be verified that positive NPVs occur for all positive discount rates up to $r = 35.71\%$. Thus, if the correct but unidentified discount rate falls within this broad range, the firm can be confident that its decision to accept the project, based on its choice of a 10% discount rate, is likely to be correct. In this example, $r = 35.71\%$ determines the boundary between the accept/reject regions of the NPV profile. More generally, the discount rate at which a project achieves a zero NPV is known as the internal rate of return of the project and is an important financial concept in its own right.

Networking

A network is a formation of individual agents or nodes where each is connected to one or more other nodes by a link. The individual nodes may be businesses, individuals, computers, or other units, and the links may be based on infrastructure, beneficial relationships, or collaboration. The term was first applied to social networks by J. A. Barnes in the 1950s. Networks can bring efficiency through the sharing of assets and pooling of competencies, and in the second half of the 20th century, networking became established as the preferred form of organization in many business sectors. Ethical aspects of networking include the requirement for openness, transparency, and trust if the networking is to be successful. Infrastructure networks such as airline route networks seldom involve ethical issues, although trust is an important element in some computer networks.

In networks where each link is undertaken for the benefit of the participants directly involved, such as supply chains, syndicated radio networks, or industry associations, ethical issues can arise in the course of the exchange between the individual members. One member may have, and abuse, market power or may seek to gain additional advantage by deceit, and the members of the network may join together to seek unfair advantage from a wider group with which the network deals.

Collaborative networks, sometimes called strategic alliances, replace a traditional contractual relationship between participants with a mutual commitment to apply one's resources toward the achievement of a shared goal. The essential feature is that the arrangements are entered into for mutual advantage but do not involve direct ownership by one party of the others, and extend beyond a simple contractual sale-and-purchase or design-and-construct agreement. Small- and medium-sized enterprises find alliances attractive as a means of enhancing competitiveness.

Collaborative networking promises the flexibility needed to succeed in complex, uncertain, and unforgiving business environments and the potential for increased innovation. Successful networking requires a level of openness, transparency, and tolerance of uncertainty beyond that required in a traditional business relationship, and collaborative networks will not achieve their promised benefits through the application of traditional management processes based on command and control. Trust and other unconventional management virtues, such as prudence, justice, and love, are essential to success in a situation where the individual units lose their independence yet remain separate. Issues can also arise in the apportionment of reward for the value added by each participant, as the extent to which each contributed to product or service improvement may be hard to determine.

Virtual networks, where the members do not make direct contact with each other, may be based on contractual or collaborative relationships. The absence of direct contact increases the opportunity for deceitful behavior, for instance, in the creation of false persona, as the very existence of each network member is taken on trust.

Newly Industrialized Countries (NICs)

As the name implies, newly industrialized countries or NICs are generally understood to be those countries that have in the past few decades transitioned their economies from being primarily agricultural to newly industrialized. The economies of these countries are not as advanced as those of the developed countries such as the United States, Japan, and Western European states. However, they are more advanced than those of the so-called undeveloped or Third World countries. NIC is a socioeconomic term applied to countries that derive a significant portion of their national income from the goods-producing sector, which consists of industries associated with manufacturing, construction, and mining operations.

NICs began to be recognized in the 1970s when countries such as Hong Kong, South Korea, Singapore, and Taiwan underwent rapid industrial growth, most now having evolved beyond this status. Current examples are Turkey, Thailand, Malaysia, Mexico, Brazil, Argentina, South Africa, China, and India. Each of these countries is experiencing a general rise in per capita income, although a higher income does not necessarily reflect a higher development status. For example, India and China, due to large populations, are likely to have low per capita incomes even though they have experienced significant economic growth rates and have large manufacturing sectors. Industrialization and growth in NICs has been achieved through diverse means: for example, import-substitution in India, export-orientation in Taiwan and South Korea, investment in heavy industries in Russia, and attraction of inward foreign investment in China.

Yet there are some common features usually shared by NICs. These include recent political and economic reforms allowing for greater civil rights and market liberalization, strengthening of the legal and economic environment to foster privatization of ownership in industry and increased competition, and trade liberalization policies allowing increased exchange of goods and cross-border investment. In almost all NICs, greater industrialization has led to increased trade, participation in regional trading blocs, and attraction of foreign investment especially from developed countries.

However, NICs face certain problems that have ethical implications. Despite the attempt to decrease government regulation and increase market efficiency, governments continue to play a large role in artificially controlling currency exchange rates. Such controls have led to financial crises in countries such as Malaysia, Taiwan, South Korea, Mexico, Russia, and Argentina. To restructure their debt, these countries sought the assistance of the IMF, whose stringent conditions like raising taxes caused hardship to the local population, often creating controversy regarding the role played by the IMF. Furthermore, many of these countries follow an active industrial policy that encourages investment in certain sectors of the economy, and due to the considerable control exercised by the State, there is a great opportunity for corruption and bribery of public officials. Corruption in turn is a major detriment to further industrialization and contributes to an unfavorable business climate. Often, in NICs, rapid industrialization is not accompanied by the concurrent increase in investment in infrastructure, thereby creating unbalanced development in different regions of the country. Migration of labor from rural to urban areas often results in problems such as overcrowding in cities, pollution, environmental degradation, and water shortages. While laws exist on paper, they may be unenforceable due to lack of resources to fund adequate law enforcement or due to lack of political will, resulting in low labor standards reflected in low wages, unsafe and unhealthy working conditions, and use of child labor. Furthermore, wealth created by industrialization, more often than not, is unequally distributed among different sectors of society leading to huge disparities in incomes and standards of living. From an international perspective, corporations operating in NICs are frequently accused of cutting corners on wages, working conditions, and environmental protections, leading to a "race to the bottom" in terms of labor practices and contributing to global environmental problems. Others, however, argue that it would be unrealistic to expect the same wages, working conditions, and environmental protections in all countries no matter the stage of development, and to demand this would only serve to entrench the position of advantage of developed countries.

Despite these problems and controversies, NICs have huge potential for economic growth. They are currently showing growth rates double those of developed nations and hence continue to attract foreign investment.

Nihilism

In laymen's terms, nihilism refers to the experience of having lost a sense of meaning or purpose in life. It also relates to the belief that nothing is valuable or desirable. The philosophical understanding of the term, though related to its popular use, is somewhat more complex. Over past centuries, philosophers have debated the cause of the loss of meaning in life vigorously and have, therefore, come to define nihilism in many different ways. These philosophical nuances provide us with important insights into the manifestations of nihilism in the business realm.

One of the prominent distinctions that philosophers make when discussing nihilism is what may be described as the difference between explicit and implicit nihilism. Explicit nihilism could be defined as the absolute repudiation of worth, purpose, or desirability. It is often the result of the realization that the truth, values, or purposes that we as human beings use to give our lives structure or to legitimize our decisions and actions lack irrefutable ground. Ethical or moral nihilism is a certain type of explicit nihilism that is the result of the realization that values refer to nothing more than bias or taste. Another form of explicit nihilism that most closely resembles the popular use of the term *existential nihilism* refers to the feeling of emptiness or pointlessness, or the experience that "life has no meaning."

Implicit nihilism is quite different from explicit nihilism. Its main proponent, Nietzsche, argued that implicit nihilism is the most extreme form of nihilism—one that results from an uncritical acceptance of certain truth claims as irrefutable. In fact, implicit nihilism is the result of operating under the assumption that one's values and truth statements are rooted in a transcendental source, such as God or some ideology. Implicit nihilism often goes hand in hand with a devaluation of life and a negation of a mortal existence in favor of the pursuit of a spiritual realm, an afterlife, or realization of some ideological ideal. One can distinguish many forms of implicit nihilism: Transcendental nihilism is the nihilism of "absolute values" or "absolute spheres," that is, the belief that God, or its representative on earth, defines what is right or wrong. Nietzsche believed that this leads to a "slave morality" or "herd mentality," whereby human beings lose their ability to judge for themselves. After the rise of Modernity, the God's sanctioning of values and truths fell away because of the Enlightenment's emphasis on the use of reason and autonomous thinking. This, however, merely led to a new kind of nihilism: passive nihilism. Passive nihilists are so disillusioned by the dismantlement of their certainties that they tend to feel that they have neither the energy nor the right to create any truths or goals for themselves. However, a worse response, according to Nietzsche, is that of reactive nihilism, which entails replacing transcendent foundationalism with an alternative universal truth. An example of reactive nihilism is found in socialism, which replaced God with yet another "moral superstructure" and, in that sense, was merely an ironic reenactment of transcendental nihilism.

The experience of nihilism is not restricted to any specific sphere of life, and hence has implications for business organizations. The various manifestations of nihilism in business organizations can be described by addressing a few basic questions that come up in the work environment. First, "Why do we work?" Experiences of explicit nihilism may cause people to have no answer to this question, since no activity has any ultimate meaning and significance from the perspective of explicit nihilism. This may cause a lack of work ethic or low levels of staff motivation, which may undermine employees' sense of doing meaningful work. A second question may be, "Why be ethical if all values are relative and there are no absolute truths?" This form of moral nihilism makes it very difficult for corporations to foster a certain ethical climate and direct ethical behavior. A third question that relates to explicit nihilism in the corporate world is, "Who can we trust?" A form of explicit nihilism is found in the public's disillusionment in the wake of deceptive financial reporting among big corporations. The mistrust that was caused by collapses like Enron is a by-product of the explicit nihilism that sets in when "truth" is revealed as "fiction" and "falsity." Uncertainty about whom and what to trust in terms of representations of truth often leave stakeholders paralyzed, cynical, and without resolve. Being aware of the dangers of both implicit and explicit nihilism may serve to make stakeholders more creative and vigilant in their ongoing questioning of corporate practices.

To address the phenomenon of implicit relativism in business is more difficult, though no less important. In counteracting the dynamics of implicit nihilism in the corporate realm, we may have to pose a few rather radical questions: Why believe in the "truths" that capitalism advocates? If one considers the widening gaps between rich and poor globally, advocates of a simplistic belief in the success of the hidden hand may suffer from some form of implicit nihilism—that is, an inability to critically assess and reconsider certain commonly held conceptions. The alternative may not be to abolish capitalism or to replace capitalism with another ideology but rather to foster the ability of people to judge for themselves. This would challenge stakeholders to interrogate the "truth" that is presented to them in corporate marketing and reporting. If stakeholders want to be more than "herd-like" followers of corporate rhetoric, they would need to start asking meaningful questions—for instance, "Is triple bottom-line reporting merely 'smoke-and-mirrors'?" To be able to get rid of implicit nihilism, the critical and analytical capacities of a broad array of stakeholders may need to be developed.

Nike, Inc.

Nike, Inc. is a high-profile sporting goods and apparel company that engages in the design, development, and marketing of footwear, equipment, and accessory products worldwide under brand names such as NIKE, Cole Haan, Converse, Starter, Hurley, and Bauer. The company, which is headquartered in Beaverton, Oregon, sells its products through a mix of independent distributors, licensees, and subsidiaries in approximately 120 countries worldwide. Nike has experienced substantial financial and marketing success since its founding in the 1960s and is now the largest sporting goods company in the world (in terms of market capitalization). Despite its success, the company has been the target of much criticism in recent years for alleged abusive or "sweatshop" labor practices in its subcontractors.

Nike was founded as an athletic shoe company by Phil Knight and Bill Bowerman in 1962 under the name Blue Ribbon Sports. In 1972, the company changed its name to Nike, after the Greek goddess of victory. Knight had been a track athlete and business student at the University of Oregon, where Bowerman was his coach. While getting his MBA at Stanford, Knight devised a strategy for the manufacturing of athletic shoes overseas that would take advantage of lower-cost off-shore production capabilities. The plan was for Nike to be essentially a design, marketing, and distribution company with all the production performed by subcontractors operating overseas.

This strategy proved highly successful. Nike started subcontracting in Japan and then moved its sourcing operations to South Korea and Taiwan to take advantage of lower cost of production in these locations. As the economies of South Korea and Taiwan developed, Nike continued to move its sourcing operations to even cheaper locations such as China, Indonesia, and Vietnam.

In the fiscal year 2005, Nike had revenues of $13.7 billion and employed about 24,000 people directly and another 650,000 in more than 800 supplier factories worldwide. The company has operations in several locations including Oregon, Tennessee, North Carolina, and the Netherlands in addition to its Niketown and Nike Factory Store retail outlets. It has several subsidiaries: Cole Haan (casual luxury footwear and accessories), Bauer Nike Hockey (hockey equipment), Hurley International (teen-oriented sports apparel for surfing, skateboarding, and snowboarding), Converse (athletic footwear), Nike IHM, Inc. (cushioning components used in Nike footwear), and Exeter Brands Group, which includes Starter and licenses other Nike brands. Nike became a publicly traded company in 1980, and its New York Stock Exchange ticker symbol is NKE.

One of the key components of Nike's strategy has been the use of celebrity athletes as endorsers for its products. Its endorsers have included some of the biggest names in sports such as Michael Jordan (after whom the famed "Air Jordan" shoes were named), Lance Armstrong, Tiger Woods, Kobe Bryant, and Jerry Rice.

In the late 1980s, Nike found itself at the center of controversy brewing over alleged sweatshop labor working conditions in its subcontractor factories in developing countries. Critics alleged that a number of labor-oriented problems existed in these factories including (1) wage and salary concerns—both the payment of low wages and the use of various schemes to cheat workers out of the wages to which they were entitled, (2) unsafe/unhealthy working conditions, (3) excessive working hours and forced overtime, (4) harsh and abusive disciplinary tactics, (5) the use of child labor, and (6) active opposition to unionization efforts by the workers. According to some critics, such as labor activist Jeff Ballinger, the opposition to unionization was the key concern because, it was reasoned, with effective union representation the other issues could be resolved.

Several incidents contributed to the notoriety Nike quickly acquired on these issues. There were several worker fatalities reported in Nike subcontractor factories in the early 1990s. In addition, reports started circulating of Nike's involvement with the use of child labor in its subcontractor factories. A picture purported to be of a child worker in a Nike subcontractor factory in Pakistan sewing soccer balls appeared in *Life* magazine in 1996. It was later learned that the photo was staged (soccer balls are sewn before they are inflated but the ball the child was holding had already been inflated). Nevertheless, Nike was perceived by the general public as a leading culprit in the exploitation of child labor. The company was lampooned in comic strips such as Doonesbury and by late night talk show hosts such as Jay Leno and David Letterman (e.g., one of the top 10 signs you are at a bad summer camp: you spend all day sewing swooshes on Nike sneakers). Critics also parodied Nike's "Just Do It" slogan by suggesting that Nike "Just Stop It."

There are several ironies related to Nike's strategy that contributed to the publicity this controversy received. The fact that Nike's shoes were high-prestige luxury items sold to well-to-do children (and sometimes not-so-well-to-do children) in the United States and other western countries contrasted sharply with working conditions being portrayed in the media and the perceived exploitation of child labor.

In addition, Jeff Ballinger, who had been working to organize Nike subcontractor factories in Indonesia in the late 1980s and early 1990s, was able to point out the disparity in the money Nike paid celebrity endorsers versus what workers were paid to make Nike shoes. In the August 1992 issue of *Harper's* magazine, Ballinger was quoted as saying that an Indonesian worker making Nike shoes in Java would have to work 44,492 years to make what Nike paid Michael Jordan in one year. This criticism was an example of how Ballinger and other critics were able to use Nike's celebrity endorsement strategy against the company. Although Ballinger would later concede that Nike was no worse than other firms in the industry, Nike's name became synonymous with the term *sweatshop labor* in the eyes of much of the general public.

Labor-affiliated critics of Nike's overall strategy and labor practices were concerned both with the loss of jobs to overseas production and what they referred to as a "race to the bottom." According to this line of argument, the exploitation of low-paid workers overseas in harsh working conditions put downward pressure on wages and working conditions of workers in the United States. Thus, it was both a matter of labor solidarity and self-interest that led union activists to criticize Nike's labor practices and to call for reforms.

The criticisms of Nike got traction on the nation's college campuses where chapters of Students Against Sweatshops began to form. Students and faculty involved began demanding to know who was making the college-branded gear (e.g., hats, sweatshirts, T-shirts) being sold in the college bookstores and under what conditions they were being made. About the same time, mid-1990s, a boycott of Nike products over sweatshop labor concerns began to pick up steam.

Both critics and supporters of Nike concede that Nike's problems were exacerbated by its initial response to the criticism. This was to disavow any responsibility for labor problems in its subcontractor facilities on the grounds that it did not make the shoes—they are made by its subcontractors. Nike subsequently enlisted former Atlanta Mayor and UN Representative Andrew Young to investigate its subcontractor factory operations in Vietnam. When a generally upbeat report was issued, Young was criticized for bias and sloppy research methods.

In November 1997, the *New York Times* stated that in an inspection report that was prepared for the company's internal use only, Ernst & Young wrote that workers at the factory near Ho Chi Minh City were exposed to carcinogens that exceeded local legal standards by 177 times in parts of the plant and that 77% percent of the employees suffered from respiratory problems. The article leaked several excerpts from this report that detailed the unsafe and unhealthy working conditions in Nike's factories.

While Nike was at the center of the controversy over alleged sweatshop labor practices, other firms and parties became embroiled in it as well. When morning talk show host Kathie Lee Gifford's line of clothing was criticized for being made with abusive labor practices, she investigated the allegations herself and confirmed some of the charges. Ms. Gifford then became an advocate for improving working conditions in the apparel industry.

As the criticism mounted regarding the use of sweatshop labor in the apparel and footwear industries, the federal government got involved. During the Clinton Administration, the White House convened a meeting of industry, labor, and activist representatives to address issues of sweatshop labor in the apparel industry. Originally called the Apparel Industry Partnership, this group came to be known as the Fair Labor Association whose purpose was to promote adherence to international labor standards and improve working conditions worldwide.

A turning point in Nike's response to critics was Phil Knight's appearance at the National Press Club in May 1988. In his speech, Knight conceded that Nike bore responsibility for conditions in its subcontractors' factories and that many of the critics' complaints about those factories were valid. Furthermore, he pledged to reform Nike's labor practices with respect to child labor, worker development, and safe working conditions. More specifically, Knight promised to raise the minimum age of all sneaker workers to 18 and apparel workers to 16, adopt clean air standards, advance microloans to workers, and expand its monitoring program. Following this speech Nike undertook a number of institutional changes to carry out Knight's promises. Notably, Nike changed its response to this controversy from defensive to proactive and began to take the lead in efforts to reform working conditions in poor countries. In addition, Nike has become more proactive in addressing criticisms of the company. Nike representatives have participated in forums at professional associations such as the Academy of Management and the International Association of Business and Society. Nike has also welcomed researchers into its factories and it has hosted college study abroad groups visiting countries in which its subcontractors operate. How much of this response was due to a sincere belief that the company had acted wrongly in the treatment of its subcontractor workers and how much was due to business expediency to silence the critics is uncertain.

Nike is one of the first companies to publicly publish a list of its active subcontractors/suppliers in an effort to establish transparency and also to gain efficiency for monitoring and inspections by collaborating with other companies who use the same subcontractors. As of May 2005, Nike is also recognized by four institutions that gauge according to their own specific criteria whether a company should be considered a socially responsible investment. These are *FTSE4 Good Index Series*, *Dow Jones Sustainability Index, Ethibel Investment Register*, and *KLD Broad Market Social*^SM^ *Index*.

Furthermore, Nike has also published a 113-page Corporate Responsibility Report FY 04 freely available on its Web site. While the company painstakingly details its efforts at engaging its five most important stakeholders, namely consumers, shareholders, business partners, employees, and the community, it recognizes that for the future they need to focus on the following priority issues with respect to workers and factories: freedom of association; harassment, abuse, and grievance procedures; payment of wages; hours of work; environment; and safety and health. The report notes that its biggest challenge is in China, which accounts for 180,000 contract workers in more than 110 factories. China accounts for 36% of its manufactured footwear and has a large and fast-growing domestic market for Nike goods. However, upholding its code of conduct in China is a difficult problem for Nike due to local laws that prevent independent labor organizing. Several other problems exist, such as the lack of clarity about the law and its monitoring, falsification of information related to wages by factories, and social problems caused by temporary migration of workers from rural China to manufacturing provinces. Nike believes that engagement with its stakeholders, including the Chinese government, and building partnerships in China is the long-term solution to improving labor conditions there.

Because Nike has been so closely tied to the sweatshop labor controversy, the underlying debate about the ethics of sweatshop labor is particularly relevant to the Nike case. Many critics have argued that companies like Nike have a responsibility to see to it that their subcontractors provide better than market-derived or legally mandated wages and working conditions in their operations in developing countries. Others though have argued that if such companies were to do so, there would be less incentive to invest in these developing countries and the benefits of economic growth would be forfeited.

As of this writing, critics and supporters of Nike are still very far apart on the quality of working conditions and the extent of labor abuses in Nike subcontractor factories. However, there does seem to be fairly widespread agreement that the criticisms leveled against the company have brought about an improvement in these conditions since the controversy started.

NIMBY (Not in My Backyard) Phenomenon

NIMBY is an acronym for Not In My Back Yard. It has two distinct usages and categories of users. First, it connotes the selfish unwillingness of individuals to accept the construction by corporations of large-scale projects nearby, which might affect their quality of life and their properties' value. Project proponents, usually consisting of the sponsoring corporation, construction labor unions and contractors, and the like, use the term in this way. Second, it implies a lack of social conscience and a class, race, or disability-based opposition to the location of social service facilities in neighborhoods. Social service and environmental justice advocates use the term in this sense.

The phrase seems to have appeared first in the mid-1970s. It was used in the context of the last major effort by electric utilities to construct nuclear-power-fired generating stations, especially those in Seabrook, New Hampshire, and Midland, Michigan.

NIMBY's negative connotation comes from the fact that those opposing high-impact projects on environmental grounds tend to be of middle-class or lower-class origins. It is therefore a wedge issue used by project proponents.

The phrase has a double edge, which makes it difficult to cope with for people so labeled. It implies that project opponents want poor people and poor neighborhoods to bear the burdens of toxic waste facilities or quarries. Also, it hints that opponents are willing to sacrifice the blue-collar jobs that construction and operation of the facility would, arguably, generate.

Some environmentalists have tried to turn NIMBY into a positive. They have argued that the very basis of environmental awareness rests on caring about what happens in a person's own locale. They have also pointed out the logical discrepancy of a corporation's playing on social class in order to win its project.

While undoubtedly true, the "NIMBY as positive" argument has had little traction because in the 1990s environmental justice advocates and other social justice campaigners generally adopted a negative usage of the term and reinforced the class-based implication of NIMBY. Now, it applies particularly to the location of group homes for people with developmental disabilities or to drug-treatment facilities.

Noncognitivism

Noncognitivists maintain that moral judgments are more appropriately viewed as *expressions* of attitudes, preferences, or desires rather than propositional claims about factual states of affairs. They typically subscribe to two related notions: First, moral statements are linguistically incapable of being true or false, and second, psychologically speaking, moral judgments are not reports of belief but indicators of other affective states of mind. Noncognitivism in ethics, thus, is a metaethical thesis regarding the truth aptness of moral judgments.

There are three principal forms of noncognitivism. *Emotivism* is the noncognitivist view that holds that moral utterances about good, bad, right, wrong, virtue, and vice (along with judgments concerning so-called thick moral concepts like justice, bravery, and beneficence) are emotional expressions of supportive or negative attitudes toward actions and individuals. So, for example, the moral judgment that "Charles was wrong to deceive her like that" is simply a complex speech act that expresses a brute attitude against Charles's deceptive act, much like "Charles's act of deception: terrible!" Even though moral judgments take the form of statements or assertions in many cases, *prescriptivism* maintains that judgments are actually imperatives: judgments like it is "dishonorable to deceive someone" amount to "do not deceive." More contemporary versions of *norm expressivism* begin from the premise that general norms or principles are, at bottom, expressions of some attitude toward an action or individual; however, norm expressivists also recognize how such attitudes can form the basis of a system of derived beliefs that are subject to the rational standards of semantic consistency.

There are at least two noteworthy philosophical motivations behind noncognitivism. The first centers on the nature of moral facts (if there are to be any) and the second concerns the underlying motivational force of moral judgments.

If moral statements are genuinely cognitive, that is, capable of reporting beliefs that are true or false, then there are presumably factual states that such statements identify and describe. Noncognitivists find this hard to accept, however, because such factual states would either have to be (1) naturally occurring states composed of moral properties or (2) nonnatural states or properties that are wholly different from anything in the natural world. Both these options lead to unacceptable conclusions for the noncognitivist. Option 1 is implausible for a reason famously identified by G. E. Moore in his open question argument. His argument was designed to show that for any naturalistic account of moral claims, someone can always intelligibly ask *why* the identified natural state of affairs has the moral characteristic identified with it. For instance, suppose that someone asserts that honesty is morally good because it produces greater states of happiness. Such a naturalist would find the question "Is happiness good?" unintelligible because he or she has already implicitly reduced the meaning of goodness to states of happiness. Moore believed, however, that such a question is quite intelligible and therefore demonstrates how moral appraisals cannot be reduced to the description of natural states of affairs. On the other hand, option 2 does not fare any better for many noncognitivists. To say that there are some nonnatural, intrinsically normative states that our ethical statements describe calls forth a deep skepticism about the existence of such metaphysically queer facts, especially when it is not clear how humans would come to know such facts.

Another motivation for noncognitivism stems from a prevailing view in moral psychology, often referred to as *internalism.* Internalism asserts that moral judgments necessarily give rise to the motivation to act in accord with the judgment. Cognitivists thus face a related difficulty; for if moral judgments are necessarily connected to motivational states of mind, it does not seem promising to reduce such judgments to beliefs about what is true or false. Factual beliefs are thought to be motivationally inert and incapable of motivating action. Thus, noncognitivists find it more plausible to characterize moral judgments as deeply connected to the expression of some affective state and, hence, are able to provide a coherent psychological explanation for why we are motivated to act in ways consistent with our moral convictions.

The implications of noncognitivism are subtle but nonetheless significant. Rejecting the truth aptness of moral claims implies that the supposed universality and objectivity of some claims, for example, those related to fundamental human rights, no longer have the validity that they are sometimes assumed to have. This worry holds equally well for the norms that govern the conduct of managers within business. There is a strong interest on the part of many observers of business to ground the validity of norms regarding fraud, honesty, and fairness in the objective nature of claims expressing those values. In response to this concern, noncognitivists have countered that the normative force of moral claims results from shared human attitudes and practices, independent of their ability to be true or false. Moreover, some noncognitivists, such as Simon Blackburn, are careful to note that while moral claims may not be literally true, the rich set of social commitments that form the basis of morality provide enough space for dialogue, criticism, and refinement of existing norms, thereby salvaging the objective "feel" of certain basic moral claims.

Nongovernmental Organizations (NGOs)

Nongovernmental organizations (NGOs) are nonprofit organizations that either deliver public services or advocate public policy, or both. Some observers also refer to them as civil society groups or third sector groups, as distinguished from the for-profit business sector and from government. They are also to be distinguished from intergovernmental organizations, such as the United Nations and the Organisation for Economic Co-operation and Development (OECD).

NGOs include a wide range of organizations—relief, humanitarian, development aid, and sustainable development—but the term more commonly refers to advocacy groups. The forerunner to the emergence of NGOs on the global scene was the rise of citizen groups and citizen activism within the United States. The proliferation of such groups occurred during the 1960s and 1970s and coincided with the rise of social regulation. The trend continues unabated in the new century and has given rise to global NGOs and international networks among citizen groups.

In the area of service delivery, there are domestic organizations that provide basic needs and social services, such as the Salvation Army, Goodwill Industries, and Habitat for Humanity. Some of these organizations provide services in the global arena as well, where they are joined by relief organizations such as the International Red Cross and Doctors Without Borders.

More central to this discussion are advocacy groups that promote change in corporate practices and public policy. These are the groups that have proliferated most rapidly over the past half century and that have promoted corporate responsibility and ethics concerns.

Before the strong wave of social regulation in the United States in the 1970s, the social movements of the 1960s transitioned into citizen groups in the following decade. What began as protest movements on civil rights, women's rights, consumer protection, and environmental protection in the 1960s transformed into more mainstream interest groups in the 1970s.

Political Tactics

The range of traditional political tactics used by citizen groups and NGOs has been broad and diverse and includes both traditional and nontraditional tactics.

Traditional Political Tactics

- Lobbying
- Campaign contributions
- Grassroots activism
- Issue advertising
- Litigation
- Research think tanks
- Ballot measures

Citizen groups hire political experts and experienced legislative staff from congressional offices to lobby legislators directly, a traditional function of Washington offices of all organizations. Along with labor unions and business, they also raise and channel campaign contributions to political candidates. The League of Conservation Voters, for instance, is the foremost political action committee of the environmental movement, while Emily's List has raised money for women congressional candidates.

NGOs have gone beyond direct lobbying to also organize grassroots campaigns to promote major public policy initiatives. They have done so by organizing their own members to write letters and contact legislators in key congressional districts while also reaching out to members of the general public who might be sympathetic to their cause. Such grassroots outreach campaigns often involve another tactic—that of issue advertising.

The 1970s also marked a time when NGOs began to make more sophisticated use of litigation and policy research. The Ford Foundation financed the development of a network of public interest law firms and legal foundations around the United States, which sponsored litigation in the areas of environmental rights, consumer rights, and civil rights. Also emerging around the same time were liberal think tanks, some of which were part of Ralph Nader's network, which produced policy research critical of corporations and of government policy.

NGOs also used the initiative process in several states to bypass legislatures and go directly to the people with ballot measures to promote their agenda. Such measures, since the 1970s, have included cigarette taxes, environmental and health disclosure standards for products, energy alternatives such as solar energy, and campaign finance reform.

Often, NGOs will be organized to use only one or two of the political tactics mentioned, such as the League of Conservation Voters on campaign contributions to candidates or the Center for Law and Social Policy to pursue litigation, or Consumers Union to provide consumer testing and research. More complex and sophisticated NGOs, meanwhile, might pursue a broader range of tactics and in essence be full-service political organizations. The Sierra Club is a good example. It engages in both direct and grassroots lobbying, produces policy research, and also sponsors litigation through the Sierra Club Legal Foundation. On a global scale, Greenpeace operates in a similar manner by lobbying, coalition building, and engaging in policy research. Meanwhile, it also pursues nontraditional and confrontational direct action campaigns against corporations, discussed in the next section.

Nontraditional Political Tactics

Beyond the range of traditional political tactics discussed, NGOs often use a range of nontraditional political tactics, as follows:

- Direct action
- Boycotts
- Shareholder activism and resolutions
- Cross-sector coalitions
- Corporate collaboration

While most of the traditional tactics are designed to influence corporations indirectly through public policy, the nontraditional tactics aim to influence corporations directly. NGOs often work with government, but they can also be cynical of their ability to force change through government policy. Hence, NGOs often advocate their positions by directly pressuring corporations. This may bring some interest groups back to their roots as social movements when they engaged in more confrontational tactics.

Protest marches and media events can bring enough adverse publicity to a corporation to cause embarrassment and possibly force change. The time-honored tactic of consumer boycotts can accomplish the same goal. The National Association for the Advancement of Colored People sponsored boycotts during the civil rights era of the 1960s, and civil rights activist Jesse Jackson threatened such boycotts against specific companies like Nike and Coca-Cola in the 1990s. Through Operation PUSH and the Rainbow Coalition, he sought to bring pressure for corporate covenants to increase minority representation in senior management and on corporate boards and to increase economic participation with minority businesses. The Internet has also become a key organizing tool, especially in attracting protesters from around the world to meetings of the World Trade Organization. Shareholder resolutions, explained more fully in another section of this encyclopedia, are another nontraditional tactic that NGOs have used to bring pressure for change in corporate policies.

Building coalitions between NGOs has often been used as a way to multiply the strength of group pressure on any issue. Environmental groups often bring concerted efforts to bear in coalition lobbying campaigns, for example. What are becoming even more common are cross-sector coalitions, where NGOs with very different agendas and interests coordinate their efforts to target a corporation or an issue. Religious groups, consumer groups, and health groups, for instance, combined forces to boycott Nestlé for its aggressive marketing of infant formula in Third World countries. Religious groups and civil rights groups joined in protesting apartheid in South Africa in the 1970s.

Often, these coalitions evolve into global networks of NGOs. Religious groups, farm worker groups, health groups, consumer groups, and environmental groups all pooled their efforts to form an antipesticides coalition, since pesticides endanger the interests of all their constituencies. Such broad coalitions may both symbolize the importance of an issue and maximize the range of tactics available in any conflict as some groups may have policy or scientific expertise, while other groups may have large and dispersed memberships to bring pressure against a corporation or against governments in different regions or the world.

Finally, as NGOs mature and moderate, they are sometimes willing to dialogue and collaborate with their corporate adversaries, perhaps even in a structured and formalized manner. This has been particularly true of dialogues among environmental groups, corporations, and government on such sweeping issues as global warming. Through such collaborative efforts, different interests can discover common ground and avert further conflict, litigation, or regulation. The World Wildlife Fund, the Institute for Resource Management, and the Keystone Center for Science and Technology have all convened dialogue groups. While studies show their recommendations have not often been formulated as public policy, the communication and collaboration they foster build the foundation for future consensus.

Impact of NGOs

Change promoted by NGOs may be either positive or negative depending on the intended and unintended consequences. Some critics also maintain that the proliferation of groups and greater amount of participation in the public policy process create gridlock and paralysis in decision making. With too many interests to accommodate, legislatures may never arrive at a consensus, and that may be viewed as positive or negative as well, depending on one's perspective.

There are two other lesser known but important impacts of NGOs. First, as groups of different views and ideologies proliferate, one can observe a countercyclical political phenomenon. Success tends to breed failure, and vice versa. When one constellation of groups has won a major public policy victory or has elected its supporters to office, it tends to grow complacent and retrench. Meanwhile, its ideological opponents may feel threatened and work that much harder to regain lost ground, leading the political pendulum to swing back in their direction. Environmental groups, for instance, experienced large gains in memberships in the 1980s after President Reagan was elected, but they have won more policy victories with less work during Democratic administrations.

Second, as the numbers of NGOs grow within a particular policy sector, inevitably, splintering occurs, as within the environmental and health sectors. Disagreements arise among the groups on both tactics and policy positions. Typically, grassroots, localized groups take more extreme positions and use more militant tactics, while groups headquartered in national capitals are more prone to compromise and resort to more conventional and moderate political tactics. Such splintering poses both a strategic opportunity and threat to corporations. The splintering makes it more likely that a corporation may find at least some groups willing to negotiate and take a market-friendly approach, as with Environmental Defense or the National Wildlife Federation. Meanwhile, it is also inevitable that groups taking an extreme position will be more intractable and will remain steadfast opponents to business.

Global Aspects

Ironically, even though the United States gave rise to citizen activism and other countries followed suit, some European countries may have surpassed the United States on certain items in the activist agenda. Global NGOs have criticized globalization as corporatization of the world economy and have emphasized human rights and environmental sustainability over other issues such as consumerism. Other issues on the NGO agenda include conflict resolution, peace keeping and nation building, refugee resettlement, and a ban on land mines. Groups have also fought for the alleviation of poverty, hunger, and diseases such as AIDS and have combated violence against women and sexual slavery.

NGOs such as Transparency International have also demonstrated a real concern for governmental process issues, and the latter has led efforts to monitor and fight bribery and corruption. Amnesty International has campaigned for political freedom and rights globally, while Freedom House has tracked and promoted the spread of democracy. NGOs have also monitored the projects of multilateral institutions such as the World Bank to ensure it respects human rights and guards against corruption.

Beyond the networking that occurs among global NGOs, facilitated by the Internet, international organizations also provide important forums for the participation of NGOs in global policy making, at least in an advisory capacity. The UN Global Compact, for instance, has many NGOs as members and enjoys the support of major corporations as well.

Critique of NGOs

One of the early criticisms of American citizen groups—lack of accountability—is also applicable to global NGOs. Studies of citizen groups going back to the 1970s found that most had no members at all, had been founded by social policy entrepreneurs, were staff dominated and undemocratic in their internal decision making, and were accountable primarily to wealthy donors and foundations. Even when they have members, NGOs do not take policy direction from them, and their staff are often insulated from their own board members in setting the agenda of the organization. Critics of NGOs see them as highly educated self-appointed elites that are closer to donors and governments than to the poor and powerless and also as too prone to compromise with economic and political elites.

Another criticism going back to the 1970s has also been applied to NGOs today: that they are really anticapitalist and antigrowth. Many international economists and advocates of globalization especially take this view. Related to the accountability problem, critics of NGOs also see them as controlled by Western nations, especially the United States; as having a pro-Western bias; and as self-appointed guardians of Third World nations and of indigenous peoples and tribes, to whom they are not accountable. Others, meanwhile, point to growth of NGOs based in Third World countries and the linkages developed with Western NGOs as indications that NGOs are becoming more mature and broadly based.

Values and NGOs

While NGOs in the United States run the gamut from liberal and communitarian groups to libertarian and conservative groups, most of the global NGOs focus on human rights and sustainability and adhere to values of social justice, equality, and communitarian values. Since most corporations are more concerned with liberty and efficiency, and find fewer allies with those values among NGOs on the global scene, relating to global NGOs is a larger challenge for corporations than relating to domestic NGOs and citizen groups. The culture clash that corporations experience in dealing with global NGOs, especially those in Europe, surpasses the distance they feel from the values of a more ideologically diverse array of groups in the United States. The NGO infrastructure in the United

States reflects its history of individual rights and freedom and of a plurality of interests, while NGOs in Europe and other areas of the world reflect a political culture more concerned about economic security and equality.

Nonprofit Organizations

What do the following organizations have in common—the Ford Foundation, the Carnegie Endowment for International Peace, National Organization for Women, U.S. Chamber of Commerce, American Red Cross, and the YMCA? They are all nonprofit organizations. Nonprofit organizations may be generally defined as tax-exempt organizations created for the purpose of serving the public interest. The public interest may be reflected in categories such as charitable, educational, scientific, literary, or religious.

Nonprofit Sector

Nonprofit organizations, taken collectively, are referred to as part of the nonprofit sector. This is a general name given to the institutions and organizations in society that are not businesses or governments. The nonprofit sector is sometimes referred to by other names, such as the not-for-profit sector, the independent sector, the third sector, the philanthropic sector, or the voluntary sector. Nonprofits are typically referred to as nongovernmental organizations (NGOs) outside the United States. It has been estimated that the nonprofit sector in the United States represents about 6% of all organizations and that roughly 1 in every 15 U.S. citizens is employed in a nonprofit organization. It has been estimated that more than a million nonprofit organizations spend in excess of $500 billion each year. In short, nonprofit organizations are pervasive and touch each of us every day. Collectively, the nonprofit sector composed of these nonprofit organizations represents a significant segment of society that affects the total citizenry. All estimates seem to indicate that the nonprofit sector is growing in size.

What Is a Nonprofit Organization?

As their name implies, the primary characteristic of nonprofit organizations is that they cannot pay profits to owners. Nonprofit organizations have no owners in the traditional business sense. As compared to business organizations that can generate profits and distribute these profits to investors, owners, or shareholders, nonprofit organizations, frequently referred to simply as "nonprofits," cannot distribute any income that represents revenues in excess of costs. Nonprofits have stakeholders, not stockholders. These stakeholders include the clientele that benefit from their services or programs and the community, in general, that receive indirect benefits from their presence. This does not mean that nonprofits cannot make any profit. It simply means that whatever profit is made must be retained and reinvested into the organization's budget and programs.

Most nonprofit organizations are created for the purpose of providing some public benefit or service. Having a public service purpose or mission is a key identifying characteristic of nonprofit organizations as they are generally thought of in society today. They are created by interested parties for the purpose of serving society, generally, or particular issues, topics, or clientele groups, specifically.

Nonprofit organizations are private, in the sense that they are not a part of government. They are typically incorporated as legal entities, and they are self-governed by their boards of directors, who are usually volunteers committed to the nonprofit's mission. In terms of daily operations, depending on their size and budget, they could be composed of all nonpaid volunteers or could have paid staff, including paid executives and managers. Frequently, most nonprofits have at least a small core of employees who are paid but accomplish much of their work with volunteers.

Many nonprofit organizations receive their funds from private contributions. However, many other nonprofits generate revenue by charging fees for their services, earning interest on their investments, or producing and selling goods and services. In short, there are many different varieties of nonprofits and they are funded in a variety of ways.

When people think about nonprofit organizations, they often think they are all tax-exempt. Many nonprofits do organize in such a way that they can receive tax-exempt status by the Internal Revenue Service (IRS) and state tax agencies, but not all of them are tax-exempt. Those most frequently known for receiving tax-exempt status are known as 501(c)(3) organizations. Many nonprofits organize in this way because they depend on private funding and contributions, and they want to organize in such a way that donors may receive tax deductions for their contributions.

Thomas Wolf has asserted that there are five distinguishing characteristics of nonprofit organizations: They must have a public service mission; they must be organized as a not-for-profit or charitable corporation; their governance structure must preclude self-interest and private financial gain; they must be exempt from paying federal taxes; and they must possess special legal status that permits gifts made to them to be tax deductible. These characteristics do describe most nonprofit organizations, but there may be some exceptions to these characteristics.

Different Types of Nonprofit Organizations

There are a number of different types of nonprofit organizations. Section 501(c) of the tax code details the types of organizations that are permitted to have tax-exempt status. The tax code distinguishes more than 25 different classifications of nonprofit organizations. BoardSource, a nonprofit association, formerly known as the National Center for Nonprofit Boards, summarizes that there are four major categories of nonprofit organizations: charities, foundations, social welfare organizations, and professional and trade associations. These four categories help us appreciate the different types of nonprofit organizations existing today.

Charities

Most of the nonprofit organizations in the United States are classified as public charities. Examples include organizations that provide, without charge, care and services to the needy, hospitals, museums, and public television and radio. At a local community level, there are many charities that provide such services. Homeless shelters and food banks would be local examples. At the state and national level, there are charities that operate more broadly. Most of these charitable organizations have 501(c)(3) or some other type of tax-exempt status. A distinguishing feature of a public charity is that it is able to demonstrate broad public support as compared to funding from one source.

Foundations

Foundations are also 501(c)(3) tax-exempt nonprofit organizations. A foundation is a charitable institution, often constituting a permanent fund or endowment that is founded or created by individuals, families, businesses, or communities as a vehicle through which they support causes and programs that benefit society. Foundations are generally thought to be more complex than simple charities, and they are regulated more closely by government and have more strict reporting requirements than other nonprofits.

There are different types of foundations. The most common types of foundations include those which are private, operating, or community based. A *private foundation* typically has a single source of funding from an individual, family, or business, and it uses income from its investments to give grants to nonprofit organizations.

Well-known examples of private foundations include the Kellogg Foundation, the Carnegie Corporation, and the Ford Foundation. Some companies set up their own foundations as vehicles through which they make contributions. The American Express Foundation and the Bill and Melinda Gates Foundation are examples. Many companies choose to create in-house giving programs rather than operating through a foundation.

An *operating foundation* is one that uses the majority of its resources to carry out its own programs rather than making grants to others. Local hospitals and colleges or universities are examples of operating foundations. *Community foundations* collect resources representing particular cities, regions, or geographical locales. They usually focus on quality-of-life issues in particular areas.

Social Welfare Organizations

Social welfare organizations represent another category of nonprofit organizations recognized by the IRS. Social welfare organizations may not be organized for profit and must be operated exclusively to promote social welfare. Examples of social welfare organizations include the National Rifle Association, the National Association for the Advancement of Colored People, and the National Organization of Women. Many social welfare organizations are tax-exempt through IRS section 501(c)4. Some social welfare organizations participate more in legislative advocacy, lobbying, or political campaign activities and are not afforded tax-exempt status.

Professional and Trade Associations

Professional and trade associations are nonprofit organizations representing the business or professional interests of specific groups. Examples include chambers of commerce, business leagues, and organizations that promote the professional interests of an industry (e.g., manufacturing) or a profession (e.g., licensed engineers). These organizations generally qualify for tax-exemption under Section 501(c)(6) of the tax code. Contributions to these organizations are not tax deductible but membership dues may be deductible by the members as a business expense.

Causes Represented by Nonprofits

There are a number of different allowable purposes for nonprofit organizations according to the IRS tax code. A listing of them provides a useful overview of the different purposes for which nonprofits are created.

Arts, Culture, and Humanities

Examples of these nonprofits would include museums, concert halls, art, history, and genealogy appreciation, halls of fame, historic preservation, and organizations of writers, artists, and performers.

Education

Examples here would illustrate the broad range of formally constituted educational organizations. This would include both public and private schools and colleges and libraries, continuing education centers, literacy programs, and so on.

Health

Health-related causes embrace a wide range of different nonprofits. Examples include nonprofits related to hospitals, blood banks, outpatient clinics, mental health facilities, and medical research.

Human Services

Human services are more broad based than health-related nonprofits. Included here would be nonprofits related to protecting the public from crime, services for prisoners, job development and training, services for the unemployed, food services, children and youth services, homeless shelters, and services for senior citizens.

Others

Other causes or purposes for nonprofits might include religious-based organizations, environmentally focused organizations, and those related to animal welfare.

Three Stages of Nonprofits: Starting, Governing, Managing

There are three major stages in creating and managing nonprofit organizations that represent different levels of activities regarding their operations: (1) starting a nonprofit, (2) governing a nonprofit, and (3) managing a nonprofit.

Starting a Nonprofit Organization

Individuals and/or groups start nonprofit organizations because they believe the nonprofit status is the most appropriate way to organize their efforts toward providing a service to the public. To begin with, starting a nonprofit organization requires a statement of purpose answering the following questions: Why will this organization exist? What will it do? Although this process of stating organizational purpose may start with a few sentences or a brief paragraph, eventually it must be formulated into a mission statement. A *mission statement* is a statement of organizational purpose that serves as the guiding document in all that is done later. The mission statement should include the nonprofit's general purpose, a statement of the primary benefits and services provided to clients, groups of clients who will benefit from the services, and values that may guide the nonprofit organization. Whole books and numerous articles have been written on mission statements and their purposes, so we will not discuss this crucial step further.

At about the same time as the drafting of a mission statement, a *board of directors* needs to be recruited and formed. If there are plans to incorporate in a particular state, the founders should refer to state law as to how many board members are necessary to meet state requirements. Typically, the board members of a newly forming nonprofit organization will be individuals who have a passion for the cause or purpose of the nonprofit. The board provides *governance* of the nonprofit, the second stage of the process being discussed in this section. The subject of governance will be discussed further under governing the nonprofit.

Assuming the nonprofit organization desires to operate formally, the next step in the process is the creation of a legal entity by filing *articles of incorporation* that might require a lawyer and the submission of an application to the IRS if *tax-exempt status* is desired. In addition, *bylaws* may be needed that outline how the board will operate and how the staff will be configured. Depending on the proposed size of the nonprofit, a lawyer, banker, and accountant may need to be retained. Once federal tax-exempt status is achieved, other legal steps might include filing for state tax-exemption, property tax–exemption from the city, getting a solicitation license to solicit funds, and a mail permit for bulk mailings. Once employees are hired, insurance and other implications must be addressed.

Many Web pages dedicated to the forming of nonprofit organizations are available. The above steps generally outline what is involved in starting the nonprofit.

Governing a Nonprofit Organization

After a nonprofit has been started and a board of directors has been formed, the process of governance of the nonprofit becomes a central issue. In strategic management terms, governance refers to the overall exercise of authority provided by the board of the organization. It involves the creation and administration of policies and affairs of the nonprofit. The governing board becomes the strategic leaders who provide direction and vision for the nonprofit. The board has responsibility for refining the nonprofit's mission statement and for ensuring that the organization stays "on mission" in a responsible way.

There are a number of different lists that could be developed describing the steps involved in governing a nonprofit organization. BoardSource, formerly the National Center for Nonprofit Boards, a nonprofit organization that is in the business of providing educational materials for nonprofits, summarizes what it considers to be the "Ten Basic Responsibilities of Nonprofit Boards." The governance responsibilities of the board may be subsumed under these 10 items:

1. Determine the organization's mission and purpose.
2. Select the chief executive.
3. Support the chief executive and review his or her performance.
4. Ensure effective organizational planning.
5. Ensure adequate resources.
6. Manage resources effectively.
7. Determine and monitor the organization's programs and services.
8. Enhance the organization's public image.
9. Serve as a court of appeal.
10. Assess its (the board's) own performance.

While each of these 10 responsibilities define what boards do in the process of governance, BoardSource takes governance more seriously by suggesting a dozen governance principles that help to make boards exceptional performers. Many of these principles overlap with the 10 responsibilities named. Each of these 12 principles is worthy of summary.

1. *Constructive partnership:* Boards must form constructive partnerships with the chief executive of the nonprofit. Their two roles are interdependent.

2. *Mission driven:* Boards must effectively decide on and sustain mission, vision, and core values.
3. *Strategic thinking:* Operational and daily activities must be aligned with strategic goals and objectives to ensure maximum effectiveness. Boards must constantly think strategically to make sure this happens.
4. *Culture of inquiry:* Sound decision making requires that boards implement a culture of inquiry so that all points of view are heard and considered in the governance process.
5. *Independent-mindedness:* Boards must ensure that their members place the interests of the organization above personal interests. Part of this requires careful conflict-of-interest policies. Another part of this is for board members to express their legitimate concerns independent of the views of or loyalty toward the chief executive.
6. *Ethos of transparency:* Boards must ensure that all stakeholders and the public have access to information about the nonprofit's operations, finances, and policies.
7. *Compliance with integrity:* The promotion of strong ethical values and practices is an obligation of exceptional boards.
8. *Sustaining resources:* Exceptional boards will make sure that resources are available to support missions, goals, programs, and services.
9. *Result oriented:* Boards have a responsibility to measure and evaluate the nonprofit's results. These results may be expressed in terms of effectiveness, efficiency, and impacts. Other legitimate results relate to timeliness and costs.
10. *Intentional board practices:* Effective governance does not accidentally happen. Boards must intentionally put in place practices, policies, and structures that ensure optimization.
11. *Continuous learning:* Effective boards evaluate their own activities and performance to ensure that they are learning from past experience and integrating these lessons into future plans.
12. *Revitalization:* Effective boards revitalize themselves through continuous improvements involving planned turnover, careful recruitment, and inclusiveness.

In summary, board governance is the most comprehensive level of attention that may be given to providing direction for nonprofit organizations. Many of these same responsibilities will need to be carried out at the management stage, but they originate with careful boards of directors. Their focus is on achieving exceptional levels of performance.

Managing the Nonprofit Organization

The third stage in implementing nonprofit organizations entails their actual management. Management, of course, is a broad term that encompasses to some extent the previous stages discussed. In fact, according to the "constructive partnership" principle mentioned above, a close working relationship must be established and maintained between the board and the management group of the nonprofit. Indeed, a number of the activities required to run a successful nonprofit will require effective action at both the board and the management level. Two key examples where collaboration will be required include planning, especially strategic planning, and fund raising.

Depending on the size and funding of the nonprofit, the management group of the nonprofit organization may be many or few, paid or unpaid. A large nonprofit might have management and staff paid comparably to for-profit organizations. They might also have several layers of management. Examples of this type of nonprofit might include the American Red Cross or Habitat for Humanity. Often, these large nonprofits have offices located at state and local levels. In contrast, many nonprofits are medium or small in size, and their managers and staff receive modest compensation. Many of them have management groups and staff that are unpaid volunteers.

Without going into details, important management aspects of nonprofits involve getting the work done with paid staff and volunteers. Key management responsibilities in nonprofits include working with volunteers, creating programs and budgets, and fund raising. Management responsibilities embrace planning, organizing, motivating, and controlling—the same that are relevant in for-profit organizations.

One aspect of managing nonprofits that is different for for-profit organizations is the use of volunteers in getting much of the nonprofit's work done. Nonprofit boards and management groups must attract, motivate, retain, and replace volunteers.

It has frequently been observed that working with volunteers is the lifeblood of nonprofit organizations. Working with volunteers requires the board and management to undertake ventures such as understanding why people volunteer, determining the nonprofit's needs for volunteers, and designing a volunteer program. A volunteer program involves finding, recruiting, motivating, scheduling, and training of volunteers. Quite frequently, the volunteers work in the form of committees, so logical and coherent committee structures must also be put in place.

Dealing with volunteers typically brings the board and the management group into a close working relationship. Board members, themselves, are typically volunteers, and they play key roles both in terms of their own volunteerism and the management of other volunteers. To illustrate all the kinds of activities that are involved in working with volunteers, M. A. Hager and Jeffrey Brudney have identified a list of practices that they have used to gather information from nonprofits about their volunteers' activities. This list includes the following topics:

- Regular supervision and communication with volunteers
- Liability coverage or insurance protection for volunteers
- Regular collection of information on volunteer numbers and hours
- Screening procedures to identify suitable volunteers
- Written policies and job descriptions for volunteer involvement
- Recognition activities for volunteers
- Annual measurement of the impacts of volunteers
- Training and professional development opportunities for volunteers
- Training paid staff in working with volunteers

It should be apparent from this list of topics that working with volunteers is an awesome management and board responsibility that gets into many details regarding the volunteers and their activities.

Summary

There are so many nonprofit organizations in existence today that their presence is even referred to as the nonprofit sector of society or the economy. Nonprofit organizations are created for the purpose of providing some public benefit or service. Different types of nonprofits include charities, foundations, social welfare organizations, and professional and trade associations. The different causes for which nonprofits have been formed include (1) arts, culture, and humanities; (2) education; (3) health; (4) human services; and (5) other, which includes religious organizations, environmental organizations, and those related to animal welfare. There are three major stages in creating and managing nonprofit organizations that represent different levels of discussion regarding their operations: (1) starting a nonprofit, (2) governing a nonprofit, and (3) managing a nonprofit. Each of these stages embraces a wealth of information necessary for effective completion. Nonprofit organizations increase in number each year, and there is every belief that the nonprofit sector is growing in importance in society and in the economy.

Normative/Descriptive Distinction

The categories of "the normative" and "the descriptive" correspond to moral and factual statements, respectively. In the first case, normative assertions about values and "what should be" are traditionally investigated as the subject matter of moral philosophy. In the second case, propositions about facts or "what is" are typically examined in the descriptive realm of the natural and social sciences.

The methodological issues raised by the distinction are long standing. Notably, Hume's characterization of the difference between *ought* and *is* prompted the question of whether normative statements can be derived from factual descriptions. Moore addressed this question by asserting that defining *good* in terms of natural objects commits the naturalistic fallacy. On the other hand, social scientists have long expressed uneasiness about collapsing normative and descriptive categories, fearing that doing so would render facts too arbitrary and relativistic for objective analysis.

The partitioning of the normative and the descriptive in business research is also due to the influence of conventional economics, which, in the tradition of social science, tends to relegate normative considerations to the arena of ethics while limiting positivistic economics to factual, testable hypotheses. This separation prompts different approaches to the same subject matter. Consider poverty, for example. An ethicist would likely consider the rights claims of the poor, possibly as a justification for ameliorating disparities of income and wealth. In comparison, a positivistic economist would tend to focus on describing or documenting various indicators of poverty and wealth. When the distinction between the normative and the descriptive is followed rigidly, the resulting tendency is to partition ethical inquiry couched in traditional notions of right and wrong from the factual analysis of social issues.

Despite the influence of conventional economics, the distinction between the normative and the descriptive is more often blurred than not in business and society research, due to the cross-fertilization of ethics and social science in the field. For instance, it is common for business and society scholars to document both the facts and moral dimensions of issues such as consumer safety, employment conditions, business and community relations, and ecological sustainability. This coexistence of the normative and the descriptive results from a symbiotic relationship in which one approach informs the other in setting research agendas and influencing applications of research findings.

—Diane L. Swanson

Normative Ethics

Normative ethics comprises the study of those actions that moral agents *ought* to perform. In emphasizing moral obligation, normative ethics is distinguished from more descriptive ethical theories that view ethics primarily as illuminating the way in which moral agents actually do act. While normative ethics may use the tools of descriptive ethics, it seeks to articulate a set of standards that are binding on all moral agents.

Normative ethical theories are commonly divided into three broad categories described as "deontological," "teleological," and "ethological." However, useful as this typology may be, in practice, moral action may make use of elements of all three.

Deontological Ethical Theories

The term *deontology* comes from the Greek word *deon* or duty. Deontological theories are primarily based on appeals to duty or some kind of unconditional obligation on the part of the moral agent. Different theories offer a variety of possible sources for this obligation. For some, it is rooted in the will of God or some other divine mandate, while for others it is rooted in the dictates of nature or reason.

Divine command theories of morality are common in theistic religious traditions, which assert some form of a personal God or gods. According to these theories, the nature of morality is prescribed by what God or the gods will to be done. Something is thus good if it accords with God's will and evil if it contradicts God's will. This idea was given a classic treatment in Plato's *Euthyphro,* where he seeks to demonstrate that the Good must be something independent of the will of God. However, this tradition has persisted and been given particularly vigorous defense in the reformed tradition of Christianity—for example, in the work of John Calvin and Karl Barth. Versions of divine command theories can be found in Judaism and Islam as well.

Kantian ethics, in contrast, seeks to root moral principles not in the external authority of a divine being, but in the autonomous exercise of human reason. Kant's theory is encapsulated in his Categorical Imperative. The first version of this theory states that one should always act in a way in which one thinks people should always act. By rooting his theory in the moral and logical consistency of the individual human will, Kant seeks an unassailable foundation from which to provide moral guidance. If the human will can consistently will a moral principle as universally binding, then it can be trusted to be a reliable principle for action.

Kant's second formulation of the Categorical Imperative puts its emphasis not on the universal validity of human reason but on the inviolability of the human person. The third formulation puts its emphasis on the autonomy of the human reason as a *legislating* will, calling on moral agents to act as autonomous legislators in a universal kingdom of ends.

The force of these three formulations, as Kant proposes them, is to offer a comprehensive conception of the nature of morality as rooted in human freedom and reason. Yet he believes that the moral law arrived at in this fashion is universally binding since all rational beings are capable of reaching the same conclusions. However, Kant's moral stringency is such that he does not allow for the possibility of contradictions among different moral principles. On the contrary, he believes that all duties are equally binding on moral agents and none can override another.

Other philosophers have sought to overcome some of the difficulties that Kant's inflexibility on this issue has produced. W. D. Ross offers perhaps one of the best examples in his theory of prima facie moral duties. Ross argues that there are moral duties that are properly described as "basic," in the sense that they cannot be reduced to other, prior duties. This includes, but is not limited to, duties such as fidelity, beneficence, nonmalificence, gratitude, and justice. Ross acknowledges that conflicts among these duties may exist and argues that it is only through a careful examination of the situation in question that one can arrive at a conditional determination of what one's "duty proper" must be in a given situation.

Another approach, which is more akin to Kant's second formulation of the Categorical Imperative, involves appeals to the idea of individual rights as constitutive of one's moral obligations. Of particular concern for business ethics is Robert Nozick's "Theory of Entitlement," which posits a natural right to the possession of certain entitlements of which one may not be deprived without one's consent. John Rawls, alternatively, offers a rights-based theory rooted in the idea of justice as fairness. This theory differs from Nozick's in a number of key respects, but most notably in that it offers a vigorous defense of a theory, rejected by Nozick, of distributive justice.

Deontological moral systems are appealing from a normative standpoint due to their clarity with regard to the nature of moral action and the source of moral authority. Most deontological moral theories are nonconsequentialist in the sense that one's duty is considered to be binding regardless of the results. This is easiest to understand in those cases where the consequences fall directly on the moral agent (e.g., if one accepts jail rather than lie or betray a confidence). Obedience to duty in such cases is seen to be a higher obligation than personal advantage. Such approaches become more problematic, however, when the consequences fall not on oneself but on others (e.g., letting an innocent person be harmed rather than lie or betray a confidence).

Deontological theories are often criticized precisely for being universal in those circumstances where they should allow for contingency. It's not immediately obvious that obedience to duty is of a higher moral value than protecting innocent life or preventing other negative consequences.

Teleological Moral Theories

The major theoretical alternative to deontological ethics is found in teleological, or ends-based, moral theories. These theories find normative guidance in the pursuit of particular goals or outcomes, though they often differ with regard to the nature of the goals to be pursued.

Catholic moral theology is based on a teleological conception of the moral life. Although, due to its reliance on a theory of natural law it is often taken to be deontological, the natural law is itself teleologically oriented toward the fulfillment of particular human and divine ends. Unlike a divine command theory, in which the moral good is solely defined by the will of God (irrespective of other concerns), Catholic moral theology understands the good in terms of that which fulfills the purpose for which it was created. This perspective was given its classic formulation in the work of St. Thomas Aquinas. Human beings, in this theory, are created as creatures to fulfill certain ends; for example, within society, humans have the goal of bringing about justice. In sexual relationships, the goal is to create further life. The interference with the specified goals of human activity represents a disruption or perversion of their created purposes. The consequences of actions are important in this approach insofar as those consequences correspond to the desired ends of human life.

Consequentialism, on the other hand, analyzes the morality of action in terms of whether it harms or benefits morally relevant subjects. Various consequentialist moral theories exist, differing both in terms of what is considered to be harm or benefit and in terms of who constitutes a morally relevant subject.

In Jeremy Bentham's version of utilitarianism, he advocates what he calls the greatest happiness principle. Happiness in this case is defined strictly in terms of pleasure. Those actions that produce the greater pleasure are good and those that produce greater pain are harmful. Similar theories were developed by James Mill and John Stuart Mill. Bentham offers a number of criteria to enable one to evaluate whether any particular action would produce a greater net amount of pleasure over pain, such as whether one pleasure is more intense than another or whether it is likely to be followed by similar pleasure in the future. Using these criteria, he developed a "hedonic calculus" on which one could calculate the likely morality of a particular course of action.

Others have criticized this analysis by arguing that defining utility in terms of pleasure leads to morally undesirable conclusions. These thinkers have offered alternative theories of utility, some arguing that utility should be understood in terms of, for example, one's interests and some arguing that utility should be defined not in terms of what individuals believe to be good for them but according to external moral criteria of what actually can be shown to be good for them.

The other key question for consequentialist theories has to do with who or what constitutes a relevant moral subject—one to whom consideration is owed in determining one's actions. The two major alternatives within consequentialist theory are identified with utilitarianism and egoism, respectively.

Utilitarianism, as noted above, is based on some version of the greatest happiness principle, which states that what is moral is that which produces the greatest amount of net happiness (however defined). This is often described as seeking the greatest good for the greatest number. According to this theory, one's own happiness is not of greater value than anyone else's, and therefore, when calculating the morality of one's action, one should not weight one's own good higher than the good of others. Egoistic theories, on the other hand, argue that one's own interest is morally paramount in deciding what action to take. That which is good for oneself takes predominance over the good of others. Some egoists would argue that one's own good should be considered *primary* and the good of others *secondary,* while others would argue that we have no moral obligations to others and each individual is solely responsible for achieving one's own good. Note that this is a *normative* egoistic ethical theory. Some thinkers, for example Adam Smith, have argued *descriptively* that human beings by nature place their own interests above others, but they do not endorse this as an ethical good. Normative egoism argues that human beings *ought* to act in their own self-interest and, at their most radical, that taking the interests of others into account is immoral. This perspective was most prominently advocated in the 20th century by Ayn Rand, who, in both her novels and her philosophical treatises, defended the virtue of selfishness.

There are a number of attractive features to teleological ethical systems from a normative point of view, particularly its consequentialist forms. It seems to conform to our ordinary moral sensibilities that the consequences of our actions ought to matter. At the same time, certain interpretations of teleological ethics, particularly utilitarianism, seem to lead to conclusions that shock the moral conscience. For example, does the principle of the greatest good for the greatest number imply that we may sacrifice the good of a minority for the sake of the rest of the population? It is difficult to derive such an interpretation from John Stuart Mill, whose own writing emphasized individual liberty in addition to the greatest happiness principle. However, other utilitarians have been less circumspect. These problems are only magnified in egoistic theories. More generally, it is not always clear that there can be said to be a moral *telos,* whether God or Good, toward which human beings are oriented.

Act-Based and Rule-Based Ethical Systems

A further distinction to be made among these theories is between those that are "rule-based" and those that are "act-based." Rule-based moral systems claim that moral norms must be understood in terms of rules that, once determined, are morally binding, while act-based systems claim that morality must be understood in terms of whether particular acts in particular circumstances correspond to relevant norms.

Deontological and consequentialist moral systems each have act and rule variants. Rule deontology claims that one's moral duty corresponds to the articulation of universally mandatory rules. Act-based deontology, on the contrary, claims that one's duty can only be discerned in light of particular circumstances.

Rule utilitarianism interprets the greatest happiness principle to be that set of general principles under which the greatest good for the greatest number is generally attained. Rule utilitarianism, unlike Kantian ethics, is not absolutist and allows for exceptions. Act utilitarianism claims that moral agents must decide, on a case-by-case basis, whether their actions will bring about a greater amount of good over harm, and act accordingly.

Ethological Ethical Theories

Ethology is a term that applies to those moral theories that are rooted in an evaluation of the appropriateness of particular actions or sensibilities in light of contexts or circumstances. Most prominent among ethologically oriented moral systems is virtue ethics. Virtue ethics is based on the pursuit of human excellence through the cultivation of good moral character. Most theories of virtue identify the cardinal virtues as wisdom, temperance, fortitude or courage, and justice. Although not all descriptions of these virtues are ethologically oriented (e.g., Plato), in large measure they describe these virtues as the product of an education in circumstance-appropriate behavior. Thus, no one is born knowing how to act courageously. Rather, one learns bravery as a result of being exposed to circumstances that require bravery and, through practice, learning the proper response. Moral education is thus experiential and circumstantial.

The classic expression of virtue ethics is found in Aristotle's *Nicomachean Ethics.* In this work, Aristotle describes morality as doing the right thing, at the right time, in the right way. That which is ethical is that which is appropriate to the circumstance, but only the well-cultivated character can properly identify and react to the circumstances. Virtue in Aristotle's *Ethics* is identified as the mean between two extremes: one of excess and one of deficiency. Thus, courage is not fearlessness; rather it is the proper degree of fear depending on circumstances. Thus, the brave man is one who has neither an excess of fear, that is, cowardice, nor a deficit, that is, foolhardiness.

In contemporary moral theory, virtue ethics has seen resurgence, in large measure as a result of Alasdair MacIntyre's seminal work *After Virtue.* MacIntyre argues that modern normative ethical theory, as understood primarily through the tradition that culminates with Kantian ethics, on one hand, and utilitarianism, on the other, is intellectually bankrupt largely because it has lost track of its own origins. The logical end product of modern ethics is the moral nihilism of Friedrich Nietzsche. It is as though a catastrophe has taken place in which we now possess nothing but the fragments of moral knowledge out of which we must cobble together partial and incoherent moral systems. In contrast to this modern day moral confusion, the tradition of the virtues offers a complete and coherent theory.

According to MacIntyre's interpretation, a virtue is an excellence in a particular practice that is cultivated within a community that is based on a particular tradition. Thus, to be excellent means to be excellent in the context of a particular understanding of human nature. In MacIntyre's framework, in contrast to that of Kant or Mill, there are no moral principles that can be detached from the history of a particular community.

Another approach to contextually based normative ethics is existentialism, particularly as articulated by Jean-Paul Sartre. The key element of this approach to morality is its emphasis on human freedom. Sartre writes that man has no nature. Rather, we are born free and as free individuals must choose how we will respond to the world in which we are "thrown." There are no universal and binding moral norms on which human beings can rely for moral guidance. Neither the Categorical Imperative nor the greatest happiness principle can absolve individuals from the obligation to choose their actions and the resultant consequences. There is no god to whom one can appeal either for guidance or for forgiveness. One must, therefore, take the entire weight of one's actions solely on oneself. However, rather than seeing this as a morally hopeless situation in which all paths are equally meaningless and, therefore, all choices equally pointless, Sartre argues that in the *act of choosing* we create a morality and by that act lend meaning to our existence.

In some ways similar to this are various pragmatic approaches to ethics—for example, those advocated by Richard Rorty and Jeffrey Stout. Pragmatic theories of morality differ markedly from one another, but what they share in common with existentialism as well as with one another is their rejection of a *foundationalist* approach to ethical normativity. Morality is rooted in social convention rather than in either a metaphysical system or a calculus of pleasure and pain. It is because we have agreed to value certain things that they have been rendered valuable, not because they have intrinsic value themselves.

Conclusion

The attempt to develop a coherent philosophical basis for normative moral action has been a preoccupation of ethical theory since its inception, and yet the conversation continues. One's normative framework often says as much about one's own ethical outlook as it does about the nature of moral action itself. It is not clear that any one moral theory is solely capable of accounting for the complexity of moral action, and so it may be necessary to abandon the search for one complete normative theory and seek to develop a mixture of different theories, which perhaps would not offer anything by way of completeness but would nevertheless satisfy our need for moral guidance in the particular times and places at which we find ourselves in need of moral guidance.

This is not a rejection of the idea that there may be such things as binding deontological principles or genuine human ends, nor is it a rejection of the importance of considering consequences in evaluating morality. It is to say, however, that our apparatus effectively determining which of these has precedence over the others is severely limited. Such a melding of different theories may rely to some degree on intuition but must also be based on the careful examination of the strengths and weaknesses of the variety of theories available and a recognition of when they do, and do not, give us an adequate picture of what is right, what is good, and what is fitting.

Normative Theory Versus Positive Theory

In general, a positive theory is a theory that attempts to explain how the world works in a value-free way, while a normative theory provides a value-based view about what the world ought to be like or how it ought to work; positive theories express what *is*, while normative theories express what *ought to be*. Each of the social sciences, but particularly economics, has advanced both positive theories and normative theories. In economics, positive theories attempt to explain how the economy actually operates and include, for example, the basic supply and demand models of microeconomics as well as the macroeconomic theories of Keynesian economics and the theory of comparative advantage of David Ricardo. Normative economic theories typically propose a goal at which economies should aim. For example, early welfare economists (e.g., Alfred Marshall and Arthur C. Pigou) proposed the goal of maximizing utility, while their followers (e.g., John R. Hicks and Znicholas Kaldor) were forced by the problem of interpersonal comparisons of utility to retreat to the less ambitious goal of Pareto efficiency. Political science has also advanced both positive and normative theories, as has jurisprudence, psychology, sociology, anthropology, and business ethics. In business ethics, for example, stakeholder theory has developed both as a normative theory (a theory of the stakeholders businesses ought to take into account) and as a positive theory (a theory of the consequences business face if they do not take stakeholders into account). Positive and normative theories are often linked, particularly in discussions of public policy. For example, in the model of the perfectly competitive market, a positive theory played a key role in discussions of how antitrust law could achieve the normative goals of welfare economics. More generally, positive theories are said to show us the means to the public policy ends that normative theorists advance. A key discussion has centered on the question of whether the distinction between positive theory and normative theory is viable, a question that is closely related to whether the fact-value or is-ought dichotomy is viable. Some have argued that the selection of the questions that a positivistic social scientist will investigate, the methods the scientist will use, and assumptions about what counts as appropriate evidence and adequate measurements are all based on the background cultural and social values of the scientist, and so theories resulting from the investigation will be value laden and thus normative. Others have claimed that because theories must be expressed in language and language is value laden, even putatively positive theories must be normative. John Searle has argued, for example, that institutional concepts are inherently both descriptive and normative. If this is true, then allegedly positive social science theories that make use of institutional concepts—such as "money," "legal," "economy," "government," "property," and "marriage"— must also be normative. Several feminist philosophers of science have argued that many so-called positive theories in the sciences turn out, on inspection, to derive from assumptions that are subtly, or not so subtly, based on gendered values.

Norris-LaGuardia Act of 1932

The Norris-LaGuardia Act of 1932 was the first "pro-union" U.S. labor legislation. Previously, the legislative climate had not produced any encouragement of employee unionism. Furthermore, the judiciary had exhibited a pronounced negative reaction to union activity. The act was clearly a turning point in U.S. policy development and was quite unusual to have been passed in a period of national economic depression, and with both a Republican president and Congress.

Nature of the Courts in the Early 20th Century

In retrospect, judges tended to come from the ranks of attorneys. Prior to being appointed or elected to judgeships, these attorneys often had served the needs of the business community. Critics have argued that many judges owed their new positions to the business community since only persons who owned property were allowed to vote during the pre–Norris Act era. Workers normally were not members of the propertied class. Both the business and the political loyalty of judges of that era have been questioned by critics.

The Injunction Process

When a union organizing effort began, the employer's attorney could contact a "friendly" judge and seek an "injunction" to stop the union action. No union official need be advised of the "ex parte" hearing. A "temporary restraining order" would require the union (officials) to "cease and desist" specified actions in the order. If the actions being restrained continued, the union officials could be immediately jailed. Judges had the power to take appropriate action to enforce their temporary restraining order. This effectively stopped the union activists and chilled workers from joining the union. Such temporary orders could later be made permanent after formal hearings.

Impact on Injunction Processes

Under Norris-LaGuardia, federal courts were prohibited from issuing such "ex parte" restraining orders or injunctions. There now had to be a formal hearing with both parties present. The burden was on the employer to show that public officers were unable or unwilling to furnish adequate protection for the employer's property. Furthermore, the employer must also show that no other remedy at law exists and that the dispute had not been settled through a "committed effort" in collective bargaining.

The "Yellow Dog" Contract

Another major component of the Norris-LaGuardia Act dealt with the so-called yellow dog contract. Employers often required employees and prospective employees to affirm in writing that they were not union members, and should they join a union while employed by said employer, the employer had the right to discharge the employee, without recourse. Even though it was obvious on the surface that the contracts were negotiated under duress, the Courts had enforced such contracts until the 1932 act made them unenforceable in federal courts. While they were unenforceable, employers continued using the "yellow-dog" contracts for several years since most employees were not aware of this fact and employers, in using them, led employees to believe in their legality.

The Norris-LaGuardia Act was soon to be joined by still more positive labor relations legislation as the Presidency and the Congress changed political parties the next year.

North American Free Trade Agreement (NAFTA)

NAFTA, the North American Free Trade Agreement, is a trilateral agreement between Canada, Mexico, and the United States in which the three nations pledge to reduce trade barriers against each other to improve international trade and comity. Celebrating its 10th anniversary on January 1, 2004, NAFTA is an example of regional economic integration combining three sovereign nations. Although Canada, Mexico, and the United States are arguably at different levels of economic development, they came together in an agreement to develop a multilateral North American trading bloc. The NAFTA Agreement had its genesis in an earlier bilateral free trade agreement between the United States and Canada, the U.S./Canada Free Trade Agreement (1989).

Origins of NAFTA

While Canada and the United States were forging the U.S./Canada Free Trade Agreement, the government of Mexican President Miguel de la Madrid Hurtado opened Mexico to the international trade community by joining the General Agreement on Tariffs and Trade (GATT) in 1986. On joining GATT, Mexico reduced its trade barriers and came into compliance with the prevailing international trade regulations of the time. Combining its GATT compelled openness with a program of economic reforms instituted by President Madrid's successor, Carlos Salinas de Gortari, Mexico became ready to join Canada and the United States in establishing a multilateral trade agreement. On August 12, 1992, Canada, Mexico, and the United States announced their intentions to create a free trade zone—the NAFTA. Stretching from the Arctic Circle to Mexico's borders with Guatemala and Belize, NAFTA would be the largest trilateral trade relationship in the world.

Objectives of NAFTA

NAFTA combined the United States with its largest (Canada) and third-largest (Mexico) trading partners. Trade between the three countries was well established prior to NAFTA due to the U.S./Canada Free Trade Agreement and a new openness in Mexico to international trade. Under Article 102 of the NAFTA Agreement, Canada, Mexico, and the United States agreed to the following macro objectives: The countries pledged to work cooperatively to "eliminate barriers to trade in, and facilitate the cross border movement of, goods and services between the territories of the Parties; promote conditions of fair competition in the free trade area; increase substantially investment opportunities in their territories; provide adequate and effective protection and enforcement of intellectual property rights in each Party's territory; create effective procedures for the implementation and application of this Agreement, and for its joint administration and the resolution of disputes; and establish a framework for further trilateral, regional and multilateral cooperation to expand and enhance the benefits of this Agreement."

Trade Liberalization Under NAFTA

NAFTA liberalized trade in a variety of ways. Tariffs were either eliminated immediately or phased out over periods of up to 15 years. Limits on investments were removed, and investors from any of the three countries were treated equally, currency was freely transferred at market rates, and performance requirements such as maintaining export levels and trade balancing were eliminated. Trade in services was liberalized and equal treatment was expected for service providers and professionals in each country. The countries pledged to facilitate the licensing of professionals and, by 1996, to eliminate citizenship and permanent residency requirements for professionals. Transportation regulations were liberalized so that by 2000 commercial buses and trucks would have almost unlimited access to the NAFTA countries. Protection of intellectual properties was to be strengthened, including protection of literary works, recordings, computer programs, and product and process patents.

The NAFTA also provided various provisions to enhance the flow of trade among the three countries. A trilateral trade commission was established to resolve disputes, to review and prevent dumping of products across national markets, and to establish procedures for a country to reinstate pre-NAFTA duties for a period up to 3 years, on a one-time only basis, if domestic industries were injured as a result of an import surge from another NAFTA country.

NAFTA's Importance in Protecting and Stimulating U.S. Investment in Mexico

The passage of NAFTA was important for the United States due to significant investments by U.S. businesses in Mexico. The passage of NAFTA not only protected this investment but also stimulated additional investment. NAFTA also provided additional markets for U.S. products, increased jobs in the United States, and is an avenue to the larger Latin American market. NAFTA is also a building block for an even larger Free Trade Area of the Americas stretching from the Artic Circle to Tierra del Fuego, one of the megatrading blocs expected to emerge throughout the world in the 21st century.

NAFTA Today

NAFTA is administered by a Secretariat under Article 2002 of the agreement. The Secretariat, organized in three section offices located in Ottawa, Mexico City, and Washington, D.C., seeks to resolve trade disputes in a fair, impartial, and timely manner. Each section office is administered by a secretary appointed by the respective governments. Each country is responsible for the costs of operating its section office.

NAFTA's Supporters and Detractors

As with any form of economic integration, NAFTA has its supporters and its detractors. Supporters typically point to the volume of trade that flows freely between the three countries and the positive impact of such free-flowing trade on the economies of the three countries. Detractors typically point to the number of jobs lost due to NAFTA.

From an announcement of intentions by Canada, Mexico, and the United States on August 12, 1992, to undertake an experiment in regional economic integration, to NAFTA's enactment by the U.S. House of Representatives on November 17, 1993, and by the U.S. Senate on November 20, 1993, an interesting passage in regional economic integration is unfolding. In the larger realm of global economic integration, the World Trade Organization also finds detractors and supporters.

Nozick, Robert (1938–2002)

Robert Nozick, political philosopher and Pellegrino University Professor at Harvard, is best known in business ethics circles for his groundbreaking work in political philosophy, *Anarchy, State, and Utopia.* In this his first book, Nozick presents a rights-based approach to ethics and a systematized defense of free market capitalism. It is often juxtaposed with fellow Harvard philosopher John Rawls's *A Theory of Justice,* which was published just 3 years earlier.

In this seminal work, Nozick grounds his political theory in the argument that humans have a fundamental, natural right to be free from force and fraud. They are, therefore, entitled to property that is obtained without force or fraud, as long as they employ what he calls justice in acquisition, which involves the attainment of previously unowned goods, or justice in transfer, which includes all voluntary exchanges, including purchases, barter, gifts, and inheritance.

To discern the justice of a given distribution of wealth, Nozick argues that analysts should use a historical approach, tracing the various transfers that led up to the current holdings. If the entire history of a good consists of voluntary exchanges, the current owner has a moral entitlement to that item. Because ongoing transfers mean that these distributions are constantly in flux, he argues that the end result or snapshot approach to analyzing the justice of distributions is morally misguided. If force or fraud is discovered in the property's history, it is subject to rectification of the injustice.

Unlike the utilitarian, "efficiency" defense of free markets offered by most economists, Nozick argues that free market capitalism is moral because it is the only economic system that recognizes humans' fundamental right to be free from force and fraud. Governmental intervention in the market and redistribution of citizens' property can be accomplished only through the use of force and are therefore unethical. Unlike anarchists, however, Nozick argues that free people would agree to voluntarily support a minimal level of government. Citizens would institutionalize the legitimate use of force, such as that required to rectify injustice, into a "night-watchman" state controlled by checks and balances.

Nozick's rights theory has been criticized for its focus on freedom above all other considerations. According to the theory, actors are behaving morally as long as they refrain from using force or fraud: What they choose to do with their resulting freedom is subject only to individual choice. His entitlement theory has also been criticized for its impracticality. Observers note the difficulties inherent in going back through time to discern the validity of each current holding. Some have also noted that he has not offered a full argument for his strong conception of natural rights.

Along with Ayn Rand's objectivist theory, Nozick's work in political philosophy has helped shape the libertarian movement in the United States. His later works, in epistemology and metaphysics, were well received in philosophical circles but have generally had little impact on the field of business ethics.

Nozick's Theory of Justice

In *Anarchy, State, and Utopia,* American philosopher Robert Nozick (1938–2002) develops an *entitlement theory of justice,* a libertarian theory of justice centered on individual inalienable rights (including, first and foremost, liberty). As an entitlement theory, it is concerned with the justice of what one has acquired. Nozick's entitlement theory has three elements—acquisition, transfers, and rectification—which are described in greater detail below.

Nozick's theory can be classified as historical and unpatterned. Broadly, Nozick constructs a typology of theories of justice in which he distinguishes between historical and unhistorical (i.e., end state or current time slice) principles of distributive justice, as well as patterned and unpatterned principles. All four combinations of principles of distributive justice are possible, but Nozick defends his own historical unpatterned theory against the other three conceptualizations (or combinations). By *history,* he refers to past transactions, choices, or actions among individuals that may create or transfer entitlements over resources (which Nozick calls "holdings"). By *pattern,* he means a systematic variation of a distribution according to some natural dimension, weighted sum of natural dimensions, or some other ordering of natural dimensions. For example, a patterned principle may demand that total distributive shares vary directly with moral merit, usefulness to society, or intelligence.

Although Nozick opposes historical-patterned and unhistorical-unpatterned (random allocation) distributions of holdings, his most explicit opposition is to unhistorical-patterned principles of justice, which are set out, for example, in John Rawls's *A Theory of Justice.* According to Nozick, liberty will necessarily upset any pattern of distribution of goods (e.g., egalitarianism). Vice versa, maintaining patterns in any distribution of holdings requires continuous interference with individuals' choices and actions. However, any such interference requires individuals' free consent. With this requirement, Nozick highlights the importance of procedural justice in which individuals agree on several principles of how holdings can be acquired and transferred and how any injustice can be rectified. Based on an individualistic, rights-centered moral philosophy, historical principles of resource allocation take priority over *end state* (also known as *end result* or *current time slice*) principles of justice, which focus on the distributive outcomes of resource allocations but do not examine how these distributions of holdings have actually come about. Nozick's deontological stance—that individuals have rights and that there are things that no one may do to them without violating their rights—does not allow for any position other than historical-unpatterned principles of distributive justice. Its three main elements—justice in transfers, justice in acquisition, and compensatory justice—are summarized in the following sections.

Justice in Transfers

In his proposition that whatever arises justly from a just situation is just, Nozick reaffirms his historical stance toward justice. Any voluntary, agreed-on exchange of goods—whether for money or by gift—satisfies the criterion of a just transfer, if the transferor in turn acquired the good through a just transfer. Although facts of nature, such as poor alternative choices, may constrain free choice, the resultant decisions are not by definition nonvoluntary or unjust. For example, it is conceivable that when workers in less developed countries agree to sweatshop working conditions (because there are no better employment alternatives), such voluntary employment contracts would be considered just in Nozick's theory.

However, Nozick also points out the limitations of free exchange between contracting parties. For example, Nozick regards various transfers as unjust: transfers that make one party a monopolist in a holding necessary to life, transfers that are fraudulent, or transfers that forcibly exclude a party from competing in exchanges. Broadly, exchanges are unjust if they, in one way or another, violate individual rights and diminish individual autonomy, which Nozick embraces as a primary moral value in his deontological ethical system.

Nozick's principle of just transfers implies that any given distributive pattern will be upset by individual choices. He uses the example of professional basketball player Wilt Chamberlain to show that patterned principles require, in Nozick's view, constant interference. Even if we assume that everyone starts out with equal shares of wealth, this distribution will shift as individuals pay voluntary fees to watch Chamberlain play basketball. Many small fees willingly paid by basketball fans will make Wilt Chamberlain very wealthy if a very large number of people pay those fees. The subsequent redistribution of wealth is not unjust, even though it is less egalitarian than the initial distribution. In short, to assess the justice of a given situation, we must examine the process through which such a situation has come about. Hence, a necessary but not sufficient condition for judging a transfer just is its voluntary nature.

In addition to the implications for business already mentioned above, the concept of just transfers implies, for business, that capitalist acts between consenting adults should not be prohibited. Community concerns over, let's say, obscenity or a range of other "irresponsible" acts cannot override the decision-making autonomy and liberty of consenting adults. Moreover, taxation of earnings is equivalent to forced labor or seizure of goods and time. To encourage the kind of justice exemplified in market-based free exchange, government must play a minimal role in individuals' and business affairs. The function of government is limited to the protection of individual rights and punishment of rights violators (including the imposition of compensation).

Several authors have criticized Nozick's theory of just transfers. One criticism points out that Nozick did not systematically delineate the rules of (and exceptions to) just transfers. Also, an accumulation of wealth typically leads to an accumulation of power, which in turn could restrict rather than manifest or express liberty. This second criticism of Nozick's theory claims that it is actually capitalism, not socialism, that restricts liberty. According to Nozick's critics, capitalism may give rise to exploitation of labor. However, Nozick would counter that some so-called exploitative capitalist contracts do not constitute any violation, or threatened violation, of natural rights (e.g., unfair wages). As long as these arrangements are voluntary, Nozick would not consider them unjust. Taking a patterned-justice view, some authors leaning to the political left do not agree with this conclusion.

Justice in Acquisition

Before a holding can be justly transferred, it must be justly acquired. Nozick does not develop a full-fledged theory of justice in acquisition but only sketches the essential elements of such a theory (as he had done with justice in transfers as well). Nozick builds on John Locke's theory of appropriation, according to which someone acquires property rights in an unowned object by mixing one's labor with it. Nozick changes Locke's proviso slightly, in that appropriation cannot be justified if the position of others no longer at liberty to use the thing would be worsened by that appropriation. So, for example, what is illegitimate under Nozick's proviso is (typically) the appropriation of the total supply of a holding necessary for life.

Nozick's proviso also has implications for his principle of just transfers. Just as someone cannot legitimately acquire the total supply of a particular good, one cannot purchase the total supply. One reason is moral: Such a purchase would violate the proviso that Nozick put on justice in acquisition. The second is economic: Over time, the rarer a good becomes, the higher will be its price and thus the less likely a person can purchase all of it. So, in many ways, market forces will prevent injustice in acquisition.

Although Locke's influence on Nozick is undeniable, Nozick also acknowledges limits on property rights. According to Nozick, these limits follow from the proviso. For example, someone may not acquire the total water supply and then charge monopoly prices on it. Nozick even disputes the morality of charging any price on an owner's exclusive holdings if some catastrophe destroys all other supplies of this good. Exorbitant monopoly pricing is proscribed by Nozick's version of the Lockean proviso. Nozick emphasizes that this restriction of property rights does not reflect some unhistorical end-state principle (which would be inconsistent with the deontological flavor of his theory), because the proviso is not about the structure of the resultant distribution of holdings but about the effect such illegitimate appropriation would have on others. However, some of Nozick's critics have pointed out that the proviso could, in fact, be regarded as a consequentialist (teleological) element of Nozick's otherwise firmly deontological theory of justice.

In general, though, Nozick affirms strong property rights in his principles of just appropriation, acquisition, and (by extension) transfer. In Nozick's view (contradicting Rawls), individuals are entitled to use or sell their natural endowments as they please. Thus, Nozick affirms strong property rights but is not quite clear on the foundation of these property rights. What is quite clear is that Nozick does not base them on a right to life. Nor do property rights emerge from a utilitarian calculus that justifies private property as the most efficient mode by which the rights to possess and use things can be arranged. Some critics of Nozick have argued that because of this lack of either a Lockean or utilitarian foundation, Nozick is unable to provide a persuasive, foundational justification of private property.

Compensatory Justice: Rectification of Injustice

The final element of Nozick's tripartite theory of justice addresses, in brief outline, how to rectify past violations of the principles of just transfers and acquisitions. Any process of rectification would compare actual situations that flowed from unjust actions (i.e., actions that violate the principles of just transfer and acquisition) with a best estimate of subjunctive (i.e., "what-if?") information about what would have occurred if the injustice had not taken place. Any gap between the two must be rectified.

Critics of this third principle of justice find fault in its impracticality. With exchanges spanning several generations, it is difficult to understand how rectification can be implemented in practice. Nozick, in fact, recognized this problem and suggested that patterned principles of distributive justice (e.g., those included in Rawls's theory of distributive justice) could, in fact, serve as temporary approximations of rectification, in the absence of historical information.

The Implications of Nozick's Theory of Justice

In general, Nozick's entitlement theory opposes the patterned principles of distributive justice espoused by John Rawls. Rawls's difference principle holds that inequalities are just only if they result in compensating benefits for everyone but, in particular, for the least advantaged groups of society. However, Nozick criticizes Rawls for proposing a redistributive state that tries to impose a patterned distribution on its citizens and, thus, interferes with individual autonomous decision making. He also claims that Rawls's difference principle is problematic because it inappropriately, in an *ad hoc* fashion, focuses on groups rather than individuals and, more generally, does not sufficiently take into account people's entitlements in holdings.

According to Nozick, Rawls failed to connect individual decision making to broader societal outcomes and structures. This criticism of Rawls's theory highlights Nozick's explanatory philosophical strategy, which has a number of interesting consequences for political theory. Nozick's insistence on sacrosanct individual autonomy and property rights leads to the recognition that the minimal state is the most extensive state that can be justified. Nozick's minimal state sits between a state of anarchy and Rawls's welfare state principles. As such, Nozick's theory was subject to criticism from both libertarians, charging that his minimal state goes too far, and contract theorists, charging that his minimal state does not go far enough. The controversy generated by *Anarchy, State, and Utopia* primarily lay in the latter perceived problem because Nozick likened taxation to forced labor and, thus, rejected government action to redistribute wealth.

Anarchy, State, and Utopia provides a compelling argument that underpins the tenets of libertarianism and free market capitalism. However, in his later work *The Examined Life*, Nozick has come to regard his theory as inadequate and too individualistic. In this book, Nozick argues that his earlier entitlement theory runs the risk of ignoring shared cultural values, identity, and solidarity. Despite Nozick's self-examination and self-consciousness (concerning his libertarian entitlement theory of justice), which are also apparent in his *Socratic Puzzles*, *Anarchy, State, and Utopia* stands as an important work affirming individualism, human dignity, and capitalism.

Nuclear Power

Nuclear power is generated by nuclear fission when sufficient amounts of uranium-235 and/or plutonium are confined to a small space, often in the presence of a neutron moderator. The nuclear reactions produce heat, which is converted to kinetic energy by a steam turbine and then a generator for electricity. In 2005, the U.S. Energy Information Administration reported more than 440 commercial nuclear power plants in the world, generating approximately 365 GW. Nuclear power proponents highlight the amount of electricity that can be generated with a relatively smaller carbon footprint (amount of carbon emitted into the atmosphere) than coal or oil, but opponents argue that the uncertainties and risks associated with operating nuclear plants and disposing of spent nuclear material outweigh the benefits of nuclear-generated power.

In the United States, commercial nuclear power plants are regulated by the Nuclear Regulatory Commission (formerly the Atomic Energy Commission) and military nuclear power facilities by the Department of Energy. Other regulatory agencies and international organizations that address nuclear power are the International Atomic Energy Agency (IAEA) as an autonomous body within the United Nations and the Organisation for Economic Co-operation and Development (OECD) Nuclear Energy Agency. In several countries, more than one regulatory agency addresses nuclear power issues depending on the aspect, such as production, transportation, military use, and civilian or public use.

Nuclear power provides about 10% to 17% of the world's electricity, with the highest percentage in France with 83.4% of all electric power in 2004 generated by nuclear power plants. Popular movements against nuclear power led to the halt of construction of new U.S. nuclear power plants in the early 1980s and severely limit or prohibit the use of nuclear power in Austria, Sweden, and Italy. However, many countries use nuclear power: for example, France, Japan, Russia, and China. The use of nuclear power involves several ethical and social issues relevant to the business community: operations and costs, risks to the environment and communities, and the proliferation of nuclear weapons.

Economics

Across the world, the increase in the amount of electricity produced by nuclear power plants is fueled by increasing demand, expanding population, and rising fossil fuel costs. In the 1970s, a movement against the use of nuclear power began and spread primarily in the United States and Europe with concerns for plant safety and disposal of waste products. Two accidents resulting in a release of radioactive materials occurred at Three Mile Island in Pennsylvania in 1979 and at the Chernobyl plant, Russia, in 1986.

The relative costs of building and operating a nuclear power plant compared to a fossil fuel plant are high, and significant barriers to entry in the market exist. To overcome this obstacle, proponents of nuclear power plants have suggested subsidies and tax breaks to encourage new development and operation of nuclear facilities. As access to fossil fuels is more difficult and the price of fossil fuels and gas products increase, nuclear power may have a cost advantage over other forms of electricity generation.

Risks

Radioactive waste products from nuclear power present risks to the environment and people from production, through transportation, through disposal. Environmental and health risks are complicated by the different psychological factors that may increase the perception of risk: an "invisible" material, a loss of a sense of an individual's control (involuntary vs. voluntary like driving a car), and the time lag between possible exposure and potential surfacing of problems. However, the fields of risk management, risk mitigation, and emergency planning have been advanced by concentrated efforts in the nuclear power industry to reduce the risk of accidents and system failures.

Nuclear waste material is expected to remain radioactive for more than 10,000 years. In the United States, the Yucca Mountain Project in Nevada is a long-term storage facility for radioactive waste. Significant protests from the public continue to affect the design, construction, and operation of this facility; however, disposal operations will begin in 2010. In addition to the risks associated with normal operations and waste disposal, there are also concerns about accidental releases, advances for nuclear weapons, and the use of nuclear materials by terrorists.

Proliferation

In addition to electricity, nuclear power plants also produce plutonium that may be used for nuclear weapons. This is one reason why a country's ability to produce electricity from nuclear power raises fears about the potential nuclear weapons available in a country. Political and military strategy since the 1940s has had to address the use of nuclear weapons as a threat and uncertainty. Mutual (or mutually) assured destruction is a doctrine of military strategy that implies that any use of nuclear weapons against a party will result in retaliation with the use of nuclear weapons, and the only outcome is that both parties (and possibly more) will be destroyed by the effects of nuclear weapons. Based on the theory of deterrence, mutually assured destruction is also known as nuclear deterrence and is a form of the Nash equilibrium where both sides attempt to prevent the worst possible outcome.

After about 18 months of use, the fuel rods within the reactor are replaced. In countries other than the United States, the spent fuel rods may be reprocessed to recover uranium and plutonium that has been formed, which can then be reused as fuel. In the United States spent fuel rods are not reprocessed due to a political decision to try to minimize nuclear proliferation; however, other countries continue to reprocess due to significant economic advantages. Since the end of the Cold War, security concerns have focused more on the operation and safety of nuclear power plants and the potential use of nuclear material in terrorist operations.

As the concern about global warming and climate change grows, there are increased pressures on the energy industry to reduce the carbon footprint, or amount of carbon released per unit of energy produced, and maintain a clean and responsible nuclear power program. Once opposed to nuclear power in any form, the environmental movement is split in its support for nuclear energy. One group maintains that the historical uncertainty and risk associated with nuclear power outweighs any benefits, but a recent group supports the safe and responsible use of nuclear energy as it is a way of providing for the increasing energy demand, has less impact on the environment, and is more cost-effective. The U.S. Nuclear Power 2010 program is a joint effort with the U.S. Department of Energy and the nuclear power industry to identify sites for new nuclear power plants, improve nuclear plant technologies, and address economic issues of expansion. The global use of nuclear power faces technical, economic, social, environmental, and political challenges.

Nuclear Regulatory Commission

The Nuclear Regulatory Commission (NRC) is an independent U.S. government agency responsible for licensing and regulating civilian use of nuclear energy. Created by the Energy Reorganization Act of 1974, the NRC opened on January 9, 1975. The NRC took over the role of oversight of nuclear energy matters from the Atomic Energy Commission. Its mission is to regulate U.S. civilian use of by-products, sources, and special nuclear materials to ensure adequate protection of public health and safety, to promote the common defense and security, and to protect the environment.

The NRC has three basic responsibilities: (1) to oversee nuclear reactor safety, reactor licensing and renewal, material safety and licensing, and waste management including storage and disposal; (2) to license and regulate civilian use of nuclear energy to protect public health and safety and the environment; and (3) to conduct public hearings on nuclear and radiological safety and on environmental and antitrust issues relevant to nuclear energy. The NRC is capable of imposing civil penalties for violations of its regulations.

NRC-regulated civilian nuclear reactors include those for electric power generation, those for research, and other test reactors for research, development, training, and testing. Reactors are required to meet construction, licensing, security, and operational specifications. The NRC is authorized to shut down nuclear facilities until violations have been corrected. Military nuclear reactors and radiological material are regulated by the U.S. Department of Energy.

Radiological materials other than those used in reactors are also overseen by the NRC. The uses of nuclear materials in medical, industrial, and academic settings and facilities that produce nuclear fuel are regulated for proper acquisition, handling, use, and disposal. In the disposal processes, the NRC supervises the transportation, storage, and disposal of nuclear materials and waste, and the decommissioning of nuclear facilities from service.

The NRC is headed by a five-member commission, each appointed by the president and confirmed by the Senate for 5-year terms. With more than 2,900 employees in 2004, the NRC is headquartered in Rockville, Maryland. There are four regional offices designated to conduct inspections, investigate nuclear incidents, and conduct emergency response programs.

The NRC is important because it deals with "extreme scientific uncertainty, conflicting interests, and growing public fears," and there are problems with the development of feasible scientific knowledge and determining scientific estimates of safety (in the absence of certainty). Radiation exposure standards were developed, but because of the uncertainty and risk of radiation exposure, they are still debated. Reactor safety is still a controversial subject and a complex public policy issue as there are concerns over the reliability of emergency core cooling systems, vessel integrity, quality assurance, and the possibilities of a major accident or terrorist attack.

An accident at Three Mile Island in Pennsylvania on March 28, 1979, melted down the reactor's core. There was no major release of radiation to the community and no need for evacuation, but the accident manifested the public concern over nuclear power safety. Afterward, the NRC put more emphasis on operator training and the human factors, protection from natural disasters and equipment failures, and emergency planning among other issues.

The Department of Energy developed a high-level radioactive disposal site at Yucca Mountain, Nevada. The NRC provides oversight and regulation for this geologic repository for spent nuclear fuel and radioactive material, as well as for repository safety, performance confirmation, closure, and safety issues.

Opponents of the NRC's actions argue that it is unprepared or failing its mission in the areas of security, supporting use of alternative technologies, licensing fraud, disposal, and risk management. Security concerns include security of sources in transportation and transition among life cycle stages, security of physical facilities, and cooperation with other government agencies. Critics also contend that the NRC has required nuclear power plant operators to maintain only a minimum level of security capability. Unchanged in 25 years, the "design-basis threat" is not adequate to address terrorist threats or insider sabotage according to some citizen groups and other organizations.

The NRC has identified four strategic arenas based on its responsibilities: nuclear reactor safety, nuclear materials safety, nuclear waste safety, and international nuclear safety support. The first three are described above. In international nuclear safety support, the NRC is active in international nuclear policy formulation, export-import licensing, treaty implementation, nuclear proliferation deterrence, international safety assistance, and safeguards support and assistance. For example, the NRC worked with the International Atomic Energy Agency (IAEA) in developing a Code of Conduct for the Safety and Security of Radioactive Sources. The NRC also collaborates with other international organizations such as the Organisation for Economic Co-operation and Development (OECD) Nuclear Energy Agency.

The NRC is adapting to a changing social, political, and business environment as the demand for clean, responsible nuclear energy increases across the globe. Once opposed to nuclear power in any form, the environmental movement is now split in its support for nuclear energy. The traditional group maintains that the uncertainty and risk associated with it outweigh any benefits, but a more recent faction supports the safe and responsible use of nuclear energy because it is a way of providing for the increasing energy demand, has less impact on the environment, and is more cost-effective. With its role in regulation, research, and cooperation with the nuclear industry, the NRC continues its emphasis on safety for plant operations, waste material, international cooperation, research, trained personnel, and potential new providers on the supply side.

O

Objectivism

Objectivism is the name Ayn Rand gave to her philosophical system. Objectivism is in the Aristotelian tradition, agreeing with that tradition's naturalism in metaphysics, empirical reason in epistemology, and self-realization in ethics. Objectivist political and economic philosophy is robustly liberal, agreeing with the classical liberal tradition's emphasis on individual self-responsibility, freedom, and limiting government to the protection of individuals' rights to their lives, liberties, and property.

Rand's Objectivism adds a romantic and idealistic element to liberalism, most strikingly in its advocacy of business as a passionate calling on a par with art and science. This romantic idealism sets Objectivism apart from those philosophies on both the left and the right that view business either as an antisocial force to be restrained or as a force to be tolerated for its contributions to social welfare.

This conception of business as a potentially heroic enterprise depends on more basic philosophical premises. In the Objectivist view, a philosophy's stances on the power of reason and the morality of self-interest shape its ultimate attitudes toward business.

Objectivism and the Morality of Self-Interest

Most traditional ethical theories are suspicious of self-interest, praising selfless acts and calling self-interested acts amoral or immoral. In the traditional view, self-interest means ignoring or harming others' interests in the pursuit of one's own. Consequently, selflessness is urged as a means to encourage individuals to acknowledge and advance the interests of others.

Objectivism holds that the exact opposite is true: Self-interest, properly understood, is the standard of morality, and selflessness is immoral. The principle of self-interest means seeing individuals as *ends in themselves.* One's own life and happiness are one's highest values; one does not exist as a servant or slave to the interests of others. The corollary is recognizing that other people do not exist as servants or slaves to one's interests. Each person's own life and happiness is his or her ultimate end. The principle of self-interest also entails *self-responsibility:* One's life is one's own and so is the responsibility for sustaining it by methods appropriate to a rational being.

Objectivism's ethics leads to its political and economic liberalism. The morality of self-interest implies that individuals have rights to their lives, liberties, property, and the pursuit of their own happiness. Politically, a moral society will limit the power of government to protecting those individual rights. Economically, a moral society will leave individuals free to pursue their economic interests. This implies that a capitalist or free market system is moral: Free individuals will use their assets as they judge best and trade with others to mutual profit.

Objectivism on Reason and Ethics

Objectivism bases its advocacy of self-interest and liberalism on its view of the power of human reason. Reason is what enables humans to survive and flourish. We are not born with cognitive instincts that tell us what is good: Each of us must learn what is good. Nor are humans born with automatic action-instincts: Each of us must learn how to act successfully. It is by reason that we learn what to eat and what to avoid, which animals are useful or dangerous, how to make tools and devise strategies, and what forms of social organization are productive.

Thus, Objectivism advocates *rational* self-interest: One's interests are not whatever one happens to feel like; rather it is by reason that one identifies one's interests. Reason enables one to identify the relevant facts, project the consequences of potential courses of action, and adopt principled policies of action.

Objectivism calls *virtues* the principled policies individuals should adopt. A virtue is an acquired character trait; it results from identifying a policy as good and committing to acting consistently in terms of that policy.

One major virtue is *rationality:* Since the use of reason is fundamentally good, rationality is being committed to using one's reason. Another Objectivist virtue is *productiveness:* Since the values one needs to survive must be produced, productiveness means being committed to producing those values. Another is *honesty:* Life depends on knowing and acting in accordance with the facts, and honesty is being committed to awareness of those facts.

Independence and *integrity* are also core virtues. Given that one must think and act by one's own efforts, being committed to independent thought and action is a virtue. And given that one must both identify and *act* to achieve one's interests, being committed to acting on the basis of one's beliefs is the virtue of integrity. The opposite policy of believing one thing but doing another is the vice of hypocrisy.

Justice is another major self-interested virtue: Justice, on Objectivism's account, is the policy of judging people, including oneself, according to their value and acting accordingly. The opposite is injustice: Giving to people more or less than they deserve. The final major virtue on the Objectivist list is *pride,* the policy of "moral ambitiousness," as Rand phrased it. Pride is the commitment to making oneself be the best one can be, of shaping one's character to the highest level possible.

The moral person, in summary, is someone who acts and is committed to acting in his best self-interest—that is how one survives and flourishes.

The Objectivist account of self-interest is currently a minority position. The contrasting view typically pits self-interest against morality, holding that one is moral to the extent that one sacrifices for others or, more moderately, to the extent one acts primarily with regard to the interests of others. Some standard versions of morality will hold that one is moral when one sets aside one's interests to serve God, or the weak and the poor, or society as a whole. On these accounts, the interests of those others are of greater significance than one's own; accordingly, one's interests should be sacrificed when necessary. These ethics of selflessness thus advocate seeing oneself fundamentally as a servant, as existing primarily to serve others' interests and not one's own. "Selfless service to others" or "selfless sacrifice" are standard phrases indicating these accounts' view of appropriate motivation and action. The core difference between Objectivism's self-interest view and the selfless view can be seen in the reason why most advocates of selflessness think self-interest is dangerous: conflicts of interest.

Conflicts of Interest

Traditional ethical theories typically take conflicts of interest to be fundamental to the human condition and take ethics to be the solution: Ethical principles are to tell us whose interests should be sacrificed to resolve the conflicts. If, for example, a fundamental conflict exists between what God wants and what humans naturally want, then religious ethics will make fundamental the principle that human wants should be sacrificed for God's. If a fundamental conflict arises between social needs and an individual's desires, then some secular ethics will make fundamental the principle that the individual's wants should be sacrificed for society's.

Taking conflicts of interest to be fundamental generally stems from one of two beliefs: That human nature is fundamentally destructive or that economic resources are scarce. If human nature is fundamentally destructive, then humans are naturally in conflict with each other. Many ethics start from this premise—for example, Plato's myth of Gyges, biblical accounts of Original Sin, Hobbes's "solitary, poor, nasty, brutish, and short" conception of human life in the state of nature, and Freud's account of the Id. If individuals naturally want to steal, rape, and kill, then society must require that these individual desires be sacrificed. Consequently, a basic ethical principle will be to urge individuals to suppress their natural desires so that society can exist. In other words, self-interest is the enemy and must be sacrificed for others.

If economic resources are scarce, then basic human needs are in conflict: For one individual's need to be satisfied, another's must be sacrificed. Many ethical philosophies begin with this premise. Malthusian scarcity theorists argue that population growth outstrips growth in the food supply. Marxists argue that capitalism is driven by brutal competition for scarce resources that leads to the exploitation of some by others. So to lessen the destructive competition, a basic principle of ethics will urge that individuals sacrifice their interests in obtaining more so that others may obtain some and society can exist peacefully. In other words, scarcity implies that self-interest is the enemy and must be sacrificed for others.

Objectivism rejects both the scarce resources and destructive human nature premises. Human beings are not born in sin or with destructive desires; nor do they necessarily acquire them when growing to maturity. One is born with a set of physical and psychological capacities, and through one's choices and actions one develops one's beliefs, character traits, and habits. Chronic desires to steal, rape, or kill are the result of mistaken development and bad habits, just as are chronic laziness and the habit of eating unhealthily. And just as one is not born lazy but through one's choices develops oneself into an active or passive person, one is not born antisocial but through one's choices develops into a cooperative or an antagonistic person.

Objectivism also rejects the claim that resources are scarce in any fundamental way. From animals to wood to coal to oil to nuclear to solar, the power of reason has made possible the discovery and development of new energy resources, and there is no reason to believe that this progress has ended. The development of new resources and the production of an ever-expanding number of goods imply also that human interests do not fundamentally conflict. Instead, Objectivism holds that the opposite is true: Since humans can and should be productive, human interests are deeply in harmony. My producing more wheat is in harmony with your producing more chickens, for by mutual productivity and trade we are both better off. It is to your interest that I be successful in producing wheat, just as it is to my interest that you be successful in producing chickens—just as it is to both our interests that our neighbors be successful in producing automobiles, computers, and music.

Conflicts of interest do exist within a narrower scope. In the short term, available resources are more fixed. Consequently, competition for those resources results, and competition produces short-term winners and losers. Business competition, however, is a broader form of cooperation—a way to allocate resources socially without resorting to physical force and violence. Through competition, resources are allocated efficiently and peacefully, and in the long run more resources are produced. Thus, Objectivism concludes, a competitive business system is in the self-interest of all of us.

Critiques of Objectivism

Rand's Objectivism has been subjected to criticism from both the left and right ends of the traditional spectrum. From the conservative right come three broad criticisms: (1) that Objectivism's reason undermines religious faith; (2) that its individualism undermines communal ties; and (3) that by overemphasizing the power of reason and individual freedom, Objectivism encourages the weakening of traditions essential to social stability. The socialist left also makes three broad criticisms: (1) that Objectivism's idolizing of science and technology leads to an artificial world of dehumanizing machines and environmental degradation; (2) that Objectivism's competitive individualism and capitalism destroy community and lead to inequalities; and (3) that the combination of science, technology, and capitalism leads to a technocratic oppression of the have-nots by the haves.

Contemporary debates over the significance of Objectivism thus have a threefold character—between those who see it as a threat to an essentially religious-traditionalist vision; those who see it as a threat to an essentially left-egalitarian vision; and those who see it as a contribution to the achievements of the modern business, scientific, and liberal democratic world.

Occupational Safety and Health Administration (OSHA)

The Occupational Safety and Health Act was passed by a bipartisan Congress in 1970 to respond to what was perceived to be a crisis in the workplace. Several studies had indicated that accidents and injuries on the job were increasing and that there were thousands of disabling diseases in the workplace caused by exposure to hazardous substances. It seemed that workers were not being adequately protected from hazards in the workplace and that federal regulation was needed. The act was passed "to assure so far as possible every working man and woman in the nation safe and healthful working conditions and to preserve our human resources." This act also created the Occupational Safety and Health Administration (OSHA) to administer this act. Congress specified several steps for OSHA to implement this mandate:

- Encourage employers and employees to reduce workplace hazards and to implement new or improve existing safety and health programs.
- Provide for research in occupational safety and health and develop innovative ways of dealing with occupational safety and health problems.
- Establish "separate but dependent responsibilities and rights" for employers and employees for the achievement of better safety and health conditions.
- Maintain a reporting and record-keeping system to monitor job-related injuries and illnesses.
- Establish training programs to increase the number and competence of occupational safety and health personnel.
- Develop mandatory job safety and health standards and enforce them effectively.
- Provide for the development, analysis, evaluation, and approval of state occupational safety and health programs.

OSHA is located in the Department of Labor and has legislative and executive functions with respect to the federal safety and health program. The mission of the agency is to ensure the safety and health of America's workers by setting and enforcing standards; providing training, outreach, and education; establishing partnerships; and encouraging continual improvement in workplace safety and health. OSHA and its state partners have about 2,100 inspectors to ensure compliance with standards, plus complaint discrimination investigators, engineers, physicians, educators, standards writers, and other technical and support personnel spread over more than 200 offices throughout the country. These people establish protective standards, enforce them in the workplace, and reach out to employers and employees through technical assistance and consultation programs.

The act encourages states to develop and operate their own job safety and health programs. These state programs are required to develop standards and enforcement procedures that are at least as effective as the federal program that prevents the states from "watering down" any part of federal requirements. OSHA approves and monitors these state programs to ensure that a state is effectively providing safety and health protection for its workers. As of June 15, 2005, 26 states were operating their own safety and health programs. Three of these state plans, however, covered only state and local government workers.

Two other agencies were established by the act to carry out certain aspects of the federal program. The National Institute for Occupational Safety and Health (NIOSH) is located in the Department of Health and Human Services and is the research arm of the safety and health program. NIOSH conducts research into safety and health-related problems and recommends criteria to OSHA for consideration in the setting of standards. Its objectives include (1) conducting research to reduce work-related illnesses and injuries; (2) promoting safe and healthy workplaces through interventions, recommendations, and capacity building; and (3) enhancing global workplace safety and health through international collaborations.

The Occupational Safety and Health Review Commission (OSHRC) is the judicial arm of the safety and health program and was established as an independent agency to promote objectivity and impartiality in its decisions. This commission handles appeals of employers on violations and penalties as a result of OSHA inspections. When an appeal is filed with OSHRC, an administrative law judge normally hears the case and makes a decision. This decision can be appealed to the full commission, and its decision can be further appealed to a U.S. court of appeals and possibly reach the Supreme Court if certiorari is granted.

OSHA does its work by setting standards related to workplace safety and health. There are two types of standards related to safety concerns: (1) horizontal standards that apply to all industries and (2) vertical standards that apply to particular industries. Health standards relate to particular substances that workers may come into contact with that are considered to be harmful. These standards are enforced through an inspection process where safety and health officers visit business facilities to check on compliance with the national safety and health standards that have been established. These inspectors are concerned with what standards apply to a given facility and whether employers and employees are in compliance with these standards. If violations of these standards are found, citations may be issued and civil penalties imposed.

OSHA has a number of programs designed to enhance safety and health in the workplace. Its consultation service is free to employers and is delivered by state governments using well-trained professional staff. Through using this service, employers can find out about potential hazards at the workplaces, improve their occupational safety and health management systems, and even qualify for a 1-year exemption from OSHA inspections. The Alliance Program, which started in March 2002, is a cooperative program that enables organizations committed to safety and health to work with OSHA to prevent injuries, illnesses, and fatalities in the workplace. Groups that can form an alliance with OSHA include trade or professional groups, educational institutions, labor unions, and employers.

The Safety and Health Achievement Recognition Program recognizes small employers who create and maintain an exemplary safety and health management system. The OSHA Strategic Partnership Program moves away from traditional enforcement methods and embraces collaborative agreements that are made with associations, unions and councils, and industries to affect multiple worksites or employers. Finally, the Voluntary Protection Program is designed to establish cooperative relationships at individual worksites that have implemented a comprehensive safety and health management system.

Ombudsperson

Ombudspersons serve as an informal resource for individuals who struggle with interpersonal conflict, violation of institutional policies, or the challenges caused by the increasing bureaucratization of organizations. Originally arising as a voice of the people for citizens to navigate claims against government, ombudspersons have been established through legislation or institutional policy in executive, legislative, advocate, or organizational roles in government, private corporations, not-for-profit organizations, and academic institutions. Organizational ombudspersons, the focus of this entry, are situated outside of regular management channels and possess no other formal or adjudicative role, but seek fair and just process. Established as an informal resource for employees, ombudspersons provide a safe place to investigate options, obtain information on policies, procedures, rights, and responsibilities, and learn about the resources necessary for satisfactory resolution of issues and disputes. Three critical marks define the organizational ombudsperson: neutrality, independence, and confidentiality.

As a designated neutral, the ombudsperson remains impartial and does not align with any party in a dispute or controversy within an institution. The ombudsperson has no power to adjudicate disputes or implement policy or decisions. The ombudsperson helps clarify policies, encourages peaceful dispute resolution, mediates, and explores all options for resolution. If an ombudsperson observes a trend that suggests the need for improvement of the entity or that violates institutional mission or policy, professional standards of practice permit systemic advocacy to encourage institutional change, so long as confidentiality is protected. To help minimize sources of conflict, ombudspersons frequently provide training on conflict management, mediation, and peacemaking.

As an independent, the ombudsperson is outside any formal reporting chains within an organization and has no other formal roles. The ombudsperson typically reports to the senior officer to ensure freedom from interference, control, or limitation on the ombudsperson's work. Although employed by the institution, the ombudsperson and the institution frequently draft charters to publicly set forth the necessary safeguards and procedures that guarantee the ombudsperson's independence, neutrality, and confidentiality.

Confidentiality remains the linchpin of the ombudsperson's responsibilities as parties seeking assistance are assured that conversations and identities will remain confidential. Confidentiality is held by the ombudsperson and cannot be waived unless the ombudsperson agrees or recognizes an imminent threat of serious harm. Unlike any other institutional officer, notice of an infraction or violation of policy or law to the ombudsperson is not notice to the organization. To protect the employee and serve justice, however, the ombudsperson may advise the individual how to give notice to the institution of violations of law or policy. Confidentiality serves a public purpose in encouraging individuals to come forward to discuss issues, explore the ramifications of giving notice to the organization or failing to give notice, inspire options, and seek resolution of problems without threat or fear of retaliation. The ombudsperson, therefore, seeks to increase workplace civility and emphasize respect for human dignity by helping individuals build confidence and hone the necessary skills to resolve conflict and pursue justice.

Omnibus Trade and Competitiveness Act of 1988 (OTCA)

The Omnibus Trade and Competitiveness Act of 1988 (OTCA) seeks to bolster the competitiveness of American companies through changes in the substance and process of trade law. Although building on earlier legislation, this most recent major trade law addresses a far broader scope of issues, more forcefully asserts the interests of American firms, and provides executive branch officials with much less discretion in implementation.

Although the United States has championed the cause of free trade through multilateral agreements under the General Agreement on Tariffs and Trade (GATT) and the World Trade Organization (WTO), concerns about the competitiveness of American workers and companies mounted in the 1980s with the rapid emergence of Japan as an economic power, growing trade deficits, and job losses in manufacturing. Constituent pressures on Congress for protection against unfair foreign trade practices increased, and the OTCA was passed after lengthy deliberations and over some opposition by the Reagan administration.

Rising imports led to increasing complaints that foreign firms competed unfairly by predatory pricing or "dumping" and by export subsidies from their governments. The OTCA amended earlier legislation to improve the enforcement of antidumping provisions and facilitate the imposition of countervailing duties to combat foreign subsidies. Some criticize these efforts to defend domestic markets arguing that the costs to American firms and workers in the particular industry affected may be offset by benefits to other stakeholders, most notably consumers of the cheaper goods.

More central to the OTCA than the defense of domestic markets were efforts to enhance the competitiveness of American firms abroad. To this end, the Foreign Corrupt Practices Act of 1977 (FCPA) was amended to relax constraints on payments to secure the timely performance of routine governmental actions. American employees became legally liable only when they had "knowledge" rather than the "reason to know" of the illegal uses of their funds. Corporate liability for employees' actions was also reduced, thus creating the possibility of scapegoating midlevel managers. Some suggest that these changes may undermine the intent of the FCPA to align American officials' actions abroad to their home country standards.

The most controversial sections of the OTCA deal with efforts to combat unfair trading practices of foreign governments and firms that reduced the competitiveness of American firms abroad. Congress sought to ensure aggressive actions by the executive branch by transferring authority to retaliate against such practices, conferred under Section 301 of the Trade Act of 1974, to the U.S. Special Trade Representative and specifying in detail the procedures to be followed. What came to be known as Super 301 required the identification of nations engaged in egregiously unfair trade practices and the unilateral imposition of sanctions if necessary to end them. Of particular concern were barriers to the expansion of service industries not yet protected under the multilateral agreements. Even more critical were infringements on intellectual property rights that slowed the foreign penetration of high-technology industries considered essential to American economic growth. In response, a Special 301 clause was included in the OTCA requiring close monitoring of countries for violations of these rights, the public listing of violators, and the initiation of bilateral negotiations, backed by the threat of trade sanctions. In 2006, for example, although only one nation, Ukraine, was placed on the Priority Foreign Country list reserved for the most serious offenders, 13 countries appeared on a Priority Watch List for failing to provide adequate levels of protection, and a Watch List numbered 36, including the EU, China, and Canada.

These policies to combat practices hindering the access of American firms to foreign markets have been controversial. Some argue that they facilitate the transfer of wealth and jobs abroad and thus erode the incomes and welfare of American workers and communities. Others object that these actions by the U.S. government undermine the development of stronger multilateral agreements, international organizations, and a world community. Finally, many argue that rights to intellectual property, however important for innovation, often conflict with human rights, with the issue of poor people's access to drugs in developing nations frequently raised.

Open-Book Management

Open-book management (OBM) refers to a system in which a company fully shares its financial status with its employees, who then become active partners in a synchronized effort to optimize future financial performance. The origins of OBM can be traced to Springfield ReManufacturing Corp. (SRC). Formerly a failing division of International Harvester, SRC was purchased in 1983 by its plant manager, Jack Stack, and 13 other executives. They paid $9 million for the plant, depositing $100,000 as a down payment and amassing a debt-to-equity ratio of 89:1. Recognizing that any financial error would cause bankruptcy, Stack decided to keep all employees informed about the company's ongoing financial status. John Case subsequently termed this approach "open-book management." Now a large and successful holding company, SRC calls its system—mirroring the title of Stack's first book—"The Great Game of Business."

Key steps in OBM include the following:

- Share with employees financial and operational information that supports optimizing business decisions. This should consist of critical numbers, highlighting the line-of-sight between employees' daily job performance and the firm's operating and financial results. OBM firms develop scoreboards—vehicles for regular communication of key numbers to the workforce.
- Enhance employee literacy in the basics of accounting and business. Simply giving financial statements to employees who don't understand them is a source of confusion and problems. Employees need to learn, for instance, about income statements, balance sheets, and cash flow statements.
- Empower people to make decisions based on what they know. Once the books are open, employees will want a voice. They should be given opportunities to self-manage and should be held responsible and accountable not just for scheduling their work and hitting quality targets but also for making their unit's budget or profit goals.
- Share the financial gains. While financial rewards take many forms in OBM firms, the key is to directly link those rewards to the "critical numbers" and profits.

However, OBM is more than a fixed series of steps. Rather, it is a process, a system, and even a philosophy.

The Case for OBM

In addition to SRC, OBM success stories include R. R. Donnelley, AES Corp., PSS World Medical, Manco, Inc., Foldcraft, and Whole Foods Market. Other firms, such as Saturn, while not referring to their efforts as OBM, employ the essential elements of the approach.

OBM combines a large number of currently popular concepts from organizational behavior and management, such as strategic planning, participation and involvement, education, empowerment, job enrichment, self-management, feedback, and goal setting. Furthermore, empowerment and aspects such as "playing the game"—short-term initiatives designed around a specific goal, with a low-cost reward if people "win"—should enhance intrinsic motivation, while directly linking performance to rewards should heighten extrinsic motivation. In addition, full implementation of OBM requires culture assessment and reinforcement or change. This set of characteristics should enhance intellectual capital, a critical resource in a knowledge economy, while fostering the sort of organic, flexible organizational structure required in complex, dynamic, uncertain environments.

Difficulties

Even staunch advocates of OBM emphasize potential difficulties associated with its implementation. They note, for instance, that some attempts to implement OBM failed because of unforeseen circumstances, changes in leadership, or unwillingness to make necessary changes in the compensation process. Some primary difficulties relating to OBM include the following:

- OBM is a major change effort, often involving even culture change, and will lead to redefinition of managerial roles, threats to status and power relationships, and uncertainty. As such, resistance is likely.
- OBM raises concerns about loss of information, including leaking of competitive secrets. Advocates respond that only critical numbers are provided to employees, not all financial information, and that most such information can already be found on the Internet and elsewhere. In addition, business law provides various protections—such as noncompete and nondisclosure agreements—against leaking trade secrets and company-specific information.
- For public companies, internal release of financial information may lead to scrutiny by the Securities and Exchange Commission. In some cases, such firms keep branch-level books open all the time but provide consolidated financials to employees only when they are released to the public. Others, such as AES Corporation, declare all their employees as insiders for stock-trading purposes.
- Implementation of OBM may be especially difficult in large organizations since the line-of-sight from individual employees' jobs to the organization's financial performance is harder to trace. In addition, political and cultural obstacles may be especially severe in larger firms.

Successful Implementation

As a major change effort, if implementation of OBM is to be successful, top management support must be strong, visible, and consistent. Probable sources of resistance to change should be identified and defused. Since OBM requires a substantial investment in people and systems, firms must be prepared to provide adequate resources. Furthermore, the organizational culture must be supportive and consistent with OBM tenets; OBM cannot survive in a command-and-control culture. In addition, the national culture must reinforce OBM; OBM may be unsuitable in national cultures favoring strong authority relationships and avoiding uncertainty. Finally, a long-term perspective and persistence are critical; as with other major change efforts, full implementation of OBM may take years.

Evidence

While OBM combines many features for which there is substantial theoretical and empirical support, evidence to date in support of OBM per se is almost entirely anecdotal. Several notable success stories are held up as exemplars. In contrast, companies that have failed to fully implement OBM or for which OBM was abandoned are typically cited just as examples of faulty implementation or unanticipated events. There may, though, have been other reasons for abandonment or failure of OBM efforts, including the desire to avoid escalation of commitment in the face of clearly intractable problems.

A study by the National Center for Employee Ownership concluded that firms implementing OBM, relative to competitors matched on SIC codes, number of employees, and sales volume, saw 3-year sales growths about 2% greater than would be expected without OBM and corresponding employment growth about 1.2% greater. While such findings are impressive, the study compared just firms that had been successful in implementing and sustaining OBM—not all firms undertaking OBM—to their competitors, and benefits may thus be overstated. On the other hand, a narrow focus on financial indicators—while certainly important—may fail to recognize other OBM benefits relating to trust building, equity perceptions, culture change, organizational commitment, and other "soft" outcomes, all of which may have long-term bottom-line impacts.

In sum, OBM combines many positive features, and its advocates can point to notable successes. However, additional research is needed to better understand OBM and provide solid evidence of its effectiveness.

Opportunism

Opportunism is a foundational assumption of many economic theories that claims human beings are generally self-interested and will take advantage of others when possible. For example, some economic actors will take advantage of another party to advance their interests by making false promises, misrepresenting intentions, reneging on agreements, or changing the terms of a deal to benefit themselves. Other economic actors will be less deliberate by attempting to benefit from free riding. Such behavior, deliberate or otherwise, leaves the "honest" party to the exchange worse off.

Scholars assuming that people are opportunistic do not necessarily believe that everyone is perniciously self-seeking. Rather, they believe that the presence of *a few* opportunistic individuals means economic exchanges should be structured to protect against *potential* opportunism. Opportunism is thus a theory of exchange that assumes the worst about individuals and makes predictions as though the worst were reality. One influential economic theory based on the assumption of opportunism, transaction cost economics, claims market exchanges fail when a transaction becomes vulnerable to opportunistic behavior. When the threat of an exchange partner behaving opportunistically becomes particularly high (which is said to occur when the transaction is characterized by substantial uncertainty, small numbers, and irreversible investments to support just that transaction), economic exchange will shift to hierarchies such as firms, rather than occurring in spot markets. According to transaction cost economics, hierarchies have supervisory, monitoring, and incentive mechanisms that are able to detect and deter opportunism.

This view of human nature (which is ultimately what opportunism represents) has been vigorously challenged. Many sociologists, biologists, ethicists, and even economists and management scholars argue that humans consistently exhibit cooperative and altruistic behaviors, which belie an overreliance on the assumption of opportunism found in much economic literature. Moreover, they argue that opportunism is greatly reduced when individuals are part of an organization with a shared purpose, such as a firm. Indeed, some of the scholars who believe in the essential cooperative nature of economic agents claim that economic theories assuming opportunism invite managers and firms to inadvertently promote the very kind of opportunism that organizational hierarchy is assumed to lessen. In short, this side of the debate believes that people's cooperative and trustworthy tendencies should be highlighted and stressed in economic and management theories, instead of their opportunistic tendencies. And, as with many such debates, there is no widely agreed-on conclusion.

Opportunity Cost

Opportunity cost is defined as the value given up by selecting one of a group of mutually exclusive alternatives. The fundamental economic problem is one of scarcity. Humans have virtually unlimited needs and wants for goods and services, but resources or inputs, such as land, labor, and capital, are limited. This combination of unlimited demand and scarce resources compels individuals and societies to make choices. When a choice is made, there is a trade-off and something must be given up. The value of the next best alternative that might have been chosen is called the opportunity cost. All decisions made by individuals and societies have an opportunity cost that may be thought of in monetary or nonmonetary terms. For example, the decision to take a walk means giving up time to read a book and the utility or satisfaction that goes along with reading the book.

The opportunity cost of a decision may exceed the out-of-pocket cost. An example often used to illustrate this point is the cost of a college education. The opportunity cost of attending college includes not only the monetary cost but also the costs associated with the foregone opportunities, such as earnings from full-time employment or the value of time spent training for the Olympics. If out-of-pocket expenses at a private university are $25,000 per year for tuition, fees, and textbooks and foregone earnings equal $18,000 per year, then the total cost of college attendance is $43,000 per year. A student must weigh this cost against the current and future benefits received to ensure that he or she is making the most efficient use of scarce resources.

Opportunity cost differs from accounting cost in that the latter does not include foregone opportunities. The financial statements of a business may show an accounting profit, while the business is sustaining an economic loss if opportunity cost is considered. Assume that a small advertising agency has a total revenue of $500,000 per year and accounting costs of $400,000, for an accounting profit of $100,000. If the small business owner could earn $150,000 per year working for a large advertising agency, then the total opportunity cost is $550,000, and the business is actually suffering a $50,000 annual loss. If the satisfaction (benefit) of self-employment does not equal at least $50,000 per year, the small business owner should shut down the operation and take the $150,000 position at the large advertising agency.

Business decisions are not always based on all-inclusive measures of opportunity cost. An example is a manufacturer who does not consider air and water pollution in the choice to adopt or not adopt a new manufacturing process. In a decision not to adopt a cleaner manufacturing process, the opportunity cost of the decision includes the costs of pollution that must be borne by local citizens. In the case of massive plant layoffs, the opportunity cost of dismissing all or part of a labor force may affect the long-term health of the company in the loss of valuable expertise and knowledge, future retraining costs of new workers, and the effects of unemployment on the local community. Community assistance resources may be strained. Local businesses may be affected when the community has less money to spend on goods and services.

In a market economy, an efficient allocation of resources requires that the marginal, or additional, benefit (or price) of each good or service be equal to its marginal opportunity cost. Often, market failures exist that prevent this efficiency condition from being met. The presence of negative externalities, such as air and water pollution, cause the marginal opportunity cost to society to exceed the marginal opportunity cost to the producer. In these instances, markets will underprice and overproduce the good or service. To ensure efficiency, the government may choose to impose regulations, taxes, or fines to ensure that the costs to the producer are equal to the costs imposed on society. Monopoly power is a market failure that results in the price of a good or service exceeding the marginal opportunity cost, resulting in less than the socially optimal level of output. In this situation, the government may regulate price and/or output. A third example of a market failure involves the provision of public goods. Private markets will fail to produce the efficient level of public goods because they are nonexcludable; that is, nonpaying users cannot be prevented from consuming the public goods. In this case, the marginal cost of additional users is zero, and it is not easily possible to charge a price. Therefore, private markets will not produce the goods, and the government becomes the provider of public goods.

Decisions concerning the efficient allocation of resources between the present and future are also based on opportunity cost. The opportunity cost of present consumption (i.e., lower future consumption) is reflected in the interest rate. When current consumption is valued over future consumption, savings will be low and interest rates will be high. The high interest rates reflect the fact that people require a high return to forego current consumption. On the other hand, if people value future consumption over current consumption, savings will increase as people put money aside to fund future consumption, and interest rates will be low. Since interest rates influence investment spending, the value of current versus future consumption affects the future productive capacity of the economy.

In practice, there are factors that may prevent the interest rate from correctly allocating current versus future consumption. First, interest rates are not completely market determined and are often manipulated by central banks to stabilize the economy. Second, some economists believe that humans are, by nature, shortsighted and undervalue future consumption. Third, prices of current goods and services do not reflect their true opportunity cost when negative externalities are present. Finally, current production will exceed the efficient level if some resources, such as rain forests, unspoiled deserts, and rare species of plants and animals, have a market price of zero.

The consideration of opportunity cost is necessary for sound economic decision making. However, in practice, determining the opportunity costs of alternatives may be difficult. This is a particular problem when public sector projects are evaluated and the cost-benefit analysis is subject to political control and the influence of special interest groups. Broadly speaking, opportunity costs include anything and everything that has any connection to or bearing on the decision. A decision that deliberately excludes the consideration of known social and economic factors raises questions about ethics in decision making.

Organisation for Economic Co-operation and Development (OECD)

The Organisation for Economic Co-operation and Development (OECD) is an international agency consisting of 30 member nations that are dedicated to economic growth and stability, democratic governance, and the economic development of the organization's less economically developed members and nonmember countries. In many ways, the OECD is unique. It provides numerous and varied services to its members including basic in-depth research on global matters, consultations on economic and social issues, and the diplomatic context in which various agreements and conventions have been entered into and observed. Moreover, the work done at the OECD is central and highly significant both in public policy formation in the member states and in terms of corporate governance given the emphasis that the agency has placed on the role that multinationals play in today's world. In short, the OECD can be called a "super organization," and in addition to having a unique mission and organizational design, the OECD also has a unique history that is a good point of departure in understanding the varied workings and reach of this international super organization.

OECD History

The OECD had its start in the transformation of the Organization for European Economic Co-operation (OEEC). The OEEC, established in 1948 through backing primarily from the United States and Canada, was designed to coordinate the Marshall Plan that had as its objective the reconstruction of Europe after the destructive effects of World War II. The OEEC had as its main mission the promotion of economic cooperation among its 16 member states so that the reconstruction of Europe might take place efficiently. There were several major economic measures that the OEEC introduced to achieve this goal including the development of trade within Europe by reducing obstacles to free trade practices between member states and the establishment of a new customs zone on the Continent. The OEEC also worked on European labor conditions and set up a permanent Committee on Manpower. In short, the OEEC was an economic development agency designed to restore Europe to some of its former stature as the geographic site of several leading economic powers before World War II.

Once the physical restoration of Europe was completed, the OEEC gave birth to the OECD on December 14, 1960. There were 20 original member countries that signed the convention establishing the OECD (Austria, Belgium, Canada, Denmark, France, Germany, Greece, Iceland, Ireland, Italy, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland, Turkey, the United Kingdom, and the United States). For more than four decades the OECD has been a major player in the economic development of Europe, seeing its role expanded in several directions. It has also been the purveyor of several important international agreements and conventions that have helped shape the world economy. Today, the organization consists of 30 total member countries (added were Japan in 1964, Finland in 1969, Australia in 1971, New Zealand in 1973, Mexico in 1994, the Czech Republic in 1995, Hungary in 1996, Poland in 1996, South Korea in 1996, and the Slovak Republic in 2000). In 2004, a report titled "A Strategy for Enlargement and Outreach" suggested that the changing face of the world, thanks to the process of globalization, made it mandatory that the OECD think very seriously about even newer ways to expand and be a relevant presence in the world.

About the OECD

As an international super organization, just what does the OECD do? The founding mission of the organization says that its primary function is to work toward policies that will achieve (1) the highest sustainable economic growth and employment and (2) a rising standard of living in OECD, member countries. This was to become the main goal of the OECD, and at the same time, the policies that it would work on with its members were fashioned to maintain their financial stability and, thereby, contribute to the development of the world economy. In short, this organization set itself some very lofty local and global goals.

Since 1960, the OECD has been hard at work attempting to formulate and implement global economic development policies. Along the way, it has found it necessary to address and work on some noneconomic issues as well. The organization has taken it on itself to improve economic efficiency, groom markets and their systems, create the conditions under which to expand free trade, and contribute to development in the industrialized states as well as in less economically developed nations.

What makes the OECD not just an international organization, but an international super organization, is the fact that it engages in such a wide variety of activities that contribute both to the welfare of its member states and, thereby, to the continued progress of the world per se. It can be taken primarily as a center for the research, formation, and writing of international public policy. But more than that, it also serves to bring nation-states together in diplomatic ways and to create international conventions and agreements that have far-reaching consequences for the people of the OECD member states in particular and of the world in general. These various conventions and agreements often serve to fulfill the OECD's mission as an economic development program, but often they deal with other pressing tangential issues as well, such as education, social affairs, and development assistance to nations in need.

In addition to its 30 member states, 70 relationships with other countries and nongovernmental organizations are maintained, so the OECD can be labeled a very comprehensive organization. It also taps policy and consulting input from two major groups dealing with international business and labor, namely, the Business and Industry Advisory Committee established in 1962 and the Trade Union Advisory Committee founded in 1948 as an advisory committee to the Marshall Plan. With its major headquarters in Paris, a council that consists of representatives from its member nations governs the organization. The council has oversight authority of the various working committees that are established within the 18 OECD directorates that are devoted to a set of diverse topics. The council also sets the annual budget that is provided by member country contributions totaling around €330 million a year. A secretary-general serves as the executive of the organization.

The bulk of the work is done by the 2,000-plus employees of the OECD secretariat who are active in diverse projects through the committees that are divided among the directorates. The committees and their working parties, subgroups, and consultants perform the research and economic and statistical analysis, and they write the many publications that are used widely by officials both in and out of the member countries as well as by many academics who study and teach about globalization issues, economic development, and international public policy. And again, while the OECD is billed primarily as an organ for economic development, its work goes into areas such as social policies, environmental analysis, and the conduct of corporate practices the latter of which can be elaborated on under the general rubric of "corporate governance."

OECD and Corporate Governance

A topic of continuing interest and productive research at the OECD is that of corporate governance. Corporate governance is defined as the interplay between the rights and responsibilities of a company's management, its board of directors, the shareholders, and direct and indirect stakeholders who will likely be affected by management, and how well this interplay might contribute to a business organization's overall market performance. The *OECD Principles of Corporate Governance* represents the official statement about corporate governance at the OECD, and this document and the research that has gone into it have become widely recognized as a collection of some key corporate mechanisms for success in global business.

Originally devised in 1999 and revised in 2004, these Principles serve as a kind of benchmark by which to measure best business practices in the area of corporate governance and as a framework for discussion and dialogue about the need for good corporate governance between OECD member and nonmember states alike.

The Principles include reference to six central items that governments are asked to address and implement:

1. An effective institutional and legal framework to support good corporate governance practices

2. A corporate governance framework that protects and facilitates the exercise of shareholders' rights
3. Safeguards that support the equal treatment of all shareholders, including minority and foreign shareholders
4. Recognition of the importance of the role of stakeholders in corporate governance
5. Procedures that underscore the importance of timely, accurate, and transparent disclosure mechanisms
6. Clarity in setting up board structures, responsibilities, and procedures

If corporate governance can be bolstered by such mechanisms as are spelled out in the *OECD Principles of Corporate Governance,* then it is possible that the world may see fewer examples of corporate scandal. It could be argued that the recent surge in corporate malfeasance as witnessed at Enron, WorldCom, and Parmalat, may have been avoided, if stronger reins were in place at the top of these organizations and if their governance was stronger with more board involvement and the good exercise of controlling powers.

So the overall goal of the six principles is to urge nations, and, in turn, the international business organizations that they regulate, to be successful in the open market and to be so in a responsible way. In fact, corporate responsibility has been another major concern of the OECD over the years, and the OECD has engaged in a number of corporate-responsibility-based activities. Among the various initiatives undertaken by the OECD in the area of international corporate responsibility, there are two important programs that need to be highlighted and detailed: the Guidelines for Multinational Enterprises and the OECD Anti-Bribery Convention.

The OECD Guidelines for Multinational Enterprises

The OECD Guidelines for Multinational Enterprises can be taken as a set of well-defined recommendations made to international corporate organizations with respect to their actual business conduct and practices. Some point to the Guidelines as the only comprehensive, multilaterally endorsed, and voluntarily adopted corporate principles available that address international business conduct and are approved and "overseen" by governments through the OECD Convention that gave birth to them. Adhering countries consist of all 30 OECD member countries and 9 nonmember countries (Argentina, Brazil, Chile, Estonia, Israel, Latvia, Lithuania, Romania, and Slovenia). These governments have committed to promoting the Guidelines among corporations to which they are host or home. As such, the Guidelines serve as useful standards for multinational corporations as they develop their approach to international management issues and concerns.

Many of the major areas of international business ethics are addressed by the Guidelines, including labor relations, human rights, environmental obligations, information disclosure and transparency, the problem of bribing public officials, consumer interests, the business concerns around matters of science and technology, competition and antitrust issues, and taxation by host countries. The Guidelines are divided into three parts. The first section lays out and details the 10 guidelines themselves, and in this first part the business ethics areas mentioned are raised with attention to both general and specific recommendations on how multinational corporations can successfully address the given topic. This section is peppered with a number of "should" statements, that is, a set of 10 normative-type directives to multinational corporations that provide pointed language about their obligations and responsibilities in the global marketplace. More discussion of the provisions found in these 10 planks is provided in the third part of the Guidelines that consists of some extensive commentary and analysis.

The second section of the Guidelines is titled "Implementation Procedures of the OECD Guidelines for Multinational Enterprises." As the title suggests, the OECD has issued the Guidelines with suggestions to the governments adhering to them about how to apply, oversee, and manage the 10 recommendations. Although the provisions set out by the Guidelines are voluntary and exist without any recourse to legal enforcement, the OECD has set up "complaint mechanisms" whereby governments have clear implementation obligations, which include establishing a "national contact point" (NCP) to handle allegations of corporate misconduct. These NCPs may be senior governmental officials or government offices charged with promoting awareness of the Guidelines and handling inquiries about corporate behaviors that run counter to any one of them and violate the spirit of the Convention. The NCPs are designed to serve as a kind of international "Better Business Bureau" in the promotion of business ethics in the global marketplace and to provide a clearinghouse where affected parties can come and have their cases heard.

It almost goes without saying that the Guidelines are not free of critics who find fault with them for various and sundry reasons. Some claim that the specific content of the Guidelines is lacking in precision, while others criticize them because of the seeming lack of enforcement procedures that would give some teeth to the Guidelines. An example of such critical appraisal comes from OECD Watch, which promotes itself as an international network of civil society organizations promoting corporate accountability.

OECD Watch issued a 2005 report, "Five Years On: Review of the OECD Guidelines and National Contact Points," which was quite critical of the Guidelines and of the issue of their enforcement, in particular. The group claims that they cannot adequately curb corporate misconduct, since the NCP system is a failure. They concluded in their report that the NCPs rarely helped to resolve specific conflicts, and that after 5 years, the NCPs are failing to promote the Guidelines or to encourage adherence to them.

Nonetheless, and in spite of such criticisms, the OECD Guidelines for Multinational Enterprises might be taken as but only the first step toward something like the policing of multinational corporations. There are a number of obstacles as to why it is difficult to have international public policies that deal with the ethical conduct and misconduct of international firms. But without the introduction of the OECD program, there would be no movement in that direction at all. Moreover, there is still another example of an OECD initiative in international business ethics that remains to be detailed.

The OECD Antibribery Convention

In 1997, member countries, along with the assent of five additional nonmember countries (Argentina, Brazil, Bulgaria, Chile, and the Slovak Republic), entered into an OECD Convention titled "Combating Bribery of Foreign Public Officials in International Business Transactions." The OECD bills this convention as a one-of-a-kind international accord that provides for legally binding curbs on the behavior of multinational corporations. Adhering countries were expected to pass legislation that would criminalize acts of bribing public officials by executives of multinational corporations to further the business interests of their firms. According to the Convention, the bribery of a foreign public official should be punished by penalties. Also, the Convention requires that attempts to cover up such bribery or "launder money" having to do with the bribery of foreign public officials should also be criminalized by cooperating governments.

The fact that the United States had already passed such legislation with its Foreign Corrupt Practices Act (FCPA) was no doubt stimulation for the OECD to undertake such an antibribery convention. Simply put, U.S.-based multinational corporations felt themselves to be at an unfair competitive disadvantage to multinationals based in other major industrialized countries that did not have such legislation in place, and it was in the interests of the United States to foster a multilateral agreement such as the OECD Antibribery Convention. Hence, the Antibribery Convention can be taken as the expression of the will of adhering countries to match the United States in its lead against the bribery of public officials by international businesses.

The Convention has provisions for a monitoring system to be put into place and be managed by the OECD "Working Group on Bribery." This group, made up of representatives from the participating nations, was established in May 1994. It is implementing a system of review that is divided into two phases. The first phase was designed as an assessment process where a country's antibribery laws are compared with the Convention's recommendations and evaluated as being in compliance with them or not. The second phase requires that the Working Group on Bribery study the enforcement procedures for the antibribery laws that a country has adopted and implemented along with input on enforcement from stakeholder groups in labor and civil society as well as from governmental officials and business practitioners.

Progress reports on Phase 1 and Phase 2 are available on the OECD Web site. This monitoring process has resulted in some tangible changes on the international scene. Several countries have amended their laws dealing with bribery so that they can stand in compliance with what the OECD Convention has recommended. Among those countries that have enacted such amendments are Iceland, Japan, the Slovak Republic, Hungary, Sweden, Bulgaria, and Switzerland.

Conclusion

In addition to the OECD's work on management systems of corporate governance, supplying guidelines for ethical multinational conduct and providing leadership in combating bribery, this organization has also taken other steps to address the issues of international corporate responsibility in general. Among the many publications that the OECD furnishes each year, it has recently published "Corporate Responsibility: Private Initiatives and Public Goals," and this can serve as just one representative example of the work that the OECD does in this area. Attempting to clearly define what practices constitute corporate responsibility, this work on international business ethics topics takes place at the OECD through the Investment Committee of the Directorate for Financial and Enterprise Affairs. In summary, then, it can be said that what seems to make the OECD an international super organization is the expertise it is willing to expend on many important matters that have a bearing on economic development. By paying close attention to how businesses conduct themselves and their impact on society, the OECD demonstrates that its horizons are broad and broad enough for it to be called an international super organization.

Organizational Moral Distress

Organizational moral distress is an extension of the concept of individual moral distress. Moral distress at the individual level is the anguish a person may experience when he or she is convinced he or she knows the right thing to do but is prevented from doing it. When applied at the level of organizations, it is a useful way to characterize and analyze conflicts or misalignment of values that can interfere with excellent organization function.

Organizations, like people, have goals and values. Organizations meet their goals by employing people to fill various roles, to take on responsibilities, and to function within the processes and systems that the organization creates. How the organization prioritizes its goals, how it designs its systems, structures, or processes to meet them, and whom it chooses to employ are a reflection of its values.

The values of an organization are generally stated in mission or vision statements and are sometimes referred to as "core values." These statements articulate the values the organization says it endorses. They are the values that the organization says it expects all its employees, including its leadership, to abide by. Moreover, these values can be perceived as a standard by which the organization can be judged. We judge individuals on whether or not they consistently live up to the values they say they endorse. So too we judge organizations on whether or not they consistently live up to the values they say they endorse.

Moral distress can arise when the organization says it values something other than what it actually values, or when the people it employs do not share the same values as the organization, or when the organization's internal stakeholders prioritize similar values differently. For instance, an organization might say that it values the quality of its product or service more than it does cost. But if the design of its processes produces outcomes that are very inexpensive, but of poor quality, then there may be a misalignment of values between what the organization says it values and what it actually values. Similarly, if an organization employs persons with radically different values or persons who share the same values but prioritize them differently, then there may be a misalignment of values between the organization and the people it has chosen to help fulfill its goals. An organization that values individual competitiveness and aggressiveness might find itself at odds with an individual whose highest priority is family time. Similarly, individuals who value competitiveness and aggressiveness would find themselves ill placed in roles that required teamwork and cooperation. Or leaders of different organizational divisions or with different responsibilities within the organization may have responsibilities that reflect different values, or that require prioritizing shared values differently. For instance, an organization might value both price and safety of a product or service, but a marketing function might value price over safety while an engineering function might value safety over price. In each instance, the situation is characterized by a values misalignment, and in each instance, the potential exists for organizational moral distress to arise.

Organizations operate in a context, the larger social environment, which can prevent them from doing what they perceive as the right thing to do. For instance, an organization might believe that it is in its best interests, as well as society's best interests, to pursue a certain type of research or product development but be prevented from doing so by legal or regulatory requirements. A good example of this is the refusal of the government to fund research associated with certain stem cell lines, resulting in individual and organizational dislocation. In these cases, the values within the organization may be in perfect alignment, with the obstacles to expressing these values being external to the organization.

Once organization moral distress develops from any of these possible misalignments of values, it can cause dislocations elsewhere. For instance, if organization leaders prioritize different values, they could inadvertently create processes that reflect these different values. Conflict is inevitable, and one form of organization moral distress can lead to another. Thus, in practice it may be hard to determine in an organization in distress where to look first for the misalignment of values.

Values misalignments are important because if they are not identified and corrected, the organization and its stakeholders will suffer. At best the organization's stakeholders will suffer confusion; at worst, organization moral distress might result in the organization's demise. Consider the expectations of customers and employees of an organization that says that it values quality over cost but that in fact does not. Customers might have expectations of the product or service that are unrealistic, and employees might be confused as to the decisions that they ought to make. Unrealistic expectations among customers might irretrievably harm market share, and confusion among employees might lead to conflict.

Or consider a situation in which employees' values are not similar to organization values. In this example, the organization expects employees to make decisions or pursue activities based on the values it endorses. If those decisions or activities are not forthcoming from employees, conflict will be inevitable. In this case, conflict might take the form of a strike or termination of certain employees. We can make the reasonable assumption that in all these situations morale is bad, that productivity is affected, and that the organization will be hurt in some way.

How does an organization prevent or cure organization moral distress? The mission and values of the organization often reflect the views of organization leadership, so it will be up to organization leadership to prevent or cure organization moral distress. Organization leaders may not be able to avoid distress that arises from the external environment, but they can prevent, mitigate, or cure organization moral distress arising from internal causes by revisiting the mission of the organization and the values that the organization says it endorses. In the same way that individuals ask whether or not they are living up to the values they say they endorse, organization leaders can ask if the organization is living up to the values it says it endorses. Organization leadership can take steps to reinforce the desired mission and values of the organization by aligning and embedding them in the strategies, processes, structures, and systems that the organization uses to fulfill its goals. Organization leaders should be clear about the organization's mission and values and communicate them to internal and external stakeholders. In this way, the organization leaders can seek to minimize gaps between what the organization does, what it says it wants to do, and how it does it. This is not a simple process, nor will it be effective if leaders of an organization do not share the same values and prioritize them similarly.

Organization moral distress results from a "values misalignment" and can take several forms, although they may easily implicate each other. Because organizations evolve over time and because organization moral distress can damage the organization, ongoing monitoring of values alignment within the organization and of the organization with its environment is critical. Preventing organization moral distress from occurring is best, but if it is already present, it needs to be identified, as a first step to curing it.

Organization of Petroleum Exporting Countries (OPEC)

The Organization of Petroleum Exporting Countries (OPEC) was formally established in 1960 by Venezuela, Iran, Kuwait, Iraq, and Saudi Arabia at a conference in Baghdad. OPEC, which currently does not include Iraq, also includes Algeria, Indonesia, Libya, Nigeria, Qatar, and the United Arab Emirates, and since 1965 has been headquartered in Vienna, where it conducts its semiannual OPEC conferences. The 11 members produce 40% of the world's oil supply today, and, more important, they jointly hold 78% of the world's proven crude oil reserves (2003 estimates).

OPEC is a cartel whose principal objectives are to coordinate petroleum policies in the best interests of member countries, to stabilize prices, to provide a regular supply to consumer nations, and to provide a fair return on capital to investors. With these aims in mind, the oil ministers of the member countries meet at least twice per year to discuss policy and to allocate per-country supply quotas that are based on demand forecasts.

The exploration for oil and its drilling, production, transportation, refining, marketing, and distribution have historically been the concentrated activity of a few powerful global companies, at the head of which have been the "Seven Sisters" consisting of the three American Standard Oil companies, Texaco, Gulf, Royal Dutch Shell, and British Petroleum. On the other hand, the production of oil is dominated by relatively young nations, many of which made the transition from Western colonies to sovereign entities after the end of World War I and historically have had little international clout or bargaining power to apply when dealing with Western powers and their multinationals. It is the need to address this imbalance of power that OPEC members use as justification for their collusion in manipulating the world's oil supply.

Oil Prices

The nominal (unadjusted for inflation) price of oil went virtually unchanged from 1950 to 1972, settling at around $2 per barrel. With the oil embargo of 1973, the price suffered its first sharp hike since the end of World War II: Prices soared when OPEC member countries refused to ship oil to those countries that had supported Israel against Egypt and Syria during the Yom Kippur War. By the end of 1974, the price of crude reached $10 per barrel and helped unchain a cycle of inflation and unemployment (stagflation) in developed countries that had relied on cheap oil for decades. The next sharp rise in prices occurred when Iran significantly decreased its flow of oil following its 1979 revolution and subsequent war with Iraq. At the time the Shah left power Iran produced 6 million barrels of oil (about 20% of OPEC exports) per day, but by the end of 1980 the combined production of Iran and Iraq was in the neighborhood of just 1 million barrels.

In the mid-1980s, the price of oil began a precipitous decline: Not only did the nominal price of oil fall sharply, but by 1999 the real price (adjusted for inflation) returned to historically low levels. This drop in the price was caused by several elements, including overproduction by Saudi Arabia, which was in need of cash (to meet its obligation to fund the allies against

Iraq in 1991), the recession in Japan, and the peak of oil production from the North Sea.

OPEC's Impact

Oil provides energy and is also a fundamental raw material in many industries. As its cost rises, so does the cost of manufactured and agricultural products. Sharp price fluctuations affect the standard of living worldwide, most dramatically in those countries that both are net importers of goods and can count on few or no oil reserves of their own. Therefore, OPEC's ability to alter the supply is not taken lightly by most countries. Members of the United States Senate, for example, have argued that by acting as a cartel, OPEC fixes prices and as such violates the Sherman Antitrust Act—extended internationally—and have suggested taking corresponding suits to the International Court of Justice.

In defending itself, and after having weathered the crises of the last three decades of the 20th century, OPEC currently takes a less politicized approach to managing the supply and emphasizes that despite the significant increases in the nominal price of oil that began in 2000, the real price is still considerably below what it was as it peaked in the 1970s and 1980s. OPEC argues that oil as a raw material is not replaceable and that member countries must be permitted to generate adequate income for capitalization in other industries for long-term development that is independent of the oil industry. In justifying price increases, the OPEC countries directly link the purchasing power of generated revenue to its nominal worth; this is an argument that has become stronger in recent years when the dollar fell significantly relative to other hard currencies (the euro in particular). OPEC also argues that as a cartel, its aim is not to maximize revenue, but rather to ensure price stability and prevent volatility in oil prices. When charged with profiteering, OPEC also emphasizes that since 1976 it has helped many developing nations through its Fund for International Development, which has transferred some windfall profits to poor nations. It is also fair to point out that most short-term windfall profits from price increases don't necessarily increase revenue for OPEC members since their supply is typically presold in the futures markets; it is the traders who, in buying low and selling high to allocate their inventory, are the beneficiaries of sudden price fluctuations.

The Future

The new millennium saw a new dynamic in oil prices, which have steadily risen since 2000 as a result of geopolitical issues, including the War on Terror and the rise of China and India as rapidly growing economies. The war in Iraq and concerns about the stability of other Middle Eastern oil producing countries have contributed to a jittery market for oil, while the rapid growth in demand, especially from India and China, has pushed OPEC close to the limits of its current production capacity. Overlaying these issues are rising concerns for the environment and global warming and the increasing gap between rich and poor nations that is exacerbated by high oil prices. These considerations will tend to propel an increasingly serious search for alternative sources of energy, and OPEC will be challenged to find a balance between meeting rising demand over the near term and the specter of substantial oil independence by its current customers in the future.

Other-Regardingness

Other-regardingness concerns acts and virtues focused on benefiting other people rather than oneself. In its most narrow formulation, other-regardingness primarily means not harming other people (nonmaleficence). Its wider formulations also require the agent to consider, and be accountable for, the various positive and negative impacts of his or her actions on others. Its application also varies in that many ethical frameworks require giving equal weight to the interests of all people affected by one's actions, while other versions will give priority to particular others, such as family, friends, or fellow citizens. Other-regardingness is a key component of common morality and also major ethical theories such as deontology, utilitarianism, and virtue.

Besides concern for actions that affect others, other-regardingness can also refer to traits of character. Some virtues are considered to be other-regarding, while others are considered to be self-regarding, depending on whether the virtue concerns dispositions that focus on interaction with others or only on the self. Other-regarding virtues include benevolence, generosity, justice, and honesty. These virtues are often considered to be morally superior to the self-regarding virtues, such as courage, prudence, and temperance, because morality primarily concerns others.

Other-regardingness and self-regardingness are not necessarily mutually exclusive categories, however. While some philosophers contend that moral actions must strictly focus on the good of others and not at all on oneself, many philosophers find a convergence. Kant, for example, claims that certain self-regarding acts are moral duties because they are based on proper self-respect and provide the foundation for performing the rest of our moral duties, and several philosophers note that actions can have multiple motives and effects, serving the interests of both self and others. For them, pure other-regardingness is not required for moral action. Similarly, self-regarding virtues can serve the interests of others, and not focus strictly on the agent's interests and character. For example, courage can enable the agent to face danger for the sake of others, in addition to serving the agent's interests and preserving his or her integrity. While other-regardingness may sometimes require self-sacrifice, it is not necessarily equivalent to altruism. Other-regardingness does not even necessarily entail equal consideration of self and others, but only that others must be taken into account in some way.

Besides its role in common morality and ethical theory, other-regardingness also figures prominently in empirical descriptions of humanity. While some accounts describe humanity as primarily or even exclusively egoistic (e.g., as with the concept *homo economicus*), most scholars contend that other-regardingness is part of human nature. Whether that concern is a product of cultural or biological evolution, or some combination of the two, remains in dispute.

In business, the traditional focus has been on the self-interest of individuals and corporations. The role of other-regardingness was disputed, except insofar as it pertained to concern for stockholders and their financial interests. The business ethics, corporate social responsibility, and stakeholder movements have all contributed to a broader understanding of other-regardingness in the business context, and the need to take the interests of others into account as a regular part of business decision making.

Ought Implies Can

The principle "ought implies can" asserts, roughly, that an agent ought to do something only if it is possible for that agent to do it. In other words, it's being possible for an agent to perform a certain action is a necessary condition on that agent's having an obligation to perform that action. In this way, the principle "ought implies can" is fruitfully understood not as a moral principle itself, but as a principle to which ethical theories must adhere. That is, for a candidate ethical theory or moral principle to be justifiable, it must not violate the principle that ought implies can; it must not require that agents perform actions they simply cannot perform. In this way, the principle itself recognizes that ethics is concerned with action, not simply with positing theoretical ideals in accordance with which no human agent can act.

Beginning with Immanuel Kant, most moral philosophers have found some version of this principle to be intuitively obvious, even if only because its denial gives rise to apparent absurdities. For example, to deny that ought implies can is to suggest that an agent (alone) could currently have an obligation to eradicate global poverty, even though that agent has no means currently available to do so. As Kant saw it, for the moral law to have any force over human agents, it must be possible for those agents to act in accordance with the duties that arise out of the moral law.

This principle is also useful in identifying unreasonable calls for businesses to reform their practices, such as demands that automakers radically (and immediately) decrease emissions and increase fuel efficiency, even when the necessary technology is not available. It might even be the case that, were the necessary technology available, nonetheless the demand could not reasonably be met; the implementation of the technology might be prohibitively expensive, forcing the automakers to ignore their prior obligations to shareholders (e.g., to provide a reasonable return on their investment) or to consumers (e.g., to provide goods and services at a fair price).

As the preceding example illustrates, for all its intuitive appeal, there are difficulties in identifying the relevant sense of "can" in the "ought implies can" principle. There are at least two leading candidates: (1) what the currently available (to the agent) resources and other means make possible and (2) what the laws of nature allow.

The first of these seems to be the operative sense of "can" when it is claimed, for example, that an individual agent has no moral obligation to repay a debt, absent the resources for doing so. This version, however, seems to ignore prior acts and/or omissions that make the current lack of resources itself morally blameworthy and insufficient to suspend the obligation to repay. Thus, even though the debtor currently is not able to repay the debt, it might nonetheless make sense to blame—and even punish—the debtor for the failure to fulfill the obligation to repay. Doing so would acknowledge that there were actions the debtor could have performed since incurring the debt that would have made repaying the debt now possible. (To return to the previous example, it might be that automakers are partly to blame for the lack of currently available, reasonably priced technologies that can control emissions and increase fuel efficiency. Perhaps they ought to have been pursuing such technology more aggressively before now.)

Understanding "can" as a function of the laws of nature recognizes that moral agents are limited in what they can do by facts about how the world works. Thus, given that no (unaided) person can leap to the top of a 20-story building in a single bound, it simply can never be the case that morality demands that a person do so.

An interesting subset of the laws of nature that would seem to have important implications for the identification of our moral obligations are laws of human psychology. Psychological egoists, for example, claim that all human action must arise from some consideration of the well-being of the agent. Thus, according to this theory, no altruistic actions (i.e., actions done exclusively for the sake of the well-being of those other than the agent) are psychologically possible, and so they cannot be morally obligatory.

OUTSOURCING

Outsourcing may be defined as the practice of transferring production or services that were once performed in-house to an external source. The outsourcing organization is most commonly a for-profit enterprise, although governmental agencies are increasingly outsourcing services. Global offshoring refers to the practice of sourcing production or services to multiple offshore locations. While labor savings can be substantial, improvements in efficiency, productivity, and quality drive much of the demand for highly skilled, offshore workers. Typically, such globalizing strategies enable multinational corporations (MNCs) to meet increased demand and offer goods and services to customers at lower prices while enhancing profits.

Ethical issues regarding global outsourcing may be usefully separated into public policy questions concerning the establishment of a just regulatory policy and questions regarding the ethical management of outsourcing by organizations. This entry focuses primarily on the obligations of managers of for-profit enterprises regarding global outsourcing. Ethical issues regarding global outsourcing may be usefully divided between the treatment of domestic, or onshore, workers whose jobs are eliminated and the treatment of the offshore workers who are hired to replace them.

The offshore outsourcing of jobs is not ethically objectionable in and of itself. However, it is unethical if either the domestic workers who are laid off are treated as mere disposable tools, unworthy of dignity and respect, or if the workers who replace them in global supply chains are so treated. In cases where neither is the case, legal outsourcing is normally ethically permissible.

The Public Policy Dimension

In democracies, just corporate-governmental relations are reciprocal. Corporations exist because of the will of the people expressed via their elected representatives. Corporations enjoy a variety of privileges grounded in the political, economic, regulatory, and military power of the nation in which they are based. In the United States, for example, corporations enjoy benefits such as transportation infrastructure, police and judicial systems that protect corporate property rights, coercive military and economic influence, and representation in international trade negotiations. In return, public policy makers in the U.S. tax corporations require that they meet specific regulatory requirements. Ethical corporations meet these regulatory demands and refrain from coercing lawmakers into modifying such regulations.

Lawmakers who believe that MNCs have an ethical obligation to retain a specific percentage of domestic employees, to provide employees with severance packages when terminated, to provide employees with advance notice of termination, or to provide any other specific benefit to employees have the power to enact such legislation. When MNCs, or their representatives, exert coercive influence over lawmakers to prevent the enactment or enforcement of such laws, they undermine a core principle of modern democracy. This is the egalitarian principle that each citizen is entitled to one and only one vote. This principle makes it morally unacceptable for corporations to exert ideological and political power via the deployment of economic resources in ways that undermine the ability of individuals to make freely determined judgments about how best to govern themselves. However, MNCs can play a constructive and ethically permissible role regarding the creation of corporate law and labor law by providing lawmakers with information regarding the likely implications of that legislation for their business.

Onshore Corporate Obligations

The prima facie case for outsourcing is that it will improve shareholder wealth via increased profits and provide much needed jobs to workers in developing nations. Much of the controversy regarding outsourcing concerns the displacement of onshore, or domestic, workers. Critics of outsourcing argue that domestic workers are unfairly treated when their jobs are eliminated and tasks previously completed in the United States are sent offshore. In reply, supporters of outsourcing typically argue that no one in the United States has a moral right to a specific job. Furthermore, they argue that the doctrine of employment at will provides not merely a legal basis, but a moral basis, for the termination of expensive U.S. labor in favor of equally skilled, less expensive, and more efficient offshore labor. The doctrine of employment at will holds that, barring a contract that stipulates otherwise and excluding certain legal restrictions, employees may be hired or fired at will. By giving both employees and employers the opportunity to exit an employment relationship “at will,” this doctrine enhances efficiencies in labor markets and promotes the overall welfare of communities.

Patricia Werhane and Tara Radin develop a series of objections to the doctrine of employment at will that it will be useful to consider. They ground these criticisms in the claim that employees have a proprietary right to the fruits of their labor. From this proprietary interest, they derive three specific objections to the doctrine of employment at will. First, employees are entitled to be treated with respect by their employers. So, for example, employees are required to be given reasons that explain the actions of employers when employees are terminated. Second, the arbitrary treatment of employees by employers is said to be illegitimate because employees do not have the same prerogative. Thus, employers have an ethical obligation to refrain from terminating employees without explanation or for capricious reasons. Third, the relationships between employees and employers are required to be reciprocal. Thus, if there is an expectation of loyalty, trust, and respect on the part of employees toward employers, then employers must also exhibit loyalty, trust, and respect toward employees. As we have seen, Werhane and Radin ground these obligations in the proprietary rights of the employees. However, it is not clear how a worker's proprietary right to the product of his or her work entails any obligations on the part of an employer other than that of providing the agreed-on wages and benefits (if any) in exchange for the product of the employee's work. There is an alternative strategy that provides a basis for the claim that employers have duties to treat workers with respect, to treat them in a nonarbitrary manner, and to regard their relationship with employees as reciprocal. These duties may be grounded in the Kantian idea of respect for persons. To fully respect a person, one must actively treat his or her humanity as an end, and not merely as a means to an end. This means that it is impermissible to treat persons like disposable tools. The Kantian basis for this claim is well established.

Employment is of critical importance to the well-being and self-respect of persons. Nonetheless, it is difficult to imagine how an employer's duty to respect employees could entail a duty to refrain from firing them. However, Denis Arnold has argued that the duty to respect onshore employees *does* entail specific duties to at-will employees whose jobs are being outsourced overseas. First, there is an obligation to provide employees with appropriate notice regarding the elimination of their position. There is no clear formula for determining how much notice is appropriate. However, it is reasonable to maintain that loyal, diligent employees should be given advance notice of the elimination of their positions proportionately to the amount of time that they have been in service to their employers.

The second specific duty defended by Arnold of corporate managers to employees whose jobs have been outsourced concerns the long-term well-being of employees. Defenders of offshore outsourcing typically argue that domestic labor markets can accommodate displaced workers. Arnold points out that it is often the case that displaced workers are ignorant of high-demand areas of employment and that they are unqualified for those jobs. He argues that employers ought to provide significant guidance regarding job retraining to laid-off employees, both while they are still being paid by the corporation and afterward. Loyal, diligent employees should be given financial support for their retraining proportionately to the amount of time that they have been in service to their employers. In this way, employers properly reciprocate the loyalty and diligence of their employees.

Offshore Corporate Obligations

The offshore outsourcing of jobs may be ethically objectionable, even if the domestic workers who lose their jobs are treated with dignity and respect. It is ethically objectionable when the workers who are hired to replace the domestic workers, whether hired directly by the MNC or indirectly via a contractor, are treated disrespectfully in the interest of reducing labor costs. Arnold and Bowie and Arnold and Hartman have argued that on Kantian grounds MNC managers have duties in their offshore manufacturing facilities to respect the basic dignity of workers. In particular, they have argued that MNCs have duties to meet minimum safety standards, pay a carefully defined living wage, and adhere local labor laws.

Some MNCs, such as Motorola and Levi Strauss, have always sought to treat workers in their global supply chains with respect. Other MNCs, such as Adidas and Mattel, put in place policies and procedures to ensure the dignified treatment of workers more recently. Nonetheless, many MNCs continue to pay little attention to the welfare of workers in offshore factories. Such workers are, for example, frequently required to endure unsafe working conditions. Workplace hazards include exposure to toxic chemicals, exposure to airborne pollutants, noise pollution, malfunctioning machinery, and fire hazards. These hazards are attributable to a lack of appropriate safety equipment, poor or very harsh working conditions, and more generally to a lack of concern for the physical well-being of workers. These conditions frequently result in neurological damage, lung disease, and the loss of body parts such as fingers or arms.

Frequently, improvements in working conditions may be put in place for little cost. For example, at the suggestion of an employee at a large Nike factory in Vietnam, rubber scraps were used to deaden the sound of metal presses, thus significantly reducing noise pollution. However, MNCs and their contractors must sometimes expend considerable sums to provide improvements such as industrial quality exhaust systems, plumbing to provide water for the comfort use of workers, appropriate equipment for handling toxic chemicals, and health clinics for large factories. Many MNCs have accepted the cost of improving working conditions in their global factories as a necessary business expense. For example, in 1997, Mattel announced the creation of a global code of conduct for its production facilities and contract manufacturers. It has spent millions of dollars to upgrade its manufacturing facilities to improve worker safety and comfort. Furthermore, it has invited a team of academics to monitor its progress in complying with its self-imposed standards and to make their findings public.

One of the most controversial issues concerning global outsourcing is that involving wages and benefits. For services that require employees to have a college education, such call center technical support operators in India or China, the wages paid to employees often allow those employees to enjoy a middle-class lifestyle while earning a fraction of the wage formerly paid to U.S. or Canadian workers. However, factory workers typically earn much less than service workers and are among the most poorly paid employees in global supply chains. Arnold and Bowie have provided a Kantian defense of the claim that MNC managers and their contractors have a moral obligation to provide a living wage to employees working a 48-hour workweek, and they have provided a country-specific method for determining what that wage should be. They argue that for workers to be respected, MNCs must ensure that such a wage is paid even if the legally mandated minimum wage is less than this. In cases where the legally mandated wage is higher, they argue that paying that wage is sufficient.

It remains commonplace for MNCs, or contract factories over which they exhibit considerable influence, to violate local labor laws. Consider, for example, local labor laws relating to wages and benefits, forced overtime, health and safety, child labor, sexual harassment, collective bargaining, and discrimination. Typically, these laws are violated in the interest of economic efficiency, often with the knowledge of local authorities. Such violations of the law are typically permitted by local government authorities to prevent the MNC factory from shutting down and moving elsewhere. Many MNCs have yet to embrace a respect for the rule of law in those nations where their products are manufactured. Indeed, many government officials in the nations that host factories remain convinced that aggressive enforcement of existing labor laws will simply cause the factory to shut down and later reopen outside their jurisdiction.

Arnold and Bowie and Arnold and Hartman argue that the violation of host nation laws by MNCs and their contract factories, especially those that are not proactively seeking to ensure compliance, should be condemned. They argue that such violations are hypocritical in that MNCs rely on the rule of law to ensure, among other things, that their contracts are fulfilled, that their physical property is secure, and that their intellectual property rights are protected. They conclude that it is inconsistent for an MNC to demand that its own legal rights be protected while at the same time it violates the legal rights of others.

In response to these claims, some argue that local labor laws are cumbersome and expensive and that MNCs have good reason to seek out host nations where laws are not enforced or where there are few laws protecting workers. Furthermore, it is argued that any money spent to improve the working conditions of workers constitutes a sort of theft from shareholders. By seeking out the cheapest possible voluntary labor and by avoiding or ignoring local labor laws, it is argued, MNCs maximize profits and are thus in a better position to reward shareholders and executives.

Ozone Depletion

Ozone is a relatively unstable form of molecular oxygen containing three oxygen atoms (0_3). Ozone near the earth's surface is the most noxious component of smog that is treated as an air pollutant in most industrial countries. The ozone layer in the stratosphere, however, shields the earth from ultraviolet radiation that is harmful to living organisms. This radiation comes from the sun, and too much of it can damage plant and animal cells, cause skin cancer and eye cataracts in humans, reduce crop yields, deplete marine fisheries, cause damage to materials of various kinds, and kill many smaller and more sensitive organisms.

Stratospheric ozone is found in a broad band, generally extending from about 15 to 35 km (9–22 miles) above the earth's surface. The amount and distribution of stratospheric ozone varies around the earth, but in general the layer of ozone is relatively thin when compared with the thickness of the stratosphere. Ozone is produced when upper-atmosphere oxygen molecules (0_2) are broken apart by ultraviolet light. Most of these freed oxygen atoms bond with ordinary oxygen molecules to form ozone. This ozone creation process is constantly at work producing more ozone.

However, ozone can also be destroyed by chemicals that react with it directly. One such destroyer was identified in 1974 by Molina and Rowland, two chemists at the University of California at Irvine, who theorized that chlorofluorocarbons (CFCs) could eventually drift up to the stratosphere to react chemically with ozone molecules in a destructive fashion. When CFCs reach the stratosphere, they are finally broken down by ultraviolet radiation to release chlorine atoms that act as a catalyst in a series of reactions that convert ozone into oxygen.

Because chlorine acts as a catalyst rather than as a reagent, a single molecule of chlorine can destroy thousands of ozone molecules before it eventually gets washed out of the atmosphere. CFCs can take as long as 6 to 8 years to reach the stratosphere to do their damage.

When first discovered, CFCs proved to be remarkable compounds with many uses. Since they were inert, they did not react with other chemicals with which they were mixed. They were neither toxic nor flammable at ground level. After their initial discovery, the number of CFC compounds grew quickly into the dozens and were used as a universal coolant; as a blowing agent in rigid insulation forms; as an aerosol propellant; as a solvent to remove glue, grease, and soldering residues from microchips and other electronic products; and as a component of foam packaging containers.

When Molina and Rowland first developed their theory, empirical validation was unavailable because of the difficulties involved in measuring actual levels of stratospheric ozone. No international action was taken to limit CFC usage until the discovery of the ozone hole over Antarctica. The British Antarctic survey conducted in 1983 found that concentrations of ozone in the stratosphere were dropping over Antarctica at a dramatic rate each austral spring to be replenished again by the end of the fall season. This discovery led to a $10 million scientific mission carried out by the United States under the combined sponsorship of NASA, the National Oceanic and Atmospheric Administration, and the Chemical Manufacturers Association to find out more about this phenomenon. By the spring of 1987, the average ozone concentration over the South Pole was discovered to be down about 50%, and in isolated spots it had actually disappeared entirely. Subsequent research showed that the ozone layer around the world was changing far more rapidly and in a different pattern than any model had predicted.

While the role of CFCs in ozone depletion had been hotly contested after the theory was first formulated in 1974, it didn't take long for these findings to be widely accepted and action taken. On September 16, 1987, after years of debate and heated negotiation, the Montreal Protocol on Substances that Deplete the Ozone Layer was signed by 24 countries, and by mid-November of 1988, that total had increased to 35 countries. The agreement included a freeze on CFC production at the 1986 levels starting in 1992, with extended deadlines for some countries, allowances to accommodate industry restructuring, and loose definitions of products that legitimately could be traded internationally. Developing countries were given a 10-year grace period past the deadline during which CFC production could be increased to meet basic domestic needs.

The cumulative effect of these loopholes meant that even with widespread participation, the protocol's goals of halving CFC use by 1998 would not be attained. Projections showed that if industrialized countries phased out CFCs as scheduled, but the developing countries did not go along, the use of CFCs by these countries would soar from 15% to 50% by the end of the century, which would leave chlorine levels slightly above the current level even with reductions by developed countries. Thus in June 1990, representatives from 75 countries met in London to sign an accord that strengthened provisions of the treaty. This accord called for eliminating CFC usage worldwide in a decade, setting up an international fund of $200 billion to help less developed countries subsidize purchase of CFC substitutes, and building new plants to produce refrigerators and other products that use CFC substitutes.

In 1989, the U.S. Congress enacted an excise tax on ozone-depleting chemicals that it hoped would discourage their use and encourage an expedited search for safe substitutes. In February 1992, President George H. W. Bush announced a speedup in the phaseout of ozone-destroying chemicals by U.S. manufacturers. Responding to a report from NASA that chlorine monoxide had reached record levels over Canada, the United States, and Europe, the president said that the United States would phase out production of ozone-destroying chemicals by the end of 1995, 5 years earlier than agreed on in the international treaty.

The net effect of these actions was to reduce the levels of ozone-depleting substances in the atmosphere. Based on measurements of inorganic chlorine in the atmosphere, which stopped increasing in 1997 and 1998, stratospheric chlorine levels were thought to have peaked and were no longer increasing. The natural ozone production process was expected to heal the ozone layer, and ozone concentrations in the stratosphere were expected to recover in about 50 years. However, in the winter of 2004 to 2005, ozone declined in the upper atmosphere over the Arctic region more precipitously than ever before, stunning scientists. Some of this decrease was attributed to violent storms on the sun's surface and bitter cold temperatures rarely seen in the Arctic, in addition to man-made chemicals.

P

Pareto, Vilfredo (1848–1923)

Vilfredo Federico Damaso Pareto was a famed economist and sociologist. He is best known for the economic concept of Pareto efficiency (or Pareto optimality). He made other wide-ranging contributions to economics that since the late 1930s have greatly influenced modern conceptions of demand, welfare, and planning. Pareto's law asserts that distribution of income and wealth follows a regular logarithmic formula. (Pareto charts are a standard statistics display tool.) He also made important contributions to sociology and moral philosophy.

Vilfredo was the only son of a nobleman, who was living in Paris in exile from Genoa for his nationalist views, and a Frenchwoman. The family returned to Italy, where the elder Pareto worked as an engineer. He made a comfortable living raising his family in a middle-class environment, providing many advantages to the young Vilfredo.

Pareto was educated in both France and Italy, graduating at the top of his class in civil engineering in 1870 from the Istituto Politecnico of Turin. Mathematical training and ideas of mechanical equilibrium shaped his contributions to economics. An ardent advocate for free enterprise and free trade, against state subsidies or protection for industry, and against militarism, the strong-willed and self-confident Pareto made his views known in writing and in public lectures that offended political leaders and sometimes led to police action.

From the early 1870s, he worked in Italy as a civil engineer, including being a director of two railway companies, and as a deputy manager and then a director with an iron company. He resigned in 1890 to conduct independent research. He had also lost a large sum speculating on iron in the London markets.

He inherited but never used his father's title of *marchese* (marquis). In 1889, Pareto married a Russian. This marriage broke down 12 years later when his wife left him. In 1902, Pareto met a Frenchwoman, and the two lived devotedly together, marrying shortly before Pareto's death in 1923. Pareto changed citizenship to the city-state of Fiume to divorce his first wife.

The important Italian economist Maffeo Pantaleoni (1857–1924) met Pareto in 1890 and, noting Pareto's interest in applying mathematics to economics, suggested that he study the work of Léon Walras (1834–1910). Pareto and Walras met. Pareto then published a series of theoretical articles applying mathematics to the analysis of economic policies, featuring Walras's general equilibrium approach. These articles and Pantaleoni's strong recommendation led to Walras's decision that Pareto succeed him in the chair of political economy at the University of Lausanne (Switzerland) in 1893.

Pareto's major works in economics, *Cours d'économie politique* and *Manuale di economia politica*, helped develop the Walrasian approach. Subsequently, Pareto concentrated on sociology and had his chair broadened to political and social studies. After his retirement, *Trattato di sociologia generale* and other sociological works appeared. Pareto argued that eternal class struggle is a circulation of power elites promoting sham ideologies.

Pareto later changed his view on free trade. He argued that social planners, aided by a Walrasian model of the economy, could be as efficient as unfettered markets. His belief in democratic liberalism had faded. Although the Fascists invoked his name as intellectual camouflage, Pareto was disdainful of Mussolini's movement and declined many proffered Fascist honors.

PARETO EFFICIENCY

One of the hardiest and most widely cited results in all of economics, Pareto efficiency, was developed by Vilfredo Pareto in "The Maximum of Utility Given by Free Competition," an article published in *Giornale degli Economisti* in 1894, and his *Manuale d'economia politica*, first published in 1906 and revised and translated into French in 1909. Pareto proposed that an allocation or distribution of goods was efficient or optimal if, once attained, any move away from it could not make anyone better off without at the same time making at least one other person worse off. Allocations that are not Pareto optimal allow for redistributions that make at least one person better off while making no one else worse off.

Consideration of Pareto efficiency, the Pareto process, and other associated terms and concepts constitutes a large part of modern welfare economics, the branch of economics devoted to the study of the distribution and allocation of goods and services.

Pareto developed his approach in response to the utilitarian Benthamite "calculus," which was premised on the view that utility was cardinally measurable and comparable across individuals. The view that utility is both cardinally and interpersonally measurable implies, among other things, that social policies can be designed for redistribution of goods leading to the utilitarian goal or ethic of the "greatest good for the greatest number." According to this view, policy makers may calculate the net aggregate utility increase or decrease of any policy change, with policy changes leading to greater increases in net utility being preferred even though some individuals may be absolutely worse off after the change.

Considering the possibility that policy changes would cause some to sacrifice for others led to a focus on the equity or fairness of such changes. For example, who decides who gains and who loses and how much each person or group gains or loses? This requires some socially accepted ethical rule beyond Bentham's "greatest good for the greatest number." This new rule itself—whatever it might be—represents a change in policy and thus is subject to the same focus on equity. Solving this requires a socially acceptable metarule on rule changes, and the infinite regress nature of the problem reveals itself.

Also, from the 1880s onward, it was noted that for the "felicific calculus" of Bentham to work, everyone would have to have identical utility functions in income, which is a special and limiting assumption. Identical utility functions in income imply that the social optimum is one of uniform, or equal, income distribution, where each individual assigns the same utility value to his or her last dollar's worth of income. It is not the equal distribution outcome that is being criticized but the restrictive assumption on utility that produces it.

Once cardinal utility was abandoned, the search was on for a new criterion for judging the efficiency of policies. The inability to make interpersonal utility comparisons means that a simple summing up of individual utilities into one number is impossible. Yet without knowing by how much "losers" lose relative to how much "winners" gain from any policy change, measuring the impact of a policy and hence finding a social optimum (or utility *optimum optimorum*) becomes extremely challenging.

Pareto—heavily influenced by the work and goals of Léon Walras—believed that he had solved this conundrum in the context of a perfectly competitive general equilibrium model by proposing the rule that a social optimum is an allocation of goods that cannot be changed to make anyone better off without at the same time making someone else absolutely worse off.

Such a state is said to be *Pareto efficient* (or Pareto optimal).

In the *Pareto process,* the move to a Pareto-efficient allocation driven by autonomous individuals voluntarily making utility-improving trades, there simply are no losers as no potential loser would have to agree to a distribution in which he or she would be made worse off. In this process, the individual is at the locus of decision making, and each individual is assumed to have an equal voice or the power to veto any suggested distribution.

In the Pareto process, one person or a group can be prevented from acting in their self-interest by the veto power of at least one other fearing harm from a redistributive move. The ethic does not have to be to "restrain oneself"; the "market" or one's fellows—with veto power—will restrain one when there is a collision of self-interests. One can induce others (or be induced oneself) with an offer of some value to accept an initial worsening of their position (prior to the compensation payment). Looking at the Pareto process in this way, it appears as if the ethical rules are simply that people should (1) act purposefully in their own self-interest (autonomy and subjectivity), (2) respect that all exchange is voluntary (utility and teleology), and (3) give everyone veto power over suggested redistributions.

Nor does this imply that the "majority rules." One person may fear that the losses from a particular change are greater than the sum of the gains to all the possible gainers from a change. In this case, it would not be possible for gainers to compensate the loser even if they were to offer their gains to the loser. Here, the interests of a single large loser outweigh the interests of many small gainers.

This does not deny opportunism or apparently "perverse" one-time or short-run behaviors that may be part of establishing a reputation, for example, tit for tat, in a longer-run repeated game context leading to long-run gains. A one-time redistribution when the parties are noncooperative may end up in a prisoner's dilemma, where, given limited information, they both do worse than they would if they could collude and enforce agreements. In a situation of one-time play or single exchange, a social rule or convention—for example, habit, custom, tradition—may lead to a better outcome for both individuals than following their own narrow, short-run self-interest. Work on the evolution of cooperative rules has established this result and gives a decision-making foundation for rules of thumb and other "social conventions" that otherwise appear ad hoc. In a repeated game context, following one's own long-run self-interest may generate these rules and customs as dominant strategic outcomes.

Pareto-improving moves are those in which at least one person is made absolutely better off by a policy change without reducing the satisfaction (or utility) of any other member of society. Thus, Pareto-improving moves may be measured without resorting to cardinal utility. A move is *strongly* Pareto improving and the allocation is said to be *Pareto superior* to the previous position if at least one person claims to be better off while no one else claims to be worse off. If at least one person is made worse off, the move is *Pareto inferior*, and if a move leaves no one better or worse off, it is *Pareto neutral.*

Pareto-efficient allocations presume full employment of resources. If there were involuntarily unemployed resources, resources wishing to be employed but currently unemployed, then a policy could conceivably be devised that would be Pareto superior. The unemployed resources could be employed, they would be better off, and no other individuals would be worse off as their allocations would be unaffected or might even increase. Involuntarily unemployed resources have no opportunity cost of employment when they are involuntarily unemployed.

Pareto proved one of the most important propositions in neoclassical economics, that every Pareto optimum may be reached by a competitive process, and the corollary that perfectly competitive processes lead to a Pareto optimum. Known variously as the *invisible hand theorem* or the first and second fundamental theorems of welfare economics, to some this tour de force proves mathematically the program begun by Adam Smith in *The Wealth of Nations.*

Somewhat embarrassingly, there are an infinite number of Pareto-efficient allocations, each as "good" as the other—*good* in the sense that a proposed move away from any of the Pareto-efficient distributions would be vetoed by at least one person. There is no overarching or metasocial utility function that ranks these Pareto-efficient allocations. Every initial endowment of resources may be allocated among society's members differently. Every initial allocation may result in an infinite number of final allocations that meet the Pareto efficiency criterion. The Pareto process takes the initial allocation, no matter how skewed or equal, as a given. It does not presume to answer the question of how that particular allocation became the starting point. In this sense, given its silence on the matter, one might view the starting point of the Pareto process as implicitly justifying the existing distribution of goods.

The differing initial allocations will lead through a competitive process to different-ending, albeit Pareto-efficient, allocations. Each of these distributions is Pareto efficient, yet each implies a potentially drastically different final distribution of resources influenced by the starting distribution of resources. All we know is that through the competitive process, no one voluntarily makes oneself worse off through exchange; however, there is nothing that guarantees that the initial endowment even ensures that all members would make it to the market to start the Pareto-improving trading process.

If attaining a Pareto-efficient outcome is taken as a justification for perfect competition, it must be emphasized that other processes, in addition to perfect competition, may also ensure the attainment of a Pareto optimum. For example, Lerner and Lange, the exponents of "market socialism," used the existence of the Pareto process and the Walrasian general equilibrium framework to argue that central planners could mimic markets, using shadow prices calculated from their competitive general equilibrium models to direct individuals' effort, yielding a Pareto-efficient allocation. This claim led to some of the most heated exchanges in 20th-century economics, resulting in the development of the view that stresses the individuality and informational efficiency of the market process. Social planners could "be" the market; however, they would have to know so much and be able to calculate so quickly that for all practical purposes, such a program—while theoretically possible—would be operationally impossible. Critics of market socialism also stressed the supremacy of processes that made autonomous individuals the decision makers, fearing that allowing central authorities the power to make decisions would lead to a loss of the individual's rights.

While economists may be able to prove that the perfectly competitive process leads to a Pareto-efficient allocation, the practical question of what this means operationally must be addressed. In a world with imperfect competitors, missing markets, increasing returns, asymmetric and imperfect information, negative and positive externalities, public goods, common property resources, and second best considerations—in short, in a world that must admit market failures—where is the "invisible hand" that will lead us to a Pareto-efficient outcome? As is well known, *that* invisible hand is truly invisible.

This leads some economists, following Friedrich Hayek (following Smith), to focus not on end states, or on equilibria, but on market *processes.* The phrase "It's the journey, not the destination" is apt here. Casting aside the pursuit of static equilibrium and making nugatory the idea of a Pareto-efficient *outcome*, these economists focus on *processes* that are dynamically efficient as measured by lower informational costs and lower transaction costs and by weighting individual choice more highly than other methods of allocating resources. Reducing frictions in markets becomes the solution not in ensuring that a social optimum—or Pareto optimum—*is* attained but in ensuring that if one exists, individuals, driven by self-interest and protected by their veto power, may at least approach it. To many, this represents a return to the original insights and program of Adam Smith, who wrote much more about resource flows occasioned by changing self-interest guided as if by the invisible hand *and* the impartial spectator than he did about static equilibria.

Other welfare economists backed away from Pareto efficiency but not from the concept of equilibrium. They have tried to design compensation mechanisms allowing gainers to compensate losers, thus operationalizing Bentham's idea of "the greatest good for the greatest number" without resorting to a cardinal ordering of utility. In their schemes, monetary payments represent a willingness to pay. If after a policy change, gainers are willing to pay at least as much as it takes to compensate losers and losers voluntarily accept the payments, then that change moves society in the "right" direction. The search for individual gain leads to a better social outcome.

This view, stressing a conceivable welfare-improving reallocation after the policy change, raises the issue of whether or not reallocations before the fact might also be welfare improving. If so, some argue that the initial allocations ought to be changed before a particular policy is changed.

Pareto efficiency is based on three assumptions: (1) Individuals are the best judge of their own utility, (2) social utility is defined only in terms of independent (not interdependent) individual utilities, and (3) interpersonal utility comparisons cannot be made. These are value-laden assumptions that leave any claim of a "value-neutral" Pareto process and allocation in doubt.

In the end, Pareto's attempt to provide a simple rule that could be used to assess the outcome of *actual* social policy is incomplete. In a Walrasian competitive general equilibrium framework, such a demonstration may be made. However, it is widely accepted that the world in which we live, hence the world of actual social policy and reallocations, does not closely resemble a Walrasian general equilibrium model.

Parmalat

In 1961, a 22-year-old college dropout, Calisto Tanzi, inherited his family-owned prosciutto business, to which he added a pasteurizing facility in Parma, Italy, which was later to become known worldwide as Parmalat. It steadily grew into a diversified multinational dairy, beverage, and bakery company and one of Europe's most influential corporations. In 2002, Parmalat Finanziaria was the holding company of a group of more than 200 subsidiaries operating in 30 countries with assets of €10 billion and annual sales of €7.6 billon. More than 36,000 people were on its payroll. But in December 2003, the company was declared insolvent in one of the world's largest corporate bankruptcy scandals, and Tanzi himself was alleged to have engaged in financial fraud and money laundering in a case that rivals Enron and WorldCom in notoriety.

After the 2003 shock of unexpected bankruptcy at Parmalat, it was later uncovered that the company had kept off–balance sheet debt transactions to the tune of €14.3 billion ($16.9 billion) hidden from the public. Such irregular accounting practices are illegal, since they give investors and potential investors a false and misleading picture of the financial health of a corporation that can unfairly influence market investment decisions. In fact, Parmalat was able to continue to reap large loans from banks such as Bank of America, Citicorp, Crédit Suisse Group, and Italy's Banca Nazionale del Lavoro while it maintained its false record keeping.

Calisto Tanzi and his family had reached Italian celebrity status before the scandal at Parmalat. Some affectionately called Tanzi "Mr. Milk" after Parmalat's chief product of milk distributed in a special tetrahedron package that extended its shelf life. Many admired Tanzi's risk taking, which had taken him from rags to riches. With control of 51% of the outstanding shares of Parmalat Finanziaria, he ran the firm as a family business. His own net worth was placed at €1.3 billion. He had associated the family business with sports teams and had done much philanthropic work in Parma. He provided funds that went to the restoration of the city's theater and basilica, and he gave to the area's AIDS patients and assisted the local poor. Some would have called him the model entrepreneur—before it came to light that he was a fraudulent deceiver and perhaps the mastermind in the Parmalat scandal.

Authorities claim that for 13 years Parmalat had sought and received bank loans based on revenues that it had inflated by claiming sales to fictitious firms. Investigators reported that Tanzi allegedly conceived the fraudulent scheme, which he executed along with his top managers and some external lawyers and auditors, although the last two professional groups have claimed their innocence. The overall plan began to come to light when, in the winter of 2003, a bond payment that was due went unpaid and it was discovered that €3.9 billion from a Parmalat subsidiary in the Cayman Islands that was supposedly deposited in a Bank of America account did not exist at all. Moreover, the investigation revealed that Tanzi had skimmed and transferred anywhere from €500 million to €1.3 billion to other family firms to cover losses there. In all, a total of €8 billion was missing from the company's "cooked books." In short, Parmalat was a case where managers simply invented assets to offset huge liabilities and falsified their accounts over a 15-year period, finally forcing the company into bankruptcy on December 27, 2003. Trading in Parmalat shares was suspended the same day.

The overriding question, of course, is how such a successful firm could go down such a road to infamy. There are a number of theories that attempt to explain the Parmalat scandal. First, it was held by some that the firm had expanded much too quickly and diversified too broadly and in so doing created massive debt that Tanzi felt should be hidden from the public and his creditors. For example, in the 1990s, Tanzi and his family had sour business dealings in sports and tourism. He also tried to enter the media business with the purchase of a TV network, which was eventually sold with a loss of an estimated €45 million. Such a business track record would have damaged Tanzi's borrowing power, so to maintain his company's status as a good credit risk, off–balance sheet fictions were created and perpetuated for over a decade.

Another possible explanation has to do with the corporate governance structure of Parmalat. According to this view, Tanzi's management style and running of such a huge conglomerate as if it were a family-owned business took its toll on the operations. And finally, it has been said that Tanzi should not shoulder the full blame for the collapse of Parmalat and that there also may have been complicity on the part of the external group of professionals whose job it was to serve the public as watchdogs of the firm and ensure that transparency was a feature of its financial dealings. After the Italian authorities became aware of the depth of the scandal, a special government-appointed "extraordinary administration" took over control of Parmalat. The head of this administration, Enrico Bondi, has claimed that there were others external to the firm that had played a major role in the fraud schemes that were uncovered. He sued 45 banks for allegedly having had a hand in the fraud. Bondi sought €8.06 billion from Citibank and Bank of America, but in 2005, most of his claims had been dismissed in a U.S. court where they had been filed.

Bondi also accused auditors from Grant Thornton International and Deloitte & Touche Tohmatsu for having engaged in professional malpractice. The Italian branch of Grant Thornton had been the auditor of Parmalat's Bonlat subsidiary in the Cayman Islands, which was the unit that had booked €3.95 billion in fictitious assets with Bank of America and that first brought the whole scandal to light. Under Deloitte & Touche's audits, Parmalat had booked its actual debt as if it were real equity, allowing the company to make continued inflated earnings statements. Bondi's claim, then, was that Parmalat, along with the investing public, was a victim not only of Tanzi's alleged criminal behavior but also of the failure of banks and external auditors to do their jobs properly. In such ways, it was hypothesized, had Parmalat traveled the road to become Europe's Enron.

PARTIAL EQUILIBRIUM

Equilibrium is the condition of balance among the forces acting on a system. Partial equilibrium focuses on the conditions within the system without considering its effects on, or effects from, other systems.

Perhaps the most well-known analysis of equilibrium in the business context is the balance between the forces of supply and demand for goods. Partial equilibrium is the condition of balance among forces directly affecting the supply and demand for a particular category or type of good without considering the effects on other types. For example, a partial equilibrium analysis of the supply and demand for gasoline considers the direct influence of the price of gasoline but not the effects of the price of public transportation on the supply and demand for gasoline or the effect of the price of cars of varying fuel efficiency on the supply and demand for gasoline.

Equilibrium processes in social systems play out over long periods of time as many individuals make many transactions, each decision based on the individual's self-interest and subjective understanding of information and knowledge. Over the long term, society progresses as each individual strives to allocate resources to those transactions he or she believes to be the most rewarding.

The process, however, is vulnerable to individual ignorance and error. The precise conditions for partial equilibrium are uncertain, unknown, and unlikely to withstand the shocks of innovation and creative change. As self-interested individuals make decisions over time and without a guiding hand, society bears the risk of short-term shortages or surpluses in the distribution of goods. In this way, partial equilibrium, in common with more general social equilibrium perspectives, puts analytical faith in long-term distributive justice and does not address short-term deficiencies.

The equilibrium of supply and demand is critically dependent on the ethical functioning of the economic system and the marketplace. Information about prices in the market plays a key role in these processes, and this information must accurately and honestly reflect the quantity and features of the goods that will be offered or demanded at any given price. Fraudulent information will disrupt the equilibrating processes of supply and demand, as will denial of fair access to willing and able suppliers and customers. Thus, even in free markets, governments may enforce the rules of commerce to ensure commutative justice and economic integrity.

Governments also may seek to improve society by disrupting the free functioning of equilibrating processes. For example, there is a partial equilibrium perspective for the quantity of illegal and harmful drugs in society, just as there is one for ethical pharmaceutical drugs. Partial equilibrium on its own is a process or analytical perspective without an embedded morality. Governments have a role to install legal and regulatory boundaries, constraints, and compliance requirements as significant forces for social responsibility.

The self-interested agency of individual managers on the behalf of business principals provides the dynamic energy for economic and market systems over time to converge toward or diverge from partial equilibrium. Patterns in equilibrating processes may differ if there is a tendency for management decisions to be biased toward or away from specific ethical principles. For example, partial equilibrium for housing in society may proceed at different rates or follow different patterns over time if a residential construction industry is managed by decision makers who seek to maximize value for shareholders rather than to return reasonable value to shareholders in order to reserve some organizational assets for social responsibility activities.

Partial equilibrium is a condition of balance between self-interested buyers and sellers in a social exchange process. It is a very simplified description of society, however, and the likelihood that a tendency toward partial equilibrium can bring about a just society over the short term, or reliably over the long term, is risky at best.

Participatory Management

Participatory management refers to involving nonmanagement employees in decisions that directly affect them. It is a form of decentralization that pushes decision making down to the lowest possible level within an organization. Participation can be very limited, with managers obtaining input from a few employees regarding a minor task, or very extensive, where all employees participate on teams that make a wide range of productivity and budgetary decisions and are financially rewarded for doing so.

Participatory management is often juxtaposed with the traditional command-and-control system of management, where nonmanagement employees are excluded from an organization's decision-making process. Factors contributing to the spread of participatory management systems include the trend toward self-management, a more educated workforce, and more than a century of praise by leading management theorists.

Types of Employee Involvement

Participatory management systems come in many shapes and sizes depending on the answers to the following four questions: (1) Who gets to participate? (2) What decisions do they get to participate in? (3) How much authority do they have over the final decision?

(4) Are the participants financially rewarded for improved performance?

The most common form of participation is a suggestion system. Suggestion systems can be designed for a select group of employees or all employees. The employees may provide input on one particular issue or a wide range of issues. Some suggestion systems offer financial incentives for submitting the suggestion, and some offer bonuses based on the financial impact of the suggestion. Usually, the person offering the suggestion has very little authority over the final decision. Survey feedback is another common form of limited participation where nonmanagement employees provide input but have no decision-making authority.

Quality circles, a group of employees who meet regularly to discuss workplace improvements, typically have greater decision-making authority. Quality circles usually involve a limited number of employees chosen based on their particular expertise.

A few organizations allow nonmanagement employees to sit on their boards of directors. Although the number of nonmanagement employees participating is minimal, the range of decisions they can influence is very broad.

Scanlon-type gainsharing plans provide a broad range of participatory features, including a suggestion system, participation on department decision-making teams, voting privileges on a review board, and a group-based performance bonus. All employees are encouraged to submit written suggestions that can reduce costs, improve efficiency, and increase revenue. These suggestions are examined by department teams composed of nonmanagement employees based on common job tasks. The teams may consist of every nonmanagement employee in the department or elected representatives and may meet monthly, weekly, or daily. The department teams are provided a limited budget to implement suggestions that affect only them. Expensive suggestions, or interdepartmental suggestions, are forwarded to a review board composed of management and nonmanagement employees for implementation consideration. Nonmanagement employees receive group-based bonuses by surpassing historical productivity benchmarks or reducing historical cost benchmarks.

Authoritarian Roots and Justifications

Authoritarian managerial power at the workplace has a long history that includes the institution of slavery in Greece, Rome, and the United States. As is evident in the writings of the Social Darwinians, authoritarianism is a deserving reward for successfully climbing the organizational ladder.

At the time of the American Industrial Revolution, there was a need to organize and motivate a large number of formerly self-employed agrarian workers or craftsmen to efficiently perform factory work. According to Frederick Winslow Taylor, the managerial system of 19th-century America operated under the notion of “ignorance and deceit.” Workers deceived employers about production output capacity, and employers deceived workers about the wage value of their output. Each interest group was ignorant of the other’s knowledge. Because of these deceptive practices, Taylor argued, industrial organizations were inefficiently managed.

Taylor recommended that managers divide every job task into its most basic components, scientifically conduct time and motion studies to determine the most efficient method for performing the task, supervise workers very closely, and link pay to performance. All planning functions were to be performed by managers and all labor functions by nonmanagement employees. The adoption of Taylor’s scientific management techniques significantly increased productivity.

Taylor’s management methods were implemented in capitalist and communist societies. Vladimir Lenin was one of the earliest proponents of Taylor’s authoritarian-based scientific management. He demanded that Soviet workers unquestioningly subordinate themselves to the single will of managers. According to Lenin, managers should coordinate workers through a unified command and to achieve a technically rational organization.

In addition to tradition and production efficiency justifications, other arguments favoring centralized command-and-control management systems over participatory ones include the following:

- Employers have a constitutional right to set the terms of employment as they see fit.
- Few employees advocate participation.
- Empirical research suggests only modest performance improvements from employee participation.

The Participatory Alternative

Participatory management was formulated as an alternative to the traditional command-and-control authoritarian model. In the 1920s, Elton Mayo and human relations school of management researchers documented the productivity benefits of fulfilling an employee's social needs and advocated collaborative mechanisms at the workplace.

During the 1960s, Douglas McGregor and other human resource school of management proponents argued that work should be a place where people continue to develop psychologically and socially. According to McGregor, participatory management represented an ideal process within organizations. Although some people disliked working and needed to be dictated to and coerced, many other people wanted to take on new responsibilities and welcomed the opportunity to constructively collaborate in an organization's decision-making process.

Tom Peters and corporate culture scholars maintain that the most successful organizations in this age of fast-paced innovation and customer responsiveness are composed of "empowered" employees at all levels, in all functions, and in nearly everything. Peters recommends that all employees participate in hiring coworkers, designing work tasks, assessing new technologies, formulating budgets, and measuring their own performance. W. Edwards Deming's total quality management approach and Peter Senge's "learning organization" both emphasize local autonomy, where those working in a specific area solve their own problems rather than await decisions made by centralized authorities.

Most recently, organizations have been adopting participatory management techniques due to the impact of downsizing and globalization. Organizations are eliminating layers of management to maintain global cost competitiveness. The remaining employees must take on greater managerial responsibilities, even at the lowest levels of the organization.

Research Findings

Researchers have not reached any definitive conclusions on whether participatory managed firms are more productive than traditional command-and-control managed firms. A major obstacle in achieving consensus on the empirical evidence is that there is no one standard form of participation. For instance, some researchers group together quality circles and gainsharing systems even though these two participatory systems have many differences and a wide range of permutations.

In general, meta-analytical researchers have concluded that the impact of participation on employee performance and satisfaction is statistically significant but rather small. Participation has a more positive effect on a particular personality type—namely, employees who tend to believe that they control their own destiny.

Political behaviors within organizations help explain some of the contradictory research findings. A plethora of case studies document how to properly implement and manage employee participation. Yet management and nonmanagement employees engage in unhealthy power games around the participatory mechanism. Internal political issues arise as a result of managers giving up power, nonmanagement employees taking on power, and both parties sharing power. The power dynamics of participation must be managed appropriately for organizations to achieve the desired outcomes.

From a multistakeholder perspective, case study research has found that gainsharing's collaborative problem-solving mechanisms benefit owners in terms of cost savings, customers in terms of improved product quality and service, suppliers in terms of product feedback, and production employees in terms of improved health and safety conditions and other favorable changes in employee policies.

In conclusion, many benefits can be achieved through participatory management mechanisms at both the individual and the organizational level of analysis. But success requires strong commitment from upper-level managers and significant training of nonmanagement employees. Until participatory management systems can be designed to significantly outperform command-and-control management systems, the right of employers to determine employment relations will remain more important than the human dignity associated with involving employees in decisions that directly affect them.

PATENTS

A patent is a governmental grant of exclusive control over a new invention—a material, product, or process—for a specific period of time, normally 20 years. A patent is granted as a reward for innovation, usually technical innovation. Recently, in some countries, including the United States, a patent may be granted on a new method for doing business. To qualify for a patent, the discovery must be useful, novel, and nonobvious—that is, not an extension of existing technology that would be obvious to an expert in the field. The patent holder has the legal right to prevent others from producing, using, selling, or importing objects that infringe on the patent. A patent holder may license third parties to manufacture or sell the invention, usually in return for royalties. A patent holder can prohibit a competitor from using or selling an equivalent invention, even if the competitor has made an independent discovery, not relying on the patent holder's research.

Patents are frequently described as monopolies, but there is no guarantee of monopolistic rewards unless the invention attracts willing buyers. In addition, the economic benefits of a patent are secure only if the patent holder has the financial ability to defend the patent against infringement or legal challenges, because patent litigation is very costly. Individual inventors or small businesses may not be able to defend patent rights.

Patents are granted by national patent offices; among the most important are the United States Patent and Trademark Office and the Japan Patent Office. Some economic regions cooperate on patent policy, notably the European Patent Office. In 1994, during the creation of the World Trade Organization, member nations signed the Agreement on Trade-Related Aspects of Intellectual Property Rights (TRIPS). This international agreement sets rigorous basic standards for legal protection of intellectual property rights in member countries.

The TRIPS agreement recognized some permissible national limitations on patent rights. The agreement permits compulsory licensing of patents, allowing competitors or the government to manufacture essential patented products or to use crucial patented processes to respond to a national emergency, such as a public health crisis. When a compulsory license is issued, the patent holder is entitled to reasonable compensation. The TRIPS agreement also allows a nation to refuse to patent plant, animal, or human life and to refuse to patent products or processes that cause serious environmental harm. If a country does not permit the patenting of plants, the government must offer an alternative legal mechanism to protect the property interests of plant breeders who create new varieties.

Influenced by the legal tradition of some European countries, TRIPS allows nations to refuse to patent an innovation if necessary to protect the *ordre public* or morality. The *ordre public* is similar to the public interest. The concept is comparable to legal restrictions on contracts that violate public policy. In the early 20th century, some patent offices refused to approve applications for contraceptive devices, for example. Those who advocate very limited use of the *ordre public* exemption question whether the staff of a national patent office has the training or resources to resolve the ethical issues raised by patent applications and, hence, to decide wisely that certain applications be rejected on the grounds of offense against standards of public morality.

Moral Justifications for Patents

According to some ethicists, a patent is an example of a natural right to property and ought to be defended in business ethics. However, others emphasize that patents are a government exemption from the normal rigors of the competitive marketplace. They claim that the use of government power to privilege certain parties to commercial transactions needs to be ethically justified.

Natural Right to Property

Some business ethicists see patents as a clear example of the human right to benefit from the fruits of one's labor. An inventor deserves a reasonable opportunity to reap the rewards associated with an invention, because the inventor's genius, hard work, and persistence have created something of novel social value. Some explicitly connect their position to John Locke's more general defense of private property. However, some who are critical of patents reply that Locke's position on property included a key proviso: A person has a moral claim to expropriate property from nature by hard work as long as other people have access to resources that provide them an equally good opportunity to create property. These critics point out that a patent gives the patent holder exclusive control over a technical idea. Once a patent is granted, others pursuing independent research lose any opportunity (for the duration of the patent) to benefit financially from their efforts if their inventions turn out to be equivalent to the subject of a patent. So, these critics conclude, patents violate Locke's proviso that other persons must have as good an opportunity to obtain similar property.

Other critics of the patent system point out that inventions are rarely the result of a flash of personal genius, completely dependent on the intellectual resources of a solitary human being. Most technical innovations depend on prior technological development and, indeed, broader stocks of social knowledge. Inventors receive from their communities the technical training that is a prerequisite for the inventor's creative accomplishment. So while inventors deserve a governmentally protected share in the value created by their ingenuity, society may place limits on property rights in an invention, because society has contributed to the innovation as well.

Fair Social Bargain

Some ethicists describe the patent system as a social bargain designed to advance the common good by encouraging, over the long run, greater technological progress. To them, the patent system is an arrangement where inventors are granted a limited period of exclusive control over their innovations in return for disclosure of adequate technical information about the discovery—information that would enable a skilled peer to duplicate and to operate the invention. These commentators warn that without patent protection, inventors would safeguard their discoveries as trade secrets. Inventors' secrecy would inhibit technological progress. According to this view, patents involve a trade-off where higher prices for buyers and possible temporary stifling of associated research are tolerated in return for more risk taking in initial research and prompt public disclosure of research findings to fellow inventors. However, there are questions about the extent to which contemporary patent documents actually promote technical progress. Some patent critics say that researchers are rarely inspired to develop important new technology through studying patents.

Utilitarianism

Many supporters of patent rights make a utilitarian argument that the social benefits of the patent system outweigh its costs. To them, the extra profits attributable to patent exclusivity are a necessary incentive for the creation of socially useful technological innovations. They frequently use as examples worthwhile products, such as innovative drugs, that are extraordinarily expensive to develop but could be copied relatively cheaply and quickly by competitors. If "free riders" were allowed to exploit the hard-won technical creativity of inventors, socially beneficial research would soon be undermined.

Some commentators have noted that there is a built-in irony in the relationship between patents and technological innovation. Fear of infringing on a patent may inhibit other inventors from developing improvements on a patented invention during the life of the patent. Thus, patents may actually retard technological progress for a time. Smaller companies may be particularly reluctant to attempt innovations that might trigger expensive patent infringement battles. Still, without the lure of the higher profits that patents make possible, the original discovery might never have taken place.

The utilitarian argument in support of patents hinges on an assessment that the social benefit of technological progress outweighs the social costs patents entail. However, those who question the moral legitimacy of patents warn that the social costs associated with patents are often not fully appreciated. These costs include governmental costs to examine and adjudicate patents, the stifling of innovation in areas where existing patents create a legal minefield, legal and commercial disadvantages for smaller firms without strong patent portfolios, misallocation of social resources to very expensive legal battles (costs ultimately borne by consumers), and the lack of social utility produced by those firms whose primary business is the aggressive enforcement of their patent portfolios.

There are some who question the utilitarian characterization of patents as essential incentives for innovation. They point out that being the first to market an innovative product—the so-called "first-mover advantage"—sometimes leads to strong financial rewards even in the absence of a patent. In other cases, patents fail to provide an effective incentive for research to meet urgent human needs. The potential rewards from a patent are too limited to be an attractive incentive if the innovation benefits only a small group, for example, those suffering from a rare, but debilitating, disease. Patents may not stimulate research beneficial to even a large group if the group is too poor to constitute a feasible consumer market. Thus, patents may not provide viable incentives to develop novel products desperately needed by some vulnerable social groups.

Other critics of the patent system contend that patents are not well suited to calibrate morally appropriate rewards for socially useful technical innovations. Some inventors get large rewards for novelties that are of trivial human benefit; other inventors cannot find a viable market for innovations of much greater benefit to humankind. These commentators suggest that the appropriate financial rewards for technological innovations would be distributed more effectively if governments or philanthropists offered monetary prizes for socially beneficial technical innovations. Proponents of the patent system respond that a system of prizes for innovations would be beset by practical problems, favoritism, and potential corruption. They conclude that a patent system in which consumers pay a premium for patented products that they genuinely want is a more efficient way to stimulate technological progress.

Controversial Ethical Issues Concerning Patents

Consistent Treatment of Lesser Developed Nations

Some commentators have questioned whether lesser developed countries have a duty to strictly respect patent rights during the early stages of their economic growth. This argument stresses moral consistency. Advocates for the lesser developed countries point out that nations such as the United States achieved rapid economic development during the early industrial era partly by exploiting ("pirating") the intellectual property of international competitors. For example, U.S. textile mill owners copied innovative British machinery without permission or compensation. Critics charge that the advanced industrial nations, led by the United States, are now inhibiting the economic development of lesser developed nations by imposing a global patent regime that prohibits the very sort of free transfer of technology that created wealth for the richer nations in the past.

Impact on Access to Medicines

There are also ethical questions about the impact of patents on access to life-saving, new medicines. Prior to the TRIPS agreement, some countries, particularly poorer countries, refused to grant patents on pharmaceuticals because patents drove up the prices of products crucial for the health and lives of citizens. When TRIPS was adopted, there was increasing pressure to safeguard the patent rights of pharmaceutical companies. About the same time, the AIDS pandemic threatened the survival of millions. As a result of expensive research, innovative drugs were discovered that made HIV infection a manageable, chronic disease. Companies selling patented AIDS drugs charged monopolistic prices. In some lesser developed countries, which were not yet required to comply with TRIPS, generic drug companies manufactured cheap copies of patented AIDS medications. Pressure from health agencies and nongovernmental organizations led to the Doha Declaration, which clarified that WTO countries were entitled to use compulsory licensing of patents in response to a national health emergency.

Supporters of the pharmaceutical companies emphasize that patent rights vigorously enforced globally are crucial as an incentive for research that saves lives. Some commentators even point out that the situation of patients in poorer countries is not made worse if patents prevent them from having access to new medicines. Such patients were struggling with life-threatening diseases before the drugs were invented; they are in the same (dire) condition—no worse off—if they cannot afford new patent-protected medications. Those who charge that patents play a critical role in making AIDS drugs inaccessible to poor people respond that the rights to life and health take moral priority over property rights created through the patent system. These commentators assert that governments—which grant patents as a privilege designed to promote the public interest—have a greater responsibility to protect citizens from life-threatening diseases than to protect the property rights of corporations.

Patenting Human Genetic Material

There are also ethical controversies about issuing patents on human DNA. Critics of such patents assert that a substance such as DNA, which occurs in nature, does not satisfy the legal requirement that a patent claim be novel. Proponents of gene patents point out that patents are granted for genes or gene sequences that have been isolated or purified, so the material is not in its naturally occurring state. Other biotechnology patents cover novel techniques devised by the inventor to manipulate genetic material or the discovery of a practical use for a human gene. Thus, those who defend patents involving human genetic material insist that these patents are appropriate rewards for human ingenuity, not a government grant of control over naturally occurring human genes.

Critics of gene patents further warn that patents on human genes might lead to morally inappropriate property rights over parts of human bodies or even human persons (persons who were the “product” of patented genetic processes). Patent advocates remind people that patents give the patent holder negative legal power to exclude others from duplicating or commercializing a discovery, not a positive entitlement to sell the invention. A patent on a process for cloning mammals and on the mammals that are the product of that technique would not entitle the patent holder to sell a human baby conceived using the technique. (The University of Missouri holds a U.S. patent on mammalian cloning; it denies any intention to pursue human cloning. The university says it would use its patent, if necessary, to prevent others from commercializing human reproductive cloning.) Some lawyers further assert that claiming property rights over a human conceived using patented genetic material or processes would be unconstitutional under the Thirteenth Amendment, which outlaws slavery.

Some scientists are concerned that patents on human genes might seriously impede biological research. The Myriad Genetics patents on using the BRCA1 and BRCA2 genes to detect increased breast or ovarian cancer risks are patents that arguably have inhibited research. There is an exception in patent law that permits a researcher to use patented material for certain scientific, noncommercial research, but in the United States, case law has narrowed the protection against infringement charges that the research exemption affords.

Opponents of broad patents on human genes warn that these patents might also allow patent holders to charge “reach-through” royalties. In other words, the patent holder might be able to demand payments from companies that made products discovered using the patent holder’s innovation—even if the patented material or techniques were not a part of the final product that the company accused of infringement had produced. Reach-through royalties might substantially raise costs for consumers of those end products. In the field of biotechnology, these additional patent royalty costs might raise the prices of essential goods such as medicines or diagnostic tests.

Some groups say that manipulation of human DNA might involve morally objectionable types of genetic engineering. Therefore, they assert that the government ought not to encourage manipulation of human DNA by offering the financial incentive of a patent. According to this position, the government should not dignify manipulation of human genetic material by according this scientific work the social recognition implied by a patent.

Some ethicists describe the patenting of human genes or gene sequences as an example of morally unacceptable commodification of human life. Other ethicists assert that human genetic material is closely connected to human integrity or identity. They point to the close connection between elements of the genetic code and important characteristics of human bodies and even behavior. Then, they argue that reducing human genes to the subject matter of a patent violates the moral imperative to respect human dignity. Some opponents of patenting of human DNA connect such moral arguments to the morality exception in European patent law and in TRIPS. They urge governments to deny patents on human genetic material as they are a violation of the *ordre public* or morality.

Other ethicists say that biochemical substances, including genes and gene sequences, are morally distinguishable from whole human beings. A gene or a gene sequence is not a person and does not have the moral value attributed to human beings. For one thing, the biochemical substratum of human genes occurs in other animals, not just in humans. According to this view, patents on human genes, which are mere biochemical substances, do not have direct implications for respect for human dignity.

Conclusion

Patents are a form of property right created by governmental action. Some business ethicists see patent rights as grounded in a natural right of inventors to control the fruits of their genius and effort. Other ethicists insist that patents, which they see as government privileges exempting patent holders from the rigors of the free market, require careful moral scrutiny. Specific patents raise business ethics issues: For example, do patents on new medicines support or interfere with human rights to life and health, and do patents on human genes have implications for respect for human dignity?

Paternalism

Paternalism is commonly understood as an infringement on the personal freedom and autonomy of a person (or class of persons) with a beneficent or protective intent, although this definition is somewhat contested in the ways discussed below. As the ensuing discussion suggests, paternalism generally involves competing claims between individual liberty and authoritative social control. Questions concerning paternalism may include as well both the claims of individual rights and social protections and the legal and socially legitimated means of satisfying those claims. The discursive use of the term *paternalism* is almost exclusively negative, employed to diminish specific policies or practices by presenting them in opposition to individual freedom.

History of Paternalism

The term *paternalism* first appeared in the late 19th century as an implied critique predicated on the inherent value of personal liberty and autonomy, positions elegantly outlined by Kant in 1785 and Mill in 1859. The etymology of paternalism, rooted in the Latin *pater* (father), reflects the implicit social hierarchies of patriarchal cultures, in which fathers or male heads of families were understood to be authority figures responsible for the welfare of subordinates and dependents. In this tradition, adult members of states, corporations, and communities functioned under the presumably benevolent authority of kings, presidents, and executives. Prior to industrialization, patronage systems informed the stratified economic, political, and social arrangements prevalent throughout Europe and the Americas. Paternalism, as it evolved through the industrial age of the 19th and 20th centuries, applied the model of family relations and practices of patronage (fatherly protection, tutelage, and control) to relationships between classes of people understood as unequal: employers and workers, the privileged and the underprivileged, the state and the masses.

Historically, then, paternalism is a critical term applied in the West to the system of beliefs and practices emerging in the transition from a social order of patriarchal class structures, including slavery in the United States, to a free society of autonomous and equal individuals. Although it is not defined by a single institution or set of institutions, paternalism was prevalent among the early industrial companies. For example, the efforts of Ford's Sociological Department to promote clean and sober lifestyles included monitoring employee bank accounts, church attendance, and family life—measures now considered extremely intrusive but not uncommon for a time when laborers were largely employed by people whose wealth, education, and social privilege far exceeded their own. In the United States, the ongoing debate between social reformists and free market advocates shifted from the political and economic integration of former slaves in the late 19th century to a broader concern in the 20th century with the rights of workers, the poor, children, and other marginalized groups such as criminals, the mentally ill, and people with disabilities.

Following several decades of relative silence about paternalism in the mid-20th century, the term was reintroduced, in the context of criminal law, to become a topic of extensive philosophical debate with the 1971 publication of Gerald Dworkin's article on morality and law. As the discourse of paternalism has evolved, its meaning has become more nuanced. Responding to what he considered intrusively interventionist policy and program changes affecting the poor (e.g., welfare, child support, homelessness), Mead defined the "new" paternalism as "social policies aimed at the poor that attempt to reduce poverty and other social problems by directive and supervisory means." From a different perspective, free market advocates apply their longstanding opposition to paternalism in championing social policies that emphasize the freedom of individual citizens rather than dependence on government or employers in planning and paying for their own health care, college education, and retirement. Standing's 2002 argument against supervision of the poor as the means of ensuring their economic security echoes Mead but insists that the human need for (and right to) collective agency and guaranteed "structured reciprocities" of mutual responsibility between citizen stakeholders and their government cannot be dismissed as paternalism.

Paternalism as a Theoretical Concept

Dworkin identified paternalism as "limitation of a person's freedom or autonomy by force or coercion, without his consent, to prevent harm, mitigate risk, or promote the welfare, interests, needs, good, or values of the person whose freedom is being curtailed" (Dworkin, 1972). To be considered paternalistic in Dworkin's analysis, an action should (1) limit a subject's freedom, (2) be performed without the subject's consent, and (3) be performed with a beneficial intent. Kleinig elucidates Dworkin with the observation that incentives may effectively replace coercion as a mechanism of social control. Buchanan adds that deception is also an effective but noncoercive means of interfering with a person's freedom.

In establishing the basic theoretical framework of paternalism based on the conditions and justifications for restricting freedom and autonomy, Dworkin differentiates among various types of paternalism as hard or soft, broad or narrow, weak or strong, pure or impure, and moral or welfare. Primarily concerned with the safety and welfare of the person, an advocate of *hard paternalism* would permit restrictions of liberty to prevent suicide or grave personal harm even when a person in question is fully cognizant of his or her actions and their consequences. In contrast, an advocate of *soft paternalism* would be concerned primarily with the autonomy of the person, justifying restriction of liberty only to ascertain whether the person in question were indeed choosing to harm or endanger himself or herself with full volition and knowledge of the facts; the soft paternalist would not deny the freedom to inflict self-harm or even death if that were an authentically free and knowledgeable choice.

Similar to soft paternalism, *weak paternalism* would consider it legitimate to use coercive means to achieve a person's desired consequence, such as requiring seatbelts, in the assumption that people desire life and health and therefore should be forced to take measures to protect themselves. *Strong paternalism* would prevent a person from achieving a desired consequence on the grounds that he may be confused or mistaken about his ends but not if he understands his choice. In such a case, a severely intoxicated person could be prevented from driving if he or she intended to drive home and was incapable of perceiving his or her inability to drive safely, but that person could not be prevented from getting intentionally intoxicated to facilitate a fatal car crash.

Broad paternalism would include coercion from any source including private institutions, families, and individuals to restrict or control a person's actions, whereas *narrow paternalism* would include only coercion by the state. *Pure paternalism* would restrict the actions of people who may be harmed by their own behavior, while *impure paternalism* would restrict the actions of third parties to protect potential victims. For example, unauthorized consumption of street narcotics is illegal to prevent people from self-endangerment or death—a pure paternalist intervention. An impure paternalist intervention would criminalize the prescription of narcotics by physicians or their production by pharmaceutical companies in order to protect the public.

Finally, *moral paternalism* is differentiated from *welfare paternalism* on the basis of the type of good intended for the person whose freedom is being restricted. Local blue laws were instituted in some communities for the purpose of promoting a moral standard of sobriety, quiet, and church attendance on Sundays, whether or not the individuals in those communities wished to observe Sunday as a religious day or considered engaging in Sunday commerce or drinking to be morally corrupting. Coercive measures imposed to promote the moral good are different from others, such as driving speed limits, inoculations for schoolchildren, or architectural design standards in neighborhoods, designed to promote the general welfare of the citizenry.

A decade after his original article, Dworkin clarified his original defense of soft paternalism, noting his position that paternalism is sometimes justified in cases where the person(s) in question is demonstrably incompetent or unable to act responsibly in his or her own self-interest. Critics have charged that this justification blurs the difference between soft and hard paternalism because of the difficulty in establishing universally accepted criteria for determining incompetence, thus creating a "slippery slope" of potential encroachment on personal liberty.

Moral Considerations of Paternalism

Paternalism raises a cluster of moral questions about the nature of a free society, its obligations to individual members, and the obligations of individuals to themselves, to each other, and to society. A key question concerns the classification of circumstances in which the limitation of individual freedom or autonomy may be properly considered to be paternalistic.

The central moral issue of paternalism is the legitimacy of limiting human freedom and autonomy in a free society of equals where all individuals are accorded respect, autonomy, and freedom by virtue of their humanity. Following Kant and Mill, this moral position derives from the assumption that human beings are best capable of determining and pursuing what is in their own interest; to deny persons this right would be to treat them as instruments of their own good rather than as ends in themselves. Moreover, individuals in a society of political equals are thought to be capable as well of discerning the commonweal and modulating their exercise of personal freedom accordingly. Paternalism denies the full humanity of individuals by failing to respect their capabilities for acting in their own best interest. Moral arguments for paternalism must offer compelling reasons to justify the restriction of freedom and autonomy.

Kant's objections to paternalism are absolute, with explicit moral prohibitions against lying and force as its chief instruments. Mill distinguishes between paternalism in relation to children and to adults: The moral presumption would favor paternalism for a child and prohibit paternalism for an adult. Mill, however, considers paternalism as morally justified among adults to prevent harm to someone who is unaware of an impending danger (e.g., about to cross a bridge without knowledge that it is unsafe). In analyzing normative judgments of paternalism, Dworkin considers two possible normative options: Either (1) it is never permitted to limit the freedom of others in an attempt do good for them against their wishes, or (2) it is possible to do so under some circumstances. The first option is often justified on the Kantian grounds that it is impossible to do good by limiting freedom. The second option may be justified on various grounds. Consequentialists may argue that the good done may outweigh the harm caused by loss of autonomy. Others may argue that individual autonomy may be protected in the long run by restricting it in the short run, such as in Mill's prohibition against willfully contracting oneself into slavery. Moral contractualists may justify paternalism on the ground that given appropriate knowledge and motivation, all reasonable people would agree to interference in certain circumstances, such as to prevent suicide caused by a temporary state of depression.

Paternalism is sometimes justified on the grounds of preventing harm. Mill's harm principle, however, justifies interference only in cases in which there would be harm to others; it prohibits interference to prevent self-harm or consensual harms. The harm principle would require toleration of (1) competent self-harm and self-imposed risk, (2) harm to consenting others, and (3) harmless acts. The harm principle could thus be applied to legally prohibit classes of actions intended to harm others (murder, rape, theft, assault) without their consent. The harm principle would also apply in upholding a zone of privacy for consensual or self-regarding acts involving consenting adults and in decriminalizing victimless crimes.

The harm principle justifies restriction of freedom on behalf of others to prevent risk or harm in cases involving children, the mentally incompetent, or those with impaired judgment or faculties because such individuals are considered incapable of authentic consent. Furthermore, the harm principle may also permit consensual or self-paternalism wherein competent individuals or groups choose to impose self-restraining measures, such as living wills or legislative limits, involving future acts.

Although the harm principle may be cited as a justifiable ground for restricting the freedom of individual agents, it leaves unresolved many of its disputed moral questions. For example, even if agreement were to be reached to disallow paternalism intended to prevent self-harm, consensual harm, or harmless acts, reasonable people could conceivably disagree about what constituted self-harm, harm to others, and valid consent. These reasonable disagreements remain contested issues, as illustrated by contemporary debates. The default framing of retirement savings plan options ("opt-in" versus "opt-out" as the default) is viewed by some as a protection of individual choice in the disposal of earned income and by others as a failure to provide proper incentives for individuals to avoid the risk of an impoverished old age. Despite scientific studies, some communities do not regard the risks of secondhand smoke sufficiently harmful to warrant indoor smoking bans. The debate over assisted suicide illustrates divergence of opinion about suicide as self-harm, its harm to others, and the validity of consent on the part of a person seeking assistance in committing suicide. While in some jurisdictions, young women under the age of 16 are considered capable of consent in contracting a marriage, other jurisdictions consider these same young women incapable of valid consent in seeking birth control or an abortion. In each of these examples, the harm principle is insufficient as a basis for achieving moral consensus.

Feinberg delineates principles for reconciling opposing views regarding permissible grounds for interference with someone's actions for the sake of preventing harm. First, he establishes distinctions: Self-inflicted harm is still harm; intended self-harm is different from unintended self-harm as a consequence of another intended action; some risks are more reasonable than others; voluntary assumption of risk is a matter of degree. He distinguishes between *strong legal paternalism*, which justifies state protection of people against their will from the harmful consequences of their own voluntary choices, and *weak legal paternalism*, which prohibits state interference except to protect individuals from self-harm from actions presumed to be nonvoluntary or coerced. Like Dworkin, he advocates weak paternalism as a means to provide protection for individuals in circumstances where the full exercise of volition may be compromised.

Paternalism Applied to Social Policy

The use of the law to restrict or require actions from people for their own good is known as *legal paternalism.* Societies may vary in the breadth or manner in which they use the law to restrict the freedom of their constitutive individual or group members, but every society applies some degree of legal paternalism to prohibit acts considered dangerous, risky, or reprehensible. Bentham classified laws by their design to (1) protect people from harm caused by others, (2) protect people from harming themselves, and (3) require people to help others. Bentham considered only the first class of laws to be legitimate.

Legal paternalism justifies state coercion to protect individuals from harm, inflicted by either themselves or others, and to give incentives for behavior that results in what is deemed good by lawmakers and others who bear the responsibility of acting in the public interest. As Feinberg notes, most societies try to find a reasonable balance between extreme paternalism, which infantilizes adults, and an absolute rejection of paternalism, which invalidates even the possibility of coercion as an instrumental means of achieving the good.

In a democratic society of political equals, the duly elected officials and appointed policy makers who make up the governing structure act as direct or indirect agents serving a citizenry of their peers. In this framework, limitation of individual freedom and autonomy for the sake of the common good is an act of self-governance; such self-imposed or consensual paternalism poses no moral dilemma. On the other hand, political and policy decision making in a complex society rarely involves the participation of the entire citizenry; actual decisions (laws, regulations, professional standards) are often made by a select group of stakeholders with specialized knowledge and privileged access to pertinent information and analysis. Perhaps more accurately referred to as "fraternalism" rather than "paternalism," actions taken on behalf of others in these circumstances exemplify the moral responsibility of the greater knowledge, power, or resources associated with specialized roles in a complex society of equals. For example, a public official closing impassably flooded roads during a hurricane would not be acting paternalistically. A group of legislators, policy analysts, and medical professionals who collaborate to restrict access, through safety or efficacy standards, to a particular drug may be acting beneficently and protectively on behalf of society on the basis of their specialized knowledge; this might be considered an example of weak or welfare paternalism because they are applying, in the public interest, knowledge or expertise not reasonably expected of ordinary citizens. It would be paternalistic if such a group were to withhold accessible and relevant facts or knowledge from the citizenry to intentionally diminish public participation in or awareness of the decision-making process.

Agents of governments, employers, families, professionals, and institutions often apply the harm principle to justify paternalism on the ground that an individual, or a class of individuals, lacks the capability for effective self-management in some essential aspect of life. These concerns are particularly evident in addressing specific areas of social policy and practice involving people with disabilities, the poor, the aged, and the deviant. Paternalism can be considered morally appropriate when those whose interests are at stake lack the capacity for self-determination, either temporarily or permanently. When people are dependent on society without evidence of contributory responsibility for their dependent condition, paternalism may be viewed as appropriate. When disability or incapacity is determined justly, paternalism allows able members of society to provide the less able with a quality of life, a level of human dignity, and relief from suffering that they cannot provide for themselves.

Patients' Bill of Rights

In March 1977, President Clinton appointed the Advisory Commission on Consumer Protection and Quality in the Health Care Industry (referred to here as the Commission) to develop a "Consumer Bill of Rights" to promote and ensure health care quality and value and to protect consumers and workers in the health care system. The Commission was composed of 34 members selected from the private sector. Members included representatives of consumer advocacy groups; institutional health care providers; health care professionals; health care insurers; health care purchasers; state and local government representatives; and experts in health care quality, financing, and administration.

In November 1997, the Commission submitted a report to the president containing the Patients' Bill of Rights.

The Patients' Bill of Rights has three major objectives: (1) to strengthen consumer confidence by ensuring that the health care system is fair and responsive to consumers' needs, provides consumers with credible and effective mechanisms to address their concerns, and encourages consumers to take an active role in improving and ensuring their health, (2) to acknowledge the importance of a strong relationship between patients and their health care professionals, and (3) to reaffirm the critical role consumers play in safeguarding their own health by establishing both rights and responsibilities for all participants in improving health care.

The Patients' Bill of Rights contains eight principal areas of rights and responsibilities:

1. *Information disclosure:* Patients have the right to receive accurate, easily understood information to help them make informed decisions about their health plans, professionals, and facilities.

2. *Choice of providers and plans:* Consumers have the right to a choice of health care providers that is sufficient to ensure access to appropriate high-quality health care.

3. *Access to emergency services:* Consumers have the right to access emergency health care services when and where the need arises.

4. *Participation in treatment decisions:* Consumers have the right and responsibility to fully participate in all decisions related to their health care. Consumers who are unable to fully participate in treatment decisions have the right to be represented by parents, guardians, family members, or other conservators.

5. *Respect and nondiscrimination:* Consumers have the right to considerate, respectful care from all members of the health care system at all times and under all circumstances. An environment of mutual respect is essential to maintain a quality health care system. Consumers who are eligible for coverage under the terms and conditions of a health plan or program or as required by law must not be discriminated against in marketing and enrollment practices based on race, ethnicity, national origin, religion, gender, age, mental or physical disability, sexual orientation, genetic information, or source of payment.

6. *Confidentiality of health information:* Consumers have the right to communicate with health care providers in confidence and to have the confidentiality of their individually identifiable health care information protected. Consumers also have the right to review and copy their own medical records and request amendments to their records.

7. *Complaints and appeals:* All consumers have the right to a fair and efficient process for resolving differences with their health plans, their health care providers, and the institutions that serve them, including a rigorous system of internal review and an independent system of external review.

8. *Consumer responsibilities:* In a health care system that protects consumers' rights, it is reasonable to expect and encourage consumers to assume reasonable responsibilities. Greater individual involvement by consumers in their care increases the likelihood of achieving the best outcomes and helps support a continuous quality improvement, cost-conscious environment.

Many other areas of the health care industry and various health care providers have developed their own Patients' Bill of Rights. For example, there is a Pharmacy Patient's Bill of Rights, a School of Dentistry Patient's Bill of Rights, and a Mental Health Patient's Bill of Rights, and the American Hospital Association has created its own Patient's Bill of Rights. Many state and local health care providers have established rights and responsibilities for individuals, such as the Child's Bill of Rights developed by the Children's Hospital of Central California.

The Pharmacy Patient's Bill of Rights delineates the patient's rights and responsibilities with respect to appropriate drug therapy and the patient's responsibilities and the pharmacist's rights with respect to the quality of services provided. The School of Dentistry Patient's Bill of Rights emphasizes care that is of high quality, timely, and courteous. It also highlights issues of informed consent, the right to have patients' complaints heard, patient record confidentiality, and access to emergency care.

Similarly, the Mental Health Patient's Bill of Rights is a detailed document that focuses on the mental health patient's right to know. It describes the patient's rights and responsibilities in terms of the benefits provided, expectation of professional expertise, contractual limitations, appeals, and grievances. The Mental

Health Patient's Bill of Rights also discusses issues of confidentiality, free choice, determination of treatment, parity of treatment, nondiscrimination, benefits of usage, treatment review, and accountability among treating professionals.

The Child's Bill of Rights provides specific rules and requirements. For example, as patients of the Children's Hospital of Central California, children have the right

- to be called by name and not by a number or by the name of the illness;
- to be greeted with a smile and treated with loving care;
- to know where they are supposed to be before they have to be there and to have their daily routine remain as normal as possible;
- to have their family members with them, whenever the family can stay, as long as the family members do not get in the way of their care; and
- to not have people whispering about them over their beds or out in the halls unless they know what is happening and not have people talking about them as if they were not in the room.

Patriarchy

Patriarchy is a form of social organization in which the father is the head of the family or a society in which men govern or rule. Patriarchy was a system that perpetuated itself because the male children would inherit the father's lands, wealth, and so on. The influence of patriarchy can be seen in all the world's cultures to varying degrees. The number of men in important governmental positions compared with the number of women is frequently quoted when discussing both the causes and effects of patriarchy. Feminists have expanded the definition of patriarchy to include how cultures view maleness and masculinity as the standard others are judged against in an attempt to expose power relationships between groups and individuals.

Due to the focus of this encyclopedia on business ethics and society, this entry will discuss the second definition of patriarchy as it affects business. There are two distinct views regarding the relationship between capitalism and patriarchy. The "unified system" theory contends that men's authority over women causing economic dependency is due to women's ability to have children. Thus, according to this view, capitalism and patriarchy are both part of the same overarching social system because they share the same concept of gender roles: men as powerful authorities and women as caretakers. A less extreme interpretation of this theory is that it is natural and appropriate for men to be in power and women to be in the home due to each gender's supposedly natural inclinations and skills. Another theory states that women's economic dependency on men is just one way the social power system becomes obvious. This power system, patriarchy, may or may not correspond with capitalism. This theory is the "dual systems theory," meaning that patriarchy and capitalism may be similar in some ways and at some moments in time, but they are not the same system. One persuasive example is that although women have gained social rights in some countries and the old rules of patriarchy have become less powerful, the free trade market has not changed and economic development of those countries has continued to grow, thus implying that patriarchy is not a necessary condition for capitalism. Arguments have been made for and against each theory.

Many businesses seem to follow the pattern of patriarchy, with men in key positions of power. While this trend has slowly been changing in developed nations, patriarchy is still accepted as the natural order of society in many developing countries. There is pressure on individuals within these nations to maintain this system. For example, women in many developing countries are not given access to education, believed by many researchers to be a prerequisite for becoming economically independent. Some believe that educating a female family member would put one's family in danger. There have been examples of rapes and murders as a reprisal for such actions. Keeping their female counterparts subservient may play a role in the lack of economic development in these countries because women become an unutilized resource of labor and innovation. Nations that have recently become more accepting of women in the workforce have, in general, seen a more marked increase in national wealth. India and China are examples of this.

In developed countries, legal requirements for equal opportunity have helped increase the number of women in the workforce. However, on average, women make less than men in the same position with comparable skills, and the promotion of women into managerial and executive positions has not advanced at a similar rate. Some researchers have labeled this the ghettoization of occupations. Women are relegated to support roles within the corporate system, such as administrative assistants or assistant managers, and struggle to move within the company both vertically and horizontally. Researchers have also documented the "glass ceiling," where a woman finds that she cannot move beyond a certain point in her career, while her male counterparts continue to rise up the ranks of the business.

Curiously, while some Marxist feminists have argued that capitalism simply reinforces the patriarchal oppression of women, a free market also provides the possibility for social change. By allowing women the opportunity to work and become more independent, capitalism has changed the landscape of the human family unit. If enough women become empowered in this way, the structure of corporations and society will change, as has already been seen in developed nations.

Pension Benefit Guaranty Corporation (PBGC)

The Pension Benefit Guaranty Corporation (PBGC) is a government body established by Title IV of the Employee Retirement Income Security Act of 1974 (ERISA) to ensure payment of pension plan benefits when the plans are terminated. The PBGC is headed by an executive director who reports to a board of directors. The board of directors consists of the secretaries of labor, commerce, and the treasury and is chaired by the secretary of labor. The PBGC states that its mission is to encourage the continuation and maintenance of voluntary private pension plans, provide timely and uninterrupted payment of pension benefits, and keep pension insurance premiums at a minimum.

The PBGC acts as an insurer and guarantor of private pension plans with two main insurance funds, one covering pension plans sponsored by single employers and the other covering multiemployer pension plans. In 2005, the single-employer insurance program covered 34.6 million workers and retirees in 29,651 pension plans. The multiemployer program covered 9.8 million workers and retirees in 1,587 pension plans.

Employers that sponsor pension plans pay the PBGC insurance premiums at a rate that is set by Congress. The PBGC also receives the assets of the plan when it takes over a pension plan. Pension plans paid the PBGC yearly insurance premiums of $2.60 per worker or retiree in multiemployer plans and $19 per worker or retiree (plus $9 for each $1,000 of unfunded vested benefits) in single-employer plans in 2005.

The PBGC takes over a pension plan when an employer voluntarily closes its plan. This could occur as a standard termination, in which case the plan must have enough money to pay all benefits before the plan can end, or it could be a distress termination, where the plan does not have enough money to pay all benefits and the employer must prove financial distress. Here, the PBGC pays plan participants the guaranteed benefits. The PBGC can also seek to close a single-employer plan without the employer's consent when the employer deems that such an action will protect the interests of workers, the plan, or the PBGC's insurance fund. The PBGC guarantees pension benefits to a maximum level that is set by law and adjusted annually. The maximum pension benefit guaranteed for plans terminated in 2005 was set at $45,613.68 a year.

While the PBGC exists to ensure the promised benefit of terminated plans, it is operating at a substantial deficit and faces a looming crisis. Until 2002, the PBGC had a $7.7 billion surplus. In 2003, it ran an $11.2 billion deficit and has an $85 billion exposure to companies with a junk bond rating (i.e., bonds rated below investment grade, which typically offer a higher return) that are at higher risk of default on their pension obligations. The PBGC also estimated a $400 billion gap between assets and liabilities in the private defined-benefit pension system in the United States in 2003.

Social and Ethical Issues

The charter of the PBGC to both promote private defined-benefit pension plans and ensure the security of those plans presents a problem for the agency. As the claims on the PBGC increase, it is pushed to tighten regulations and increase the insurance premiums on such plans. Those are actions that in turn lead plan sponsors to close weak plans and others to avoid establishing new defined-benefit plans.

With the government insuring private defined-benefit pension plans, this creates a moral hazard. A private employer with limited cash or in financial distress may not be able to provide workers with increases in cash compensation, but it can provide enhanced pension benefits, as ERISA allows the sponsor 30 years to fund the benefit. Employees would be inclined to accept the enhanced pension benefit because it is guaranteed by the PBGC. Thus, increasing pension benefits in financially distressed firms becomes a more viable action because of the insurance underwriting the future promise, which in turn increases the overall level of risk in the pension system.

Even more important are the implications of shifting the long-term economic and financial risk incurred by private companies to the government. When private companies are able to step out from under the long-term financial commitment of a pension plan on a voluntary basis, it can affect the competitive relationships among employers in a given industry. Companies that seek to support pension plans may find themselves at a disadvantage relative to firms that shift their long-term pension liability to the PBGC.

Finally, as the premiums paid by plan sponsors prove inadequate to cover the benefits insured by the PBGC, meeting that obligation could require additional funding from tax revenue. Since the majority of taxpayers are not covered by a defined-benefit pension plan, they will find themselves taxed to pay benefits to individuals who have a benefit that is not available to them. Furthermore, no such protection is afforded to the defined-contribution form of pension plans, which are more widespread.

Pensions

Pension Programs

Pension benefits are a critical component of income security for retired workers. In the broadest terms, a pension program is any program that is established by means of which a worker earns a benefit that will provide income during retirement. Favorable tax treatment dating back to 1921 encouraged the development of the U.S. pension system. Most pensions take the form of an annuity and generate periodic payments to the recipient. They can be set up by the individual's employer, trade unions, or the government. There are two main types of pension plans: defined benefit (DB) and defined contribution (DC).

Defined-Benefit Plans

A DB plan provides benefits based on a formula that typically multiplies years of service, final average pay, a pension rate (e.g., 1.5% for every year of service), and frequently a partial offset for the primary social security benefits the participant receives. Under a DB pension plan, the pension benefit received by the participant is defined by the plan's formula and is usually structured to provide an annual pension payment during the life of the worker, with a reduced payment made to the spouse after the worker's demise for the duration of his or her life. The employee is able to approximate the pension he or she would receive by calculating the number of years of service he or she expects to have at retirement and by estimating what the final pay would be. The DB plan formula represents a promise: "We (the company) will pay you a pension of *x* dollars dependent on how long you work for us and what you are being paid just before your retirement." The employee does not have to be concerned with any investment risk, and as long as he or she remains employed by the company, the pension is perceived to be secure and backed by the assets of the pension trust established to meet those future promises. The employee does bear the risk that after retirement, the real value of the pension received will be eroded by inflation since the benefit paid is generally a fixed amount. In addition, there is a growing awareness of the risk associated with an employer's termination of or default on a DB plan. DB plan designs are effective at ensuring that the funds in the plans are only accessible for the intended purpose of income during retirement.

Defined-Contribution Plans

DC plans are most commonly 401(k)-type plans, with more than 80% being profit-sharing and thrift-savings plans. Initially, DC plans were offered as supplements to or in conjunction with DB plans. Increasingly, DC plans are being offered as the sole pension plan by organizations. DC plans address a key issue important to participants, the lack of portability in DB plans. However, DC plans make retirement income heavily dependent on the investment decisions made by the individual plan participant and shift that investment risk from the employer and plan sponsor to the individuals participating in the plan.

In a DC plan, the employer eliminates both the long-term obligation and the funding volatility faced in DB pension plans, promising instead to contribute a specific amount each year pegged to variables such as participant pay or firm profitability. In a typical DC plan, the employer may promise to contribute a certain amount each year into an account established in the plan for the participant. DC plan designs eliminate the portability problem inherent in the DB plan design. Whatever a person earns at one company remains invested and growing, so the pension funds ultimately available to that person on retirement would be, theoretically, the same whether they were all earned through one employer or represented funds accumulated from several DC plans. In a DC plan, the issue from the participant's perspective is not portability but investment risk.

Comparison of the Plans

The primary downside of a DB pension plan, from the perspective of most employees, is the lack of portability. While legislation established vesting and accrual requirements that protect the pension benefit earned by the employee, the structure of the promise is such that if an employee's career consisted of periods at more than one employer (even if each employer had an identical DB plan), the cumulative pension benefit would be less than the benefit earned if the entire career was at one company. This relates to the benefit being tied to final average pay.

In a DB pension plan, the employer, or plan sponsor, is expected to make contributions to a trust in order to fund the pension liabilities being incurred by the plan. In addition to being affected by the demographics of plan participants, the amount of the employer contribution is determined in large part based on the investment results of the trust. During years in which plan assets earned a higher return, employer contributions would be lower, and during years in which plan assets earned a lower return, employer contributions would be higher. In a DB plan, it is the employer that bears the investment risk. This presents DB plan sponsors with a degree of funding volatility for obligations incurred under the plan, which spans a very long period of time.

However, while the organization bears the investment risk, the participant faces a risk associated with the termination of or default on the plan by the employer. When the promises made span decades, there is no assurance that the employer will still be in business, and on termination or default, the plan is taken over by the Pension Benefit Guaranty Corporation (PBGC), and there is a high probability that the payments available under PBGC guidelines will provide for a substantially smaller pension payment than had been earned under the plan.

Reducing funding volatility was a major driver behind employers' shift from DB to DC pension plans. In a DC plan, the employers' obligation is satisfied once they make the promised annual contribution. It is the employee who will benefit if the return on the assets in his or her account is higher than planned, and it is the employee who will be affected if the return on assets in his or her account is less than planned or if the plan experiences an investment loss. This risk is especially acute as the employee nears retirement, since even small-percentage losses translate to relatively large dollar losses and the employee will have less time to make up for losses or underperformance in the years remaining before retirement.

Another criticism of DC plans is that pension funds can be accessed or diverted from the intended purpose. In a DB plan, the assets invested in the pension trust to cover the participants' future pension obligations are not available to them except for the promised purpose of providing income in retirement. However, in most DC plans, the employee has access to the funds and can use those funds for purposes other than retirement income. When I terminate my employment with an employer, my DC plan account balance can be withdrawn and rolled over into my new employer's DC plan or into an individual retirement account (IRA). However, I can also take those funds and use them for any purpose, incurring in that year both an income tax liability and an early withdrawal penalty. Even if I remain with my employer, I can often withdraw money for specific purposes such as medical expenses, educational expenses, or purchase of a home. Many plans also provide loan features that allow participants to borrow against their accounts, thus reducing the balance invested and accumulating earnings.

Social and Ethical Issues

Irrespective of the form of the pension program offered by employers, there is an implied covenant that the program will provide some degree of reliable and adequate income in retirement, and some view the decline of the DB pension plan as meaning that fewer individuals will have that. Those who view the DB plan as the best vehicle to deliver on this promise look to Congress to act in order to reverse the trend. Among the actions they call for are reducing the overregulation of DB plans, repealing the cap on compensation that can be used to calculate a DB plan benefit, privatizing the PBGC and shifting it from a requirement of plan sponsors and employers to a voluntary election made (and paid for) by individual plan participants, and easing the ability of employers to recover surplus assets in DB plans. While there is no doubt that some actions by Congress could increase the relative attractiveness of DB pension plans, the question should not be how we can make DB plans more attractive for employers but whether moving back in the direction of DB plans would provide for a greater degree of adequate and reliable retirement income.

Some Challenges in Defined Benefit Pension Plans

The concept behind a DB pension plan is straightforward. An employer estimates the age at which plan participants will retire, the amount of the annuity they will receive at that time, and how long they will receive those payments based on life expectancy. From that, enough money must be set aside to fund those payments based on estimated earnings from the assets invested.

The employer bears the risk associated with underperformance of the investments. The employer also bears the risk of not having sufficient funds set aside if life expectancy is underestimated. This is becoming an increasingly large risk as we see medical and technological advances increase life expectancy in ways that are at best difficult to forecast. Those are the traditional risks of which plan sponsors are generally quite cognizant. They are risks inherent in any forecast or plan.

An inherent structural issue with a DB plan design, and a potentially more serious risk, is associated with the maturation of the company sponsoring the DB pension plan. A DB pension plan carries with it a promise that is multigenerational in nature. An employee hired out of college may work for four decades before retiring and then draw pension benefits for two or more decades after leaving the company's employment. In a young company, the majority of payments from the plan are 30 to 50 years off. There is sufficient time to invest, and any shortfalls from expected returns on invested assets have time to be recouped.

As the company matures, the plan faces an increasing number of pensioners in relation to active participants. It also means that a higher proportion of the fund's assets will be needed to make the promised payments each year. Just as individuals in a DC plan face greater investment risk as they approach retirement because the impact of shortfalls will be larger and there will be less time to recoup them, sponsors of DB plans face similar risks. While the risk increases for a mature company's DB plan, with prudent management of that risk to ensure that cash inflows from investment returns on the plan's assets and cash outflows to retirees are matched, the plan can continue to operate without difficulty. This translates to a need for a much more conservative investment strategy than is in place today in DB plans. It is also required that there be an ongoing new flow of contributions to offset any shortfall from invested assets.

A critical point is that DB plans by design become increasingly risky as they mature, and unless a plan remains in place and is active, as more of the participants begin drawing out pensions, there is an increasing likelihood that the trust will be unable to deliver the promised benefits even if it is fully funded at the time it is terminated. Even for active plans, the ability of the plan to meet its promises is affected by the mix of new and active participants with retirees. The higher the proportion of retirees to active participants, the greater the risk presented to the plan. Thus, there is a structural mismatch between the dynamic relationships that make a DB plan viable and the underlying demographics of the workforce—that is, an aging population and an increasing ratio of retirees to individuals active in the workforce.

These structural issues are exacerbated when you place them in the context of economic conditions. In its 2004 bankruptcy filing, U.S. Airways said that it would be "irrational" to keep making contributions to its underfunded pension plans, since it "provides no benefit" in helping the company stay alive. While this may be one of the more dramatic examples, it illustrates an important point. Pension assets are invested, and the majority of those assets are in equities. When the economy weakens and stock values fall, the value of the assets held in pension plans falls, often creating an underfunding. In 2002, two thirds of the 360 Standard and Poor 500 companies that offered a DB plan indicated that they were underfunded. Under the DB model, the employer should increase contributions to make up for that shortfall. However, if the reason underlying the weak stock values is related to weaknesses in the economy, then the company sponsoring the plan is also likely to be facing some business pressures. The greater the underfunding and the greater the business pressures, the greater is the likelihood that the company will either elect to terminate the plan or be forced to terminate it through the actions of creditors.

An employer offering a DB pension plan has a responsibility to employees to make sure that the plan will be there when they retire and will be able to meet the payments promised. Yet 75% of DB plans were not there to provide the promised benefits. Economic necessity (or expediency) resulted in their termination. Those terminations meant reduced benefits to participants. When three quarters of plans of a given design, namely DB plans, prove to be not viable, it is unreasonable to strive to perpetuate that approach to providing retirement income.

Issues With Defined Contribution Plans

Structurally, DC plans do not face the issues of underfunding the benefits promised because the promise generally takes the form of a contribution to the employee's account in the year in which the benefit is earned. For employers, this removes the funding volatility and the decades-long liability that plagues DB plans. Nor does a termination of a DC plan carry the same loss for participants since the assets accrued belong to the participants and not the trust. Hence, they remain invested and earning a return for the participant. A DC plan also eliminates the negative impact on pension benefits associated with job changes.

These issues are not structural issues in the concept of a DC plan but issues related to design features. DC plans can provide a pension benefit that is as large as or larger than that accruing from a DB plan. Issues of adequacy stem from two primary sources: (1) the accessibility of the money intended to provide retirement income for other purposes and (2) the quality of the investment decisions made by the participant and the risk associated with those decisions.

DC plans present an appealing source of funds for participants facing financial needs. They have an account that has what they perceive to be a substantial balance, and they may be decades from retirement. Under that scenario, many individuals tap into their plans to fund other financial needs. Consider individuals who are laid off by their employer. They take their DC plan assets and roll them into an IRA. As unemployment drags on beyond the time covered by their severance payment, they withdraw some money from their IRA. They pay income tax on this withdrawal and also pay a 10% penalty for making a withdrawal before age 59½. In addition, many DC plans allow the participant to take out a loan for any reason. In 2003, 18% of all eligible participants in 401(k) plans had an outstanding loan against their account. If DC plans are to provide adequate retirement income, the issue of access to retirement funds for nonretirement purposes needs to be addressed.

The issues of investment decisions and risk pose a more substantial problem when it comes to ensuring the adequacy of retirement income from a DC plan. With 64 million active participants in private sector DC plans in 2004 and the performance of the stock market since 2001, large numbers of employees near retirement are experiencing firsthand the issues of investment risk and fund adequacy. By some estimates, many DC plan participants will need 30 years to make up for the losses incurred in the bear markets of 2000 and 2001.

While investment risk cannot be eliminated, it can be reduced. First, prudent management of investments requires determining objectives and determining the best way to achieve those goals. Most individuals have no conception of how much money they need to accumulate in order to provide a specific level of income for their retirement years. Most individuals don't know how many years of retirement they should expect—that is, projected life expectancies. Making matters worse, even if a participant knows that some investments generally provide higher returns along with higher risks, they generally have no way of assessing the degree of risk that is appropriate based on their age and the accumulated assets in relation to retirement income targets. All this would suggest that more emphasis on education and communication is necessary, which should be provided to employees by employers sponsoring DC plans. While this is appropriate, plan sponsors need to consider design elements that either allow or require professional management of accounts. Regulations currently allow for such plan-directed management; however, legislation would need to address the fiduciary risks associated with that approach, as well as the fiduciary risk that emanates from employees being provided education, which is currently treated by the regulations as providing financial advice.

One way of reducing the risk some employees experience with the collapse of their 401(k) plan is to adopt regulations that prohibit concentrating assets in any single investment, most commonly today the employer's company stock. DC plan designs that direct company contributions to company stock should be severely restricted, if not prohibited outright. Enron employees were covered under a DC plan that required that the company's contribution be held in the employee's DC account as Enron stock. With the collapse of Enron, the value of those holdings dropped precipitously and effectively wiped out the value of all contributions made by Enron toward the retirement of the employees. Furthermore, the percentage of funds in a DC plan that participants can direct to any single source should be limited. It would be advantageous if such regulations also included age-based risk parameters. Such guidelines could provide the framework to shape investments toward lower-risk portfolios as an individual participant nears retirement.

Finally, DC plans need to move to a design that enables participants to easily translate their DC plan assets into an annuity income stream. When an individual is in retirement and the assets need to be managed to provide an income stream for 20 or more years, few individuals can prudently manage the risks and investment fluctuations that will occur over that period.

Conclusion

The controversy over DB versus DC will continue to be a subject of debate as long as some individuals feel that employers are moving from DB to DC to meet their own financial needs and manage their risks by shifting them to the employee, while others feel that the move is logical, even ethical, given the financial volatility of many corporations in the 21st century. This discussion has attempted to highlight some issues that indicate that forcing companies to continue offering DB plans may not be as simple as many workers believe it to be.

People for the Ethical Treatment of Animals (PETA)

People for the Ethical Treatment of Animals (PETA) is an organization committed to ending abusive treatment of animals in business and society and promoting consideration of animal interests in everyday decision making and general policies and practices. Founded in 1980 by Ingrid Newkirk and Alex Pacheco, PETA's objectives have been supported by scholarly work in ethics—most notably, Peter Singer's *Animal Liberation,* which Newkirk cites as providing the impetus behind PETA's establishment.

PETA's earliest efforts concentrated on exposing the abuse of animals in experimentation, and this area continues to be a focus of its activities. PETA has made efforts to minimize the suffering of animals in laboratory settings by appealing to industries that have traditionally engaged in extensive and invasive animal testing—such as the cosmetics and pharmaceutical industries—to discontinue animal testing in favor of cruelty-free alternatives. Business has responded to these efforts. Many cosmetics industry leaders, for example, have discontinued the practice of testing on animals, and more than 500 cosmetics companies have signed a pledge of assurance that they will not engage in animal experimentation. The auto industry has also responded to PETA's concerns about the treatment of animals in testing by eliminating the use of animals in crash tests; the successful alternative of using crash test dummies has become an industry standard.

In the course of its growth and influence, PETA's activities have targeted other areas of commerce closely associated with animal abuse. PETA's concern for the maltreatment and destruction of animals for fur in the fashion industry, for example, has prompted many industry leaders, including Georgio Armani, Calvin Klein, and Ralph Lauren, to go "fur-free." The once standard use of animals in entertainment, such as in the circus industry, has also been reduced. There is tighter legislation, and new industry standards are being set by competitors, such as Cirque du Soleil, that do not use animal acts. Other significant changes include raising standards for the treatment of animals by suppliers for fast-food chains and increasing public awareness of the abusive practices of suppliers in countries that lack protective legislation, such as China.

PETA's efforts to alter public attitudes toward animal concerns include creative campaigns that, while serious in their message, include humorous and spoof-like elements. For example, in addition to distributing information on the health costs associated with meat products and exposing the abusive treatment of animals used in the meat industry, such as calves and chickens, PETA developed a spoof on the beef industry's "Beef . . . It's What's for Dinner" campaign by recasting the slogan as "Beef . . . It's What's Rotting in Your Colon." While such an approach has been effective, it is also controversial and has been objected to by opponents of PETA's position on animal interests as well as those who favor the position but take a more moderate view concerning the methods of promotion.

PETA's position justifying the consideration of the treatment of animals is that animals have rights in proportion to their "interests," and that these rights should be respected and protected. As PETA explains it, an animal, like a human, has an interest, for example, in not experiencing pain unnecessarily. Thus, that interest should be taken into consideration—the right not to have unnecessary pain inflicted should be protected. An animal does not, however, have all the interests that humans do. For example, animals do not have interests in voting, so they, like children, do not have rights to vote that should be protected.

While there have been objections to its position, many of PETA's advancements in promoting animal protection have resulted from its exposure of cruelty and abusive conditions alone. To objections that have been raised, such as that animals do not have rights because they cannot reason and that changes in attitudes and practices toward animals decrease concerns about people, PETA replies that such claims tend to be irrelevant to the issue or are based on misunderstanding. There are, for example, humans who cannot reason, or reason as well as some animals, but they are assumed to have rights in proportion to their interests.

Hence, there is no principled reason to deny that members of other species have rights in proportion to their interests on the basis of reasoning capacity. Calling on the positions of Albert Schweitzer and Jane Goodall, PETA also claims that there is reason to think that the promotion of concern for the well-being of animals tends also to promote, rather than weaken, concerns about the well-being of humans.

Perfect Markets and Market Imperfections

The perfect market entails a structure of production and exchange in which optimal outcomes, both private and social, are attained efficiently and simultaneously without the need for intervention by nonmarket actors. In other words, the price and profit signals in the market lead automatically to production efficiency at minimum unit cost and to allocative efficiency at the most desired mix of output. In a perfect market, the self-interested behavior of individuals responding to price signals is sufficient to direct society as it answers the basic questions of what to produce, how to produce, and for whom to produce.

The model of the perfect market rests on the assumption of perfect rationality in the utility and profit maximization motives of economic agents (consumers and producers). Additional assumptions of a perfect market include the voluntary exchange of homogeneous goods and services within complete and perfectly competitive markets under perfect and symmetric information about the prices, quality, and availability of output. These assumptions ensure that no individual market participant can influence market price and that all necessary inputs and possible outputs have a pecuniary value and are traded unconstrained by time or circumstance. In addition, one must assume the absence of several noteworthy features of actual markets, which include externalities, public goods, direct transaction costs, asset specificity, taxes, and other distortions, as well as economies of scale and scope and other resource, political, or technological barriers to entry and exit. In total, the restrictions result in a level of certainty and stability in the market that generate both the full and efficient employment of resources as well as the maximum and correct mix of output by each firm.

However, the assumptions necessary to sustain the model of perfect markets—with its Pareto-optimal levels of production and allocative efficiency, market order, and social coordination—limit its ability to explain or anticipate actual economic processes and events. As such, the perfect market model remains more an abstract theoretical construct that forms an ideal and useful point of reference against which imperfect market structures such as monopoly, oligopoly, and monopolistic competition can be assessed.

The Behavior of a Perfect Market

Although markets have existed since the Stone Age, the concept of a perfect market developed during the Industrial Revolution as the focus of economic activity changed from the motive of subsistence to one of gain. Adam Smith employed the idea of an "invisible hand" to illustrate how the motive of gain operates through the self-interested behavior of individuals who, by responding to price and profit signals, unintentionally promote wider social interests.

Each producer is a price taker for a homogeneous good or service who has no control over the price he or she can charge in the market. Because each producer would like to maximize profits, his or her output settles at the level where marginal cost equals marginal revenue. If the market price of a product or service is sufficiently high at this level to generate profits in excess of the rate normally expected from the next best alternative use of resources, producers are said to be earning economic profits. In this instance, the producer's return is above the normal rate sufficient to maintain it in production. Under perfect market conditions, this result is short-lived as new suppliers are immediately attracted into the market. The response is immediate because the absence of specific assets and economies of scale or scope, as well as the presence of perfect markets to price and trade assets, leads to little, if any, distinction between fixed and variable costs. As a consequence, suppliers instantaneously enter and exit, and there is no distinction between the short- and long-run market conditions.

Typically, the markets for agricultural commodities and financial instruments are used to illustrate the behavior of a perfect market. In these cases, the main assumptions relating to numerous producers of identical products with low barriers to market entry are present. For example, if the market price of soybeans should exceed the average cost of production, the sale of soybeans generates revenue in excess of all implicit and explicit production expenses. Consequently, farmers will be willing, able, and motivated to switch quickly to the cultivation of soybeans or to sell their stored stocks. Although no individual farmer is large enough to affect the market price, the combined shift by numerous farmers will lead to an increase in the market supply of soybeans, which consequently puts downward pressure on the price. As the price of soybeans declines, economic profits (or what might be considered excess profits) diminish, and farmers switch again to the cultivation of other crops. Should agricultural prices decline in general, those farmers who are no longer able to cover their costs of production will exit the market and thereby free resources for other uses. Because of their structure and the prompt reaction by market participants, perfect markets function to ensure production efficiency where price equals minimum average cost.

Along with efficiency in production, perfect markets also ensure allocative efficiency. Here, society achieves its optimal combination of outputs. Following the above example, when the market price of soybeans results in economic profits, consumers are signaling a desire for a different mix of output—in this case, a mix that includes an increased supply of soybeans. Consumer utility, as revealed in the market price, exceeds the opportunity cost of production, as measured by the average cost of resources used in production. In a perfect market, allocative efficiency is quickly established as resources are redirected to soybean production, thereby increasing supply, reducing prices, and eliminating economic profit. The elimination of economic profit indicates that consumers are getting exactly the amount of soybeans that they desire, again at a price equal to the minimum average cost of production.

Market Imperfections

In reality, conditions and structures are often less than ideal, and markets might not function automatically to achieve the efficient outcomes predicted by the perfect market model. The failure of the market mechanism to generate optimal outcomes is commonly attributed to one of three sources: the presence of market power, externalities, and public goods. In each of the three cases of market failure, the market directs resources away from levels of productive efficiency and fails to produce the optimal mix of output desired by society.

First, the presence of economies of scale; information asymmetries embodied in technology, trademarks, and patents; and brand differentiation through marketing creates barriers that often hinder market entry and exit. These characteristics confer a degree of market power to an established producer, at least in the short run, that impedes the function of the highly competitive structure described in the soybean example. Instead of numerous producers each too small to directly affect market supply and price, a limited number of producers might operate behind high market barriers. Consequently, output is restricted to and maintained at a level that results in both production inefficiency and prices that generate economic profit. Should a farmer have a patent on a strain of insect- or drought-resistant soybean, the resulting power to control the supply of this desirable commodity will prevent the perfect market model from functioning as assumed.

Second, the cost or benefit of an activity or transaction often spills over to a third, unrelated party. Because market prices might reflect only private considerations, they likely do not measure the entire value to society of a specific productive activity. These indirect considerations are known as externalities and, like market power, also prevent markets from operating as assumed in the perfect market model. When production generates external costs, a reliance solely on market prices can result in overproduction. Conversely, output that generates external benefits can lead to underproduction. With our example of soybeans, farmers might not include the effects of pesticide or fertilizer use in their measure of market price.

Therefore, if the negative social effects of runoff on water supplies are not factored into the price of soybeans, the market price of soybeans will not reflect their true social cost. As a result, the market produces too many soybeans, with its resultant pollution—more than would be provided if all private and social costs were considered.

Third, some output—known as public goods—generates economic value that cannot be limited to specific, paying consumers. Once these outputs are available, producers are unable to exclude those who do not pay from their benefits. In addition, consumption of public goods by one individual does not lessen the amount available for consumption by others. The nonexcludable and nondivisible characteristics of public goods result in free rider problems wherein everyone simply waits for someone else to supply the output. As a result, the market alone is unable to produce these goods in sufficient amounts. The soybean farmer does not face this problem since soybeans produce private benefits only for the individual consumer. Other services such as national defense or airport security are not similarly excludable and require nonmarket, usually government, intervention to ensure their production in the amounts required by society.

Generally, market imperfections can be ascribed either to the inability of the basic assumptions of the perfect market model to hold or to the failure of the market mechanism to function in the prescribed manner. With the former, for example, the assumption that information is precise, symmetric, and perfectly available results in a level of certainty that is rare in reality. The presence of imperfect information often results in uncertainty before a transaction in the form of adverse selection bias and high search costs or uncertainty after a transaction in the form of principal-agent problems and high enforcement costs. On the one hand, the imperfections issuing from any or all of the sources of market failure present opportunities for private gain as individuals design and implement strategies to take advantage of these deficiencies. On the other hand, market imperfections also result in socially suboptimal outcomes that compel intervention or regulation on the part of the state in an attempt to offset the failure.

Because government actions and other extramarket regulation interfere with the market process described above, some political and economic observers frequently prescribe a hands-off (or laissez-faire) approach that relies on price and profit signals to efficiently direct the market process. A balanced commentary here would consider the inability of markets to operate perfectly in tandem with the inability of government intervention to unambiguously remedy these shortcomings.

The perfect market concept, along with the origin and scope of market imperfections, provides essential elements in understanding how societies attempt to achieve ideal market outcomes through a mix of private and public actions. As a result of this diverse interplay between the private and public sectors, there exist a variety of state/market linkages—from laissez-faire to corporatist to command approaches—that prevail from one country to another.

Persuasive Advertising, Ethics of

One of the standard questions that is addressed by business ethics is whether or not there is something ethically objectionable about some or all forms of advertising. This question is usually posed in terms of asking whether advertising is merely the provision of information to consumers that enables them to find the right product to satisfy their preexisting desires or needs or whether advertising manipulates, brainwashes, or deceives persons into buying products that they would otherwise have had no interest in purchasing. That is, this question addresses the ethics of using what is termed persuasive advertising rather than the ethics of using what is termed informational advertising. Questioning the ethics of using persuasive advertising is distinct from other ways in which advertising can be subject to ethical criticism—for example, advertising addictive products such as cigarettes or alcohol or advertising to children.

Types of Advertising

In general, there are seven different types of advertising recognized by business ethicists. The first is pure informational advertising. Such advertising merely conveys straightforward information about the product that it is being used to promote. For example, if the product in question is a certain type of car, such advertising will present factual information about the car in question, such as its top speed, its costs, and its safety rating. The second type of advertising is deceptive advertising. Such advertising presents information about the product that it is promoting as though it were true information, when, in fact, the advertiser believes the information to be false. For example, were a certain brand of cigarettes to be advertised as being good for its smokers' health when the advertiser believed that smoking it was in fact harmful, such advertising would be deceptive advertising. (It is important to note here that for an advertisement to be a deceptive advertisement, the advertiser need not know that he is providing his consumer audience with false information. Instead, he need only believe this to be the case.) The third type of advertising that is possible is that termed "puffery." Such advertising consists of hyperbolic promotional claims about the product advertised. For example, a hamburger chain might indicate in its advertisements that its staff are so customer-friendly that even its CEO cooks hamburgers there and interacts with the consumers, or the advertiser of a certain brand of soda might indicate through its promotional material that its soda is so tasty that even polar bears enjoy it. The fourth type of advertising is bombardment, or name recognition advertising. Here, advertisers attempt to expose as many consumers as possible to their advertisements for a particular product for as long as possible. The aim of such advertising is to establish in consumers' minds that if they require a certain product, then they should buy the advertised brand of that product. This aim is achieved through advertising bombardment by establishing in the consumers' minds a link between the purchase of a certain type of product and the purchase of a certain brand of that product. This type of advertising is often termed "name recognition" advertising. The fifth type of advertising is misleading advertising. Here, an advertiser does not actually present any information to the consumer that he believes to be false. However, he does attempt to mislead the consumer without doing so. For example, an advertiser promoting a certain type of car might mislead consumers into thinking that its performance is better than it is by claiming, correctly, that it had the best performance in its rally class, without noting that its performance was such that its rally class consisted solely of that type of car. The sixth type of advertising is associational advertising. When an advertiser uses this type of advertisement, it attempts to associate the product it is selling with certain nonmarket goods, such as happiness or sex appeal. For example, an advertiser promoting a certain brand of beer might attempt to associate the consumption of that beer with an enhanced attractiveness to the opposite sex. The final type of advertising that is widely recognized by business ethicists is so-called coercive advertising. Coercive advertising is advertising that the consumer cannot avoid. For example, the use of advertising inside public transit vehicles is held by some business ethicists to be coercive insofar as the persons inside such vehicles cannot avoid looking at it; they are thus coerced into viewing it.

John Kenneth Galbraith and the Dependence Effect

With these types of advertising outlined, they can be divided into two main categories of advertising: (1) that which is purely informational and (2) that which is persuasive. In the first category fits, clearly, informational advertising, while the six other forms of advertising outlined above fit into the category of persuasive advertising. Insofar as advertising merely conveys factual information to a consumer, it is held to be morally unobjectionable. It is the second category of advertising—persuasive advertising—that is considered by many business ethicists to be morally problematic. Naturally, each type of persuasive advertising is subject to different criticisms that pertain specifically to the techniques used to persuade consumers to purchase. However, persuasive advertising as a whole is subject to two general criticisms that are supposed to show that it is per se immoral. The first of these criticisms was offered by John Kenneth Galbraith in his 1958 book, *The Affluent Society.* Galbraith started his general criticism of persuasive advertising by outlining his demons analogy. Galbraith noted that if a man was assailed by demons every morning that instilled in him passionate desires for various consumer goods, we would think that it would be sensible for him to secure the goods in question so that he could quench these desires and thus be free of their urgings. Moreover, Galbraith stated, since being subject to these desires would be unpleasant, we would have reason to think that it would be sensible for this man to satisfy these desires no matter what the consumer goods were that the demons motivated him to pursue. However, Galbraith continued, even though we might think that this man was sensible to act in this way once the desires were instilled in him, if we came to learn that this man had cultivated the demons in the first place, and if we also learned that his efforts to satisfy the desires that they instilled in him led them to greater efforts to instill yet more desires within him, we might wonder how rational he was. Indeed, Galbraith concluded, we might think that this man's problem of being beset by this array of desires that forced him to act in ways in which he would not have acted had he not been subjected to them would be better solved not by his satisfying these desires but by his not being subjected to the demons in the first place.

With this analogy in place, Galbraith stated that the man subjected to the urgings of the demons is analogous to the consumer subjected to the urgings of advertisers. Galbraith argued that as a society becomes more affluent, persons will have wants created in them by the process by which they are satisfied. This is because, argued Galbraith, if a person wants a certain good and then buys it to satisfy this want, this purchase will provide a reason for the retailer of that good to desire to sell yet more to the consumer in order to ensure that the retailer continues to make money. As such, then, the producers of goods will be motivated to create new desires within consumers who purchase their goods through advertising and salesmanship. If this is so, the wants that persons will have will come to depend on the output of goods that need to be sold by their producers. Given this, Galbraith continued, one can no longer assume that a higher level of production of consumer goods will lead to an increase in the overall level of welfare. This is because the higher level of production might merely be sustained in a situation where a higher number of wants were being created by advertisers, which would in turn require a higher level of want satisfaction. The process by which the wants of consumers are thus dependent on the activities of advertisers acting at the behest of the producers of consumer goods was termed by Galbraith the "Dependence Effect."

As well as arguing that owing to the influence of advertisers, a higher rate of production need not lead to a higher level of consumer satisfaction, Galbraith also argued that advertising would have adverse effects on the distribution of resources. Galbraith argued that a community's well-being could be improved just as well by investing its resources in buying goods for public consumption as it could by buying goods for private consumption. For example, argued Galbraith, a community's well-being could be improved just as well by buying schools or parks as it could by private individuals buying bigger cars. Galbraith then noted that, in general, communities satisfied their desires for private goods rather than their desires for goods for public consumption. The conventional wisdom, Galbraith claimed, was that this distribution of the income of the persons in the community was arrived at through a democratic process, by which the members of the community used democratic processes to arrive at the way in which they would distribute their individual incomes between goods for private and goods for public consumption. But, claimed Galbraith, this conventional view of how a community arrives at its decisions concerning the distribution of the income of its members rests on the implicit assumption that the wants of consumers are determined independently of any external factors. However, argued Galbraith, given the fact of the Dependence Effect, this is not true. Since persons' wants for consumer goods are "synthesized," or created, by advertisers, and no such effect occurs with respect to nonconsumer goods, those produced for public consumption, the existence of advertising skews the wants of the members of each community toward consumer goods and away from goods produced for public consumption. As such, Galbraith concluded, persuasive advertising is immoral as it interferes with the decision procedure by which persons come to assess how to spend their incomes on goods for private consumption versus public consumption. Thus, for Galbraith, persuasive advertising is ethically suspect as its operation will serve to undermine the well-being of those subjected to it, insofar as it adversely affects their decision procedures and, in doing so, leads them to make decisions that might not reflect their true desires. Moreover, for Galbraith, in affecting consumers in this way, advertising also serves to undermine their individual autonomy. This is so as they are now, to an extent, being controlled by the advertisers rather than being in control of their own decisions and actions.

F. A. Hayek and the Non Sequitur of the Dependence Effect

In 1961, F. A. Hayek responded to Galbraith's ethical objection to advertising. Hayek pointed out that Galbraith's argument depended on the claim that a large proportion of the desires that a person in modern society experiences are not desires that he would experience spontaneously if he were not situated in a modern consumer society. Instead, noted Hayek, for Galbraith many of the desires that persons have are created by the process by which they are satisfied; that is, they are created by the production of consumer goods and by the advertising of such goods. From this, Hayek noted, Galbraith assumed that such desires could be neither important nor urgent, and so we would lose nothing were such desires to be eliminated, perhaps by restricting or eliminating the advertising of consumer goods or restricting or eliminating their production. Hayek accepted that Galbraith was correct to note that many desires that persons have are created by the process by which they are satisfied. It is true that we would not desire any of the amenities of modern society if we did not live in an age when they are being produced. However, Hayek argued, to accept this is not to endorse Galbraith's further claim that such desires therefore fail to be urgent ones to satisfy or are somehow rendered less important. To make this further claim from the first one was, Hayek argued, to endorse a non sequitur. Indeed, claimed Hayek, if we were to accept Galbraith's argument that for this reason persuasive advertising is in many instances unethical, we would have to accept the idea that other cultural phenomena that similarly generate desires in persons would also be ethically suspect. But this, argued Hayek, shows how absurd Galbraith's argument against advertising is. For example, Hayek noted, other similarly synthesized desires would include the desires for literature, art, and music. Although a person would not, Hayek argued, experience desires for such artifacts were such artifacts not produced, this does not show that it is not important to satisfy these desires or to have these goods. From this, Hayek concluded that rather than being unethical, persuasive advertising is ethically acceptable. This is because advertisers are hired by the producers of consumer goods to advertise their wares, as they believe that advertising can influence the decisions of consumers. However, although advertising might indeed be one of the elements that shapes consumers' tastes, it cannot determine them. It is the consumer who decides what goods he or she will buy, not the advertiser. As such, concluded Hayek, Galbraith's criticism that advertising undermines consumers' well-being and adversely affects their autonomy is mistaken.

Autonomy, Advertising, and Consumer Well-Being

The debate between Galbraith and Hayek is one of the central debates in business ethics concerning the ethics of advertising. It is clear that at its heart, it is a debate over the effects that advertising has on consumer autonomy and consumer well-being. This is not surprising, for these two concepts underlie other debates that concern the ethics of advertising. Deceptive advertising, for example, is morally condemned on the grounds that deception serves to undermine the autonomy of the person who is so deceived. It achieves this insofar as the person subjected to such advertising directs his or her actions in accordance with the claims that are made in it, claims that are believed to be false by the advertiser. If the consumers direct themselves on the basis of such claims, it will be the advertiser, and not the consumers, who will be really in control of the actions they perform with respect to the product in question—even though the consumers themselves do not realize this. Moreover, such advertising is also condemned on the ground that if consumers' autonomy is undermined through deception, they will be less able to direct themselves successfully in accordance with their own desires and values, and so, as a result, it is likely that their well-being will be lower than in the counterfactual situation where their autonomy is not so undermined. Similar charges are offered against both puffery and bombardment advertising. For both types of advertising, it is claimed by those critical of persuasive advertising on ethical grounds that the autonomy and well-being of consumers are likely to be adversely affected through being exposed to them. If consumers are subjected to puffery, such critics claim, they are more likely to make a decision based on a false view of the product that they are contemplating. This is likely to adversely affect their well-being and autonomy for the same reason that deceptive advertising might do so. Similarly, if bombardment advertising is effective, it might preclude consumers from exploring other brands of the product they are contemplating buying through associating in their mind the particular brand advertised with the type of product in question. This too might adversely affect both their autonomy and their well-being by having the consumers' purchase of the product directed primarily by the advertiser and not by the consumers themselves. Similar conclusions can also be made about misleading, coercive, and associational advertising.

Yet although these ethical objections to persuasive advertising are widespread, recent work in business ethics (e.g., by Ann Cunningham) has cast doubt on their twin claims that persuasive advertising undermines both consumer autonomy and consumer well-being. It is argued by those who defend persuasive advertising on ethical grounds that advertisers cannot directly control the decisions that consumers make. In particular, they cannot prevent consumers from assessing their claims to see if they can believe them or not. Moreover, even when no direct claims are made—when, for example, puffery, associational advertising, and bombardment advertising seek to promote a view of the product advertised through the use of nonpropositional images, consumers who are exposed to such advertisements can still ask themselves if they have a good reason to buy the products in question. Thus, contrary to those who claim that persuasive advertising is unethical as it adversely affects human autonomy and well-being, the defenders of advertising hold that such charges assume that advertisers have more power than they actually have. This defense of the ethics of advertising is not an unqualified one. Those who propose it often differentiate between different types of advertising, with those whose claims are more amenable to consumer evaluation being more ethically defensible. Thus, insofar as the implicit claims of puffery are easy to assess, this advertising technique is more defensible than deceptive advertising, which, when successful, will present claims to consumers that they cannot readily assess. For this reason, deceptive advertising is frequently considered to be ethically illicit.

Piracy of Intellectual Property

Piracy of intellectual property refers to the unauthorized use, reproduction, and/or distribution of protected material such as computer software, video games, music, or movies. Piracy has become an increasing concern in recent years because of the rise of the Internet and the speed with which copyrighted material can be distributed globally to a large number of people.

What is labeled *piracy* is literally the infringement of intellectual property rights—that is, copyright, patent, and/or trademark infringement. *Piracy* literally refers to robbery and other crimes committed at sea, where prey are more vulnerable in the absence of conventional law enforcement mechanisms. The term *piracy* is used in connection with intellectual property infringement, particularly with regard to electronic and audiovisual materials, because of the similar difficulty in detecting and preventing this sort of inappropriate behavior and the mass scale on which it can occur.

The use of the term *piracy* is, however, controversial. Unlike theft on the open seas, accompanied often by violence, loss of life, and permanent loss of property, intellectual property infringement does not have the same sort of victims. Whereas it can be argued that the piracy of intellectual property devalues the protected intellectual property (by making it more readily available) and deprives the owners of potential sales, it does not inherently involve violent crime or complete theft. Holders of patents, copyrights, and trademarks still retain their rights; they just lose the exclusivity of those rights.

The harm imposed by intellectual property piracy actually extends beyond the emotional and financial damages to the holders of patents, copyrights, and trademarks. In fact, piracy threatens the system of protected rights that encourages individuals and organizations to invest in the development and distribution of intellectual property. Furthermore, it jeopardizes the marketplace trust that attaches meaning to recognized expressions of ideas.

Patent Infringement

Intellectual property infringement has been a concern as long as intellectual property rights have been protected. In fact, instances of patent infringement were documented in the 19th century during the Industrial Revolution, when American law did not grant reciprocity to intellectual property developed in other countries. Early manufacturing in the United States was based on technology patented in Britain, without any compensation being paid to the legitimate foreign patent holders. At the time, this was condoned by the government in the United States.

Patents are granted to protect the opportunity of individuals and organizations to recoup their investment in inventions. Patent infringement occurs when the creator or user of an invention refuses to acknowledge the priority of the patent holder. The high cost of enforcing patents deters many holders from pursuing legal action, and many pirates take advantage of this.

Trademark Infringement

Trademark infringement occurs when products are manufactured or sold under the trademark of another company without that company's permission. The widespread distribution of counterfeit products—fake purses, knockoff watches, and so on—has turned this into a serious problem. Trademark infringement began about 20 years ago, with the men on 5th Avenue in New York standing around with suitcases full of knockoff Rolex watches that they sold for $10 apiece and the storefronts in Chinatown openly selling counterfeit handbags by Coach, Louis Vuitton, and so on, for a fraction of the retail value of the originals. In fact, vendors were so bold and the supply was so great that many would hand customers catalogs from which to choose their purchase.

The counterfeiters remain in business today, but several things have changed. First, the vendors are no longer as bold. Many of the transactions take place behind closed doors, in unmarked buildings in unadorned rooms, and potential customers are scrutinized before they are invited to consider purchases. Second, the product line has expanded. Luxury purses and watches are no longer the extent of counterfeit merchandise available. All sorts of luxury items and clothing are still available, along with fake medicine, fake automobile parts, and fake electronics. Third, the marketplace has grown beyond New York, and the merchandise is traveling not just to the United States but from the United States and other Western countries as well. In 2004, 800,000 doses of counterfeit medicine were seized at the borders of countries in the European Union. Most of those fake drugs were on their way to countries among the poorest in the world. Fourth, many of these items are now exchanged in e-commerce to unsuspecting customers, and this is undermining the brand names that have become staples in the global economy.

Influence of China

The recent emergence of China as a player in the global economy has exacerbated rampant intellectual property infringement. In addition to the counterfeit goods exported from China (and other parts of Asia) are the fake items sold in China to tourists and to China's enormous population. China is replete with factories to which all sorts of electronics and other products are outsourced. There is thus a large amount of intellectual property available for pirates to steal. In addition, the hoards of available workers enable factories to churn out both legitimate and counterfeit merchandise at lightning speed.

The result is significant confusion regarding brand legitimacy. LG, for example, experienced this firsthand as it attempted to introduce a local version of its Chocolate phone. Sluggish in launching its Chinese version, LG found that copies were available in China before the originals. By the time legitimate LG phones were ready for sale in China, the fake phones were so prevalent in the market that the LG phones were viewed as the counterfeits.

China remains a sort of "attractive nuisance" to pirates. There is so much intellectual property available to be copied, and the costs are so low and the profits so great, that the practices continue, and trademark infringement remains a significant concern.

Copyright Infringement

During the past decade, copyright infringement has also mushroomed. In earlier years, the main concern of copyright holders was "bootlegged" copies of songs, movies, and so on. The bootlegged versions were not exact replicas but were, instead, generally separately recorded, second-rate copies. As technology has advanced, concerns about copyright protection have also advanced, because of both the increased magnitude of the harm and the enhanced quality of the counterfeit copies.

In 1999, the birth of Napster added the considerable challenge of peer-to-peer file sharing to the list of threats to copyright protection. Peer-to-peer file sharing occurs as individuals make exact copies and share original computer files of protected material, such as music in the MP3 format, video in AVI and MPG formats, and computer software in all sorts of formats. Napster was the first known entity to facilitate the sharing of files via the Internet through a system of linked servers and users. Other decentralized programs have since been introduced, such as Kazaa, Livewire, BearShare, and, more recently, BitTorrent.

At its peak in 2001, Napster claimed 26.4 million users—that is, 26.4 million people who were sharing pirated intellectual property. Since that time, authorities have clamped down on these practices. The Recording Industry Association of America has reacted strongly against Napster, which was eventually shut down in response to the legal action taken against it for its participation in rampant copyright infringement. Today, Napster exists under new ownership as a fee-based music subscription service.

The downfall of Napster created significant barriers to Internet-based file sharing as a vehicle for the distribution of copyrighted material, but it has not put an end to it—it has just made it more difficult.

Warez

"Warez" is the name that has been given to copyrighted material being pirated (i.e., being exchanged in violation of copyright law). It refers primarily, but not exclusively, to software. There are various subgroups of warez, including appz (retail versions of computer applications) and gamez (computer-based games and video games). In spite of the fall of Napster, users continue to share warez via the Internet.

Legislation

Laws in the United States, as well as in many other countries, recognize the value and importance of intellectual property and grant exclusive, defined rights to the holders of patents, copyrights, and trademarks. Furthermore, they provide legal remedies to victims of intellectual property infringement. The problem is that detection can be tricky and enforcement is difficult and often costly.

Furthermore, the presence of international actors, not all of whom are constrained by the same sorts of laws and norms that govern the United States, further complicates the situation. A poignant example pertains to the Russian online company AllofMP3. AllofMP3, an online music store based in Moscow, has the appropriate licensing agreements with the Russian Organization for Multimedia and Digital Systems, which is the organization responsible for regulating licensing in Russia. These documents are similar to the arrangements that the Russian radio stations have with the organization. Under this agreement, AllofMP3, per Russian law, has the right legally to distribute the music from all artists and all labels, without consideration of the copyright infringement laws of other countries, such as the United States.

While in the past, online companies have been able to evade expulsion by organizing in countries that do not safeguard intellectual property rights in the same way as the United States, the tide appears to be changing. The threat by the United States to withhold Russia's membership in the World Trade Organization forced the Russian government to adopt intellectual property laws that overlap or mimic those of the United States. It was anticipated that early in 2007, this would put an end to AllofMP3. Already, credit card companies such as Visa and Mastercard had withdrawn their business from the Web site.

This is becoming less of an impediment, however, as more and more countries are passing local legislation that respects the rights of intellectual property holders and recognizes reciprocity with other countries. In addition, international treaties continue to call for reciprocity with regard to the recognition of intellectual property rights.

Arguments Against Regulation

As legislation and litigation tend to be the favored responses to alleged intellectual property infringement, there are very strong arguments against continued regulation of intellectual property pertaining to music, mathematical formulas, and so on. The ease with which individuals can infringe on the rights of the creators of protected material has been fueled by the rise of the Internet. The question remains, Who is truly being harmed?

This battle between the corporations and the individuals who pirate the protected intellectual material is often portrayed as a battle between the corporation and the individual, with the belief that the artist is also being harmed by the alleged infringement. This belief appears somewhat misguided, however, in that many artists argue that swapping of music and movies, even though prohibited by laws, does not threaten their livelihood. In fact, artists have argued that the Internet and file sharing have enhanced their profitability as a result of their increased exposure. Many musicians, for example, assert that existing regulation protects the labels to the exclusion of the artists; they contend that free, single-track sharing creates much more exposure for the artists (and perhaps even profits for the labels) since more money comes from concert tickets and sales of compact disks.

There are also significant questions and challenges to "ownership" as it pertains to intellectual property. People do not own their ideas to the exclusion of others; on the contrary, they share their ideas with others. What is protected are the rights to claim credit, both reputationally and financially, for the ideas.

The very phrase *intellectual property* is somewhat misleading in that it suggests exclusive ownership, whereas that is not what it actually means. The entitlements associated with copyrights, patents, and trademarks are linked primarily to the right to the financial benefits that accrue from the use of the intellectual property.

Conclusion

Piracy of intellectual property remains a prevalent concern in the United States and abroad. Detection remains difficult (and is often not attributable to the source), and enforcement continues to be costly.

Piracy is tempting for many reasons, not the least of which is the ease with which it can take place. In addition, many people do not consider it theft since it does not involve obvious victims—owners of intellectual property are deprived only of the exclusivity of their rights, not of the rights themselves.

What pirates need to remember is that it is the system itself that creates the value of the intellectual property they steal. In other words, the value of copyrights, trademarks, and patents relies on the system of providing exclusive rights in exchange for investments in intellectual property. While the practices of these pirates do not constitute theft in the traditional sense, their actions do have significant financial consequences and do serve to undermine the system of intellectual property rights in general.

Plagiarism

Samuel Johnson (1709–1784), the English lexicographer and the author of the *Dictionary of the English Language* (1755–1756), commented on a certain piece of writing that he believed to have been plagiarized. He stated that he thought the passage was both good and original. However, he added that the part that was original was not good and the part that was good was not original. Plagiarism has long been a subject of interest in academia, the media, and the creative arts. It has been with us since our ancestors first learned to commit their thoughts to paper or parchment.

So what actually is it? Plagiarism is, according to one source, knowingly presenting the work or property of another person as if it were one's own without appropriate acknowledgment or referencing. In plain language, plagiarism is a form of literary theft. It is intellectually dishonest and usually (though not always) occurs within an academic context. A London-based dictionary of 1721 defined plagiarism as stealing other people's works and publishing them as one's own. Samuel Johnson said that plagiarism was a form of theft. It was literary adoption of the thoughts or works of another. It was one of the most reproachable, though perhaps not the most atrocious, of literary crimes.

John Aubrey (1626–1697), a social gossip and a writer of anecdotes, described someone he thought was a plagiarist in the following terms. He was, he said, a person of real worth who stood very gloriously up on his own basis and did not need to be beholden to any man for fame, yet he was so greedy of glory that he stole feathers from others to adorn his own cap. Another comment from the 17th century was that it was a worse sin to steal dead men's writings than their clothes. These comments from the 17th and 18th centuries suggest that people have always felt strongly about literary theft. Dictionaries offer a range of definitions: (1) the wrongful appropriation, or purloining, and publication as one's own of the ideas, or the expression of the ideas (literary, artistic, musical, mechanical, etc.), of another; (2) the unacknowledged use of somebody else's ideas or words, the misappropriation and publication of ideas and words as one's own, or the act or practice of taking the thoughts, writings, or inventions of another as one's own; (3) using the work of another with intent to deceive; and (4) passing off someone else's work as your own, intentionally or unintentionally, for your own benefit.

There are a number of other issues to consider: For instance, where do imitation and legitimate borrowing fit into this argument? Thinking people would regard any form of plagiarism (whether in academia, the media, or the creative arts) as morally objectionable. The argument becomes confused if we take the opposite approach and argue that very little intellectual activity was ever original. People have been tweaking or filching other people's ideas forever, as the examples later in the section will illustrate. Plagiarism is a subset of the intellectual property argument. It is a Western construct and one that did not really apply to the classical masters of old. So what actually is intellectual property?

Intellectual property is the term given to creations of the intellect or the mind that have commercial value or can generate monetary reward. Examples of creations of the intellect include inventions, literary works, artistic works, music, creative writing, and films. With respect to industrial properties, the term includes patents for inventions, trademarks for brand identity, designs for product appearance, and copyright for materials.

Intellectual property rights are the specific legal rights that protect the owners of intellectual property. The two concepts, intellectual property and plagiarism, are closely related. For example, someone steals the idea for an invention or claims to have composed a hit tune that sounds similar to an earlier classical composition, thereby standing to gain at somebody else's expense. These are forms of plagiarism and are both morally and legally reprehensible.

Authoritative sources and originality become central in any discussion about plagiarism. Authority figures and authoritative sources were the usual starting points for any serious intellectual investigation. In the 17th and 18th centuries, three schools of thought existed with differing views about the way to acquire new knowledge: (1) Scholasticism, (2) Humanism, and (3) Cartesianism. The Scholastics studied the writings of Aristotle (384–322 BCE) and Saint Thomas Aquinas (1226–1274). They based much of their approach to learning on the syllogistic method of reasoning. Humanism was a term for a learning style that involved studying the literature of the classical masters and *imitating/copying* their style. René Descartes' (1596–1650) thinking is best expressed in his *Cogito, ergo sum* (I think, therefore I am) proposition. Each of these methods had its followers and supporters, but it was the Humanists who practiced and advocated a style of learning that contained many aspects of plagiarizing or plagiarism. Their approach to learning consisted largely in imitating the style and ideas of the early Greek and Roman masters. They could see nothing wrong with this approach, as copying or imitating was for them the sincerest form of flattery. There are ethical, moral, and legal reasons why plagiarism is unacceptable. Plagiarism is a form of literary theft, and so a person who plagiarizes or takes material that belongs to another is guilty of theft. There are also aesthetic arguments, but the moral argument with respect to professional integrity outweighs the others.

Plagiarism in Classical Times

Etymologically, the word *plagiarism* comes from the Greek *plagion*, meaning "slanting" or "athwart." *Plagion* has military connotations and refers to the flanks of an army. When used in a literary or metaphorical sense, it came to mean "sideways," "askance," or "treacherous."

Martial (Marcus Valerius Martialis, ca. CE 40–103), a Roman poet from a Spanish/Celtic background, is associated with the earliest use of the Latin form *plagiarius*, meaning "kidnapper" or "seducer." He excelled in writing epigrams, many of which are obscene and pornographic. Gradually, *plagiarius* came to mean "steal," in a more general sense, and later, specifically, "literary theft." Martial had accused another poet of stealing some of his ideas. He was possibly guilty of this himself, because according to his critics he had imitated earlier Greek poets.

Seneca (Lucius Annaeus, ca. 4 BCE–CE 65), orator, writer, and poet, was supposed to have said with respect to plagiarism that originality was the art of concealing one's sources. There are numerous stories about people such as Aristophanes, Isocrates, and Democritus using ideas from others who went before them. Virgil (Publius Vergilius Maro, 70–19 BCE) was a Roman poet who used ideas from Theocritus, Hesiod, and Homer. Later writers imitated or copied the writings of Æsop (Aisopos), the traditional creator of the Greek fables. Horace (Quintus Horatius Flaccus, 65–8 BCE), another Roman poet, used Æsop's well-known fable about the crow who disguised himself with peacock feathers. Versions of this story have appeared in English literature in a variety of guises.

Plagiarism in the 17th and 18th Centuries

A line that appears on the cover page of *Poetaster: A Comical Satyr*, written in 1601 by Ben Jonson (1572–1637), the English dramatist and poet, had appeared earlier in Martial's Book VII, Verse 12, an epigram consisting of 99 verses. We know that Jonson used ideas taken from Ovid (Publius Ovidius Naso, 43 BCE–CE 17), Horace, and Seneca and that his name appears in investigations of plagiarism in English literature. According to one source, Jonson invented the pejorative term *playwright* in 1687 to describe someone who had put together the work of others. Jonson alluded to the works of Horace and Virgil and to Rome. Jonson wrote that the name Canidia was but a borrowed name and that the ditty was borrowed. The words were Horace's, he stated, "Hang him plagiary." This use of the term *plagiary* appeared in 1601. It referred to someone who forcefully possessed another. It had appeared earlier, in 1555, as *plagiaire* (French), and, in 1577, as *plagium* (Latin), translated as a net to entangle game, but was used in English Civil Law when referring to kidnapping or man stealing. It appeared also in July 1607, when Thomas Legge, Master of Gonville and Caius College, Cambridge, referred to the fact that someone had kidnapped his ideas for a play, *The Destruction of Jerusalem*. The use of Latin or French was common among the educated and upper classes of that time, many of whom would have been familiar with one or both languages. Alexander Pope (1688–1744), another English poet and satirist, was a great imitator. According to one source, he borrowed anything and everything from Homer, Horace, Virgil, Chaucer, Spenser, Shakespeare, and Dryden.

In the world of musical composition, George Frideric Handel (1685–1759) was a musical magpie. He took ideas for many of his melodies from a range of other European composers, a practice that was not altogether condemned but seen as a form of flattery for the original composer.

In the field of dramatic art in the 18th century, the character "Sir Fretful Plagiary" had appeared in Richard Brinsley Sheridan's (1751–1816) *The Critic; or a Tragedy Rehearsed*. Sheridan, the Irish-born dramatist and then politician, is better known for *The Rivals* and *The School for Scandal*. His plays and his stage characters, such as Sir Fretful Plagiary, Sir Lucius O'Trigger, Lydia Languish, and Mrs. Malaprop, reflect something of the scandal-ridden Anglo-Irish society of the 18th century. From that time, the word has come to mean "literary theft."

Plagiarism and Students

With respect to student behavior, plagiarizing is a serious misdemeanor, and with the advances in data storage and retrieval, plagiarism seems to have made a student's life superficially easier. Universities allocate resources to combat it, but it is probably well entrenched. Academic dishonesty and issues of educational integrity appear to be on the increase. Whether this is due to an increase in student numbers or an increase in actual cases is yet to be determined.

We know that the total number of students attending universities has dramatically increased over the last decades. Whether this behavior involves plagiarism (accidental, inadvertent, due to cultural differences) or cheating is also yet to be determined. Universities have evolved into business organizations (students have become customers, and staff meetings are concerned with budgets and cash flow) in addition to being centers of learning and intellectual excellence. It is possible, therefore, that the underlying ethos of many universities may have been diminished.

There have always been moral and pedagogical imperatives with respect to plagiarism. The cultural dimension has become more of an issue in disputes involving student plagiarism. Some students come from countries where different teaching styles and standards prevail, where the unacknowledged copying of content matter and rote learning are normal. Libraries and student information services prepare information bulletins about plagiarism and ways of ridding their campuses of it. They have produced information on topics such as student rights and responsibilities; guiding ethical principles; penalties for plagiarizing, such as suspension, exclusion, a fine, or expulsion; and copyright and moral rights. Yet despite these measures, plagiarism is probably rife on most campuses. Suggestions to counter instances of academic dishonesty range from developing academic honor codes at one end of the scale to having an authoritarian approach whereby university proctors (officers responsible for student discipline) would coordinate investigations of suspicious written submissions.

Another approach would be to rely on the professionalism and the interest of individual members of the staff. A staff member who has established good rapport with students could present a case why plagiarism in any form is unacceptable. He or she would be more likely to persuade students that plagiarism is unacceptable than would readings taken from a Web site. The fact that plagiarism is now prevalent on campuses probably relates to pressures on students to complete their courses in minimum time and the perceived drop in standards in writing skills and general ability. Anecdotal evidence suggests that earlier generations of students may have been superior with regard to general ability and writing skills.

Conclusion

This entry first identified some early literary figures who were said to have been plagiarists. Second, it identified the need for policies and procedures to be in place for the busy academic who may have to sit in judgment of unethical student practices. Third, as Samuel Johnson said, plagiarism was not the most atrocious of literary crimes. It might be reproachable, and for many students it was but a minor indiscretion, easily rectified by the addition of references and sources. Sometimes, the students involved were incredulous when told of the importance attributed to plagiarism. However, there could well be serious consequences and repercussions for the person found guilty of plagiarism. The student or academic who has been involved in a case of plagiarism might not receive the recognition, fame, reputation, or financial reward that he or she would otherwise deserve at some future time.

At the research and thesis level, plagiarism is a serious matter and is the responsibility of the supervising committee. At the undergraduate level, subject controllers need to design assignments that will discourage plagiarism. They must monitor, review, and supervise the type of assignments that are in place if plagiarism is to be controlled. If the same questions keep appearing, undergraduate students (where enrollments are sometimes in excess of 1,000–2,000 students) are more likely to take shortcuts.

A footnote with respect to the earlier reference to Samuel Johnson now follows. The footnote relates to Johnson's comment about reproachable literary crimes. It concerns another practice, known as literary hoaxing. To illustrate, two cases involved the publication of novels and the subsequent fallout from their publication. The first case involved a supposed author, J. T. LeRoy, who wrote about life on the streets. However, this was a hoax. J. T. LeRoy was the pen name of two musicians. When a public appearance of the author was required, the sister of one of the hoaxers acted the part. The second case involved James Frey, the author of *A Million Little Pieces*, marketed as an autobiography but later found to be full of inconsistencies.

A second footnote relates to plagiarism becoming evident in most forms of creative human activity. Examples of plagiarism can be found in the creative arts, the print media, and now it seems in political speech writing. Examples are well known and do not need repeating here. It has provided unwelcome publicity for some and has been the cause for some people to lose their jobs. In one incident, the writer was aware of a situation where the parties concerned received a lot of media publicity over what started as a minor disagreement. The disagreement initially related to accusations of plagiarism, followed by counteraccusations of "soft marking," that is, less rigorous marking for fee-paying students in the hope that the episode would just go away. It did not. The incident blew up and became well-known. It received major coverage on national television and in the national dailies. Some chose to regard the initial plagiarism in this case as a serious misdemeanor; others described it in less dramatic terms.

Finally, we may ask, What is the difference between a literature review and a plagiarized piece of prose?

The literature review in a thesis contains sources, references, and citations. In a plagiarized piece of prose, there is no attempt to show from whence the material came. The reader will probably see that much of the material in this contribution has its origins in authoritative sources. However, there is one major difference between this piece and a plagiarized piece. There is no attempt at deception. Plagiarism will always be present in some form. Academics need to be vigilant and, like the *paidagogos* of old (the trusted slave and tutor in ancient Athens), to take students in hand and lead them through the complexities of the learning process.

—Michael W. Small

Pluralism

Pluralism generally is defined as the quality or state of being plural. Often, pluralism is used in the context of political science, particularly related to modern democracy. David Truman and Robert Dahl are two important exponents of political pluralism, which typically has competed with elitism and majoritarianism as a view of modern democratic societies. In its essence, political pluralism is the idea that individuals form interest groups that then compete with each other for favorable government policies. No group has more inherent power than another, and public officials (after lobbying by the interest groups) decide on policy based on their views of the public interest. An important feature of political pluralism is the understanding that competing groups' values are equally valid—that is, the claims made by interest groups cannot be ranked generically, allowing public officials to exercise their judgment in making policy decisions.

Applied to moral philosophy, the above definition typically translates to the idea that more than one moral principle, or more than one intrinsic good, are equally and universally valid. This definition places moral pluralism in contrast both with monism (the idea that one and only one principle is always and everywhere valid) and with subjectivism (the idea that no principle is universally valid).

Isaiah Berlin, perhaps the most well-known pluralist thinker of the 20th century, worked in both political and moral philosophy. Berlin emphasized objective pluralism (*objective* meaning that human values are part of the essence of humanity), which he wished to contrast with subjectivism. For Berlin, there were many different and irreducible values (also called ends or intrinsic goods) that men could seek. Although humans can understand others' values, and perhaps even admire them, because of their irreducible plurality, those values will at times be incompatible, and there is no common yardstick by which to judge which value is more important. In a political context, Berlin infers from this that people should be allowed as much freedom as possible, compatible with freedom for all; in a moral context, he infers that people with different values should respect each other. He does, of course, allow for the possibility of people, groups, and societies being wrong and of the necessity to fight those who are.

An example of a pluralistic theory that includes principles is that of Sir David Ross, a British academic like Berlin. Ross's theory is deontological in nature as well as pluralistic. He gives seven types of duties, none of which are seen to be more basic than any of the others, and three or four intrinsic goods. The duties include fidelity (keeping an explicit or implicit promise), reparation (making up for a previous wrong), gratitude (paying someone back for a good deed), justice (ensuring that people get what they deserve), beneficence (helping people in certain ways when we can), self-improvement (trying to improve our own condition in terms of virtue or knowledge), and nonmaleficence (not harming others). The intrinsic goods Ross lists are virtue, knowledge, justice (pleasure in proportion to virtue), and (at times) pleasure. When duties or intrinsic goods conflict, Ross calls on us to use our moral judgment to decide, all things considered, what is the proper action in the specific situation.

Mark Timmons argues that the most plausible versions of most moral theories are pluralistic in nature—what he calls "limited moral pluralism" in that there is a plurality of principles or goods, and the theory cannot give a final answer regarding the right action in specific situations without resort to moral judgment. For example, utilitarianism or natural law theory could each allow for a plurality of intrinsic goods and give limited guidance on how to resolve conflicts among those goods.

Other major theories can be seen in the same light. For example, Kant's theory could be seen as containing a collection of rules that specify duties but not containing any overarching principle from which the rules themselves would be derived (admittedly, it is not often interpreted in this manner). Virtue theory under this prism actually would contain many virtues, several of which would be central to the individual as a virtuous agent but none of which would be more important in that characterization than any of the others, and such a theory would contain no principle from which to derive rules on which virtue is more important in any given situation. American pragmatism also can be seen as a pluralist theory. However, it is different from the above examples in that the pluralism results from a plurality of individual ideas, not of principles or intrinsic goods.

Pluralism often is argued for because it seems to represent the reality of moral decision making better than the alternatives. A related argument in favor of pluralism concerns its treatment of moral judgment. Such judgment can be seen to be used by nearly all people in many situations. Judgment cannot be captured in a single principle, so a pluralistic account of morality fits better with our observations of people making decisions.

Two arguments against pluralism are that it is inconsistent and that it is indeterminate. That is, people who use moral pluralism privilege different principles or goods in different situations. Also, pluralistic theories give no easily identifiable rule for people to use in making decisions. Pluralists argue in return that inconsistency is important because situations and people are different and that indeterminacy is unimportant because the real world is complex and moral judgment is needed to navigate it.

Most of the moral decision frameworks put forward in the business and society fields are pluralistic in one form or another. For example, most theories arguing for consideration of multiple stakeholder interests are pluralistic to the extent that they do not rank stakeholders, thus putting the onus on managers to balance competing and valid stakeholder interests.

Political Action Committees (PACs)

Political action committees (PACs) are lawful mechanisms established to raise and pool political contributions from individuals and then channel that money to political candidates. Their operations are based on the First Amendment values of both freedom of speech and freedom of association. Though some critics of political money have suggested that PACs be outlawed, no serious proposal has been made, and such a proposal would in any case be of dubious constitutionality.

Brief History of PACs

Labor unions were the first primary sponsors and promoters of PACs, and the largest early PAC was the AFL-CIO's Committee on Political Education. Corporations learned about the utility of PACs from unions and began aggressively organizing PACs in the 1970s. Corporate contributions to candidates for federal office had actually been banned since 1907 by the Tillman Act, though the act had often been violated. In fact, the Watergate scandal surrounding the Nixon reelection campaign in 1972 involved illegal corporate contributions to the Committee to Re-elect the President. That scandal led to the passage of the 1974 Federal Election Campaign Act, which more tightly regulated contributions and political expenditures. By imposing a contribution limit on PACs, this act also implicitly validated the PAC mechanism and reinforced its legitimacy.

Due to the growing concern over illegal corporate contributions and the shutting off of that pipeline to candidates, along with the congressional approval of PACs, more corporations from the late 1970s onward began organizing PACs. The Public Affairs Council, the association of corporate public affairs professionals, was especially instrumental in promoting the formation of corporate PACs and in training PAC administrators.

Types of PACs

The law allows for two types of PACs, an affiliated PAC and an independent PAC. Affiliated PACs may be organized by corporations, labor unions, and nonprofit organizations. Among corporations, large firms and those in regulated industries tend more often to form PACs. Political advocacy groups such as environmental organizations, professional associations, and business associations also form affiliated PACs. Three of the largest association PACs are those of the National Realtors Association, the American Medical Association, and the American Trial Lawyers Association.

Independent PACs are not affiliated with any preexisting organization and are self-standing organizations. They are usually organized by like-minded individuals with the aim of promoting a particular ideology or cause. The earliest independent PAC, which contributed money to only liberal candidates, was the National Committee for an Effective Congress. Two PACs organized to contribute to only conservative candidates were the National Conservative PAC and the Committee for the Survival of a Free Congress. Emily's List was organized to raise money on behalf of women congressional candidates, and the League of Conservation Voters raised money to contribute to congressional candidates who were strongly committed to protecting the environment.

To facilitate the selection of the appropriate recipients among incumbent candidates, independent PACs would also create rating systems based on congressional voting patterns to determine which legislators were the most pro-environment, pro–free markets, proconservative, proliberal, prolabor, prodefense, or probusiness. Beyond independent PACs, other organizations and publications also produce vote-rating systems, and the Business-Industry PAC exists primarily to advise corporations and business associations on which probusiness candidates to support. To determine which challengers might be worthy of support, PACs will either interview or send questionnaires to such candidates in an attempt to ascertain their positions on issues crucial to the PAC, since they have no prior voting records.

PAC Operations and Structure

The PAC actually is a committee composed of managers and officers who supervise the solicitation of funds to the PAC and decide how to disburse the moneys to candidates. They select as recipients those candidates who would best serve the strategic interests of the corporation and who might occupy key positions of power in Congress or sit on committees with jurisdiction over issues of great importance to the firm.

The PAC solicits voluntary contributions from managers and executives and can solicit from shareholders as well, though companies rarely engage in that type of solicitation campaign. To guard against coercion, Federal Election Commission regulations prohibit supervisors from soliciting from subordinates. To protect individual rights and freedom of choice, PACs may allow contributors to earmark or designate their contributions for specific candidates, although that system would undermine the value of centralized strategic decision making.

Contributions and Independent Expenditures by PACs

The aforementioned 1974 law contained two provisions regarding the disbursement of PAC moneys. The first provision limited contributions to candidates to $5,000 per election, which would allow a PAC to give $5,000 to a candidate running in a primary election and another $5,000 prior to the general election. That provision still stands as good law and was upheld by the U.S. Supreme Court in the landmark *Buckley v. Valeo* decision of 1976. The Court reasoned that although there was a certain speech value in any contribution, the First Amendment is not violated by a contribution limit, since the limit serves a compelling government interest of preventing the corruption of candidates.

The second provision of the 1974 law affecting PACs placed a limit on independent expenditures—that is, on money spent endorsing the candidate or on behalf of the candidate rather than contributed directly to the candidate. In the *Buckley* case, the Supreme Court struck down the limits on independent expenditures as a violation of the First Amendment, since expenditures had a higher free-speech value and since expenditures cannot corrupt a candidate. They are not given to a candidate, and there is thus no exchange relationship with the candidate.

The result is that PACs must abide by the $5,000 limit in contributing to a candidate but face no limits in mounting an independent expenditure campaign. However, corporations generally do not engage in independent expenditure campaigns, since they lack the expertise and resources to mount effective advertising campaigns. National association PACs do take advantage of that legal right, though. They generally have large staffs and can hire experts to design independent expenditure campaigns. The National Realtors Association and the American Medical Association, for example, have engaged in such endorsement campaigns.

Another law that gave further impetus to PAC activities is the Bipartisan Campaign Reform Act (BCRA) of 2002, otherwise known as the McCain-Feingold Law. One of its major purposes was to ban unregulated corporate soft money donations to political parties. Such donations had become popular as a way to evade the strict limitations on corporate PAC contributions to candidates established by the 1974 law. In banning corporate soft money donations, the BCRA provided an incentive to corporations to either establish or revitalize their PAC operations, and many companies did just that.

Negative Impacts of PACs

Critics of PACs allege that they have created several negative impacts for the political process, and some of those impacts also have negative ethical aspects:

- *Escalation of campaign costs:* Due to the proliferation of PACs, candidates have more private sources of campaign contributions, and that cash has fed the steady escalation of campaign costs from one election to the next.
- *Entry barriers to challengers:* Corporate PACs and other affiliated PACs tend to favor incumbent candidates over challengers, since the incumbents are known quantities with whom they have built relationships. As the rich get richer, this creates equity problems in political contests, and incumbents also become entrenched in safe seats for long periods of time.
- *Special interest influence:* With campaign contributions comes access to legislators, which other interests may not enjoy, and that raises the specter of influencing candidates as well, again creating equity problems. Studies tend to show that money does not buy legislative votes, but it does reinforce sympathizers and mobilizes legislative leaders to lobby internally on behalf of their contributors. Those low-income interests in the population that cannot afford to play the campaign finance game may be shut out of the process, raising even more serious equity questions.
- *Exploitation of contributors:* The relationship between contributors and candidates is a two-way street, and while contributors might exploit candidates, candidates can also exploit contributors. Rather than contributors always buying access, candidates can also sell access. By stressing the upcoming important issues of corporate concern before a candidate's committee, the candidate's aide can imply that access to their legislative offices comes at a price. This mutual exploitation relationship raises questions of Kantian violations, as each party is treating the other as a means rather than an end and according little respect to the other party.
- *Erosion of party discipline:* This impact is less laden with ethical aspects, but to the extent that candidates can build their own effective fund-raising operations dependent on individual donors and PACs, they need to rely on political parties far less. The parties then have less influence on a legislator's positions on key issues. Advocates of strong political parties see this as a negative impact, but those who believe in independent thinking and freedom for legislators would see this as a positive impact.
- *Undermining civil discourse:* The independent ideological PACs have created many of the negative attack advertisements that one sees on the airwaves during campaign seasons. They do so through independent expenditures, since they can use these ads either to endorse candidates or to attack candidates whom they oppose. The attack ads often convey messages that candidates would be unwilling to say on their own. This is particularly true of contentious ads on moral issues such as gay rights or abortion. During the 2004 election, ideological PACs were also joined in the negative ad campaigns by the so-called 527 committees (named after a section of the Internal Revenue Service [IRS] code), established to evade the ban on soft money contributions to political parties instituted

by the BCRA. The so-called Swift Boat ads against Senator John Kerry are one example. Instead of making soft money donations to political parties as before, wealthy donors contributed instead to "independent 527 committees," which in turn produced ads supporting or opposing candidates.

Positive Impacts of PACs

Supporters of PACs argue that they have created a positive net gain for the political process, in the following ways:

- *Democratization of politics:* Instead of corporations and other institutions relying on their own assets or budgets to support candidates, PACs rely on voluntary contributions from individual managers or members. This promotes individual participation in the political process, a key ethical concept as well, based on deontological reasoning.
- *Political education:* PACs and their institutional sponsors usually combine solicitation efforts with political education campaigns. In that way, employees learn more about the candidates running for office and the central issues in the campaign, thereby becoming better citizens, which is vital to a self-governing democracy.
- *Expanded political participation:* As a result of the above two factors, an individual donor base combined with more political education, voter turnout is likely to grow and PAC supporters are more likely to get involved in politics in other ways, perhaps even by running as candidates.

POLITICAL ECONOMY

Political economy was a term widely used from the late 18th century to the end of the 19th to designate the comprehensive study of economic activity in its relationship to public policy, custom, and law. With the great 19th-century advances in economics (including partial and general equilibrium theory and marginal utility theory) came considerable specialization and formalization, and by the early 20th century, the more general field of political economy had split into economics on the one hand and political science on the other.

The term *classical political economy* refers to a (predominantly British) subset of the works of political economy. Classical political economy was social theory at its grandest. The classical political economists combined comprehensive views of economic progress—and all its attendant complications and discontents—with arguments about the legitimacy and role of government and about the basis of individual and social morality. They were the last great generalists in the Western tradition.

Exactly whose work is properly placed within the classical school is a subject for much academic debate, but its core figures certainly include its widely acknowledged founder, Adam Smith (1723–1790); its greatest and most influential theorist, David Ricardo (1772–1823); and its consolidator and clarifier, John Stuart Mill (1806–1873), who came to believe late in his life in the consistency of classical economics with socialist policies. Karl Marx (1818–1883), who coined the term *classical political economy*, regarded himself as both an inheritor and a critical reformer of this great tradition. That the classical political economists are sometimes referred to as "Ricardians" or "classical Ricardians" speaks to the centrality of Ricardo's thought to the school.

Precursors to the classical system include the French physiocrats Richard Cantillon (1680–1734), François Quesnay (1694–1774), and A. R. J. Turgot (1727–1781), from all of whom Smith borrowed extensively, and Smith's friend, the Scottish philosopher and historian David Hume (1711–1776), whose essays "On Money" and "On the Balance of Trade" informed classical monetary policy. Ricardo's closest disciples, who continued to advance his doctrine after his death, were James Mill (1773–1836), J. R. McCulloch (1789–1864), and Thomas de Quincey (1785–1859). Jean-Baptiste Say (1776–1832), J. C. L. Simonde de Sismondi (1773–1842), and T. Robert Malthus (1766–1834) were, in different ways, both in competition with and in the orbit of the classicals. Henry Fawcett (1833–1884), John E. Cairnes (1823–1875), and the great moral philosopher Henry Sidgwick (1838–1900) continued to promote the classical doctrine to the end of the 19th century—even as the "marginal revolution" and other economic advances were beginning to consign it to the pages of history.

Mercantilists and Physiocrats

The dominant school of economic thought from the 16th to the early 18th centuries—as both the European nation-state and modern international trade were developing—was "mercantilism." The mercantilists held that the wealth of a nation was to be measured by its stock of precious metals. The economic goal of any nation was to win what the mercantilists regarded as the zero-sum game of world trade. This could be achieved only by one nation selling more goods to other nations than it purchased from them, thus amassing a stockpile of bullion. This favorable balance of trade was to be maintained by various protectionist policies including, especially, tariffs.

In France in the 1760s, there arose a new economic school opposed to mercantilism: the "physiocrats," associated most powerfully with the work of François Quesnay. In contrast to the mercantilists, whose policies promoted manufacture and commerce, the physiocrats were convinced that the source of any nation's wealth was the productivity of its agricultural sector. In the manufacturing and commercial sectors, they reasoned, total output was logically equal to the sum of the inputs, yielding no net gain in productivity. Agriculture, however, was different, in that land could actually produce more value than was put into it. For a nation to achieve its highest possible net product, therefore, it needed to concentrate on agricultural improvements. This meant, among other things, eliminating various medieval strictures on land use and alienation.

The physiocrats' innovations in economics were many. Quesnay's work theorizing the flow of income between different sectors of the economy was highly influential, as was his advocacy of laissez-faire economic policy. Cantillon is credited with developing an early supply-and-demand model for short-run market price and with defining long-term market equilibrium in terms of a balance among flows of income. He also conceived of labor supply and output in terms of the land necessary to support laborers and thus developed a "land theory of value." Turgot studied the role of capital accumulation in economic growth, advanced theories of supply-and-demand price determination, and wrote—before Adam Smith—about the economic productivity of the division of labor.

Adam Smith

There is hardly anything wholly original in Adam Smith's economic writings, yet there is still ample reason for counting him as the founder of classical economics. First, there is the sheer scope of his classic work *An Inquiry Into the Nature and Causes of the Wealth of Nations.* Where his predecessors had contented themselves with pamphlet-length arguments about particular economic issues, Smith wrote a truly comprehensive tome. *The Wealth of Nations* was at once a definitive refutation of mercantilism and the founding document of classical political economy. The book develops economic theory across the whole range of micro- and macroeconomic topics, examines much of economic history in light of that theory, and makes numerous policy recommendations. It contains more arguments about more areas of economic policy than any earlier, and most later, works; Smith's work announced the research agenda of modern economics.

Smith's most famous contribution to economics is the idea of "the invisible hand," the market mechanism whereby the uncoordinated actions of self-interested competitors result, thanks to the interplay of pricing and competition, in the efficient allocation of resources both within and between industries and in the lowest-cost provision of social needs. But it would be a mistake—and the mistake has often been made—to brand Smith as a naive laissez-faire theorist who thought that the unfettered market could resolve all social ills. He had a lively sense of the rapacity of merchants and manufacturers and of the necessity to use regulation and good institutional structure to keep self-interest from running amok.

Smith is also famous for his analysis of the productive power of division of labor, both within the manufacturing sector (as illustrated in his famous discussion of the many distinct tasks involved in factory pin manufacture) and within society as a whole.

Smith made a number of errors and followed innumerable theoretical blind alleys. He notoriously failed to recognize the advent of the Industrial Revolution all around him (though he did recognize the dehumanizing effect of repetitive, specialized factory labor on the laborer). He toyed with a number of different and incompatible theories of value; he proffered an untenable distinction between "productive" and "unproductive" labor. But however many his errors, the fact remains that he was an acute observer of economic behavior and analyst of economic policy and made his observations across an unprecedented range of social and governmental activity. Smith was, in addition, an important jurist, a theorist of ethics, and an entertaining essayist and critic.

David Ricardo

Ricardo was a follower of Smith but differed from Smith both in his overall social outlook and in his technique. In outlook, Ricardo was decidedly more pessimistic. His vision was of a society locked in unending economic conflict, with landlords reaping the greatest benefits for the smallest contribution. Capitalists pay their workers only survival wages, but those wages are driven up by the greed of protectionist landlords, who use tariff legislation to prevent cheap food imports from undercutting their prices. Capitalists' profits are further undercut by their competition with one another. When they do manage to earn profits, capitalists invest them in new productive capacity. This causes the demand for labor to increase and increases the profits accruing to labor—but only temporarily, because wealthier workers will soon have more children, increasing the labor supply and driving wages down to subsistence level again. This population growth drives marginal land into food production at a higher cost. The market price of grain therefore rises, giving a windfall to landlords with highly productive land and cutting into capitalists' profits by again raising the subsistence wage they must pay their workers. Hardworking capitalists thus see their profits undercut both by competition and by food prices; hardworking laborers are kept at subsistence level by population pressure; and landlords reap profits undiminished by competition and increased, not decreased, by population pressure.

This description of the Ricardian economic vision also reveals Ricardo's distinctive technique—his major contribution, for better or for worse, to all subsequent economics. Ricardo's economics is not based on the subtle Smithian observation of the complex behaviors of real people. It is instead based on abstract models, theoretical interactions of prototypical (and often unidimensional) economic actors: the laborer, the capitalist, and the landlord. Ricardo demonstrated an ability to predict the economic consequences of policies by reference to abstract theories involving very few, and very "thin" and abstract, variables. This model building remains one of the most powerful and controversial tools of economics; not for nothing did Joseph Schumpeter label the economist's unhealthy habit of overabstraction "the Ricardian vice."

Throughout his career, Ricardo engaged in a series of debates on economics with his archrival and close friend Rev. Thomas Robert Malthus. Malthus was well known for having advanced the theory that population pressure would always outstrip progress in economic productivity. Workers who earned more than subsistence wages would have more children, and while population would increase "geometrically" (as those children had children of their own), economic progress and agricultural productivity could only be "arithmetic," or linear. Thus, even the greatest innovations in productivity cannot keep the mass of mankind from a life of poverty and near starvation. Ricardo incorporated a version of this population pressure theory into his own. But Ricardo disagreed strongly with Malthus on another of his dismal theses—namely, that manufacturing productivity could give rise to a "general glut," the economic stagnation that would result when too many goods were produced to satisfy too little demand. Following Jean-Baptiste Say, Ricardo argued that no general glut was possible, because every good, in being produced, gave income to someone. That income would inevitably be used to purchase more goods, for people have an unquenchable desire for commodities. This idea—that a general glut of goods in the market is impossible because the income generated by the production of goods will always be used to buy other goods—has come to be known as Say's law. It is sometimes described by the misleading formula "Supply creates its own demand."

John Stuart Mill

John Stuart Mill is today better known as a political and moral theorist than as an economist, but his *Principles of Political Economy* was the undisputed leading text in economics for the entire latter half of the 19th century. Mill's work is the summation of classical political economy; his was the work from which the postclassical economists first learned their economics.

Mill saw his work as little more than a refinement and restatement of Ricardo's: "I doubt if there be a single opinion in the book, which may not be exhibited as a corollary from his doctrines." But Mill (particularly in later editions of his work) was more inclined than Ricardo to be sympathetic to socialist and other reformist argument. Mill was willing and able to engage in Ricardian theoretical abstraction, and he believed generally in laissez-faire policies, but he balanced both these tendencies with a real-world concern for effective social reform.

He made room for such social reform by drawing a sharp distinction between economic production and economic distribution. The laws of economics governing production, Mill thought, are rooted in nature: The productivity of labor power or of land is determined by objective forces. But distribution is determined not by nature but by society and is thus subject to our control. Where Ricardo saw landlords' enrichment and workers' impoverishment as following inevitably from economic laws, Mill saw these things as correctable through progressive social policy: taxation, redistribution, and education.

Like Adam Smith, Mill was noted not only as an economist but also as a progressive social and political theorist, as a philosopher, and as an essayist and critic.

Karl Marx

Karl Marx's economics is often taken to mark a decisive break from classical political economy. But Marx saw his own work as inheriting the insights of the classicals and, in some sense, completing them. Marx thought highly of the classicals not only for having made great strides in mapping out the laws governing production in the capitalist economy but also for having dealt explicitly with the broader social forces and contradictions to which those laws gave rise.

What Marx thought was missing from the insights of the classicals, though, was the full realization that the laws they were charting were not eternal but were the laws only of a particular historical moment. Marx saw those laws as unique to a historically determined system of production (the capitalist system) that had itself arisen inevitably from the forces and contradictions inherent in the previous (feudal) economic system. In his own work, Marx sought, in part, to correct and qualify the insights of the earlier classicals into the workings of the capitalist economic system. But he also sought to situate that system within a dialectical history of the progress of economics. Much of his work consisted in reviewing and illustrating the wrenching dialectical progress of previous economic regimes toward capitalism. And, of course, much of it consisted in his efforts to isolate particular contradictions within the capitalist system that would, in his view, push capitalism toward its own historical completion, destruction, and transformation into what Marx regarded as the next, and final, economic regime: communism.

Conclusion

Mill published his *Principles* and Marx his *Communist Manifesto* in 1848, but as early as the 1830s, economists had begun to experiment with "marginal analysis" and with utility-based theories of economic value. The "marginal revolution" that displaced classical political economy was well under way when Mill died in 1873, and it was complete only a few years after Marx's death a decade later. But although later economists acquired formal tools superior to the classical political economists' and were able to correct many of their technical errors, none has matched the power of their sweeping social vision.

—Stephen R. Latham

Political Legitimacy

Political legitimacy concerns the foundation of authority and the obligations of government and organizational leaders. Consent of the governed or managed exists in accordance with the degree of legitimacy that operates between the leadership and the led, which shifts in relation to events, perceptions, and preferences.

In a political context, legitimate government requires its citizens to limit direct democracy and transfer authority to the representative model. In a theocracy, political leaders look to a deity as the source of legitimacy. In hereditary monarchy, a legitimate king or queen is a person with a certain parentage.

International business complicates political legitimacy when cross-border activities raise questions in relation to who should govern such activities when sovereignty is contested. The onset of globalization through the flow of trade, money, and people means that business activities often transcend traditional political borders.

The feature that shapes and determines the possibilities and outcomes associated with political legitimacy is power, a series of implicit and explicit interventions made with the ability to enhance or detract from the legitimate political process. Power operates in a political system through coercion, compulsion, and participation, each of which undermines or strengthens legitimacy.

Business activities in the form of lobbying may damage political legitimacy because they may be perceived to employ unfairly money or gifts as bargaining tools. Lobbying is a technique used to influence the outcomes of political decisions, particularly in the area of regulation and compliance, that may have an impact on costs and profits in a range of industries, sectors, and markets.

Wider institutions such as religious bodies have an impact on political legitimacy. For example, the Catholic Church urges believers to question the legitimacy of institutions that undermine canonic moral principles or the natural law. Various faiths have views on consumerism, interest, profit, and speculation that may shape the policies relating to behavior, introducing codes and practices that may hinder business investment. The influence of culture and society on political legitimacy should not be ignored.

In the world of international relations, the operation of political legitimacy is further complicated by the absence of a formal world government. The structure of the international order is legitimated under certain conditions. The fault lines of legitimacy primarily relate to concerns expressed by interested parties regarding the legitimate status of a state, its related agencies, and the documentation of that legitimacy. International business works alongside the international community at various levels through organizations such as the United Nations, the International Monetary Fund, the World Bank, and the World Trade Organization. The degree to which these organizations are perceived by some stakeholders to prioritize the interests of developed market institutions negatively affects their perceived political legitimacy, particularly in developed countries.

Therefore, political legitimacy depends on the relationship between the authority of leaders and the consent of those led, and the uneven power relations between them, which is further complicated by the presence of money where there is economic inequality.

—Paul D. Sheeran

Political Risk

Political risk refers to the probability of loss for commercial market direct investment activity that can be attributed causally to noncommercial, or specifically governmental, politically motivated events or decisions. Originally, and still often, termed *country risk* or *sovereign risk* by analysts and business leaders, the events or decisions at issue are traditionally related to concerns surrounding the likelihood of expropriation or nationalization of a single business or an entire industry, currency inconvertibility or restrictions on convertibility, restrictions on transfer or repatriation of profits, and war or civil disturbances, related to a government's activities or decrees. Additional, more recent concerns include a wide range of nonmarket and government-sanctioned or officially sponsored episodes, such as restrictions on export of goods or services produced, corruption (including but not limited to bribery and extortion), mistreatment of citizens (human rights), and terrorism (state or antistate in origin). Political risk analyses can then refer strategically to probabilistic losses associated with all three stages of an investment business plan: entry into a new market (initial direct investment activity), continuation in a current market (including expansion, merging, or contraction of ongoing business), and exit from a market (winding up the business and selling off assets in an orderly fashion).

While the probabilities for losses related to all such events or decisions could be calculated for investments in one's home country, the notion of political risk is typically applied only to direct investment activity in a host country—that is, where one is not a citizen. Likewise, while these calculations can be made by companies whose homes are is in either developed or developing countries, for investments targeting developed or developing host countries, the vast majority of political risk analyses are generated by or on behalf of businesses based in developed countries seeking to invest in developing host countries.

Although discussion and assessment of nonmarket risks when doing business abroad have been traceable since the beginnings of cross-border trade in the ancient world, formal political or country risk analysis as we know it today historically grew out of the mid-20th-century needs of businesses in the extractive industries, such as mining, and oil and gas companies to calculate the risks associated with operating in relatively unknown and potentially politically unstable regions of the world. Since such companies had to go where the resources were located, they needed some means to help determine whether the investment required would likely yield acceptable returns. Experience suggested that whether returns would indeed be acceptable would only be calculated properly if nonmarket risks could be folded into their business plans. It was not enough, for example, to discover an oil field with sufficient proven reserves to be profitable after explorations were conducted if its operations subsequently would be expropriated once the plant was built and functioning as planned, or if the recovered oil was restricted to host-country use at government-mandated subproduction cost prices, or if profits could not be converted into one's home currency and repatriated.

Attempts to calculate and address these concerns have led (and continue to lead) to some normatively perverse incentives and outcomes: Generally, political risks are easier to identify and key political actors more amendable to influence under dictatorships than democracies, where transparency is limited and reforms are difficult to enforce, and managing risks and opportunities in such environments suggests that government stability is more desirable than overall economic growth for the country. Corruption is consequently a closely related concern, especially since empirical studies hint at but fail clearly to establish direct negative impacts between decisions by corrupt regimes of whatever political stripe concerning business investments and a country's economic development. See, for example, the work of Transparency International through its annual *Corruption Perceptions Index* for data related to business perceptions.

Contemporary global expansion of business operations across a wide range of industry sectors, from manufacturing industrial and consumer goods and foods for international markets to cross-border provision of professional services such as accounting and marketing, today demands market and nonmarket probabilistic loss calculations for all sorts of international investment activities. Concomitantly, freer production and movement of goods and services require less emphasis on accommodating problematic regimes.

In the face of these uncertainties and potential losses, businesses look to analysts to help factor nonmarket contingencies into their investment planning. Some companies establish in-house bureaus or departments to offer analyses and advice; others look to professional service firms that provide, for example, banking, accounting, or legal advice and also supply political risk calculations as part of their advisory packages; still others seek out independent practitioners and firms that specialize in providing political risk analyses.

Whatever the locus of the analysts, political risk advice is typically conducted and proffered in a quantitative or qualitative form, with emphasis on macro or micro perspectives, in aggregated regional or country-specific geographies, according to the theoretical commitments of the analysts and the needs of the business. Hence, one report might provide a quantitative analysis of macroeconomic conditions across Southeast Asia to a computer components manufacturer, where the principal political risks might concern foreign exchange volatility and convertibility. A second report might provide a qualitative analysis of the specific conditions for mining in Irian Jaya, where the principal political risk could center on managing the triangle of relations between the indigenous inhabitants, the Indonesian government, and the company.

One standard qualitative methodology uses a panel of country experts, often political scientists or other academic and business specialists who have considerable experience in the region or country under study, to provide responses to questions in a formal survey that permit narratives as well as scaled scores. A variation on this method affords a feedback loop whereby all initial responses are returned to panel members so that they can reevaluate their initial judgments in light of others' anonymous responses. The reworked final set of replies then becomes the basis of a combined averaged, scaled, and narrative report. One standard quantitative methodology uses a panel, often of professional economists or econometricians, to assess macro- and microeconomic and politicosocial conditions in a region or country on the basis of data reported by international agencies such as the International Monetary Fund and the World Bank, as well as publicly available data from the government(s) under study, along a narrow, weighted range with a set scale for each criterion. These numbers are then averaged to produce a single number along a set scale for an overall evaluation of risk in that market. See, for example, the range of country and regional reports available from the Economist Intelligence Unit.

A standard mixed methodology uses a panel of academics, businesspeople, and professional economists, who provide narrative rationales along with weighted, scaled scores for a report that gives a single number along, say, a 100-point scale (0 = *no risk*, 100 = *certainty of loss*), with a historical assessment of how the region or country has moved along the risk scale over the past 5 to 10 years and its likely place along the scale over the next 5 to 10 years. See, for example, the work of firms such as Oxford Analytica and the semiannual risk surveys published by *Euromoney* magazine. A relatively recent innovation in the mixed methodology category is to apply Bayesian decision theory to aid in the computation of probabilities of risks and outcomes for particular projects in specific locales.

Finally, managing risks, whether political or commercial in nature, requires more than knowledge about the possibilities of incurring losses. So to give incentive to companies to engage in foreign direct investment, government-sponsored and private reinsurance agencies now provide political risk coverage. For example, the Overseas Private Investment Corporation (OPIC), an agency of the U.S. government, has long provided political risk advice and insurance to American companies seeking to establish operations overseas. The Multilateral Investment Guarantee Agency (MIGA), an international governmental financial agency within the World Bank Group, has provided political risk insurance since 1988 to companies from member states (irrespective of whether the member is a developed or a developing state) seeking to invest and operate in another, developing country member state. OPIC provides political risk insurance for investments in more than 140 countries, while MIGA can underwrite political risk insurance across its more than 180 members.

Political Theory

Political theory treats a wide range of concerns having to do with normative aspects of the state, power, individuals, and groups. Some political theorists concern themselves with more or less traditional attempts to justify and explain specific regime types, such as liberal democracies, or their underlying philosophies, such as liberalism. Others work on more recondite areas, such as the attempt to ground political and social action in the absence of metaphysical foundations or specific aspects of the history of political thought.

This entry, however, shall focus on several overarching conceptions important in considering political questions within contemporary liberal democracies. With this in mind, we will begin with three major concepts, liberalism, liberty, and consent, and then focus on three areas of specific concern for the student of business, distributive justice, property, and natural or human rights.

Liberalism

Liberalism is the term for the political philosophy that underwrites most contemporary Western societies. Originating in the early modern political thought of Thomas Hobbes (1588–1679) and John Locke (1632–1704), it still provides a philosophical foundation for contemporary political philosophers as different as John Rawls (1921–2002) and Robert Nozick (1938–2002).

Liberalism relies on several key assumptions about human nature, including the following: that human beings are fundamentally rational, that human beings are endowed with inherent "natural" rights antecedent to any social contract or political association, and finally that people are naturally competitive and basically self-interested. These assumptions suggest that people are capable of living freely and determining their own interests, as opposed to being controlled by passions, emotions, or irrationalities. As a result of these basic assumptions, several conclusions follow. The most important of these is that political organization should be oriented to maximizing the individual's ability to pursue whatever idea of the "good life" is desired, provided that it does not interfere with the abilities of others to also pursue their conception of the good life. In this sense, government is considered to be "instrumental" in that it is limited in size and scope to doing what the individual cannot do for himself or herself.

In the "classical" liberalism of John Locke, the government is restricted to the very basic functions of defense, policing, and judicial work and, to a lesser extent, regulation of commerce and public works. All other matters should be left to individuals' own inclinations. Government plays an important role in regulating disputes between individuals, but it should remain to the greatest degree possible neutral on the question of the good life, preferring to prevent infringements on individual rights rather than designating ways of living.

In a more abstract sense, political communities under liberalism are considered to be artificial constructs, designed to guarantee particular rights to individuals while avoiding any unifying conception of the good. Freedom of the individual is paramount under liberalism, and the particular kind of freedom emphasized in liberalism is termed "negative" freedom, or liberty (see below).

The classical liberalism of John Locke described above has its closest present-day American equivalent in the various libertarian philosophies, a prominent example being Robert Nozick's *Anarchy, State, and Utopia* (1974). Mainstream liberalism today, however, relies on a more expansive notion of the role of the state and its role in assisting individuals toward their conception of the good life. John Rawls perhaps best represents this position, arguing in *A Theory of Justice* that the state has a responsibility to ensure that all members of the political community have at least some minimal ability to pursue the good life. Rawls's position provides a philosophical basis for the contemporary welfare state.

Liberty

That much debate surrounds the concept of liberty should not be surprising, given its foundational role in political theory since the time of Plato; much disagreement remains about the basic meaning of the term. In the latter part of the 20th century, theorizing about liberty was decisively shaped by Isaiah Berlin (1909–1997), whose seminal essay "Two Concepts of Liberty" influentially divides the term into "negative" and "positive" types.

Negative liberty finds its roots in the thought of Thomas Hobbes, who in *The Leviathan* famously defines liberty as "the absence of external coercion."

Although Hobbes's definition is extreme, his point is clear: Liberty consists in freedom from interference on the part of either the government or the wider society, with the latter given a prominent role first in the writings of John Stuart Mill (1806–1873). Negative liberty depends heavily on liberal neutrality on the question of the good life and on an idea of a self that has the ability to develop and fulfill its own idea of the good life. The individual, in this sense, seeks noninterference to the greatest degree possible from the government and the wider society in pursuit of the good life. And as Mill points out in *On Liberty*, negative liberty restricts interference in the lives of individuals to cases where the behavior of the individual would harm others; the individual's own good is not sufficient warrant for interference.

Positive liberty, in contrast, usually begins with a more unified conception of the good life and a conception of the self more dependent on the wider social and political community. Individuals need certain key characteristics to fully thrive as human beings. These characteristics can be as simple as a good education, self-control, or a level of material comfort, but most depend on conceiving the individual as being split between a higher and a lower nature, and the latter ought to be suppressed or at least controlled in pursuit of a higher self. Berlin highlights the darker side of positive liberty, noting that totalitarian regimes often have very well-defined ideas of self-fulfillment, which they force on an unwilling population. Writing during the height of the Cold War, Berlin draws parallels between positive liberty and the excesses of Communism under Stalin, where self-fulfillment involved the sublimation of the individual to the collective.

Berlin's account of liberty has not gone unchallenged. Gerald MacCallum, for example, argues that freedom always has a triadic structure consisting of an agent, an obstacle, and a goal, where the goal can be to *do* or *not do,* to *become* or *not become* something. Despite criticism, Berlin's conceptual apparatus of negative and positive freedom remains an important basis for understanding human freedom.

Consent

Consent is a key term in the contemporary justification of the state. States are frequently said to be legitimate to the extent that they rest on the consent of the governed; liberal states in particular, with their heavy reliance on the autonomy of the individual, need to demonstrate consent on the part of the governed. Consent to the state also generates political obligations. Individuals who consent to the state agree to abide by promulgated laws.

In general, an individual is said to be able to consent when he or she has knowledge of the gravity or consequences of agreeing and freely agrees (or is not coerced). Both of these qualifications—as we shall see—create serious and perhaps insuperable problems for the theory of consent.

Political theorists distinguish between two types of consent: express and tacit. Express consent consists of active declarations—usually verbal or written—of agreement. Examples of these are loyalty oaths, oaths of citizenship, and oaths of office. In general, express consent is considered to be binding, and individuals who have expressly consented generate obligations to the state that they have a moral responsibility to honor. In most contemporary states, express consent is a relatively rare phenomenon and cannot be relied on to provide legitimacy to the government.

Tacit consent, however, proves more difficult to establish. John Locke makes one of the earliest arguments for tacit consent in his *Second Treatise of Government* (1689), where he argues that simple presence in a given territory indicates tacit consent to the government. Locke's argument clearly fails, however, in that it is not clear that the individual is knowledgeable about the agreement or necessarily has the option to leave. More recent attempts to establish tacit consent are equally problematic, most failing to meet the criteria for consent outlined above, and political theorists have turned to other means of generating legitimacy for the state and moral grounds for obeying the law, such as arguments based on duty, fair play, and gratitude. Unfortunately, as A. John Simmons argues, these arguments are equally difficult, and this fact presents a major problem for liberal theories of government.

Distributive Justice

Distributive justice concerns the manner or pattern by which social benefits and goods are distributed within a society. The attempt to arbitrate between the competing claims of individuals, groups, classes, firms, or geographical areas should be kept distinct from procedural justice, which is concerned with proper adherence to administrative processes. Although discussions of distributive justice go back to Aristotle, we will focus here on the most influential contemporary accounts.

John Rawls

Rawls's 1971 work, *A Theory of Justice*, places the regulation of the individual's conception of the good life as the primary responsibility of government. In this sense, distributive justice concerns itself with how to distribute the prospect of obtaining what Rawls calls "primary goods": basic rights, powers, liberties, authority, and opportunity. These are things that Rawls claims every rational person would be assumed to want, as they allow for maximal flexibility in the pursuit of one's goals.

Conflicts over the distribution of primary goods can be resolved by appealing to two principles. The first of these is the "principle of greatest equal liberty," or that each of us has an equal right to the same total system of basic liberties. This system—where "basic liberties" are roughly equivalent to the U.S. Bill of Rights—is to be as extensive as possible.

Rawls divides his second principle into two parts, the "difference principle" and the "principle of fair equal opportunity." According to the former, social and economic inequalities are to be arranged to the greatest benefit of the least advantaged, while the latter requires that we go beyond formal equality of opportunity to ensure that persons with similar skills, abilities, and motivations enjoy comparable potential for success. Rawls is clear that the first principle is necessarily prior to the second principle. In other words, we must satisfy the principle of greatest equal liberty *before* we satisfy either the difference principle or the principle of fair equal opportunity. In practical terms, these two principles justify a substantial degree of redistribution of resources in a society to ensure that those worst off have ample opportunity to pursue the good life.

Rawls justifies his two principles of justice by appealing to the decision preferences of hypothetical individuals in what he calls the "original position"—a version of the older state-of-nature argument used by the earlier liberal theorists to justify the social contract. Rawls places these individuals behind a "veil of ignorance," allowing them to know that they will be members of the society the rules for which they will create but not allowing them to know any specifics about the position they will occupy in that society. Rawls argues that these individuals will favor maximizing the fortunes of the least well-off, in effect hedging their bets lest they wind up occupying that position.

A Theory of Justice has attracted much attention, and a good deal of it is critical. Michael Sandel, for example, has claimed that Rawls's conception of individuals in the original position rules out the possibility of a person's being constitutively attached to his or her ends and that this conception is invalid and incoherent. Other critics have pointed out that it is not at all clear that the individual in the original position will select to maximize benefits for the least well-off given any reasonable account of risk taking.

Similarly, it is not entirely clear why basic liberties need to be equally distributed at all. Certainly, individuals do not maximize the use of all their liberties. It might make more sense to give more of some liberties to some individuals and fewer to others, and these may not be inconsistent with their own understanding of the good life.

In response to his critics, Rawls substantially revised his argument in later editions of *A Theory of Justice*, attempting to distinguish his theory as relevant to a property-owning democracy rather than a welfare state conception. In a later work, *The Law of Peoples*, Rawls also objected to the application of his principles of justice to the international sphere.

Property

Much of contemporary political thought surrounding property is fairly recent in origin, although one can find early discussions of property in texts such as Locke's *Two Treatises of Government* and Hegel's *Philosophy of Right* (1821). More recently, C. B. Macpherson, in *The Political Theory of Possessive Individualism* (1962), called attention to the subject by arguing that the major figures of 17th-century political thought were deeply indebted to possessive assumptions about market society, and he did so through an analysis of their (flawed) theories of property.

Macpherson's argument was quite controversial, provoking attempts to develop new rights-based accounts and rules to explain what property is, what rights are associated with it, and how to justify its acquisition. These issues are particularly pressing in that property is clearly implicated in the distribution of power and justice; if an adequate explanation of the distribution and transferal of property is unlikely, existing social and economic structures can be called into question.

One important voice in this debate can be heard in Nozick's entitlement theory in *Anarchy, State, and Utopia*, where he discusses a system of property justification similar to Locke's, arguing that labor creates entitlement and that property acquisition can only be limited when it is shown to worsen the situation of others, which he seems to narrowly define as depriving others of property altogether. Once property has been established, the owner is free to alienate the property through market exchange, gift giving, and so on.

Nozick's arguments, however, are highly problematic and do little to answer some of the basic questions about the acquisition and distribution of private property. In this sense, they are symptomatic of the problems facing a rights-based account of property. In fact, Jeremy Waldron (1953–) concludes—partially based on Nozick's argument—that no rights-based argument for private property is possible.

More typical of recent discussions of property is Stephen Munzer's *A Theory of Property* (1990). Munzer, recognizing the important role property has in the living of a fully human life and drawing heavily on Kant and Rawls, argues for a system of heavily constrained private property, with justice and equality taking precedence over efficiency and desert.

Rights

The liberal sense of self involves the claim that individuals have rights: inherent moral claims that protect certain values such as liberty, equality, or autonomy. In this sense, rights are distinct from privileges, which accrue to individuals on the basis of their membership in a particular political community. For liberalism, rights provide an important barrier between the individual and the government or the wider society.

When we say that "*A* has a right to do *X*," we mean that one ought not interfere with *A*'s ability to do *X* and that there is nothing wrong with *A* claiming a right to do *X*. We also assume that the right is universal, so that if *A* has the right to do *X*, so do all other individuals.

Critics of rights-based justice, including Mary Ann Glendon and Michael Sandel, have concerns about the emphasis on rights in liberal democracies. The most general of these is that the use of rights is too egoistic to allow for an adequate sense of community to develop. In addition, rights-based disputes are not subject to easy resolution, thus leading to increased litigation. These critics would prefer to see more of an emphasis on duties or responsibilities, drawing the individual into the community as opposed to constantly marking off the boundaries between the self and community. Feminist critics such as Carol Gilligan, while agreeing with Glendon and Sandel, also point out that an emphasis on rights mirrors a privileging of aggressive, masculine values.

The criticisms listed above sometimes mask a deeper concern with the underlying justification for rights. Early modern thinkers such as Locke grounded rights in divine command, while later thinkers preferred to talk about "natural" rights. Either approach, however, leaves one open to the charge that the assertion of a right looks like just that, an assertion, without evidence or proof. As Jeremy Bentham pointed out, the assertion of a right lays down as truth what one cannot prove.

This is a vexing and difficult problem for liberals and provides much traction for critics. Communitarians such as Charles Taylor, in particular, assert that rights-based liberalism, grounded in a sense of self that is antecedent to society, does not square with our perception of reality. Instead, they argue, society should be viewed as antecedent to the self, providing the individual not only with important formative characteristics but also privileges. These privileges extended by society are not to be viewed as the sole possession of the individual. Liberals complain, correctly, that this view of the self substantially weakens the barrier that rights provide against the government or society but fail to provide a persuasive alternative understanding of the self.

POLLUTION

Pollution is defined as undesirable physical, chemical, or biological changes in the characteristics of water, air, or land that negatively affect the survival, health, or activities of humans and other living organisms. For much of human history, the natural world was considered as an adversary to be defeated and as a reservoir of resources to be exploited—pollution was at most a local problem for some communities and was not of widespread practical or ethical concern. However, as the world rapidly industrialized and as problems of pollution grew in regional and global scope, ethical theories of the environment were advanced to address the ethical and moral obligations of humans to stem the adverse impact of human-generated pollution.

The amount of pollution attributable to human activity has grown geometrically over the past two centuries, coincident with global industrialization. In 2001, humans generated about 927 million metric tons of solid municipal waste (garbage) and about 270 million metric tons of solid hazardous waste. Improper disposal of solid wastes can cause groundwater pollution, mercury and polychlorinated biphenyl (PCB) poisoning, birth defects, increased cancer rates, and many other human health consequences. The United Nations estimates that during 1995 humans emitted about 22,000 million metric tons (2,204 pounds) of carbon dioxide (CO_2) into the air, 141 million metric tons of sulfur dioxide (SO_2), and 99 million metric tons of nitrogen oxides (NO_x), among many other gases. Worldwide per capita emissions of CO_2 average about 4 metric tons annually. In the United States, Australia, and Canada, annual CO_2 emissions approach 20 metric tons per capita. Western Europe, Japan, and other industrialized nations emit about half this amount. Carbon dioxide is implicated in global warming, sulfur dioxide in acid rain, and nitrogen oxides in smog and increases in ground-level ozone. Aggregate statistics for the quantity of polluted wastewater (sewage) that is discharged each year are unavailable due to measurement problems, but the quantity is huge and is growing.

As human-generated pollution has come to affect much of the natural environment, consideration of pollution as a topic of ethical and moral discourse has grown. Three broad strands of ethical theory have been brought to bear on the problem of pollution. There are those who assert that the natural world is valuable unto itself and that moral behavior demands that humans protect the natural world from pollution regardless of the cost or its impact on humans. A second perspective is that pollution is wrong in principle only when it causes avoidable harm to humans, and possibly to other "higher-order" sentient animals. The third perspective is that pollution is never wrong in principle but only when the harm of pollution outweighs its human benefit. Much of the current debate and controversy about pollution can be traced to these three ethical perspectives and to their inherent differences.

Environmental and Social Impact of Pollution

The impact of pollution on global societies, economies, and ecosystems is profound. Human-generated emissions of greenhouse gases (GHGs) are widely implicated in global warming. GHG emissions, including carbon dioxide, methane, nitrous oxide, and fluorinated gases, among others, totaled 33 billion metric tons (CO_2 equivalent weight) in 2000. Based on longitudinal temperature studies, scientific theory, and computer climate models, worldwide temperatures may increase by 1.4 to 5.8 °C between 1990 and 2100, with unknown consequences. Predictions vary widely, but some forecasts suggest that sea levels may rise as the polar ice caps melt, precipitation patterns may shift, agricultural productivity patterns may change, ocean currents may destabilize, and ecosystems may evolve (e.g., from wet to arid), with unpredictable impacts on plant and animal life. Beyond global warming, emissions of sulfur dioxide, largely from coal- and oil-burning power plants, are a cause of acid rain, which damages forests and fish populations in lakes and streams. Chlorofluorocarbons (CFCs) used in refrigeration and air conditioners are thought to be a cause of ozone depletion in the upper atmosphere.

On a regional and local scale, agricultural runoff and dumping of raw sewage have damaged the ecosystems of many rivers, lakes, and estuaries. For example, in India, every year the Ganges River accepts raw sewage from 70 million living people and the cremated remains of some 30 million dead. The use of DDT as an agricultural pesticide in the 1950s and 1960s is implicated in the sharp decline of some bird species during that period. Air quality is chronically poor in many of the world's largest cities. Mexico City arguably suffers from the worst air pollution in the world: Sulfur dioxide levels range from one to four times the upper limit set by the World Health Organization (WHO), and the WHO guidelines for dust and soot are exceeded by three to six times. The disposal of hazardous wastes also creates serious environmental problems. Globally, about 275 million metric tons of hazardous waste is produced annually. There are 34,000 hazardous waste sites in the United States alone and 1,600 Superfund (abandoned or uncontrolled) hazardous waste sites.

Finally, pollution catastrophes occur periodically, with great social and environmental consequences. In 1984, the accidental release of toxic methyl isocyanate (MIC) gas used in the manufacture of pesticides killed more than 15,000 persons and injured hundreds of thousands of others in Bhopal, India. In 1986, a nuclear power plant in Chernobyl, Ukraine, suffered a catastrophic steam explosion, producing a radioactive plume that badly contaminated parts of Ukraine, Belarus, and Russia; an estimated 4,000 people there are expected to die prematurely because of exposure to radiation. In 1989, the oil tanker *Exxon Valdez* hit a reef in Alaska's Prince William Sound, spilling between 11 and 35 million gallons of crude oil in the enclosed sound and killing about 250,000 sea birds, 2,800 sea otters, 300 harbor seals, 250 bald eagles, as many as 22 orca whales, and billions of salmon and herring eggs. It may be 30 years before Prince William shoreline habitats fully recover.

Causes of Pollution

Why does pollution occur? Since the societal and environmental effects of pollution are usually negative, why not simply stop polluting? The simple answer is that all human activities, processes, and systems generate by-products that are unintended and unwanted. When these by-products have harmful effects on human activity or on the environment, they are termed *pollution*. As an example, humans have burned wood for heat and light for thousands of years. Burning wood involves a chemical reaction that combines oxygen in the air with carbon in the wood, releasing heat and producing carbon dioxide, smoke, and ash (unburned solids), among many other compounds. The carbon dioxide, smoke, and ash are undesired by-products of burning wood that can pollute the environment if disposed of incorrectly. In fact, it is impossible to burn wood (or coal or oil) without creating carbon dioxide, smoke, and ash since these are the inevitable by-products of hydrocarbon combustion. And so it is with all human-related activities, as well as those of all living organisms. Raw materials (air, water, food, minerals) are acquired and then converted into something useful (energy, nourishment, materials, products). But there are always "leftovers" that can become harmful or deadly "pollution" if disposed of incorrectly. The challenge for humankind is to minimize, manage, and control its waste streams so as to minimize their negative environmental impact and to thereby minimize pollution.

Environmental Impact

The impact of pollution has grown in step with the human population. A common conceptual model defines the impact of pollution as the product of population, resource consumption per capita, and consequent pollution per unit of resource consumed:

$$\text{Impact of pollution} = \text{Population} \times (\text{Resource use/person}) \times (\text{Pollution/unit resource})$$

The increase in global pollution in recent decades can be explained, at least in part, by this equation. First, world population has exploded over the past two centuries. World population reached 1 billion in about 1800, 2 billion by 1925, 3 billion by 1960, 5 billion by 1990, and 6 billion by 2000. Second, during this same time period, industrialization has created human prosperity on a scale never seen before (albeit unevenly distributed). This prosperity greatly increased the per capita consumption of global resources. Third, as industrial production grew and complex manufacturing processes multiplied, the amount of pollution generated per unit of resource consumed increased. In terms of the equation above, all three terms have increased remarkably over the past two centuries, which helps explain the geometric growth of pollution over the same period.

Tragedy of the Commons

A second explanation for the increase in pollution can be attributed to the *tragedy of the commons.* This expression refers to medieval Europe, where common grazing areas were set aside for pasturing livestock. Since these "commons" were owned by no one but used by many, there was a tendency for local herders to place too many animals on the commons, with the outcome that the commons became overgrazed and were less productive than they would have been with fewer animals. While all might agree that too many animals used the commons and that community welfare would have been improved with fewer animals, it was detrimental to any individual herder to withdraw livestock from the commons. If the community decided to collectively limit use of the commons, then all would benefit. But even if this agreement could be accomplished, individuals had incentives to "defect" from the agreement and to graze more animals than their quota. Without a better enforcement or incentive mechanism, the result was a "tragedy" in that the commons were overgrazed even though less grazing would have benefited all.

This situation provides an analogy that can be used to partially explain the difficulty in reducing human-generated pollution. The atmosphere, oceans, seas, rivers, lakes, and unproductive land have traditionally been owned by no one but are available to all for use as dumping grounds for the waste streams of human activity. These "environmental commons" are modern-day equivalents of the medieval grazing commons. For much of history, pollution from human activities was small compared with the environmental commons, and the aggregate impact of human pollution on nature was relatively small. But as human populations exploded in the 19th and 20th centuries and polluting activities increased geometrically, the negative impact of human pollution on the environmental commons also exploded. Even if individuals, industries, or communities unilaterally decided to reduce their pollution, each would pay a cost relative to others using the same environmental commons but not reducing their contributions to pollution.

Contractual Ethics and Pollution

One possible answer to the *tragedy of the commons* is *contractual ethics* or *contractualism.* Contractual ethics intends to create rules or contracts by which all individuals in the sphere of the contract must abide. For example, in the case of the overgrazing of a common pasture, medieval communities developed strong rules and cultural norms regarding who could use the commons and how many animals they could graze there. Violators of the rules and norms were subjected to social sanctions such as being prohibited from using the commons in the future.

In more recent times, government agencies have passed laws and established regulations that limit and prohibit certain types of polluting activities and regulate how various forms of pollution are handled. These regulations are binding on all citizens and businesses operating in the jurisdiction, and violators are typically dealt with by the civil and criminal justice systems. By establishing these laws, the tragedy of the commons is avoided because there is no legal opportunity to easily defect and there are significant penalties for those who try. While the costs associated with these regulations are substantial, the costs are distributed across society so that one group, business, or individual is not particularly disadvantaged by the regulations. In general, the intention of government regulation and law is that all parties bear the costs and all gain from the benefits of clean air legislation. In this way, it can be in our rational self-interest to submit to coercive rules and regulations. In many instances, we can all benefit when we mutually agree to restrict our actions and when we can be assured that our agreement will be enforced.

More specifically, contractual ethics posits that groups of individuals form *social contracts* that are mutually coercive and mutually beneficial to members of the group and that mitigate harm to society and promote behavior that is valued by society. These contracts may take the form of government law and regulation, religious creeds and doctrines, industry standards, or third-party accreditations. Note that in some cases participation in the contracts is obligatory (e.g., government law), but in other cases participation is voluntary (e.g., third-party accreditation). As an example of the latter, many firms voluntarily work to be certified by the International Organization for Standards (ISO) as compliant with its ISO 14000 environmental management standards. (ISO is an international nongovernmental organization that sets international standards used by governments and industries around the world.) ISO 14000 is a set of management standards intended to ensure that products and services have the lowest possible environmental impact, and it includes pollution management standards. ISO 14000 is entirely voluntary, but many businesses and governments require that their vendors be ISO 14000 certified, thus bringing economic pressure and industry sanctions to bear on many businesses that might otherwise defect from this "social contract."

The scope of social contracts necessarily expands as human communities grow and increasingly interact with and affect one another over time. In medieval Europe, social contracts governing the use of a commons involved only a single village or manor. In current times, the activities in one nation-state may have a severe impact on the well-being of other nation-states around the world. For example, air pollution generated in the United States causes acid rain in Scandinavia, industrial pollution in China influences weather on the west coast of North America, and carbon dioxide emissions from human sources around the world may contribute to global warming. One of the great challenges of contemporary environmentalism is to develop enforceable social contracts between nation-states that will mitigate and control the harmful effects of pollution on the entire world.

Utilitarian Ethics and Pollution

Utilitarian ethics focuses on the outcomes or consequences of an act (or acts) with the goal of maximizing human pleasure, happiness, and prosperity, or, more generally, human "utility." Utility is defined as the sum of all the benefits and all the harms that flow from an act. The benefits and harms included in utility calculations can include physical pleasure and pain, happiness and distress, wealth and poverty, education and ignorance, beauty and ugliness, and health and sickness, among many others. A utilitarian perspective does not identify pollution as either good or bad. Pollution has no moral content. The rightness or wrongness of pollution depends on the *consequences* of pollution—that is, on the goodness and badness that flows from it.

A general utilitarian view of pollution is that the harm caused by pollution must be balanced against the needs of humankind and the human benefits that flow from pollution-generating activities. For example, coal-burning power plants create energy in the form of electricity but produce air and water pollution as side effects. Humans need energy to flourish but are harmed by pollution. A utilitarian would argue that if the benefits of the energy created by the power plant exceed the harm done by its pollutants, then the "greater good" is served by allowing the power plant to operate.

A utilitarian perspective on pollution has two main attractions. First, it provides a single absolute principle with which to evaluate and judge polluting activities: Does a polluting activity on balance increase or decrease the general welfare of humankind? If yes, then the activity should be undertaken. If no, then it should not. Second, utilitarianism provides a concrete means or calculus to assess morality (e.g., utility maximization) rather than just offering general rules or platitudes (e.g., "don't pollute unless you have to"). Utilitarianism suggests that morality derives from the benefit it provides to humankind and that humankind is not a slave to some external morality—moral actions must benefit humans or they are not moral.

Because utilitarianism fundamentally relies on cost-benefit analysis to judge the ethical content of an act, it is critically reliant on science and scientific reasoning to inform us of the likely consequences of our actions (positive and negative). Science provides utilitarianism with intellectual and rational support, but it also suggests several problems when a utilitarian evaluates polluting activities. First, how can we truly know the consequences of our actions? Second, how do we actually calculate the "greater good" or "maximize utility"? And third, over what time frame should we maximize utility?

Knowing the Consequences

The first problem of utilitarianism is that it is difficult to know all the antecedents and consequences of our actions, and consequently, it is difficult to evaluate the utility of those actions. For example, coal-burning power plants historically create significant pollution, including sulfur dioxide gases that cause acid rain. For many years, power plants have built very tall stacks to better disperse and dilute the effects of airborne and gaseous pollutants. These stacks do, in fact, reduce airborne pollution in the region surrounding a power plant but have the unanticipated consequence of causing acid rain in regions far away from the plant. When sulfur dioxide is launched high into the atmosphere, natural chemical processes convert it to sulfuric acid, and high-altitude winds blow the acid across continents and across oceans. The sulfuric acid eventually washes out of the atmosphere in rain, causing damage and destruction to forests and lakes far distant from the originating power plant. A similar example is the longtime use of CFCs in refrigeration and cooling systems and their eventual effect in reducing upper-atmosphere ozone, thus creating an "ozone hole" over Antarctica during the greater part of each year.

When utilities built power plants with high stacks, and refrigeration companies designed compressors using CFCs, no thought was given to acid rain or ozone depletion because their detrimental effects were unknown and unanticipated at the time the design decisions were made. In fact, high stacks were originally designed into power plants at additional expense to *reduce* regional pollution, but it had the unexpected side effect of increasing pollution farther away. This case provides a good example of the problem of *unanticipated consequences* when evaluating the pollution impact of human activity.

The utilitarian response to the problem of forecasting outcomes is to assert that humans cannot know everything but must still make consequential decisions every day. Even choosing to do nothing is a decision with its own anticipated and unanticipated consequences. Imperfect and insufficient knowledge is a dilemma of human existence that cannot be avoided, so the best we can do is to assess the *expected* utility of an action and adjust to consequences as they occur. In the case of coal-burning power plants and acid rain, retrofitting power plants with stack scrubbers, installing more efficient coal-burning technology, and burning low-sulfur coal has reduced (but not eliminated) the occurrence of acid rain in many parts of the world. To the utilitarian, this is an acceptable outcome. Decisions were initially made to produce needed energy and reduce known sources of pollution, and when new sources of pollution were created and identified, corrective action was taken.

Calculating Utility

A related problem with utilitarianism is that of calculating utility. In the case of power plants and acid rain, what is the true benefit of the energy created by a power plant, and what is the true harm of acid rain? Who decides the relative worth of the benefits and harms? For example, environmentalists and ecologists might assign a very high weight to the harm caused by acid rain and a relatively low weight to the benefit of cheaper electricity. To them, the ecological damage caused by acid rain far exceeds the benefit of more abundant energy and lower electric prices. Conversely, industrialists and urban consumers may ascribe a much higher value to low electric prices than to the health and well-being of fish in a remote lake hundreds or thousands of miles away. How do we decide which perspective is correct, and how do we calculate utility?

The utilitarian answer to this problem is that conceptions of utility evolve over time as a part of ongoing political and cultural discourse and debate. It was once acceptable to dump raw sewage into streams, rivers, lakes, and seas because the amount of sewage was small relative to the size of the waterways and because technology had not evolved to the point where there existed practical alternatives. As populations grow and sewage volumes increase, the harm caused by untreated sewage accelerates, and as technological solutions become available, the relative ratio of harm to benefit of dumping raw sewage changes. While utility was once maximized by dumping raw sewage into waterways, sewage treatment is now the norm in industrialized countries even though the direct costs of sewage treatment are significant. Contemporary debates about environmentalism and pollution change a society's calculation of utility, as does evolving technology and growing human knowledge. The utilitarian perspective is that human culture and the natural world evolve dynamically, and so must our calculations of utility.

Time Frame

A third problem with a utilitarian perspective of pollution is the time frame over which utility is calculated. In many cases, pollution may have long-term effects that are difficult to know and to quantify. For example, a current debate involves the disposal of radioactive wastes from nuclear power plants. All nuclear power plants generate radioactive by-products, some of which will remain dangerously radioactive for thousands and tens of thousands of years. How should we determine the potential long-term harm that these wastes cause? Proponents of nuclear power argue that these wastes can be safely buried in geologically stable formations in areas remote from human habitation. Critics of nuclear power counter that areas that have been geologically stable may become unstable through natural processes and that some future civilization may unwittingly dig into a buried waste dump, unleashing significant radioactive harm on an innocent populace.

The utilitarian answer to the problem of time is similar to the answers to the first two problems: We must make the best calculations of benefit, harm, and net utility that we can, given current human understanding and preference, and then we must be prepared to modify and correct our decisions as history unfolds. In the case of nuclear waste in the United States, the current societal calculation of utility is currently tipped in favor of not interring nuclear waste in central repositories, and nuclear waste remains stored in temporary facilities adjacent to nuclear power plants. As technology evolves and if the environmental costs of burning fossil fuels continue to grow, the calculation of benefit and harm may begin to favor the central burial of nuclear waste even if there is some small chance of a problem in the distant future. Conversely, if there are new nuclear accidents such as Chernobyl or if nuclear wastes are used in terrorist attacks, then calculations of utility may dictate that nuclear power be abandoned altogether as an energy source. Since morality resides in maximizing human utility and not in an act itself, a utilitarian is morally indifferent to the outcome of this debate so long as it ultimately maximizes human welfare.

Contemporary Ethics and Pollution

Attitudes and beliefs about the ethics of pollution are evolving rapidly as global pollution rises and its attendant problems become increasingly a matter of concern. Pollution and its associated effects are being addressed using a variety of controls and methods that reflect the ethical theories of morality, including contractualism, utilitarianism, and rule-based deontology.

Contractual Control of Pollution

The earliest and most prevalent response to pollution has been contractual control in the form of laws, rules, and regulations. For example, in 1306, King Edward I of England banned the use of sea coal in London because of the smoke it caused. In the 1880s, Chicago and Cincinnati passed clean air legislation to cope with the rapidly declining air quality. In the United States, the federal government passed a series of Clean Air Acts in 1955, 1963, 1970, and 1990 that addressed air quality standards, motor vehicle emissions, toxic air pollutants, acid rain, and stratospheric ozone depletion. In 1972, the Federal Water Control Act was enacted, which requires (with subsequent amendments) a permit to discharge pollutants into navigable waters, funds the construction of sewage treatment plants, and establishes water quality criteria for the Great Lakes. Similar laws and regulations have been established in the European Union and Japan and are under consideration in rapidly industrializing countries such as India and China. In 1991, Germany passed its so-called Green Dot legislation, which requires manufacturers to take back and recycle packaging associated with their products, and is considering legislation that would require manufacturers to accept the return of their products at end-of-life for recycling. In 2005, the European Commission issued a directive for all members of the European Union to develop recycling plans similar to Germany's.

Globally, signatories of the United Nations Kyoto Protocol agreed to reduce emissions of carbon dioxide, methane, nitrogen oxide, and CFCs by 5.2% compared with their 1990 levels. The Kyoto Protocol is an international treaty negotiated in Kyoto, Japan, in December 1997, with the intent of reducing the long-term concentration of atmospheric GHGs, which are implicated in global warming. By September 2005, 156 countries had ratified the agreement, with the notable exception of the United States, which argued that the treaty would cause undue hardship to the U.S. economy. The unwillingness of the United States to sign the Kyoto Protocol illustrates the difficulty in establishing voluntary contractual obligations between independent parties.

Utilitarian Approaches to Pollution

Over the past decades, considerable work has been undertaken to better understand and measure the impacts of pollution on general welfare and to modify the decision making of individuals and organizations. These include better accounting for the externalities of polluting activities, creating economic incentives to reduce the propensity to pollute, and technological innovations to directly reduce and eliminate pollution.

Accounting for Externalities

To better incorporate environmental externalities, some have advocated the use of a *triple bottom line*, which includes both social and environmental measures of performance as well as the traditional financial measures. Corporations, governments, and nonprofit organizations would include data on each of these three criteria as part of their normal reporting requirements and would be accountable for social and environmental performance just as they currently are for financial performance. One problem with the triple-bottom-line concept is determining standard metrics so that organizations can uniformly and comparably report social and environmental performance. Critics also argue that the triple bottom line diverts organizations away from their core competencies on which society relies. We do not expect social service agencies to build automobiles, and equivalently, we should not expect automobile manufacturers to provide social services. But despite problems and criticisms, many organizations now report their environmental and social performance in addition to financial performance.

Economic Incentives

A number of economic incentive structures have been proposed and implemented to help reduce pollution. Perhaps the most innovative is the creation of pollution markets where companies buy and sell rights to pollute using tradable pollution permits. Government agencies set upper limits or quotas on the aggregate amounts of a particular type of pollution (e.g., carbon dioxide) that can be discharged annually, and companies bid for pollution credits that assign them a fraction of the total quota. Companies that invest in pollution abatement equipment or newer, less polluting processes need to purchase fewer credits, while those with older plants need to purchase more credits. Markets for pollution credits provide economic incentives for firms to invest in pollution control activities and penalize those that do not. Over time, controlling agencies can reduce pollution caps or quotas, thus increasing the price of pollution credits and reducing the total amount of pollution allowed. A number of emissions trading markets currently exist, including the European Union Greenhouse Gas Emission Trading Scheme, which trades carbon dioxide emissions; the voluntary Chicago Climate Exchange, which trades carbon dioxide and sulfur dioxide emissions; and the regional exchanges in Illinois and New York.

Another approach to economic incentives is to directly tax polluting activities and products with the so-called "green taxes." Examples of green taxes include carbon taxes on fossil fuels, garbage disposal taxes, taxes on effluents and hazardous waste, and taxes on end-use products such as gasoline and gas-burning vehicles. For example, Germany has green taxes on petroleum and fossil-fuel-generated electricity. By directly taxing polluting activities and products, economic incentives are created for producers and consumers to switch to less polluting equivalents; for instance, power companies are encouraged to increase investments in renewable energy sources such as wind, and consumers are encouraged to switch from gasoline-powered autos to hybrid autos.

Innovation

A third utilitarian approach to the problem of pollution is technological and procedural innovation, which reduces pollution by inventing new processes and products that inherently generate less pollution than the incumbent alternatives. These innovations can include management and procedural innovation in addition to hard (physical) technological innovation.

For many years, the mantra for mitigating pollution has been "reuse, recycle, and reduce." Perhaps the easiest means to delay pollution is to reuse materials and products rather than throwing them away after one use. When materials and products have reached the end of their useful life, they can be either discarded (often in a landfill) or recycled. Recycling is the process of reprocessing materials and components into other useful products and materials. The third "R" is reduction of the amount of materials consumed; this is sometimes called *dematerializing.*

On a larger scale, businesses and governments are investing heavily in developing alternative energy technologies to supplement or replace fossil fuel power. Since the power industry is a large contributor to global pollution, finding cleaner methods to generate electricity could have a significantly positive impact on pollution levels around the world. Candidates include wind, solar, geothermal, and tidal power technologies, as well as others that are more speculative. In addition to investigating new power-generating technologies, electric power industries are also developing cleaner methods to burn traditional fossil fuels, such as fluidized bed coal technology, which improves efficiency while reducing pollution.

Industrial Ecology

A related approach to pollution is that of *industrial ecology*, which proposes that humans shift from open-loop to closed-loop industrial systems. In open-loop systems, resources are extracted from the environment, consumed, and then discarded as waste and pollution. In contrast, closed-loop systems use the waste stream of one process as the raw material or feedstock of another. The perspective of industrial ecology is that industrial processes are not separate from the biosphere but rather are a part of it in a larger ecosystem. Just as in nature, the wastes of one species are usually a resource for other species, so too the waste streams of one industrial process can be a resource for other processes. For example, the warm water generated from the cooling towers of a power station might be used for fish farming rather than dumping it into a nearby river and changing the area's ecology. By treating industrial and economic activities as closed-loop systems, we may significantly reduce pollution and ultimately reduce costs by reusing material resources rather than discarding them. The promise of industrial ecology and other utilitarian approaches to pollution is to help provide humanity with the methods, means, and incentives to live in sustainable equilibrium with the natural world.

Pollution Externalities, Socially Efficient Regulation of

In economics, an externality is a benefit or cost that accrues to some entity that is a third party to the market transaction. Because under an externality the market price of the good will reflect the benefits and costs of the buyers and sellers of the good but will not incorporate the costs or benefits affecting the bystanders affected by the production or consumption of the good, the market will generally fail to provide these goods in socially optimal quantities. Viewed in this manner, an externality is the difference between the public and private costs (or benefits, depending on the nature of the externality) of a market activity. In the case of positive externalities, output will be below the socially optimal level, while negative externalities will be associated with output in excess of the socially optimal level.

One classic example of a negative externality is the production of pollution. When the externality occurs on the production side, it may be that a firm generates pollutive wastes in the course of producing a good. Generally, the producer will not incorporate the costs those wastes may cause on society in the price of the good. As a result, the good will be underpriced in the market, relative to the socially optimal level, and thus overconsumed. An example of a pollution externality on the consumption side might be the air pollution generated as consumers drive motor vehicles. The price of the car and the price of the gasoline, in a completely free market, are unlikely to include any costs related to this pollution.

Equilibrium output in the market occurs, and economic welfare is maximized, when output is produced at the level where marginal revenue equals marginal cost. In competitive markets, price equals marginal revenue. In both competitive and concentrated markets, the structure of supply and demand will determine the marginal revenue and price. However, the supply and demand in these cases will only reflect the private costs and values to the market participants: the buyer and the seller. A benevolent social planner would view a different set of costs or values. In the case of pollution generated during the production of a good, the planner would realize a supply schedule that reflected higher costs: costs that included both the private costs and the third-party (public) costs. As a result, a market operating under the planner's considerations would charge a higher price for the good and produce a lower quantity of output.

Mechanisms to change the level of output and the price of a good associated with a pollution externality are varied. Private solutions are occasionally possible for some externalities; and the Coase theorem implies that if private parties can bargain costlessly over the allocation of resources, they can internalize the costs and benefits and solve the problem of externalities on their own. It can be difficult to reach such agreements or enforce them without cost, especially when they involve a large number of economic agents; and the assignment of rights that often must exist for the theorem to work may also be difficult to accomplish or enforce. As a result, public solutions to externalities have often been pursued.

Public policies regarding pollution externalities can take one of two approaches, a command-and-control approach or a market-based approach. The command-and-control approach involves output restrictions, requirements to use specific technologies, or even outlawing of certain types of releases. Market-based approaches attempt to use incentives to align private interests with social goals. Arthur Pigou (1877–1959) was an early advocate of addressing the difference between private and social costs through the use of taxes and subsidies, and taxes and subsidies to correct externalities are thus often referred to as Pigovian taxes or subsidies; for instance, a tax such as a specific levy for each amount of pollution produced is a Pigovian tax. Firms are free to choose how, or if, they wish to reduce their pollution, and policy makers, by setting the tax at different levels, can control how rewarding it is for firms to pursue pollution reduction. Presumably, the tax would also generate revenue that can be used for environmental cleanup or to otherwise alleviate the social costs that remain and are still externalized. Unlike most other types of taxes and because they correct externalities, Pigovian taxes increase economic efficiency. Unlike command-and-control approaches, the tax structure also provides a set of incentives to continue pollution reductions, whereas the maximums permitted under command-and-control policies tend to also become the minimums.

Tradable pollution permits are another major market-based approach to reach socially optimal pollution levels. Under this approach, the government can decide on the amount of pollution that is permissible and then sell permits to emit the pollution. Firms in industries where alternatives to pollution are not available or are very costly will be more willing to pay for the permits than those firms in industries where pollution control is less costly. However, such market-based solutions may fail when there is no acceptable level of pollution or when the administrative costs are prohibitive, such as would be the case in levying a charge on consumers for individual vehicle emissions.

Information demands play a large role in the success or failure of most pollution control policies. Command-and-control approaches require policy makers to know what technologies are available for industries and to have detailed knowledge of the firm and its costs and activities. Often this information is difficult to obtain. Pigovian taxes have fewer knowledge requirements, but the taxing authorities must know the market demand for the firms to correctly set the taxes at a rate that will result in the optimal output level being reached. Tradable pollution permits have the lowest information requirements in that an output level is chosen and the market then allocates the ability to pollute where it is of greatest value.

All approaches to the socially efficient regulation of pollution externalities are limited by the difficulty of determining what the socially optimal or economically efficient level of pollution output should be. Policy makers, much like individual firms in the market, will seek to equate the marginal benefits of pollution control with the marginal costs of that control. However, determining the marginal benefits of additional pollution control can be difficult, if not impossible. Measurement of the marginal costs of pollution control can be extremely difficult, even under market-based approaches, where the impact of any costs will not be uniform across producers, industries, or geographic regions. Under any approach, the affected profit-maximizing firms will seek to pass on the additional costs of pollution control to consumers, and their ability to do so will depend on how responsive consumers and other economic agents are to price changes. Similarly, different groups or types of consumers are likely to be affected differently by any increased pollution control costs a firm is able to pass on. As a result of these sorts of challenges, it can be very difficult for policy makers to determine the optimal level of pollution that yields economically and socially efficient outcomes.

POLLUTION RIGHT

Polluting, or contaminating, the environment is widely recognized as an undesirable by-product of both good and bad activities. For instance, animal waste in a stream could be an undesirable effect of the desirable activity of raising cattle. Similarly, the production of power in power plants is a beneficial and necessary activity, yet such plants emit significant amounts of the pollutants sulfur dioxide, nitrogen oxides, carbon dioxide, and mercury. Many industries emit harmful products and gases into the environment, all of which are either man-made or facilitated products of manufacturing. Barring a technological miracle, a certain amount of pollutants in the environment is a necessary evil in many activities.

The fact that pollutants are viewed as an acceptable by-product of certain activities that are desirable to the economy gives rise to the precept that, at least to a certain degree, people have a right to pollute. Understandably, many individuals and groups concerned with the environment seek to limit that right. Some of the many issues related to the right to pollute are the following: To what degree is pollution acceptable? What kinds of pollution are tolerable? and What are the means for limiting such pollution?

Federal and state governments have attempted to provide answers to these questions, in part, by setting limits on the amount of pollutant emissions that companies may acceptably produce and levying fines against those companies that are out of compliance with such levels or even types of pollutants. For example, federal legislation provides that a power plant be allowed to emit a certain level of sulfur dioxide. Legislation also provides that credits for the right to pollute be distributed at no cost to power companies. All pollution emitted by the power companies reduces their allocation of pollution credits. If a company successfully reduces its emissions to amounts below the prescribed allowable levels, the remaining credits can be banked for later use by the company in its existing or potentially expanded operations. Alternatively, such pollution credits may be traded, or sold, to other companies that are still exceeding the required maximum emission levels under the federal statute, thus enabling such businesses to continue in existence rather than allowing regulation to result in their closure. These marketable pollution rights allow businesses to sell the right to pollute to one another.

Although the right to pollute is thus legally traded, the question of the ethics of such trading confronts society on many levels. Research claims that more African Americans than whites live near power plants, thus exposing them to greater pollution risks. The fact that power plants are allowed to purchase the right to pollute means that such a right may affect African Americans at a greater rate than whites, leading to allegations of discrimination against such a right. Pollution rights given to businesses enable industry to cut the costs of polluting, but it is arguable whether the sale of pollution rights results in any significant decrease in pollution overall. The caps on emissions themselves are the vehicle designed to decrease pollution. However, if a plant is emitting pollutants at a greater level than the cap allows, significant fines can be avoided by purchasing the right to pollute in excess of such a level at a lower cost to the business than the potential fine. This situation encourages the economic growth of industry but may not have the desired effect on the overall reduction of pollution levels, at least in certain areas.

Ponzi Scheme

A Ponzi scheme is a variant of the centuries-old fraud popularly known as "robbing Peter to pay Paul," which requires luring an initial group of gullible investors by offering them an improbably high return on their money, presumably made possible by investing their funds in a superbly profitable business venture. In reality, this great enterprise is either nonexistent or is merely a front, and the initial investors are actually paid with the funds provided by a second group of investors. These, in turn, are paid with the funds provided by a third group, and so on. The term *Ponzi scheme* is now used generically to describe all such swindles.

This type of fraudulent scheme takes its name from the Italian immigrant Charles Ponzi (1882–1949), who in 1920 promised a 50% profit in 45 days to investors in his newly created firm, the Securities Exchange Company. This generous offer implies an annual rate of return exceeding 2,500%, whereas banking interest rates at the time hovered around 5% per annum. The company's ostensible goal was to use those funds to profit from the even more fabulous arbitrage opportunities available by trading in international reply coupons. Each coupon was redeemable for a postage stamp in more than 60 countries belonging to the Universal Postal Union and, thus, effectively functioned as postal currency.

The geographical arbitrage Ponzi claimed to exploit sprang from the fact that the purchase price of a postal coupon differed across countries, after adjusting for currency exchange rates. Ponzi's company allegedly profited from these price disparities by purchasing international reply coupons in a country where they were cheap, exchanging them for stamps in a country where the coupons were expensive, and selling the stamps for cash.

The final step of this arbitrage cycle was the hardest to execute, and Ponzi never revealed how he managed to cash the stamps, saying only that the cashing mechanism was "his secret." Furthermore, analysts noted that the necessarily small value of each coupon meant that Ponzi's company could only profit by purchasing an inordinately large number of them, far in excess of the relatively meager worldwide supply required for purely postal transactions. These and other contemporaneous objections did not deter the swarm of mostly small investors eager to exchange their hard-earned money for "Ponzi notes" issued by the Securities Exchange Company. Indeed, in less than 1 year, more than 30,000 individuals invested a total of nearly $10 million in the fledgling enterprise.

Alas, the arbitrage cycle described by Ponzi was just a ruse. In August 1920, Ponzi's scheme unraveled after the press revealed that Ponzi had served jail time in both Canada and the United States. As a result, the flow of fresh funds came to an abrupt halt, the Securities Exchange Company could no longer meet its financial obligations, and Ponzi was tried and convicted for fraud. After spending several years in jail, Ponzi was deported to Italy in 1934. He later went to Brazil, where he died penniless.

Population Growth

According to the *United Nations,* the demography of world population will change dramatically in the near future. The changes will have a major impact on the economies and lifestyles of societies, particularly in industrialized nations, which may lead to the redistribution of global power and wealth. A brief history of population growth is first discussed and analyzed, followed by an analysis of consequences of the new demographic challenges of aging populations and varied birthrates throughout the world.

Population Growth

At the onset of the 21st century, a population explosion seems to be the biggest challenge of the years ahead. The long hours of morning and evening commutes, traffic jams, environmental pollution, the growing competition for parking spaces in malls during holiday seasons, and many other nuisances of our everyday life are making us realize that our planet is getting crowded. Furthermore, starvation in many parts of the world due to inadequate food supplies, residents living in areas prone to flooding, wars waged over scarce resources, illnesses, and so on, are other constant reminders of a burgeoning population, particularly in the developing world. But how fast is the population really growing? Should we be concerned? Will our children's lives be affected by it?

A review of history will reveal the true nature of population growth throughout the globe. During the first millennium, humans survived with minimal population growth. According to the demographer Massimo Livi-Bacci, from the University of Florence, the estimated growth rate of the world's population from CE 1 to 1750 was just 0.064% per year. The total world population in 1750 was less than 800 million. The life expectancy remained the same, at about 25 years, between the years 500 and 1750. Later in that century, infant mortality rates fell significantly, primarily because of improved pediatric care and better hygienic living conditions. This led to rapid population growth, especially in the European countries. The growing population of the poor and middle classes demanded a greater share of wealth, thus leading to the revolutions in Britain and France and ending monarchic rule in both countries during the 19th century.

The fast growth in population during the 18th and 19th centuries made the leaders of the European societies concerned about maintaining the balance between the human population and the availability of natural resources. A famous demographer and political economist during that period, Thomas Malthus, discussed the fate of humankind in his *Essay on the Principle of Population* in 1798. He famously predicted that because of the limited land on earth, food production in the world would not be able to keep up with the geometric growth rate of the human population. He did not, however, foresee the coming of the Industrial Revolution, which dramatically changed everything from food production to the standard of living in the next two centuries.

The Industrial Revolution started slowly in Europe but quickly gained momentum. By the late 19th century, people in Western Europe and North America were enjoying the prosperity brought to them by new technologies. The population growth enhanced technological progress, especially in medical science and practice. At the same time, the abundance of food, energy, and other useful goods and the efficiency of distribution of all commodities in these societies resulted in population growth in these parts of the world. Human consumption per capita also increased at a faster pace than ever imagined. Arts and science flourished in this century, resulting in a better lifestyle for humankind.

Though most of the innovations and industrialization processes started in the European countries and the United States, they were gradually diffused throughout the European colonies, located in different parts of the world. The life spans of people started to increase due to better food supply and improved social hygiene and public sanitation by the end of the 19th century. Even though we have had natural disasters and wars, the world population has increased sharply since 1900, according to UN estimates. The graph in Figure 1 indicates the nature of population growth since the beginning of civilization. It shows how world population more than doubled during the last half of the 20th century.

According to the latest UN estimate, if growth continues at the current pace, the world population will reach 11 billion by the end of 2050. Yet many

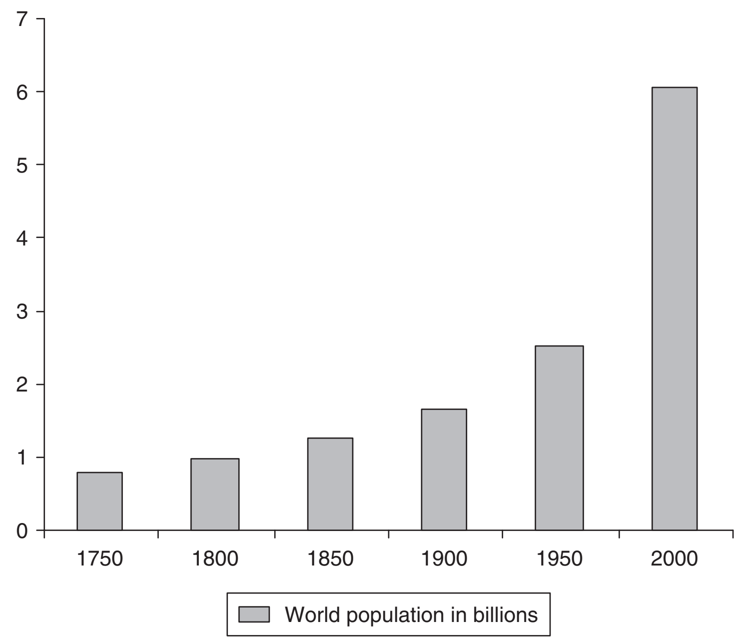

Figure 1 World Population Growth Between 1750 and 2000

Source: United Nations Population Division.

demographers have noticed that growth rates are not staying the same but are declining, particularly in most industrialized nations. Thus, the future population growth in many parts of the world remains uncertain.

Analysis of Population Growth Rates

As noted before, while the world population has been growing over the years, the population growth rate has been declining in most regions, particularly in the developed world. It reached its peak at 2% in the 1960s and had declined to 1.2% by 2005. According to the 2005 UN report, without any significant change in current trends, particularly in most regions of the developed world, population growth will slow down and eventually stop, and then the population will start declining. It has been projected that the world population will level off at just above 10 billion by the year 2200 before it starts declining. Many developed countries—for instance, Japan and Italy—already have zero growth rates, and Germany and Russia have negative growth rates. The United States is still able to maintain a growth rate of 0.91, compared with Canada and Great Britain at 0.88 and 0.28, respectively.

The main reason behind such low growth rates is the drop in fertility rates throughout the world. Most nations are unable to meet the minimum required fertility rate of 2.1 children per woman. Many developed countries, such as the United Kingdom (1.66), Germany (1.39), Italy, Spain, and Russia (1.28), Japan (1.4), Turkey (1.92), Canada (1.61), and Australia (1.76), are all below the fertility replacement level. The United States is one of the few industrialized nations that is still able to maintain the minimum required fertility rate of 2.1. The two most populous countries in the world, China and India, have current fertility rates at 1.73 and 2.73, respectively. In contrast, many countries in Africa and parts of Asia and the Middle East have maintained high fertility rates—for instance, Afghanistan (6.69), Bangladesh (3.11), Ethiopia (5.22), Nigeria (5.49), Pakistan (4.0), Saudi Arabia (4.0), and Yemen (6.58). This may result in a new demography in the coming years, with higher and younger population densities in these parts of the world. Nevertheless, the average fertility rate for the world today is 2.59, a little above the replacement level.

Some of the probable causes for this worldwide reduction of fertility rates are the rise of urbanization, feminism, female education and participation in the workplace, social and government policies for population control in developing countries, the availability of contraception and the legalization of abortion, and the rising cost of raising children. Also, reduced infant mortality indirectly is causing fertility rates to fall. A range of lifestyle and environmental factors such as smoking, alcohol consumption, and exposure to chemicals can also affect a couple's fertility, especially for women. Epidemics such as AIDS have also had a devastating effect on population growth in many areas. Women with the HIV virus have lower fertility rates than do women without it. In some Asian countries, governmental birth control policies and the use of modern medical technology for sex identification and abortion are resulting in a sudden increase of the male-to-female ratio. This is especially worrisome for countries with large populations, such as China and India. History has shown that higher male-to-female ratios have resulted in increased violence in such societies.

Coping With Depopulation

Nations with fertility rates below replacement levels are trying different ways to improve their situations. Russia is planning to adopt a 10-year program that will encourage women to have children by providing them with financial incentives and subsidies. Australia is offering a $4,000 tax-free bonus for every baby and is also committed to pay all child care costs for women who want to work. Many of the developed countries (e.g., France, Italy, Poland, and Japan) have offered some combination of bonuses and monthly payments to families. Singapore spends $3,000 for the first child, $9,000 for the second child, and up to $18,000 each for the third and fourth children.

Immigration is another option for these countries, which they are considering with caution. Japan, Russia, Germany, France, Singapore, and other countries recently have liberalized their strict anti-immigration laws in response to their acute population implosion problem. At the same time, these nations are afraid of losing their identity by bringing in an influx of immigrants. Also, changes in their societies are needed to encourage and welcome immigrants. According to the UN population report, there is a growing interest among governments, civil society, the private sector, and others in capitalizing on the benefits and minimizing the negative consequences of migration.

The United States is the largest industrialized economy of the world that is still able to maintain its fertility rate at the minimum replacement rate of 2.1. The United States ranks third after China and India on current population count, and it is projected to stay in third place after India and China in 2050. Part of its success in maintaining a modest growth in population is due to its liberal immigration policy, which accounts for 40% of its population growth annually, up from 24% in the 1980s. Where many countries are fearful of losing their identity, diversity in population has been promoted as the unique identity for this nation.

Aging Nations

Life expectancies of the world's peoples have grown more over the last half century than in the previous 5,000 years, mostly due to the reduction in infant mortality rates, improvements in lifestyles, and the excellence of modern medical systems. Even the developing and underdeveloped countries are able to save their infants and children from many life-threatening diseases by providing vaccinations on their own or with the help of the United Nations. Currently, only 12% of the population throughout the globe is over age 65, but this is projected to reach close to 21% by 2050. Most of the European nations and Japan are already facing a faster increase in the number of retirees than in the number of new workers in industry. China will experience one of the fastest aging populations during this generation, making it older on average than the United States by 2015.

As per the prediction of the United Nations, the median age of the world population will rise from 26.4 today to 36.8 in 2050. More precisely, the median age will be 45.2 years in developed nations and 35.7 years in less developed nations. Currently, Japan has the oldest population, with a median age of 41.3 years. People age 80 and older are the fastest-growing segment of the population in this century.

The graying of its population poses a serious threat to any nation's economy. In all industrialized societies, working adults are providing for underage and retired nonworking populations. The public pension systems, similar to the social security systems in the United States, support the elderly when they reach their retirement age. This would probably work in the long run if the population of new workers and retirees remained the same. However, the enormous increase of retirees and the severe reduction in the working population will strain the tax burden of working adults over the next decade, since the latter are contributing to the social security system through payroll taxes.

Also, providing health care for the aged population will cost nations dearly. In the United States, people over 65 years of age, roughly 12% of the current population, are consuming 38% of all health care costs. With rising health care costs and the increase in the older population, governments of these aging nations will have to decide whether to reduce the promised pension and medical care benefits or increase payroll taxes on the shrinking numbers of workers. Providing the necessary benefits to the elderly without compromising the working adults' financial status poses a challenge to our political leaders and to our society.

Most developing and underdeveloped countries are without established government programs for financial and health benefits for the elderly, who will face a more difficult challenge. For example, populous countries such as China and India will have a huge population of elderly people in the near future with neither any government benefits nor any personal savings. Moreover, the working adults in these countries are continuously migrating toward the mega cities, leaving their old relatives behind without any financial or medical help. Another drawback of aging nations is the short supply of creativity and innovation. Studies have shown that these qualities flourish in people of younger ages. The nations with higher median age will lose their competence in these sectors.

However, there are some positive outcomes in countries with an aging population. These countries will see a substantial reduction in their crime rates. New business options such as asset management, health care, cosmetics, plastic surgery, exercise training and equipment, and so on, will be created to cater to the needs of the vast elderly population. Marketers and media will continue to create a whole new set of products targeting these senior citizens.

New Demography Equals New Challenges

The combination of reduced fertility rates and the fast growth of the aging population has a tremendous effect on a nation's economic, military, and geopolitical situations. The declining labor force will result in reduced gross domestic product (GDP) growth, which has been projected to be 0.5% to 1% per year between 2010 and 2030. According to a study by the McKinsey Global Institute, the household financial wealth of the top two European nations, Germany and the United Kingdom, will decrease 25% and 34% in the next 20 years. The slowdown in savings and accumulation of financial assets in Europe's wealthiest countries could deter economic growth severely.

Military forces of today's powerful and wealthy nations will experience major changes in their internal and external security systems. Military expenses might be curtailed to pay for the needs of the ever-growing aging population. Also, reduced numbers of youths may result in smaller armies. Reductions in police forces could encourage *more* criminal and terrorist activities in the world. Nations will have to choose among a limited number of young adults and decide whether to send them to the military and police forces or keep them working in industry.

Governments will have to find new strategies to control their budget deficits, keeping taxes low for the working population and at the same time providing for the needs of retired people, and keeping their countries secured internally and as well as in the global arena. Since population density will increase in developing and underdeveloped countries, global powers among the nations will be redistributed depending on the economic and military strength of the nations. At the same time, these countries with higher populations will also have to struggle with ethical issues such as alleviating hunger for the poorer classes, putting the brakes on the overcrowding of cities, and eradicating contagious diseases, among other things. Bridging the gap between the haves and the have-nots will be one of the most pressing problems for governments in these regions.

The forecasted recent population growth followed by future population decline presents a multifaceted challenge for our generation. The uncertainty and challenges of the future demographic mosaic portend an unclear and doubtful future. The result might be a redistribution of global power and an increased interest on the part of national governments in implementing effective economic, humanitarian, and environmental policies as well as evaluating their ethical and practical implications.

Pornography

Pornography can be defined as material whose primary purpose is to sexually arouse its consumer. It should be distinguished from material that is sexually explicit but does not have as its intention the arousal of the consumer (e.g., a medical textbook on human reproduction) and material that is not sexually explicit but may unintentionally arouse a consumer (e.g., an ad for shoes that appeals to a foot fetishist).

Because the term *pornography* is almost always used in the pejorative, the term *erotica* is often employed as an alternative for sexually suggestive material that is not degrading or dehumanizing. For instance, in an attempt to cast pornography in terms of harm rather than content for the purposes of legislation, Catharine MacKinnon and Andrea Dworkin define pornography specifically as graphic sexually explicit work that subordinates women through pictures and words. However, attempts to distinguish between "good" pornography and "bad" pornography often crash on the rocks of subjective taste; one person may find Rodin's *The Kiss* pornographic, and another may feel that Reage's *The Story of O* is a nice piece of erotica. The distinction between "hard-core" and "soft-core" pornography is likewise slippery, though the latter often indicates simulated sex and no images of genitalia.

Pornography is not a legal term. Instead, the courts use the term *obscenity* to refer to material that falls outside the protection of the First Amendment. What qualifies as obscenity is determined by a three-part test: An average citizen applying community standards would find that the work appeals to prurient interest; the work depicts, in a patently offensive way, sexual conduct as specifically defined by the applicable state law; and the work taken as a whole lacks serious literary, artistic, political, or scientific value. Despite this test, it is easy to sympathize with Justice Potter Stewart's famous comment that despite his own doubt that he could succeed in intelligibly defining pornography, he knows it when he sees it. Definitions that depend on community standards encounter a problem when public proclamations and private behavior do not coincide. When, for instance, the percentage of homes that order pay-per-view pornography greatly outweighs the percentage of those who claim to favor a total ban on pornography, a decision must be made whether a community standard is defined by what people profess to believe or by their actual behavior.

Another issue in the definition of pornography is its medium of presentation. Photographic and filmic images are generally considered of a different order than written pornography, because of the mass extent of their distribution and exhibition, because of the profilmic reality of actual bodies and activities, and finally because the sense of reality that photography-based images convey makes them more likely to be accepted as reality and thus to influence social behavior. The advent of computer technology has greatly eased and expanded the transmission of pornography. The use of company computers by employees to find and view pornographic material has become one of the primary arguments for monitoring computer activity in the workplace in recent privacy disputes. Computers have also introduced a new class of images—namely, digital illustrations that have the appearance of photographs. Such "virtual pornography" has been at the center of recent court cases that hinge on photorealistic, sexually explicit images of children that were not created using actual children.

Despite its air of disrepute, the pornography industry is a multi-billion-dollar business. Although the actual distinction might seem slight, there is an enormous difference in public presentation between companies that produce pornography and those that merely distribute it. Hotel chains, for instance, make millions of dollars from selling pay-per-view access to pornographic films yet do not brand themselves as part of the adult-entertainment industry. Certainly, it raises eyebrows when a company refuses to publicly discuss a service that makes up a significant portion of its revenue stream. Some socially responsible investment funds, primarily Christian but also feminist, make a point of not holding stock in such companies.

Market forces seem to have the effect of simultaneously encouraging both less tasteful and more tasteful content. Some argue that the consumption of pornography follows an escalating curve, as a user becomes desensitized to certain content and seeks out more extreme forms. Such a pattern encourages producers to continually top themselves by pushing the boundary of the acceptable. At the same time, the identification of women and couples as an untapped and growing market for pornography has resulted in attempts to create more tasteful forms of pornography, such as films with more narrative content and less fascination with anatomy.

Pornography and Harm

Discussions about the harmful effects of pornography usually focus on its consumption, but a case can be made for the deleterious effects on those involved in its production, such as the abuse of children that results from the creation of child pornography. The coercion of female performers can be explicit or may take subtler forms, such as the lack of economic options for women. Recently, emphasis has been placed on the health risks to performers, in particular exposure to the HIV virus. But these arguments can play into the hands of the defenders of pornography; greater public acceptance of pornography as a conventional business might result in greater self-regulation, including greater worker protection. With regard to public safety, pornography can be lumped with alcohol, prostitution, the drug trade, and gambling. Given the impossibility of completely uprooting such vices, some argue that it would be better to raise them out of their *demimonde* status so that they could be properly regulated by state, union, and market forces. A full legalization of various forms of sex work removes the surrounding criminal infrastructures and might better ensure the well-being of both producers and consumers.

Such arguments must take into account, however, the effects of pornography on consumers and society. The most serious and the most contested link between pornography and behavior is rape. Among those who argue for such a link, there is some disagreement about the definition of pornography. Some argue that pornography that includes violent content belongs to a special class, whereas other commentators argue that it is merely a difference in degree rather than kind. The depiction of women as objects of violence is merely a logical extension of the depiction of women as endlessly available sexual objects in "nonviolent" pornography, and both lead to the same result. The exact definition of "violent" and "degrading" pornography has also been thrown into question by the case of lesbian-produced sadomasochistic pornography, material the defenders of which say is an expression of a consensual, positive subculture despite its outward similarity to humiliating images in heterosexual pornography.

In any case, a definitive link between rape and pornography is difficult to either prove or disprove. Both detractors and defenders of pornography too often fall back on anecdotes and speculation rather than scientific certitude. While there is no reason to doubt the sincerity of antiporn feminists, there are those in the procensorship camp who have seemingly used the threat to women as a red herring. According to some activists, the 1992 Canadian Supreme Court decision that redefined obscenity explicitly to protect women from pornography's harmful effects was subsequently used by customs agents to specifically target gay and lesbian pornography, work that either didn't feature women at all or was produced by and for women.

But even if the link between pornography and nonconsensual sex is impossible to prove, other consequences must be considered. Acts of violence toward women, such as rape, are just the far end of a continuum of negative behavior toward women that may be caused in part by pornography. A full accounting of pornography would have to take up a much broader conception of public good, one that would include more intangible elements, such as women's self-image, gender equality, and the quality of relations between men and women. Such an account would have to include the relatively new concept of "pornography addiction," which places this product in the same class as cigarettes, alcohol, and gambling. The possibility that their products are potentially addictive, even if in just a small minority of users, raises special ethical concerns for companies involved in the production and distribution of pornography. A perhaps more immediately tangible harm can be seen in the effects of pornography distribution in particular neighborhoods. Zoning laws cite public good in regulating where sex shops and strip clubs can be located. Such legislation, however, must take into consideration the fact that such laws have the effect of protecting one area at the expense of another.

Another major concern is the potential direct and indirect effects of pornography, a product designed exclusively for adults, on children. The issue of children's exposure has come to the fore with the ease of access to pornography on the Internet, where the general anonymity of computer users makes it difficult to offer content to some and restrict it from others. An extreme case is the anecdotal evidence that sex offenders use pornography to entice minors into performing sexual acts. Some studies claim that the age of exposure to pornography correlates with the age of first sexual activity. But given the inconclusiveness of the debate surrounding the effects of violence in the media on children's behavior, it is unlikely that there will soon be any definitive evidence of the harmful effects on children of exposure to adult material.

Moreover, it is not surprising to note the changing standards of what constitutes a negative effect. For instance, earlier studies of pornography repeatedly decry the fact that it causes deviant behavior such as homosexuality, an argument that today lacks force when a substantial portion of the public no longer believes that homosexuality is either "caused" or "deviant." Indeed, there are those who argue that pornography not only is harmless but also has generally beneficial effects. One rather crude argument is that pornography can function as a form of "safety valve," allowing for a safe release of sexual pressures that might otherwise lead to antisocial behavior. Some propornography feminists argue that both the production and the consumption of pornography by women is a step in reclaiming their sexuality. Sexual minorities can point to pornography as a realm that validates their sexual identity and behaviors in the face of a disapproving culture. Defenders of pornography also argue that excessive censorship will have a general chilling effect on free speech. Such a position may concede that pornography results in concrete harms but asserts that they are outweighed by the potential harms of restricting free expression.

Positive Economics

Economists have long subdivided their discipline into two branches: positive economics and welfare economics. Positive economics aims to be scientifically descriptive (what is) and predictive (what will be) of objective facts. While positive economics emphasizes a purely scientific methodology, whether any social scientist can be truly unbiased with respect to facts or values is open to serious question. This approach to economics invokes the positivism associated with the French sociologist Auguste Comte (1798–1857). Comte advocated the application to social studies of the methodology of observation and experimentation then developing in the natural sciences (e.g., physics and chemistry). For Comte, positivism was the third and final stage of human reasoning, succeeding the previous metaphysical and theological stages for explaining causality (i.e., why reality is the way it is). The positive economist functions as a scientist studying phenomena; but human behavior is not necessarily subject to something analogous to the fixed physical laws of nature. This purely scientific approach to human behavior applies often unrealistic assumptions to predict long-term outcomes such as unemployment trends or equilibrium between supply and demand and neglects to include descriptive measures of the short-term consequences borne by real people, who may suffer unemployment or shortages of housing and health care. The purely scientific approach deliberately eschews subjective value judgments, regarded as strictly the province of welfare economics. Positive economics is thus unable to address ethical dilemmas. These two limitations of positive economics are addressed below.

The Is-Ought Distinction in Economics

The two branches of economics closely parallel the is-ought (or descriptive-normative) distinction in ethics. This fact-value distinction is of long standing in economic literature. Positive economics came from a conscious decision to simplify the problem of economic analysis. The social and moral sciences deal with very complex considerations. To enable more rapid progress of knowledge, social scientists in the 19th century decided to divide the scope of political economy (as economics was then called) into two branches with different methodologies. A normative branch would focus on policy making for a moral society and public welfare. A separate, positive science would describe the workings of the economic system as it is.

Positive economics adopts a strongly consequentialist perspective in the spirit of utilitarianism. This orientation can be illustrated by examples at the microeconomic and macroeconomic levels of analysis. Microeconomics studies choices by individuals, households, firms, and governments. At the microeconomic level of analysis, positive economics describes and predicts, for example, how changes in specific prices or taxes will affect human choices. A regressive tax affects less wealthy households more than it affects wealthier households. A positive analysis might conclude that a regressive tax is relatively efficient or inefficient in acquiring private resources for public activities. Positive economics studies the causes and effects of horizontal mergers among producers in markets for goods and services. A positive analysis might conclude that a specific horizontal merger will reduce consumer welfare. A positive analysis might conclude that the global expansion of Wal-Mart increases the welfare of consumers and investors while decreasing the welfare of its employees, suppliers, and competitors.

Macroeconomics studies the aggregate results of microlevel choices by multiple decision-making units. At the macroeconomic level of analysis, positive economics describes and predicts, for example, the relationship among wages, unemployment, and price inflation. Edmund Phelps received the 2006 Nobel Memorial Prize in Economic Science (this title reflects the positivist tradition) for an explanation of this relationship. According to Phelps's explanation, wages and prices rise together, pushing one another, until the unemployment rate reaches an equilibrium (or natural rate), at which point inflation halts. This process of interaction involves what economists term rational expectations. Both workers and managers have to form changing expectations about the current and future state-conditions of the world, and they do so with incomplete information. Rational expectations are at best guesses about future equilibrium conditions; in principle, rational expectations should be the same as economic theory predictions.

Developmental History of Positive Economics

In a general sense, all the currently important approaches to economic inquiry adopt a basically scientific orientation. Karl Marx (1818–1883) claimed to have discovered the scientific laws of capitalist development, ending in socialism as the final stage of economic history. The Austrian School of Economics evolved in the later 19th century as a methodological criticism of the historicist school in Germany and England. The historicist school used historical data to test its theories. Responding in part to Marx, the historicists argued that the so-called economic laws being developed by the English classical economists (Adam Smith and his 19th-century successors) are highly dependent on specific historical and sociological contexts. This historicist school informed American Institutionalism, which similarly stressed that the interactions among historical and sociological factors helped shape institutions such as governments and markets. The econometrics favored by positivists is simply statistical analysis of historical data. The Austrian School—including the Austrian-born economists Ludwig von Mises (1881–1973) and Friedrich Hayek (1889–1992), winner of the 1974 Nobel Memorial Prize—later emphasized criticism of both socialist central planning and neoclassical mainstream economics. The Austrian-born economist Joseph Schumpeter (1883–1950), who emigrated to the United States, served as a bridge between the Austrian and neoclassical approaches. The significance of the Austrian School for positive economics is in the thinking that economics is best understood at the level of individuals making subjective decisions within the conditions of their local context. Therefore, positivists must clearly explain the logic that links descriptive models and measures to individual decision making and why purely backward-looking analyses of historical data, as studied through econometrics, are useful descriptions of the current contexts in which individuals make their decisions.

Mainstream economics since the last quarter of the 19th century has been neoclassical economics. This mainstream approach was initially synthesized from a combination of the classical and the Austrian approaches by Alfred Marshall (1842–1924) in his 1890 book, *Principles of Economics.* Positivism, as a specific view of scientific methodology, dominates this mainstream neoclassical approach. Milton Friedman, recipient of the 1976 Nobel Memorial Prize for his work on the quantity theory of money, is a well-known modern representative of this mainstream economic tradition of positivism.

Adam Smith emphasized the invisible hand efficiency of the relatively free market mechanism; and this efficiency approach to resource allocation theory dominates modern neoclassical economics and its positivist methodology. The so-called Socialist Calculation Debate occurred from the turn of the 20th century through at least the 1930s. The essence of the debate was whether government central planning in a socialist economy could perform as well as, or perhaps even better than, a laissez-faire market economy. Markets involve various defects such as externalities, monopoly power, and public goods. Central planning might adequately mimic the general equilibrium outcomes of the ideal decentralized market system. A necessary condition would be that government planners calculate and use the prices of a competitive market economy. This theory of central planning led to the development of mathematical programming techniques for computing such prices. Ludwig von Mises and Friedrich Hayek argued that central planning would not be sufficient to duplicate the complex information and incentive advantages of the market economy. The implications of this debate, especially in light of the collapse of the Soviet-style planned economies in the 1990s, is that the development of positive economics has progressed to the certainty that scientifically useful observations and descriptions are those that can be clearly related to the price information people use to make economic decisions.

The Methodology of Positive Economics

Marshall described economics, beyond the classical conception of markets, as the study of human choice or decision making in everyday life. He emphasized that economics is a logically rigorous approach to reasoning about human choice. The scope of positive economic inquiry has thus steadily broadened. Gary S. Becker, the 1992 Nobel Memorial Prize winner, extended microeconomics to the study of traditionally sociological subjects such as the family, crime and punishment, and discrimination in the markets. In his 1992 Nobel lecture, Becker emphasized that economics is essentially a way of looking at life. This emphasis on logical reasoning defines positive economics as a scientific methodology. As noted earlier, however, positive economics tends to invoke highly unrealistic assumptions in order to derive long-term predictions, such as unemployment trends or equilibrium between supply and demand, and to neglect the short-term effects on real people, who may suffer unemployment or shortages of housing and health care. For example, neoclassical economists may talk about the advantages of competitive markets, whereas real markets have important monopoly elements. This tendency arises with the conscious use of simplified, abstract analysis to focus on the essential logic of choice.

Logic and behavior may be different. In 1953, Milton Friedman published an influential and widely critiqued paper arguing that the empirical realism of economic model assumptions is largely irrelevant in theory development. Any primitive assumption (or intuition) is acceptable if the deductive implications prove to be empirically valid for the purpose of predicting behavior and outcomes. Indeed, the more unrealistic the assumptions, the easier the construction of a theoretical model for testing. Economic theories have purely instrumental value in terms of generating testable predictions. It has been suggested that Friedman's views unevenly combine positivism, pragmatism, and realism and that, if anything, pragmatism is the dominant element.

Key elements of positive economics are methodological individualism (i.e., agent optimization), price theory, equilibrium, the use of mathematics, and the use of econometric hypothesis testing. Methodological individualism means that microeconomic analysis begins with assumptions about the optimizing choices and behavior of a representative actor (or agent). For example, a representative actor presumably prefers more wealth to less wealth, all other conditions being held constant (the *ceteris paribus* assumption, as expressed in Latin) for the purpose of this specific choice opportunity. Generally, all human actors behave the same as this representative actor. Price theory, pioneered by Marshall, explains how supply (i.e., marginal cost) and demand (i.e., marginal utility) jointly determine market prices. A market price is one type of economic equilibrium.

Positive economics is today strongly and increasingly mathematical in reasoning orientation, because mathematics can be readily applied to the analysis of logical choices. Marshall studied physics; and neoclassical economics arose as a conscious effort to be a physics of human choice. In the 20th century, this mathematical approach has increasingly emphasized the axiomatic method for studying general equilibrium, culminating in the Arrow-Debreu model. Economics has evolved from physics toward pure mathematics.

Over roughly the same period, econometrics has become increasingly important for statistical testing of empirical hypotheses derived from economic theorizing. For example, econometric methods might be used to test statistically whether raising teacher salaries improves student academic performance.

Rationality and Behavioral Economics

Positivism emphasizes a strong rationality assumption in modeling the choices of *Homo economicus* (economic man) that tends to equate the economic logic of choice with predicted and desirable human behavior. Rational choice equated with logic is, even under conditions of uncertainty, relatively easy to model. Gary Becker coauthored a pioneering 1988 article on whether addiction might be rational. Rationality means simply that an actor aims, in a general sense, at optimization in economic choices (i.e., agent optimization). A rational actor seeks less rather than more of an undesirable condition and more rather than less of a desirable condition. A firm generally attempts to minimize its costs and maximize its revenues. Cost is undesirable; revenue is desirable. This view, as developed further in the next section, tends to denigrate altruism and corporate social responsibility. Rationality simply asserts that actors are logical in their choices given some goal (or set of goals) and some resource (or set of resources). To the degree that human choices deviate from this rationality assumption, positivism can be misleading with respect to predictions and policy-making prescriptions.

Human choice and behavior may prove to be much more complicated and difficult to predict. For example, Adam Smith expected that as wealth increased, people would tend to be more sympathetic toward others. A behavioral revolution has occurred in economics over the past two decades. Behavioral economics investigates the empirical validity of the assumption of rationality and thus of the rational expectations theory mentioned earlier. Behavioral economics focuses on the possible interrelations between economics and psychology. Psychologists are concerned with understanding how emotion and cognition interact in forming preferences and making choices. A real person may have very inconsistent preferences and may make apparently conflicting choices. There are strong limits on information availability and human cognitive processing, which Herbert A. Simon (winner of the 1978 Nobel Memorial Prize) characterized as bounded rationality. Simon also argued that economic actors engage in satisficing rather than optimization: An actor stops searching for an optimum as soon as a satisfactory threshold is reached. For example, an actor may decide that 40 hours of work a week is sufficient, even though more wealth might be obtained by working more hours. Considerations of values and ethics may be in reality very important to people in shaping their choices.

Andrei Shleifer developed behavioral finance as an alternative to efficient market theory. In 1999, Shleifer won the John Bates Clark medal of the American Economic Association, regarded as second only to the Nobel Memorial Prize. In his 2001 Nobel Memorial Prize lecture, George A. Akerlof argued that macroeconomics must be grounded in behavioral economics. Akerlof shared the prize with A. Michael Spence and Joseph E. Stiglitz for studies of the asymmetric information properties of markets. Asymmetric information means that one party has more valuable information than other parties, or thinks so. This reality or perception greatly shapes human choice and behavior. When managers withhold information from the other stakeholders of a corporation, or distort it, they are manipulating markets.

Positive economics is today making greater efforts to understand the realities of human choice and behavior. In 2002, the Nobel Memorial Prize was shared by the economist Vernon L. Smith and the psychologist Daniel Kahneman. Smith popularized the use of laboratory experiments for studying economic behavior. Kahneman, together with Amos Tversky (1937–1996), applied insights from psychology to economics. Much of their work concerns how heuristics and biases affect human judgment under conditions of uncertainty. They developed prospect theory to explain how individuals mentally account for gains and losses; loss aversion occurs because losses have a greater psychological impact than gains. Neoclassical economics assumes additive utility functions, whereas prospect theory suggests that an actor may compare gain or loss to some reference point. This difference in viewpoint has great implications for policy-making prescriptions.

Value-Free Economics in Relationship to Ethics

Positive economics treats value judgments as subjective and thus cannot address ethical dilemmas. In keeping with utilitarianism, one individual's preferences are as good as another person's preferences. In Pareto-efficient gains, such as voluntary market exchanges, at least one person's welfare improves without harming the welfare of any other person. In such gains, the value content of individual welfare functions is not relevant.

An important assumption in neoclassical economics is self-interest. Comte coined the term *altruism* to describe the regard for others as more important than self-interest. Comte believed that everyone had a responsibility for the general welfare. Adam Smith, in *The Theory of Moral Sentiments* (1759), defined citizenship in terms of obedience to laws and government authority and good citizenship in terms of such a concern for the general welfare.

Milton Friedman argued that the corporate social responsibility of businesses reduced to self-interested wealth seeking, although it is important to note that Friedman very clearly limited wealth seeking to behavior within the limits defined by laws and customary ethics. A key element in Friedman's argument was that any broader notion of corporate social responsibility is corporate altruism at the expense of the firm's key stakeholders. If the firm's managers practice such altruism, it is theft from the other key stakeholders and in the self-interest of the managers. If the owners of a publicly traded firm practice such altruism, it is in effect socialism undermining the proper role of government. This approach reduces corporate altruism to strategic philanthropy practiced for the self-interest of the firm. The owners of a privately held firm can do as they please, much like individuals.

Conclusion

Positivism is the approach to scientific methodology that lies at the intellectual core of mainstream neoclassical economics. The Austrian School of Economics and modern behavioral economics have sought in different ways to modify the impact of positivism on mainstream neoclassical economics. Positivism has both strengths and weaknesses. A methodological advantage is that positivism focuses economic analysis on the rational logic of human choice and the resulting predictions for the long-term functioning of markets. A marked disadvantage is that positivism tends to ignore the psychology of human behavior and the short-term effects and defects of markets. Most important, positivism eschews subjective value judgments and tends to denigrate altruism and corporate social responsibility. Business ethics addresses the importance of altruism and corporate social responsibility and the ethical dilemmas that positive economics cannot handle.

Positivism

The term *positivism* can be traced back to Enlightenment thinkers such as Pierre Simon De Laplace and David Hume and was adopted by Auguste Comte in the 19th century to designate a philosophical movement which held that science is the only kind of valid knowledge and that empirical facts are the only possible objects or building blocks of knowledge. It held that humanistic areas such as ethics, politics, and religion would be meaningless unless they could become scientific disciplines. Logical positivism or logical empiricism, the dominant form of positivism usually viewed as coextensive with positivism in general, developed out of discussions held by the Vienna Circle, a group growing out of the analytical tradition and composed of Austrian and German philosophers, which began in the early 1920s. Equating knowledge in general with scientific knowledge, they denied the validity of traditional philosophical concerns with metaphysics, ethics, and epistemology. During the following decades many of the positivists moved to England and the United States, where they exerted an enormous influence. Positivism soon became the major framework for the philosophy of science and a powerful school of philosophy in general. While it no longer exists as a unified movement or school of philosophy, its ongoing influence is evidenced in the present widespread focus on issues relating to scientific thinking and developments in formal logic and in a concern with a particular type of rigor in various philosophies.

Positivism holds that there are only two sources of knowledge, logical reasoning and sense experience. Logical knowledge includes math, with math reducible to formal logic. Logical/mathematical truths are based on the rules of language, which are conventions, and thus are true independently of sense experience. They are not truths of some "higher order" or "higher realm of being" but are independent of sense experience only because they are empty of content. Empirical knowledge, whose truth is dependent on sense experience, is composed of scientific knowledge such as physics, biology, physiological psychology, and so forth.

The logical positivists' major points of focus were on what became known as the verifiability theory of meaning and its consequences, the structure of scientific theories, investigations into logic and mathematics, and the philosophy of language as a concern with the possibilities of an ideal logical language as a representation of reality.

Perhaps their most famous tenet was the verifiability theory of meaning, which held that the cognitive meaning of a statement is its method of verification. A statement is meaningful if and only if it can be shown to be true or false, at least in principle, through sense experience. Its meaning is reducible to, or is nothing more than, the sum of all conceivable observation experiences that would go to verify its truth.

Traditional metaphysics, which incorporates abstract speculation about the nature of reality, has no significance as it is not reducible to observation statements. Statements about the existence and nature of God or the absolute are meaningless, for example, as there is no set of observations that could conclusively verify or falsify their truth. Such knowledge claims are always more than, or beyond, any possible set of observation circumstances or statements.

Even traditional epistemology loses its significance unless it is reduced to the scientific descriptions offered by disciplines such as behavioral psychology or physiology. Claims about the external world are as meaningless as claims about metaphysical entities, as there is no possible way of verifying that an external world does or does not exist as a cause of our sensations. Thus, the differing understandings of the relation of the mind or thought to an external world are all equally meaningless.

Positivism resulted in noncognitivist theories of ethics. According to noncognitivism, moral claims do not assert moral facts, and the assertion of some "realm of values" beyond or above sense experience is senseless. Moral claims are neither confirmable nor disconfirmable; they cannot be shown to be true or false by observational means and so are devoid of cognitive content. While noncognitive theories can take numerous forms, the emotive theory became the more dominant one. According to this view, normative statements are not assertions of anything but are merely expressive of or appeals to human emotions. For example, to say "Stealing is wrong" either evinces our own emotions of disapproval concerning stealing or is a way of trying to influence others to feel that same way. Ethics should concern itself with the clarification of moral language, with the metaethical question of what moral terms mean. In ethics itself, the only viable philosophic endeavor is to catalog the various ways societies and their members express their feelings in moral language and analyze the role moral language plays in influencing human behavior.

While past philosophers had at times argued in one way or another that various assertions in the above areas of philosophy were useless or unprovable, the positivists went beyond that. Statements concerning these various issues are not just useless or unprovable but devoid of meaning, empty of cognitive content. It is literally senseless to either assert or deny them. The sole role of philosophy is to clarify and define the meaning of statements. Philosophical claims are about the way language is used, not about a world or realm beyond language.

The positivists were intensely concerned with clarifying the structure of scientific theories. Scientific theories are axiomatic systems in which "rules of correspondence" supply a correlation between the abstract concepts of theory and observations. A scientific theory is thus expressed in two types of language, observational and theoretical. According to this view, scientific investigation does not penetrate nature in a way the senses cannot, but rather, scientific investigation is the rigorous, economical organization of what is given to us in experience. And since what we have in experience are not objects "out there" but sensations, the goal of scientific investigation becomes that of discovering the relations between sensations. The construction of theoretical entities is useful in science, but these are not an attempt to get at some transphenomenal realities. Rather, they are learning devices or models. According to the positivist analysis of science, a theory is a hypothetico-deductive system, similar to a logical or a mathematical ordering. The issue of the predictive power of theories or the process by which theories are formed was seen as irrelevant. What is the object of concern is only the relationships between the theory and the empirical or observational evidence. Positivists were also interested in the development of what is called the unity of science, the view that all special sciences, such as biology, psychology, chemistry, and so forth, can be understood, ultimately, through the fundamental laws of physics. Their ultimate goal was the establishment of a unified language of science, with philosophy equivalent to the logic of science.

Positivism has had a big impact on legal theory. While the term *legal positivism* houses a variety of related tenets, they are all intertwined with the general view, which is commonly called the separability thesis, that there is no connection between legal validity and morality. Law and morality are conceptually distinct, and the concept of law must be entirely free of moral considerations.

Legal positivism usually takes the noncognitivist view that moral judgments—in this case, moral judgments made about human laws (their justice or injustice, goodness or badness)—are not claims about moral facts but are merely expressions of feelings or choices or commands. Legal positivism has led to debates concerning the issue of mandatory pro bono service as a duty of any officer of the court. Is this equivalent to the taking of property without just compensation?

The separability thesis in legal positivism is mirrored in the separation thesis in business ethics—namely, that the norms and practices of business and morality are conceptually distinct. The arguments concerning mandatory pro bono service are analogous to the arguments in business ethics concerning corporate social responsibility (CSR). Is there is any real moral issue attached to CSR, whether as a duty entailed by the nature of the corporation and corporate membership in relation to the larger society or as a demand that infringes on the property rights of shareholders?

Positivism accepts the fact-value distinction, denying the reality of value as normative because it is not reducible to the factual. Some contemporary positions, such as relational holism or emergentism, undercut the fact-value distinction in favor of empirical situations that are concretely rich, value-laden relational complexes in which both facts and values emerge as wedded dimensions of complex contexts that cannot be dissected into atomic bits. Such an approach does not reduce values to facts but rather understands empirical and normative business ethics as inquiries that focus on different dimensions of a concrete unified situation based on the two fields' differing contextual interests. Such a view provides a basis for interdependent shared problem domains, the intersubjective construction of meanings, and a general openness onto "the other." It provides a basis as well for a relational view of corporate citizenship within the complexes of community life and responsibilities and for stakeholder theory as providing an understanding of one type of commitment within these relational webs.

POSTMODERNISM

Postmodernism refers to a wide range of eclectic thinking applied to art, architecture, fiction, literature, philosophy, and cultural and literary criticism, among other things. It is considered a reaction to the assumed certainty of scientific or objective attempts to explain reality. As such, postmodernism conflicts with explanations that claim to be universally valid—that is, for all cultures, groups, traditions, and ethnicities—and instead focuses on the relative truths for each person.

Modernity has its roots in Latin from the phrase *just now*. The Postmodern, then, literally means "after just now," or "after modernity." It refers to the appearance or actual dissolution of those social forms associated with modernity. Postmodern is "post" because it denies the existence of any ultimate principles, and it lacks the optimism of there being a scientific, philosophical, or religious universal truth, a characteristic of the modern mind. It is important to note, however, that postmodernism is a response to modernism—that is, the negation of or disbelief in the modern outlook—rather than simply an approach that arose after modernism. In many ways, the society we live in is still considered modern, not postmodern.

According to the postmodern theorist Jean-François Lyotard, the term represents a culmination of the process of modernity and enlightenment thought, toward speedy cultural change, to a state where constant change is the status quo, leaving the notion of progress contradictory. Postmodernism, thus, relies on concrete experience over abstract principles, always cognizant that the end result of one's experience will necessarily be fallible and relative rather than certain and universal. While modernism deals with purpose, design, hierarchy, distance, synthesis, centering, and presence, postmodernism is synonymous with play, chance, anarchy, participation, antithesis, dispersal, and absence. As a cultural movement, factors such as globalization, consumerism, the fragmentation of authority, and the commodification of knowledge have greatly contributed to the development of postmodernism.

History and Development

Ihab Hassan points out several instances when the term was used before postmodernism became a theoretical discipline in the 1970s. John Watkins Chapman, an English academic painter, used it in the late 1870s to mean postimpressionism, whereas Federico de Onis used it in 1934 to mean a reaction against the difficulty and experimentalism of modernist poetry. The eminent historian Arnold Toynbee used it in 1939 to mean the end of the "modern," Western bourgeois order dating back to the 17th century, while Bernard Smith, in 1945, referred to it to mean the movement of socialist realism in painting.

By the late 19th century, Soren Kierkegaard and Karl Barth's important fideist approach, or the view that religious knowledge depends on faith and lifestyle, brought irreverence to reason and the notion that "truth is subjectivity." Nietzsche introduced the concept of existentialism and injected a new nihilism and atheism that influenced culture. The early 20th century saw aspects of postmodernism arise with the emergence of the Dada movement, which focused on the framing of objects and discourse as being as important as, or more important than, the work itself.

Many philosophers during the mass postcolonialism period after World War II speculated that one could not have an objectively superior lifestyle or belief. This idea was further expounded by the antifoundationalist philosopher Heidegger, followed by Jacques Derrida, who reexamined the fundamentals of knowledge and deconstructionism. These philosophers broadly argued that rationality and logic were neither as certain nor as clear as the modernists or rationalists assert.

The main postmodernistic movement started in the late 20th century and is reflected in the social and philosophical realities of that period. Many, such as John Ralston Saul, have argued that postmodernism represents an accumulated disillusionment with the promises of the progress of science so central to modern thinking. Important books on postmodernism during this period include those by Jean-François Lyotard and Richard Rorty. Jean Baudrillard, Michel Foucault, and Roland Barthes are others who contributed strongly to the development of postmodern theory during this period.

Postmodernism and Business Ethics

Postmodern business ethics assumes that values and actions are determined without objective valuation grounds on a relative basis. Values both are born and die socially. There is no objective measure of value, and there is no need for it. Although many authors consider postmodernism synonymous with relativism, one should not make the mistake of viewing morality as a relative phenomenon with no universal basis. It is, however, a local and temporary custom, affected by the nuances of local or tribal histories and cultural inventions.

Advertising and other forms of promotional activities as well as entertainment communications such as movies have proliferated tremendously, and the lines between these promotional and media techniques have become increasingly blurred. For example, product placements are increasingly replacing advertising, while "video news releases" from private companies and the government are often assumed to be hard news. Media products in this era are characterized by relativism, cynicism, irony, and hedonism. These tumultuous changes have prompted professional marketing organizations to be concerned about the conduct of professionals with regard to law and the benchmarks for moral decency in human exchange relationships.

According to Stephen Brown, postmodern consumers, concurrently, have become more cynical, world-weary, self-obsessed, and hedonistic in their craving for instant gratification and their ever-increasing need for stimulation. Brown further notes that rather than relying on rational decision making, they are increasingly becoming victims of the fast pace of social and cultural change and the decline of absolute values of morality and entities without moral sensibilities or critical faculties.

Ronald Green argues that business ethics is postmodern because it rejects unitary or totalizing explanations of reality. He further states that this is so because the premise of postmodernism rejects the position that any single economic or social theory can address or eliminate the ongoing ethical problems of organizational and ethical life. Finally, business ethics shares postmodernism's decentering of perspective and the discovery of otherness, difference, and marginality as valid modes of approach to experience.

Andrew Gustafson summarizes four major characteristics of postmodern business ethics:

1. *Holism:* There should not be such a radical separation of personal and professional ethical behavior. One is always a human being, irrespective of whether one acts as a corporate agent or sometimes as a self-interested private agent. Thus, the same ethical litmus tests should apply for decision making on behalf of the family household as well as the business organization in which the individual is employed.
2. *No abstracted ethics in a vacuum:* Postmodern business ethicists rely on a narrative approach instead of an abstract theory. In other words, a postmodern ethic considers the entire worldview of a person and thinks of business as an integral part of the way one looks at all of life. Ethics proceeds by analogies rather than by strict principles alone, and narratives, rather than superficial rules, constitute the postmodern method. The focus of virtue ethical theories is more on being and character than on rules for action. The heroes and saints are viewed more holistically than by abstract detached principles.
3. *Suspicion of universal theories:* Postmodern business ethicists are more interested in coming up with local rules that can work and be agreed to than in attempting to create a universal system of ethics. Their primary focus is on building particular segments of consensus rather than on propounding "one-size-fits-any-situation" rules. For example, while Karl Marx and Sigmund Freud believed that "self-interest" plays a role in what we consider good or just, Derrida believed that we are primarily influenced by our linguistic conception of the world, while Socrates held the view that sheer ignorance was the primary reason behind having a deficient view of the truth. Thus, the postmodern approach accepts the various explanations regarding what is objective rather than expecting universal acceptance of one theory.
4. *Tempered quest:* Postmodern business ethicists strive for conceptions that have a better fit and an ethics that makes better sense and can work better than other approaches, at least for now. As such, it is not a quest but a tempered quest for certainty, using satisfying (instead of maximizing) approaches.

The desire of postmodern business ethics is to come to grips with the political and social pluralism in any culture and to acquire a flexible method of making ethical decisions.

Postmodernism and Its Critics

The interesting paradox of the postmodern position is that in placing all principles under the microscope of its skepticism, it must realize that even its own principles are not beyond questioning. As noted by the philosopher Richard Tarnas, postmodernism "cannot on its own principles ultimately justify itself any more than can the various metaphysical overviews against which the post modern mind has defined itself."

Marxist critics are among the harshest critics of postmodernist trends and posit that postmodernism is symptomatic of "late capitalism" and the decline of institutions, particularly the nation-state. They further contend that the nature of exploitation remains fundamentally unchanged in the postmodern era. Some postmodernists, such as Lyotard, have noted that in advanced societies, socialist struggles and their goals have been transformed into the regulators of the system. Others have asserted that it is the expected reaction to mass broadcasting as well as to a society conditioned to mass production and mass politics.

Many argue that postmodern scholars do not completely dismiss the scientific method and that they are too caught up in the idea of the primacy of moral judgments. Roy D'Andrade, for example, critiques postmodernists' definitions of objectivity and subjectivity by examining the moral nature of their models. He claims that these moral models are purely subjective and argues that despite the fact that utterly value-free objectivity is impossible, it is the goal of the scientist to get as close to that objective as possible.

Pauline Rosenau specifically identifies seven contradictions in postmodernism:

1. Postmodernism's antitheoretical premises can essentially be considered a theoretical stand.
2. While postmodernism accentuates the irrational, instruments of reason are freely employed to advance its agenda.
3. The postmodern prescription to focus on the marginal is itself a judgmental emphasis of exactly the kind that it otherwise attacks.
4. Postmodernism emphasizes the interrelatedness of texts yet often treats texts in isolation.
5. Postmodernists cannot argue that there are no valid criteria for judgment by stubbornly rejecting modern criteria for judgment.
6. The field of postmodernism practices a double standard by being critical of the inconsistency of modernism but refusing to be held to the norms of consistency itself.
7. Postmodernists contradict themselves by relinquishing the claims of truth in their own writings.

Jurgen Habermas further argued that postmodernism contradicts itself on the basis of performative contradiction and the paradox of self-reference and notes that postmodernists assume concepts they otherwise seek to undermine—for instance, freedom, subjectivity, and creativity. Postmodernists have either rejected these criticisms or provided a counterresponse. Lyotard, for example, refutes the notion that intersubjective communication implies a set of rules already agreed on and that universal consensus is the ultimate goal of discourse. He recommends having an "irreducible plurality" of all phenomena with their own local rules and practices.

Conclusion

Postmodernism has been interpreted as being a "perspective" or a new paradigm or thought. Living a social life loaded with multiplicity of meanings, without a right meaning attributable to an event or a process, and a fragmented reality with no interactions among the parts may have in many ways created the "death of reason." While critics argue that this leads to an "anything-suits" brand of ethical practice, not tempered by rigorous morality, postmodernists encourage us to look past the macro perspective and instead consider how rules and ethical norms are being defined at a micro level by different cultures and subcultures.

Postmodernism and Business Ethics

The postmodern perspective on ethics emerged as a critique of what Alasdair MacIntyre, in *After Virtue,* has called the "Enlightenment Project" for justifying a human-centered system of moral sense making. In pre-18th-century Europe, ethical norms served as external guideposts to help humans journey toward a preordained transcendental purpose, or *telos*, as revealed in the Greek concept of the good or the Christian vision of the godly life. The Enlightenment faith in science as an extension of human rationality undercut the dependence on the teleological assumption that an external "great chain of being" linking all life forms to a higher purpose could provide an external justification for the moral precepts that guide human actions. Thus, a self-consciously modern justification for creating and maintaining a moral order requires a way to derive "universal" ethical norms from a shared *capacity to reason.* Postmodern ethicists, such as Zygmunt Bauman and Richard Rorty, would eventually come to question the modernist assumption that moral claims can be justified by applying various reasoning procedures to tap into universal truths embedded within an essential, unchanging human nature. Thus, Immanuel Kant's categorical imperative defines a procedure whereby a moral norm can be generalized to become an ethical principle that reasonable persons potentially affected by its application would consider fair to all concerned parties. Jeremy Bentham and the later utilitarians hold out the "greatest happiness for the greatest number" as the consequential measure of an ethical action. John Rawls extends a "veil of ignorance" as a refinement of Kant's procedure to ensure that the potential partiality of "reasonable persons," based on their self-knowledge of previous circumstances, would not impair their judgment of what constitutes a principle of justice. Postmodern critics argue that such ethical rule systems pose the threat of external social control because their reasoning procedures ignore or suppress consideration of the particular contexts, contingencies, and paradoxical juxtapositions that can inform individual moral choices within local communities of discourse. A troubling consequence of this critique is the inherent difficulty of defining and justifying a postmodern ethic dedicated to ironic word play and a celebration of *difference.*

Does Postmodernism Lead to Ethical Relativism?

Proponents of a postmodern ethics, as well as of postmodern thought generally, are vulnerable to the charge that their epistemological (ways of knowing) and ontological (ways of being) assumptions and methods of analysis pose a serious problem of "incommensurability," which may open the floodgates to a sea of ethical relativism or normative nihilism. This problem suggests an inability to know anything for sure, since all knowledge claims are regarded as contestable "language games" that must be subjected to a rigorous methodology of textual "deconstruction." This methodology questions all knowledge claims but especially "totalizing metanarratives" that make pretensions to a universal truth that is vulnerable to critical scrutiny. To European postmodern critics, the totalizing, hegemonic claims of fascism, communism, and even free market capitalism illustrate the destructive potential of overreaching by the ruling elites, who try to bend the rhetoric of the Enlightenment Project to their own advantage. This postmodern critique holds that universal claims of objectively valid truths are suspect for the following reasons: (1) Interactions between the researcher and the object of research necessarily influence the meaning that is constructed; (2) facts are inseparable from the values that shape the way meanings are constructed; and (3) knowledge claims are acts of colonization rather than voyages of discovery, since learning outcomes arise from a power struggle among the contestants of language games.

If applied to the agency theory of the firm, a widely accepted rationale for modern corporate governance practices, the methodology of textual deconstruction would scrutinize the claim of top business executives that they allocate organizational resources according to the "best interests" of the firm. The rationale that business managers owe a primary fiduciary duty to maximize profits for shareholders could be deconstructed as being not so much an objective scientific account as a narrative that reinforces the claims of shareholders and management to ownership and control rights while undercutting other stakeholder claims. An executive decision to "lower transaction costs" or "reduce resource dependency" by seeking to minimize environmental regulations or to limit employee wage or benefit claims could be reinterpreted as an assertion of power politics to realize a particular interest's favored value position rather than as a finding of objective management science. Postmodern philosophers hold that meanings are constructed within contested narrative space, not surgically extracted from an underlying stratum of objective reality.

The controversial and still unfolding relationship between postmodernism and business ethics is framed by a sharp exchange in a 1993 issue of the *Business Ethics Quarterly* between Ronald Green and Clarence Walton. Green argued that business ethics is assuming a postmodern cast by rejecting a unitary or "totalizing" explanation of reality and by legitimizing the right of "others" to be heard and to have their interests or "stakes" taken into account in corporate decision making. He suggested that recognition of the need to "decenter" business ethics to include the (frequently marginalized and noisy) voices and stories of those who can affect or are affected by business operations is implicit in both stakeholder and corporate social responsibility theory and practice. Walton focused primarily on the methodology of textual deconstruction, developed by European postmodern philosophers such as Jacques Derrida, Michel Foucault, and Jean-François Lyotard, to criticize Green for opening the way in business ethics to a nihilistic threat of ethical relativism. If all moral claims are deconstructed to reveal their partisan, self-interested nature as narrative ploys in competing language games, then the possibility of rationally constructing a set of universal ethical principles binding on all persons, reasonable or otherwise, would appear to be at risk.

Andrew Gustafson, in a thoughtful reply to Walton's denunciation of Green's tentative foray into postmodern territory, argues that postmodernism is not inherently nihilistic and relativistic. He finds that the methodology of textual deconstruction of meta-narratives can be applied usefully to ask tough questions about "what we can know" about any knowledge claim. He concludes that while postmodernism may be better at asking questions than in providing answers, such questions are relevant to developing a better theory of business ethics.

The diversity within postmodern thought also must be acknowledged. Pauline Rosenau notes that both negative and affirmative themes are evident within postmodern thought throughout the social sciences. A postmodern approach to business ethics is more likely to arise from within the affirmative camp, which poses interesting questions about the creative role of cognitive (thinking) and affective (feeling) processes for awakening an ethical sense of responsibility within *relationships* between the self and the other. Such questions are especially relevant to further theory development, since an improved management capacity for building and sustaining relationships through communicative practices is critical for the advancement of emerging management trends toward stakeholder engagement, corporate social responsibility, and corporate citizenship.

Zygmunt Bauman's Postmodern Ethics

In his groundbreaking book *Postmodern Ethics*, Bauman, as an affirmative postmodern European, takes on what he sees as the coercive threat of external normative control posed by the Enlightenment Project as well as the counterclaim that the postmodern critique opens the door to moral relativism and social anarchy. He recognizes that the decline of teleological assumptions about humanity's place within a great chain of being threatened to sever the link between private personhood and social order. However, he objects that the Enlightenment thinkers' self-consciously "rational" methodology for deriving universal principles and rules of ethical conduct do not gain much traction at the personal level. Such guidelines tend to take the form of *negative duties*, defining what individuals should *not* do rather than inspiring them to exercise a *positive ethical responsibility* toward others. Given the unlikelihood that most individuals will conform voluntarily to negative proscriptions, powerful interests extend the political and legal arms of the modern instrumental state to preserve social order by imposing legislative enactments grounded in supposedly "universal" ethical rules. The emergence of this external apparatus of ethical control has the ironic consequence of negating the assumption of internal ethical responsibilities within a process of personal growth and transformation. This insight suggests that the regulatory focus on requiring ethical "compliance systems" in the aftermath of the corporate scandals at Enron and elsewhere will have little positive effect in the absence of personal transformation and ethical commitment within a supportive ethical culture in business organizations.

For Bauman, morality does not arise primarily from a *rational* process of cognitive sense making. It emerges more from the workings of the heart than the head. Bauman draws on the French affirmative postmodern philosopher Emmanuel Levinas to situate the source of ethical behavior within a *moral impulse*, which Levinas characterizes as "being *for* the Other." For Levinas and Bauman, the essence of morality is not adherence to a principle drawn from an external essentialist meaning but rather openness to the possibility of internal self-transcendence by assuming a responsibility to care for others. Moreover, this personal responsibility arises in relationships with particular others in local communities of discourse rather than from a generalized love of humanity in the abstract. It is in this sense that Bauman holds that morality is not "universalizable." However, he rejects the charge of ethical relativism because each person's moral impulse exerts a counterforce to the downward pull of self-interest. Thus, an internal moral impulse is available to animate each person's potential for finding and expressing responsibility to care for particular others. For Bauman, humanity is defined not so much by its objectively determined essential nature as by its affirmative capacity for self-development.

Richard Rorty and the Ethics of Storytelling

As an American neopragmatist philosopher, Richard Rorty offers a complementary perspective on the possibility of a postmodern ethic. In his address to the 2005 annual meeting of the Society for Business Ethics, Rorty challenged the essentialist claim, going back to Plato, that moral norms must correspond to an underlying, universal Truth, whether embedded externally in a great chain of being or internally within a common human capacity to reason. For Rorty, the central question of the modern age—What does it mean to be a human being?—has become less relevant than new, more pragmatic, existential, and ultimately postmodern questions: How can we create a better world for our descendants? What sort of person shall I try to become? He noted that an applied ethic dedicated to answering these questions must look to history, politics, and literature for stories of human experience that highlight personal or social *aspirations* toward a better life. Such stories are useful to the extent that they call forth in a person facing an ethical challenge an imaginative, empathetic sympathy for the plight of others. Thus, a postmodern ethic does not ask "What is real?" or "What is rational?" but rather "What is it useful to talk about?" in the ongoing developmental quest to construct a better life for ourselves and for others. For Rorty, moral progress will come not from an abstract, rational effort to get in touch with human essences but rather from unleashing the potential of human imagination—making intuitive leaps that offer guidance on how personal and social aspirations can become new, emergent realities. Thus, Rorty concludes that the proper role of the business ethicist should be that of a poet, inspiring others to dream better stories and to embark on a pragmatic, incremental journey toward realization of a just life for all.

Related Developments in Business Ethics

In 1994, R. Edward Freeman, the leading exponent of stakeholder management theory, challenged the "separation thesis," which holds that business rationality and moral rationality are logically distinguishable because of the conventional (i.e., modern) distinction between facts and values as building blocks of knowledge. This influential doctrine maintains that business rationality should ground organizational actions in an empirical investigation of objective "facts," whereas moral rationality should ground ethical rules in a logical process for deducing universal moral principles. Standard practice is that business rationality should prevail until an ethical dilemma prompts an exceptional appeal to an alternative mode of moral rationality.

Freeman's challenge of the separation thesis served as an open invitation to new expressions of moral imagination to find ways to better integrate business and ethical thinking, both from his research associates, such as Daniel Gilbert and Andrew Wicks, and from a range of other business ethics and business and society scholars, including the author of this entry. In 1999, Diane Swanson noted that extant theories of corporate social responsibility and performance suffer from an "integration problem." Social responsibility and performance cannot be specified or measured purely in terms of "facts," since responsibility and performance, necessarily, will be defined differently, depending on the value orientation of stakeholders. This insight supports Freeman's call for a new approach to corporate decision making that integrates stakeholder value orientations with consideration of the "facts." Swanson advocates abandonment of the conventional "value neglect" approach to business decision making in favor of a new "value attunement" orientation within corporate governance processes that seek common ground among contending stakeholder claims. She concludes that this orientation will most likely arise from a communicative ethic or a dialogue based on mutual respect among corporate managers and groups in the community.

While not specifically labeled as postmodern, recent developments in business ethics, stakeholder theory, and corporate social responsibility and performance are being influenced by postmodern insights. New terms such as *stakeholder engagement, multistakeholder learning dialogue*, and *whole-systems management* suggest that business ethics is becoming more than a useful adjunct to control for lapses in individual ethical judgment within organizational settings. An emerging theory and practice of business ethics are being slowly integrated into a more complex and emergent organizational context where a managerial capacity to respect, listen to, and learn from stakeholders is being recognized as critical to both business success and system sustainability. The challenge remains that better stories, such as Sandra Waddock's *Leading Corporate Citizens*, must be converted from an inspiring account of the dreams of the few into an emergent reality for the many.

Poverty

Poverty is broadly defined as a condition in which a person or group of people lacks the essentials and necessities to achieve a minimum standard of living and well-being. Poverty is most frequently defined by economic circumstances, where individuals have insufficient access to resources. However, it may also be defined by the social ramifications that are predicated by a deprived state of social or political power.

The prevalence of poverty varies throughout the world. Industrialized nations have a lower incidence of poverty than less developed nations. In developing nations, poverty is a bleak reality. The causes of poverty are diverse, but in countries with densely impoverished regions they are geological, agricultural, ecological, and geopolitical. Official reporting agencies debate the method with which poverty is measured and reported, but general international indices include infant mortality, hunger, and child malnutrition. Infant mortality rates and child malnutrition are the most prevalent in the African continent, for example, where some regions report that as many as 20% of all preschool children are underweight. Furthermore, childhood hunger is the most ubiquitous in South Asia, with dense pockets of poverty juxtaposed with areas experiencing the benefits of economic growth.

In the United States, the official rates are determined by the U.S. Bureau of the Census (Census Bureau). The Census Bureau has been measuring poverty rates since 1964 when it developed its official poverty indices known collectively as poverty thresholds. Poverty thresholds define the minimum levels below which poverty exists and are viewed as a comprehensive poverty measure. They are used for statistical purposes. U.S. poverty thresholds are indexed to inflation and other economic indices and updated annually. Some debate the methods with which the Census Bureau determines poverty thresholds because it estimates rates using total income. Noncash sources, such as food stamps, are not factored into the calculations. Still, they are the most widely used indices. The Department of Health and Human Services also produces an index called poverty guidelines. It is another federal poverty measure, but it is different from poverty thresholds because it is used for administrative purposes only, such as determining eligibility for federal programs.

The Census Bureau examines income level, household composition, ethnicity, age, occupation, education, geographic factors (such as region, urban or rural areas, economic differences between states and regions), and health insurance costs and coverage to report annual figures and year-over-year comparisons. Data reported in 2006 for 2005 indicated that 37.0 million people (12.6% of the population) in the United States were at or below the poverty level. The majority of this figure represented women and children who did not participate in the workforce that year. This figure remained relatively stable as compared with 2004. The most marked increase was for seniors, aged 65 and older, whose poverty total increased by approximately 3%. Otherwise, blacks, Hispanics, whites, and other household compositions remained stable year over year.

At the time the Census Bureau began to define and monitor poverty in 1964, U.S. rates exceeded 20% of the population. In the most recent decade, however, they have ranged between 10% and 15%. History has proven that the rate varies the most when the overall economy is in a recessionary period.

The Influence of Business and Society on Poverty

In the United States, the poverty threshold is tied to economic health and income levels. Thus, the roles of business and society are significant in influencing the well-being of many individuals and groups who live at or below the poverty thresholds. Influencing factors include the composition or type of business, the demographic of those who are seeking work, wage levels, education, and health insurance benefits.

The United States experienced an unemployment rate of 5.08% in 2005 (4.63% in 2006), at a time when 12.6% of the population was determined to be impoverished. Despite a high overall level of employment, many working individuals did not meet the minimum cost-of-living standards to rise above the poverty level. These "working poor" are defined as members of households in which there is at least one working adult who spends a minimum of 27 weeks in the labor force or is searching for work. In 2004, the U.S. Bureau of Labor Statistics reported that there were 7.8 million working poor (5.6% of the overall population). The majority of these individuals work full-time. Blacks, Hispanics, and Latino workers were twice as likely to be counted in this group as whites. In addition, the majority of the working poor did not possess a high school level diploma.

Closing the gap between gainfully employed workers and impoverished workers is a challenging task. There are many who study this disparity and impress on businesses the need to increase wages in order to improve the lives of U.S. workers. They argue that it is an employer's ethical duty to provide a living wage. Opponents of this debate contend that economic conditions would be impaired by a living wage because the labor market would outprice businesses' ability to pay workers. Unemployment rates would increase as a result.

Over the years, the U.S. Congress has attempted to regulate minimum wages to address income levels. In the past, the minimum wage level has not kept pace with cost-of-living standards. Between 1979 and 2003, real wage rates (adjusted for inflation) fell behind other cost-of-living indices. In addition, the last increase in the minimum wage was in 1996. Proponents of the minimum wage promote increases to benefit U.S. workers. This group argues that increases will improve the overall standard of living and promote economic growth. Opponents state that increases will cause unemployment and slow economic growth and will reduce the demand for workers because they will price businesses (small businesses in particular) out of the labor market. This group also argues that government influence disrupts free market forces that would automatically adjust rates to an economically viable wage.

Three additional factors further compound the economic challenges of business and society when addressing the needs of the impoverished: The greater part of the U.S. economy is composed of the service sector, the costs of health care and health care insurance have escalated exponentially, and there is limited access to education.

Like most industrialized economies, the majority of the gross domestic product (GDP) of the United States is based on the service sector. As the economy has shifted from the agricultural and manufacturing sectors, available jobs are in service industries. According to the Census Bureau, in 2005 the majority of the working poor worked in service occupations; sales and office occupations; and production, transportation, and material moving occupations. This poses a challenge to business and society as a disproportionate number of jobs are in a sector with narrow margins and historically low wages.

In addition, the United States maintains a private health care system, which has promoted high levels of quality health care, but with escalating costs. The United States spends more on health care than any other industrialized nation, even those that provide government-sponsored coverage to their residents. In 2006, health care costs represented 16% of the GDP. Furthermore, the majority of U.S. citizens attain health care insurance coverage through their employers as a benefit of employment.

Employer-sponsored health insurance coverage was created following World War II to provide incentives to workers. The government also instituted tax incentives for employers to offer health care coverage as a benefit. Today, it is extremely challenging for businesses to offer these worker benefits because of the associated costs. Since 2000, employment-based health insurance premiums have increased 87%. On average, health insurance for a family costs $10,880 per year. Comparing this cost with the 2005 average income of $19,971 for a family of four, it is apparent that health care costs are demoralizing. In the meantime, the number of people without health insurance coverage increased from 15.6% to 15.9% in 2005, while 59.5% of individuals were covered by employment-based health insurance that same year. To manage rising costs, employers will often share them with employees.

It follows that health care inflation is increasingly affecting the numbers of individuals who have access to health care and health care insurance. The majority of individuals are dependent on employers to pay part, if not all, of their insurance premiums. Whether nonworking or working, those who are impoverished are unable to meet the escalating costs of health care and health care insurance unless they are employed by an employer that pays for the premiums.

Attaining a high level of education has proven to be necessary to securing higher-paying jobs. On average, individuals with advanced degrees earn four times more than those without a high school diploma. Impoverished individuals are less likely to attain a high school diploma and fewer still have access to a college-level education.

Conclusion

When faced with these economic challenges, businesses must weigh the opportunity of increased profits, competitive advantage, and business sustainability against the needs of the nation's poor and its working poor. Many businesses, particularly those in the predominant service sector, have difficulty meeting the expenses of competitive wages and health care premiums while considering the critical business goals of annual profit and growth. Society faces significant challenges as it addresses the educational needs of those who do not have access. Yet the ethical dilemma goes far beyond a business decision when a human life or an individual's minimal needs are at stake. It is a delicate balance.

Power, Business

Many observers believe that the modern corporation is the most powerful institution in society today, eclipsing the power and resources of many governments. Some statistics uphold this point of view. One report published in 2000 indicates that when measured by company sales and country gross domestic product, 51 of the world's 100 largest economies are not nations or governments but in fact corporations. Among the top 200 global corporations measured by size, 82 were U.S. companies, and 41 were Japanese. Combined, these companies' annual income was 18 times that of the 1.2 billion people in the world who lived on less than $1 a day in 2000 (estimated to be about 1.1 billion in 2005). Furthermore, the report indicates that these companies' economic activities make up some 27.5% of the total of all economic activity but that they employ less than 1% of the total workforce.

Businesses have power in multiple arenas: economic, technological, political, and sociocultural. These arenas encompass economic power because of companies' control over financial, human, and material resources and technological power because businesses influence how quickly new developments in technology appear. Companies also have considerable political power through their efforts to influence public policy, laws, and associated regulations in their favor, through the use of political action committees, testimony before legislative bodies, and other tactics. They exert sociocultural power because business activities such as marketing and advertising as well as products and services influence both individual and societal norms and expectations and environmental power because of the pressures that business activities place on the natural environment. In addition, businesses not only have power over their own employees; because of this power, they also exert influence over families and community life in general.

Businesses today, particularly multinational businesses, command a good deal of resources and attention because of their power and influence. Companies incorporate for a variety of reasons, but among them are limitations to the risks undertaken by owners. Incorporation allows owners to avoid taking on the debts incurred by the company, without which the debts of the company are also the debts of the owner; hence, incorporation grants owners limited liability. Incorporation also permits the company to develop an organizational form that allows for greater complexity, necessitating more coordination of activities, growth, and control of resources, and consequently the capacity to develop products and services that influence the purchasing behavior of customers. These benefits of growth and power have enabled large companies to produce goods and services desired by societies and individuals around the world.

The power of business is such that *BusinessWeek* magazine asked whether there was "Too Much Corporate Power?" in a cover story published in 2000. The magazine's survey of U.S. citizens found that although two thirds thought that businesses should get the credit for prosperity and that large corporations make good products that are globally competitive, nearly three fourths believed that businesses had too much power over their lives. In the survey, the American public perceived that large companies did not share productivity gains with their employees, the chief executive compensation was excessive, and there was a growing gap between the wealthy and the poor. In addition, the government, which traditionally put controls on corporate activities through legislation and regulation, and labor unions, which focus on obtaining good wages and working conditions for workers, lost power relative to corporations in the last part of the 20th century.

There are also issues around corporate control—that is, who really owns or controls the corporation—with many scholars suggesting that although owners or shareholders ostensibly own the company, in fact most companies are actually controlled by their top management team, led by the chief executive officer. Concerns about control, termed agency problems, arise when these top executives act in their own self-interest rather than in the interests of shareholders. Many observers believe that the very high compensation for executives in U.S. companies in the early 2000s is an example of an agency problem and a problem of misguided use of corporate power.

Much of the power corporations have today arises from the fact that they are treated as persons. In 1886, the U.S. Supreme Court ruled that corporations could be treated as a "natural person" by the law and had the same rights as individuals. This ruling means that companies have all the rights that citizens do in the United

States, including the right to free speech, to lobby legislators, and to make political contributions. Power comes from the fact that corporations control significantly more resources than do most individuals and therefore have more economic clout to bring to bear on public discourse, legislation, and other public policy matters, which leads some observers to suggest that corporate power and democracy are incompatible. Corporate abuses of power can occur in all the domains mentioned earlier. For example, some companies use their power to manipulate communities and governments by getting tax breaks for locating in a given place and later shutting down the facility. Companies with long supply chains have been noted in recent years for abuses of employees' human and labor rights, as well as for serious problems associated with environmental health and safety in the workplace and for environmental pollution in unregulated or less regulated areas.

The major imperative of firms as defined in U.S. law and the dominant economic theory called neoclassical economics is to maximize shareholder wealth. Wealth maximization, in turn, tends to lead corporations to want to continue to grow, and with more growth comes greater power because of the attendant control over economic and other resources. Combined with the agency problem mentioned above, this consolidation of resources means that a great deal of power resides in the hands of corporate executives, who make decisions on the basis of the company's and potentially their own self-interests rather than the public interest or common good.

Other issues related to corporate power in the early 21st century involve the consolidation of many industries into oligopolies, or industries in which there are only a few dominant firms, particularly as firms globalized. This consolidation took place through mergers of already giant corporations as well as the growth and success of some companies. Of particular concern to some observers is the control by a few companies of industries associated with the public good, such as telecommunications, agriculture, transportation, energy, and similar large industries. Testimony to the economic clout of some firms is the success of the giant U.S. retailer Wal-Mart, which by itself in 2002 represented some 2.5% of the U.S. gross domestic product.

Concern about corporate power also arises because companies spend so much money on advertising and marketing their products to consumers that consumerism is on the rise around the world. Given its limited ecological resources, many environmentalists believe that the earth cannot sustain the levels of consumption prevalent in the industrialized nations. Studies of the ecological footprints of developed nations show that significantly more resources are consumed per capita in developed countries than in developing countries, which also have lower standards of living. Differential rates of consumption fostered by corporate marketing are considered problematic because of the inherent inequities across peoples and nations that they imply: The developed world consumes 45% of all the meat and fish, with the poorest fifth only 5%, and 58% of the energy, with the poorest fifth less than 4%, among other indicators, according to the United Nations Human Development Program.

Pragmatism

Unlike other philosophic approaches, pragmatism posits no ideal, ultimate, absolute principles of right and wrong. Good and bad are determined by the application of human intelligence to the problems at hand and by the effect that negotiated compromises have on the lives of individuals and the communities in which they live. Pragmatic philosophy is an outgrowth of the earlier work of Charles H. Peirce, William James, John Dewey, and George Herbert Mead and later extensions by C. I. Lewis, W. V. O. Quine, and Richard Rorty. The approach generally adheres to a correspondence theory of truth: Truth consists of a relation to reality. The competing coherence theory associates truth with some specified set of propositions.

Pragmatic concepts have been applied to ethical issues in business by Sandra B. Rosenthal, Rogene A. Buchholz, Joshua Margolis, and William C. Frederick. Rosenthal and Buchholz developed a pragmatic theory of the corporation that emphasizes the inseparability of the corporation and society. They further argue that these reciprocal relationships define the corporation's moral responsibilities to employees and the communities whose lives are affected by corporate operations.

Pragmatism is an analytic approach that emphasizes the continuity of experience and nature, the relationship of organism and environment, and the derivation of truth and value from the lived experiences of humans in social and organizational contexts. Values emerge from applying human intelligence to problems encountered in the course of everyday living, where both past and present experience provide guides for resolving practical dilemmas. Human goal seeking is an ongoing process of finding, adjusting, and improving the means appropriate to achieving the sought ends-in-view. This means-ends process implies no ultimate, predetermined, absolute goal, end, or purpose to be attained beyond the immediate need to confront and resolve a problematic situation. Knowledge gained in the course of resolving such matters becomes instrumental in addressing future issues and dilemmas.

Pragmatists cultivate an open-ended view of human possibilities, relying on human intelligence based on prior experience to support reliable ways of confronting problems. The sources of human experience are the many diverse and pluralistic social and cultural traditions resulting from historical and evolutionary developments extending far back in human times. Culture and nature are intertwined and coevolved aspects of human development, providing a broad base of experience and values selectively useful for supporting life in the present.

A pragmatic approach to business ethics begins within the workplace, identifies the values in contention, ascertains the respective goals and interests of the contending parties, proposes negotiations to establish an instrumental way to compromise opposing viewpoints, and seeks a pluralistic solution satisfying an optimum number of ends-in-view. Pragmatism recognizes that any resolution achieved today is subject to continued revision and improvement tomorrow. Hence, human pragmatic experience yields an ongoing, continuous means-ends activity that enables business operations to continue while achieving some of the goals sought by both business and nonbusiness participants.

Predatory Pricing and Trading

Predatory pricing is an anticompetitive measure employed by a dominant company to protect market share from new or existing competitors. It generally involves temporarily pricing a product low enough to end a competitive threat. Thus, the two major parameters under consideration are costs and the intent of the firm. Costs are usually easy to define yet there is a debate on the appropriate ones to use. Intent, on the other hand, is easier to comprehend yet most difficult to prove.

The exact legal (statutory) conditions for predatory pricing vary across the globe. In the United States, pricing below a dominant average variable cost (the *Areeda Turner* test) was last used by the Supreme Court in 1993 as a criterion for this practice in deciding *Brooke Group Ltd. v. Brown & Williamson Tobacco Corp.* According to the Court, this practice arises when a business rival prices its products in an unfair manner in an attempt to eliminate competition and exercise control over prices in the market. While the law should protect price competition, it should distinguish unfair pricing practices that would eliminate competition. The basic antitrust dilemma is to distinguish price predation from hard competition.

Generally, the following conditions must exist to constitute predatory pricing:

- The predator must have the market power to unilaterally increase its prices.
- The predator must charge prices that fall below a predatory price standard (which varies from country to country).
- The predator should be able to recoup its losses after the competitors have been driven out of the market.

The predatory pricing argument is as follows. The predatory firm initially lowers its price until it is below the average cost of its competitors. The competitors are then forced to lower their prices below average cost, thereby incurring losses on every unit sold. They are then faced with a difficult situation: If they opt not to drop their prices, they are bound to lose their entire market share and their profitability in the long run; on the other hand, if they do cut their prices, they will also lose a lot of money. After forcing competitors out of the market, the predatory firm raises prices and recoups its losses in the short run and increases its profits in the long run.

Researchers over the past four decades have yet to provide a clear-cut example of a monopoly created by predatory pricing. Some contend that competitors who are unable or unwilling to cut prices make these claims. In most cases, the courts have wrestled with how to characterize price predation. So far, three tests have been used: (1) predatory intent, (2) below-cost pricing, and (3) likelihood of recoupment of costs. In most cases, they have considered a combination of these three cases.

History and Cases of Predatory Pricing

The notion of predatory pricing can be traced back to the dawn of the industrial era. Notable examples include John D. Rockefeller's Standard Oil Company, which was accused of using low prices to drive away competitors in the late 19th century. AT&T spent $100 million per year in the 1970s defending against claims of predatory pricing.

American Airlines in the Mid-1990s

Between 1995 and 1997, three small carriers—Vanguard, Sun Jet International, and Western Pacific—entered the Dallas market by offering low-priced service to midwestern cities. American responded by matching their fares and increasing service on these routes. For example, American's one-way fare from Dallas to Kansas City was $108 before the low-cost start-ups entered the market in 1995. American promptly cut fares to $80 and almost doubled the number of flights to 14. All three start-ups subsequently abandoned Dallas Airport. Soon after, American raised its prices to $147 and scaled back the number of flights. None of the start-ups remain in business today.

The airline industry typically operates with very high fixed costs (e.g., equipment) and low marginal costs. On the other hand, as noted earlier, to win predatory pricing cases, one has to prove that the firm sold products or services for less than its average variable cost. The U.S. Congress enacted the Airline Competition Preservation Act in 2001, putting the airline industry on notice that it planned to monitor anticompetitive and "predatory" practices. The act issue guidelines to prevent large carriers from eradicating the start-ups. One such suggestion was to force the dominant carrier to continue offering the low fares for 2 years if they respond to a low-fare service by a new entrant. The proposal also gives the Transportation Department the authority to investigate whether or not an airline is charging an average fare on a route that is unreasonably high.

Microsoft in the Late 1990s

In 1996, Microsoft began giving away its Web browser, Internet Explorer, as well as free software and marketing assistance to use its products. This enabled the company to successfully overcome the marketing dominance of its archrival Netscape Communications in the mid-1990s. In addition, to gain supremacy in the software industry, the company repeatedly gave away software that other companies were selling, thus hurting other firms such as Stac, Symantec, Novell, and Oracle.

Microsoft has aggressively defended these giveaways, arguing that lower prices are good for consumers. Moreover, bundling several types of software packages into an affordable unit is driven by customer needs. The courts have sided with Microsoft to date, and the company has stayed out of further controversy by refraining from raising the prices of its products, coupled with a strong public relations campaign involving several corporate social responsibility programs.

Wal-Mart in 2000

In 2000, government officials in Wisconsin, Oklahoma, and Germany accused Wal-Mart of pricing goods below cost with the intent of driving competitors out of the market. The Wisconsin Department of Agriculture, Trade and Consumer Protection filed a complaint against the giant retailer for violating the state's antitrust law by selling butter, milk, laundry detergent, and other staple goods below cost in stores in many cities and towns, thereby forcing other local stores out of business, gaining a monopoly, and ultimately increasing its prices.

In Oklahoma, Crest Foods, a three-store supermarket chain, filed a predatory pricing suit against Wal-Mart, contending that the latter regularly sent employees to visit their store to monitor prices and subsequently targeted price cuts, often dipping well below their own costs, so as to undermine them. Similarly, in Germany, the Federal Cartel office accused the retailer of predatory tactics using "corner product" items such as milk and vegetable oil. German law prohibits below-cost pricing because the practice decimates small businesses and independent shops.

Support for the Rationale for Predatory Pricing

Many economic models based on game theory and the theory of imperfect competition have shown that predatory pricing can be rational and profitable under specific circumstances. For example, by using "low-cost signaling"—that is, by increasing production and simultaneously lowering costs below the price—a firm may hoodwink its competitors into believing that it has a lower cost of production than the rest, thereby persuading them to leave the market as it would not be profitable for them to compete. Aggressive pricing also enables predators to acquire the reputation of being "tough," which may deter many potential entrants in the future. A final reason for predatory pricing is that aggressive pricing strategies will ensure more loyal customers from whom the company can make a profit in the future.

Skepticism Regarding the Theory of Predatory Pricing

Many question the justification for the theory of predatory pricing since it is an irrational practice and the laws designed to prevent the practice only discourage competition. The Federal Trade Commission has not successfully prosecuted any firm for this practice in over two decades, and there are no empirical examples illustrating demonstrated predatory pricing by a firm. Such practices can be very costly for a larger firm (usually the predator), and a price war is an extremely risky venture given the uncertainty of how long it is likely to last. In addition, the competition may temporarily shut down its operations and resume when the price wars are over. Critics further argue that there has been no case when predatory pricing has led to monopoly. Conversely, there is strong evidence of the practice having failed repeatedly.

It is interesting to note that when Ford introduced the Model T in the early 1900s, it actually lost money and market share to Buick, Oldsmobile, and other competitors. By 1910, the auto industry was booming, yet Ford decided to cut its price by 20%, to $780, which was below the average total cost. On the contrary, General Motors, Ford's major competitor, had decided to increase its prices. Ford may have "preyed" on its competitors, yet few would argue against the fact that the customers were the ultimate beneficiaries. However, it does make one wonder whether such actions would have been allowed in today's environment.

Issues for Further Research

There are many issues that are yet unresolved regarding the effects of predatory pricing on marketing decisions and strategies. For example, it is not clear what the long-term effects of predatory pricing on customer behavior are. As noted before, consumers benefit by paying less in the short run, yet the impact of higher prices set by the predatory firm after the demise of competition is not clear. Are consumers aware of predatory practices, and if so, how, and does it cause any backlash? Research is also needed to identify product-, company-, and industry-based factors that contribute to the occurrence of predatory pricing practices.

Another issue relevant in international trade pertains to the circumstances under which dumping may be considered predatory marketing. Dumping occurs when a foreign firm sells a product in a host country at a price below the cost or at a price below that at which the firm sells the same product in its domestic market. This is not the same as predatory pricing as firms often sell in free markets for nonpredatory reasons as well, such as during recessions or when the company's sale price remains high enough to cover the variable cost as well as part of the fixed costs they would continue to incur even if they stopped selling. Although the U.S. antidumping law and policy do not specifically prohibit predatory pricing, it is worth investigating the relationship between dumping and predatory pricing in other markets throughout the world and the necessary conditions under which one is considered to be the other.

Preferential Treatment

The term *preferential treatment* refers to forms of recruitment, appointment, hiring, and promotion that give preference to (members of) groups previously or presently affected by discrimination.

Preferential treatment is often called "affirmative action." But whether the two terms are synonymous will depend on the narrowness or broadness of the definitions used.

The forms of discrimination that lead to policies of preferential treatment need not be intentional or rooted in racist or sexist attitudes. Discrimination is sometimes unintentional and connected to practices that have discriminatory effects. Hiring by personal friendships and word of mouth are common instances, as are some seniority systems. Advertising and interviewing only in certain geographical regions or at certain colleges may have the effect of excluding minorities from consideration for jobs. Even bias-free individuals may engage in selection procedures that have disproportionate and adverse effects on certain groups. Preferential treatment policies have been established to redress policies or practices that have had such discriminatory effects.

Preferential policies make the properties of race and sex morally relevant considerations, even though these properties should, under circumstances free of discrimination, be morally irrelevant. However, the reasons for using these properties in preferential policies are different from the role these properties play in invidious discrimination. Racial discrimination and sexual discrimination typically spring from feelings of superiority and a sense that other groups deserve lower social status. Preferential treatment entails no such attitude or intent. Its purpose is to restore to persons the status that they have been unjustifiably denied, help them escape stigmatization, and foster relationships of interconnectedness in society.

Preferential treatment can appear in the form of specific target goals or, in more subtle ways, of giving special opportunities to minorities or women. Merely terminating discriminatory attitudes or practices does not constitute preferential treatment. To stop a policy of hiring by family connections or to terminate a seniority system might have the desired effect of ending discrimination, but it would not involve preferential treatment.

Preferential policies are often said to have their moral foundations in the principle of compensatory justice, which requires that if an injustice has been committed, just compensation or reparation is owed to the injured person(s). However, it has been disputed that any form of justice is adequate to justify policies of preferential treatment. It is generally agreed by all parties to the discussion that individuals injured by past discrimination are owed compensation as a matter of justice. However, controversy has arisen over whether past discrimination against *groups* such as women and minorities justifies preferential treatment for current group *members*. Critics of group preferential policies hold that only identifiable discrimination against *individuals* requires, and warrants, a policy of compensation; they argue that group preferential polices are unjust. Some supporters of preferential policies try to show that principles of justice do apply to groups, but other supporters appeal to social ideals and good social outcomes rather than principles of justice. Each of these three positions is considered below.

Those who claim that preferential compensatory measures are *just*, in the sense of required by justice, argue that past discrimination warrants present remedies, including preferential treatment of groups. Proponents note that the effects of discrimination linger. For example, African Americans whose families were victims of past discrimination may be handicapped by poverty and undereducated parents, whereas the families of past slave owners are still being unduly enriched by inheritance laws. On this account, those who have inherited wealth accumulated by iniquitous practices have no more right to their wealth than the sons of slaves, who have some claim to it as a matter of compensation. In the case of women, the argument is that cultural attitudes foster in women a lack of self-confidence and prejudicially exclude them from much of the domestic and international workforce or treat them as a low-paid auxiliary labor unit. Consequently, only highly independent women can be expected to compete with men on initially fair terms; and even these women may not be able to compete equally in the setting of multinational corporations having operations in many countries.

Those who claim that group compensatory measures are *unjust* argue that no criteria exist for measuring just compensation to groups, that employment discrimination in society is presently minor and controllable by enforcement of existing law, and that those harmed by past discrimination are no longer alive to be compensated. Some minority groups that were once underprivileged and discriminated against but are now successful argue that their long struggle for equality is being jeopardized by programs of "favoritism" to specific minorities and women. Instead of providing compensation, these opponents of preferential treatment argue, strict equality as well as merit hiring and promotion should be enforced while attacking the roots of discrimination.

The third view is that some compensatory measures are not justified by principles of justice but are justifiable on some other moral basis. Proponents argue that even if preferential policies are unfair in their treatment of some individuals (producing so-called reverse discrimination), these preferential plans can be justified on consequentialist grounds because they can be reasonably expected to serve public utility as society's principal instrument to the end of eradicating intolerable social situations of discrimination.

Arguments for and against preferential treatment have had a profound effect on corporate life and on many other social institutions. The once widespread acceptance of racial segregation and sexual dominance in America has surrendered to a more polite culture that accepts racial integration and sexual equality. As women and ethnic groups have made advances, public opposition to preferential treatment has hardened. However, many writers have pointed out that despite the vast changes in attitude and increases in opportunities in recent years, social data indicate that many underlying practices and patterns of discrimination—or at least failures of proportional representation—remain fundamentally unaltered. Controversies over preferential policies are not morally a thing of the past.

PRETEXTING

Pretexting is the practice by which personal information is obtained under false pretenses. It often takes place by telephone or via the Internet. For example, pretexting occurs when someone calls a credit card company, pretends to be a particular credit card holder, and obtains information about the true credit card holder's account. It has been deemed both inappropriate and illegal according to the laws of the United States. The term is derived from the false "pretext" that is used to obtain personally identifying information.

Individuals who participate in pretexting are known as "pretexters," many of whom sell the illegally obtained information to others. This information may be used to obtain credit in someone else's name or to investigate or sue a particular person. Pretexting is similar in many ways to identity theft in that it involves theft of personally identifying information.

A variety of tactics are used by pretexters to obtain someone's personal information. For example, it is common for a pretexter to call a person and claim to be asking questions on behalf of a survey firm. After obtaining the desired information, a pretexter then typically uses that information to obtain that person's financial information, such as account numbers, credit card numbers, and so on. In this way, the pretexter can also acquire identification information such as work history and social security numbers.

Hewlett-Packard

Although it is generally assumed that such an illicit practice would only be undertaken by unscrupulous characters, recent newspaper headlines have indicated otherwise. Hewlett-Packard (HP) has recently been the subject of investigations by the California attorney general's office and the U.S. House of Representatives. It is believed that pretexting was condoned by the most senior executive, the chairperson of the board of directors.

During 2005, HP instituted an investigation of numerous leaks to the press by its board of directors. HP hired a private investigation firm to carry out the inquiry. The private investigation firm subsequently hired another firm that used pretexting techniques to obtain phone records, allegedly with the knowledge of HP personnel. The resulting investigations have led to the dismissal of key management executives in the company, including both the chairperson and another member of the board of directors.

Although consumers in the United States are critical of corporations, HP has been considered a role model by many people, particularly in terms of ethics and responsibility. When such an event occurs, it undermines the reputation of the corporation and, in particular, the perceptions of consumers regarding the integrity of the corporation.

Trust is a valued and valuable commodity. It is, however, undermined by behavior such as pretexting, particularly when it is sanctioned by business leaders. Unfortunately, the deterioration of trust resulting from such an incident affects business in general, not just the individuals or companies directly involved.

Price Discrimination

Price discrimination occurs when a seller charges different prices to different customers for the same product. Such unequal treatment raises questions of fairness. Under certain circumstances, price discrimination may violate the Robinson-Patman Act's prohibition against predatory pricing.

Price discrimination may violate our ethical intuitions. Behavioral economics teaches that people are highly sensitive to perceived attempts to exploit or price-gouge them. In a famous experiment by Daniel Kahneman and coworkers, 82% of subjects considered it to be "unfair" or "very unfair" for a hardware store to raise the price of snow shovels after a large snowstorm. Similarly, Coca-Cola was the subject of snide editorials and columns when it was rumored that the company had begun testing a vending machine that could automatically raise prices for its drinks in hot weather. Customers complained when the Mets baseball team introduced variable pricing—from $8 to watch the Mets play the Brewers on a weekday up to $16 to see Barry Bonds on Saturday. New Jersey's top civil rights official has determined that ladies' nights (where a bar offers women a lower price of admission or free drinks) illegally discriminate against men, and many states prohibit the practice. Wal-Mart has been accused of driving mom-and-pop stores out of business by selectively lowering prices in stores that compete with them.

Sellers don't want to provoke a customer backlash. Accordingly, they are hesitant to engage in practices such as off-peak pricing. Ski operators are reluctant to boost holiday prices, and hotels are reluctant to charge a market-clearing price for hotel rooms. The Cornell economist Robert Frank quotes a ski industry consultant as saying, "If you gouge them at Christmas time, they won't come back in March." Afraid of growing public anger, Coca-Cola quickly slapped down rumors about its weather-sensitive vending machines.

Nevertheless, in the economist's lexicon, price discrimination is a term of art and does not necessarily have any pejorative connotations. This entry assesses claims that price discrimination is unfair or illegal.

Does Price Discrimination Allow Sellers to Exploit Customers?

A seller will earn higher revenues if it can charge different prices than if it can charge only one price. This is because customers differ in how much they are willing to pay for a product or service. Take the case of airfares: One customer might want to fly to Hong Kong badly enough to pay $1,000 for the fare, while another customer might be unwilling to buy a ticket unless the price is $600 or less. If the seller (here the airline) can charge only one price for both tickets, it will earn $1,200 (i.e., two fares of $600). However, if the airline can price discriminate—that is, charge the first customer $1,000 and the second customer $600—it can make an additional $400 in profits. Each customer pays no more than he or she is willing to pay, but the airline has expropriated virtually all the "consumer surplus" (i.e., the difference between what customers are willing to pay and what they actually have to pay for the good or service in question).

Some people fear that the Internet has enhanced the ability of powerful online retailers to engage in price discrimination (so-called "dynamic pricing"). This scenario goes as follows. Online retailers collect vast quantities of information about customers' preferences and buying habits. Then, they construct consumer profiles from this information. Finally, they use the profiles to estimate each customer's reservation price (the maximum he or she is willing to pay) for a good (or service) and price the good accordingly. In this way, the retailers can price their goods so as to squeeze the maximum dollars out of each customer.

The catch with each of these scenarios is that they assume that the seller has monopoly power (or there is some other market failure). If the airline, for example, is *not* a monopolist, then the high prices it charges its customers can be expected to attract new entrants into the market. Other airlines will offer the customers lower prices. As in the standard economic model, the airlines will successively undercut one another's prices until they have competed away the profit and the price is back at long-run equilibrium.

In summary, price discrimination cannot be used to systematically "gouge" customers unless the seller has a monopoly (or there exists some other market failure). But if there is a monopoly, then that, not price discrimination, is the problem.

Is Price Discrimination Unfair *Between* Customers?

A second objection to price discrimination is that it unfairly discriminates *between* customers. It appears to violate Aristotle's conception of justice, which requires that like cases be treated alike and different cases be treated differently. Is it fair that one passenger should pay $1,000 to fly to Hong Kong when the person sitting next to him or her has paid only $600?

Note that there must be some underlying economic explanation for the difference in fares. Otherwise, in a competitive market, the price discriminator would lose its $1,000 customer to another airline. This is the tip-off to the fact that, most likely, there is some morally relevant difference between the two passengers that justifies the price difference. The customer with the $1,000 seat may be getting more for the higher fare. Obvious examples are the convenience of being able to buy a ticket the day before the flight or the ability to cancel the ticket if a business meeting is called off.

Passengers don't simply buy (or rent) a seat on an airliner. The fares they pay reflect other features as well. Other price differences between customers are not arbitrary. A meal on a Saturday is not the same as a meal on another day of the week. A Coke on a hot day is worth more (in terms of utility) than a Coke on a cold day. Seen in this light, there is strictly no unfairness because the good or service is *not* identical. Aristotle's definition of justice requires not only that like cases be treated alike but that *unlike cases* be treated differently in proportion to their difference. Here, despite superficial similarities, the goods and services are different.

On close inspection, moreover, the $1,000 customer may actually be a *beneficiary* of the difference in fares. If the airline can fill only half its seats at $1,000 on a particular route but the flight breaks even only at 60% capacity, then selling an additional 20% (or more) at $600 will make the flight profitable. In this way, everyone is a winner. If airlines were required to charge the same price for every seat, many seats would remain empty and many flights would remain grounded.

Price-Gouging Following Disasters

Perhaps price discrimination is never more vilified than following a disaster. And the gap between our commonsense intuitions and standard economic analysis is never wider than in such circumstances. After Hurricane Hugo struck Charleston, South Carolina, in 1989, the price of a $20 sheet of plywood jumped to $200, and a $125 chain saw cost $750. The city council passed emergency legislation making it a crime to charge prices higher than those that prevailed pre-Hugo, and the mayor declared martial law.

However, many economists argued that attempts to suppress price-gouging made matters worse. First, if sellers aren't permitted to charge higher prices during a shortage, they have less incentive to carry spare inventories. Second, higher prices also ration demand and ensure that scarce resources are applied to their most valuable uses. Third, in a shortage, the choice generally is between higher prices and empty shelves.

Benign Price Discrimination

Finally, there is a class of cases where treating people alike seems obviously unfair. In other words, price discrimination is morally called for. For example, we demand that drug companies make their anti-AIDS drugs available at a lower cost to people with HIV in Africa and other poor countries. We also don't object if museums give students discounts.

Note that drug companies can supply anti-AIDS drugs to Africans only if market forces are somehow prevented from working. If Merck or GlaxoSmithKline supplies anti-AIDS (or antimalarial or antituberculosis) drugs to Africans, there is the risk that arbitrageurs will buy the drugs in Africa and smuggle them back into Europe or America, where they will earn a large profit. Benign price discrimination is no more stable than the malignant version.

Illegal Price Discrimination? The Robinson-Patman Act

Price discrimination may constitute "predatory pricing" in violation of Section 2(a) of the Robinson-Patman Act. But predatory pricing allegations rarely succeed in courts today. The reason is that for the act's prohibition of price discrimination to apply, the price must (a) injure competition and (b) be below cost. Thus, if Wal-Mart charges lower prices in one store than in another, competitors won't prevail in court by simply showing that they have been injured (i.e., have lost revenues and/or been forced out of business). After all, legitimate price competition also reduces revenues. To prove predatory pricing, the competitors must further show that Wal-Mart has priced its product below its cost. The desuetude of Robinson-Patman is explained by the courts' reluctance to interfere with healthy competition. Moreover, public policy is much less preoccupied with monopoly than in the past. The reason is that most economists believe that monopoly profits will attract rivals into the market and so are likely to be ephemeral.

PRICE-FIXING

Price-fixing is any agreement between competitors ("horizontal") or between manufacturers, wholesalers, and retailers ("vertical") to raise, fix, or otherwise maintain prices. Many, though not all, price-fixing agreements are illegal under antitrust or competition law. Illegal actions may be prosecuted by government criminal or civil enforcement officials or by private parties who have suffered economic damages as a result of the conduct.

Horizontal Price-Fixing

Examples of horizontal price-fixing agreements include agreements to adhere to a price schedule or range; to set minimum or maximum prices; to advertise prices cooperatively or to restrict price advertising; to standardize terms of sale such as credits, markups, trade-ins, rebates, or discounts; or to standardize the package of goods and services included in a given price. All such agreements are per se illegal under United States antitrust law; that is, the court will assume that any such agreement is anticompetitive and will not hear arguments to the effect that the agreement actually enhances quality, competition, or consumer welfare in a particular case. Horizontal price-fixing agreements are also illegal under European Union (EU) competition law, where they are similarly subject to so-called hard-core restrictions.

There is nothing illegal about competitors actually setting the same prices as one another or even about them doing so consciously. (Indeed, in a perfectly competitive market, we would expect retailers to sell their goods at the same prices.) The offense lies in their *entering into an agreement with one another* to set or raise or maintain prices. (Section 1 of the U.S. Sherman Act, for example, prohibits any "contract, combination or conspiracy" that restrains trade.) The agreement, to be a violation, need not set a particular price; the law frowns on any agreement that interferes with competitors' ability to set their own prices with complete freedom. Thus, agreements that set price ranges, establish formulae for rates of change in prices, or supply guidelines for competitors' responses to changes in their cost structures are all violations, even though they neither establish a precise common price nor eliminate all possible price competition. Not every competitor in the market need participate in the agreement. Even an agreement between two tiny competitors in an enormous, busy, and otherwise competitive market will be a violation.

Analysis of Horizontal Price-Fixing

Economists generally agree that horizontal price-fixing agreements are bad for consumers. Competition normally drives prices down, as competitors seek to lure away one another's customers. In a competitive market, therefore, the consumer realizes the greatest possible amount of *consumer surplus*—the value to the consumer of the good in excess of what the consumer actually has to pay for it. Price-fixing agreements, since they reduce competitors' ability to respond freely and swiftly to one another's prices, diminish consumer surplus by interfering with the competitive marketplace's ability to keep prices low. More important, horizontal agreements among competitors may facilitate their joint acquisition of *market power*—the ability to sustain higher prices than free competition would allow, without losing customers. A wide enough agreement could permit competitors to act as de facto monopolists, raising prices and cutting back on production to the detriment of consumer welfare. Moreover, they could do this without gaining any of the efficiency benefits of an actual merger or consolidation.

There are some critics of horizontal price-fixing policy, however. Some conservative economists argue that it is scarcely worth policing horizontal price-fixing arrangements, since they are economically unstable. Each member of a horizontal price-fixing agreement has a strong incentive to defect, secretly offering lower prices to attract a greater share of customers. In addition, any market with inflated prices induced by a horizontal agreement will rapidly attract new entrants, and they can easily restore prices to the competitive level. Finally, many economists are skeptical of courts' and prosecutors' abilities to distinguish real price-fixing arrangements from other complex arrangements with legitimate, procompetitive purposes.

In addition, there have been some concerns about the per se prohibition of horizontal price-fixing agreements in contexts where it is difficult for consumers to judge the quality of goods or services on their own. Take medical care, for example: Patients are often unable to judge for themselves whether the care they receive is of high or low quality. (High-quality care does not guarantee good outcomes, and patients who have received care of poor quality may nonetheless get better.) If high-quality care is both expensive to provide and hard for consumers to detect, the argument goes, then vigorous price competition will drive high-quality care off the market. Patients will not pay more for a difference in care they can't detect or verify. On the other hand, if price competition is minimized through horizontal agreements, then the pressure to cut costs by cutting quality will be reduced.

A third argument against the prohibition of horizontal price-fixing agreements involves the social desirability of cross-subsidization of services for the poor. Physicians, lawyers, and institutional health care providers have frequently argued that a reduction in price competition among them can give them the cushion necessary to supply necessary services at a reduced price or at no cost to poorer consumers. (Another, perhaps more intuitive, way to put this is that vigorous price competition reduces margins, and reduced margins result in cutbacks in charity care and pro bono work.) While competition law has not accepted these arguments, a number of state and local legislatures and regulators have created schemes under which competing health care providers, for example, can apply for permission to fix their prices under close state supervision in order to subsidize low-cost care for the poor. These schemes shield the providers from prosecution by extending the state's immunity from antitrust enforcement to cover their private actions.

Vertical Price-Fixing

Vertical price-fixing arrangements include agreements by manufacturers to set minimum or maximum resale prices for their products. Minimum resale price-fixing is often termed *resale price maintenance.* Direct agreements to maintain resale prices are per se illegal in the United States and subject to "hard-core restriction" in Europe. In both places, however, it is possible for manufacturers to achieve de facto resale price maintenance through indirect means—for example, by refusing to deal with retailers who discount their goods or by offering rebate programs that gear rebate amounts to pricing levels. These indirect means are especially difficult for courts to sort out when the vertical pricing arrangements are combined with other vertical restraints, such as geographic exclusivity deals, service and parts agreements, promotional agreements, and so on.

Maximum vertical price-fixing is at least prima facie procompetitive, since it appears designed to keep prices to consumers low. It is therefore generally judged on a case-by-case basis, with the court balancing the pro- and anticompetitive effects of the agreement in question against each other. (This case-by-case standard of evaluation is known in U.S. law as the *Rule of Reason*; it contrasts with the per se standard, which permits no such balancing.)

State-mandated and -supervised vertical pricing schemes—such as state price controls on auto insurance or on hospital charges—are immune from federal antitrust prosecution under U.S. law. In contrast, EU member states enjoy no such broad "state action immunity" from European competition law. Government-sponsored price-fixing schemes at the U.S. federal or EU-wide level (e.g., agricultural price supports) do not violate domestic antitrust laws but may be challenged as protectionist by other countries through the World Trade Organization.

Analysis of Vertical Price-Fixing

The economic effects of vertical price-fixing are complex, but economists are generally agreed that at least some prohibited vertical price-fixing could be efficient and procompetitive. Consider, for example, a resale price maintenance program put in place by the manufacturer of a certain brand-name appliance. The program guarantees adequate profit margins for the brand's retailers and lets them attempt to capture market share from one another via nonprice competition. Such nonprice competition might include the provision of excellent and attentive service by sales staff in well-stocked retail showrooms, armed with informative promotional brochures. The price maintenance program's limits on *intra*brand price competition have the long-term effect of enhancing the brand's reputation for quality and service; this, in turn, would enhance *inter*brand competition. Without price maintenance in place, however, low-service discount retailers can free ride on the costly services provided by others. Consumers could get their information from the salesman in the comfortable showroom but then actually purchase their appliances from the free-riding low-service discount warehouses. In the long run, without price support, excellent service will be driven out of the market, and the brand's ability to compete with other brands on quality and service will be diminished. Resale price maintenance might also serve to secure margins for small-volume retailers who, without some such guarantee, would be disinclined to devote shelf space to the product. Here, again, intrabrand competition is curtailed to secure distribution channels that facilitate more vigorous interbrand competition. Where the prospect of enhanced interbrand competition is minimal, however—as in the case of a manufacturer with market power in the product being sold—the anticompetitive effects of resale price maintenance may dominate.

Maximum price-fixing keeps costs to consumers down. While it may impose burdens on retailers, those burdens may not be injurious to competition, since retailers who find the maximum resale price burdensome can in many cases simply switch to a different supplier. Moreover, in situations where manufacturers grant geographically exclusive distribution rights to retailers (perhaps to retain control over the secondary markets for parts, service, and repairs), maximum price-fixing can prevent the "local monopolists" from gouging consumers. Finally, maximum price-fixing can limit the total damage to consumers from the repeated markups that occur when all levels of the distribution chain—manufacturer, wholesaler, and retailer—are in the hands of firms with significant market power.

International Price-Fixing

Internationally, price-fixing has been common through the ages. OPEC, for example, is a well-known decades-old cartel of oil-producing nations that sets its production levels cooperatively, with an eye toward keeping oil prices high. OPEC is protected from prosecution under other nations' antitrust laws, both by the international legal doctrine of sovereign immunity and by Austrian law governing service-of-process (OPEC is headquartered in Vienna). Recently, however, the argument has been made that OPEC's price-fixing practices could be attacked through the World Trade Organization, to which the OPEC member nations belong.

In the last decade of the 20th century, an unusual number of global price-fixing cartels surfaced. Among those prosecuted criminally were cartels fixing prices on lysine, vitamins, graphite electrodes, sorbates, sodium gluconate, construction, computer memory chips, marine construction, and citric acid. These cartels inflicted billions of dollars of losses on consumers, raising prices from 30% to 100% during the course of the conspiracies. The cartels were prosecuted vigorously in several countries. Criminal fines paid by companies in half a dozen of the cases exceeded U.S.$100 million; to these were added billions of dollars in payments of private claims to customers alleging economic damages. Executives from Germany, Belgium, the Netherlands, England, France, Switzerland, Italy, Canada, Mexico, Japan, and Korea have been convicted, fined, and in some cases jailed for price-fixing violations.

PRICING, ETHICAL ISSUES IN

Pricing, one of the four functions of marketing (along with product, place, and promotion), is a dynamic process by which buyers and sellers determine what, and how many, units of wealth should be exchanged for a needed product or service. Buyers and sellers have differing goals in this exchange process. Usually, buyers are interested in obtaining needed products and services at the lowest possible price, while sellers tend to concern themselves with maximizing their profits.

Price affects both the supply of, and the demand for, a particular item. Generally, higher prices encourage sellers to produce more of an item but discourage buyers from purchasing large quantities of the item. Contrariwise, low prices tend to whet buyer demand for an item while discouraging sellers from producing. There is a price point, called *price equilibrium*, at which the supply of and demand for an item are equal. At price equilibrium, buyers purchase as many units of production as sellers make available.

The ethical issues in pricing are similar to those governing other aspects of business and deal primarily with fairness—fair competition and fair treatment of buyers and sellers. Generally, any pricing practice that maintains the competitive nature of the market and is fair to market players is ethical; practices that hamper free competition or unfairly treat specific constituencies of buyers or sellers are likely to be unethical.

Anticompetitive Pricing

Anticompetitive pricing practices impede the natural dynamism of a free market. Some anticompetitive pricing practices are illegal, in addition to being unethical. In *price discrimination*, the seller offers identical products or services at different prices. There are three types of price discrimination. Price may vary by customer, when the value of the product or service is subjective or demand is highly elastic. Price may vary by quantity sold, which allows the buyer to enjoy scale economies on large purchases. Price may vary by location or customer segment, which allows both the seller and the buyer to enjoy economies of location. From the seller's perspective, perfect price discrimination would allow the seller to charge each buyer the maximum price the buyer is willing to pay; this form of price discrimination would create an infinite number of points along the demand curve at which the maximum price could be attained from various buyers, each involving a different quantity sold. In theory, perfect price discrimination could be attained at any level of seller output at which there is at least one buyer willing to pay the asking price for the good.

Many forms of price discrimination are ethical. For example, many restaurants offer a children's or senior citizen's menu. Supermarkets offer discounts to customers who use coupons or become price club members. Cinemas may have lower-priced tickets for matinees or for children. Price discrimination may occur even when the seller does not have a monopoly. In this instance, sellers operate in competitive markets but enjoy some degree of discretion in pricing due to brand loyalty, special product characteristics, or market segmentation.

Price discrimination may be predatory in nature, such as when prices are set below cost for certain preferred customers or with the intention of driving smaller competitors out of the market. *Predatory price discrimination* may violate specific laws, such as the Robinson-Patman Act, antitrust legislation, and Federal Trade Commission regulations. Determination of the legality or ethicality of pricing discrimination must be done on a case-by-case basis.

Price-fixing is the process by which a number of sellers agree to sell their commodity for a specified price in a specific market. While all sellers in a market may indeed sell their wares for the same price, this situation is price-fixing only when the sellers agree to do so in advance. In most states, seller collusion to set prices at a certain level is illegal. There is often tacit collusion to fix prices when some sellers' pricing strategy is to match, but not exceed, the price of an industry leader. The Federal Trade Commission has decided in many instances of tacit collusion that the circumstances did not meet the definition of price-fixing because the sellers did not agree among themselves in advance to charge the same price. Tacit collusion can only be considered price-fixing as defined by the Federal Trade Commission when the sellers have advance knowledge of each other's pricing actions and agree to behave similarly. Many states also have "below-sales-costs" laws, which make it illegal to sell goods or services below costs if the purpose of such a strategy is to force competitors out of the market to create a monopoly. Price-fixing is sometimes a form of *predatory pricing* and may be determined as such on a case-by-case basis.

Another anticompetitive pricing practice, *resale price maintenance*, occurs when producers make rules that govern the pricing behaviors of wholesalers or retailers of their products. This is done to limit free competition among sellers and keep all sellers reasonably profitable. Resale price maintenance also helps maintain a premium image for some products and might be used to support after-sales customer service. While resale price maintenance is not strictly illegal, it does inhibit free trade.

Unfair Pricing

Unfair pricing practices are also unethical. Unfair pricing techniques are those that involve fraud or manipulation or violate the requirement that fair market exchanges be informed and voluntary. Unfair pricing also exploits buyers in cases of significant time pressure beyond the buyer's control, emotional distress, and lack of information or experience or where the buyer's normal bargaining power is diluted in a situation of emergent need. *Price-gouging* is a form of unfair pricing that is often considered unethical and is sometimes illegal. It occurs when sellers raise the price of scarce goods to the highest price the market will bear regardless of the cost associated with the production of the goods being sold. Price-gouging is often targeted in areas where substitute goods are not readily available. Frequently, price-gouging is also practiced for items in temporary shortage, such as ice during a power outage or temporary lodging after a natural disaster. Generally, sellers who are able to price-gouge enjoy at least temporary monopoly status in the market in which the price-gouging takes place. Many communities have outlawed price increases during emergency situations unless the seller can show demonstrable cause for the price increase.

Deceptive pricing is another form of unethical pricing and occurs when a seller intentionally misrepresents the total cost of an item, makes incorrect comparisons between the seller's price and the prices offered by competitors, or significantly and artificially inflates the asking price of a product or service with the intention of offering a deep discount for the item. In such a case, the bargain received by the purchaser is a false one, unless the original price is one at which the product was offered for a reasonably substantial period of time or a significant number of items were sold for the original price. In another form of deceptive pricing, products or services are sold as a set; buyers are not given an opportunity to purchase each item independently or decline those items for which they have no desire. The buyer ends up paying for items not needed or wanted.

Hidden costs are another type of deceptive pricing, in which the costs of the item are not readily apparent on examination of the item or the accompanying documentation. Undisclosed shipping or handling costs, finance charges, or maintenance fees are some examples of hidden costs. Failure to disclose such costs is illegal in many states and may violate some Federal Trade Commission regulations. In short, deceptive pricing occurs anytime the price of a product or service is misrepresented, is incorrectly compared with the price of a competitor's product, or includes items the buyer does want but is not given the right to refuse or when all costs are not revealed and made explicit to the buyer at the time of purchase.

Manipulative pricing is another form of unethical pricing, in which price points are set to make buyers think the actual price of an item is lower than it really is. Odd-even pricing is one kind of manipulative pricing, wherein an item is priced in such a way that buyers think the item costs less than it really does. For example, a seller might price an item at $9.99 to lead buyers to believe that the price of the item is significantly less than $10.00. In another form of manipulative pricing, sellers allow buyers to purchase goods and make payments over time, in an attempt to make buyers believe the item costs less than it would if paid for in one lump sum. For example, an item might be sold for $50.00, or for five payments of $9.99. The five-payment scheme might confuse buyers into believing that paying for the item in increments is a significant savings over making just one payment. Another form of manipulative pricing involves setting the price of an item and then offering a seeming discount for volume purchases. The seller might price a particular item for $5.00 or two for $9.99. Again, this form of pricing may confuse buyers into thinking purchasing two of the item results in savings, when it really does not.

The Concept of a "Just Price"

Many discussions of the ethics of pricing decisions stem from the idea of the *just price*, an economic concept originated in the 16th century by Dominican theologians at the School of Salamanca. The theory of just price uses concepts of natural law philosophy as the foundation of economic thinking. The just price of an item is the sum of material costs necessary to produce the item plus a reasonable wage that would allow the seller to maintain a lifestyle appropriate to his or her station in life. The just price, therefore, represents the inherent value of the good or service. Just price theory predates capitalist economic thought. Its origins in Spain in the 1500s mean that just price theory is based on certain assumptions about culture and commerce that do not hold true in a free market economy.

First, just price theory assumes that the household, rather than the firm, is the owner of the tools of production and that human labor is the chief source of wealth. Therefore, a just price must compensate the seller for the cost of materials and labor expended in the production of goods. Fair exchange is based on the value of the labor of the seller, which may increase only if the seller's station in life improves. Since this was unlikely in medieval times, the established price for an item rarely changed.

Second, just price theory assumes that people in similar occupations do not trade goods or services with each other and that the value of labor and raw materials does not change due to factors external to the naturally established price.

Third, profit is not a factor in the computation of a just price; in circumstances where production or labor costs decrease, sellers are expected to pass those savings along to buyers.

Finally, the theory of just price has as an underlying principle the assumption that virtuous human conduct is characterized by restraint from extreme action. Thus, a merchant's most virtuous conduct would be to take a moderate stance by holding to the naturally established price for an item.

The four assumptions underlying the just price theory create the following practical implications for its implementation:

1. Sellers may not sell their wares for more than the naturally established exchange price.
2. Sellers may not raise prices to recoup losses due to business downturn or inventory shrinkage.
3. Sellers may not raise prices in times of natural disaster.
4. Sellers may not raise their price for a commodity once it has been established.

While just price theory may have worked in medieval Europe, the degree to which it would be successful in a secular, capitalist economy is unclear. The limitations on seller behavior imposed by just price theory are incongruent with the demands of a free market and would probably impede the efficient allocation of goods. In addition, the inability to earn a reasonable profit would most likely retard long-term economic growth as it would hinder expansion and discourage new competitors from entering the market.

The question of ethics in pricing is best answered by considering the seller's motivation for choosing a particular strategy and the impact the strategy has on stakeholder constituencies. If it is a seller's intention to use pricing as a means of profit maximization regardless of its impact on those who need the product or service, if the intention is to use price to limit the availability of products needed to sustain life, or if pricing is used as a means of forcing competitors out of the market, such motives are likely to be unethical. If, however, the seller's intention is to make needed products and services available to all who need them, and to make a fair living in the process, this would likely be an ethical approach in pricing. Thus, it is not the strategy itself that is ethical or unethical; it is the reasons for choosing a particular strategy and its impact on the market that determine the ethics of the particular pricing approach.

Primary Goods

For many, the term *primary goods* refers to John Rawls's use of the term in his book *A Theory of Justice.* In this context, the term was used in reference to distributive justice as the first sort of good one might desire to create well-being (which assists one to live out one's rational life plan). A second meaning also occurs in the literature in those theories that focus on goods needed for action. Finally, there is a third understanding of primary goods as capability. Thus, the three senses are well-being, specific goods attainment, and capability.

Rawls and Primary Goods

Rawls defines primary goods as things that everyone presumably wants, such as rights, liberties, powers, opportunities, income, and wealth. These primary goods are meant to promote well-being. Rawls admits that there are certainly other primary goods (such as health), but they are not at the disposition of society to provide. A theory of distributive justice can only concern itself with that which society can provide.

From this standpoint, Rawls would have us imagine that these primary goods are equally distributed to all in society. Since this egalitarian allocation will not be a stable one, trade-offs will result. Rawls's difference principle is meant to govern such transfers. The difference principle states that social and economic inequalities should be arranged so that they are reasonably expected to be to everyone's advantage and so that they are attached to positions and offices open to all. Thus, with primary goods, all trade-offs that result in inequalities (generally for the sake of economic efficiency) must be structured so that the least advantaged gain from the action. For example, in a business contemplating executive stock options (which will increase the inequality of wages in the company), there must be a direct tie to how the typical line worker in the company (the least advantaged) will also benefit. It is not enough to say that the incentives will make the executives do a better job for stockholder wealth. (This would be the position of Milton Friedman.) The difference principle would require companies to offer line workers the first share in greater profits, either through salary or through contributions to their retirement plans. This is because the difference principle only allows increases in income to the advantaged group so long as the least advantaged are proportionally rewarded as well. This is because the least advantaged must always share in equal fashion whenever a more advantaged group is given more.

The principle behind economic growth implied by the difference principle is that of chain connection. Under chain connection, helping the least advantaged directly by giving them additional primary goods will give a positive upward stimulus to the economy. By giving goods directly to the least advantaged, they will be helped. Also, since the least advantaged will spend this subsidy, there will be a subsequent positive economic stimulus. This positive economic stimulus will be felt throughout the economy. It can be summed up by the maxim "All rise together with the tide." Chain connection is the opposite of trickle-down macroeconomics, which asserts that the way to help the least advantaged is to give tax breaks or other incentives to the rich so that they will invest the money in securities, with the result that businesses will have more money to hire more workers (which will include the poor). The poor under the trickle-down approach are not the proximate but the remote target in economic stimulus.

Another important point to be made about primary goods is that those fundamental liberties are to be shared equally and not bartered or exchanged for other goods. Such liberties include political liberty (the right to vote and to be eligible for public office), freedom of speech and assembly, liberty of conscience and freedom of thought, freedom of the person, the right to own property, and freedom from arbitrary arrest and seizure. Primary goods such as the use of one's time, talents, and income are the only goods eligible for barter. The others (basic liberties) are sacrosanct. Thus, the primary goods eligible for exchange must be carefully monitored by application of the distribution principle so that the macroeconomic strategy of chain connection comes about.

The Second Approach: Primary Goods and Action

The second approach to primary goods can be seen from the vantage point of the foundations of action. This understanding of primary goods can be found in the writings of Alan Gewirth and Michael Boylan. Under this approach, the question becomes, Which goods permit fundamental action? Gewirth takes a rather general view of what these goods might be by classifying them as goods of freedom and well-being at the basic level (most fundamental but unspecified), the nonsubtractive level (less fundamental but specified as those goods one already possesses), and the additive level (the least fundamental but specified as those goods one wishes to possess.) Boylan's approach is similar in that the goods sought are those that permit action (which is assumed to be the primary human need). However, the significant difference is that Boylan offers a table of actual goods (such as food, clothing, shelter, and protection from unwarranted bodily harm) that are set in categories from the most fundamental to action to the least. The point is that when there is a conflict between claims for competing goods of agency, society has a duty to provide goods to the claimant that are more fundamental. Thus, if wealthy citizens want a tax cut directed to them so that they might buy more luxury goods or increase their passive investment income (excess discretionary spending) but the consequent would be lower spending on food programs for the very poor, then the claims of the poor trump those of the rich because the good they desire is more proximate to the fundamental conditions of action (compare this also with Henry Shue). In the action theory approach, primary goods still find a way to affect public policy, but the justification is somewhat different from Rawls's (though the policies advocated may be very similar).

The Third Approach: Primary Goods and Capability

The third kind of primary good allocation strategy is to enhance the capability for action. This is the strategy proposed by Amartya Sen. Instead of focusing on the goods themselves, Sen is thinking about capability for action. An example of this is when one person is not eating because he is fasting and another person is not eating because he has no food at all. Both individuals lack food (a primary good). But the first lacks it by choice: He is choosing to fast. He could also choose to end the fast at any time. In the latter case, an individual lacks a primary good and has to find a way to obtain it or die.

It is Sen's conjecture that public policies on the inequality of goods distribution are all wrong. What we really should be thinking about is how to enhance the capability sets of individuals so that they might realize the sort of life that appeals to them (also known as a rational life plan). How do we go about finding ways to increase the capability sets within a society? Look at cultural/political amalgamations that work. Some of these are not directly tied to money or material goods. If one judges contentment by mortality rates, then a country such as Costa Rica, which has a fraction of the per capita income of the United States yet virtually the same mortality rate, is a success. Institutions such as free and available health care and gender and minority rights may be two examples of policies that encourage the creation of robust capability sets. In this way, primary goods are to be seen as powers or capacities rather than actual specific goods themselves.

—Michael Boylan

PRISONER'S DILEMMA

Prisoner's dilemma is a term used to describe certain types of non-zero-sum situations in game theory where rational self-interested individuals make choices that lead to suboptimal results. Many games are zero sum in that a positive result for one side (+1) will result in a loss (−1) for the other (+1, −1 = 0). In a prisoner's dilemma, however, the outcome is often negative for both parties. Economists, mathematicians, and psychologists, among others, use game theory to observe and predict the choices that people will make when faced with various outcomes. The games involve each player having preferences and choices about the outcomes. They have information about the options open to the other party but do not know exactly how they will behave. The outcomes are not fixed but depend on the choices the players make. Two-player games of this type are useful because they provide objective quantitative data about rational choices under variable conditions.

The name *prisoner's dilemma* came about from a story developed in 1950 by the mathematician Albert Tucker, who was trying to explain a problem that arises in games developed by his colleagues Merrill Flood and Melvin Dresher as part of their work for the RAND Corporation. The narrative varies in its particulars but sets up a paradoxical dynamic where individual benefits are balanced against mutual gain. Classically, two suspects are separated, and then the interrogator who has sufficient evidence for a minor charge makes a proposition to each suspect separately: Whoever confesses first and implicates the other will get a plea bargain and a small fine, while the accomplice will face the harshest charge possible and a consequent long sentence. Each suspect gets to think about the deal and slip a note under the jail door by morning. This dilemma leaves the individual with two distinct choices, to confess or to keep quiet, but the outcome depends on what the other person does. If one keeps quiet, that person will only do well if the other suspect remains quiet as well; if the other person confesses, the nonconfessor will end up in prison for a long time. Each prisoner reasons that he or she is better off confessing irrespective of what the partner does. Yet paradoxically the best mutual outcome would result from not confessing. Central to the dilemma is the fact that the actors have to operate in the absence of full information and trust. Left to ponder what is in one's personal best interest, each prisoner's best rational choice (called an "equilibrium") is to minimize the risks posed by the various options and confess as quickly as possible.

The dilemma is often represented graphically, with rows representing the choices of one party and columns the choices of the other (see Table 1). Thus, if one confesses while the other keeps quiet, the result would be that the one who kept quiet has a significant negative outcome, whereas the confessor benefits. Similarly if both confess, then there is a negative result for both.

The setup means that both parties will have a common set of individual preferences. Often the choices are given the more value-laden terms "cooperation" (c) and "defection" (d). The best individual ranking of payoffs would be confession when the other is silent (d/c), followed by mutual silence (c/c), then mutual confession (d/d), and finally, keeping quiet while being implicated by the partner (c/d). Still, both prisoners are reasoning the same way at the same time, with the result that as a group they are worse off than if they could have cooperated more. The game thus leads to an outcome that is Pareto suboptimal. In other words, there are other choices that the players could have made that would have left both better off without either being made worse off.

In game theory terms, the rational dynamic that leads the players to choose as they do is known as a *dominant strategy.* Anyone faced with the dilemma is forced to choose what to do regardless of the other person's choice, and in this case it makes the most sense to confess in the absence of full information. The game is also *symmetrical* in that both parties are given identical choices and are aware of each other's preference ordering.

Business and Daily Life

Once we recognize the dilemma, we can see it in business and in everyday life, from nuclear disarmament treaties to gas pricing at stations across the street from each other. For example, most airlines would like to get rid of their frequent flyer programs, which reward travelers with free seats at given reward levels and thus deprive the airlines of potential revenue. However, it is illegal for the airlines to collude, and therefore, they have to make moves in the market that make assumptions about the way their competitors will behave. If all airlines simultaneously abandoned their frequent flyer programs, they would all be better off. However, if one announces that it is going to, the others are faced with the choice of doing so as well (cooperating) or capitalizing on the market opportunity to make short-term gains (defecting). So although they would all be better off dropping the programs, in the absence of full trust and knowledge about the future behavior of others, none is willing to make the first move.

Another everyday example is where traffic flows in a single direction on a two-lane highway. If one of the lanes is blocked due to roadwork, signals advise motorists to merge to form a single lane. Drivers then have the choice to either slow down and allow cars in the blocked lane to merge gradually or race ahead and cut in at the front. It would be mutually beneficial for all motorists to have a slower but constant flow of traffic; but if there is any suspicion that someone will not cooperate, then the drivers are faced with the choice of enduring the consequent stop-and-go traffic caused by the defector or becoming defectors themselves. Similarly, there will be a temptation for political rivals to implement a negative campaign that attacks the other side even though both realize that they would both benefit from not doing so.

The prisoner's dilemma is especially prescient in analyzing cases where there is a limited resource held in common but there are incentives for individual gain at the cost of the general welfare, such as exploiting the environment. Thus, we can see that if fishing grounds are depleted, it makes sense for everyone concerned to agree to wait until they have a chance to replenish. At the same time, there are potentially huge rewards for someone who defects from the agreement. If everyone thinks the same way, then it will be rational, if not moral, to defect from a ban on fishing.

Table 1 A Prisoner's Dilemma

	Confess	*Keep Quiet*
Confess	−3, −3	0, −6
Keep quiet	−6, 0	−1, −1

Preference Ordering

The prisoner's dilemma is a form of *mixed motive* game in that the preference orderings can be adjusted so that it is not always in someone's best interest to cooperate or defect. In the classic case above, the order is d/c > c/c > d/d > c/d, where ">" represents the preferred outcome. Other orderings have been given individual labels too. The sequence d/c > c/c > c/d > d/d represents the game of "chicken" made famous by teen movies in the 1950s. Opposing parties engage in a destructive course of action, such as driving cars toward each other, and the winner is the one who steers away (cooperates) last. The best outcome is to stay on track while the other car swerves away. However, there are no rewards and a huge downside if no one veers and a crash occurs. This game of chicken is the sequence set up by brinksmanship or hardball bargaining in business. There are great benefits if one side can cause the other to cave in, but if both act in the same adversarial way, then they are likely to lose out on a potentially profitable deal and spoil their future relationship at the same time. Lengthy labor strikes reflect this outcome.

The order c/c > d/c > d/d > c/d is sometimes called a stag hunt, after a story from Rousseau. Here, people are engaged in a cooperative enterprise that none could succeed at individually. However, if a smaller reward presents itself to one of the participants—such as an easily caught rabbit—the temptation is to abandon the team project and go for the surer reward. Again, if everyone behaves similarly, then they are all better off seeking their own pickings, but the worst outcome is to be operating for the benefit of the team when everyone else is out for themselves. This case illustrates what happens when a group project lacks strong unanimity of purpose or lack of trust in the ultimate outcome.

So far, the games described have been symmetrical and one-time choices. Considerable research has gone into studying the effects of changing these variables. The payoffs may be adjusted, and sometimes each party will have a different preference order. For example, if one party were very rich so that the marginal utility for the profit and loss would be relatively less than it would be for a poorer player, the situation allows the rich side to play chicken since it could accommodate a mutually unfavorable result, whereas the poorer player has a traditional prisoner's dilemma ordering.

Other factors may affect the way the prisoner's dilemma is played. Conditions may be relaxed so that the parties may confer, for example. Although communication sometimes increases cooperation, it also gives players the opportunity to set up sham agreements and lie to each other.

Iterated Games

If we imagine our prisoners pondering what to do, it will make a difference if they have dealt with each other previously. In repeated (or iterated) games, where the payoff matrix is known, certain strategies will emerge as being more successful over time. Robert Axelrod has run a number of computer versus computer games, and it turns out that when players can punish each other through defection or, alternatively, reward each other through cooperation, the most successful strategy is the one labeled "tit for tat" (TFT), whereby one initially cooperates with and then reciprocates the move made by the other party. Axelrod describes the program as nice in that one is never the first to defect, retaliatory in that it penalizes defection, forgiving in that it does not aim to punish beyond the move at hand, and clear insofar as its strategy is very explicit. In computer tournaments (more than 120,000 moves), TFT survived better than any other program.

The prisoner's dilemma itself is a rational exercise, and therefore, the lessons we draw from it will be prudential but not necessarily moral. The research implies that over repeated encounters, each side will be better off cooperating rather than seeking short-term gain. Trust and reputation have considerable benefits because they will allow parties to reach optimal solutions instead of defaulting to behavior that focuses solely on defensive postures. These insights can certainly be used to develop a practical ethics and have been used to explain the development of altruism when a population is self-interested.

Unlike computers, humans bring a range of emotions and psychological drives that often make their actions subrational in a technical sense. Individuals often bring a desire to do better than the other side no matter what the cost (the so-called auction dynamic), a desire for vengeance, a need to maintain a notion of personal integrity (e.g., never to squeal or defect even in the face of considerable incentives), or numerous other factors that influence play. This reality leads some commentators to suggest that corporations with clear mandates may be more rational than humans. However, this logic suggests that corporations may just be strategic players, with an expedient egoistic morality.

The prisoner's dilemma and similar games are necessarily artificial and do not represent the full richness of human interaction. Nevertheless, by paring down complex issues into straightforward choices, they provide useful quantitative data for many areas of social science research.

PRIVACY

Privacy is a surprisingly obscure and disputed value in contemporary society. With the tremendous advances in technology alone, calls for greater protection of privacy have increased in recent decades. Yet there is widespread confusion concerning the nature, extent, and value of privacy. Some Western countries, for example, do not acknowledge a legal right to privacy as recognized within the United States, while others, such as New Zealand and Australia, are sophisticated in their centralized and consistent approaches to personal privacy issues. Even within the United States, there is significant disagreement about privacy. The U.S. Constitution, for example, makes no mention at all of a right to privacy (though it also neglects to mention other rights, such as the right to marriage), and the major Supreme Court decisions that have relied on a fundamental right to privacy, *Griswold v. Connecticut, O'Connor v. Ortega*, and *Roe v. Wade,* remain highly contentious and controversial. The strongest arguments in favor of the right to privacy stem instead from the Fourth Amendment protection from unreasonable searches and seizures and from the omission of privacy from the rest of the Constitution and the inclusion of the Ninth Amendment, which explains that the enumeration of certain rights does not deny the remaining rights, and the Tenth Amendment, which provides that powers not given to the government are reserved to the people.

Two general understandings of privacy can be found in the legal and philosophical literature on this topic: privacy as the right to be left alone within a personal zone of solitude and privacy as the right to control information about oneself. Each interpretation can be problematic, but each has important implications for business. It may be considered unreasonable by employers for a worker to expect to be left alone in the workplace, so the first interpretation may pose conflicts in business ethics. Likewise, though the Supreme Court's decisions define privacy according to the latter interpretation, employers may be entitled to a good deal of information about employees. Establishing the proper limits of privacy, including drawing the line between the personal and the public at work, is a significant challenge in connection with business ethics.

Before turning to some of these more specific issues, however, it would be first worthwhile to consider the connection between these two senses of privacy. Certain decisions that one makes about how one lives one's life, as well as the control of personal information, play a crucial role in defining personal identity. Privacy is important because it serves to establish a boundary between individuals and thereby serves to define one's individuality. The right to control certain very personal decisions and information helps determine the kind of person one is and the person one becomes. To the degree that one values individuality and the distinct and individual treatment of others, one ought to recognize that certain personal decisions and information are rightfully the exclusive domain of the individual.

Specifically in connection with privacy, ethical issues arise in the process of gathering information, assessing its accuracy, correcting it, and disclosing it, as well as in connection with the substance of the information itself. The simple awareness that others have personal information about them may feel to some invasive or violating. For that amorphous reason, privacy is a slightly difficult concept to define and includes the ability to control what others can find out about you. Why do we care that someone has our personal information? We can imagine items of personal data that we simply do not want others to know, notwithstanding whether they would actually do something with that information. We do not like people knowing things about us; it comes down to one's ability to be autonomous in controlling one's personal information.

Do you care about the information that others have about you? Should you care if your boss knew of all of your off-work activities? Consider Milton Hershey. Milton Hershey would tour Hershey, Pennsylvania, making note of workers' lawns that were not kept up or homes that were not maintained. He would even hire private detectives to find out who was throwing trash in Hershey Park. Another business owner, Henry Ford, used to condition wages on workers' good behavior outside the factory. He had 150 inspectors in his Sociological Department to keep tabs on workers' hygiene habits and housekeeping.

Privacy Issues Unique to Information Technology

Information technology provides us with a host of ethical challenges. New technology imposes new implications for the balance of power in the workplace. For some time, we have had in-home offices, allowing for greater invasions. Moreover, the line between personal and professional lives has become blurred as workers conduct personal business in the office and professional business at home. The office usually provides faster, cheaper, and easier access to the Internet, while some work must be done at home to be completed according to our modern, technologically enhanced pace.

The privacy implications of both these blurred lines and the advancing technologies at work are monumental. Should the technological ability to find something out make it relevant? With new employee-testing technology, employers can obtain all sorts of personal information. Through genetic testing, hair follicle testing, or drug testing, employers can find out anything they want to know about their employees. But with the ability to do something comes a responsibility to do it ethically. Should an employer obtain the information simply because it has the ability to do so?

Legislation of Privacy

Georgia was the first jurisdiction whose courts recognized a common-law right to privacy. The court in *Pavesich v. New England Life Ins. Co.* justified its conclusion by finding a right of privacy in natural law, recognized by municipal law, inferred from expressions used by commentators and writers on the law as well as judges in decided cases, and embraced within the absolute rights of personal security and personal liberty. Though some states rely on statutory protections rather than common law, only two states—North Dakota and Wyoming—fail to recognize *any* of the four privacy torts generally accepted by the courts. Other states that provide constitutional recognition and protection of privacy rights include Alabama, Arizona, Florida, Hawaii, Illinois, Louisiana, Montana, South Carolina, and Washington. However, in all states except California, the application of this provision to private sector organizations is limited, uncertain, or not included at all.

Federal Legislation

More than 100 bills on privacy protection have been introduced in Congress, but only one on the collection of personal information from kids on the Internet has been approved. For an extended period of time, the White House only supported privacy protections related to medical information, because they believed that this type of uncertainty will dissolve as firms and employees become more comfortable with the medium.

The Privacy for Consumers and Workers Act (PCWA), proposed first by another name in 1989, then again in the 101st, 102nd, and 103rd Congresses, was finally debated by the Subcommittee on Labor-Management Relations in 1993. The bill was revised and eventually approved by the House Education and Labor Subcommittee, though the 103rd Congress failed to pass it. The bill provided some additional mandates for adequate notice of when the employee is being monitored on the job. This would have been a critical requirement since adequate and effective notice may remove an employee's reasonable *expectation* of privacy, and some intrusions may be acceptable once notice has been given. On the other hand, in other situations, even the best form of notice does not transform a wrongful intrusion.

The PCWA sought to find a balance between the employer's desire to maintain quality and the employees' (and consumers') expectations of privacy in their communications. Specifically, the act also provided that workers who had been employed for less than 60 days could be monitored periodically or randomly without notice or limitation, while employers would be required to provide notice of periodic or random monitoring to workers from that time until they had been employed for 5 years. Once a worker had been employed for 5 years or more, periodic or random monitoring would be completely prohibited. In addition, employers could not disclose information obtained through monitoring. Notwithstanding the amount of time an individual had worked for a firm, monitoring would be capped by the PCWA at 2 hours per week.

Some researchers contend that adequate universal information privacy safeguards can only be achieved by the enactment of public policy legislation by the Congress and the president. David Linowes, former chairman of the U.S. Privacy Protection Commission, contends that appropriate and effective legislation would require that (1) there be minimum intrusiveness into the personal affairs of an individual, (2) fairness be emphasized (therein including disclosure), and (3) there be a means for confidentiality when information privacy is expected.

The Electronic Communications Privacy Act of 1986 (ECPA) is also relevant to this analysis as it prohibits the "interception" or unauthorized access to stored communications. However, its impact is to punish electronic monitoring by third parties rather than employers, since courts have ruled that "interception" applies only to messages in transit and not to messages that have actually reached company computers. In addition, the ECPA allows interception where consent has been granted. Therefore, a firm that secures employee consent to monitoring at the time of hire is immune from ECPA liability.

Other U.S. statutes related to the protection of privacy are as follows:

- Cable Communications Policy Act
- Children's Online Privacy Protection Act
- Customer Proprietary Network Information Electronic Communications Privacy Act
- Fair Credit Reporting Act
- Family Education Rights and Privacy Act
- Federal Trade Commission Act
- Gramm-Leach-Bliley Act
- Health Insurance Portability and Accountability Act
- Identity Theft Assumption and Deterrence Act
- Privacy Act
- Right to Financial Privacy Act

Given the nature of the legal uncertainty or instability with regard to these challenging areas of information gathering, one finds that perhaps the only source to which one should look for an answer is ethics. Yet Professor John Haas from the University of Notre Dame reminds us that we remain vulnerable to a plethora of dangers when the development of our moral systems is not able to keep pace with technological and medical developments. Even the courts recognize this dilemma when they deal with new challenges, such as in *State of Washington v. Young*, where the court reviewed the legitimacy of police use of infrared thermal detection devices aimed at an individual's home without a warrant or notification. The court held that subjective expectations of privacy may be unconsciously altered when affected by the fast-paced changes in technology. The court in that case cautioned that our decisions should reflect thoughtful and purposeful choices rather than simply mirror the current state of the commercial technology industry.

Constitutional Protections

The Fourth Amendment to the U.S. Constitution protects the right of people to be secure in their persons, houses, papers, and effects, against unreasonable searches and seizures. This protection implies a reasonable expectation of privacy against intrusions *by the state, only.* As this provision of the Constitution does not apply to actions by private sector employers, their employees must rely instead on state-by-state laws and the common law made and accepted in the courts. A similar limitation exists in connection with the First Amendment's protection of personal autonomy and the Fifth Amendment's protection against self-incrimination—each of these only protects the individual from invasions by the state. Currently, employment-related privacy legislation that would apply to private sector employers has been proposed in several states, but those states fall in the distinct minority.

What the courts will generally consider in cases involving both the Fourth Amendment and common-law privacy protections is (a) whether the employer has a legitimate business interest in obtaining the information and (b) whether the employee has a reasonable expectation of privacy. Several examples of common-law actions by the courts are illustrative of the courts' attempts at creating this balance, but perhaps more significant are the settlements reached by firms concerned about the *prospect* of a judge's decision.

Common-Law Protection of Privacy

Supreme Court Decisions

One of the first cases to designate a right to privacy was *Union Pacific R. Co. v. Botsford*, decided in 1891. In that case, the court established the inviolability of the person, though it did not base the decision on its constitutionality but instead on privacy as a sacred right, carefully guarded by the common law, defined as the right of every individual to the possession and control of his or her own person, free from all restraint or interference of others unless by clear and unquestionable authority of law. Again, in 1928, in a dissenting opinion in *Olmstead v. U.S.*, Supreme Court Justice Brandeis identified the right to privacy as the core value in American life.

Constitutional protection of the right to privacy was most clearly and articulately established by the Supreme Court in the 1965 case of *Griswold v. Connecticut*, where the Court was asked to determine whether the Constitution protects marital privacy in connection with a couple's ability to be counseled in the use of contraceptives, where a state restriction against such counseling exists. The Court in this landmark case held that though the Constitution does not include a specific right to privacy, the Bill of Rights created zones of privacy. The Court found that the First, Third, Fourth, and Ninth Amendments created the right to privacy in marital relations. Since the Connecticut statute conflicted with the exercise of this right, the statute was declared null.

In 1973, the Court heard the now well-known case of *Roe v. Wade*, in which a pregnant single woman challenged a state statute prohibiting abortions except in cases where the mother's life was threatened. Roe argued that the statute violated the Due Process Clause of the Fourteenth Amendment, which protects against state action the right to privacy, including a woman's qualified right to terminate her pregnancy. In that case, the Court recognized that the state may have legitimate interests in protecting both the pregnant woman's health and the potentiality of human life and thereby needed to define that "potentiality." The Court then balanced these competing interests and designed a response based on the chronological progression of the fetus.

In 1987, the Court determined the case of *O'Connor v. Ortega*, which involved supervisory searches of public employees. It was this case that established the "reasonable expectation of privacy" standard for application throughout public sector workplaces and, by inference, also established the boundaries of protection for private sector employees. In addition, the expectation of privacy in the public sector workplace, according to the Court, was to be balanced with the particular circumstances of each case, the government's need for supervision and control, and the expectations of the employees involved.

Additional Judicial Decisions

Case law recognizes the tort of intrusion into seclusion, which finds liability when one intentionally intrudes on the private affairs of another if the intrusion would be highly offensive to a reasonable person. As we begin to live more closely with technology, and the intrusions it allows, the concept of reasonableness under this formulation becomes tenuous. Additional state-by-state protection through regulation often focuses on online privacy to the exclusion of workplace privacy, though related legislation has been proposed in several states.

In one case, two McDonald's restaurant employees used voice mail to transmit love messages during an affair. They believed that these messages were private since the firm had told them that only *they* had the access codes. The franchise owner monitored the voice mail messages and later played messages for the wife of one of the workers. The lovers sued for invasion of privacy. They settled for several million dollars, so we do not yet have any judge's decision in a situation like this. In another case that never made it to the courts, the Minnesota attorney general sued several banks for revealing personal information about clients to marketers in exchange for more than $4 million in fees. One bank eventually agreed to pay attorney's fees plus $2.5 million to Habitat for Humanity.

While the law has not yet settled in connection with monitoring or the privacy of obtained information, hence the settlements, monitoring does seem justified by several cases where e-mail was later used as evidence to encourage a settlement. Within the past several years, several large firms, including R. R. Donnelly, Morgan Stanley, and Citicorp, have found that cases often hinged on e-mail transmissions that people originally thought had been deleted. In one case, this included an e-mail containing 165 racial, ethnic, and sexual jokes sent to the entire firm. In another, the e-mail included sexual jokes about why beer is better than women. Had the firms enforced stringent policies about the use of e-mail and monitored to enforce these policies, perhaps these e-mails would never have been sent.

The *New York Times* also found itself with some problems. They fired 24 employees at a Virginia payroll processing center for sending inappropriate and offensive e-mail in violation of corporate policy. The public sector is not immune to similar challenges: The U.S. Navy reported that it had disciplined more than 500 employees at a supply depot for sending sexually explicit e-mail. It happens all the time, and it is continuing to happen.

In cases where the courts have been able to address the issue, it seemed at first that notice of monitoring might emerge as the critical factor. Perhaps persuaded by early case law, of the 67% of mid- to large-size firms that monitor, 84% notify their employees of this activity. Notice might range from a one-line comment in the middle of an employee manual that someone receives on the first day of work to a dialogue box reminding you that e-mail may be monitored that pops up each time you hit the "send" button to transmit an e-mail.

Many court decisions seem to depend on whether the worker had notice that the monitoring might occur. Since the basis for finding an invasion of privacy is often the employee's legitimate and reasonable expectation of privacy, notice of monitoring would remove that expectation. This conclusion was supported in *K-Mart v. Trotti*, where the court held that search of an employee's company-owned locker was unlawful invasion since the employee used his own lock.

The basis for the decision was that the employees were left with the legitimate, reasonable expectation of privacy because they used their own locks. On the other hand, an employer's search of employee lunch buckets was held reasonable by another court only 2 years earlier.

In a later 1990 case, *Shoars v. Epson*, Epson won a suit filed by an employee who complained about e-mail monitoring. In that case, the court distinguished the practice of *intercepting* an e-mail transmission from *storing and reading* e-mail transmissions once they had been sent, holding that the latter was acceptable. In a 1992 action, Northern Telecom settled a claim brought by employees who were allegedly secretly monitored over a 13-year period. In this case, Telecom agreed to pay $50,000 to individual plaintiffs and $125,000 for attorneys' fees.

Similarly, an employee-plaintiff in a 1995 federal action won a case against his employer where the employer had monitored the worker's telephone for a period of 24 hours to determine whether the worker was planning a robbery. The court held that the company had gone too far and had insufficient evidence to support its claims. One might therefore conclude that if an employer adequately notifies workers that it will conduct monitoring, it has effectively destroyed any reasonable expectation of privacy on the part of the workers. It would now be *unreasonable* to expect privacy since one is told not to expect it. However, in a case where the alternative extreme was true, where a firm notified workers that it would *not* monitor, the court did not follow congruent logic. It did not find a reasonable expectation of privacy based on a firm's pledge not to read e-mail.

In this case, *Smyth v. Pillsbury*, Smyth sued the firm after a manager read his e-mail. At the time, Pillsbury had a policy saying that it would not read e-mail. One might presume that this policy should have created a reasonable expectation of privacy. But instead, this was the first federal decision to hold that a private sector, at-will employee has no right of privacy with respect to the contents of his or her e-mail when it is sent over the employer's e-mail system. The court found that there is no reasonable expectation of privacy in the contents of e-mail communications voluntarily made by an employee to his or her supervisor over the company's e-mail system, notwithstanding any assurances that such communications would not be intercepted by management. The end result of *Smyth,* then, is to allow for monitoring even when a firm promises not to monitor. Evidence of the impact of this decision is the fact that only one state, Connecticut, requires employers to notify workers when they are being monitored.

In an Arizona case, a husband and wife who worked as nurses were fired from a hospital after hospital officials learned that they ran a pornographic Web site when not at work. The couple explained that they engaged in this endeavor to save more money for their children's college education and that it would be irrelevant to their employer. Though their dismissal attracted the attention of the American Civil Liberties Union for what it considered was at-will gone awry, the nurses had no recourse. In another case, a police officer was docked 3 days' pay when his wife posted nude pictures of herself on the Internet as a surprise to her husband. However, the pay suspension was justified by the department in that case since police officers could arguably be held to a higher standard of conduct than average citizens.

Courts have often supported reasonable monitoring of employees in open areas as a method of preventing and addressing employee theft. For example, in *Sacramento County Deputy Sheriff's Ass'n v. County of Sacramento*, a public employer placed a silent video camera in the ceiling overlooking the release office countertop in response to the theft of inmate money. The California Court of Appeals determined that the county had engaged in reasonable monitoring because employee privacy expectations were diminished in the jail setting.

The facts of any particular case might determine and thereby explain its outcome. For instance, in a 2005 case, *U.S. v. Hill*, the Eighth Circuit found against an individual who claimed that he had a reasonable expectation of privacy in a convenience store bathroom where he had locked the door. On the surface, this ruling might seem of concern to the average person using a store bathroom. However, that perception might change when one learns that the individual went in there with a member of the opposite sex; that there was no response when police knocked on the door; and that they then picked the lock on the door and found the individual half dressed and with illegal narcotics all around him. The court found that since he was in the restroom with another person, was using the restroom for a purpose other than its intended use, and did not exit the restroom after having been asked several times, without any excuse (such as illness), any expectation of privacy that he might have enjoyed when he first entered the restroom had expired by the time the police arrived.

Privacy: Additional Issues Specific to the Workplace

As in other areas of lightning quick advances, the law has not yet caught up with the variety of ways in which an employer can now gather information about employees. While the law might be clear with regard to tapping a worker's telephone, it has taken longer to find that clarity with regard to monitoring a worker's e-mail or text pages on a handheld device. Employee monitoring in the private sector workplace is generally governed by state legislation and case law precedent. (As mentioned above, the Fourth Amendment protection against an unreasonable search and seizure governs only the public sector workplace through the Constitution's application only to state action.)

As discussed above, case law is not yet conclusive with regard to many workplace privacy issues. It becomes all the more critical to maintain this patchwork regime of privacy protection in the workplace when one considers the implications of the European Union's (EU's) Personal Data Protection Directive. In addition to striving to harmonize the various means of protecting data throughout the EU, the directive also prohibits firms in the EU from transferring personal information to a non-EU country unless that country maintains adequate protections of its own. In fact, the United States would not qualify as having adequate protection, so the Department of Commerce negotiated a Safe Harbor exception for firms who maintain certain protections of information within their possession. If a firm satisfies these requirements, the directive allows the information transfer. If not, both firms can be held liable. The Safe Harbor requires that the receiving firm provide

- Clear and conspicuous notice
- A choice to opt out
- Onward transfer only to firms with adequate protections
- Reasonable measures to ensure reliability and protection from disclosure or loss
- Processing of only information relevant to the purpose for which it was gathered
- Access by data subject and the ability to correct misinformation
- Mechanisms for ensuring compliance and consequences for noncompliance

Of course, these issues are not limited to the United States. The Global Business Privacy Project has identified seven major developments of importance to businesses in connection with cyberethics:

1. The European Union Privacy Directive
2. The commencement of an international privacy standards process
3. New national and global information flows
4. Information superhighway initiatives
5. Model business principles for global businesses
6. New information technology applications
7. New global interest in fashioning consumer data protection laws

Privacy Rights Since September 11, 2001

The United States has implemented widespread modifications to its patchwork structure of privacy protections since the terror attacks of September 11, 2001. In particular, proposals for the expansion of surveillance and information-gathering authority were submitted, and many, to the chagrin of some civil rights attorneys and advocates, were enacted.

The most public and publicized of these modifications was the adoption and implementation of the Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism (USA PATRIOT) Act of 2001, Pub. L. No. 107-56. The USA PATRIOT Act expanded states' rights with regard to Internet surveillance technology, including workplace surveillance and amending of the Electronic Communications Privacy Act in this regard. The act also grants access to sensitive data with only a court order rather than a judicial warrant, among other changes, and imposes or enhances civil and criminal penalties for knowingly or intentionally aiding terrorists. In addition, the new disclosure regime increased the sharing of personal information between government agencies to ensure the greatest level of protection.

Title II of the act provides for the following enhanced surveillance procedures, among others, which have a significant impact on individual privacy and may affect an employer's effort to maintain employee privacy:

- Expanded authority to intercept wire, oral, and electronic communications relating to terrorism and to computer fraud and abuse offenses
- Roving surveillance authority under the Foreign Intelligence Surveillance Act of 1978 (FISA) to track individuals (FISA investigations are not subject to Fourth Amendment standards but are instead governed by the requirement that the search serve "a significant purpose")
- Nationwide seizure of voice mail messages pursuant to warrants (i.e., without the previously required wiretap order)
- Broadening of the types of records that law enforcement may obtain, pursuant to a subpoena, from electronic communications service providers
- Permission of emergency disclosure of customer electronic communications by providers to protect life and limb
- Nationwide service of search warrants for electronic evidence

Pursuant to these provisions, the government is now allowed to monitor anyone on the Internet simply by contending that the information is "relevant" to an ongoing criminal investigation. In addition, the act provides anti-money-laundering provisions designed to combat money-laundering activity or the funding of terrorist or criminal activity through corporate activity or otherwise. All financial institutions must now report suspicious activities in financial transactions and keep records of foreign national employees while also complying with the antidiscrimination laws discussed throughout this text. It is a challenging balance, claim employers.

Though some of its surveillance and information-sharing provisions were set to expire (or "sunset") in 2005, the USA PATRIOT Act was not the only legislative response. By September 2002, the Office of Management and Budget had recorded 58 new regulations responding to terrorism, and both federal and state agencies have passed a number of new pieces of legislation. Not everyone is comfortable with these new protections. Out of concern for the USA PATRIOT Act's new permitted investigatory provisions, some librarians now warn computer users in their libraries that their computer use could be monitored by law enforcement agencies. The *Washington Post* reports that some are even ensuring privacy by destroying records of sites visited, books checked out, and logs of computer use. The American Civil Liberties Union reports that a number of communities have passed anti–USA PATRIOT Act resolutions.

Employers have three choices in terms of their response to a governmental request for information. They may

1. voluntarily cooperate with law enforcement by providing, on request (as part of an ongoing investigation), confidential employee information;
2. choose not to cooperate and ask instead for permission to seek employee authorization to release the requested information; or
3. request for a subpoena, search warrant, or FISA order from the federal agency before disclosing an employee's confidential information.

PRIVATE GOOD

A private good is a product or service produced by a privately owned business and purchased to increase the utility, or satisfaction, of the buyer. Most of the goods and services consumed in a market economy are private goods. The prices of these products, such as hamburgers, haircuts, and dental services, are determined to some degree by the market forces of supply and demand. Private goods are both excludable and rivalrous. *Excludability* means that producers can prevent people from consuming the good or service, based on the consumer's ability or willingness to pay. *Rivalrous* means that one person's consumption of a product reduces the amount available for consumption by another.

The absence of excludability and rivalry introduces market failures that ensure that some goods and services cannot be efficiently provided by markets. For example, pure public goods are, by nature, nonexcludable and nonrivalrous. The most often cited example of this type of good is national defense. Pure public goods are nonrivalrous because they can be consumed collectively. For example, a nation's army can protect all its citizens at the same time, and one person's consumption does not reduce the amount available to other consumers. At the same time, it is impossible to exclude any consumers from military protection. This nonexcludability leads to a free rider problem, by which consumers get the benefits of the good or service without paying for it. If left to the devices of private markets, pure public goods will be underproduced or not produced at all because it is not profitable to do so.

Inefficiency in the production and consumption of private goods also arises when there are spillover effects, or externalities. A positive externality exists if the production and consumption of a good or service benefits a third party not directly involved in the market transaction. For example, an individual's education provides a direct benefit to him or her and also provides benefits to society as a whole through the provision of more informed and productive citizens. Private markets will underproduce in the presence of positive externalities because the costs of production for the firm are overstated and profits are understated. A negative externality exists when the production or consumption of a product results in a cost to a third party. Air and noise pollution are oft-cited examples of a negative externality. Private markets will overproduce when negative externalities are present because the costs of production for the firm are understated and profits are overstated.

Social and ethical questions regarding private goods arise in connection with these inefficiencies. In the case of pure public goods, the government becomes the producer, and the level of production is determined through a political process. When externalities are present, policy makers must decide how to correct the markets through mechanisms such as public provision of the good (e.g., public education) or rules, fines, taxes, and the assignment of property rights. Common pool resources, such as pastures or oceans, are similar to public goods to the extent that they are nonexcludable. However, since they are rivalrous, individuals may overuse these resources, resulting in the "tragedy of the commons." A possible solution to overuse is to introduce private ownership or to assign property rights to grazing lands and fisheries.

Issues of fairness and justice also arise with respect to private goods. Excludability implies that consumers will get different amounts of goods and services. If people have a right to basic necessities, such as food and safe drinking water, then complete reliance on private markets is unacceptable, especially when there is wide disparity in the distribution of income. Similar questions arise with respect to other goods and services, such as health care. Those who believe that people have a right to health care maintain that it should be provided by government as a public good. As a private good, health care may be provided more efficiently, but the poor and those without insurance may be unable to afford it. This illustrates the tradeoff between efficiency and equity. In these instances, public policy determines which private goods should become public goods.

PRIVATIZATION

Privatization is a public policy decision to reduce the role of the state in the economy. It is a process that transfers control of economic and financial resources from a government to a private sector entity. In the 1990s alone, global privatization receipts totaled $936.7 billion. Among the key industries affected were telecommunications, postal services, electric and gas utilities, airlines, railroads, coal mining, iron and steel manufacturing, and banking. Italy had the largest privatization program, followed by France, Australia, the United Kingdom, Spain, Mexico, and Portugal.

The impetus for privatization stems from evidence that direct state ownership or control of major national industries and companies cannot create adequate economic growth and prosperity for the future. In the former Soviet Union and Eastern Europe, privatization represented the dismantling of the Communist command-and-control economies. For Western Europe, sub-Saharan Africa, and Latin America, privatization was the reversal of earlier nationalization policies following World War II.

Different Meanings of Privatization

Most commonly, privatization transfers control of resources by way of a sale of state-owned assets, such as highways, bridges, ports, airlines, factories, and banks. A sale can be effected by means of an initial public offering or a direct sale to a preselected buyer. Also, a voucher method has been widely used in Eastern European countries, in which governments issued paper claims to citizens to be exchanged for shares or units in a portfolio of companies.

The term *privatization* can have a broader meaning, especially in the United States. Other than in the electric utility industry, the United States has not had a tradition of significant government ownership, so the sale of state-owned enterprises has not been common. The most prevalent means of transferring control from the government to the private sector is outsourcing, or contracting out. For example, when a municipality or a county contracts with the private sector for services such as solid waste disposal, street construction, facilities operations, building repair, or ambulance services, there is a transfer of control, though not a sale, of an economic activity to the private sector.

Privatization also can refer to the deregulation of an industry to improve the competitive environment. Nothing is sold or contracted out, but the government loosens its control on an economic activity and allows the private sector greater freedom to operate. Equally, market liberalization is a means of increasing competitiveness and can be called privatization. It is a way of bringing increased levels of private sector participation into the economy by removing certain barriers to entry. Dropping statutory constraints on private sector health care delivery is an example, and allowing foreign banks to enter a domestic marketplace by removing regulatory impediments is another.

Privatization in Theory

Fundamentally, privatization is justified by the claim that the private sector can achieve economic efficiency levels that are unattainable in the public sector. Efficiencies lead to wealth creation, higher employment, lower consumer prices, improved service, and a better standard of living. Consider two theories that try to explain why the private sector is necessarily more efficient than its public sector counterparts.

First, property rights theory maintains that ownership is an important determinant in the efficiency of a company. Share ownership provides financial incentives to act efficiently because owners are entitled to retain profits, sell shares, and transform the assets of a company. Owners are motivated by self-interest to improve performance in order to derive the highest level of benefit possible. Correspondingly, companies suffer financially if they are not efficient: Falling share prices, inability to raise capital, and, ultimately, bankruptcy can result. Governments are neither motivated by profit nor concerned about bankruptcy; hence, they do not have an incentive to be efficient and wealth creating. Consequently, the private sector rather than the public sector should be the preferred environment for businesses.

Some theorists point to a principal and agent problem. That is, self-interested managers (agents) may focus more on getting high salaries, bonuses, and perquisites than on the interests of shareholders (principals). To ensure that agents discharge their responsibilities, principals monitor their performance through financial reports, independent audits, and oversight by a board of directors. Monitoring can be very costly, so it reduces some of the efficiency gains. The property rights response is to propose the use of mechanisms that align the interests of owners and managers—for instance, using stock options as part of executive compensation.

The second justification for privatization is public choice theory. It implies that governments have their own agency problems. That is, self-interested bureaucrats respond to power, prestige, and perquisites. And self-interested politicians are motivated to act in ways that maintain or enhance their power, such as providing higher than economically warranted levels of service and capital goods to obtain public favor. Finally, coalitions of self-interested voters come together to lobby for legislation that promotes their objectives. None of this is compatible with cost efficiency, and none of these groups have to face market tests such as falling share price, reduced revenues, or bankruptcy.

The persuasive force of the property rights theory rests importantly on the presumption that the marketplace provides the primary standard for assigning value. However, critics argue that governments are not intended to be motivated by profit; indeed, the social contract perspective suggests governments should provide services even where profit and efficiency are not feasible. Examples include national defense, activities to protect minority rights, and utility service in sparsely populated rural areas. In addition, it is maintained that some social services, such as education, health care, waste disposal, and natural resource management, should be assessed by qualitative measures that reflect the common well-being of citizens, not profit or efficiency. Furthermore, the principle that ownership itself holds the primary explanation for economic performance can be questioned. What about other important factors that affect corporate performance, such as regulatory controls, level of taxation, product mix, production capacity, access to capital, leadership, organizational structure, competitive positioning, and economic cycles?

Finally, is ownership per se really so motivating? In a widely held public company, small shareholders have almost no control over, say, setting dividend policy or reorganizing the company. And to the extent that ownership is motivating, it can be mediated by specific situational details. For instance, a retired person living on a modest fixed income could find very demotivating a company's decision to stop paying dividends and reinvest its free cash. Yet all of his or her theoretical property rights still remain.

With respect to public choice theory, the presumption is that what explains behavior is self-interest. Yet we know from our daily lives that family love, loyalty to friends, dedication to social causes, commitment to democratic principles, and much else besides also motivate people. Why, then, it is argued, should we accept such a dim view of elected officials, public servants, and interest groups? Why would the virtues of public service not find some place in their behavior? One author notes the ironic discrepancy between the enlightened self-interest that produces benign results in the marketplace and the seemingly pathological behavior it yields in government.

Privatization in Practice: Benefits and Costs to Society

Many governments have argued that robust privatization programs can yield significant benefits to society. For instance, governments use privatization as a means of generating funds to pay down debt or maintain social programs without raising taxes. In addition, governments can relieve themselves of future financial burdens by transferring enterprises to the private sector that are expected to require ongoing subsidies to cover losses or capital expenditures. Collateral benefits can include improved credit ratings if the proceeds are used to reduce state debt. And for developing countries, eligibility for World Bank loans can be achieved where having a privatization program is a prerequisite.

A second benefit is enhancement of the financial markets. Privatizing state-owned companies through the use of capital markets increases the number of companies listed on stock exchanges, giving investors a greater choice and more inclination to become active in public markets. In turn, market liquidity improves, and this benefits other listed companies by giving them generally greater access to capital. In the case of countries with less developed capital markets, having more listed companies encourages market and regulatory improvements.

Third is the argument that a government can improve its own efficiency by reducing what it manages. By selling state-owned enterprises, it removes them from the political agenda, thereby freeing up time for more pressing public policy matters. Equally, bureaucratic management time and attention are saved.

Fourth, social benefits can be promoted by privatizing entities in a way that achieves widespread ownership. The voucher privatizations in Eastern Europe were intended to promote egalitarianism because even the poor could have ownership. Similarly, wealth redistribution was a British objective in the 1980s. Furthermore, sales to owner-operators could both foster a culture of entrepreneurship and create less dependency on the state.

These potential benefits are not without costs. For instance, some researchers contend that privatization in fact works against the equitable distribution of economic benefits. In certain European privatization programs, the main beneficiaries were allegedly large banks, legal and financial advisers, and management consultants. In addition, a number of former politicians were rewarded with board-level appointments or senior management jobs in privatized companies. Observers of the privatization programs of both Mexico and Chile comment as well on the concentration of ownership that resulted, despite the fact that mechanisms were developed to encourage worker participation in ownership.

The disadvantage of privatization for workers is often cited as a cost, especially for less skilled workers, who are vulnerable to wage cuts or job loss. For example, after Brazil sold the Federal Railroad System, service levels improved. However, the 40,000-person labor force was ultimately reduced to 11,500. Significant labor cutbacks also occurred with the privatization of major ports and the steel industry. In rebuttal, it could be argued that such labor reductions demonstrate prior overstaffing and that the cuts will lead to economically healthier organizations.

Privatization can also give rise to important political concerns such as resentment against foreign ownership. This might arise, for example, in a developing country if strategically important assets, such as national television and radio stations, the postal system, and railroads, were sold to foreign corporations.

The debate for and against privatization positions the private sector's ability to deliver economic efficiency and prosperity against societal concerns about inequitable distribution of public goods and harms to the economically and politically least advantaged. Deciding which side to support is complicated by a number of factors that can affect our choice. First, privatization has different meanings. An outright sale of a major state-owned enterprise may have consequences and invite criticism that contracting out for road repair does not. Second, the magnitude of the sale might be important. Selling a national postal system could have implications for national sovereignty and hence raise serious concerns. But selling a small family-run business to its operators would have no national significance and may seem quite benign. Third, assessing the economic and societal merits of privatization requires agreement on what values are to be promoted and on what criteria success will be judged. Sometimes they face off against each other without resolution. Fourth, the circumstances under which a privatization takes place are sometimes crucial to its success and our approval. An initial public offering in a country with a well-developed capital market that achieves a wide distribution of ownership can be highly beneficial. However, sale of a major state asset in a transitional economy to a political friend of the government is not.

Clearly, as with most important public policies, decisions require balancing different social and economic principles, careful consideration of contextual factors, and sound execution.

Procedural Justice: Philosophical Perspectives

Procedural justice is a conception of justice that proposes that following certain specified procedures will result in an outcome that is just. Procedural justice typically is employed as the preferred method of settling cases in which parties disagree on the just outcome of conflicting private interests or of conflicting conceptions of the public good.

Among the philosophical issues associated with procedural justice are the clarification of types of procedures; the relation between procedures, outcomes, and related values; and, perhaps most central, the issue of whether or not justice should be conceived of *as* procedural in the first place. In other words, if we know what the outcome should be, as we must to assess it for its justice, why should we be bothered with procedures at all?

Types of Procedures

Among the first questions to be answered in the attempt to find a just outcome to some conflict is which of the available procedures ought to be employed. Even a cursory glance at the history of human conflict reveals a remarkable range of possible procedures by which matters of justice may be settled. This range runs from combat (in which the disputing parties fight for the winnings—justice belongs to the winner of the fight) to chance (in which parties agree to allow luck to determine the outcome—justice follows the flip of a coin). Between these lie a variety of possible procedures that are more morally justifiable because they draw on supporting values, such as equality, merit, or fairness, rather than relying on luck or violence.

A common procedure by which justice may be obtained is bargaining. Bargaining covers those situations in which one of the parties in the conflict offers the other some benefit in exchange for completing some action. The particular benefit offered may be an advantage that the other party seeks or the removal of some threat that the other party dreads. Bargaining is the procedure of choice for most of us when we seek commodities and services or when we contract for employment. In such cases, the offer of advantage comes in the form of an offer to pay a selling price or an offer of salary. Bargaining is also used to settle economic and social conflicts, such as when workers strike for better compensation or when social groups protest for the reformation of discriminatory laws. The threat of strike or of protest represents the disadvantage to be removed at the successful completion of the bargaining process.

An alternative to bargaining is what is often referred to as a "discussion on merit." This procedure is devoid of threats or inducements from or against any party and involves the parties' willingness to deliberate the merits of each other's position. This procedure is noted for its tendency to allow parties to modify their positions in response to the merits of the other's argument. Ideally, even when no party gets all that it wanted or was entitled to, the outcome is such that all parties are satisfied. This last feature is important, since the conflicting parties could use force, coercion, or threats to ensure that the outcome would be closer to their position in the dispute, but they opt not to employ such methods. Discussion on the merits emphasizes rational, reflective discussion by all parties on the respective merit of each position. In this procedure, each party asks itself, "What is the best outcome, even if that outcome is not maximally to my benefit?"

Another frequently employed procedure is contest, understood as a demonstration of relevant abilities. This procedure is most useful in situations in which the dispute is about who is best suited to occupy some position, office, or title. Contest is frequently employed in hiring processes that include a demonstration of ability—giving a lecture to a class for a faculty position, administering medications for a nursing position, operating the bus for a bus driver's position, typing a letter or transcription for a secretarial position. Rather than a discussion of the merit of a party's claim, contest is a demonstration of each party's relevant achievement. As long as each party is aware of the terms of the contest and each undertakes it in the same manner as the others, the outcome is most likely to be seen by disputants as fair.

Another important type of procedure is voting. Voting is among the most justifiable of the procedures and is one that has a fairly long track record of success. It is among the more justifiable procedures, because of the related values: (1) *equality,* especially when each party has one vote; (2) *fairness,* especially when each party is not coerced and has access to all relevant information; (3) *liberty,* especially when parties are free to vote as they wish or even withhold their vote; and (4) alternately, *openness* or *privacy*, depending on whether the vote is by show of hands or by secret ballot, respectively. Voting may take a variety of specific forms to suit the circumstances in which the conflict arises and to suit the particular issue to be settled. A vote by show of hands after considerable deliberation and reflection among the members of the board of directors of a corporation may be the best way to decide whether or not to proceed with a stock split. However, a snap vote or straw poll may be the best way for a hiring committee to narrow the candidate pool for the position of office manager. In both cases, the use of voting will lead to a just outcome only if the parties agree that they are equally capable of sharing the decision and that the option that receives the most votes is the just outcome, whatever it is.

As an alternative to voting, conflicts may be settled by the ruling of a single authoritative figure, such as a legislator, a chairperson, or an executive officer. Vesting decision-making authority in a single individual or in a single body, committee, or panel may be the best means for settling conflicts that require a respected authority's sanction to ensure compliance. It is often considered the procedure of choice to settle disputes that require access to specialized, technical knowledge beyond the comprehension or expertise of the parties to the dispute or for disputes in which the preference of all parties is for a settlement to be determined by a neutral or impartial authoritative arbiter. An example can be found in civil disputes in which a judge has the requisite technical knowledge of the applicable laws, has the respect of the parties, and is impartial as to the particular outcome.

Finally, the best procedure for settling a dispute may involve some combination of these types. For instance, a procedure for settling employment contracts may involve a combination of bargaining and voting. A procedure for a board of directors to decide how to proceed with modifications to stock availability may involve a combination of discussion on merit and voting. The preferred procedure for hiring an office assistant may involve a combination of discussion on merit, contest, and authoritative determination, where the hiring committee deliberates the merit of each candidate to narrow the pool, followed by each candidate's demonstration of his or her ability, which then informs the manager's final determination of who will be hired.

Procedural Justice and Related Values

Typical in most conceptions of procedural justice is the association of justice with one or more values, such as equality, fairness, liberty, desert, or merit. Values often help confirm whether we are on the right track with regard to what we are trying to accomplish. In economics, for example, some of the related values are efficiency, productivity, and marketability. Any one or combination of these values functions to determine whether a modification is economically worth pursuing. For example, efficiency sets the parameters for whether or not some modification to the manufacturing process is economically justified. If the modification results in greater efficiency, then it is worth implementing. If it results, instead, in the same or lower efficiency, then the modification is not economically justified and is not worth implementing. Moral values work in a similar way when what we are concerned with is justice rather than economics. The function of these related moral values is twofold: (1) to justify the procedures used (i.e., to determine that *this* is the appropriate procedure to use) and (2) to validate the outcome (i.e., *this* outcome is a just outcome). These two functions are closely related.

Consider the example of selecting a new chairperson for the board of directors of a major corporation. If the company executives decide that the position of chairperson should go to the best-qualified candidate (on merit), it would be reasonable to employ a procedure that reveals the merit of the candidates. Drawing straws among candidates would be ruled out, since this procedure allows luck to determine justice. A contest of arm wrestling would similarly be ruled out, unless the case could reasonably be made that meritorious arm wrestling is a reliable indicator of meritorious corporate oversight. A suitable procedure would be one that reliably reveals the candidates' ability to perform in the role of chairperson. In such cases, merit serves as the measure of a procedure's likelihood to deliver a just outcome. Any procedure that fails to meet the standard set by the related value would fail to be a just procedure. The justice of any outcome would therefore be in doubt.

The preceding example illustrates the justificatory relation between values and procedures. But what of the second function, in which values serve as a standard against which the outcome is validated as an outcome consistent with justice?

Take the example of a jury trial (typically a mixture of discussion on merit and voting). The desired outcome is the conviction of the guilty party or, at the very least, the acquittal of an innocent person. The desired procedure is one in which the likelihood of an injustice, such as the conviction of an innocent person, is minimized. The relevant value is desert, such that those who deserve punishment receive it and those who do not are not punished. In case the jury convicts an innocent person, the outcome of the trial is an injustice, but it is only understood as such when the outcome is compared with the operative value, desert. In such a case, someone is punished who did not deserve it. The outcome contravenes the value against which the justice of jury trials is measured.

What does it mean when related values are violated? The first response may be that the procedure employed was itself unjust. However, the violation of related values may indicate instead that the procedure was not properly followed (e.g., witness perjury, jury tampering, failure to disclose available evidence). It may also mean that this case is one of those cases in which a generally reliable procedure did not result in the expected outcome. If such failures are repeated, however, it may indicate an inadequacy in the procedure itself.

Perfect, Imperfect, and Pure Procedural Justice

The reliance of procedural justice on values such as equality, fairness, and merit raises a philosophically interesting distinction: (1) the justification of procedures when the outcome is independently known and (2) the justification of procedures when the outcome is not independently known. In the first case, procedural justice may be understood in terms of either perfect or imperfect procedural justice. In the second case, procedural justice is best understood in John Rawls's sense of pure procedural justice. More often than not, the just outcome is neither known in advance nor known independently from the application of some procedure. This makes all the difference when the issue involves someone's life or liberty, where it is not obvious or certain beforehand what outcome would result in justice. This fact of human social life and of the limitations of human knowledge underscores the importance of procedures to justice.
