List of Entries

Reader's Guide

All the entries in this *Encyclopedia* have been arranged into this Reader's Guide. Here each entry finds its place in one or more thematic groupings of entries that pertain to a central conceptual domain covered by the *Encyclopedia.* For example, the *Encyclopedia* contains a number of entries on topics such as "Applied Ethics" and "Corporations in the Social Sphere." Classifying the entries into such groupings allows an interested reader to quickly peruse many entries pertaining to one of the key conceptual areas addressed by this *Encyclopedia.*

About the General Editor

Robert W. Kolb is Professor of Finance and the Frank W. Considine Chair of Applied Ethics in the business school at Loyola University Chicago. Kolb's career as a finance professor spans almost three decades and includes appointments at the University of Florida, Emory University, and the University of Miami, where he served as department chair and as the John S. and James L. Knight Professor of Finance. Recently he was Professor of Finance and Assistant Dean for Business and Society at the University of Colorado at Boulder. There he led the school's program in business ethics and business and society.

He has published more than 50 academic research articles and more than 20 books. In 1990, he founded Kolb Publishing Company to publish finance and economics university texts, built the company's list over the ensuing years, and sold the firm to Blackwell Publishers of Oxford, England, in 1995.

He also recently published the sixth edition of *Understanding Futures Markets* and the fifth edition of *Futures, Options, and Swaps* (both with James A. Overdahl). He recently edited three monographs: *The Ethics of Executive Compensation, The Ethics of Genetic Commerce,* and *Corporate Retirement Security: Social and Ethical Issues*.

He is the general editor for the five-volume *Encyclopedia of Business Ethics and Society*. He earned two Ph.D.s from the University of North Carolina at Chapel Hill (one in philosophy, in 1974, and the other in finance, in 1978).

About the Associate Editors

Norman E. Bowie is the Elmer L. Andersen Chair in Corporate Responsibility at the University of Minnesota. He is currently an associate editor of *Business Ethics Quarterly.* He is on the editorial board of the *Academy of Management Review.* He is on the Board of Academic Advisors for the Business Roundtable Institute on Business Ethics. He is the author or editor of 15 books and more than 75 scholarly articles in business ethics, political philosophy, and related fields. His most recent book is *Management Ethics* and his most recent edited book is *Blackwell Guide to Business Ethics.* His authoritative coedited text *Ethical Theory and Business* is in its seventh edition, and the eighth edition is in press. He is a strong believer in interdisciplinary research and has conducted joint research with those in organizational behavior, strategic management, marketing, and accounting. He has held a position as Dixons Professor of Business Ethics and Social Responsibility at the London Business School and has also been a fellow at Harvard's Program in Ethics and the Professions. He is a founding member of the Society for Business Ethics and served as its president in 1988. He served as executive director of the American Philosophical Association from 1972 to 1977.

Archie B. Carroll is Professor Emeritus of Management and currently Director of the Nonprofit Management & Community Service Program in the Terry College of Business, University of Georgia. He held the Robert W. Scherer Chair of Management for 20 of his 34 years on the faculty. His research on corporate social responsibility, stakeholder management, and business ethics has been published in all the leading journals of the profession. He is senior coauthor of *Business and Society: Ethics and Stakeholder Management,* sixth edition, 2006, and is currently working on the seventh edition. He was a founding board member of the International Association for Business and Society (IABS). In 1992, he was awarded the Sumner Marcus Award by the Social Issues in Management Division of the Academy of Management, and he served as president of the Society for Business Ethics during 1998 and 1999. He was elected a fellow of the Academy of Management and the Southern Management Association. He has served on the editorial review boards of the *Academy of Management Review, Journal of Management, Business and Society, Journal of Public Affairs,* and *Business Ethics Quarterly.* He received his three academic degrees from Florida State University. He may be contacted at acarroll@terry.uga.edu

Laura P. Hartman is Associate Vice President for Academic Affairs at DePaul University, is Professor of Business Ethics and Legal Studies in the Management Department in DePaul's College of Commerce, and serves as Research Director of DePaul's Institute for Business and Professional Ethics. She is also an invited professor at INSEAD (France), HEC (France), the Université Paul Cezanne Aix Marseille III, and the Grenoble Graduate School of Business, among other European universities. She has published in, among other journals, *Business Ethics Quarterly, Business & Society Review, Business Ethics: A European Review,* and the *Journal of Business Ethics.* A book chapter cowritten with Patricia Werhane titled "The End of Foreign Aid as We Know It: The Profitable Alleviation of Poverty in A Globalized Economy" will be published in *Alleviating Poverty through Business Strategy.* She has also written several texts, including *Rising Above Sweatshops: Innovative Management Approaches to Global Labor Challenges, Employment Law for Business, Perspectives in Business Ethics,* and *Business Ethics* (with Joe DesJardins). She is past president of the Society for Business Ethics. She graduated from Tufts University and received her law degree from the University of Chicago Law School. She lives in Chicago with her two daughters, Emma and Rachel.

Diane L. Swanson, Ph.D., is an associate professor and the von Waaden Professor of Business Administration at Kansas State University, where she teaches undergraduate and graduate courses in business, government and society, and professional ethics. She is also the founding chair of KSU's *Business Ethics Education Initiative,* which sponsors several ethics outreach activities, including research and teaching in continuing professional education programs. Her record includes publishing widely on business ethics, organizational dynamics, and corporate social responsibility; serving on editorial boards; holding governing positions in academic associations; and interviewing frequently with the media. The recipient of the 2001 *Award for Best Article in Business and Society,* she is listed in several biographical indices, including *Who's Who in America, Who's Who in Finance and Industry,* and *Who's Who in Business in Higher Education.* Since spearheading a national campaign to improve business education in 2002, she has been invited to speak to several audiences on the importance of teaching business ethics. In 2004, she received the *Best Ethics Educator Award* at the Teaching Business Ethics Conference in Boulder, sponsored by Colorado State University, the University of Colorado at Boulder, and the University of Wyoming.

Duane Windsor is the Lynette S. Autrey Professor of Management in the Jesse H. Jones Graduate School of Management at Rice University (Houston, Texas), where he has been on the faculty since 1977. Most recently, he has been teaching required courses in leadership and business ethics in the MBA for Executives program. Previously, he taught required MBA courses in business-government relations and strategic management. His recent research has focused on corporate social responsibility, the stakeholder theory of the firm, and the role of business and society and business ethics in business school curricula. He has published six books (including one second edition) and several other monographs (including edited works and major technical studies), in addition to various journal articles and book chapters. He has served as the president, program chair, and proceedings coeditor of the International Association for Business and Society (IABS). He has served as the program chair and division chair of the Social Issues in Management (SIM) Division of the Academy of Management. Beginning January 1, 2007, he assumed duties as editor of *Business & Society,* the official journal of IABS. A Rice University alumnus (B.A.), he received his Ph.D. from Harvard University.

About the Special Library Consultant

Carol H. Krismann has been the head of the William M. White Business Library at the University of Colorado at Boulder since 1982. She is the author of two books, *Encyclopedia of American Women in Business* and *Quality Control: A Bibliography*, as well as several journal articles. She holds a B.A. in art history from Smith College, a master's in library science from Columbia University, and an advanced certificate in librarianship from the University of Denver.

Introduction

Commerce is by its very nature a normative enterprise. It is concerned with creating value for owners and other constituencies, ranging from the firm's immediate stakeholders, such as employees, customers, and suppliers, to the entire society within which the business operates. As a field of study, *business ethics* aims to specify the principles under which businesses must operate to behave ethically. Thus, business ethics focuses on issues such as those that have recently attracted so much public scrutiny: executive compensation, honesty in accounting, transparency, treatment of stakeholders, and respect for the environment. These are, in fact, perennial questions that accompany the long history of human economic activity and that will also be present through an indeterminate future.

Business and society is a distinct field of study closely related to business ethics. Business and society explores the entire range of interactions between business entities and the societies in which they operate. Almost all the questions addressed by business and society have a normative dimension. But in contrast to business ethics, the discipline of business and society relies much more strongly on the tools of the social sciences. Thus, business and society scholars frequently examine the effects of business on society using empirical tools such as surveys, empirical data, and statistics.

There is no firm demarcation between the two disciplines of business ethics and business and society. While both disciplines may have their separate academic societies, the questions explored are clearly related, and many scholars belong to both kinds of societies and move between the two areas of inquiry with perfect ease.

While business ethics and business and society are united by a common concern with normative issues surrounding commerce, they are most strongly distinguished by their typical methodologies. The paradigmatic methods of business ethics are drawn from the Western philosophical tradition, while business and society scholars turn most naturally to the methods of the social sciences. Each of these fields of study relies to a considerable degree on the methods of the other, however. The questions of value that business ethics finds most compelling naturally draw the greatest attention from scholars in business and society. For its part, business ethics as an applied discipline relies on the findings of business and society to help identify those issues most in need of study.

Rationale for the *Encyclopedia*

The *Encyclopedia of Business Ethics and Society* recognizes the inherent unity between business ethics and society that stems from their shared primary concern with value questions in commerce. Topics of study do not come neatly divided into those that require conceptual analysis or philosophical consideration and others that will succumb to empirical study or generate empirical generalizations. To isolate the two disciplines impoverishes both, as is well recognized by scholars who find their most natural home in one discipline or the other. Therefore, the focus of the *Encyclopedia* embraces all normative aspects of business.

As an example of this breadth of vision, consider the relationship between the employer and her employees, whose essential relationship is specified by an employment contract, which can be a legal document or merely specified by custom. A host of issues surround this one business relationship. The contract specifies rights and obligations of both parties, so it is inherently normative. Some forms of employment contract prevail over others in different situations. Thus, there is an empirical issue concerning what types of contracts occur in various industries and why specific forms of employee contracts seem to arise in particular industries and for employees with specific skills. Of course, in a complex industrial economy, government plays a major role in the employer-employee relationship, with laws and institutions that set bounds on the kinds of contracts that can exist and the way in which given contracts are expressed in daily life. Here, one need only think of minimum wage laws and safety regulation. No full understanding of the relationship between employer and employee can be attained without a consideration of all these different factors.

To that end, the *Encyclopedia* addresses the normative dimensions of commerce with a broad mandate that embraces the following themes and dimensions of business:

Accounting

Applied ethics

Corporate management and the environment

Corporate powers, organization, and governance

Corporations in the social sphere

Customers and consumers

Economics and business

Employee issues

Environmental thought, theory, regulation, and legislation

Ethical thought and theory

Finance

Gender, age, ethnicity, diversity, and sexual orientation

Information systems

International social and ethical issues

Justice

Legislation and regulation

Management

Marketing

Organizations

Political theory, thought, and policy

Problematic practices

Rights

These topics are the headings for the Reader's Guide, and all the entries in the *Encyclopedia* fall under one or more of these broad themes. As the list indicates, the scope of the *Encyclopedia* encompasses the theoretical and ranges to the very practical social and ethical issues that beset the various functional areas of business.

Content and Organization

The *Encyclopedia* is composed of almost 900 entries arranged in alphabetical order. The entries range in length from about 500 words to almost 11,000 words. As has already been touched on above, the *Encyclopedia* embraces commerce in all its ethical and social dimensions. This ambition requires comprehensive and fairly lengthy essays on such crucial topics as justice, freedom, stakeholder theory, and regulation. At the other end of the spectrum, very brief essays introduce important personages in the field, while other similarly brief entries explain the nature and function of various organizations.

Because so many of the topics discussed in the *Encyclopedia* relate to other matters, every entry has cross-references to other entries in the *Encyclopedia.* In addition, a list of references and suggested readings accompanies each entry. The Reader's Guide allows a user of the *Encyclopedia* to find the many entries related to each of the broad themes covered by the work.

How the *Encyclopedia* Was Created

The *Encyclopedia* was created in several steps.

1. I began by examining all the leading university texts in business ethics and business and society to create an initial list of potential headwords. In addition, I explored the leading journals in both fields for the immediately previous 5 years to capture new terms and ideas that were entering the profession but were not yet enshrined in textbooks.
2. Armed with this initial list of prospective headwords, I approached the most eminent scholars in business ethics and business and society to solicit their participation in the project as editors. Eventually, I recruited five of the very best scholars in the two fields to serve as a team of associate editors.
3. The associate editors and I worked together to refine and expand the headword list. The associate editors also played a pivotal role in developing a broader editorial board of about 25 exceptional scholars from both fields.

4. I also recruited a highly respected university librarian, who specializes in business and leads the business library at the University of Colorado, to serve as a special library consultant. The idea here was to capture the talent and knowledge of someone who works every day with college students who are actually exploring other resources similar to the *Encyclopedia.*

5. With the editorial team in place, we again revised the headword list and the editors collectively began to develop a list of potential contributors for each topic. Anxious to capture the insight of the very best scholars in the field, members of the editorial team undertook the writing of some of the most lengthy and most important entries in the *Encyclopedia.* After several iterations of refining the list of headwords, we began the process of recruiting authors for each entry.

6. Before assigning entries, I created several diverse sample entries to serve as guides for authors as to the level of intellectual rigor and complexity of language that we desired. Also, potential authors received very detailed submission guidelines before they were assigned, and they were asked to review both the sample entries and the submission guidelines before agreeing to write for the *Encyclopedia.*

7. Every entry was reviewed by at least two members of the editorial team. The editors requested revisions, sometimes numerous revisions, of virtually every entry in the *Encyclopedia*, including those written by the editorial team. We believe that this lengthy process of criticism and refinement led to the creation of much better entries than would have been possible otherwise.

Acknowledgments

The *Encyclopedia* began when Rolf Janke, publisher of the reference division at Sage, approached me with the idea of developing a two-volume work in the general area of business ethics. I was immediately intrigued by the idea, because I thought that creating an *Encyclopedia* could be an important contribution to the field and help define a still nascent discipline.

It quickly became apparent that any adequate treatment of the normative issues facing business required a perspective beyond business ethics per se, because so many issues impinge on each other. We, therefore, decided to broaden the scope of the project to include not only business ethics but also business and society. The scope and success of the project owe much to Rolf, not only for the original idea but also for his flexibility in expanding the project by more than 100%.

The editorial team, which includes the associate editors, the editorial board, and the special library consultant, all deserve the greatest appreciation. Not only did they write many of the key entries; they also patiently read many drafts of many entries and guided all of them to a higher state of excellence.

The *Encyclopedia* consists of the writing of scholars drawn from the fields of both business ethics and business and society, so the greatest thanks go to the contributors. Over the course of the project, it became ever more apparent how deeply these men and women care about their respective fields and how fully they are committed to their growth and development. I think that they shared with me a belief in the project's importance, and they almost invariably made the extra effort to improve the entries and to make each one as good as it could possibly be.

Throughout the writing phase, I worked very closely with Yvette Pollastrini, the developmental editor for the *Encyclopedia* at Sage. Yvette read every entry for substance and style and never hesitated to ask for clarification of passages that were too technical or too complex for university students. Amy Parziale, a graduate student at the University of Colorado and now at the University of Arizona, was instrumental in serving as the managing editor. Amy handled many of the thousands of e-mail communications with authors, and she employed her very considerable organizational talents to discipline a somewhat scattered lead editor.

To all these people, I owe a great deal of appreciation. However, one other person lived the entire multiyear experience of creating the *Encyclopedia* and deserves special gratitude. My wife, Lori Kolb, listened to my complaints (or at least pretended to), was always understanding when the work of the *Encyclopedia* interfered with family plans, and provided the best support one could ever ask from a spouse.

—Robert W. Kolb

AARP

AARP, known as the American Association of Retired Persons until 1999, is one of the largest nonprofit, nonpartisan associations in the United States. The new name was part of a branding effort to attract the baby boomers, soon to attain the membership age of 50. AARP's mission is on their Web page: AARP is dedicated to enhancing the quality of life for aging Americans and to lead positive social change and deliver value to members through information, advocacy, and service. Their vision is of a society in which everyone ages with dignity and purpose and in which AARP helps people fulfill their goals and dreams. AARP has over 35 million members.

Founded by retired high school principal Dr. Ethel Percy Andrus in 1958, AARP grew out of the National Retired Teachers Association (NRTA), which she had founded to enable retired teachers to access private health insurance. NRTA is now a division within AARP. Her vision included encouraging older persons to serve rather than being served. She turned the organization into a national force through publicity—inspirational speeches, testimony in Congress before an antitrust commission, participation in the first White House Conference on Aging, an article for *Reader's Digest*, and an AARP exhibit at the 1964 New York World's Fair. Insurance executive Leonard Davis partnered with her to sell health insurance to the members.

AARP's national headquarters is in Washington, D.C. The executive director, under the supervision of an elected 21-member board, coordinates field operations and state offices. Each state's office helps identify legislative matters concerning the members and advocates for change at that level. There are also over 2,500 community chapters. Thousands of volunteers work at all levels on advocacy issues such as health care, social security, elder abuse, and other legislations affecting the elderly.

There are two affiliated groups—AARP Foundation and AARP Services, Inc. The Foundation is nonprofit and runs programs such as free tax preparation and counseling, work training for low-income older persons, support for major litigation, and training volunteers for dealing with elder law and advocacy. It also sponsors programs on crime prevention and defensive driving. AARP Services, Inc. is a wholly owned for-profit subsidiary that manages for-sale products such as Medicare supplemental health insurance, discounts on prescription drugs and consumer goods, entertainment and travel packages, long-term care insurance, and automobile, home, and life insurance.

AARP is financed through membership dues ($12.59 per year), advertisements in their publications, and fees from the service providers. Publications include the bimonthly *AARP Magazine* (formerly

Modern Maturity), monthly *AARP Bulletin*, quarterly *Segunda Juventud,* the AARP Web site, numerous research reports and consumer education booklets from AARP's Public Policy Institute, and an online database, *Ageline.*

AARP is not without controversy. They have been accused of conflict of interest between lobbying for health care and selling insurance, of misusing their political influence, of being pro-Democrat and pro-Republican, and, throughout the years, of being unwilling to change social security in any way. The Internal Revenue Service and the Postal Service considered it a profit-making business, and Senator Alan Simpson held a congressional hearing in 1995 about this issue. Members resigned in the thousands when AARP endorsed President George W. Bush's prescription drug program. In 2005, they were staunchly defending social security from another attempt to change it and have been fiercely criticized by those who advocate private accounts. They also published a research report on stem cell research. Throughout the years, AARP has taken stands and lobbied on issues based on their understanding of views shown through membership polls and their own research.

Absolutism, Ethical

Ethical absolutism is the belief that all individuals are held to a particular moral standard. This view establishes that certain actions are always correct while others are always wrong. No matter where in the world absolutists may be, they are responsible to treat others according to the same moral standard established by their beliefs. Those who adhere to ethical absolutism insist that a distinction can be made between what is thought to be right and what is truly correct, and they believe that all people are held to these standards whether or not they are aware of their existence. The prescriptive nature of ethical absolutism allows for the acceptance of fundamental ethical principles without any qualifications with regard to place or time. This view provides a contrast to ethical relativism, which asserts that something is morally relative to a particular situation or standpoint.

Deontological viewpoints complement ethical absolutism well in that they provide guidelines for what exactly the moral standards are that should be upheld. For example, the Kantian would assert that lying is wrong in any situation because it violates the categorical imperative (i.e., lying cannot be willed a universal law). Although utilitarianism, unlike deontology, clearly has no absolutist starting point, utilitarian theorizing can result in absolutist prescriptions, such as Peter Singer's defense of animal rights.

Ethical absolutism is sometimes historically linked to traditions based on Divine Command such as Judeo-Christian practice and the Ten Commandments or the five pillars of Islam as well as other religious doctrines that provide distinct prescriptions for action. However, individuals may view their particular religious viewpoint as the basis for an absolutist belief system. Due to the variety of possible foundations for an absolutist standpoint, the outlook frequently faces fire from its critics. When absolutist beliefs, such as radical fundamentalist movements, are taken out of their religious context, they often do not stand up to rational criticism.

An absolute moral standard has never been proven, but recent attempts have been made to empirically demonstrate the existence of these unconditional rules. These principles, sometimes referred to as hypernorms, stem from integrative social contracts theory (ISCT). ISCT provides an account of the moral appropriateness of business practices through the formulation of fair agreements based on both micro and macro principles. As hypernorms represent the convergence of political, religious, and philosophical viewpoints, further empirical exploration of hypernorms may demonstrate the existence of global absolutist ethical beliefs.

Academy of Management

The Academy of Management, founded in 1936, is the largest professional organization for management scholars and teachers in the world. With nearly 15,000 members in 2005, the Academy has members from 90 different countries, is headquartered in the United States, and is governed by its members. Membership consists of scholars at colleges, universities, and research institutions, who create and disseminate knowledge about organizations and management, and some practicing managers with scholarly interests from business, government, and nonprofit organizations.

The Academy has a mission to enhance the practice of management through scholarship and also to advance the professional development of its members. It accomplishes these ends through a variety of scholarly means. It holds an annual conference that draws together the world's leading management scholars to share their research and also includes professional development activities. The Academy publishes four peer-reviewed scholarly journals: *Academy of Management Journal*, *Academy of Management Review*, *Academy of Management Executive*, and *Academy of Management Learning and Education.* The Academy publishes a newsletter, brings out a Best Paper Proceedings CD based on the annual meeting, and provides its members online access to articles published in its journals. It services members through online list servers, job placement at the annual meeting, and awards for research, scholarship, teaching, and service.

Structured into 21 divisions and interest groups, the Academy focuses on a broad range of scholarly issues facing managers today as highlighted by division names. Divisions in 2005 reflect the breadth of interests among members: Business Policy and Strategy, Careers, Conflict Management, Critical Management Studies (interest group), Entrepreneurship, Gender and Diversity in Organizations, Health Care Management, Human Resources, International Management, Management Consulting, Management Education and Development, Management History, Management Spirituality and Religion (interest group), Managerial and Organizational Cognition, Operations Management, Organizations and Management Theory, Organizational Behavior, Organizational Communication and Information Systems, Organizational Development and Change, Organizations and the Natural Environment (interest group), Public and Nonprofit, Research Methods, Social Issues in Management, and Technology and Innovation Management.

Topical coverage in the Academy's journals and conferences reflects a similar broad range of interests. Much of the scholarly work on business and management ethics and the role of business in society can be found under the umbrella of the Social Issues in Management division; critical scholarship is found within the Critical Management Studies interest group. Numerous other divisions also reflect scholarship with an ethical, ecological, diversity, public interest, meaning-making, social issues, or leadership orientation as well.

The Social Issues in Management division domain includes the following: social environment, including corporate social responsibility, corporate philanthropy, stakeholder management, corporate social performance; the ethical environment, including codes of ethics, corporate crime, individual and organizational ethical behavior, ethical implications of technology, personal values, and corporate culture; the public policy environment, including political action committees, legal and regulatory areas; the ecological environment, including environmental management and ecological issues; stakeholder environment, including impact of technology, workplace diversity, corporate governance, public affairs management; and the international environment, including topics mentioned above, plus how the nation-state system affects international organizations.

ACCOUNTABILITY

Accountability can be defined as "being answerable"—that is, being able to give an account. In the corporate environment, it has been closely associated with financial auditing and reporting, as well as accountancy in general. Within the neoclassical conception of the corporation, it is described in terms of duties owed toward its shareholders. Recently, however, corporate social responsibility (CSR), or corporate citizenship (CC) as it is otherwise referred to, movements have led to an increased awareness of the duties associated with the various other relationships in which corporations typically participate. From this perspective, the corporation is compelled to acknowledge its accountability to a wider network of stakeholders.

AccountAbility, the organization responsible for the AA 1000 standard for "social and ethical accounting, auditing, and reporting," defines accountability as follows: "To account for something is to explain or to justify the acts, omissions, risks, and dependencies for which one is responsible to people with legitimate interest." From this description, it is clear that the notion of accountability is closely related to the concept of responsibility. It belongs to the area of causal responsibility that assigns blame or punishment, and it should ideally also include credit or reward in recognition of corporate success. The primary focus has, however, been on how corporate blame or punishment is appropriated. It is, therefore, understandable that accountability has become associated with corporate control, that is, the establishment of a meaningful way of accounting for corporations' efforts to protect the interests of their shareholders. The notion of corporate sustainability and the introduction of triple-bottom-line reporting have underscored the fact that corporate success can be conceived in nonfinancial as well as in financial terms. Both CSR and CC argue that corporations should be responsive to all stakeholders and not only to shareholders. Instead of defining accountability primarily from the perspective of the fiduciary duties that managers owe to the owners of the corporation, a proper understanding of accountability must now also reflect the mutual dependence between corporations and their stakeholders. From this perspective, accountability refers to the way in which a corporation is able to account for its economic, social, and environmental activities. Social corporate control not only involves the mechanism by which society could respond to corporate failures but also the way in which relationships between corporations and broad groups of stakeholders are proactively sustained.

It is possible to distinguish between "hard" or "involuntary" accountability and "soft" or "voluntary" accountability. Hard or involuntary accountability refers to the kind of accountability that is imposed as a legal, organizational, or societal requirement. This constitutes a more reactive reading of accountability, which focuses on the way in which corporations and their agents are dealt with when something goes wrong. Soft or voluntary accountability is something that the corporation engages in on its own terms and of its own volition. This represents a more positive, proactive approach to accountability in which the corporation actively manages its reputation by fulfilling its responsibilities toward its various stakeholders. It also addresses the way in which the corporation's various agents account for everyday business decisions and actions. Changes in the contemporary business environment, however, make a clear-cut distinction between voluntary and involuntary accountability problematic. In fact, the increasing complexity of business relationships may require a new understanding of accountability, one that is able to deal with multiple stakeholder constituencies, intangible assets, and complex decision-making processes.

Involuntary Accountability

When things go wrong, society wants to hold someone, or some institution, accountable. When corporate scandals such as Enron and WorldCom happen, there is inevitably a demand that those responsible be punished and that stricter penalties and tighter procedures be implemented. Legislation such as Sarbanes-Oxley, therefore, assigns direct accountability for the accuracy of financial statements to specific corporate officers. Corporate control is typically exercised through the enforcement of compliance with processes and procedures, and failures are punished via legal mechanisms.

The assumption that underpins this strategy is that accountability entails controlling conduct and, more particularly, preventing misconduct. There are clear limitations to this strategy. If something is not technically illegal, or if no particular moral agent can be held directly liable for a corporate failure, this form of control ceases to be effective.

Legal Strategies for Effecting Accountability: Assumptions and Limitations

The legalistic strategy for dealing with ethical failures is based on certain assumptions. In the first place, it assumes that there is a direct cause-and-effect relationship between the decisions of individuals and organizations and the negative results of those decisions. It also suggests that decisions and acts are the deliberate responses of rational individuals. One assumes that, to exercise this rational capacity, corporate agents have a clear understanding of the principles or values held within a specific society and the expectations around decisions and actions that these values or principles create. This notion of accountability relies heavily on the belief that decision makers are capable of developing a clear, "objective" view of what is "right" and "wrong" in any given situation. It is also associated with a tendency to unproblematically assume that following certain basic rules will guarantee positive results. It is based on a belief in strict cause-and-effect relationships between individual decision and actions and the consequences of those decisions and actions.

Conventional notions of accountability have, therefore, come to rely on the ability of the individual business practitioner or executive team to consider in an unbiased fashion only the objective rules and facts that pertain to a given situation and to act strictly in accordance with the official mandate that their professional roles afford them. This notion of accountability encourages rule-driven behavior, mirrors the belief in direct cause-and-effect relationships, and suggests that judgments should be based on a factual analysis of right and wrong.

One objection to such an understanding of accountability in business is that it offers too simple and inflexible a way of looking at things. For instance, from this perspective, the individual corporate executive or management team is supposed to be able to base decisions on a full and objective understanding of only the "hard" facts. A command of the "facts" is, however, often gained solely through a survey of the debit and credit entries that are encoded in the double-entry accounting system. The problem with this approach is that the positive and negative values of particular kinds of behaviors and decisions cannot readily be calculated and assessed in terms of this limited evaluative paradigm. The double-entry accounting system is unable to adequately account for so-called intangibles. Markets today are driven as much by perception as by analysis, and the value of brand and reputation in such an environment is as important as it is difficult to quantify precisely and reliably. The trust and respect that an organization or individual comes to command within the business environment is often simply the cumulative effect of countless acts of personal investment in the intangible quality of relationships. Since the effects of these actions are often not immediately apparent, it is difficult, if not impossible, to assess their effect or value in simple, concrete terms and to account for them in the more conventional sense. To discount them, though, would be to ignore one of the major factors that drive business activity today. Within the analyst community, the importance of measuring these variables has been evidenced in the development of metrics that attempt to measure nonfinancial performance. The success of these metrics to account for these often intangible factors will have to be tested over time. What seems clear, though, is that one's ability to get to an accurate reflection of the true state of a business organization's affairs will require an awareness of how the distinction between objective facts and subjective opinions has become blurred in contemporary business life.

Particular occurrences within the business environment are not always decidable in terms of a simple cause-and-effect chain of events. They often emerge as anomalous side effects of the multidirectional interaction of a large number of diverse actors or institutions. As a result, an understanding of accountability structures that depend on strict cause-and-effect relationships between the actions or decision of a rational individual and the negative outcomes of these decisions has become increasingly problematic. In business environments that are characterized by a complex network of multidirectional, interactive relationships between diverse practitioners and institutions, it is the dynamics of the system as a whole that determine the significance of particular actions and decisions rather than individual decision makers. This complicates the ability of the legal system to assign accountability to specific agents.

The study of moral agency is very pertinent to understanding the limitations of legal mechanisms for ensuring accountability. Some contemporary moral theorists propose a radical departure from the notion of an isolated, rational moral agent who acts on a priori universal imperatives and who can therefore be held individually accountable for his or her rational, deliberate decision and acts. It is argued that contemporary business practitioners are not homogeneous and that they do not necessarily function in an independent, rational way. Business practice in an increasingly interrelated, virtual world challenges this understanding of agency. Instead of being calculating, isolated decision makers, business practitioners are compelled to act in relation to, and in interaction with, one another. From this perspective, therefore, moral agency is not located in an isolated individual agent—in fact, it is a thoroughly relational affair.

This view of moral decision making may lead to a comprehensive reconsideration of more conventional notions of moral accountability. From a modernist perspective, normative judgment involved the identification of universal moral principles and the operationalization of appropriate rational protocols for their application to specific problems. A number of 20th-century theorists have, however, challenged this account of normative judgment and objected to it being characterized as a form of a priori principled reasoning. They have drawn attention to the way in which historical contexts, social practices, metaphoric language, as well as his or her embodiment shape the moral agent's moral judgments. In their view, moral judgments reflect tacit knowledge and social grammars that the moral agent is seldom conscious of. Judgments that are made on this basis, it is argued, are neither necessarily purposeful nor willful. In fact, moral knowledge is acquired by an ongoing process of trial and error. The specific actions or decisions of individuals and organizations represent a whole constellation of unarticulated beliefs and half-remembered perceptions. Together, these beliefs and perceptions constitute the corporate culture of a particular organization, which informs the moral sensibilities of individual employees. For instance, an immediate supervisor's example tends to play a more important role in giving an employee direction on appropriate behavior than written codes and policies.

If there is any validity to these proposals, legal mechanisms may prove not only inadequate but also inappropriate as a means of ensuring corporate accountability. If moral decision making is indeed as complex an affair as some theorists suggest, it may prove helpful to explore a more proactive notion of accountability within the context of a dynamic, self-sustaining corporate culture.

Voluntary Accountability

Corporations have come to appreciate the potential benefits of increased stakeholder trust and an enhanced corporate reputation and, therefore, seek to display their commitment to accountability. The assumption underpinning this strategy is that the market will reward a corporation for its commitment to accountability. The market mechanism for ensuring proactive accountability, however, depends on consumer activism and stakeholder interaction. These mechanisms are only effective if individuals and groups have access to reliable information, and if there is a way to measure, compare, and verify corporate reporting. This has led to the development of a whole array of instruments and reporting frameworks that seek to assist stakeholders in assessing the quality and veracity of corporate triple-bottom-line reports. Examples of these are AA1000, SA8000, relevant ISO standards, and the Global Reporting Initiative's guidelines.

The notion of voluntary accountability is reliant on the willingness and ability of a corporation to make accurate corporate information available. As such it requires an uncompromising commitment to transparency on the part of the corporation. The reliance on transparency in the system becomes particularly problematic in cases where ethical failures are already present. Cases such as Enron and WorldCom highlighted the fact that corporations sometimes misrepresent the true state of affairs to keep stakeholders under the impression that all is well. What all this seems to suggest then is that without a general corporate commitment to ethical practices, and more specifically to transparency and honesty, voluntary accountability becomes untenable.

Corporate misrepresentations are not only the result of a lack of transparency. In the case of Enron, it was exacerbated by the fact that certain professions, which were supposed to act as checks and balances within the system, failed to do so. Professions have since become more strictly regulated than ever before, precipitating the implementation of involuntary accountability in professional environments that could previously pride itself on its ability to self-regulate.

It seems as though the notion of voluntary accountability becomes increasingly untenable in a context where the public cannot trust corporations and the professions that support them. It also seems unlikely that involuntary accountability, enforced through enhanced legislations and heavier penalties, could rebuild the trust relationship between corporations and their stakeholders once it is compromised. It may, therefore, prove necessary to pursue a third kind of accountability, one that seeks to use more dynamic, relational mechanisms to account for corporate actions. Accountability, from this perspective, becomes an emergent property of a complex network of institutions, organizational practices, and multiple stakeholder interactions.

Accountability as Responsiveness Within Complex Corporate Environments

There is evidence to suggest that the notion of the complex adaptive system may be the most appropriate way of interpreting and understanding the dynamics of today's business environment. Multinational organizations are increasingly becoming more powerful than national governments, and increasing decentralization grants corporate entities more freedom to explore new partnerships and associations. As companies seek and terminate strategic partnerships, and as they introduce new strategies and products, the economic landscape is constantly transformed, making business a far more volatile and uncertain affair. These dynamics have the effect of moving the business environment toward a greater degree of interrelation and complexity. In the process, multiple interdependent cooperation networks are created, and an organization's success depends on its ability to navigate this intricate network of relationships. Some theorists describe the increasing dematerialization and decentralizing within contemporary business as a shift from a representationalist to a relational understanding of the economy. Wealth creation is no longer understood as the orderly accumulation of capital through the scientific application of objective economic principles, but as something that takes place primarily within the context of ongoing relationship building and reputation management.

This may require a broadening of our understanding of accountability. We usually think of moral agents as being accountable *for* something. However, we may expand our understanding by also considering what it would mean for a moral agent to be accountable *toward others* or *in terms of* some form of normative orientation. The notion of being accountable *for* something is usually associated in the business environment with responsibility for a set of defined concrete assets. There is merit in this, but it may be insufficient within the context of an open network of interactive relationships where perceptions and other intangible dynamics play such a crucial role. It may, therefore, be more meaningful for individual business practitioners and organizations to consider their responsibilities in terms of the obligation to be accountable *toward* those who participate with them in this extended network of functional relationships. To do so would be to acknowledge that much of the value of an organization is generated in and through multiple relationships and that the quality of these relationships represents the organization's most valuable assets. The emphasis in such an approach is on the way in which an organization and its employees engage with and respond to its partners and competitors within an extended network of reciprocal business relationships. In addition, the nature and limits of an individual or organization's moral responsibility toward those with whom they interact could be clarified if it was understood *in terms of* a particular relational form of moral orientation. This is an approach that remains cognizant of the fact that an individual's professional inclinations and an organization's moral priorities develop relationally in the course of the interpersonal interaction between agents within a system of relations as well as under the influence of contact with alternative perspectives that may enter the system from without. The tacit sense of reciprocal responsibility, loyalty, and common cause that develops among colleagues and collaborators in this way may resist formal articulation in the form of rules and procedures, but they nevertheless form the normative backdrop against which the actions and decisions of individuals and organizations become intelligible. As such, it is also an understanding of the nature of accountability that acknowledges the need for discretion and discernment. It also relies on the nurturing of normative orientations in and through the corporations' multiple relationships and activities. Accountability is simultaneously the effect of the decisions and actions of individual agents and the systemic forces operating within the system as a whole.

From this perspective, accountability is not something that can be institutionalized in any final, intransigent form. Instead, accountability requires that individuals and corporations remain constantly aware of the changing dynamics of the interactive network of stakeholder relationships in which they participate. Accountability within a highly dynamic contemporary business environment is likely to be enhanced by both voluntary and involuntary mechanisms, but perhaps, it requires most of all that individuals and corporations remain responsive to the duties that emerge from participation in a broad matrix of dynamic stakeholder relationships. It remains the task of business ethicists and practitioners to be attuned to these dynamics and to constantly work toward the development of new ways of fostering this ongoing responsiveness within organizations.

Accounting, Ethics of

Accounting ethics determines the ethical obligations and responsibilities of an accountant. A professional accountant has an obligation to record, provide, and attest to information regarding the economic affairs of an organization. The fundamental ethical responsibility of an accountant is to fulfill this obligation, which is crucial to the functioning of commerce in any market. All other ethical responsibilities of the accounting professional are derivative on the performance of this task.

Originally, financial records were kept by and for the person who used the information. As economic and market systems grew more complex, the nature of the information required for the successful functioning of the economic systems became more complex as well and the demand for this information by various stakeholders increased. These two factors combined with the ever increasing volume of data led business owners and decision makers to request the services of a professional accountant.

To fully understand this definition, it is necessary to examine each of the three constituent parts; the first requirement is to record information. The accountant is required to accurately record the debit and credit entries produced by a specific person or organization. The second requirement is to provide this record to the legitimate users of the information. Legitimate users span the spectrum of stakeholders and there are four different reasons why users would seek this information: The first is that managers of the organization need the information provided by professional accountants to effectively plan and control the organization's operations. For example, if a certain division is consistently losing money despite repeated investments of time and treasure, it would be very helpful for a manager to have this information. The second is that investors use the information to determine which organizations would be a good investment for them based on their own risk tolerance and other factors.

Third, rating agencies, lenders, and other groups use this information to assess the value of the organization and make decisions about its viability and future. Finally, the government uses this information to determine how much tax should be levied on an organization.

The third obligation requires the accountant to attest to the truthfulness of the information they provide to the users. Accountants, then, are asked to affirm that the information that they have recorded and provided to legitimate users is true to the best of their knowledge. This formal act of attestation is manifested through the signature of the accountant.

However, the notion of a "true" and "accurate" picture presents a problem. Similar to the adage regarding the malleability of statistics, there are any number of ways to interpret the economic data of an organization. Therefore, it is possible to present several different pictures of a company that either highlight or shadow the strengths and weaknesses of the organization depending on the circumstances. For example, a picture developed by a corporate accountant for the purposes of securing a loan can make an organization appear healthy and strong. On the other hand, if the picture is being developed for submission to the Internal Revenue Service (IRS), the outlook is likely to be far less rosy. Quite often the picture developed by the professional accountant serves the interest of the party who hired the accountant more than the interests of other parties who need information concerning the organization.

The Ethical Considerations

The question often asked is, "Why is an accountant obliged to disclose the true picture of the organization?" In response, it is possible to argue that accountants provide information, and if this information persuades people to act in one way or other, and their action either benefits or harms the persons giving or getting the information, such information giving takes on ethical importance. Depending on the use, giving out information can be very much like selling. For example, the CEO may be selling the board or the stockholders on the soundness of a company's financial situation. His or her bonus might be tied to how rosy a picture he or she is painting. The worth of his or her stock options may rest on the financial picture he or she is able to present. At the same time, the CEO is selling the IRS a different picture of the company, and still a different one to potential investors and/or lenders. Since accounting involves presenting the product to be sold, it enters into and influences market transactions.

In the ideal market transaction (assuming the ethical probity of the market system), two people decide to exchange goods because they believe that the exchange will make both better off. Ideally, there is perfect information about the worth of what is being given and gotten in return. If one of the parties involved in a market exchange is misled into believing a product is not as it is being represented, then the effect of both sides being better off is undermined. The deceived party most likely would not have *freely* entered into the exchange had that party known the full truth about the product. If the true picture of the company had been available, the bank would not have made the loan, the public offering of stock would not have been so successful, and the bonus for the CEO would not have been so large. The bottom line is that the conditions for an ideal market transaction include *informed consent.* Informed consent cannot be presumed if one lacks adequate knowledge of the product one is acquiring. The purpose of misrepresentation is to get someone to act in a way detrimental to them and beneficial to the one doing the misrepresentation, which they would not do if they knew the truth. In these cases and others like them, the manipulation and withholding of information is not "creative accounting," it is simply an unethical action.

What Sort of Disclosure and Auditing Requirements Do Accountants Face?

In the United States, the Securities and Exchange Commission (SEC) oversees financial statements of corporations. Despite the proliferation of "watchdog" groups, the accounting profession is largely self-regulating. It was the self-regulatory nature of the industry that caused a great deal of controversy during the accounting scandals of the late 1990s. Financial statements continued to be prepared by the company's own accountants and "independent" accountants. Certified public accountants (CPAs) in the United States and chartered accountants in United Kingdom audit the financial statements. CPAs and chartered accountants are responsible for certifying that the companies' financial statements are *complete* in all material aspects and the figures have been arrived at through the *use of acceptable measurement principles.* These watchdog functions were set up to protect the integrity of the financial systems.

Watchdog Organizations

There are several watchdog organizations that are charged with overseeing the accounting industry. To ensure that the financial statement provided by the accountant gives a reliable and useful picture of the financial affairs of an organization, guidelines have been developed by the profession itself. The accounting practice in the United States rests on a conceptual framework, which can be described as a coherent structure of objectives and ideals that are expected to promote consistent standards for the entire profession. The first watchdog group is the Financial Accounting Standards Board (FASB), which is one of the organizations designated to establish standards for the financial accounting and reporting that govern the preparation of financial reports. FASB develops both broad accounting concepts and specific standards for financial reporting. In addition, FASB offers guidance regarding the implementation of these concepts and standards, and their mission states that the FASB is also engaged in educating both the profession and the public. Although the FASB is composed of members of constituent organizations with an interest in financial reporting, the board itself is independent from the other organizations.

A second watchdog group is the Governmental Accounting Standards Board (GASB), the counterpart of FASB for state and local government. The GASB describes its purpose as to both establish and improve the standards of state and local accounting and reporting to provide useful information and educate the public. A third group, the Financial Accounting Foundation (FAF), provides oversight and funding for the FASB and the GASB. A fourth group is the Public Company Accounting Oversight Board (PCAOB), which is a private, nonprofit corporation, created by the Sarbanes-Oxley Act in 2002. PCAOB is charged with the oversight of the auditors of public companies to protect the interests of the public in general and investors in particular. Finally, the American Institute of Certified Public Accountants (AICPA) is a national, professional association responsible for providing its members, who are all CPAs, with the resources and information to perform their jobs well and contribute to the public interest. In addition, it was the AICPA that designated the Federal Accounting Standards Advisory Board (FASAB) to establish accounting principles for federal entities. FASAB created a framework referred to as the Generally Accepted Accounting Principles (GAAP). GAAP encompasses the set of principles and guidelines for the recording and summarizing of transactions in the preparation of financial statements. Every country has its own version of the GAAP.

The AICPA Code of Ethics

The purpose of ethics in accounting is to preserve public trust in the profession and to maintain its integrity. Statements of the profession's ethics are found in the rules and regulations of the AICPA, state accounting societies, the SEC, the General Accounting Office, and the PCAOB. Since rules and regulations are in constant change, however, accountants are guided first and foremost by professional codes that reflect the enduring ethical principles of the profession.

The AICPA, for example, has promulgated a code of professional conduct for public accountants, which the organization maintains and enforces. The Institute of Management Accountants (IMA) and the Institute of Internal Auditors (IIA) have also established codes of ethics. These codes provide guidelines for responsible behavior by accounting professionals. The codes are largely consistent, in that they all emphasize integrity, objectivity, confidentiality, and competency. The following principles capture the primary ethical concerns for the accounting profession.

Integrity

Integrity is an element of character that entails performing work honestly, diligently, and responsibly. Integrity refers to the professionalism displayed by accountants, particularly as this professionalism (or lack thereof) affects public confidence and the trust of stakeholders. The notion of professionalism has proved particularly important in the wake of recent scandals, where a lack of professionalism has resulted in deterioration of this trust.

Integrity, considered fundamental to the accounting profession, requires accountants to be honest and forthcoming with information. Accountants are expected to respect client confidentiality with regard to their personal communications. This means that, as long as fraud is not suspected, accountants are expected to remain silent regarding client communications. Only if legally required to do so are accountants permitted to disclose confidential information without the authority of the client. Accountants are responsible for the financial statements they certify; if they have suspicions or knowledge that information on the financial statements is not accurate, they are required to do what is necessary (including revising the information or conducting further investigation) to ensure that the financial statements they certify are accurate.

Objectivity

Objectivity refers to the necessary independence and freedom from conflicts of interest. When providing auditing and other attestation services, accountants are expected to be independent in fact and appearance. Accountants are required to advise all parties of any actual, apparent, or potential conflicts of interest.

Objectivity is a distinguishing characteristic of the accounting profession. Whereas other professionals—such as lawyers and doctors—are named advocates of their clients/patients, accountants are explicitly not advocates—at least not in the traditional sense. On the contrary, accountants are expected to be honest and impartial. In this way, their assessments of their clients' financials can be considered valid and trustworthy.

The principle of objectivity, therefore, has two key components: impartiality and disclosure. Accountants are expected to behave impartially, and they are required to disclose any information that could be viewed as distorting their assessments.

Competency

Competency is fundamental, and professional accountants are required to maintain an appropriate level of professional expertise. They are expected to do this through the ongoing development of knowledge and skills, such as through continuing education programs. In addition, they are required to have knowledge of relevant laws and regulations, and they are required to behave consistently with those standards.

This is also referred to as "due care." This requires accountants to treat their responsibilities competently, to the best of their ability, in the best interest of those being served.

Client Interest/Public Interest

A further obligation, which accountants have and which accrues to all professionals, is to look out for the best interest of the client. The accountant is hired to perform a service for the client. Given that, it goes without saying that when an accountant accepts a position with a client, there is at the very least an implied understanding that the accountant will look out for the interests of the client.

But the accountant's code of ethics is unique in the emphasis that it places on an often overlooked obligation specific to the accountant, the obligation to the public. Since accountants have a responsibility to all those who use their professional services, they are different from most professionals. Most professionals have an overriding responsibility to their client, but accountants, whose role in the financial markets is so crucial, have numerous constituencies depending on the information that only they can provide. Professions such as law and medicine are clearly client oriented. Doctors and lawyers would state that their first, and possibly only, obligation is to their patient or client, subject only to the constraints of some higher moral principle, for example, a lawyer cannot suborn perjury. A distinguishing mark of "public" accountants is that their primary obligation is to the public, and in a broader sense to the truth—the accuracy or veracity of the financial statements they deal with. Because the scope of their responsibility extends to all those who use the information, accountants have prima facie responsibilities beyond those to their clients, or to those who pay their fee.

It follows that if accountants are responsible to various groups—clients, colleagues, and the public—they will inevitably face conflicting pressures from each of the groups. How is one to handle these pressures? The AICPA code of ethics suggests that the best interest of the client is served when accountants fulfill their responsibility to the public. This passage reveals an interestingly optimistic motivation for being ethical. It claims that there cannot be a substantial conflict between the public, clients', and employers' interests. In doing what is right for the public, the client's and employer's interests are best served. Hence, it follows that if an employer pressures a management accountant to "cook the books," the accountant should not acquiesce, not only because it would not be in the public's best interest but also because it would not be in the employer's interest. In short, the code assumes that ethical business is always good business. Therefore, accountants are encouraged to interpret interests in such a way that even though something appears to be in a client's or employer's interest, if it is not in the public's interest, then that appearance is false and misleading.

Accounting Roles

While the major function of the accountant is to present a picture of the financial affairs of an organization, accountants play many other roles. We will examine the roles of auditing, managerial or financial accounting, and tax accounting—and the consequent ethical responsibilities that they bring. We will look briefly at the role of consulting and the difficulties it brings with respect to conflict of interest and independence, particularly for accountants or firms who are fulfilling both auditing and consulting roles for a client.

Auditing

Perhaps the most important role of the accountant is the role of the independent auditor. The function of the auditor (internal or external) is to determine whether the organization's estimates are based on formulas that seem reasonable in light of whatever evidence is available and to make sure that the same formulas are applied consistently from year to year. Thus, the accountant has to ensure both reasonable and consistent application. Given the way financial markets and the economic system have developed, society has carved out a role for the independent auditor, and this role is absolutely essential for the effective functioning of the economic system. If accounting is the language of business, it is the auditor's job to make sure that the language is used properly so that relevant material is communicated accurately.

The classic statement of the function and responsibility of the external auditor is given by Justice Warren Burger in the 1984 landmark Arthur Young case. In his opinion, Justice Burger insisted that the auditor had several responsibilities; the first is to issue an opinion as to whether the financial statement fairly presents the financial position of the corporation. The second responsibility is for accountants to protect themselves from undue influence (or even the appearance of undue influence), since any blemish on the reputation of a professional auditor undermines the accuracy and credibility of the financial picture that he or she presents. Finally, professional auditors and those who manage them must do everything in their power to bolster the public trust in their industry. Given the conflict of interests between the public and clients, it is clear that auditors face conflicting loyalties.

Another responsibility of the auditing profession is to report on any significant uncertainties that are detected in financial statements. To perform this task, the *Statement on Auditing Standards* recommends an attitude of professional skepticism in which the auditor assumes neither honesty nor dishonesty on the part of management and considers evidential matter objectively to see whether they are free of material misrepresentation. This requirement of skepticism makes it clear why there needs to be independence on the part of the auditor.

The reasons for avoiding even the appearance of having a conflict of interest, as Justice Burger suggests, are obvious. The first is that for people to make informed decisions they need faith in the information that they use to make those judgments. And information provided by people who have, or even appear to have, conflicting interests does not inspire such faith. Reasonable people, taking a commonsense approach to human behavior, tend to think that certain relationships affect one's behavior. The second reason is that although there may indeed be no conflict at all, the appearance of conflict is sufficient to weaken public trust and inspire public cynicism concerning the auditing industry. Finally, even if the auditor continues to act appropriately in a situation of conflict, such a situation presents a temptation that, while it is currently being resisted, will sooner or later likely prevail.

Managerial Accounting

A second role for accountants is that of a managerial accountant. Businesses need controllers and internal auditors since they need in-house accountants, whose role is to give the most accurate picture of the economic state of the organization so that it can flourish. But to the extent that the board, managers, and shareholders can be at cross-purposes, the accountant is conflicted. These conflicts create the grounds for many ethical problems.

The accountants within the firm, whether they work for the firm as financial officers, valuations experts, or bookkeepers, have responsibility for the picture of the firm's financial situation that is portrayed. There is an obligation to represent the firm as accurately and truthfully as possible, even if this representation may be detrimental to the company. One could say that while the management accountant has a responsibility to the firm that is his or her employer, the management accountant has an overriding obligation to disseminating the truth.

According to their ethics code, management accountants have obligations to at least four stakeholders—the general public, the members of their profession, the organization they serve, and themselves. The primary obligation of the management accountant is to present as accurate a picture as possible of the financial situation of the company, including assets and liabilities and as good advice as possible to all those entitled to it based on that picture. Consequently, the basic function of accountants does not change whether an individual is an auditor or a managerial accountant. This is the case since the use of independent judgment, with complete freedom, is required of both public and managerial accountants.

Because of the management accountant's special obligation of fair reporting, the accounting function should be kept separate from the rest of the management process. This is not only ethically sound, it is managerially wise. To make decisions about a company it is important, even for those within the company, to have as accurate a picture as possible of the company's financial condition. The managerial accountant has a clear responsibility to the company and its stakeholders to tell the truth about the financial state of the company, and this obligation overrides their responsibility to do what the president asks, if what the president asks is to mask the true picture of the company.

Tax Accounting

A third role for accountants is the determination of tax liabilities for clients, either individual or corporate. The tax accountant has further responsibilities to the public, on account of the relation of his or her role to the government's right and responsibility to impose tax. The first responsibility is that the tax accountant has an obligation not to lie or be party to a lie on a tax return. The second responsibility is that as an attester the tax accountant declares, under penalty of perjury, that the return and accompanying materials are accurate and complete. This attestation indicates a responsibility to both the client and the public to be forthright and, at the very least, not to be complicit in a client's attempt to deceive, even if that means breaking off the relationship with the client. These responsibilities flow from the nature of the tax system. The tax system, which depends on self-assessment to function effectively, needs everyone to give honest assessments and pay their fair share of taxes.

Thus, tax accountants have a duty not only to their clients but also to the system. The client's duty is to pay the taxes they legally owe, no more no less. The taxpayer has the final responsibility for the representation of the facts and for the positions taken on the return, but the accountant has the responsibility to point out to the client what is legally owed and not owed and the responsibility not to go along with a client who wants to take advantage of the tax system.

Some object that the above representation is naïve and even unjust, since certain taxes are unfair. However, fairness is a notoriously ambiguous concept, and in applying it to the evaluation of tax burdens, the most prudent course is that of adhering to what the society, following its due process of passing determining legislation, decides is fair. The founding fathers of the United States did not rail against taxes so much as taxation without representation. There should be general agreement to go with what the current tax demands are and, if one thinks such demands are unfair, work through the proper procedures to change them. Furthermore, not only is working within the system called for, more recent emphasis claims that the tax accountant should be ruled by the spirit of the law and not just the letter of the law.

Defenders of tax-evasion schemes will argue that these evasion activities are necessary given the competition of the marketplace. They will refer to Oliver Wendell Holmes's view that we should not pay one iota more than the law allows. Still, every law, being composed by fallible human beings, will have a loophole that can be exploited. It can be argued that it is contrary to the principle of fairness and the promotion of public welfare in attempting to circumvent the obvious purpose of a specific law to facilitate clients paying less than their determined share of taxes. Furthermore, there is general agreement that ethically a tax accountant should not recommend a position that "exploits" the IRS audit selection process or that serves as a mere "arguing" position. Taxation, as much as one does not like it, is the human invention that centralizes the sharing of the expense of performing government functions in a fair and equitable manner. To view accounting as a profession best employed in dodging those expenses is an unethical distortion of the role of the accountant.

Implicit in all the above arguments is a recognition of the responsibility of the accountant and firms to uphold the soundness of our tax system—to draw the delicate balance between intended tax advantages and loopholes that undermine the system.

Financial Planning

More and more accountants are engaging in a fourth kind of activity, which springs from their knowledge of tax law and financial investment markets—financial planning. One could argue that this is not a role of an accountant as such, but rather a role an accountant is well qualified to take on given some of his or her areas of expertise.

Consulting

Finally, there is the area of consulting. Since accountants are so familiar with the financials of companies, they become quite valuable for companies as consultants in helping with money management, income distribution, and accounting and auditing functions. Here, too, we could argue that this is not a role of an accountant, as such, but a potential role an accountant can play based on his or her particular experience.

The performance of all these different functions, and in particular the adoption of roles such as consultant and financial planning roles, has caused the accounting profession to move from the more traditional profession of the auditor to the more entrepreneurial professions of consultant and planner. Many claim that these moves have created a crisis for accountants. The face of accounting is changing, if not in accounting itself that maintains the same functions—auditing, attesting, preparing taxes, and running the financials of a company—then at least in the make-up and orientation of the larger, and sometimes the smaller, accounting companies.

The Role of Education

Education and professional development play a particularly significant role in the accounting profession. Particularly since Sarbanes-Oxley, ongoing education is essential for accountants to remain competent and knowledgeable regarding the many rules and regulations governing the accounting profession.

There are numerous resources available today for accountants. In addition to the continuing education courses offered by numerous providers in every state, there are also books, pamphlets, and Web resources readily available.

Conclusion: Ethical Implications of Accounting

In spite of the numerous rules and regulations and professional codes, not all ethical problems are resolved successfully by accountants, as demonstrated by the troubles at WorldCom. The accounting industry suffered an additional blow when, in June 2004, the Securities and Exchange Commission (SEC) announced that Symbol Technologies, Inc., a recognized leader in providing mobility products and solutions, agreed to pay a $37 million penalty for fraudulent accounting practices and other misconduct. Then, in September 2004, the SEC announced the settlement of fraud charges against Computer Associates International, Inc., one of the world's largest IT management software providers, and three of the company's former top executives. It was found that the company prematurely recognized billions of dollars of revenue. Although accounting fraud continues, the consequences are becoming increasingly severe as the public (and other stakeholders) has indicated that unethical accounting behavior will not be tolerated.

Acid Rain

Acid rain is a term that is used to describe the several ways in which acids fall out of the atmosphere and reach the earth. *Acid deposition* is a more precise term that can be used to describe this phenomenon, which has both wet and dry aspects. Wet deposition refers to acidic rain, fog, and snow, which fall to the ground and affect a variety of plants and animals. What effect the acid deposition has depends on many factors, including the acidity of the water, the chemistry and buffering capacity of the soils affected, and the types of fish and trees and other living things relying on the water. Dry deposition refers to acidic gases and particles that are blown about by the wind onto buildings, cars, homes, and trees. These gases and particles can also be washed from trees and other surfaces by rainstorms, adding to the acidity of runoff water.

Acid rain is traceable to the burning of fossil fuels in power plants, factories, and smelting operations and, to a somewhat lesser extent, the burning of gasoline in automobiles. It is believed to be largely a man-made problem, as the burning of fossil fuels releases sulfur dioxide, nitrogen oxides, and traces of toxic metals such as mercury and cadmium into the atmosphere to mix with water vapor. Acid rain then results from chemical reactions that follow to produce dilute solutions of nitric and sulfuric acids. Sunlight increases the rate of most of these reactions. These solutions then come down to the ground level in the form of either rain, hail, snow, or fog or as dry particles. They may travel hundreds of miles before falling to the ground and do not respect political or national boundaries.

These acid depositions are formally defined as having a pH level under 5.6, compared with a neutral solution that has a pH level of 7. Most of the acid rain falling in the United States has a pH of about 4.3. The pH levels of acid rain and the chemicals that cause it are monitored by two networks supported by the Environmental Protection Agency (EPA). The National Atmospheric Deposition Program measures wet deposition and discloses through its Web site maps of rainfall pH and other important precipitation chemistry measurements. The Clean Air Status and Trends Network measures dry deposition and discloses information about the data it collects, the measuring sites, and the kinds of equipment used.

Acid rain is believed to cause many serious environmental problems. When it enters a body of water, acid rain carries a deadly burden of toxic metals that can stunt or kill aquatic life. Many lakes that had previously supported fish life became fishless due to their high acid content. As the buffering effect of the acid-neutralizing minerals in the water diminishes, lakes appear to die suddenly and turn clear and bluish. Surface waters that have a low acid-buffering capacity are unable to neutralize the acid effectively and are quickly affected.

Snowmelt in Northern areas can quickly kill a lake as all the acids accumulated in the snow are released at once. Because of the freezing point depression phenomenon combined with the recrystallization of snow after it falls, the most acidic snow crystals will melt first, thereby releasing 50% to 80% of the acids in the first 30% of snowmelt.

When acid rain is absorbed into the soil, it can rob plants of nutrients because it breaks down minerals containing calcium, potassium, and aluminum. This aluminum may eventually reach lakes through water tables and streams and further contribute to the suffocation of fish. Acid rain is suspected of spiriting away mineral nutrients from the soil on which forests thrive. Areas with acid-neutralizing compounds in the soil can experience years of acid rain without serious problems. But the thin soils of the mountainous and glaciated Northeast have very little buffering capacity, which makes them vulnerable to damage from acid rain. It contributes to the damage of trees at high elevations and can have a corrosive assault on buildings and statutes and sculptures that are part of our nation's cultural heritage. Acid rain can also affect water systems, which costs millions of dollars annually. It can degrade visibility and may also pose a substantial threat to human health principally by contaminating public drinking water.

Over 80% of the sulfur dioxide emissions in the United States originated in the 31 states east of or bordering the Mississippi River, and more than half the acid rain that fell on the eastern United States originated from the heavy concentration of coal-and-oil burning power and industrial plants in seven central and upper Midwestern states. Prevailing winds transported these emissions hundreds of miles to the Northeast across state and national boundaries. The acidity of the precipitation falling over much of this region had a pH of 4.0 to 4.2, which was 30 to 40 times greater than the acidity of the normal precipitation that fell on this region.

Before the 1970 Clean Air Act, sulfur dioxide and nitrogen oxide emissions in the United States were increasing dramatically. Between 1940 and 1970, annual sulfur dioxide emissions had tripled. By 1986, however, after pollution control equipment had been installed on many facilities, annual sulfur dioxide emissions had declined by 21% and nitrogen oxide emissions had increased by only 7%, even though the economy and the combustion of fossil fuels had grown substantially over the same time period. More reductions, however, needed to be accomplished to solve the problem.

The new Clean Air Act passed in 1990 contained provisions for large reductions in emissions of sulfur dioxide and nitrogen oxides to reduce acid rain to manageable levels. By the year 2000, sulfur dioxide emissions were to be reduced nationwide by 10 million tons below the 1980 levels, a 40% decrease. Emissions of nitrogen oxide were also to be reduced by 2 million tons below levels that would occur in the year 2000 without new controls. This represents about a 10% reduction from the 1980 levels. These reductions were to be achieved by instituting a variety of reforms aimed at limiting emissions after 1995 from electric power plants and other sources.

Reductions in sulfur dioxide were to be obtained through a program of emission allowances where each utility can "trade and bank" its allowable emissions, something of a market-based approach to pollution control. It was hoped that this program would achieve regional and national emission targets in the most cost-effective manner. Power plants covered by the program are issued allowances that are each worth 1 ton of sulfur dioxide released from smokestacks during a specified year. To obtain reductions in sulfur dioxide pollution, these allowances are set below the current level of sulfur dioxide releases.

Plants can release only as much sulfur dioxide as they have allowances to cover. If a plant expects to release more sulfur dioxide than it has allowances, it has to buy allowances from plants that have reduced their releases below their number of allowances and therefore have them to sell or trade. These allowances can be bought and sold nationwide, with stiff penalties for plants that release more pollutants than their allowances cover.

The program to reduce nitrogen oxide emissions has many of the same features as the sulfur dioxide trading program. It also has a results oriented approach, flexibility in the method to achieve emission reductions, and maintenance of program integrity through measurement of emissions. However, it does not cap emissions nor does it use an allowance-trading system. Emission limitations for boilers that emit nitrogen oxides provide flexibility by focusing on the emission rate to be achieved and give options for utilities to meet the emission limitations in the most cost-effective manner and allow for the development of technologies to reduce the cost of compliance.

The acid rain program supposedly allows sources to select their own compliance strategy rather than having this dictated by the federal government with a command-and-control approach. They can use coal containing less sulfur, wash the coal, or use devices called scrubbers to chemically remove pollutants from the gases leaving smokestacks. They can also use a cleaner burning fuel such as natural gas or reassign some of their energy production from dirtier units to cleaner ones. Sources may also reduce their electricity generation by adopting conservation or efficiency measures or switch to alternative energy sources such as wind power or solar energy.

In its 2003 progress report, the EPA reported that in that year there were 10.6 million tons of sulfur dioxide emissions, which represented a 38% reduction from the 1980 levels. The program was thus on target to reach its goal of 8.95 million tons by 2010. Nitrogen oxide emissions stood at 4.2 million tons, which were close to 4 million tons less that forecasted for 2000. The electric power industry achieved nearly 100% compliance with the requirements of the program as only one unit had emissions exceeding the sulfur dioxide allowances that it held and no units were out of compliance with the nitrogen oxide program.

This report also indicated that over the last decade (1) ambient sulfur dioxide and sulfate levels are down more than 40% and 30%, respectively, in the eastern part of the country; (2) wet sulfate deposition has decreased 39% in the northeastern United States and 17% in the southeastern United States; (3) some modest reductions in inorganic nitrogen deposition and wet nitrate concentrations have occurred in the

Northeast and Mid-Atlantic regions, but other areas have not shown much improvement; and (4) signs of recovery in acidified lakes and streams are evident in the Adirondacks, the northern Appalachian Plateau, and the upper Midwest. These signs include lower concentrations of sulfates and nitrates and improvement in acid-neutralizing capacity.

Acid rain is also a problem in Europe as well as in Russia and China. Due to industrialization across Europe during the 1970s and 1980s, acid deposition became a particularly prevalent problem across the region. Pollution across national boundaries is a problem there due to the relatively small size of countries. To deal with this problem, the United Nations Economic Commission for Europe implemented the Convention on Long Range Transboundary Pollution in 1979, and since its implementation, sulfur emissions have fallen significantly. But with the increase in vehicle traffic across Europe, nitrogen oxides emissions have been reduced only slowly.

The United Kingdom has been called the dirty old man of Europe because it emits more pollution than is deposited there. Sulfur and nitrogen emissions are carried to other countries further east because of prevailing wind conditions. Most of the sulfur dioxide comes from power stations, while the largest source of nitrogen oxides is road transport and power stations. The 1998 Gothenburg Protocol requires the United Kingdom to reduce sulfur emissions by 85% and nitrogen emissions by 49% by the year 2010 from the 1980 levels. To meet these goals, emissions of sulfur dioxide in the United Kingdom are being reduced through the use of cleaner technology in power stations and the use of cleaner fuels and car engines in the transport sector.

Adelphia Communications

Founded by brothers John and Gus Rigas in 1952, Adelphia Communications Corporation eventually became the dominant cable provider in southern Florida, western New York, and Los Angeles. In addition to cable entertainment, the publicly traded firm offered high-speed Internet access, long-distance telephone service, digital cable, home security, and paging. The company was admired for its aggressive growth and was recognized for industry leadership. By the early 2000s, Adelphia was one of the largest cable television companies in the United States, and John's sons, Michael, Tim, and James, were executives and members of the board of directors at Adelphia.

Adelphia filed for reorganization under Chapter 11 of the U.S. Bankruptcy Code in June 2002, shortly after the Rigas family executives resigned their positions. The events leading to the bankruptcy highlight the misconduct that can occur when a firm's corporate governance system is weak. In addition to the use of corporate jets for personal business, off–balance sheet loans were made to Rigas family members. For example, Adelphia helped fund the family purchase of a golf course and the Buffalo Sabres hockey team. John Rigas's daughter and her husband, who served on Adelphia's board of directors, lived rent-free in a Manhattan apartment owned by Adelphia. A Rigas-owned farm made most of its revenue by performing snow removal, landscaping, and related services for

Adelphia. A Rigas relative was paid nearly $13 million for furniture and design services in 2001.

Adelphia was a public firm with thousands of stockholders. However, the Rigas family controlled the firm with over 50% of the share votes, despite holding only 11% of the shares. This dual-stock structure, along with the executive power held by Rigas family members, set this corporate governance scandal apart from those at Enron and WorldCom. The U.S. Securities and Exchange Commission (SEC) detailed evidence of $2.3 billion in off–balance sheet debt, inflated earnings, falsified operations statistics, and blatant self-dealing by the family.

Adelphia pursued a lawsuit against Rigas family members and 20 companies controlled by the family. The lawsuit focused on violations of the Racketeer Influenced and Corrupt Organizations Act, including a breach of fiduciary duty, abuse of control, waste of corporate assets, and substantial self-dealing. Adelphia's external auditor, Deloitte & Touche, paid $50 million to settle SEC charges stemming from its audit of Adelphia's fiscal year 2000 financial statements. Adelphia paid $715 million to settle charges with the SEC and United States Department of Justice, while the Rigas family forfeited more than $1.5 billion in assets. The scandal caused losses to investors of more than $60 billion.

In mid-2005, 80-year-old John Rigas was sentenced to 15 years in prison after a U.S. District Judge rejected his plea for leniency. Timothy Rigas was sentenced to 20 years in prison, while other cases are yet to be determined. Observers noted that the sentences sent a clear signal about the extent to which white-collar crime would be punished. Under its bankruptcy reorganization plan, most of Adelphia's assets were to be sold to Time Warner and Comcast.

Administrative Procedures Act (APA)

The Administrative Procedures Act (APA) governs the way federal agencies make and enforce regulations. First made law in 1946, it was the product of concern about the rapid increase in federal agencies and their power at the beginning of the 20th century. Federal agencies were not new—the first was authorized in 1789 to estimate appropriate import duties. Over the next 120 years, about one third of federal peacetime agencies came into being. In just 30 years, from 1900 to 1930, another third was established. President Roosevelt then used federal agencies extensively to implement New Deal programs. The amount of government authority wielded by these new agencies focused attention on competing policy issues.

Agencies are extensions of the executive branch of government that have the ability to make rules and interpret and enforce them, which combines executive, legislative, and judicial functions in a nonelected body. This structure seems to some to upset the balance of powers among the three branches of government. Others argue that the protection from tyranny comes, not from separating these powers, but from a system of supervision: The legislature supervises and the judiciary reviews administrative actions. Either way, agencies serve an important pragmatic need to move more quickly and in more detail than Congress can to deal with specific issues. Often, they are called on to apply specific scientific, technical, or administrative expertise to implement the broad policy decisions made by the legislative branch.

In 1938, President Roosevelt commissioned a full study of existing administrative procedures and recommendations for change. Before the committee report could be issued, Roosevelt vetoed a bill that would have placed administrative agencies directly under the courts, allowing judicial review of all agency decisions (the 1940 Walter-Logan bill). He indicated in his veto message that a report would soon address comprehensive regulation of federal administrative processes.

The 1941 report by the committee of lawyers, jurists, scholars, and administrators laid the groundwork for the APA. The purposes of the act are (1) to require agencies to keep the public informed of their organization, procedures, and rules; (2) to provide for public participation in the rule-making process; (3) to prescribe uniform standards for the conduct of formal rule making and adjudicatory proceedings; and (4) to restate the law of judicial review.

An agency is defined as any authority of the United States, excluding Congress, the courts, and the governments of the territories, possessions, or District of Columbia. The APA sets out specific procedures to be followed when agencies make rules or enforce them (adjudication). Each process can be formal or informal. Informal rule making requires agencies to at least publish the proposed rule and allow interested parties to respond (notice and comment). Formal rule making is less common. It is quasi-legislative, requiring detailed hearings (rule making on the record). Similarly, formal adjudication is like a trial, presided over by an administrative law judge. Most agency decisions are subject to judicial review.

In 1990, two laws allowed agencies to use more collaborative methods of making and enforcing rules as supplements to the APA. Negotiated rule making (reg-neg) lets an agency meet with affected interest groups to reach a consensus on a proposed rule. Agencies were also authorized to employ alternative dispute resolution methods such as mediation and arbitration to resolve differences.

Adverse Selection

Adverse selection is a term used in economics and insurance in reference to a market process in which buyers or sellers of a product or service are able to use their private knowledge of the risk factors involved in the transaction to maximize their outcomes, usually at the expense of the other parties to the transaction. The concept of adverse selection was first used predominantly in the insurance industry to describe the greater likelihood that the people who elect to purchase insurance policies are more likely to file claims that will, over the life of the policy, exceed the total dollar value of the premiums that they pay.

The individuals who elect to purchase insurance know that they have higher risk factors than the population norm that enhance the chance that they will file future claims. If insurers use the risk factors of the general population to set premiums, they will lose money when the number of individuals who file claims exceeds the population norm. If insurers raise the cost of premiums to cover the increased claims, they also increase the likelihood that individuals who know that they are less likely to file future claims will opt out of the plan, increasing the number of individuals remaining in the plan that will file claims.

Insurers may also use adverse selection to their financial advantage. If insurers have the ability to deny coverage to individuals who are deemed "high risk," they will try to avoid insuring all individuals except for those believed to be least likely to file future claims. This practice, known as "cherry picking" or "cream skimming," may result in insurers providing coverage to a group of individuals who are less likely to file claims than the population norm, thereby increasing the insurers' profits. In these instances, the costs incurred by the higher-risk individuals are generally borne by society. To combat this practice, the government may forbid insurers to act on information about their population even if they are able to discover it. For example, some U.S. states require health insurance providers to insure all who apply at the same cost, regardless of their individual risk factors.

Adverse selection is most likely to occur in situations in which there is an asymmetry of information. In economics, information asymmetry occurs when one party to a transaction has more or better information than the other party. While information asummetry tends to favor the buyer in the insurance industry, the concept of adverse selection has been expanded by economists into numerous markets other than insurance where similar asymmetries of information may exist that tend to favor the seller. Examples of situations where the seller usually has better information than the buyer include used-car sales, stock, and real estate.

Advertising, Subliminal

The word *subliminal* comes from two Latin words, "sub," meaning "below," and "limen," meaning "threshold." If something is subliminal, then, it is something that is "below the threshold"—here, below the threshold of conscious experience. Subliminal advertising, then, is advertising that operates below the limits of the consciousness of its audience. Subliminal advertising operates by including text or images into the overt, perceived advertising product that will not themselves be consciously perceived but will appeal to basic and universal human needs, such as for food, sex, security, or status. Such advertising messages are sometimes referred to as "hidden" or "embedded" messages.

The potential use of subliminal techniques has been recognized since 1898, with the publication of a book by E.W. Scripture called *The New Psychology*. The public awareness of subliminal advertising, however, was stimulated by two events that occurred in 1957. The first of these was a widely publicized experiment that James Vicary, the person who coined the term subliminal advertising, claimed to have performed at a Fort Lee, New Jersey, movie theater during the summer of 1957. Vicary claimed to have placed a tachistoscope in the projection booth of the theater and then to have used it to flash messages onto the screen every 5 seconds during the showing of the movie *Picnic*. (A tachistoscope is a shutter fixed to a projector that can flash slides onto a screen at speeds down to 1/125th of a second.) The messages that Vicary claimed to flash onto the screen were "Drink Coca-Cola" and "Hungry? Eat Popcorn." Vicary claimed that these messages resulted in an 18.1% increase in Coca-Cola sales and a 57.8% increase in popcorn sales. The second event that popularized the idea of subliminal advertising was the 1957 publication of Vance Packard's book *The Hidden Persuaders*, which outlined how advertising draws on knowledge of human psychology to motivate persons to purchase goods—including the possible use of subliminal techniques. Packard, however, was skeptical of the efficacy of subliminal advertising and did not use the term subliminal in *The Hidden Persuaders*. Indeed, even Vicary expressed the view that subliminal messages could only remind people to do what they would have done anyway and could not be used to motivate people to perform actions that they would not have otherwise done.

Yet despite Packard's skepticism and Vicary's modesty, between 75% and 80% of the American public believes in the existence and efficacy of subliminal advertising, according to Martha Rogers and Kirk Smith, in a survey whose results were published in the March 1993 edition of the *Journal of Advertising Research*. Moreover, according to the same source, consumers spend $50 million a year on subliminal self-help products. Such confidence in the power of subliminal advertising is partly owed to the success of a series of three books written by Wilson Bryan Key—*Subliminal Seduction*, *Media Sexploitation*, and *The Clam Plate Orgy*—in which he discusses various alleged uses of subliminal advertising. For example, Key claimed that the word sex was embedded on the face of Ritz crackers through the placement of holes on them and that the same word was embedded on the ice cubes of a drink shown in a well-known advertisement for Gilbey's gin. A similar case of the alleged use of subliminal advertising occurred in 1990, when Pepsi Cola withdrew one of its "Cool Can" designs after complaints that the random lines on the cans would spell the word sex when two cans were stacked on top of each other. Regulators have also taken the power of subliminal advertising seriously. In 1974, for example, the Federal Communications Commission issued a report saying that the use of subliminal advertising was contrary to public interest. More recently, in 2000, two Democratic Senators, Ron Wyden and John Breaux, requested that the Federal Communications Commission review the Republican National Committee's advertisement that was run against

Senator Gore's prescription drug plan. If the film was slowed down, they claimed, the word "Rats" appeared in large white letters superimposed over the words "The Gore Prescription Plan."

However, this widespread belief in the power of subliminal motivational techniques is at odds with the received view of them within the academy and within the advertising community. Although Vicary's New Jersey experiment has become so famous that it has even entered popular culture (even gaining an explicit mention in the movie *Double Exposure*), its alleged demonstration of the power of subliminal advertising is now widely discredited. Vicary himself admitted in a 1962 interview with *Advertising Age* that his "experiment" proved nothing. Earlier still, Vicary failed to produce any evidence for his claims when asked to do so in 1958 by the Advertising Research Foundation, and he failed to replicate his claimed results when he conducted the same experiment under the invigilation of a firm of independent investigators at the request of Henry Link, the president of Psychological Corporation. A similar lack of success was had by the Canadian Broadcasting Corporation when in 1958 it flashed the message "Phone Now" during the broadcast of a popular Sunday night television show called "Close-Up." The widely held view among academics and advertising professionals that subliminal advertising is ineffective has recently gained empirical support from studies conducted by S. C. Draine at the University of Washington in Seattle. In his 1997 doctoral dissertation "Analytic limitations of unconscious language processing," Draine shows that combinations of two or more words to form grammatical wholes cannot be comprehended by unconscious cognition. This means that the subliminal commands "Eat Popcorn" and "Drink Coca-Cola" could not be efficacious in stimulating behavior, even if the persons who saw them were inclined to eat popcorn and drink Coca-Cola prior to seeing such images.

Although it is widely accepted that subliminal advertising is ineffective, this does not mean that it never occurs. For example, advertisers who believe that it is efficacious might attempt to use it. Furthermore, disgruntled employees might embed words or images into advertising copy as an attempt at revenge against their employers.

Advertising Ethics

In a modern capitalist society, ads are ubiquitous; criticisms of advertising are nearly as common. Some ethical criticisms concern advertising as a social practice, while others attack specific ads or advertising practices. Central to ethical criticisms are concerns that ads subvert rational decision making and threaten human autonomy by creating needs, by creating false needs, by developing one-sided narrowly focused needs that can only be satisfied by buying material products and services, and/or by appealing to genuine and deeply rooted human needs in a manipulative way. A second sort of criticism is that ads harm human welfare by keeping everyone dissatisfied. At a minimum, ads try to make us dissatisfied with not currently having the product, but many ads also aim at keeping us permanently dissatisfied with our social positions, our looks, our bodies, and ourselves. Advertising has been blamed for people today being neurotic, insecure, and stressed.

Business ethicists have traditionally either considered advertising in general or divided ads into information ads, which are ethical as long as they are honest, and persuasive ads, which are always problematic. However, recent literature on advertising ethics considers the division of ads into informative and persuasive to be entirely inadequate because it fails to consider separately the various persuasive techniques that ads use.

Economic Criticisms and the Function of Advertising

One economic criticism of advertising in general is that advertising is a wasteful and inefficient business tool; our standard of living would be higher without it. This criticism fails to understand that economies of scale for mass-produced goods can often more than offset advertising costs, making advertised products cheaper in the end. It is also suggested that advertising causes people to spend money they do not have and that advertising combined with credit cards creates a debt-ridden society, which causes stress and unhappiness. Furthermore, it is claimed that advertising encourages a society based on immediate gratification, which discourages savings and the accumulation of capital needed for a thriving capitalist economy. Granted that American society may currently be deeply in debt, this cannot be blamed on advertising because there are numerous societies that are inundated with ads but have positive savings rates and fiscal surpluses. Canada is one, and there are others in Europe and Asia.

There are also economic defenses of advertising. It has been argued that the creation of consumer demand is an integral part of the capitalist system; capitalism needs advertising since capitalism has an inherent tendency toward overproduction. And capitalism is an economic system that has made us the richest, longest lived, healthiest society in human history; even the poor in consumer societies are better off than most people in the Third World. Surely such well-being makes advertising ethically justified.

Information Ads

Many ads are simple information ads. Consider, for example, the flyers left on your doorstep that say that certain products are on sale at a certain price at a store in your neighborhood. Such ads are generally considered ethical provided they are honest. Problems arise if they make claims that are false, misleading, or exaggerated. Making false claims is a form of lying and, hence, clearly unethical. A claim is misleading if it is literally true, but is understood by most consumers in a way that includes a false claim. The ad is misleading whether or not the advertiser intends the misunderstanding. Generally, the honesty of ads should be judged not on their literal truth, but on how consumers understand the ad; this is because companies have, or can easily get, this understanding of the ad from focus groups and other marketing research techniques. Exaggeration, or puffery, in ads is thought acceptable by many people on the grounds that consumers can be expected to discount claims in ads. This is true except for vulnerable groups such as young children.

Normally, withholding information in advertising does not raise ethical issues. Car ads, for example, do not often print crash and repair reports; such information is readily and inexpensively available, and obtaining it is rightly viewed as the customer's responsibility. However, ethical constraints on exaggeration, withholding information, and misleading advertising become much more severe in cases where the customer cannot obtain accurate information, or cannot obtain it at reasonable cost, and the information is important to the customer's physical or financial well-being. Drug advertising by pharmaceutical companies is often criticized for failure to meet these more stringent standards, even though regulations in many countries try to control this for prescription drugs by requiring details on possible side effects, contraindications, and so on. This is a clear case of the information not being available since drug trial results are often confidential to the corporation, and the implications for the user's well-being are clear. This situation is not helped by press coverage of new drugs; such coverage tends to emphasize benefits over risks.

Impact of Persuasive Ads on Individuals

Discussion of the ethical issues surrounding persuasive advertising must consider separately various persuasive techniques such as benefit advertising, emotional manipulation, symbol creation, and so on.

Benefit ads emphasis a product's benefits to the user rather than product features. Typically, benefit ads show an enthusiastic, often exuberant, person enjoying the results of using the product; for example, a housewife is shown as jubilant that her laundry detergent got her sheets whiter than her neighbors'. In benefit ads, users tend to appear like real people and are not overly idealized; their emotions, however, are greatly exaggerated. Most benefit ads are ethically harmless if we allow for consumer discounting of exaggeration. Some critics, however, question the hidden premise that the consumer ought to want the benefit. Why should a person care if their wash is whiter, their car is faster, their hair is bouncier? Though a consumer's ability to deal with this form of persuasion may be made more difficult by the fact that a benefit ad assumes but does not state its premises, most of these ads are not a serious threat to human autonomy. However, there are some cases for concern. Consider, for example, ads placed by pharmaceutical companies for mood-changing drugs; life's little hassles become stress, sadness becomes depression, tranquility becomes listlessness, and contentment becomes apathy. Normalcy is not stated but assumed to be a medical condition requiring prescription pills. We are encouraged to be constantly dissatisfied with our most personal emotions. There are ethical problems with the intentions of the advertisers in this case, regardless of the actual effect on people's autonomy.

Ads try to manipulate many human emotions; fear ads are only one example, but they make clear the ethical issues. Fear ads tend to become more common during economic recessions, and they reached a crescendo during the 1930s. A Johnson & Johnson ad for bandages from 1936, for example, shows a boy with his right arm amputated because a cut without Johnson & Johnson bandages became infected. More recently, American Express used a print ad in eerie gold and black colors showing a distraught mother frantically phoning while her feverish daughter lies in the background. The solution offered is that American Express keeps lists of English-speaking physicians in most large cities. Critics maintain that appeals to emotions undermine rational decision-making processes and threaten our autonomy. Defenders point out that the fears portrayed (of infection before penicillin, communication problems with foreign doctors) are real even if dramatized, and the product offers a legitimate solution for the problem.

Advertising can persuade by turning a product into a symbol of something entirely different from itself. Chanel is a symbol of Parisian sophistication, Calvin Klein a symbol of sex, DeBeers diamonds symbolize love, and Mercedes Benz is a status symbol. We often do not buy products for what they are, but what they mean to us, and, just as importantly, what they mean to others. Critics claim this undermines human rationality by preventing us from assessing products based on their intrinsic worth; symbolic meaning of the product invariably biases our judgments. But, in fact, it is not irrational for people to buy a symbol if they want to express something meaningful. There is nothing irrational, for example, with buying and waving your country's flag. If you want to project high economic status, a Mercedes does indeed do so. Symbolic ads are not false or misleading for the simple reason that they do in fact work; products and logos do come to have symbolic meaning for us. To give a diamond is to give an object useless in itself, but the symbolic meaning, largely created by decades of DeBeers advertising, can give the gift life-changing significance. Symbolic meaning can add to the price you pay for a product (consider designer labels, for example), but there is nothing irrational in paying a price for a symbol that you want. Indeed, advertising provides a useful social service by creating symbols that allow consumers to communicate various meanings to those around them.

A self-identity image ad turns the product into a symbol of a particular self-image; the product then allows the buyer to express to themselves or others what sort of person they are. For example, Marlboro cigarette ads for decades featured the Marlboro man, a symbol of rugged independence and masculine individuality. Marlboros were very popular with teenage males, not because they thought the product would turn them into cowboys, but because they wanted to conceive of themselves as ruggedly masculine and because they wanted their peers to see them like that.

The more unnecessary a product type is, the more likely it will be promoted with self-identity image ads; they are a common type of ad for perfumes and colognes, cigarettes, beer, and expensive designer labels. One of the ethical objections to self-identity ads is that they manipulate our fundamental conceptions of ourselves to sell us dangerous (as in the case of Marlboro cigarettes mentioned above) or useless products. In response, it can be argued that these ads do not manipulate us without our active participation; we have to play the image game for these ads to have any affect, and experimenting with one's self-image is voluntary. Perhaps concern should only be for vulnerable groups or individuals, such as insecure teenagers under peer pressure; but then, images available through logos may help teenagers feel more secure if they can afford the product with the label. There have been stories of people who have committed violent crimes to obtain footwear with the right logo, but advertising cannot be held responsible for poverty or the resulting violence. Ads that specifically target the poor may be unethical because they target a vulnerable group; ads for "power" beer that target inner-city neighborhoods have been criticized for this.

Self-identity image ads cannot be criticized for being false or misleading because they do not work by giving information or making promises. They mostly appeal to our fantasies, and fantasies as fantasies are not false. A woman, for example, does not buy a perfume because she thinks it will transform her into the slim, beautiful, chic young woman in the ad. Consumers are not that gullible. She buys the perfume because associating herself with that image in her own mind makes her feel good about herself. The resulting self-confidence may, in fact, make her more attractive.

If we actively buy into the identity images of ads, there may be an element of self-fulfillment. None of this threatens human autonomy since active participation is required and is voluntary.

Even if self-identity image advertising is considered generally an ethical technique, there may still be ethical objections to specific images. For example, the images of women in ads have raised many ethical complaints. The most serious complaints concern the unremitting presentation as beautiful of an ideal body that is excessively thin or even anorexic looking, is extremely tall and long legged, and has a poreless, wrinkleless, perfectly smooth china-like complexion. That this body image dominates ads for women's beauty and fashion products is true, though recently there has been an increase in ads using more realistic body types. The tall thin image extends to fashion models, who now average more than 6 feet in height and are generally underweight. This body type is impossible for most women to achieve even with dieting and plastic surgery. In fact, the images in ads often have their hair and complexions airbrushed and their legs stretched using computer techniques; the result is a distorted body image that no woman, not even the models in the photos, have or can ever obtain.

The purpose of this idealization and distortion is to make women dissatisfied with their own bodies; this leads them to purchase the "beauty" product in the hope of looking and feeling better. But since the ideal is so extreme and unachievable, dissatisfaction quickly returns, and the woman is ready to buy more beauty products. Constant dissatisfaction with one's own body is the objective.

Ethical objections to these beauty ads include claims that they undermine women's self-confidence; that they cause anorexia and other serious eating disorders; that they distract women from family, careers, and other serious aspects of life; that the "beauty myth" drains women of energy and locks them into a stereotype that belittles the serious contributions they make; and that all this is a male power move that oppresses women. There is much debate about how many of these criticisms are true, but the fact that many women react so strongly against body image ads seems by itself to indicate that there is at least some problem. Some advertisers have listened to women and other critics, and other more realistic body types have become more common in advertising over the past few years. The accusation that such body image ads are unfair to women is mitigated by the fact that in the past 15 years or so more and more body image ads have been targeted at men. How men will be affected by this in the long run will not be clear for a generation. This trend may mitigate the gender fairness issue, but the other ethical issues are made twice as extensive. Of course, the idealized body image is different for men, but it is nearly as hard to attain; we may soon be seeing excessive steroid use for fashion reasons as the male equivalent of anorexia.

Self-identity image ads also raise the problem of false consciousness. Image ads try to create a consumer who desires products as symbols of his or her self-image. The individual is seen by defenders of advertising as a free and autonomous self who chooses to play the image game and chooses which self-image to project. But the autonomous self may be an illusion: The reality is (according to some) that people are not defined by consumption; they are defined by their role in the system of production. That the individual can choose a self-image is an illusion that would be shattered by the consciousness of the person's true alienated relationship to themselves and others. A young male may choose Marlboros, for example, as a symbol of ruggedness and independence, but reality is earning the money for the Marlboros by working in a fast-food franchise where he humbly takes orders from both his boss and the customers, adapts his every movement to a predefined time-and-motion system, and is forced to fake a smile on cue. The real self is his role as worker; the consumer self is an illusion created by the capitalist system through advertising precisely to prevent consciousness of reality. Defenders of advertising can reply that people's consumer self-image is just as real to them as the self-image they derive from their job. Though the consumer image game is pleasant, why should we assume it blinds people to their role in production? They may be well aware of it.

Impact of Ads on Society

Besides concerns about how ads affect individuals, critics have raised ethical issues about how advertising affects society. For example, J. K. Galbraith argued that advertising creates the desires that the production of consumer goods then satisfies. This dependence effect, in which consumer desires for goods depend on the process of creating the goods, undermines the usual ethical justification of capitalism based on consumer freedom of choice and the value of supplying people with the goods that they want. Others accuse advertising of creating a materialistic society full of people who think that happiness lies in owning things and who are obsessed with buying consumer goods. These critics think we are creating a society in which private goods are plentiful but in which public goods, which are seldom advertised, are ignored—a society rich in private cars but whose highways and streets are disintegrating. Ads drive selfish consumption at the expense of friendship, community, art, and truth. Furthermore, advertising allows the system to "buy off" politically unsatisfied people with promises and consumer goods, leading to political apathy and the undermining of democracy.

However, there are many who think these sorts of criticisms exaggerate the impact of ads on society. Schudson, for example, claims that advertising does not have much impact on society because it does not increase product-type usage; it only leads to brand switching and functions primarily as reminders to people who are already heavy users of a product-type. Major social changes are not caused by advertising; ads follow social trends, they do not create them.

This debate centers on two perhaps unresolvable issues. First, there is the empirical question of how much impact advertising has on society; this is difficult to answer because the effect of ads cannot be separated from other social forces, and because it is hard to determine whether ads cause or follow social trends. Second, there is the ethical question of whether the purported effects, such as materialism, are morally objectionable. Perhaps it is more helpful to look at specific issues rather than the social impact of advertising in general.

Lifestyle Ads: Sex and Violence in Ads

Some people object to ads that encourage sex, gambling, smoking, the consumption of alcohol, and other "vices." Even people who are not much concerned about such vices are still concerned that ads encourage *underaged* sex, gambling, smoking, the consumption of alcohol, and other vices. They believe that ads present bad role models. Advertising, some critics say, contributes to the moral breakdown of society because it presents ubiquitous images of unconstrained hedonism.

Ethical concerns about ads for gambling, tobacco, and alcohol are often legitimate. Products that are harmful and sometimes addictive raise ethical issues in themselves; encouraging the use of such products is even more questionable. Many countries and states limit, control, or even ban ads for some or all these products.

Violence in advertising would be ethically objectionable if there was much of it, but it is rare. The main exceptions are ads for films and video games, but objections in these cases should be aimed at the violence in the products, not just in the ads. The exposure of unsuspecting people and children to such ads is an issue that should be, and in many jurisdictions is, controlled by regulations on the placement of the ads.

Sex in advertising is a much bigger issue because there is so much of it. The ethical issues can be best seen if we separate consideration of sex in ads for products that are connected to sex from consideration of sex in ads where it is gratuitous and has no or only a tenuous connection with the product.

Ads for condoms and sex clubs, of course, emphasize sex. Except for puritans, the only ethical issue about these ads is making sure young children are not exposed. Other products, such as fashions, jeans, underwear, perfume, and chocolate, are related to sex, and advertising is often used to associate a product or logo with sex. Calvin Klein, for example, has built his business on making his clothes and perfumes sexy. Raising ethical objections to this is difficult unless one objects ethically to current sexual mores in most developed countries. Advertising did not cause our liberal attitudes toward sex; the sexual revolution was caused by the pill, penicillin, and other social forces. Any decrease of sex in advertising would probably not change society's sexual attitudes, so there is no ethical problem with Calvin Klein jeans, underwear, and perfume being thought sexy.

Sex is also used gratuitously in ads for products that have nothing directly to do with sex. We are all familiar with scantily clad women in ads for beer, cigarettes, cars, trucks, and vacation beaches. Note that for the most part these ads are aimed at straight males and use the stereotypical sexy woman—sexy, that is, in the minds and fantasies of straight males. Consider, for example, a two-page ad from a men's magazine that shows on the first page a woman with huge breasts, clad only in a bikini and posed in a sexually suggestive fashion. The copy asks if her measurements get the reader's heart racing. Turn the page and there is a pickup truck and the reader is asked to look at the truck's measurements. Horsepower, torque, and so on are listed. How do such ads work? Their ubiquity in men's magazines certainly suggests that they do sell cars, trucks, and beer. Such ads seem to say, "If you are a straight male attracted to big breasted women, you can prove it to yourself and others by buying our 'masculine' product." This interpretation presupposes that many straight males are very insecure about their sexual orientation and need to have their masculinity constantly confirmed by buying products with a masculine image. Is this manipulation of insecurities unethical? Perhaps not; straight males are generally capable of freely choosing to buy or not buy these products.

A more serious ethical objection to such ads is the attitude toward women that they imply and encourage. Women in these ads are being used as sex objects. One does not have to be a radical feminist to be concerned about the effects that exposure to thousands of such ads might have on straight men. It does not encourage them to see women as intelligent, productive, and competent individuals. Perhaps the vast majority of straight males are not greatly affected individually, but it does set a social tone about what are acceptable attitudes toward women. And the few men who take the objectification of women as sex objects seriously sometimes commit extremely unethical actions.

Advertising and Culture: Clutter, Appropriation, and Imperialism

Some critics of advertising are deeply concerned about the impact of advertising on our culture. Many of these criticisms are not so much about ethics as they are about aesthetics and taste, but some raise genuine ethical concerns.

Ads clutter our culture. Outdoor ads are unsightly, commercials interrupt television programs and sports, jingles jam the airwaves, and magazines seem to be nothing but ads. And ads are creeping everywhere. Clutter and ad creep raise two issues: general concerns about the ubiquity of ads and concerns about ads creeping into specific places such as public schools.

The ubiquity of ads certainly raises aesthetic issues, but in itself is not an ethical problem. Most ads are placed in media that people can choose to use or not. Magazines, newspapers, television, and radio can be avoided if a person wishes, and there are ad free news sources and alternatives to most media. Outdoor ads cannot be avoided, but their unsightliness is and should be a matter for local bylaws. Ad creep will not increase the impact of advertising on the consumer or society. The psychological wall we all have that blocks out ads is only made stronger by more ads. In terms of advertising impact, more is less. It is the lack of impact of advertising that is forcing advertisers to place more and more ads.

There are, however, specific places that many feel should be ad free. These include religious institutions, government buildings, and schools. The first is a private matter for the institution. Policy on placing ads on government property should be decided democratically. Ads in schools, on the other hand, raise ethical issues. School attendance is compulsory and so the audience for the ads is trapped; school pupils are children or adolescents so they may be vulnerable; the ads are shown in an educational environment so children may find it hard to discount their message; and finally, the peer pressure and groupthink inevitable in classrooms may dramatically increase the impact of ads. However, as long as schools are underfunded, schools will be tempted to accept advertising. Any solution to the ethical concerns about ads in schools will have to be enacted democratically.

Ads appropriate images from cultures and history, using them for the private gain of the advertiser. For example, perfume ads have used images of the beautiful "Indian princes"; motorcycles and cigarettes have used the "Indian brave" with feathers or a headdress as a symbol of masculinity. Is it ethical to use cultural symbols and images such as this? If an ad does use such a symbol, do they have any obligation to historical accuracy, or are faux simulacra acceptable? The peoples who created these symbols and images in the first place are generally not able to trademark or copyright them. Asking permission is often not an option; it is frequently not possible to identify whom to ask. One possibility that would minimize the ethical concerns would be to refrain from using cultural symbols if people from the relevant culture object. Images that do not receive complaints could be used; the Scots, for example, seem to like the kilted curmudgeon who sells malt whiskey. This approach requires a certain amount of cultural sensitivity on the part of corporations and a willingness to pull ads if they offend, even if those offended are not consumers of the product advertised.

Some critics complain that advertising is a form of American cultural imperialism. It is true that American advertising images such as Ronald McDonald and Coca-Cola are a large part of globalization, but European and Japanese corporations advertise worldwide too, and Chinese, Indian, and other cultures will be playing much larger roles in the future. Also, the dominance of American images is partly caused by the desire of many people for these images; Coca-Cola is advertised in many countries because the people there are eager to buy the product. In fact, it is this local popularity of American symbols and products that make some people in other cultures feel threatened. Some Italians and French may think that liking McDonald's food shows bad taste compared with liking their traditional foods, but the fact that McDonald's offends some people does not make it unethical to promote a popular symbol or product. Interfering with people's free choice by, for example, occupying or destroying restaurants raises more ethical issues than does advertising foreign products.

Advertising to Vulnerable Groups

Children and some people in the Third World are especially vulnerable to manipulation by advertising. Furthermore, we are all vulnerable to subliminal techniques if subliminal advertising works.

Children are vulnerable to advertising because they do not understand the purpose of ads; cannot tell ads from the rest of their environment; cannot separate fantasy from reality; find it difficult to control their emotions; do not understand finances, takeoffs, and deferred gratification; and do not have the psychological wall that blocks most ads in adults. Some people defend ads aimed at children by pointing out that young children cannot themselves buy most of the products advertised; they have to ask their parents who can and should make rational decisions on the child's behalf. But this defense leaves out advertising's intentional and conscious use of the "nag factor." Ads are designed (with verification using focus groups) to get children to whine and nag their parents for the advertised products. This technique tends to undermine the rationality of parental decisions, and it causes unhappiness in both parents and children, which is unethical on utilitarian grounds.

Some jurisdictions, such as Quebec and some European countries, ban altogether television or other advertising aimed at children. Many others ban only images that might be traumatic to children, such as sex and violence, or try to control the use of fantasy by insisting ads be realistic. Some people advocate also banning ads for products that might harm a child, calling, for example, for bans on junk food ads during children's programs. Ethically, corporations ought at least to stay within the law, but should also consider the impact of their ads on children's happiness and welfare.

Advertising to people in those Third World countries in which advertising is not a traditional part of their culture and who are not used to advertising yet can raise special ethical issues. These issues can be aggravated if the population targeted by the ads is illiterate, uneducated, and lacking in freedom and empowerment. A good example is the advertising campaigns Nestlé used in Africa that featured images of Caucasian "doctors" and "nurses" advocating the use of Nestlé baby formula in place of breast-feeding. The ads exploited the target market's illiteracy and lack of familiarity with advertising and its purpose, but the ethical issues in this case went beyond this; the ads were deceptive in that Western medical opinion did not support the use of formula feeding in the Third World. But the most serious ethical problems arose because of the consequences of the use of baby formula; it exposed the infants to malnutrition, disease, and contaminated water. International agencies claimed many babies died as a result. This case makes clear that using advertising to exploit people's vulnerabilities puts an ethical obligation on the advertiser to ensure that no harm results.

Subliminal ads are ads that the target market cannot see, hear, or otherwise be aware of. For example, if a movie theater flashes "Drink Band X Soda" on the screen so fast no one can perceive it, this is an attempt to manipulate people below their level of consciousness; as such, it tries to subvert rational decision making and so is unethical. Key's book titled *Subliminal Seduction: Ad Media's Manipulation of a Not So Innocent America,* popular in the 1970s, claimed that this technique was common and that large numbers of people were being brainwashed by it. Since then, experiments have failed to show that subliminal advertising works, and it is unlikely that it was ever widely used. Notwithstanding that, many legal jurisdictions have banned it.

Subliminal ads should not be confused with suggestive ads. As an example of a suggestive ad, consider a magazine ad that shows a couple passionately embracing in the background; in the foreground is a long cylindrical bottle of men's cologne obviously suggestive of a phallus. This is not subliminal; the viewer can clearly see what is going on. (In case the viewer needs confirmation, the letters "man's co. . . ." disappear strategically around the side of the bottle.)

Suggestive advertising is not inherently unethical since there is no evidence that it manipulates below our level of awareness or that it subverts rationality.

Advertising and the Natural Environment

Advertising affects the natural environment in three ways: ads use resources; some ads encourage destructive activities; and ads always encourage consumption, never nonconsumption.

Although radio ads and television commercials use a minimum of natural resources, print ads such as newspaper ads and inserts, flyers, and direct marketing mailings use vast amounts of paper. However, pulpwood for paper is a renewable resource if forests are harvested sustainably, and paper can be recycled, so reduced usage may not be ethically required. What is required is a sustainable paper industry, but is this the ethical responsibility of the advertisers? If advertisers insist on print media using sustainable paper supplies, the pulp industry would be hugely affected in a positive way. But the grounds for saying this is that the advertiser's ethical responsibility are not clear unless, of course, the advertiser claims to be an environmentally friendly company.

Some ads encourage activities destructive to the environment, such as the multitude of SUV ads that idealize off-road driving. Ethically, it is questionable whether advertisers should use such images. Sometimes, a negative environmental impact is inherent in the product advertised; for example, flying to the Caribbean on a vacation package uses petroleum, a nonrenewable and polluting natural resource. In such cases, environmental concerns should concentrate on the product, not just the advertising. What actions should be taken about such products is greatly debated, but the ads do not interfere with environmentalists who choose, for example, to vacation nearer home. Nor do they interfere with such environmentalists advocating this course of action to others.

Finally, critics of ads point out that consumer advertising always promotes consumption; reduced consumption is never advertised except occasionally by some advocacy groups that never have the money to compete with large corporations. Even government advocacy ads tend to emphasize recycling rather than reduced consumption; reduced consumption threatens jobs, taxes, and the economy. Environmentalists argue that, ethically, the developed countries ought to reduce their level of consumer consumption. Perhaps this is true, but the ethical responsibility cannot lie with the individual advertisers because they would be at a potentially fatal competitive disadvantage if they stopped advertising. This is a social and cultural problem that should only be changed by citizens through democratic processes and changes of their own behavior.

Corporate Control of the Media

Advertising critics claim that advertising gives corporate advertisers too much control of the programming and editorial content of the media; advertising biases mass media news coverage, and as a result, the media in North America only present what is in the interests of corporations for people to believe. For example, cigarette advertisers for decades threatened to and did pull their ads from any magazine or newspaper that carried articles on the health risks of cigarettes. Most magazine advertisers ask for advanced information on articles in the issues their ads will appear in; their ads are pulled if any article might create negative associations with their products.

Defenders of advertising do not deny that corporations sometimes withdraw ads or threaten to; they argue that corporations have a right to select where they advertise, and a fiduciary duty to shareholders and other stakeholders not to jeopardize the image of the corporation or its products. It can also be pointed out that newspapers and magazines that do not rely on corporate advertising are available to those who choose them; their subscription price is, of course, much higher (compare, e.g., the subscription prices of *Time* or *Newsweek* with the *Guardian Weekly*), but if people choose to be free of corporate influence they cannot expect to benefit from the subsidy that advertising gives much of the media.

In Defense of Advertising

The volume of criticism of advertising can make us lose sight of possible ethical defenses. Besides the economic role of advertising mentioned above, it can also be pointed out that advertising gives us information, introduces us to new products, presents us with images we can enjoy, creates symbols that allow us to express ourselves, subsidizes our media, and promotes human freedom by presenting to us vast numbers of products from which we can freely choose what we want to buy. Those who want to ban or strictly regulate all advertising should remember that advertising is a form of expression and that freedom of expression is a basic human right recognized in the UN Declaration of Human Rights and most national constitutions. However, that should not prevent the regulation of ad techniques or placements that cause specific harms. Those who worry about advertising should consider Schudson's point that ads are targeted primarily at people who are already heavy uses of a product-type and that the purpose of most advertising is not increase product-type usage, only brand switching. Ethical objections to ads have to make a case about specific ads on grounds of harm, viewer vulnerability, subversion of rationality, or plain dishonesty.

Advisory Panels and Committees

Advisory panels and committees make recommendations, give advice, identify important issues, and produce reports to guide decision making. An organization uses advisory panels and committees to increase the scope of its moral imagination to deal with uncertain situations with which its own members lack familiarity. Current examples of such uncertain situations that advisory panels and committees have been called to address include the consequences of rapidly innovating in biotechnology and nanotechnology; medical care providing experimental therapies; and the use of surveillance technology in free societies. In such unfamiliar situations, even well-intentioned people within the organization may be uncertain about the most appropriate principled behavior that considers and justly balances multidimensional consequences.

In addition to the need for guidance in uncertain situations, it may be difficult to make decisions that are credible to all stakeholders when the decision makers' self-interest also is at stake. It is helpful to balance the subjectivity of decision makers with input from wise, compassionate, skilled, and objective experts. Advisory panels and committees are formal institutional mechanisms whose function is to provide this seasoned and objective input. Recently, for example, advisory panels have been used to recommend the pay and benefits of top-level business managers and to avoid negative perceptions of self-interested managers awarding themselves extraordinarily extravagant pay and benefits.

As institutional mechanisms to signal an organization's objectivity, advisory panels and committees also have been called on to interpret policies for an organization, hold hearings on organizational members accused of policy violations, review draft decisions and approve final decisions, and provide oversight for policy implementation. By performing this function with independence, objectivity, and fairness, panels serve to increase procedural justice within an organization.

The effectiveness of advisory panels as mechanisms to introduce objectivity into decision making depends on the lack of any conflict of interest in the panel members. Such conflict of interest, unfortunately, has been a frequent criticism of advisory panels. In the example of panels used to recommend the pay and benefits of top-level business managers, interlocking membership between the advisory panels and managers is a common way of introducing conflict of interest. Interlocking membership means a person sits on a panel that makes a recommendation, such as setting pay, and the manager whose pay is being recommended sits on a similar panel for their recommender—a clear conflict of interest that interferes with objectivity in setting a fair pay level. In addition to not forming interlocking memberships, another common way for advisory panels and committees to avoid the appearance of conflicts of interest is for its members to serve without pay. The absence of pay for panel members suggests the absence of incentives for them to bias their decisions in favor of a paying organization.

Advisory panels and committees typically do not have all the information that is available to the organizational insiders. The effectiveness of panels, therefore, requires effort to overcome this information asymmetry. This effort is a function of the time and resources decision makers allocate to nurturing relationships between the organization and the panel. Some managers may minimize or neglect this effort because they think it is a burden on their costs and a constraint on their activity. By going without effective guidance, however, these managers are taking on the compound risk that they may act with suboptimal principles, that their expedient behavior may be publicly discovered, and that they will not be able to credibly demonstrate their intention to behave ethically.

Organizations that frequently and transparently communicate with advisory panels and committees before significant actions are proactively ensuring their behavior is scrutinized for integrity. Because of the significant time and resources required for this, advisory panels and committees often are found in those organizations that can demonstrate the positive cost-benefit consequences of the relationship. In the United States, such tangible and significant consequences may result from legal processes of public policy or tort law. For this reason, advisory panels and committees often are found in branches of government, hospitals, and businesses with significant assets.

Organizations can establish a reputation for compassionate concern for the public welfare by including outsiders (nonemployees, nonowners) from the community in the membership of their advisory panels and committees. Broad membership is particularly important when there are diverse views in the community concerning the appropriate principles that should be applied to a specific situation. Panels are a means for organizations to connect to a network of relationships in the communities its actions affect.

The smooth functioning of an advisory panel composed of people with a broad range of backgrounds and diversity of philosophical perspectives may be a challenge. Important ethical principles for the management of the process include fairness, efficiency, and utilitarianism balanced by respect for the rights of minorities. Absent these principles, advisory panels and committees may serve little more than an ineffective public relations function.

The important role of advisory panels and committees to guide their constituencies in uncertain and critical situations calls for these panels to be transparent in their ethical principles and distribute them widely. This communication process is supported by multiple and rich media such as an intranet that enables dialogue to promote high ethical standards throughout an organization whose members may be dispersed by a global economy across many geographic areas and cultures. Furthermore, by linking advisory panels to external communities via the Internet, business can sustain the relevance of its ethical principles and initiatives to the broader communities to which it is responsible.

Affirmative Action

The origins of affirmative action lie in a 1965 executive order issued by U.S. President Lyndon Johnson that required federal contractors to develop policies to combat discrimination. Since this order, several U.S. policies and laws have encouraged or required corporations and other institutions to advertise jobs fairly and to promote the hiring and promotion of members of groups formerly discriminated, most notably women and minority ethnic groups. Implementation of both the letter and the spirit of these federal requirements has often involved employment goals and targeted employment outcomes intended to eliminate the vestiges of discrimination. These goals and policies are the core of affirmative action.

Target goals, timetables, and quotas were originally initiated to ensure more equitable opportunities by counterbalancing apparently intractable prejudice and systemic favoritism. Over the years, many policies initiated with these lofty ambitions were criticized on grounds that they establish quotas that unjustifiably elevate the opportunities of members of targeted groups, discriminate against equally qualified or even more qualified members of majorities, and perpetuate racial and sexual paternalism. The problem of affirmative action is whether such policies can be justified and, if so, under which conditions. At its roots, this problem is moral rather than legal. However, the most influential arguments have been legal ones advanced in the opinions of judges.

What Does "Affirmative Action" Mean?

The term *affirmative action* refers to positive steps to rank, admit, hire, or promote persons who are members of groups previously or presently discriminated against. It has been used to refer to everything from open advertisement of positions to quotas in employment and promotion.

The original meaning of affirmative action was minimalist. It referred to plans to safeguard equal opportunity, advertise positions openly, ensure fair recruitment, and create scholarship programs for specific groups. Few now oppose these means to the end of equal treatment, and if this were all that were meant by affirmative action, few would oppose it.

However, affirmative action has acquired broader meanings—some advanced by proponents, others by opponents. Most important, it became closely associated—especially through its opponents—with quotas and preferential policies that target specific groups, primarily women and minorities, for preferential treatment. Stern critics of affirmative action hold that affirmative action today means little more than naked preference by race. Proponents of affirmative action wholly reject this suggestion. They see affirmative action as confined to policies that favor qualified women and minority candidates over similarly qualified men or nonminority candidates, where there is an immediate objective of remedying persistent discrimination, achieving diversity, and achieving a race- and color-blind society.

Criticism of affirmative action policies has often centered on the alleged use of quotas. *Quota* here refers to fixed numbers of a group that must be admitted, hired, or promoted—even to the point of including less qualified persons if they are the only available members of a targeted group. However, the term *quota* originally was not used with this meaning. Quotas were understood as target numbers or percentages that an employer, admissions office, recruitment committee, and the like sincerely attempts to meet. In this second sense, quotas are numerically expressible goals pursued in good faith and with due diligence, but they do not require advancing unqualified or even less qualified persons.

The language of quotas seems now to be going out of fashion, most likely to be replaced with the language of "diversity." Many goals of affirmative action are today discussed as issues of "diversity in the workplace."

Divergent Accounts of Discrimination and Its Remedies

Although racism and sexism—the primary sources of discrimination in the history of affirmative action—are commonly envisioned as *intentional* forms of favoritism and exclusion, intent to discriminate is not a necessary condition of discrimination in the relevant sense. Employees are frequently hired through a network that, without design, excludes women or minority groups. For example, hiring may occur through personal connections or by word of mouth, and layoffs may be controlled by a seniority system. It has proved particularly difficult in the more camouflaged areas to shatter patterns of discrimination and reconfigure the environment through affirmative action remedies.

Empirical evidence of social discrimination is readily available, though not always easy to interpret. Data indicate that in sizable parts of American society (and many other societies) white males (or other male groups) continue to receive the highest entry-level salaries when compared with all other social groups and that women with similar credentials and experience to those of men are commonly hired at lower positions or earn lower starting salaries than men. Whether these statistics demonstrate invidious discrimination is controversial, but additional data drawn from empirical studies reinforce the judgment that racial and sexual discrimination are the best explanation of the data. For example, studies of real estate rentals, housing sales, home mortgage lending, and employment interviews show significant disparities in rejection rates, usually comparing white applicants and minority applicants. Disparities seem to exist even after statistics are adjusted for economic differences. Race appears to be as important as socioeconomic status in failing to secure both houses and loans.

Persons who believe that such apparent discrimination is detectable and correctable by recourse to legal remedies are unlikely to defend strong affirmative action measures. In contrast, anyone who believes that discrimination is securely and almost invisibly entrenched in many sectors of society will likely endorse, or at least tolerate, affirmative action policies. These policies have had their strongest appeal, and firmest justification, when discrimination that barred groups from desirable institutions persisted even though strictly forbidden by law. All parties today agree that *individuals* who have been injured by past discrimination should be made whole for the injury by some form of compensation and that when we reach the point that a color-blind, sex-blind society can be achieved by legal guarantees of equal opportunities to all, affirmative action policies should be dispatched.

Those who support affirmative action and those who oppose it both seek the best means to the end of a color-blind, sex-blind society. In this respect their ends do not differ. Nor do they entirely disagree over the means to these ends. If a color-blind, sex-blind society can be achieved and maintained by legal guarantees of equal opportunities to all, both sides agree that social policies should be restricted to this means. But here agreement ends. Those who support affirmative action do not believe that such guarantees can, at present, be fairly and efficiently achieved other than by affirmative action policies. They see the goals of affirmative action as broader than mere legal guarantees of equal opportunity—for example, diversity itself can be a warranted goal. Those who oppose affirmative action believe that this recourse is unnecessary and that affirmative action policies unjustifiably discriminate in reverse. Many also try to show that today's affirmative action policies are, on balance, more harmful than beneficial.

The Justification of Affirmative Action

Presumably, affirmative action policies (in whatever form) are justified if and only if they are necessary to overcome the discriminatory effects that could not otherwise be eliminated with reasonable efficiency. Those who believe in aggressive policies of affirmative action point to the intractable, often deeply hurtful, and consequential character of racism and sexism. The history of affirmative action, from their perspective, is an impressive history of fulfilling once-failed promises, displacing disillusion, and protecting the most vulnerable members of society against demeaning abuse. They believe that affirmative action policies will likely be needed in pockets of the most vicious and visceral racism for roughly another generation, after which it can be reasonably expected that appropriate goals of fair opportunity and equal consideration have been reached. The goal to be reached at that point is not proportional representation, which has occasionally been used as a basis for fixing target numbers in affirmative action policies, but merely the end of discrimination. That is, the ultimate goal is fair opportunity and equal consideration. Once this goal has been achieved, affirmative action will no longer be needed or justified and should be abandoned.

Many supporters of affirmative action do not hold that it is needed now for *all* institutions. They believe that racial, sexual, and religious discrimination has been so substantially reduced or eliminated in some sectors of society that affirmative action no longer has a purpose in these sectors. The problem is that in other social sectors it is still common to encounter discrimination in favor of a favored group or discrimination against disliked, distrusted, unattractive, or neglected groups.

The Role of the Courts

The U.S. Supreme Court has upheld some affirmative action programs and found others insupportable. It is difficult to pin down exactly what, in the history of the Court's opinions, has been sustained and what has been discouraged. Both sides of the moral controversy over affirmative action have commonly appealed to the authority of the Court for support.

In two cases decided in the late 1980s, the Supreme Court supported the permissibility of specific numerical goals in affirmative action plans that are intended to combat a manifest imbalance in traditionally segregated job categories (even if the particular workers drawn from minorities were not victims of past discrimination). In *Local 28 v. Equal Employment Opportunity Commission*, otherwise known as *Sheet Metal Workers*, a minority hiring goal of 29.23% had been established. The Court held that specific numbers of this sort are justified when dealing with persistent or egregious discrimination. The Court found that the history of Local 28 was one of complete "foot-dragging resistance" to the idea of hiring without discrimination in their apprenticeship training programs from minority groups. The Court argued that "affirmative race-conscious relief" may be the only reasonable means to the end of assuring equality of employment opportunities and to eliminate deeply ingrained discriminatory practices and devices that have fostered racially stratified job environments to the disadvantage of minority citizens.

In a 1989 opinion, in contrast, the Supreme Court held in *City of Richmond v. J. A. Croson* that Richmond, Virginia, officials could not require contractors to set aside 30% of their budget for subcontractors who owned "minority business enterprises." This particular plan was not written specifically to remedy the effects of either prior or present discrimination. The Court found that *this way* of fixing a percentage based on race, in the absence of evidence of identified discrimination, denied citizens an equal opportunity to compete for subcontracts. Parts of the reasoning in *Croson* were affirmed in the 1995 case of *Adarand Constructors Inc. v. Pena.* Some writers have interpreted *Croson*, *Adarand*, and a 1997 decision of a three-judge panel of the 9th U.S. Circuit Court of Appeals—to the effect that a California voter-approved ban on affirmative action (Proposition 209) is constitutional—as the dismantling of affirmative action plans that use numerical goals.

This prediction could turn out to be correct, but the U.S. Supreme Court has not specifically so determined and has, with reasonable consistency, adhered to a balancing strategy. As important as its landmark cases are, no comprehensive criteria have yet been established by the Court for legally valid affirmative action plans.

Impact on Business

Affirmative action programs and various attempts to achieve diversity in the workplace have affected U.S. businesses in profound ways. Some of these plans were imposed by government on business, but most plans that survive today have been voluntarily undertaken by corporations.

Nonvoluntary Plans

In the early history of affirmative action, plans were nonvoluntary. In the typical circumstance, the government announced that it found a pattern of discrimination and that diversity was noticeably lacking in a company and that affirmative action must be enforced. An early and classic case in law and business ethics is an AT&T affirmative action agreement in the 1970s. The salient facts of this case are as follows: The U.S. Equal Employment Opportunity Commission (EEOC) had investigated AT&T in the 1960s on grounds of employee-alleged discriminatory practices in hiring and promotion. In 1970, the EEOC stated that the firm engaged in "pervasive, system-wide, and blatantly unlawful discrimination in employment against women, African-Americans, Spanish-surnamed Americans, and other minorities" (U.S. Equal Employment Opportunity Commission, "Petition to Intervene," Federal Communications Commission Hearings on A.T.&T. Revised Tariff Schedule, December 10, 1970, p. 1.). The EEOC argued that employment practices at AT&T violated several civil rights laws and excluded women from all job classifications except low-paying clerical and operator positions.

AT&T denied all charges and produced a massive body of statistics about women and minorities in the workforce. However, these data ultimately worked to undermine the corporation's own case. The data showed that half of the company's 700,000 employees were female and that the women were uniformly either secretaries or operators. It became apparent that the company categorized virtually all its jobs in terms of men's work and women's work. The federal government was determined to obliterate this aspect of corporate culture in the belief that no other strategy would break the grip of entrenched sexism. Eventually AT&T entered a consent decree, which was accepted by a Philadelphia court in 1973. This agreement resulted in payments of $15 million in back wages to 13,000 women and 2,000 minority-group men and $23 million in raises to 36,000 employees who had been harmed by previous policies.

Out of this settlement came a companywide "model affirmative action plan" that radically changed the character of AT&T hiring and its promotion practices. The company agreed to create an "employee profile" in its job classifications to be achieved in an accelerated manner. It established racial and gender goals and intermediate targets in 15 job categories to be met in quarterly increments. The goals were determined by statistics regarding representative numbers of workers in the relevant labor market. The decree required that under conditions of a target failure, a less qualified (but qualified) person could take precedence over a more qualified person with greater seniority. This condition applied only to promotions, not to layoffs and rehiring, where seniority continued to prevail.

Today it is no longer seriously doubted that AT&T's hiring and promotion practices did, at the time, involve unjustified discrimination and serious wrongdoing. Even basic moral principles were violated—for example, that one ought to treat persons with equal consideration and respect, that racial and sexual discrimination are impermissible, and the like. Less clear—and still unresolved today—is whether or to what degree the responsible corporate executives should be morally blamed. Several factors place limits on judgments about the blameworthiness of agents—or at least the fairness of doing so. These factors include culturally induced moral ignorance, a changing landscape in civil rights law, and indeterminacy in an organization's division of labor and designation of responsibility. All were present to some degree in the AT&T case.

Judgments of exculpation depend, at least to some extent, on whether proper moral standards were openly acknowledged in the culture in which the events transpired—for example, in the professional ethics of the period. If society generally had possessed clear standards regarding the justice of hiring and promotion in the 1950s and 1960s, it would be easier to find AT&T officials culpable. The absence of such standards is a factor in assessing culpability and exculpation, but need not be included in judgments of the wronging that occurred. Individuals and groups may be owed compensation even when parties to the wrongdoing cannot reasonably be held culpable for their actions.

However, the fact of culturally induced moral ignorance does not by itself entail exculpation or a lack of accountability for states of ignorance. A major issue in the past, and still today, is the degree to which persons are accountable for holding and even perpetuating or disseminating discriminatory beliefs when an opportunity to remedy or modify the beliefs exists. If such opportunities are unavailable, a person may have a valid excuse; but the greater the opportunity to eliminate ignorance the less is exculpation appropriate. Culturally induced moral ignorance was a mitigating factor in the 1960s and early 1970s, but history also suggests that it was mixed with a resolute failure to face moral problems that were widely appreciated to be serious, and they were problems that had been directly faced by other institutions.

Voluntary Affirmative Action Plans

Most corporate affirmative action policies are now voluntary plans, and these plans have arguably been more successful in transforming multiple corporate workplaces than have government-mandated policies. Many American corporations have welcomed these plans, on grounds that discrimination causes the institution to lose opportunities to make contact with the full range of qualified persons who might be contacted. These institutions have found that carefully controlled selection for diversity in the workforce is correlated with high-quality employees, reductions in the costs of discrimination claims, a lowering of absenteeism, less turnover, and increased customer satisfaction. Many corporations also report that they have invested heavily in eliminating managerial biases and stereotypes while training managers to hire and promote appropriately. They are concerned that without the pressure of an affirmative action plan managers will fail to recognize their own biases and stereotypes.

One moral worry about today's voluntary plans concerns a failure of truthfulness in publicly disclosing and advertising the practical commitments of the policies. Advertisements for jobs and the public statements of corporations about their affirmative action plans rarely contain detailed information about a corporation's objectives and policies, yet more information would be of material relevance to applicants and employees. The following are examples of facts or objectives that might be disclosed: a unit may have reserved its position for a woman or a minority candidate; the chances may be overwhelming that only a minority group member will be hired; the interview team may have decided in advance that only women will be interviewed; or the advertised position may be the result of a corporate policy that offers an explicit incentive (perhaps a new position) if a minority representative is appointed. Incompleteness in disclosure and advertising sometimes stems from fear of legal liability, but more often from fear of embarrassment and harm either to reputation or to future recruiting efforts.

Many corporations seem to be in the odd situation of fearing to make public what they believe to be morally commendable in their recruiting efforts. There is something deeply unsatisfactory about a reluctance to disclose one's real moral commitments and goals. This situation is striking, because the justification for the policy is presumably that it is a morally praiseworthy endeavor. Here we have a circumstance in which the actions taken may not be wrong, but the agents may be culpable for a failure to clearly articulate the basis of their actions and to allow those bases to be openly debated so that their true merits can be assessed by all affected parties.

—Tom L. Beauchamp

AFL-CIO

The AFL-CIO, a federation of over 50 labor unions and more than 13 million members as of 2005, was formed in 1955 with the merger of the American Federation of Labor (AFL) and the Congress of Industrial Organizations (CIO) to become the largest labor organization in the United States representing 85% of the country's unionized workers. This merger renewed an old but tenuous alliance between trade unions and industrial unions that had fractured in a bitter confrontation at the height of the Great Depression in 1935 at the AFL annual convention in Atlantic City. At issue was the failure of the AFL to support the organizing efforts of industrial workers who had become the engine of a national economy increasingly built on mass production.

Originating with the craft and trade unions of skilled workers, such as shoemakers, typesetters, and metal workers, the AFL was slow to recognize the value of cheap, unskilled workers—minorities, immigrants, and women—who threatened the livelihoods of its membership base of mostly white, English-speaking men who built small businesses as they moved up the ranks from apprenticeship to master tradesmen. The AFL unions were more concerned with the competitive position of small businesses than with creating a platform of rights for industrial workers. Tensions increased as some organized labor leaders urged solidarity and support for industrial unions as well as elimination of racist and ethnic barriers within the trade unions. At the time of the Atlantic

City convention in 1935, when one fifth of American men were out of work, there was little sympathy among skilled trade unions for the plight of unemployed or underpaid factory workers.

The AFL leadership was itself split, with the majority steadfastly loyal to the trade union interests. Frustrated when AFL leaders rejected his efforts to expand the AFL agenda to include industrial workers through a new AFL Committee on Industrial Organizations, John L. Lewis led eight industrial unions in forming the independent Congress of Industrial Organizations in 1938, which quickly succeeded in organizing workers in several large mass production industries, including automobile, mining, steel, and rubber, to build a membership of 6 million by 1945. Building on initial victories won by strike strategies in the auto industry, CIO leaders went on to organize strikes in other industries to secure salary and benefit concessions in addition to labor-organizing rights. Both the AFL and the CIO worked successfully to gain political support for American workers and organize American labor, enabled in part by the Depression that highlighted the vulnerability of American workers and a booming World War II and postwar economy that provided ample work opportunities for both skilled tradesmen and industrial workers who began to see their common interests in relation to an emerging class of white-collar professional and technical workers with specialized knowledge in an economy oriented more toward service and technology than toward material production. Both organizations came to share the basic union agenda of promoting worker benefits through collective bargaining, political action, legislative initiatives, and strikes. When the presidents of both unions died in 1952, with many of the initial disagreements diminished, both organizations sought the 1955 merger under the leadership of George Meaney (AFL) and Walter Reuther (CIO).

The AFL-CIO and the U.S. Labor Movement

American economic interests were initially framed from the perspective of property owners who viewed labor as an input cost of business to be contained as much as possible to generate profit. Slavery was just one institutional expression of this viewpoint. It wasn't until 1914 that the Clayton Antitrust Act affirmed that labor was not a commodity. The craft and trade unions traced their roots to the medieval European guilds formed to protect the business interests of tradesmen and artisans by controlling occupational entry through a system of supervised apprenticeship and journeyman phases leading to master, grandmaster status with corresponding autonomy and income potential. Struggling with cyclic depressions and competition from the Southern slave-based economy, Northern apprentices and journeymen who found it difficult by the 19th century to establish their own independent shops sought instead to improve their lot as employees of master tradesmen. American workers' early efforts in the 19th century to assert their economic interests were met with strong, sometimes violent, resistance. The Philadelphia journeyman Cordwainers's campaign for wage increases in 1806 was met with a criminal conviction on conspiracy charges brought by their trade master employers. Eighteen more conspiracy cases were brought to trial until the Massachusetts Supreme Court ruled in 1842 (*Commonweath v. Hunt*) that labor unions were not de facto criminal conspiracies. The AFL was founded by Samuel Gompers in 1886 at the height of campaigns to protect workers in the American economy's shift to industrial production.

The impetus for the AFL was sparked by widespread dissatisfaction among trade union constituents impatient with the ineffectiveness of leadership in existing unions, such as the Knights of Labor, in securing legal and economic guarantees (10-hour workday, elimination of child labor, workplace safety) for workers. To distinguish itself from its predecessors, the new AFL promoted the autonomy of its affiliated unions, barred employers from membership, and focused on achieving benefits for its working members. Gompers himself, however, accommodated the AFL base of skilled workers unions, who insisted on restrictive membership policies excluding minorities, unskilled, illiterate, and immigrant workers. By the late 19th century, industrial unions such as the United Mine Workers, International Ladies' Garment Workers' Union, and the United Brewery Workers had joined the AFL, broadening its membership base and generating competing agendas among its affiliated unions. Despite this influx of industrial members, the AFL continued its primary focus on the concerns of skilled workers, hoping to ensure its own organizational stability and avoid potentially hazardous and futile political confrontations.

Contemporary critics of the AFL-CIO see it as a declining organization, citing the loss of union membership, diminished influence in both Democrat and Republican parties, the failure of unions to stand unequivocally for the equality of women and minority workers, and recurrent scandals among its leadership and member unions. Once a vocal and visible champion of American workers, organized labor no longer attracts members in a postindustrial economy rapidly shifting from manufacturing to service, technology, and knowledge. From a high of 32.5% in 1953, union membership among American workers has dropped steeply to the current 13%, or 15.7 million workers. While losing membership among its industrial base of mining and manufacturing industries, the young, and in most occupational groups, however, the AFL-CIO has successfully organized teachers, government employees, and protective service workers (firefighters, law enforcement, security, and corrections). Despite these gains, however, the AFL-CIO has failed to attract workers among the emerging technology, professional, and services sectors.

While the demise of unions and collective bargaining as a force in American political and economic life is not much disputed, the causes of union decline and possibilities for renewal are a subject of debate among labor historians. Labor demands are sometimes characterized as narrowly self-serving and intransigent in the face of pervasive conditions of industry or market failure. Workers are no less alienated by excess, greed, and corruption from their union bosses than from their employers. The negative effects of union-negotiated wage inflation and occupational entry barriers are more apparent to an increasingly mobile and adaptive workforce less amenable to industry-based organizing practices designed for stable, long-term employees of large corporations. These same workers, however, face new challenges of underemployment, work and wage restructuring, and global competition for which organized labor has yet to demonstrate its effectiveness in mediating the demands of a multiple stakeholder environment.

African Business Ethics

African business ethics needs to be viewed in the context that each person belongs to a group defined by social, religious, political, or geographical parameters. It, therefore, carries a high degree of complexity and constant changing environments and as such requires a degree of flexibility to operate in. Nonetheless, the distinctive features of African business ethics can be made clear.

Marshall, in a seminal passage constructing the topicality of business ethics in the book *Business and Society,* sketches three different kinds of ethics based on three separate approaches to what is right and what is wrong: social ethics, transcendental ethics, and tactical ethics. It is suggested that social ethics (ethics determined from within any particular society) and tactical ethics (ethics based on the calculated observance of ethical standards in their conduct) are particularly relevant to African business ethics, each encapsulating a wide scope of ethical action and practice.

In the context of business ethics in relation to Africa, three key components need to be kept in mind: (1) cultural subtleties (ethics and tradition), (2) the natural environment (ethics and subsistence, including arable land scarcity), and (3) historical factors that have shaped and misshaped the human experience (ethics and social organization). Each category is cast with a caution, "In Africa, worldviews and ethics have reference points in traditional nations, the modern state leading to conflict as well as liberation."

Africa is a continent imbued with complexities and mixed signals; ethnic diversity, a range of religious and spiritual traditions, and the consequences of colonialism have had an impact on the dynamic cultural mosaic (the impact of Anglophile and Francophile cultural artifacts should not be ignored in the analysis). Its diverse geographical canvas covers the north and south temperate zones, the thick tropical cores lying in the North and in the South. In every area, Africa's geographical features have shaped cultural practices throughout its long history.

An understanding of the relationship between the environment, culture, and ethics is crucial in making sense of African business ethics. Africa's multifaceted cultures, landscapes, and peoples require diligence in studying the ethical content; simplistic binaries are not useful, although struggles between the strongest and smartest help in an understanding of ethics within Africa. In simplistic categories, the northern part is influenced by Arabic traders who veer toward Europe in the ebb and flow of business relations. The eastern side is heavily shaped by the Indian traders. The south is modeled by Europeans. The west is organized by a combination of African, Lebanese, European, and Indian business cultures.

The business climate in countries such as Angola, Ghana, Nigeria, South Africa, and Libya is relatively positive, whereas the range of social and economic problems in Liberia, Sierra Leone, Ethiopia, and Mozambique produce an atmosphere where business ethics are secondary to the instinct of base survival. To reiterate, laws, codes, regulations, and minor "norms of behavior" need to be considered in a local setting, each being cross-referenced to norms constructed by the family, the community, and "the state." This to a larger extent would determine the success or failure on the part of a business on its ability to adjust to Africa's dynamic market.

Africa is rich in resources, encapsulating substantive deposits of diamonds, gold, and oil. The wealth accrued from these commodities has not benefited the vast majority of citizens, the spoils often leading to widespread corruption, avarice, coups, and civil wars. Citizens are increasingly vocal in criticizing dysfunctional systems and structures that impede development and, in most cases, are ready to take the law into their own hands. Civil society is active in responding to the negativity that prevails in some areas, but recognizes its limits in terms of power. Nonetheless, traditional governmental structures organized by an intransient core are being challenged. Similarly, tribal codes and practices are being questioned by traditionally passive recipients, access to knowledge being democratized albeit unevenly.

Corruption among civil servants is extensive, highlighting the problems of accountability and responsibility in civil organizations. As a result of poor pay and unsustainable employment, bribery is embedded in the conduct of business. Bribes are common, and law enforcement is often corrupt. Taxes are not collected systematically or regulated in a positive sense. The culture of defrauding is not necessarily linked to the motive of generating large financial gain. It is operated to procure a modest improvement to the individual, family, and community, which can only be obtained through recourse to the network of favors, facilitated in part by brides, particularly in the area of health, education, and employment.

At the government level, there are problems with capital flight, embezzlement, and aid dispersion. Government and big business have been complicit in some areas, leading to international condemnation. For example, the case of Ken Saro-Wiwa in Nigeria, which resulted in the death of the activist following public criticism against the Nigerian government and Shell, is important in understanding the often tenuous relationship between foreign investment and environmental destruction. Numerous cross-sector industry cases, for example, fair trade and diamond mining, highlight the full challenges in relation to the ethical minefield in Africa.

International responsibilities that have an impact on ethics are also related to the military-industry complex, which in some cases extenuates the longevity of local conflicts and impedes social alternatives. The ethics of using Africa as a resource—plants, animals, and minerals—has long been an area of animosity, which is debated at length in the literature on global political economy. Johan Galtung, for example, in his well-known article, makes clear the relationship between imperialism and exploitation and between core and periphery. African business ethics are shaped by the numerous cultures that coexist in the continent: Clues or guidance to a shared ethical reference point is more likely to be found in the indigenous arts than Western textbooks; external international relations, however, should not be ignored in seeking to understand the complexities that operate in this unique and culturally rich continent.

Age Discrimination

Acts of age discrimination are motivated by prejudice toward an individual's or group's age.

In the workplace, age discrimination occurs when an employer treats an employee or prospective employee differently than others because of the person's age.

In the United States, there have been several fundamental pieces of legislation enacted to protect individuals against age discrimination. The Age Discrimination in Employment Act of 1967 (ADEA) is the most significant. It protects individuals who are 40 years of age and older from employment discrimination based on age. The ADEA was created to extend the law stated in the Civil Rights Act of 1964, which prohibits discrimination based on race, sex, creed, color, religion, or ethnic origin, to include age.

The ADEA's protections apply to both employees and job applicants. Under the ADEA, it is unlawful to discriminate against a person because of the individual's age with respect to any term, condition, or privilege of employment, including hiring, firing, promotion, layoff, compensation, benefits, job assignments, and training. The ADEA further states that it is unlawful to retaliate against an individual complainant or participant in any age discrimination charge, investigation, proceeding, litigation, or testimony.

Regulations set forth by ADEA apply to employers with 20 or more employees, including federal, state, and local government organizations. Employment agencies, apprenticeship programs, and labor organizations are also subject to ADEA. Age preferences, limitations, or specifications are prohibited, but they may apply under rare exceptions. An employment agency, for example, may not make age specifications when posting job notices or making preemployment inquiries.

ADEA waivers are allowed, but only if they meet minimum standards. For example, an airline pilot is required to have a maximum level of correction relative to eye sight. A firefighter may be required to lift and carry 150 pounds. Age and other physical requirements are considered when filling these jobs. A waiver could be requested in these instances. The employer would be required to use specific language that would apply to all employment notices and advertisements for these positions. Discrimination also occurs with younger employees, but protections and liabilities are not legislated, and thus, cases and claims are rarely documented.

The ADEA is enforced by the Equal Employment Opportunity Commission (EEOC), a federal government agency. The EEOC is charged with eliminating illegal discrimination from the workplace. Individuals who think they are victims of age discrimination can report the activity to the EEOC. The EEOC provides information about how to file charges at the state and federal levels.

Age discrimination laws are also defined and imposed at the state level. These laws are based on the mandates stipulated in existing federal laws, although some state laws enforce broader protections. For example, there are states that enforce protections that apply to employers with fewer than 20 employees.

Age Discrimination and Employees

Age discrimination most commonly occurs as older workers seek new jobs, make efforts to sustain current employment, or compete for a promotion. Older workers are frequently highly compensated. These individuals tend to be employed for a lengthier period of time, achieving senior-level positions and progressively higher compensation.

Some individuals maintain that employers target these workers for replacement because they are more costly to keep than younger workers. Younger workers tend to be compensated at a lower rate, benefits are less costly, and there is a longer time horizon before retirement. These individuals are less expensive to hire and employ. A company may also consider younger workers as opposed to older workers because these individuals are perceived to be more creative, innovative, energetic, and adaptable. Benefits and pension plans are affected also. These programs are expensive to maintain for older workers. Employers may use these data to impose layoffs that are targeted at a disproportionate number of older workers. For example, due to newly revised pension arrangements, an older worker may be forced to make employment decisions, such as early retirement or a job change, which would not normally be the case or differ from younger counterparts. In this case, there are protections under the law.

The Older Workers Benefit Protection Act (OWBPA) was passed in 1990. It guarantees protection against discrimination in benefits packages. For example, OWPBA sets strict guidelines prohibiting companies from converting their pension plans in a way that would provide fewer pension dollars to older workers.

Age discrimination may eventually result in a job or career change, a significant transition for an older worker. Replacing a lost job with a comparable position is very difficult due to the high level of compensation and rank this worker has attained in the profession. There are fewer jobs available at this level, so there is more stringent competition for key positions.

Age discrimination comes in more subtle forms as well, and it is more common than estimated. These occurrences take many forms and are more noticeable in everyday activities. A younger worker may be awarded important job assignments or training opportunities over older workers, for example. A company may reorganize resulting in an older worker being reassigned to a new area, deemed a "lateral move," yet this person has fewer responsibilities and is no longer functioning in a primary role with the original work unit. Older workers may be encouraged to consider retirement by a supervisor in the instance where other employees are not. This is a dangerous form of subtle age discrimination because it is difficult to prove.

Claims between older employees and employers usually arise when compensation and promotion decisions are made unfairly, favoring equally qualified younger workers. Disputes also surface when an older worker has been fired or laid off over a younger worker of equal or lesser qualifications or when a qualified older worker has been declined employment in the hiring process, whether it is for a new position or a promotion. An older worker may have an outstanding performance record or may have been a key contributor to a company's success over a lengthy period of time, yet a younger professional with less experience, time, and expertise is chosen for important positions and promotion.

Age Discrimination and Employers

Employers may intentionally or unintentionally infringe on age discrimination laws. An intentional violation occurs when an employer makes overt statements about a job candidate that exclude this individual from the rest of the hiring pool because of age. For example, a company may review potential candidates and eliminate the older applicant because it is assumed that this individual will not be able to keep pace with the workload. Other common assumptions include the following: the older worker will not be as adaptable to the corporate culture, this individual will not be a long-term worker, or the older worker will suffer from poor health.

Another intentional, and sometimes unintentional, tactic is to create unclear employment documentation that may be legitimate for the purposes of the company, yet it provides an opportunity to exclude applicants and employees from job opportunities. In addition, a firm may develop company policies that unintentionally exclude individuals because of age.

In most cases, a company will make decisions that result in age discrimination to save costs. In so doing, a company takes certain risks that may result in adverse financial consequences. Age discrimination conflicts frequently result in a lawsuit or other form of conflict mediation. Plaintiffs may sue for past wages, future lost wages, emotional distress, and punitive damages, resulting in potentially costly verdicts.

Victims of age discrimination may sue for disparate treatment or disparate impact. Disparate treatment occurs when the employee is treated unfairly because of age, race, sex, creed, color, religion, or ethnic origin. Disparate impact takes place when the employer creates policy that negatively affects employees based on age, race, sex, creed, color, religion, or ethnic origin. Disputes are expensive, not only financially but they may also adversely affect a company's reputation. Small to medium-sized businesses are particularly vulnerable to these effects because they typically do not have the financial wherewithal to spend on lengthy and expensive lawsuits. Plaintiffs also bear the expense of these lawsuits. They are time intensive and expensive for all parties.

There are circumstances where age-related reorganizations are acceptable. Companies will sometimes provide financial incentives and severance packages to older workers that are favorable to the employee. This strategy enables the firm to create positions for younger workers and to reduce the number of highly paid individuals. Firms may also set mandatory retirement age under certain exceptions. For example, federal law recognizes ADEA exemptions in the case of air traffic controllers, federal police officers, airline pilots, and firefighters. In 1996, Congress passed legislation that allowed state and local governments to set retirement ages for these and similar employees as young as 55. In addition to mandatory retirement ages, many public safety jobs also have mandatory hiring ages, thus closing the door to potentially otherwise qualified people. There are some individuals who argue against mandatory retirement age exceptions because it would be fairer to all employees to rely on periodic fitness testing, since some older workers may be just as able (or perhaps more so) to carry out their duties as younger ones.

Age Discrimination and Society

Societal values and expectations both favor and discriminate against age. Many contend that older workers are more productive, stable, loyal, and wise. Older workers provide institutional knowledge that may not be recorded elsewhere. Studies show that these individuals are just as productive as younger counterparts, experience less absenteeism, and are less costly to recruit.

The counterargument is that older workers are inflexible, slow to change, and less apt to adopt new technologies.

These differing viewpoints and the conflict between them require employers to acknowledge age discrimination as a real and present issue. Baby boomers are moving through middle age and toward retirement in the United States. These individuals are healthier and are working beyond traditional retirement age. If an employer has not already embraced the value of having a mixed, age-diverse workforce, the demographics will present many issues in the future.

Employers most frequently have a financial incentive to discriminate against older workers. Firms are under tremendous pressure to meet and exceed the expectations of shareholders and other corporate constituents. Companies are in the businesses of maximizing profits and reducing costs. To accomplish these goals, employers experience difficulty balancing the obligations to worker welfare and the important role of contributing to the society at large. Employers have a responsibility to eliminate discrimination and consider employee welfare, regardless of a worker's age.

Conclusion

Age discrimination is a real and present issue in the workplace, and it will become more so for the United States as the large population of baby boomers grows older. Businesses without a firm philosophy and belief in diversity in the workplace will have to examine age-related bias and determine whether these biases are warranted. Are older workers less productive than younger workers, or is it simply a difference in work style and maturity? Relative to costs, what does an employer lose in institutional knowledge, skills, and talents if it eliminates categories of jobs that are commonly held by mature workers—what is the real financial cost?

If the business is stable or growing, a worker's job should be secure when the worker possesses a history of strong performance and ability. Businesses that must reduce workforce for economic reasons should do so with a balanced approach, being mindful of the overall implications to the business, economic development, and society.

What is the cost of age discrimination to the older worker? Whether age discrimination is overt or subtle, it frequently takes a financial and psychological toll. An unanticipated job search for an older worker usually takes longer than it would for a younger worker. Finding equivalent work at the same salary can be difficult, even in favorable market conditions.

A business makes decisions on its overall values and the values of its stakeholders. Workers of diverse ages can promote a balanced workplace while serving society and the public good. It behooves a business to closely examine whether age-related bias exists and, if so, why, and whether it is founded in a realistic framework. This examination should reveal the true costs of making decisions that discriminate against older workers, proving the impracticality of maintaining age-related bias.

Agency, Theory of

The theory of agency seeks to explain why and how service and control can succeed or fail in a wide variety of social settings. One actor, the agent, is modeled as acting for another, the principal. These actors face characteristic problems that can appear remarkably similar across social or organizational contexts. The agent's problems focus on serving the principal (and, sometimes, on avoiding or manipulating such service). The principal's problems generally entail dilemmas of how to assure that the agent will do what the principal wants him or her to do (although the use of agents can also be a way to defer, shift, or avoid real action). Thus, the analysis of agency relationships features both an agent side and a principal side. Because human systems often feature multiple agents, and multiple principals, the problems of agency can quickly become quite complex, both to the participants and to social scientists seeking to understand such behavior.

Agents, principals, and their problems are pervasive in human relationships. Because of the utility of seeing common patterns across such relationships, the theory of agency, in various forms, has spread across the social sciences. Thus, agency theory can help social scientists explain such otherwise diverse phenomena as employee-employer, physician-patient, legislator-constituent, director-shareholder, parent-child, social worker–special needs client, and a host of other relationships and more complex settings that feature agents and principals in interaction. Agency relationships can be viewed as the building blocks in complex organizational settings as well as in societal networks.

Some Characteristic Behaviors and Problems of Agency

Agents can help solve the principal's problems in action in several ways. Agents are employed when the principal has a fundamental or qualitative inability to perform the needed action by himself or herself. For example, the principal lacks the expertise to cure himself or herself of illness or the balance or agility to clean leaves out of the gutter of his or her house. A second circumstance can arise when the principal is capable of doing the agency task but finds it rational to have another perform it instead. Thus, editors use foreign correspondents to get the news and senior managers delegate work to junior managers. In general, it may be more efficient for the principal to have someone else do the work, or there may be technical or structural reasons that prevent the principal from performing it. A third reason is rooted in the ability of agents to assist in resolving collective action dilemmas, providing a coordinating or coercive service that permits group action to occur. For example, the United Way acts as an agent for corporations in resolving problems of ensuring and distributing charitable contributions from many corporations to many charities. Finally, agents can serve symbolic purposes, as when presidents establish national study commissions with the purpose not of solving a pressing national issue but of defusing criticism from third parties for lack of action.

A central logic in the analysis of agency relationships focuses on the factors that interfere with perfect service and/or perfect control. *Perfect agency,* featuring the exact realization of the principal's goals in the relationship, rarely obtains. A host of factors can intervene to prevent perfect agency. They include, for example, biases or errors in perception, differences or conflicts in goals or values, differences in risk preference among the actors, differences in information conditions, incompetence or skill deficits, communication problems, lack of effort, emergent factors generated by the existence of systems of agent action, challenges from other institutions, and so on. In general, principals and agents expend resources on the costs of specifying what the agent is supposed to do and in monitoring and policing what actually occurs, or is perceived to have occurred. These costs have been termed *specification costs* and *policing costs.*

Among the major insights of agency theory is the observation that the consequences of agency failure due to the operation of such factors are often rationally and even routinely tolerated. That is, it may not pay the principal to insist that the agent perform perfectly because the costs of insistence, both in specification and policing, exceed the benefits to the principal of doing so. This tolerance applies also to the agent side (and to third parties who might participate in the relationship): It may not pay agents or third parties to invest in behaviors that result in perfect service because their gains in doing so do not exceed their costs. Thus, both control failures and service failures can have rational bases.

These patterns of failure can be institutionalized into social systems, with routinization both of their management and their tolerance. Two such problem patterns that deal with subsets of the general set of agency problems are the problems labeled by Kenneth Arrow as "hidden information" (*adverse selection*) and "hidden action" (*moral hazard*) problems. In adverse selection, the principal can observe the agent's behavior but cannot judge the quality of that behavior. In moral hazard, the principal cannot observe the agent's behavior, though could judge the quality of the agent's behavior were observation possible.

Barry Mitnick argues that, in the contexts of organizational action that produce common dilemmas in business ethics, the problem of adverse selection is better understood as two problems: the problem of *adverse claims*, which occurs as agents are hired by the principal, and the problem of *adverse performance*, which occurs after the agency is created, as the principal attempts to assess the quality of the agent's performance within the relationship of agency. In the first case, the principal must assess the credibility of the agent's claims regarding his or her ability to perform as agent, if hired by the principal. In the second case, the principal must devise means of evaluating the agent's performance, distinguishing the agent's contributions from those of other agents in the organization while having the benefits of observing ongoing, perhaps repeated acts of agency as well as the availability inside the organization of other, potentially more expert and reliable evaluators of that performance. Thus, the first case is essentially a credibility problem, while the second case turns on measurement and evaluation issues. Ethical issues can arise in either circumstance, as agents misrepresent their capabilities or conceal or collude to gain advantages in the relationship. Given the interdependent character of organizational agency, adverse performance issues also encounter problems in the judgment of fairness or justice among agents. The full range of agency problems, their consequences, and the means by which they are managed are far from understood.

Origins of the Theory of Agency

The term *agency theory* is often used to refer to a particular body of work that has developed in economics, accounting, and financial economics. This work is actually a subset of the wider range of work using the concepts of agency. Its assumptions about human motivation, especially its assumption of self-interest in the actors, and its focus on decisions as the key modeling contexts constitute significant simplifications that enable theoretical development to be formalized. But this approach, sometimes labeled the *economic theory of agency*, is also limited by these assumptions and has been the target of criticism from scholars working in other traditions.

As it has spread through the social sciences, research in agency theory has incorporated normative, institutional, cognitive, social, and systemic factors, going beyond the assumptions of the economics-based model. Thus, the best-known application of the approach, to the theory of the firm, is only one application of it.

Agency theory grew out of several rich theoretical streams in the social sciences. In economics it goes back at least to Ronald Coase's work on the firm in the late 1930s, in management to Chester Barnard's classic work on the functions of the executive about the same time, and in accounting and control to William Cooper's work in 1940 and 1951. In sociology, there is even earlier work of relevance in some of the classic works of George Herbert Mead and Georg Simmel.

In economics, the stream carried a series of studies on the divergence of owner and manager interests and behavior and on the objective function of the managed firm (notably from such scholars as Adolf Berle and Gardiner Means through Andreas Papandreou, Edith Penrose, Robin Marris, and William Baumol to Oliver Williamson's 1964 theory of managerial discretion; see also work on agency and the firm by Harvey Leibenstein). Jacob Marschak and Roy Radner's 1972 work on the theory of teams and Michael Spence and

Richard Zeckhauser's 1971 work on risk and insurance highlighted the effects of differing information states and risk preferences. Oliver Williamson's 1975 transaction costs approach examined how institutional choices could be understood as economizing on costs in *exchange.* In contrast, agency theory uses the costs of specification, monitoring, and policing to understand the choice of institutions in its modeling of *control.* In 1972, Armen Alchian and Harold Demsetz explained the emergence of organization from the functional need to monitor individual contributions in situations of joint production; it is often seen as one of the foundational works in an agency theory of the firm. In several works, Arrow observed the importance of considering noneconomic factors in relations in which one party acts for another, as well as critical information asymmetries; his 1963 article on medical care is widely cited (another accessible discussion by Arrow appears in a 1985 book edited by John Pratt and Richard Zeckhauser on principals and agents).

A number of other early works used agency concepts, but they did not propose agency as a coherent and general theoretical approach. In economics, examples included Anthony Downs's economic model of democracy in 1957 and papers by Victor Goldberg and by Barry Weingast in the early 1970s. In political philosophy, we saw agency concepts employed in books by Joseph Tussman in 1960 and Hanna Pitkin in 1967. In sociology, we saw them, for example, in an article by Guy Swanson in 1971.

Work on incentive systems and on the use of inducements in employment relations in political science and economics provided approaches useful in the conceptualization of the governance of agency relations. In particular, Herbert Simon's work on administrative behavior and on the employment relation (see also the later work on the employment relationship in economics by Oliver Williamson, Michael Wachter, and Jeffrey Harris), James March and Herbert Simon's inducements-contributions model, and Peter Clark and James Q. Wilson's incentive systems theory suggested how the discretionary zone that Barnard left to managers could be shaped and shrunk by attention to the reward system. Attention to the shaping of choice via incentives suggested a focus on control that flows directly into modern institutional agency theory. Those who view agency as a creature of economics often miss these critical theoretical ties. In addition, work in sociology on exchange theory by such scholars as George Homans, Peter Blau, Richard Emerson, Bo Anderson, Karen Cook, and Peter Marsden should be seen as theoretical development cognate to that in agency and in the transaction costs literature in economics.

Despite the history of work in related areas, and a long stream of research that developed many key concepts, the first scholars to propose, explicitly, that a theory of agency be created, and to actually begin its creation, were Stephen Ross (in a 1973 proceedings article) and Barry Mitnick (in a 1973 proceedings and a 1975 journal article), independently and roughly concurrently. Both labeled the proposed theoretical approach the "theory of agency." Ross is responsible for the origin of the economic theory of agency and Mitnick for the institutional theory of agency, though the basic concepts underlying these approaches are similar. Ross introduced the study of agency in terms of problems of compensation contracting; agency was seen, in essence, as an incentives problem. Mitnick introduced the now common insight that institutions form around agency, and evolve to deal with agency, in response to the essential imperfection of agency relationships. Behavior never occurs as it is preferred by the principal because it does not pay to make it perfect. But society creates institutions that attend to these imperfections, managing or buffering them, adapting to them, or becoming chronically distorted by them. Thus, to fully understand agency, we need both streams—to see the incentives as well as the institutional structures.

The work that has probably had the biggest impact on agency studies is Michael Jensen and William Meckling's 1976 article, which provided an explicit agency theory of the firm as a "nexus of contracts." Subsequent work by Eugene Fama and Jensen identified the decision process in firms as central, and argued that study of the assignment of rights to "decision management" and "decision control" could explain many features of firm behavior. The contexts of research in the Jensen-Meckling stream usually concern the economic theory of the firm, not necessarily a general theory of agency relations in social behavior. Because this work tends to focus on incentives and decision contexts, it should be seen as an outgrowth more of the economic theory of agency than its institutional agency counterpart.

One of the first papers published in the institutional agency stream was by Edward Banfield in 1975. Relying on concepts from and influenced by Mitnick's work, Banfield developed a comparative analysis of the production of corruption in public versus private organizations. In the mid-1970s, Mitnick's work introduced institutional agency theory to economics, political science, and sociology via presentations and publications. But it was a long time before agency theory took root outside economics. Agency did not enter political science in a major way until Terry Moe's article in 1984; did not enter sociology similarly until Susan Shapiro's article in 1987; and did not become prominent in management work until after Kathleen Eisenhardt's article in 1989. Today, use of agency theory is common throughout the social sciences as well as across studies in business school disciplines.

Agency Theory in Social Science and Management Studies

At present there is no unified, coherent "theory of agency." Depending on the research tradition in which the particular work in agency has been developed, different explicit logics, based on different social science literatures, such as economics or sociology, and sometimes displaying divergent approaches even within disciplines, are used to construct explanations. This diversity in logics produces the appearance of streams of work, each stream tending to operate within its own assumptional world. Even within the economics area agency work divides into formal mathematical modeling and modeling based on a more descriptive theory of the firm. The accounting literature also features behavioral/descriptive theoretic works in such areas as auditing relationships, ethical issues (see Eric Noreen's 1988 article), and contract design (including such public sector application areas as contracting out and municipal bond decisions). The formal work in economics, finance, and accounting features proofs of theorems based on assumptions about such characteristics of the agency situation as the preferences (including risk) of the agent and principal, the contract between them and its incentive structure, the sequencing of action in the relation, and conditions of information held by the parties about each other and the state of the environment (see also work sometimes labeled as "information economics"). A number of reviews of this now extensive work can be found in the finance, economics, and accounting literatures (e.g., by Oliver Hart, David Sappington, Stanley Baiman, Glenn MacDonald, Joseph Stiglitz; see also work by such scholars as Bengt Holmstrom, Jean Tirole, James Mirrlees, Steven Shavell, and a number of others).

In contrast, some of the work in management, sociology, and political science has explored agency using variables and perspectives that are of more traditional interest within those fields. For example, there is work in agency now examining the role of trust and of sociological norms (e.g., Mitnick's 1973 and 1975 work on norms in agency; Susan Shapiro's 1987 article on trust and agency; there is work by Mitnick and by the sociologist Arthur Stinchcombe on what they call the "fiduciary norm," and later work on the fiduciary relationship by Robert Cooter and Bradley Freedman in the law and economics literature; on agency theory and sociology, see the 2005 review by Shapiro, as well as works by Edgar Kiser, Carol Heimer, Arthur Stinchcombe, and others). The study of control has been linked to older traditions in management, sociology, and political science as well as to newer networks approaches by such scholars as Robert Eccles, Joseph Galaskiewicz, Kathleen Eisenhardt (see her 1989 article), and Harrison White. Agency analysis has been applied to political corruption and to bureaucratic behavior by such scholars as Gary Miller, Terry Moe (see his 1984 article), and Susan Rose-Ackerman, in addition to the work by Banfield and by Mitnick. Agency has been used to study corporate political activity (e.g., Mitnick's 1993 book). There are quite a number of applications of agency to government regulation and some in public administration, for example, by Mitnick (in his 1980 book); Barry Weingast; Daniel Spulber; Pablo Spiller; Jeffrey Cohen; B. Dan Wood; and Richard Waterman and Kenneth Meier. A whole subfield of research on delegation to bureaucratic agents now exists, beginning with Mitnick's 1980 book and including works by Morris Fiorina; Mathew McCubbins, Roger Noll, and Barry Weingast; Rod Kiewiet and Mathew McCubbins; David Epstein and Sharyn O'Halloran; Daniel Spulber and David Besanko; Jonathan Macey; and a number of others.

In management, scholars have used (or modified) agency approaches to explore such topics as behavior in boards of directors (e.g., works by Barry Baysinger; Gerald Davis; Amy Hillman and Tom Dalziel; John Hendry; Kevin Hendry and Geoffrey Kiel; James Westphal; and Edward Zajac), organizational control (e.g., works by Lex Donaldson and James Davis; Kathleen Eisenhardt; Huseyin Leblebici; Benjamin Oviatt; and James Walsh), stakeholder theory (Charles Hill and Thomas Jones), information policy in the firm (Michael Jacobides and David Croson), disclosure (Eric Abrahamson and Choelsoon Park), competence (John Hendry), managerial risk taking (Robert Wiseman and Luis Gomez-Mejia), behavior of professionals (Anurag

Sharma), bargaining (e.g., works by Mitnick; David Lax and James Sebenius; and Lawrence Mnookin and Robert Susskind), and compensation practices (e.g., works by Luis Gomez-Mejia; Henry Tosi; Edward Zajac and James Westphal; and Edward Conlon and Judi McLean Parks). An area of work termed "organizational economics," which includes both agency and transaction cost approaches under its umbrella, has been developing (see, e.g., work by Jay Barney). Agency has also seen some attention in the marketing literature. The appearance of each body of work more nearly resembles the kinds of theory construction and hypothesis testing practiced in these disciplines.

In an important stream of work in management, Lex Donaldson, F. David Schoorman, and James Davis (see, e.g., their 1997 article) offer a "theory of stewardship" as a counter to the economic agency theory of the firm that originated in Michael Jensen and William Meckling's 1976 article. The economic theory of agency seems biased toward the analysis of corrections; it is a theory of decisions about control (or of who gets control, e.g., decision rights). But agency has two sides: control and service. There is no reason why a viable theory of the firm cannot be constructed taking the service side as primary (e.g., other things equal, managers seek performance; correction is then taken as a secondary, marginal activity). Of course, the most descriptive theory of the firm may take a contingent approach that simply uses the conceptual tools of both service and control to understand the production of behavior in and around the firm.

Scholars using agency theory tend to rely on the sources for that theory with which they are most familiar. Because most scholars have assumed that agency originated in economics and are often unaware of institutional alternatives, they usually rely on the major works in the economic theory of agency, such as Jensen and Meckling's 1976 article, and adapt its features to the study at hand. The reliance on models in the economics stream tends to lead to more limited kinds of analysis as assumptions from the economics paradigm are imported into settings for which social science has additional tools available. Susan Shapiro's 2005 review notes that the agency approach need not rely solely on that paradigm, citing the more general work of Mitnick.

Agency theory is sometimes confused with scholarship on the law of agency; there are important differences. In the law of agency, it is presumed that the agent is acting under the orders of the principal; the law itself functions, of course, as a normative guide to behavior and to the resolution of disputes regarding appropriate action in agency roles (see the *Restatement of the Law Third, Agency,* published with this title by the American Law Institute in 2006). Agency theory is just that, a group of descriptive theoretical approaches that seek to provide understanding of a broad class of social behaviors; agents need not be presumed to be under explicit direction and hence to possess particular obligations, legal or otherwise. The law of agency does, however, provide rich materials for exploration via agency theory, and contributes central insights that can expand the quality and domain of agency theory (the first such use of the law of agency was in Mitnick's 1973 paper, but there is much work now by such scholars as Robert Clark; Robert Cooter; Frank Easterbrook and Daniel Fischel; and in a number of the law reviews). The same may be said of the related bodies of law and legal analysis in contracts and trusts; of particular interest is work on "relational contracting" by Ian Macneil.

Implications for Business Ethics

Applications of concepts relevant to agency are found in numerous places in the business ethics literature, but, with the exception of the 1992 volume edited by Norman Bowie and Edward Freeman and some scattered work elsewhere (see work in accounting by Eric Noreen in 1988 and by Wanda Wallace), most applications in business ethics use materials based on the law of agency (e.g., the concept of fiduciary duty) and on moral philosophy (e.g., the obligations of the moral agent; it is sometimes discussed as corporate moral agency). But Thomas Jones (also, with Dennis Quinn, on "agent morality") has explored the potential of applying guiding moral principles to agency and to stakeholder theories in general, which usually involve concepts that look like agency's relationship of "acting for."

Agency relations take on a special character when the principal is highly dependent on, or vulnerable to, the actions of an agent who has agreed to act on behalf of the principal. Under such circumstances, the fiduciary norm, a social norm commonly supported by informal societal sanctions, is prescribed. When the contract between agent and principal is formal, the similar but legally prescribed (and defended) fiduciary principle governs. Agents acting under fiduciary prescriptions must meet special expectations for agent performance: They must act diligently, with appropriate skills and with appropriate levels of effort, for the principal. No other interests must be permitted to interfere with that action; only the principal is to be served. The greater the principal's dependence on the agent, the more highly prescribed is the fiduciary norm and the fiduciary principle.

Fiduciary prescriptions (and general expectations) are common in societal roles that feature high dependency. They are ways of ensuring both to dependent agents and to observers that efficient, capable service is being provided, without exploitation of the principal. In general, the use of fiduciary controls is a great economizing tool—it lessens the principal's need for costly monitoring and policing of the agent. It can help ensure ethical performance of agency. In addition, publicity regarding the presence of fiduciary prescriptions signals assurance to observers, that is, it can have an important symbolic role. For example, the members of corporate boards are supposed to serve as fiduciaries for shareholder interests, so that the presence of a board filled with apparently competent, high-status directors—what Mitnick terms a *pantheonic directorate*—signals investors that their wealth is in good hands. Yet a huge literature on the myths of director performance suggests that it is common to find that such boards too often fail to provide the kind of oversight of top management that is required.

In the professions, the fiduciary prescription is commonly formalized. For example, medicine features a severe adverse selection problem, in that patients as principals lack the expertise to evaluate the quality of service provided by their agents, physicians. Thus, in medicine the fiduciary expectation is conveyed via the Hippocratic Oath required of new physicians: Do no harm. Note that the prescription goes beyond what would be required of a fiduciary: The physician is expected not only to act as the patient (principal) desires but to not harm the patient as well. Physicians do not necessarily follow the direction of their patients. We might presume, of course, that what patients want when they go to see a doctor is to be made well. But they may also request the use of particular therapies, for example, that a physician would recognize as inappropriate or even dangerous to the patient. In such cases, physicians are required to *not* follow the instructions of their principals, so as to avoid harming them. Thus, the service relationship in medicine is not purely fiduciary in character. The physician must add to the expectation that the patient's preferences will be served an additional prescription that says that that service must not harm the patient. Otherwise, in the extreme case, we might see physicians willfully performing euthanasia for patients who, whether sick or not, simply request it.

We see fiduciary expectations formalized across the professions; examples include law, dentistry, certified public accountancy, and so on. In many, if not most, cases, such professional relationships are also, like medicine, not simple fiduciary relationships. In some cases, considerable attention is given both to the defense of fiduciary behavior as well as to situations in which breach of fiduciary duty is acceptable in certain narrow circumstances to serve potentially conflicting but overriding interests. The recognition of conflict and/or limits in agency is most obvious in the law, in such situations as attorney-client relations and the attorney's accompanying role as an officer of the court and the extent to which the responsibilities of trustees as agents can be limited. The social scientific study of such relationships using agency theory is only beginning.

Although sometimes described as a professional role, the role of the business manager is not that of a professional. Yet, like any professional, a manager can experience the normative pressure to act as a fiduciary in service to a supervisor who may be dependent because he or she cannot observe the manager and/or cannot determine whether the manager's exercise of expertise is optimal. Indeed, from the perspective of the study of ethical failures in business, one of the central dilemmas comes exactly when managers do act as fiduciaries, but without the constraints or the superior interests imposed on true professionals. Instructed by the provisions of fiduciary behavior, agents set aside their self-interests—indeed, they set aside all interests that question the nature, appropriateness, or extremity of their acts of agency. And, if the principals either are not present, not able, or not inclined to set limits to the discretionary excesses of such dedicated agents, the outcomes from such agency can be frightening. Fiduciaries can produce not only the caring behaviors of health professionals but also the efficient implementation of the Holocaust's "final solution."

Thus, it is not enough to argue that management must become a profession and institutionalize the expectations of the fiduciary. What is also needed is a clear statement of the full, appropriate extent of the obligations placed on agents in business. Fiduciary service is only part of those obligations. Indeed, nothing highlights the critical role of concepts such as corporate social responsibility and corporate citizenship more than the realization that societally undesirable outcomes can follow from the behavior of dedicated agents in business wearing fiduciary blinders. Thus, study of the normative structure of business relationships must yet work out the nature, forms, and management of prescriptions that would ensure that professional agents in business are not only efficient but also serve socially acceptable ends.

Agency relations in business, as well as in organization and social life in general, are pervasive. Therefore, it will not be surprising if modern agency theory evolves into a useful and powerful descriptive theory of service and control that can greatly improve our understanding of the behaviors as well as the normative dilemmas of agents in business.

Agrarianism

Agrarianism is a philosophy of society and politics that stresses the primacy of family farming, widespread property ownership, and political decentralization. These tenets are typically justified in terms of how they serve to cultivate moral character and to develop the full and responsible person. Many proponents of agrarianism bear a reverent affection toward nature (understood as natural phenomena or as God's creation), respect tradition and experience, distrust ideological systems of thought, and regard skeptically what they perceive as the pretensions of science and technology. By attaching individuals to nature, the agrarian suggests that our labor can enhance life; by bonding individuals to the rooted and stable associations of family and locale, we may experience, in a nonacquisitive way, the goods of a grounded community, including leisure, friendship, love, art, and religion.

Agrarianism has strong roots in classical Greece and Rome. As early as the eighth century BCE, in his *Works and Days*, Hesiod forged a link between moral improvement and farming. In the third and second centuries BCE, the Roman, Cato the Censor, in his only surviving work, *On Agriculture*, defended the honor of farming, offering moral prescription and wisdom alongside advice on the tilling and managing of land. Virgil's highly praised *Georgics*, written in the last century BCE, and influenced by Hesiod, expresses a love for the countryside and includes instruction in agriculture. Horace, a friend of Virgil, and himself the recipient of a farm granted by a benefactor, also praised the country life. In his *Odes*, he revisited the hills and woods of his childhood and set forth the rural life as the means to independence and self-reliance.

In the modern era, there have been several notable defenses of agrarian themes. In his *Notes on the State of Virginia*, Thomas Jefferson maintained that farming, rather than urban manufacture, would more likely ensure the independence and strength of character necessary for the free citizens of a decentralized republic. In 1782, about the time that Jefferson was composing his *Notes*, J. Hector St. John de Crèvocoeur, a Frenchman who had spent a decade in America, published his *Letters From an American Farmer.* The land-owning farmer not only acquires independence and freedom but personifies the new American. In the early 19th century, in his book, *Arator*, John Taylor of Caroline defended the Jeffersonian view. Taylor decried the use of law to favor factional and commercial interests, upheld wide property ownership, defended decentralized political power, and advocated rural rather than urban living. For Taylor, as for Jefferson, it is the free farmer whose independence is crucial for citizenship.

In the early 20th century, agrarian ideas also found expression in the Country Life movement led by Liberty Hyde Bailey and through the books of Ralph Borsodi, who published in the 1920s and 1930s. Defending the family farm and decentralization, Bailey and Borsodi each expressed a confidence in technology and expertise, and each maintained a critical attitude toward traditional religion. On the other hand, in the distributist thought of G. K. Chesterton and Hilaire Belloc, one finds the wedding of agrarian ideas to Catholicism. Belloc, for example, argued for a wide distribution of property and upheld the importance of the traditional household and local community.

The most notable of the 20th-century agrarians were those of the American south. The Southern agrarians, some of whom were poets, developed an explicit and resonant defense of their views in *I'll Take My Stand.* John Crowe Ransom, Robert Penn Warren, Allen Tate, Andrew Lytle, and Donald Davidson, along with seven other southerners, most affiliated with Vanderbilt University, defended a mode of life they believed consonant with European rather than industrial society. Against the economic doctrines of socialism and corporate capitalism (not to mention the assumptions of humanism and technocratic science), these thinkers proffered a wide-ranging portrayal of the settled and traditional mode of farm life that they believed typical of the southern region of the United States. Theirs is a portrait not of the sometimes perversely romanticized "Old South" of plantations and slavery, but of the yeoman farmer whose way of life and culture they regarded as threatened by both industrialization and the proponents of progress. Although their version of agrarianism derived from their experience as southerners, they maintained that they were expressing universal ideals. In their estimation, a society dominated by science, technology, and industry, and a nation inclined to favor the urban over the rural population, would suffer an impoverishment of manners, art, education, community, and spirit. The family farm and the rhythms of rural life were essential to a good society. Such a life would encourage consonance with nature, discourage the ambitious pursuit of material goods, permit the leisurely enjoyment of family and community, and allow the appreciation and experience of the spiritual and the aesthetic. The property-owning individual, granted an independence of mind and spirit, would nonetheless be attached to a stable community rooted in the traditions and experiences of a locale whose culture was part of the larger whole. Thus, the Southern agrarian was attempting to defend a manner of living, a way of life. To do so, of course, ultimately required consideration of the individual, society, economy, culture, religion, and politics, each of which finds mention in *I'll Take My Stand.*

The ideas of the Southern agrarians were often greeted with hostility. Although their considerations have had little practical import, some of their ideas have reverberated in the writings of Richard Weaver, and more recently in the works of Wendell Berry, since 1960 the most significant person associated with agrarian ideas, including the defense of the farm against agribusiness.

In defending a mode of life that emphasizes family, culture, leisure, and manners, as well as the historical and contingent particularities of persons and places, agrarianism poses interesting issues for business and society. Agrarian ideas challenge the notion of progressive industrialization and offer a rebuke to those who seek to reform and remake the provincial and particular. The agrarian suggests that the regional and the traditional contain goods that cannot be replicated by persons focused on acquisition or institutions guided by some ideal of abstract humanity. In this sense, the agrarian counters the advocates of growth and globalization, as well as those who defend egalitarian doctrines of democratic capitalism. Second, agrarians call into question the dominance of corporations. In their view, the corporation separates ownership from control, thereby diminishing the way in which private property has traditionally encouraged and demanded owner responsibility. Some agrarians also criticize the corporation as an artificial creature of the state, and one that has, in their view, secured ever more legal privileges or subsidies. Third, the agrarian perspective revisits questions concerning the commodification of society and the extension of the profit motive into all fields of endeavor. For example, the agrarian shares with certain environmentalists a critique of farming for profit, a wariness regarding the use of technology to control nature, and a strong concern about the factory farming of animals. Finally, agrarians raise important questions about the extent to which governments too often privilege one group (or mode of activity) over others, perhaps favoring an elite that seeks to impose its notion of progress on those deemed backward. Although their works are not always systematic, the agrarians' vision of independence, decentralization, and tradition raises significant questions about the nature of the good life and poses interesting challenges to modern conceptions of progress, commerce, and politics.

Agribusiness

"Agribusiness" identifies several 20th-century changes in the way food is grown and food animals are raised, especially in the United States, Canada, Australia, and, to some extent, Northern Europe, consisting in an expansion (by several orders of magnitude) in the size of the average working farm, a new emphasis on profitable operation (or "the bottom line"), the systematic application of laboratory and experimental findings to the growing of crops, consolidation of ownership and control in companies not always directly involved in the actual cultivation of the soil, and a vastly increased reliance on technology and external inputs to agricultural operations.

If by "business" we mean a privately initiated enterprise instituted for the purpose of yielding a living for its principals, then farming has always been a business. The Neolithic farmer with his digging stick knew that his work had to yield enough for his family to eat, or they would die. Profit and loss was never stated more simply. Yet distinct changes in the enterprise in the last century permit us to distinguish "agribusiness" from the kinds of farming that preceded it. The term *agribusiness* was brought into popular use by populist author Jim Hightower in his 1973 work, *Hard Tomatoes, Hard Times*, and some critics have used it as a catch-all term to sum up what they see as agricultures' negative social impacts.

The Growth and Success of Agribusiness

For purposes of this entry, we may divide agriculture into two periods—traditional agriculture (comprising the vast extent of human prehistory and history) and the agribusiness era (beginning essentially in the Enlightenment, but taking its present form in the Americas in the 20th century).

As agriculture developed into historical time, it was certainly successful as a productive enterprise; its success by 6000 BCE allowed the creation of castes of priests, soldiers, and governors who did not work the land but lived off its surplus. It fed elaborate cities, empires, and crusades. During most of this time, agriculture was governed almost entirely by tradition (each generation doing just what was done in the last), prescription (priests or overlords dictating the allocation of land, the seasons of planting, and the crops to be delivered), and luck—what was available was planted, what grew was harvested. Progress was made, between the origins of agriculture and the end of the medieval period, in choosing the best of the seed to save for each year's planting and in increasingly sophisticated irrigation systems. Where new crops, domesticated animals, or productive trees became available, they were nurtured and cultivated. But agriculture was essentially a fatalistic enterprise, dependent on the luck of weather and on the patience to wait for the crop, and over much of its activity it was open to investment with superstition and consequent fear of change.

Until the Age of Enlightenment agriculture was rarely studied scientifically, with specific intent to increase yield or expand the number of foods available on the market. Unremarked in that period, when the effects of human activities on the planet were considered insignificant, even the earliest agriculture took a devastating toll on the natural environment.

The farmers who came to the New World from the British Isles (and later from the remainder of Northern Europe) were not the tradition-bound peasants of the Middle Ages; they were entrepreneurs who rapidly adapted what they knew to the conditions of the land in which they found themselves to survive and prosper. The Pilgrims' legendary introduction, on the advice of the indigenous agricultural consultant Squanto, of dead fish as fertilizer for the corn hills (included in every elementary school's Thanksgiving pageant) may be the earliest example of technology transfer in the Americas. It paved the way for many others.

The United States institutionalized its commitment to scientific farming and the improvement of agricultural output by the establishment of agricultural experiment stations in 1887, followed by the state and national agricultural extension services in 1914. The laws created a tightly linked alliance of the federal government (in the United States Department of Agriculture, USDA), land grant universities heavily invested in agricultural research, and the businesses that supply the products that emerge from that research, from tractors and cultivators through pesticides, fertilizers, and herbicides to genetically engineered seed—including seed genetically engineered to flourish despite liberal application of the firm's own herbicides (for instance, Monsanto's genetically engineered "Roundup Ready" soybeans that are resistant to Monsanto's effective herbicide, Roundup). The more extensive the technological input to the process of growing the crops, the larger the farm had to be to take advantage of it. On an American farm run on the agribusiness model, monster machines cultivate, sow, harvest, and bale 40 rows at a time of food or fiber. Aerially delivered herbicides eliminate weeds between the rows while the genetically engineered soybeans, corn, or canola grows untouched. The entire product is purchased, processed, and distributed by the same firms that provided the machines, fertilizer, pesticides, and herbicides. And the product (in the form of food, fiber, meat, or milk) is distributed to the consumer through enormous food distribution chains. In agribusiness, farming is now one small component of an enormous and highly technological industrial process, with higher rates of return on investment in the input industries (mechanical, chemical, and genetic) and the food manufacturing, transportation, and distribution industries. Over the past decade, large corporations have purchased or have effective managerial control over all phases of these input, production, and supply chains.

Does the system work? It certainly provides enough good food, and with a fraction of the human effort historically required. An enterprise that used to absorb the energies of 85% of the population now requires only 2% or less; it is mechanized from start to finish. Economically, the system is very problematic: This whole process is part of a "free market" system in name only. It cannot support itself on the prices the market can bear, so government subsidies of billions per year are required to keep it going. But the result for the consumer is truly marvelous; Americans spend a smaller portion of their income on food and fiber than any other nation, leaving a historically atypical amount in the family budget for discretionary purchases. The same pattern can be found in Canada and Australia; the Green Revolution of the 1950s and 1960s meant to establish it world wide and end world hunger for good.

Doubts About Agribusiness

From the point of view of the private sector and the consumer, the growth and success of agribusiness would seem to be an unqualified good. Yet it has drawn the attention of many critics; in this section, we will characterize the criticisms and use them as a framework to place agribusiness in social context.

First, *criticisms from the perspective of the public good*, especially from the perspective of the social good for the countryside. From a populist point of view, agribusiness has been devastating to rural life, a veritable neutron bomb, replacing farming jobs with machinery. As a result, many rural communities in the United States have suffered population declines that threaten their viability. The life of a town turns on a certain population size in its base industry, which supports the rest. When 6 to 12 people (varying by season) lived on a 300- to 400-acre family farm, the 30 or 40 farms in a township easily supported a general store, a hardware store, and a lively food and clothing exchange, not to mention a bank, a school, two (or three) churches, a social or service club or two, and at least two bars, one of which would be in a small hotel. The milk and produce created by a typical town justified a railroad station for daily pickups of milk and grain, often supplemented by a canal or river port, and generated a satisfying economic existence and cultural life for its residents. But when all those farms are rolled up into two, one in corn and one in soybeans, tended by huge machines, there is not enough employment to attract anyone at all to live there—the school closes, the stores fail, and each closure means fewer people to support what remains. Brave people will announce, often on the front page of sympathetic urban newspapers, their determination to stay in the town and revitalize the downtown, but the success of such efforts is very much in doubt. The end result is that the country towns, and all the richness of country life, are gone, leaving only a remote-controlled mechanism for producing food and fiber. Jim Hightower's work exemplifies this perspective.

Second, *criticisms from a liberal or left-oriented economic perspective*. It is very worrisome, especially to critics from the left half of the political spectrum, that agribusiness concentrates power and control over food production firmly in the hands of the large suppliers of agricultural inputs, such as Archer Daniels Midland (ADM). Such concentration is bad, not only because it permits the kind of price-fixing of which ADM was convicted, a crime in any free market system, but more generally because it entrenches the possessors of great wealth in positions of economic power, which has eventually to be bad for worker and consumer alike.

Third, *criticisms from the environmental perspective*. Rachel Carson shocked the consciousness of the United States in 1962 with the release of *Silent Spring*. She described how invisible agricultural pesticides were having the unintended consequence of poisoning the environment and threatening wildlife, and she argued that this was wrong. Her work triggered the most important reform of U.S. pesticide policy and the creation of the U.S. Environmental Protection Agency. Subsequent critics have described agriculture as being the human activity with the longest running and most extensive negative environmental impacts.

Fourth, *criticisms from the perspective of earth science*. Rachel Carson, a first-rate biologist, laid part of the blame for widespread pesticide contamination on the undue influence that input manufacturers have on the kind of science conducted at public agricultural research institutions (the land grant universities). She and subsequent critics condemn the very close working relationships of agricultural science with the same companies that profit most from industrial agriculture, and question the quality of the results on that basis. For instance, efforts to "streamline" the agricultural enterprise, but working with only the two or three most productive genetic stocks of certain products, has led to a steep decline in the number of varieties of produce (apples and potatoes, for instance) available for the ordinary consumer. Paralleling the critics of our dependence on fossil fuel, this voice asks for further research into alternatives (such as organic farming) that may not be as "efficient" as our current practices, but which in the long run may be healthier for our bodies and the long-term prospects for the industry.

Fifth, *criticisms from the perspective of nutrition*. Many nutritionists have concluded that millions of Americans suffer from poor health due to their diet and that agribusiness bears a major responsibility for this because its advertising plays such a large role in shaping consumer choices. Public health information about diets has been strongly influenced by research funded by agribusinesses, and many nutritionists claim that obesity, heart diseases, and cancers can be traced back to contemporary U.S. diets, and indirectly to agribusiness advertising. The powerful bonds between agribusiness and the fast-food industry are worth a moment's notice. The potato most grown for the market is the New Leaf, a genetically engineered variety whose major virtue is that it produces slices of perfect length for McDonald's French fries. It requires a great deal of pesticide; it would require less pesticide if several varieties of potatoes could be grown in the same field, or if they were grown in smaller sections, but the pressure from the enormous market created by the fast-food chain McDonald's dictates the size of the field and the number of varieties that will be grown. The hamburger market similarly dictates the feedlot practices of the beef growers, while KFC accounts for the mass pens of chickens. America is rapidly becoming a fast-food nation, and this economics does not support careful shopping for produce and meats differentiated by taste, texture, or nutritional qualities.

Sixth, *criticisms from the perspective of animal welfare*. When the precepts of agribusiness are applied to the flocks and herds as well as the plants, the results can be devastatingly unhealthy, discomforting, and sometimes terrifying to the animals. The conditions under which animals are raised for maximum productivity are generally described as factory farming, and they always include the conditions of crowding, unnatural quarters, antibiotics, steroids, and food additives (such as the corn-based supplement lysine) to get the animal or bird from birth to market in the shortest and most profitable terms.

Seventh, *criticisms from the perspective of national economic policy*. Political scientists and economists have called attention to the market distortions caused by the continued federal subsidies for the most important crops, such as corn, soybean, rice, or cotton. These subsidies were launched during the New Deal era of President Franklin Roosevelt to preserve rural life, but the program has continued, even as agriculture has undergone dramatic changes, because it is so popular among elected officials from farm states. These subsidy policies have also had the effect of keeping consumer food prices artificially low. The vast majority of federal dollars go nowhere near the small remainder of family farms, for which they were originally intended; they now flow to a small minority of very large farms. Taxpayer watchdog groups, environmental organizations, and economists have begun to join forces to attack farm subsidy policies as having outlived their purpose, causing economic distortion, and contributing to environmental degradation by providing incentives for continued high agrochemical use.

Eighth, *criticisms from the perspective of food safety*. We may be willing to sacrifice the variety, taste, and nutrition of our food for the convenience of a fast-food dinner, but safety is not so easy to ignore. Recent changes in agricultural practices, especially in meat and poultry production, have compromised the safety of some foods produced and marketed by agribusinesses. Food-borne illnesses, caused by, for example, salmonella and *E. coli*, have sickened hundreds and in a few cases resulted in deaths, especially of children and those with compromised immune systems. There is no doubt that the prevalence of these food-borne diseases is directly related to the crowded conditions of their rearing and that the occasional severity of the diseases caused by these microbes, their nonresponsiveness to antibiotics, is directly related to the use of antibiotics in their feed. This is a serious concern and one that some states are trying to address with legislation limiting the use of antibiotics.

Singly, most of these criticisms can be answered. Collectively, though, their effect has been to raise serious doubts about our current agricultural practices. Over the course of several decades, these critiques of agribusiness have had the effect of raising some questions in the mind of the public about the health and safety of their food, as well as the social and environmental ethics of the industrial agricultural system in general and the behavior of agribusinesses in particular.

A Future of Sustainable Agriculture?

The industrial model of agriculture may have outlived its usefulness. The enormous damage being done to the soil and to the aquifers, by the wasteful practices initiated to keep farming cheap, cannot be sustained.

Alternatives are available and can be instituted quickly. Agribusiness may soon, like the buggy-whip shops and phrenology institutes of yesterday, be of merely historical importance. Food will never be so cheap again, but we will have to find a way of tilling the soil that will preserve it for our grandchildren. Companies working in the agribusiness sector are now addressing some of these ethical critiques in their practices and marketing efforts.

Since the 1980s, critics of agribusiness have worked together to advance the notion of "sustainability" as an alternative approach to agriculture and food. This term has emerged from international conferences held by the United Nations. Sustainability is founded on the principle that human societies must meet the needs of the present generation without compromising the ability of future generations to meet their own needs. Sustainable agriculture integrates three main goals—environmental health, economic profitability, and social and economic equity. People in many different capacities, from farmers to consumers, have shared this vision and contributed to it.

Firms involved in agriculture are recognizing that a small but influential sector of the consuming public is willing to pay a premium price for quality foodstuffs and that definitions of quality often extend to sustainability issues in production (adequate wages, and environmentally responsible farming practices). The price premium captured by organic agriculture is the most widely recognized example of this emerging phenomenon. Note on the use of the word *agribusiness*: The term connotes big business, more than any particular kind of agricultural practices. Right now organic farming is a tiny slice of the agricultural market and not eligible for concentration into large vertically integrated corporations. It will be interesting to see if the term follows organic farming into mega-economic concentrations.

—Keith Douglass Warner and Lisa H. Newton

Agriculture, Ethics of

Agricultural ethics as a field is a virtual orphan, the child of three neglectful parents, applied or professional ethics (which would govern the professional ethics of the farmer or agricultural extension worker), business ethics (which would govern the business conduct of farmers and of all who participate in the enterprise of bringing food from seed to supermarket shelf or fast-food outlet), and environmental ethics (which would govern the interactions between farmer and ecosystem). The orphan is truly acknowledged by none of them and at the best of times has not swung securely among them. Let us consider it from all three of its inheritances.

As a branch of professional ethics, agricultural ethics explores the several dimensions of a field of practice, namely, farming or agriculture. In that sense, it is like any other field of occupational ethics—medical ethics, legal ethics, or engineering ethics—which together, with some additions, constitute the field of applied ethics. All fields of occupational ethics address multiple layers of problems: At the personal level, the rules for acceptable conduct on the part of the practitioner (Should a physician refer a patient to an X-ray facility that he or she owns?); at the field level, the policies for optimal practice for the profession as a whole (Should hospital policies prohibiting "futile" treatment overrule families' demands to "do everything" for a dying patient?); at the societal level, the policies for limiting and guiding the practice of the profession for the greater good of the nation and for human society as a whole (What are we going to do about 45 million people with no health insurance?). We may note at this point that the multiple layers addressed by applied ethics are not necessarily congruent.

Agriculture as a profession has the same layers of problems. Should the farmer represent his crop as "organically grown" if he has used hormonal root stimulants to grow them, if the laws defining "organic" simply don't mention such substances? Should the farmer plant, and the law support him in planting, "fencerow to fencerow" even though everyone knows that better environmental practice leaves wildlife corridors between the fields? And at the national level, should we be subsidizing agriculture in a way that encourages, even demands, overproduction and consequent dumping of agricultural products on the world market?

At the business level of agricultural ethics, new sets of problems arise. As soon as we look up from the plow, we notice that the farmer's work, the daily toil in the earth, coaxing it to yield food for the body and fiber for our clothes, has no more independence at all; it is part of a huge enterprise, integrated horizontally and vertically, that supplies the machinery for the huge farms, the seed, the fertilizer, the herbicides that keep down the weeds, the pesticides—or, alternatively, the genetically modified seed that resists the herbicide and has its pesticide bred into it—then buys the crops, processes them, and delivers them to the door of the consumer. This business has not always behaved itself very well, but its underlying ethic, as a business, is more troubling than its occasional brushes with the law. Critics of agriculture argue against "productivism," or the dominant philosophy in agriculture that holds production as the sole criterion for evaluating its success; it is as if IBM were to measure its success by how many computers it could make, working day and night around the world, regardless of whether or not the world needed those computers. The result of this philosophy is the despised "subsidies": When the farmer has produced far more than the market can purchase, the taxpayers are required to buy the surplus to keep the farmer from going out of business. Surely a better business philosophy is possible?

Environmental ethics has even more problems with agriculture. We have to remember that the relationship of the farmer to wild nature has been adversarial since the New Stone Age, and it is not surprising that environmentalist pleas to practice environment-friendly agriculture fall on deaf ears unless accompanied by strong financial incentives, usually financed by the same taxpayer who buys the surplus. Industrial agriculture has arguably had the broadest environmental impacts of any human activity, chiefly because it is the most extensive land-based activity of human society. Yet to a surprising extent environmental ethicists have actually ignored agriculture, largely because they have focused on "pure," "natural" ecosystems. Agriculture takes place in working, multifunctional landscapes, and thus, ethical positions always involve balancing multiple social goods. The lack of attention by environmental ethicists is all the more ironic, given the considerable interest in agriculture by one of its pioneers, Aldo Leopold (author of *A Sand County Almanac*, one of the bibles of ecocentrism), and the impact that Rachel Carson's *Silent Spring* had on U.S. society.

The central tension agricultural ethics attempts to negotiate is that between food production and resource preservation. Industrial agriculture is highly effective at producing foodstuffs, but it threatens the environmental resource base on which production depends and, thus, threatens the ability of future generations to produce food. Paul Thompson, the leading figure in agricultural ethics, articulates competing duties for those involved in agriculture: fulfilling the duty to produce safe and abundant food, while conducting operations in such a way as to preserve the soil and water resources on which future generations have a legitimate moral claim. Thompson proposes integrated pest management, or IPM, as an example of balancing production and protection. IPM is an approach to pest management based on ecological principles, preferring to control insect (and other) pests using strategies that do not result in environmental harm.

Agricultural ethicists argue for an ethic that can hold together such tensions. Drawing from environmental ethics, Thompson recommends "holism" as an ethical approach, proposing that the multiple social functions of agriculture should be evaluated in light of their impact on the sum of social benefits and costs of agriculture, including environmental degradation. This approach to agriculture could help its practitioners negotiate the competing moral claims on it.

The dramatic expansion of confined animal feeding operations has added concerns about animal welfare to agricultural ethics.

AIDS, Social and Ethical Implications for Business

AIDS is an acronym for acquired immunodeficiency syndrome. AIDS is associated with the presence of HIV, the human immunodeficiency virus, though all persons with HIV cannot appropriately be said to have AIDS. The United States Centers for Disease Control's (CDC's) technical descriptor of AIDS has to do with either the presence of an opportunistic infection associated with HIV or a diminution of the body's CD4 (T-lymphocyte or T-cell) count to below 200 per cubic millimeter of blood. Evidence suggests that HIV is spread through transmission of bodily fluids typically associated with intimate sexual contact and/or intravenous drug use, though cases of in utero mother-to-child transmission are both on the rise and well documented. HIV is fragile once outside the body and is therefore not transmittable through casual contact. AIDS is treatable but not curable. With proper treatment, it is not unusual for individuals to live 10 years or even longer from time of initial diagnosis with HIV, with death no longer an eventuality.

The statistics related to HIV/AIDS are staggering. Originally identified as a disease of male homosexuals in the United States, as of 2006, 65% of the total cases of HIV are in Sub-Saharan Africa. Nearly 13,000 people are newly infected every day, and less than 10% of the 40 million people living with the virus know they are infected—dramatically increasing the likelihood of their transmitting the disease to others. China, India, Russia, Ethiopia, and Nigeria are identified as second-wave countries for HIV infection. With these five regions accounting for 43% of the world's population, the potential for infection to spread is virtually without limit. It is sobering that in regions such as the English-speaking Caribbean HIV/AIDS is the leading cause of death among 15- to 44-year-olds. In general, epidemics might eventually become concentrated among economically disadvantaged populations due primarily to the fact that those who are wealthier and better educated are in a position to take preventative or curative action. As noted in the literature, throughout the world one of the greatest barriers to preventing the spread of HIV and even caring for people with AIDS is the persistent level of stigma and denial associated with the disease.

HIV/AIDS and Business

The Joint United Nations Programme on HIV/AIDS (UNAIDS) describes a situation unfamiliar to business leaders accustomed to the pandemic in the United States. While the United Sates suffers from an HIV infection rate of about one in every 265 people, there are countries where the rate can be as high as one in four urban-based adults, and these countries are now experience staffing shortages and productivity interruptions.

The impact of HIV/AIDS on business takes a number of forms. Bloom and his colleagues suggest these can be categorized as the effect on the workforce, the threat to the customer base, the impact on brand and corporate reputation, and concern for the global good. Others have added to the list the general economic toll HIV/AIDS takes on a country's gross domestic product (GDP).

Effect on the Workforce

Globally, the labor force has decreased by more than 28 million people as a direct result of the onslaught of the pandemic. If there were no further intervention, it is predicted this number could grow to 74 million during the next decade. UNAIDS estimates that 37 million working people are living with HIV/AIDS. The International Labour Office estimates that an average of 15 years of working life will be lost for each employee affected by AIDS.

HIV/AIDS is not an equal opportunity disease where workers are concerned. The most active industry groups are food/beverages, mining and minerals, and energy. A key occupational risk is work involving mobility. Workers engaging in regular travel and living away from spouses and partners in high prevalence countries are at particular risk for contracting HIV/AIDS. Costs of dealing with HIV/AIDS can be substantial. One global mining company has calculated that total expenses for dealing with the disease could amount to 8% to 17% of their total payroll by 2009; a manufacturer in South Africa puts the figure at 4% of its total current wage bill. More sobering is a report from *The Economist* documenting that some multinationals in South Africa hire three workers for each skilled position to ensure that replacements are available when trained workers die.

The onslaught of escalating expenses has precipitated a shift in policy, which runs counter to workplace privacy rights. In the summer of 2004, the World Health Organization and UNAIDS, in partnership with the Global Business Coalition on HIV/AIDS (GBC), endorsed a change from voluntary counseling and testing to an approach that routinely offers and recommends testing. While there is always the ability to "opt out," the clear intent is that mandatory testing for HIV become the company norm. The positive economic and utilitarian justifications for this change pepper the literature.

The GBC has become a visible presence regarding issues of HIV/AIDS and business activity. Established in 1997 to fully engage the private sector and recognize business as an important partner in ending the HIV/AIDS pandemic, the GBC is organized as a nongovernmental organization (NGO) to get businesses to do their part against the spread of HIV/AIDS. By 2001, the organization had only 17 members; today, the partnership boasts 215 members. In 2006, GBC issued their first annual "the State of Business and HIV/AIDS" report, and labeled it an effort to document a baseline for identifying trends and new frontiers to help companies improve their response to the HIV/AIDS pandemic. Booz Allen Hamilton, one of the GBC's most active members, played the lead in the report.

This report is the first attempt to provide a foundation on which business could consider the pace, range, and content of its response to the pandemic. The study was designed using GBC's Best Practice AIDS Standard, a 10-component self-assessment tool enabling companies to confidentially monitor their business AIDS response and examine their progress.

The report provides some evidence that business has been successful in partnering with NGOs, as well as with education and prevention programs. Other activities were proving more difficult. Companies found it challenging to engage business associates and supply chains in the fight against HIV/AIDS. That area was the one with the lowest score in the survey, with only 9% of companies able to successfully engage their supply chain contractually in supporting their HIV programs. Companies reported taking about 3 years to get fully into action around their own response to the pandemic. After that, a company was generally active in 20 of the 50 specific activities that the GBC surveyed.

One critical component of HIV/AIDS programming is prevention and treatment. A total of 82% of companies reported providing workplace information on HIV/AIDS, or to approximately 11 million workers. One of the more interesting findings has been that companies with operations only in America and Europe are less likely to focus on workplace programs, ostensibly because employees' medical insurance coverage tends to cover HIV/AIDS. In addition, the report notes that only 41% of those companies were conducting surveys and assessments to make sure that the programs in place were hitting the targets they were aiming at. In the area of treatment, 84% of the companies in the survey ensured that their staff had access to treatment; only 34% of these companies, however, fully subsidized that treatment. Of critical import, some 94% of HIV-infected employees were able to continue normal working life after receiving treatment.

The baseline report underlined that the fight against HIV/AIDS was now a real strategic concern for business and had moved on from simply being a matter of corporate responsibility. Treatment coverage has increased as costs of antiretroviral treatment (ART) have fallen over the past 6 years from around US$10,000 to US$140–300 per person per year. Cost reductions are to the point that in the short term the cost of ART is more than covered by the savings achieved through a reduction in absenteeism. Globally, 36% of companies surveyed by the GBC (which by their own admission are not necessarily representative of the population at large) are fully subsidizing treatment for direct employees, with 45% additionally providing access to treatment for all dependents.

Threat to Consumer Base

It is well known that HIV/AIDS affects people within their most productive years. As a result, both saving rates and disposable income among infected populations drop precipitously. In the long run, this has the effect of reducing the market size for business. One study published by UNAIDS shows that monthly consumption per capita of families living with AIDS was roughly half that of the general population.

The impact on the market has historically been concentrated by region and industry. A leading manufacturer in South Africa—the hardest hit of any country by the HIV/AIDS pandemic—has forecast the prevalence of HIV among its customers. Their conclusion? An expected increase from 15% in 2000 to 27% in 2015, with a corresponding reduction in their customer base of 18%.

Infection rates have accelerated to the point that the GDP for entire countries is predicted to drop as a result of the pandemic. As one example, over the next 10 years a 2005 report predicts China's GDP growth rate will drop by a full 1% as a result of HIV/AIDS.

The news is not all bad, however. In a recent survey, 71% of consumers indicated they would pay more for a product if they knew the extra proceeds would benefit HIV/AIDS. And companies such as Levi Strauss, United Distillers, and Northwest Airlines actually report improved community relations and even increased sales after being associated with work on AIDS.

Business Interventions

Bloom and his associates have noted that business interventions have been employee driven, market driven, brand driven, or a combination of the three. Whatever their impetus, virtually all the literature on business and HIV/AIDS recommends collaborative interventions crossing all sectors of the economy as most effective. The GBC is adamant that the next frontier for business response to HIV/AIDS includes creative partnerships and collaboration, including leveraging supply chains, linking business growth with HIV prevention, and realizing investment in new technologies.

The GBC approach is to rate companies using a common index capturing 10 global business HIV/AIDS categories. The baseline report outlines success on 2 of the 10 categories: prevention initiatives and community and government partnerships. The other categories fall below what the GBC establishes as an acceptable threshold of engagement. These eight categories include the following:

- Nondiscrimination in the workplace
- Care, support, and treatment
- Product and service donation
- Testing and counseling
- Corporate philanthropy
- CEO advocacy and leadership
- Monitoring, evaluation, and reporting
- Business associates and supply chain

In many instances, the business response to HIV/AIDS has been delegated to already overworked parts of the organization or passed down several levels, resulting in efforts that appear fragmented, low level, or even invisible.

HIV/AIDS, Business, and Ethics

Deep ethical concerns underlie the pragmatic impacts of HIV/AIDS. Links between HIV infection and social "baggage" such as homosexuality, sexual promiscuity, and drug abuse render HIV/AIDS a volatile issue for those formulating corporate policy.

From the view of Kantian ethics, or deontology, there is a potential clash of rights between the HIV positive worker and the HIV negative coworkers. The concern on the part of some during the early years of the HIV/AIDS pandemic that the ease of transmitability of HIV had been grossly understated has since been countered by evidence documenting the fragility of the virus. Calls for disclosure of HIV/AIDS status persist, however—although for different reasons than those advanced during the early years of the disease. Those infected with HIV are justifiably concerned with the variety of discriminatory practices, including erosion of the right to privacy, revocation of health benefits or escalation of the cost of such benefits, shunning by coworkers, and even termination of employment, which often accompany making a positive diagnosis with HIV a matter of public record. As recently as five years ago, a survey in Thailand showed that 12% of businesses fired staff known to have HIV/AIDS.

It is not immediately apparent how much regard ought to be given to an employee's right to privacy when the company has a countervailing duty to protect its shareholders' interests—in part by securing its workforce from disruption. Furthermore, the right of the HIV/AIDS sufferer to his or her work must be considered against the backdrop of the right of the employer to exercise the doctrine of employment at will, if such applies. This particular conflict is compounded—or perhaps alleviated—by the Americans with Disabilities Act, which in part treats workers with AIDS as a disabled class subject to the protections contained in this legislation.

Utilitarianism requires consideration be given to the consequences of including or excluding HIV/AIDS sufferers from the workplace, with an eye toward bringing about the "greatest good for the greatest number." The presupposition of utilitarian logic is that relevant benefits and costs can be both identified and quantified. On this logic, the "end" of corporate profitability may well justify the "means" of violating the rights of HIV/AIDS workers. Utilitarians must, however, come to terms with research into the longevity of HIV positive individuals indicating that a supportive community leads to life extension.

Perhaps the most relevant ethical perspective to adopt relative to HIV/AIDS is the ethic of care. This perspective demands attention be given to consideration of the personal—and relational—implications of AIDS policy formulation and implementation. The topic of AIDS in the workplace needs to be connected to how we as human beings live, and more particularly how we live in a caring relationship with one another. Jonsen offers perhaps the best insight to any discussion of policy alternatives relating to HIV/ AIDS in the workplace as he argues that in all epidemics fear stimulates isolation while responsibility requires inclusion—adding this might well be called the moral law of epidemics.

Airline Deregulation

The Airline Deregulation Act (ADA) of 1978 initiated an era of fundamental change in the U.S. airline industry. The ADA attempted to address the economic inefficiencies of regulated air carriers by opening the airline marketplace to competition among both established and predicted new entrants. Prior to the passage of the ADA, the U.S. government used regulation as a tool both for protecting the airlines' economic interests and for overseeing the traveling public's safe, reliable access to service. The U.S. airline industry's response to the opportunities presented by government deregulation under the ADA has spawned a wide array of initiatives that have changed the basic nature of this industry's customer-supplier relationship. The consequences of these actions have affected both the structures and the operating philosophies of airlines globally.

The early days of the U.S. airline industry—generally considered as the time period between the end of World War I and the onset of the global depression of the 1930s—contained a mixture of government support schemes and competitive marketplace efforts. Most air carriers survived only through air mail contracts granted by the government on behalf of the U.S. Post Office. In the 1930s, though, the modern U.S. airline industry began to grow and take shape: Fledgling aircraft manufacturers and air transport companies began to develop the technologies and infrastructure needed to transform air travel from a novelty to an economic necessity.

However, during this decade the world was in the midst of a major economic depression, which many people blamed on the previous decade's lack of governmental control over national and international economic activities. Accordingly, the U.S. government under Franklin D. Roosevelt's New Deal policies established governmental agencies whose enforcement agendas combined protection of the public's welfare with the promotion of economic growth. In this context, the government established regulatory structures that encouraged the airlines' economic development while protecting them from unrestrained competition in national and international markets.

In 1938, the Civil Aeronautics Act created the Civil Aeronautics Board (CAB) as the regulatory body mandated to oversee the sometimes conflicting interests of growth within the nascent U.S. airline industry and safe, reliable service for the traveling public. To accomplish these goals, airline regulation in the United States followed the pattern of regulation employed for the most heavily used form of interstate transportation in the early 20th century—the railroads. This pattern dictated that regulation should encompass both route restrictions and price controls as effective means for ensuring industry profitability and guaranteed levels of service. However, the pricing and route protections afforded by government regulation, in turn, shielded this industry from external competition, creating barriers to entry that encouraged market-sharing collusion among the established participants in the industry. The result was the development of regulated oligopolies that, over time, limited supply and thus increased prices for the traveling public.

The rapid growth of aeronautical technology in the first decade after the onset of regulation—a product of the gradual economic recovery from the depression coupled with the global military rearmament occasioned by World War II—soon highlighted the practical consequences of the CAB's dual "growth and service" mandate. After the conclusion of wartime hostilities in 1945, the commercial airline industry had access to technologically advanced aircraft and highly trained air personnel—resources that, in an unregulated market, could have fostered increased service and customer-friendly competition at reduced prices. What arose instead, though, were problematic economic distortions driven by the CAB's regulatory mandates for the commercial airline system. On the one hand, as early as the 1950s critics of government regulation noted that when surplus aircraft and trained air crews became available for newly formed charter air companies, the CAB generally restricted these companies' scope of operations to protect the economic interests of the established carriers. This protective regulatory behavior suggests the working of the so-called capture thesis of regulation, whereby regulatory agencies and their legislative oversight committees are captured or co-opted by agents of the regulated industry to ensure the continuation of their regulated oligopoly. Yet during this same time period government regulation also provided substantial consumer benefits such as subsidized air service to smaller communities—service that otherwise would have been economically unfeasible for individual air carriers.

As the airline industry expanded and aircraft technology continued to improve in the two decades after World War II, political pressure mounted for reforming the process of governmental oversight of the industry. By the late 1960s, the growing economic inefficiencies and overall high price levels of the regulated airline industry began to generate increasing political criticism from both anti–big business liberal forces and conservative free market advocates. Belief in the benefits of free, unregulated markets was gaining strength as the United States entered the 1970s, a decade marked by economic recession, inflationary pressures, and decreasing public trust of government's beneficial role for society. Furthermore, proponents of airline deregulation began to laud the financial and service performance of intrastate regional airlines, which were not subject to the federal interstate regulations established under the CAB to control entry to or exit from the industry, as an example of the potential benefits of broader industry deregulation. The economic success and consumer benefits of these localized air operations supported the assertions of deregulation advocates that a free market would provide the necessary incentives for lower prices and increased choices for consumers.

When the CAB, in response to the political pressures supporting deregulation, in turn started to relax its regulatory restrictions in the late 1970s, air fares on average declined industrywide. Industry growth, as calculated by revenue-generating passenger miles, accelerated at a faster pace than it had over the previous decade. These immediate economic gains under the CAB's tentative moves toward government deregulation created further political support for complete economic deregulation of the industry. Although the economic recovery that followed the national recession of the early 1970s, and an easing of the Organization of Oil Exporting Countries oil embargo of 1973–1974, also contributed to these early successes, the apparent confirmatory trend of economic and consumer benefits resulting from reduced regulatory strictures led to the passage of the ADA of 1978.

Once airline deregulation became law, the number of airlines competing for customers increased dramatically. This competitive growth allowed two significant factors to drive competitive activity within the airline industry: the newly gained ability of airlines to set fares without prior governmental approval and the greatly expanded ability of airlines to add and remove routes at will. Both new entrants and established air carriers used pricing as a competitive tactic: They began ticket discounting, established various restricted and unrestricted ticket fare classifications, and created peak and off-peak travel times as common pricing stratagems. Airline route systems also changed under deregulation from the previously used market-to-market (point-to-point) route pattern to hub-and-spoke route models: Airlines scheduled short-haul (relatively short distance) flights as “feeders” to a central airport location, where passengers would then switch to connecting flights to their final destinations.

These structural changes in the airline industry’s pricing and operations increasingly shifted the industry’s performance focus from the qualitative elements of service (such as customer amenities, frequency of flights, and customer satisfaction) employed under regulation to the more quantifiable elements of operating costs and operating efficiency. This shift in emphases often brought the established airlines into conflict with their workforces, which were predominantly unionized. With deregulation affecting the predictability of revenue growth from ticket sales, airlines found that they could improve their financial performance by working to minimize their fixed costs, which consisted primarily of physical assets (airplanes), ground lease agreements (for airport landing gates and services), fuel, services, and labor. Both established air carriers and new entrants under deregulation carried similar cost burdens for ground lease agreements and fuel; however, they increasingly faced substantially different financial structures for their physical assets, services, and labor costs.

The first significant cost difference among airline competitors created by deregulation was a change in the costs for physical assets. Prior to deregulation, most air carriers had owned their aircraft fleets: Because CAB policies ensured a guaranteed economic profit for all competitors based on the operating costs of the industry, the costs of new aircraft were simply added to this calculated cost basis. In this approach, the CAB mirrored the price-setting approach taken in other regulated industries, such as natural gas and electric utilities. However, when the recessionary pressures of the 1970s forced several established airlines into bankruptcy, this provided a temporary low-cost opportunity for new entrants to obtain used airplanes at reduced prices. In addition, the new entrants were able to choose those types of aircraft best suited to the changing route structure of the deregulated environment, thereby achieving load factor efficiencies, while established carriers often owned a wide variety of aircraft types purchased over many years to meet the varied route structures of the regulated environment. Finally, the growth of new approaches to financial management in a wide range of industries led many new entrants to lease aircraft rather than purchase them, thereby reducing their initial cost outlays as they moved to challenge the established industry players.

Service then became an important cost factor under deregulation. Under a regulated structure, where all fares were set by the CAB, competing airlines could only differentiate themselves from their competition through the use of service incentives such as improved meals, free beverages, and customer amenities such as airport lounges and convenient scheduling. Deregulation brought the rise of “no frills” carriers, which initially lowered ticket prices by reducing or eliminating previously supplied levels of customer service. While the established “full service” carriers often matched these reduced ticket prices, they also chose for many years to maintain their previously set level of customer service. This created a cost differential between established players and new entrants, which proved difficult to lessen without accompanying decreases in services and amenities.

The largest cost element affected by deregulation, though, was labor costs. Established air carriers had contractual relationships with unionized labor forces in most critical operations—pilots, flight attendants, mechanics, baggage handlers, and maintenance. New airlines entering the now deregulated marketplace could not only enter the market with lower labor cost structures because of their (generally nonunion) employees’ lower levels of experience, but they could also take advantage of a labor surplus created by the same recessionary conditions that had affected the availability of lower-priced aircraft. This labor cost differential was the competitive variable most open to modification by the established carriers, as bankruptcy or the threat of bankruptcy allowed them to renegotiate or, in some cases, terminate entirely their previously negotiated labor agreements.

Since the passage of the ADA of 1978, then, the U.S. airline industry has worked through a series of "boom or bust" cycles. While under regulation the industry's profitability would rise and fall with economic conditions, the protective fare-setting role of the Civil Aeronautics Board ensured that, as a whole, the industry remained financially healthy. Under deregulation, though, global economic and competitive pressures affected air carriers much more directly and much more intensively. This has produced mixed results for both consumers and industry participants. Consumers benefited from overall lower fares, although not necessarily to equal degrees in all markets (middle- to large-size markets tended to reap the greatest rewards); they also found improved overall quality of air service, although again this change tended to benefit middle- to large-size markets more and smaller consumer markets less; and they sometimes found expanded consumer choice in the number of carriers and travel options available. Accompanying these benefits, though, was a decrease in service predictability and stability for consumers, as both fare schedules and even the continuation of service could change on a daily basis. As a result, in many major air travel markets near oligopoly conditions have again arisen—now under deregulation—driven by the economic strength of the larger carriers and the operational barriers to entry created by major airlines' hub-and-spoke airline route systems.

For industry participants, the contrasts have been much more drastic. While low-cost carriers have entered the marketplace and succeeded in the deregulated environment, over two decades of deregulated air travel have produced many more unsuccessful new entrants than viable ones. Likewise, the legacy carriers have undergone considerable change since deregulation, with consolidation during the first decade of deregulation leading to a reduction of the number of long-standing carriers in the United States to less than 10. This level of economic consolidation intensified the industry's boom or bust response to economic conditions. During the extended period of economic growth of the 1990s, these "legacy" carriers and many viable new entrants transported record-setting passenger loads and thus reaped record-setting profits. However, when the U.S. economy moved into recession in early 2001, followed by the impacts of the September 11, 2001, hijackings on U.S.-based airlines and the subsequent economic burdens of increasing fuel prices, the majority of these air carriers soon registered unprecedented financial losses, which led several into bankruptcy reorganization and threatened the continued viability of others.

A less-recognized, although significant and growing, impact of airline deregulation in the United States, though, was its influence on the global airline industry. The U.S. airline industry, even under regulation, maintained tens of air carriers, from small short-haul airlines through regional, national, and international carriers. When the United States chose to deregulate its domestic airline market, it also began to pursue agreements with other governments to permit greater airline competition internationally. Attempts to imitate the pattern of deregulation followed since the late 1970s in the United States have encountered a critical difference in many other countries that was not faced in the United States during the move toward deregulation—direct state ownership of part or all of many countries' major national air carriers. This structural difference has proved to make deregulation an extremely contentious political and economic issue in many international venues, as non-U.S. governments and consumers have viewed air service not simply as "another business" requiring free market remedies but as an essential national service.

With sluggish economic growth outside of North America throughout the 1990s, the financial costs of supporting state-owned air carriers placed considerable strains on many countries' national budgets. When these countries then initiated tentative actions toward deregulation of their air travel markets, the results were decidedly mixed. Arrayed against the successes achieved by emerging low-cost carriers in Europe and Asia were several high-profile, expensive failures of established national airlines. This provided a confirmation that many of the volatile economic consequences of deregulation witnessed in the United States were not bounded by geography. Airline deregulation emerged and grew as part of a larger post–World War II movement toward economic globalization and the "liberalization" of economic markets. In many senses, the deregulation of the airline industry across national boundaries provides a striking expression of the larger globalization of industry competition in the 21st century. Whether the consumer benefits and drawbacks of deregulation witnessed in the United States will also extend globally—where the dynamics of national and regional markets differ markedly from the conditions driving deregulation in the United States—is a question that the coming years will answer. Regardless, airline deregulation has played a significant role in the restructuring of pricing and service for this critical global industry.

Air Transportation Stabilization Board (ATSB)

The Air Transportation Stabilization Board (ATSB) was created by the Air Transportation Safety and System Stabilization Act, which was signed by President George W. Bush on September 22, 2001, for the purpose of issuing federal loan guarantees to airlines experiencing financial difficulties following the terrorist attacks of September 11, 2001. As of May 2005, seven airlines have been granted such guarantees and nine airlines have been denied.

Applicants must meet three criteria under the act: (1) the airline is unable to obtain a loan without the guarantee, (2) the amount of the loan is prudent, and (3) the guarantee is necessary for a viable air transportation system in the United States. ATSB often demands stock warrants or related securities, giving the government an ownership stake in those airlines whose loans are guaranteed.

The creation of ATSB has been surrounded by controversy from the beginning. Although the terrorist attacks of 2001 clearly caused a drastic drop in airline patronage, it is debatable whether the proper role of government is to aid failing businesses. Some airlines that received guarantees were losing money prior to the 2001 attacks, in which case the government is inadvertently rewarding mismanaged airlines while better managed airlines do not enjoy the same benefits. Also, one could argue that it was unfair to single out one industry for federal assistance due to the terrorist attacks. What about New York hotels and theaters? What about restaurants and other service providers who rent space in airports? If federal assistance is available to airlines, one could argue that it should be equally available to all businesses directly affected by the terrorist attacks.

Another objection to ATSB, rooted in broader ideological concerns, comes from those who believe government should never interfere with free market processes. Airlines have the responsibility to plan for terrorism and other traumatic shocks to the industry, and it could be argued that airlines that were inept in their planning deserve to fail so that more competently managed airlines can take their place.

In contrast, there are strong arguments in favor of ATSB rooted in the premise that it is proper for government to ameliorate the harm caused by terrorism. Generous government aid was made available to individuals harmed in the 2001 attacks, so perhaps aid should likewise be offered to affected companies. The airlines were treated differently than, for instance, airport restaurants, because a slew of restaurant closures would not threaten the U.S. economy as much as the collapse of the airline industry.

Also, it should be emphasized that ATSB does not give loans; it merely guarantees the loans made by others. The government is responsible for the debt only if an airline defaults on its loan, which should not occur if ATSB's criteria are properly applied. ATSB's cautious approach is illustrated by the fact that it has rejected over half the airlines that have applied for loan, including the large and financially troubled United Air Lines.

Alien Tort Claims Act

The Alien Tort Claims Act (ATCA) is a part of the Judiciary Act of 1789 organizing the U.S. federal court system. The brief one-sentence passage states simply that the federal district courts have jurisdiction over any civil action brought by an alien for a tort in violation of international law or a U.S. treaty. The obscure provision was likely intended to deal with piracy on the high seas and issues arising in connection with foreign ambassadors. There was until 1980 little application of the ATCA.

A tort is any wrongful act not involving a breach of contract for which a civil suit can be brought. The U.S. Bill of Rights, Amendment VII of the Constitution, guarantees jury trial for nontrivial damages. The ATCA permits aliens to bring tort actions in U.S. federal courts against individuals and corporations regardless of nationality or location. To fall under the ATCA, an act must be universally prohibited, there must be sufficient criteria to determine whether an action constitutes the prohibited act, and the prohibition is always binding. A related cause for tort litigation is the Torture Victim Protection Act (TVPA) of 1991.

The rising number of ATCA actions since 1980 continues the expansion of modern tort litigation. Businesses complain that the burden of litigation is too high, that much of the punitive damages simply go to lawyers, and that personal injury lawyers are out of control. There is a social cost of litigation, in the sense that compensatory and punitive damages may ultimately pass to consumers. On appeal, however, judges often reduce jury damage awards—even in notoriously plaintiff-friendly jurisdictions. A difficulty with calculable punitive damages is that it may lead on to the callousness to human life and limb that allegedly occurred in the Ford Pinto case. A successful tort litigation lawyer presumably builds up a war chest with which to tackle tougher defendants.

Expansion of ATCA Litigation

Since 1980, ATCA litigation has expanded from an initial application to oppression by foreign governments of their own citizens to private individuals to U.S. and non-U.S. companies. Complaints have spread from alleged human rights abuses to alleged environmental damages. Complaints against businesses have been mostly by poor rural citizens of developing countries.

To date, no ATCA plaintiff has prevailed at trial against a U.S. corporation. However, Unocal settled out of court in an ATCA case arising in Myanmar (Burma). The business concern is that, if any suit prevails, then all multinational corporations (MNCs) will be sued in due course. The U.S. Chamber of Commerce, the National Association of Manufacturers, the National Foreign Trade Council, and the George W. Bush administration have all opposed business application of the ATCA. The counterargument is that MNCs avoiding human rights abuses exposure should have nothing to fear in U.S. federal courts.

In 1980, the Second Circuit Court of Appeals held in *Filártiga v. Peña-Irala* that torture committed by a Paraguayan police officer in Paraguay was a violation of the law of nations. The defendant was resident in the U.S. at the time of the litigation. The Second Circuit permitted a suit by Bosnian Serbs against the president of the so-called Bosnian-Serb republic within Bosnia-Herzegovina in the 1995 case *Kadic v. Karadzic*. In 1995, in *Wiwa v. Royal Dutch Petroleum Co.*, the Second Circuit permitted Nigerian emigrants to sue two foreign holding companies for alleged participation in human rights violations against them by government forces in connection with their opposition to oil exploration activities in Nigeria. The case involved as well claims of coercive land appropriation without adequate compensation and environmental claims of air and water pollution. In 1996, in *Mushikiwabo v. Barayagwiza*, a U.S. district court awarded $105 million to five Rwandan citizens for torture and execution of relatives by government forces and Hutu political militias during the 1994 genocide campaign against the Tutsi. Since the early 1990s, at least an estimated two dozen companies have been sued over alleged complicity in abuses committed in other countries—for example, torture in Guatemala (Del Monte), murder in Colombia (Coca-Cola), and environmental damage in Ecuador (Chevron Texaco).

The U.S. Supreme Court held in June 2004 in *Sosa v. Alvarez-Machain* that U.S. courts have jurisdiction under ATCA to hear claims concerning violations of international treaties or customary international law. Alvarez, a Mexican citizen, was allegedly abducted to California by a fellow citizen hired by the Drug Enforcement Agency (DEA) to face trial for torture murder of a DEA agent. The Supreme Court unanimously dismissed Alvarez's claims as not meeting ATCA standards, but determined that the ATCA was suitable for claims concerning human rights violations.

The Unocal Case

In December 2004, following the *Sosa* decision, Union Oil of California (Unocal) settled an ATCA lawsuit out of court. Unocal was then acquired for about $18 billion by Chevron Texaco (itself subsequently under ATCA litigation concerning alleged environmental pollution in Ecuador, as described in the next section).

Unocal was sued in 1996 by human rights activists in both federal and California state courts on behalf of anonymous ("John Doe") Burmese farmers. The suits alleged complicity in and liability for human rights abuses in connection with the Yadana Gas Pipeline Project in Burma. There was an activist effort to revoke Unocal's California corporate charter. The George W. Bush administration filed a brief in the Unocal case arguing that human rights violations and environmental claims should be regarded as impermissible under the ATCA, which should be restricted to offenses against diplomatic immunity.

The Yadana Gas Pipeline Project in the southern Tenasserim region of the country was organized to move energy resources from the Andaman Sea across Burma to Thailand. Yadana is the largest foreign direct investment project in Burma. The project has been widely criticized both for potentially propping up the regime with revenues and for the regime's alleged abuses of local populations during construction of the pipeline. The project is a 1993 joint venture among Total (France) at about 31% share, Unocal (Union Oil of California) at 28%, PTTEP (Thailand) at 25%, and the Burma Oil and Gas Enterprise (a state-owned entity) at 15%. Total contracted for government security before Unocal joined. There have been accusations of human rights atrocities by the Burmese military providing security for the project in terms of forced labor, forcible relocation, rape, and murder. Total took the position that it was the victim of a disinformation campaign. Unocal argued that all work is paid labor and that local contractors must follow fair hiring practices.

After extended legal maneuverings, the Ninth Circuit Court of Appeals ordered the case to trial. The appeals opinion contains an informative discussion of whether the legal basis for the suit should be international law or federal common law—involving the allegation of forced labor as akin to slavery prohibited in the United States. The courts concluded that no action was feasible against Total or the Burmese and Thailand governments (due to sovereignty immunity). Unocal was the remaining defendant. In the United States, tort litigation involves joint and several liability doctrine, meaning Unocal could be found liable for damages.

International business may occur in countries where there are pervasive human rights abuses and social and economic repression. Burma is in the grip of a repressive military regime. In 1988, socialism-oriented dictator General U Ne Win gave up power after 36 years. A military junta seized power and did not honor the 1990 national election results in which the National League for Democracy (NLD), led by Daw Aung San Suu Kyi—daughter of the nationalist hero General Aung San assassinated in 1947 (he worked with the Japanese occupation during World War II against the British)—reportedly won 60% of the popular vote and over 80% of government seats. Daw Suu Kyi was placed under house arrest in July 1989 (remaining in that condition off and on to the present day) and received the 1991 Nobel Peace Prize. Levi Strauss discontinued outsourcing contracts in 1992; PepsiCo subsequently exited under pressure from a U.S. boycott campaign. There has been a prolonged international debate over whether sanctions or constructive engagement is the better approach for dealing with the Burmese situation. Daw Suu Kyi and most activist lobbies call for sanctions to bring down the regime.

Extension of ATCA to Environmental Claims

U.S. courts more typically dismiss environmental rather than human rights claims on procedural or jurisdictional grounds. In *Aguinda v. Texaco*, 30,000 Ecuadorian Indians sued Texaco (subsequently merged with Chevron) for alleged improper oil exploration and waste disposal practices in the Amazonian rain forest region. The district court dismissed on procedural grounds that Ecuador itself was an adequate alternative forum. The Second Circuit reversed on the basis that Texaco must submit to jurisdiction of Ecuador courts. The district court again sent the case to Ecuador, where litigation is underway. A remaining issue is whether the U.S. courts should and will enforce if necessary the findings of the judicial system of Ecuador. A suit concerning the Bhopal, India, chemical plant disaster by Union Carbide Corp. was dismissed by the Second Circuit on grounds that claims had been fully litigated and settled in India already.

An International Bill of Rights

The conception of human rights can be broadly expanded. The Chad-Cameroon Petroleum Development and Pipeline Project constructed by Exxon Mobil and joint venture partners with investment by the World Bank trying to develop a model project approach to controlling corruption and stakeholder impacts has received human rights criticism from Amnesty International in its September 2005 report "Contracting Out of Human Rights: The Chad-Cameroon pipeline project." A vital matter concerns whether the notion of a tort-violating law of nations or U.S. treaties can expand beyond genocide, slavery, and torture to forced relocation, fraud, and breach of duty to treat with dignity.

The global importance of the ATCA or the TVPA is the potential role of private litigation in expanding human rights protection. Generally, international law reflects what countries are willing to support and mostly out of national self-interest. International law develops progressively by customary practice, international treaty, and multilateral convention. The "International Bill of Rights" presently comprises three statements adopted by the UN General Assembly: the 1948 Universal Declaration of Human Rights, the 1966 International Covenant on Civil and Political Rights, and the 1966 International Covenant on Economic, Social and Cultural Rights.

Alternative Dispute Resolution (ADR)

Alternative dispute resolution (ADR) is a blanket term that refers to a number of different procedures for settling disputes that do not rely on litigated judgments. The hallmark of ADR is that all parties voluntarily accept a third party who assists with the process and/or the substance of the dispute.

The court system is designed to resolve serious disputes. Trained lawyers use an adversarial approach to make their case before a judge and jury. The hearings are formal in that there are strict rules about acceptable evidence and procedure. There is usually a public record of a case, and rulings may serve to set policy or precedent. Litigation is often expensive, time consuming, and leads to judgments where a win for one side represents a loss for the other. Court cases are particularly effective when there is a need for a clear ruling on a particular matter or when they involve distributing resources between rival claimants. However, the vast majority of disputes in America are resolved outside the courts. Sometimes this is because settlement talks produce agreement prior to the case being heard. Many cases are resolved by various means of ADR. The incentives for moving to ADR may include the potential for a resolution that is less expensive, less time consuming, more predictable, or one that may be customized to the particular details of the conflict. ADR is appropriate in cases where there is a continuing relationship between the parties, and the issues are not limited to allocation. Thus, a violation of worker safety standards or establishing a payout of assets after a bankruptcy may benefit from formal adjudication, whereas ADR is useful in cases such as contract negotiations or settling a dispute between neighbors.

ADR encompasses a number of processes that range from the parties framing their own settlements to private systems that echo what goes on in court. The kinds of ADR are quite flexible and may be adapted as the parties see fit. They include arbitration, mediation, hybrid mediation/arbitration, early neutral evaluation, minitrials, and summary jury trials. Parties may choose to engage in ADR instead of going to court or may undertake it concurrently with regular court procedures, so that they have the default of litigating if ADR is unsuccessful.

The two most common forms of ADR are arbitration and mediation. Arbitration involves a neutral party who hears evidence and decides on an outcome that is then imposed on the parties. Essentially, it is a form of private judgment that echoes the court system except that it has more relaxed rules on procedure and evidence and takes place in an informal setting. In contrast, a mediator is more of a negotiation expert who assists the parties to come to a settlement of their own. Legal precedent and findings of right and wrong take a minor role in mediation because the mediator's job is to help the parties find an outcome that satisfies their interests to the greatest extent possible. Some institutions have integrated internal ADR functions into the office of the ombudsperson.

Arbitration

Arbitration is a form of delegated decision making. The authority to make a decision or render an award is handed over to a third party, who adjudicates the case and then the parties abide by the ruling. Both sides in a dispute mutually and voluntarily choose the arbitrator. Arbitrators can be anyone that the parties agree to: A construction company may feel that a retired engineer would be more acquainted with the specialized issues and more capable of rendering an authoritative decision in a dispute than someone trained as a lawyer. The American Arbitration Association is a commercial organization that trains and refers professional arbitrators.

Arbitration is often included in purchasing or service contracts as the initial procedure to be used in the case of a dispute. For example, it is not unusual for customers to agree at the time of a new car purchase that they will go to arbitration if there is a subsequent dispute with the dealer or manufacturer and then be bound by the arbitrator's decision. Parties may agree to arbitration as a step before litigation or even after court proceedings have begun.

Arbitration may be attractive because it is more flexible and efficient than the formal legal system. The parties are not bound by strict rules on procedure, and may frame the approach they believe most appropriate for their case. Thus, issues of discovery, rules of evidence, and reliance on case law are all negotiable before the arbitration begins. The process allows greater involvement and opportunities to be heard than formal litigation. Arbitration is often more inexpensive and faster than traditional resolution through the courts.

Decisions made by arbitrators differ from court-mandated judgments in several ways. First, they do not carry the force of precedent. Therefore, individuals with similar cases cannot rely on previously arbitrated decisions as a basis for a later ruling, nor can they automatically expect a similar outcome. Second, the arbitration procedure does not usually allow for an appeal. Hence, although it is efficient it carries the risk of infringing on the legal rights of one party without providing a forum for recourse.

There are many varieties of arbitration. One of the best-known is "baseball" arbitration because it has been used to settle salary disputes of major-league players. In this procedure, disputants attempt to reach a settlement, but if they fail to do so by a set date they are obliged to submit their last offer to an arbitrator who is required to choose one of them. As well as "last best offer" arbitration, there is wide latitude in process design. For example, in "control contract" arbitration, parties agree to a range of settlement ahead of time and adjust the arbitrator's award so that it stays within those limits.

Private judging is another kind of arbitration. Parties contract with a knowledgeable legal expert, usually a retired judge, to hear their case, apply the rule of law, and render a binding decision. The process is typically more expeditious, inexpensive, and confidential than the traditional court setting. A more sophisticated form of private judging is the minitrial, which is a voluntary settlement conference. Attorneys typically represent parties and reveal their entire case to a judge during the process, who then renders an opinion or, if the parties agree, a judgment. It tends to be less adversarial than regular court proceedings, because both sides are aware that the goal is settlement rather than victory. It is rare for a minitrial to involve witnesses, and thus, the focus of the proceeding is on questions of law and fact instead of personal credibility.

Nonbinding arbitration invites experts to give an unbiased advisory opinion about a case, or the use of judges or other professionals to predict how the case might be resolved in court. This gives the disputants an idea of how worthwhile it is to pursue legal remedies and what a realistic settlement range might be. It is also useful when expert opinion may sway the parties' perceptions, for instance, in settlement negotiations that have reached impasse or where impartial third parties can assess the value of economically elastic assets such as art or real estate.

Mediation

Mediation is a procedure that enhances the parties' ability to negotiate. Mediation is the intervention into the dispute of an acceptable, neutral, and impartial third party without decision-making authority who is present to assist the parties in developing their own mutually acceptable agreement. A mediator's main job is to manage the process without imposing decisions on the parties. For example, in a dispute over terms over working conditions the mediator will invite the parties to treat the issue as a mutual problem that the parties have to solve together rather than telling them what the outcome will be.

In most states, mediation is considered confidential, and this allows the parties to disclose matters that may lead to settlement. Mediators examine the causes of a dispute and attempt to define issues in a way that makes them clearer and more easily resolvable. They may suggest a process that enables each party to maximally satisfy their interests. Because mediators have no independent authority other than that granted to them by the disputants, their main role is to manage the procedure rather than the substance of the negotiation. They may set ground rules and reframe statements into more value-free language. Mediators often test agreements by asking the parties to consider hypothetical situations and options. Sometimes they test whether the parties have realistic perceptions about their potential for winning a lawsuit or the time and cost involved in a particular course of action.

Mediators often classify negotiation approaches as either positional or interest based. A position represents an explicit demand for a particular settlement—perhaps an amount of money or other restitution. Interest-based bargaining begins with the discovery of the parties' underlying interests as opposed to the positions that they espouse.

For example, if an employee wants to leave a company but contests its no-compete clause, both sides may face the time and expense of litigation. In confidential discussions, the employee discloses that he is going through a nasty divorce and his wife works in the same department. His interests are to avoid being around his spouse in the workplace, yet he feels constrained in his employment opportunities because of his specialized training. The employer wants to keep their competitive advantage in the market by keeping trade secrets. A skillful mediator would allow both sides to put their positions on the table and then see if there is room for mutual accommodation or compromise that would still satisfy both parties' needs; it may be that the employee could move to another department within the company, or the company could modify their clause to cover only certain aspects of the job. The outcomes need not be optimal for all concerned—indeed, both could be equally unhappy with them, but they are probably more attractive than the alternative of prolonged and expensive litigation. Mediation is usually initiated when the parties are willing to negotiate but feel that they need assistance in dealing with emotional or psychological barriers to substantive agreement.

Mediators differ widely as to how directive they are with the disputants. Some actively suggest solutions and craft agreements, whereas others are more concerned with encouraging the parties to come up with their own settlement. Mediated agreements may be quite informal and rely on the voluntary compliance of the parties, while others are memorialized as formal contracts drafted by lawyers. Mediators come from a variety of backgrounds, including law, social work, and psychology.

Because mediation involves some degree of accommodation or compromise, it will be unsuitable for some types of dispute. Thus, some cases are useful in establishing public policy and are best dealt with in the courts. Other poor candidates are those that involve safety or tortious liability. There are concerns that although mediation has high settlement rates, the process itself is shielded by confidentiality agreements and does not afford much opportunity for legal review or appeal.

Hybrid Processes

Mediation/arbitration (or med/arb) is a hybrid process that starts by having the parties try to come to an agreement themselves. If they fail, then they ask the mediator to decide on a settlement. The process may be more efficient if mediation fails because the neutral is already aware of the facts and issues involved. However, there are concerns that the dynamics of the mediation will change; participants will be unwilling to fully disclose information that may later prejudice their arbitration case, and they may treat the mediator as an adjudicator.

Another variation is known as early neutral evaluation, where court officials screen disputes that are slated for litigation, and those with the potential for settlement are steered to evaluators who facilitate settlement discussions.

Special masters are appointed by federal judges to assist in settlement of large lawsuits under Federal Rules of Civil Procedure 53. They are typically specialized experts who manage complex issues and encourage settlement. Their decisions have the backing of the court. They will often act as arbitrators who present the parties with a settlement zone and expect the parties to come to resolution within it.

Another court-ordered form of ADR is the summary jury trial. This usually occurs when all parties are fully prepared for trial. In corporate cases, executives with settlement authority are required to attend the trial. The judge may order each side to produce exhibit lists and summaries of likely witness testimony. A jury is selected and hears the evidence from both sides. At each stage of the hearing, the executives are encouraged to engage in settlement negotiations. After the jury reaches a verdict, representatives of each side are allowed to question members on their perceptions of the case. The process has the benefit of allowing the parties to have a court hearing while at the same time promoting autonomous and efficient settlement.

Individuals are faced with significant outlays in time, money, and emotional strain when taking cases to court. In many cases, the intervention of a third party can help disputants realize their procedural, psychological, and substantive interests more effectively than a judicial decision could.

Altruism

Altruism is the conscious devotion to helping others regardless of whether the motivation is self-interested or other centered. It is a premeditated pursuit of charity to unify and increase the overall welfare of society. Although there is some dispute among moral philosophers as to the merits of the doctrine, altruism is generally viewed as the opposite of "egoism." *Altruism* was first employed as a term or concept by the French positivist philosopher Auguste Comte in 1831. Derived from the French root, *autrui*, meaning "other people," Comte favored an ethical perspective that individuals need to attend to the interests of others as a way of achieving universal happiness. The specific definition and focus of altruism varies significantly across different disciplines. Despite its ethical roots, more modern views offered by political scientists, psychologists, sociologists, and biologists have led to different approaches to the concept. Altruism's place in business has also been questioned.

Altruism and Moral Philosophy

From a philosophic point of view, altruistic behavior is deliberate with the underlying intent to help others. Ancient accounts on ethics explored the virtue of being helpful to others. To understand human nature, Plato and Aristotle devised a naturalistic ethics that focused on how moral virtues were linked with a person's happiness. A moral way of life involves behaviors that generate intrinsic happiness within individuals. It is part of human nature that individuals would seek such pleasure. Principles of justice were considered an altruistic quality by Plato but were closely tied to the psychological motivation to produce intrinsic happiness. The Socratic position differed slightly in that virtuous behavior was viewed to be derived from moral wisdom and that justice toward others is a good in itself for the greater benefit it generates. Altruism developed as a refutation of ethical egoism—that it is unethical and irrational for individuals to engage in behavior that compromises their own self-interest.

From this groundwork laid down by moral philosophers in response to the idea of ethical egoism, Auguste Comte originated the actual term *altruism* in the mid-19th century. However, the creator of the term believed that emotion did indeed play a role in the motivation to care for others over self. Comte posited that human beings were motivated by both self-interested feelings and socially benevolent emotions. His ethical theory stated that morality is the subjugation of self-interested tendencies in favor of other-regarding drives to promote societal welfare. True happiness could be found in a life that serves others' needs and interests. This understanding of altruism has religious overtones as well. Christian dogma professes that decent followers should love their neighbors as they would love themselves. By serving the needs of the greater humanity, an individual is serving God.

In contrast to Comte's view of altruism, English social evolutionist Herbert Spencer took a more psychological approach to understanding the motivation to be altruistically inclined toward others. Having coined the phrase "survival of the fittest," Spencer—a contemporary of Charles Darwin—believed that feelings of pleasure or happiness became biologically inherited in the later stages of evolution, when social relationships were important for survival. Intrinsic egoistic feelings of happiness transformed into pleasurable feelings associated with helping others. Spencer claimed that humans were capable of making psychological associations between certain actions and the pleasure generated by those actions. Behaviors that sustained and promoted the greater good of society—a utilitarian notion—induced emotional and psychological pleasure for those individuals engaging in those prosocial acts. The ethical standard of altruism resulted when these associations of personal happiness and greater societal utility were passed down to later generations. Societies prosper when the greater utility of the community is served by individual acts.

Psychological Altruism

Also skeptical that such a selfless motivation exists, psychologists waged their own critique of altruism. One idea that is counter to the existence of altruism is psychological egoism. Psychological egoism describes behavior that is seemingly altruistic but that has underlying selfish motivations. This view contends that individuals are instrumental in nature and will perform acts of kindness that help others but only in the hope that the favor will be returned some day. The promise of reciprocated rewards provides the motivation for the act. However, it is difficult to prove whether or not purely altruistic behavior actually exists. The biologists attempt to provide the mechanism and rationale for altruism.

In contrast, the cognitive basis of psychological altruism rests in people's desires. Being concerned for another's welfare does not mandate self-sacrificing behavior, however. Wishing that someone else other than you succeeds need not mean incurring a cost. Often, assisting another person does not involve an expense or risk to the benefactor.

The psychological perspective on altruism strongly emphasizes the role of cognition in determining moral behavior. Cognitive psychologists such as Lawrence Kohlberg do not ignore the fact that emotions have a role in determining how individuals are motivated to act morally, but they do play up the role of reason for making moral decisions. In his hierarchical stage model of moral development, Kohlberg asserted that people progressed from self-centered motives for behaving morally to a concern for others as they developed morally through their experiences, education, and growth. The fact that a concern for the welfare of others only becomes a motivation for moral behavior at later stages in his model suggests that altruistic motivations are considered a higher morality.

In game theoretic terms, the prisoner's dilemma demonstrates how altruistic behavior is rationally the best choice in a single-iteration game. Given a situation where you and an accomplice are questioned for a crime, does it pay the two parties to act selfishly and confess the crime, or is it more advantageous for them to act altruistically and remain silent in the interrogation? Cumulatively, in terms of the costs incurred for confessing the crime, the parties are worse off if they both act selfishly than if they had acted altruistically. The jail time is longer if both acted in his or her own self-interest.

Biological Perspective

In biology, altruism occurs when a living being performs an act that benefits another being at the expense of the creature performing the act. It is when someone behaves for the sake of someone else at a personal expense with no immediate observable benefit. With biological altruism, no conscious motive needs to underlie the behavior. This is quite different from philosophical notions of altruism, which are centered on the idea that individuals consciously behave to help others for the sake of the good of the act. The implicit motive is based on the moral sensibilities of the person performing the act. In classical economics, altruism was counterintuitive to the rationally self-interested human. In evolution, altruism made more sense because of the purpose it served.

William Hamilton addressed the issue by examining individuals' survival abilities in their environment. He posited that altruism is not dispensed randomly but with reference to kin. Individuals will discriminate against those organisms that do not appear to be close kin to the individual offering the altruistic act. In the face of the concept survival of the fittest, Hamilton argued that genes can only be spread if the gene benefits from a behavior. It has little to do with whether the host of the gene benefits from a behavior. Altruistic tendencies proliferate in groups of individuals if the behavior is toward family members who may possess that altruist's genes. Thus, Hamilton developed his concept of inclusive fitness, where the principles of survival and adaptability not only pertained to the individual person but also to anyone in the group who may have similar genes. Behavior that seemingly costs the altruist in some regard at the organism level may in fact benefit the altruist's building blocks at the gene level of analysis.

For business ethics this is important because the biological explanation of altruism assumes that the trait became part of an organism's genetic makeup or phenotype. Altruism as a moral principle served an adaptive function that aided human beings to survive. Group cooperative behavior was facilitated by moral principles and enabled humans to maneuver through social exchanges.

Altruism and Business

As a concept, altruism has faced sharp criticism from philosophers such as Friedrich Nietzsche and Ayn Rand, who claim that purely selfless behavior does not exist and that the concept itself is morally subversive. These critiques of altruism are based on the morality of egoistic behavior. Nietzsche argued that it is unnatural for an individual not to be concerned for personal self-interest. Rand asserted that altruistic behavior is unethical and detrimental to business organizations because it represents a conscious disregard for the natural values that are necessary for survival. Her objectivist ethical standard focused on rational values with no regard for feelings or emotion. These rational selfish values did not include human sacrifices.

Altruism's place in business ethics is subject to debate and is dependent in large part on which model of human nature is used. Free market beliefs espoused by neoclassical economists viewed humans as rationally self-interested. In this view, people are motivated to advance their own interests in spite of potential costs to others. In a laissez-faire economy, the market will operate to society's benefit if everyone strives to satisfy their own needs. Adam Smith argued that by pursuing one's own self-interest, the interests of society are served. He states that individuals cannot depend on the benevolence of others in society to survive. Rather, it is people's self-orientation that supports industry and business.

Managerial capitalism, based on assumptions from neoclassical economics, contends that the firm is run in the interests of the shareholders, or owners of the business. In this model, the interests of parties outside of the stockholders are not directly considered. Milton Friedman believed that managers of businesses had no obligation to attend to the needs of other individuals, unless otherwise dictated by a majority of the shareholders. To him, no social responsibility existed outside of making a profit for the owners of the firm. The managers were agents of the owners and were solely responsible for making money for the company. Altruistic behavior would go against this agenda. Thus, does altruism have a role in organizations at all if business is driven by self-interested motives?

In an alternative theory of the firm, a broader group of interests are considered. Stakeholder theory allows room for the needs of others to be taken into account by business. In fact, stakeholder theory states that business interests are better served when managers pay attention to the demands of any individual or group who has a stake in the operations of the company. So a manager's role is to attend to the claims of multiple parties. The goal is to have a balanced relationship with the stakeholders of the firm. Certainly, in the course of satisfying multiple stakeholder claims, the interests of the shareholders should be served. Many studies have shown a correlation between corporate social performance and corporate financial performance. In effect, the argument is that firms can do well by doing "good" for others. Corporate social responsibility is based on the core idea that managers are stewards of society. Taking care of stakeholders will generally result in shareholders doing well financially. It could also be argued that generating shareholder wealth and increasing their value in the firm will benefit several stakeholder groups as well. As a doctrine, corporate social responsibility encourages that businesses work to promote the betterment of society. If shareholders do not get anything in return, however, the business may ultimately cease to exist. This is not exactly a selfless act to benefit others if the underlying motivation is to generate profit.

Taking into account all the varying perspectives on why people act in a prosocial manner, it is difficult to conclude what specifically motivates this behavior. Regardless of whether altruism truly exists, individuals do help others. Even if the underlying motive is personal gain, acts that benefit others do occur. Perhaps the most accurate description of altruism incorporates a pluralistic view of motivation, in which both self-regarding and other-regarding drives are acknowledged.

American Bar Association

The American Bar Association (ABA) is believed to be the largest voluntary professional association in the world. In 2005, there were more than 400,000 members. Five main aspects of the ABA will be considered: (1) origins, (2) purpose and goals, (3) structure and divisions, (4) lobbying, and (5) programs.

Origins of the ABA

Saratoga Springs, New York, was the birthplace of the ABA. It was founded on August 21, 1878, by a group of approximately 100 attorneys representing 21 states. The profession was very different at that time from the contemporary legal world. The law industry that exists today was only beginning to emerge at that time. Attorneys were typically solo practitioners who had been trained as an apprentice.

Purpose and Goals

The purpose of the ABA can be discerned from its mission statement and the published ABA goals. "The mission of the American Bar Association is to be the national representative of the legal profession, serving the public and the profession by promoting justice, professional excellence, and respect for the law," the ABA proclaims.

The published goals of the ABA are as follows: (1) to provide improvements in the American system of justice; (2) to promote meaningful access to legal representation and the America system of justice for all persons regardless of their economic or social condition; (3) to provide ongoing leadership in improving the law to serve the changing needs of society; (4) to increase public understanding of and respect for the law, the legal process, and the role of the legal profession; (5) to achieve the highest standards of professionalism, competence, and ethical conduct; (6) to serve as the national representative of the legal profession; (7) to provide programs, benefits, and services that promote professional growth and enhance the quality of life of the members; (8) to advance the rule of law in the world; (9) to promote full and equal representation in the legal profession by minorities; (10) to preserve and enhance the ideals of the legal profession as a common calling and in dedication to public service; and (11) to preserve the independence of the legal profession and the judiciary as fundamental to a free society.

ABA Structure

The ABA is an inherently complex and extensive organization, because of the size of its membership and the diversity of the issues with which it deals. The main assembly of the ABA, the House of Delegates, was established in 1936. ABA publications call this body the policy-making organ of the association and, therefore, responsible for the direction and administration of the ABA.

In addition, the ABA is managed by a board of governors. This 38-member group supervises the general operation of the association and develops specific tactical plans. This committee meets quarterly.

Much of the operational activity of the ABA is accomplished through the approximately 2,200 organizational entities encompassed within the association. In fact, there are six levels or types of entity within the ABA; the main three are sections, divisions, and forums. There are 22 sections, 6 divisions, and 6 forums. The purpose of the ABA sections, divisions, and forums is to provide a consistent structural organizational presence with respect to the specific subject in question, such as business law, antitrust law, and taxation. Much of the work of the ABA is accomplished through these organizational entities. In addition, the ABA structure includes committees, commissions, and task forces. In 2005, there were an estimated 3,500 committees, six forums, and half a dozen task forces.

Not only is there a relatively large number of subgroups within the ABA, but the membership of these specialized subsections tends to be substantial. The ABA estimated that section membership size ranges from a low of at least 2,300 to larger entities with more than 70,000 members.

ABA Lobbying

Lobbying might be the main activity of the ABA. The Government Affairs Office lobbies governmental entities on behalf of association interests. For instance, the 106th Congress, which met in 1999 to 2000, was lobbied on more than 100 different public policy issues, gave testimony at nearly 30 congressional hearings, and sent about 160 letters to various members of Congress, certain congressional committees, and particular executive branch offices.

Political lobbying is not uncommon. The ABA has in the past denounced President Bush's warrantless domestic surveillance program. The death penalty has also attracted the attention of the ABA, which has called for a moratorium of the practice.

ABA Programs

ABA members actively participate in a number of very important social outreach programs. The ABA declared that it provides law school accreditation, continuing legal education, information about the law, programs to assist lawyers and judges in their work, and initiatives to improve the legal system for the public.

The ABA has implemented literally hundreds of legally oriented client service programs, addressing a diverse range of public interests, another source noted in 2006. It specified that these programs concerned child abuse, protection of the elderly, affordable legal services, law clinic practice management, domestic violence, and juvenile justice programs, to name a few. Another important instance of ABA benevolence involves the charitable work of the association. The ABA, in fact, supports three different major charities: the American Bar Endowment, the Fund for Justice and Education, and the American Bar Federation.

American Civil Liberties Union (ACLU)

The American Civil Liberties Union (ACLU) dedicates itself to protecting the rights guaranteed by the Bill of Rights of the United States Constitution. The framers of the Bill of Rights designated those areas of civil life where government could not intrude, ensuring that those rights belonged to individuals and the associations to which they belonged. The Bill of Rights limited the government's authority to regulate freedom in areas such as speech, religion, assembly, press, the right to petition one's government, and to be safe from unwarranted search and seizure. From its founding in 1920, the ACLU has grown from a single office to an organization with chapters in almost every state.

Chapters possess some degree of autonomy and may pursue strategies prior to the national board voting on an ACLU position. As a national organization, the ACLU protects civil liberties through litigation, lobbying, and public education. Since its founding, the ACLU has expanded to include staff attorneys and a membership of over 500,000 persons. Some chapters have developed specific projects focusing on issues such as juvenile rights, prisoner's rights, national security, gay and lesbian issues, immigrant rights, and voting rights, although all are dedicated to the mission of vindicating civil liberties.

Two historical facts help explain the development of the ACLU. Many of the Constitution's framers did not believe a Bill of Rights was necessary. Fearful that enumerating rights would suggest federal powers that were not explicitly named, the framers initially believed that the federal government would only possess powers specifically enumerated in the Constitution, thus securing those liberties not regulated by the Constitution. The absence of a Bill of Rights, however, threatened state ratification resulting in the adoption of the first 10 amendments that specifically prevented Congress or the government from infringing on individual rights. Unlike the government's duty to prosecute crime, however, government was not specifically charged with enforcing the Bill of Rights. Protecting these rights often necessitated litigating against government action that appeared to violate constitutional protection or lobbying against legislation that would authorize government restriction of individual liberties. Even the judiciary, established to complete the checks and balances between the branches of government, required a party to file a case to determine whether a constitutional violation occurred. An affected individual or association or some nongovernment entity acting on behalf of that individual would have to call the government's alleged violation of those civil rights into question.

Second, the 20th century witnessed expansive growth of the federal government, especially in its reach over the lives of its citizens. The Supreme Court's interpretation of the Constitution's Fourteenth Amendment incorporating the protections of the Bill of Rights against state governments led to a concomitant need for protection against encroachment of rights by any government, whether federal, state, or local. Simultaneously, the United States became a world power with its involvement in the two World Wars and leadership throughout the Cold War. That new role increasingly raised concerns over new national security laws. Furthermore, the expansion of the welfare state as orchestrated by the federal government multiplied government regulations affecting all citizens and residents.

Under a constitution that necessitates citizen diligence to ensure that government does not overstep its bounds, the task of defining and protecting liberty never ends. The expanding scope of government and the constant threats, domestic and international, will always lead to imperfect responses to perceived threats. In times of war and economic crisis, elected leaders often interpret their duty to provide for the common defense and promote the general welfare in ways that limit individual rights. Majority concerns about national security and the loss of a perceived unique American culture lead to legislation that places vulnerable minorities or the foreign-born at risk. In response, the ACLU grew into a national organization with both staff and volunteer attorneys to address these new challenges. Even the United States Supreme Court has recognized the ACLU's role, finding that it has "engaged in the defense of unpopular causes and unpopular defendants and has represented individuals in litigation that has defined the scope of constitutional protection in areas such as political dissent, juvenile rights, prisoners' rights, military law, amnesty, and privacy" (*In re Primus*, 1978).

Although the ACLU reacts to new laws and threats to liberty, it also lobbies and educates prior to legislation. Because it represents the most vulnerable at times of war or natural emergency, it often engages in great internal debates and endures hostile public opinion. A few examples culled from its eight decades reveal these tensions and consequences. Initially, the ACLU developed in the post–World War I years when the National Civil Liberties Union worked on behalf of the rights of conscientious objectors who had been imprisoned and fined during the war. Recognizing that the expanding reach of government would affect civil liberties beyond conscientious objection to war, Roger Baldwin proposed to establish a new organization whose mission would be dedicated to protecting all civil liberties. In January 1920, the ACLU began its work with Baldwin, Crystal Eastman, and Albert DeSilver among its founding members. Unlike other civil rights organizations, which were dedicated to a particular group or cause, the ACLU's founding principles called for the defense of civil liberties regardless of the person or organization professing the views.

Subsequent to World War I, the ACLU concentrated on labor's right to organize. In the absence of federal labor legislation, states frequently enacted laws restricting union organizing. In the 1920s, Attorney General Palmer arrested hundreds of immigrant union organizers and activists under the allegation that they were anarchists and terrorists. The Palmer raids led to the deportation of hundreds of immigrants and their families and affirmed the ACLU founders' beliefs that the Bill of Rights applied to more than just conscientious objection to war. In the 1920s and 1930s, the ACLU defended union activists and opposed the anti–civil libertarian restrictions that had stemmed from World War I. Significantly, dedication to protecting free speech also raised the issue of whether to protect the liberty interest itself, or the speaker. In 1937, when the National Labor Relations Board sought to restrict the Ford Motor Company's distribution of literature opposing the organization of its workers, the ACLU faced intense debate within its ranks because of its historical support of labor. Although the free speech principle led the ACLU to support Ford's position, the incident highlighted the complexity often faced by the ACLU in defending free speech.

As federal labor legislation increasingly protected employees, the ACLU responded to new challenges as religious groups such as Jehovah Witnesses were restricted from proselytizing and were punished for refusal to recite the Pledge of Allegiance in public classrooms. Often working in conjunction with the Jehovah Witnesses' attorneys, the ACLU defended the freedom to leaflet, sell literature, and exercise their religion. Young Jehovah's Witnesses following their biblical understanding to follow no other gods were expelled from schools for refusing to pledge allegiance to the flag. In an early case, the Supreme Court upheld school suspensions, but subsequently, in the midst of World War II, the Court rendered one of the most famous maxims in American constitutional history: "If there is any fixed star in our constitutional constellation, it is that no official, high or petty, can prescribe what shall be orthodox in politics, nationalism or other matter of opinion or force citizens to confess by word or act their faith therein" (*West Virginia v. Barnette,* 1943). Thus, the ACLU through many individual cases helped develop case law protecting religion and speech.

World War II brought President Franklin D. Roosevelt's executive order to designate military zones excluding Japanese Americans from residing within, thus leading to the internment of over 100,000 persons. The ACLU, despite great internal discord on whether to contest the president's wartime actions, challenged the president's executive order. The Supreme Court eventually upheld the president's right to detain the Japanese Americans, but the ACLU litigated after the war to restore rights lost by the detainees.

World War II again raised questions of conscientious objection to war and whether a segregated military violated the rights of African American soldiers. These issues constantly confronted the ACLU to determine how to support national efforts at defeating dictatorships without conceding the right of the United States to engage in unconstitutional activities. Whether supporting conscientious objectors, challenging internment procedures, or defending free speech in the Cold War, such controversies subjected the ACLU to intense internal debate and external criticism.

Defending unpopular minorities reached its high point when the ACLU decided to defend the right of an American Nazi to march in Skokie, Illinois, in 1977.

Initially rebuffed from marching in Marquette Park in Chicago, he sought permission to march in nearby suburbs. When Skokie requested a $350,000 bond, the ACLU was asked to contest the restrictions on free speech. Jewish residents composed almost half of Skokie's population and a significant number were survivors of the Nazi Holocaust. The tension between free speech and harm to a community's citizens could not be more marked. Skokie then enacted three ordinances that banned, in part, symbols offensive to the community and material that incited hatred based on race, national origin, or religion. The Illinois chapter, with the national ACLU's endorsement, challenged the ordinances. The federal district court, granting an injunction, reaffirmed that the First Amendment precludes government from restricting expression because of its message, its ideas, its subject matter, or its content. Although prevailing at court, the ACLU's Skokie case raised national questions of how far freedom of speech should be protected when its consequences harmed those receiving the speech. The ACLU became the center of controversy itself, and thousands resigned their membership.

Other areas reveal the difficulties of defending the concept of liberty as one person's liberty may infringe another's freedom. The First Amendment protects the exercise of religion and prohibits government establishment of religion. Throughout the 1940s, the ACLU filed numerous briefs supporting the free exercise of Jehovah's Witnesses to stand on streets and proclaim their religion. They helped defend public school children who believed their religion would be violated if they pledged allegiance to anything or anyone other than their God. Subsequently, the ACLU's position on the establishment clause led to litigation contesting perceived religious partnerships with government, championing the metaphor that the Constitution guarantees separation of church and state. But that separation may infringe one's free exercise when courts remove familiar symbols such as Ten Commandments from parks and courthouses, eliminate prayer from public schools, or delete "under God" from the Pledge of Allegiance. Many other legal organizations have since argued that the ACLU limits liberty because free exercise permits more public recognition of religion, and establishment jurisprudence does not call for a strict separation of church and state.

The growth to meet expanding issues has not occurred without controversy. By seeking to protect any violation of rights, the ACLU confronts the question of how to protect all civil liberties without turning allies into opponents. The Skokie case and the religious freedom cases reveal this intrinsic stress point within a large national organization. Protecting individual liberties during the Cold War called on the ACLU to decide how to protect the liberties of those accused of subverting our government while supporting a rule of law that permitted such challenges. State chapters and interest-related programs often view issues from their context and disagree with the national leadership. Local-national perspectives may place different priorities on developing issues involving racial discrimination, women's rights, sexual orientation, traditional concepts of marriage, or the rights of the foreign-born leading to conflicts within the ACLU. New challenges arise. Technologies unimagined by the drafters of the Constitution provide greater information to government, but raise complex issues involving privacy and freedom of speech. Shortly after September 11, 2001, Congress enacted the USA PATRIOT Act containing provisions granting access to private information, restricting immigrants, limiting legal recourse against government action, and increasing surveillance and monitoring of citizens. The ACLU has contested broad interpretation of the act and lobbied to eliminate provisions during renewal legislation. Although internal and external critics challenge the ACLU as subverting traditional values or strengths in a time of war or great social change, the ACLU has encouraged more speech and more ideas to help determine how best to define liberty in the 21st century.

To some extent, the ACLU remains reactive to laws that affect liberties. Its defense of the vulnerable has raised significant deliberations of how to protect liberty against government encroachment. Through its lobbying and educational efforts, it not only encourages greater citizen involvement but also attempts to persuade government officials to enact legislation that secures the national defense without trampling on individual liberties. The ACLU's history of defending those who are threatened, seeking more transparency in government action, and educating the public calls government to accountability and serves to ensure the continued vitality of the Bill of Rights' protections.

—Craig B. Mousin

American Federation of State, County and Municipal Employees

The American Federation of State, County and Municipal Employees (AFSCME) is the largest public services union in the United States. The union seeks to promote economic and social justice in the workplace. AFSCME is an affiliate of the American Federation of Labor and the Congress of Industrial Organizations (AFL-CIO).

The constitution of the AFSCME lists seven objectives for the organization. The first four objectives center on membership: (1) to promote the organization of workers in general and public employees in particular, (2) to promote the welfare of the membership and to provide a voice in the determination of the terms and conditions of employment, (3) to promote civil service legislation and career service in government, and (4) to provide research and educational services. The remaining three objectives focus on AFSCME cooperation with other constituencies: (5) to foster cooperation among affiliates; (6) to cooperate with labor organizations and others to justly distribute the material riches of American society; and (7) to work with people in other lands to improve the conditions of work in all countries, toward the diminution of international tensions.

The AFSCME has more than 1.4 million members. They work in child care centers, corrections facilities, government facilities, hospitals, offices, schools, and universities. Approximately 45% of its members work in county and municipal governments and for school districts. State government workers account for approximately 37% of the union's membership. College and university and nonprofit members compose 10% of the union's membership.

The officers of the AFSCME include the international president, the international secretary-treasurer, and the international vice presidents. There is an international vice president for each of the union's 24 legislative districts. In addition, some districts have two or three international vice presidents based on their concentration of members. All sovereign powers of the union rest with its biennial convention; however, a special convention for specific purposes can be called at any time by the international executive board or by the request of any 10 legislative districts. The headquarters of the union is, by its charter, in the Washington, D.C., metropolitan area.

In 1965, the AFSCME held a special convention to create a "Bill of Rights" for its membership as part of a campaign by International President Jerry Wurf to emphasize union reform and union democracy. The Bill of Rights for the union membership emphasized eight areas: (1) equal opportunity in union membership, (2) active and free discussion of union affairs, (3) the right to conduct internal union affairs free from employer domination, (4) free and democratic elections at all levels of the union, (5) equal rights by members to run for and hold office, (6) a full and clear accounting of all union funds, (7) full participation in all union decision making, and (8) a fair trial with strict due process for any member or officer charged with wrongdoing.

The AFL chartered AFSCME in September of 1936. At that time the primary focus of the union was to lobby to pass or strengthen civil service laws. After the AFL-CIO merger in 1955, the union began stressing public workers' rights and collective bargaining as a means to improve the working conditions of its members.

Around 1970, the union began to focus on political action in its efforts to increase its membership and as a means to increase its power. Currently, the AFSCME views itself as an important participant in dialogues concerning a variety of critical political and national issues. The AFSCME has sponsored political advertising and grassroots political campaigns supporting Medicare and other government entitlement programs.

Through its pension program, the union has established a program to conduct shareholder proxy campaigns targeted toward restraining excessively generous executive compensation packages.

The current emphasis on political power has sparked an ongoing debate on the nature and appropriateness of political activity by public employee unions. This debate is framed around potential conflicts of interest. The argument goes as follows: Public sector employees in a "monopoly position" pay union dues that then support and elect self-interested political officials who in exchange for continued campaign contributions are co-opted to the self-interested demands of the unions in subsequent contract negotiations. These inherent conflicts of interest lead to self-reinforcing cycles of inefficient and dysfunctional government actions and public policy that, in turn, lead to higher taxes at every level of government. Such potential conflicts of interest are not unique to unions; they also could apply to corporations, PACs, and other interest groups.

—Frank L. Winfrey

American Federation of Teachers

The American Federation of Teachers (AFT) is a labor union that represents teachers and other educational workers. It is a national organization of over 1 million members, over 40 state groups, and over 3,000 local groups. Founded in Chicago in 1916, it is affiliated with the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO). The mission of the AFT, adopted in July 2000, is to improve the lives of their members by representing their aspirations and strengthening their institutions. The AFT Web page states several beliefs that the organization advocates: high academic and conduct standards for students, greater professionalism for teachers and school staff, cooperative problem solving and workplace innovations, and high-quality health care provided by qualified professionals.

The AFT has five divisions: teachers; paraprofessional and school-related personnel; local, state, and federal employees; higher education faculty and staff; and nurses and health care professionals. The groups of members elect delegates to biennial conventions where officers are elected and union policy is set. The president and secretary-treasurer are also vice presidents of the AFL-CIO.

The AFT has a long and proud history of proactive political activities on behalf of their members. Early teachers' contracts included dress and social strictures with some districts banning union membership. The 1932 Norris-LaGuardia Act outlawed such contracts. During the McCarthy years, the union defended their members' academic and personal freedoms. One of the first groups to extend full membership to minorities, they were also heavily involved with the Civil Rights Movement, with their emphasis on desegregation of schools and voter registration drives in the South. During the 1960s, teacher militancy began with a 1-day walkout in New York City. More than 300 teacher strikes followed across the country, leading to comprehensive contracts with higher pay and better benefits. By 1970, membership numbered over 200,000. Since then, the union has been involved in the fight against tuition tax credits, educational reform, and educational standards. By 2005, there were 1.3 million members and 43 state affiliations.

The AFT has been criticized for putting their support of liberal political and economic activities before the education of children. The union officers and elected representatives choose which activities to support without a vote from the membership. The AFT social agenda is international as well as liberal and, as a result, sometimes these activities are not what individual union members would choose. Other criticisms are that the dues are very high and that union officials are too generously compensated.

American Institute of Certified Public Accountants (AICPA)

The American Institute of Certified Public Accountants (AICPA or the Institute) is the premier national, professional organization for certified public accountants (CPAs) in the United States and its territories. Although the majority of its active members are employed by either public accounting firms (39%) or in industry (42%), its members also occupy positions in law, consulting, government, and education.

A significant portion of the Institute's efforts relate to ensuring the ongoing professionalism of the Institute's members, primarily in the areas of accounting, auditing, and taxation. This is an extremely important part of the Institute's efforts, as it directly supports the critical role that CPAs have in relation to one of their primary functions—performing audits of the financial statements of public, private, nonprofit, and governmental organizations. This assurance function is an important component of the U.S. economic system, as it provides investors and creditors with independent verification that a company's financial statements have been prepared on a consistent basis in accordance with generally accepted accounting principles.

In addition, the AICPA seeks the highest possible level of uniform certification and licensing standards and promotes and protects the CPA designation. To accomplish this, the AICPA has assumed responsibility for maintaining the Uniform CPA Examination and works through the individual state boards of accountancy to administer the exam throughout the states. The AICPA also requires that its CPA members receive continuing professional education (CPE) to stay abreast of current developments in accounting-related areas and in general business topics as well.

The AICPA's mission is to provide its members with the resources, information, and leadership that will enable them to provide high-quality services in a manner that will benefit the public as well as employers and clients of CPAs. This is accomplished in a variety of ways, including member newsletters, publications (e.g., *The Journal of Accountancy*), educational programs, and special interest divisions of the Institute such as Taxation and Personal Financial Planning. In fulfilling its mission, the AICPA also works closely with state CPA organizations, giving priority to areas where public reliance on CPA skills is most significant. With approximately 335,000 active members, the AICPA serves the accounting profession by representing and promoting the interests of CPAs before governments, regulatory bodies, and other organizations.

The AICPA's history dates back to 1887, when the American Association of Public Accountants (AAPA) was formed in New York City by a group of British chartered accountants and American practitioners. One of the results of the Industrial Revolution in the United States was that a high degree of public reliance was beginning to be placed on the financial information provided by accountants. Thus, the founders of the AAPA sought ways in which the public interest might be protected. The AAPA proposed a college of accounts, where a 1,000-hour course of training, overseen by the AAPA, would have to be completed by anyone wishing to enter the accounting profession.

In 1895, the AAPA changed its direction and, instead, focused on securing legislation in the state of New York for the licensing of CPAs, a model more consistent with those used to demonstrate professional competency in other professions. Within a very short period of time, legislation had been passed in eight other states, and by 1925, almost every state had adopted some form of legislation relating to the accounting profession.

In 1917, the AAPA changed its name to the American Institute of Accountants and remained so until 1957, when it adopted its current name. Ultimately, in 1936, the AICPA merged with the American Society of Certified Public Accountants, which had been formed in 1921 to act as a federation of state societies. The merged organizations remain today as the AICPA. When the two organizations merged, it was decided that full membership in the AICPA should be restricted to CPAs.

The AICPA offers three different levels of membership, each having its own specific requirements. A full member must possess a valid and unrevoked CPA certificate, have passed the Uniform CPA examination, be employed by a firm enrolled in Institute-approved practice-monitoring programs, and agree to abide by the AICPA bylaws and its code of professional conduct (Code). Full membership also requires that individuals remain in public practice and complete a total of 120 hours of CPE during each 3-year reporting period, with a minimum of 20 hours completed each year. Associate membership is limited to those who have passed the CPA examination, but have not yet met their state's other licensing requirements (i.e., experience). Associate members, too, must agree to abide by the AICPA bylaws and its Code. Non-CPAs may belong to the AICPA as section associates provided they are employed by a CPA firm that participates in an Institute-approved practice-monitoring program. Section associates also must agree to abide by the AICPA bylaws and its Code.

The above membership requirements emphasize the prominent role of the AICPA's Code. The Code provides guidance and rules to AICPA members to assist them in performing their professional responsibilities and serving the public interest with honesty, integrity, and high moral standards.

The Code is divided into two major sections, the Principles and the Rules. The Code sets forth six principles—professional responsibilities, public interest, integrity, objectivity and independence, due care, and nature and scope of services. The rules govern the performance of professional services by AICPA members. Technical standards outline more detailed applications and interpretations of the rules. The AICPA bylaws require that members adhere to both the rules and standards.

Since state boards of accountancy, not the AICPA, issue licenses to CPAs, only those agencies have the authority to take actions affecting the status of the licenses issued by that state. Thus, compliance with the Code is left primarily to members' voluntary actions, secondarily to reinforcement by peers and public opinion, and ultimately on disciplinary proceedings brought by the Institute against those alleged to have violated the code. Enforcement is overseen by the AICPA's Professional Ethics division. Since the AICPA cannot affect the licenses of CPAs for violations of its Code, the bylaws of state and territorial CPA societies provide for the societies to participate in a Joint Ethics Enforcement Program so that actions taken by one or more of these societies or the AICPA are in the names of both the society and the AICPA.

When alleged violations of the Code come to the attention of the AICPA's Ethics division, the division investigates the matter under due process procedures. Depending on the facts found in the investigation, the Ethics division has the option to take a confidential disciplinary action, settle the matter with suspension or revocation of membership rights, or refer the matter to a panel of the Trial Board division for a hearing. The bylaws mandate publication of the member's name in *The CPA Letter* published and distributed to the membership of the AICPA if the member is found guilty or is suspended or expelled.

As the premier professional organization representing CPAs, the AICPA has sought to serve the interests of both its membership and the public for over 120 years. It is through its Code that the public interest is protected.

American Management Association (AMA)

The American Management Association (AMA) is a global not-for-profit, membership-based association. It was on March 14, 1923, that the National Personnel Association changed its name to AMA on the ground that the members of the former association believed that the personnel manager should have complete and final authority in all matters concerning employees. AMA has an interesting descent in a line from various progenitors. In 1922, the National Personnel Association was formed by the merger of the National Association of Corporation Training and the Industrial Relations Association of America. The National Association of Corporation Training was founded in 1913 as the National Association of Corporation Schools, while the Industrial Relations Association of America was founded in 1918 as the National Association of Employment Managers. Soon after the AMA was founded, AMA merged with the National Association of Sales Managers in 1924 and acquired the International Management Association in 1957 to form the AMA International.

AMA had issued various kinds of monthly or periodical membership magazines including *Management Review.* This professional publication dealt with topical issues. Concerning business ethics and society, it featured articles on the changing social environment in the1970s and stakeholder negotiations. AMA formed its Supervisory Management Association and issued the booklet-sized membership magazine *Supervisory Management* in 1955. AMA founded its own publishing division AMACOM in the 1960s. AMACOM publishes numerous titles concerning management, business, and personal development and some guides to promote business ethics and ethical leadership.

AMA played a major role in investigating the lack of job opportunities for minorities and establishing equality at work places. Before the War, AMA researched the job opportunities for African American factory workers in 1942 and reported on a study on lack of opportunities for women in 1943. These studies and reports made an impression on corporate managers and the business community. During and after the War, AMA and its publishing departments worked on social security, minimum wages, collective bargaining, and fair trade problems. In the post-War economic reforms, AMA made its attitude clear by employing a catchphrase "Greater Productivity through Labor-Management Cooperation." As the post-War economic boom ended, the business community assigned AMA to play a role in the field of management education and ethics training programs.

Every year, AMA issues the Corporate Values Survey.

The mission statement of AMA is as follows: AMA provides managers and their organizations worldwide with the knowledge, skills, and tools they need to improve business performance, adapt to a changing workplace, and prosper in a complex and competitive business world. AMA encourages managers to continuously enhance their professional and personal development and increase their value to their organizations. In 2005, more than 3,000 organizations and 25,000 individuals in 89 countries are members of the AMA, and most of the Fortune 500 companies adopt AMA seminars and its training programs.

American Medical Association (AMA)

The American Medical Association (AMA) is the largest and most influential organization representing medicine in the United States. The AMA was founded in 1847 with the aim of improving medical education and establishing a code of medical ethics (and thereby improving the status of the profession). Today, the AMA maintains those aims within its more general advocacy for the welfare of physicians and the health of the public.

The AMA is both a membership organization and an umbrella organization; that is, physicians can join as individuals (roughly a third of physicians do so), but the House of Delegates consists of representatives of specialty organizations (e.g., the American Academy of Pediatrics) and state medical societies (e.g., the Michigan State Medical Society). Each of these organizations has its own method of choosing delegates. The officers of the AMA itself (its president, board members, etc.) are elected by the House of Delegates. The duality of this structure creates certain internal conflicts: Funding comes from the dues of the individual physician members, but policy is made by the House of Delegates.

Five AMA councils advise the House of Delegates as well as produce authoritative statements on their own. They are the Council on Ethical and Judicial Affairs (CEJA), the Council on Long Range Planning and Development, the Council on Medical Education, the Council on Medical Service, and the Council on Science and Public Health.

The AMA publishes the highly respected *Journal of the American Medical Association* (founded 1883) and contributes to the publication of nine important *Archives* (not literally archives but peer-reviewed professional journals for particular specialties). They are the *Archives of Internal Medicine*, the *Archives of Neurology*, the *Archives of Ophthalmology*, the *Archives of General Psychiatry*, the *Archives of Pediatrics & Adolescent Medicine*, the *Archives of Dermatology*, the *Archives of Otolaryngology—Head & Neck Surgery*, and the *Archives of Facial Plastic Surgery.*

Members are offered various kinds of assistance in medical practice: They can, for instance, purchase a demographic analysis of areas where there are high numbers of potential patients. The AMA's "Physician Select" is an online database including virtually every licensed physician in the United States and its possessions; listings of AMA members offer considerably more information than listings of nonmembers. Osteopaths, the only other group of physicians recognized in the United States, are accepted as members of the AMA and are listed in the Physician Select database.

The code of ethics adopted in 1847 closely resembled Thomas Percival's 1803 *Code of Medical Ethics*, a document marking the move from vague oaths of honor to codified behavioral requirements. The AMA was the first national assembly of professionals to propose a code of conduct for all its members and the first to present it as an explicit social contract between the profession, its patients, and the general public. The original code has been revised several times; in the 1950s, there was an attempt to separate etiquette from ethics and in the 1970s, to separate law from ethics. Today's code includes, besides nine statements of basic principle, the opinions of the Council on Ethical and Judicial Affairs (CEJA). These address nearly 200 topics, ranging from the use of placebos through assisting a suicide, testifying in court, and patenting medical inventions. CEJA Reports, giving the rationale for these opinions, are available separately.

The AMA has been highly influential in the politics of health care. Its two aims—to promote the interests of physicians and the health of the general public—are often mutually reinforcing. Early efforts to improve and standardize physician education not only strengthened the social and economic status of doctors but also protected the public from quackery and fraud. Today, the AMA lobbies for reform of medical legal liability, and argues that protecting doctors would lessen incentives for them to leave practice or areas of practice. Similarly, the AMA lobbies for increasing the reimbursement for Medicare patients, arguing that this would encourage more physicians to accept such patients.

The two aims—physician well-being and patient welfare—can also conflict. When the Roosevelt administration proposed universal health care in the 1930s, the AMA opposed it; 30 years later, when Congress was considering Medicare, the AMA lobbied against it. Nevertheless, by 2001, the organization's rarely revised central "principles" were changed to include the idea that physicians should support access to medical care for all people.

In recent decades, the organization has been involved in several controversies. In the late 1990s, it entered into a contract with Sunbeam, allowing the manufacturer to use the AMA's logo in return for payment (as opposed to simply giving a seal of approval to all products that meet certain standards, as the American Dental Association does). The subsequent uproar led the AMA to break its contract with Sunbeam and draw up guidelines for interactions with industry. In the early years of the 21st century, a more complex controversy had arisen over the organization's acceptance of pharmaceutical industry funds in its campaign discouraging doctors from accepting gifts from that same industry.

Recent decades have also seen a number of progressive initiatives and programs. The AMA expressed early opposition to discrimination against HIV/AIDS patients. In 1986, it stopped investing in tobacco funds and encouraged medical schools and universities to do the same; in 1995, *JAMA* published a significant selection of previously secret documents from the tobacco industry (culled from the millions of pages made available through legal proceedings). Currently, the AMA is promoting healthy lifestyles and working to eliminate health disparities (particularly between races). In 1997, the AMA established its Institute of Ethics, a forum for grappling with emerging ethical issues such as those that arise from genetic science, the rise of managed care, and the growing influence of the pharmaceutical industry on drug trials. In response to the latter concern (which has included at times industry control over which results are published), the AMA has called for a comprehensive, publicly available database of clinical trials.

Americans with Disabilities Act of 1990 (ADA)

The Americans with Disabilities Act (ADA) gives individuals with disabilities the same types of civil rights protections that are provided to individuals on the basis of race, sex, national origin, and religion. The ADA is modeled after the Rehabilitation Act of 1973, which applies to federal contractors and grantees. In contrast, the ADA applies to private employers (of 15 or more employees), state and local governments, employment agencies, and labor unions. Discrimination in all employment practices is prohibited (e.g., job application procedures, hiring, firing, promotion, compensation, training, etc.). The ADA also prohibits discrimination in public accommodation and requires transportation and communication systems to facilitate access for people with disabilities.

Since the act's passage in 1990, the courts have been working to define the meaning of its terms. The definition of the term *disability* was particularly problematic. In June 1998, the Supreme Court decided that the definition of "disability" included both major and minor impairments. Under this ruling, the definition of disability covers a wide range of conditions, such as HIV, cancer, dyslexia, and bad backs. However, this broad definition was later restricted in 2003, when the Equal Employment Opportunity Commission (EEOC) ruled that a condition only qualifies as a disability if it substantially limits a major life activity. As defined by the EEOC, these major life activities include seeing, hearing, speaking, walking, breathing, performing manual tasks, learning, caring for oneself, and working.

Not all people with disabilities are covered by the ADA. Individuals qualify for ADA protection only if they can perform the *essential functions* of the job. As with the term *disability*, the definition of essential function can be a challenge to pin down. One well-publicized case where this definition was particularly problematic involved professional golfer Casey Martin. Martin suffers from Klippel-Trenaunay-Weber syndrome, a degenerative circulatory disorder that obstructs the flow of blood from his right leg to his heart. Due to the severe pain caused by this progressive disease, Martin was physically incapable of walking an 18-hole golf course. Walking would not only cause him pain but also create a risk of significant injury. Martin applied to the PGA for permission to ride a cart in PGA tournaments while other players were walking the course. The PGA refused and Martin sought protection under the ADA. The core issue in question was whether walking the golf course was an essential function of playing professional golf. Eventually, the Supreme Court ruled in Martin's favor, deciding that he could use a cart because using the cart would not alter the game in any fundamental way. In other words, walking the court was deemed to not be an essential function of golf. When an individual qualifies for ADA protection (i.e., the disability impairs a major life activity but the individual is still able to perform the essential functions of the job), firms are expected to provide *reasonable accommodations* to the individual as long as the act of providing these accommodations does not present an *undue hardship* for the firm.

AMORALITY

The term *amoral* is usually used to refer to decisions or persons that are said to be void of ethical values or removed from the moral realm. A decision is amoral if it is made without taking ethical factors into consideration. Persons are said to be amoral when they do not incorporate moral principles, concepts, or codes of conduct in their decisions, actions, or behaviors.

Usually, decisions that are said to be amoral are those decisions that are based on criteria that are believed not to include values such as justice, fairness, and equality. For example, a decision to close down a plant is said to be an amoral decision if it was made solely based on economic parameters. The well-being of the labor, employees, and communities attached to this plant are not included as decision criteria. Managers are regarded as amoral when they are guided by their concern for the economic performance of their companies while paying no attention to any social or human considerations. The phrase "business is business" embodies the essence of amorality. It implies that morality is not applicable in the domain of business.

Some scholars consider the notion of amorality to be a pure version of Adam Smith's perception of capitalistic behavior. The main idea is that common good is achieved by the pursuit of self-interest. Business decisions, practices, and activities are only concerned with the pursuit of profits, and no moral purpose is incorporated. This approach to business decisions, practices, and activities is sometimes referred to as the *theory of amorality*.

Two Types of Amorality

The amoral person may intentionally or unintentionally not subject decisions, actions, or behaviors to moral evaluation. Such a distinction led some scholars to identify two types of amoral persons—intentionally amoral and unintentionally amoral. The intentional amoral person consciously and deliberately chooses not to acknowledge ethical considerations in his or her deliberations. The unintentional moral person, on the other hand, does not subject his or her decisions, actions, or behaviors to moral evaluation due to carelessness or lack of sensitivity or knowledge.

A manager who holds that the realm of ethics and that of business are separate is an intentionally amoral person. He or she deliberately excludes ethical notions from the spheres of business. For example, an intentionally amoral manager may reject a proposal to expand an investigation of the effects of a new drug on patients that extends beyond the requirements of the Food and Drug Administration on the grounds that a concern for the implications on the well-being of patients beyond what is required by law is not within the scope of business. The sole criterion for evaluating proposals is their impact on the corporation's financial bottom line. On the other hand, an unintentionally amoral manager may include height as a selection criterion when hiring construction workers, for example, without considering the negative impact that this criterion would have on women and certain minorities. Women and some minorities may be systematically excluded from the hiring process due to their disadvantage on height when compared with average white males. In this example, the manager did not take the care to consider the moral implications of his or her decision criteria. He or she was thus unintentionally amoral.

Morality

To better appreciate a discussion of amorality, it is useful to understand the different contexts, approaches, and philosophies of morality.

Three Definitions of Morality

The term *morality* frequently is used in three different ways. First, morality may be used to refer to a set of beliefs that is held by an individual. Second, the term may be used to refer to a set of beliefs or a system of principles and judgments shared by a society, culture, or community. Third, the term may be used to refer to philosophical codes of behavior.

Three Philosophies of Morality

Three major philosophies of morality include moral absolutism, moral relativism, and moral skepticism. First, moral absolutism refers to the belief that right and wrong are determined by absolute standards. Individuals who believe in moral absolutism would hold that their set of beliefs is universal and appropriate for application globally. Managers who believe in moral absolutism would adhere to a certain code of conduct and be guided by it in whichever society or community they conduct business.

Second, moral relativism refers to the belief that right and wrong is different from one society to another. Individuals who believe in moral relativism would hold that right or wrong behaviors depend on the society or community in which the behavior occurs. Managers who believe in moral relativism are more likely to acknowledge the international context in which they conduct business.

Third, moral skepticism, which is closely related to moral nihilism, contends that moral statements are neither true nor false. Moral skepticism supports such a claim through doubting the possibility of moral knowledge, its justifications or logical arguments, and moral truth or facts. Moral skepticism may be regarded as the polar opposite to moral absolutism. While moral skeptics zealously support their position, opponents of moral skepticism assert that it is dangerous and absurd. It is useful to understand moral skepticism and compare it with amorality, because there are slight differences.

Amorality and Moral Skepticism

Amorality is different from moral skepticism. As previously stated, an amoral person is a person who does not subject his or her decisions, actions, or behaviors to moral evaluation. Moral skepticism, on the other hand, is the belief or ideology that asserts that moral statements are neither true nor false. Amorality does not correspond to moral skepticism. In the case of an amoral agent, not subjecting decisions, actions, or behaviors to moral evaluation does not necessarily mean that the agent doubts the truthfulness of moral statements. The agent, intentionally or unintentionally, just does not subject his or her decisions, actions, or behaviors to moral evaluation. In contrast, a moral skeptic, or nihilist, would refuse to even acknowledge moral evaluation of decisions, actions, or behaviors. He or she would challenge the truthfulness and philosophical basis of the moral statement itself.

An intentional amoral manager may develop a work schedule that does not provide accommodations for some minorities to observe certain religious holidays. The manager would defend his or her position arguing that the moral obligation to provide such accommodations should not have an effect on business decisions since such issues do not apply to business decision making. An unintentional amoral manager may also fail to provide such accommodations, but for a different reason. He or she may not have been careful enough to incorporate certain accommodation criteria in his or her decision-making process; he or she may have been just careless or inattentive to ethical facets. A moral nihilist, in contrast with the intentional and unintentional manager, would question the truthfulness of the obligation itself. The moral nihilist would argue that the statement "minorities '*should*' be accommodated to observe religious holidays" could neither be regarded as true or false.

Amorality, Consequentialism, and Deontology

Consequentialism is a moral concept that evaluates the rightness or wrongness of decisions, actions, and behaviors in light of their consequences. A decision, action, or behavior is deemed right, or ethical, if it results in favorable consequences. If the consequences are unfavorable, the decision, action, or behavior is deemed wrong, or unethical. Utilitarianism is one of the most widely known types of consequentialism. For example, according to one version of utilitarianism, broadening the scope of investigating the side effects of a new drug on patients beyond what is required by law would be justified and morally right if it would make the aggregate benefit to all concerned parties higher than it is in the absence of such an investigation. Note that the justification for building the day care facility is the conclusion that the aggregate welfare of all concerned parties is enhanced. The criterion for justification is the outcome, or consequence.

In contrast with consequential ethics, which considers the results of an action or decision in determining its appropriateness, deontological ethics is an approach that considers the nature of the action or decision itself in determining its ethics. Kantian ethics is a main strand of deontological ethics. According to

Kant, ethical evaluation is based on duty. It is one's duty that mandates certain actions and decisions, regardless of the outcomes. For example, a justification for broadening the research scope of investigating the side effects of a new drug on patients beyond what is required by law, discussed in the pervious example, would be justified based on the obligation that the company has toward its customers, not the conclusion that such an investigation would make all concerned parties better off. The consequences of this project have no bearing on the rightness and wrongness of the decision.

Some scholars argue that decisions that are usually referred to as amoral are in fact a restricted or limited form of consequentialism. Managers who only consider economic parameters are usually deemed amoral. However, since the decisions of the amoral agent rely on certain criteria and are aimed at achieving a certain outcome, then such an agent may be regarded as a consequentialist. Managers who base their decisions on economic parameters only aim at achieving a desired financial objective for their organizations and maximizing the wealth of their investors. For these managers the outcome matters. Consequences matter. The manager, in this case, did not lack a code of conduct. The manager was always aware of the appropriate behavior. For such a manager, the financial performance of the organization and the wealth maximization for investors were the guiding ethical notions. According to this view, a manager is considered to be amoral if he or she does not incorporate deontological notions of ethics in his or her moral evaluation and only adopts a limited version of consequentialism where the only evaluation criterion is shareholder wealth maximization.

Distinctions Between Amorality and Immorality

Amorality should not be confused with immorality. In contrast to an amoral person who does not incorporate moral considerations in his or her decisions, actions, or behaviors, an immoral person has a clearer sense of moral dimensions of his or her decisions, actions, or behaviors. This person is aware of the applicable codes of conduct. However, such codes of conduct are not followed. Consequently, the behavior of the amoral person is not influenced by any codes of conduct. The immoral person, on the other hand, acts in a manner that conflict with sound ethics. The immoral person elects to do wrong and is aware of it and acknowledges his or her wrongdoing, even if only admitted to himself or herself.

In contrast to the two types of amorality—intentional and unintentional—according to Ronald D. Milo, Aristotle depicted two types of immoral behavior—wickedness and moral weakness. A wicked person deliberately acts in an immoral way. A wicked person prefers to act in the way he or she does by committing a wrongdoing. In contrast, a morally weak person is overpowered by external forces and circumstances that he or she cannot resist. The morally weak person prefers not to act in an immoral manner, but he or she ends up committing a wrongdoing. Moral weakness results from a weak will, not from ill intentions or motives.

Amorality in Business Ethics Literature

In business ethics literature, the term *amoral manager* refers to a manager who does not subject his or her decisions, actions, or behaviors to moral evaluation. The term *amoral decision* refers to decisions that do not incorporate ethical factors or standards into the decision-making criteria. The following are two examples of how the notion of amorality has been used in business literature.

Models of Management Morality

Archie B. Carroll proposed three models of management morality—moral, immoral, and amoral. First, moral managers are those managers who incorporate ethical values into their decisions, actions, and behaviors. They follow ethical principles or an ethical code of conduct. They believe that ethics applies to business and business practices. The operational strategy of moral managers is to maximize shareholders' wealth through appropriate means and within the bounds of ethics. For example, a moral manager would consider the social and moral implications of the contents of a computer or video game when marketing such a product. He or she will market it to the appropriate customer segment with the appropriate rating.

Second, immoral managers knowingly violate ethical codes of conduct, usually in pursuit of their self-interest at the expense of others. The operational strategy of immoral managers is maximizing shareholders' wealth through any possible means. For example, the concern of an immoral manager would be to maximize profits from marketing a computer or video game even if the content would have a negative social or moral impact on the target market, which, in this case, are usually children.

Third, in contrast to moral and immoral managers, amoral managers are those managers who do not subject their decisions, actions, or behaviors to moral judgment. Their decisions, actions, and behaviors are void of moral content. Amoral managers may be intentionally or unintentionally amoral. For example, an amoral manager would not incorporate the social or moral impact of the content of a computer or video game on the customers. To the intentionally amoral manager, such considerations are irrelevant to business decision making. To the unintentionally amoral manager, such considerations are excluded due to carelessness, inattentiveness, or lack of ethical perception.

Carroll also proposed two hypotheses regarding the three models of moral management. The first, the population hypothesis, suggests that the majority of managers are amoral. The second, the individual hypothesis, suggests that the majority of the decisions made by an individual manager are amoral. Carroll's hypotheses suggest that the amoral model of management is the dominant model of management morality. The amoral model of management seems to best describe the moral status of professional managers.

Value Neglect and Value Attunement

Consistent with Carroll's models of moral management, yet investigating decision making in corporate social policy, Diane L. Swanson proposed two ideal types of the decision-making process—value neglect and value attuned. First, in the value neglect ideal type of decision making, the decision maker is one who perceives that values are irrelevant to the decision-making process. Normative myopia characterizes the policy formulation process. The resulting corporate social responsiveness is of the "value neglect" ideal type.

Second, in the value attuned type of decision making, the influence of personally held ethical values on the decision-making process is acknowledged. Normative receptivity characterizes the policy formulation process. The resulting corporate social responsiveness is of the "value attunement" ideal type.

The value neglect type of decision making proposed by Swanson is similar to the notion of amoral decision making. The value attunement ideal type of decision making is similar to the notion of moral decision making.

Anarchism

Anarchism is the doctrine or theory that the state is immoral and unjustified and that society may flourish without any coercive governmental institutions. Anarchism (from the Greek *an archos*, without a ruler) is not a synonym for chaos or violence but a critique of the state and a theory of how voluntary interaction and organization allows individuals to flourish freely. As a philosophy, anarchism has arisen in the modern period, though one may discern anarchistic suggestions in the ancient Greek Stoic Zeno of Citium (fourth to third century BCE) and in the ancient Chinese philosopher Lao Tse (sixth century BCE). There is no single anarchist doctrine, and many anarchists have been antitheoretical, but all anarchists agree on the illegitimacy of the state and emphasize the importance of liberty and autonomy or the significance of equality and solidarity.

Kinds of Anarchism

Anarchists make two types of claims: that the state is illegitimate and that a society without the state is preferable to the alternative. The anarchist typically contends that the state is intrinsically coercive and, therefore, unjust. (Some anarchists, such as Mikhail Bakunin, have accepted the state as necessary in some historical circumstances.) The injustice of the state is explained in terms of how the state transgresses liberty or autonomy, violates rights, or exploits one group or class against another. Others (such as the contemporary economist David Friedman) have argued that the state is immoral on broadly consequentialist grounds: All things considered, anarchy is preferable to government. The anarchist critique of the state is sometimes coupled with attacks on justifications of the state, including the theory of the social contract or the contention that public goods cannot exist without the state. Against the social contract, anarchists remark that almost all states have arisen through acts of violence or conquest. Against the public goods argument, it is pointed out that there may be fewer such goods than commonly claimed and that the public goods that the state arrogates to itself could be generated (if not improved!) through voluntary activities.

One might distinguish two broad classes of anarchists—those on the left and those on the right. Left anarchists have argued for communally based forms of society (socialist or communist anarchists) or for federations of worker-owned firms (anarcho-syndicalists); more recent types of left anarchists include ecological anarchists. Left anarchists emphasize equality and solidarity and seek to overcome not only the coercion of the state but also other forms of domination that may occur between rich and poor, employer and employee, and so on. By eliminating or diminishing the property relations and other unequal social structures created and enforced by the state, individuals will realize their humanity and antisocial behavior will diminish. On the right are individualist anarchists, including market anarchists or anarcho-capitalists, who contend that private property allows for freedom, individual flourishing, and pluralism. The anarcho-capitalist maintains that the protective functions now assumed by the state can be provided by private firms competing to sell both security and adjudication services.

From the perspective of either the left or the right, the anarchist argument runs counter to Thomas Hobbes's well-known argument that a state of nature (anarchy) would be so horrible that all would agree to institute an absolute sovereign. Hobbes's account suggests that without the state certain public goods (indivisible goods from which nonpayers cannot be excluded) would not come into existence. Under conditions of anarchy, even if individuals desire these goods (e.g., security), no one has an incentive to provide them. However, if anarchists are correct, voluntary cooperation is possible. For example, left anarchists suggest that human nature is not, in fact, as corrupt as it has become under the conditions of state capitalism. And individualist anarchists maintain, following the conclusions of game theory, that iterated interactions among individuals provide incentives for cooperation. In this way, so-called public goods could be provided by voluntary contract; for example, private security firms could compete peacefully to provide protective services and adjudication.

Brief History of Anarchism

Some of the earliest instances of anarchist thought are to be found in the work of Étienne de la Boétie in *The Politics of Obedience: The Discourse of Voluntary Servitude*, 1577. However, William Godwin is often taken as the first systematic architect of modern anarchism in *An Enquiry Concerning the Political Justice*, 1793. For him, the object of humankind, happiness, is achieved best without the state generating injustice, violence, and inequality. The thought of Pierre-Joseph Proudhon, the first to use the term *anarchism*, proved more influential than that of Godwin. In his 1840 work *What Is Property?* Proudhon distinguishes illegitimate forms of property (receiving state sanction) from possessions (land or goods) that should be equally available to all. Rejecting revolution and communism, he argues for "mutualism," under which credit banks would lend money without interest.

Mikhail Bakunin was the first to articulate a theory to appeal to large masses of workers, influencing thereby the emergence of anarcho-syndicalism, such as that developed in Spain well into the 20th century. Bakunin's works, including *Statism and Anarchism*, 1873, offer an atheistic anarchism according to which the overthrow of the state will allow for federations of workers' associations. The goal is the moral and material development of each individual's humanity through collective labor.

Unlike Bakunin, who maintained that reward should accord with labor, anarcho-communists, such as Peter Kropkotin, author of *Fields, Factories and Workshops*, 1899, sought the Marxist goal of rewarding each according to need. For Kropotkin, each individual should live an integrated life that includes the work of the field and that of industry. Leo Tolstoy, like Kropotkin, also maintained that the distribution of goods should correspond to need, but Tolstoy based his anarchist philosophy of nonviolence and nonresistance on Christian ideals in *The Kingdom of God Is Within You*, 1894.

In more recent times, left anarchists have included the linguist Noam Chomsky and Murray Bookchin, author of *The Philosophy of Social Ecology*, 1994, and a former communist who turned to anarchism and then adopted a communalist outlook. Against both capitalism and private property, he has sought to decentralize society, so that the locus of governance is at the level of the municipality. There, individuals would meet face to face and in democratic assembly, neither dominating others or nature itself.

Among 19th-century anarchists, there were also thinkers of a decidedly individualist outlook. For example, Max Stirner argued, in *The Ego and His Own*, 1845, for individual egoism and against the state. More prescient is the Belgian economist Gustave de Molinari, who, in *The Production of Security*, 1849, anticipates the arguments of recent anarcho-capitalists that the state should have no monopoly on the provision of security. The classical liberal Herbert Spencer developed a natural rights defense of equal freedom and drew an important distinction between a militant (compulsory and warlike) and an industrial (voluntary and peaceful) society. He influenced several thinkers, including Auberon Herbert, who argued in *The Right and Wrong of Compulsion by the State*, 1885, that state functions must be supported voluntarily.

One of the first of the American anarchists was Josiah Warren. Impressed by Proudhon's mutualism, Warren also defended the idea of self-ownership. In turn, he influenced Benjamin Tucker, who published, from 1881 to 1908, a journal, *Liberty*, devoted to anarchism. Espousing an individualist form of anarchism, bearing the influence of Spencer, Tucker distinguished between violence in self-defense and that initiated against another person. Associated with Tucker's journal was Lysander Spooner, a strong abolitionist and advocate of natural rights, including those of property. In a series of robust essays, *No Treason*, published after the Civil War, he argued that he could not be bound to a constitution that he had not signed.

Among the individualist anarchists of the past 30 years, the most provocative and prolific has been Murray N. Rothbard. An economist of the Austrian School and an anarcho-capitalist, Rothbard contends that individuals have natural rights to life, liberty, and justly acquired property. Such rights entail that one ought to be free of the threat or initiation of force, whether wielded by bandits or agents of the state. Not only is taxation an illegitimate use of force but so is the government's monopoly on security. In anarchy, private protective agencies could provide systems of law and adjudication; other needed services (e.g., roads) could be provided through private firms competing in a market governed by private legal norms.

Problems and Prospects

There exist a variety of objections to anarchism. In a real sense, however, any political theory that attempts to justify allegiance to the state serves as an argument against anarchism. Thus, the classic social contract theory of Hobbes, or that of John Locke, seeks to show why individuals would seek to live in societies governed by a state. More recently, Robert Nozick has sought to explain how, in an anarchy governed by Lockean natural rights and featuring competing protection agencies, a state could emerge without violating anyone's rights.

Criticisms such as these may suggest that the topic of anarchism is far removed from the ethical considerations of markets and commerce. However, there are several anarchist considerations to which business ethicists might attend. Although anarchy typically refers to a whole society functioning without a state apparatus, it may also describe processes at smaller levels. And at this dimension, or at the societal level, business ethicists might consider whether there are self-regulating processes available for ameliorating or solving problems. Second, some business ethicists assume the coherence and strength of a notion of a social contract, but anarchists consistently argue that there is no contract without the consent of each individual. Third, the possibility of the provision of private law and private security raises interesting, albeit hypothetical, questions about the ethics of restitution, as well as the business ethics of private punishment and the nature of impartial arbitration and mediation. Finally, many anarchists speak eloquently of the way in which the apparatus of the state may be taken over by a particular faction or class. When this occurs, the state is no longer a neutral instrument but a blunt one wielded less for the public good than for the interests of a group. State policies and regulations that aim, ostensibly, at some public good may, in fact, serve private interests, including the interests of those whose livelihood depends directly on the state rather than on interactions in society or market.

Animal Rights

Businesses use animals in numerous ways. The fish and meat on the table for dinner come from farms, fish markets, and butchers. Many items of clothing are from the leather industry, the animal dye industry, and the fur trade. Circuses, zoos, and trained-animal fights (such as cockfights) are parts of the entertainment industry. Many cosmetics have been safety tested on animals, and the pharmaceutical and chemical industries each year expend millions of research dollars on millions of animals used in toxicological studies.

Many businesses have internal review committees established, at least in part, to protect the interests of research animals. Their charge is to see that prevailing policies intended to protect animals are properly implemented and that pain and suffering are minimized. Many corporations in the pharmaceutical, chemical, and cosmetics industries have such committees, often with veterinarians and other experts on animals involved in deliberations. However, committees in these industries may intentionally allow a high level of harmful activity, such as the acute toxicity test (increasing doses until animal welfare is seriously compromised). Other industries—such as circuses, slaughter houses, and farms—generally do not use ethics committees for purposes of reviewing their practices (though these industries are regulated by governments in some uses of animals). Concerns in these industries center more on having healthy animals, a pragmatic rather than moral concern.

Differences in the review of uses of animals derives in part from tradition and in part from diverse conceptions of when animals have interests that must, from a moral point of view, be protected.

Do Animals Have Rights?

Animal rights is a generic term that refers to a wide range of accounts of how animals should be protected against human misuse. The language of *rights* derives historically from the need for strong and meaningful protections of citizens in political states against oppression, unequal treatment, intolerance, and the like. Given this history, many framers of declarations about protections for animals chose rights language as the basic terminology. Others interested in animal welfare intentionally do not use the language of rights.

Although the term *animal rights movement* is broadly used, social movements to protect animal interests divide roughly into two (or, when the two are combined, three) different types or approaches: (1) those who believe that animals have rights (animal rightists) and (2) those who believe that animals do not have rights but that humans have obligations to protect the welfare interests of animals (animal welfarists).

A third position situated between these two approaches holds that rights and obligations are correlative, and therefore, whenever an animal has a right some human has an obligation and whenever a human has an obligation to an animal, the animal has a right. Thus, if a farmer has obligations to feed his cattle and abstain from using painful electrical prods, then the cattle have rights to be fed and not to have the pain inflicted.

Animal rightists generally endorse strong positions on rights, for example, declaring that certain animals have a right to life, a right to an uncontaminated habitat, a right not to be constrained in tight cages or pens, and comparable rights. "Rights" are here understood as justified claims that individual animals or groups of animals have and that are binding on human agents and societies. If an individual or group possesses a right, others are validly constrained from interfering with the exercise of that right. A right, then, is a justified claim or entitlement. The position that *animals* have such rights has been regarded by many critics as an inappropriate and innovative doctrine, and some even view it as a radical, revolutionary doctrine. Nonetheless, the view that animals have rights has come to be one of the most important ideas in the literature on animals and human responsibilities for them.

Animal welfarists, in contrast to animal rightists, tend to have more utilitarian and pragmatic perspectives. They acknowledge that humans have a duty not to cause animals avoidable harm, but animal welfarists are generally prepared to use animals for human benefit. Many utilitarians, for example, regard the idea of rights as undercutting the risk-benefit calculus at the heart of utilitarian reasoning. Many animal welfarists accept the view that some level of suffering may be necessary to produce food for humans, to produce products such as leather goods, to use animals to test for the safety of cosmetic products, and even to use animals in chemical and pharmaceutical testing.

Many writers on human uses of animals reject both the animal rightist and the animal welfarist positions. They take human obligations to animals to be either self-imposed obligations or obligations owed only to the owners of animals. The so-called rights of animals are not truly rights; they are ways of restating various provisions that have been or could be made by humans for the protection of animals. Since claiming a right occurs only within a community of moral agents authorized to make such claims, rights and real obligations appear only in human communities. A more appropriate vocabulary than rights, from this perspective, is *charity*, *stewardship*, and *moral ideal.* In this conception, even the idea of obligations of beneficence toward animals should be stated in terms of kindness, compassion, and generosity.

Moral Status

The major issue in moral philosophy about animals and their rights is that of *moral status* (or moral standing). To have moral status is to deserve the protections afforded by the basic norms of morality. The starting question about moral status is "Which individuals and groups are entitled to the protections afforded by morality?" Throughout much of human history, certain groups of human beings (e.g., racial groupings, tribes, or enemies in war) and effectively all nonhuman animals have been treated as less than persons, as not being able to act morally, or as not members of the moral community. The assumption has been that these groups either have no moral status whatever or at least have a considerably reduced moral status.

If animals have no place in the moral community—no moral status—then it appears that humans owe nothing to animals and can do with animals as they wish. On one such account, we owe obligations to the humans who own animals but not to the animals owned. Thus, if a man poisons all the cattle on a dairy farm, he violates a moral obligation to not destroy the owner's cattle, but the man does not violate any obligation to the cattle. The property owner is injured by the action; the cattle that are killed are not wronged.

Many people find this conclusion deeply counterintuitive, and some judge it false and offensive. Others think these questions are difficult to judge because they are at the outer boundaries of proper moral concern. For example, they are like questions about moral obligations to future generations of humans and obligations to the environment. Such questions are at the frontiers of ethics.

To sort through these issues requires examining several underlying issues about the nature of animals and about their moral status. The mainstream approach to the question of what *kind of entity* merits moral protection has been to ask which *properties* of the entity qualify it for moral protection. Some say that there is one and only one property that confers moral status. For example, some say that this property is human dignity—a very unclear notion that moral theory has done little to clarify. Others say that another property or perhaps several properties are required for acquiring moral status—for example, sentience, rationality, or moral agency. Each such property has been developed as a general theory of moral status. The leading theories have turned on (1) distinctively human properties or (2) properties of sentience and other psychological properties such as emotions. Each type theory of moral status now has a considerable body of supporting literature.

The first type of theory, based on distinctively human properties, has long been attractive, because these theories supposedly distinguish humans in the relevant ways from animals and justify the ways in which we traditionally allow human interests to rank higher, have more value, and count for more whenever they are in conflict with the interests of animals. Much of the recent discussion about moral status has centered on the criteria for being a *person*, under the assumption that all and only persons have the relevant distinctive properties for which we are looking.

Most theories of this sort do not restrict themselves to mere human biological criteria and species criteria. The theories tend to telescope to certain *cognitive* properties ("cognition" here refers to processes of awareness and knowledge, such as perception, memory, thinking, and linguistic ability). The thesis is that individuals have moral status because they are able to reflect on their lives through their cognitive capacities and are self-determined by their beliefs in ways that nonhuman animals seem not to be. Properties found in various theories of this first type include (1) self-consciousness (consciousness of oneself as existing over time, with a past and future), (2) freedom to act and capacity to engage in purposive sequences of actions, (3) having reasons for action and the ability to appreciate reasons for acting, (4) capacity to communicate with other persons using a language, and (5) rationality and higher-order volition. Any entity having such higher-level properties has moral status, which confers moral rights.

However, cognitive properties may in the end not confer moral status only on humans. Many writers believe that capacities such as intention, understanding, desire, preferences, suffering, free action, having systems of communication, and having beliefs are not distinctively human, because many animals exhibit significant levels of these capacities. In addition, critics of theories based on the idea of distinctively human properties argue that some creatures deserve moral status even if they do not possess a single *cognitive* capacity. They argue that a *noncognitive* property may be sufficient to confer some measure of moral standing. This opens the way to a second type of theory.

In the second approach, properties that are not cognitive are highlighted. The most frequently invoked properties are those of sensation—especially pain and suffering—but also mentioned are properties of emotion—especially those associated with fear and suffering. As Jeremy Bentham pointed out long ago, the capacity to feel pain might by itself be sufficient for conferring a significant moral status. The emotional lives of animals have long been avoided in scientific literature, where attributions of emotion, intention, and the like have been criticized as an unscientific abandonment of critical standards and precise measurements, as well as an importing of anthropomorpism. Yet many good reasons exist for attributing a range of emotions to animals, and the basis of belief in their emotional life is as good as we have for the attribution of pain and suffering.

Animal Minds

At the root of many of the issues addressed thus far is a rich body of theoretical issues not only about moral status but also about animal minds. Most observers of animal behavior today agree that many animals have capacities to understand and have developed complicated, sometimes elaborate forms of social interaction and communication (whether these qualify as "linguistic" is controversial). Intelligence and adaptation in animal behavior, as explored by ethologists and psychologists, is often inexplicable without acknowledging that animals exhibit understanding, intention, thought, imaginativeness, and various forms of communication. Certain facts of *mental* life in animals do not seem any more in doubt than facts about *physical* processes in these creatures.

Little agreement exists, however, about the levels and types of mental activity in these animals or about the ethical significance of their mental activity. Humans understand very little about the inner lives of animals, or even about how to connect many forms of observable behavior with other forms of behavior. Even the best scientists and the closest observers have difficulty understanding *intention* and *emotion* in animals. Forms of communication in animal communities have proved extremely difficult to grasp. Neither evolutionary descent nor the physical and functional organization of an animal system (the conditions responsible for its having a mental life) gives us the depth of insight we would like to have in understanding the animal's mental states. Even when we have as full an explanation as can be obtained, we still have to decide about an animal, as with a brain-damaged human, whether the individual truly has certain attributed mental states or is just acting *as if* he or she had such states. The more we are in doubt about an animal's mental life, the more we may be in doubt about moral status and issues of rights.

The Problem of Species Preference

Speciesism is a widely discussed term in discussions of animal rights. A speciesist is one who believes that the interests of members of the species *Homo sapiens* are to be favored over the interests of other species. Species membership, therefore, determines whether a creature has moral status.

The term *speciesism* is often used pejoratively by analogy to racism and sexism; in this usage, speciesism is understood as an *improper* failure to respect the lives and rights of animals. Just as gender, race, IQ, accent, national origin, and social status are not relevant properties in moral assessments of humans, neither is species relevant to assessing an animal's moral entitlements. "To each according to species" seems as morally irrelevant and unfair as "to each according to one's skin color." However, speciesism need not be understood in such a pejorative manner. Some speciesists willingly and even enthusiastically accept the label if it is used only to mean placing a moral priority on members of the human species.

In the practical world of how animals should be treated in business and commerce, speciesism may be the major topic that needs to be addressed. The strong human bonds of species preference often override all other considerations. But even if such partiality comes naturally, is this as it should be?

Animal Rights Movement

The animal rights movement is a political movement that ascribes to nonhuman animals some of the same protections that many people recognize as belonging to all humans. It has taken two main tracks. First, there have been diverse activists whose conduct runs the spectrum from those who have made personal choices about animals and have become vegetarian, for example, to those who are much more radical and engage in various public acts of social disruption, upheaval, and, in some cases, even extreme violence. These individuals find grave fault with the way humans treat animals in contexts such as factory farming and agribusiness, the entertainment industry, and in medical experimentation and seek to change practices in these areas. However, this movement also can be depicted as a scholarly and more academic endeavor that has been led by a number of prominent applied ethicists among other concerned individuals. Together the intellectual and activist movements form the backbone of the animal rights movement. And, it should be said, there has not always been a positive reaction to this movement as many see the idea of ascribing rights to animals as wrongheaded and, for some, just plain silly.

The goals of the animal rights movement vary from activist to activist, and not all ethicists who advance the intellectual claims of animal rights agree on a common set of purposes, but there are some positions that present recurring themes. First, the theme of reducing, if not eliminating entirely, the suffering of animals is a position that many advocate. Whether this pain comes at the hand of intentional cruelty or arises from the treatment many animals receive in the commercial sectors of factory farming and agribusiness, suffering is often pointed to as abridging the rights of animals. Second, the issue of the morality of using animals in medical and other forms of experimentation is one that is in the forefront of the movement. Is animal experimentation a form of inhumane exploitation of them, especially if it leads to a reduction in disease for humans and animals?

Third, the issue of using animals for entertainment in venues such as small and confining zoos, circuses, rodeos, and traveling carnivals also present concerns for many advocates. They are especially troubled by the usually poor and degrading treatment that animals receive in such entertainment facilities and there are often news items of petting zoos that report cruelty to animals. Likewise, staged animal fighting and bullfights are highlighted as unacceptable forms of entertainment. Finally, many animal rights advocates seek an end to the hunting and trapping of wild animals where, they say, human pleasure is had through animal pain and suffering. The hotly debated U.K. controversy over the "blood sport" of fox hunting with hounds, which was banned in 2004, is a good case in point.

Animal Rights Activists

On the activist front, any number and variety of groups and organizations can be identified. There is a spectrum of these concerned citizens, and they can be categorized according to the kinds of activities in which they engage. For example, there is the well-known American Society for the Prevention of Cruelty to Animals, founded in 1866. This organization is best known for its support of animal shelters and programs that encourage the humane treatment of animals. The Humane Society of the United States also promotes animal rescue and shelters.

Then there are groups that engage in more direct political action. One such organization is People for the Ethical Treatment of Animals, or "PETA" as it is widely known. With a membership of over 800,000, PETA has staged publicity stunts and supported celebrities urging the public to recognize that animals have certain rights that have been denied to them. One tactic that PETA has used was throwing buckets of red paint on furs in expensive furriers, making the point that minks, sables, and foxes had given their blood so that humans might wear their skins as coats. Other advocates in the movement—variously called "animal liberationists," "animal welfare militants," and "animal terrorists"—have made something of a name for themselves as they engage in the destruction of property to make their case. For example, the Animal Liberation Front (ALF), started in Great Britain in the mid-1970s, has accepted responsibility for much damage to public and private property. In congressional testimony in 2002, the Federal Bureau of Investigation proclaimed ALF, along with the environmental militant group Earth Liberation Front (ELF), a domestic terrorist group.

ALF has taken aim at fur companies, animal farms, restaurants, and animal research laboratories as targets for their illegal direct actions that include raids in which animals are released from their confines and set free. However, the most destructive direct action that ALF has engaged in is arson. Estimates are that this group alone is responsible for losses to commercial and medical research facilities in excess of \$45 million. Adding in the destruction done by environmental militants, the total cost of damages has been placed at more than \$110 million for the decade ending in 2005.

The driving force and major motivation that seems to stand behind these sorts of radical tactics is that the activists are protesting some fairly cruel and unusual treatment of animals in various contexts, but especially their treatment in animal experimentation. Here, the claim is that not only will animals suffer great pain from the actual experiments that they are being used in but that the conditions under which they are kept during the experimentation are inhumane. The unnecessary punishment inflicted on research animals including beatings, inducing fear, cramped living conditions, poor nutrition, and so on has been documented. It is just this sort of inhumane treatment that has prompted radical animal rights activists to engage in the kind of direct actions that get them newspaper headlines. The radicals are also motivated by the mistreatment of animals in agriculture, where they say factory farming creates great pain for all kinds of farm animal. Many other uses and abuses of animals also come under their fire such as sport hunting, especially trapping and "canned hunts" where large and small game is kept within the confines of an "animal preserve" and hunters have an easy time in finding and shooting them.

In Europe, radical antivivisection groups have also formed adding fuel to the animal rights campaign and making it a worldwide phenomenon. In 1999, Stop Huntingdon Animal Cruelty (SHAC) was set up in the United Kingdom with the express goal of closing down Huntingdon Life Sciences (HLS), Europe's largest animal testing laboratory. HLS uses all kinds of animals in its tests of drugs, pesticides, household cleaners, and other substances. SHAC was established after a covert video, taken by PETA revealing much animal cruelty at an HLS facility, was shown on British television. SHAC has used various tactics of direct action against HLS, including the harassment of managers and employees, their families, and any companies that do business with HLS. Even though SHAC openly disavows physical harm to people, in 2001, three men wielding pickax handles and spraying CS gas attacked the HLS managing director.

The SHAC campaign against HLS has gone international as the firm itself grew with clients from around the world. It now has a research facility in the United States and boasts resources from three continents. Protests by SHAC have taken place in numerous countries where HLS clients have their home base. In 2005, SHAC saw success in the United States when the New York Stock Exchange (NYSE) postponed a listing of HLS on the market. The decision to delay a listing for the company came in the wake of a massive e-mail campaign directed at the NYSE. If they are not listed, then the ability of HLS to raise capital will be severely hampered. At the time, HLS was only being traded on a NASDAQ over-the-counter bulletin board as "Life Sciences Research."

In reaction to the radical tactics of some activists and to the general idea that animals actually should be considered as having rights, there has been a backlash of those who hold that the animal rights movement is a misguided one. For example, in the area of animals and medical experimentation, the Foundation for Biomedical Research has been advocating what it calls the humane and responsible use of animals in medical and scientific research. This group tries to expose the radical practices of ELF and SHAC and paint them as primarily criminal acts. It offers the public arguments to demonstrate what it sees as the major benefits to both humans and animals when medical experimentation includes the use of animals but without any mistreatment in the conduct of the research.

Intellectuals and Animal Rights

While it may be thought that the animal rights movement is purely a contemporary one, there are actually a number of well-known thinkers throughout history who have promoted rights for animals or at least for changes in the way that humans treat them. Among the major forerunners of the contemporary movement, Jeremy Bentham (1748–1842) should be mentioned. Bentham, who is recognized as one of the founders of utilitarianism in ethics, also offered an argument for animal rights based on the notion of sentience. This view holds that since animals are aware of their own suffering, they deserve the right to be free from it. For Bentham, it is not a matter that animals can't talk or can't reason; for him the point was that they can and do suffer.

In the 19th century, the German philosopher Arthur Schopenhauer (1788–1860), an antivivisectionist who criticized Christianity for leaving animals out of moral consideration, based his philosophy of animal rights on "universal compassion." He held that even though animals are less rational, they have the same "essence" as humans and as such they deserve our respect. Schopenhauer was likewise critical of the position of the philosopher Immanuel Kant on animals and morality, as Kant had argued that we have no moral duties to animals because they lack reason and only beings that can reason deserve respect. The philosopher René Descartes had gone even further in his understanding of animals when he said that they were akin to machines and so could not be the sort of entities about which we could even say that they possessed rights.

The question of the moral standing of animals has been a central concern for those who have pondered about animal rights. For many, though, the moral significance of animals is essentially a nonissue since they see animals as having only instrumental value for humans. In this strong anthropocentric view, where only humans are considered as morally significant, animals have only one purpose—to serve the ends of humans. In some accounts, the Bible is pointed to as giving man dominion over the world including its flora and fauna, and humans have the responsibility to shepherd the animals of the world to fulfill human need. Yet others see animals as personal property, and their instrumentality as pets or as farm animals providing food for humans becomes paramount. In either case, the view that animals have only an instrumental value will serve as an obstacle to any granting of bona fide rights to them. What is required is widespread recognition that animals have an intrinsic or inherent value, if they are to become rights bearers. Hence, much of the intellectual effort of the animal rights movement has been spent on the construction of arguments that attempt to establish the intrinsic value of animals.

This issue has been taken up notably in the writings of well-known applied ethicists Tom Regan and Peter Singer. Such ethicists argue that animals have bona fide rights that are sacrosanct because animals have equal or near equal moral standing to humans. To hold otherwise, they further claim, is to engage in the discriminatory practice of "speciesism." Like racism and sexism, speciesism is unacceptable because it is based on an unfounded bias. This is the prejudice of "anthropocentrism." If it is wrong to discriminate on the basis of the traits of race and gender because these traits differ from those of the discriminator, so too it would be wrong to use species as such a discriminating trait according to this view.

Peter Singer's arguments are based on utilitarianism. This position claims that animals, like humans, have certain preferences and interests that should be taken as morally considerable when we make decisions about how they should be treated. Animals have an interest in avoiding pain and in continuing their existence, argues Singer, and these interests deserve to be given equal considerations to those of humans. So, for Singer, when humans eat animals, experiment on them, and perform acts of animal cruelty in agribusiness, they do not give equal consideration to the interests that animals are said to have, thereby making these behaviors morally objectionable and questionable.

Tom Regan's position differs from Singer in that he holds a "direct duty" view of animal rights. His argument is that any being that can be seen as a "subject of a life," like human beings, should never be treated as a means toward an end. Since animals too are "subjects of a life," since they have complex subjective experiences, they have intrinsic value like humans and not mere instrumental value. If it is the case that animals have intrinsic value, then they have a right to be considered as members of a moral community (as moral patients, not as moral agents that require a higher level of rationality) in which duties and respect are owed to them. For Regan, acts such as breeding animals for food, using them for entertainment, and hunting and trapping them would violate the direct duties that members of the moral community have to one another, and these acts should be held as condemnable, immoral acts.

One proviso should be mentioned here, namely, that both Singer and Regan do draw a line that circumscribes the moral standing of animals. In other words, neither intellectual hands out rights to animals in carte blanche manner. According to Singer, animals that are sentient—feel and be self-conscious—or that have a central nervous system should be seen as having rights, while for Regan the line is drawn down to adult mammals. Only these animals are truly subjects of a life, and therefore others not in possession of the defining moral traits do not have the same moral standing and need not be considered as equally partaking of intrinsic value.

The Dilemma of Animal Rights

There are any number of values that drive people to advocate for animal rights: compassion, aesthetic appreciation, the belief that all life is sacred and interconnected, the knowledge that many animal species are endangered and may become extinct, and so on. This latter item has led to controversial laws in many countries that protect vanishing species and promote biodiversity by regulating human activities that might affect the preservation of the species so endangered. In one sense, animals are given certain rights by laws such as the U.S. Endangered Species Act, which has caused much controversy in its enforcement as the interests of commerce have come into conflict with the interests of the animals that the law is designed to promote. The case of the logging industry and the preservation of the spotted owl in the Pacific Northwest is a classic example of these human-animal controversies.

However, legal protections for animals have led to difficult dilemmas and not just controversy. The most recent is that of the overpopulation of elephants in certain sections of Africa that require authorities to make hard choices deciding the fate of a number of the world's largest living land mammals. As many wildlife parks dwindled in size, their carrying capacity for large numbers of elephants has likewise diminished even while elephant populations increased. For example, in Kenya, where poaching was rampant, the 1973 elephant population was around 167,000 but fell dramatically to 16,000 in 1989. Today, the numbers have bounced back to 28,000 due at least in part to legal protections. In Kenya and elsewhere in Africa, elephants are said to be destroying park habitats and making it difficult for other species to find food. They have also been roaming out of the parks and creating human-animal conflicts where destruction of property and even the killing of people have resulted. Thus, authorities are led to difficult animal management choices. Should they force sterilization on the elephant population? Should they move elephants elsewhere and if so where? Or should they cull the population and selectively kill some elephants, so that human-animal conflicts can be avoided?

Anthropocentrism

The word *anthropocentrism* comes from the Greek άυθρωπος, *anthropos*, meaning "human," and κέυτρου, *kentron*, meaning "of the center." In practice, anthropocentrism is generally understood as the view that human beings are the central fact on earth.

One ancient and influential text expressing anthropocentrism is in the description of the creation of the human being, in Chapter 1 of Genesis at the beginning of the Bible. This text, in accordance with the most common interpretation, reveals that men and women have an inherent dignity, since they are in the image of God, and superiority over all other creatures on Earth. This superiority is also expressed in several other places in the Bible. However, in the Bible, the human domination on Earth is not absolute but relative to God, the absolute owner of the whole of creation. This is made clear, for instance, in Psalm 104 in which it is declared that God is just in his concern for wild species and their habitats as he is for human beings. These and others biblical texts lead most experts to interpret that humans are called to dominate the Earth as stewards—in a responsible way, not as despotic dominators.

Both Judaism and Christianity have maintained and reinforced these biblical beliefs for centuries. Islam also considers people as a priority over the rest of creation, although it still preaches respect for nature. Other religions, such as Buddhism and Hinduism, have pantheistic conceptions of the world; there is no a clear difference between God and the cosmos. This gives a divine sense to nature. Some conclude that this vision offers a more sympathetic conception of the human relation to the rest of nature and a kind of spirituality that fosters unity between humans and nonhuman nature. Monotheistic religions encourage a respectful relation between humans and material nature but not a complete unity. But they are also far from a radical dualism between human and nature, since humans are part of nature, but not only so. They have a privileged condition and distinctive moral claims. Nature is fully recognized as a value, but the supreme value is not nature but the human person.

Anthropocentrism: A Historical Perspective in Western Civilization

In the sixth century, St. Benedict stressed a sense of stewardship of humans toward creation, and St. Francis, in the 12th century, preached a loving relationship of humans toward creation. In the Middle Ages, Christian theologians presented a close connection between the loving and redemptive purposes of God for the world and the original ordering of creation.

However, this anthropocentric view started to change in the 14th century, with William of Ockham. He maintained that creation is not God's loving purpose, as previously had been believed. Instead, he supposed that it obeys the arbitrary will of God. In the Renaissance the human-nature dualism started to gain acceptance as mainstream thought, and nature was understood basically as a mechanism to be studied and dominated. Francis Bacon emphasized that nature should be used for the sake of humankind; science and technique would be the means. Bacon did not advocate value-free technology, but the human-nature relationship was no longer seen in terms of stewardship. In the 17th century, Descartes considered that animals and plants were nothing more than *res extensa* (a thing with extension, pure matter). They are like machines, while humans are *res cogitans* (something which knows, that is a mind), with a *res extensa*, or body. Consequently, both the animal and human body should be explained by "mechanics."

The mechanistic view of nature was extensively considered by Galileo and Newton, and later by many others. Frequently, this mechanistic view has not only been applied to knowing how nature works but also to explaining its origins and meaning. In this way, any transcendent or ethical vision of nature disappears and, progressively, anthropocentrism becomes synonymous with the domination of nature by humans.

While some advocated an anthropocentrism without any limits, a nonanthropocentric view also appeared. Some popular scientific theories displaced man from the center of the universe to the periphery of it. In this line, Copernicus showed that the Earth moves around the sun, and Darwin suggested humans are the latest part of the evolutionary chain. In addition, some modern ideologies have also eroded anthropocentrism in certain aspects. Agnosticism and atheism ignore the transcendent roots of human dignity, while materialism destroys the notion of a human soul or spiritual principle nonreducible to mere matter.

In recent decades, a controversy over the influence of religions on the environment has arisen. Its origin is an article by Lynn White, published in 1967, in which he blamed Christianity as the ultimate cause of the Western environmental crisis. The main arguments are the biblical concept of subduing the Earth and the idea of a creator God who is "outside" creation. This position has been criticized on several points, including the fact that the real cause of the current ecological problems are related to the economic and cultural forms of late modernity rather than to religious influence on the cultural context.

All this has led to an alternative to anthropocentrism called biocentrism or ecocentrism. In the latter model, human beings are held to be a mere animal species coexisting with others and without any outstanding dignity over other animals. Consequently, some defend "animal rights," giving them similar nobility to human rights, while others apply utilitarianism by balancing pleasure and pain for every sentient being affected by an action. As a reaction, a renewed view of anthropocentrism with more solid foundations, and establishing its limits, has appeared.

Two Kinds of Anthropocentrism

This historical overview helps us to distinguish two different kinds of anthropocentrism. One is conceived as dominion, in the sense of absolute domination, while the other is an anthropocentrism understood as stewardship.

Dominion

In this vision, a radical dualism exists between human and nonhumans, and the former have an absolute domination over the latter. Human individuals are seen as autonomous beings endowed with knowledge and power to dominate Earth for their use, and with full right to do so practically without limits. Animals and natural goods are no more than possessions to serve the interests of their owners, without further consideration. Nature is taken to be a mere instrument that is continuously manipulated through technology. In addition, for many years it was believed that the technological impacts on nature could be easily absorbed. Modern capitalism has found support in these ideas. The cultural context defending the absolute domination over nature, accumulation of wealth, and an immoderate consumerism have produced notorious abuses in the exploitation of natural resources, abundant pollution in all its forms, and an increasing amount of waste products. This way of understanding anthropocentrism seems erroneous because of both the weak philosophical bases of its vision and of the negative effects of technology on nature, which in fact is not able to absorb these impacts.

Stewardship

This way of understanding anthropocentrism is rooted in the Judeo-Christian tradition and in philosophical anthropologies (Aquinas, Kant, Personalism, and others), which overcome the mechanistic vision of the natural world and stress human rationality, conscience, and freedom. Both approaches support the idea that humans are the central fact of Earth and only they have dignity and authentic rights. But, at the same time, humans are seen as stewards of nature. Development is not reduced to an indiscriminate possession of things and an unlimited consumerism. Development is, above all, human and sustainable development, which requires using material goods with moderation and a sense of responsibility, as a means for human flourishing and concern for future generations.

Anthropocentrism-stewardship does not disdain animals and it respects an ecological order. On the contrary, one must take into account the nature of each being and of its mutual connection in an ordered system, which is precisely the cosmos. This means, among other considerations, that animals have to be considered as having their own identity, and without reducing them to a mere instrumental value. Consequently, humans have to avoid cruelty to animals and even to be sympathetic to them.

Anthropocentrism and Business

A certain vision of anthropocentrism is related with business. Since the Industrial Revolution, capitalism and modern business have contributed to a considerable economic growth, provided jobs, made products more accessible, and been an effective means to fight against poverty. But, at the same time, capitalism has often been associated with greed for wealth accumulation, insatiable use of natural resources, technology with damaging effects on the environment, accumulation of population in large cities, and chaotic urbanization in many places. In the 19th century and a great part of 20th century, an unchecked organizational exploitation of natural resources was seen as desirable and even legitimate for the sake of economic development.

While the results of business activity have been beneficial for humans, the consideration of humans in productive processes has frequently been far from being human centered. People have been used as a mere means or resource for gains or for consumption, and not in accordance with the requirements of human dignity. In this approach, based on the anthropocentric-domination model, people receive some benefits, but the human person and his or her development is not the main motivation for economic progress.

In opposition to this approach, some have proposed substituting the conventional “anthropocentric management” paradigm, which is based on the idea of an unlimited domination, for an “ecocentric management” paradigm. However, this new paradigm has met criticism. It is argued that this proposal is rooted in a romantic conception of nature and is misanthropic because of the desire to remove the privileged position of humans within nature. In addition, it is accused of using controversial tone and of being selective in the treatment of environmental information. It could be argued that the ethical arguments that support the latter paradigm lack strength and several central tenets of the ecocentric discourse are questionable.

Since the middle of the 20th century, in many countries a new awareness regarding humans, their innate rights, and their habitat has arisen. In recent decades, a greater concern for the environment, both human and natural, has emerged, and the concept of “sustainable development,” which pays attention to future generations, has become increasingly popular. Simultaneously, a “stewardship management” based on “anthropocentrism-stewardship” is emerging. This includes respect for human dignity and rights and concern for the inherent value of the cosmos. An increasing respect for the environment for the sake of humans and their future generations is also a crucial aspect of this approach.

Antitrust Laws

Antitrust laws in the United States were passed to limit the economic power of large corporations that can control markets by reducing competition through concentration or through the adoption of anticompetitive methods of competition. Large corporations are not simply passive responders to the impersonal forces of supply and demand over which they have no control. They have economic power, which can be used to gain some control over market forces. Markets may fail if the dominant firms in an industry are allowed to engage in predatory practices that drive competitors out of business or if firms are allowed to interfere with competition by gaining a monopoly position.

Background

It only took a single generation from the end of the Civil War for the United States to emerge as a world industrial power. During this period of rapid economic growth, the modern business enterprise was born in response to changes and opportunities in the economy. The corporate form of organization was used more and more frequently to make these enterprises even larger, as it allowed more capital to be accumulated and spread the risk across large numbers of stockholders. The growth of these large enterprises, however, posed a threat to the competitive structure of the economy. They often engaged in predatory pricing practices such as cutting prices below cost to drive smaller firms out of business to gain a monopoly position.

As competition became more and more severe in the late 19th century and individual firms found it difficult to gain a monopoly position, collusion between firms was not uncommon. The largest organizations created various arrangements with their competitors such as gentlemen's agreements and pools and new organizational innovations such as trusts and holding companies to reduce competition and gain control of an industry. These practices affected competition in the economy as a whole, and the economic power of large firms gave them the ability to dictate the terms of trade to smaller groups such as farmers, wholesalers, and retailers. There were no rules to regulate the behavior of these enterprises, and competition was disappearing in an unregulated market economy that became more and more concentrated.

Society began to fear the power of these enterprises, and the government responded to this concern by passing laws aimed at curbing their economic power and restoring competition in the economy. These laws were meant to embody the ideal of competition and provided a way for society to reaffirm its belief in the notion of a purely competitive economy where economic power is limited. The history of antitrust laws in the United States shows that the complex social and economic impacts of big business lead to institutional responses that interpret and enforce economic philosophy and political ideology.

The Laws

The Sherman Act of 1890 was the first piece of antitrust legislation and was supported by a coalition of small businesses and farm groups who were concerned about the economic power of the large trusts that, at the end of the century, had come to dominate many industries. The most important parts of the Sherman Act are the first and second sections. The first section attacks the act of combining or conspiring to restrain trade and focuses on methods of competition or firm behavior. This section seems to make illegal every formal arrangement among firms aimed at curbing independent action in the market. It places restrictions on market conduct, in particular those means of coordination between sellers who use formal agreements to reduce the independence of their actions. The second section enjoins market structures where seller concentration is so high it could be called a monopoly.

The language of the Sherman Act was quite broad, leaving a good deal of uncertainty as to what specific practices were in restraint of trade and thus illegal. The Clayton Act of 1914 was passed to correct this deficiency by being more specific with regard to anti-competitive practices. It bars price discrimination, where one buyer is charged more than another for the same item, when it tends to lessen competition in any line of commerce or tends to create a monopoly. The Robinson-Patman Act of 1936 was passed to amend the section that deals with price discrimination to strengthen it and plug loopholes.

Another section bars tying arrangements, where sellers give buyers access to one line of goods only if the buyers take other goods as well, and exclusive dealing arrangements, where sellers give buyers access to their line of goods only if the buyers agree to take no goods from any of the seller's rivals. Another section was designed to slow down mergers of companies by forbidding mergers that substantially lessen competition or tend to create a monopoly. This section prevented the acquisition of the stock of one company by another in the same line of business when the effect was to lessen competition or tend to create a monopoly, but it said nothing about the purchase or sale of assets to combine firms. Merger-minded companies exploited this loophole, which was finally plugged by the Celler-Kefauver Amendments of 1950, which forbid purchase of sale of assets when the effect of such acquisition may be substantially to lessen competition or tend to create a monopoly.

The Federal Trade Commission Act was also passed in 1914 to create the Federal Trade Commission (FTC) and empower it to protect consumers against all "unfair methods of competition in or affecting commerce." Exactly what methods of commerce were unfair was left up to the commission itself to decide. The FTC initially was allowed to attack practices that it defined as unlawful even though such practices did not violate establish antitrust law. These actions were eventually curbed, but in 1938 the Wheeler-Lea Act was passed to amend the relevant section to include unfair or deceptive acts or practices in commerce. This gave the FTC the authority to pursue deceptive advertising and other marketing practices that did not necessarily affect competition.

These three laws and their amendments constitute the pillars of antitrust legislation, but they have to be updated from time to time to take account of current developments. A major revision of these laws was accomplished in 1976 with passage of the Hart-Scott-Rodino Antitrust Improvements Act. Title I of this act gave the Justice Department broadened authority of interview witnesses and gather other evidence in antitrust investigations. Title II provided for premerger notification, requiring large companies planning mergers to give federal antitrust authorities advance notice of their plans. Corporations cannot complete the merger for 30 days after the notification report is filed, giving antitrust agencies time to study the proposal and take action to block the merger if the agencies find that the proposed merger raises anticompetitive concerns. Title III of this act allows state attorneys general to sue antitrust violators in federal court for treble damages of behalf of overcharged consumers even though the state itself was not injured.

Purpose

The role of government is to maintain a workable competition given the impossibility of developing a system of perfect competition that exists only in economics textbooks. Workable competition refers to a system where there is reasonably free entry into most markets, no more than moderate concentration, and an ample number of buyers and sellers in most markets. This objective is more realistically attainable than a perfectly competitive system given the nature of modern technology and organizations. The government is also interested in promoting fair competition referring to the exercise of market power in a manner that will enhance the competitive process. Competitors who have market power are thus prevented from engaging in anticompetitive practices that would destroy the competitive process.

Antitrust laws focus on both conduct and structure, as defined by Sections 1 and 2 of the Sherman Act, where conduct is the focus of the first section and structure of the second. The conduct of firms in a competitive market tends to sink to the lowest common denominator. If a firm adopts some kind of predatory practice that helps it gain a larger market share, rivals will have to adopt the same practice to stay in business. Thus, antitrust laws are in part a set of rules that set a standard of fair competition to which everyone has to adhere.

With regard to structure, the antitrust laws prevent the attainment of a monopoly position where the firm has an unfair advantage and could dictate the terms of trade in the market as a whole. Anticompetitive conduct falls into two general classes: (1) collusive actions whereby competitive rivals act in a joint fashion to achieve monopolistic goals and (2) exclusionary policies adopted individually that bolster a firm's economic power in relation to potential rivals. Collusion may be implicit when competitive rivals act uniformly through following the leadership of the dominant firm in an industry with regard to prices or through price signaling in press releases or explicit where rivals enter into express agreements to fix prices or allocate sales territories. Exclusionary practices include predatory pricing to drive rivals out of business, price discrimination, tying arrangements, and exclusive dealing arrangements.

Market structure refers to the economically significant features of a market that affect the behavior of firms in the industry operating in that market. These features include seller concentration, product differentiation, barriers to entry, elasticity of demand, and diversification. The most important of these features is concentration, which refers to the extent to which the market is under the control of a few dominant firms in an industry. Historically, the four-firm concentration ratio has been used to measure the percentage of sales attributable to the top four firms in the industry. It was generally believed that if the top four firms had 50% of the sales, this signaled the beginning of an oligopolistic industry where market power of the dominant firms is a factor in the way the industry as a whole conducts itself. More sophisticated measures of industry concentration have been used in recent years to determine concentration.

Enforcement

Enforcement of this antitrust legislation at the federal level is shared by the Antitrust Division of the Department of Justice and the Bureau of Competition within the FTC. There is substantial overlap between these two agencies, particularly with regard to the Clayton Act and its amendments, where the Antitrust Division and the FTC have concurrent jurisdiction. Technically speaking, the Sherman Act is the sole province of the Antitrust Division and the FTC has sole responsibility for enforcing the Federal Trade Commission Act. But overlap occurs, as the FTC can reach violations of the Sherman Act under the broad mandate to deal with "unfair methods of competition." Because of these overlapping areas, the FTC and the Antitrust Division of the Justice Department exchange notifications and clearances to assure they do not duplicate efforts and file the same cases. They also coordinate their activities where necessary.

The intentionally vague language of antitrust laws allows each administration to interpret and enforce the laws in accordance with its economic philosophy. Courts also have power to interpret the meaning of antitrust legislation through their rulings on cases that come before them. The history of antitrust enforcement shows changes in notions of competition and fears about the power of big business. Enforcement efforts reflect the tensions of maintaining allegiance to the ideals of competitive markets while allowing society to reap the benefits of large-scale production, distribution, and organization. The antitrust laws thus institutionalize our fear of large concentrations of power, yet their application is flexible to allow the benefits of concentrated industries to be exploited when society deems appropriate. These realities make a straightforward application of abstract notions about competitive markets extremely difficult.

This flexibility was already evident immediately after the antitrust laws were passed as the courts remained probusiness for several years. In 1895, for example, the Supreme Court ruled that American Sugar Refining, even though a trust, was not a monopoly in restraint of trade and therefore not in violation of the Sherman Act. A year earlier, the Court had issued an injunction against the union in the Pullman strike on the basis that it was a conspiracy in restraint of interstate commerce. The framers of the law had no intention that it should apply to unions, and unions were later exempted from antitrust laws. The Justice Department lost seven of the first eight cases it brought under the Sherman Act. Finally, in 1911, two trusts, Standard Oil and American Tobacco, were found guilty of violating the Sherman Act and ordered to be dissolved into several separate firms.

In finding these firms guilty, however, the Court invoked the so-called rule of reason. These firms were found guilty because they had restrained trade unreasonably. This decision emphasized the vicious practices these companies had used against their competitors. Section 1 of the Sherman Act was thus interpreted to prohibit only unreasonable restraints of trade. Under this rule of reason test, antitrust litigation relied on extensive economic analysis and evidence to determine whether the business practice in question was actually anticompetitive. Subsequent cases against Eastman Kodak Company, United Shoe Machinery, International Harvester, and U.S. Steel were found in favor of the firms because they had not visibly coerced or attacked rivals.

Eventually, however, the courts came to adopt a per se approach to violations of Section 1 of the Sherman Act. They began to hold that certain kinds of conduct are so unreasonable that they cannot be excused by evidence that they do not adversely affect competition. In the Trenton Potteries case (*United States v. Trenton Potteries Co.*), the Court held that price-fixing per se was illegal, whether reasonable or unreasonable. "The power to fix prices," the Court said, "whether reasonably exercised or not, involves power to control the market and to fix arbitrary and unreasonable prices. The reasonable price fixed today may through economic and business changes become the unreasonable price of tomorrow."

This represented a major change in the Court's thinking, and the practices that became per se violations of Section 1 of the Sherman Act include (1) price-fixing, (2) restriction of output, (3) division of markets, (4) group boycotts, (5) tying arrangements, and (6) resale maintenance schemes. With respect to these practices, proof can be limited to the fact and amount of damage. The establishment of a per se approach to these practices relieves the parties to the suit and the Court from having to inquire into the factors relevant to a rule-of-reason analysis. Under the per se approach, it is irrelevant to inquire into the reasonableness of the restraint or attempt to provide an economic justification for an illegal practice.

With regard to structure or Section 2 of the Sherman Act, the issue is more complicated. While the rule of reason was in effect, it was clear that the law did not make mere size or the existence of unexerted power an offense. Size could only be an offense if accompanied by certain predatory types of market conduct. This changed with the Alcoa case of 1945 (*United States v. Aluminum Co. of America*), where it was held that a high level of seller concentration in and of itself could constitute a violation. The Court could find no predatory conduct on the part of Alcoa. Its 90% market share was obtained by an honest industrial effort. But Alcoa's monopoly was not thrust on it, the Court said, and by a series of normal and prudent business practices the firm had succeeded in discouraging or forestalling all would-be competitors. The Sherman Act forbade all such monopolies no matter how acquired.

In the 1970s, the Justice Department attempted to extend the reach of antitrust laws to oligopoly itself. This structure was called a "shared monopoly" in that the largest companies in some industries achieve consensus decisions on output and pricing that resemble those of a more traditional single-company monopoly. The Justice Department proposed filing a suit on this basis to test the thinking of the courts regarding this issue. The FTC actually did file a suit against the four largest manufacturers of ready-to-eat breakfast cereal, charging violation of Section 5 of the Federal Trade Commission Act (*FTC v. Kellogg et al.*). The suit charged that the largest companies in the cereal industry compete by introducing more and more brands. The result is brand proliferation, which gives little hope that new companies will get much of a foothold because they have to compete for ever smaller slices of the market. This was held to be an unfair method of competition because it raises barriers to entry for new companies and is a shared monopoly.

These efforts came to naught with the end of the "activist" period in antitrust litigation in the 1980s as the country turned more conservative. Economists began to attack antitrust laws blaming the decline of U.S. competitiveness at home and abroad at least partly on outdated antitrust enforcement practices. They argued that it is wrong to look at the structure of an industry and conclude that a small number of companies automatically means less competition. Economies of scale exist in concentrated industries, they argued, which mean unit production costs and therefore prices are often lower than if the industry were more competitive. This philosophy was reflected in the Reagan administration's approach to structure, arguing that big businesses are very valuable things because they tend to be the most efficient. Antitrust enforcement should strive for only one goal, that of maximum production at the lowest price.

Recent years have seen some changes in the application of antitrust laws, but no radical changes of philosophy regarding both conduct and structure. Most of what has occurred could be called simply a change of emphasis. Merger activity waxes and wanes in response to economic opportunities, and the antitrust laws are activated whenever it is deemed appropriate and necessary. One of the most interesting cases in recent years has been the suit against Microsoft Corporation, which came to hold about 90% of the operating system market. This gave it power to tie application programs such as its Web browser to its

Windows operating system. The government was concerned that Microsoft was using its Windows monopoly to dominate other markets and that the company had to be reined in lest it gain a choke hold on Internet development. The underlying problem was Microsoft's ongoing practice of rolling new features into its operating system, a process that made each new version of Windows better and more powerful. Because computer users are essentially locked into Windows, it was easy for the company to get them to use its other software even if competitors make better products. This practice is called bundling and is said to dampen competition, reduce choices for consumers, and retard innovation in the industry.

The government pressed hard for a breakup of the company into two separate and competing companies, one for its Windows operating system and one for its other computer programs and Internet businesses. They sought a structural remedy and believed that such a solution would be the only way to force Microsoft to change its conduct. But in the final settlement the government agreed to a solution geared to change Microsoft's conduct with respect to certain parts of its business activities. The most important part of the problem, namely Microsoft's ability to include more and more application programs in its operating system, was not addressed. The case was not the bell-weather case many had hoped for, and did not do much in providing directions regarding the way in which antitrust law will be applied to so-called new economy companies that provided computer software or hardware or were based on the Internet.

With the development of a global economy, companies such as Microsoft faced antitrust litigation in other countries. The European Union (EU) found that Microsoft violated its antitrust laws by bundling other software with its Windows operating system. Government requirements regarding antitrust laws are thus a major hurdle in geographic areas where these laws are well developed, while compliance is less burdensome in other areas of the world that do not have stringent antitrust requirements. Many argue that companies need to be large and have more freedom to compete effectively on a global scale and that U.S.- and EU-style antitrust laws are an obstacle to achieving this effectiveness.

Arbitrage

In its strictest definition, arbitrage is defined as the activity of buying and selling a portfolio or collection of assets that provides a guaranteed, or riskless, cash flow when the present total cost of the portfolio is zero or less. Note that a positive cost for an asset suggests a cash outflow so that a negative cost would be considered a cash inflow.

In a simplified world where there are two dates for cash flows to change hands, today and some future date that we shall call tomorrow, there are two types of arbitrage that may occur:

1. Where a nonpositive investment occurs today (someone pays you today or gives you the rights to own the portfolio), which then produces a guaranteed positive cash flow tomorrow
2. Where a negative investment occurs today (someone pays you today to own the portfolio), which then produces a nonnegative (the portfolio provides a cash flow of either zero or a positive amount) cash flow tomorrow

In a competitive market, arbitrage opportunities generally do not exist. If they do exist then they will be traded on by arbitrageurs until the arbitrage opportunity that is caused by a mispricing event in the market between cash flow substitutes disappears.

If we can rule out the possibility of arbitrage in securities or asset markets, then we can use this information to price an asset that is a cash flow substitute for another asset. That is, if two assets will produce the same cash payoff tomorrow, then the two assets must cost the same today. Specifically, the no-arbitrage condition of asset pricing requires that the price of the two assets mentioned above must be the same. As an example, assume that the cash flows and payoffs are as below for Asset A and Asset B:

- Payoff of Asset A tomorrow is $10.
- Payoff of Asset B tomorrow is $10.
- Cost of Asset A today is $6.
- Cost of Asset B today is $7.

It is easy to see that B is over priced relative to the price of A. An arbitrageur could put on the following arbitrage trade to profit from the relative mispricing:

- Sell Asset B short today for an inflow of $7.
- Buy Asset A today for an outflow of $6.
- Net inflow today is $1.

Tomorrow, the arbitrageur would do the following an instant before the two assets made their respective cash payouts:

- Repurchase Asset B for $10.
- Sell Asset A for $10.
- Net cash flow tomorrow is $0.

The net benefit of the arbitrage trade was a $1 cash inflow today with a guaranteed neutral cash flow tomorrow for the arbitrageur. This meets the second definition of arbitrage mentioned above.

In the above example, the arbitrageur would continue to put on the arbitrage trade until the arbitrage no longer existed. Note that the trade that the arbitrageur puts on will cause the price of Asset A to increase and the price of Asset B to decrease. The arbitrageur will continue to trade until both prices are equal, thereby removing the arbitrage opportunity.

What Arbitrage Is Not

Often times traders will identify a trade that depends on certain events occurring, which will make the trade extremely profitable. However, if the future happens to take an unanticipated course then the profitability of the trade is much lower or even unprofitable. Such a trade is not an arbitrage trade. An arbitrage opportunity requires that there be no risk concerning the cash flows as well as no cost today (initial investment) for the portfolio. This means that if there is any chance that the payoff for owning the portfolio (or combination of assets) will not be constant under any circumstances, then there is no arbitrage opportunity available. In the prior example, let's assume that the cost and payoff for Asset A remains the same but only the payoff for Asset B is slightly altered. That is, Asset B now has a 90% probability of producing a $10 cash flow tomorrow and a 10% probability of producing an $11.50 cash flow tomorrow. Let's assume that the same arbitrage trade is put on by an arbitrageur. It is easy to see that the cash flows to the arbitrageur will have a 90% probability of being just as we calculated in the earlier example. However, let's examine the cash flows for the trade the other 10% of the time:

- Today, the cash flow will be just as before.
- Sell Asset B short today for an inflow of $7.
- Buy Asset A today for an outflow of $6.
- Net inflow today is $1.

However, 10% of the time the cash flows will be as follows:

- Repurchase Asset B for $11.50.
- Sell Asset A for $10.
- Net cash outflow tomorrow is $1.50.

Now we have introduced the possibility that the arbitrageur will have to pay out $1.50 tomorrow. Therefore, the payoff is not guaranteed to be the same in all circumstances.

Consequently, the set of cash flows for Assets A and B do not provide an arbitrage opportunity since the payoff of the constructed portfolio is not constant and does not therefore meet the qualifications of either type of arbitrage. In fact, given the second example setup, it is entirely possible that the relative prices of Assets A and B are completely arbitrage free. To reiterate, for a trade opportunity to be an arbitrage opportunity, it must meet two criteria: (1) a trade opportunity must involve a riskless or guaranteed profit and (2) it must involve a nonpositive investment.

No-Arbitrage Conditions

As mentioned earlier, arbitrage profits are either available for very short periods of time or not at all. Such a no-arbitrage condition, therefore, yields the ability to price derivative instruments in a fairly precise manner. That is, if two portfolios will generate the same cash flows tomorrow, regardless of the state of the world, then they must have the same cost today. Since derivative instruments derive their payoff from some underlying security, then we are usually able to construct a portfolio of derivative instruments whose payoffs can be duplicated by owning some amount of a market-priced underlying security. If the payoffs of these two portfolios are the same, then their market prices must also be the same. From that point, it is a simple matter of deducing the no-arbitrage market-determined price of each derivative instrument.

ARCHER DANIELS MIDLAND

Founded in 1902 and incorporated in 1923, Archer Daniels Midland (ADM) is one of the largest agricultural processors in the world. It supplies many of the inputs for agricultural production, buys the crops from the field, processes them into food for humans and animals, fuels, and chemicals, and sells them all over the economy—and lobbies, very successfully, to obtain and retain the legislation that makes the entire operation profitable.

It *is* profitable. In the fiscal year ending June 30, 2005, ADM reported net earnings of $1,044 billion, or $1.59 per share, compared with $495 million, or $0.76 per share, in the previous year. Profits were up in Europe, South America, and Asia. So the board of directors declared a cash dividend of $0.085 per share on the company's stock—ADM's 315th cash dividend and 295th consecutive quarterly payment, 73 years of uninterrupted dividends. Clearly, they are doing something right.

In addition to being profitable, ADM tries to be environmentally friendly, and often succeeds. In the same fiscal year, ADM won two United States Environmental Protection Agency Presidential Green Chemistry Awards for a way to reduce volatile toxins in paints and a way to lower trans fats and oils in vegetable oils.

It is not always easy to be good. ADM stands at the heart of an enormous network of companies and activities, owning or controlling the entire agricultural enterprise through direct ownership or joint ventures with other companies. Its position entails that it controls the entire food chain, from the decision on what to plant, from the seed, through the machine that plants the seed and the pesticides and herbicides that help that seed to prosper, through the tending and harvest of the crop, through all processing and distribution of the products, to the very shelf in the supermarket (or repose in the chuckling fat of the fast-food French fries cooker). In the course of its vertically integrated enterprises, it is often difficult to discover the market price of a product that, for instance, is created from crops on an ADM farm and immediately sent back to another ADM farm to feed hogs. Just such a product is lysine, a corn-based dietary supplement for farm animals that is widely used across several countries. Yet it turns out to be possible for one to cheat, and price fix, on this product, for that's just what ADM was caught doing in 1996; they ended up paying a record fine of $100 million for price-fixing. That wasn't the end of their problems: Two years later the government brought separate criminal charges against three top executives for conspiring in the crime, collected more fines, and sent the executives briefly to jail. Later, the European Union added its own penalties; in all, ADM had to budget over a quarter of a billion dollars for all expenses connected to the price-fixing incident.

ADM has maintained its agenda in Washington largely through very generous political contributions to both parties, amounting to some $2 million per year. A large part of its Washington lobbying agenda has been to urge, as the petroleum resources decline, the adoption of a provision requiring that ethanol should be a part of every gas station and oil reform. (The concern for oil scarcity has a lot to do with the fact that ethanol is produced from corn; at this point ADM controls more than 50% of the ethanol capacity in the world.) Conservatives and liberals alike have objected to this huge subsidy, but it continues.

Arendt, Hannah (1906–1975)

Hannah Arendt is best known for her writings on political philosophy, most specifically her analysis of the 20th-century totalitarian regimes. Born in Hanover, Germany, Arendt studied philosophy with Martin Heidegger, and later with Karl Jaspers. In 1933, Arendt fled Germany for Paris, surviving a brief internment en route. Although Arendt was neither religious nor a Zionist, the rise of the Nazi party and the rapid spread of anti-Semitism through Europe provoked in Arendt a strong consciousness of her Jewish identity. In her intellectual writings of the 1930s, she argued that conditions of freedom and citizenship should never require repudiation of one's ethnic or cultural identity.

Emigrating to New York in 1941, Arendt gained recognition among political theorists and philosophers as a bold and controversial intellectual. She was University Professor in Political Philosophy at the New School for Social Research and a visiting fellow at the University of Chicago. Her major works include *The Origins of Totalitarianism*, *On the Human Condition*, and *The Life of the Mind.*

Most relevant to the field of business ethics is Arendt's authoritative analysis of the trial of Nazi leader Adolf Eichmann, *Eichmann in Jerusalem: A Report on the Banality of Evil.* Arendt attended the trial in Jerusalem to report the proceedings in a series of articles for the *New Yorker* magazine. As she listened to Eichmann's defense of his own motives and actions, Arendt concluded that Eichmann was not a monster but an ordinary man, following orders and doing his job to the best of his ability. He asserted that he bore the Jews no particular ill will and that in different circumstances he wouldn't have taken actions that ultimately killed millions of Jews—he just happened to be the person in that role, a role any number of Germans might have filled as well as he did. It was precisely this inability to think about the moral implications of his actions that led Arendt to characterize Eichmann's evil as banal. This characterization was a radical departure from previous sociological, philosophical, and psychological analyses of evil. Furthermore, Arendt asserted that the Holocaust could not have happened without the collaboration of Jewish organizations. In this, she was not blaming the victims but describing an essential component of the Nazi strategy to force cooperation and thereby undercut Jewish resistance solidarity. For these views, she was accused of insulting Jewish victims of Nazi genocide and including them as blameworthy in accounting for the atrocities of World War II.

In contemporary social analysis, the term *the banality of evil* has come to generally indicate the ease with which immoral actions, such as lying, stealing, falsifying records, and violating rules, are accepted into daily life. Indeed, the term *Eichmann* has come to represent that potential in each of us to be blind to the moral impact of our actions.

Aristotle (384–322 BCE)

A Greek philosopher who lived in the fourth century BCE, Aristotle was long referred to as "*the* Philosopher" and the master of those who know. He was a student of Plato and the teacher of Alexander the Great, and he is widely credited with having been one of the most comprehensive, influential, and profound thinkers ever to have lived. His books were numerous and their topics wide-ranging. Including but not limited to writings on natural science, psychology, logic, ethics, metaphysics, rhetoric, and the art of poetry, Aristotle's corpus also included works treating the investigations at the heart of this encyclopedia.

Three general characteristics of his work help to distinguish Aristotle from other ancient philosophers: (1) he was greatly concerned with empirical evidence, so when studying politics, for example, he compiled data on many actual constitutions; (2) he attended to the opinions of other thinkers, so he offered explicit criticisms of Plato, for example, and of the atomists and Pythagoreans; and (3) he stressed the importance of focusing on the end or purpose (*telos*) of things, so in discussing causality, Aristotle stressed the final cause or purpose, whereas both his predecessors and his followers show more concern with material or formal causes.

Widely studied by scholars of the history of thought, Aristotle is also turned to as a thinker with contemporary relevance, especially when it comes to his treatment of ethics and politics. His teleology helps him to argue that the city-state is natural, for example, and has the purpose of helping human beings reach their natural end or fulfillment. This natural end requires that we live well as human beings, and this in turn entails exercising the virtues he examines in his *Nicomachean Ethics.* Different political arrangements should thus be judged in light of their ability to foster this ethical end. As he makes this case, Aristotle even seems alert to modern temptations such as relativism, hedonism, and communism (which he knew in its Platonic variety). Along with his empiricism, which helped limit any tendency toward utopianism, his teleological approach led him to take a stand against these still vigorous intellectual currents, and this in turn has helped him to continue to find enthusiasts even in recent centuries.

As regards business, ethics, and society, note first that Aristotle gave the word "ethics" its prominence. Related to the Greek words for habit (*ethos*) and for a sustained disposition or characteristic (*ēthos*) of a person, Aristotelian ethics develop the view that the human good is happiness, that a person's happiness proceeds from activity in accord with virtue, and that the virtues are identified especially by examining the specific endowments of human beings as such. Aristotle thus rejects the view that happiness is the mere gratification of desire, while he also opposes the view that duty or obligation is fully defensible without regard to its contribution to the happiness of the dutiful person. In more technical language, his approach to ethics is neither hedonist nor deontological; rather, it helps give shape to what is now known as "virtue ethics," where the focus is on possessing and exercising virtues, not on an external criterion of right action.

A second way in which Aristotle is important for business ethics is that his treatment of "business" (or, more precisely, "the art of acquisition," *chrematistikē*) is focused on the question of whether acquisition should be limited or not. Late in Book I of his *Politics*, he appears to develop the view that acquisition that is not limited by a proper purpose is "unnatural," while natural acquisition is limited by reasonable goals. While Aristotle's criticisms of various sorts of utopianism serve in advance as cautions against important features of Marxism, he also advances principles that do not sit well with the acquisitiveness of modern capitalism. His teleological view of acquisition is one such principle; his teaching that things have inherent value also discourages a complete surrender to the market as the determinant of worth.

Arms Trade

The arms industry is a massive global business enterprise that never seems to lack suppliers and customers. For better or worse, an armament is a product or system designed to maim, kill, or destroy. The arms trade is the sale or barter of armaments (weapons) between two or more parties for profit. Such exchanges are generally (but not exclusively) conducted by sovereign governments and by private contractors around the world and subject to various regulations. Most of the biggest sales are state-to-state transfers of highly sophisticated weaponry, but the bulk of sales involve smaller arms and light weapons (SA/LWs).

Basic Information

The international trade in weapons is currently worth in excess of $35 billion per year. Some weapons producers are state owned. But advances in international communication and the end of the Cold War helped consolidate manufacturing across national boundaries in private hands, now dominated by a small number of Western multinational corporations. America and Europe currently account for about 94% of arms sales. In fact, the United States is the world's leading arms exporter—with a 63% market share that is more than all other competing nations combined. Other major arms exporters include Russia, France, the United Kingdom, Germany, Canada, China, and Israel. Nations such as Iran are often portrayed in the news media as a major supplier of arms to militant Islamic groups, but this role is often as an intermediary since many of those weapons were originally produced in other countries.

The figures above are informed estimates because of the failure to create an effective international system to mark or trace exchanges, especially for small and light arms. Unlike a jet fighter, SA/LWs have many legitimate buyers including individuals and police forces in addition to military clients. As unpleasant as it might be to think about, law enforcement needs armored vehicles, CS and pepper gas, electric shock batons and leg irons, execution equipment, guns and ammunition, rubber bullets, security and surveillance equipment, water canons, and so on. There are also many participants in the arms system, with SA/LW production occurring in over 90 countries and with more than 1,200 companies involved in some aspect of the trade (from production to repair). Putting controls on the arms market is further complicated by the lack of transparency in most such deals. SA/LWs are especially easy to hide, pass along, smuggle, steal, and capture from the enemy. In the conventional weapons category alone there are also multiple (and often conflicting) sources of data for the many levels of trade. The bottom line is that weapons are very easily available from a variety of different sources.

Illegal Transfer of Weaponry

One area of concern is the illegal transfer of weaponry. Although unlawful, an active and highly profitable underground armaments marketplace exists. Ironically, the vast majority of small arms on the black market were originally manufactured and marketed legally before being diverted into an illicit network. This diversion occurs via a number of ways, including the following:

- "Straw purchases" in countries such as the United States without limitations on the number of weapons a person can legally buy or own at one time, and the illegal resale of some of those arms either domestically or in other nations where gun laws are more restrictive
- Theft from civilian gun owners
- Accidental loss and misplacement by governments
- Theft from government weapons stockpiles
- Looting of military and police arsenals during periods of instability
- Soldiers selling their weapons because they haven't been paid or have sympathy to a rebel cause
- Violating arms embargos by bribing officials in one country not on a debarred list to allow transshipments to a sanctioned country

Weapons might be sold for cash; bartered for hostages, drugs, or any marketable commodity; or countertraded for oil or food. The deals can be transacted by unscrupulous go-betweens who are equally comfortable in shipping toxic waste to the horn of Africa, smuggling illegal immigrants to the United States, or trafficking in counterfeit computer chips to Europe. This trade requires access to cargo ships typically registered in a "flag-of-convenience" nation noted for its openness to corruption through low registration costs, dummy commercial ownership rules, and banking secrecy. Ultimately, the money payments and commodity sales are moved through international networks of so-called ghost companies and coded bank accounts in tax haven countries, which benefit by protecting all financial transactions against prying regulatory scrutiny. Constantly attempting to keep ahead of investigators (usually successfully), these clandestine networks thus are conduits for an incredible variety of goods and services.

Lack of International Controls

Unfortunately, these black market sales/resales operate outside of any viable international system of law enforcement. The Organization of American States and the Organization for Security and Cooperation in Europe are largely ineffective in terms of legal armaments monitoring, let alone clandestine trafficking. Even the United Nations (UN) has no mechanism for ensuring that its rules are followed. This impasse may arise out of the fact that the five permanent members of the UN Security Council (the United States, France, Russia, China, and the United Kingdom) are among those responsible for more than 80% of global arms sales.

Instead, many arms sales are subject to stringent national and bilateral export/import controls. Such restrictions tend to work fairly well on large weapons and systems. Nevertheless, loopholes are plentiful even there. Products that have both military and civilian applications (especially electronics and other dual-use equipment) often escape export restrictions. Even when arms agreements are in place, still another ambiguity is encompassed in weapons brokering. Unlike the direct trade in armaments, brokering involves the legal selling of weapons to what turns out to be an intermediary without reporting the actual destination customer for the goods (typically an oppressive rogue regime or insurgency). A variation occurs when an arms manufacturer issues a license for its weapons to be built overseas in a country with low wages and lax export rules. Because this activity creates local employment in the recipient nation, such licensed production also serves as an incentive for the purchase of additional weapons.

Even the question of what actually constitute armaments is subject to nuance. Arms products typically include various types of guns, ammunition, disabling gases, explosive devices, tanks and other vehicles, ground-to-air and air-to-air projectiles, aircraft and naval ships for military use, integrated weapons systems, and associated consumable items (clothing, body armor, helmets, food rations, etc.). Despite organized opposition to private weapon ownership in many countries and although their use can prove to be lethal, guns and knives carried for self-protection and those used for hunting/sport purposes (as compared with military specification) are generally not regarded as "arms" in most analyses.

SA/LWs are considered a subcategory of "conventional weapons," which make up the bulk of the arms trade. In 1997, a UN panel developed working standards to define SA/LWs that are now widely accepted. In essence, a small arm is one that can be fired, maintained, and transported by one person; a light weapon requires a crew of two or more people and is transportable on a light vehicle or pack animal. Small arms include revolvers, self-loading pistols, rifles and carbines, smaller machine guns, and related ammunition. Light weapons range from heavy machine guns, grenade launchers, shoulder-fired antitank missiles, and other portable antiaircraft guns, to mortars of less than 100 mm caliber.

A major weakness is that there are no binding international treaties or other legal instruments dealing with establishing universal arms export criteria, brokering standards, creating arms identification marks, or tracking of conventional weapons. On the other hand, weapons of mass destruction (WMD), such as nuclear, biological, and chemical weapons, are banned through a variety of global agreements. But even in the case of WMD, there is an illicit market that is especially worrisome to antiterrorist authorities in the United States and Europe.

The U.S. Perspective

Historically, Americans have been suspicious of arms manufacturers, fearing that those who had the most to benefit from weapons sales also had an incentive to stir up conflict. As far back as George Washington's day he warned against getting involved in entangling military alliances. In the 20th century, the U.S. Senate established a committee to investigate the industry and war profiteering. After hearings lasting from 1934 until 1936, the committee published a series of studies reporting a strong link between lobbying by munitions industry representatives ("merchants of death") and the American government's decision to enter World War I. Committee members were also highly critical of the way the nation's leading bankers operated, arguing that their role at the center of the American economic system made war inevitable.

Nearly 25 years later as his last term neared its end, President Dwight D. Eisenhower, in his farewell address, also warned against giving too much power to this military-industrial complex, but his concerns like those of the Senate committee have largely been ignored. Today, just 12 firms dominate American weapons production (AAI Corporation, BAE Systems Inc., Boeing, Carlyle Group, Colt's Manufacturing Company, General Atomics, General Electric [primarily through GE-Aviation], General Dynamics, Honeywell, Lockheed-Martin, Northrop Grumman Corporation, and Raytheon Corporation). They are generally working hand in hand with the Department of Defense and the Congress, the so-called iron triangle.

Most of these companies are household names, since many also produce a diversity of civilian products and services (including ownership of major media). Such interconnection raises questions about information control and propaganda. Other firms not on the list, such as Bechtel and Halliburton, benefit by providing services in the aftermath of military conflict, as has been in the case of the American occupation of Iraq beginning in 2003.

Ethics of International Arms Sales

Are any forms of international arms sales ethical? Businesses do not operate in a vacuum. Their activities inevitably lead to a series of social and environmental impacts, especially when the product created is designed to maim, kill, and destroy. Proponents, however, argue there are tangible benefits to the arms business. These positive impacts include the following:

- Providing domestic and overseas employment
- Contributing to balance of trade surpluses
- Helping governments maintain stability and defend themselves against attack
- Gaining influence in other countries through military foreign aid
- Securing access to overseas military facilities
- Further rewarding allies when engaged in conflicts such as the current actions in Afghanistan and Iraq

Critics suggest the price for such strategic partnerships and coalitions is steep, with the United States taking the brunt of the blame over weapons proliferation and the cynicism engendered. A number of nongovernmental groups have been monitoring developments and agitating for better monitoring tools and stronger treaties to beef up international control and enforcement. Many of these groups say that bribery, insider deals, and political back-scratching characterize today's arms trade so that any participation is morally repugnant. Opponents further argue that U.S. arms transfers often end up fostering a climate of violence by adversely

- diverting expenditures that otherwise would go to health, education, and other social programs,
- empowering undemocratic regimes,
- enhancing surveillance of dissidents and minorities,
- contributing to torture and internal repression,
- exacerbating other human rights abuses,
- fueling external aggression/wars (especially when supplying both sides of a conflict),
- obstructing relief programs,
- contributing to child prostitution and labor (with some even forced into service as soldiers), and
- fostering war crimes.

Worse, instead of securing the regional stability they were supposed to ensure, weapons sales frequently undercut global security. This ironic result has been cynically called in Orwellian fashion a perpetual war for perpetual peace by historians such as Harry Elmer Barnes.

According to the United Nations, there are over 635 million SA/LWs in circulation worldwide. These SA/LWs alone account for over a half million deaths annually, including 300,000 in wars and related unrest. Cluster bombs and land mines are widely used and continue to be dangerous well after a conflict winds down. Lack of funding too often precludes removal. So when properties remain mined they cannot serve a productive use, such as the raising of animals or growing of crops.

The majority of arms are sold to developing nations, which by definition tend to have serious problems of poverty, hunger, and governance. Not surprisingly, fully 80% of the world's poorest countries have suffered from a major armed conflict in the past two decades. By way of example, of the 49 major conflicts occurring in the 1990s, small arms were the weapons of choice in all but two instances. The AK-47, a very effective and durable machine gun first created in the Soviet Union, is plentiful and can be bought for under $10 in some countries. The almost $25 billion spent on arms each year by developing nations is considerable. However, the arms expenditures in turn are a drop in the bucket compared with the nearly $600 billion Third World nations owe to the United States, members of the European Union, and other creditors. One problem compounds another.

Maintaining controls on what happens to legal sales is also increasingly difficult over time. This dilemma is exacerbated when governments change policies or fall from power as arms provided to friendly forces end up in the hands of potentially ruthless adversaries. For example, U.S. M16 machine guns were used in 1991 to murder peaceful demonstrators in East Timor. Following the Gulf War, Saddam Hussein used Soviet and Western-made arms in the domestic slaughter of thousands of Iraqi Kurds and Shiites. Stinger missiles that the United States supplied to the mujahedeen in Afghanistan in the 1980s were used against American forces in the war with the Taliban. Even weapons dating back to the intervention in Vietnam are still in circulation.

The illicit trade and trafficking in small arms is of particular concern for nations subject to rebellion and which have poor law enforcement. For far-flung countries with extensive coastlines, they face particular challenges involving transfer of nonsanctioned SL/LWs by sea. Police and intelligence authorities have detected the involvement of international organized criminal groups in the trade in small arms. Such firearms are not only used by insurgents, but end up in the hands of civilians and linked to crimes, especially armed robberies.

Arrow, Kenneth (1921–)

Born August 23, 1921, in New York City, Kenneth J. Arrow was awarded the Royal Bank of Sweden Prize in Economic Sciences in Memory of Alfred Nobel (widely known as the Nobel Memorial Prize) in 1972 with Sir John R. Hicks for their contributions to general economic equilibrium theory and welfare theory. Arrow is one of the major representatives of the neoclassical school of economics. His main contributions were devoted to the fields of social choice theory—which includes his famous Arrow impossibility theorem—general equilibrium theory, growth theory, and economics of information and organization.

He graduated in 1940 with a B.S. in social science with a major in mathematics at City College of New York. He received an M.A. in mathematics in 1941 from Columbia University. During World War II, he served as an officer in the Weather Division of the Army Air Corps, conducting research. After the war he returned to graduate study at Columbia. In 1947, he joined Jacob Marschak as a research associate at the Cowles Commission, University of Chicago, where he became Assistant Professor of Economics during 1948 to 1949. His work on social choice dates from this period. In 1949, he was appointed Acting Assistant Professor of Economics and Statistics at Stanford University where he has been working ever since, except for the period 1968 to 1979. In 1968, he moved to Harvard University as Professor of Economics, becoming the James Bryant Conant University Professor in 1974. In 1979, he returned to Stanford as Joan Kenney Professor of Economics and Professor of Operations Research. He retired in 1991 when he was designated Emeritus Professor. Among other high honors, he received the John Bates Clark Medal of the American Economics Association in 1957.

A desired objective of economists is to formulate a "social welfare function." This function—the relationship between the well-being of the society at large and the utility of the individuals comprising that society—would determine the best possible social situation stemming from individual rankings of alternatives. Is it possible to achieve a social situation that satisfies all individuals? What does this achievement entail? Arrow endeavored to achieve this objective under minimal ethical conditions: the function should include all the possible orderings, decisions should be coherent, and no individual would have a privileged position in determining the solution. Arrow's conclusion was that this social ordering was logically impossible. The result, called Arrow impossibility theorem, was part of his doctoral dissertation at Columbia—published in 1951 as *Social Choice and Individual Values*—which states that it is impossible to formulate a social preference order corresponding to individual rankings satisfying a set of minimal acceptable conditions. Instead, it seems plausible for Arrow that a "dictator" imposing an order of preferences is required. This conclusion gave rise to a lot of academic work on welfare economics. Amartya Sen's "Paradox of Impossibility of a Liberal Paretian," which states that it is impossible to obtain an acceptable distribution on the basis of liberal minimal conditions, constitutes an example of this line of inquiry.

As stated above, Arrow also contributes to the economics of information. Although neoclassical economic theory is based on the presupposition of complete information for every economic agent, actually different individuals have often unequal knowledge of relevant information. This situation of "asymmetric information" engenders a number of problems to economics: misguiding incentives and decisions and the generation of unnecessary or avoidable costs—for example, the setting of wages in labor markets and employer's preferences for the existing employees (productivity levels of potential employees is unknown to the employer). Asymmetric information before a contract is signed is called "adverse selection," and after contracts, "moral hazard." A typical example of moral hazard is the negligible behavior of insured car drivers. The insurance company ends up with an adverse selection of people and rising the premium for all kind of consumers. A nonoptimal allocation of resources results from this divergence between the private marginal cost of an action and the social marginal cost of the same action. This notion of moral hazard was developed by Arrow in a 1963 paper about medical insurance.

Arrow has always expressed a concern for the ethical aspects of economics. This concern always reflected the kind of topics he addressed (i.e., welfare economics, information problems). He advocates for an ethical repair of market failures.

It is impossible to encompass all his outstanding, thought-provoking, and pathbreaking contributions in a short entry. He is one of the most fruitful and respected living economists.

—Ricardo F. Crespo

Arrow's Impossibility Theorem

Arrow's impossibility theorem is a proposition that it may be impossible to create a consistent collective decision-making rule. Consistent collective decision making treats individuals fairly and equitably and increases the likelihood that people will accept the outcome of a social decision. The theorem provides insights into the complexities of social decision making and the difficulties inherent in improving the voting process.

Difficulty in achieving consistent collective decisions is particularly evident when society is made up of more than one person and there are at least three choices being considered. Nobel Prize–winning economist Kenneth Arrow postulates that a voting scheme should satisfy six exhaustive axioms. First, the voting scheme should produce the same result regardless of the configuration of individual voter preferences. If pairwise voting (Choice A vs. Choice B, and the winner goes up against Choice C) is used, a different result may occur depending on which vote is held first (A vs. B or B vs. C).

This voting process may not lead to a single result if the pairwise voting process is allowed to go on indefinitely. This vote cycling is often referred to as the "paradox of voting." If the voting process is not allowed to go on indefinitely, the one who sets the agenda (voting order) may be able to manipulate the outcome of the election. Neither scenario is desirable for group decision making.

Second, the voting rule should be able to rank all outcomes at the end of the voting process. Third, the ranking of outcomes should be responsive to the individuals in society. Social welfare must be a function of the welfare of the individual in society. Fourth, the outcome of the vote should not violate the law of transitivity. If Choice A is socially preferred to Choice B and B is preferred to C, then A should also be preferred to C. The social voting rule should produce a consistent outcome. Fifth, the outcome should be independent of irrelevant alternatives. If society is ranking Choices A, B, and C, only individual preferences of A, B, and C are relevant. Where individuals would rank Choice D is irrelevant because it is not included in the vote. Preferences concerning Choice D should not influence the vote on Choices A, B, and C. Last, the voting rule should not be solely based on the preferences of one individual in society. The social welfare function should not be determined by a dictator.

Each of these axioms is intuitively pleasing and seems very reasonable. A voting rule that satisfies all these criteria would most likely be accepted by society. However, when grouped together these axioms imply that it is unlikely that a society would be able to create a consistent decision-making rule. The results of collective decisions cannot be expected to be as consistent as the results of individual decisions. Social decision-making consistency is only possible for some patterns of individual preferences. For example, if all voters have identical preferences for Choices A, B, and C, a voting rule is likely to produce consistent results. According to the theorem, it is not completely impossible for consistent decisions to be made collectively, it is just highly unlikely.

A body of academic literature has evolved as a result of Arrow's work. Social scientists have given mathematical proofs of the theorem and have written papers on the implications of possibly relaxing one or more of the criteria. A collective decision-making rule has not been developed that can stand up to all the axioms of the theorem. It is widely accepted that majority (the winning choice has more than 50% of the votes) and plurality (the winning choice has more votes than the other choices) voting are very good ways to make social decisions. Kenneth Arrow and John Hicks shared the 1972 Bank of Sweden Prize in Economic Science in Memory of Alfred Nobel for their contributions to general economic equilibrium theory and welfare theory.

Welfare theory is a branch of economic theory where resource allocations are assessed. Resource allocation simply means "who gets what" in society. Positive theory is concerned with how an economy operates, while normative (welfare) theory is concerned with what should be. The findings of welfare theorists can be used to establish criteria for government intervention in private markets and for the establishment of mechanisms for making collective decisions. Arrow's impossibility theorem helps social scientists better understand the voting process. The theorem indicates difficulty for economists attempting to create a social welfare function, as ranking alternatives often appears to be impossible for society as a whole. This well-known theorem has found applications in mathematics, political science, and many subfields of economics such as public finance and public choice theory.

Arrow's impossibility theorem is not a condemnation of the democratic process. It is not correct to conclude that the theorem implies that all voting methods are fundamentally unfair and that a dictatorship is the best way to make collective decisions. While a dictatorship may be able to produce consistent results, it is generally not considered preferable to majority voting or other voting schemes. In fact, a lack of unanimity may lead to political debate where alternatives can be tested. Inconsistency may be good for the political process, even though someone will always be disappointed by a collective decision. The theorem points out fundamental difficulties in trying to make improvement in our current voting processes. Arrow's impossibility theorem gives insight into the complexities of collective decision making.

Arthur Andersen

Arthur Andersen was the largest public accounting firm in the 1990s, with more than 85,000 employees operating in 84 countries. During the last decade of the partnership's life, auditors at several regional offices failed to detect, ignored, or approved accounting frauds for large clients paying lucrative consulting fees, including Enron and WorldCom. In 2002, the partnership was found guilty of obstruction of justice for destroying documents related to the Enron audit, a decision later unanimously overturned by the United States Supreme Court.

Consulting Schemes

For more than half a century, Arthur Andersen, founded in 1913 by Arthur Andersen, who had a reputation for acting with integrity, was primarily an auditing firm focused on providing high-quality standardized audits. But a shift in emphasis during the 1970s pitted a new generation of auditors advocating for clients and consulting fees against traditional auditors demanding more complex auditing techniques. The problem worsened when Andersen's consulting division began generating significantly higher profits per employee than the auditing division. Auditing revenues had flattened and growth came primarily through consulting fees. Consulting schemes publicly praised by Andersen partners included the following:

- Using highly qualified consultants from other regional offices to market their services during client presentations and then not including them on the project team after the contract was obtained
- Determining the client's budget for consulting services and then selling as many consulting services as possible up to that budget limit, even if the services were unnecessary
- Charging clients a partner's high billable hour rate and then assigning most of the work to lower paid, and less qualified, staff

The Enron Audit

The combination of more complex financial statements, more aggressive accounting techniques, greater concern for customer satisfaction, greater dependence on consulting fees, and smaller cost-effective sampling techniques created many problems for auditing firms. Andersen's Houston office was billing Enron $1 million a week for auditing and consulting services, and David Duncan, the lead auditor, had an annual performance goal of 20% increase in sales. Duncan favorably reviewed the work of Rick Causey, Enron's chief accounting officer and Duncan's former colleague at Andersen. Duncan let Enron employees intimidate Andersen auditors, such as locking an Andersen auditor in a room until he produced a letter supporting a $270 million tax credit. Andrew Fastow, Enron's chief financial officer, successfully lobbied for the removal of an Andersen accountant for questioning his aggressive accounting schemes.

The Indictment

In June 2001, the Securities and Exchange Commission (SEC) issued a cease-and-desist order against Andersen regarding any securities violations for its role in a $1.7 billion accounting fraud at Waste Management. Andersen partners were forewarned that any future violation would result in an extreme penalty from the Justice Department.

By late September 2001, Enron insiders knew the firm would publicly announce on October 16 a third-quarter operating loss, its first ever, along with an after-tax nonrecurring charge of more than $1 billion. Both Enron and Arthur Andersen went into a crisis management mode to prepare for an anticipated SEC investigation. On October 12, Andersen's in-house lawyer requested that the director of Andersen's Houston office comply with the company's documentation retention policy—all extraneous documents should be destroyed.

As expected, the SEC requested Enron audit information on October 17. Six days later, Duncan ordered his audit team to destroy documents at a pace quicker than required by the documentation retention policy. Within 3 days, an unprecedented amount of material had been shredded, and e-mails and computer files deleted, in Houston and several other regional offices. The shredding stopped on November 8 when the SEC formally subpoenaed Andersen for Enron-related material.

CEO Joseph Berardino immediately notified the SEC on finding out about the excessive document shredding, and he fired Duncan following the public uproar. Andersen's response was considered inadequate given that three other major corporations for whom Andersen recently issued unqualified or clean audit opinions—Global Crossing, WorldCom, and Qwest—were either being investigated by the SEC, drastically restating previous financial statements, or abruptly declaring bankruptcy.

On March 14, 2002, the Justice Department indicted Andersen for obstruction of justice. Clients wanting to ensure investors that their financial statements could meet the highest accounting standards abandoned Andersen for its competitors. They were soon followed by Andersen employees and entire offices. Berardino was forced to resign and 4,000 employees were laid off.

In early April, Duncan pleaded guilty to one felony count of obstruction of justice. Andersen requested and received a speedy trial because of the mass client defection. On June 15, 2002, Arthur Andersen was found guilty of shredding evidence and lost its license to engage in public accounting. Three years later, Andersen lawyers successfully convinced the United States Supreme Court to unanimously overturn the obstruction of justice verdict based on faulty jury instructions. But by then there was nothing left of the firm beyond 200 employees managing its lawsuits.

Aspen Institute's Business and Society Program

As a highly visible part of the Aspen Institute—a global forum and cultural institution gathering leaders in reflection and dialogue to create enlightened policy and practices—the Business and Society Program seeks to develop business leaders for a sustainable global society. Since 1999, through its seminars, research, awards, and publications, the Program has sought to disseminate information, promote change, and develop leaders and networks in business and society.

The Program's Web sites provide sources of innovative curriculum, notably through www.caseplace.org and www.beyondgreypinstripes.org. *CasePlace.org* is a free, online service for business school faculty, students, and businesses. It provides some of the best cases, references, and commentary published by and for business educators and business executives. Materials incorporate social impact management (the field of inquiry examining interdependency between business needs and societal concerns), corporate social responsibility, and business ethics.

Beyond Grey Pinstripes is a joint project between the Business and Society Program and The World Resources Institute (WRI), which in 1998 created *Grey Pinstripes with Green Ties*, a report that examined the inclusion of environmental management topics in 37 MBA programs. In 1999, WRI partnered with the Aspen Institute's Business and Society Program to balance the report by examining MBA programs for the teaching of social impact management. Today, *Beyond Grey Pinstripes* has grown in influence and has been used by tens of thousands of students, academics, and major corporations. The current Web site contains detailed information on 130+ global MBA programs. It is the only global survey that evaluates MBA programs for their efforts to prepare graduates on social and environmental stewardship in business. This biennial publication accounts for the majority of articles and press releases about the Business and Society Program. The most recent edition was published in 2005 and notes that an increasing number of schools surveyed (54%, up from 34% in 2003) require one or more courses in ethics, sustainability, business and society, or corporate social responsibility.

In addition to rating leading MBA programs, *Beyond Grey Pinstripes* also identifies "Faculty Pioneers." These are exceptional scholars and excellent teachers (one includes *Encyclopedia* editor Sandra Waddock) who are leading the way in incorporating social and environmental issues into their teaching and research both on and off campus. Faculty are nominated by their peers and selected from a pool of finalists by a panel of corporate judges.

As one of 15 policy programs supported by the Aspen Institute, the Business and Society Program periodically explores topics of current interest and importance, in service to the larger Institute's mission of lifting people out of their usual selves. Some critics of the Aspen Institute consider it more of a social club for the cultural and corporate elite. This charge comes from the Institute's heritage, as a "hobby" of wealthy Chicago businessman Walter Paepcke (1896–1960), who was influenced by the University of Chicago's Great Books program and the humanism inspired by the work of Professor Mortimer J. Adler. Paepcke was a believer in the necessity of business leaders to have time out from commerce to contemplate values and experience the broadening power of the arts. The Aspen Institute is currently managed by Walter Isaacson, noted author and former CEO of CNN and managing editor of *Time* magazine, who exemplifies the Institute's continuing interest in harmonizing business and ethics. A mixture of political and corporate leaders continues to manage the Institute, including Madeleine Albright, Jack Valenti, Henry Kissinger, Micheal Eisner, and Brent Scowcroft. With values training seminars, 1-week in duration, costing almost $10,000, the Institute reaches top-tier business and political leaders but must contend with charges of elitism. By working with university faculty and graduate students, the Aspen Institute's Business and Society Program seeks to provide practical services to balance the more esoteric gatherings at its Aspen and Wye River, Maryland, campuses.

In addition to its case Web site and Beyond Grey Pinstripes study, the Business and Society Program conducted a multiyear survey of 1,700 MBA students at 12 leading international schools of business. The study published in 2003 as *Where Will They Lead?* examined student attitudes about the role of business in society. Another effort was the Corporate Governance and Accountability Project, a study of prevailing models of corporate governance and theories of the firm as taught by business school faculty. The Program was formerly known as The Aspen Institute's Initiative for Social Innovation through Business.

Association for Computing Machinery (ACM)

The Association for Computing Machinery (ACM) was founded on September 15, 1947, as an organization for computer and information professionals. At that time, there was growing interest in the commercial applications of both mechanical and digital computers, although there was little more than speculation that computing technology would become a primary means of global change within the following 50 years.

The ACM publishes an academic journal, *Journal of the ACM*, which was a primary outlet for computer science research. The group also publishes several magazines for practitioners and students.

Another function of this organization was to promulgate a set of professional standards as the discipline of computer science grew into a plethora of subdisciplines, including software engineering, information security, and others. The organization has 34 special interest groups (SIGs), each devoted to a specific area of practice. There is a strong emphasis and focus on computer hardware and end-user applications. Several of these SIGs hold annual conferences, which have become important venues for presenting research and innovations in related fields. Several of these fields each have an ACM academic journal. These are called the *Transactions.*

At the association's founding, computing technology had already been used as a powerful military weapon. Computer scientists in the United States, the United Kingdom, and Germany had participated in a variety of projects to develop faster, more reliable automated equipment for use in cryptography, ballistics, weapons targeting, and other military applications. Computing technology allowed the bureaucracies of the industrialized world's governments to process and store far more information than ever before, more accurately, and at less cost.

On October 16, 1992, the ACM Council adopted a code of ethics and professional conduct, which was developed by a task force of 13 members. (This document replaced a previous code of professional conduct, which was adopted by the ACM in 1982.) The primary purpose of the ACM Code is educational. Thus, the code is normative, with a strong emphasis on deontology and stakeholder theory. The 1992 Code contains 24 statements of personal responsibility for information professionals. These statements are presented as moral imperatives and distributed in four sections: general imperatives, specific imperatives, leadership imperatives, and compliance imperatives.

The general imperatives focus on basic obligations to society. In many ways these principles draw from common laws and professional norms, including intellectual property, trust, privacy, and the avoidance of both personal harm and discrimination.

The second section provides more specific rules for addressing the previous section, including the need for professional competency. The ongoing review of work and performance is a critical area. This includes a professional obligation to honor contracts and agreements.

The third section drew heavily from a draft version of the International Federation for Information Processing (IFIP) Code of Ethics. The imperatives for organizational leadership emphasize the duties of executives, managers, and leaders. At the heart of this section is the tension between the limitations and possible uses of computer systems. Users must understand and abide by a statement of acceptable practices that is specific to the organization and its external environment. A special emphasis is placed on the dignity of users and anyone who is affected by each computing system. In this regard, the code appears to acknowledge a stakeholder view of professional and social responsibility.

The final section addresses the voluntary nature of the Code. Members of the association pledge to abide by its imperatives and to support other members and professionals in their own compliance efforts.

Association of Community Organizations for Reform Now (ACORN)

The Association of Community Organizations for Reform Now (ACORN) is an independent grassroots network of neighborhood organizations whose members engage in direct action to win political, social, and economic benefits for low- and moderate-income people in communities throughout the United States. While many advocacy groups appeal to a single constituency or focus on a single issue, ACORN is committed to organizing communities around a variety of issues. Whether fighting for better schools, affordable housing, new libraries, or more favorable banking practices, they identify winnable goals that have broad appeal across racial, gender, geographic, economic, political, or employment status boundaries. Using an approach that combines electioneering, legislative lobbying, legal action, peaceful protest, and in-your-face confrontation, their coalitions fight for, and often win, tangible benefits for their members and their communities.

Critics of ACORN contend that ACORN's tactics are counterproductive and that they are motivated by a left-wing political agenda that is out of step with the communities that they represent. In addition, in March 2003, the National Labor Relations Board found ACORN in violation of some of the same labor laws that they challenge in other organizations.

ACORN is structured into local chapters, which are democratically run by dues-paying members. Leaders are elected to fill roles in community, city, state, and national ACORN offices. The national president of ACORN since 1990 has been Maude Hurd.

Chapter members identify local issues that people care about and around which they can organize. ACORN staff members do not select community-organizing goals.

Seventy-five percent of all funding comes from members and from member activities, including dues and fund-raising events. ACORN also accepts government funding for specific community programs.

History, Growth, and the *People's Platform*

ACORN grew as an offshoot of the National Welfare Rights Organization (NWRO). The NWRO leadership realized that, as a single-issue organization, they would be unable to organize broader constituencies to obtain a wider array of benefits. With the support of the NWRO leadership, community organizer Wade Rathke founded ACORN in 1970 as the Arkansas Community Organizations for Reform Now.

ACORN expanded beyond Arkansas in 1975 by adding offices in Texas and South Dakota, and by 1980, they had opened offices in 20 states. In 2004, ACORN opened their first international offices in Canada and Peru, and in 2005, they opened additional offices in Mexico and the Dominican Republic. At the time of this writing, ACORN reports that there are 175,000 member families in 850 neighborhood chapters in 75 cities throughout the United States. ACORN continues to add offices and chapters both inside and outside the United States.

In 1979, ACORN adopted their *People's Platform.* The *Platform* is both a vision statement and a detailed list of goals and demands. The *Platform* addresses affordable housing, living wages, accessible health care, better schools, fair utility pricing, the preservation of family farms and family owned businesses, community development, tax relief, industrial and toxic waste cleanup, safe neighborhoods, civil rights, communication rights, community representation in government, and community representation in big business. More recently, ACORN has added immigrant rights to their list of goals and demands.

Through the years, ACORN has created or affiliated with a number of allied organizations. The ACORN Housing Corporation, founded in 1986, builds or restores housing in low-income neighborhoods. The Living Wage Resource Center promotes and supports the living wage movement. Project Vote registers low-income people to vote.

While remaining true to their roots in community organizing, ACORN leaders also organize state and national campaigns around issues that affect all communities. Issues such as fair taxation, living wages, and social security protection are better suited for political action directed at higher levels of government.

ACORN and Business

Early in ACORN's history, the primary targets of their actions were governmental agencies. Over the years, they have also found fertile ground in organizing challenges to corporate activities that they judge to be unfair or abusive.

For example, ACORN has used protests, regulatory challenges, and class action lawsuits to attack predatory lending practices. Loans are considered predatory when lending institutions offer only higher-interest loans to people whose credit histories would justify more favorable terms. Minorities and people living in poor or transitional neighborhoods are often victims of predatory lending. ACORN brought and settled a class action suit against Household Finance in 2003. In 2004, they reached an agreement with Citigroup for fair banking and credit services for low-income households. They also helped to pass California's Predatory Lending Law in September 2001 and similar legislation in other states as well. ACORN continues to pursue legislative protections and legal remedies to challenge predatory lending practices by banks and other lenders.

ACORN also challenged predatory practices associated with refund anticipation loans (RALs). RALs are short-term loans, secured by an income tax refund, commonly offered by tax preparation services. The fees associated with RALs can be several hundred percent when calculated as an annualized effective loan rate. In 2005, ACORN reached an agreement with tax services company H&R Block for better disclosure and reduced fees. They are currently pursuing similar action against other tax preparation companies.

ACORN does not always have to challenge a business practice to win benefits for their communities. In 2005, the Forrest City Ratner Companies (FCRC) enlisted the support of ACORN in the early planning stages of a mixed-use real estate development project in

Brooklyn, New York. As part of their plan, FCRC guaranteed thousands of low- and middle-income housing units, jobs and job training, minority development contracts, and community use of a new professional basketball arena. By addressing ACORN's concerns early in the planning stages, the FCRC proposal received ACORN's endorsement.

Criticism

Several critics remind us that ACORN's roots lie within a left-wing ideology. Even today, the *People's Platform* speaks about the struggle of the masses to share the wealth. Yet, at the same time, ACORN coalitions are composed of people across the political spectrum.

By drawing attention to class differences and making a direct challenge to American political and economic institutions, these critics argue that ACORN's rhetoric may be seen as divisive, not embracing. Conservative participants in ACORN coalitions may participate only to the extent that the action benefits them and addresses their local issues. Critics also wonder what would happen if a local chapter pursued a conservative agenda that was out of line with ACORN's ideals.

In its defense, ACORN does manage to form and maintain coalitions, one issue at a time, and win benefits for their communities. However, the potential conflict between ACORN's goal-oriented activism and their left-wing ideals should not be overlooked.

Association of Trial Lawyers of America (ATLA)

As the world's largest trial bar, the Association of Trial Lawyers of America (ATLA) is a broad-based, international organization of attorneys, judges, law professors, paralegals, and law students. The ATLA is dedicated to promoting justice and fairness for injured persons, safeguarding victims' rights (especially through the right to trial by jury), and improving the civil legal system through education and disclosure of the information to the public.

Started in 1946 by a group of plaintiffs' attorneys involved in workers' compensation litigation, the then named National Association of Claimants' Compensation Attorneys (NACCA) was founded to protect the rights of victims of industrial accidents. Shortly thereafter, the NACCA attracted personal injury, admiralty, and railroad lawyers, eventually opening the organization to all areas of trial advocacy.

With continued growth and expansion of its advocacy, the NACCA changed its name to ATLA in 1972 to reflect the broadening membership base. In 1977, ATLA moved its headquarters from Boston to Washington, D.C., to more effectively lobby and advocate on behalf of its membership. With approximately 60,000 members worldwide, ATLA provides attorneys with information and professional assistance to better serve their clients successfully in trial advocacy and support ATLA's goal of protecting the democratic values inherent in the civil justice system. ATLA is a voluntary professional organization governed by the membership.

In recent years, ATLA has become one of the most influential and well-funded political lobbying groups in the country. ATLA is very active in the legislative arena on behalf of matters of concern to its members and their clients, focusing primarily (but hardly exclusively) in the area of tort and judicial reform. ATLA is major contributor to politicians and political campaigns, especially to those in the Democratic Party.

Association to Advance Collegiate Schools of Business (AACSB International)

AACSB International, the Association to Advance Collegiate Schools of Business (formerly American Assembly of Collegiate Schools of Business), is a not-for-profit corporation of educational institutions, corporations, and other organizations devoted to the promotion and improvement of higher education in business administration and accounting. AACSB, which is the oldest and largest business accreditation organization, was founded in 1916 by the deans of 17 business schools in an effort to establish and maintain minimum accreditation standards. In 1980, to address the needs of the accounting profession, AACSB adopted additional standards for undergraduate and graduate degree programs in accountancy.

Many business school constituents have continually criticized the AACSB for not enforcing standards relating to public policy, moral philosophy, social values, and other humanities in curriculum development. In 1925, the first detailed AACSB curriculum standards were approved, requiring a reasonable amount of work in at least five groups of study, including business law. In 1949, new standards required that at least 40%, but not more than 60%, of a student's education consist of nonbusiness courses. Critics of the AACSB argued that too many business programs violated this standard and that the educational requirements of humanities were inadequate.

Going into the 1960s, the business school reform movement called for increased business and society study because business students needed to understand the connection between business and nonbusiness studies. Both the Ford and Carnegie Foundations maintained that the content of business law courses, intended to inform students of the broader societal concerns, was too narrow. The Ford Foundation recommended that the business law course be replaced with a course that taught the legal environment of business or a more broad-based course that dealt with the social, political, and other dimensions of business environment. The Carnegie report recommended that business law be replaced with a class about political and legal factors of business in addition to six credits in business policy and social responsibilities. In 1967, the AACSB revised its standards requiring business programs to include in their curriculum the economic and legal environment issues and social and political influences that affect both profit and nonprofit organizations. In 1974, this standard was expanded to include ethical considerations. As a result, the teaching of business and society topics became a growth activity throughout the 1970s and into the 1980s.

The loss of public confidence as a result of corporate scandals of the early 2000s renewed the demand for ethics education. Despite the growing support by constituents to require stand-alone ethics coursework, AACSB failed to require it in the accreditation standards adopted in 2003 and revised in 2005. Ethics continues to be excluded from the list of accredited subjects. Accredited institutions can choose to address the subject matter by either incorporating it in other required coursework or as a separate course.

Asymmetric Information

Neoclassical economics is founded on the assumptions of complete and symmetric information. Information is complete when all parties to a transaction know, or have access to, all information that ought to be relevant to their activities. Information is symmetric when all parties know all relevant information possessed by others involved in an exchange. However, most economic activities involve some failure to meet these conditions. People often do not possess full information related to decisions they make, and more important, some people usually have better information than others. When two or more individuals interact, asymmetric information exists when at least one individual possesses relevant knowledge that others do not have. Asymmetric information pertains only to situations involving interactions of two or more people.

Asymmetric information is best understood in the context of an exchange between buyers and sellers. A classic example involves the selling of a used car. The owner of the car knows its quality, but the buyer does not. If it is difficult, costly, or even impossible for a buyer to determine the quality of the car, then we say the seller possesses private information. Asymmetric information is a problem because people who possess the superior information may have an incentive to intentionally misrepresent the product and defraud others, while people who do not possess the superior information may incur costs trying to obtain better information or to protect themselves from being harmed. For example, in the case of used cars, the seller might try to convince the buyer that the car is of better quality than it actually is to obtain a higher price for the car. Knowing this, the buyer might pay a mechanic to inspect the car; or the buyer might hire a lawyer to draft a bill of sale that stipulates that the seller is obligated to issue a refund to the buyer if serious mechanical problems arise with the car within a stated period of time.

There are several reasons why asymmetric information exists. First, acquiring information is costly. This is because it usually takes time to search for and identify relevant information. Thus, some people may find that the cost of acquiring information may not be worth the expected benefits from possessing it. Second, some information is difficult to transfer, such as scientific knowledge or firm-specific knowledge. Knowledge is difficult to transfer if it cannot be easily quantified or articulated explicitly. Related to this is the fact that people are boundedly rational, meaning they have a limited capacity of acquiring, processing, and storing information. People are also forgetful. Thus, even if information were freely available, cognitive limitations will prevent people from being able to integrate all relevant information into the decisions they make. The implication is that some people will inevitably have better or more complete information than others possess.

Asymmetric Information Problems Manifested as Adverse Selection or Moral Hazard

Asymmetric information problems can arise either before or after an exchange is established. *Adverse selection* is the term used to describe problems of asymmetric information arising before an exchange occurs. *Moral hazard* is the term used to describe problems of asymmetric information occurring after an exchange is established.

Adverse Selection

Adverse selection is the process by which bad products or outcomes are "selected," and it occurs when people opportunistically exploit private information they possess. The classic study on adverse selection is by the Nobel Prize–winning economist George Akerlof (1940–). In his article, "The Market for Lemons," Akerlof elaborates on the problem of buying and selling used cars. The term *lemon* refers to a defective car. Akerlof argues that if a used car market consists of good cars and lemons, and if sellers have private information about car quality, then buyers would be willing to pay at best a price equal to the average quality of cars. Because an average price is less than the value of good cars, owners of good cars might pull out of the market, resulting in a market that either collapses or consists only of lemons.

Another example Akerlof offers is medical insurance for people aged more than 65 years. Companies offering medical insurance do not know the true health risks of applicants, but applicants know their personal medical conditions. That is, buyers of medical insurance possess private information. Therefore, insurance companies would offer a price for insurance reflecting average health risks of applicants. People who believe they are relatively healthy may find this average price too high and opt out of the medical insurance market. As healthy people begin to do this, the average health risk of applicants increases. This causes the insurance company to increase premiums, resulting in even more people seeking to self-insure. The result is that the cost of medical insurance becomes so large that no medical insurance sales take place for people over age 65. As a contrast, Akerlof says the market for group insurance for employed workers functions because there is no asymmetric information. If health is a precondition for employment, then medical insurance companies will know that people who are employed are relatively healthy. As a result, they can offer prices for their policies that are low enough for the healthy and employed to be willing to pay. Akerlof suggests that his "lemons principle" provides an insight into the true cost of dishonesty. If sellers can either honestly represent or misrepresent their products, or if buyers can either honestly represent or misrepresent their true types, then dishonest dealings tend to drive honest dealings out of the market.

Because the root problem of adverse selection is information asymmetry, solutions generally involve some form of either signaling or screening. Signaling is the process by which people with superior information credibly communicate their true types to others. Screening is the process by which people without superior information infer the true types of others based on their observed behavior. For example, education can be an effective signaling and screening device. Suppose employers want to hire hardworking employees, but they cannot determine which workers who apply for employment will work hard and which applicants will shirk. According to Akerlof's lemons principle, employers would only be willing to offer a wage reflecting the average quality of workers, resulting in hardworking applicants withdrawing from the labor force, because these workers would find this average wage less than what they believe they are worth. However, suppose applicants who would have been hardworking employees could take an action that signals their true quality, such as earning a college degree. If a college education is challenging enough so that shirking workers would be unable or unwilling to complete a college degree, then a college education would be an effective signal of worker quality in this sense: People who have college degrees are expected to be hard workers, while those without them are not. Employers can infer which workers would work hard and which would shirk by observing whether applicants have a college degree. Moreover, employers could screen job applicants by requiring a college degree or by hiring workers who obtain college degrees from certain universities.

Moral Hazard

Moral hazard refers to the risk one party carries because of the behavior of others. Like adverse selection, it exists because of asymmetric information. Moral hazard occurs when, after an exchange takes place, one party to the exchange changes his or her behavior or acquires information unbeknownst to the other party, thus increasing risk for the other party. For instance, without an insurance policy, drivers must bear the full cost of an auto accident. This will usually give them an incentive to drive carefully. However, if drivers purchase an auto accident insurance policy that pays in the event of an accident, they will have less of an incentive to drive carefully, thus increasing risk to the insurance providers. Another example occurs in employment. People who are paid a fixed salary may have less incentive to work hard than people who are paid on commission, thus affecting the productivity of the employer.

Moral hazard problems are manifested as consequences of hidden action or hidden information. Hidden action refers to situations in which the person taking an action knows what the action is, but those affected by the action cannot observe or infer at low cost what the action is. The insurance and employment examples are representative. In the case of insurance, insured drivers know if and how their behavior changes as a result of the insurance policy and, most important, if an auto accident is a result of careless driving. The insurance company, however, might not be able to determine if an accident is the result of chance or careless driving. In the case of employment, an employer might not know if the poor performance of workers is the result of shirking or other factors outside of their control, but workers would know how hard they work.

Hidden information refers to situations in which people who have entered into an agreement acquire specialized knowledge as a result of completing their duties that would be valuable to their trading partners. For example, lawyers, physicians, and accountants will often learn information that would be beneficial to their clients because of the work they perform for them. Similarly, persons in sales might learn about market conditions or the activities of competitors, knowledge that would be valuable to their employers. Hidden information is a problem because persons with the private knowledge might have an incentive either to fail to fully or truthfully disclose knowledge they have to others who may be entitled to that knowledge or to use that knowledge for their own benefit at the expense of others. For example, physicians might know the true health of their patients but may order unnecessary medical tests or procedures that benefit them financially, or accountants and auditors might know the true financial status of a corporation but report false or misleading information to affect stock prices.

Asymmetric Information and Ethical Behavior

Asymmetric information is at the heart of most unethical behavior in business. Whether manifested as adverse selection or moral hazard, people who possess superior information will often have an incentive to use their private knowledge for their own benefit at the expense of others. Insider trading, corporate accounting scandals, deceptive advertising, shirking, and employee theft are examples of problems that arise in business because some people possess or have access to private information.

Ethical problems arising from asymmetric information are not just confined to business, however. They pervade all aspects of life. Family, social, and political life are often disrupted or complicated because people take advantage of or fail to disclose relevant, private information. For example, consider the case of courtship and marriage. Presumably, potential marriage partners want to find the best person they can marry. Courtship is a time in which potential partners learn about each other. However, partners are often reluctant to disclose all information about themselves or their past, such as how many previous partners they may have had or what illicit behaviors they may have participated in as a youth. Marital strife and even divorce can result when partners learn things about their spouses that they did not know about before marriage. In the case of politics, many people have a cynical view of politicians. The reason is in part related to the problem of asymmetric information. People know that politicians possess information that the average citizen does not, and people believe that many politicians use that information to enrich themselves at the expense of the tax-paying public.

If asymmetric information is at the heart of unethical behavior, then solutions to unethical conduct involve efforts to create private and public institutions that attempt to make that information more public, symmetric, and transparent. Examples of such institutions include private investigators, government regulators, and rules regarding the disclosure of financial information by companies. When private information is transparent, the incentive to exploit such information is often reduced or eliminated. All said, when asymmetric information persists, principles of ethics suggest that people ought not to use private information they possess to benefit themselves at the expense of others.

Auction Market

Auctions are a form of trade, a mechanism to match a buyer and seller for any item of value. The valuation of items is usually subjective and is usually achieved through a bidding process that finally ends after the last bid is accepted by the seller. Historical evidence suggests that auctions have been around for about 10,000 years. Auctions have been used to sell items to consumers, auction off assets such as treasury bonds and transmission bandwidths, and for many other types of sales. An auction market is a place for off-line auctions or a virtual space for online auctions that facilitates auctions.

The main function of a good auction market is to facilitate an efficient and fair trade. *Efficiency* could be defined as generating the best valuation for the seller with the least cost of the auction process itself. *Fairness* could be defined as eliminating any advantage to buyer(s) or seller(s) that could be derived through a variety of unethical, illegal, and other means. Over the long history of auction markets, many different auction mechanisms have been designed to increase efficiency and fairness. Different types of auction markets (or mechanisms) and efficiency and fairness issues related to those are presented next.

The number of identical items for sale, number of sellers, and number of buyers are the factors that are relevant in designing appropriate auction markets. For example, if all the items being sold are one-of-a-kind items, and the auction has multiple buyers and one seller, we will have a traditional *English auction.* Here, each bidder would successfully bid higher and the final price is settled once there are no more bids. If the seller has several of the same items the auction would be a *Dutch auction*, where the bidders will still continue to bid higher and higher. However, in this auction, the bidders will have the choice of indicating the number of items they are committed to buy at their price. If there are many sellers and a single buyer the auction results in a *reverse auction.* For example, a state government interested in buying aluminum sheet could invite several sellers to the auction, the sellers bid against each other by continually lowering their sales price and the final price is reached when there are no more bidders at a lower price.

Auctions can also be *open bid*, where everyone in the market knows the value of the bids of other participants, or *closed bid*, where the bids are not disclosed. Auctions can also be classified based on the type of participants as consumer to consumer, business to consumer, government to business, and so on. Auctions can also be classified as off-line or online. In an off-line auction, the most common auction before the explosive growth of the Internet, all potential buyers and the seller(s) would congregate in one location (a physical place), the buyers would examine the items being auctioned off and develop an initial valuation for the item, and then start bidding for the item at a preset time and continue to bid until there are no more bids. In contrast, online auctions are held in a virtual space on the Internet and buyers and sellers can be anywhere in the world. An example of the most successful online Internet auction market is eBay.

If a participant is purchasing an item in an auction to derive some personal value, such as buying a bottle of 100-year-old wine to consume at a special occasion, then the value of the item is considered a *private value.* However, if all the buyers perceive the same use for the item, like buying a certain transmission bandwidth for developing cell phone networks in a certain location, the value generated will be *common value.*

In any auction market the efficiency increases as more buyers and sellers participate as there will be more competition. Efficiency also increases when there is information transparency, that is, all participants have access to all the information necessary to assess the value of the items. In an open-bid auction, the information generated through the bidding process increases the efficiency. This transparency is lacking in the sealed-bid process. A variation of the sealed-bid auction is a multiple-stage process, where the bid details of each stage are revealed to all participants to improve the efficiency of the bidding process in successive stages. In eBay auctions, where there is a preset time for the closing of the auction, it is possible for the bidder with the most information about the item to wait until the last minute to start bidding. This reduces the information available to other bidders in the bidding process and leads to information asymmetry and a reduction in the efficiency of the auction market. This last-minute bidding, to obtain a valuable item for a cheaper price, is sometimes known as *sniping.* Auctions on Amazon .com compensate for this by not having a firm preset close for an auction. These auctions close only when there are no bids for a 10-minute period after the last bid before the flexible preset close time. This reduces the possibility for sniping and provides more valuation information to all participants. In some auctions, sellers may bid in their own auctions early in the bidding process to provide wrong information about the value of the items to other bidders thus potentially increasing the value of the final bid. This is called *shilling.* Some auction markets, both off-line and online, try to eliminate this unfair practice by requiring the participants to register and by monitoring for shilling activity. Inaccessibility of the auction, whether technological or otherwise, to many potential participants also results in reduced efficiency of the auction market.

With the explosion of the Internet, many successful, and possibly more efficient and fair, online auction markets have been created. The trend appears to favor growth of online auction markets.

There are some social and ethical issues that must be considered in designing auction markets. In electronic auction markets, the digital divide, the unavailability of communication and information technologies to individuals and organizations, can have a negative social impact on participants by restricting entry through unavailability and increased cost of technologies and through lack of understanding of appropriate technologies. An ethical issue that should be carefully monitored, in both off-line and online auctions, is the presence of collusion by participants to reduce the final bid price, thus decreasing the fair payoff to the seller.

—Hindupur V. Ramakrishna

Austrian School of Economics

The Austrian School of Economics is an economic school initiated by Carl Menger (1840–1921). Menger's first disciples were Eugen von Böhm-Bawerk (1851–1914) and Friedrich von Wieser (1851–1914). Joseph Schumpeter (1883–1950) is sometimes associated with the Austrian School. Although he was a student of the last two, he departed early from Austrian ideas. The Austrian current was continued by Ludwig von Mises (1881–1973) and Friedrich A. Hayek (1889–1992). Other representatives were Murray N. Rothbard (1926–1995), Ludwig M. Lachmann (1906–1990), and Israel M. Kirzner (1930–). The School is still alive and universally active, though concentrated mostly in the United States.

The Austrian School is more than an approach to economic theory. It also deals with matters of political philosophy, social ontology, and social science epistemology. It supposes, and sometimes explicitly speaks about, an anthropological conception. It is generally associated with classical liberalism or libertarianism, though this is not necessarily a particular trait of the Austrian School. Most Austrians are vigorous advocates of the cause of political freedom, free markets, private enterprise, and individualism. Mises and Hayek were paradigmatic in this respect. They opposed totalitarianism in all its forms. Hayek's *Road to Serfdom* (1944) is still today a necessary point of reference on this issue. They both engaged in the "socialist calculation debate," arguing that government planning cannot achieve the efficient results of a free market system.

Main Characteristics

We may summarize the characteristics of the Austrian School in five main items:

1. Economic explanations rely on human purposive action. "Purposive" means that it stems from an individual decision aiming at an end or goal—a "subjective" decision. Hence, subjectivism is a relevant trait of Austrian economics. One difference with neoclassical marginalism, stemming from Austrian subjectivism, is its stress on the opportunity cost theory: This theory emphasizes the necessarily subjective role of personal demand preferences in the determination of prices. Austrian economics refuses mathematical and mechanical explanations, considering them inadequate for dealing with purposive human actions. One consequence for businesses of this trait is that Austrians strongly support a market system absolutely free, without governmental controls.

2. Methodological individualism—the explanation of social phenomena as resulting from purposeful individual subjective actions—is the method of Austrian economics. Hayek developed this issue. A typically Austrian nuance of this perspective is depicted next.

3. Individual actions have unintended consequences. The traditionally considered unintended consequence is a tendency toward market equilibrium. However, Austrian economics does not focus on equilibrium outcomes. For Austrians the market is a process that tends toward equilibrium. These last two characteristics reinforce the relevance of freedom in economic actions in the Austrian approach.

4. A fourth trait—although arguable—is value neutrality as a condition of scientific knowledge. It was defended by Menger, Mises, and Hayek and, despite some dissent, is still defended today. This is relevant for business ethics because value neutrality entails putting aside ethical concerns within economics.

5. Specifically, economic ideas include concrete approaches to the concept of cost (as mentioned above); a theory of business cycles based on monetary overinvestment; a time-theoretic theory of interest and capital; and the special relevance of the price system for coordinating decentralized, subjective individual preferences to achieve a spontaneous and harmonious order. Kirzner has developed a theory of entrepreneurship in which entrepreneurial alertness has a significant role. For him, entrepreneurial discoveries propel the market process.

The Austrian School Versus Neoclassical Economics

From its beginnings, the Austrian School has been differentiated and opposed in several points to the neoclassical school. The causes of these differences may be found in the Austrian School's ontological, anthropological, and epistemological premises. Concerning ontology, while neoclassical economics has a determinist or closed social ontology, Austrians take an open view of society as always subjected to unexpected change. The neoclassical anthropology entails a mechanistic vision of man and of human action, while Austrians are open to freedom in a teleological conception of human action. Both schools have different epistemological assumptions appropriate to those philosophical positions. The Austrian School, rather than supporting neoclassical naturalistic or mechanistic frames, leaves room for an epistemological special framework for social sciences, where human interpretation enters the game. This has been for Austrians a source of continuous criticism of neoclassical economics.

A Nonmonolithic Doctrine

The Austrian School is not a closed system—it has been far from static. It has made room for different philosophical influences—from Aristotle to Immanuel Kant, Max Weber, Alfred Schutz, and scholastic thinkers as well. The common idea is subjectivism and a conception of all that is economic as human action. Another common trait is the search of an economy that respects individuals and their freedom from totalitarian and socialist regimes.

Austrian subjectivism has expanded since its creation. The first step was Menger's application of subjectivism to human needs. The second was the extension of subjectivism to means, while ends are given. Hayek considers the conveying problems that subjectivism has to overcome. Lachmann, following the British economist George Shackle (1903–1992), introduces hermeneutics: We do not only have information but we also have interpretation influenced by imagination and desire, as well as by rationality. This process draws on expectations and broadens rationality. Subjectivism reaches ends, which are a creative result of people's imagination, thus making the future unpredictable.

An epistemological tension within the Austrian School can be expressed in the question, "How can we explain the unpredictable?" For Kirzner, the resolution of this dilemma would become the future research program of the Austrian School. This tension has not yet been fully resolved and has prompted the development of two positions. One position prefers equilibrium over uncertainty, despite relaxing the firmness of equilibrium. The other position prefers uncertainty over equilibrium, where unintended consequences cannot be foreseen.

This last position has been challenged by the Austrian orthodoxy as being nihilistic: We cannot develop science from unpredictable or unmanageable actions or processes. We should choose: We must retain either unpredictability or coordination. We cannot have both and consider that plans coordinate unpredictable actions by the intervention of miracles. A possible solution is a profound social shaping of human beings that makes them act individually, while taking into account that they are social beings. However, this solution will be always limited because an Austrian must acknowledge the creative character of human beings. This tension between subjectivism/nihilism and coordination/scientific predictability leads

Austrians to try a solution in a position located between the absolutely open position of a radical hermeneutics and the closed position of social determinism.

Conclusion

What is the essential message of the Austrian School for business, business ethics, and society? Austrians' strong support of free markets ultimately translates into an ethical mandate. Since businesses must develop in a free market environment, the ethical principle of freedom becomes paramount.

AUTHENTICITY

When we refer to documents, works of art, or historical artifacts as authentic, we mean that it is the "real thing," or that it is what it claims to be. For example, to claim that a Picasso painting is authentic, art dealers would have to determine that it was truly painted by Picasso. Similarly, in providing attest services, auditors verify that a company's financial report reflects the true state of the company's financial affairs and is therefore authentic. You can see that in all these examples, when one calls something "authentic," one is making a truth claim. When it comes to attributing authenticity to a person, we also refer to the extent to which a person is true to himself or herself. This definition assumes that each individual has a unique identity and unique values and habits and that authentic persons would display these beliefs and traits in their everyday behavior. A person who claims to be honest, but conducts dishonest business activities, cannot be called authentic.

Ironically, as a result of the idea that authenticity entails "being true to yourself," it became associated with moral subjectivism. If individuals make moral decisions based solely on their own individual beliefs or interests, we lose the ability to criticize individual acts that may be considered morally problematic from the perspective of the shared values and beliefs existing in society. Charles Taylor, a communitarian, finds the roots of the individualist understanding of authenticity in the Cartesian motto of *I think therefore I am*, and traces it through the history of modern philosophy to Sartre's existentialism and the individualism found in John Locke's political philosophy. Taylor argues that it is a mistake to define authenticity in individualistic terms, because it tends to result in narcissism and self-indulgence. He argues that individuals only develop a sense of self in interaction with others in society. Beliefs derive moral significance because human beings assign value to certain things in interaction with one another. In the process, we develop shared horizons of significance, which inform individual values, beliefs, and habits. The notion of self-determining freedom to "be yourself," which is so influential in popular conceptions of authenticity, acknowledges the creative nature of individual construction of meaning, but it underestimates the importance of shared horizons of significance. Taylor points out that one cannot have a sense of self without also taking into consideration the dialogical setting within which your sense of who you want to be originates. An authentic moral response would be one that displays an awareness of how one's unique ethical response is formed by or interacts with the norms and values existing in society. For example, being an authentic auditor will therefore mean that one displays the norms and values that society associates with auditors—objectivity, veracity, due care, and so on. If one fails to display these traits, one cannot be an authentic auditor. Poststructuralism would concur with the communitarian critique of the individualism and instrumentalism that characterize modern notions of authenticity. However, poststructuralist perspectives on authenticity would depart from the communitarian dialogical understanding at various points. Heidegger's notion of authenticity differs from other definitions of authenticity in that it does not measure it in terms of a person's compliance with certain normative standards of behavior. In fact, Heidegger would argue against a representational account of values and morality in general. Representing the "moral" in terms of a set of rules, or defining it in instrumental terms, that is, whatever would facilitate a balance of benefits over harms, would be to sacrifice the possibility of an authentic life. An authentic existence in Heidegger's terms lies in the phenomenological idea of "world openness," which entails resisting the instrumental considerations that allow us to objectify and categorize everything that we encounter in our attempt to survive. We orientate ourselves toward certain end results and therefore degrade everything else as unimportant, or inessential. Authenticity entails the ability to remain open to the possibility of emergence of the world out of hiddenness. This requires a new type of openness. The characteristic mode of being that allows for this openness is that of a "lingering attentiveness," that is, pausing to consider how what we are doing or saying is both hiding and revealing certain aspects of our existence.

Heidegger's critique of instrumentalism has direct implications for the definition of business objectives. Heidegger seems to be making a strong argument against a business model that would focus only on extrinsic, instrumental motivations such as mere profit. The intrinsic value of being human beings in the world would problematize the way in which meaningful work is often defined in instrumental terms. Heidegger describes our everyday existence as filled with restlessness, which is the result of always being driven toward a specific end. He argues that, as a result, we find ourselves in a perpetual state of homesickness. We feel homesick because we no longer have access to those conditions that provide us with access to an authentic humanity.

However, business life can be a space that allows for an authentic life if it could provide the space within which an openness toward the world can be realized in and through one's everyday work. Business creates the objects and services that frame our experience in particular ways. Technologies such as jugs, bridges, cell phones, and so on can distract us from certain aspects of being in the world, or they could serve to facilitate our openness toward different modes of being. In choosing certain product lines or new services, business should consider how it may assist or hamper our authentic existence. That means giving some consideration to how these objects or concepts may facilitate a "lingering attentiveness" to what it means to be human.

AUTHORITY

Authority is defined as the exercise of legitimate influence by one social actor over another. There are, of course, many ways that an actor can influence another to behave differently, and not all of them have equal claim to authority. To differentiate the term from other forms of influence, consider a simple hypothetical: Imagine that a person wielding a club forces another person to hand over his or her money and possessions. This act might be considered coercive—the exercise of brute power, which in many instances would be criminal. However, if the person with the club is a bailiff, a person occupying a legitimate role in a society, and menaces the other person in the process of repossessing goods, the act of influence may well be legitimate and constitute the exercise of authority.

This classic hypothetical illustrates the basic distinction between authority and coercion by physical force. As the psychologists French and Raven point out, however, these are only two of the common bases of social power, and the distinctions between authority and the other forms of social influence are somewhat more subtle. For example, if the person no longer held a club but instead offered the other person a toaster to hand over all of his or her money, we might see this reward (i.e., the toaster) as a source of power but probably not authority. The banker, who rewards a client with future interest payments (and sometimes a toaster) for doing exactly this has no authority over the client, for the client is always free to decide not to give the money and, later, to require the money's return. The same might be true of peer pressure, a good argument, or any other form of influence for which one cannot say, "Person B has an obligation to obey Person A and hand over all of his or her money." Indeed, it is in this sense that there exists some normative relationship between A and B, some duty that B has to obey A, which constitutes authority.

Governments are, perhaps, the most familiar example of an authoritative social actor, as by most accounts, they generally possess a monopoly on the legitimate use of physical force to compel obedience to their mandates in a given geographical area. It is easy to imagine our hypothetical Person A using the club legitimately to quell a riot or to subdue a fleeing prisoner. The soldier or police officer serves as an extension of state authority and shares its legitimacy. However, even these familiar forms of political authority as exercised by the state have limits, and a police officer who uses the same club to compel a confession or to extort money steps outside the limits of the legitimate authority usually accorded to the police and thereby engages in coercion, which is the opposite of authority where the presence of a normative relationship is concerned.

Of course, the exercise of authority, thus defined, is neither limited to the state nor confined to the use of physical force. Instead, the concept of authority extends to cover a variety of social interactions and resides with a variety of social actors. Through the mechanisms of corporate governance, shareholders and their boards of directors exercise authority over the executives of publicly held corporations. They have, for example, the right to hire and fire the chief executive, to set his or her wages, and to review important corporate policies. Business firms create rules to regulate and, thereby, exercise authority over employees. Indeed, the very notion of hierarchy that characterizes most complex organizations rests on the exercise of authority by superiors over subordinates. Much of the early scholarship in organization theory centered on questions of why authority dynamics arise in organizations and how these dynamics facilitate the coordination of organizational action.

As a central concept in the study of societies, states, and organizations, authority has drawn the attention of several very different fields of study. The nature of authority and what makes the exercise of authority legitimate is a central question for political philosophers. "When," they ask, "may a state legitimately compel its citizens to act?" And, conversely, "When may citizens legitimately refuse to obey state mandates?" For sociologists and political scientists, the more pressing questions concern the antecedents and effects of de facto state authority (existing state authority, especially as it actually exercises its power rather than how it's supposed to do so, according to the constitution or the Federalist Papers or a philosopher, for example). They ask, Why do individuals, groups, and organizations submit to authority? How do broader social institutions serve to legitimate this authority? How does the form of authority exercised by a state affect society and its members? For social psychologists, the more fundamental question concerns individual reactions to the exercise of authority. Why do individuals obey authority? And what are the limits of this obedience, especially where other normative considerations are concerned? Each of these three very different sets of questions has clear implications for understanding the role of business in society.

Authority as Normative Question

To the political philosopher, the central question concerning political authority is under what conditions state action can be considered legitimate. After all, we can agree that authority requires some clear appeal to a higher sense of legitimate state function, but agreement on this point does not imply agreement either on the principles that define what is legitimate or on the limits of this legitimacy. When, for example, are citizens obliged to obey laws that either imperil their own lives (i.e., the problem of Socrates) or conflict with other important moral considerations (i.e., the problem of Thoreau)? Such questions have occupied political philosophers for centuries and have inspired important contributions by philosophers such as Thomas Hobbes, David Hume, and John Rawls.

In recent years, commentators such as Robert Paul Wolff have placed such questions in starker terms, considering authority to present a paradox: If legitimate authority requires an actor to act in ways contrary to their own judgment and if moral autonomy (i.e., the right to exercise reason on moral questions and act according to one's reason) is a fundamental human right, then the exercise of authority is always a violation of the other person's moral autonomy and is immoral. This has given new life to the discussion of normative justifications for legitimacy.

For those interested in applying insights from political theory to the conduct of business, one avenue is a direct analogy of the state-citizen relationship to that existing between the state and the firm. After all, the question of when and why a firm should obey state mandates is particularly important given the magnitude of social consequences when it fails to do so. Moreover, to the degree that the corporation (a popular form of business organization) relies on the legitimacy of state mandate for its very existence, one might expect a higher rather than a lower degree of obedience.

More interesting is the question of whether insights from political theory apply to the actions and mandates of the business firm itself. If we can say that a firm exercises authority over its employees (or any other stakeholder groups), then we must also ask whether the boundaries ascribed by political philosophers to state legitimacy apply equally well to organizational action. For example, do notions of consent that underpin theories of democracy at the state level necessitate similar notions of employee or stakeholder democracy at the firm level?

The relationship between political philosophy and organizational ethics is controversial, not least because some political philosophers (e.g., John Rawls) have specifically excluded private associations from the scope of their thinking. Business ethicists disagree about the need for an organizational ethics separate from political philosophy, with some arguing for the direct application of philosophical insights about authority, while others argue that organizations are sufficiently different from states so that few of these philosophical insights apply with any precision.

Authority as a Sociological Question

To the sociologist, the legitimacy that distinguishes between coercive power and authority rests not on some theoretical normative foundation but rather on de facto social convention (actual social convention, meaning here that legitimacy is not whether an actor's behavior satisfies some ideal ethical norm but whether it fits with social norms held in common by real people in society).

Society confers on certain actors the right to influence others and to expect their obedience. A community member who stops another on the street and searches his or her possessions against his or her will is a vigilante, exercising coercive power; a police officer who engages in the same behavior in accord with legal procedures, validated by social convention, is exercising authority. Max Weber identifies three inner justifications, or sources of legitimacy, for the exercise of authority: traditional norms sanctified by long-standing convention; charisma, which attracts the personal confidence and devotion of followers; and rational-legal considerations supported by belief in the validity of legal statutes and functional competence. Much of the authority cited in business and other organizations today rests on a rational-legal source of authority. It is the combination of a manager's position relative to statutory and rational structures that constitutes the right to expect obedience from subordinates. Stockholders share a similar type of authority in their dealings with the corporation via governance mechanisms.

For organization theorists, it is Chester Barnard's so-called consent theory of authority that lays the foundation for thinking about the relationship of business with its stakeholders, despite its focus only on intrafirm relationships between executives and subordinates. Contrary to top-down notions of authority (such as that of Weber), Barnard held that an executive's order would have authority only insofar as a subordinate judged it acceptable, falling within a *zone of indifference* that would keep the subordinate from questioning the executive's authority. From this, one might infer that the responsibility of the executive is to maintain employer-employee relations on a sufficiently positive basis that could sustain authority necessary for the efficient functioning of the organization.

Extending this notion of authority to multiple stakeholders, one might also argue that much of an organization's treatment of its stakeholders rests on some level of authority. When a firm proscribes certain behaviors from customers (e.g., behaviors when standing in line), employees, and local communities, it often rests not on a direct market exchange but on the willingness of stakeholders to accept the authority of a firm's managers. In this sense, the conflicts that companies often face at the hands of stakeholder groups represent the breakdown of organizational authority.

The extreme example of how a firm might exercise authority, on a consent basis, among its stakeholders is the increasing trend toward self-regulation, in which even the state cedes some authority to firms (individually and collectively) to determine right behavior. For example, the Motion Picture Association of America participates in a voluntary rating scheme in which, in lieu of federal regulation, the Association assigns content ratings to films. In this sense, the association exercises not only direct authority over filmmakers but also indirect authority over the movie theaters that show the films and even the moviegoers who can be turned away from seeing the films if they do not meet certain age restrictions.

Authority as a Psychological Question

To the psychologist, the interesting issue concerning authority is how it can overcome other considerations in compelling individuals to obey orders, especially basic considerations such as survival and basic morality. In the latter half of the 20th century, this question took on particular importance as social scientists struggled to make sense of the nightmares of World War II, particularly the willingness of ordinary German citizens and soldiers to take part in the extermination of Jewish and other minorities in the concentration camps. Stanley Milgram, a social psychologist at Yale University, conducted the most famous (and infamous) of these studies designed to understand the limits of a person's willingness to obey authority. Milgram discovered, as he later wrote in his book *Obedience to Authority*, that adults would do almost anything when commanded by an authority. He traced this willingness, in no small part, to the division of labor that characterizes modern society and alienates individuals from the consequences of their own actions.

In organizational terms, this willingness of individuals to authorize others to control them raises a serious dilemma. On the one hand, this willingness to obey represents one of the key psychological underpinnings of the complex organization. The reason companies adopt hierarchies rather than leaving every exchange to the market is that it is more efficient and less costly for a person to obey his or her superior rather than engaging in constant negotiations. On the other hand, many of the most infamous moral lapses in recent organizational history have involved individuals who were willing to follow authoritative commands rather than questioning their morality. For Hannah Arendt, commenting on the behavior of Adolf Eichmann during World War II, this banality of evil represents the ultimate horror of bureaucracy, in which even unspeakable acts can become normal and routine through the exercise of authority.

AUTONOMY

Since the early 1970s, the concept of autonomy has become increasingly important within discussions of business ethics. For example, it plays a key role in discussions of the ethics of advertising, where much of the debate centers around the question of whether or not persuasive advertising undermines consumer autonomy. It also plays a key role in discussions of the morality of sweatshops, where it is often alleged that the use of sweatshops is unethical insofar as the labor conditions that exist within them evince a failure on the part of their owners fully to respect the autonomy of their employees. Respect for autonomy also plays a key role in grounding ethical objections to fraud, coercion, and even bluffing in business situations. More recently, persons have argued that respect for the autonomy of consumers requires that businesses provide as much information as possible about the products that they offer, including such information as the place of manufacture, whether sweatshop labor was involved, and (in the case of foodstuffs) whether they include genetically modified ingredients.

Given that the concept of autonomy plays such a central role in so many discussions of business ethics, it is important to be clear as to what exactly it is for a person to be autonomous or to lack autonomy. Such clarity is especially important because there are two distinct approaches to understanding autonomy: the Kantian approach, which is based on the work of the 18th-century philosopher Immanuel Kant, and the Millian approach, which draws on the approach to autonomy that was taken by the 19th-century philosopher John Stuart Mill.

Kantian Autonomy

The proponents of both the Kantian and the Millian approaches to autonomy draw on the etymology of the term, which stems from the two Greek words *autos* and *nomos*, meaning "self" and "rule." However, the proponents of these two approaches to analyzing autonomy have very different understandings of what it is for a person to be self-ruled. For Kant, a person is self-ruled only if his or her decisions and actions are unaffected by any factors that could be said to be external to his or her self. As such, on a Kantian understanding of autonomy, a person lacks autonomy, and is thus heteronomous, to the extent that his or her decisions or actions are the result of factors that are not essentially his or hers. For the Kantian, then, a person will be heteronomous with respect to his or her decisions or actions if they are the products of any factors that are merely contingent on his or her situation. This is important, for people's desires can be contingent on the situation that they find themselves in. A person in 18th-century France, for example, would not have the desire for a new Mercedes, whereas a person in 21st-century America would not have the desire to wear a powdered wig. More fundamentally, even if people's desires are not the product of their social environment but are, instead, the product of their physiology, they are still not essential to them. For example, a person who liked chocolate ice cream simply because it affected his or her palette in certain ways would not be a different person if he or she were to lose this taste and acquire one for vanilla instead.

Since people's desires are thus not essential to who they are but are merely contingent factors that might influence their decisions and actions, a Kantian holds that those who act on their desires are not acting autonomously, for in doing so, they would not be guided by their essential self. Instead, for a Kantian, since a person is essentially rational, he or she will only be autonomous with respect to his or her decisions or his or her actions if they are directed by his or her rationality. Kant is clear that this does not mean that a person is autonomous if he or she acts instrumentally rationally to achieve some end. To act in this way is merely to act on a hypothetical imperative—that you will perform a certain action if you wish to achieve a certain goal. Actions that are the result of hypothetical imperatives would be performed to secure some goal that would be dictated by the person's desires. Thus, since these desires would not be essential to the person's self, the actions that they lead to would not be ones that the person was autonomous with respect to. Rather, for a Kantian, to act rationally in the sense that grounds ascriptions of autonomy to a person, he or she must act in accord with a categorical imperative—one that must be followed by every rational individual regardless of his or her desires or inclinations. For Kant, such a categorical imperative is to act rationally without being affected by the contingencies of one's desires or inclinations; you must recognize that all other persons could, without logical contradiction, perform the action that you are contemplating performing were they to be in the same situation as you are in. Acting out of respect for this maxim, for Kant, would be an act of respect for the moral law, for the actions that it would allow would be moral ones. Thus, for example, a person whose actions were guided by this categorical imperative could not lie to gain an advantage. This is because were this person to will that everyone lie when it is to their advantage, no one would trust the word of anyone else, and so no one would be able to reap the advantages of lying that would motivate this. Lying, then, cannot be consistently willed to be a universal law.

For Kant, then, a person is autonomous to the extent that he or she acts out of respect for the moral law. Moreover, for Kant, the moral law also shows why autonomy is important. Insofar as persons must, to be moral, act on maxims that they can consistently will to be moral law, and insofar as they consider themselves to be intrinsically valuable as rational agents, they must also recognize that other rational agents are intrinsically valuable, too, for there is no relevant difference between their rational agency and that of others. As such, for Kant, persons must always treat rational humanity, whether in their own person or that of another, as an end in itself (i.e., as intrinsically valuable) and never as a mere means (i.e., as merely instrumentally valuable). This Kantian claim that we must always respect the autonomy of other persons is frequently used to ground claims concerning the ethical conduct of business. It is, for example, often used to ground the claim that persons should not be coerced into employment and that businesses should not defraud those they interact with, on the grounds that such practices would be examples in which persons were not treated as ends in themselves, and so their autonomy was not respected, but only as mere means. This Kantian claim has also been used to ground the view that multinational enterprises should not exploit workers in the developing world but should, instead, not only adhere to local labor laws but also ensure that they provide good working conditions to their employees and pay them fair wages. Were these multinationals not to do so, it is argued, they would be treating their workers merely as means to their own profits and thus would fail to respect their autonomy in the way required by Kantian ethics.

Millian Autonomy

The Millian view of autonomy is very different from the Kantian one. For Kant, a person is autonomous if he or she acts out of respect for the moral law, with no concern for his or her contingent desires or inclinations. In contrast, for Mill, persons are autonomous to the extent that they rule themselves and are not ruled by others. For Mill, autonomy was closely connected with the idea of individuality; indeed, in his seminal work *On Liberty*, Mill used the latter term in preference to the former. For Mill, persons are autonomous if they choose their plan of life for themselves. A person is autonomous to the extent that he or she directs his or her actions in accord with his or her own values, desires, and inclinations—the polar opposite of the impersonal account of autonomy offered by Kant.

This Millian account of autonomy has been more widely adopted within discussions of applied ethics in general and business ethics in particular than its Kantian rival, for three reasons. First, the Millian account of autonomy appears to be more empirically accurate. Very few persons explicitly act out of respect for the moral law, yet it does not seem that autonomy is a rare phenomenon. Second, insofar as its focus is on persons acting in accordance with their own desires and values, the Millian account of autonomy is well suited to discussions of business ethics, especially when considering whether or not persons are, for example, autonomous with respect to their decisions to gratify their desires to purchase an advertised product. Third, the application of the Millian approach to autonomy in discussions of business ethics has benefited from a recent flourishing of analyses of what it is for a person to be autonomous in this desire-based sense of autonomy. This discussion was started by the philosopher Harry G. Frankfurt's seminal article "Freedom of the Will and the Concept of a Person," in which he outlined a hierarchical analysis of what it is for persons to be autonomous with respect to those of their desires that actually move them to act.

Hierarchical Analyses of Autonomy

Frankfurt's early hierarchical account of what it is for persons to be autonomous with respect to those of their desires that actually move them to act has been enormously influential and is no doubt in large part responsible for the popularity of the Millian, rather than the Kantian, approach to autonomy in discussions of business ethics. Frankfurt offered an account of autonomy that was able to accommodate the intuitively plausible claim that persons might not act autonomously even though they were, in a sense, doing what they wanted to do. For example, persons who are addicted to a drug but who do not want to be so addicted would still be doing what they want to do when they take the drug to which they are addicted, even though it is plausible to hold that they are not fully self-directed, not fully autonomous, when they do so. To accommodate the intuition that such unwilling addicts would not be autonomous with respect to their taking of the drug to which they are addicted even though they do so to satisfy a desire that they have for the drug, Frankfurt claimed that it was necessary for a person to endorse his or her first-order desires for him or her to be autonomous with respect to them. Thus, to be autonomous with respect to his or her taking of the drug, the unwilling addict would have not only to have a desire for the drug but also to have a desire to have that desire for the drug. Yet even if the addict has such a second-order desire (a desire about another desire whose intentional object is not a desire), he or her might still not be autonomous with respect to his or her taking of the drug. This is because he or she might want to have the first-order desire for the drug but not want it to move him or her to act. (He or she might, for example, want to know what it feels like to be addicted but might not want to take the drug to which he or she is addicted.) To be autonomous with respect to his or her effective first-order desire for the drug, then, this addict would, for Frankfurt, have to both endorse his or her effective first-order desire and want it to move him or her to act. In Frankfurt's terms, then, persons are autonomous with respect to their effective first-order desires if they volitionally endorse them, if they both want them and want them to move them to act.

This Millian account of autonomy developed by Frankfurt has been subject to three criticisms. First, it is not clear why a person would be autonomous with respect to his or her second-order volition. If the answer is that this was endorsed by a third-order volition, then a regress is entered into, for the same question can arise with respect to this third-order volition. If, however, the answer is that the person is autonomous with respect to it for some other reason, then Frankfurt's account is incomplete. Second, it is not clear why a person's higher-order desires should be considered to be more genuinely his or hers, those that he or she is more autonomous with respect to than his or her first-order desires. A person's second-order desires might, for example, be the products of socialization, with his or her first-order desires being those that are more autonomously his or hers. Finally, Frankfurt's Millian account of autonomy seems vulnerable to what is termed the *problem of manipulation*. A person might implant both a first-order desire into another person and a corresponding endorsing second-order volition, and the implantee would, on Frankfurt's original account, be autonomous with respect to him or her, resulting in implanted first-order desire. But this seems implausible. These three objections have led Frankfurt to revise his account of autonomy. Most recently, Frankfurt holds that to be autonomous with respect to an effective first-order desire, a person must not only reflectively endorse it but also be satisfied with his or her endorsement of it, where such satisfaction consists in his or her having no interest in altering the desire in question. This revision of his account appears to meet the first two objections stated above. However, it does not appear to meet the problem of manipulation, for a person could still be manipulated into being satisfied with an implanted desire. To avoid this problem, the philosopher John Christman has developed a historically based version of Frankfurt's account. For Christman, to be autonomous with respect to an effective first-order desire, a person must not have resisted its development when attending to this and when his or her attention to this matter was uninhibitedly reflective.

The analyses of Millian autonomy and their subsequent revisions in light of criticisms are not, however, only of interest to autonomy theorists: They are of crucial importance to those areas of business ethics in which the concept of autonomy plays a central role. If, for example, Frankfurt's original hierarchical account of autonomy is accepted, then it would not, from the point of view of someone who held autonomy to be morally valuable, necessarily be morally objectionable to defraud consumers. This is because, on Frankfurt's original account of autonomy, provided a person volitionally endorsed his effective first-order desire then he was autonomous with respect to it. Thus, if a person was fraudulently sold defective goods, his or her autonomy would remain inviolate, since he or she would have volitionally endorsed his or her effective first-order desire to purchase them. If, however, Christman's Millian account of autonomy is accepted, then a person who held autonomy to be morally valuable would have grounds for objecting to fraud, for its victims would have resisted the development of their desires for the fraudulent goods had their reflection on them not been inhibited by those who intended to defraud them.

Judgmental Relevance

The question, then, of which theory of autonomy to accept will be in part guided by what the philosopher Gerald Dworkin has termed *judgmental relevance*—the degree to which each theory matches our pretheoretical intuitions as to when a person is autonomous with respect to her actions and her desires and when she is not. Thus, if we believe that fraud is an affront to autonomy we would endorse either a Kantian account of autonomy or else a Millian account of the sort developed by Christman. That different conceptions of autonomy fit with our pretheoretical intuitions concerning the scope of this concept in particular cases does not, however, imply that they should all be accepted. Instead, it shows that to arrive at a core analysis of autonomy we should pay particular attention to cases in which there is disagreement over whether or not a person is autonomous with respect to her actions. Such cases will show us either that when we disagree we do so because we are talking about different, but related, concepts (such as autonomy and authenticity), and we can then refine our discussions accordingly, or that if we agree on the concept at hand, we can refine our analysis of it to accommodate all our intuitions about its extension. As such, discussions of the ethics of persuasive advertising, bluffing, and sweatshops should play a role in our discussions of autonomy, since by providing real-life examples of cases in which a person's autonomy is in question they can help us to identify the appropriate scope of this concept.

Bait-and-Switch Practices

The term *bait-and-switch* is most commonly used to refer to an advertising practice that is both unethical and illegal. While the term has been used since the 1920s, the practice is likely to be much older. It typically involves an advertiser luring customers into the store by offering a product at an unrealistically low price (the bait). The customer is then told that the advertised goods are (1) not available or (2) of inferior quality and/or not suitable for the customer's needs. The goal is to "switch" the customer to another, more expensive product or one that has a higher profit margin. What sets bait-and-switch apart from other advertising practices is that the store does not intend to sell the advertised product—the advertised product is intended to attract customers, who are then persuaded to buy another product.

It is not only retailers who use bait-and-switch techniques. This technique could be used by any provider of goods or services, such as companies providing financial services and products, recruitment agencies, and travel agencies. Even governments have been accused of using bait-and-switch strategies.

An Example

The following example highlights the issues raised by bait-and-switch practices. Suppose a product is advertised at a very attractive price and customers arrive at the store to buy it. Customers are convinced by the salesperson that the advertised product is not value for the money, is unreliable, and has few features that most people think essential. The customers are persuaded to spend significantly more on an alternative product.

The advertisement that drew customers to the store was an alluring but insincere offer to sell the product advertised. The intention was to entice potential purchasers into the store and then sell them the more expensive item. The claim is that what has taken place is fraudulent. As soon as customers decided to visit that particular retailer rather than another (in other words, they "took the bait"), they have made an investment of time, money, and effort; so, even if they do not end up purchasing from that store, they have nonetheless been deceived. Once in the store, the salesperson aims to convince customers not to buy the product they came in to purchase. However, once they are in the store, that store has a competitive advantage over other retailers of similar products. This is why the "switch" is often successful. The present and actual product to which customers have been switched is more attractive than hypothetical products at other retailers, making it more likely that the salesperson will complete the sales of the more expensive model. In this example, the appealing offer was not what it seemed. The advertised product was simply an enticement to get customers to identify themselves as being interested in the type of product advertised, thereby providing the sales staff with an opportunity to sell a model that was more advantageous to the store.

The Law and Bait-and-Switch Practices

In the United States, the Federal Trade Commission (FTC) regulates against deceptive practices.

Bait-and-switch practices are considered deceptive and therefore unlawful. The federal court interpretation of bait-and-switch practices is usually consistent with the FTC guidelines, and reference is often made to them. Many state courts have adopted the Uniform Law version of Consumer Protection Laws, in which bait-and-switch practices are identified as deceptive.

According to the FTC, advertisements for products must be bona fide efforts to sell the product advertised. It is illegal to advertise goods or services that the company has no intention of selling, intending instead to sell to the customer another, usually higher-priced product or service.

Advertisements are not bona fide offers if, for example,

- the advertiser refuses to show, demonstrate, or sell the advertised product or service;
- the product or service is disparaged by the salesperson;
- there is insufficient stock to reasonably meet anticipated demand;
- the advertiser refuses to take orders for advertised goods to be delivered in a reasonable time frame;
- the advertised product fails to fulfill the purpose represented or implied in the advertising; or
- sales staff are penalized if they sell the advertised product.

Even though bait-and-switch practices are illegal and those involved risk federal and state prosecution or lawsuits from competitors, from a practical perspective, the time and expense involved in establishing injury is prohibitive.

Ethics and Bait-and-Switch Practices

There is a connection between autonomy, deceit, and coercion. For most people, autonomy is a value. This means that autonomy is something that is intrinsically good or worth having for its own sake and anything that erodes autonomy is bad. To be autonomous is to be in command of one's own life, to be in a position to review alternatives for action knowing exactly what they involve and what their consequences are. Autonomy can be eroded by false or misleading information. Bait-and-switch practices are not consistent with a commitment to the value of autonomy. If a customer was influenced to purchase an alternative product by information that was deceptive and if the customer would not have bought the product except for the information provided, then he or she has been coerced into buying it. This is exactly what happens in a successful bait-and-switch.

The effect of bait-and-switch practices is harm to consumers and to honest competitors. Moreover, it is often the poor and less well educated who are most susceptible to the "hard sell" techniques employed to switch a customer from the bait product to another more expensive one. In the following sections, a brief ethical analysis of bait-and-switch practices is provided from three different perspectives: the golden rule, utilitarianism, and Kant's ethics.

The Golden Rule

The golden rule of doing unto others as you would have them do unto you is a widely accepted moral principle. It is an ethical norm that is a cornerstone in (almost) all the major religions. Clearly, anyone who subscribed to the view that we should treat others as we would like to be treated ourselves would have a problem with bait-and-switch practices. It is implausible that anyone would seriously claim that he or she would not object to being treated in the way that victims of bait-and switch practices are treated. According to the golden rule, bait-and-switch practices are unethical.

Utilitarianism

For the utilitarian, there is only one ultimate moral principle. This is the requirement to act so as to produce the greatest happiness for the greatest number. When there are more than one alternative courses of action, the right action is the one that produces the greatest net happiness. A distinction needs to be made between *rule* and *act* utilitarianism. Rule utilitarianism is concerned with identifying a set of moral rules that satisfies the principle of utility better than any alternative set of moral rules. Particular actions are judged right or wrong according to whether they conform to the chosen set of rules. Act utilitarianism, on the other hand, requires a utilitarian calculation to be undertaken for each possible action in order to identify what is ethically required.

How would bait-and-switch practices be evaluated against the utilitarian criterion? First, a rule utilitarian would identify the general rules of conduct that maximize utility. Arguably, any such set of rules would include injunctions to act honestly (or not act dishonestly). To see why this is the case, we only need consider two societies, one in which there is a rule requiring honesty and one in which there is not. We then consider whether people will be better off in the first or the second society. The first society is preferable from the point of view of utility. Since bait-and-switch practices deceive consumers, the rule to act honestly is violated, and a rule utilitarian would judge the practice wrong.

An act utilitarian analysis of bait-and-switch practices requires that everyone affected be identified and taken into account, together with the extent of the impact. First, consider those who benefit from bait-and-switch practices (i.e., those for whom the consequences are good). Clearly, the company engaged in the practice will benefit financially, with a flow-on effect to that company's owners and employees. However, long-term consequences also need to be taken into account. If there is legal action or adverse publicity as a result of the bait-and-switch practices being made public, then any short-term financial benefit could be outweighed.

Next, we turn to those who are harmed by bait-and-switch practices (i.e., those for whom the consequences are bad). Most obviously, it is the customers who have been victims of successful bait-and-switch practices who are harmed. Honest competitors who do not engage in deceitful practices are also harmed because potential customers have been lured away from them. Moreover, a whole sector could be damaged by publicity relating to questionable practices. For example, if it becomes common knowledge that many automobile dealerships use this technique, then even honest operators' reputations can be harmed. When all the consequences of bait-and-switch practices are considered, it is impossible to conclude that the practice maximizes long-term utility.

Kant's Ethics

In contrast to utilitarianism, Immanuel Kant believed that moral principles can be identified by the exercise of reason alone, without having to know anything about the consequences of actions. Kant believed that it is only when a person acts from "goodwill" or duty that the action has moral worth. At the core of Kant's moral theory is his categorical imperative. In answer to the question "What makes an action right?" the categorical imperative states that an action is morally right only if the maxim (or principle) represented by the action can be accepted as a universal law. The categorical imperative is binding on all rational agents regardless of their specific goals or desires and regardless of the consequences.

There are two other ways to understand or interpret the categorical imperative. First, an action is right only if the agent would be willing to be treated in this way if the positions of the parties were reversed. This formulation of the categorical imperative is a variation of the golden rule discussed previously. Second, people should always be treated as ends, never merely as means to others' ends. This formulation of the categorical imperative is sometimes referred to as respect for persons. The requirement to act from a sense of duty and the three understandings of the categorical imperative can be used as tests to evaluate actions.

Bait-and-switch practices would be judged unethical from a Kantian perspective. First, those who are involved in these activities act from a sense of self-interest and not duty, so their actions cannot be morally praiseworthy. Second, rational agents could not accept the principle underlying the action as a universal law. To do so would require accepting a principle that said something like "It is acceptable to deceive customers in order to benefit financially." Third, those who employ bait-and-switch practices would not be prepared to change places with the customers who are victims of these practices. Finally, customers are being used simply as a means to generate profits.

Conclusion

Bait-and-switch practices can be used in many contexts; however, what makes them all legally and ethically problematic is that their success relies on deceit. Bait-and-switch practices are deceptive and therefore unlawful. The golden rule, utilitarianism, and Kant's ethics all support the claim that bait-and-switch practices are unethical.

Bankers' Trust

In the mid-1990s, BT Securities Corporation, now part of Deutsche Bank, was involved in two landmark legal cases that helped clarify the duties and responsibilities of swap dealers and their customers.

The first case involved Gibson Greetings, Inc., a manufacturer of greeting cards and related products. Gibson sued BT for losses on two swap transactions where BT was the dealer. The contracts in dispute represented the cumulative position resulting from 27 earlier transactions. Of the 29 transactions between Gibson and BT, many involved the termination of one position in exchange for entering into another position. This process requires agreement between the parties as to the terms that will equate the market value of the terminated swap (or swap portion) to the value of the new position (or amendment) received in exchange.

The dispute between Gibson and BT centered on the duties of each party in determining the termination value of the swaps. Gibson alleged that an advisory relationship existed between BT and Gibson, meaning that BT was supposed to be acting on Gibson's behalf. BT argued that their transactions with Gibson were strictly arm's-length deals and that the swap master agreement did not establish any advisory or fiduciary relationship. BT argued that termination values they quoted were simply that—quotations at which BT stood ready to terminate a swap. BT argued that Gibson was free to shop for better deals in the market. The suit was settled out of court in November 1994, with Gibson paying BT only $6.2 million out of the $20.7 million owed under the terms of its swap agreements.

In a second case, Procter & Gamble (P&G) sued over its similar experience with BT. P&G accused BT of misleading statements about the terms of two interest rate swaps. The swap agreements included some complicated option features designed to allow P&G to lock in a favorable interest rate even if interest rates rose.

The pricing of the deals relied on BT's proprietary valuation models. P&G had placed itself in a position in which it had to rely on the computations of BT, without understanding how the results were reached. In large part, this was due to the complex option provisions of the swaps. P&G claimed that it relied on BT's models to value the swaps but that BT would not share the specifics of their models. P&G claimed that it was the victim of a financial fraud, a charge that BT strongly contested. BT argued that P&G was fully aware of the risks when it had agreed to the swaps and was free to get a second opinion on swap values from another dealer. The case was settled out of court with P&G paying BT $35 million of the more than $200 million BT claimed it was owed.

As a result of these two cases, swap dealers are careful to enumerate the duties of the dealer and the responsibilities of the dealer's customers. Swap dealers are also careful to abide by these duties once established.

Bank of Credit and Commerce International (BCCI)

The Bank of Credit and Commerce International (BCCI), a large private bank founded in 1973, engaged in various lines of illegal activities, ultimately leading to its demise. Its name is associated not only with illicit practices and financial scandals (e.g., fraud, money laundering, fund diversions, account falsification, deceitful management) but above all with the fact of having worked as a front to cover up other dirty business on the margins of banking activity, including drug trafficking and international terrorism, among others.

The BCCI, founded by the Pakistani Agha Hassan Ahbedi, had its headquarters in Luxembourg and was controlled by the Emirate of Abu Dhabi. In its day, it was considered the seventh largest private bank in the world, with a turnover of more than $30,000 million and offices in 70 countries. However, to the surprise of many, the bank was closed by judicial order in 62 countries on July 5, 1991.

The BCCI was more than a bank; it was a type of state within the state. It had its own intelligence service, an army, and, naturally, its own central bank. Due to this, although the banking business was important, it only represented a small part of the entirety of its activities. The so-called "Black Network" stands out, a clandestine division comprising 1,500 employees in charge of carrying out espionage, selling arms, trafficking in drugs, as well as perpetrating bribes and extortions at an international level. A few of the well-known clients of the bank were, among others, Manuel Noriega, Abu Nidal, Saddam Hussein, and Ferdinand Marcos. The BCCI was also the bank used in the dubious Iran-Contra affair.

The police siege of the BCCI started to bear fruit in October 1988, when customs agents apprehended seven financiers related to the bank in Florida. Three days later, another 40 directors were arrested in Europe under charges of laundering money proceeding from drug trafficking for the value of $14 million. As subsequent investigations revealed, the BCCI had also clandestinely controlled for years the capital of First American Bankshare, whose president was former Secretary of Defense Clark Clifford. It maintained total financial duplicity to secretly manage other banks in the United States and to organize its business in third-world countries.

As the investigations progressed, the BCCI began to appear more and more like an empty shell. In December 1991, the bank was found guilty of fraud and money laundering. A New York court indicted Sheikh Khalid bin Mahfouz, a top officer of Saudi Arabia's National Commercial Bank, a BCCI subsidiary, to be able to recover a fine of $170 million. Clark Clifford and his partner Robert Altman were also accused of being conspirators and of having hidden important facts related to the fall of BCCI.

Bankruptcy, Ethical Issues in

Bankruptcy occurs when an individual or a corporation that has insufficient assets to pay all debt obligations is subject to laws that provide some protection from creditors and permit an orderly distribution of assets to satisfy creditors' claims. There are two broad kinds of bankruptcy. In "liquidation" or "straight" bankruptcy, the assets of an individual or a corporation are turned over to a trustee, who liquidates them and distributes the proceeds to the creditors. An individual who goes through liquidation bankruptcy is absolved of many debts and is free to make a "fresh start." A corporation that is liquidated goes out of business. The second kind is "reorganization" bankruptcy, in which a corporation obtains temporary relief from debt obligations while it seeks to reorganize and regain solvency. Individuals may also use reorganization bankruptcy to work out a repayment schedule with creditors. In the United States Bankruptcy Code, liquidation bankruptcy is governed by Chapter 7 and reorganization bankruptcy by Chapter 11.

Bankruptcy is vital for a well-functioning economy. Without it, indebted individuals may suffer a lifetime under debt burdens that keep them from enjoying a rich, full life. The prospect of possible ruin without promise of relief is likely to deter individuals from risky, but potentially profitable, business ventures. Without the possibility of an orderly liquidation of a failed business, suppliers would be less willing to extend goods on credit or make capital available. Most important, reorganization bankruptcy permits potentially profitable businesses to recover from temporary adversity and remain going concerns. This kind of protection enables business organizations to continue to provide jobs and serve customers and to keep productive assets employed during difficult times. Overall, bankruptcy increases the wealth of any society.

Despite these benefits, bankruptcy poses some ethical issues. One ethical issue in bankruptcy concerns the moral justification of bankruptcy laws. Laws that absolve individuals and corporations from paying debts they have incurred or else allow them to defer payment might appear to violate the ethical principle that all debts should be paid. Alternatively, very stringent bankruptcy laws might be viewed as unjustifiably punitive, especially when they force individuals to pay heavy debts or prevent corporations from reorganizing and returning to profitability.

A second ethical issue is the possible abuse of bankruptcy laws. Individuals might be accused of abusing bankruptcy, for example, when they incur large debts just before filing for bankruptcy. In corporate bankruptcies, all creditors should be treated fairly with respect to their claims. However, in bankruptcy proceedings, it is possible for some creditors to get more than they deserve and others, less. In particular, when corporations reorganize and emerge from bankruptcy, those parties that control the process have an opportunity to enrich themselves at the expense of some creditors and other groups, such as employees. Bankruptcy also affords corporations the opportunity to enter bankruptcy in order to achieve strategic ends, such as avoiding legal judgments or strengthening their negotiating position with creditors. Such "strategic bankruptcy" is often criticized as an abuse of the law.

The Justification of Corporate Bankruptcy

When a corporation is unable to pay its debts, the moral imperatives are that the remaining assets be used to satisfy the creditors' claims to the fullest possible extent and that all creditors be treated fairly, with each receiving a proper share. Sometimes, creditors are best served by liquidation, in which the corporation is dissolved and its assets distributed to the creditors. In liquidation, no assets are lost; they are merely put into different hands. At other times, however, the creditors are better served when an insolvent corporation is allowed to reorganize and return to profitability. This occurs when a corporation's assets have greater value kept together in an ongoing entity rather than dispersed to the creditors. Not only creditors but also employees and the rest of society benefit when potentially profitable firms are allowed to reorganize.

From an economic perspective, a bankruptcy code that allows for either liquidation or reorganization maximizes the value of a corporation's assets. Since the creditors are the major beneficiaries in bankruptcy, they can decide themselves whether to liquidate an insolvent firm or permit its reorganization. However, creditors, who in bankruptcy replace shareholders as owners of a corporation, typically have different, competing interests. Unlike shareholders, who have a single objective—namely, profit maximization—creditors are more diverse due to their different kinds of claims. Bondholders, for example, may have interests that differ from those of unpaid suppliers; and some creditors may be secured, while others have unsecured debt. The challenge of any bankruptcy code, then, is to force creditors to act collectively in making wealth-maximizing decisions. In short, the code should force creditors to act like shareholders, who have the single objective of wealth maximization, instead of individual claimants whose only objective is the payment of particular debts.

One way of justifying an ideal bankruptcy code is by employing the "creditors' bargain." This justification asks the hypothetical question, What system would all creditors agree to in advance of any bankruptcy proceedings? The answer would be a system that maximizes a corporation's assets, from which their claims will be satisfied. Although individual creditors, especially those with secured claims, might collect more of what they are owed in one case by liquidation, say, they might collect more in another case by reorganization. In any event, creditors as a group will collect more under a bankruptcy code that maximizes the value of a corporation's assets. Such a code is likely to allow for both liquidation and reorganization and to force creditors to act collectively. The creditors' bargain thus justifies any particular bankruptcy code by employing a hypothetical contract argument of the following form: This code is justified because it is one that would be agreed to by all creditors in advance of any particular situation.

Although any bankruptcy code that is justified by the creditors' bargain is in the creditors' interest, it remains to be shown that it also serves the interests of society as a whole. However, an argument that such a code serves society's interests can be constructed along the lines of the argument for shareholder control. Bankruptcy can be understood as corporate governance under conditions of insolvency. As long as a corporation is solvent, shareholders ought to have control, and such control, according to the standard argument, serves all other interests because shareholders will make wealth-maximizing decisions. When a corporation becomes insolvent, creditors rather than shareholders assume control because all remaining corporate assets should be used to satisfy their fixed claims, which have priority over shareholders' residual claims. By forcing creditors to act like shareholders, though, a well-designed bankruptcy system ensures that creditors, like shareholders, will make wealth-maximizing decisions that benefit everyone.

Abuse of Corporate Bankruptcy

The bankruptcy code in the United States has been used by companies to avoid or reduce the payment of heavy legal judgments in suits over defective products and contract breaches and to void or renegotiate collective bargaining agreements and other onerous contracts. Some solvent corporations have entered bankruptcy to gain additional leverage with employees, creditors, and other groups as part of a reorganization. In such situations, bankruptcy is a strategic choice rather than an unavoidable condition.

Is there anything wrong with such "strategic bankruptcy"? Critics charge that it abuses the bankruptcy code by enabling corporations to avoid their moral and legal obligations. However, the obligations to pay legal judgments or fulfill contracts are no different from the obligations to pay other creditors; they are all debts. And the bankruptcy code is designed to enable companies that are insolvent—or would become insolvent if forced to pay a legal judgment or fulfill a contract—to maximize the value of their assets. Moreover, bankruptcy does not permit corporations to avoid their obligations entirely but only to negotiate the terms under which they will be fulfilled. And if not all obligations can be fulfilled, then every claimant must settle for only partial payment. In many cases, successful litigants and contract holders end up being well served by the outcome of bankruptcy proceedings. A well-designed bankruptcy code should permit companies to renegotiate ruinous legal judgments and onerous contracts if fulfilling these obligations would prevent them from fulfilling other obligations to creditors, employees, and other parties. Morality requires that all claimants be treated fairly, and preventing strategic bankruptcy might allow some claimants to take priority over others.

Another objection to strategic bankruptcy is that claimants who receive their claims under one set of rules must fight for them again under another set of rules. Thus, victims of defective products who receive awards in court suits are forced to win their case all over again in bankruptcy proceedings. Workers who negotiate a labor contract in good faith can find themselves back at the bargaining table, this time before a bankruptcy judge. Strategic bankruptcy might be compared to a game of poker in which a dealer with bad cards is able to stop the game, rearrange some of the hands, and resume the game under different rules.

It can be argued in response that the situation for victims of defective products and workers with contracts is no different from that for other creditors. Every claim includes a provision for default. Thus, bondholders and suppliers must expect to go to court if their claims are not paid. If a company is insolvent, then not everyone can be paid, and some way must be found for all claimants to receive a fair share of a firm's assets. Moreover, the poker game to which strategic bankruptcy might be compared is not unfair if the dealer's option is understood at the beginning of play. All creditors should be aware of the possibility of strategic bankruptcy and play their hands accordingly.

A third objection to strategic bankruptcy is that it might enable managers to enrich themselves at the expense of creditors and even shareholders. American law permits easy access to bankruptcy protection because a company need not demonstrate that it is insolvent but only that it would face insolvency without protection from its creditors. The bankruptcy code also permits managers to retain control during the reorganization process. With such easy access, managers have the opportunity to "play games" at the creditors' expense. If bankruptcy is an acceptable risk, managers might be willing to pursue more risky strategies that benefit themselves and shareholders since creditors will also lose if the strategy fails (which is an instance of moral hazard). Managers' pursuit of exceptionally risky strategies in an effort to keep their positions might also lead to greater losses for shareholders as well. There is some evidence that since the American Bankruptcy Code was liberalized in 1978 to allow easier access to bankruptcy protection, both bondholders and shareholders have lost proportionately more in bankruptcy proceedings.

The crucial question, then, is not whether to allow strategic bankruptcy—it can serve to benefit all claimants of a corporation—but how easy the access to bankruptcy protection should be. If this question is answered by the creditors' bargain, then creditors, as well as shareholders, might prefer a system with relative restrictive conditions for receiving bankruptcy protection.

Personal Bankruptcy

The standard justification for personal bankruptcy, which allows individuals to discharge their debts and have a fresh start, is based on welfare and justice. At one time, when individuals were unable to pay their debts, they were cast into prison. Even without the threat of imprisonment, people with heavy debts might spend a lifetime of economic struggle with consequences not only for themselves but the whole of society. Everyone, debtors and creditors alike, are better off in a society that allows personal bankruptcy because even creditors might find themselves with debts they cannot pay. Although there is an obligation to pay one's debts, the benefit of fulfilling this obligation may be outweighed by the loss that results when people are unable to live full, productive lives. In addition, it is unfair for people to suffer crushing debt loads that are caused, in many cases, by adversities beyond their control.

However, a liberal system of personal bankruptcy creates opportunities for abuse. Easy access to bankruptcy protection with little stigma or inconvenience might lead individuals to be less restrained in incurring debts. When facing bankruptcy, individuals might incur all the debt they can, knowing that it will soon be discharged, and seek to shield other assets from creditors by improper means (such as transferring the title for property to a relative). In the United States, creditors, most notably banker lenders and credit card issuers, whom critics accuse of enticing customers into unmanageable debt loads, have protested against this abuse and sought changes in the law to prevent it.

The main issues in the debate over changes in the law of personal bankruptcy are as follows: (1) Should individuals above a certain income level as determined by a "means test" be required to pay off a certain portion of their debts (in reorganization) instead of having them discharged completely (in liquidation)? (2) Should some assets (such as a home or pension savings) be shielded from creditors during bankruptcy proceedings? (3) Should certain debts be nondischargeable (e.g., those for luxury goods or large cash advances obtained just prior to seeking bankruptcy protection)?

Opponents of more stringent personal bankruptcy laws argue that abuse is committed by only a small portion of those seeking protection and that the vast majority of personal bankruptcies are due to job loss, divorce, illness, and business failure. For such people, a fresh start will often enable them to resume successful lives, whereas requirements to pay off a portion of their debts will mire them in cycles of indebtedness. Opponents also claim that bankruptcy due to the failure of a business is more common than is generally recognized and that more stringent laws will strongly deter individuals from starting new businesses, thus damaging a vital engine of economic growth.

Barings Bank

Barings Bank, PLC, was a British merchant bank founded in 1763 and known as the "Queen's Bank." The bank was one of the world's most highly regarded financial institutions before it suddenly collapsed due to the actions of a 28-year-old rogue trader, Nick Leeson, operating from the bank's Singapore affiliate. The sad tale of Barings highlights the need for financial institutions to adopt strict internal control procedures to monitor the positions established by traders on the institutions' behalf.

Leeson was supposed to be conducting stock index arbitrage between Japanese stock index futures contracts traded in Japan and similar futures contracts traded on the Singapore exchange (SIMEX). Such trading involves buying the cheaper contract and simultaneously selling the more expensive one, then reversing the trade when the price difference has narrowed or disappeared. The strategy seeks to capture small and temporary pricing discrepancies between markets. Theoretically, stock index arbitrage is risk free, and properly executed arbitrage transactions involve very low levels of actual risk. The risk is limited, because of the close relationship between a stock index futures contract and the underlying stock index itself.

However, Leeson apparently strayed from his strategy in late 1994 and early 1995. Through the futures markets and using options on futures, Leeson made very large one-sided bets that Japanese stocks would rise. The Kobe earthquake in January 1995, however, rocked the entire Japanese economy and led to a dramatic drop in the Japanese stock market. The highly leveraged bets on a rising Japanese market turned out to be giant losers. These losses completely exhausted the capital of Barings, which declared bankruptcy and was acquired by the Dutch investment bank ING for one pound British sterling on March 3, 1995.

When Barings filed for bankruptcy in February 1995, it was discovered that Leeson, in the name of Barings, had established (and concealed in an error account) outstanding notional futures positions on Japanese equities of $7 billion. In addition, Leeson had outstanding notional futures positions on Japanese bonds and euroyen totaling $20 billion. Leeson had also sold Nikkei put and options with a nominal value of about $7 billion. The reported capital of Barings at the time was $615 million. In a short period, Leeson's trades lost about $1.4 billion. Leeson's actions were overlooked because of poor risk oversight and poor internal controls at the bank. The bank had allowed Leeson to be both a risk taker and a risk monitor. The bank had ignored internal warnings about this conflict of interest, perhaps because it appeared on paper as if Leeson's trades were highly profitable. After the losses became public, Leeson was arrested, convicted, and sentenced to a 6½-year prison term in Singapore. By 1999, Leeson was out of prison, giving speeches on the dangers posed by rogue traders at $100,000 per appearance, appearing in commercials on behalf of brokerage firms, playing celebrity online poker, and receiving numerous job offers in risk management. In 1999, a movie appeared, titled *Rogue Trader*, based on Leeson's autobiography of the same name. In 2005, he took a marketing job with an Irish football team.

Leeson's rogue trading, while spectacular, is hardly an isolated incident. The 1990s witnessed a steady stream of staggering losses caused by rogue traders. In the mid-1990s, Daiwa and Sumitomo Corporation each lost over $1 billion from rogue traders in their employ. In 1997, Codelco lost $200 million, allegedly because of a rogue trader. In February 2002, Allied Irish Banks (AIB) announced a $750 loss attributed to rogue trading, a further reminder of the need for financial institutions to adequately address issues related to internal control procedures.

Barriers to Entry and Exit

Entry and exit barriers limit the number of firms competing in a product market or industry. Entry barriers lessen the degree of competition by imposing hurdles that decrease the ability of new entrants to operate profitably. One result is that firms operating in an industry protected by strong entry barriers tend to benefit from higher prices, and thus profits, than do firms operating in an industry without strong entry barriers. In contrast, exit barriers increase the degree of competition within a product market or industry by imposing obstacles that make exit difficult or costly. The rivalry between firms in an industry with strong exit barriers tends to be more intense than the rivalry between firms operating in an industry where exit is easy or relatively costless. One result is that firms in an industry with strong exit barriers tend to suffer lower prices and, thus, profits.

What entry and exit barriers have in common is their strong impact on the nature of competition: In the case of entry barriers, competition is lessened, while in the case of exit barriers, competition is magnified. This relationship between competition and entry and exit barriers has important ethical implications associated with erecting and maintaining various forms of entry and exit barriers. Competition benefits consumers; it ensures that firms operate efficiently and share the resulting gains by lowering prices, boosting innovation, improving quality, and/or further increasing profitability. Firms can also benefit from competition; consider the case of Pepsi and Coke, whose rivalry has significantly increased cola consumption. However, all else being equal, firms prefer to erect and maintain barriers to entry that furnish them some level of protection from highly competitive forces. Different barriers will benefit consumers versus firms in different ways. Some forms of barriers to entry and exit are more likely to engender a sense of commutative justice, where both consumers and firms benefit equally. Other types of barriers may justly favor one over the other, creating an undercurrent of distributive justice. Finally, some barriers may unjustly benefit one group at the expense of the other. Understanding how barriers to entry and exit affect the distribution of benefits between consumers and firms is crucial to comprehending their ethical implications.

Entry Barriers

Entry barriers can be broadly classified according to whether they are internally based or externally based. Internally based barriers to entry appear when managers make investments that give their firm a competitive advantage, thus allowing them to charge above-average prices, capture high market share, and/or benefit from an extraordinary cost position. Such investments develop into entry barriers when they become costly enough to discourage potential new firm entrants. Externally based barriers to entry appear when managers successfully influence key external stakeholders to impose policies that render entry by potential competitors into the industry impossible or unreasonably complex.

Internally Based Barriers to Entry

There are two categories of internally based barriers to entry—explicit and tacit. First, explicit, internally based barriers to entry are tangible and easily measurable. The costs and benefits that emerge from these barriers to both firms and consumers are clear. High fixed costs are one of the main types of internally based barriers to entry. For example, the costs involved in exploring for oil and then constructing the pipeline infrastructure to bring oil, once discovered, to a port or a refinery are enormous, even when oil is found quickly. It is very difficult for potential new firms to enter oil and gas production because of the massive capital investment required to bring the product to market.

Strategic lock-in, in which a firm attempts to retain customers in the long term, is another example of an explicit, internally based barrier to entry. For example, commercial airline frequent-flyer programs are designed to “lock in” passengers on future flights; a customer is more likely to remain brand-loyal if he or she needs only a few more flights in a year to qualify for free upgrades. This lock-in of future customer purchases raises the cost of entry to new firms in the product market or industry by increasing the switching costs customers face in transferring their business from existing firms to new firms.

Similarly, some firms erect barriers to entry with the intent of creating a form of strategic “lock-out.” The recent consolidation in the telephone industry illustrates this. When Baby Bell SBC acquired the weakening long-distance firm AT&T, it gained the best long-distance carrier in the industry—that is, the firm with the best assets and a national reputation for quality in the long-distance market, where many of the Baby Bells are weak. Thus, SBC may have locked out its long-distance rivals from competing effectively against it in the future by taking the best-asset long-distance carrier (AT&T) off the market and by leaving weaker acquisition targets (such as MCI) for rival acquirers. A similar pattern occurred in global commercial airlines following deregulation.

Explicit, internally based barriers to entry provide relatively equal benefits to both consumers and firms. Firms benefit from a limited level of competition, thus allowing them to enjoy higher payback levels against their initial investments. Consumers benefit from greater access to the product in the case of the oil refinery, lower prices in the case of frequent-flyer programs, and higher quality in the case of SBC and AT&T. Explicit, internally based barriers to entry engender commutative justice for both firms and consumers, since both parties benefit fairly from having the barriers in place and both are left better off as a result.

The second category of internally based barriers to entry consists of tacit barriers. The characteristics of tacit barriers are often intangible or vague. The costs and benefits for firms and consumers are difficult to track. Super brands—brands with global recognition—such as Coke or Pepsi provide the most well-known example of tacit, internally based barriers to entry. Any firm entering the markets in which Coke or Pepsi operate, for example, would face great difficulty in credibly challenging the products of those two firms. Many customers will buy only Coke or Pepsi soft drinks. The Coke or Pepsi brand is a form of tacit barrier that has come into existence over time, with millions of dollars of investments in all facets of marketing. It has taken decades for Coke and Pepsi to develop their brand identities and consumer loyalties; such a resource is almost impossible for a competitor to duplicate quickly, and thus, many potential competitors do not enter those markets.

The brand, a tacit barrier to entry, is a costly endeavor for a firm. When successful, it allows firms to recoup significantly above-average returns by charging the consumer substantially high prices. However, consumers who purchase these products often do so with the belief that they are high-quality products and/or represent an image with which they wish to be associated. This reciprocal relationship between firms and consumers, although measurably benefiting firms more than consumers, seems to satisfy the argument for commutative justice—that is, where benefits are distributed to both parties, not necessarily equally but reasonably enough to warrant future exchange.

In the case of super brands, they tend to dominate their particular industry segment by dominating advertising media, distribution channels, and retail shelf space, thus enjoying monopolistic power. Super brands such as Pampers, Coke, and Kleenex are good examples. The risk inherent in super brands is that they often become powerful enough to decrease consumer choice, thus violating the norms of distributive justice in favor of benefits to the firm. Although many anticompetitive agencies attempt to rein in violators, super brands sustain their power by purchasing other strongly branded products. This maintains the pretence of fair competition while increasing the super brand's power over competition; Coke is a key example, selling beverages with over 500 different brand names globally. Adidas recently acquiring Reebok or Starbucks acquiring Seattle's Best Coffee are examples of brands increasing their market power while maintaining the pretence of competition.

Externally Based Barriers to Entry

Similar to internally based barriers to entry, externally based barriers can also be divided into two categories. The first category consists of externally based barriers to entry that have the goal of producing a public good. These are typically the result of an agreement between specific firms in the industry and a particular stakeholder, typically from the government. The second category consists of barriers that have the goal of producing a private good.

Best-known in the category of barriers with the goal of producing a public good are public policies that restrict competition in a product market or industry. For example, patents, a form of an externally based barrier to entry, allow pharmaceutical firms enough time to earn a payback on their research and development (R&D) costs. For successful drugs, it takes 7 years to bring a drug along the various phases of R&D and can cost hundreds of millions of dollars. By sanctioning monopoly status for the drug, both firms and consumers benefit. Pharmaceutical firms are encouraged to continue investing in innovation and scientific discovery, and consumers benefit from access to new lifesaving technologies. Of course, some pharmaceutical firms use patent protection solely for private gain. For example, some firms seek patents for minor changes to existing drugs (so-called cosmetic changes that do not result in a therapeutically new or distinct drug) whose patent protection will shortly expire, simply to erect entry barriers for generic drug companies.

Other industries where we see legally sanctioned monopolies are telecommunications, banking, cable, electricity, gas, water, and transportation. These industries are also often the ones in which scale economies are so high that only one firm can profitably recoup the costs of infrastructure investment. This was the rationale for telephone service in the United States being provided solely by AT&T until 1984; constructing phone lines nationwide was so costly that one firm needed the entire national market to recover its infrastructure costs profitably. Without a legally sanctioned monopoly in the early phases of the telephone service industry, its growth would have been much slower, leaving consumers and firms alike to suffer the consequences. During their protected phase, legally sanctioned monopolies can earn very high levels of profits. Some would argue that this skews the distribution of benefits in favor of firms. We suggest that the payback risk assumed by firms such as pharmaceutical companies undertaking R&D or companies engaging in infrastructure development is very high. Therefore, although they may reap significant benefits, these are fair and warranted. We suggest, therefore, that barriers to entry that have the goal of producing a public good benefit firms and consumers by meeting the threshold for distributive justice.

When barriers to entry are intended to produce a private good, they benefit firms more than they benefit consumers. A typical example is tariffs and other types of trade restrictions, such as quotas, that prevent entry to foreign (exporting) firms in a product market or industry. They do so by raising the price of the foreign product (the import) relative to the price of the domestically produced price (by the amount of the tariff), thus deterring the entry of foreign firms. Subsidies also dampen competition by giving subsidized firms a cost advantage over nonsubsidized firms, which must be proportionally more efficient than their subsidized competitors to be able to meet the price of the subsidized firm and still recover their costs. Despite these higher levels of efficiency, nonsubsidized firms are unable to pass on the benefits of their efficiencies to consumers, while subsidized firms are disincentivized to become more efficient. Under these circumstances, consumers experience measurable losses in terms of paying higher prices and supporting inefficient, and often underperforming, industries. Agriculture is probably the most frequently subsidized industry internationally, but subsidies are also paid to high-technology industries, such as the highly visible public underwriting of Airbus Industrie's R&D costs by a consortium of European governments.

Similarly, many developed nations require occupational licensing; in the United States, there are over 500 occupations that require licensing. Occupational licensing is an externally based barrier to entry that effectively limits economic opportunity by restricting access to many occupations to those individuals able to pay for the required training and testing.

In contrast to the above example, which focuses on public policy to restrict entry, there are certain private agreements that restrict entry by potential competitors. The best example of this occurs in distribution channels. Retail stores, for example, have only a limited amount of shelf space on which to display products. If a drugstore has already committed half its shelf space for one brand of cosmetics, for example, then the odds of a competing cosmetics manufacturer receiving access to critical retail distribution channels is lessened. Many potential entrants are discouraged in industries with a relatively fixed supply of distribution. Apart from retail industries, commercial airlines face a similar bottleneck in airport gates. Departure/arrival gates are critical to being able to offer air transportation, yet almost all gates at most airports are already fully booked or owned by existing carriers. The existing contracts that govern access to gates are a steep obstacle for any potential new airline to overcome. In both these examples of private agreements that restrict entry, firms benefit at the expense of consumers. In both examples, competition is limited in a way that allows the protected firms to behave in a monopolistic manner by raising prices; consumers lose, and an unjust distribution of benefits prevails.

Exit Barriers

The main impact of exit barriers is to increase competition among the firms in a product market or industry by increasing the costs of leaving the industry during hard times. Firms within an industry typically seek to erect barriers to entry to protect them from outside competition, allowing them to earn above-average profits. However, firms are unlikely to erect barriers to exit intentionally since they impede mobility, increase competition, and encumber profitability.

There are two main kinds of exit barriers—operational and reputation based. First, operational exit barriers are firm characteristics such as high fixed costs or highly asset-specific investments that are required for the firm to operate within the industry. An example of a high fixed-cost exit barrier is a new

Table 1 Main Types of Entry and Exit Barriers and Their Ethical Implications

	Consumer Benefits	*Firm Benefits*	*Ethical Implications*
Explicit internally based barrier to entry	High	High	Commutative justice
Implicit internally based barrier to entry	Low	High	Distributive justice tending toward injustice
Externally based barriers to entry intended to create a public good	High	High	Commutative justice
Externally based barriers to entry intended to create a private good	Low	High	Injustice
Exit barriers	High	Low	Injustice

semiconductor fabrication plant, which costs about $5 billion. Even if the price of semiconductors drops dramatically and margins are adversely affected, most firms having made this large capital investment would remain in business in the hope that prices would increase and they could recoup their investment. The profitability threshold for exit decisions tends to be greatly altered when there is a costly and highly asset-specific investment involved.

Second, reputation-based barriers prevent easy exit from an industry when a firm encounters difficult macroeconomic or firm-specific conditions. Consider the case of a business school that has faced steeply declining student enrollment for years. Most managers when faced with such circumstances would seriously consider closing the business. No university administrator would seriously contemplate this, however, because the negative impact on the remaining schools and divisions in the university would be severe. Who would feel comfortable attending a school that might pull the rug out on the program at any moment and thereby devalue the degrees of all alumni? Similarly, consider relationship spillover effects: two firms may benefit from a long-standing joint venture that is highly profitable. Then, something changes for one or both partners to render the venture unprofitable; firms in such relationships are often reluctant to exit because they do not want to earn a reputation for being unable to maintain business-to-business relationships. Finally, managerial pride or arrogance often serves as a reputation-based exit barrier. For example, managers will be so committed to a strategy that they will escalate the strategy, despite clear signals to exit the product market or industry. In all these examples, an underperforming segment of a business is retained when it should not be to preserve the broader reputation of the entity. Exit barriers, thus, lock firms into industries even when expected returns fall short of a breakeven point. When exit barriers are high, firms often become fixated on contributing to their margins and drop prices significantly. In the short term, consumers benefit from unusually low pricing, and firms often experience losses. Over the long term, these industries typically experience a great deal of shakeout and sometime collapse. Indeed, the distribution of benefits engendered by exit barriers is unjustly skewed in favor of consumers at the expense of firm benefits.

In summary, entry and exit barriers influence competition and, thus, the distribution of benefits between firms and consumers (see Table 1). Different types of entry and exit barriers influence this distribution in different ways, sometimes achieving the goal of commutative justice or distributive justice and sometimes resulting in an unjust distribution.

BARTER

Barter is the direct exchange of goods or services without the use of money as an intermediary. It is often assumed that bartering is an exchange system limited to nonliterate societies, collapsing states, and the margins of official economies, but it is important to recognize that bartering plays a role in any economic system. Adam Smith famously asserted that it is part of human nature, removed from any utilitarian motivation, to truck, barter, and exchange one thing for another. According to a strict definition, barter demands both that each exchange is balanced and that the exchanged goods are actually desired by the acquiring parties. The first postulate assumes that each meeting results in a trade that both parties deem fair and that neither party walks away with any debts or obligations. In practice, delayed transactions and various forms of credit are often worked into barter systems. The second postulate assumes that the parties are trading to meet some demand or, in other words, that the traded goods have an immediate use-value for their recipients. When one party acquires goods that are not needed with an eye toward retrading them at a future date, such goods are basically functioning as a unit of exchange. For example, in a black market economy such as the one in a prison, a pack of cigarettes may function simultaneously as a commodity and as a medium of exchange. In such cases, multiple commodities can potentially act as media of exchange. Anthropologists often define barter as a purely economic transaction, to distinguish it from other forms of nonmonetary exchange that have more of a social than an economic function, the most widely cited example being the exchange of gifts.

The term *countertrade* refers to modern agreements where goods or services are reciprocally exchanged without pure cash transactions. *Countertrade* has become an umbrella term that encompasses a number of practices in addition to simple bartering, including bilateral clearing, compensation arrangements, counterpurchases, offsets, production sharing, switch transactions, and technology transfers. Estimates of countertrade as a percentage of world trade differ widely, ranging from 5% to 40%. Countertrade was a standard component of Soviet-bloc trade, especially in the 1980s, and continues to play a major role in trade with developing nations. The primary motivations for countertrade are large debts, hyperinflation, a lack of hard currency with which to import goods, and a desire to promote exports in new markets. Less scrupulous companies have used countertrade to avoid or minimize taxes. The tax codes of most countries consider the value of what is changing hands the equivalent of a cash purchase, but the complexity of many of these transactions allows for "creative" accounting practices in determining revenue. Countertrade can be risky and quite complex, but many companies see a willingness to engage in countertrade as a competitive advantage. Countertrade has been criticized as running contrary to the principles of free trade by fostering bilateral agreements and tampering with markets.

Bayesian Approach

Named after the 18th-century English cleric Thomas Bayes, the Bayesian approach refers to a distinctive framework for decision making. Accepting the dictum that "probability is the guide to life," the Bayesian approach provides a model for rational choice in which the expected utility of an action is determined in relation to a person's notions of the probabilities and utilities associated with the potential outcomes of the action under consideration. In considering alternative courses of action, the Bayesian principle is to choose an action with the greatest expected utility. The Bayesian approach has been widely influential in the development of rational choice theory and has been used in the study of rational choice in diverse disciplines, including management science and economics. Three elements central to the Bayesian approach include the Bayesian account of belief, rationality, and learning.

Bayesian Belief

There are two key aspects involved in the epistemology of the Bayesian approach toward belief. The first is that beliefs come in varying degrees of strength. According to Bayesians, beliefs are probabilistic in nature rather than all or nothing. Thus, in the Bayesian approach, we can assign probabilistic values, represented by numbers between 0 (no confidence) and 1 (full confidence), to beliefs, based on the degree of strength that persons have in those beliefs. In the Bayesian approach, the strength of a belief corresponds to the level of confidence that a person has in the truth of the proposition expressed by that belief, which, in turn, can be determined by a consideration of what gamble that person would be willing to accept as fair on the truth of that proposition. Most Bayesians now admit that it is unrealistic to think that most persons can assign numerically precise values to the strength of their beliefs. Bayesians, generally, now only hold that we can represent the beliefs of people in terms of some confidence measure, which orders their beliefs on the basis of their comparative confidence in those beliefs.

Second, since the Bayesian approach takes the strength of a belief to represent the actual conviction that a person has in the truth of that belief, Bayesians endorse a subjectivist approach to probability. Since people do often disagree on the degree to which they believe a given proposition, such a subjective view of probability denies that there are objectively correct probability values that attach to individual beliefs. For instance, if Smith believes Proposition p to Degree x, but Jones believes Proposition p to Degree y, there is, according to the Bayesians, no objective fact about which value is closer to the truth. This subjectivism about belief in the Bayesian approach has been the subject of much criticism, since it seems to imply that it is rational for individuals to assign any degree of probability whatsoever to their beliefs. In response, however, Bayesians point toward their account of rational coherence and rational learning as ways of mitigating the force of such a criticism.

Bayesian Rationality

Although the Bayesian approach places no restrictions on people's assignment of probabilities to individual beliefs, it is not the case that any numerical assignment that agents assign to their beliefs is acceptable within Bayesianism. The Bayesian approach requires that the assignments that persons give their beliefs must obey the axioms of the probability calculus. That is, while Bayesians place no restrictions on the assignment of individual probabilities, they do place important restrictions on the assignments that persons can place on their beliefs taken as a set. In this regard, the Bayesian approach can be seen as offering a type of coherence theory of rational belief formation, since it requires that a person's assignment of probabilities be internally consistent.

Not only does the Bayesian approach require that a person's assignment of probabilities conform to the probability calculus, but it also offers a notable justification for this requirement, known as the Dutch Book argument. The argument attempts to show that anyone whose beliefs violate the laws of the probability calculus is practically irrational. Informally, a Dutch Book is made against a person whenever that person accepts a series of bets such that this person will lose no matter what turns out. Such a situation will arise when a person assigns a degree of belief to a statement (or statements) that conflicts (according to the probability calculus) with the degrees of belief that the person assigns to other statements. For instance, according to the probability calculus, if a person assigns the probability .5 to some statement X, then he or she ought to assign the probability .5 to the statement not-*X*. If a person who assigned the value .5 to *X* violated this condition and assigned a probability of, say, .8 to not-*X*, then there would be some series of bets that such a person would consider as being fair on *X* and not-*X*, given the probabilities he or she assigned these statements, on which, nonetheless, he or she would lose money no matter whether *X* or not-*X* turned out to be true. Building on this idea, the Dutch Book theorem is meant to show that persons who violate the laws of probability will end up performing actions that make them less well off, on their own terms, than some available alternative when they attempt to maximize their expected utility. Thus, the Dutch Book argument shows that agents who violate the laws of probability will be practically irrational in committing themselves to actions that, according to their own preferences, will make them worse off.

The Bayesian approach to rationality is particularly connected to the classical notion of economic rationality, since it supposes both that rationality involves maximization and that the relevant values of outcomes are subject to numerical quantification. As to the first point, Bayesians generally accept that a rational agent should choose the act that has the greatest subjective expected utility, a principle standard to classical economic thought and one that has close ties to typical forms of cost-benefit analysis. With regard to the second point, the Bayesian approach has obviously been seen as particularly fecund in analyzing behavior in economic contexts in which the outcomes in question can be assigned numerically ordered values, such as dollar values. While both of these points have made the Bayesian approach especially attractive to those working in the classical economic tradition, they have also, and for the same reasons, attracted criticisms with regard to the adequacy of the Bayesian approach in providing a foundation for rational choice. On the first point, critics have raised concerns as to whether the notion of rationality as subjective maximization is compatible with respect for moral rights, since actions of maximal expected value may well often involve the violation of individual rights. As to the second point, some critics have concerns about the supposition that all relevant outcomes can be given numerically ordered values in the way that the Bayesian approach supposes. Such critics have been particularly concerned with the tendency in economic thinking to use dollar values to rank all outcomes, especially when those outcomes involve noncommercial goods, such as human lives or environmental damages.

Bayesian Learning and Bayes's Theorem

The Bayesian approach also maintains that although the initial assignments that different persons give to a particular belief may differ initially, their degrees of confidence will converge as they take in new evidence. In this vein, Bayesians argue that as new evidence arises, people will move toward intersubjective agreement in their assignment of probabilities. This convergence is because the Bayesian approach sees learning as conditionalization, in which persons update their prior beliefs conditional on new information. Bayes's theorem, which can be deduced from the probability calculus, stipulates that where *E* represents some new evidence and *H* represents an initial hypothesis, the posterior probability of *H* conditional on *E*, or $\Pr(H/E)$, can be calculated by the following formula:

$$\Pr(H/E) = [\Pr(H) \times \Pr(E/H)]/\Pr(E).$$

Thus, even if two different persons start out with widely different prior probability assignments to *H*, as they both accommodate new evidence, the posterior probabilities they assign to *H* will begin to merge together. This Bayesian notion of learning through conditionalization has been widely appealed to in other contexts as well, including the development of spam-filtering programs for e-mail.

While the Bayesian account of internal consistency and intersubjective learning may allay some of the worries about the subjective nature of the Bayesian approach, some critics still see the Bayesian approach to rational choice as too internalistic in nature. They argue that a plausible theory of rationality must also be supplemented by the use of some external principles of rational choice to properly evaluate and justify an individual's prior belief formation. In this regard, and as previously noted, the Bayesian approach has been seen by many as central to the economic notion of rationality, and the criticisms of the Bayesian approach are akin to more general concerns about whether the economic notion of rationality is too narrow in its scope.

BENEFITS, EMPLOYEE

Employee benefits are the noncash compensation offered by employers to their employees as part of the total compensation package. The benefits offered by employers generally reflect a basic care and concern for the well-being of employees and the importance of that well-being to employee productivity. For the most part, employee benefits may be placed in one of three categories: health-related insurance, financial insurance, and quality-of-life benefits.

Health-related benefits, which include health, dental, vision, and disability insurance, are designed to provide for the health care needs of employees and, in many instances, may be extended to include their spouses and/or dependent children. The purpose of financial insurance, which includes retirement and pension plans, life insurance, and flexible spending accounts, is to help employees become more financially secure. Quality-of-life benefits, which have grown increasingly important to employees in recent years, help employees live less stressful lives by maintaining a healthy work-life balance. Quality-of-life benefits includes personal and parental leave time, on-site child care, day care subsidies, paid holidays, flexible work schedules, employee assistance programs (EAP), concierge services, and a plethora of additional elective benefits, such as insurance for their homes, pets, and long-term care.

Employee benefits may be further classified as voluntary or mandatory. Mandatory benefits are those that employers are required to provide by law and include social security, Medicare, and unemployment and disability insurance. Voluntary benefits are health care and retirement plans, as well as other elective benefits that employers provide above and beyond what is required by the government.

Employee benefits as an essential feature of the total compensation package grew out of the U.S. labor movement. The Norris-LaGuardia Act of 1932 and the Wagner Act of 1935 guaranteed employees the right to join unions and required employers to engage in good faith collective bargaining. In 1949, labor unions won the right to include employee benefits in the bargaining agreement.

The rapid growth throughout the 1950s and 1960s in the number of employers that offered benefits as part of the total compensation package reflected an expanded social consciousness in which employers felt increasingly obliged to invest in the total well-being of their employees. The growth in employee benefits was further facilitated by a strong economy and the tax incentives that the government made available to firms that provided benefits. Subsequently, by the 1970s, almost all employers offered some type of employee benefits to their regular full-time employees, primarily health insurance and retirement plans.

With so many individuals now dependent on employee benefits programs for their health care and retirement, legislation was enacted to safeguard their rights as participants in these programs. The Employee Retirement Income Security Act (ERISA) of 1974 established minimum standards for most voluntary pension and health care plans in private industry to provide protection for the employees participating in these plans. ERISA requires employers to provide employees with detailed information including the benefits plan features and funding, defines the fiduciary responsibilities of those who manage and control plan assets, requires plans to establish a grievance and appeals process for participants to get benefits from their plans, and gives participants the right to sue for benefits and breaches of fiduciary duty.

Today, few view employee benefits as optional; they are largely perceived as an essential part of the employee's total compensation package. A strong benefits package that meets the broad array of needs of a diverse workforce is critical for most employers to recruit and retain the best talent. Most employers are legitimately concerned about the physical and financial well-being of their employees; however, the rising costs of health care and retirement benefits and the continued pressure to improve existing benefits while remaining competitive in a global economy present a significant challenge.

Benefits now encompass a significant portion of the total human resources budget. In 2003, U.S. employers spent $1.18 trillion on voluntary and mandatory benefits programs, including $569.1 for retirement benefits, $501.4 for health care benefits, and $114.1 for other types of benefits. The dramatic growth in the cost of health care benefits, which is projected to soon surpass the cost of retirement benefits, may be most alarming for employers. As a result, employers have taken various steps to rein in the costs.

Many employers, for example, have shifted their retirement programs from defined benefit to defined contribution plans. In a defined benefit plan, the employer guarantees that employees will receive a specified sum on retirement and as such is required to pay this sum regardless of the actual financial performance of the retirement fund investments. Employers offering defined benefit plans have also seen an increase in the financial burden of funding these programs due, in part, to the increase in the average life span of retirees and the mandatory cost-of-living adjustments these plans require.

In a defined contribution plan, the employers specify the amount of money they will contribute to employees' retirement savings; however, the employees assume all the investment risk. Employees are generally responsible for determining how to allocate the savings among various investment options, and the dollar value of the benefits received on retirement is dependent on the financial performance of their investments. In many instances, the employer's contribution to the plan depends on the amount that the employee contributes; if the employee opts not to contribute, he or she does not receive the benefit.

Another step employers have taken to control their benefits costs is to pass more of the expense on to employees, particularly the cost of health care insurance. Many employers require employees to absorb an increasingly greater portion of the insurance premiums, as well as to make larger copayments for doctor visits, medical procedures, and prescription drugs. As a result, there has been a dramatic rise in the number of workers who go without health care insurance, even though their employers offer it, because they cannot afford it.

Controlling benefits costs is a key factor driving many companies to fill vacated or new positions with temporary or contract employees, who are not entitled to receive the same benefits as regular, full-time employees, or to outsource functions to external providers. Many have resorted to relocating operations to countries where benefits costs are comparatively low or are not required as part of the compensation package. Still others have opted to reduce or eliminate the benefits offered to retirees.

Some are predicting that within the next 10 years, the costs of providing benefits will cause many employers to move away from covering benefits for employees. Benefits advocates argue that the costs of the health, financial, and quality-of-life benefits offered by employers is offset by reduced costs in other areas such as worker's compensation, greater ease in recruiting and retention, and increased productivity due to reduced absenteeism and employee stress. Many who take a paternalistic view of the relationship between the organization and its employees contend that organizations that exist to serve people should also serve the needs of their own employees.

Many employers contend that the benefits from offering comprehensive benefits packages to their employees are being outstripped by the costs. Employers increasingly argue that the best way to control the costs is to make employees more accountable for managing their own benefits. Just as defined contribution retirement plans have replaced traditional defined benefit plans as the prevailing choice for retirement insurance, many are predicting that defined contribution health plans, in which employers contribute a specific sum to each employee's health spending account and empower the employee to determine how to spend those dollars for health care, will one day become the standard for health-related benefits. Opponents of these plans argue that they will shift more of the burden of paying for health onto those who are less healthy. Critics also worry that individuals will be poor purchasers of care on their own and susceptible to scam artists. Most agree that society in general benefits from a healthier and more financially secure citizenry; however, the debate as to who should be responsible for providing these benefits—employers, the government, or individuals themselves—is likely to increase as the costs continue to escalate.

Benevolence and Beneficence

Many problems in business ethics involve questions about the obligations and motives of beneficence. Diverse examples are obligations to protect Internet users from obscene materials, responsibilities for human subjects in pharmaceutical research, paternalistic policies of consumer protection, government actions to control markets in the public interest, policies to improve the welfare of farm animals, benefit packages for employees, ideals of corporate philanthropy, obligations for poverty-related ill health, programs to benefit children and the incompetent, preferential hiring policies, and many environmental protection programs.

The Concepts of Beneficence and Benevolence

The term *beneficence* connotes acts of mercy, kindness, and charity, and perhaps even altruism, love, and humanity. In ordinary language, the notion is broad, but it is understood even more broadly in ethical theory, to include effectively all forms of action intended to benefit other persons. The language of a *principle* or *rule* of beneficence refers to a normative statement of a moral obligation to act for the benefit of others, helping them further their important and legitimate interests, often by preventing or removing possible harms. Many dimensions of business ethics appear to incorporate appeals to beneficence in this sense, even if elliptically. For example, when cigarette manufacturers are criticized for the way they market their products, the ultimate goal is the beneficent one of removing conditions that cause harm to persons. Similarly, when apparel manufacturers are criticized for not having good labor practices in factories, the ultimate goal is to obtain better working conditions, wages, and benefits for workers.

Whereas *beneficence* refers to an action done to benefit others, *benevolence* refers to the socially valuable character trait—or virtue—of being disposed to act for the benefit of others. An account of moral *motives* is often connected to a theory of the virtues, and benevolence has sometimes served as the prime example—for example, in the ethical theories of Francis Hutcheson and David Hume. Benevolence has seemed to these writers close to the essence of morality itself.

Acts of beneficence may be done from obligation, but they may also be performed from nonobligatory moral ideals, which are optional. However, not all exceptional beneficence rises to the level of the moral saint or moral hero. Saintly beneficence and benevolence are at the extreme end of a continuum of beneficent conduct and commitment that exceeds duty. A celebrated, though fuzzy, example of beneficence that rests somewhere on this continuum is the New Testament parable of the "good Samaritan." In this parable, robbers have beaten and left half-dead a man traveling from Jerusalem to Jericho. A Samaritan takes compassion on him, tends to his wounds, takes him to an inn, and stays with him. The Samaritan's actions are clearly beneficent and the motives benevolent. However, they do not seem—on the information given—to rise to the level of heroic or saintly conduct. The morally exceptional, beneficent person, then, may be laudable and worthy of emulation yet neither a moral saint nor a moral hero.

Historical Place in Ethical Theory

Celebrated writings in the history of ethical theory suggest that there is no one correct way to think about beneficence and benevolence. Several landmark ethical theories embrace these notions, in assorted ways. Utilitarianism is the most notable example, because its principle of utility is, in effect, nothing but a strong and demanding principle of beneficence. Other distinguished theories, such as Hume's moral psychology and virtue ethics, are not as demanding as utilitarianism but nonetheless make benevolence and utility their centerpieces. All such theories closely associate the goal of benefiting others with the goal of morality itself.

Many other writers in the history of ethics make beneficence even less of a centerpiece yet maintain that obligations to confer benefits, prevent and remove harms, and weigh and balance an action's possible goods against its costs and possible harms are central to the moral life. In a renowned theory, Immanuel Kant argued that everyone has a duty to be beneficent—that is, to be helpful to others according to one's means and without hoping for any form of personal gain thereby. Benevolence he regarded as unlimited, whereas beneficence done from duty should not be viewed as placing unlimited demands on persons. Kant abstractly anticipated what, as noted below, have become several key issues about beneficence.

Predictably, deep disagreements have emerged regarding how much is demanded by *obligations* of beneficence and also about whether these obligations have anything to do with business. An impressive body of work has been done in recent years on Adam Smith's moral psychology and economic model for business ethics. His views about the role and place of benevolence in business have interesting implications for how we should understand the roles and obligations of businesses. Smith says that the wealth of nations is dependent on social cooperation but is not dependent on the benevolence that characterizes moral relations. Market societies, he argues, depend heavily on cooperation, yet it would be vain for us to expect benevolence when interacting in market societies. In commercial transactions, he says, the only successful strategy is to appeal to personal advantage: Never expect benevolence from a butcher, brewer, or baker; expect from them only a regard to their own interest. Market societies operate not by concerns of humanity but rather from self-love.

Mixed and Pure Beneficence

Several key problems in business ethics today can be framed as attempts to come to grips with Smith's view. Discussions of the role of the corporation in society and the very purpose of a corporation as a social institution are examples. It is not disputed today that the purpose of a for-profit corporation is to make a profit for stockholders, but there has been an intense debate about whether maximizing stockholder profits is the *sole* legitimate purpose of a corporation—as Milton Friedman and others have notoriously argued—and whether beneficent corporate conduct is justifiable. This is a normative question, but there is also the question of moral psychology raised by Smith: Is it reasonable to expect benevolent acts from the business community?

Some corporate social programs appear to involve a *mixture* of limited beneficence and self-interested goals such as developing and sustaining relationships with customers. An example is found in public utilities programs to help customers pay for electricity, gas, oil, phone service, and the like. These programs often decrease rather than increase corporate profits. They are, in effect, a form of corporate philanthropy. The programs locate and attempt to remedy the root causes of bill nonpayment, which typically involve financial distress. The programs also seek to rescue people in the community who are in unfortunate circumstances because of industrial injury, the ill health of a spouse or child, drug dependency, and the like. The company may even pay for consumer advocates, who are social workers trained to deal with customers and their problems. These programs, by design, make life much better for various unlucky members of the community. They therefore have a strong appearance of beneficence, but they may not be entirely motivated by benevolence because they may also be designed to achieve a positive public image as well as payment of overdue bills.

In contrast, some firms have charitable programs that seem to be cases of pure beneficence (not admixed with some form of outreach that will help the company). Money is taken directly out of profits, with no expected return benefits. It has been questioned, however, whether even programs of this description are instances of pure benevolence. In the precedent U.S. case of *A. P. Smith Manufacturing v. Barlow* of 1953, a judge determined that a beneficent charitable donation to Princeton University by A. P. Smith Co. was a legitimate act of beneficence by responsible corporate officers. However, the judge acknowledged that such beneficence may not be pure beneficence but rather an act taken in the best interest of the corporation by building its public image and esteem. In effect, the judge suggests that such a gift, while beneficent, may not derive from entirely benevolent motives.

If beneficent acts by corporations are actually nothing more than clever ways to maximize profits, then these actions seem to satisfy Friedman's demands. However, such a simple reconciliation of Friedman and corporate beneficence accounts does not reach down to the question of proper moral motive. Most moral philosophers have insisted that a morally meritorious act of beneficence must come from true benevolence—that is, purely benevolent motives. Apart from this problem, it is unlikely that an easy reconciliation of Friedman's views and beneficence-oriented ones is possible. Consider stakeholder theory, which arose, in part, as an effort to broaden our horizons regarding who should legitimately benefit from corporate profits. In the classical profit-to-stockholder view, stockholders' interests were supreme, but what about the interests of other stakeholders, particularly those whose efforts are necessary for a firm's survival and flourishing? Who deserves to benefit?

Even beyond stakeholders, might there be obligations of beneficence to some larger community? In a statement of "The Johnson and Johnson Way," in the Johnson and Johnson Company credo, it is said that Johnson and Johnson is responsible to the communities in which it thrives, indeed to the world community. The company asserts an obligation to be good citizens, including the support of charities, the encouragement of civic progress, the bettering of public health, and the improvement of education. Johnson and Johnson and many other companies assert that they have obligations to these ends, but to many writers in business ethics, this claim of obligations seems misguided: The moral demands here seem more like ideals or commitments, especially if they reach out to the world community. This takes us to a critical distinction between obligatory and ideal beneficence.

Obligatory and Ideal Beneficence

Some ethical theories insist not only that there are obligations of beneficence but that these obligations demand severe sacrifice and extreme generosity in the moral life. In some formulations of utilitarianism, for example, it appears that we may have obligations to give our job to a person who needs it more, give away a substantial part of our income, devote much of our time to civic enterprises, and so on. Few societies, it appears, have ever operated on such a demanding principle, but it does seem embraced, at least abstractly, by a large number of moral philosophers, including many utilitarians and Kantians.

Predictably, many other moral philosophers have denied that we have such demanding obligations, and some have argued that we have no general obligations of beneficence at all—only obligations deriving from specific roles and assignments of duty. A decisive example of the latter is found in the contemporary moral theory of Bernard Gert, who maintains that there are no *moral obligations* of beneficence, only *moral ideals* of beneficence. For Gert, the general goal of morality is to minimize evil or harm, not to promote good. Rational persons can act impartially at all times with regard to all persons with the aim of not causing evil, he argues, but rational persons cannot impartially promote the good of all persons at all times.

Philosophers such as Gert who reject the principles of obligatory beneficence draw the line at obligations of *nonmaleficence.* That is, they embrace rules that prohibit causing harm to other persons, even though they reject all principles or rules that require *helping* other persons or acting to prevent harm. Thus, they accept moral principles such as "Don't kill," "Don't cause pain or suffering to others," "Don't incapacitate others," "Don't deprive others of the goods of life," and the like. However, the mainstream of moral philosophy has been to make *both* not-harming and helping to be obligations while preserving the distinction between the two.

Some philosophers defend an exceedingly demanding principle of obligatory beneficence. In a widely discussed theory of "the obligation to assist," Peter Singer distinguished—in his early work on the subject—between preventing evil and promoting good. He contended that if it is under our control to prevent something bad from happening, without our having to sacrifice anything of comparable moral importance, then we are morally obligated to do it. In other words, we ought to donate time and resources until we reach a level at which, by giving more, we would cause as much suffering to ourselves as we would relieve through our gift. This claim implies that morality sometimes requires us to make large sacrifices. In the case of corporations, the wealthier the corporation, the larger its contribution should be to assist others in need.

Singer's proposals struck a number of critics as far too demanding. The requirement that persons or corporations must seriously disrupt their life plans to benefit the poor and underprivileged seemed to these critics to exceed the limits of common moral obligations. They argued that Singer proposes as obligatory what is actually supererogatory—an aspirational moral ideal but not an obligation. In reply, Singer attempted to reformulate his view so that his principle of beneficence does not set too high a standard. He concluded that his principle requires a more guarded formulation using the notion of a level of assistance. In particular, he argued that we should strive for a round percentage of income, around 10%, which means more than a token donation yet not so high as to make us a moral saint. This he proclaimed the minimum that we ought to do to conform to obligations of beneficence.

It is difficult to assess whether such a percentage of income—for a person or a corporation—states one's obligation. But wherever the line of precise limits of obligatory beneficence is drawn, the line is almost certain to be a revisionary one, in the sense that it will draw a sharper boundary on our obligations than exists in ordinary morality. Singer's proposals represent a revision of our ordinary moral outlook, despite its faint presence in the history of Western morality, where it is found primarily in religious obligations of tithing.

Liberty-Limiting Beneficence: The Problem of Paternalism

An important issue about beneficence descends historically from John Stuart Mill's classic work *On Liberty*, in which he argued that paternalism is an indefensible moral position. Paternalism involves an attempt to benefit another person when the other does not prefer to receive the benefit. Paternalism may be defined as the intentional overriding of one person's known preferences or actions by another person, where the person who overrides justifies the action by the goal of benefiting or avoiding harm to the person whose preferences or actions are overridden.

Paternalism is often found in the practices of business and in government regulation of business. For example, many businesses require employees to deduct money from their salary for a retirement account; they may likewise deduct salary money to pay for a life insurance policy. If employees do not want these "benefits," they are not free to reject them. Paternalism is here assumed to be an appropriate liberty-limiting principle. Another commonplace example comes from the construction industry and the chemical industry. If an employee does not wish to wear a particular suit, mask, or other protective device, the company (and also the government) will compel it anyway, often (though not always) for paternalistic reasons.

A much-discussed example at present is the restriction of various pictures, literature, or information—often pornography or violent depictions—on the Internet, in bookstores, and in video stores. Many customers may wish to purchase or receive information about these products, but paternalism often prevails. Arguments are put forward maintaining that those exposed to pornography will harm *themselves* by such exposure—for example, pornography might reinforce their emotional problems or render them incapable of love and other distinctively human relationships.

A classic problem of paternalism derives from the principle, often mentioned in business ethics, of *caveat emptor*—Latin for "let the buyer beware." This property-law-derived principle can here be taken as a general principle governing sales: A buyer is responsible for determining any unfitness in a product and is not due any form of refund or exchange unless the seller has actively concealed the unfitness. The buyer is free to either make the purchase or not make it. Many paternalistic restrictions on purchasing have arisen with the objective that buyers will not harm themselves or will not fail to receive benefits that they otherwise might not receive. For example, the control of pharmaceutical products and all controlled substances—through government policies and licensed pharmacies—has often been justified by appeal to paternalism. Many believe that the Food and Drug Administration (FDA) in the United States is fundamentally a paternalistic agency.

As the marketplace for many products has grown more complex and the products themselves more sophisticated, buyers have become more dependent on salespersons to know their products and to tell the truth about them. An engaging question in business ethics is whether a salesperson's role should be viewed as that of paternalistic protector of the buyer. Suppose, for example, that a consumer wants a sprinkler system in his yard to water his grove of evergreens; he loves the sound and look of sprinklers. However, these sprinklers will be worthless for appropriate watering of the roots of his evergreens: The owner needs drip-hose for his large collection of pine, spruce, cedar, and cypress. Should a salesperson insist on selling only drip-hose, refusing to sell sprinkler heads, or should the salesperson acquiesce to the customer's strong preference for sprinklers? Traditionally, salespersons have not viewed their obligations of beneficence in this way, but perhaps paternalistic beneficence would here be a commendable change of practice?

Bentham, Jeremy (1748–1832)

Jeremy Bentham was born in London, and in 1760, he entered Queen's College, Oxford. When he graduated in 1764, he started the study of law at Lincoln's Inn, London. Bentham never practiced law, although he was qualified to do so, preferring instead to write in favor of both legal reform and the reform of social institutions such as prisons. Indeed, one of Bentham's main projects was the design of the "Panopticon," a model prison where the prisoners could be observed at all times by the guards—who could not themselves be seen by the prisoners.

Drawing on both the English tradition of empiricism and his belief in the power of reason, Bentham held that human behavior could be described scientifically. Some of his major works based on these principles include *A Fragment on Government, Plea for the Constitution*, and *On the Liberty of the Press and Public Discussions.* Bentham believed that all human behavior could be explained by reference to the twin motivations of pleasure and pain.

The theory of psychological hedonism formed the basis of Bentham's account of utilitarianism, the moral view that he helped found and that he famously described in his major work, *Introduction to the Principles of Morals and Legislation.* Utilitarianism was based on the principle of the greatest happiness for the greatest number. According to its proponents, an act was right insofar as it produced the greatest happiness for the greatest number and wrong insofar as it failed to do so. For Bentham, it was not only the happiness of people that mattered morally, but the happiness of all sentient beings counted as well.

This does not mean, however, that Bentham (or other utilitarians, such as James Mill, John Stuart Mill, and, more recently, Peter Singer) believed in “animal rights.” This is because Bentham did not believe that anyone, animal or human, possessed any natural rights at all. That is, Bentham did not believe that any being possessed any rights by nature. Indeed, Bentham is famous for claiming that such rights are nonsense on stilts. Bentham’s rejection of natural rights was informed by his legal philosophy, in which he held that laws are simply commands expressing the will of the sovereign. (This approach to the philosophy of law is termed *legal positivism*, and Bentham had a great influence on 20th-century legal positivists such as J. L. Austin and H. L. A. Hart.) As such, for Bentham, there is no such thing as natural law—and hence no such things as natural rights. All rights are simply legal rights, created by the law. On his death, Bentham was, at his own request, dissected, embalmed, dressed, and placed in a chair at University College, London University, which institution he helped finance through a large bequest.

Berle-Dodd Debate

The Berle-Dodd debate of the early 1930s, between specialists in corporation law, was the opening exchange in the still-raging controversy about shareholder versus stakeholder views of the firm. This controversy concerns the primary purpose of the publicly owned corporation. Adolf A. Berle Jr. proposed that public policy should define a strict fiduciary duty for management. E. M. Dodd Jr. replied in favor of public policy safeguarding multiconstituency and community responsibilities. Dodd may be regarded as a forerunner of stakeholder and corporate social responsibility theories. The debate itself had an important impact on the U.S. securities acts of 1933 and 1934.

The Debate

The debate originated in the perceived problem of separation of investor ownership and management control. Adolph Berle and Gardiner C. Means, then an economics doctoral student at Columbia University, where Berle taught, argued this thesis in *The Modern Corporation and Private Property.* Separation effectively destroyed the traditional property rights basis for shareholder control of business decisions. The shareholder had become purely a “rentier.” Berle’s proposed solution was for public policy to define a strictly fiduciary duty for management. Berle’s article drew on the established legal doctrine of trusts to argue that the manager should be strictly a trustee for assets owned by investors.

Dodd replied that the business corporation had in addition a vital social service function. Dodd made three points. He drew a distinction between the equity (i.e., money) capital of investors and the “capital” of other constituencies defined in terms of their cares and concerns invested in the firm. Dodd argued that the common law had earlier treated business as a public profession; this view had subsequently been limited to businesses deemed to have some public interest. The 19th century was a judicial reversal of the previous common-law tradition. Dodd argued a case for public policy explicitly strengthening customers’ and employees’ rights. Dodd basically agreed with Berle that managers could not be trusted with discretion concerning multiple responsibilities.

Berle responded in a rejoinder that Dodd’s position was an expression of theoretical rather than practical principles. Berle's concern was that weakening of a strict fiduciary duty for managers would prove dangerous in practice. Berle conceded that Dodd had won the debate (at least temporarily) in the sense that social fact and judicial decisions had over time come to support Dodd's general viewpoint against strict fiduciary duty.

Historical Background of the Debate

This debate between two legal experts had roots in the development of corporation law. In the United States, a corporation exists artificially and only in contemplation of the law, according to Chief Justice John Marshall in the 1819 U.S. Supreme Court case *The Trustees of Dartmouth College v. Woodward.* The Michigan Supreme Court addressed the basic elements of the Berle-Dodd debate in 1919 in the case of *Dodge v. Ford Motor Co.* Henry Ford had paid a double dividend for some years (i.e., a regular dividend and a special dividend). He announced his intention not to continue the special dividend in order to reduce prices to customers and increase wages to employees. The Dodge brothers filed suit in state court for continuation of the special dividend. The Michigan Supreme Court ruled that the primary purpose of the investor corporation was investor wealth and supported continuation of the special dividend. The opinion also articulated the business judgment rule, holding that managers and directors are not expected to have perfect judgment but only to exercise business acumen reasonably for the goal of profit seeking. Ford did not use a line of defense that arguably might have proven successful. He could have argued that reducing prices and increasing compensation was a reasonable strategy under the business judgment rule for increasing sales and labor productivity.

In the 1883 case of *Hutton v. West Cork Railway Co.*, Lord Justice Bowen considered whether a company could properly provide gratuities to employees. He concluded that liberal dealing with employees could ease friction and thus benefit the company. This opinion accords with Dodd's view that, in the long run, management consideration of employee welfare would increase shareholder profits.

Effect on Securities Legislation

The Berle-Dodd debate had important impacts on the content of the U.S. securities acts of 1933 and 1934. Berle had significant influence on the drafting of the legislation. Because shareholders did not control management, control must rest on full disclosure of information. Disclosure follows from either Berle's view of the separation of ownership and control or Dodd's view of constituency and social responsibilities. Such disclosure and transparency remain the fundamental philosophy of the securities acts.

Modern Concern With the Debate

The modern version of Berle's thesis was famously stated by the Nobel Prize–winning economist Milton Friedman. He explicitly characterized discretionary corporate social responsibility by managers as theft from the primary stakeholders (customers, employees, and investors alike). In addition to invoking a primitive stakeholder model of the firm, Friedman also noted an irreducible role for customary ethics as well as for public policy. He admitted that companies might need to engage in prudential altruism to forestall even more burdensome public policy developments. In contrast to Friedman, subsequent authors have tended to omit ethics and reduce limitation on managerial conduct strictly to law. The formal version of this line of reasoning is principal-agent theory. Any managerial behavior other than maximizing shareholders' wealth, up to the limits imposed by law, arguably reduces social wealth due to increased agency costs.

The debate continues to this day. Justice Bowen's line of reasoning was rejected decades later in the 1962 case *Parke v. Daily News Ltd* on the basis that enlightened industrial relations do not meet the standard of short-term profit calculation. This opinion accords with Berle's and Friedman's concerns that it is not practical or wise to deviate from strict fiduciary duty. The two U.K. decisions noted above simply place business strategy and company law in plain conflict. There may be no strong empirical evidence of any definite relationship among corporate social responsibility, stakeholder management, and profitability.

U.S. corporate governance law, enacted at the state rather than the federal level, is bifurcated. Some 29 states have adopted corporate constituency statutes that permit or require director attention to the interests of one or more stakeholders other than investors. Available evidence suggests that these statutes effectively do nothing to increase stakeholder influence or interests; rather, they simply increase managerial discretion at the expense of shareholder control for no tangible gain by other stakeholders. The evidence tends to support Berle's contention. It has been argued that managers can handle only one objective at a time, so that objectives must be ordered hierarchically—meaning wealth seeking primacy (within the law) and stakeholder considerations being secondary. A strategic view suggests, however, that managers would be well advised to practice enlightened stakeholder management: Since employee sentiments can affect employee morale and hence productivity, consideration must be given to those sentiments.

The general case for constituency or stakeholder attention rests on the experiences of European and Japanese industrial relations in contrast to the U.K.-U.S. legal doctrine. German industrial democracy, in effect since 1920, includes dual boards (a supervisory board including employee representatives appoints the management board) and works councils at establishments. Japanese business operated after World War II on the basis of management–labor cooperation. Both Germany and Japan, as examples of employee-oriented industrial relations (they may or may not be beneficial to consumers in the long run), reflect a scheme of industrial conflict management. It is difficult to see that these approaches are truly multiple-constituency models—everything depends on whether one believes that the approaches are in the long run in the public interest. European unemployment is structurally much higher than U.S. unemployment (reflecting more flexible labor markets and higher economic growth rates), and while Japanese unemployment is considerably lower, there is some evidence that it has risen and that lifetime employment practices are deteriorating. Evidence suggests that stakeholder management practices in Europe are measurably costly.

During the 1980s and 1990s, U.S. corporations—following the lead of General Electric (Jack Welch, CEO), for example—pioneered in shareholder value maximization (or wealth seeking) practices. The long success story (until tarnished by the dot.com bubble burst and recent corporate scandals) seemed to indict stakeholder or multiple-constituency theory. The Dey Report from Toronto in 1994, the Hampel Report from London in 1998, and the Peters Report from Amsterdam in 1997, issued by stock exchanges, all attempted to increase the weight of shareholder orientation without reducing the existing weight of stakeholder orientation.

Critics of stakeholder theory have returned to Berle as a touchstone—arguing why Dodd was wrong despite Berle's tentative concession. The general lines of argument run as follows: (1) investors have property rights that should not be reduced; (2) U.K.-U.S. corporate governance law should emphasize shareholder primacy; and (3) efficient, competitive markets generate social wealth without the need for governmental regulation or discretionary corporate social responsibility.

This reasoning tends to ignore the Berle and Means separation thesis. Principal-agency theory suggests imperfect control by investors and substantial discretion for managers. It is more likely that directors and executives emphasize corporate wealth, defined as corporate assets under discretionary managerial control rather than shareholder primacy. The latter remains a legal and economic ideal, if not a fiction, rather than the functioning reality.

Biographical Information on Berle and Dodd

Both Berle and Dodd were Harvard graduates, lawyers, and ultimately university professors. Dodd spent most of his career at Harvard, while Berle went into government service and returned to Columbia after World War II. Both Berle and Dodd practiced and taught in the field of corporation law.

Adolf Augustus Berle Jr. (1895–1971), born in Massachusetts, graduated from Harvard College and then Harvard Law School. His parents were active in the Social Gospel approach to progressive reform and politically connected. He first worked in the Boston law firm of liberal justice Louis D. Brandeis. Later, he provided legal services for the Henry Street Settlement House on Manhattan's Lower East Side. He formed his own law and Wall Street firms with specialization in corporation law. He commuted from New York to teach at the Harvard Business School. Resigning from the American delegation to the Paris Peace Conference in protest against the terms of the Versailles Treaty, Berle returned to practice law in New York City and, in 1927, began teaching "law of corporation finance" at Columbia, where he met Means. Berle became a member of Franklin D. Roosevelt's (FDR's) New Deal "brain trust" and an adviser to New York City Mayor Fiorella La Guardia. As assistant secretary of state for Latin American affairs (1938–1944), Berle was spokesman for FDR's Good Neighbor Policy. During World War II, he was the head of State Department intelligence activities.

After serving (1945–1946) as ambassador to Brazil, when the Vargas dictatorship was toppled, he resumed his professorship at Columbia and was a founder and chairman (1952–1955) of the Liberal party. In 1951, he became chairman of the board of trustees of the Twentieth Century Fund. During the Kennedy administration, Berle chaired a task force on Latin America that originated the Alliance for Progress.

Edwin Merrick Dodd Jr. (1888–1951), born in Rhode Island, also graduated from Harvard College and then Harvard Law School, several years ahead of Berle. He practiced law in Boston and then joined the Washington and Lee School of Law for 1 year, resigning to join the War Industries Board. After World War I, Dodd returned to legal practice in Boston and then in 1922, to teaching and scholarship on the law faculties successively of Nebraska, Chicago, and from 1928, Harvard. He died untimely in an automobile accident.

Better Business Bureau (BBB)

The Better Business Bureau (BBB) is a network of private, nonprofit organizations concerned with fair business practices and consumer protection. The BBB has no policing powers, does not give legal advice or assist in breaking legal contracts, and does not make collections or give credit information. The BBB, under the leadership of the Council of Better Business Bureaus, collects and disseminates information about companies based on unanswered or unsettled complaints. In this endeavor, the BBB depends on the input and feedback from consumers. In addition, the BBB provides buyer-seller mediation and arbitration services and monitors advertising and selling practices.

Historical Background

Consumer activism is not a new phenomenon. Its roots can be traced back to early political economists such as John Stuart Mill and Adam Smith, who recognized that consumption was linked with politics and social organization. The modern consumer movement in the United States dates to the 1930s, to the period between the World Wars, when consumers lobbied for a more equitable tax system, price control, social security, and more stable labor-management systems. Writers such as Kathleen Donohue point to the establishment of the Consumers Advisory Board of the National Recovery Administration and the Office of the Consumers Counsel General within the Agricultural Adjustment Administration during the presidency of Franklin D. Roosevelt as a mobilization and institutionalization of a wave of citizen consumers. It is within this overall consumer context that the BBB is situated.

From the inception of the BBB, its major concern has been the issue of business ethics. One area of concern was that of advertising, which until 1880 was completely unrestrained. Some advertisers were making unbelievable claims, and the first acknowledgment of the overinflated claims made by advertisers first appeared in the *Farm Journal* in October 1880. The publishers of the *Farm Journal* declared that they would make every effort to ensure that advertisements that appeared in its pages were signed by trustworthy persons and went further by stating that they would make good on any losses suffered by a consumer as a result of a published advertisement. At the turn of the 20th century, the infant advertising industry established its own self-regulating organization known as "Vigilance Committees," which was devoted full-time to eliminating abuses and creating advertising codes and standards. Within a year, vigilance committees were established in Boston, Milwaukee, Atlanta, Des Moines, Seattle, and Denver. The Advertising Club Volunteers operated the vigilance committees, examining newspaper ads and contacting those suspected of making false claims and attempting by moral persuasion to appeal for voluntary ethical business practices. The publication of information called the attention of the public to those companies that were not willing to voluntarily reform their advertising. Within a few years, consumer complaints included demanding refunds and repairs or replacement of products or services. Eventually, the work expanded to consider the ethical issues involved in consumer complaints. If companies failed to resolve complaints, public reports were issued, resulting in an increased awareness among the public of the unethical activities of businesses. With the increased public awareness of the vigilance committees, it was inevitable that a consumer would inquire about the reliability of a company with whom the consumer was considering a business relationship. Thus the Reliability Reporting service of the BBB was initiated.

Better Business Bureau Structure

All BBBs provide a common set of core services and offer optional programs and services that reflect their local preferences, all provided for within the governance and structural makeup of the BBB system. BBBs share the same mission and values but are locally governed. Each BBB is an independent nonprofit corporation organized and governed by its business members. Members derive no financial benefit from the operation of the BBB but do have a vote (one per member) in the election of the board of directors and the officers of the corporation. Members are invited into the organization by membership representatives and are approved by the organization. Members pay annual dues, usually based on the size of the company. They may be removed from membership if they fail to abide by the BBB membership standards. The board of directors provides financial and policy oversight. The CEO, appointed by the board of directors, conducts business under procedures established under the bylaws of the corporation. BBB members provide the financial support that enables the BBB to offer services. The BBBs in the United States and Puerto Rico are organized into five regions. The BBBs in each region conduct an annual regional conference, organize other staff-training conferences, encourage effective communications within the region, and elect representatives to serve on the Council of Better Business Bureaus board and committees. The Council receives financial support from its member BBBs, from its national members, and from fees paid for national program services. The Council is organized as a nonprofit business membership organization that provides a national leadership voice for the BBB and protects the use of the registered Better Business Bureau name and its torch logo. It also provides services to BBBs ranging from consumer education materials and training to computer programming and support and membership marketing support.

Programs and Services

The BBB is concerned with ethical issues, a moral test that goes beyond the legal standard. Promotion of ethical advertising is a core service of the BBB. The BBB has developed an advertising code that establishes a set of guidelines that reflect the ethical advertising standards fostered by the BBB system. The BBB provides reliability reports that are designed to provide consumers with an informative, accurate, and unbiased summary of information documented in the BBB records. BBBs provide reliability reports but do not endorse or recommend any company, product, or service. The BBB provides dispute resolution services. Complaints are usually reported to the BBB in writing, many online. At the first level, the objective of the

BBB complaint process is to present the complaint to the business for a response and settlement of the issues. Most complaints are resolved at this level. If the complaint is not resolved, the BBB provides mediation services. Mediation involves helping the parties reach their own agreement to settle a dispute. The third level is arbitration, a process in which two parties allow a third party to make a legally binding decision to settle a dispute. The Better Business Bureau Auto Line is a very successful national dispute resolution program. Auto Line is a mediation and arbitration program designed to settle warranty disputes between auto manufacturers and customers. The BBB provides consumer education materials, information that helps identify quality features of products and services. BBBs provide information that helps businesses maintain ethical advertising and selling practices and effective customer relations. Most BBBs maintain some form of charity review program. The model program was developed by the Better Business Bureau Wise Giving Alliance, which operates as a service of the Council of Better Business Bureaus. Its objective is to establish wise giving guidelines and to gather information from national charities and present the information to potential donors in its Better Business Bureau Wise Giving Reports.

Bhopal

The Bhopal disaster—night of December 3, 1984—was the worst industrial disaster in the history of the world: the leakage of 40 tons of methyl isocianate (MIC) recorded at the plant that Union Carbide India, Limited (UCIL) had in Bhopal, the capital of Madhya Pradesh, one of the poorest and most overpopulated states in India. There were 6,903 dead, approximately 20,000 injured, and almost another 850,000 seriously affected in different ways.

Union Carbide Corporation occupied third place in the ranking of the chemical sector in the United States. It had assets of over $10,000 million and around 110,000 employees. Nevertheless, it underwent the worst financial situation in recent years: Net profits plummeted from $310 million in 1982 to $79 million in 1983.

Why did the disaster occur? The causes are related to diverse and complex factors. On the one hand, they were attributable to technical aspects and shortcomings detected in the safety mechanisms of the industrial plant, and the management was aware that it did not have adequate plans in place to resolve possible contingencies and accidents. On the other hand, they were related to the human factor: The morale of the workers was low, and it seems that there was not enough staff, technical training was rare, and the director did not have the required experience—excessive rotation of directors is apparent if we keep in mind that there were eight different general directors in 15 years. As regards the remaining reasons—and without wanting to annul the moral responsibility of the company for what happened—the insistence of the Indian authorities in keeping operative control of the subsidiary in the hands of nationals may have also contributed to the disaster by somehow removing the parent company from direct control of the plant.

The most noteworthy consequences of the disaster in Bhopal were the following: loss of human lives, illnesses, lack of confidence in the sector, more regulations, lawsuits, indemnities, loss of image, lack of worker motivation, and economic losses—in one week, the market value fell by almost $1,000 million. Months later, Union Carbide had to implement a restructuring plan: the closing of different plants and the dismissal of over 4,000 workers. It also had to defend itself against a hostile takeover attempt by GAF Corporation. Although the company managed to dodge problems successfully during this period, Union Carbide was no longer even a shadow of what it once had been. In the end, the company had to refocus its business and center it on the manufacturing of plastics and chemical products. It carried out a staff reduction program until only a little more than 12,000 employees remained, who were under pressure to declare that they were committed to the environment in the face of public opinion.

Bilderberg Group

A subject of much speculation, the Bilderberg Group is one of the more secret forums for high-level interaction by key business and political insiders from the principal nations of Europe and the United States. Formed in 1954 under the auspices of Prince Bernhard of the Netherlands, who hosted the first meeting at the Hôtel de Bilderberg near Arnhem, the group over time has served to promote collaboration between the European Union and the United States, including support for the North Atlantic Treaty alliance (NATO). Although claiming to have no formal charter, organization, or Web page, it has a chairman and a steering committee.

The Bilderberg conferences feature about 100 eminent financiers, corporate heads, government officials, media owners, intellectuals, and other political movers. The 4-day meetings are held once or twice a year, generally at out-of-the-way hotel and resort locations (always five-star) with strict security to keep away the uninvited. Camaraderie is created by all participants arriving without their spouses to live, talk, and dine together without being on the record. There is an unwritten rule that anyone attending a Bilderberg conference should be able to later, in a private capacity, contact other attendees, who over time form a virtual "who's who" of influence. Press coverage is discouraged, and participants are pledged not to repeat publicly what was said in the discussions. So despite the presence of many leading media figures over the years, very little is reported about these gatherings.

Ethical decision making and communication generally are enhanced by transparency and openness. So understandably, any largely autocratic and unaccountable means for those in the seat of power to meet clandestinely will give rise to concern. There are those who see the Bilderberg conferences as a type of secret society in which agreements are made to pull strings to clandestinely dictate government policies. In this respect, the Bildebergers are often grouped by conspiracy analysts with the Council on Foreign Relations, the Trilateral Commission, the United Nations Organization, the Vatican Bank, and other entities. The argument is that they are part of an overt/covert so-called shadow government having interlocking connections with major business interests, media, educational foundations, think tanks, and other powerful organizations.

Unless one is an insider, it is hard to evaluate these negative claims about such elite groups. There is no doubt about their influence, but many proponents argue that meetings such as the Bildeberg conferences help build personal contact, promote understanding, and serve the public good.

Biocentrism

Biocentrism ("life centered") is an ethical perspective holding that all life deserves equal moral consideration or has equal moral standing. While elements of biocentrism can be found in several religious traditions, it was not until the late decades of the 20th century that philosophical ethics in the Western tradition addressed this topic in a systematic manner.

Much of the history of environmental ethics can be understood in terms of an expanding range of moral standing. Traditional Western ethics has always been anthropocentric, meaning that only presently living human beings deserve moral consideration. As environmental issues such as nuclear waste disposal, population growth, and resource depletion came to the fore, many ethicists argued that moral standing should be extended to include future generations of human beings. The animal welfare and animal rights movement argued for an extension of moral standing to, at least some, animals. Arguments followed to extend moral standing to plants and then to such ecological wholes as ecosystems, wilderness areas, species, and populations.

The philosophical challenge throughout this process was to articulate and defend a nonarbitrary criterion by which the question of moral standing could be decided. On what grounds do we decide that objects deserve to be considered in moral deliberation? Supporters of extending moral standing to future generations argued that temporal location, like geographical location, was an arbitrary ground for denying equal moral status to humans not yet living. Defenders of animal rights cited characteristics such as having interests, sentience, being conscious, and being the subject of a life as the most appropriate criteria for moral standing.

Biocentric ethics argues that the only nonarbitrary ground for assigning moral standing is life itself. Biocentric ethics extends the boundary of moral standing about as far as it can go. All living beings, simply by virtue of being alive, have moral standing and deserve moral consideration.

Roots of biocentric ethics can be found in a number of traditions and historical figures. The first of the five basic precepts of Buddhist ethics is to avoid killing or harming any living thing. The Christian saint Francis of Assisi preached to animals and proclaimed a biocentric theology that explicitly included animals and plants. Some Native American traditions also held that all living things are sacred. The romantic movement of the 18th and 19th centuries defended the intrinsic value of the natural world against the tendency of the technological age to treat all nature as having mere instrumental value.

In the 20th century, preservationists such as John Muir held that the intrinsic value of natural areas, and in particular of wilderness areas, created responsibilities on our part. Preservationists argued that the intrinsic value of nature imposes duties on us to respect and preserve natural objects.

But the preservationist ethic can go beyond biocentrism in that it is not life itself that always carries moral value. Wilderness areas and ecosystems, after all, are not alive. Similarly, Christopher Stone's famous argument that trees should have legal standing would not strictly be biocentric in that Stone also advocated standing for mountains and rivers. This observation suggests that biocentrism is essentially an individualistic ethic. Life would seem an attribute of individual living things. Many environmentalists argue that holistic entities such as ecosystems, wilderness areas, and species all deserve moral consideration. To the extent that such entities are not alive, strictly speaking, environmental holism differs from biocentrism.

Albert Schweitzer was another early-20th-century thinker who argued that it was life itself that was the decisive factor in determining moral value. Working in the most remote areas of Africa, Schweitzer experienced the diversity, complexity, and multiplicity of plant and animal life forms there, rarely seen within industrialized societies. Schweitzer used the phrase "reverence for life" to convey what he took to be the most appropriate attitude we ought to take toward all living beings. Life itself, in all its mystery and wonderment, commands our respect, reverence, and awe.

Only in the final decades of the 20th century did philosophers attempt to develop a more systematic and scholarly version of biocentric ethics. Paul Taylor's 1986 book, *Respect for Nature*, was perhaps the most comprehensive and philosophically sophisticated defense of biocentric ethics. Taylor provided a philosophical account for why life should be accepted as the criterion of moral standing, and he offered a reasoned and principled account of the practical implications of biocentrism.

Taylor claimed that the reason why life itself is a nonarbitrary criterion for moral standing is that all living things can be meaningfully said to have a good of their own. Living things have a good because they are "teleological centers of life." The Aristotelian notion of a *telos* calls attention to the fact that living things have characteristic activities that are goal directed. Living beings aim toward ends; they have directions, purposes, and goals. Pursuing these characteristic and natural goals—essentially what is the very activity that is life itself—constitutes the good for each living being.

As a normative theory, biocentrism has practical implications for our behavior. Taylor argued that the good of all living beings creates responsibilities on the part of human beings. Taylor defended four basic duties of biocentric ethics: nonmaleficence, noninterference, fidelity, and restitutive justice. The duty of nonmaleficence requires that we do no harm to living beings, although it does not commit us to the positive duties of preventing harm from happening or of aiding in attaining the good. The duty of noninterference requires that we not interfere with an organism's pursuit of its own goals. The duty of fidelity requires that we not manipulate, deceive, or otherwise use living beings as mere means to our own ends. The duty of restitutive justice requires that humans make restitution to living beings when they have been harmed by our activities.

While Taylor offers a careful explanation and defense of biocentric ethics, serious challenges remain both for his particular version and for biocentrism in general. Examining these challenges can provide a helpful overview of the present state of biocentric ethics.

Numerous practical challenges suggest that biocentrism is too demanding an ethics that requires too much of us. Taylor's alleged duties to do no harm to living beings and to refrain from interfering with the lives of other beings asks a great deal of humans. It is difficult to understand how any living being, and especially humans, could survive without doing harm to and interfering with other living beings. Not only would abstaining from eating meat seem to be required, but even vegetables would seem to be protected from harm and interference.

The more general point is that any biocentric ethics would seem to face a dilemma. On the one hand, the commitment to biocentric equality could be taken seriously, and every living being is understood to have equal moral standing. This option would appear to create a very demanding ethical world of constant moral tragedy. We have ethical duties not to harm beings with equal moral standing, yet we need to eat those beings to survive. On the other hand, we could acknowledge situations in which strict equality can be abandoned. As Taylor himself argues, we can make a distinction between basic and nonbasic interests to provide guidance in cases where the interest of living beings conflict. In such a case, one would conclude that basic interest should trump nonbasic interests. For example, the interest in remaining alive should override the interest in being entertained. Thus, it is unethical to hunt animals but ethically justified to kill an animal in self-defense. But this second alternative quickly threatens the consistency of biocentric equality.

Consider the interest in remaining alive that might be attributed to a bacterium, a mold, or an insect and compare that with any of a number of relatively trivial human interests and actions that would result in the deaths of countless bacteria, molds, or insects. Either the basic/nonbasic interest distinction is applied equally across species, or human interests are given priority. In the first case, biocentrism again seems to require a level of ethical care that is unreasonably demanding. In the second case, we would seem to abandon biocentric equality by granting human interests a privileged standing.

In response to such concerns, defenders of biocentric ethics often argue for a principle such as Taylor's restitutive justice. When inevitable harms do occur in the conflicts between living beings, a duty to make restitution for the harms is created. Thus, I can compensate for the harms I do in harvesting trees or crops by restoring the forest or planting more crops. But this response raises the second major challenge to biocentric ethics.

An important environmentalist perspective, identified as "ecocentrism" to distinguish it from biocentrism, holds that ecological collections such as ecosystems, habitat, species, and populations are the central objects for environmental concern. This more holistic approach typically concludes that preserving the integrity of ecosystems and the survival of species and populations is environmentally more crucial than protecting the lives of individual elements of an ecosystem or members of a species. In fact, ecocentric environmental ethics often would condone destroying the lives of individuals as a legitimate means of preserving the ecological whole. Thus, we can be justified in culling members of an overpopulated herd or killing an invasive nonnative plant or animal species.

Thus, a strictly biocentric ethics will conflict with a more ecologically influenced environmentalism. Protecting individual lives may actually harm rather than protect the integrity of ecosystems and species. It is, of course, always open for the biocentric approach to accept this conflict by simply denying the value of ecological wholes. Biocentric ethics would thus only incidentally have overlapping concerns with environmental ethics. But as Taylor's reliance on restitutive justice suggests, biocentric ethics may need the value of ecological wholes to solve its serious practical problems. The beneficiaries of biocentric restitution and compensation, after all, are the nonliving ecosystems and other species members that replace and compensate for the harmed individuals.

Finally, challenges remain to the fundamental claim that life itself is the nonarbitrary criterion of moral standing. The biocentric perspective relies on a problematic teleological hypothesis. Living beings are said to have an intrinsic moral value because each living being has a good of its own. They have this good in virtue of the fact that living things are goal-directed (teleological) beings. But this teleological assumption that being goal directed entails having a good may be unwarranted.

The biological sciences do commonly refer to an object's purpose, goals, or function, and in this sense, they seem to adopt a teleological framework. But the challenge is whether all goal-directed activity implies that the goal must be understood as a "good." Such an inference was made in the Aristotelian and natural law traditions, but it is not obviously valid.

Consider the clear example of a human action that aims for some goal. Why do we assume that a human goal is a good thing? The obvious explanation is that we assume that any intentional act by conscious agents is undertaken because that agent believes that the goal is, in some sense, good. By definition, a rational person wouldn't choose to do something unless he or she believed that it was a good thing to do. Aristotle himself argued that all acts aim for some good. But, if the subject is nonconscious and nonintentional, can we still conclude that its goal is a good?

In contrast, consider the following examples from biology: "The purpose of the kidney is to remove waste from the blood" and "The goal of brightly colored plumage on male birds is to attract females." Assuming that kidneys and bright plumage do not consciously and intentionally choose the goals they serve, it is not at all clear that attaining these goals does accomplish even a perceived good. Only if some other value component is elsewhere assumed (e.g., that blood free from waste is good for the body in which the blood circulates or that attracting female birds is good for the preservation of the species) can one conclude that attaining the goal is good. Ecocentric environmentalism might argue that life is goal directed, but like bright plumage, the good associated with this goal is the good of something other than the object itself—for example, the good of ecosystem integrity or of species survival.

The fundamental philosophical challenge to biocentric ethics thus involves two questions. Is the activity of living really goal directed in itself, even when nonintentional? Even if it is goal directed, why assume that a living thing serves its own good rather than, like kidneys and bright plumage, the good of something else?

Perhaps one way to revive biocentrism is to learn from elements of Aristotle's ethics other than his teleology. One might think of biocentric ethics as more congenial to a virtue-based ethics than to a rule- and principle-based ethics. Biocentric ethics will always face difficult challenges when it seeks to provide a decision-making rule or principle by which we can resolve conflict and make unequivocal decisions. But Aristotle warned against seeking more exactitude than a subject matter allows and rightfully reminded us that ethics is not mathematics.

Consider biocentrism not as a set of rules to follow but as an attitude or character trait with which to approach life. Aristotle would have called such an attitude a virtue, and this is more a description of an ethical person than it is an action-guiding rule. Interestingly, both Schweitzer and Taylor allude to similar ideas. Schweitzer characterized the reverence for life more as a profound feeling of awe that one develops in the face of the mystery of life. Reverence is a virtue. Taylor refers to a "biocentric outlook" as an ultimate moral attitude toward life.

In this way, biocentric ethics advises us to develop a set of habits and attitudes with which we interact with living beings. Approaching any and each living being with awe and with humility will help make our own human life more meaningful and significant. A sense of bereavement and loss in the face of death would be an equal part of biocentric ethics, even when we recognize that death is both inevitable and necessary.

—Joseph R. DesJardins

BIODIVERSITY

Biodiversity is a term used to represent the total number of all life forms on our planet. This term includes all existent varieties of microbes, plants, animals, and fungi and all the genetic information they represent. Biodiversity entered into popular use with the publication of a volume edited by E. O. Wilson in 1988, titled *Biodiversity*, and is a contraction of the term *biological diversity*. While there is no comprehensive global database of all species, there are descriptions of between 1.4 million and 1.75 million documented species (depending on your source), with estimates of as few as 2 million to as many as 50 million more species yet to be identified and classified. While this disparity in estimates testifies to our limited understanding of the ultimate extent of biodiversity, it is even more surprising to note that some experts believe that as many as three species per hour are being lost largely due to human activity. Ecologists generally agree that species loss is happening at a historically unparalleled rate and could claim as many as one third of all organisms over the next 50 years. Given the estimates, it is possible that more species could be lost over the next century than are currently known and described. The awareness of our lack of deep knowledge of biodiversity raises many questions for humanity on both philosophical and practical levels.

Comprehension of biodiversity is critical to a proper understanding of the concept of sustainability (see entry) in the immediate and abstract sense. Biodiversity is an ecological demonstration of W. Ross Ashby's law of requisite variety, introduced in 1956, which states that the greater the variety possessed by a system the greater the number of disturbances that system can absorb without failure. Ashby observed that as variety is reduced below a requisite level, systems begin to fail. Because all life on the planet is part of the same biosphere, or interconnected ecological system or ecosystem, the variety of life-forms, or biodiversity, helps ensure the sustainability of all life on the planet by helping absorb the disturbances encountered within our ecological system. As has been observed and demonstrated, the existence of life helps create the conditions to support life, a notable example being the production of oxygen by trees and of carbon dioxide by animal respiration, each required to support life for the other.

As biodiversity decreases, the law of requisite variety predicts that the resilience of the ecosystem will also decrease until at some point the ecosystem will fail. In isolated regional ecosystems, such as island ecologies, this prediction has been demonstrated: As the biodiversity falls below the requisite variety, the ecosystem fails for life-forms related to that specific system, and especially harmed are those life-forms higher up on the food chain and therefore dependent on a greater number of other life-forms for their continued existence. Biodiversity has particular impact for human populations because our species is dependent on many other species of plants, animals, fungi, and microbes. At this point, scientists and ecologists have no clear idea of what number of other species constitutes the minimum *requisite variety* in terms of the global ecosystem's ability to provide ecological services to the global population of living creatures. The United Nations Environment Programme (UNEP) has estimated ecosystem services to be worth between $16 trillion and $54 trillion annually. What is clear is that the human population, and our ability to adapt to most biological niches, has made species survival for many other life-forms on this planet increasingly difficult. In the expert opinion of some scientists, our planet is experiencing the greatest rate of species extinction in 65 million years. By all indications, human activity is either directly or indirectly the cause of this massive reduction in biodiversity.

Humanity's collective need to maintain biodiversity presents some business organizations with contentious dilemmas. Organizations such as resource extraction industries that disturb or destroy habitat, such as mining, oil extraction, and logging to name a few, are often the focus of these dilemmas. The global population creates demand for power, lumber, and materials for goods, yet it also requires a planet with a sustainable ecosystem. It is well known that species diversity is most concentrated in areas such as rain forest and other undisturbed wilderness areas, and these are often the places where resource extraction companies find their raw materials. Regulations, both national and international, have provided one solution to this dilemma, but population pressure and a desire for continued and unimpeded economic growth continues to challenge the ecological necessity to keep some places wild. In some cases, even what some advocates represent as minimally invasive resource extraction technologies contribute to habitat fragmentation and species loss. Another example of human activity affecting biodiversity can be found in the fishing industry's management of common fishery resources (see the entry "Tragedy of the Commons") where once seemingly inexhaustible fisheries have been driven to collapse because of overfishing and habitat destruction. Examples of this exist in the Atlantic cod fishery, the Pacific and Atlantic salmon fishery, and the Chilean bass fishery in the south Pacific. Even fish farming has its dark side. Once thought to be the answer to world hunger, introduction of alien species into occupied habitat and disease caused by monoculture and reduced genetic diversity have created many unintended ecological problems, resulting in new threats to biodiversity. Finally, commercial farming or agribusiness in pursuing economies of scale through the use of monoculture farming and agricultural chemicals creates situations that deplete soil and reduce native plant stock variety, again having the unintended consequence of reduction in biodiversity.

Citizens, governments, and businesses must come to terms with the new realities that attend increased understanding of our planet and its limitations. Destruction through ignorance is tragic, but continued degradation of shared resources such as biodiversity becomes a societal and moral failure once the peril of such behavior is exposed. As more people understand, or in the worse case feel the effect of loss of biodiversity, business may find society less willing to allow free markets to function when self-regulation has the biosphere heading for a collapse due to loss of biodiversity (see entry on market failure).

Some positive steps have been taken. UNEP has been carefully monitoring global environmental health, while efforts are being made by some corporations to adopt more ecologically friendly practices. A number of management tools have been suggested for business organizations to help improve their environmental performance, including triple bottom line, balanced scorecard, *natural capital* (see entry), industrial ecology, the natural step, Zero Emissions Research Initiative, ecological footprint, and eco-effectiveness (cradle-to-cradle model). All these approaches represent an opportunity for management and governments to recognize that bottom line and the ecological baseline are not inextricably at odds.

By limiting our impact on the environment, including reducing our impact on habitat and pursuing sustainable management practices, society is making a statement about intergenerational justice and the intrinsic right of other species to share this impossibly rare inhabitable planet. Whether the arguments are based on enlightened self-interest, social justice, ecological theory, or systems theory, it is becoming abundantly clear that action must be taken to avert the dire consequences. Climate change and levels of ultraviolet radiation can have a devastating effect on species diversity. While action on global warming has been slow to muster, action on ozone depletion has been achieved, and the results have been dramatic. The damage to the ozone has begun to reverse. In the United States of America, the Endangered Species Act, for all of its detractors, has been a demonstration that concerted action can reverse the damage done through ignorance and greed. The experience gained from the Endangered Species Act has taught us that a species-by-species approach is inefficient and that global society must address habitat destruction and climate change. Yet this experience has also shown that progress can be made and that concerned and active citizens can make meaningful contributions to maintaining a balance between other species and human activity as part of a policy of sustainability.

The science of ecology informs us that maintaining biodiversity is not a luxury to achieve if possible or as budgets allow. It has provided us with evidence that biodiversity is the requisite variety needed to ensure the resiliency of our ecological system and ultimately secure the future of humanity.

Bioethics

Bioethics is the study of ethical issues in the practice of medicine and biomedical research. The field of bioethics has flourished for 30 years, and bioethicists have made significant progress on ethical issues in clinical medicine—that is, on "bedside" issues in the delivery of health care. More recently, significant attention has been paid to the just distribution of scarce health care resources. At the forefront of contemporary bioethics are issues tied specifically to for-profit health care such as the ethical development and marketing of pharmaceuticals.

The field of bioethics is one of the closest allied areas of research to business ethics. Bioethics and business ethicists deal with many similar issues, such as the appropriate use of ethical theory in dealing with practical ethical questions, obligations to conflicting stakeholders, and the scope and limits of professional codes of conduct. However, health care providers have generally welcomed the advances made by bioethicists regarding the ethical delivery of health care, and most hospitals now have an ethics committee, the task of which is to adjudicate difficult ethical issues that arise in the practice of medicine. In addition, ethical training is now routinely incorporated into medical school and nursing school curriculums. In contrast, businesspeople have not welcomed advances made by business ethicists in the same way, and business ethics education is not typically a required element of business school curriculums. Part of the explanation for this difference in attitudes lies in the fact that physicians and nurses regard themselves as having *ethical* duties to patients, whereas managers and directors typically regard themselves as having *fiduciary* duties to the owners of the business. It is also the case that in the United States, physicians and nurses have self-governing licensing boards that enforce ethical standards, whereas business managers and directors do not have equivalent layers of self-governance and ethics enforcement.

Clinical Biomedicine

One of the most important and influential ethical frameworks for examining problems in bioethics is known as principlism. Developed by Tom Beauchamp and James F. Childress, this approach derives principles from common morality and medical traditions. This approach to bioethics is not "top-down" in the sense of consistently applying principles derived from ethical theory to the practice of medicine. Rather, the approach grants that prima facie principles can and should be modified in light of a variety of sources of justification such as case judgments and rules of practice. The four principles identified by Beauchamp and Childress are (1) respect for the autonomous choices of individuals; (2) nonmaleficence, or do no harm; (3) beneficence, or the prevention of harm and the promotion of good; and (4) justice in the allocation of health care resources. Physicians and nurses who conduct their professional lives in a manner consistent with this approach, it is argued, do much of what is necessary for the ethical practice of medicine. Critics of principlism argue that this approach to bioethics fails to provide an adequate means for resolving cases in which principles come into conflict. They also argue that the "common morality" that principlism invokes is often inconsistent and as such cannot provide an adequate basis for an approach to bioethics.

In part due to the influence of Beauchamp and Childress but also because of the work of many other normative bioethicists and because of the transformation of medical training, concepts such as respect for autonomy, nonmaleficence, and beneficence have become commonplace among medical practitioners. The actual practice of medicine has been transformed from one dominated by the paternalistic judgment of physicians to one in which respect for patient autonomy is regarded as a core value. There is less agreement among bioethicists, practitioners, and U.S. policy makers regarding the just distribution of health care resources. This is the case despite the progress scholars such as Norman Daniels have made in articulating and defending a systematic account of just health care.

Profit-Driven Biomedicine

The 20th century saw major shifts in the provision of health care. These shifts include the transformation of the professional practice of medicine from a service orientation to a market orientation; the emergence of powerful pharmaceutical and health care corporations; and the development of new, innovative, and expensive biomedical technologies by for-profit enterprises. These changes have been accompanied by the emergence of a range of ethical issues that have not historically been discussed by bioethicists. One set of issues that is receiving increasing attention concerns the purposes and functions of HMOs, insurance companies, and physician practice groups, such as pricing, capitation, resource scarcity, and appropriate standards of care.

A second, more prominent range of ethical issues concerns the pharmaceutical industry. Critics of pharmaceutical companies such as Marcia Angell allege that direct-to-consumer marketing campaigns manipulate consumers into requesting unnecessary or inferior drugs from physicians; that pharmaceutical representatives provide incomplete and erroneous data regarding the efficacy of particular drugs to physicians; that pharmaceutical companies develop and aggressively market expensive "me too" drugs rather than developing truly innovative drugs; that most of these companies do little to provide the affordable, life-savings drugs most needed by people in the developing world; and that the companies are unjustly profitable. In reply, pharmaceutical companies and their representatives argue that they do not engage in marketing to consumers or to physicians but instead provide educational services, that all their drugs are intended to provide innovative benefits to consumers, that companies such as Merck have spent hundreds of millions of dollars to help eradicate diseases such as river blindness (onchocerciasis) and elephantiasis (lymphatic filariasis) in the developing world, and that they are for-profit enterprises with obligations to their owners to be profitable. In addition, they point out that their industry trade group, PhRMA, provides voluntary guidelines for ethical marketing and a range of other areas of concern.

In the 21st century, these issues concerning profit-driven medicine have begun to take a more prominent place in both bioethics and business ethics. However, since bioethicists normally focus on the obligations of individual clinicians on the one hand and the provision of health care by governments on the other, they are typically not in a position to address the obligations of for-profit enterprises. Similarly, business ethicists do not normally have expertise in biomedicine and so may not be well positioned to address the distinctive obligations of for-profit health care companies. It is likely that work at the intersections of these two fields of applied ethics will be collaborative and will be produced by senior scholars with broad professional experience. Normative ethical scholarship in this area has just begun and is likely to become much more sophisticated.

Birth Control

Birth control remains a highly controversial topic throughout the world. Birth control is any method that prevents birth; as such, it includes not only contraceptives and contragestives but also abortion—both chemical and surgical—and sterilization. Contraceptives are birth control methods that prevent fertilization of an egg by a sperm (conception). Contragestives are methods that prevent the implantation of a fertilized egg (embryo) after conception. Abortion is the removal of an embryo or fetus from the uterus. Sterilization is a surgical procedure by which the male vas deferens or the female fallopian tubes are severed or removed. This entry will focus on the ethical dimensions of each type of birth control, as well as some of the issues that arise between birth control and business.

Different ethical dilemmas regarding birth control come to the forefront depending on when and where it is discussed and by whom. People of higher social class and/or from developed countries generally have more birth control options than those of lower social class or from developing countries. Birth control is also more of an issue for women since they can become pregnant. This difference is evident in the number of birth control options that involve female activity compared with those available for men.

Birth control generally is viewed in two ways: as population control and as a means to control when pregnancy occurs. Generally, the issues of birth control with regard to population control are discussed and regulated by government. For example, in China, women are forced to undergo surgical sterilization after giving birth due to the one-child policy the government has imposed in the hope of controlling the country's population growth. Governments may also adopt policies against birth control to ensure national survival. For example, abortion was banned in post–World War I France to encourage the birth of more French children.

The discussion on using birth control as a means to control when a woman will get pregnant occurs in many different venues. For example, the Roman Catholic Church is against most methods of birth control because it views controlling pregnancy as an attempt to thwart God's plan, thus attributing birth control to a lapse in Christian values. Viewing birth control as a means by which women can control when they will become pregnant has caused many feminist thinkers to support its use. Feminists believe that a woman should have the right to choose when she will become pregnant. The right to choose the timing and method of birth control can allow women more control over their life plan. Of course, a woman can be disempowered if the decision to use birth control is taken from her. To the extent that men exercise control over women's birth control choices, feminists see a pattern of patriarchal dominance.

There are many ways in which birth control issues affect businesses. These are some of the ethical questions companies may need to answer: Is it ethical to produce and sell birth control products? Is it ethical for some birth control methods to be easily available to minors or unmarried women? Is it ethical to provide birth control through health insurance paid for by the company? Is it ethical to cover some birth control options through company health insurance but not others? As will be discussed later, some businesses have been criticized by public activists for their answers to such questions.

Contraceptives

Female Contraceptives

"The pill" is the most widely used female birth control method. The ethical concerns regarding the use of oral contraceptives are their health risks and their potential to act as contragestives.

Barrier methods are another form of female contraceptive, but these methods are no longer popular due to the advent of oral contraceptives. Barrier methods include diaphragms, sponges, cervical caps, and female condoms. While these methods do not introduce hormones into the body, and therefore do not carry the same risks as oral contraceptives, there are other potential risks associated with their use: they are difficult to use properly, there is the risk of developing a potentially fatal toxic shock syndrome, and most do not protect against sexually transmitted diseases (STDs). The continued emphasis on oral contraceptives over safer barrier methods that protect against STDs, such as the female condom, exposes women to health risks from introducing hormones into the body and from STDs and HIV/AIDS.

Other female contraceptives introduce hormones into the body through a vaginal ring, dermal patch, injection, or subdermal implant. Each has similar potential health risks as oral contraceptives since hormones are used. Each also has different degrees of risk based on the method of delivery. Injected hormones cannot be reversed quickly, thereby decreasing a woman's choice to restore her fertility. In contrast, implants, pills, and the patch can be removed from the body, thereby restoring fertility relatively quickly. Injectable contraceptives also have a great potential for abuse. A woman can be injected without her consent or knowledge, as has happened in refugee camps and psychiatric hospitals.

Male Contraceptives

Currently, there are only two methods of male contraception that have a high rate of success: condoms and sterilization. Sterilization is a radical contraceptive choice. Some would argue that it is not used to prevent pregnancy but rather reflects the desire to never have children. The male condom has the added benefit of helping prevent transmission of STDs, including HIV/AIDS. There is great potential for the advent of a male form of oral contraceptive within the next 5 years. Strides toward developing a reversible, nonbarrier male contraceptive have been made recently, and research shows that men are receptive to the idea of an oral contraceptive. Oral contraceptives for men would most likely interfere with the maturation of the sperm.

Contragestives

Contragestive or interceptive methods of birth control intervene after fertilization by causing the destruction of the embryo. Contragestives can affect the embryo either before implantation or after, but the user of a contragestive cannot determine when the embryo is destroyed. Contragestives include intrauterine devices (IUDs), emergency "morning after pill" contraceptives such as Plan B and Mifepristone (also known as RU-486), and menstrual extraction. Contragestives bring up many of the same ethical issues as abortion because they can be viewed as abortifacients, depending on one's definition of abortion and when personhood begins.

Abortion

While there is little evidence that people view or use abortion as a form of birth control, technically it is one. Abortion ends a pregnancy, thus controlling when a woman gives birth. Elective, surgical abortion brings up a multitude of ethical problems. While the debate about abortion is too complex to fully discuss in this entry, here are a few of the issues. When does human life begin? When does personhood begin, and what are the rights of a fetus? Does the extent of these rights increase as the fetus approaches viability inside or outside the mother's womb? What are the morally acceptable reasons for deciding to have an abortion? When and how should abortion be made available? Who can decide whether or not to have an abortion? Should the fetus's right to life take precedence over the mother's right to privacy? Should the mother's right to privacy include her autonomous control over decisions that affect her own body? Should the health of the mother be considered in evaluating an abortion option? Should abortion be made available to all women, since all women are morally equal? What constitutes a good parent? Governments, religious groups, and other organizations around the world have taken a stance regarding abortion. These positions have polarized many people.

Sterilization

Sterilization is currently a surgical procedure that involves the cutting, sealing, tying, or removal of the male vas deferens and the female fallopian tubes. Abuses of surgical sterilization abound. Such abuses have in common the assumption that sterilization is justified by the needs of society. Eugenic sterilizations have been imposed all over the world on persons considered undesirable due to their race, ethnicity, sexual orientation, nationality, and mental or physical condition. In the past, U.S. courts have imposed sterilization on an unknown number of men sentenced for fathering children that they do not support or for being convicted as sexual predators. Women in China and India are often encouraged or required by the government to have the procedure after giving birth to their first child. "Fetal protection" policies have also forced sterilization on women so that they can get certain jobs that could be dangerous to an unborn fetus. These policies will be discussed further in the next section of this entry.

Birth Control and Business

There are many ways in which issues of birth control and business intersect. Below are brief synopses of four cases where business operations and birth control issues have conflicted.

The Dalkon Shield

The Dalkon Shield is a form of IUD that was introduced in the United States with a high level of serious side effects, including uterine infection and death. When the Dalkon Shield was taken off the market in 1975, 14 deaths and 223 spontaneous abortions had been related to its use. The company that made the Dalkon Shield, A. H. Robins, then sold large quantities of the product to the U.S. Agency for International Development's Office of Population. The Dalkon Shield was distributed to women around the world despite the known health risks. It is unknown how many women were given this product or how many deaths it caused, but in 1985 A. H. Robins declared bankruptcy due to numerous lawsuits.

"Fetal Protection" and Johnson Controls

"Fetal protection" policies have forced sterilization on women so that they can get certain jobs that could pose mutagenic risks to an unborn fetus. These jobs generally have higher pay than others in the same industry and expose the worker to toxins. In 1991, the U.S. Supreme Court ruled that Johnson Controls' fetal protection policies were a form of sexual discrimination. While this ruling can be viewed as a victory for women's rights, the language of the decision causes a mother who exposes her fetus to toxins in the workplace to be criminally liable for any harm to the fetus.

Plan B and Wal-Mart

In March 2006, Wal-Mart reversed its stand on Plan B, deciding to stock the product. Wal-Mart had refused to carry the product, citing not ethical reasons but rather low demand for the product. Women in Illinois and Massachusetts sued the company, claiming that Wal-Mart outlets were the only pharmaceutical option available in some communities. Plaintiffs claimed that as a part of the national health care system, Wal-Mart pharmacies should carry Plan B. After losing both suits, Wal-Mart changed its policy and began stocking Plan B. Wal-Mart continues to have a "conscientious objection" policy allowing employees to refuse to distribute items they find ethically objectionable; however, the employee must direct the customer to another employee or store that will service the request.

Insurance Coverage of Contraceptives

In recent years, most insurance companies and employers have decided to cover oral contraceptives, largely due to intense lobbying by female employees and women's groups. This coverage excludes women who cannot take the pill due to health issues or who prefer another method of contraception. Recent innovations offer women alternatives that have fewer side effects and are easier to use (the patch, vaginal rings, etc.). The newer methods, however, tend to be far more expensive for insurance companies that have negotiated discount rates for birth control pills with the many manufacturers vying for their business. For example, the cost of the patch to insurance companies can be 10 times the cost of the pill, because the patch is made by one company. Insurance companies and employers argue that because these alternatives are less popular, limiting access is a way to reduce health care costs without affecting many people. It is probable that costs will decrease and insurance policies will cover these methods as they become more popular and/or are produced by multiple companies. For now, this issue is unresolved.

Black Market

The black market refers to any economic activity that is illegal, unrecorded, unreported, or in violation of the law. Other terms used to describe this illegal activity include *underground*, *shadow*, *subterranean*, *informal*, *parallel*, or *irregular economy*. Another related term is the *gray market*, but this describes goods that are sold and not manufactured under patent, trademark, copyright, or exclusive distribution laws. The term *black market* derives its name from economic activities conducted in the dark or shadow, since it is hidden from the law.

Black markets exist so that individuals may evade taxes or restrictive government controls, sell illegal goods or services, or obtain goods through unsanctioned channels. Examples of black market activities include trading stolen goods such as illegal drugs, offering illegal services such as prostitution, paying someone cash who will not pay taxes, manufacturing a banned substance such as anabolic steroids, or bartering goods or services to circumvent being taxed for them. Bartering occurs when you exchange goods or services without entering into any monetary transactions. For example, instead of paying a dentist for the cleaning of your teeth, you would change the oil in the dentist's automobile. Without monetary exchange, such transactions cannot be tracked for tax purposes.

Economic Implications

There are several economic factors that may prompt the emergence of a black market economy, including an increase in taxes, high unemployment, illegal immigration, lack of strong unions, or a government embargo. An embargo is imposed when a country outlaws sale of a product within its national borders, such as the U.S. embargo of Cuban cigars. The black market can affect the economy in a variety of ways. First, if a product or income is untaxed, the brunt of the taxes will fall on those who legally report their transactions. Second, the cost of the goods offered on the black market is usually higher since the demand is high or the supply may be scarce. For example, the price for banned substances is substantially higher for goods such as fireworks, which may not be legally sold in several U.S. states. The same is true for exotic animals, which may only be purchased by professionals in limited venues, such as zoos. However, the prices may be lower if they have circumvented normal, more costly channels. If stolen goods are offered for sale on the black market, then law-abiding business owners lose out to the dishonest ones. Third, black market transactions affect the measurement of economic growth. Estimates of the extent of black market economic activity range from 9% of the gross domestic product (GDP) in the United States to 76% in Nigeria. GDP refers to the total market value of the final goods and services sold within a given country in 1 year.

One method to estimate the extent of the black market is to compare the amount of personal income declared on tax returns with the amount of money that is actually spent. Two other methods include measuring the changes in currency supply and gauging the velocity of money (how many times money circulates in a given period).

History

The origins of the black market economy extend back to the first time governments intervened in the commercial transactions of commodities. However, the black marketing of slavery in the United States began sometime after January 1, 1808, after importing slaves was officially outlawed. This practice continued until the end of the Civil War in 1865, which was the same year in which the Thirteenth Amendment to the Constitution abolished slavery in the United States. Alcohol products were black market goods illegally sold in the United States during the 1920–1933 prohibition era. During World War II, when the U.S. government imposed rationing or price controls on meat, sugar, automobile parts, penicillin, and gasoline, a black market emerged. After the Cold War, the United States and the Soviet Union dismantled 40,000 nuclear warheads. Fears have been expressed that at least some of these nuclear materials may have been offered on the black market for weapons of war and terrorism.

Illegal immigration also has been connected to black market activity. In 2006, as many as 12 million illegal immigrants, according to some experts, may now reside in the United States. Since black market employment goes unreported, this can cost the U.S. government over $30 billion in uncollected income taxes. In addition, these immigrants are underpaid, lack any medical benefits, and often work in unsafe or unhealthy conditions. Such black market activity creates a higher unemployment rate for those who might otherwise have been employed and paid legal minimum wages. Unethical subcontractors gain a competitive advantage if they can pay below minimum wages.

Ethical and Practical Concerns

Although economic activities conducted in the black market are illegal, a 2003 survey by the Internal Revenue Service reveals that 17% of respondents believe that cheating on taxes is acceptable. However, many individuals will not purchase commodities from the black market because they believe it is unethical, because they prefer purchasing from the legal suppliers given that there could be a problem honoring the warranty, or because they could face a punishment or a fine.

There are some possible approaches to discouraging a black market economy in the United States, but these raise other practical or ethical concerns. Illegal products could be legalized, but this would make banned substances such as cocaine or heroin readily available. Increasing Customs Service enforcement of restrictions on importation of banned substances could be another solution. Another possibility is President George W. Bush's proposed 2006 "guest worker program," which requires illegal immigrant workers to register for a temporary work visa and then return to their home country within 6 years of this registration. Many Republicans oppose this proposal, believing that the government is too lax and that this proposal would encourage even more illegal immigrants to enter the United States. Consequently, black market activities appear to be extremely pervasive and cannot be easily obliterated from the economy.

Blue Sky Laws

Blue sky laws are state laws regulating securities. They gained their unusual name from concerns that fraudulent securities offerings were so brazen and commonplace that issuers would sell building lots in the blue sky. In general, these laws predate the Securities Act of 1933 and the Securities Exchange Act of 1934 and were not preempted by those federal acts. In the 20-year period between 1911 and 1931, 47 of the existing 48 states adopted such laws.

Blue sky laws typically require the registration of any securities sold in the state, regulate broker-dealer and investment advisers, impose liability for false and misleading information relating to securities, and establish administrative agencies to enforce the laws. The registration requirements often include a "merit review" that gives the administrative agency the power to prohibit the sale of securities that it considers not to be "fair" or "equitable." This is in contrast to the federal securities law approach that relies on the market to determine a fair price after ensuring full disclosure of relevant information. It should also be noted that blue sky laws do not regulate interstate trading of securities.

Although the majority of states have adopted the Uniform Securities Act (USA), these states have made variations to the USA, which creates significant differences from state to state. In addition, judicial interpretations of the USA can also vary significantly from state to state. Thus, actions that may be considered fraudulent under the USA in one state may not be fraudulent under the USA in a different state.

In an attempt to achieve greater uniformity between the states and thus reduce the burden on issuers and broker-dealers, Congress passed the National Securities Markets Improvement Act (NSMIA) of 1996. The NSMIA classifies certain securities as "covered securities," which are exempt from state registration or merit review requirements. The covered securities include securities listed on a national stock exchange, mutual funds, and other offerings. Certain types of intrastate and small-scale securities offerings continue to be regulated by the states.

In addition, Congress passed the Securities Litigation Uniform Standards Act (SLUSA) of 1998 to place limits on state court jurisdiction over securities fraud lawsuits. Under the act, federal courts have exclusive jurisdiction over class actions alleging fraud. This subjects the plaintiffs to the reforms of the Private Securities Litigation Reform Act of 1995, which has significantly more difficult procedural hurdles than typical blue sky laws. It is unclear, however, to what extent the SLUSA requires nonfraud class action claims, such as a breach of a fiduciary duty claims, to be heard only in federal courts.

The SLUSA does not prohibit state and local governments (and their pension funds) from bringing securities fraud claims. The importance of this exception became clear in 2002, when the New York attorney general used the state's blue sky law (known as the Martin Act) to reach a settlement with Merrill Lynch that required Merrill Lynch to make significant changes to its operating and disclosure practices. This settlement became a leading example of regulation by prosecution. Subsequently, other states have amended their blue sky laws to increase their attorney general's prosecutorial powers, and Congress has considered new legislation in an ongoing attempt to find the appropriate balance between federal and state powers in securities regulation.

Bluffing and Deception in Negotiations

Deception can be defined as intentionally causing someone to have false beliefs. Bluffing in negotiations involves attempting to deceive others about one's intentions or negotiating position. In the United States, it is common, often a matter of course, for people to misstate their intentions during business negotiations. For example, suppose that Bob is selling a house and tells a prospective buyer that $350,000 is absolutely the lowest price that he will accept, when he knows that he would be willing to accept as little as $320,000 for the house (in this case, $320,000 is his "reservation price"). Such statements are lies according to standard dictionary definitions of lying—they are intentional false statements intended to deceive others. (See Carson, 1993, for an alternative definition of lying, according to which it is not so clear that such statements are lies.)

In a business negotiation, there is typically a range of possible agreements, any one of which each party would be willing to accept rather than reach no agreement at all. For instance, Bob might be willing to sell his house for as little as $320,000. His range of acceptable agreements extends upward without limit—he would be willing to accept any price at or above $320,000 rather than fail to make the sale. Suppose that a prospective buyer is willing to spend as much as $335,000 for the house. (He or she prefers to buy the house for $335,000 rather than not buy it at all.) The buyer's range of acceptable agreements extends downward without limit—he or she would be willing to purchase the house for any price at or below $335,000. In this case, the two reservation prices overlap, and an agreement is possible. No agreement is possible in a negotiation unless there exists a "bargaining range"—that is, unless the buyer's reservation price is greater than or equal to the seller's reservation price.

If there exists a bargaining range between the positions of negotiators, then the actual outcome depends on the negotiations. Consider again our example of the negotiation over the sale of the house. Whether the house sells for $320,000, $335,000, or somewhere between $320,000 and $335,000, or whether it sells at all will be determined by the negotiations. In this case, it would be very advantageous for either party to know the other person's reservation price and disadvantageous for either party to reveal his or her reservation price to the other. It can sometimes be to one's advantage to mislead others about one's own reservation price. In the present case, it would be to the seller's advantage to cause the buyer to believe that $335,000 is the lowest price that the seller will accept.

Attempting to mislead the other person about one's reservation price can backfire and prevent a negotiation from reaching an agreement that both parties would have preferred to no agreement at all. For example, suppose that the seller tells the buyer that he or she won't accept anything less than $375,000 for the house. If the buyer believes the seller (or believes that the seller's statement is close to the truth), the buyer will break off the negotiations, since, by hypothesis, the buyer is not willing to pay more than $335,000 for the house. Since negotiators typically don't know the other party's reservation price, it is risky for them to engage in such deception.

It is possible to bargain aggressively and engage in the give and take of negotiations without making any false claims about one's reservation price. One can withhold information about one's reservation price and engage in the process of making offers and counteroffers without making any false claims about one's reservation price and, thus, without doing anything that might constitute lying or deception.

Is It Morally Permissible to Misstate One's Negotiating Position?

Clearly, it is permissible for a person to protect his or her interests by withholding information about the reservation price. One is not obligated to reveal this information to others or answer questions that ask one to reveal it. No one who writes on the topic claims otherwise. The literature on deception and bluffing in negotiations focuses on the question of whether it is permissible for one to attempt to gain an advantage in a negotiation by making deliberate false statements about one's reservation price.

A Defense of Bluffing

Carr argues that misstating one's reservation price is morally permissible. Business, he argues, is a game like poker—a game in which special norms apply. The moral norms appropriate to the game of business or the game of poker are different from those appropriate to ordinary contexts. Carr claims that bluffing (misstating one's reservation price) is morally permissible because it is legal and a common practice that is regarded as permissible by conventional morality. Carr's argument presupposes the following principle: Any practice engaged in by businesspeople in a given society is morally permissible provided that it is consistent with both the society's conventional ethical principles governing the practice and the laws of that society. This principle is most implausible. Conventional morality and the law are not infallible moral guidelines. In the past, many immoral practices, most notably slavery, were condoned by the conventional morality and legal codes of many societies.

There is a second, more plausible, argument that *may be* implicit in Carr. This argument can be stated as follows: People who play poker know that the rules of the game permit deception. Thus, they consent to being deceived when they play poker. If they object to being deceived, then they shouldn't play poker. Similarly, people who negotiate consent to have others attempt to deceive them by means of false statements; therefore, it is morally permissible for negotiators to attempt to deceive others by means of false statements. Often, consent makes it morally right for people to do things to others that would otherwise be wrong for them to do—for example, enter their house, drive their car, operate on their knee, or caress their body. However, this argument fails for several reasons. First the (conventional) rules for negotiations are not as clear and widely known as the rules for poker; it is not clear what, if anything, one knows to expect when entering into a negotiation with a stranger. Second, negotiations are not purely optional in the way that playing poker is. Those who refuse to negotiate economic transactions pay a high cost. A person who wants to purchase a home or car has very limited options if he or she refuses to negotiate with others (or refuses to negotiate with those who engage in deception).

No one else who writes on this topic gives the same blanket endorsement of deception in negotiations. Recent literature on this topic focuses on cases in which one has reason to suspect that the other party is attempting to deceive one about his or her reservation price.

Two More Qualified Defenses of Bluffing

Dees and Cramton argue that the law and conventional business practice make a sharp distinction between deception about one's reservation price and deception about other matters. For example, in a personal injury lawsuit, statements about the amount of money one is willing to accept are expected to be deceptive, and the law permits this; however, statements about the extent of physical injuries suffered are not expected to be deceptive and are not permitted by law. Typically, negotiators have no grounds to trust the other party's claims about his or her reservation price. Negotiators often risk suffering significant disadvantages by refraining from making false claims about their reservation price. In such cases, Dees and Cramton contend, negotiators have little moral obligation to refrain from lying/deception about their reservation price. However, they claim that it is wrong for negotiators to engage in lying or deception about other matters.

Like Dees and Cramton, Strudler makes a sharp distinction between deception about one's reservation price and deception about other matters. He argues that given the uncertainty and lack of trust endemic to negotiations, lying and deception about one's reservation price can be useful devices to signal one's intentions and reach mutually beneficial agreements. Given their usefulness in serving this function and given the general understanding that such statements are not to be trusted, such lying and deception usually do not cause other people significant harm. Thus, according to Strudler, there is no moral presumption against such lying and deception, and those who engage in this sort of lying and deception shouldn't feel moral regret or embarrassment.

The View That Bluffing Can Be Justified (Only) on Grounds of "Self-Defense"

Carson argues that it is usually permissible to misstate one's reservation price when one has good reason to think that one's negotiating partner is doing the same, and it is usually impermissible to misstate one's reservation price if one does not have good reason to think that the other party is misstating his or her price. He contends that there is a moral presumption against attempting to deceive others about one's reservation price (whether or not it counts as lying). However, when others attempt to deceive us and thereby gain an advantage over us, we are often justified in deceiving them in "self-defense." Similarly, it is at first view very wrong to use violence or deadly force against another person, but when doing so is necessary to protect ourselves from the violence or deadly force of others, then it is morally permissible. Carson defends what he calls a generalized principle of self-defense. Roughly, this principle says that even if a certain action is ordinarily morally wrong, it can be morally justified if it is necessary to defend oneself against others who are doing or trying to do the same action to oneself. (Alternatively, and a bit more precisely, the ordinary moral presumption against doing a certain harmful act to someone else does not hold if doing that action to another person is necessary to prevent that person from harming one by doing the same action.) Carson claims that rational people can follow this principle and maintains the view that people can defend themselves and refuse to be prey for others.

According to Carson, misstating one's reservation price is permissible in cases in which one has reason to think that others are doing the same and thereby gaining an advantage over one. He also holds that there is a strong presumption for thinking that this is wrong otherwise. Dees and Cramton hold a somewhat more permissive view. They don't require that one have positive reason to think that the other party is misleading one and thereby harming one. They think that misstating (or lying about) one's reservation price is justified provided that one lacks a positive reason to trust the other party and there is a *risk* that deception by the other party will significantly disadvantage one.

Dees and Cramton, Strudler, and Carson all think it is wrong to deceive others about other matters in negotiations. Among other things, they claim that it would be wrong to deceive someone about the properties of a house whose price is being negotiated and wrong to deceive someone about the extent of injuries suffered in negotiations over damages for a personal injury.

Boesky, Ivan (1937–)

Ivan Frederick Boesky, born on March 6, 1937, in Detroit, Michigan, is most well known for his involvement in a Wall Street insider trading scandal in the mid-1980s. The son of a Russian immigrant who became a top Detroit restaurateur and graduate of the Detroit School of Law, Boesky landed on Wall Street in 1966 as a stock analyst. With the assistance of his father-in-law, the real estate magnate Ben Silberstein, Boesky started his own arbitrage firm in 1975.

Throughout the early 1980s, Boesky, working as an arbitrage specialist and known affectionately as "Ivan the Terrible," amassed a fortune estimated at approximately $200 million by betting on corporate takeovers and mergers. Boesky, along with other corporate financiers such as T. Boone Pickens and Sir James Goldsmith, took advantage of the gap between public and private market values to raid corporate targets, a legal enterprise as long as the trading in the targets securities was based on public knowledge of the imminent acquisitions. During this time, the U.S. Securities and Exchange Commission (SEC) investigated Boesky for engaging in certain investments based on tips received from corporate insiders regarding potential takeover targets. Boesky acquired securities in various companies based on insider tips, often with significant purchases made only days before a corporation publicly announced a takeover, resulting in substantial returns for Boesky when the news of the pending takeover was released.

While use of such insider information to trade in public securities was illegal, the SEC until this point had rarely engaged in enforcement proceedings for insider trading. In November 1986, Boesky, as a result of an SEC investigation into illegal insider trading on Wall Street, pled guilty to one felony count of manipulating securities and agreed to cooperate with the SEC in its ongoing investigation. Boesky, in return for leniency, allowed the SEC to secretly tape his conversations with various corporate insiders and takeover specialists, including junk bond trader Michael Milken. Boesky's cooperation led to an insider trading probe of Milken and his firm Drexel Burnham Lambert, resulting in both Drexel and Milken later entering guilty pleas to securities law violations.

As a result of his plea agreement and cooperation with the SEC, Boesky received a sentence of 3½ years in prison, a $100 million fine, and a permanent ban from working in the securities industry for the remainder of his life. Boesky, who served his time at the Lompoc Federal Prison Camp in California, was released from prison after serving 2 years.

The actions by Boesky and others (including Milken) are viewed as emblematic of the greed and excesses critics argue marked the 1980s on Wall Street. Prior to his guilty plea, Boesky gave an infamous speech at the University of California in 1986 extolling the positive aspects of greed, stating that he thought greed was healthy. Boesky's statements inspired the key speech by the fictional character Gordon Gekko (played by Michael Douglas) in the 1987 movie *Wall Street* claiming that greed was good.

Bottom of the Pyramid

The term *bottom of the pyramid* (BoP) refers to the lower two thirds of the economic human pyramid, those 4 billion people living in abject poverty. More broadly, it refers to a market-based model of economic development that promises to simultaneously alleviate widespread poverty while providing growth and profits for multinational corporations (MNCs). The approach is also known as base of the pyramid (avoiding the negative connotations of the earlier term) and as sustainable livelihood business. It is increasingly adopted by firms in different industries (e.g., household goods, energy).

Alleviating global poverty was identified as a top priority in the United Nations Millennium Goals. Unlike traditional aid-based models of economic development, BoP approaches recast poverty as an economic opportunity for MNCs. The basic argument has three premises: (1) the world's poor constitute massive growth opportunities and profit potential for multinational enterprises, (2) such companies are uniquely qualified to unlock the economic potential of these difficult to access markets, and (3) bringing the poor into the global economy will simultaneously generate fortunes for firms while solving the problem of global poverty.

Critics of BoP approaches note two crucial challenges, governance and sustainability; neither challenge is currently well addressed. Effective governance mechanisms and bodies are needed to regulate, monitor, and oversee the development of markets and effective competition, and like MNCs, they must transcend national sovereignties. Raising the consumption levels of the world's 4 billion poor dramatically requires radically new business models and technologies to avoid disastrous impacts on the earth's ecosystems; governance mechanisms are needed to enforce the adoption of radical resource efficiency measures and clean technologies across a multinational playing field.

Four billion poor people constitute a staggering market opportunity, but without buying power (income) and transaction capacity (credit, infrastructure, distribution systems, and other institutional frameworks), the poor are locked into poverty. BoP approaches contend that MNCs in particular have the incentive (growth opportunities), the financial resources, and the capabilities (low-cost mass production, marketing expertise, international experience) to produce and distribute appropriate, affordable products at high volumes and razor-thin profit margins. Working with political actors, small businesses and entrepreneurs, and aid organizations to overcome self-reinforcing poverty traps, MNCs supply goods and services, provide credit and social engineering, help reduce corruption, and facilitate growing empowerment. Engaging in BoP demands significant innovation, new business models, and organizational learning and offers opportunities for sustainable entrepreneurship. Once initiated, economic activity becomes the engine for continuing wealth generation and growth.

Bringing the poor into a global economy as active participants in consumption and production has significant implications for the notion of sustainable development, which depends equally on healthy social, ecological, and economic systems. To the degree that BoP approaches can empower the poor and alleviate poverty, they strengthen economic and social systems. Raising consumption levels of 4 billion people currently living at or below subsistence levels, however, massively increases the demand for energy and resources while producing pollution and waste. The strain on the natural environment will be devastating unless increases in consumption are achieved through radical improvements in resource-efficient, clean technologies, as well as effective regulatory schemes.

Bounded Rationality

Bounded rationality argues that a decision agent is as rational as its limited resources and other conditions will permit. This theory recognizes that, contrary to neoclassical decision theory, decision makers are not purely rational, optimizing individualistic outcomes. Rather, bounded rationality suggests inherent limits on rational thought and decision making.

Neoclassical economic theory unrealistically suggests how rational consumers *should* behave. However, bounded rationality describes what imperfect human beings *actually* do, allowing better explanation or prediction of their decisions.

Bounded rationality is a central theme in *behavioral economics*, which studies how the imperfections of actual decision making influence those decisions. Thus, behavioral economics departs from one or more neoclassical assumptions regarding rational behavior. By considering nonmonetary costs, the limitations of human perception, and altruistic motivations, bounded rationality theory demonstrates that seemingly irrational behavior often can be fully justified. Nonetheless, the fact that buyers are less than perfectly sovereign raises controversial social and ethical issues for marketers.

Rational Decision Making and Economic Rationality

Many social sciences behavioral models assume human "rationality." Rational deliberations are described by *rational choice theory,* used by practitioners in economics, management, philosophy, psychology, and other behavioral science fields. The theory explains deliberations among alternative courses of action, assuming motivation by the pursuit of individual usefulness or happiness—that is, *utility.*

Rationality suggests that decision makers select *optimal* options—the best possible or most preferred alternatives for each agent, given their resource constraints and knowledge of their environment. Decision makers maximize personal utility by carefully quantifying, weighing, and comparing all relevant information.

Rational decision making has been studied extensively in *neoclassical economic theory* under the theories of (1) the consumer and (2) the producer. Decision agents—households and firms—are conceptualized as rational actors maximizing *subjective (expected) utility* via the "self-interest standard." Given their knowledge of utilities, alternatives, and outcomes, they calculate the alternative yielding the greatest subjective utility for the costs incurred.

The *neoclassical (microeconomic) theory of the firm* studies individual business choices. Business organizations face the *profit maximization problem*, deciding which price and output alternatives maximize earnings.

The *neoclassical theory of consumption* (*consumer decision making*) analyzes individual consumer choices regarding quantities of various products (goods and services) to be purchased at particular prices. Consumers derive needs and wants satisfaction (*utility*) from the consumption of products. They face the *utility maximization problem:* how to maximize satisfaction by spending their scarce money. Buyers possess *omniscient rationality*—they make highly informed optimal decisions based on self-interested economic calculations, maximizing their expected utility per dollar spent.

This theory proposes a *utility function* providing a mathematical representation of an individual's preferences over alternative bundles (market baskets) of commodities purchased during some discrete time period. Personal preferences are defined to be rational and can be represented by a utility function if they are (1) *complete* (any two bundles can be compared, and all combinations of goods can be ranked), (2) *transitive* (logically consistent), (3) *reflexive* (more utility is preferred to less), and (4) *stable* (unchanging over a particular time period).

Two applications emerge. First, observers can normatively *describe* optimal economic behavior by explaining what the best decision *should* be in a given situation. Second, they can *explain* and *predict* what actual economic behavior *will* be.

Bounded Rationality and Satisficing

Neoclassical economic theory is based on several key but highly questionable assumptions from an empirical, behavioral perspective. Fundamentally, it assumes that people possess perfect and costless information. Specifically, the theory presumes the following:

- Individuals have precise information (or else a reliable probability distribution) regarding the outcomes of a particular decision.
- Persons are fully aware of all possible alternatives and their prices.
- Consumers are cognizant of the personal utility yielded by each item, fully understanding their needs and wants.
- People have the time and ability to compare all alternatives.

That such assumptions are usually unrealistic is embraced by the concept of *bounded rationality.* The computer scientist and psychologist Herbert A. Simon (1916–2001; Nobel Prize for Economic Sciences, 1978) of Carnegie Mellon University formulated bounded rationality theory during the 1950s. Simon pointed out that most people are only partly rational and are otherwise irrational. He noticed that in a complex and uncertain world, humans make decisions under the constraints of limited resources, knowledge, and time. Yet economics' rational decision-making models largely ignore information and time constraints. Consequently, Simon proposed "bounded rationality," suggesting that people are usually unable to calculate optimal strategies.

Another problem is that neoclassical economic theory is *prescriptive* (*normative, evaluative*), explaining how rational consumers *should* behave, assuming that they are fully informed, accurate, and rational. Hence, economics often seems moralistic, judgmental, and unrealistic.

The theory is based strictly on *deductive (inferential) reasoning*—deriving logical conclusions regarding optimal behavior. Conversely, bounded rationality is a *positive* (*descriptive*) approach—founded on *inductive (empirical) investigation* of actual behavior (the behavioral perspective), allowing decisions to be better explained or predicted.

In Simon's view, people's decisions are *unboundedly rational*—always the best, given their available evidence. Individuals are partly rational in that they try to logically understand things and make sensible choices. However, they lack the capacity and time to understand a large and complex world. Hence, bounded rationality models are more psychologically plausible than neoclassical economic theory without giving up completely on the idea of reasoned decision making.

Simon indicated that perfect (deductive) rationality breaks down for two reasons. First, there are *cognitive limitations*—restrictions of knowledge and cognitive capacity. People are constrained by their *schemas*—mental structures used to organize and simplify information. Furthermore, people cannot rely on others to behave perfectly rationally, and so they must guess their behavior.

A second cause of bounded rationality is *time limitations.* Computational difficulties make it difficult to make optimal decisions within a reasonable time.

Consequently, consumers formulate and resolve problems in satisfactory rather than completely optimal ways. In Simon's parlance, *satisficing* is behavior attempting to achieve at least some minimum level (rather than a maximum possible value) of an outcome: profitability for the firm and utility for consumers. Hence, people are only "rational enough," that is, they are *boundedly rational*—rational within certain limits.

Rational Ignorance Theory: Count the Costs

By extending the concept of "cost" to include these two nonmonetary factors—*cognitive effort* and *time*—almost every purchase maximizes the ratio of satisfaction to cost to some degree. As an example of effort, consider that classical economists regard *brand loyalty*—purchasing the same brand regularly due to a strong preference without considering competitive brands—as foolish due to the possibility of overlooking new and better alternatives. However, brand loyalty is rational if the shopper feels that the expected benefits of seeking out a better brand are not worth the effort and time.

As an example of time, consider patronizing convenience stores even though product prices are relatively high. Such patronage seems perfectly rational when the *opportunity cost*—the next best use of the consumer's time—is accounted for.

According to *rational ignorance theory*, ignorance about an issue is "rational" when the cost of educating oneself to make an informed decision outweighs any potential expected benefit from that decision. Even where information is available, its acquisition can be costly in terms of effort, time, and money. As postulated by *information economists* such as George Stigler, the rational consumer searches for marketplace information until the expected marginal costs of the search exceed the anticipated additional gains.

To save time, effort, and money, "cognitive misers" use *decision heuristics*—quick, easy shortcut mental decision rules derived from experience—to exploit reasonably consistent environmental patterns. Examples: "Purchase the brand your friend recommends," "Choose the brand rated highest by *Consumer Reports*," and "Buy the brand your spouse likes."

Often such heuristics entail a single buying criterion to simplify decision making, speed decisions, and overcome information overload. Examples: "Buy the brand with the lowest sodium content," "Pick up the lowest-cost brand," or "Purchase the best-known brand."

Search costs explain why, in the absence of easily acquired and understood gauges of product quality, consumers sometimes rely on a decision heuristic called *surrogate indicators.* These are readily discernable product attributes that consumers use, often erroneously, to make probabilistic inferences on product characteristics that are less easily comprehended, such as a product's composition, quality, or performance. Surrogate indicators serve as a product *signal*—a quick, easy way to deduce product quality. For example, reasonable buyers might assume that high price indicates high quality or that heavily advertised brands are better.

Such *market beliefs*—assumptions about how product signals connote quality or performance—are not always correct, thereby leading to *nonoptimal* choices. Market beliefs are most likely to be used where buyers have insufficient product category information, are unable to intelligently select, are rushed, and lack motivation to make a careful decision.

As the economist Gary Bauer has observed, heuristics-using consumers are nonetheless rational. Heuristics are rational since they help buyers reduce *perceived risk*—their beliefs about the uncertainty of possible negative product purchase and use consequences.

The Limitations of Human Perception

Perception is the process whereby people are exposed to, attend to, and comprehend information. Two characteristics of perception hinder acquisition of perfect information: *selectivity* and *subjectivity.*

The boundedly rational buyer's information intake is *selective* in two instances: (1) when it is not worth spending sufficient resources to obtain perfect information and (2) due to cognitive human limitations—people perceive only a tiny fraction of the surrounding sensory stimuli.

The stimuli people most likely notice are determined by (1) their *perceptual (mental) set*—what they expect to perceive based on prior experiences—and (2) their *perceptual predispositions*—desires, interests, values, beliefs, and attitudes. Individuals exhibit *perceptual vigilance*, being more likely to notice stimuli relevant to their needs. Humans also selectively perceive stimuli consistent with their predispositions to achieve *cognitive consistency*—uniform predispositions. Consequently, consumers seek advertisements affirming their purchase decisions, thereby alleviating *cognitive dissonance* (postpurchase doubt). In addition, consumers tune out stimuli that they find psychologically threatening or contradicting their predispositions (*perceptual defense*).

A second perceptual limitation is *subjective* perception—information acquisition is biased and distorted due to individual interpretations based on personal past experiences and predispositions. Hence, people generally perceive what they expect or desire. Consequently, marketers enhance brand perceptions via perceptual cues such as color (cigarette ads featuring lush green imply healthiness and freshness), euphemisms ("bargain priced" vs. "cheap"), and shapes (oval is feminine).

Subsumed under subjectivity is an issue ignored by neoclassical economists—*emotional satisfaction.* Traditional economists believed that it is irrational to purchase based on *emotions*—uncontrollable feelings (e.g., fear, anger, excitement). However, fulfilling emotional motives yields satisfaction, so rationality should be broadly interpreted to include them.

Simon explained that a full account of human rationality must include emotions' influence on choice behavior. Contrary to Simon's early writings, subjective, emotional criteria are not irrational because irrationality implies failure to maximize utility. However, consumers nearly always attempt to select alternatives that, in their estimation, maximize their satisfaction, including emotional or hedonic fulfillment. For instance, a product might be selected based on its promise to enhance the user's sex appeal, thereby bolstering the consumer's self-confidence. Hence, rational and emotional motives can both underlie a given purchase. In fact, the opposite of rational is not emotional but *nonrational* or *irrational*, while the opposite of emotional is not rational but rather *nonemotional.*

One type of emotional purchase is *impulse purchasing*—buying without deliberate, careful planning. People display *time inconsistency*—when deciding about the future they are reasonably rational. However, when facing a decision on whether to gain consumption pleasure now or defer gratification to maximize their long-term best interests, they can be as impulsive as wild animals (e.g., grabbing a package of junk food in the supermarket checkout aisle). Impulse purchasing appears economically unwise and irrational. However, such consumers also might have short time horizons, deriving much more utility from current pleasure than from the possible long-term gain realized by abstinence.

The Paradox of Altruism

Simon and others have questioned the classical economics assumption of the "self-interest standard." Consider *altruism*—caring for one's fellow humans, leading to maximizing others' interests while sacrificing one's own self-interest. Altruists practice self-sacrifice for general causes such as the public good or the environment.

Economists have traditionally viewed helping behavior as a paradox since it fails to enhance one's own well-being. For instance, *empathy*—feeling compassion for others—leads to selfless behavior (e.g., parents sacrificing time, money, and energy for their children). Other examples include philanthropy—acts of charity—and voluntary deeds of duty, such as serving in the armed forces during wartime or purchasing environmentally friendly but expensive products.

However, usually underlying all these forms of altruism is self-interest since they usually give a "warm glow" and a sense of moral satisfaction. Indeed, traditionally, moral philosophers have accentuated "constrained self-interest" over pure self-interest.

The Limitations of Consumer Sovereignty

Simon also questioned the neoclassical assumption of *consumer sovereignty*—buyers being in reasoned control of their decision making and not malleable by outside forces. In perfectly competitive markets, where both buyers and sellers have freedom of choice and good (if imperfect) information, consumers are sovereign—uncontrollable by external forces.

However, modern psychology, communication theory, and marketing practice recognize that marketing efforts, peers, and society can influence buyers. Moreover, the assumption of consumer sovereignty can be very flawed. These are so-called *free-market failures*—marketplace exceptions to the classical economic assumption that informed consumers make optimal decisions.

Four such marketplace circumstances relate to bounded rationality and have clear ethical/social implications:

1. *Consumers lack "perfect" (or even "good") information.* For instance, for hi-tech and health care products, technology, complexity, or the pace of change has outpaced the learning ability of most buyers. This *information asymmetry* between buyers and sellers means that purchasers are at a disadvantage relative to knowledgeable sellers who can take advantage of their ignorance.

2. *Deception and other unethical behaviors occur.* Consumers cannot make intelligent decisions if they are misled into believing something false. Deception arises from marketing communications creating a divergence between perception and reality, resulting in marketer manipulation of consumers.

3. *Vulnerable groups exist.* Certain categories of consumers fail the "reasonable man" test—they are more easily misled. These groups include children, people with mental disabilities, the emotionally disturbed, the recently bereaved, some recent immigrants, those of low education levels, addicts, and some elderly people.

4. *Consumers have latent needs. Latent* (subconscious) wants are those that buyers are unaware of—they lack conscious knowledge of what they need. Latent needs characterize "unsought goods"—products satisfying functional needs but yielding delayed gratification (e.g., life insurance, cemetery plots, estate planning). Consumers therefore ignore information on these products. Marketers who are accused of trying to "manufacture demand" are actually often simply trying to tap into these subconscious needs.

Often, private market solutions to these problems will not work, and instead, government intervention is recommended (e.g., providing consumer information, punishing deception, and protecting vulnerable groups).

Social and Ethical Issues

The theory of firm and consumer rationality is grounded in neoclassical economics and capitalism, stemming from the work of the 18th-century moral philosopher Adam Smith, who emphasized that a free-market economy should occur within a legal and moral framework. Smith argued that the capitalist system is based on managers' honesty and integrity, without which the "invisible hand" would not work.

However, modern economics during the 20th century became an "amoral" science, presupposing "value-free" market exchanges. It focused on how things *actually* work *materially* rather than on how they *should* work *morally*. However, Smith never envisioned a value-free pursuit of wealth ignoring moral judgments or ethical consequences.

Neoclassical economists merely explain market participants' choices, considering it beyond their discipline to morally judge these choices. Economists do suggest that for business activity to benefit society, observance of *minimal moral restraints* is necessary (avoiding theft and fraud, observing contracts, etc.). Beyond this, they say, business managers need concern themselves only with maximizing profits.

However, increasing profits via means such as pollution, bribery, tax evasion, and price-fixing harms society. Consequently, the firm's economic objective can be framed in boundedly rational terms as a *constrained optimization problem*: Maximize profits subject to qualitative ethical/social responsibility constraints (e.g., considering employee, environmental, and consumer welfare).

Archie Carroll outlined four levels of *corporate social responsibility*—the second through fourth might entail sacrificing corporate profits:

1. *Economic responsibilities:* Being profitable for shareholders while providing economic benefits to other corporate stakeholders (e.g., fair-paying jobs for employees and good-quality, fairly priced products for customers)

2. *Legal responsibilities:* Complying with business laws

3. *Ethical responsibilities:* Going beyond the law by avoiding social harm, respecting people's moral rights, and acting justly

4. *Philanthropic responsibilities:* Voluntarily "giving back" time and money to good works enhancing various stakeholders' well-being

Since sellers deal with buyers possessing imperfect information, several controversial social and ethical issues arise. Readers can delve more deeply into these:

- There is the economic argument that producing whatever the buying public wants is good. However, satisfying buyers' desires assumes that their wants are moral and they know what is in the best interests of themselves and society. What about controversial products such as handguns, pornography, and even "unhealthy" fast food and junk food? But disallowing them would rob consumers of choice, further eroding consumer sovereignty.
- Whose moral responsibility is it to educate consumers so that they can make better-informed decisions: the firm, the consumer, the government, or some combination thereof? How can this education be best implemented? Can and should sellers strive to reduce consumers' time, money, and energy costs in gathering this information? Is the fact that people selectively screen information a justifiable excuse for not providing full disclosure?
- Do marketers sometimes create artificial brand loyalty by increasing *switching costs*—psychological, physical, and economic costs that buyers face in switching between technologies or products, such as learning new tax preparation software?
- Is encouraging impulse purchasing through tactics such as enticing in-store displays and samples ethical? After all, these can be very emotional decisions, and consumers often feel temporarily out of control.
- Might the use of surrogate indicators by marketers in signaling quality to uninformed consumers sometimes be misleading? For example, if a product is of comparable quality with its competitors, is it ethical to charge a higher price to create a high-quality image?
- Are "impression management" and "spin control"—selectively and positively reporting information to make one's firm look good—morally justifiable in light of subjective and selective perception?
- Can perceptual cues, such as appetizing artificial colors in food, and euphemistic language, such as "gaming" (for *gambling*), be deceptive?
- Might the use of strong emotional advertising and selling appeals such as fear, guilt, and fantasy confound consumer decision making?
- Where do advertisers and salespeople cross the line between exaggeration ("puffery") and deception?
- What extra precautions, if any, should be taken with vulnerable groups? For instance, are children more susceptible to impulse purchasing, perceptual cues such as attractive packaging, emotional appeals, and puffery?
- Is it legitimate to conduct *motivational research*—marketing research tapping into buyers' latent needs through techniques such as depth interviews and indirect questions, with a view to appealing to those needs?
- Is it preying on consumers' altruistic sensibilities to use appeals such as cause-related marketing (donating money to a charitable cause for each unit of a brand purchased)?
- Can corporate social responsibility activities become a public relations ploy?

Boycotts

A boycott occurs when one or more parties (e.g., consumer advocacy groups, activist organizations, local municipalities) ask that consumers refrain from making certain purchases to achieve desired goals. Boycotts target businesses directly and governments indirectly via boycotts of businesses operating under an offending government's jurisdiction. The boycott of Shell, Coca-Cola, and other companies for their operations in South Africa under apartheid is an example of such a boycott, sometimes called a surrogate boycott. Note that although some boycotts occur in an effort to meet consumer aims, successful boycotts are often used to achieve essentially non-market-based goals of primarily moral import. Boycotts have been used to combat discrimination, improve labor conditions, and raise the bar on corporate policies concerning the environment and animal welfare.

The term *boycott* dates back to a dispute between a British estate manager in Ireland, Charles Cunningham Boycott, and his workers. After years of leaving the workers in deplorable living conditions, Boycott decided to pay his tenant farmers a fraction of their usual wage to bring in the harvest. When they refused, Boycott had his family attempt to bring in the harvest. When his wife pled with the workers, they agreed to return to work but were evicted on rent day. The workers vowed to ostracize Boycott completely, urging all his servants to quit and promising that his name would go down in infamy. Although today's boycotts still engage in economic ostracism, they rarely involve the same degree of social ostracism.

Contemporary boycotts are generally employed alongside other forms of consumer activism such as shareholder activism, socially responsible investment or divestment, and direct lobbying of the offending institution. Since boycotts generally occur in tandem with other strategies for effecting social accountability, it may be difficult to determine the boycott's effectiveness in isolation. That said, it should be noted that boycotts have been important to institutional reform. It should also be noted that the efficacy of contemporary boycotts often depends more on media publicity than on actual loss of sales. Damage to the corporate image is generally perceived as the greater threat.

Boycotts may be implemented in several ways. Commodity boycotts ask that consumers refrain from the purchase of all brands and models of a particular product or service. A boycott of meat would be an example of a commodity boycott. Other boycotts target a single brand name or a firm along with all its brand name subsidiaries. In 1981, the Interfaith Center on Corporate Responsibility launched a boycott against Nestlé for its marketing of formula that led to countless infant deaths in the developing world. This would be an example of a brand name boycott since all Nestlé brand products were targeted.

Perhaps the most well-known boycotts are the antisegregation bus boycotts in the American South during the 1950s. At the time, buses were segregated by race. If the whites-only section of the bus were to fill up, blacks were expected to give up their seats. In March 1953, black community leaders in Baton

Rouge successfully lobbied for passage of an ordinance allowing blacks to be seated on a first-come, first-serve basis. Drivers, unwilling to enforce the measure, went on a 4-day strike. A suit was filed; the Louisiana attorney general sided with the drivers since the Baton Rouge ordinance violated state segregation laws. In June 1953, a majority of the black population, who had originally accounted for about two thirds of all riders, boycotted local buses. Eventually, a compromise was struck allowing black riders to be seated on a first-come, first-serve basis so long as the rear seat of the bus was reserved exclusively for blacks and the two side front seats for whites.

This boycott was followed by the renowned Montgomery bus boycott. On December 1, 1955, Rosa Parks refused to give up her seat to a white man, in violation of segregation law. Parks had long been involved in local politics, serving as a secretary for the local National Association for the Advancement of Colored People between 1943 and 1955. This was not the first time that Parks had violated segregation laws, but this time local leaders decided to launch a boycott in protest. Local leaders elected to have Martin Luther King Jr. take over leadership of the 382-day boycott. As in the Baton Rouge boycott, the organizers were successful because they were able to arrange alternate transportation through the formation of the Montgomery Improvement Association. More than 90% of black riders stayed off the buses until the case made its way into the federal courts for an antisegregation ruling.

African Americans are not the only group to have used boycotts in the fight against racism. American Jewish communities organized a boycott of German goods during World War II. By April 1939, a Gallup poll showed that 64% of Americans were willing to join the movement to boycott German-made goods. Later, in March 1992, American Indians were outraged when the Hornell Brewing Company introduced Crazy Horse Liquor. Many felt that the liquor's name was insensitive and demeaning given the alcohol abuse problems facing American Indian communities. Moreover, the revered Lakota leader was known to have vehemently opposed the consumption of alcohol by American Indians. Two other organizations joined the American Indian Movement in calling for a boycott.

Boycotts have been a key strategy for defenders of human rights in other arenas as well. ACTUP (AIDS Coalition to Unleash Power) initiated a boycott of Philip Morris in the early 1990s, citing the company's campaign donations to Senator Jesse Helms, an opponent of gay rights. The boycott ended in June 1991, when Philip Morris said that it disagreed with Senator Helms on gay rights but that it may still donate to his campaign. Lest the company be seen as opposed to gay rights, Philip Morris promised to give at least $2 million to gay and AIDS support organizations annually. Feminists have also launched prominent boycotts. The National Organization for Women, for instance, called for tourism boycotts of states that refused to pass the Equal Rights Amendment in the 1970s.

Although labor organizers typically rely more on strikes to effect change, labor has strategically used boycotts when scarcity of labor was difficult to control. This was especially true during the late 1800s and early 1900s in the United States. The Knights of Labor, who represented easily replaceable, largely unskilled workers, launched strategic boycotts of necessities and inexpensive luxury items. The Knights of Labor also engaged in secondary boycotts—that is, the boycott of businesses selling items produced by the offending companies. During the mid-1890s and in 1908, the American Federation of Labor published a "We Don't Patronize List" in a similar attempt to get business to meet labor demands. After the Supreme Court decisions of *Loewe v. Lawker* and *Buck's Stove* made boycotts more difficult, the American Federation of Labor stopped printing the list. The Taft-Hartley Act of 1947 banned secondary boycotts as an unfair labor practice, and the Landrum-Griffin Act of 1959 outlawed secondary boycotts as coercive.

More recent labor boycotts include an initiative advanced by the United Farm Workers Organizing Committee in California led by Cesar Chavez during the 1960s. The boycott of grapes picked by migrant workers was launched when the National Labor Relations Act denied migrant farm workers the right to organize. Within 6 months of launching the boycott, there was a 30% drop in grape shipments to New York City, the United States' largest urban market for grapes. Another recent labor boycott was led by the Coalition of Immokalee Workers (CIW). Their 4-year boycott of Taco Bell ended in the spring of 2005. CIW, representing primarily Guatemalan and Mexican tomato workers, demanded that Taco Bell pay one penny more per pound of Florida tomatoes and adopt a code of conduct allowing Taco Bell to cut ties to suppliers who abuse farm workers. Taco Bell announced that it would pay growers an extra $100,000 per year for tomatoes. Taco Bell also agreed to help farm workers persuade other fast food chains and tomato retailers to increase pay and monitor conditions to ensure that workers are not beaten or forced into indentured servitude.

Environmentalist and animal welfare organizations have launched numerous boycotts. These boycotts are especially likely to be part of a broader strategy to change standard practices in entire markets rather than targeting the policies of a single supplier. Often, industry leaders are subjected to the first boycott in the hope that other members of the industry will follow suit in a domino effect. Rainforest Action Network (RAN) led a 9-year boycott of Mitsubishi, which ended in 1998 after the company agreed to stop using old growth timber and to use almost all non-wood-based paper by 2002. In 1997, Greenpeace, RAN, the National Resources Defense Council, Forest Ethics, and others formed the Coastal Rainforest Coalition (CRC). This group first targeted the Home Depot, as an industry leader in the home supply chain industry, asking the company to stop purchasing timber from ancient forests. In 1999, Home Depot agreed to a progressive wood-sourcing policy. After a successful campaign with Home Depot, CRC moved on to Lowe's, Menards, Wickes Lumber, and 84 Lumber, all of which agreed to make substantive changes. People for the Ethical Treatment of Animals (PETA) has implemented a similar strategy. PETA launched a campaign against McDonald's in 2001 asking the company to allow announced and unannounced slaughterhouse audits of all its livestock suppliers, stop purchasing from suppliers who failed the audits, increase space for laying hens, and change feeding and catching standards. In September 2002, McDonald's agreed. PETA launched a similar campaign against Burger King, which agreed after 5 months of the boycott to make the requisite changes. PETA has since moved on to a boycott of KFC, in the hope that the fast food industry will follow the lead of companies like McDonald's and Burger King. It is interesting to note that in these examples, media exposure was highlighted more than the refusal to purchase products.

The aforementioned environmental and animal welfare boycotts are led by professional organizers that are likely to see boycotts as fundamentally instrumental, one step in a long-term strategy to effect positive policy changes. This stands in contrast to expressive boycotts where the organizers' primary aim is to express dismay with corporate policy. Punitive boycotts employ aspects of both instrumental and expressive boycotts. A punitive boycott is designed both to express public outrage concerning perceived policies of wrongdoing as well as to effect future changes. For example, the American Family Association and Christian Leaders for Responsible Television boycotted Chlorox, Mennen, and Burger King in an effort to punish the companies for supporting television shows with sex, violence, and profanity. This sort of boycott both expresses moral disapproval of corporate policy and seeks specific policy changes. In 1990, due to the boycott, Burger King promised to support programming that promoted "family values." It should be noted that even the more instrumental boycotts employed by professional environmental and animal welfare organizations may involve punitive aspects as well.

BRANDS

A brand is the unique, ownable identity of a business, enterprise, company, or undertaking. It includes the name of the entity and its logotype or any identifying design by which the enterprise is known and recognized, and it conveys what the enterprise stands for, its products and services, and ultimately its role and significance for the customer, consumer, user, or perceiver in its respective society, culture, or civilization.

Increasingly, a brand is any carefully articulated identity.

During the late 20th century, corporate brands rose to a level of strategic significance within the world of modern business and enterprise. Growing from their humble origins as an indicator of ownership or a source of goods, brands became the primary tool used to create and orchestrate enterprise identity, a major factor in setting corporate strategy, and an important asset in developing enterprise value and creating wealth. As such, brands became the most important and the most strategic and monetarily valuable asset in successful organizations, be it a commercial enterprise, a nonprofit organization, a governmental agency, a nation, or even an international body,

Concurrent with this rise to previously unprecedented social and economic power, brands, with their ability to determine perception, drive behavior, and influence public markets, have become the focus of a number of ethical debates regarding the nature of capitalism, consumerism, and corporate social responsibility.

The Power of Brands

Although they have existed since the earliest days of urban civilization and commerce, brands made their debut, in the modern sense, during the European Renaissance as the "trade names" of businesses and enterprises.

However, it wasn't until during the 17th and 18th centuries that brands began to be used commercially as "brand names" to market goods and services and thus to have an increasingly commercial existence. It was with the arrival of their use for commercial purposes that brands began to achieve their modern significance as a valuable enterprise asset. By the end of the 19th century, with the passage in the United States of the federal trademark legislation of 1870, "trademarks" acquired rights similar to those of real property, and these early brands became formally acknowledged and protectable under the law.

Throughout the 20th century, brands became recognized for their ability to distinguish one product or service from another, impart intangible value, convey quality, and eventually, in a world increasingly populated with brands, enable consumer choice in the marketplace. Most notably, during the 20th century, with the rise of marketing as a business discipline, it became clear that branded products and services commanded higher prices and delivered greater margins to their enterprises, as consumers often chose one nearly or actually identical product over another because of what its respective brand stood for in their minds.

By the end of the 20th century, business leaders and corporate executives had become aware of the power of brands to deliver competitive advantage and build wealth. Thus, "branding," now understood as the articulation of a compelling identity and the successful positioning of an enterprise within a market, became a theory of brands that formalized the principles of creating and strategically deploying these powerful new assets.

It was only as the brand, understood as a powerful asset of the organization, began to be deployed to drive markets by maximizing consumption that questions emerged regarding the ethical use of brands within society. As it became clear that brands could instill desires where they hadn't previously existed and otherwise increase consumption, especially within easily persuaded audiences such as children, the elderly, or the less educated, the negative concept of "consumerism" emerged along an ethical spectrum of increasingly questionable enterprise behaviors that were suggestive of greed and exploitation.

For many, the apparent manipulation of audiences and populations to drive corporate profits became questionable and, for some, morally reprehensible. Brands had been a benefit to society in building and segmenting markets, in differentiating goods and services, and in the eventual discovery of intangible assets as powerful creators of wealth. However, as corporations sought and investors came to expect unending growth from their commercial enterprises, aggressive forms of marketing evoked ethical questions about the propriety of creating unnecessary desires and driving consumption beyond natural need, the effect of omnipresent advertising and the overall commercialization of society, the possibly unsustainable toll on natural resources and the environment incurred by unnecessary manufacturing and the consumption of raw materials, and the effect on society of creating a worldview that equates personal happiness and self-image with shopping, consuming, and owning material possessions.

The Theory of Branding

Largely developed through the 1990s and into the first decade of the 21st century by management consultants, marketers, and corporate executives within the pages of well-established professional business publications such as the Harvard Business Review, the California Management Review, and the Wall Street Journal, brand theory has only recently become aware of itself as a discipline.

Brands have been defined by theorists as the primary identity vehicle for products, services, initiatives, and entities transacted within the economy and society. In the most formal sense, brands are understood as highly successful commercial or public entities with well-orchestrated identities that consist of complex sets and hierarchies of meanings and attributes and that are broadly and instantly recognized, accurately perceived by specific constituencies, and associated with a name, a trademark, and often a symbol.

From the perspective of an enterprise, brands are an intellectual capital asset that organizes and gives meaning to an undertaking. From the perspective of management, a brand is that for which all activities are undertaken, the *raison d'etre* for the development and marketing of various products or services. And strategically, a brand is that which is leveraged to achieve strategic results and, most essentially, to provide competitive advantage and create often substantial monetary value.

Uniquely, brand theory holds that brands *distill* intellectual, monetary, and moral value from other organizational intangible assets, such as intellectual property, knowledge, human capital, corporate culture, innovation, core competencies, or the social capital that is unique to a respective organization. Accordingly, brands, by their nature, put a face on products, services, and other intangibles or knowledge-based assets and organize them into an expression of a more complex set of meanings. This process is called "branding" and is based on defining what the brand stands for, articulating its values, identifying its audiences, and ultimately creating its personality. Such organizing is what creates or produces the economic value chains that turn ideas and innovation into products and services and, eventually, into brand assets that drive wealth.

In this sense, intangible assets, such as an intellectual property portfolio of patents, may be very valuable economically, but brand theory suggests that whatever that value may be, it is likely to be worth exponentially more when it is advanced commercially under a brand that provides more complex and organized meanings.

Therefore, in brand theory, well-articulated brands (1) communicate the meaning of an enterprise; (2) identify its goods, attract consumers, and differentiate the company from other players in the marketplace; (3) create trust and repeat purchase, increase interaction, and encourage brand loyalty; (4) possess extraordinary economic value, convey that value, and deliver profitability; and (5) become intellectual capital assets of the respective organization—all of which benefit the individual enterprise and, possibly, society.

The Practice of Branding

It is with the "practice" of branding that we can begin to see ethical issues arise. With the advent of the 21st century, branding became a highly formalized practice that was applicable across all organizations, products, and services in all the major industries and sectors within the economy and society, and it was a well-defined professional discipline practiced by management consultants and corporate executives.

The strategic thinking behind a brand is captured by the concept of a *brand strategy*, whereby what the brand stands for is thoroughly articulated, its position within the marketplace is analytically identified, and a marketing strategy that implements and realizes that brand strategy is defined.

To this end, practitioners developed methodologies to define the enterprise to be branded, stating the justification for the brand, its relevance to the consumer, its promise, and some summary brand philosophy that defines what a brand stands for in the minds of its consumers. Also, the most influential brands have determined how they will be expressed, dimensionalized their "brand personalities," and created a brand identity to incarnate their respective brand. When thought of this way, every brand needs a strong creative and imaginative idea at its center that brings it to life and provides it with relatively unlimited possibilities for growth and expansion.

In addition, every brand is assumed to be a true expression of the enterprise for which it stands. Thus, brands, in their nature, possess an ethical core, character, or agency from which they may or may not diverge. Brands that evoke the greatest levels of trust and marketplace success are frequently those that are founded on and expressive of the authentic nature of their respective enterprise. In contrast, those brands that are founded or deployed purely on motives of greed and exploitation and are embarked on only for commercial gain are those that invoke the least trust, are frequently seen as mere façades, and are deemed to be those that most characterize "commercialism" in its worst sense. Such brands exist not to express the abiding nature of an enterprise but solely to capitalize on and exploit yet another target audience or to maximize consumption beyond need, and they are seen by individual consumers and society to violate the trust society expects between business and its markets. Society expects a business to deliver legitimate products and services, and the potential trickery that marketing is capable of delivering to entice unnecessary consumption and to sell yet another unit or service to make the numbers that will drive earnings and stock prices is increasingly seen to be in bad faith and thought to be socially irresponsible.

Others, in contradistinction, believe it is the prerogative of business to sell products and make as much money as possible for itself and its shareholders by whatever legal means exist. They argue, in juxtaposition to the social responsibility argument, that their responsibility lies in delivering earnings and gains to their shareholders and that rather it would be "bad faith" to investors not to maximize their returns, even at the expense of aggressive marketing technique.

Both schools of thought seek their respective maximal profits but draw the line differently between the maximum allowed under a social conscience and the maximum allowed under the law. In either case, the operational deployment of a brand, referred to as "building the brand," involves marketing programs that are designed to enhance the image and vitality of a brand or brands. Increasingly, and in virtue of the sophisticated brand valuation tools developed at the turn of the 21st century, enterprises are regularly able to benchmark the monetary value of their brand to obtain a baseline against which to measure the ability of a brand or marketing program to build brand equity.

The implicit code of ethics that stands behind the modern practice of branding is grounded in the assumption that brand building builds or develops brand equity, thus contributing to enterprise value, and that commercialization understood as exploitation destroys brand equity but may drive enterprise revenues. The primary strategies driving the development of brand equity at the beginning of the 21st century are marketing strategies such as (1) niche marketing, (2) integrated marketing, (3) lifestyle marketing, (5) permission marketing, and (5) corporate social responsibility initiatives.

Historically, the first impact of the rise of brands was the shift from traditional marketing, which was designed to create desire in mass populations, to niche marketing. By the late 20th century, markets had become flooded with brands. Across the consumer products industries alone, over 20,000 products per year were entering the marketplace, and by the end of the decade of the 1990s, many segments of the consumer marketplace were reaching saturation. Consumers were swamped with innumerable advertising messages each day, and only the most highly differentiated brands could cut through the media clutter to be perceived and engaged by consumers. Well-branded products became essential to enabling the shopping process, and soon only those products that had identified a "niche" in the marketplace for their message could be expected to survive. Thus, marketing became "niche marketing," and "positioning" products for consumer apprehension became de rigueur.

Soon, driven by the globalization of commerce and the proliferation of channels of trade such as the Internet, modern branding also became characterized by "integrated marketing." Branding started to involve the creation of one coherent identity that was well articulated and able to be communicated in each of the various internal and external communications that each enterprise needed to deploy in each of its respective markets and channels of trade. In daily business, this meant that each dimension of a brand was defined and mapped against the needs of the respective consumers to ensure that a consistent and well-integrated brand was presented at each communication opportunity. Because the expressions and communications about a brand needed to be orchestrated and blended to achieve synergy and because research demonstrated that perceiving the same identity or same brand through multiple media and channels of trade increased credibility and brand awareness, marketing became "integrated marketing."

Further, because research had demonstrated that the most successful brands became part of the consumer or end-user's "lifestyle," marketing also focused on positioning products within the lifestyles, usage occasions, and consumption patterns of target audiences. By the end of the 1990s, brands had become a part of the identity of individual lives, and they were implicated within the individual consumer's self-discovery in such a way that they became an expression of an individual's inner spiritual and personal search. Thus, too, marketing became "lifestyle marketing."

While each of these approaches, per se, grew out of the evolving dynamics within markets, as markets became more saturated and competition increasingly fierce, what became the commercialization of society began to emerge. Soon, everything was an advertising medium. Coupons, deals, direct mail, telemarketing, broadcast media advertising, in-store marketing, online spam and pop-ups, in-store radio, and cell phone advertising all combined to reach a crescendo culminating in the branding of university and civic buildings in return for monetary considerations of one form or another. For many, business was overstepping its proper bounds, invading personal privacy, destroying culture, and undermining civilization by commercializing every space and moment as a selling opportunity.

Concurrently, brand marketing, in an effort to regain its ethical character as a discipline and the respect of consumers, adopted an approach known as "permission marketing." Assailed by sophisticated marketing strategies, constant advertising, intrusive direct marketing efforts, and new online promotional vehicles, consumers reacted in various ways to filter out the ongoing onslaught of marketing and advertising messages. Permission marketing appeared to characterize those endeavors that marketed only to receptive targets that were interested in the offered goods.

The most recent evolutionary development of brand strategy has been the trend toward corporate social responsibility. Oversaturated markets and omnipresent advertising messages were driving high levels of market fragmentation and a consumer backlash against marketing per se and the companies that used it the most. Many brand strategists began to see a need to take an entirely different approach to building their brands through a focus on corporate reputation, which became known as corporate social responsibility. With a commitment to favorably influencing or solving social problems that were frequently complementary to enterprise markets, brand strategists found a new way to build important levels of brand equity while at the same time being instrumental in ameliorating many of society's ills. However, in many cases, even corporate social responsibility became hollow rhetoric, just another marketing tactic, without sincere motivation. Fortunately, for many businesses, corporate social responsibility predominantly became an ethical brand-building response to the greed, exploitation, and abuse of their markets.

While probably any approach to branding and marketing could be abused, the dynamics of markets and competition, compounded by the demands of investors, creates a complex ethical situation. Investors expect their investments to grow and demand steadily increasing quarterly earnings, and thus, businesses must find ways to deliver the unending growth that is becoming more impossible in saturated markets. Thus, business and enterprise must turn to marketing and branding to drive new levels of consumption and market penetration.

However, because branding and marketing as disciplines and business practices are ethically neutral as methodologies, careful attention to the development of socially responsible brand strategies, coupled with approaches to brand marketing that build brand equity, typify the modern practice of branding and its ability to orchestrate values and meanings to create notable monetary value. Increasing sophistication among professional practitioners and the realization that intangible, intellectual capital assets such as brands are driving significant new levels of enterprise market capitalization and societal wealth are working together to enhance the strategic significance of brands in the modern world.

The Financial Dimensions of Brands

Because brands have become valuable assets that are readily improved by intelligent development and wise exploitation, they have also caught the attention of accountants, financial analysts, investors, and capital markets.

Worldwide, there are hundreds of thousands of brands, with thousands more entering the public marketplace every year. In the United States alone, over 245,000 trademark applications are filed each year with the Patent and Trademark Office. Combined, these many brands constitute a major economic force in the world. During 2005, estimates place U.S. market capitalization at nearly $15 trillion, with over $11 trillion of that amount being contributed by brands and other intellectual capital assets. Such calculations highlight the enormous opportunity to be realized by businesses, the economy, and society through the astute leveraging of assets of such tremendous value.

For these and similar reasons, the branding of products and services has emerged to occupy a place of paramount concern within businesses, often becoming *the* corporate or enterprise strategy. By the end of the 1990s, branding had become the *uber*-discipline for CEOs, corporate executives, and marketers. Articles and books on the subject of branding appeared daily, and numerous branding consultancies emerged, specializing in creating every aspect of a dominant, winning identity in the marketplace. Brands moved to the center of business strategy, and prestigious business and financial publications such as *Financial World, Fortune,* and *BusinessWeek* began printing annual tabulations of the "top 100 brands" and their specific monetary values.

Showcasing the monetary value of brands has helped financial analysts and executives recognize them as their most valuable assets and, thus, develop correspondingly sophisticated strategies designed to leverage these intangible intellectual assets to drive corporate valuations and market capitalization in much the same way that traditional physical and financial assets have long been leveraged to deliver enterprise performance. The simple axiom that leveraging your most valuable assets is the essence of good management applies no less to intangible intellectual assets and brands, as their paramount instantiation, than it does to plant, property, equipment, and financial assets.

However, complex ethical issues arise with the valuation of intangible intellectual assets that frequently go undetected because of both the complexity of setting such valuations and that of the financial transactions that surround such assets.

The primary market for intellectual assets such as brands and intellectual property is that of mergers and acquisitions. Since the early 1990s, such assets have increasingly determined pricings in such transactions. Brands were quickly recognized as the primary source of value in such dealings, and soon brand valuation methodologies emerged to set values. However, their complexity militated against transparency, opening the door to min-maxing tactics that led to substantial balance sheet write-downs that hurt investors and their respective businesses. The volatility and difficulty in defining the metes and bounds of such assets has often spawned unscrupulous activity that is only recently beginning to be policed through new Financial Accounting Standards Board regulations and rules that minimize conflicts of interest and encourage enhanced impartiality.

The Future of Brands

The concept of branding, while quickly spreading around the world, has also spread beyond the world of business into nonprofit organizations and society, into government and nongovernmental organizations, into the world of personalities and celebrities, and into every area where complex created identities operate. Thus, the future of brands is tied up with business and the economy, society and culture, governments and civilization, worldviews, and the entire zeitgeist. Brands have laid an intellectual foundation that, like the ripples from a pebble falling into a still pond, is spreading outward across the dimensions of our world and influencing the creation and management of identity in diverse respects.

Most obviously, in the 21st century, brands have become the future of business in every form because they have extended the paradigm of business from the product or service itself to its meaning in our minds and our society. As a result, brands have enlarged the economic capacity of our global economies, allowing them to hold thousands upon thousands of individual products that wouldn't otherwise exist and all the while concurrently creating vast amounts of new wealth out of ideas and meanings.

Brands, with their miraculous economic contributions, convey the promise of a bright economic future. Yet the brands of the future, if they will fulfill such a promise, face theoretical and practical challenges that are inherent in their nature and their dynamics.

As brands become more global, many face problems of brand elasticity and diminishing returns as they seek to encompass ever greater ranges of meaning and significance. The meaning of an individual brand can only be stretched so far before it begins to lose it significance and becomes empty and meaningless. Consequently, in the future, brand elasticity will remain a problem as brands struggle to orchestrate global meanings without overextending themselves.

In addition, as the number of brands in existence continues to increase, many may find it difficult to carve out differentiated brand positions in their respective markets as they grapple with the finitude of possible brand positions. Many early-21st-century markets are already becoming saturated, and a market can only be parsed and segmented so far before meanings collide and become inconsequential.

Both issues of brand elasticity and those of brand positioning are leading to increased instances of unfair competition, trademark infringement, trade dress infringement, misappropriation, piracy, and counterfeit goods as legitimate enterprises and illegitimate enterprises collide. While many such matters are illegal and are handled in due course through litigation and indictment, many are also ethical problems requiring enhanced professional ethics and enterprise codes of conduct for their amelioration.

Brand lifespan may also emerge as a problem for markets and consumers, as some brand strategists strive to create brand vitality and fail, leaving their efforts to clutter the commercial landscape with diluted meanings, creating consumer dissatisfaction, and frustrating legitimate commercial aspirations. Waves of brands that come into and go out of existence create confusion and undermine trust in all brands—for trust is of the essence for a brand, and the most successful brands are always those that inspire the greatest trust, the ethical sine qua non for brands. Correspondingly, the entire role of marketing and the overcommercialization of society will continue to be debated, putting pressure on brands to have meaning, legitimacy, and authenticity and to avoid creating social problems of excess, insincerity, and exploitative intention.

Further, to meet the challenges of the future, many thinkers believe that brands will need to productively marshal an ongoing commitment to successful innovation in order to ensure their continuing relevance with an ongoing stream of "new" products or services. In this respect, much will depend on the talent and skill with which brand propositions are articulated and expressed and structural issues such as whether brands can remain relevant beyond their native audiences, their generation, and their nationality without losing critical mass with those constituencies.

Brands are also deeply implicated in fulfilling the ongoing need of society for prosperity, and because of their power to organize other intangible assets, synergize their value, and constellate higher-order sets of meaning, brands are likely to play a determining role in the future creation of wealth. For many, their evident impact on the development of prosperity at the end of the 20th century portends the creation of new wealth beyond that ever yet produced through traditional physical or financial assets. This paradigm shift to a new era of intellectual capital assets, with the brand—because of its distilling nature—as the intellectual capital asset par excellence, brings with it a whole new momentum that promises new value, based not on supply and demand but on meaning and significance.

Bretton Woods Institutions

The Bretton Woods Institutions—consisting of the International Monetary Fund (IMF) and the World Bank (the Bank)—were created in 1944 to help promote the economic health of the world economy. The Bretton Woods Conference, officially called the United Nations Monetary and Financial Conference, was held in Bretton Woods, New Hampshire, at the Mount Washington Hotel on July 1–22, 1944, as World War II was coming to a close.

Delegations from 45 governments agreed on a framework for economic cooperation designed to avoid a repetition of the disastrous economic policies that contributed to the Great Depression of the 1930s. During the 1930s, as economic activity in the major industrial countries weakened, these countries attempted to support their own economies by increasing restrictions on imports. Unfortunately, increased restrictions led to a downward spiral in world trade, limited economic output, increased unemployment, and worsening living standards in many countries.

At the close of World War II, various plans to restore order to international monetary and financial relations led to the creation of the Bretton Woods Conference and the Bretton Woods Institutions. The British economist John Maynard Keynes and the U.S. Treasury international economist Harry Dexter White were the intellectual founding fathers of the Bretton Woods Institutions. Keynes and White shared a belief that powerful, multilateral institutions could prevent future depressions while helping build a strong, global economy. John Maynard Keynes, the father of Keynesian economics, in particular, actively advocated for a strong government role in developing interventionist policies to mitigate economic recessions, depressions, and booms. As the father of macroeconomic theory, Keynes argued for an interventionist role of governments in alleviating unemployment, stirring investment, and increasing savings rates by focusing on aggregate consumption and investment.

Initially, the IMF and the Bank were designed to help rebuild Europe after the war. The IMF was charged with promoting global economic growth through international trade and financial stability, with stable currency exchange rates initially tied to gold reserves. The Bank made its first loan of $250 million to France in 1947 for postwar reconstruction. Over the intervening decades, with the increased international integration of markets, the IMF and the Bank have increased their responsibilities to coordinate, assess, and promote international cooperation for continued monetary stability. Expanding memberships and a strategic focus on poverty and debt reduction have led to new initiatives by the Bretton Woods Institutions.

Headquartered in Washington, D.C., the IMF and the Bank are governed by their member countries. As specialized agencies of the United Nations, the IMF and the Bank are related but have different purposes.

The IMF promotes balanced expansion of world trade, stability of exchange rates, avoidance of competitive currency devaluations, and orderly correction of balance of payment issues. Balance of payment issues occur when a country starts running short of money and credit by buying more goods and services abroad than it can sell or as a result of investors taking their capital abroad. The IMF provides temporary financing to ease the balance of payments crisis provided the country agrees to implement policies addressing the cause of the problem and ensuring that the IMF is repaid. Member countries provide money (called quota subscriptions) to the IMF. The IMF then lends to members in financial difficulties. Quotas, based predominantly on the country's economic size, determine the voting power and the amount of funds a country can borrow. A 24-member executive board provides oversight to the managing director, his or her deputies, and an international staff that carries out the IMF's work. The finance minister and other high officials of all member countries comprise the board of governors, the overall authority for the IMF.

The Bank focuses on promoting long-term economic development and poverty reduction. By financing specific projects, the Bank assists countries by focusing on longer-term development issues. Owned by 184 member countries, the Bank has become a Group composed of five closely related institutions: the International Bank for Reconstruction and Development (IBRD), the International Development Association (IDA), the International Finance Corporation (IFC), the Multilateral Investment Guarantee Agency (MIGA), and the International Centre for Settlement of Investment Disputes (ICSID). The Bank Group focuses on poverty reduction and improvement of living standards around the world. The IBRD focuses on middle-income and creditworthy poor countries, while the IDA focuses on the poorest countries of the world. Low-interest loans, interest-free credit, and grants are provided for education, infrastructure, communications and other initiatives. The Bank Group works to help countries' governments take the lead in preparing and implementing development strategies to reduce poverty in their own countries. The Bank's Comprehensive Development Framework, adopted in 1999, guides its assistance by focusing on four key components: (1) comprehensive and long-term vision is emphasized, (2) strategies are "owned" by the country with local stakeholders shaping them, (3) countries lead the management and coordination of aid programs, and (4) performance is evaluated through measurable results.

While the IMF might be called in an emergency for a financial crisis brought on by balance of payment issues, for example, the Bank is the world's largest source of development assistance and is heavily involved in reducing poverty in low-income countries. Every year, nearly 40,000 contracts ranging in size from a few thousand dollars to multimillion-dollar contracts are decided for delivering goods and services around the world. The Bank also provides an extensive array of advice and facilitates private sector investments in developing countries to promote growth and opportunity.

In recent years, the Bretton Woods Institutions have been subjected to severe and significant criticisms on their globalization policies, with allegations that the IMF and the Bank promote poverty and inequality. Following the disrupted talks of the World Trade Organization in Seattle in 1999, protesters have annually demonstrated at the combined IMF and World Bank boards of governors meetings. In 2000 at Prague, Czech Republic, the board of governors was forced to cut short its annual meeting after protests, lobbying, and workshops denouncing globalization. In 2001, 20,000 protestors convened for an often raucous demonstration in Washington, D.C., preventing the boards from meeting.

BUDDHIST ETHICS

Buddhist philosophy originates with the teachings of the Buddha (566–486 BCE), which are framed by the goal of eliminating suffering. Buddhist ethics aims at providing the path to achieving this goal. The teachings of the Buddha were preserved as an oral tradition for 400 years until they were compiled by monks in the Pali canon around the first century BCE. (There are many schools of Buddhist thought, but they share the same core teachings.) No separate discourse for Buddhist ethics exists in the ancient sources. Rather, a sophisticated and profound ethical theory is found throughout the canon and is inseparable from the rest of the philosophy. Works devoted explicitly to Buddhist ethics are recent, blending material from various sources into a more well-defined moral theory.

The Foundation of the Theory

Buddhist ethics is grounded in a theory of the nature of reality. It is logically embedded in Buddhist causality and the concomitant notion of nonsubstantiality. The presumption is that everything has a cause, that something cannot arise out of nothing, and that all phenomena thus fall under causal law. It follows that everything depends on something, indeed everything, else. This is known as the principle of dependent origination, and it lies at the heart of Buddhist philosophy.

On a physical level, every object obviously depends on a variety of causes and conditions. For instance, a table is made of wood, which comes from trees, and trees depend on water, earth, and sunlight. The table comes into existence because of the carpenter, who also depends on food, air, water, and so on. No element in nature can be conceived of as not connected to myriad others. We can also understand this principle conceptually. That is, this is a table by virtue of our definition of it; at other times, the wood may be firewood, a chair, or a bat. No element or object possesses an intrinsic, independent identity.

The principle of interdependence naturally leads to the conclusion that there is no separate self or soul either. In addition, if everything is subject to causation, then everything is also constantly changing and is impermanent. According to Buddhist philosophy, a person is a combination of five fluctuating aggregates (body, sensation, perception, dispositions, and consciousness). We cannot claim that any of these constitutes an intransigent self.

The concept of dependency entails significant moral implications. From our dependency and interconnectedness with others follows a sense of obligation and concern about the well-being of others. Since we are ultimately dependent on every aspect of the universe, ethical consequences follow regarding social philosophy, attitudes toward animals, and environmental ethics. Thus, understanding interdependence brings with it respect for nature and all living things.

Further moral implications ensue from the view of "no self." Without a permanent, fixed self-identity, one is not invested in one's own ego. Selflessness and other-directed actions follow. That is, without being preoccupied with oneself, a selfless concern for the well-being of others becomes possible. Egoism is replaced by the idea that distinction between self and others is an illusion.

The most important manifestation of the Buddhist view of causality is the law of karma, which is a natural law. *Karma* literally means *actions*. The principle that every effect has a cause means that actions have consequences for oneself and others. Karmic effects can be twofold, external and internal. One's actions affect others and accordingly accumulate merit or demerit. Immoral actions, such as killing, stealing, and lying, result in bad karma; good deeds result in good karma. Accepting a belief in reincarnation, people are reborn according to the moral ledger of their actions. The family one is born into, one's professional life, one's character, and even one's physical appearance may manifest past karma. The second aspect of karma is psychological, the way in which karma affects the agent. Here, karma is a psychological law, the law of causation applied to mental events. Immoral actions have negative effects because they are embedded in states such as anger, resentment, and violence. Negative thoughts and emotions lead to anxiety, even depression; they cause internal turmoil, and they are in themselves forms of suffering. By harming others one harms oneself. Positive thoughts and emotions lead to calm and satisfaction. Belief in reincarnation is not necessary for appreciating the psychological aspect of karma.

Karma is also a moral law. Unlike the system of rewards and punishments in monotheistic religions, in Buddhism, without a god, responsibility for one's destiny lies within oneself. By understanding how character and events come about, we learn to redirect the course of our lives, as the Buddha outlined in presenting his Four Noble Truths.

The Four Noble Truths

The core of Buddhist teachings is expressed in the Buddha's Four Noble Truths, his first sermon. The Four Noble Truths sketch a moral path. The assumption is that all beings wish to avoid suffering and attain happiness. Buddhist ethics begins with the desire to end suffering, and Buddhist concepts of right and wrong follow. The Four Noble Truths provide an analysis of what causes suffering on the one hand and what brings peace and happiness on the other.

The first Noble Truth is the truth of suffering. The point is to identify the nature of suffering as a problem in order to eliminate it. The principle is that suffering pervades human existence. Buddhism identifies a broad spectrum of phenomena as suffering, and areas causing psychological and moral problems are broader than what we find in Western moral theories. Birth, sickness, old age, death, as well as pain, grief, and sorrow are all forms of suffering, but even pleasurable experiences can cause suffering because of their transient nature. A new car, a new promotion, or a new relationship are only new for a short while. If our well-being depends on these highlights, we are subject to constant ups and downs. Not getting what one wants is suffering. Here, the Buddha is referring to the idea that whenever there is a gap between what we have and what we want or who we are and who we want to be, we will suffer. Expectations embedded in ignorance of the principle of dependent origination lead to suffering. Assuming a fixed, permanent self makes one a slave to the demands of the ego; one's social status and material possessions become central, and we try to satisfy aspects of an existence that cannot be satisfied because it does not exist per se.

The second Noble Truth identifies the origin of suffering. Desire and attachment cause suffering. Craving and attachment refer not only to pleasure and to material goods but also to ideals, theories, and beliefs. Desires are viewed as insatiable, and thus in principle they cannot be satisfied. All forms of suffering, from personal problems to political struggles such as poverty and war, can be viewed as rooted in selfish cravings and desires and in attachment to material goods, ideologies, or religions.

The three roots of evil are greed, hatred, and delusion. Here, the principle of causality and karma applies not only to action but also to intentions, thoughts, and feelings. Negative thoughts give rise to offensive speech and violent actions, just as sympathetic and compassionate thoughts give rise to kind words and actions. Thus, thoughts and feelings have karmic effects as well. Wishing someone ill is not morally neutral. In this sense, Buddhist philosophy offers a deeper analysis of morality by including human psychology as a cause of our behavior. This link between psychology and ethics is a central feature of Buddhism. The second Noble Truth shows that what causes psychological suffering also causes immorality. As the goal is to eliminate suffering, one must consider one's state of mind.

The third Noble Truth concerns the cessation of suffering and the possibility of attaining nirvana. Nirvana is mostly described in negative terms as it is impossible to convey this transcendent state rationally. Several Buddhist scholars refer to nirvana as a moral state because it includes the cessation of the causes of immorality—that is, greed, hatred, delusion, desire, and attachment. Negative emotions or mental states are eradicated as well. The goal is to eliminate the cycle of birth and death, although, as mentioned previously, this point is not essential to the moral theory.

The Fourth Noble truth is the truth of the Eight-Fold Path. The Eight-Fold Path lies at the core of Buddhist practice. It embodies the main principles of Buddhism and represents the middle way prescribed by the Buddha between asceticism and self-indulgence. The path entails three aspects: wisdom, morality, and meditation. Wisdom pertains to understanding the true nature of reality, that suffering is grounded in ignorance. Moral conduct is a way to purify one's actions, which also purifies one's motives. Meditation creates awareness and mental discipline. This path also embodies one of the main principles in Buddhist philosophy—nonviolence.

The Eight-Fold Path entails the following: (1) right view—that suffering originates in ignorance, hence understanding the true nature of reality is necessary for liberation; (2) right resolve—after understanding the causes of suffering, one needs to intend to change them; (3) right speech—one's words should be used only constructively, not destructively; one's speech should be honest and nonviolent; (4) right action—one should act in nondestructive, nonviolent ways; (5) right livelihood—one's livelihood should not involve harm to others, sentient beings, or the environment; (6) right effort—one should recognize that this path is not easy and requires work; one needs to replace negative emotions by positive ones, selfish motivations by selfless ones, unwholesome mental states by wholesome ones; (7) right mindfulness—this creates self-awareness, essential for combating aggression and negative motivations; and (8) right concentration—meditation and stillness allow deeper insights. The Eight-Fold Path underscores how ethics is essential to eliminate suffering.

Virtue Ethics

In philosophy, virtue ethics concerns one's character. Beyond analyzing the causes of immorality, Buddhist ethics proffers positive reasons to behave ethically and to resist unethical tendencies. There are four cardinal virtues: loving kindness, compassion, sympathetic joy, and equanimity. These are incompatible with their opposites and serve as antidotes to their negative counterparts. Loving kindness, the aspiration for another's well-being, is incompatible with hatred for others. Compassion, the hope that others be free from suffering, is incompatible with cruelty. Sympathetic joy, the ability to truly rejoice in another's success, is incompatible with envy. Equanimity, being serene and of an even mind, helps dissolve desire and aversion. Cultivating these virtues, then, is an important part of Buddhist morality. Practicing virtues leads to thinking about others, identifying with others, and experiencing selflessness. Considering the positive effects of these virtues, we can see that by helping others one also helps oneself.

Ethical Precepts

Buddhist ethics also includes a normative component, and there are several sets of precepts governing action. Five basic precepts pertain to the lay person: no killing, no stealing, no lying, no sexual misconduct, and no intoxication. Additional sets of 8 and 10 precepts guide lay persons in deepening their practice. There are over 200 precepts for monastic life.

Classification of Buddhist Ethics

Buddhist ethics is an ethics of enlightenment and compassion. As a nonauthoritarian philosophy, clinging to scriptures or theory is viewed negatively. Truth can only be attained by one's own authority. Tolerance follows this antifundamentalist approach, with wisdom and compassion inseparably linked. In contrast, in Aristotle, for instance, morality is a means to an end, to happiness. The Buddhist concept of nirvana as a moral state indicates that morality is not merely a means to enlightenment but an end in itself as a feature of enlightenment.

Buddhist Economics

Economic teachings are scattered throughout the Buddhist scriptures. "Right livelihood" is one of the requirements of the Eight-Fold Path. In applying the principles of nonviolence and not harming others, right livelihood means that one should refrain from making one's living through any profession bringing harm to people, sentient beings, or the environment. Therefore, the Buddha denounced professions that trade in weapons, drugs, or poisons; violate human beings; or kill animals. It follows that Buddhist economics cannot be a discipline separate from other aspects of life, notably from Buddhist ethics. Economics becomes a subset of morality and a normative social science, with moral considerations providing the framework for economic thought. From this perspective, and given the principle of interdependence, economic decisions cannot be made without taking into consideration individuals, society, and the environment. One cannot consider costs alone. If economic decisions are made solely on the basis of profit and loss, they become the source of social and environmental problems rather than positive solutions.

Given the goal in Buddhist philosophy of liberation, well-being cannot be defined by consumption or the accumulation of goods. Nevertheless, Buddhism is by no means adverse to wealth. On the contrary, wealth prevents poverty, about which the Buddha claims that hunger is the greatest illness. The concept of the middle way rejects the extremes of poverty or seeking riches for their own sake. Moderation, simplicity, nonviolence, and nonexploitation are the watchwords for economic activity, and the accumulation of wealth must also be carried out without violating any of the five precepts against killing, stealing, lying, sexual misconduct, and taking intoxicants. Being born into wealth is considered the result of good karma, and wealth provides an opportunity to practice generosity. Sharing wealth supports individual well-being and the community.

The goal of liberation implies that wealth is only a means to an end. If greed, craving, and attachment cause suffering and if one's attitude toward wealth includes these dispositions, wealth will bring suffering rather than enjoyment or solutions to the problem of suffering. In addition, economic activity motivated by greed will yield different results than when motivated by the desire for well-being. Greed leads to overconsumption and needless accumulation of goods, whereas the desire for well-being leads to moderation, balance, and sustainability. Distinctions between right and wrong consumption and use follow, given these attitudes toward wealth and its pursuit.

Buddhist philosophy consistently addresses the motivation behind human activity, and in the end the causes of suffering, unethical behavior, and immoral economic activity are the same. Thus, ethics and economics are integrated through causal analysis and consequently provide guidelines that aim at both individual and social transformation.

Business Ethics

Although Buddhist philosophy was forged during an agricultural era and before the rise of modern capitalism, the main tenets of Buddhist theory are applicable to business ethics today. From a Buddhist perspective, practical questions pose themselves for people engaged in business and commercial activities. Given the principle of right livelihood and that certain trades are denounced altogether, the first question one has to ask is what is being produced? For example, from a Buddhist point of view, there is no way to morally justify a multibillion-dollar weapons industry (enabling war, massacres, genocide, and other atrocities). The second question that arises is how is the product being produced? Does it involve harm to people, sentient beings, or the environment? Then, given the principle of interdependence, because businesses are integral parts of the community, decision making cannot be reduced to profits without considering the impact on people and the environment. Moreover, given that materialism is not the ultimate goal in Buddhism but only a means to an end, profits cannot be considered in isolation; they ought to be subservient to the moral path rather than dominate and compromise it. Finally, the goal in Buddhism is to eliminate suffering, so allowing businesses to profit while exploiting people and polluting the environment increases the amount of suffering and is counterproductive to the overall goal.

Bureau of Land Management

The Bureau of Land Management (BLM), part of the U.S. Department of the Interior, administers more federal land than any other federal agency: over 264 million acres of land (about one eighth of all land in the United States). Also, it manages 700 million additional acres of subsurface mineral resources and has responsibility for wildfire management and suppression on 388 million acres. The bulk of these lands are located in the western United States and include a variety of terrain, such as rangelands, forests, high mountains, arctic tundra, and deserts. Within these public lands, commercial, cultural, recreational, and wilderness resources abound; the responsibility for management and multiple uses of these resources puts the BLM in challenging public-private debates.

The mission of the BLM is to sustain the health, diversity, and productivity of public lands for the use and enjoyment of present and future generations. BLM functions include preparing land-use plans and assessing environmental impacts; issuing leases and other use authorizations; identifying and protecting significant natural, cultural, and recreational resources; managing and suppressing wildfires; and monitoring resource conditions.

The roots of the BLM can be traced back to the early years of the United States, with the Land Ordinance of 1785 and the Northwest Ordinance of 1787. By the late 19th century, a shift in federal land management priorities was marked by creation of the first national parks, forests, and wildlife refuges. Public lands were valued for more than simple commodity extraction and population settlement. By 1934, a U.S. Grazing Service was established to manage the public rangelands. In 1946, this Grazing Service merged with the General Land Office to form the modern BLM within the Department of the Interior.

In 1976, Congress enacted a unified legislative mandate for the BLM, with passage of the Federal Land Policy and Management Act of 1976. Congress confirmed the value of public lands and charged the BLM to practice "multiple-use" management: These lands and their various resource values should be used in a combination best meeting the present and future needs of the American people. Balanced use of public lands is increasingly a challenge, since most of the public lands are in the Western states, which experience intense population growth. Traditional land uses of grazing, mining, and timber production continue to be in high demand. The BLM increasingly is the target of lawsuits initiated by both citizen and commercial organizations.

The American public wants access for recreational and cultural activities. Oil and gas interests, along with ranching and timber interests, lobby for access to harvest resources from these public lands. These commercial and recreational activities must be balanced in an environmentally responsible manner. Further, the BLM must not only balance these varied interests but must also ensure future enjoyment of public lands by future Americans.

Bureau of National Affairs

The Bureau of National Affairs (BNA) is a leading print and electronic publisher of more than 200 books, journals, and newsletters providing news, analysis, and commentary regarding legal, economic, and regulatory matters. BNA is especially known for its publications on federal and state regulatory activities, corporate law, labor and employment law, tax law, banking, bankruptcy, health care law, and business finance. Due to its long history of reliable publishing of authoritative material in these areas, it is regarded as an original source for researchers, government, and businesses.

Founded in Washington, D.C., in 1929, where it is still based, BNA was incorporated as a wholly employee-owned company in 1946. It reports that it is the oldest organization in the United States to be wholly employee owned. It received the *Business Ethics Magazine* Employee Ownership Award in 2000, which noted that BNA had continued to maintain employee ownership despite recent offers to purchase the company. All employees can own stock, and no employee owns more than 3% of the stock of BNA. Employees and retirees represent 10 of the 15 positions on the board of directors, with the other 5 positions filled from outside the company. There are no special stock options for senior management. It has also been previously honored by *Fortune Magazine* as one of America's 100 Best Companies to Work For, which recognized BNA for its family-friendly policies.

The American Bar Association has partnered with BNA to produce various legal reference books and jointly publishes with BNA the *Lawyers' Manual on Professional Conduct*. The Society for Human Resource Management has also partnered with BNA to survey trends in human resources.

BNA has acquired other media enterprises and provides a variety of services today, which include document delivery, regulatory monitoring, and custom research for its clients. BNA has become heavily involved in electronic delivery of its services and publications, and select material is available through LexisNexis.

Bureau of Reclamation

Established in 1902, under Teddy Roosevelt, the Bureau of Reclamation is part of the Department of the Interior. Its presence in the four regions made up of the 17 Western states concerns water resources. Dubbed "Reclamation" because of its initial purpose to provide irrigation in order to "reclaim" unusably arid land for human benefit, Reclamation is best-known for dam and canal projects, including the Hoover and Grand Coulee dams. More recently, however, Reclamation is known for its construction and maintenance of hydroelectric power plants. Emphasis at Reclamation has shifted from that of construction to maintenance of those facilities and environmental water concerns.

Although it is a federally funded agency, Reclamation's projects were in part supposed to be financed by those who benefited from them. Repayment to Reclamation prior to the 1960s often fell short due to terms favorable to consumers and unfavorable to the agency. Since the 1960s, new Reclamation contracts have been written so as to be less one-sided.

The 1980s saw a further shift at Reclamation. Due to changes in the running of the federal government, Reclamation changed from a construction agency to a maintenance one. Now well established as a natural resource management agency, Reclamation's mission is to deal with water and water-related resources in ways that are both environmentally and economically beneficial to American interests.

Reclamation's effect on business has been profound since its beginning. Through its irrigation and power plant projects in the West, Reclamation has made vast areas of arid land economically viable. In addition, Reclamation has had an effect on the use and management of water resources to control water hoarding and infringement on water rights.

Reclamation must balance national interests with state and tribal water rights and environmental concerns. As the population in the West grows, these concerns about water, power, and their appropriate use also grow. Reclamation faces new water-related challenges due to changes in the economy, population, and industry in the area.

Reclamation also has an international presence through its research and scientific and economic studies concerning water. Reclamation's economic impact in farming; ranching; residential, commercial, and industrial power and water; and the development of new economic units is enormous. This development includes water conservancy districts, also known as irrigation districts, for which many Reclamation projects have been undertaken.

Some might ask what business a federal agency has in this arena. To answer that, we can think of Reclamation as similar to those agencies that construct highways, railroads, and other infrastructure that contributes to the overall economic growth of the nation, as it has contributed to the Western expansion of previous centuries.

The Bureau of Reclamation serves the public good in its management of water resources in the West as well as its construction and maintenance programs concerning electric power. Charged with reclaiming the usefulness of the arid West, Reclamation is important to the vital needs of both citizens and business in the areas of its operation.

Still, though, Reclamation is not without its critics. Significant criticisms come from environmentalists who are concerned about the reliance on water levels to which the Western states have become accustomed. Some water resources that Reclamation has exploited for development are nonrenewable at the current rates of use, such as the reclaiming of groundwater. This casts a questionable light on many Reclamation projects in that it seems that via Reclamation some economic and development enterprises in the West rely on water that will not be there in the long run to support the projects. So while the initial purpose of Reclamation was to make the West usable, it may have done its job too well—making the West more usable than the water resources can really sustain.

Bushido

Bushido is an ethical system based on the relationship between a samurai warrior and his overlord. The essential feature of this ethic is the relationship between master and vassal, with allegiance owed to the master by the samurai and care owed to the vassal warrior by the master. The master-vassal association, the core of *Bushido*, is reflected in the Japanese model of corporate management—that is, the spirit of devotion by employees for the sake of the company culture while the company (the master) shows the employees mercy and sympathy in ways such as lifetime employment, the seniority-centered employment system, and the "*ringi* system" of decision making. The latter is based on the rule of consensus, which encourages employee teamwork and unity in spirit. Furthermore, it leads employees to share fundamental values of "mutual trust and mutual responsibility" as if the company were a feudal domain. It should be noted, however, that Japanese corporate management and governance are evolving, embracing both *Bushido* and Anglo-American models of corporate management and governance.

The term *Bushi*, or samurai, can be traced back to the middle of the Heian period (782–1191). However, there was no such term *Bushido.* The ethics of the samurai in the Japanese medieval world (1192–1603) and the word *Bushido* (*Bu* = military, *shi* = knight, *do* = ways) were coined during the early times of the Tokugawa Shogunate (1603–1867). And the moral path that the *Bushi*, the warriors, were required to observe has been passed on for more than 800 years.

There are three key components of the master-vassal relationship, or the Japanese samurai's system of vassalage, usually called *Shuju Kankei*, that are important to understand what *Bushido* is:

1. From the perspective of followers in the master-vassal relationship, the master is required to possess three qualities: (1) "master with high fighting skills," (2) master with "benevolence or mercy," and (3) master with "sympathy or pity" having the tenderness of a warrior. Only when these three qualities are fulfilled will followers be convinced that they share the same destiny with their master and convince themselves to commit their lives to the master. This interpretation is what Hikozaemon Ohkubo writes in his *Mikawa Story*.

2. Tetsuro Watsuji called the samurai master-vassal relationship "absolute subordination" and "the ethic of devotion." For the core of the ethic of devotion, Watsuji says that the very fundamental spirit of the samurai is to overcome self-love. The master ignores his self-interest for the sake of his vassals, and for such masters, their followers serve them with absolute readiness to risk their own lives—that is, selfless devotion. Submission to authority, the sacrifice of all private interest, and risking life in battle for the master are essential. Watsuji argues that the ethic of devotion is the central value and denies the interpretation of a mutual benefit relationship such that *go'on* (debts) to the lord must be repaid by *ho-ko* (service).

3. Sokichi Tsuda contends that the central essence of the master-vassal relationship is based on mutual benefit. Master and follower are united by the exchange of interest, the foundation of their relationship. When the essence of this mutual benefit is damaged or lost, it ends the relationship.

As observed above, *Bushido* is not a fixed idea, and there are various teachings and interpretations related to it. As for the ethical underpinnings of *Bushido,* the teachings of Confucius provided the most significant foundation, while Buddhism furnished a sense of calm trust in fate, and the tenets of Shintoism thoroughly imbued *Bushido* with loyalty to the sovereign.

Historically, *Bushido*'s precepts are represented by *Shido, Hagakure*, and *Meiji Bushido*:

1. *Shido*, the way of the samurai, is based on the well-known "Yamaga Gorui" written by Soko Yamaga (1622–1685), who emphasizes the samurai's legitimate social role in governance through moral leadership. The personality of a great man was the single most important component of his notion of the perfect samurai, and it implied, above all, courageous and self-enhancing conduct in the pursuit of moral ideals. *Shido* is united with neo-Confucianism, which emphasizes five moral relations between master and servant, between father and son, between husband and wife, between older and younger brothers, and between friends. The important elements that support the five moral relationships are benevolence, justice, politeness, wisdom, and sincerity.

2. *Hagakure* means hidden leaves. Bravery, loyalty, filial duty, and benevolence are the fundamental values of *Hagakure.* The precepts, as set forth by Tsuramoto Tashiro, are based on what Tsunetomo Yamamoto (1659–1719) told about his ideal of the samurai. Although *Hagakure* was dedicated to Mitsushige Nabeshima, the lord of Saga Han (the Domain), it is the most famous and aggressive evocation of *Bushido,* a manifesto of protest against the majority of samurai who accepted their destiny of domestication.

Tsunetomo Yamamoto rejects the exchange aspect of vassalage—the pattern of *go'on* (debt) and *hoko* (service). Instead, he emphasizes absolute devotion on the part of the followers without any expectation of an appropriate reward from the master. In *Hagakure,* the way of the samurai is found in death. When it comes to either/or, there is only one choice, and that is death. One should be determined and advance in the face of opposition.

Only through learning how to die honorably could a man attain the mind-set of a true samurai, in peacetime as well as during war. Avoiding *haji* (shame) was a central moral precept in *Hagakure*; it was a matter of inner dignity. Readiness to die meant courage in fighting, *chu*, absolute loyalty to the lord, and *ko*, the virtue of filial piety to one's parents. *Hagakure* proposed to rescue the moral autonomy of the samurai while simultaneously protecting the absolute authority of the lord. Absolute loyalty to the lord was redefined as the moral choice of the samurai vassal, who entered on the difficult path of devotional service through "secret love" without expecting any reward.

3. *Meiji Bushido* includes especially the *Bushido* written by Nitobe and published in 1899 in America. The greatest contribution Nitobe made was the idealization of the traditional *Bushido*, the ethical system, and this view has been widely disseminated among the people. The central points of Nitobe's *Bushido* are the following. Rectitude or justice is a twin brother to valor, another martial virtue. Courage, the spirit of daring and bearing, is doing what is right. The spiritual aspect of valor is evidenced by composure—calm presence of mind. Benevolence, love, magnanimity, affection for others, sympathy, and pity are also recognized to be supreme virtues. Benevolence is a tender virtue and motherlike. Politeness (propriety) springs as it does from motives of benevolence and modesty and is actuated by tender feelings toward the

sensibilities of others. It is a graceful expression of sympathy. Without veracity and sincerity, politeness is a farce and a show. Confucius teaches that sincerity is the beginning and the end of all things; without sincerity, there would be nothing. The sense of honor, implying a vivid consciousness of personal dignity and worth, characterizes the samurai, born and bred to value the duties and privileges of their profession. "You will be laughed at" and "Are you not ashamed?" are the last appeals to correct behavior on the part of a delinquent youth. Finally, the duty of loyalty is central to *Bushido* feudal morality. It shares other virtues in common with other systems of ethics, with other classes of people, but this virtue—homage fealty to a superior—is its distinctive feature.

It was the ideal to embrace "the morality of the East" (*Bushido*) and "the art of the West" (science and technology) that Shozan Sakuma (1811–1864) and many other leaders in the last days of the Tokugawa Shogunate held up for the future of Japan. Eiichi Shibusawa (1840–1931), a great contributor to modern Japanese capitalism in the late 19th and early 20th centuries, believed that harmony between profit and righteousness is an immortal principle common to the Orient as well as to the Occident. He writes in his well-known book *Rongo to Soroban* (*The Analects and the Abacus*), "*Bushido* sunawachi Jitsugyodo nari" (the ethics of the samurai is same as "the ethics of business"). The term *Sikon Shosai* (embracing the samurai spirit and business acumen) was coined during the Meiji era (1868–1912). The central values of the *Bushido* spirit, such as "contribution," "devotion," "gratitude," "untiring efforts for improvement," and "team work united in spirit," are inherited in the corporate philosophy as well as the corporate culture of Japanese companies.

Business, Purpose of

The word *business* derives from the Middle English terms for *busy* and *ness*, and its primary meaning is to engage in purposeful activity. Thus, the notion of the purpose of business is in one sense redundant since in its generic meaning, business means having a purposeful activity. However, there is a secondary meaning of the word *business*, which denotes activities that involve the production and exchange of goods for economic purposes, primary among which is the generation of profit. Consequently, business is often defined as economic activity engaged in for the sake of profit. For that reason, business engaged in for the profit motive is distinguished from other "busy" activities, such as those carried on by nonprofit enterprises such as schools, hospitals, government bodies, and nongovernmental organizations. So those businesses generating profit are a species of organizations unto themselves and are concerned with generating enough profit to continue to exist in a competitive marketplace. Because of this specific difference from other organizations engaged in productive activities, it appears that the profit-making feature is the specific differentiating factor, and consequently, it is thought that the generation of profit is the primary purpose of business. However, despite this account, the question remains as to whether this is the correct way to characterize the purpose of business activity. There are alternative accounts of the purpose of business that can be articulated.

The Importance of the Question of Purpose

There are two reasons why determining the purpose of any organization or institution is important. The first is that the purpose of anything determines whether the activities of an entity are appropriate. Given the ethical maxim "Good is to be done and harm avoided" and given the fact that the purpose determines what counts as good, the purpose of any entity will determine when activities within that institution or entity are appropriate. In other words, the purpose of an entity furnishes us with the criteria of evaluation. For example, a knife has an end or a purpose. What makes a knife a good knife is how well it "fulfills its purpose"—that is, cuts. Analogously, a business is designed for some purpose, and what makes it a good business is determined by whether and how well it fulfills that purpose. If the main purpose is to maximize profits, then a business with a good bottom line that maximizes profits is a good business. But some businesses that maximize profit can act in an unethical fashion. This means that if there is a purpose over and above the maximization of profit, or shareholder wealth, we would need to determine what this purpose is in order to determine whether the pursuit of profit needs to be overridden by ethical considerations.

The second reason that determining the purpose of an object or entity is important is that the purpose furnishes criteria for determining whether the object or entity is well designed. Again, using the knife analogy, a knife is designed well if on account of the design, it is able to perform its function most effectively. Through experimentation, people have realized that a knife cuts well if it is designed with a strong handle and a sharp blade. In the case of business, if the purpose is to make a profit, the organization will be well designed if it fulfills that purpose and maximizes profit. It is evident how this purpose will greatly influence many diverse aspects of the organization, including perhaps the manner in which employees are treated and the allocation of resources. Further, the purpose of the business also determines and prioritizes the responsibilities of the people who are charged with managing the business. If the purpose of business is to make a profit, then the "excellencies" of the managers will be those qualities that enable them to improve the bottom line. However, if there are other purposes of business besides profit making and wealth creation, they need to be determined in order to be able to ethically evaluate business activities.

The Societal Roots of Business

While it is true that what distinguishes business from other activities is that it is activity that is motivated by the hope for a profit, and that profit-making activity designates the specific property or necessary condition of business, that specific property of profit generation is not sufficient to encompass the entire notion of the purpose of business, particularly if one looks at the place of business in society, in a capitalist society.

Human beings are social animals, which means that they exist and thrive in and depend on society for their existence. They develop conventions, institutions, systems, and/or forms of life to fulfill the purposes of their social communities. Business is one of those institutions. Consequently, it is important to look at what purpose business fulfills in a modern capitalist society.

Anthropologists and economists point out that for time immemorial, human beings have produced goods as well as developed means to exchange and barter surplus goods. Since this tendency to produce and exchange runs through the entire period of human history, markets are a standard feature of society. These instincts are evidenced time and again, whether it is a couple of kids on the playground with a few baseball cards or hundreds of men and women on the floor of the New York Stock Exchange or at the local shopping mall. Before there was any formalized government, law, or even state, people who had a proficiency in producing one of the necessities of life were trading with someone else who had a proficiency in the making of another needed item. This informal market and the informal division of labor it produced benefited society, and therefore, society permitted and encouraged entrepreneurial activity since it worked out for the betterment of all the members of a community.

In the early stages of human history, before the invention of money, instead of trying to accumulate a profit, people accumulated goods that were not perishable. The introduction of money allowed not only the accumulation of nonperishable goods but also the possibility for capital to be invested. With the introduction of capital, the notion of how much property it was appropriate for people to own changed. Rather than the prevailing rule of justice that superabundant goods were owed to those in need, the prevailing belief changed so that it was thought that it was permissible to save and invest superabundant monetary goods. If goods were not perishable and could be accumulated without loss, it was possible to set up capital markets, and these two developments altered the beliefs concerning how much property people were entitled to own and affected the conception of distributive justice.

Political economists such as Adam Smith pointed out that since most people only rarely produce for the sake of others and mostly produce out of their own self-interest, production could be enhanced and society would benefit if markets were set up in such a way as to incentivize this self-interest. The incentive became known as profit. The self-interested pursuit of profit would lead to the whole society being better off. Smith's recognition of human behavior was codified in the well-known doctrine of the invisible hand. However, there was a constraint on this pursuit of self-interest. It was permitted as long as it did not violate the rules of justice.

Society has developed since the origin of the human community and cooperation, but the nature of human motivation remains the same. People want to promote their best interest and consequently are motivated to act in ways that will make them better off than they were before the action was performed. People trade goods and services because they believe that they will be better off trading than not, and the fact that human trade continues on a massive scale demonstrates that human beings today are in that respect the same as their original forbearers. There are no significant differences between the original traders and contemporary traders, only modest ones. The introduction of money, of course, obviated the need to have a good or a service to participate in an exchange—that is, barter. I only have to bring a wallet to the food market, and I can leave my pigs at home. The second difference is that people produce goods and services in collectives, rather than as individuals, and these collectives can vary in size from just a few people to hundreds of thousands of people working together to provide a good or a service (or a series of goods and services). In addition, there is a greatly increased variety of goods and services for sale on account of human ingenuity. Nevertheless, despite the changes, the basic motive to barter, truck, and trade remains, and this is on account of the fact that it improves the lives of the people who participate in the great exchange.

Nevertheless, it is important to note that society's permitting the appeal to self-interest and profit, and consequently providing great incentives for productivity, does not thereby abrogate the societal purpose of business. Self-interest is an individual motivator. But business is a societal institution, and as a societal institution, it has a social purpose.

Beneficial Goods and Services

The societal view of business's purpose must ask how any business activity is beneficial to society. Throughout history, it seemed clear that while production and trade are good, unbridled and unfettered exchange is not good for society. Communities, and the governments that represent them, have always insisted on the right to regulate trade for the maintenance and promotion of the good of society. At times, this has meant that certain goods were declared illegal, then legal, and then illegal again, depending on consensus of the populace. Other goods have been regulated in certain places and unregulated in others. With some products, regulation is accepted readily and even sought after, and with other products, regulation is fiercely debated. But, whatever its applications, regulation has remained the unchallenged prerogative of governments, as representatives of the people, to prevent the activity of exchange and the institution of business from harming the society it has done so much to help.

Consequently, the very existence of pervasive regulation clearly entails that the purpose of business from a societal point of view must be something to the effect that business exists in the way that it does so that it can increase production and facilitate exchange in a way that makes people better off—that is, in a way that promotes the common good, the general welfare, or the public interest. Therefore, business practices that do not fulfill this purpose are irresponsible.

Maximizing Profit and Creating Shareholder Wealth

However, as was noted, there are those who maintain that the societal notion of the purpose of business as the creation of goods and services to promote the general welfare is naive and simplistic. This view maintains that the primary purpose of business is to create wealth or generate maximum profits. The maximization of profit and the notion of shareholder value and shareholder wealth are structurally similar, if not identical, since they hold that the primary purpose of business is to serve the interest of the individual owner of a business rather than the interest of society.

This view is developed by Max Weber, who defines capitalism as a system where there is pressure for ever-increasing profits, and continued by those who see capitalism as an economic system of free markets, such as Milton Friedman, who believes that the system works best when each person, *homo economicus* (economic man), pursues his or her own interest. In such a system, the primary and only responsibility of a corporation is to maximize profits for those self-interested individuals who have invested their capital in the system, subject to laws and fundamental ethical customs. Since this view must define a primary responsibility as a function to be performed in the face of desired ends, it implicitly recognizes the purpose of business as maximizing profits. Other proponents of this theory change the description of the end and outcome from maximizing profit to increasing shareholder wealth or shareholder value, but structurally, increasing wealth and value are the same as the goal of maximum profit.

The evidence for this view rests on the fact that most investors enter into the market with the intention of increasing their wealth rather than with the intention of directing or controlling the behavior of firms so that they act in accordance with the goals of society in enhancing production and exchange. Hence, in this view, profit maximization or wealth generation or shareholder value generation must be the goals of management. In this view, managers who deviate from acting in accordance with the interests of the shareholders—that is, providing them with maximum return on investment—are failing in their fiduciary duties by misappropriating what does not belong to them.

This point is further supported by the court findings in the well-known case of *Dodge v. Ford Motor Company*, argued at the beginning of the 20th century. In that case, presented before the Supreme Court of Michigan, Justice Ostrander, writing the majority opinion, claimed that the benefits of lower-priced automobiles for customers could not take priority over the interests of the shareholders. It had been Henry Ford's plan, which was not formalized, even though it was publicly known, to continually decrease the price of his automobiles while increasing the quality of the cars. So Ford determined that he would neither issue dividends to his shareholders that accurately reflected Ford's record profits nor lower the price of the automobiles that year. Rather, he would hold onto the profits of that year to raise enough capital to better expand and improve Ford's production faculties in order to produce a higher-quality product for consumers at a lower price. The shareholders argued that Ford was no longer running a business but instead was running a quasi-charitable institution. The justices agreed and ordered Ford to pay the higher dividends. In his opinion, Justice Ostrander stated that it was one thing to engage in charitable activities for the benefit of one's employees, such as constructing an employee medical center for their use, but it is another thing entirely to fundamentally change the ends and purposes of business, which he identified as increasing shareholder value. To do otherwise is to disregard what is legitimately owed to the shareholders.

Proponents of this view also claim that since the firm is the property of the shareholders, the managers are the agents of the investors and are therefore required by a fiduciary duty to act in a manner that promotes their interests. A fiduciary relationship is defined as one in which one person, a principal, justifiably has confidence in another, an agent, whose help or advice is sought in some manner. The agent is obliged to act with loyalty in advancing the client or principals' interest. Doctors are fiduciaries of their patients, and lawyers are fiduciaries of their clients. Similarly, managers are agents of the shareholders and should act with loyalty in advancing the interests of the shareholders for two reasons: first, a shareholder is not involved with—that is, does not control—the day-to-day operations of the business, and second, the shareholder lacks information about those day-to-day operations of the business.

Concerning the first reason, in the same way that patients cannot refer themselves to a specialist for a treatment that they may very much need, individual shareholders (for the most part) cannot enforce their will in terms of their own ideas and proposals on the organization. Concerning the second reason, which is lack of information about the status of the organization, even if this information were provided to them, the shareholders would still be unsure if the information they have received is complete and how to understand the information they have been presented. Finally, in the same way as the doctor and the lawyer can cause great harm to the patient or the client, whether through deliberate actions or through inattention, the manager can cause financial harm to the owner either through deliberate action or inattention. Therefore, it is on account of the fact that property owners could have their property harmed through the actions of others (whether deliberate or not) that they are owed a fiduciary obligation by the managers who are in their employ. It is this fiduciary obligation that requires that the purpose of the business is to be run for their financial benefit. Since agents are to act on behalf of a principal, in this case the owners, they need to determine what the point of their activity is, and if it is defined as profit making, the managers and directors have an obligation to pursue that profit, as much as possible, for the shareholders, unless the shareholders say otherwise.

Responses to the Profit-Maximizing Account

There are two problems with the belief that profit maximization or increasing shareholder value or wealth is the primary purpose of business. This view does not take into account the great variety of businesses, many of which have no shareholders, where there is no separation of ownership and control. Furthermore, it fails to take into account the differences between small businesses and large corporations. A small business can be run by its owner, and the owner can be in the business because one likes what one does or likes independence and merely wants enough profit so that one can live modestly from the profits of the business.

Such a business is privately owned and managed by the owner. As a business, it is still interested in profit, but it is not under pressure for ever-increasing profits, which Weber characterized as the spirit of capitalism. Rather, the small entrepreneur can be interested not in the maximization of shareholder wealth, since there are no shareholders, or in the maximization of profit, since one doesn't always need maximum income, but only in making enough money to live comfortably. Such owners are in business and producing goods and services that society needs and increasing their assets and profit, but they are not pressured to maximize profit. The fact that the defenders of profit maximization and shareholder wealth do not often reflect on privately owned and/or small businesses indicates that there is an entire area of business that they have not considered or that they are using profits as a measurable tool for monitoring agency behavior. But monitors for agent behavior are not purposes but measurable outcomes.

The second problem with the alternative account is that it confuses or conflates two quite different things, motives for actions (subjective causes) with purposes for the action (objective justificatory reasons). If one distinguishes between motives (which explain) and purposes (which justify) one is logically impelled to reject the view that the primary purpose of business is the pursuit of profit.

There are two different answers to the question "Why?" when addressed to human actions: the justificatory and the explanatory. To cite a purpose for doing something is to attempt to justify it and give it a legitimating reason. To cite a motive for doing something is to give it a psychological explanation. Hence, the question "Why did you make the bread?" can be answered by the justifying purpose, "To alleviate hunger," or by the psychological motive explanation, "Because I can sell it and buy things I want and need."

Confusing motives with purposes is similar to confusing the engine of a train with the destination of a train. The goal or purpose of the train may be to get to London, but it is the engine that gets it there. While the engine may be necessary to help us get to London, it is not the goal. The purpose of being a brewer is to make beer, while the motive for making the beer might be that it enables the brewer to make a good living. After the initial love of beer making wears off, it is not from altruism that a brewer makes beer but from his own self-interest. Nevertheless, the outcome of the profit-making venture is the manufacture of beer.

Thus, those who argue that profit maximization is the primary purpose of business have put the cart before the horse. They would have to argue, for example, that the purpose of baking is to make money and the secondary purpose is to provide food for the hungry.

Furthermore, this way of viewing the situation, which turns the self-interested motive for an action into the purpose of an action, opens a Pandora's box because it legitimizes or justifies the unfettered pursuit of self interest. If self-interest is the purpose and the purpose determines what activities are acceptable, the self-interested "rational maximizer" needs to do whatever is necessary to gain profit. But such unfettered self-interest is greed. It begets and legitimates the greedy, grasping, acquisitive, profit-motivated, bottom-line-oriented entrepreneur who feels no responsibility to the public welfare and for whom business ethics is indeed an oxymoron.

Recent Perspectives on the Social Purpose of Business

It should be noted that business as a social institution, convention, or form of life is different from a natural entity that has its own *telos* or purpose. As an institution or convention, it is created by society for societal purposes. It would be contradictory for society to create an institution that has the seeds of its own destruction. Hence, in creating and allowing business to exist, society must have in mind the general welfare. The fact that governments create laws that incentivize and appeal to self-interest does not make self-interested motives the purpose.

The granting to the corporation the status of a person, to protect the individual from liability, generated the needed capital investment and as a law must be justified by an appeal to the public interest. Laws developed to be of benefit to individuals at the expense of the public interest are unjust laws. Thus, a legal perspective must look at the purpose of business as not being for the benefit of any specific individual but to encourage individual enterprise for the sake of society's well-being. Any incentives, such as the introduction of corporate laws protecting individual investors, have always been to incentivize the individual for the sake of society. The principle is that because business—that is, the production and exchange of goods—is good for society, government ought to develop ways to incentivize productive market behavior. The profit motive and government-created incentives to make a profit are beneficial because they spur businesses on to generate and exchange more and more goods, which benefits the public interest.

This kind of thinking becomes more manifest in more recent court findings that more and more clearly articulate the public purpose of business. It begins with the case of *AP Smith Manufacturing Company v. Barlow et al.*, which was filed in 1953, in which the court provided something like legal permission to perform actions that primarily promote the public good, as long as there is a demonstrable secondary benefit to the shareholders.

AP Smith Manufacturing Company was incorporated in 1896 and produces equipment for the water and gas industries. The company is located in New Jersey and had around 300 employees, and furthermore, the company had a history of donating funds to local educational institutions. The subject of the case was a $1,500 donation to Princeton University, which was approved by the board of directors and authorized by the president of the company. The shareholders of AJ Smith disputed this allocation of corporate funds as disadvantageous to their interests and filed suit. The president of the company argued that the donation was a good investment for the business for the following reasons: (1) donating money to educational institutional promotes goodwill among members of the community, who have an expectation that their local corporations will act in socially responsible ways, and (2) contributing to educational institutions will help secure an able and efficient workforce in the future. In addition, the chairman of Standard Oil, writing as a friend of the court, also argued that corporations are expected to acknowledge their responsibilities to support the system of free enterprise (and since free enterprise depends on educated workers, supporting free enterprise means supporting educational institutions). Furthermore, the chairman argued that it is not good business to disappoint a societal expectation, and finally, he contended that businesses, as a whole, should not take from the community without giving back.

The court agreed with the arguments of the plaintiff and, in the majority opinion, offered the following thoughts. When wealth was primarily in the hands of individuals, they discharged their responsibilities by donating their wealth for charitable purposes. However, on account of the fact that wealth has been largely transferred to the corporation and that individuals now suffer under an increasing tax burden, individuals are no longer able to support charitable causes in the same manner as they used to, which is troubling since the need is even greater now than it was before. Therefore, individuals have turned to corporations to assume the modern obligations of good citizenship in the same way that humans do. Moreover, corporate contributions in the area of education are really an investment in the business since corporations will be an important beneficiary of a well-run and well-funded educational system.

In contrast to the *Dodge v. Ford Motor Co.* case, legal opinions that offer a defense of activities more beneficial to society while taking the shareholder into account become an important milestone for advocates of the doctrines of stakeholder theory and corporate social responsibility. Generally, those doctrines would hold that businesses have responsibilities above and beyond those to the shareholders. Businesses are entities that act like citizens in a community and have a range of duties to all those who have a stake in the business.

—Ronald F. Duska and Julie Anne Ragatz

Business Ethics

Although defining business ethics has been somewhat problematic, several definitions have been proposed. For example, Richard De George defines the field broadly as the interaction of ethics and business, and although its aim is theoretical, the product has practical application. Manuel Velasquez defines the business ethics field as a specialized study of moral right and wrong. Unfortunately, a great deal of confusion appears to remain within both the academic and the business communities, as other related business and society frameworks, such as corporate social responsibility, stakeholder management, sustainability, and corporate citizenship, are often used interchangeably with or attempt to incorporate business ethics. Relative to other business and society frameworks, however, business ethics appears to place the greatest emphasis on the ethical responsibilities of business and its individual agents, as opposed to other firm responsibilities (e.g., economic, legal, environmental, or philanthropic).

A Brief History of Business Ethics

The subject of business ethics has been around since the very first business transaction. For example, the Code of Hammurabi, created nearly 4,000 years ago, records that Mesopotamian rulers attempted to create honest prices. In the fourth century BCE, Aristotle discussed the vices and virtues of tradesmen and merchants. The Old Testament and the Jewish Talmud discuss the proper way to conduct business, including topics such as fraud, theft, proper weights and measures, competition and free entry, misleading advertising, just prices, and environmental issues. The New Testament and the Koran also discuss business ethics as it relates to poverty and wealth. Throughout the history of commerce, these codes have had an impact on business dealings. The U.K. South Sea Bubble of the early 1700s, labeled as the world's first great financial scandal, involved the collapse of the South

Sea Company. During the 19th century, the creation of monopolies and the use of slavery were important business ethics issues, which continue to be debated until today.

In recent times, business ethics has moved through several stages of development. Prior to the 1960s, business was typically considered to be an amoral activity; concepts such as ethics and social responsibility were rarely explicitly mentioned. During the 1960s, a number of social issues in business began to emerge, including civil rights, the environment, safety in the workplace, and consumer issues. During the late 1970s, the field of business ethics began to take hold in academia, with several U.S. schools beginning to offer a course in business ethics by 1980. From 1980 to 1985, the business ethics field continued to consolidate, with the emergence of journals, textbooks, research centers, and conferences. From 1985 to 1995, business ethics became integrated into large corporations, with the development of corporate codes of ethics, ethics training, ethics hotlines, and ethics officers. From 1995 to 2000, issues related to international business activity came to the forefront, including issues of bribery and corruption of government officials, the use of child labor by overseas suppliers, and the question of whether to operate in countries where human rights violations were taking place. From approximately 2000 until today, business ethics discussion has mainly been focused on major corporate scandals such as Enron, WorldCom, and Tyco, leading to a new phase of government regulation (e.g., the Sarbanes-Oxley Act of 2002) and enforcement.

This current "scandal" phase of the business ethics field has tremendously enhanced its popular use. For example, a search in Google using the term *business ethics* (as of November 2005) generates over 88 million hits. Hollywood continues to portray important business ethics issues or dilemmas in movies such as *Wall Street, Quiz Show, Boiler Room, Erin Brockovich, The Insider*, and *Jerry Maguire* and even in children's films such as *Monsters, Inc.*

Moral Standards and Business Ethics

Although the field of business ethics covers a broad range of topics, the core of the field is based in moral philosophy and its use of moral standards (i.e., values, principles, and theories) to engage in ethical assessments of business activity. A literature review indicates that five moral standards have been applied in the field of business ethics to a greater extent and with greater consistency than others. Two moral theories are particularly dominant in the business ethics literature: utilitarianism and deontology. Utilitarianism, often expressed as a teleological or consequentialist framework, is primarily based on the writings of Jeremy Bentham and John Stuart Mill. Deontology (i.e., duty-based obligations) is often expressed in terms of "Kantianism" (or more specifically as the principle of the categorical imperative), being primarily based on the writings of Immanuel Kant. In addition to utilitarianism and deontology, two other moral theories (typically considered deontological in nature) have been used extensively in the business ethics field: moral rights and justice (e.g., procedural and distributive). The fifth moral theory receiving attention appears to be moral virtue, being primarily based on the writings of Aristotle. The predominant use by business ethicists of these moral theories points toward their importance in the field. Other important moral standards that are also used (although to a somewhat lesser extent) in the field of business ethics include moral relativism, ethical egoism, and religious doctrine.

There have been several means by which moral standards have been applied in business ethics. Some of the more apparent ways are (1) individual ethical decision making; (2) organizational ethical decision making (e.g., policies and practices); (3) the moral evaluation of business systems (e.g., capitalism) and the marketplace (e.g., competition); (4) the relationship between business and society (e.g., corporate social responsibility); and (5) specific issues in business (e.g., affirmative action and discrimination, conflicts of interest, privacy, whistle-blowing, executive compensation, consumer protection or marketing, and international business). In conjunction with the above are the uses made of moral standards with respect to both teaching and research in business ethics.

Business Ethics as an Academic Field

Richard De George might be considered the first to attempt to distinguish business ethics as a separate field of study. De George suggests that business ethics is a field to the extent that it deals with a set of interrelated questions to be untangled and addressed within an overarching framework. He argues that the framework is not supplied by any ethical theory (e.g., Kantian, utilitarian, or theological) but by the systematic interdependence of the questions, which can be approached from various philosophical, theological, or other points of view.

Despite business ethics being a relatively recent distinct field of study, several typologies have emerged. There appear to be five general approaches: (1) a normative and descriptive approach, (2) a functional approach, (3) an issues approach, (4) a stakeholder approach, and (5) a mixed approach. For example, in terms of the normative/descriptive approach, academic business ethics research is often divided into normative (i.e., prescriptive) and empirical (i.e., explanatory, descriptive, or predictive) methodologies. A functional approach attempts to divide the subject of business ethics into separate functional areas such as accounting, finance, marketing, or strategy. Others attempt to categorize business ethics by using an "issues" approach—in other words, by discussing issues such as the morality of corporations, employer-employee relationships, or other contemporary business issues. Another approach attempts to discuss the subject of business ethics from a stakeholder perspective (i.e., in relation to which stakeholder is most directly affected). For example, business ethics issues might be framed based on the following stakeholders: owners, employees, consumers, suppliers, competitors, the government, the natural environment, and the community. Finally, a mixed approach draws on aspects of several of the approaches (e.g., normative/descriptive, issues, and stakeholder) and appears to be the most popular approach used by business ethics academics. For example, quite often business ethics textbooks will commence with a normative discussion of moral theory and business systems. The discussion will then turn to a more mixed normative/descriptive discussion of the specific issues. In addition, many of the issues are tied to stakeholders, typically involving employees and customers.

In terms of business ethics research, in a review of the first 1,500 articles published in the *Journal of Business Ethics* from 1981 until 1999, Denis Collins found the presence of the following major business ethics research topics: (1) prevalence of ethical behavior, (2) ethical sensitivities, (3) ethics codes and programs, (4) corporate social performance and policies, (5) human resource practices and policies, and (6) professions—accounting, marketing/sales, and finance/strategy.

Major Early Contributors to Business Ethics

Several important early contributors to the field of business ethics, mainly through their initial textbook publications, include Norman Bowie, Richard De George, Manuel Velasquez, Thomas Donaldson, W. Michael Hoffman, Patricia Werhane, John Boatright, and many others too numerous to mention. John Fleming conducted a study in 1987 to determine among other things the most referenced authors, books, and articles in business ethics. The top five referenced authors were (1) Milton Friedman, (2) Christopher Stone, (3) Thomas Donaldson, (4) Peter French, and (5) Alasdair MacIntyre. The top three referenced books were (1) Christopher Stone, *Where the Law Ends*; (2) Thomas Donaldson, *Corporations and Morality*; and (3) John Rawls, *A Theory of Justice.* The top three referenced articles were (1) Brenner and Molander, "Is the Ethics of Business Changing?"; (2) Peter French, "The Corporation as a Moral Person"; and (3) Milton Friedman, "The Social Responsibility of Business Is to Increase Its Profits."

Business Ethics Today

Based on early efforts, the field of business ethics continues to flourish in both academia as well as the business community. For example, a search (as of November 2005) using the database ABI/Inform for the term *business ethics* found in scholarly journal articles generates over 11,000 hits. Several important academic journals now exist, including *Journal of Business Ethics, Business Ethics Quarterly, Business & Society, Business Ethics: A European Review,* and *Business & Professional Ethics Journal*, among others. Business ethics conferences are held annually, including those conducted by the Society for Business Ethics and the European Business Ethics Network. Every 4 years, the International Society of Business, Economics and Ethics organizes a World Congress on Business Ethics, often portrayed as the "Olympics of Business Ethics." Research centers such as Bentley College's Center for Business Ethics, Wharton's Zicklin Center for Business Ethics Research, or the Ethics Resource Center based in Washington, D.C., continue to support research efforts in the field of business ethics. Surveys suggest that approximately two thirds of the top U.S. business schools now teach business ethics as either a mandatory or an elective stand-alone course. In the corporate world, the growth of ethics officers as well as the Ethics & Compliance Officer Association, ethics programs (e.g., codes of ethics, ethics hotlines or helplines), ethics audits and reports, ethical investment, and even corporate business ethics awards highlight the growing practical importance of the field. Consulting efforts in the business ethics field appear to have grown significantly as well due to the various corporate scandals and the desire of firms to avoid them in the future.

Yet despite the growth of business ethics and the apparent acceptance of its importance among many, several issues are being debated. For example, can business ethics be taught? What factors actually influence ethical behavior? What should a firm's ethical obligations (i.e., beyond the law) consist of? Does ethical behavior actually improve the firm's financial performance? Is a firm capable of being held morally responsible, or only the firm's agents? How can business ethics best be integrated into a firm's corporate culture? These issues, as well as many others, remain to be examined and debated by those active in the business ethics field.

Business Ethics and Health Care

The health care industry faces several aspects of ethical considerations in the business aspects of their practice. The challenges facing the industry are first outlined, followed by some ethical frameworks and guidelines that might be helpful in resolving these issues. A practical checklist of questions that health care providers should try to address as they face various ethical dilemmas in the business aspects of their profession is finally outlined.

Challenges in the Health Care Industry

The following are some of the major challenges facing the health care industry today.

Clinical Health Care Ethics

These are issues that deal with the practice of clinical medicine that physicians and their patients encounter as they work together to diagnose and receive treatment, respectively, for the disease. For example, who has the right to keep or stop the life-supporting devices? Does a badly wounded patient have the right to refuse medical care? Should euthanasia be considered legal? Who is eligible for an organ transplant, and how should the decision be made? Should the health care system encourage assisted reproduction or abortions?

Scientific Bioethics

This relates to the ethical questions associated with medical progress. For example, should humans be used as experimental research subjects? Should genetic and neuroscience research be allowed to progress? Are cloning and stem cell research ethical? Should the use of randomized trials—that is, studies in which the patient is randomly assigned to either the experimental or the control group—raise ethical problems?

Cultural Ethics

Does the fact that there are different cultural norms for ethical behavior imply that all ethical norms are relative to the cultures in which they are found and are valid only in that time and place? Does it assume that there are no universal ethical norms that transcend the borders of culture, tradition, and history? This happens more acutely when persons from one cultural tradition encounter the health care of another culture. For example, how do people of a particular country view the authority of physicians? How do people of specific religious denominations feel about abortion or about life support technology? Should a doctor inform a patient that he or she has cancer, even if it is inappropriate according to the patient's culture? How should a gynecologist from a Western country react to genital mutilations of young African patients, especially when their mothers vigorously defend the practice as holy and good for women?

Religious Freedom Versus Patients' Rights

Health workers and patients have clashed when service providers have refused to give care that they feel violates their beliefs, resulting in an intense and complex debate over religious freedom versus patients' rights. On the one hand, those who believe in a "right of conscience" for health workers argue that there is nothing more dutiful and courageous than protecting individuals from being forced to violate their moral and religious values, while patient advocates and others point to a long tradition in medicine of having an ethical and professional responsibility of putting patients first.

Should an ambulance driver refuse to transport a patient for an abortion because of his or her beliefs? Should fertility specialists rebuff a gay woman seeking artificial insemination? Should a pharmacist turn away a rape victim seeking the morning-after pill? Should anesthesiologists refuse to assist in sterilization procedures? Should gynecologists be allowed to decline prescription of birth control pills? Should doctors be allowed to reject requests for Viagra from unmarried men?

After the historic 1973 *Roe v. Wade* decision, many states passed laws protecting doctors and nurses who do not want to perform abortions. Oregon's monumental 1994 legalization of physician-assisted suicide, however, allowed doctors and nurses an opportunity to decline to participate.

Marketing Practices in the Health Care Industry

The ethical aspects of the marketing practices of the health care industry are best studied under the rubric of the four Ps—that is, product, price, promotion, and place. Each of these Ps raises its own characteristic set of ethical questions as discussed below.

Product

The word *product* raises questions about product safety, availability, and efficacy. Are medical products and services available in the market truly effective? Is it ethical to sell products to patients under false pretenses if they are likely to be better off without it? Should pharmaceutical companies focus more of their research development efforts on "life-enhancing" drugs versus "life-saving" drugs?

Promotion

The health care industry has used extensive promotional tools, such as advertising, personal selling, and publicity and public relations to market their products to medical professionals as well as consumers at large. In many cases, marketers and advertisers work side by side with major researchers in positioning new drugs as potential bestsellers. One such technique is to employ ghostwriters to write articles for medical journals that tout the benefits of the new products. They also recruit other doctors with expensive fees, whose opinions are valued, to speak to peers about the drugs' benefits.

Drug companies are prohibited from promoting their products before the approval of the Federal Drug Administration or from promoting them for unapproved uses. Critics also contend that advertisers are also influencing the clinical drug trials, while the latter disagree and note that they are tightly regulated.

Price

Over 12% of the gross national product of the United States is spent on health care, and there is a lot of debate on how health care costs can be contained and made affordable for the common citizen. Other issues include the appropriateness of bundling of medical services through physical-hospital organizations and the appropriate pricing of life-saving drugs for diseases such as AIDS in the poorer regions of the world.

Placement

Placement issues refer to the "distribution channel" aspect of marketing: the possible avenues through which customers gain access to the product or service. The following are some salient issues. Is rationing of health care ethically defensible? Who makes rationing decisions? How should access to health care be structured based on whether it is offered through private insurance or government programs?

The Ethical Frameworks

According to a report by the *Woodstock Theological Center,* health care professionals have three different but interrelated sets of responsibilities. The first and foremost responsibility of physicians, nurses, hospital executives, therapists, health educators, and other health care professionals is to attend to the health needs of the individuals in the communities they serve. This includes taking appropriate and reasonable measures to prevent serious illness or injury in the healthy, curing and alleviating the suffering of the sick, and comforting the dying. The next level of responsibilities is to administer and use wisely the physical, technological, financial, and human resources available to health care professionals in meeting the needs of the communities they serve. The final set of responsibilities is for continued enhanced research, education, and scientific advancement so that the quality of care available for patients and the efficiency and efficacy with which those resources are used can be improved gradually.

Health care professionals typically have to face all the above responsibilities in various shapes and forms. The following section presents the benchmarks for ethical decision making by health care professionals as they undertake these responsibilities.

Compassion and Respect for Patients

Health care professionals must be committed, first and foremost, to the welfare of their patients. Respect for human dignity forms the basis for compassion, honesty, integrity, and confidentiality. It is unethical for individual health care providers to exploit the vulnerability of the patient and benefit monetarily. Institutional health care providers have a primary responsibility to serve the patient and to ensure adequate facilities, equipment, supplies, support staff, and services, while executives and trustees are responsible for fostering institutional cultures that focus on patient care.

Commitment to Professional Competence

Health care providers have an obligation to keep up with the latest developments in their field and the benchmarks for "best practice" in their respective fields. Inadequately trained, misinformed, or inexperienced physicians and practitioners can not only cause harm to the patients but also drive up costs by misdiagnosis, administrating inappropriate treatments, or ordering unnecessary tests. "Competence" by executives and trustees also involves creating a climate that rewards delivery of quality care and encourages cost-saving innovations and an efficient, yet flexible and realistically designed, system.

Commitment to Spirit of Service

Given the exorbitant costs of medical care and the vast number of people who are unable to afford it, health care providers should be mindful of the high standards required by the social covenant and exercise their community responsibilities by providing uncompensated or reduced fee service to needy patients and by implementing public policies that allow poor and uninsured people to receive adequate care. The "not-for-profit" institutions should particularly be cognizant of these obligations to serve the community, given the tax benefits received by them.

Honesty

Health care professionals also have an ethical obligation to be honest and truthful about a patient's condition, appropriate treatments, and related costs and provide this information to the patient or an appropriate guardian. They are also obliged to keep accurate and truthful medical records and also to provide truthful and accurate information to third-party payers. The executives of hospitals and managed care organizations are also obligated to foster a culture that avoids deceitful practices. Finally, intellectual honesty enhances professional competence. Professionals should acknowledge their doubts, be open to new ideas, and seek second and third opinions from colleagues when they are unsure of a diagnosis or a proposed path of treatment.

Confidentiality

Health care professionals have an obligation not to divulge intimate details of a patient's illness or condition without the individual's permission, except as required by law. The only exceptions are in extreme cases when there is a threat of serious harm to the patient or to other individuals at risk by exposure to the patient. Third-party payers, such as insurance companies, should only be provided information that is legally required. Newer patients should be provided a thorough explanation of what information is recorded, how it is used, who has access to that information, and what the rules may mean to the patient.

Good Stewardship and Careful Administration

Even though the primary responsibility of the health care industry is to take the best care of the patient, they must also be aware of their gatekeeper role in managing costs. Professionals should carefully balance the relative costs with the potential of benefits of alternative therapies for their patients, counsel the latter about these issues, and work with third-party payers to encourage treatments that are the most cost-effective. It is also imperative to maintain detailed and accurate records as well as assist public health authorities in gathering information on issues such as the effectiveness of new therapies and the spread of diseases. Executives are responsible for a wide range of administrative, financial accounting, providing useful information about services, costs, and patient outcomes to various stakeholders, such as physicians, patients, third-party payers, and government regulators.

Health care ethics is not just about patient-related decisions but about decisions made by executives and in boardrooms, as these people play their roles as various stakeholders, such as health care providers, employers, community service organizations, and citizens of the community. Health care industry professionals face the day-to-day challenges of making sound decisions on the basis of ethical guidelines and criteria based on the understanding that the health care organization is committed to patients' rights, the careful use of resources, just working conditions for the employees, and service to the community.

Business Ethics Research Centers

Business ethics research centers are organizations dedicated to the study of what is good or right for individuals and groups of individuals engaged in business activity. Since business ethics is a form of applied ethics (a branch of philosophy), the work of these centers is concerned with taking theoretical ethical concepts and principles and applying them in the real world. More particularly, business ethics research centers investigate and analyze the application of such concepts and principles to business decision making and action and consider the ramifications across the entire range of business functions, including the management of legal compliance, risk, stakeholder relationships, and business reputation, to name just a few. This investigation and analysis usually has the aim of developing greater awareness and understanding of ethical issues in the business environment and promoting best practices to address them. Accordingly, business ethics centers are most effective when they bridge theoretical inquiry and practical application and guide organizations in the development of ethical business cultures.

Business ethics centers are generally not-for-profit organizations, and although most have been established within business schools and universities, some exist independently. Funding and support for institution-based centers are usually provided by the host institution or by corporate and individual donors, government grants, revenue-generating activities (such as executive education programs, conferences, and publishing), and sometimes by all these sources in combination. There are some institution-based centers that derive funding from consulting activities. Independent centers may generate funding from similar sources, with consulting revenues likely to contribute a proportionately greater share in many cases. Typically, centers are small with a full-time director, one or more research and consulting staff members or associates, and several full- and part-time support staff. In the university setting, it is common for faculty members to be affiliated with such centers. They are often charged with teaching business ethics within a broader discipline-based curriculum and, especially now in business schools, integrating the subject into students' general education.

History and Geographical Distribution

Significant active research in business ethics began in the mid-1970s as the field became more widely recognized as a legitimate subject for study and teaching. Demand for such research was driven by the heightened social and ethical consciousness that emerged in the wake of a decade of civil unrest, environmental concern, and consumer enfranchisement—and especially after a series of high-profile scandals such as Watergate and the aerospace industry bribes.

There are over 200 centers worldwide, more than 120 of which are in the United States alone. The majority have been established in an academic setting, but most centers are characterized by an outward focus and a desire to provide practical assistance to business communities around the world. The earliest business ethics centers were established in the United States in the 1970s, with Europe, Canada, and Australia following in the 1980s. Among the oldest business ethics centers are the Center for Business Ethics, founded in 1976 at Bentley College in Waltham, Massachusetts, and the Olsson Center for Applied Ethics, which became active around the same time in the Darden Graduate School of Business Administration, at the University of Virginia. Countries and regions that became significant for interest in business ethics in the 1990s, and that saw the creation of research centers, include Latin America, South Korea, Hong Kong, Japan, and South Africa.

The Work of Business Ethics Research Centers

The particular focus of individual centers varies widely but, in general terms, all are concerned to stimulate, support, conduct, and disseminate research related to business ethics and corporate social responsibility (see the next section). Very few centers now concern themselves solely with conducting or collecting research. Even when the majority of a center's time and resources are used in this way, it is likely that there will be subsidiary activities such as organizing occasional conferences or publishing reports. Most centers have multiple functions, often a combination of research with teaching and the preparation of teaching materials, organizing conferences and seminars, and the provision of speakers and scholars for media interviews. A growing number of centers offer advisory and networking services to corporations and other organizations. Some centers are repositories for books, journals, videos, and corporate ethics materials. Among centers that publish business ethics newsletters or magazines, the trend is toward online publications to enable more timely and cost-effective dissemination of ideas and information. The Ethics Resource Center in Washington, D.C., and the Institute of Global Ethics in Camden, Maine, have been notable trendsetters in this regard.

Centers differ in the degree of specialization within the field of business ethics, ranging from an interest in business generally to a specialist focus on particular industries or professions. Prominent centers in the former category include the Zicklin Center for Business Ethics Research at Wharton, University of Pennsylvania; the Center for Business Ethics at Bentley College; and the Institute of Business Ethics in London. At the other end of the spectrum is the Isbell Center for Hospitality Ethics at Northern Arizona University and the Silha Center for the Study of Media Ethics and Law at the University of Minnesota.

Widening Research Focus

Since the mid-1990s especially, the field of business ethics research (which, as noted below, has always been an interdisciplinary pursuit) has widened further to place greater emphasis on matters external to business organizations. While it remains important to study the design and implementation of internal corporate strategies, policies, and structures to ensure legal compliance and ethical conduct, corporations have become increasingly concerned with the obligations, relationships, and risks associated with outside stakeholders, including shareholders, customers, suppliers, strategic partners, communities, the media, and the environment. This wider definition of business ethics has led research centers to recognize and embrace a blurring of the boundaries with fields such as corporate social responsibility (CSR)—sometimes now called corporate responsibility—and corporate governance. This has happened in Europe and elsewhere to a greater extent than in the United States, where CSR is generally less advanced and tends to focus on philanthropic issues, as opposed to more strategic concerns such as sustainable development and the integration of economic, social, and environmental issues (the so-called triple bottom line).

Effect of Major Corporate Ethics Scandals

Numerous high-profile corporate scandals occurring between 2001 and 2004—especially in the United States—and the forceful regulatory response to them have done much to reinvigorate discussion and inquiry about ethical best practices in business. Inevitably, this has focused attention on existing business ethics research centers, as recognized experts in the field, and led to the establishment of new ones. The unprecedented magnitude and frequency of the corporate ethics scandals, involving corporations as large and ostensibly successful as Enron, WorldCom, Parmalat, and Tyco, is having at least two significant consequences for the field of business ethics and for the research centers that study it. First, while the short-term effect of the scandals (in the United States, at least) was the introduction of comprehensive, compliance-focused legislation such as the Sarbanes-Oxley Act of 2002—designed primarily to ensure greater accountability, responsibility, and transparency in the financial reporting of public corporations—there seems to be a longer-term consequence with possibly greater significance: an accelerated and widespread realization that a rules-based approach to business ethics is a necessary but insufficient requirement for ensuring ethical behavior in organizations. More than this, there needs to be an underlying commitment, embraced at the highest level of the organization, to operating in a manner that is consistent with clearly defined and appropriate organizational values, which will guide ethical decision making and positively influence the corporate culture.

The second significant development, arising largely out of the first, is the wider recognition of the critical influence of organizational culture in either promoting or discouraging ethical business conduct. A notable indication of these developments, and the fact that they are already shaping public policy and legislation, was the U.S. Sentencing Commission's amendment, in November 2004, of the Federal Sentencing Guidelines for Organizations to include the word *ethics* for the first time, as distinct from rules-based "compliance." Furthermore, the amended Guidelines emphasize the importance of organizational culture and the responsibility of senior management and the board of directors for positively influencing that culture.

Research centers have been advancing the understanding of values-driven management techniques for some time, and considerable research has been carried out on the importance of corporate culture. Centers are likely to redouble their efforts in these areas. Thus, although currently in the United States a compliance-led, legalistic approach continues to predominate, there are some obvious signs of a changing emphasis, and business ethics research centers are likely to be a driving force, as corporations look to the results of empirical research in shaping best practices.

Influence of Centers on Business Ethics Teaching

The frequency and magnitude of corporate scandals occurring since 2001 prompted questions to be asked (especially in the United States) about the adequacy and rigor of business education—specifically, whether business schools properly address the ethical dimension when educating tomorrow's managers and business leaders. This is a debate in which business ethics centers have participated energetically. The debate has focused not only on whether business schools have been including sufficient ethics-related material in their courses but also whether they are integrating business ethics throughout the curriculum. The Association to Advance Collegiate Schools of Business (AACSB) has promoted the teaching of business ethics in business schools since the 1980s; indeed, ethics education has been included in AACSB's accreditation standards since 1991. Although the standards issued by AACSB in 2003 do not contain specific ethics course requirements, there are concerns that many business schools are taking a minimalist approach, including just sufficient ethics content in their MBA programs to satisfy the AACSB mandate, with ethics courses disappearing slowly as programs have been redesigned. This situation is not peculiar to the United States, because a 2004 study in the United Kingdom concluded that business ethics occupied a more marginal position within the curriculum than previous studies had suggested. Furthermore, there is evidence in Australia that business ethics is still sidelined in business schools' curricula and is not yet a mainstream subject in business management programs.

Universities that host business ethics research centers are clearly at an advantage when it comes to establishing credentials in this critical area of business education. A number of centers located on university campuses have begun initiatives that aim to infuse discussion, teaching, and learning about business ethics throughout the curriculum and the campus community. Some, such as the Center for Business Ethics at Bentley College, have been successful in educating a broad range of faculty members on how to explore the ethical dimensions of business in their own classes, as opposed to bringing in specialist ethics professors. Other centers, such as the Center for Ethics and Business at Loyola Marymount University, have used strategies such as intercollegiate ethics case competitions to raise the profile of business ethics teaching.

Relationships With the Business Community

The renewed focus on business ethics in recent years has led many corporations to look for ways to demonstrate a visible commitment to promoting ethical business practices. One way in which some companies have tried to do this is by aligning themselves with business ethics centers and providing funding for them. Some centers have taken their sponsor's name, such as the Prudential Business Ethics Center at Rutgers University. In some cases support has taken the form of a philanthropic venture, such as the Merck Company Foundation's financial support for a number of business ethics centers, including the Ethics Resource Center (Washington, D.C.), the Gulf Center for Excellence in Ethics (Abu Dhabi, U.A.E.), and the Ethics Institute of South Africa (Pretoria). In other cases, corporate support has occurred through strategic alliances, as in the case of the LRN-RAND Center for Corporate Ethics, Law and Governance, founded in 2004 to study the ways in which businesses can best conduct operations ethically, legally, and profitably at the same time. Another notable development has been the establishment of the Business Roundtable Institute for Corporate Ethics at Darden Graduate School of Business Administration, University of Virginia. Here, an association of 160 chief executive officers of leading U.S. corporations has linked with a business school with the expressed intention of building and sustaining public confidence in the marketplace, in the wake of corporate misdeeds.

The funding of ethics centers by corporations, which—as previously noted—can involve naming them or their programs after the sponsor (or one of its executives), is considered problematic by some. To be sure, such partnerships can be enormously valuable to nonprofit centers with limited sources of funding and can enable resources, facilities, and programs to be expanded, generally making the centers more effective in their work. However, when a center takes a corporation's money or its name, it can present ethical issues that both partners need to address carefully. The questions that may need to be considered include the following. Are the values and missions of the two partners properly aligned, and is this really a good fit? What conditions, if any, are attached to the funding? What safeguards are in place to ensure that the center's research objectivity is not compromised? Are there actual, potential, or perceived conflicts of interest? If the corporate sponsor should subsequently attract bad publicity, what contingencies are in place to prevent or minimize damage to the center's reputation and credibility by association? In that event, could or should the center change its name or return the money received previously? Clearly, there are advantages to the business ethics movement both in improving ethics centers' access to funding (especially when they operate on a nonprofit basis) and in bringing about greater interaction with the private sector, since both increase the opportunities for advancing knowledge and learning and facilitating dialogue and the exchange of ideas. Nevertheless, there is a balance to be struck between these laudable objectives and the risks inherent in pursuing them in particular ways. Such risks (actual, anticipated, or perceived) need to be identified, quantified, and addressed.

Research Methodologies

A feature of business ethics research is that it draws on other disciplines and contributes to them, and therefore, business ethics research centers are, by necessity, interdisciplinary in their approach. Richard De George, a leading business ethics scholar, has observed that this field of study derives its descriptive component from the work of economists and those who study business and corporations from sociological, psychological, and other social scientific perspectives; it requires the theory of organization, management, and business activity provided by professors of business; and it requires the systematic development and application of moral norms and normative theory provided by philosophers and theologians. The field is essentially interdisciplinary because all the above disciplines (and more) are necessary for the study of business ethics, and each discipline is to some extent changed by its union with the others.

Research methodologies employed at centers differ widely, depending on the nature of the subject matter, the research objectives, and the resources available. Some centers conduct empirical research to investigate, evaluate, and explain companies' practices, using qualitative methods such as case studies and interviews, as well as quantitative analysis of large-sample survey data that might have been gathered with the assistance of a specialist survey firm. Research is also carried out using secondary sources, such as companies' annual reports and accounts and other corporate publications, public filings, media coverage and directories, as well as other academic research that has already been published. The work of some centers requires a greater degree of theoretical abstraction, grounded in the discipline of philosophy.

There is a trend toward cooperation in business ethics research, with the establishment of numerous alliances, especially between business and academia. This may help strengthen the base of the field, especially in parts of the world where business ethics is still a relatively new formal discipline.

The Future

In the early years of the 21st century, business ethics research centers have achieved greater prominence than previously, as the value of their work to society has been more fully recognized. There are encouraging signs that perceptions of ethics as "soft" and peripheral to the real challenges of business may be on the wane. There is certainly heightened awareness—in the business community, the marketplace, academia, government, and society generally—of the potentially savage economic and social consequences of unethical business conduct. This has shone new light on the need for greater understanding of ways to align our thinking and actions with appropriate values and promote business cultures in which ethical conduct will flourish. As business ethics research centers seek to drive this pursuit forward, they are likely to face at least three significant challenges: (1) in overcoming the still widespread misconception that ethics is a matter of legislation and enforcement, and what might be termed the "check-box" mentality that pervades many corporate efforts to ensure integrity; (2) in more fully exploring the relationship of business ethics to other disciplines and fields, so that business can more easily see the benefits and opportunities of an integrated approach to addressing its evolving responsibilities in contemporary society; and (3) in finding increasingly innovative and engaging ways to sample, analyze, and present data such that the relevance of ethics to business is understood by all and disputed by none.

Business Ethics Scholarship

Business ethics scholarship is usefully divided into three distinct categories of research: conceptual, normative, and descriptive. Conceptual scholarship seeks to advance our understanding of certain mental concepts that inform our understanding of business. Normative scholarship seeks to clarify the purposes of business and the ethical constraints under which businesspeople should operate. Descriptive scholarship seeks to explain and predict business practices.

In the 1970s, philosophers working in normative ethics found that more specialized attention to the practice of business was necessary to assess the ethical status of specific business practices and provide guidance to ethical managers. This increase in specialization paralleled a similar increase in specialization by philosophers working on normative questions in bioethics and seeking to counsel physicians. Since that time, both business ethics and bioethics have become increasingly specialized as fields of applied ethics. Historically, normative business ethicists have approached the subject from distinct theoretical perspectives, such as Kantianism, libertarianism, and contractarianism. Descriptive business ethicists have approached the subject using lenses such as cognitive developmental psychology and institutional theory. In recent years, both normative and descriptive business ethicists have begun to specialize in specific areas of inquiry and research, such as ethics and financial services, marketing ethics, ethics in human resources, ethics in information technology, international business ethics, and business ethics and the natural environment.

Conceptual Scholarship

To properly understand and assess the practice of business and to prescribe specific constraints on businesspeople and business organizations, philosophers and social theorists have analyzed key concepts and defended particular understandings of those concepts. For example, there is an extensive literature on the ontological status of organizations that seeks to clarify our knowledge of concepts such as corporate intentionality, corporate personhood, corporate agency, corporate moral responsibility, moral imagination in business, and both negative and positive deviancy in business. It is only after such concepts are clarified that questions concerning the moral status of organizations can be understood. For example, if a corporation is properly understood as a moral agent, then it is possible to praise or blame corporations and not just the directors, executives, managers, and workers of a corporation at a particular time. Punishment of the corporation, and not just the corporate personnel, is thereby justified when corporate intentions are morally objectionable. Without such conceptual scholarship, such judgments would be difficult to render.

Another important area of conceptual scholarship concerns stakeholder theory. The notion of a stakeholder was initially developed by R. Edward Freeman in response to the stockholder conception of the corporation. The stockholder conception holds that a corporation is an organization whose function is to serve the interests of shareholders. In this view, the obligation of the manager is to increase value for shareholders. Freeman has argued for more than 20 years that the stockholder conception of the corporation fails to accurately capture the purposes of the modern corporation. He argues that all corporations have stakeholders, persons who are helped or harmed by corporate actions and whose rights are either respected or violated by corporate managers. Stakeholder theorists seek to identify and prioritize stakeholders and thereby clarify the purposes of the modern corporation.

These are just two examples of the sort of conceptual work undertaken by business ethics scholars. All concepts related to business ethics are open to conceptual analysis by business ethicists. Such conceptual analysis typically lays the groundwork for more sophisticated work in normative and descriptive business ethics.

Normative Scholarship

Normative business ethics scholarship is distinct from both conceptual scholarship and descriptive scholarship in that such scholarship argues for or against particular business practices and thereby attempts to establish *norms* for the ethical conduct of business. One theory that is commonly associated with business is utilitarianism. This theory, whose most famous proponent was the 19th-century philosopher John Stuart Mill (1806–1873), holds that when actions promote overall welfare, they are right and when they do not promote overall welfare, they are wrong. According to utilitarianism, then, if business activities maximize the overall welfare of society, then those activities are justified. However, utilitarianism has been criticized for being unable to account for basic moral concepts such as the dignity of individual persons and justice. This may explain why utilitarianism is typically not used by business ethicists to defend or justify business practices and why there are few active research streams in utilitarian business ethics.

There is a range of other normative ethical theories that business ethicists use to inform their work. It is not possible to canvass each of these theories, or perspectives, in the space of this entry. Instead, this discussion focuses on three of the most active areas of research within normative business ethics: libertarianism, integrative social contracts theory (ISCT), and Kantianism.

Libertarianism

Libertarian theorists of the corporation hold in common the view that it is the obligation of publicly held corporations to maximize profits for shareholders within the bounds of certain moral side-constraints. The most well-known defender of a libertarian conception of the corporation was Milton Friedman, whose stockholder theory of the corporation remains influential despite having been subjected to significant criticism. Prominent 20th-century libertarian theorists, such as Friedrich Hayek, Robert Nozick, and Friedman, defended a core set of libertarian doctrines. These included the ideas that individual persons, rather than the community, should be regarded as the basic unit of social analysis; that individuals should be free to decide what is best for themselves so long as they respect this same freedom in others; and that government intervention in market exchanges should be minimized in the interest of freedom and economic prosperity.

Libertarian theories of the corporation are grounded in these ideas and hold in common the view that it is the responsibility of publicly held corporations to return profits to shareholders within the bounds of certain moral side-constraints. Moral side-constraints are blocks or restrictions against actions, and they may be either weak or strong. A weak-side-constraints view will require relatively few restrictions on corporate actions, whereas a strong-side-constraints view will require significantly more restrictions. Proponents of weak side-constraints ground these constraints in the rules or norms presupposed by the activity itself. In this view, moral side-constraints are grounded in notions of fair play. For example, in *Capitalism and Freedom*, Friedman argued that the normative function of the corporation is to use its resources and engage in activities designed to increase its profits so long as it stays with the rules of the game—that is, engages in open and free competition, without deception or fraud. The rules are determined by the will of the majority of citizens in democracies. Actions that do not violate the rules of the game are permissible, whereas actions that violate those rules are not.

This view has been widely criticized on numerous grounds. For example, it has been argued that this view cannot justify the negative impact of externalities produced by business. It has also been pointed out that this view presupposes the existence of a form of democracy that exists almost nowhere in the world. Denis Arnold has argued that the view is incoherent when applied in a global context, since many nations in which corporations operate, such as China and much of the Middle East and Africa, are undemocratic. Furthermore, he argues that even if such a democracy were found to exist, one that acted always in a manner consistent with the will of the people and never at the behest of corporate lobbyists, basic ethical norms would still need to be adhered to, irrespective of the will of the people. For example, one's right not to be enslaved should trump the collective will of a majority of citizens in a democratic society that approves of slavery.

This is a view shared by many libertarians. Proponents of strong side-constraints, such as Nozick, ground side-constraints in fundamental rights. Rights may be either negative or positive. Negative rights constitute shields against the unjust violation of individual freedoms. Positive rights, on the other hand, constitute entitlements to things that are necessary for the exercise of individual freedom. Libertarians famously embrace negative rights while rejecting positive rights. The possibility of defending such a position has proven difficult for libertarians in light of the criticisms leveled against the distinction by philosophers such as Henry Shue. Even Nozick admitted toward the end of his career that his arguments in this regard were unsuccessful. Libertarian business ethicists have also been criticized for failing to address in any serious manner the ways in which business interests exercise a coercive influence over governments and thus undermine democratic institutions.

Integrative Social Contracts Theory

One influential view among business ethics scholars is ISCT, developed by Thomas Donaldson and Thomas Dunfee. While ISTC owes much to contractarian ethical theory, it introduces a variety of new concepts, such as hypernorms and microsocial contracts, and as such is properly understood as the first new normative theory to be developed by business ethics scholars. Donaldson and Dunfee defend a pluralistic account of economic ethics. They reject extreme universalism on the grounds that it is incompatible with the toleration of a variety of diverse moral beliefs. They reject relativism on the grounds that it may sanctify inhumane ethics. Instead, they defend a social contract model that is tolerant of diverse ethical practices while ruling some practices out of bounds.

The social contracts approach for determining the ethical norms for economic ethics favored by Donaldson and Dunfee has three core components: hypernorms, macrosocial contracts, and microsocial contracts. At the global level, there are hypernorms. These are the fundamental principles or norms by which lower-order norms are to be derived. The sources of these hypernorms are intentionally left unspecified. That is, Donaldson and Dunfee are agnostic with respect to the ultimate source or sources of hypernorms. Hypernorms are divided into three distinct categories: procedural, structural, and substantive. Procedural hypernorms set the terms for contracting microsocial contracts implied in the macrosocial contracting situation. The terms specified are the right to exit the microsocial community and the right to exercise one's individual voice within the microsocial community. Structural hypernorms are described as the principles that support the core background institutions of society. These include the right to property, the right to fair treatment under the law, and necessary social efficiency. Finally, substantive hypernorms specify fundamental conceptions of the right and the good, especially with respect to economic activity. These hypernorms are derived from outside the macrosocial contracting situation. Substantive hypernorms such as prohibitions against bribery and gender discrimination are said to emerge from the convergence of religious, cultural, and philosophical beliefs around certain core principles.

Hypernorms are identified and validated by macrocontractors, who are imagined to convene in a sort of parliament of humanity. These rational global contractors would, according to Donaldson and Dunfee, derive the following macrosocial contract with the following terms for economic ethics:

1. Local economic communities have moral free space in which they may generate ethical norms for their members through microsocial contracts.
2. Norm-generating microsocial contracts must be grounded in consent, buttressed by the rights of individual members through microsocial contracts.
3. To become obligatory (legitimate), a microsocial contract norm must be compatible with hypernorms.
4. In cases of conflicts among norms satisfying macrosocial contract terms 1 to 3, priority must be established through the application of rules consistent with the spirit and letter of the macrosocial contract.

The hypernorms agreed to by macrosocial contractors are necessarily general and lack specific moral guidance. It is here that Donaldson and Dunfee believe that microsocial contracts can be useful. By microsocial contracts, they have in mind the extant agreements, both formal and informal, that exist within companies, industries, and other economic groups. These "microcontracts" are to be regarded as legitimate so long as they are consistent with hypernorms and authentic local norms.

ISCT has been criticized on numerous grounds. For example, several theorists have argued that it is relativistic with respect to substantive hypernorms and thereby fails to meet the theory's own internal standards of viability. In an even more penetrating critical assessment, John Boatright and others have argued that Donaldson and Dunfee have omitted too much ethical theory in their account of ISTC for it to be viable. They argue that by invoking religious and cultural norms as a basis for hypernorms, while eschewing traditional ethical theory, ISTC fails to provide reasonable grounds for businesses operating on the global stage to adhere to any one set of hypernorms.

A significant secondary literature on ISCT has been developed. Most of the constructive literature has been produced by social scientists who were persuaded by the efficacy of ISCT. Given the ambitiousness of the theory and its lack of theoretical foundations, the theory has not been taken up as a viable project by many philosophers. In defending ISCT against criticism, Donaldson and Dunfee rightly point out that they are the first business ethicists to examine the relevance of microsocial contracts in everyday economic life. This remains undisputed.

Kantian Business Ethics

One of the most significant traditions in ethics is derived from the work of the 18th-century German philosopher Immanuel Kant (1724–1804). Kant scholarship and Kantian ethics are two of the most important research streams in 21st-century philosophy. Kant scholars study the written works of Kant and attempt to advance our understanding of his work. For example, many Anglo-American readers of Kant take him to believe that it is always unethical to lie, even if doing so would save an innocent life. The Kant scholar Allen Wood has recently shown that this counterintuitive view is not Kant's view. This provides some indication of the ongoing importance of Kant scholarship.

Kantian ethics is a flourishing field in which contemporary philosophers advance the key insights of Kant while at the same time avoiding the difficulties that may be found in some of Kant's original arguments. Such work is increasingly used to provide a theoretical foundation for business ethics. For example, contemporary Kantian ethicists seek to better understand what duties are entailed by the Kantian doctrine of respect for persons. One prominent view holds that a proper understanding of the duty to respect persons yields a core set of managerial obligations. Such a view has important implications for business ethics. In particular, such a view suggests that corporate managers have specific duties to employees regarding health, safety, and working conditions, as well as to other stakeholders.

One of the most influential Kantian business ethicists is Norman Bowie. In his work, Bowie combines contemporary work in Kantian ethics with contemporary work in organizational theory and strategic management to advance discussion of the ethical practice of business. Bowie argues that managers have basic duties to respect their stakeholders and that such duties are compatible with the pursuit of profit. He argues that Kant's first formulation of the categorical imperative provides the basis for a theory of the moral permissibility of market transactions. The first formulation of the categorical imperative requires that actions be universalizable—that is, that everyone in like circumstances should be able to perform the action without self-contradiction. For example, deceiving investors about the financial condition of a firm is self-contradictory in the sense that if every business did this, faith in stock markets would collapse, investment in publicly held companies would stop, and publicly held companies would cease to exist. Market transactions that are consistent in this sense are morally permissible, whereas market transactions that are not are prohibited.

Bowie argues that managers have a duty to protect and promote the welfare of their employees. This duty is grounded in the second formulation of Kant's categorical imperative, which holds that one must always treat other persons as ends in themselves and never as only a means to an end. This means that managers must respect their employees. To do anything less would be to fail to properly respect the dignity of human beings. Examples of respecting employees include refraining from deceit, providing a living wage, and providing meaningful work. Arnold and Bowie argue that the Kantian doctrine of respect for persons also entails that managers of multinational corporations have the following duties in their off-shore manufacturing facilities: to ensure that local labor laws are followed, to refrain from coercion, and to meet minimum health and safety standards.

Bowie argues further that a proper understanding of the duties of managers regarding employees and other stakeholders requires that managers cultivate firms as moral communities. Some of the principles that he argues should guide the moral firm are as follows.

- The firm should consider the interests of all the affected stakeholders in any decisions it makes.
- The firm should have those affected by the firm's rules and policies participate in the determination of those policies and rules.
- It should not be the case that for all decisions, the interests of one stakeholder should trump the interest of all the others.
- When stakeholders come into conflict, the humanity of some stakeholders cannot be sacrificed merely because there are a greater number of stakeholders in the other set.
- Only principles that are universalizable may be adapted.

Unlike ISCT, the Kantian approach to business ethics is not susceptible to the criticism that it lacks sufficient theoretical foundations. Rather, critics argue that because of its theoretical foundations, the Kantian view is susceptible to all the criticisms that have been mounted against both Kant's ethics and Kant's metaphysics. Since this is the case, they argue, Kantian business ethics is not a viable research project. Kantians normally respond in one of two ways. First, they argue that the resurgence in work by Kantian scholars and Kantian ethicists in recent years has reinvigorated Kantian ethics and disarmed many traditional criticisms. Second, they argue that elements of Kantian ethics, such as the doctrine of respect for persons, can be assessed independently of other elements of Kant's philosophy and have been shown to merit allegiance in their own right.

Descriptive Scholarship

In contrast to normative business ethics, descriptive business ethics is not (or less) concerned with determining the moral status of an act in the business realm. Instead, it is concerned with explaining and potentially predicting the commission (or omission) of that act. Accordingly, descriptive business ethics adopts a social scientific perspective to business ethics topics. The social scientist who studies business ethics relies on factual evidence to make neutral descriptions of behavior related to morality and ethics and to support or refute theoretical explanations of the relationships between concepts. A social scientist might, for example, gather evidence about the role of tenure in embezzlement or the relationship between an organization's size and its propensity to overstate earnings and use such findings as a basis for a more general explanation of embezzlement or disclosure. While many believe that the descriptive and normative elements operate in parallel domains and that any interaction between the two threatens to violate the naturalistic fallacy (deriving an "ought" from an "is"), many business ethics researchers assume that empirical findings on business ethics can be integrated with normative implications in a perpetual cycle of learning that requires ongoing theoretical development, empirical validation, and the refinement of normative prescription.

The Scientific Method

The social scientific study of business ethics normally follows a generalized format. First, the researcher identifies a phenomenon of interest or a research question to be answered. Generally speaking, business ethics researchers are concerned with the phenomena of moral and/or socially responsible behavior as they relate to business practices or policy, but typically the phenomenon of interest or the research question itself is focused on a very specific practice or policy. Those who study whistle-blowing, for example, might ask what leads an individual to become a whistle-blower or what kind of treatment individuals might receive after they have reported unethical behavior in a company. Once the researcher has identified the research question, a theory is put in place to answer that question. The central concept of social science is the theory, a generalized statement about the relationship of two or more concepts. A theory might be developed through intuitive reasoning, grounded experience with the phenomenon (e.g., a case study, participation, observation), evidence from previous empirical work on related topics, or a combination of all three. The researcher then selects a methodology for testing that theory. In some cases, a theory will implicitly dictate the kind of methodology to be employed. If a theory, for example, purports causality, a methodology that establishes causality, such as an experiment in the lab or the field, is not only suitable but perhaps also required. If a theory simply argues that two concepts are associated with each other, the researcher might be justified in selecting a survey or the analysis of archival data to find evidence of a correlation (or a lack thereof) between the two. Similarly, if the phenomenon being studied is a process, the methodology will require repeated measures to establish patterns of behavior and changes over time. Some research questions are amenable to qualitative approaches, or perhaps combined approaches that meld many different kinds of methodologies into an overall program of research. Ultimately, the research relies entirely on a methodology to gather data that support or refute the theories involved and illuminate the original research question.

Social scientific research on business ethics is often categorized according to the level of analysis. While some work has been conducted on groups, industries, and market-level issues, the vast majority of business ethics research has focused on the individual and the organization. Within these two very large categories, researchers have attempted to explain individual and organizational behavior in the context of generally accepted moral norms and social obligations.

Individual-Level Research

Much of the individual-level research is tied to the cognitive developmental approach to moral behavior. This field is most appropriately summarized by James Rest's four-stage model of moral behavior. According to Rest, moral behavior is the result of a four-stage process wherein the individual (1) recognizes the moral issue, (2) makes a moral judgment, (3) establishes the intention to act morally, and (4) finally behaves morally. Researchers have conducted numerous studies to better understand all the possible factors that might shape these four stages of behavior. For example, a great deal of research has considered the role of gender in each of these four stages; some of this work has found differences between the genders (i.e., women are more aware of moral issues and are more likely to behave morally), while others have found no evidence of a gender effect.

The cognitive developmental approach has dominated the field for decades and has spurred a great deal of research on why and how individuals act morally or immorally. Nevertheless, this research has also demonstrated the shortcomings of a cognitive approach, and as a result, there are growing movements to explore other kinds of frameworks or approaches as a basis for explaining individual moral behavior. Several researchers, for instance, have proposed emotions and intuition as a basis for moral decision making and moral behavior.

Within this large stream of literature, the field has recognized that individual moral behavior is influenced not only by individual factors (gender, age, intelligence, personality traits, etc.) but also by contextual factors. Some of the more well-researched areas related to contextual factors include the characteristics of the issue itself (moral intensity), elements of the immediate environment in which the individual works, and characteristics of the larger culture in which the individual lives. Research on organizational ethical climates, for example, has demonstrated that organizations develop shared norms about what is done and how it is done and that these expectations influence individual moral decision making and behaviors. Research has also demonstrated that both immediate factors, such as peers, bosses, and reward systems, as well as more distant factors, such as codes of conduct, ethics training, and other institutional mechanisms, can affect individual moral decision making and behavior.

A substantial proportion of descriptive business ethics research has focused on the organization as a level of analysis. Perhaps most prominent among such approaches has been the stakeholder approach to management discussed above. The stakeholder approach argues that the organization exists in a network of relationships with primary and secondary stakeholders and that by developing and managing these relationships the organization can garner and develop financial and moral legitimacy in the marketplace. While much of the stakeholder literature is theoretical in nature, empirical research has quantified variables related to the theory to test some of these arguments. For example, there is empirical evidence to suggest that stakeholders who are powerful and legitimate and have urgent claims receive more attention from the organization as opposed to other stakeholders who are less powerful and less legitimate and have less pressing claims.

Organization-Level Research

Other research focusing on the organization as a level of analysis has generally focused on the social performance of the organization. This literature typically seeks evidence of the causes and effects of an organization acting beyond its financial responsibilities toward more socially oriented obligations. Within this literature, researchers have identified the factors that increase the likelihood that an organization will act in a socially responsible manner, the factors that increase the likelihood that such socially responsible behaviors will be successful, and the consequences of an organization acting in accordance with social expectations. A great deal of the research in this area is aimed at identifying a relationship between the financial performance of the firm and its social performance. As a matter of empirical evidence, recent meta-analyses along these lines suggest that while financial and social performance are correlated, an organization that conducts itself in a socially responsible manner is not necessarily more successful financially, though it may reap intangible rewards that facilitate the long-term survival of the organization.

Challenges

Conducting business ethics research involves several challenges. While many of these challenges are inherent in any social science research, others are unique to the study of business ethics. One of the most common challenges faced by business ethics researchers involves a fundamental methodological concern: measurement. To conduct empirical research, the researcher must determine the means for measuring the concepts in question. Subsequently, if a researcher is interested in studying moral behavior, it is undoubtedly required that the researcher employ a measure of moral behavior. As with many social scientific constructs, a measure such as this is difficult to create because the researcher must establish the validity of the construct and provide evidence that that measure measures what it claims. Such a task is dramatically more difficult in the business ethics realm, however, because of what many view as the subjective nature of morality. Whether a behavior is moral or not might be relative, and even the most universal of behaviors might be considered immoral under specific conditions. For example, if the researcher is interested in moral behaviors and chooses to focus on dishonesty, does withholding information constitute lying? Furthermore, does dishonesty sufficiently represent the concept of immoral behavior? In the face of such difficulties, the researcher must rely on the norms and traditions of social science and conduct the research in accordance with those standards but must also be mindful of the underlying philosophical concerns that might invalidate his or her measure. Clearly, measurement is a significant challenge for the business ethics researcher.

Another challenge that affects the business ethics researcher, perhaps more so than any other social scientific researcher, is that studying how individuals and organizations act in the context of moral norms might require or threaten the violation of those or other relevant moral norms. When studying the impact of light, for example, it would be useful from a scientific perspective for a researcher to create an environment where light is low or absent. Creating an environment where morality is weak or absent, though, could in and of itself be considered an immoral act because of the harm it might do to the participants of the research. For this reason, the business ethics researcher is at all times both an observer and a subject of business ethics phenomena. The difficulty of operating in such conditions was perhaps never more apparent than in Stanley Milgram's famous studies. Milgram asked very poignant questions about the role of authority in individual moral behavior. His studies employed deceit to examine how completely individuals would follow authority. Although his studies were informative, the methodology that they used posed a threat to the psychological well-being of the individuals and violated some of the very moral norms the experimenters were exploring. Of course, any study involving subjects contains an element of inconvenience and perhaps a risk to the subject. Descriptive ethics studies, however, must take special care to consider the risks of their studies to ensure that the studies themselves do not violate moral norms of behavior. Over the years, human subjects guidelines have evolved, and expectations about how subjects are treated during the research process have become institutionalized, and these guidelines are particularly salient to business ethics research. Nevertheless, they do not encompass all the moral concerns that the study of morality entails.

A final challenge for business ethics research is to effectively define the unique elements and status of business ethics issues in order to sufficiently justify the existence of business ethics research. In other words, business ethics researchers have at some level an obligation or a requirement to explain what is inherently or effectively unique about moral topics. For example, training is an important part of organizations and has been studied extensively from many different perspectives. In recent years, ethics training has received increased attention, but researchers might ask, Is ethics training somehow distinct from other forms of training, and if so, what is the nature and implications of those differences? If ethics training is not unique and different from other training, then there is little to no value in studying and explaining ethics training other than to make incremental contributions to a larger body of knowledge on training. One area of study that is most subject to this kind of concern is that of individual moral decision making. A considerable amount of research has been conducted on moral decision making, but there is some question about how moral decision making is different from other more generalized forms of decision making. Are the processes of moral decision making unique, do they involve factors not included in other forms of decision making, or is moral decision making merely a specialized form of decision making? To the extent that researchers can identify the unique aspects of moral decision making, they have the potential to better understand the topic of concern, to more fully legitimate the field, and to more fully contribute to society.

One approach to justifying the study of business ethics and, perhaps paradoxically, establishing the unique position of moral topics is to suggest that every topic has an ethical dimension. While such an approach is philosophically debatable, from a practical perspective, it justifies the integration of a much larger circle of social scientific research. There are many areas of study that lie outside the traditional business ethics realm that are nevertheless at some level conceptually related to ethics, and research in these areas might have much to offer more traditional business ethics topics. The most obvious of such areas is that of justice. Researchers have identified at least four principal forms of justice (distributive, procedural, interactional, and systemic) as psychological constructs. A host of research in a wide variety of social scientific settings has subsequently measured these different forms of justice and has identified relationships to various different variables. The question that remains, though, is to what extent is justice a business ethics topic? This question is critical because descriptive ethics is in constant tension with normative ethics, with an assumption of some interplay between the two. If justice is considered to be a business ethics topic, then there is a secondary analysis to be conducted that could dramatically inform our understanding of this topic. The same could be said for other areas of research, including whistle-blowing, deviance, corporate governance, the environment, and others. These topics have strong ethical undercurrents, yet they are not always identified as business ethics topics per se, and thus there is some question about the social scientific identity of these issues. On the one hand, arguing that there is an ethical dimension to every decision provides an avenue for integrating these kinds of topics into business ethics research. On the other hand, doing so also threatens to dilute business ethics more generally as a unique field of social inquiry.

In sum, descriptive business ethics is an attempt to explain and predict the occurrence of moral behavior in business settings. Most descriptive business ethics research has been focused on individuals and organizations, but regardless of the level of analysis, business ethics researchers face common methodological and institutional challenges. To develop valid and useful work, they must follow a general scientific method that adheres to the norms of established social science and is consistent with the underlying philosophical principles.

Looking Forward

To date, much of what has been produced by business ethics scholars has focused on large, publicly held corporations and the managers and employees who populate them. We expect that as in other similar academic fields, business ethics scholarship is likely to become more diverse and more specialized. For example, a literature on the ethics of entrepreneurship and on the ethical issues confronting small and medium-sized enterprises has begun to emerge. Similarly, it is more common for scholars to focus on specific subfields, such as accounting ethics or marketing ethics. This increased specialization produces knowledge that is more relevant to professionals in the various business disciplines. As the field matures and develops, we expect that more attention will be paid to these kinds of elements, producing a richer and much more comprehensive body of knowledge, and ultimately business ethics will more fully represent all those concerns with which the term *business* is associated.

Business for Social Responsibility (BSR)

Business for Social Responsibility (BSR) is a global organization that helps member companies achieve success in ways that respect ethical values, people, communities, and the environment. Its mission is to create a just and sustainable world by working with companies to promote more responsible business practices, innovation, and collaboration.

BSR began in 1992 as an association of approximately 50 companies dedicated to helping businesses be both commercially successful and socially responsible. Many of these founding companies were small and medium-sized businesses—such as Ben and Jerry's, Patagonia, and Tom's of Maine—which themselves strongly believed in and pursued responsible business practices.

During the past years, corporations are becoming more aware that to compete successfully, they need to develop responsible business policies and practices and make them an integral part of their mission, values, strategy, and operations. Along with this increasing importance of corporate social responsibility (CSR), the world has witnessed the growth of a network of national organizations that promote awareness of CSR and provide business leaders with tools and opportunities to collaborate with innovative managers across all industries, geographies, and functions. BSR, as part of this network, provides information, tools, training, and advisory services to make CSR an integral part of business operations and strategies.

BSR helps address a broad spectrum of CSR issues: business ethics, community investment, environment, governance and accountability, human rights, marketplace, mission, vision, values, and workplace.

To fulfill its mission, BSR works mainly in four specific areas. First, it provides advisory services on matters such as CSR reporting and implementation, stakeholder engagement, working groups, supply chain management, CSR strategy and structure, and CSR assessment and policy development. Second, BSR sponsors a series of conferences, including the BSR Annual Conference, which has become the largest forum for CSR practitioners, bringing together over 1,000 business leaders from more than 40 countries and their colleagues in the independent and public sectors. In the course of 4 days, executives, economists, analysts, academics, nongovernmental organizations, and public policy leaders can participate in training sessions and instructive breakout sessions covering business action in the areas of economic development, governance and accountability, human rights, and the integration of CSR into core operations. Third, BSR provides a collection of resources on responsible business practices, mainly online tools and guidelines. Fourth and finally, its store contains a number of books and reports that enhance the knowledge and promotion of CSR.

In addition, being a nonprofit organization, BSR promotes cross-sector collaboration and contributes to global efforts to advance the field of CSR: BSR connects its members to a global network of business and industry peers, partners, stakeholder groups, and thought leaders, mainly because cross-sector dialogue and collaboration have become the essential ingredients of a successful CSR strategy. Working in partnership with these groups, BSR is expanding its capacity to serve its members' global business needs and to achieve the mission of the BSR Education Fund. BSR has established formal partnerships with Global Compact, Ethos Institute (Brazil), CSR Europe (Belgium), MAALA (Israel), Business in the Community (United Kingdom), and Acción Empresarial (Chile). BSR is also a founding member of EMPRESA, the Forum on Business and Social Responsibility in the Americas. BSR has established additional links with other business organizations with similar interests in the United States, Canada, Europe, Latin America, Asia, and Africa.

BSR also acts as an intermediary between business and civil society. While understanding business and serving its needs, BSR maintains strong relationships with other key stakeholders and opinion leaders in the civic and public sectors. Through these relationships, BSR provides companies with alternative viewpoints and engagement opportunities that help them better formulate decisions, positions, and actions.

Today, BSR member companies have nearly $2 trillion in combined annual revenues and employ more than 6 million workers around the world. Even though the organization was started by medium-sized companies and membership is open to all companies regardless of size or sector, nowadays BSR's members consist mainly of large corporations such as American Express, Coca-Cola Company, Ford Motor Company, General Motors Corporation, IBM, McDonald's, Nike, Procter & Gamble, UPS, and Walt Disney Company. On its Web site, BSR lists what it describes as an "illustrative" list of members, implying that some prefer their identity not to be publicly disclosed. Membership provides the previously mentioned extensive set of practical resources.

Business Judgment Rule

The business judgment rule serves to shield an officer or director from civil liability when sued for a breach of a fiduciary duty, with the highest fiduciary duty owed to shareholders. Under corporation law, the business judgment rule is the classic defense used by directors and officers of corporations when they are sued, usually by shareholders. While the business judgment rule presumes that an officer or director has behaved reasonably, that presumption can be overcome by evidence of a negligent or disloyal act. The courts of Delaware, where more than 60% of Fortune 500 companies are incorporated, have largely defined and applied the rule through case law, not through statutory law.

Impact

The business judgment rule prevents courts from second-guessing management decisions and from interfering with management prerogatives. This is especially important in a capitalistic system as a way to provide an incentive to officers and directors to take the necessary risks preferred by shareholders and to create wealth for society. Mistakes sometimes occur when taking risks, but officers and directors would avoid risk taking entirely if they were to suffer personal liability from any mistake. They would then operate fearing litigation at every step.

Historically, Delaware courts have accorded more protection to management than to shareholders, especially during the wave of takeovers during the 1980s. It is more difficult today, however, for directors to invoke the veil of protection of the business judgment rule, due to recent judicial applications that have tightened the legal demands on officers and directors. Courts today more closely scrutinize potential violations of fiduciary duty by officers and directors.

Elements of the Business Judgment Rule

The elements of the business judgment rule are loyalty, candor, care, and good faith. The business judgment rule presumes that officers and directors abide by these elements, but the presumption is rebuttable and can be overcome by evidence in court. These are the elements of fiduciary duty, and the breach of any such duty can create personal liability for an officer or director. While good faith is an element of other duties, such as loyalty and care, courts increasingly see it as a separate duty, especially as corporate charters have eroded the significance of the duty of care.

Loyalty

Officers and directors must believe in good faith that their actions serve the best interests of the corporation, not their own personal interests. Loyalty stands as a barrier to conflicts of interest and demands that officers and directors exercise independence of judgment. It prohibits officers and directors from engaging in self-dealing and using their position to their own personal financial advantage. If a director, for instance, would benefit from the sale of land or real estate to the corporation, the deal must be an economically prudent deal for the corporation. The director must not promote such a real estate transaction if only the director benefits, while the corporation would gain more from an alternative transaction.

Corporate codes of conduct often extend and reinforce the duty of loyalty by requiring that all employees refrain from conflicts of interest. Often such codes require that an employee disclose any conflict of interest to either the board of directors or the corporate legal counsel. Even without such a code, however, officers and directors owe a common-law duty to the corporation to refrain from any conflicts and to disclose them.

Related to the duty of loyalty is the independence of judgment that directors should exercise. To honor their fiduciary duty, directors should not act in a self-interested manner; this issue has been prominent in cases involving mergers, takeovers, and takeover defenses. So long as a takeover defense is designed not to entrench managers in their positions but rather to protect the independence of judgment of officers and directors to make the best decision for shareholders, a takeover defense will be consistent with the business judgment rule.

The independence of judgment required to fulfill one's fiduciary duty to shareholders and to remain loyal to the corporation may go beyond the avoidance of self-interest and conflicts of interest. Independence can also be jeopardized by social relationships and loyalties to other institutions. For instance, directors employed by a university that receives substantial philanthropic contributions from a company might not be able to independently judge the merits of a legal dispute with the university or with officers who have ties to the university.

Candor

Officers and directors also owe a duty of candor to investors and in their own deliberations. Officers should not hide bad news from the board of directors, and the board should share an honest description of the company's conditions and prospects with investors and regulators. Officers and directors should disclose any conflicts of interest, and they should freely exchange their own views in a culture of open dialogue.

This common-law duty is reinforced by Securities and Exchange Commission (SEC) regulations and other government regulations. It also relates to the ethical duties of honesty and disclosure.

Care

Breach of the duty of care is the first step in proving a negligence action against an officer or a director. To fulfill their duty of care, officers and directors must be diligent, act rationally, and make informed decisions. In establishing a standard for the duty of care, courts apply an "ordinarily careful and prudent director" standard. Some decisions have held that directors violate their duty of care only when gross negligence can be shown. Most states have also enacted statutes specifying the degree of care consistent with prevailing judicial decisions.

In determining the nature of an informed decision, courts have held that officers and directors are not liable for good-faith reliance on a consultant's report, so long as they behaved reasonably in selecting the consultant and discussed the accuracy of the report's information and conclusions. However, when a board spends only 2 hours on a Sunday afternoon deliberating and then approving a major leveraged buyout of the firm based on a biased report, as in one landmark case, courts have found that it does not constitute an informed decision.

The duty of care includes the duty to actively monitor corporate performance through a corporate information and reporting system. In the case In re Caremark International Inc. Derivative Litigation, 698 A.2d 959 (Del. Ch. 1996), the Delaware Chancery Court held that although a board of directors cannot be expected to know about all wrongdoing in a company, it nevertheless has a duty to exercise adequate oversight as part of its duty of care as well as its duty of good faith.

One major legal erosion of the duty of care has occurred. The Delaware General Corporation Law now allows companies to adopt charter provisions exculpating their directors from the need to fulfill the duty of care. However, directors are not exculpated from honoring other fiduciary duties, including the duty of good faith. For that reason, courts are beginning to breathe more life and significance into the duty of good faith than it has heretofore enjoyed, as explained next.

Good Faith

Courts in the past tended to doubt whether a duty of good faith exists separate and apart from the duty of care or loyalty. Increasingly today, however, courts have elevated that duty to a separate status in situations where the duties of care and loyalty have not been violated. This is especially important given that corporate charters increasingly contain exculpatory clauses that relieve directors of liability when they fail to exercise due care.

To find a lack of good faith, a court must find the director's decision so irrational that it cannot be explained except for bad faith. Bad faith would also include recklessness or intentional wrongdoing. For instance, if a chief executive officer demanded a bribe from an acquiring company as a condition for the completion of a merger, a director who approved the merger might be held liable for demonstrating lack of good faith.

Even though the directors of Disney were not found liable for violating their fiduciary duties in approving the $140 million severance payment for the former president Michael Ovitz, a judge denied a motion to dismiss the charges at an earlier stage based on a conscious and intentional disregard of director responsibilities, which constituted bad faith. Disney itself had a charter provision that exculpated directors from any liability due to breach of due care, so the case moved forward on the basis of a possible breach of the duty of good faith.

If board members engage in a "sustained and systematic failure" to monitor a firm's compliance with pharmaceutical safety regulations, that can constitute bad faith. If a corporate officer fails to disclose a blatant conflict of interest to the board or to the chief counsel, as required by a corporate code, that failure can also constitute bad faith.

Current Legal Interpretations

The SEC has acted in parallel to the evolving standards of the business judgment rule in some of its recent enforcement actions. Failure of oversight has been important in bringing action against some directors for securities fraud. For instance, if a director ignores a decision by top management to fire the company's outside auditor for charging the company with improper accounting, the director's failure could breach the duty of care as well as violate SEC regulations. The SEC is also pursuing directors for failing to maintain adequate information and reporting systems, as articulated in the Caremark case.

There are two other aspects to the role of the SEC in these enforcement actions. First, even when a director might be exculpated under a charter provision from liability for breach of the duty of care, the director might still be subject to SEC penalties for the same duty of care violation. Second, and much to the chagrin of states' rights advocates, the SEC is using standards of fiduciary duty established under state corporation law in its own body of federal regulations. Critics of the Sarbanes-Oxley Act complain that the law federalizes principles of corporate governance, which have been the focus of state law and court decision throughout American business and legal history.

Under recent interpretations of the business judgment rule, and especially of the separate good faith standard, it is becoming more important for directors to take the initiative and to more actively monitor corporate performance and for boards to focus more on process issues. While the details of a reporting system are a legitimate question of business judgment, it is at least important for the board to ensure that there is a sufficient system of reporting and internal controls in place. That should include financial, operational, and compliance controls. Such controls are also important in complying with the provisions of the Sarbanes-Oxley Act, so they serve multiple purposes.

Directors also protect themselves from charges of intentional and reckless wrongdoing when they pay more attention to red flags or warning signals. They need to pay attention to both internal reports and such external signals as lawsuits and negative media reports. This is especially true when the gravity and duration of the alleged wrongdoing are greater.

Directors can further protect themselves from liability, and also demonstrate care and good faith, by ensuring compliance with the standards set by both government agencies and self-regulatory organizations, such as the New York Stock Exchange. Being proactive and going even further to study and adopt the best practices developed by other companies, especially in such challenging areas as compensation and executive succession, would also be prudent.

—John M. Holcomb

Business Law

Law can be defined as rules set by society to govern behavior; thus, business law refers to those rules of behavior that govern business. To govern behavior efficiently, law must be both predictable and flexible. It must be predictable so that people can plan their behavior, and it must be flexible so that it can be applied in a wide variety of different situations.

Law is directly related to ethics, especially in a business context: Much of business law amounts to the formalization of "good business practices" or ethics, and neither ethics nor law can be meaningful without each other. Ethics without the authority and enforcement of law is a mere aspiration. The reverse is also true: Mere law, if it does not mirror societal expectations of behavior at least to some extent, is not likely to be enforced. For example, although there was contract law in place shortly after the dissolution of the former Soviet Union, that law was often not effective because post-Soviet society was not used to expecting people to keep their promises.

When a community is appalled by an ethical violation, that violation may drive the development of law, whether through legislation, judicial decision, or both. For example, the Enron and WorldCom scandals of 2001 to 2002, which involved deceptive and fraudulent accounting practices, led to the prosecution of those involved and also led directly to the Sarbanes-Oxley Act (SOX), which created new duties and accountability for corporate officers and accounting firms. Much of the unethical behavior involved, however, was illegal before both these scandals and the act. Thus, the ultimate lesson of those scandals may well be that law alone cannot prevent such acts. In these cases, short-term business pressures led companies first to stretch the laws of accounting practice and then violate them in an effort to present a positive picture and preserve the stock market value of the companies involved. The legal scandals that developed from these dishonest acts ultimately resulted in the demise of those companies. In the aftermath, it has been posited that law by itself is an insufficient deterrent for unethical practice, because under pressure of competition, companies will continue to look for ways to abide by the letter, rather than the spirit, of the law. Businesspeople must not only abide by the law, but they must also realize that unethical behavior ultimately leads to the destruction of a business, and they must be aware of the business virtue of absolute moral conviction.

To make the relationship between law, business, and ethics still more complex, while there are times when societal mores and ethics lead to the enactment of law, there are also times when morality and business law diverge. For example, it is a long-standing principle of common law that there is no duty to rescue, so that if you see a man about to step in front of a fast-moving car, you have no legal obligation to reach out and stop him—though most of us would feel we had a moral obligation to do so. To begin with, enforcing a duty to rescue would be contrary to a free society and the principle that individuals have the freedom to pursue their own individual good as long as they do not attempt to deprive others of theirs or impede their effort to obtain it. Creating a legal duty to rescue would imply a society that focuses on a group good rather than individual good. Moreover, creating a legal duty to rescue would be impractical. When would such a duty arise? How would it be enforced? If there were a crowd of people, on whom would the duty fall?

The same divergence between ethics and law can be found in business. For instance, Henry Ford once wanted to forego increasing dividends for his shareholders and instead wanted to use the money for philanthropic purposes. He felt that his company was rich enough and the ethical thing to do at that time was to lower the price of cars and increase the size of his company so that he could hire more workers and pay them the same good wages he was paying his current employees. However, in a famous opinion, the Michigan Supreme Court disagreed: The court found that Ford Motor Company's primary duty was to its shareholders and to make a profit and did not justify the charitable steps he was planning.

In addition to being driven by ethics, business law is also driven by society's need to foster commerce, because a strong commercial environment is directly related to the health of a nation's economy and the welfare of its citizens. The United States Constitution was influenced by the concern that commerce be fostered, as seen in the Commerce Clause, which has been interpreted as prohibiting states from discriminating against products from other states. The creation of the Constitution, however, was also driven by the nation's need to raise taxes, and this taxing power has led to a symbiotic relationship between business tax laws and new forms of business entities such that business forms are designed to take advantage of tax laws.

Some of the topics most often discussed that display the interplay between business law, commercial need, and ethics include contracts and sales, business torts and products liability, environmental protection, workers' remedies (safety, antidiscrimination, privacy, and whistle-blowing), and trade law (fair trade, intellectual property, and anticorruption laws).

Contracts and Sales

For businesses to thrive, they must be able to rely on commitments. Sometimes, business is successfully concluded merely on a handshake ("my word is my deed"), such that neither party feels the need to verify that the commitment will be enforced by the law should the other party fail to keep his or her word. However, if the commitment is a large one, if the parties are strangers, or even if they are just cautious, either or both of them may want to verify that the agreement will be enforced by a court should something go wrong. Parties need to be free to contract according to their own best interest, but they also need to be free from being obligated unless they specifically intend to be obligated and they understand those obligations. Contract law systems attempt to balance these ethical and practical considerations.

Common Law of Contracts: Offer, Acceptance, and Consideration

Traditionally, in common law—the law derived from centuries of cases decided by English courts and used in 49 of the United States—an enforceable contract requires proof of just three things in addition to the intent to be bound: offer, acceptance, and consideration. An offer must be sufficiently precise and complete such that the other party's merely saying "yes" to that contract means that a contract will be formed. However, if some of the necessary information or terms are missing, then the statement is not an offer. For example, "Would you like to buy six widgets at $12.00 per widget?" constitutes an offer for the sale of six widgets and indicates that if a buyer agrees, then the seller intends to be bound to the resulting contract. In contrast, the statement "Widgets for sale, $12.00 per widget" is not an offer because merely saying "Yes" would not complete a contract—neither party would know how many widgets were being sold. Instead, this kind of statement is called an "invitation to negotiate." As with most advertisements, the purported seller is simply trying to interest potential buyers; he is not making a formal offer for sale.

An acceptance, in concept, is similarly simple. It signifies the other party's intent to be bound by the terms of the contract: "Yes, I'll buy six widgets for a total of $72.00." However, if the buyer were to say, "Will you accept $8.00 each for six widgets?" then no contract would be formed because the buyer has not accepted the original offer. Instead, he has implicitly rejected it and made a new offer, a *counteroffer,* instead.

The third concept required by common law is *consideration,* which refers to the thing that each party receives in exchange for his or her agreement to perform the obligation or obligations indicated in the contract. This requirement of mutual consideration means that there is some indicia that each party *bargained for* what he or she is receiving under the contract. *Bargained-for consideration* is merely another way of verifying that the parties intend to be bound by the terms of their agreement. Civil law, the law used in 90% of the world (including Louisiana), does not recognize the concept of consideration but uses instead a related principle, termed *cause: cause* is the reason why one obligates oneself to a contract. Both *consideration* and *cause* serve to verify that the parties intend to be bound.

When a party to a contract fails to perform his or her obligations, the other party may sue for breach of contract. Thus, if the buyer pays the $72.00 for the widgets, but the seller fails to deliver them, the buyer has a legal remedy: the buyer can demand the return of the $72.00 or demand that the widgets be delivered, and the court will order the seller to do one or the other. Similarly, if the widgets are defective, the buyer can sue under various warranty theories. Finally, if the seller delivers the widgets but does so in such an unfair and unethical way that the buyer cannot enjoy their use, then the buyer can sue for a breach of the *duty of good faith and fair dealing.*

All these basic contract concepts are the legal embodiment of a basic ethical principle: One should not make promises lightly, and one should deliver what one promises to do, and no less. They are also basic good business practice because they encourage win-win agreements. Where businessmen keep their word and deliver a good and useful product at a fair price, they are likely to be successful. If, on the other hand, they fail to keep their promises, deliver a poor product, or otherwise make their customers miserable by behaving unethically, their businesses will eventually decline and they will have trouble attracting new customers. Thus, basic contract law is based on centuries of experience about what constitutes both good ethics and good commercial practice.

Statutory Contract Law

Statutory law builds on these basic principles, setting standards and specifics for commercial contracts involving the sale of goods (Uniform Commercial Code, Article 2 [UCC-2]), contracts involving e-commerce (the Uniform Electronic Transactions Act), negotiable instruments (Uniform Commercial Code, Section 9), and others. In addition to providing remedies for unethical conduct, these statutes are designed to improve communication and efficiency and prevent disagreements by setting standard terms for commercial contracts and providing directions for what should be done if the parties' contract fails to provide for some contingency. For example, under the UCC-2, if commercial parties fail to mention a price for the sale of a good, then as long as they intend to be bound to the contract, a court can imply a "reasonable" price as determined by the local market.

International Contract Law

In addition to common law and state and federal statutes, some contracts are governed by multinational treaties signed and ratified by the United States: the Vienna Convention on Sales, the Electronic Signatures in Global and National Commerce, and others may be *mandatory* law (law a court must follow) if the parties to the contract are residents of different countries. Most, if not all, of these treaties state the basic requirements of the type of contract at issue and incorporate the same fundamental concepts of offer, acceptance, cause or consideration, and the duty of good faith. In addition, parties to a contract often stipulate which state, country, or international law they want to govern their contract in the event that they come to some disagreement; and they often stipulate that their disagreements will be resolved out of court, through mediation or arbitration, both of which methods of alternate dispute resolution are governed by still more law.

Business Torts and Products Liability

The most fundamental purpose of law and government is to stop people from hurting each other, or at least to punish them or force them to make recompense when they do. The difference between a tort and a crime is that a tort is a civil wrong: One party sues another. A crime is a societal wrong such that government sues (i.e., *prosecutes*) the malfeasor on behalf of the people as a whole. Businesses have long been held civilly liable for the intentional or unintentional torts of their agents and employees. Although they can be held criminally liable as well, this section will deal only with businesses' civil liability for torts. An intentional tort is one where the tortfeasor specifically intends to commit a wrong—for instance, where an employee wrongfully restrains a customer he suspects of shoplifting (committing the tort of *false imprisonment*). Businesses are allowed by statute to restrain customers they reasonably suspect of shoplifting but must do so within certain limitations. If they restrain a purported shoplifter for too long a period prior to contacting the police or if they restrain him or her under improper and overly punitive conditions, then that person may sue for false imprisonment.

Vicarious Liability for Unintentional Torts

In addition to being held vicariously liable for intentional torts, businesses may be held vicariously liable for the unintentional torts of their employees. For example, if a pizza deliverer causes an accident while delivering pizza, the injured person can sue both the pizza deliverer and his or her employer. Similarly, if a business fails to properly maintain its premises, it can be held liable for negligence when a customer is injured as a result—these are the well-known "slip and fall" cases, where a grocery store is liable for a customer's slipping in a puddle of water on the floor.

Liability for Third-Party Crimes

Thus, businesses are often held liable for the misdeeds and negligence of their employees, but until recently, they had not been held liable for the misdeeds of third parties while on their premises. As with the lack of any duty to rescue, businesses traditionally had no duty to prevent third parties from committing crimes against customers on their business premises, for several reasons: It would be unfair to hold a business liable for criminal conduct it could not predict; such liability would place an undue economic burden on commercial enterprise and the consuming public; protecting citizens is a function of the government that should not be shifted to the private sector; merchants should not become insurers of customer safety; and one can reason that the criminal's act is what caused the harm, not the merchant's purported failure to protect the customer from the crime.

This is changing, however. Generally, a business still has no duty to protect customers from the criminal acts of third parties that occur on its premises. The business is not the insurer of its customers' safety, and it has no absolute duty to implement security measures to protect them. However, a number of states now impose a duty on businesses to take reasonable precautions to protect customers from foreseeable criminal acts. The question then becomes how to define *foreseeable.* Although different courts use different definitions, the trend now is to define foreseeable in terms of a balance between the likelihood and gravity of the risk as opposed to the economic burden preventative measures would place on the business. If the risk is low and the cost is high, a business is found not liable for a particular criminal act. On the other hand, if the risk and the gravity of the harm are great (as when a customer is abducted from a business's parking lot where a number of crimes have already taken place, so that one would logically expect more crime) and the burden of preventing such crimes would not be too onerous (a security guard could have been hired for a reasonable rate), then the crime is foreseeable and the business is liable for the damages caused by the crime.

In setting these new standards, courts try to strike a balance between the policy reasons that originally denied such a duty and practical considerations. Courts recognize that the economic and social impact of requiring businesses to provide security on their premises is significant. Security is a significant monetary expense for any business and further increases the cost of doing business in high-crime areas that are already economically depressed. Moreover, businesses are not responsible for the endemic crime that plagues society, a problem that even law enforcement and other government agencies have been unable to solve. At the same time, while acknowledging that businesses do not cause the crimes committed on their premises, in imposing a limited duty to protect customers, courts recognize that business owners are often in the best position to both appreciate the crime risks that are posed on their premises and take reasonable precautions to protect against those risks.

Strict Products Liability

Another area of business tort law in which courts and legislatures have had to strike a balance between ethics and economic reality is products liability. Originally, only the direct buyer of a product could sue the manufacturer if a product was defective. If the product was sold to the injured consumer by anyone other than the manufacturer, then the manufacturer was not liable because it had no contract with the consumer. As the 20th century advanced, bringing ever more industrialization and faced with increasingly serious claims by consumers injured by factory-made products, courts began to stretch negligence theory to cover such situations, but this also proved unsatisfactory because it is very difficult for an injured consumer to obtain the information needed to show that the manufacturer thousands of miles away, and not the wholesaler, the retailer, or some other handler, was responsible for the injury-causing product defect.

Finally, courts developed the theory of strict products liability to cover such situations, and this theory has been widely adopted by state legislatures as statutory law. Under strict products liability, the injured consumer need only prove that a defect in the product made it unreasonably dangerous, and this defect caused his injury. The manufacturer, distributor, and seller of the product can then together be held liable for the consumer's injury, unless they can show that the product was not defective or they had no part in the defect. This change means that the law favors the consumer rather than the manufacturer.

There are three kinds of defects possible: (1) manufacturing defects, (2) warning defects, and (3) design defects. A manufacturing defect occurs when the product is dangerous because it was not made the way it was supposed to be made. For example, assume that weak screws securing an electric saw fail, causing the tool to fly apart, and the flying pieces then strike and injure the operator. The injury is caused by a manufacturing defect because the screws were not as strong as originally designed. In contrast, a warning defect occurs when a court finds that the product is dangerous by its own nature and the manufacturer should have warned the consumer about that danger. One famous (or infamous) example of a warning defect case is the one involving an older woman who suffered burns when she spilled McDonald's coffee on herself—the jury found that the warning on the cup was not large enough. The third kind of defect is a design defect, which is when the manufacturer should have used a safer design rather than the one that injured the plaintiff. In design defect cases, courts use the same kind of risk/burden analysis used in determining whether a crime committed on business premises was foreseeable. In the case of a design defect, the question is one of balancing the gravity of the danger posed by the existing design against the cost and feasibility of an improved design. If the danger of the harm is greater than the cost of an improved design, then the design is defective and the manufacturer is liable.

In developing the doctrine of strict products liability, courts balanced the interests of individuals of limited means and sometimes serious, debilitating injuries against manufacturers' economic interests. Three policy reasons justify the doctrine: (1) the cost of the medical injuries may be overwhelming to the consumer, and the manufacturer is better able to bear that cost; (2) of the two, the manufacturer is better able to prevent the defect, and the possibility of facing liability for consumer injuries encourages manufacturers to do so, and (3) the costs of such awards and increased insurance premiums bought by manufacturers can be distributed to the public through higher prices.

Environmental Protection

Another legal and ethical concern of business is its effect on the environment. In 1970, the U.S. Congress created the Environmental Protection Agency (EPA) and passed a series of laws protecting the environment. Over the years, federal, state, and local laws have added to this basic structure, creating the most comprehensive system of environmental protection laws in the world. Some of the other major federal acts include the Clean Air Act (setting standards for air quality), the Clean Water Act (designed to gradually end the discharge of pollutants into navigable waters), the Resource Conservation and Recovery Act (controlling the disposal of hazardous waste), and the Comprehensive Environmental Response, Compensation, and Liability Act (creating a federal superfund to finance the cleanup of toxic waste sites).

Originally, many of these regulations primarily employed injunctions and penalties to force businesses to reduce or stop emissions deemed unacceptable. However, over time, critics criticized the network as complex, expensive, inflexible, and unproductive. They argued that the costly regulation, focused on punishing businesses it perceived as polluting, was making American firms less competitive globally and was inefficient. The same critics further argued that the goal of reducing pollution would be better met by encouraging companies to reduce emissions through profit motives rather than purely through penalties that become incorporated into the cost of doing business. In the case of sulfur dioxide emissions, this criticism led to the creation of a trade-reliant permit system used to encourage companies to reduce emissions rather than a penalty system. Companies can purchase allowance permits for emissions at an auction held by the EPA and then sell these permits to other companies. The market in emissions permits has encouraged those companies that are most able to reduce their emissions to do so, and they then sell their allowances to less able companies for a profit.

Environmental concerns are complex, the problems difficult to remedy and sometimes difficult to balance with commercial development. Therefore, the debate continues over the best way to address them. As shown by the emissions allowance permit system, some environmental problems may be best addressed by encouraging technological development.

International Environmental Protection Treaties

The balance between commerce, the environment, and effective law is an international concern, not just a domestic one. In the international context, the United States has ratified some international environmental treaties and rejected others. Thus, while the United States has long adopted and enforced the Cites treaty protecting wildlife around the world, it rejected the Kyoto Accord on climate change. Under the Kyoto Protocol, which went into effect on February 16, 2005, industrialized nations are required to reduce their emissions of greenhouse gases, which are the product of fossil fuels. Developing nations such as

China, India, and Brazil, however, are not so required. Although the Protocol was originally proposed with the backing of the United States, the Senate refused to ratify it because of a perceived ethical concern—the disparity in treatment between industrialized and developing nations—and President Bush similarly refused to support it. Nevertheless, it came into effect for the signing countries in February 2005.

The Protocol, as originally proposed, requires industrialized nations to reduce their emissions of carbon dioxide to 5% below the 1991 levels by 2012. Complying with the requirements of the Kyoto Protocol presents serious difficulties to some industries. For example, Canada, in switching from utility plants powered by fossil fuels to hydroelectric power, may endanger indigenous sturgeon, a fish once endangered by water pollution and carefully brought back. However, as enacted in 2005, the treaty includes provisions for emissions trading markets, enabling industries to buy and sell emissions credits in much the same way that the sulfur dioxide permits operate. As a result, global investors are beginning to develop new insurance products to handle the risks created by global warming and also developing investments in clean technology because they see its profit potential.

Workers' Remedies

A great deal of law has been developed to protect workers from ethical violations in the workplace: There are laws to protect against unsafe working conditions, workplace discrimination, and invasion of privacy and now a ban on retribution for whistle-blowing.

Safety in the Workplace and Workers' Compensation

Traditionally, there has been little consensus in the United States regarding the appropriate balance between risk and security in the workplace. Overregulation stifles competition and detracts from efficiency, yet because of the excesses of unethical business practices in the latter part of the 19th century, the state now has some role in mandating that employers compensate workers injured in the workplace. In addition to the workplace safety standards set by the Occupational Safety and Health Administration of the U.S. Department of Labor, workers' compensation provides a way to compensate workers who are accidentally injured on the job, through a no-fault recovery system. Under such state systems, employers regularly pay a certain amount into the system, and their injured workers then receive compensation quickly without having to prove that the employer was at fault. In exchange, the employer is assured that the injured worker is limited to compensation under the state workers' compensation act and may not sue the employer for more. The workers may receive less than they would from litigation, but they are assured of receiving it. However, while worker's compensation schemes limit employer liability, an injured worker is still free to sue other potential defendants, such as the manufacturer of the equipment that caused the injury, under strict products liability.

Antidiscrimination Law

Discrimination is another legal and ethical concern in the business world. In addition to laws mandating safety standards, federal law also bans discrimination on the basis of race, color, religion, sex, or national origin. The equal protection provision of the Fifth and Fourteenth Amendments to the United States Constitution prohibits governments from denying any person within their jurisdiction the equal protection of law and is the foundation for antidiscrimination laws. These amendments require the government to treat different groups of people similarly situated in the same way; however, they do not require the same of private citizens and businesses. After the protests against segregation in the 1960s, Congress passed comprehensive civil rights legislation that addressed discrimination on the part of private businesses and individuals. It outlawed discrimination in public accommodations (hotels, motels, restaurants), housing, public education, federally assisted programs, and employment. Title VII, the provision dealing with employment, bans not only outright differential treatment but also practices that appear to be neutral but that disproportionately disadvantage members of one race, sex, or religion.

Sexual Harassment

Laws against sexual harassment have identified two types of illegal sexual harassment: quid pro quo and hostile environment. Quid pro quo refers to demands for sexual favors with threats attached: The victim either gives in and provides the favors or loses a tangible job benefit. Hostile environment refers to behavior that creates an intimidating or abusive workplace atmosphere. The Supreme Court, in 1999, held that Title VII protects men as well as women and that the fact that both plaintiff and defendant are of the same sex does not necessarily prevent a claim of sex discrimination. While sexual harassment is unethical and illegal, as a practical matter, society must recognize that the workplace is a realm that can be alive with personal intimacy and sexual energy. People who work together come into close personal contact, and close personal contact can lead to interactions with sexual overtones without constituting either discrimination or harassment. Thus, the law is structured in an effort to sort between legitimate claims of sexual harassment and nonoffensive interactions.

The Age Discrimination in Employment and Americans with Disabilities Acts

Since the passage of Title VII, additional types of discrimination have been made illegal, specifically discrimination on the basis of age or disability. The Age Discrimination in Employment Act (ADEA) protects individuals who are 40 years of age or older from employment discrimination based on age. The ADEA's protections apply to both employees and job applicants, making it unlawful to discriminate against a person because of his or her age with respect to any term, condition, or privilege of employment, including hiring, firing, promotion, layoff, compensation, benefits, job assignments, and training. The Americans with Disabilities Act makes it illegal to discriminate against an individual who with reasonable accommodation can perform the essential functions of an employment position that the individual either holds or desires. Reasonable accommodation can include making the existing facilities used by employees readily accessible to and usable by individuals with disabilities and restructuring the job to accommodate the individual. In determining whether an individual with disabilities can perform the job, consideration is given to the employer's judgment as to what functions of the job are essential and can be determined by any written job description.

Wrongful Discharge and Whistle-Blowing

Traditionally, most employment is considered to be *at will,* meaning that either the employee or the employer can terminate the employment at any time for a good reason, a bad reason, or no reason whatsoever. Thus, in the United States, as opposed to other countries, there are very few grounds for wrongful discharge. One exception to this rule is quid pro quo gender discrimination. A new exception is whistle-blowing: the SOX prohibits any publicly traded company from discriminating against any employee who lawfully provides information or otherwise assists in an investigation of conduct that the employee "reasonably believes" constitutes a violation of federal securities laws. The intent of this new law is to encourage corporate insiders to report fraud and help prove it in court. However, the practicality of this new provision has been questioned. To begin with, the new law cannot guarantee shelter for whistle-blowers: It may be difficult for the whistle-blowing employee to prove indirect retaliation. In addition, the statute affords protection only for whistle-blowers who report securities fraud, and while this is a very broad area because it refers to any falsity on any public statement or document filed with the SEC, other kinds of whistle-blowing remain relatively unprotected. Under the new Sarbanes-Oxley provision, winning a reprisal lawsuit against an employer has risen, but only to between 25% and 33%, which means that a corporate employee is still unlikely to win such a lawsuit. In general then, in deciding whether or not to blow the whistle, an employee is still likely to face a difficult choice between his or her conscience and continued employment with that particular company.

Privacy Concerns

Because of past unethical behavior, laws prohibit certain unsafe conditions in the workplace, prohibit discrimination and sexual harassment, protect whistle-blowers, and provide no-fault compensation when employees are injured on the job. A current issue that may lead to new law concerns employee privacy. Employers want to find out if their workers are productive and loyal, but employees need a degree of privacy to thrive. Companies want to know the preferences of potential customers or the strategies of competitors, but customers may not want their preferences sold from company to company, and competitors will want to protect their trade secrets. Tension between privacy and the need to know is increased as a result of computer technology, because information gathering has never been so fast, efficient, or omnipresent.

Employees' Expectations of Privacy

The Constitution does not expressly protect a right to privacy. The Fourth Amendment protects citizens from "unreasonable searches" by the government, but there is no constitutional protection against searches or surveillance by private corporations. However, intellectual property laws and contracts protect individuals' and companies' property rights in inventions (patents), creative products (copyright), and trade secrets. In contrast, however, employees may have a hard time objecting to employers monitoring their workplace e-mail messages. Employees may claim that electronic monitoring by their employers amounts to an intrusion—the tort of invasion of privacy; however, this tort requires that the means used to intrude must be an obnoxious deviation from the normal, accepted means of discovering the relevant information and the reasons for the intrusion must be unjustified. Courts have held that employees do not have a reasonable expectation of privacy in e-mail communications voluntarily made by them over the company e-mail system, especially when the communication is made to a supervisor. Similarly, an employer may legally film its employee to demonstrate that the employee is fit and able when that employee is suspected of filing a fraudulent workers' compensation claim.

Consumers' Privacy Expectations

Like employees, consumers' privacy rights can be limited in some respects as well. For example, in the United States, consumers' ability to prevent companies from selling information about them may be limited, even if the company promises not to sell information about its customers to nonaffiliated third-party vendors. For example, in one case, Chase Manhattan, despite its commitment not to do so, sold information about its customers' names, addresses, telephone numbers, account or loan numbers, credit card usage, and other financial data. The third-party vendors then used this information to create lists of Chase customers who might be interested in their products or services and contacted them by telemarketing and direct mail solicitations. Chase customers sued under New York's business law, claiming that Chase had violated their privacy and its own promises as well as deceived them. However, because the plaintiffs could not prove that they were actually injured, they lost the suit.

While U.S. law is concerned with protecting citizens from government intrusions, European law is much more concerned with protecting citizens from intrusions by private parties. Under the 1995 European Directive on the processing of personal data, companies must guarantee that the personal data gathered are accurate, up-to-date, relevant, and not excessive. Moreover, the information collected may be used only for the purpose for which it was collected and can be processed only with the consent of the subject. Furthermore, under the 2002 Directive on Privacy in the Electronic Communications Sector, which builds on the 1995 legislation, companies doing e-commerce with citizens in the European Union must protect their customers' data, erase the data automatically, and obtain their customers' consent before using the data to market electronic communication services. Thus, in Europe, selling information about customers the way Chase did would be unlawful. Because of the difference between U.S. and European privacy law, under a bilateral treaty designed to resolve this difference, U.S. companies doing business with European customers must comply with *safe harbor* provisions: Among other requirements, they must notify their customers if they are collecting information electronically, give customers the option not to have that information sold, and take measures to ensure the accuracy of the information transferred.

Securities, Trade, and Antitrust Law

Much of the previous discussion has been focused on how individuals in a business can be affected by law. However, companies themselves can be held liable for unethical, illegal, and even criminal behavior as it relates to other companies or individuals. Securities, trade, antitrust, and intellectual property laws hold companies to certain legal standards of ethical business behavior.

Securities Laws

Securities laws, developed after the stock market crash of 1929, require that publicly traded companies provide shareholders and potential shareholders a substantial amount of financial and other information about themselves. The underlying rationale is that the required transparency discourages fraudulent behavior by companies, gives potential investors some rational basis on which to decide to invest, and creates public confidence in the stock market so as to avoid similar widespread market failure. Since the creation of the securities laws and the Securities and Exchange Commission in the early 1930s, publicly traded companies have been subject to ever-increasing levels of corporate compliance, and hence increasing costs, as new laws, such as the SOX, are passed in reaction to new scandals. In the long term, such requirements may become so cumbersome that companies may decide not to go public. For example, the pre-SOX annual cost of compliance was approximately \$91,000 per company. After SOX, the average cost of compliance increased to approximately \$3,507,000. As a result, a number of companies, both U.S. and foreign, delisted themselves from American exchanges, choosing to be traded on the London or Hong Kong exchanges instead. In the future, to avoid such consequences, policy makers may consider the potential effect of any additional compliance requirements on the various American exchanges.

Trade Law

Trade law is focused on two goals of public policy: first, that competition is to be encouraged because it leads to more and better products and, second, that technological developments can be encouraged only if the developer is allowed to make a profit before competition ensues. Under the international standard set by the 140 members of the World Trade Organization (WTO), freer trade and importation, as demonstrated by the lowering of customs duties and other barriers, are encouraged. However, under U.S. and international law, an industry can ask that customs duties be raised, thereby discouraging competition from imported products, when it has been subjected to unfair trade practices and thereby rendered unprofitable. Specifically, customs duties may be raised when an imported product's low price is the result of dumping (selling below the cost of production) or subsidization (artificially low production costs caused by governmental grants in the home country) or when a weak or fledgling industry needs to be temporarily protected and safeguarded from foreign competition until it can strengthen itself.

Antitrust Law

A monopoly or trust is a concentration of wealth and power over an industry in one company or group of companies that have agreed to maintain certain price structures for their products or have otherwise taken steps to minimize competition. Because these kinds of arrangements minimize or obliterate normal marketplace competition, they cause markets to stagnate and discourage development of new products and services. To prevent the creation of such monopolies, Congress passed the Sherman and Clayton Antitrust Acts. When a company has become so powerful that it prevents competition from developing, it may be broken up or otherwise prohibited from certain business practices under these Antitrust Acts. In 2001 to 2002, Microsoft faced major antitrust litigation in both the United States and Europe. The U.S. claim was that Microsoft illegally tied its Web browser software to its operating system software, thus preventing competition from other browsers. The suit was eventually settled. Similar claims in Europe and South Korea resulted in rulings that Microsoft had abused its dominant position and must change its business practices by allowing competing media players and servers to interface with its operating system. As of 2006, Microsoft has agreed to uniformly license its operating systems and allow manufacturers to include competing software.

Intellectual Property

One of the reasons why the Microsoft cases were both intriguing and difficult to decide is that they revolved around copyright law. Patents, copyrights, trademarks, and trade secrets are all forms of intellectual property, which provides inventors and developers with a monopoly over their invention for a certain period of time. The reason such monopolies are tolerated is because such innovations are unlikely to be made without a profit incentive. Especially with patents or software, the development of a new invention may involve a great deal of research and development cost. Intellectual property laws allow the owner to recoup research costs and make the first profit before allowing other parties to compete.

Trade secrets include information that helps keep a business competitive and are protected only if the company that developed them takes specific measures, such as nondisclosure agreements, to protect them. Examples of trade secrets include customer identities and preferences, vendors, product pricing, marketing strategies, company finances, manufacturing processes, and other competitively valuable information.

While trade secrets are protected under state law, patents, copyrights, and trademarks are registered and protected under federal law. A patent gives an inventor the right to exclude all others from making, using, importing, selling, or offering to sell the invention for up to 20 years without the inventor's permission, though there are some exceptions and extensions. Patents protect technological inventions, such as pharmaceuticals. Copyrights protect works of authorship, such as writings, music, and works of art that have been tangibly expressed. The Library of Congress registers copyrights, which last for the life of the author plus 70 years (95 years from publication in the case of works made for hire). Trademarks protect words, names, symbols, sounds, or colors that distinguish goods and services. One example of a trademark is the Nike "swoosh." Unlike patents and copyrights, trademarks can be renewed forever as long as they are being used in business. Software, such as Microsoft's browser system, is copyrighted. Thus, in the 2002 case, the claims were that Microsoft had manipulated its copyrights in such a way as to prevent all competition and, in so doing, had become monopolistic.

International Trade Law

As has been seen, the tension between encouraging competition and encouraging innovation has resulted in two bodies of law, antitrust and intellectual property. Writ large, the same tension has been taken into the international arena through various treaties. The WTO, founded by the General Agreement on Tariffs and Trade (the GATT treaty), is aimed at increasing competition worldwide by encouraging countries to lower duties and taxes so as to allow imports to compete in domestic markets, thus forcing domestic products to lower prices and improve quality. In conjunction, the World Intellectual Property Organization encourages countries to protect the copyrights, patents, and trademarks of imported products. Both organizations recognize that these goals are more difficult for developing countries than for already industrialized nations.

United States v. Microsoft Corp., 253 F.3d 34 (D.C. Cir. 2001).

Business Roundtable

The Business Roundtable is the leading association representing the interests of big business in the United States. Founded in 1972, the Roundtable derives its strength from its organizational structure. As opposed to most other Washington, D.C.–based industry and trade associations, the Roundtable maintains a very small staff. Its policies and activities are driven by its membership—in this case, chief executive officers (CEOs) of 150 to 200 of the largest corporations in the United States.

The Roundtable was the result of a merger of three other big business associations. The Construction Users Anti-Inflation Roundtable and the Labor Law Study Group represented major U.S. corporations in the late 1960s and early 1970s, when the foremost concerns of big business were the increasing costs of labor (particularly in construction) and the political activities of labor unions, which were attempting to strengthen their protection under federal labor law. Following the passage of a series of laws and the creation of new federal regulatory agencies in areas such as consumer protection, environmental protection, worker safety, and employment discrimination, a third association—the March Group—was formed to counter what CEOs perceived to be a decline in business political power.

The consolidation of these three groups was intended to (1) decrease fragmented political power among conflicting industries, (2) educate big business on the new politics of regulation in the 1970s, and (3) coordinate big business political activities. It achieved these goals by restricting Roundtable membership to CEOs of only the largest companies and maintaining the locus of the decision-making and political activities in the hands of the CEOs themselves.

Within a few years, the Roundtable had demonstrated its organizational and political success by leading the efforts to defeat a proposed Consumer Protection Agency, to rebuff labor efforts to amend federal labor law, and to reduce corporate taxes. In the early 1980s, the Roundtable devoted its energies toward reducing federal regulation and addressing the concerns of increasing federal budget deficits. By the mid-decade, corporate CEOs found themselves under attack by agency theorists, who blamed the decline in the U.S. economy on the strategic decisions of U.S. corporations. Aided by institutional investors and armed with a politically accepted finance theory, leverage buyout companies formed to challenge CEOs in the "market for corporate control" by threatening to take over and dismantle corporations. The Roundtable counterattacked by lobbying state legislatures and acquiring protection from what they characterized as "hostile" takeovers and testifying before Congress that these takeover threats posed real dangers to the U.S. economy.

In the mid-1990s, the Roundtable found its political power waning in the midst of Republican congressional victories. Congress, the House of Representatives in particular, was more politically in tune with the interests of small rather than big business. The Roundtable was displaced by the National Federation of Independent Business as the leading pan-industrial political association. Responding to this weakening of its political power, the Roundtable refocused its activities to support the policies of the congressional leadership and the Bush administration. In doing so, it reacquired its political status and success.

The Roundtable was not only heavily involved in the political debates over corporate governance in the 1980s and 1990s, but it played an important role in the philosophical debates as well. In 1981, the Roundtable advocated what became the definitive stakeholder model of the corporation, with managers balancing the interests of the various corporate constituencies. By 1997, the Roundtable's CEOs had redefined their "paramount role" as serving the interests of shareholders, whom they now claimed were the "owners" of the corporation.

Campaign Finance Laws

Campaign finance laws govern the amounts of money candidates or parties may receive from individuals or organizations and the cumulative amounts that individuals or organizations can donate. These laws also define who is eligible to make political contributions and what sorts of activities constitute in-kind contributions.

There have been three major periods of campaign finance regulation in the past century: the era before the Federal Elections and Campaigns Act (FECA) of 1971 and its subsequent amendments; the era from 1974 to 2002, when FECA regulated campaigns; and the current era, following the enactment of the Bipartisan Campaign Reform Act (BCRA) of 2002.

Before FECA, campaign finance laws were mainly addressed to particular types of contributors. By 1947, federal employees, corporations, and labor unions were barred from making contributions to candidates. Unions and corporations responded by forming political action committees (PACs), which aggregated voluntary contributions by individual members or employees.

The FECA of 1971 established limits on candidate spending; on the contributions of individuals and PACs to candidates, parties, or political committees; and on the amount of money candidates could spend on their own campaigns. FECA also established a public funding system for presidential campaigns, financed through a voluntary income tax checkoff. FECA created the Federal Election Commission (FEC) to enforce and clarify campaign finance laws.

In its 1976 *Buckley v. Valeo* decision, the Supreme Court ruled that restrictions on candidate spending and candidate self-financing violated the First Amendment. The Court allowed the limits on spending in presidential campaigns to stand because these limits were contingent on receipt of public funds. And the Court upheld the limits on contributions from individuals or PACs; thus, from the passage of FECA in 1971 until 2002, individuals were limited to contributing no more than $1,000 to a candidate, up to a total of $25,000, and PACs were limited to contributing no more than $5,000 to a candidate.

Many have contended that FECA abetted the development of PACs and increased the reliance of congressional candidates on PACs. FECA has also been said, however, to have reduced the reliance of candidates on individual donors or organizations. That is, because of the contribution limits, it is unlikely that any one donor or organization will contribute enough to a candidate to have an influence on that candidate's campaign. At the presidential level, FECA also restrained spending. All major party nominees abided by FECA's spending limits in their primary campaigns from 1976 through 1996, and public funding of general election campaigns ensured that candidates could not outspend each other.

During the 1990s, two major developments took place that, according to many politicians, undermined FECA's restrictions. First, although corporations and labor unions cannot make direct contributions to candidates, FECA did not prohibit them from contributing to political parties as long as this money was used for “party-building” activities. During the 1990s, political parties began to solicit “soft money” donations from corporations, labor unions, and wealthy individuals. Because these funds were not distributed by the parties to candidates or used to advocate the election or defeat of a candidate, they were not subject to contribution limits. Second, recall that FECA limited the ability of individuals and organizations to spend money in a coordinated fashion with a campaign. The FEC has interpreted this as a prohibition on advocacy that explicitly encourages voters to vote for or against a candidate. Yet, during the 1990s, several advocacy organizations began to advertise heavily on television, describing candidates in a manner virtually indistinguishable from a candidate’s campaign advertisement but without using “magic words” such as “support” or “oppose.”

The BCRA of 2002 was a response to both developments. The two major components of BCRA are a ban on soft money contributions to the national parties and severe restrictions on so-called electioneering advertisements by advocacy groups. These restrictions prohibit organizations that receive corporate or labor funding from broadcasting advertisements that refer to a candidate for election within 30 days of that candidate’s primary election or within 60 days of the general election. BCRA also doubled individual contribution limits and indexed them to inflation. BCRA took effect the day after the 2002 election. In *McConnell v. FEC*, the Supreme Court upheld all the major provisions of BCRA.

As to the soft money ban, some students of campaign finance make a distinction between “pushed” and “pulled” money. “Pushed” money is contributed voluntarily by donors who wish to advance an ideological cause. “Pulled” money is contributed somewhat reluctantly, as a consequence of pressure exerted by politicians on donors. Even prior to the passage of BCRA, many corporations reported that they were becoming reluctant to give soft money contributions to the parties but felt pressured to do so by members of Congress. As a consequence of BCRA’s prohibition on soft money, giving by many corporations, particularly publicly held corporations, declined substantially in 2004. Many individual business CEOs contributed large sums to “527” organizations, organizations independent of the parties that engage in advertising, voter registration, and voter-mobilization activities. Business PACs also grew, though not at a rate larger than the increase across previous election cycles.

BCRA’s advertising restrictions would have prohibited millions of dollars in advertising by peak business organizations, such as the Chamber of Commerce and the Business Roundtable, and industry-specific organizations, such as Citizens for Better Medicare and the United Seniors Association, had they been in place from 1996 to 2002. By 2002, however, the broader peak organizations had already begun to limit their advertising, citing the fragmented television market and the increasing efficiency of using the Internet to communicate with employees.

Canadian Business for Social Responsibility

Founded in 1995, Canadian Business for Social Responsibility (CBSR) is, according to its Web site, a nonprofit, business-led, national membership organization of Canadian companies that have made a commitment to operate in a socially, environmentally, and financially responsible manner, recognizing the interests of their stakeholders, including investors, customers, employees, business partners, local communities, the environment, and society at large. Its vision statement is to be Canada’s leading voice for corporate social responsibility (CSR), harnessing the power of business to create positive change. Its mission statement is to offer practical services and tools to assist Canadian businesses to improve their performance in support of CSR. CBSR members have three guiding principles: (i) implementing and acting on socially, environmentally, and financially responsible policies and practices; (ii) ensuring shared prosperity of shareholders, staff, the environment, as well as local and international communities; and (iii) fostering an exchange of ideas and information within the business communities.

There are three types of members of CBSR: founding members, sustaining members, and regular members. CBSR currently has more than 140 members representing many of Canada's largest corporations, small businesses, and entrepreneurs. The members vary in location across Canada, as well as in size and sector.

One of CBSR's primary activities is the provision of advisory services to help organizations achieve their CSR goals. Different advisory areas that are worked on by CBSR include the following: board and senior executive engagement, research and benchmarking, CSR assessments, stakeholder engagement, CSR strategy and planning, training and education, management tools and systems, and policy and program development. CBSR's advisory services attempts to help companies answer the following four questions: (1) How do you engage your employees in CSR, from frontline staff to senior executives? (2) How do you develop your "random acts of goodness" into a strong and cohesive CSR strategy? (3) How do you communicate your CSR achievements internally and externally? (4) How do you develop the business case for CSR in your company?

CBSR also engages in a number of other projects and activities each year, including the hosting of conferences developing CSR tools and methodologies, as well as the provision of CSR research reports. Examples of some of CBSR's current or past projects include the following: Human Rights: Everyone's Business, Building Sustainable Relationships: Aboriginal Engagement and Sustainability, and the Small and Medium Size Enterprises Program.

The organization takes a collaborative approach to its activities and has entered into partnerships with a number of other CSR-related organizations from around the world including international CSR networks, government agencies, industry associations, educational institutions, the media, and nongovernmental organizations. For example, CBSR considers the U.S.-based Business for Social Responsibility to be one of its many partners. CBSR has offices in both Vancouver, British Columbia, and Toronto, Ontario.

Capabilities Approach

In general, organizational capabilities are categorized in one of three different ways. First, capabilities reflect an ability to more efficiently perform a basic business function (e.g., distribution, marketing activities, operations, logistics, etc.) compared with rivals. For example, Nike has significantly better global brand management than its competitors and has developed extensive competitive capabilities around its brand. Continuously improving the dynamics of interactions is a second type of capability—dynamic capabilities. These types of capabilities focus on the learning associated with repeated and recurring activities. For example, going beyond expectations in customer service responses by anticipating questions or designing next-generation products/services from information gleaned from customer responses is a dynamic capability. Another dynamic capability is the rapid development of bringing ideas to the marketplace. The third category of capabilities enables firms to recognize intrinsic value or develop novel strategies before others. Schumpeter's creative destruction is an example of the third type of capabilities, which is closely tied to cognitive and creative abilities of management and leadership.

Each of these three types of organizational capabilities (static, dynamic, creative) deploys resources to effectively compete against rivals and create a new vision of the future. The ability of competitors to learn and duplicate a firm's existing capabilities depends on the sustainability of the competitive advantage of the capability. A highly imitable capability such as outsourcing to lower-wage countries is not likely to create an advantage for a long period of time. Highly inimitable capabilities, such as personal networks among the top management with elite politicians or understanding the political relationships of employees or the commitment of retirees for effective grassroots lobbying, on the other hand, may create longer-term sustainable advantages. Overall, capabilities based on rare, valuable, or inimitable resources are best for creating sustainable competitive advantages.

For example, when John Deere, Caterpillar, or Komatsu are developing contracts with governments in developing countries, a capabilities approach for these manufacturers of large, earth-moving machines might emphasize infrastructure development. Infrastructure development reflects dynamic and creative capabilities. Dynamic capabilities can be derived from the web of networks and relations with rivals, nongovernmental organizations, and governmental officials for concomitant development of banks, legal systems, regulatory oversight, utilities, telecommunication systems, and so on. By creatively providing inimitable capabilities in addition to earth-moving tractors, John Deere, Caterpillar, or Komatsu can add value, distinguish themselves from competitor's bids, and bring better long-term consequences by creating and managing relationships with outside stakeholders. Rather than competing as manufacturers of earth-moving machines, these firms can extend their product offerings with relational and creative capabilities. Likewise, Cisco Systems or Microsoft uses a capabilities approach by building literacy and computer skills in local neighborhoods and by making computers and software systems available to developing countries. By extending their product offerings by building literacy and computer skills and interacting with policy makers on contentious topics such as privacy, Microsoft and Cisco Systems have the ability to improve living conditions, help eliminate poverty through jobs, and potentially increase demand for future generations of their products/services while creating more stable business conditions and employment opportunities.

By focusing on what firms do extremely well, a capabilities approach encourages development of those activities, processes, and inimitable resources in related areas. Extending the processes executed efficiently and creatively to new contexts, new audiences, and new products can create new markets and improve the long-term economic rents of firms. New contexts might be to different countries or different regions of the world. New audiences might include disadvantaged consumers, the public sector, not-for-profits, or nonprofit trade associations. New products could be extensions of existing product line or unrelated diversification.

Capabilities are embedded within the routines of business activities. That is, a capability cannot be readily isolated and removed from the business. An added value of the product/service is the firm's capability, and the capabilities are a result of the ongoing learnings from the creation, distribution, or consumption of the product/service. Unfortunately, capabilities are often seen as the way to get the product/service sold rather than as a distinguishing feature requiring resources and thoughtful management.

The more valuable the capability the less likely the capability can be exactly duplicated in another firm. For example, Toll Brothers' ability to build seemingly similar large-scale houses in a short time frame is a capability that is currently being duplicated by its competitors in tract housing. As demand for new houses based on a limited number of choices continues, this new capability will likely become more widespread. Easy duplication of Toll Brothers' track-housing skills (a static capability) renders their initial advantage obsolete. Similarly, readily available and cheap worldwide labor sources capable of reproducing accurate data entry/data management activities are changing the competitive structure of many industries. Data management and international call centers are currently core capabilities in some firms operating in low-cost, labor-rich countries.

Capabilities Approach to Distributive Justice

One of the central claims of the capabilities approach is that when people are situated differently and have different levels of needs and expectations, certain rights-claims can be better understood as claims regarding equal level of capabilities to function than simply, for example, the equal rights to resources, which may turn out to be unequal in real terms. Thus, one important idea of this approach to distributive justice is to enrich the discourse on equality by reframing the notion of human rights from being empty rhetoric of entitlements to ideas concerning institutional and material arrangements that are conducive to achieving a certain measure of a full human life. The approach has been developed by Harvard economist and philosopher Amartya Sen and later endorsed and expanded by the University of Chicago law professor and ethicist Martha Nussbaum. For Sen and Nussbaum, seeing rights as capabilities has some helpful advantages in that it indicates that all human rights have broader economic and social dimensions because the capabilities approach emphasizes the actual ability to do or to be. The rights talk in itself does not clarify what is needed to make those rights a reality unless they are understood as securing effective measures to make people capable of appropriate functioning in those areas involving needed material and institutional support. It is thus not helpful to rely on the usual distinction between political and civil rights on the one hand and economic and social rights on the other. Another advantage of the capabilities language over rights talk is that because functioning of the central human capabilities is culturally neutral and sufficiently universal, cross-cultural agreement on basic entitlements is easier to obtain than when the politically and culturally loaded concept of rights is used.

The capabilities approach agrees with John Rawls in not accepting the amount of material wealth for a country (the analog of the gross national product per capita as the model for a country's development or prosperity) or the utility principle for assessing quality of life or human development, as these measures fail to adequately account for the fairness issues in distributive justice. John Rawls, the Harvard political philosopher, is credited with the most influential formulation of the notion of distributive justice in recent times. Rawls defended liberal egalitarian principles of justice among fellow members of a single society as the social contract that would result from hypothetical deliberations in which members of a society assumed to be self-sufficient seek to pursue their individual interests in ignorance of the nature of their goals and resources. This conception of justice, known as justice as fairness in contemporary political philosophy, stipulates that in a just society people should have equal access to social advantages that, in Rawlsian terminology, are primary social goods such as liberty, opportunity, and wealth, unless an unequal access or distribution is to everyone's advantage. Because capabilities approach specifies that capabilities are integrated together for maximal human functioning, both Sen and Nussbaum claim that the Rawlsian primary goods should be understood in terms of central human capabilities. This way, it gives the Rawlsian conception the latitude it needs without making it too thin or abstract.

Nussbaum goes on to argue that the capabilities approach provides a better account of the need, dependency, and vulnerability of many real people than the account of needs conveyed by the notion of primary goods of imaginary contracting parties in the Rawlsian scheme. Accordingly, though Nussbaum's position is close to Rawls's in many ways, she claims that her capabilities approach can overcome certain deficiencies in the Rawlsian notion of social justice. Sen, on the other hand, claims that because capabilities are certain indicators of individual functioning and opportunities only, they cannot adequately account for the fairness or equity of the process involved in justice. Accordingly, for Sen, the bigger arena of justice, where priority of liberty and procedural equity matters, is outside the reach of the capabilities approach.

Nussbaum is more optimistic about the justice implications of her capabilities approach, and this is where she challenges Sen over the issue of endorsing a list of basic capabilities as essential requirements of social justice. Sen is reluctant to endorse a predetermined set of basic capabilities that is not context specific because the capabilities approach allows significant latitude in interpretation and implementation. Underlying this difficulty on his part is his insistence on the need for public reasoning for the validation of rights as capabilities. Given the importance of unobstructed public reasoning in a democracy and the open-ended nature of capabilities, Sen would not like to see a fixed list of capabilities unduly influence the tone and direction of civic discourse that is vital for the evolving social judgment and policy assessments in a democracy. The discourse should be open and have as broad a reach as possible, both for objectivity and fairness. For Sen, public discourse is vital for democracy. Capabilities themselves depend on it, emerging from and being shaped by it, so any theoretical list shouldn't be allowed to preset the tone of the debate.

Unlike Sen, Nussbaum is more insistent on listing a core group of capabilities as valid and applicable through all cultures. Instead of regarding such a list as a denial of the reach of democracy, she believes that her list should be a challenge to all democratic regimes to take rights talk seriously. Nussbaum claims that her capabilities approach offers great potential in deciding on the fundamental constitutional entitlements for citizens in a just democratic state—entitlements that can be put together in constitutional guarantees. It starts with the broad idea of human dignity—an idea that is foremost in many modern liberal democratic constitutions—and then goes on to include a list of 10 capabilities as key ingredients of a rich plurality of life activities that constitutes a life with dignity. The list includes the central human capabilities such as life, bodily health, bodily integrity, emotions, practical reason, social and political affiliations, leisure, and material resources, which, for Nussbaum, better convey the sense of a flourishing human life than a list of negative and positive rights that do not take into account the totality of a full life. A just society must secure for all its citizens each of the 10 capabilities up to a threshold level as constitutionally guaranteed basic entitlements. Nussbaum's list of fundamental entitlements broadly covers the same domain of liberties that features prominently in the discourse on human rights in international politics. Also, Nussbaum views her list of central capabilities as essential requirements of justice, in the sense that the denial of any one of the capabilities on the list is a matter of urgent concern and subject to appropriate judicial review.

Nussbaum thinks that there is considerable tension between Sen's insistence on a strong priority of certain capabilities as fundamental entitlements of all people everywhere and his generic endorsement of capabilities as freedom, without saying which freedoms are important and which ones lack merit, which are socially desirable and which not. Nussbaum acknowledges that public reasoning is crucial in understanding and implementing the range of capabilities in different cultures, and she leaves room for that discourse in her list, which is thick but left open-ended regarding the viability of specific functionings. Just as the broad language of human rights justifiably leaves room for latitude in local interpretation and implementation beyond a certain threshold level, Nussbaum likewise asserts that the threshold levels of the fundamental capabilities are set in different constitutional traditions according to their own history and current possibilities. She nonetheless is left wondering how Sen can avoid evaluating human freedoms and not endorsing a core list of capabilities if he were to embark on a coherent social and political conception of justice. If a constitutional democracy tries to pursue a reasonably just political order, its constitution has to specify, as a minimum requirement of justice, certain freedoms or capabilities as basic entitlements for its citizens.

Firms operating abroad cite the beneficial effects of their business on the country's economy, including opportunities for economic growth. However, the message of the capabilities approach for these companies would be that they need to be concerned with the capabilities of their workers to lead a good measure of meaningful human life, which is the best guarantor of productivity consistent with the well-being of the workers and the society in which they live. This means that international business should operate on a different notion of productivity than the one understood only in terms of material resources and utility. From a capabilities perspective, firms doing business at home and abroad need to include a growth model in their business operations that would emphasize sustainability rather than just material productivity. Otherwise, the global acceleration of a consumer culture would endanger environmental qualities, clash with cultural values, and widen the gap between the rich and the poor. All this is detrimental to an equitable approach toward distributive justice.

CAPITALISM

Capitalism is a system of economic organization, based on private property and freedom of enterprise and contract, in which decisions are coordinated not through coercive mechanisms but through the market. "Economic systems" is the name we give to the different ways in which economic decision making may be organized in a society. Such systems try to answer questions such as what goods and services to produce, how much of each good or service to produce and in what way to produce it, how to distribute the output among all those who have contributed to producing it, how to ensure that the standard of living of the population steadily improves, and so on. And all that has to be done under the real-life conditions of scarcity, ignorance, and uncertainty.

Throughout history, various economic systems have been developed: the tribal economy, feudalism, the planned economy or communism, capitalism, and so on. Intermediate types, displaying features of different systems, have also appeared, such as the war economy and many varieties of mixed economies. Following the crisis of communism, the dominant system has been capitalism.

The Capitalist System

The above definition encapsulates the distinguishing features of capitalism: (1) private property (above all, private ownership of the means of production); (2) the market as the mechanism for coordinating decisions; and (3) freedom of exchange and enterprise for the economic agents vis-à-vis the State and other agents, which implies decentralization of decision making, so that all decisions are made by those most directly affected by them.

The combination of private property and economic freedom gives rise to the incentives that are needed for the agents to base their decisions on criteria of efficiency—efficiency being understood as the achievement of the best possible outcome given the scarce resources available or, alternatively, as the achievement of the desired result using the least possible resources. Under certain conditions, this will lead to a social optimum, by which we mean an efficient allocation of scarce resources to serve goals such as those the agents themselves have freely decided.

The task of coordinating individual decisions is entrusted to the market and the price mechanism. It is assumed that prices contain all, or at least a large part of, the information that the agents need for their decisions to be efficient. Thus, the market performs three broad functions:

1. It is a mechanism for gathering, storing, processing, and transmitting, at minimal cost, information that is scattered among millions of agents who are not even aware that they have it and would not know how to use or share it—a task that no central planning office could ever perform.
2. It promotes and orients incentives so that the agents act as efficiently as possible, minimizing their costs and optimizing their outcomes.
3. It coordinates the decisions of those millions of agents so that their demands and supplies are reasonably well satisfied in time and space, without wastage of resources.

Varieties of Capitalism

The outline given above is the core of the theory of the capitalist system. But just as the market is the product of human action, but not of human design (i.e., it is a "spontaneous" order that arises informally and is continually evolving), capitalism, too, has developed in accordance with specific geographical and historical circumstances: through spontaneous evolution, through reactions to the incentives that have been created, and through the deliberate efforts of the agents.

That is why, in the real world, "pure" capitalism does not exist. Instead, we find numerous variants of capitalism, reflecting the various factors that influence the way in which different societies organize their economic activities. In a sense, it would be fair to say that there are as many capitalisms as there are human communities and historical periods: The capitalism of Germany is not the same as that of Taiwan or Brazil, nor is the U.S. capitalism of the 1950s the same as the U.S. capitalism of the 2000s.

Nowadays, it is common to distinguish between different forms of capitalism. One of them—perhaps the most genuine—is Anglo-American capitalism, represented by the United States, the United Kingdom, Canada, Australia, and New Zealand. Anglo-American capitalism is more individualistic (it assumes that the agents make their decisions based exclusively on their own individual preferences and interests) and more competitive (relations between the agents are more adversarial than oriented toward consensus and negotiation), leaves the agents (persons or organizations) to make their own basic decisions about their future (i.e., it allows only a limited role for the State), puts the emphasis on short-term financial results (as the key to economic efficiency), and concedes an important role to the capital markets.

Another prominent model, which tends to be set in opposition to Anglo-American capitalism, is the continental European model, represented by Germany, Austria, and Switzerland. This model puts the emphasis on the social dimension of decisions (relying on negotiation, agreement, participation, and coresponsibility in decision making), stresses long-term results and social security safety nets that guarantee protection for all citizens (the paradigm for this would be the social market economy, introduced in Germany after World War II), seeks to moderate the free market through a broad array of regulations, and seeks a financial system in which banks play a bigger role than the capital markets. But not all continental European countries fit that model: There are marked differences between, say, France and Germany. There are differences, also, between the Mediterranean countries (Italy, Spain, Portugal, Greece) and the Nordic countries (Sweden, Norway, Denmark, Finland), in which the social security system is far more comprehensive (from cradle to grave), the State plays a much greater role, and incentives also function differently (e.g., when seeking employment).

There is also a Japanese model, which, in its pure form, would include close coordination between economic policy and corporate interests; a system of cross-ownership, forming business groups made up of large companies, their suppliers, and banks; and stable industrial relations, which ensure low labor costs, less conflict, lifetime employment, high productivity, and strong employee loyalty. However, this model is rapidly changing, especially since the 1990s.

It has often been debated which of the various models is the best. There is no one criterion by which to establish an order of preference, so no ranking will be accepted by everyone. In continental Europe, for example, protection of the employment relationship and extension of the welfare state are considered nonnegotiable, so that the apparent advantage of the Anglo-American model in terms of productivity growth is not a conclusive argument.

On the other hand, the ranking of the different models has varied over time. Taking economic growth as a criterion, for example, Europe held the lead in the 1960s, while in the 1980s Japan seemed the model to follow. Since 1995, having achieved only mediocre results in the 1970s, the United States has seen a strong recovery in its growth rate. And now, at the start of the 21st century, China is experiencing tremendous progress. But China is not a pure capitalist economy (nor communist, for that matter); its advantage has a lot to do with the transition from an underdeveloped economy to an industrialized one, although some of its progress is undoubtedly attributable to the introduction of capitalist institutions, markets, and incentives, and the same can be said of some of its problems, such as the growing inequality in the distribution of income and wealth.

Ethical and Social Dimensions of Capitalism

Each generation needs to reach its own conclusions about the social legitimacy and ethical validity of its economic system. Therefore, the fact that the debate on the moral and social aspects of capitalism has been continuing for centuries should come as no surprise. What's more, the same arguments have been put forward time and again. The debate is further complicated when, as often happens, the features of the theoretical or pure model are mixed up with those of capitalism as actually practiced in particular countries and periods.

First of all, it should be pointed out that capitalism is not morally neutral: It is not a purely technical, amoral form of organization but has far-reaching ethical implications. It is possible to describe more or less aseptically how a system works, but moral judgment is somehow inevitable. And from that judgment there derives a set of rules for the system's organization, operation, and results.

To orient our analysis, we must situate the capitalist system within the broader system of society, of which the economic system is a part, whose ideas, values, and attitudes sustain it and whose laws, social norms, ethical precepts, and institutions it shares. In practice, it is impossible to understand capitalism without reference to the society in which it develops. That is why it may be helpful to distinguish between at least four components of any economic system:

1. A complex of ideas and values, from the most elevated (on nature, man, society, happiness, the good) to the popular views and conceptions of daily life, including historical, artistic, scientific, and technical ideas. It is a disordered and often incoherent set in which diverse, even contradictory, ideas and values may coexist. Some are likely to be dominant, but they will change over time in line with trends in the "values market," in which these ideological and axiological sets are forever competing with one another.
2. Prominent within that complex of ideas and values are the philosophical, economic, sociological, and political theories of how the system works or, better, a set of not always consistent theories, based on certain interpretations of man and the community, that explains the incentives, role divisions, and coordination mechanisms in society. Any such explanation will obviously help us to understand the system, but its assumptions will be simplifications of reality, so criticisms of those assumptions cannot be extrapolated to the system.
3. A body of norms and rules (legal, administrative, and social; customs, practices, and cultures) and institutions (market, private property, contracts, money, credit, etc.), which together constitute the formal and informal fabric of society, reflecting its history and its ideas.
4. A system of formal or informal, explicit or implicit incentives that motivate the agents to act in such a way as to achieve their objectives within the framework of norms and institutions.

In an economic system such as capitalism the web of ideas and values, together with certain aspects of the environment (geography, history, endowment of resources, etc.), specifies the norms and institutions. The norms and institutions, in turn, shape the incentives and coordinate the agents' decisions so that they achieve the goals they have set themselves, individually or in groups. Norms and institutions are products of human action, but they may or may not be the result of human design. Insofar as they are the result of human design, a specific role is assigned to collective decision-making mechanisms, especially the ones we know as the State. Now, we are in a position to analyze the problems of social legitimacy and ethical evaluation of capitalism.

The Foundations

As we said earlier, the foundations of capitalism are private property, economic freedom, and coordination through the market. Clearly, our ethical assessment of those foundations will decisively influence our moral and social attitude toward the system as a whole.

1. Capitalism does not flourish in a vacuum but within a legal and institutional framework. A key element of that framework is recognition of the right to private ownership of goods, factors of production, and ideas. Any debate on capitalism starts, therefore, with how to justify that right.

That can be done, for example, by appealing to the principles of justice: People have ownership rights to goods that they have obtained through their own labor or entrepreneurial initiative, or they have ownership rights to goods that they have purchased and possessed peacefully or goods that they need to survive, and so on. Or it can be done by appealing to the principle of freedom: Exercise of private ownership is an indispensable condition for the agent's autonomy. It can also be done by citing natural law, utilitarian arguments, or other reasons that stress the role of efficiency and social welfare: Private property is the best way to conserve and increase material goods and motivate the agents to take personal and social responsibility for their future.

Some authors criticize the individualistic content of the right to private property, as recognized in capitalism, while others accept that right, albeit with limitations (emphasizing the social role of property). In that case, what they are criticizing is not the foundation of the capitalist system as such, but the inadequacy of its legal and institutional system to define property rights appropriately. And there are, of course, those who radically reject the system. Karl Marx, for example, argues that private property constitutes, on the one hand, the right of the capitalist to appropriate the labor of others (the product of their work), and, on the other, the impossibility for labor to appropriate its own product. Therefore, it is a means of abuse of power and, as such, should be abolished.

And Pierre-Joseph Proudhon, on the other hand, declares that all property is theft.

2. The various freedoms that form the foundation of capitalism (freedom of exchange, initiative, labor, contract, etc.) are justified by a variety of principles—freedom, efficiency, moral duties, natural law, and so on.

The freedom that takes center stage in the economic agents' decisions is freedom of choice. Attacks on capitalism are not usually targeted at the principle of freedom as such but at this particular interpretation of freedom, as reflected in legislation, institutions, and the theoretical interpretation of the system. Some authors say that this limited conception of freedom is reductionist and incomplete. Others, while accepting the conception of freedom as being centered in choice, criticize the conditions and limitations imposed on the exercise of that freedom in practice—for example, because the unequal power of the economic agents effectively limits the freedom of those who lack resources or because the huge power of companies and the distortions created by advertising effectively prevent consumers from exercising the sovereignty that the system supposedly grants them.

3. As pointed out earlier, in capitalism the agents' decisions are coordinated through the impersonal market mechanism, not by any planning agency. Efficiency is the main argument used to justify the market. For example, the economic theory of welfare shows that under certain (fairly restrictive) conditions the competitive equilibrium in a free market economy is a paretian optimum, as shown by Arrow and Hahn; that is to say, agents acting to satisfy their personal preferences in competitive markets achieve the efficient coordination of all their decisions, guided by the "invisible hand" invoked by Adam Smith.

And yet the idea of coordination by the market is often criticized. Most of the criticism is technical. In practice, the conditions that must be satisfied for that social optimum to be achieved are indeed very strict: perfect competition in all markets (including cost-free perfect information); existence of perfect markets for all goods, present and future; absence of external effects and public goods; the agents' decisions must be based exclusively on their personal preferences and must not include those of other agents, and so on. Given that those conditions are never met, the capitalist system does not, in practice, yield the excellent results it promises, which is not to say that the alternative systems do any better.

In any case, capitalism operates within a legal, regulatory, and institutional framework, whose task is to channel the agents' decisions so as to achieve economic efficiency, coordinate the agents' decisions, and correct any negative effects that arise when reality does not coincide with the assumptions of the theoretical model. For example, in the absence of perfect competition, it is the task of the legal and institutional system to remedy that shortcoming by promoting "sufficient" competition or by correcting the effects of the lack of competition. Any shortcoming of the system is, above all, a shortcoming of the legal and institutional framework.

The Role of the State

The criticisms of capitalism on the grounds of efficiency demonstrate the need for precisely such a legal and institutional framework to foster the necessary incentives so that agents achieve their goals, their decisions are sufficiently coordinated, and economic efficiency is obtained. This means that in the capitalist economic system there is a role for the State. That role consists, basically, of four tasks:

1. Promoting the legal, regulatory, and institutional framework, that is, formulating laws, regulations, and standards; adhering to them; and ensuring that they are adhered to. That includes developing the institutions that depend on the law. For example, to develop the institution that we call "contract," a legal system has to be created that favors freedom of contract (certainty, legal guarantees, impartiality, etc.) and a judicial system that encourages compliance with those requirements. Note that this is an ethical duty of the State: If the capitalist system is incapable of generating that framework, it will be failing not only in its economic but also in its moral function.

2. Providing public goods. Public goods are goods that may be consumed by one citizen without excluding their being consumed by others. (For example, if police officers patrol a particular street, all the people living in the street will benefit from that service; none can be excluded.) Precisely because nobody is excluded, nobody wants to pay for that good (everyone will think that if the others pay the police to patrol the street, each will be able to enjoy that service at no cost to him or her). That is why, ultimately, the State must take responsibility for providing public goods,

financing them through coercive taxes levied on all citizens. And that, again, is a duty of the State and, therefore, an ethical requirement of capitalism.

3. Correcting external effects. External effects or externalities are the effects that one person or organization's behavior has on another with whom it has no direct relations in the market. For example, the pollution caused by a factory harms local people because the company offloads onto them part of the costs deriving from its activity. In such cases, the State must intervene to limit that external effect by taxing the polluting activity, imposing physical limits on the amount of pollution, and so on. Once again, that is a duty of the State and, therefore, an ethical requirement of the capitalist system.

Obviously, we could draw up a much longer list of possible interventions by the State. The three points mentioned above should be seen as the essential minimum to correct the deficiencies of the market system (so-called market failures) as a mechanism for coordinating decisions aimed at efficiency. Some of the other functions attributed to the State are similar to those just mentioned—for example, provision of infrastructure, roads, railroads, schools, and so on, which have at least some of the characteristics of public goods or help correct external effects. Others, meanwhile, are part of what the State needs to perform its functions—for example, creating the necessary administrative services for the State to carry out its tasks of international representation, justice, defense, public order, and so on. There is one more function, however, that is also very important.

4. Providing a minimum income for citizens. The reason for this function is that agents come to the market to obtain certain goods that they do not possess in exchange for goods and services that they do possess and that they have obtained through natural endowment (their labor, for example), inheritance, or donation or through an earlier exercise of their capacity for work or entrepreneurial initiative. Obviously, the agents' capacity for exchange will be limited by their initial endowments, which may be insufficient to guarantee them a minimum standard of living. Therefore, there will be equity (and also efficiency) reasons for ensuring that each agent has a minimum income, although many authors dispute this argument.

Of course, one may also require the legal and institutional framework to contribute to the redistribution of wealth, and there are ethical principles to support that view, though they are not universally accepted. In any case, any effects that such redistribution has on efficiency will also have to be taken into account (if, e.g., the possibility of receiving transfers from the State reduces the incentive to work or act entrepreneurially). This also has a moral dimension, insofar as it affects not only the well-being of society but also the fulfillment of the individuals' responsibilities toward their own future and their contribution to the common good.

The Ethical Limits of Capitalism

Probably the strongest charge against the capitalist system, from the moral point of view, concerns its anthropological assumptions. However, any discussion of these issues lends itself to confusion because it is not always clear what we are talking about: (1) the characteristics that the agent must have for the capitalist system to work, (2) the anthropological characteristics identified by the theoretical model, or (3) the characteristics of real men and women in existing capitalist societies.

1. What the capitalist system demands is that the agents be resourceful, evaluating, maximizing persons. *Resourceful* means capable of improvement, not passive, filled with a desire for what is best. It means that the agents are capable of developing their tastes, preferences, and capabilities, so as to open up new opportunities, thus broadening the variety of agents and their capacity for specialization. *Evaluating* means that the agents do not look at the world through indifferent eyes but analyze, order, and compare states of the world to choose between them. And *maximizing* means that the agents always try to obtain the best they can from the scarce resources at their disposal. Provided the agents have these characteristics, even if only to a partial and limited extent, the system will work. And it seems reasonable to assume that real-life men and women do indeed have those characteristics, or at least a lot of them do.

2. The theoretical model of capitalism is quite a different matter. It tends to specify those characteristics much more closely, depending on the need for detail and precision of conclusions. It is assumed, for example, that the agents are driven exclusively by self-interest and often that they are selfish. It is assumed, also, that the agents are rational, in the sense that they have a preference function with certain conditions (continuity,

internal consistency, divisibility of goods, etc.). Often, it is further assumed that their calculation ability is perfect and that they have all the necessary information (all these being assumptions that are criticized by those who believe that rationality is bounded).

Obviously, though, those specifications are not required for the capitalist system to work. For example, the agents must be capable of identifying the goals of their actions, which as a rule will be their own personal goals but which may also be oriented toward the interests of other agents (altruism, solidarity). Self-interest means simply that each person is capable of identifying the goals of his or her actions. And needless to say, people's goals do not have to be "selfish," in the sense of ignoring the effects that their actions have on others or not including other people's interests in their preference function. It does not seem legitimate, therefore, to criticize capitalism for the assumptions on which the theoretical models are based or for the implications of those models—although it is not always easy to identify which assumptions are part of the theoretical apparatus and which are relevant to the capitalist system in practice.

It should also be pointed out that the economic optimum, which economics tells us is achieved in a system of private property and free enterprise, is not devoid of ethical content. In effect, what is achieved is a Pareto optimum, that is, a situation in which no change can be made without benefiting one party to the detriment of another. An optimum, thus defined, is not ethically neutral, however. It is based on utilitarian assumptions that have been widely debated. It is only natural, therefore, that the situation achieved under a capitalist system should be considered ethically unacceptable under other moral assumptions.

3. Last, we must consider the set of ideas and values of the flesh-and-blood agents who actually make decisions in the capitalist system. We already pointed out that these ideas and values are plural, disordered, sometimes contradictory, and always changing. What is often criticized about the capitalist system is precisely that set of ideas and values.

That criticism may be important, but it is unfair. It may be important insofar as capitalism, because of the way it works, promotes values that, at least from certain ethical viewpoints, may be described as immoral, because they are individualistic, selfish, uncaring, and so on. In a word, the theoretical model does not take into consideration the mechanisms of moral learning (acquisition of virtues or vices) at work in people's lives. But it may also be unfair insofar as those values are provided by society (the "values market" mentioned earlier), which offers or imposes them on the agents and on the economic system.

The problem becomes even more complicated if we consider that individual and social ideas and values are channeled through laws and institutions. From the moral point of view, it would seem natural to expect society to set up the legal and institutional framework so that it encourages ethically correct and economically efficient behavior and discourages undesirable behavior. But that is not the function of the economic system. The invisible hand referred to by economists is an economic, not an ethical, mechanism. It works to harmonize the decisions of millions of agents acting in accordance with their—selfish or altruistic—personal interests. But the result is an economic, not an ethical, harmony. In capitalism, as in other economic systems, there is no "ethical invisible hand" that works automatically to bring about the improvement of people and the achievement of higher social goals.

Ultimately, the final moral evaluation of the economic system is a moral evaluation of the society of which the economic system is a part. The economic system is not self-sufficient: It needs the above-mentioned legal and institutional, and through them, moral mechanisms that lead society toward an ethically better situation.

All this becomes clearer if we consider the purpose of the economic system, which we have identified as efficiency. In economics, efficiency is defined as a comparison of the resources actually used with the goal pursued: It is always efficiency "for something," for a particular purpose. How that goal or purpose is defined will, in a way, give us the key to the morality of the system whose efficiency we are trying to evaluate. Capitalism efficiently produces weapons, food, drugs, and textbooks, and the moral value of its production will have to be assessed from outside the system.

The thoughts set out in the preceding paragraphs help us to better understand some of the criticisms commonly leveled against capitalism, for example, the criticism that puts the emphasis on how limited the market is—many activities are completely omitted, such as friendship, family, religion, artistic creation, culture, and so on. That is obviously not a shortcoming of the capitalist system, however, but an acknowledgment that a mechanism whose purpose is to achieve efficiency in the use of scarce resources cannot possibly account for every facet of human activity. And the fact that, in recent years, people have developed economic theories of the family, art, religion, altruism, culture, and so on does not alter that argument, because in every human decision involving the use of scarce resources to achieve alternative goals there is room for economic reasoning. That is not to say, however, that such a decision is exclusively economic.

To end this section, it will do no harm to recall that the capitalist system also develops—and demands—moral values such as honesty, integrity, trust, keeping one's word, respect for the law, and many others, and it fosters an entrepreneurial spirit, generosity, risk taking, vision of the future, personal responsibility for building one's own life, and so on. And it also demands values. For example, many economists say that the social responsibility of a company manager is to conduct the business in accordance with the owners' desires, which generally will be to make as much money as possible while conforming to the basic rules of the society, both those embodied in law and those embodied in ethical custom. Ethical ideas and values, embodied in legislation, regulations, institutions, and social culture, are necessary for capitalism to work efficiently.

The Results

The last block of criticisms and defenses of capitalism concerns the actual results. The following are some of the arguments:

- Capitalism is more efficient than other systems in that it has achieved higher rates of economic growth and, therefore, a higher standard of living for the population. In fact, the rapid economic growth of the last two centuries is directly related to the spread of capitalism. But that is true only if we consider material well-being. Higher living standards may have promoted other private or social goods, such as moral quality, cultural development, artistic activity, and so on, but that need not necessarily be so. As pointed out earlier, the economic system aims to achieve efficiency, not to provide those other goods.

- In promoting freedom of enterprise and the entrepreneurial spirit, capitalism has promoted technological progress and innovation. Others, meanwhile, point to the costs of progress, in terms of unemployment, regional underdevelopment, and so on. Once again, this topic brings us back to the legal and institutional framework in which capitalism moves and the incentives it promotes.

- In capitalism, economic growth has been accompanied by an unequal distribution of wealth. The usual response to this criticism is that growth generates opportunities for all: When the tide comes in, all the boats go up. Once more, our judgment will depend on the rules and institutions, above all on the treatment given to those who lack the resources demanded in the market, the opportunities they have to improve their endowment (e.g., through education), social security policy (unemployment and health insurance and retirement pensions), and so on.

- Many years of experience of economic cycles, especially during the Great Depression of the 1930s, led many people to believe that the capitalist system was essentially unstable, prone to boom and bust cycles, high unemployment rates, periods of high inflation, and so on. In the second half of the 20th century, however, governments learned to handle economic policy much better, smoothing the cycles and mitigating the effects of recessions. Moreover, we now have a better understanding of the causes of unemployment and inflation, and the appropriate policies to combat them, so that today these problems are not usually considered to be endemic to capitalism. Nevertheless, failures of market coordination, of the kind mentioned by John Maynard Keynes, still occur, though it does not seem practicable to resolve them by means of planning mechanisms. In any case, insofar as any economic system must protect decision-makers' freedom, such problems of coordination will always exist.

- Environmental deterioration was considered a defect of capitalism. Yet the results achieved by other systems have been no better. Again, the problem is one of institutions, policies, and incentives, and introducing market mechanisms—environmental ownership rights, pollution markets, and so on—is part of the solution to that problem.

- Many critics of capitalism still see it as containing deep cultural contradictions, including promoting contradictory values and life styles (e.g., the work ethic as opposed to the ethic of consumption); the need for trust while creating incentives to violate it (opportunism); the alienation of workers and consumers; the exaltation of work as the key to building a family, while work effectively could destroy the family; the defense of consumer sovereignty and its negation via the manipulation of consumer preferences through advertising; the insistence on the need for competition and the continuous incentive to destroy such competition; the defense of long-term profitability as key to economic efficiency and the predominance of very short-term profit as the guide for financial decision making, and so on. In recent years, other defects have been identified in the framework of a globalized economy. They include irrational bubbles in the financial and real estate markets, job destruction as a means of value creation for shareholders, value chain manipulation as a means of profit maximization, and so on.

- On a sociological and ethical level, the unequal distribution of power, especially between large and small companies, between multinationals and governments, and so on. Once again, it becomes apparent what an important role the legal and institutional system plays. That system cannot be taken as a given; rather, it is something that has to be continuously earned and improved, precisely because the incentives to manipulate it are always there.

- As opposed to these arguments, capitalism is also seen as a system based on freedom. As Milton Friedman pointed out, freedom is one and indivisible, and economic freedom is key to the creation of a space for individual autonomy, mainly vis-à-vis the State. Ultimately, the defense of capitalism is based mainly on two arguments: efficiency and freedom.

The debate on economic systems tends to be impassioned, because it brings into play crucial aspects of the underlying conception of the human person and society. Opinions are very unlikely to converge when the starting paradigms are so different. Nevertheless, study, reflection, and dialogue may help find points of agreement and identify the reasons for disagreement. This entry has offered an outline that may help identify, first, what is essential in the capitalist system and, second, what aspects of the capitalist system are most criticized.

CARNEGIE, ANDREW (1835–1919)

Andrew Carnegie was born in Dunfermline, Scotland, in 1835 and died in Lenox, Massachusetts, in 1919. He was a leading industrialist, investor, and philanthropist who shaped the railroad, bridge-building, and iron and steel industries in the United States. Carnegie moved with his family to Pittsburgh, Pennsylvania, in 1848, where he literally rose from rags to riches, starting at age 13 with a factory job. After his retirement in 1901, he became known popularly as the richest man in the world.

Carnegie's aggressive business strategies and benevolent acts were well known. He is considered one of the industrialist robber barons, 19th-century capitalists who used ruthless business methods to attain great wealth. He was a contemporary of Herbert Spencer, admiring Spencer's ideas of survival of the fittest and social evolution. Carnegie favored the monopolistic concentration of industry among a few owners freely competing, and he thought his individual success uplifted society. He also felt a mandate to give away his money for the public good, and Carnegie's outspoken criticism of idle wealth spurred philanthropy among his contemporaries.

Carnegie as Businessperson

The management techniques Carnegie developed for handling complex organizations were adopted widely. His trademark style used new technology to drive industrial development, returned profits to the firm to enhance its capitalization, and continuously sought ways to cut costs of production, labor, and distribution. Although these techniques enabled the United States to harness its resources and establish itself as an industrial power, many facets of them became the epitome of bureaucracy, such as a rigidly hierarchical reporting structure, decisions solely made on the basis of cost accounting, and using purely quantitative criteria for performance-based promotions.

Figure 1 Carnegie (Bearded Figure, Center) at the 1911 Founders Day Celebration at Carnegie Institute of Technology

Source: Photograph used courtesy of Carnegie Mellon University Archives.

Carnegie's record as an employer was mixed. He saw himself as a friend of the working man, but he treated labor as an abstract cost to be reduced. He used his good rapport with workers to encourage them to run the mills 7 days a week for 12-hour shifts under dangerous working conditions. Although he did not oppose unions overtly, he hired upper-level managers with antilabor reputations. An infamous strike at his Homestead Steel Works in 1892 erupted in violence when replacement workers arrived. The strike's resolution eventually became a significant defeat for the labor movement in the United States, when his workers were forced to accept wage concessions and give up their union.

Carnegie as Philanthropist

Carnegie gave away an estimated $350 million, creating foundations for world peace, education, and research. Perhaps his best-known philanthropic activity was the creation of more than 2,500 libraries in the English-speaking countries, but he also donated to a range of other concerns. The organizations he created include the Carnegie Corporation of New York, the Peace Palace at The Hague, Carnegie Endowment for International Peace, Carnegie United Kingdom Trust, Carnegie Endowment for the Advancement of Teaching, Carnegie Hero Fund, Carnegie Institute of Technology (later Carnegie Mellon University), and the Carnegie Museums of Pittsburgh.

Carrying Capacity

Carrying capacity is the ability of an environment to provide the resources for life-forms to survive and reproduce indefinitely. Every species or organism has needs that must be met for it to survive, but if any population gets too large in relation to the environment's ability to provide for those needs, the ecosystem becomes overloaded and cannot provide basic needs to every organism. Human beings, for example, need space, clear air and water, food, and other essentials to survive and maintain a certain quality of existence, but if the human population gets too large relative to its environment and resource availability, the carrying capacity of the ecosystem may be overtaxed with adverse effects on human welfare. An ecosystem does have limits relative to the size of various populations it can support, whether one is talking about human beings or animal populations.

Below the carrying capacity, populations will tend to increase, while they will decrease above the carrying capacity. Population size decreases above the carrying capacity due to either reduced survivorship because of insufficient space or food or reduced reproductive success because of insufficient food or behavioral interactions. The carrying capacity of an ecosystem will vary for different species in different habitats and can change over time due to a variety of factors including trends in food availability, environmental conditions, and space. The field of population ecology, which deals with the dynamics of species populations and how these populations interact with the environment, attempts to predict the long-term probability of a species persisting in a given habitat.

William Rees (1996) has defined human carrying capacity "as the maximum rates of resource usage and waste generation that can be sustained indefinitely without progressively impairing the productivity and functional integrity of relevant ecosystems wherever the latter may be located." The size of the corresponding population that can be maintained is a function of the technology employed and the per capita material standard of living. Regardless of the state of technology, however, humankind depends on a variety of ecological goods and services provided by nature. For sustainability, these goods and services must be available in increasing quantities from somewhere on the planet as per capita resource consumption and population increase.

Humans have developed technologies to grow more food and dispose of the wastes that we create. These technologies have extended the carrying capacity of earth. However, there is still a limit to the human population that the earth can support. This carrying capacity is a function of the number of people, the amount of resources each person consumes, and the ability of the earth to process all the wastes produced. Sustainability is about finding the right balance point among population, consumption, and waste assimilation at any point in time given the existing technologies.

This same concept of carrying capacity applies to certain elements of the environment such as air and water. Every such medium has a certain ability to absorb waste material without serious harm done to the quality of that medium. Thus, air, for example, can absorb a certain amount of waste material without serious harm being done to its quality. But if the carrying capacity of the air is exceeded, the air starts to become fouled by certain pollutants and the quality of the air is affected. Its natural dilutive capacity is violated and human health is affected as a result of exposure to harmful pollutants.

The concept of carrying capacity is related to the idea of natural capital. While "capital" is most often used to refer to money and material goods, natural capital refers to the functions the ecosystem provides for the sustainability of human life, including natural resources, air, water, and other such functions. A community that is living within its means and caring for its natural capital is living within the carrying capacity, while a community that is degrading and destroying the ecosystem on which it depends is using up its natural capital and living unsustainably. In this case, natural capital is being used up faster than it is being replenished or replaced.

Related to the concept of carrying capacity is the idea of a limiting factor, that the population size of a species is constrained by whatever resource is in shortest supply. For example, the availability of water is a limiting factor for human populations living in desert conditions. While other resources necessary for sustainability may be available, the unavailability of one critical resource means that the carrying capacity of that ecosystem may be exceeded. Organisms may, however, substitute a closely related substance for one that is required but is deficient in the environment, or they may be able to alter the conditions in which they are living so as to reduce their requirements.

While in the abstract the concept of carrying capacity makes sense, measuring the carrying capacity of the earth is fraught with difficulty. One of the debates in the population literature centers on what the maximum carrying capacity of the earth is at present and whether we are below or above that level. Doomsayers think that the earth has already exceeded its carrying capacity, while some of their critics seem to believe that the carrying capacity of the planet is infinite. Some question the practical usefulness of the concept, while others focus on ecological footprint analysis to get a handle on the carrying capacity of the earth. Such an analysis approximates the amount of land and sea area it takes to sustain a population and is widely used as an indicator of environmental sustainability. There is thus some controversy about the concept of carrying capacity and its usefulness in helping formulate policies for individual countries.

Cartels

A cartel typically consists of a voluntary and temporary agreement among firms in the same industry to follow common policies instead of competing with each other. These policies can include agreements on prices, market shares, quota systems (limiting production to certain quantities), and conditions of credit. From the perspective of these firms, the main reason for the voluntary formation of cartels is to avoid excessive competition that can lead to price wars that decrease profits for all firms in an industry. This is a departure from the conventional understanding that a competitive market of unfettered supply and demand is the most efficient and fair way of establishing prices and quantities of production. While prices and quantities of production are variable under conditions of free competition, cartels may adapt production to meet demand quotas. Because of this, they can also be used as tools of industrial policy by governments.

The use of cartels was established in Germany at the end of the 19th century. During this period, for example, the coal cartel of Westfalia-Renania formed in 1893 and acted as a sales agent for the majority of mines in Ruhr. Later, in 1925, German chemical companies merged to form IG Farben. It is estimated that there were 3,000 or so cartels in Germany in the 1930s, which the Nazis used to control the German wartime economy. Cartels have also existed in other countries, such as Austria, England, Switzerland, France, Italy, Scandinavia, and Japan, often as a result of government policies aimed at providing incentives for corporate development.

After World War II, cartels fell out of favor with many theorists. Presently, there seems to be a consensus in many camps that cartels are neither efficient nor fair. The adverse implications for social welfare include unused production capacity, higher prices for consumers, and the maintenance of inefficient companies to the detriment of efficient ones. Even so, it is important to note that forms of noncompetition have long existed in market economics. Besides cartels, these include monopolies, oligopolies, trusts, vertical integrations (consolidations of supply chains), and *zaibatsus* or industrial groups that once dominated the Japanese economy. Furthermore, cartels are generally thought to be unstable in that member firms have incentives to cheat on agreements and sell more than the production quotas set by their cartels.

Casuistry

Casuistry is a case-based method of reasoning used in business ethics, bioethics, and the ethics of various professions. Casuistry typically uses general principles in reasoning analogically from clear-cut cases, called *paradigms*, to vexing cases. Similar cases are treated similarly. In this way, casuistry resembles legal reasoning. Casuistry may also use authoritative writings relevant to a particular case.

Practitioners in various fields value casuistry as an orderly yet flexible way to think about real-life ethical problems. Casuistry can be particularly useful when values or rules conflict. For example, what should be done when the duty to meet a client's expectations collides with a professional duty to protect the public? Casuistry also helps clarify cases where novel or complex circumstances make the application of rules unclear. Should e-mail receive the same privacy protection as regular mail? If someone develops an idea while working for one employer, is it ethical to use that idea to help a subsequent employer? Casuistry seeks both to illuminate the meaning and moral significance of the details in such cases and to discern workable solutions.

How Casuistry Works

Consider the following scenario: A maintenance supply vendor visits the manager of a large apartment building and demonstrates the advantages of switching to energy-efficient light bulbs. The vendor adds, "We're having a special promotion right now. Everyone who orders 10 cases of bulbs gets a free emergency radio." Is it ethical for the manager to order 10 cases and accept the gift?

A casuist might approach the scenario by identifying its morally significant features. Those features might include

- the value of the gift,
- the quality of the product being offered for sale,
- the availability of similar products from other vendors at a lower price, and
- the timing of the gift offer relative to the timing of the manager's decision about whether to buy.

The casuist might next identify any generally accepted rules or values involved in the case. A rule in the case of the manager might be, "Get the best value for the building owner's money."

At this point, the casuist might look for analogous paradigm cases. One paradigm would involve a clearly unacceptable gift, such as an expensive piece of luggage offered to promote a shoddy, overpriced product. A second paradigm would involve a generally acceptable gift, such as an inexpensive ballpoint pen given as a thank-you for purchasing a competitively priced, high-quality product.

The casuist would compare the building manager's case with the two paradigms. A closer resemblance to the paradigm involving an acceptable gift would argue in favor of letting the manager accept the radio. A closer resemblance to the opposite paradigm would argue against accepting the radio.

Casuistry's attention to the details of cases can help open up a range of options for those caught in ethically murky situations. In the case of the building manager, possibilities might include demanding a discount instead of the radio, asking for a delay to allow competitors' products to be evaluated, or simply rejecting the radio. The moral and practical advantages and disadvantages of the options would then be discussed.

When examining complex issues, casuists may arrange and sort many cases to create a resource called a *taxonomy.* Treating similar cases similarly, casuists use taxonomies to develop general guidelines or policies.

History of Casuistry

Biblical writers, Greek and Roman philosophers, rabbis, Christian preachers and teachers, and Muslim jurists have used casuistry to solve real-life moral puzzles. The Roman orator and philosopher Cicero wrote the first known "case book" on situations where duties seemed to conflict.

In Europe between 1556 and 1656, members of the Society of Jesus (Jesuits), a religious order in the Catholic Church, produced an extensively developed form of casuistry that became known as "high casuistry." The "Provincial Letters" by the French religious philosopher and mathematician Blaise Pascal criticized the misuse of casuistry as sophisticated excuse making. Following Pascal's critique, casuistry fell into disrepute.

The rise of professional ethics led to renewed interest in casuistry. Contemporary casuists recognize the potential of self-interest and other forms of bias to corrupt casuistry. At the same time, many authors affirm casuistry's usefulness in helping people with diverse beliefs to reach workable agreements in difficult moral cases.

Casuistry and Other Methods in Ethics

Casuistry departs from ethical approaches that work deductively from rules thought to have clear applications in all circumstances. Casuistry takes rules into account but begins with the moral and practical features of each case.

Casuistry also departs from approaches to ethics that rely solely on good character or virtuous motives. Instead, casuistry demands deliberation about how to put good character and virtuous motives into practice.

Some authors classify casuistry as a subset of "applied ethics." Others restrict the term *applied ethics* to deductive reasoning from principles to cases. Accordingly, these authors view casuistry as an alternative to applied ethics.

Like casuistry, "situationism" or "situation ethics" focuses on cases. Unlike casuistry, situationism uses no paradigm cases and views principles as "guidelines" at most. Situationism also departs from casuistry by viewing circumstances as unique and isolated rather than as continuous with broader moral experience.

Cato Institute

The Cato Institute, founded in 1977, is a nonpartisan research organization based in Washington, D.C. The mission of the self-described market liberal think tank focuses on traditional American principles of limited government, individual liberty, free markets, and peace. In keeping with these free market principles, the Institute accepts no governmental funding or endowments, instead relying on private donations to support its $14 million annual budget.

The Cato Institute keeps its intellectual forebears in the forefront, as evidenced by its naming, after *Cato's Letters*. Advocates rely on the values propounded in these revolutionary pamphlets, along with the written works of the founding fathers. While embracing modern individualist philosophers such as Robert Nozick and Ayn Rand, the Institute demonstrates a special attachment to Friedrich Hayek. Hayek argued that freedom for all would allow genius and innovation to emerge from any sector or strata of society, ultimately leading to social benefits for all.

Cato researchers explore market-liberal positions on diverse domestic topics such as education policy, labor law, homeland security, and tobacco. Indeed, the Institute has been looked to by a series of presidential administrations as the leading source of research and analysis on the privatization of social security, a research program that it formalized in 1995 with the founding of its Project on Social Security Choice. The Cato Institute also addresses global issues. While critical of the International Monetary Fund's and World Bank's fostering of financial dependence among developing economies, the Institute is a strong advocate of free trade, as evidenced by the Cato Center for Trade Policy Studies.

The Institute's market-liberal economic position is accompanied by an equally libertarian social position. The Cato Institute's goals include the pursuit of liberty for all citizens, primarily in the form of equal freedom from governmental intervention. Their positions often align with "socially liberal" politics, in that the Institute supports sexual and racial freedoms and decries the "war on drugs." The Institute also disagreed vocally with the Bush administration's decision to invade Iraq, arguing that the military should instead focus on its legitimate role as defender of homeland soil.

The Cato Institute's critics claim that it is a front for corporate interests and foundations anxious to benefit from these antiregulatory advisers in Washington. Others argue that it is misleading to label the Institute *nonpartisan*, a term that may describe its relationship to the two leading political parties in the United States, but that belies its strong philosophical position.

The Cato Institute publishes books and policy studies, along with their regular publications *Cato Journal*, *Cato Policy Report*, *Regulation* magazine, and the free quarterly *Cato's Letter.* In addition to holding regular policy and book forums in Washington, D.C., the Institute also hosts conferences in major cities around the world.

Cause-Related Marketing

Cause-related marketing (CRM) refers to a marketing activity that involves a company forming a relationship with a particular cause or causes for mutual benefit. CRM can be characterized as a strategic marketing tool employed to achieve both social and corporate objectives; it simultaneously benefits the company and a charity or similar cause. The cause could be general, for example, a concern for the environment, or specific, for example, when a percentage of the sales of a particular product are donated to an identified charity. From the company's perspective, the benefits include the opportunity to enhance their reputation, differentiate themselves from the competition, boost employee morale, raise brand awareness, increase customer loyalty, build sales, and attract positive publicity. From the perspective of the "cause," the benefits include increased revenue and public awareness of their activities.

CRM originated in the United States, where corporate philanthropy is typically characterized as "enlightened self-interest" or as "doing well by doing good." American Express is credited with being the first company to launch a CRM campaign in the early 1980s. Increasingly, companies are moving away from "no strings attached" donations toward joint ventures in which commercial sponsorship of charities is included within overarching corporate objectives, and it is becoming common for contributions to social causes to be funded by the marketing budget rather than a central philanthropic fund.

There are several concerns raised by CRM. Neither the short-term nor long-term effects of CRM on charitable income are known. While CRM campaigns appear to result in increased funding for the social causes involved, there are fears that traditional sources of income may be harmed by CRM. There is concern that CRM will undermine traditional donations as companies come to expect a return for their contributions. Moreover, individuals may be less likely to spontaneously donate to particular charities if the products they buy support social causes. There is also a question relating to the sustainability of income for social causes from CRM. When a company feels it has exhausted CRM's benefits it will move to more profitable campaigns leaving the social causes they previously supported to find alternative ways of generating income. If CRM does undermine spontaneous donation, then after the campaign ends the charity may be badly affected. This possibility raises the question of what, if any, ongoing responsibility companies ought to have to the social causes they have entered into CRM relationships with after the campaigns end.

On a more theoretical level, the concern is that CRM marks a shift from an intrinsic motivation for companies supporting social causes (i.e., supporting them because it is the right thing to do) to an instrumental or prudential reason for doing so (i.e., supporting them to derive a benefit). At an individual level, CRM may undermine consumers' commitment to social causes because it is mediated through a market transaction that could lead to a sense of moral disengagement from social issues.

Caux Principles

The Caux *Principles for Business* were first presented to the business community in 1994. The authors of the *Principles* are members of the Caux Round Table (CRT), which was organized in 1986 by 28 senior business executives from Japan, Europe, and the United States. The group meets in various nations but often in Caux, Switzerland, hence their name.

To have efficient and fair markets, CRT executives recognized the need for worldwide ethical principles. Some members also belonged to the Minneapolis-St. Paul Minnesota Center for Corporate Responsibility, now called Center for Ethical Business Cultures, which had already forged global ethical principles. CRT discussed those principles and decided to adopt them with a few changes. CRT added two basic principles to their *Principles for Business.* The first, from the Eastern tradition, is the Japanese principle of *kyosei*, which means living and working together for the common good, enabling cooperation and mutual prosperity to coexist with healthy and fair competition. The second principle, from the Western tradition, is *human dignity*, which refers to the sacredness or value of each person as an end, not simply as a means to the fulfillment of other's purposes. The *Principles* include a preamble, seven general principles, and six more specific sets of stakeholder principles, covering customers, employees, owners/investors, suppliers, competitors, and communities.

CERES

See Coalition for Environmentally Responsible Economies (CERES)

Certified Public Accountants (CPAs)

A certified public accountant (CPA) is an individual who has been certified by a state examining board as having passed the Uniform CPA Examination and met that state's additional requirements with respect to education and work experience. Most states also require that licensed CPAs obtain a specified number of hours of continuing professional education every 3 years to maintain the license to practice as a CPA.

Professional ethics plays an important role in the public accounting profession. Every state society of CPAs has its own code of professional ethics, and its members are expected to adhere to that code. Alleged violations are investigated by the state board or its designee, and those deemed to be in violation are subject to penalties ranging from censure to license revocation.

The Uniform CPA Examination was recently changed to a computer-based format that is administered two out of every three months during the year at test centers across the United States. Individual state boards of accountancy determine if candidates meet their jurisdictions' requirements to sit for the examination. The revised exam is divided into four sections—auditing and attestation, financial accounting and reporting, regulation, and business environment and concepts—and takes a total of 14 hours to complete. Candidates may take as many sections of the exam as they choose during each examination window, but must pass all four parts during a rolling 18-month period, beginning on the date that the first section has been passed.

Educational and experience requirements for CPAs vary somewhat from state to state. However, at present, most states require 150 hours of postsecondary education at an accredited college or university and 2 years of experience in public accounting or internal auditing. A useful resource summarizing the requirements by state is the *Digest of State Accountancy Laws and State Board Regulations* published jointly by the American Institute of Certified Public Accountants (AICPA) and the National Association of State Boards of Accountancy.

The largest national, professional organization representing CPAs in the United States is the AICPA. With approximately 328,000 members, the AICPA works with state CPA organizations, giving priority to those areas where public reliance on CPA skills is most significant. AICPA membership is not mandatory for CPAs, but it is estimated that three out of every four CPAs are members of the AICPA.

CPAs pursue careers in public accounting, private industry, governmental agencies, and not-for-profit organizations. CPAs in public practice engage in a broad range of services, including auditing, tax, and consulting activities for their clients. However, the Sarbanes-Oxley Act of 2002, passed partially in response to accounting scandals at Enron and WorldCom, prohibits public accounting firms from performing consulting and certain other services for those clients whose financial statements they audit. The firms, however, are permitted to perform these services for other, nonaudit clients. A primary function of CPAs is the audit of financial statements of public and privately held companies, as well as other business entities. This assurance function has become an important component of the U.S. economic system, as it provides potential investors and creditors with independent verification that a company's financial statements have been prepared on a consistent basis in accordance with generally accepted accounting principles. This verification process supports the overall economy by effectively lowering the overall cost of capital.

There has been a rapid increase in the number of CPAs specializing in forensic accounting as a result of the recent accounting scandals. Forensic accountants investigate alleged white collar crimes, such as securities fraud and embezzlement, as well as other criminal financial activities, such as asset misappropriation and financial statement fraud. Forensic accountants combine their knowledge of accounting, law, and investigative techniques to determine if illegal activity has occurred. Often, forensic accountants serve as expert witnesses during trials, presenting the results of their investigations.

CPAs in private industry often hold the title of chief executive officer, chief financial officer, controller, and/or treasurer. They record and analyze financial information of the companies for which they work and are involved in budgeting, performance evaluation, product costing, cost system design, and asset management. CPAs in private industry also pursue careers as internal auditors, verifying the accuracy of their organization's internal records and checking for mismanagement, waste, or fraud. They also evaluate their firms' financial and information systems, evaluate management procedures, and assess whether internal controls are adequate.

CPAs also work in the public sector for governmental agencies and not-for-profit organizations, maintaining and examining records of government agencies and charitable organizations. CPAs employed by federal, state, and local governments guarantee that transactions are recorded in accordance with laws and regulations. They also work as Internal Revenue Service agents or in financial management, financial institution examination, and budget analysis and administration.

Multiple career options are one of the many attractive qualities of a career as a CPA. In addition, the implementation of the Sarbanes-Oxley Act of 2002 has greatly increased the demand for auditors and, particularly, forensic accountants. These new-age accounting jobs require more than simply crunching numbers. Rather, they require a detail-oriented mind and solid communication skills to converse with clients and upper-level management. Along with the variety of career paths available to CPAs comes a very work-oriented life style. CPAs usually work between 40 and 50 hours a week during the regular year, with the number of hours increasing dramatically during the traditional busy season during the first calendar quarter.

The job outlook for CPAs is bright. It is predicted that 2005 hiring for entry-level accounting positions will increase by 13% over 2004, according to a new survey from the National Association of Colleges and Employers.

CFA Institute

CFA Institute is the global, nonprofit professional association that administers the Chartered Financial Analyst curriculum and examination program worldwide and sets voluntary, ethics-based professional and performance-reporting standards for the investment industry. As of June 2005, CFA Institute had 76,000 members in 119 countries. Its membership includes the world's 64,000 CFA charterholders, as well as 131 affiliated professional societies and chapters in 52 countries and territories. CFA Institute is headquartered in Charlottesville, Virginia, USA, with additional offices in London and Hong Kong.

Mission and Membership

The mission of the CFA Institute is to establish a direction for serving its members and setting a higher standard within the global investment community. CFA Institute has adopted a formal strategic planning process and a set of values around which all its programs, services, and initiatives revolve. It strives to be the organization for investment professionals who are dedicated to meeting the highest standards for ethical behavior, education, and ongoing professional development and excellence of practice in the profession. CFA Institute provides a range of products and services to its members, other investment professionals, and the investing public, and it aims to fulfill its mission and vision through effective use of volunteers, good stewardship of resources, and effective use of technology. Therefore, the core values of excellence, integrity, strength of community and cooperation, and volunteer service have been adopted.

Formerly the Association for Investment Management and Research, CFA Institute offers three membership categories: CFA charterholder, regular, and affiliate. To qualify as a CFA charterholder member, an individual must have satisfied the requirements to become a regular member and the requirements of the CFA program established by the CFA Institute. As a regular member of CFA Institute and a local society, an individual must (1) hold a bachelor's degree from an accredited institution or have equivalent education or work experience, (2) have passed Level I of the CFA exam or the Self-Administered Standards of Professional Practice Examination and have 48 months of acceptable professional work experience in the investment decision-making process, and (3) agree to adhere to and sign the Member's Agreement and Professional Conduct Statement. An affiliate membership applicant must adhere to the Member's Agreement and Professional Conduct Statement.

Code of Ethics and Asset Manager Code of Professional Conduct

The CFA Institute code of ethics states that its members shall act with integrity, competence, dignity, and in an ethical manner when dealing with the public, clients, employers, employees, and fellow members. The Code encourages members to practice in a professional and ethical manner that will reflect credit on members and their profession, while striving to maintain and improve their competence and the competence of others in the profession. Moreover, the Code asks members to use reasonable care and to exercise independent professional judgment.

Recently, the Asset Manager Code of Professional Conduct has been revised and new standards are expected to be included in the 2006 exam year. This Code addresses six areas: (1) loyalty to clients, (2) the investment process and actions, (3) trading, (4) compliance and support, (5) performance and evaluation, and (6) disclosures to clients. The Code compels management firms to, among other things, place clients' interests first, have a reasonable basis for investment decisions, and act according to clients' or funds' objectives. Firms must also fairly allocate trades among clients and give priority to client trades over self-interest; appoint a compliance officer to implement policies and investigate complaints; use fair-market prices when necessary; and ensure that performance information is complete, accurate, and timely. Last, the Code calls on companies to make all necessary disclosures to clients in a truthful and timely manner.

An integral part of the CFA Institute is the *Financial Analysts Journal*, which circulated its inaugural issue to about 700 subscribers in January 1945. Despite having different governing bodies, the publication adheres to the same standards and principles as CFA Institute.

CHAEBOL

A *chaebol* is a family-controlled South Korean conglomerate. While the founding families do not own majority stakes in the companies, Korean culture allows them to maintain control out of respect for their long associations with the businesses. Among major *chaebol* are Samsung, LG, Hyundai, and SK Group. *Chaebol* produce nearly two thirds of South Korea's exports and attract 70% of foreign capital inflows.

South Korean government-*chaebol* cooperation has been termed an unholy alliance, with rampant favoritism and corruption and little transparency. While that cooperation has been credited with fueling the nation's growth and transformation, critics say it also has led to monopolistic and oligopolistic concentration of capital and economically profitable activities. The *chaebol* culture is now accused of stifling creativity, amassing political power for leading families rather than maximizing profits, providing an unfair playing field for small and medium-sized enterprises, and excluding women and divergent voices from management. *Chaebol* payoffs to former South Korean presidents Chun Doo Hwan and Roh Tae Woo were estimated to be in the hundreds of millions, and perhaps billions, of dollars, subsequently leading to the convictions of those leaders.

Webs of cross-shareholdings enable families running the *chaebol* to covertly transfer funds from healthy companies to weaker ones in the group. As a result, investors in high-performing companies in the *chaebol* are forced to subsidize survival of frail members. In addition, the South Korean government has pursued a "too big to fail" doctrine, with government-owned banks regularly rescuing large firms despite continuing huge losses, resulting in *chaebol* acquiring massive debt. Foreign investors have long applied a "Korea discount" of 20% or more to Seoul-traded shares, showing reluctance to pay high valuations on companies that may be secretly controlled by insiders.

In 1997, following devaluation of the Korean *won*, the International Monetary Fund bailed out South Korea with an aid package worth almost $60 billion. That aid came with strict conditions that South Korea reform its economy and the *chaebol.* The *chaebol* situation was the key issue in the 2002 South Korean presidential race, with Roh Moo Hyun, a crusading civil rights lawyer, riding into office on a wave of reformist sentiment.

A variety of reformative measures have been taken. For example, Chey Tae Won, chairman and CEO of SK Group and heir to the company's founding family, was arrested in 2003 and jailed on misappropriation charges. He was convicted of accounting fraud and breach of his fiduciary duties and sentenced to 3 years in jail. Nevertheless, he served just 3 months in prison and remains at the head of the *chaebol.*

Laws implemented in 2004 limit the amount conglomerates may loan or invest in their affiliate companies, require disclosure of shares held by members of the top executives' families, and permit the Bank of Korea to investigate the assets of owners' family members to prevent concealment of assets. Largely because of reform efforts, 12 of Korea's top 30 *chaebol* prior to 1998 no longer exist as coherent entities.

Nevertheless, some critics argue that reform has been slow, tentative, and incomplete, hampered in part by recent scandals surrounding Roh Moo Hyun's aides and donors. Reform may also face opposition since forced closure of loss-making *chaebol* businesses would result in cutting 200,000 or more jobs and because of the still massive power of the *chaebol.*

Challenger Disaster

The *Challenger* Disaster refers to the accident in which the Space Shuttle *Challenger* exploded barely a minute after liftoff and killed all seven people on board. This incident is cited as an example of what can happen when members of an organization fail to blow the whistle on what they recognize as a potential problem.

The Space Shuttle *Challenger* flew nine successful missions prior to the incident in 1986. This mission was unique in that, on this flight, *Challenger* was scheduled to carry the first teacher to fly in space, Christa McAuliffe. The mission was also unusual in that, from the start, it was plagued by anomalies. Although liftoff was originally set for January 22, weather delays and equipment servicing issues delayed liftoff until January 28.

A subsequent investigation identified the cause of the disaster—the failure of an O-ring seal. It was determined that the O-ring was not designed properly. Regardless, had the shuttle lifted off on January 22 as originally planned, it is likely that the launch would have been successful. It was the abnormally low temperature on January 28 coupled with the design defect that caused the disaster to occur.

In fact, engineers and managers at Morton Thiokol, the manufacturer of the O-rings, were not entirely surprised by what happened. On the night before the fated day, several of them protested the launch because of the impending bad weather predicted for the next morning. First, they believed that choppy sea waters might make it considerably difficult to recover the shuttle boosters after the launch. Second, they feared that ice in the booster support troughs might interfere with the shuttle orbiter. Third, they were openly concerned about the weather—they admitted that they could not predict the behavior of the O-rings that sealed the booster joints, because the O-rings had not been tested at temperatures below 50°F (degrees Fahrenheit). The temperature was predicted to be about 30°F at the time of the scheduled launch.

Thiokol signed off on the launch over the objections of the engineers. Managers at Thiokol saw their first priority as to execute the launch. Since there had been 24 successful launches prior to this one, they did not see any reason this launch would not be successful as well. Moreover, the engineers could not prove that the O-rings and shuttle orbiters would not function at temperatures below 50°F. The engineers did not blow the whistle—they did not report their concerns to anyone other than their managers. On January 28, 1986, at 11:39 EST, Space Shuttle *Challenger* disintegrated, 73 seconds into its flight.

Many lessons were learned on this day. Manned space flights did not resume in the United States for more than 2 years after the *Challenger* Disaster. Only after technical modifications were made and after NASA management implemented stricter regulations regarding quality control and safety did the space shuttle program resume on September 28, 1988, with the flight of Space Shuttle *Discovery*.

Chamber of Commerce of the United States

The idea of forming a national organization to represent the unified interests of U.S. business first took shape under the presidency of William Howard Taft. On April 12, 1912, his vision for the organization became a reality when a group of 700 delegates from various commercial and trade organizations came together to form the U.S. Chamber of Commerce to represent business interests at the national level. More than 90 years later, the Chamber has grown to include more than 3 million business organizations, 2,800 state and local chambers, 830 associations, and 102 American Chambers of Commerce abroad.

The U.S. Chamber focuses on national issues at the federal level that affect business interests. The Chamber tries to influence these issues through lobbying or talking with government leaders, testifying before Congress on behalf of business, going to court, keeping track of the legislative agenda, speaking out for business, and other means to make sure business interests are taken into account by the federal government. Its influence has grown over the years as it has become more sophisticated in its ability to affect the public policy process and make its voice heard in Congress and other parts of government. It has been a leader in fighting government regulation thought to be too onerous on business and pressing hard for legislation that is supportive of individual opportunity and the free enterprise system.

The Chamber has a number of programs that provide services to its members. The National Chamber Foundation, for example, is an independent, nonprofit public policy think tank that promotes discussion of cutting-edge issues affecting business. The Institute for Legal Reform helps reduce excessive and frivolous lawsuits while restoring fairness and balance to the nation's civil justice system. It does this by promoting civil justice reform through legislative, political, judicial, and educational activities at both national and local levels. Another legal program focusing on litigation is the National Chamber Litigation Center, which plays a major role in shaping public policy on important legal questions of concern to American business while achieving long-range improvements in the legal system as a whole.

Access America focuses on women and minority-owned business leaders and entrepreneurs and tries to open doors to networks and markets and fosters strategic alliances and investments for these groups. The Center for Corporate Citizenship works with public and private sectors to enable and facilitate corporate civic and humanitarian initiatives. The Center for Workforce Preparation elevates the quality of a community's workforce by participating in grant-based programs. The Institute for Organization Management and the Institute for Advanced Management offer continuing education opportunities and professional credentialing for chamber and association professionals. There is also a Homeland Security program that recognizes the stake American business has in a strong national defense and homeland security policy that safeguards Americans while also promoting their mobility and freedom.

With regard to trade and international programs, the U.S. Chamber has an International Division that tries to improve the ability of U.S. business to compete in the global marketplace by providing its members tools and resources as well as promoting cutting-edge events that bring world leaders to its membership. The Center for International Private Enterprise is an independent, nonprofit affiliate of the Chamber that promotes democratic and market-oriented economic reform by working directly with the private sector in developing countries. The Space Enterprise Council represents businesses with a commercial interest in space by providing a forum for space-related companies. Finally, TradeRoots is a national trade education program dedicated to building grassroots support for trade in the U.S. Congress and stopping antitrade protectionism.

The Chamber has a number of publications and e-newsletters for its membership. The Member magazine keeps its readers alert and up-to-date on legislation that will affect business. Whether it is taxes, energy, or transportation, the magazine claims to tell it membership what it needs to know. *SmartBrief* is an e-newsletter that provides an inside track to business best practices to help chamber and association members lead their organizations. The *Workforce Preparation News* provides information about current workforce development projects in support of workforce training and education. And finally, *The Corporate Citizenship* is a monthly e-publication that provides insight on current trends and policy developments that have an impact on the active role of business in society.

The Chamber of Commerce of the United States is one of a number of organizations that work at the federal level to promote business interests. The National Association of Manufacturers (NAM), for example, was formed before the Chamber and claims to be the voice of American industry. The Business Roundtable was formed to represent the largest companies in the United States who felt they had different interests that were not being adequately represented by the Chamber and NAM because these organizations covered such a broad range of business organizations from the smallest to the largest. Finally, the National Federation of Independent Business was formed to represent the interest of smaller companies. Nonetheless, the Chamber is one of the premier organizations representing business at the federal level and is likely to remain so in the future.

Charity, Duty of

Charity is the act of giving something of value, usually money, physical property, or time, to a worthy cause or to a person or people in need. Generally, charity is extended to those whom the giver views as less fortunate or those whose cause the individual considers worthy of receiving charity. People living in chronic poverty, suffering from disease, abuse, or other misfortune, and victims of crime or natural disaster are sometimes viewed as especially deserving of charity.

Some social theories posit that the duty of charity is part of the social contract that allows individuals to live together in relative harmony. Each person helps others in times of adversity, knowing that their good deeds will be reciprocated when, or if, necessary. At a minimum, the social contract implies a duty to provide aid in times of emergency. In this regard, charity is a form of social insurance in which a person gives so that others will give to them at appropriate and beneficial times.

Historically, it has been considered a social duty and a moral obligation of the affluent social classes to provide charity to the poor, the sick, the indigent, and others in chronic and acute need. Thus, charity has taken many forms, from cash contributions to charitable organizations, financial endowments of schools and other facilities, to performing many kinds of volunteer work. Involvement in charity work was based on the knowledge that there were others less fortunate than the benefactor and the awareness that those who are more affluent, better educated, or in a higher social class have a specific obligation to behave charitably toward those with fewer resources or a lower social standing.

While charity is seen as a duty, it is not, from a secular perspective, an absolute duty; the social contract does not obligate people to give at all costs. The duty of charity should not place an intolerable burden on a person. Sometimes it is morally impossible to fulfill the charitable obligation—individuals cannot give what they do not have. People are not expected to practice charity when doing so compromises their own survival or that of their families, nor are they obliged to perpetrate immoral or illegal acts in the name of charity.

In the Abrahamic traditions (Judaism, Christianity, and Islam), charity is the root and foundation of all moral behavior. These major world religions equate charity with mercy and love, while also stating that every other virtue relies to some degree on the ability to behave charitably. They further identify forgiveness as an act of charity toward a person who has done wrong. Charity is an individual responsibility and a form of ministry through which observant Jews, Christians, and Muslims may express their faith.

Charity is one of the principle tenets of Judaism. Jewish theology equates charity with mercy and graciousness. It is expressed by the Hebrew word *yadid,* combining two Hebrew characters—*yad* (hand) with *dod* (loved one). The definition of charity in the Jewish tradition is extending a hand of friendship to another for one's own good and for the benefit of others. Charity is a *mitzvah* (pl. *mitzvoth*), a commandment, good deed, and source of joy, which blesses both the giver and recipient. *Mitzvoth* are pleasing to God and beneficial to the world at large. Judaism emphasizes *mitzvoth* as a way to achieve self-improvement.

Jewish religious practice offers many opportunities for *mitzvoth.* A charity box is found at the entrance of many synagogues. Its purpose transcends fundraising. Contributing to the charity box before entering the synagogue to pray encourages observant Jews to consider the needs of others before their own. It is a special *mitzvah* to observant Jews to extend charity before *Pesach*, otherwise known as Passover, so that Jews with insufficient resources may participate in the celebration. Charity at other times in the Jewish religious year is also a *mitzvah.* It is customary to make a contribution to the synagogue or another charitable cause on the day before Rosh Hashanah, the start of the Jewish calendar. At the Feast of Purim, which celebrates Esther's intervention in a plot to assassinate innocent Jews, it is customary to give gifts of money, food, and other goods to the poor.

The custom of *Kapparot* takes place in preparation for Yom Kippur, the Day of Atonement. In ancient times, *Kapparot* was the ritual sacrifice of a rooster (for men) or a chicken (for women), with the meat being distributed to the poor. In the modern *Kapparot* ritual, observant Jews make a monetary donation to the synagogue or a charitable organization of their choice. Charitable acts at other important times are also *mitzvoth.* In ancient times, it was the custom for a Jewish bride and groom to set aside a table at their wedding feast to feed the poor or indigent; the modern equivalent is a contribution to the couple's favorite charity. When an observant Jew dies, it is the custom during *shivah*, the 7-day mourning period, to make a donation to the departed's synagogue or favorite charity, instead of sending gifts of food or flowers to the bereaved family. In terms of monetary charity, Jewish teaching also advocates tithing, wherein 10% of one's earnings is given to charity. The tithe should be paid before any other financial obligations are met, in keeping with the *first fruits* teaching found in the Bible in Deuteronomy, Chapter 14.

The duty of charity follows observant Jews into their roles as sole proprietors or owners of privately held corporations, but it is not clear that the duty of charity extends to their roles as officers of publicly traded companies. As corporate officers, their primary duty is to act as agents of the shareholders, so they may practice giving with corporate profits only if directed to do so by the shareholders.

Like Jewish teaching, Christian theology advises believers to tithe. Charity is viewed by theologians as the root of Christianity. Jesus's death on the cross to redeem mankind's sins is perceived as the ultimate act of charity. Throughout Christian wisdom literature, the terms *charity*, *mercy*, and *love* are often used interchangeably. In the Christian tradition, the interdependence of people living in community requires each to work for the safety, growth, and well-being of others. This ideal is expressed in the Great Commandment given by Jesus to his followers—to love God with all one's heart, soul, and strength and one's neighbor as oneself. This is the most basic teaching of Christianity.

In addition to charity, The Baltimore Catechism, which is recognized in both the Catholic and the Protestant traditions, identifies specific charitable acts that faithful Christians are obligated to perform when the need arises; these are called the corporal and spiritual works of mercy. The corporal works of mercy are feeding the hungry, giving drink to the thirsty, clothing the naked, sheltering the homeless, visiting the sick and imprisoned, ransoming the captive, and burying the dead. The spiritual works of mercy are instructing the ignorant, counseling the doubtful, admonishing sinners, bearing wrongs patiently, forgiving wrongs willingly, comforting the afflicted, and praying for the living and the dead.

Charity is one of the Five Pillars of Islam, called *zakat* (purification or growth) in Arabic. Islamic charity is based on the teaching that all things belong to God (Allah) and are held by people in trust. One's possessions are purified by setting aside a portion for those in need; this pruning action encourages new growth. Each Muslim calculates his or her own *zakat*. Generally, this may represent 1.5% to 2% of one's capital, though more or less may be given, depending on individual circumstances. In addition to *zakat*, Islamic teaching on charity includes *sadaqa,* voluntary charity. While this may be interpreted as monetary charity in excess of *zakat*, *sadaqa* are much broader.

At a minimum, *sadaqa* instructs observant Muslims to refrain from wrongdoing and uncharitable behavior. It further directs them, to the degree they are able, to urge others to behave charitably and to work to aid the poor and needy. According to the Prophet Mohammed's teaching, even greeting a neighbor is an act of charity. Islamic hospitality is another custom that corresponds to *sadaqa*. Muslims are instructed to entertain guests generously, as their station in life allows. In particular, women, children, those who are sick, and travelers, especially those on religious pilgrimage, are deserving of hospitality.

The practice of *waqf* is also an Islamic teaching on the duty of charity; in Arabic, the word means tying up or dedication and is used similarly to the English words bequeath or bequest. Under *waqf*, personal or business assets are used to endow charitable or benevolent activities. Generally, *waqf* are permanent arrangements—donors relinquish the right of ownership over their donated property, and managers of *waqf*, called *mutawalli,* act as agents of Allah, not of the original owner or the charitable organizations who may receive funds from the proceeds of the *waqf*.

What distinguishes *zakat* and *sadaqa* from other forms of charity is the Islamic emphasis that the observant Muslim seeks Allah in the performance of charitable acts, so any act of charity must be in keeping with Islamic teaching and law. Muslims are expected to perform charitable acts circumspectly, without thought of payment or acknowledgment. In addition, *sadaqa* explicitly precludes uncharitable behavior. During his lifetime, the Prophet Mohammed taught that to receive Allah's charity faithful Muslims must behave charitably by doing for others what they desire for themselves, contributing to the needs of the poor, dealing honestly in business transactions, caring for animals and the physical world, and behaving modestly and circumspectly.

There are two major differences between the secular and spiritual perspectives of charity. First, secular thought holds that charitable giving involves something of tangible value and presumes that the giver is more able to give than the receiver may be. While the spiritual perspective recognizes such giving as charitable, it expands the definition of charity to include good deeds that may be extended to an affluent person by a poor one. Second, secular thought views charity as an imperfect duty, that is, people should behave charitably, but choosing not to do so is an acceptable course of action. In the spiritual view, charity is not voluntary—it is mandatory, though people are not coerced into giving. Regardless of status, wealth, or social standing, all are capable of giving and must do so to the degree they are able. Judaism, Christianity, and Islam have charity as a prime foundation of their respective faiths. While none of the Abrahamic traditions require charity from those who are unable to give, they all state that every person of conscience is capable of giving something, and each should give as much as they are able when circumstances require it.

Chernobyl

On April 26, 1986, an accident occurred at Unit 4 of the Chernobyl nuclear power plant in the former Ukrainian Republic of the Union of Soviet Socialist Republics, near the present borders of Belarus, the Russian Federation, and Ukraine. The accident destroyed the reactor, contaminated large areas surrounding the reactor, and led to an increase in radiation levels over practically the whole of the northern hemisphere.

The Chernobyl power station consisted of four Soviet-designed light water–cooled graphite-moderated (RBMK) reactors of 950 MW each. These units used graphite to moderate the nuclear reaction and used water flowing through channels holding the fuel elements to cool it. There was no containment structure. The immediate causes of the accident were a flawed reactor design coupled with serious mistakes made by the plant operators during a test procedure when many control systems had been deliberately overridden. There had been little communication between those responsible for the test and the plant operators, formal safety approvals were either bypassed or given perfunctory attention, and the experiment carried out on a less well-resourced night shift when it had been scheduled as a daytime activity.

The greatest doses of radiation were received by 200,000 workers, called *liquidators*, who participated in the cleanup. Thirty-one people died almost immediately; 237 occupationally exposed individuals were admitted to hospital with clinical symptoms attributable to radiation exposure, of whom 14 died over the next 10 years. This was the only time when radiation-related fatalities occurred in a commercial nuclear power plant.

Those in the affected areas learned about the nature of the event and its hazards not from authoritative reports but from hearsay and international reports. This lack of transparency lowered public confidence. Some contemporary media reports emphasized the potential dangers, and thousands of mothers-to-be aborted unborn children. Evacuation of residents began the day after the accident and continued into August. The 116,000 people who were evacuated and those who remained living in the less affected regions will, over their lifetimes, receive doses of radiation comparable with doses they would receive from natural sources. Demographic indicators in the "contaminated" regions have worsened as people have been resettled or have migrated. Economic activity has also been limited.

A significant increase in the incidence of thyroid cancer among those in the affected areas, who were children in 1986, is directly linked to the accident, and continued incidence among exposed residents is expected. These cancers are not usually fatal if diagnosed and treated early. Other health effects have been reported but none have been confirmed as directly related to the accident.

Some radiosensitive local ecosystems received lethal doses in the first few weeks after the accident. Within 3 years the natural environment in these localities had begun to recover and no sustained severe impacts on animal populations or ecosystems have been observed. Long-term genetic effects remain a possibility, and some groups attribute many thousands of deaths to the accident. A concrete shell or sarcophagus was constructed around the destroyed reactor, which has provided protection since its construction. Its stability and the quality of its confinement are in doubt.

Thus, a series of seemingly inconsequential operational decisions led to an event that had a significant impact on the availability of electric power (and hence economic development) in the Soviet Union and has had lasting consequences on the attitude toward nuclear energy well beyond the region.

Chicago School of Economics

The Chicago School of Economics refers to the free market approach to economics advocated by members of the Department of Economics at the University of Chicago. The Chicago School approach began in the 1930s under Frank Knight and persisted for decades producing multiple Nobel Prize winners. In addition to Knight, some of the leading and more well-known figures include Gary Becker, Ronald Coase, Aaron Director, Milton Friedman, Merton Miller, Richard Posner, and George Stigler. The Chicago School of Economics is also associated with the law and economics approach to jurisprudence developed at the University of Chicago Law School.

At the heart of the Chicago School approach are neoclassical price theory and a belief in free markets. Simply stated, the Chicago School approach stands for the belief that markets without government interference will produce the best outcomes for society (i.e., efficient outcomes). A primary assumption of this school of thought is the rational actor (self-interest maximizing) model of man. Under this view, all decision makers will act to maximize their self-interest and will, therefore, respond to appropriately designed price incentives. At the society level, free markets populated by rational actors will cause resources to be distributed based on their most valuable uses (allocative efficiency).

The Chicago School's approach to antitrust law in the area of regulatory policy provides an excellent demonstration of its general principles and approach. The traditional approach to antitrust regulatory policy is to limit concentrations of market power, such as by breaking up a firm that has monopoly power. The Chicago School approach, on the other hand, argues that consumers are best protected by competition, even if that is only between a few large firms in an industry. Those large firms may have gained their dominant market positions through efficiency advantages that provide greater benefits to consumers than a market forced by the law to include many smaller firms. Even if a firm gains monopoly power, the Chicago School approach prefers to allow the market to correct the problem rather than rely on government intervention, which may cause greater harms to efficiency.

The Chicago School's price theory and rational maximizer approach has been applied to a wide variety of areas, including both market- and nonmarket-based activities. For example, Gary Becker extended this analysis to areas such as crime, racial discrimination, marriage, and family life. In the realm of law and economics, the Chicago School approach argued that legal rules and court decisions should be based on the promotion of efficiency. The role of the law is simply to alter the incentives of individuals and organizations to achieve that end. For example, in the area of tort law, the goal should not simply be the minimization of costs from accidents but also the minimization of the costs of preventing such accidents. If liability rules require individuals to take precautions against accidents that are more costly than the accidents themselves, then the outcome is allocatively inefficient.

There are many criticisms of the Chicago School approach. For example, behavioral law and economics scholars challenge the assumption that humans are rational, self-interest maximizers. Instead, they argue that certain decision heuristics and biases prevent people from being the ideal decision makers assumed by the Chicago School approach. Others argue that the goal of efficiency comes at the cost of justice and equality in society.

Chief Compliance/Ethics Officer (CCO)

The chief compliance/ethics officer (CCO) typically has responsibility for oversight of a company's ethics initiative and compliance activities, including its code of conduct, guidance and reporting system, and ethics and compliance training. The CCO works with senior-level management to develop strategies and tools that are designed to integrate ethics, values, and compliance into all levels of the organization. To succeed, the CCO must have a deep understanding of the nature of the business, its policies and procedures, and its unique ethics and compliance risks.

The CCO is a relatively new position that is evolving in terms of role and job responsibilities. Larger companies are more likely to create such a position, or give more visibility to a preexisting position, as a result of the major corporate scandals of the early 2000s and increased regulation that requires public companies to institute better corporate governance and strongly encourages all companies to adopt effective ethics and compliance programs. Although some companies may make a distinction between a compliance officer and an ethics officer, others do not. In fact, many companies that have both titled functions assign these responsibilities and titles to one individual.

Origin of the CCO Position

The CCO is a newcomer to the executive suite who owes his or her position primarily to a more demanding regulatory environment. Of particular importance are the following laws, regulations, and guidelines: the Foreign Corrupt Practices Act (1977) (making it a crime for American companies or their agents to bribe foreign officials or politicians to gain or retain business), the Defense Industry Initiative (1986) (the agreement of major U.S. defense contractors to promote sound management practices and comply with regulations), the U.S. Federal Sentencing Guidelines for Organizations of 1991 (building on the Defense Industry Initiative principles to outline a framework for corporate compliance programs), the Sarbanes-Oxley Act of 2002 (mandating stronger corporate governance, integrity, and transparency in financial reporting and effective internal controls for public companies), and the Amended Federal Sentencing Guidelines for Organizations of 2004 (expanding and clarifying the framework for effective corporate compliance and ethics programs).

In the wake of the corporate scandals of the early 2000s, companies came under regulatory pressure to centralize ethics and compliance responsibilities under one officer. For example, in a speech to the American Society of Corporate Secretaries in 2002, Securities and Exchange Commissioner Cynthia Glassman stated that it was important for companies to designate a corporate responsibility officer so that someone within the company had ownership of corporate compliance and ethics issues.

Ms. Glassman's remarks proved to be a precursor to the U.S. Sentencing Commission's revisions to the Federal Sentencing Guidelines in 2004. The Guidelines, as originally drafted, made clear that an effective compliance and ethics program could lead to greatly reduced fines and penalties for a company convicted of a crime. The amendments to the Guidelines highlighted the criticality of a company having a knowledgeable governing authority (board of directors) to provide reasonable oversight of the program and designating overall responsibility for the program to a high-level executive or executives.

The Shared Role: A Different Approach to Ethics and Compliance Leadership

Although many companies have centralized responsibility for ethics and compliance under one officer, other companies, both public and private, have resisted this trend. Historically, these companies have considered responsibility for ethics, compliance, and governance to reside in the offices of the general counsel, the corporate secretary, and elsewhere and have seen little benefit in altering their structure. According to a 2006 chief compliance officer survey of nearly 400 companies conducted by The Society of Corporate Secretaries & Governance Professionals and *Corporate Secretary* magazine, nearly half of the companies surveyed did not have a dedicated CCO position. Many of these companies, instead, assigned compliance and ethics responsibilities to either the general counsel or the corporate secretary.

Companies have given various reasons for allocating multiple responsibilities to one function or individual, including the fact that much of the work in ethics, compliance, ethics and compliance risk management, and governance is overlapping. For example, in the interest of efficiency, Nike has designated one individual as corporate secretary and senior governance counsel, with the added responsibility of corporate compliance. Other companies have combined these roles to avoid excessive bureaucracy or because they are not highly regulated and see little need for a compliance position apart from the general counsel. Many smaller companies have chosen not to designate a separate compliance officer due to insufficient work, limited staff, and lack of resources.

The CCO and Compliance Program Reporting Structure

The reporting structure for a company's ethics and compliance program is often tied to the company's history and culture. For example, if the general counsel has had responsibility for the compliance function in the past, a recently appointed CCO may report to the general counsel. According to the chief compliance officer survey, 28% of CCOs or chief governance officers report to the CEO, 17% report to the general counsel, and 15% report to the audit committee. Other reporting options include the chairman, the board of directors, a compliance or governance committee of the board of directors, and the corporate secretary.

Regardless of the precise reporting structure, a company is well-advised to give the CCO access to executive management (in particular, the CEO, the CFO, and the general counsel) and to the audit committee or an independent committee of the board of directors. Granting the CCO a direct or dotted reporting line and direct access to the board of directors is particularly important in light of the Amended Federal Sentencing Guidelines, which place ultimate responsibility for knowledge about and oversight of the compliance and ethics program with the board of directors.

In larger organizations, the CCO is often supported by a mid-level manager and other staff, often located in different business units, who are responsible for the program on a day-to-day basis. The Amended Federal Sentencing Guidelines make it clear that the individual or individuals responsible for daily operation of the program should report periodically to the CCO or other high-level personnel in charge of the program and should also have direct access to the board of directors.

Another element of the reporting structure for some companies is a cross-functional compliance committee—often made up of high-level managers from departments such as human resources, legal, internal audit, and line operations—that meets regularly to discuss compliance issues throughout the company. At Dupont, for example, the chief ethics and compliance officer manages the Ethics and Compliance Central organization and chairs its Corporate Compliance Committee.

Role and Responsibilities of the CCO

The role and responsibilities of the CCO vary from company to company. According to the chief compliance officer survey, in 2006, only 39% of companies with a designated CCO had a specific job description. Generally speaking, the CCO is accountable for developing, directing, and providing oversight to the organization's ethics and compliance program, including its code of conduct, related programs and policies, communication, training, and guidance/reporting system. He or she is often recognized as an expert and a leader, working with executive and line management to establish and sustain an ethical culture.

The Ethics & Compliance Officer Association (ECOA), a professional association for managers of ethics, compliance, and business conduct programs, which was founded in 1992, has outlined the chief responsibilities of the CCO. These include accountability for all program activities related to standards of conduct, including ethical relationships with employees, customers, shareholders, suppliers, and other stakeholders; development of a compliance risk management program; responsibility for a confidential reporting program; ethics and compliance training and regular communication on corporate values, ethics, and compliance; integration of new acquisitions into the program; conducting investigations into alleged violations of the company's code of conduct and making recommendations regarding discipline; assessing the effectiveness of the program; and providing reports to top management and the board of directors.

In some companies, however, some of the responsibilities listed by the ECOA as belonging to the CCO may be allocated to other functions. For example, the legal department may retain responsibility for compliance risk assessment and risk management; human resources may lead or partner with the CCO on the ethics and compliance training initiative; human resources, internal audit, the legal department, and the security organization may conduct investigations of alleged wrongdoing, depending on the nature of the violation; and recommendations as to discipline for violations of the code of conduct may fall within the jurisdiction of the human resources and line functions.

Although the public often perceives that a company's corporate social responsibility (CSR) or corporate citizenship initiatives are linked to its ethical culture, the CCO rarely is assigned responsibility for the CSR function. For example, General Electric's citizenship strategy is managed primarily by the vice president of corporate citizenship.

Background and Job Qualifications

Because the CCO is a relatively new position, those who fill the role come with a wide variety of backgrounds and experience. Most commonly, the CCO will have previously served in positions in the legal, human resources, finance, or internal audit department. Some companies require CCO candidates to have a J.D. or master's degree, a given number of years of managerial experience, and expertise in domestic and international laws and regulatory compliance.

The ECOA lists common characteristics of CCOs as including strong communication skills; ability to establish and maintain credibility and trust throughout the organization at all levels; ability to assimilate information on complex issues; political savvy; organizational knowledge; working knowledge of applicable laws and regulations; experience with training and development; broad management skills; ability to protect confidential information; ability and willingness to take on a difficult or unpopular position, if necessary; and common sense, objectivity, maturity, rationality, and integrity. One might add to this list independence and strong influencing skills.

Benefits of Creating a CCO Position

Companies that have established a CCO position report generally favorable results, according to the chief compliance officer survey. Some respondents suggest that the position is more form than substance and others comment that the role is still not clearly defined or understood within their company. Other respondents, however, observe that the centralized position has enhanced the company's focus on compliance, governance, and ethics and enabled both the company and regulators to more effectively regulate and monitor compliance. Other benefits reported in the survey include better anticipation of compliance risks, establishment of a climate of ethical conduct, help in setting the "tone at the top," and companywide acceptance of the program, with the backing of the CEO and board of directors.

Major Challenges for the CCO

According to a Compliance Program and Risk Assessment Benchmarking survey conducted by the

Association of Corporate Counsel (ACC) and Corpedia, Inc. in 2005, the top challenges for CCOs when planning or implementing their company's compliance and ethics function have been dealing with the complexity of the regulatory and legal environment, the complexity of the company's own compliance processes, and staffing issues. Other problems listed by the respondents to this survey include the perception that compliance is not a strategic function, organizational resistance to change, lack of adequate financial resources, inadequate technology, inadequate senior executive support, and inadequate peer support.

Top management support is generally regarded as critical to the success of the CCO and the company's ethics and compliance program. A CCO may have to report bad news or investigate alleged wrongdoing by a senior executive. He or she may face pressure to ignore misconduct or may be overruled by high-level managers in deciding how to address it. In such cases, senior executive backing is critical to the CCO's effectiveness and survival.

For CCOs of companies with international operations, partners, and suppliers, there is the additional complexity of overseeing a global ethics and compliance program that is consistent in principle but flexible enough to be effective in different cultures. Some companies have adopted a fairly broad, values-based code of conduct that makes reference to specific policies (relating to matters such as gifts and entertainment, conflicts of interest, discrimination and diversity, and political contributions) that vary, somewhat, on a country-by-country basis.

CCOs of global companies must also ensure that their program's reporting system is effective and legal in all countries in which the company operates. For example, in some cultures, employees are much more reluctant to report improprieties via a helpline than is the case in the United States. In France, Germany, and other countries, anonymous reporting channels (which are mandated for public companies by the Sarbanes-Oxley Act of 2002) have been banned unless they meet certain standards that may be inconsistent with the act. In addition, the CCO who oversees training on the code of conduct and compliance must often ensure delivery of training in the local language, tailoring of the message to address cultural differences, and adaptation to circumstances in which technological or staffing resources are limited.

Supporting Organizations and Their Role

Although one problem reported by CCOs in the ACC/Corpedia survey is a lack of peer support, several organizations have begun to fill this gap. Primary among these in the United States is the ECOA, which holds an annual conference focusing on the trends and issues faced by those with responsibility for ethics and compliance in their organizations. More recently, the Open Compliance and Ethics Group, the Society for Corporate Compliance and Ethics, the Society for Corporate Secretaries and Governance Professionals, and various consultants have begun to offer resources and advice to compliance professionals.

Chief Executive Officer (CEO)

A chief executive officer (CEO) has responsibility for developing and implementing a strategic plan to achieve goals and objectives of the corporation. The corporation's board of directors selects and oversees the CEO and the executive team. Historically, the majority of U.S. CEOs have also been the chairman of the board, although this practice has diminished in recent years. In publicly held organizations, shareholders elect the board of directors.

The functions of the CEO include figurehead, spokesperson, leader, resource allocator, monitor, liaison with outside groups, disseminator of information to internal stakeholders, crisis manager, entrepreneur, and negotiator. All these functions involve managing various stakeholders. The following sections describe planning, reporting, and behavioral imperatives that CEOs face.

Reporting

Securities Exchange Commission and Other Governmental Agencies

CEOs of firms with publicly traded stock have regular financial reporting responsibilities to the Securities and Exchange Commission (SEC). CEOs and chief financial officers (CFOs) are ultimately accountable for the accuracy of these reports, as signified by their signature. Individual penalties may occur if information in these reports is later found to be untruthful.

While they do not personally develop them, CEOs are also responsible for other reports that are made regularly to government agencies, such as the Internal Revenue Service, the Occupational, Safety and Health Agency, the Environmental Protection Agency, and the Department of Labor. In addition, CEOs are responsible for compliance with a number of acts and regulations that affect how business operates, such as the American with Disabilities Act, the Employment Retirement Income Security Act, and the Sarbanes-Oxley Act.

Sarbanes-Oxley Act

The Sarbanes-Oxley Act has had perhaps the largest impact on CEO behavior since the Securities Acts of the 1930s. It is an extremely complex piece of legislation. Sections 302 and 906 are particularly relevant to CEOs because of the individual accountability imposed on them. Following Sarbanes-Oxley, CEOs and CFOs must certify the effectiveness of internal controls and the fair and accurate representation of financial reports. Section 302 of the Sarbanes-Oxley Act addresses the fairness of financial statements, and Section 906 addresses the adequacy of internal control.

While both Sections 302 and 906 have similar requirements, Section 302 is less stringent because it allows certification based on the officer's knowledge. In contrast, under Section 906, the CEO needs to acquire whatever expertise is necessary to attest to the quality of internal control; the CEO cannot rely on other people's knowledge.

While faulty Section 302 certification does not have specific penalties, faulty Section 906 certification can result in criminal penalties and/or imprisonment for individuals. Criminal penalties under Section 906 include fines up to $5 million and/or imprisonment of up to 20 years. In addition, CEOs who are found guilty may be temporarily or permanently barred from serving as an officer or director of another firm.

For certification under Section 906, CEOs rely on documents produced in compliance with Section 404 of the Sarbanes-Oxley Act. Section 404 requires companies to oversee the documentation, testing, and issuance of a report on the effectiveness of internal controls. External auditors then must attest management's report on internal control. While there are no penalties or sanctions for poor internal control, the strength of the internal control system affects the amount and scope of work that needs to be completed by the external auditors before they can determine an audit opinion. Material weaknesses in internal control must be reported to the audit committee and the board of directors.

Section 406 of the Sarbanes-Oxley Act requires that companies disclose the code of ethics applicable to their CEO and other top officers throughout the organization. The purpose of the code of ethics is to promote honest and ethical conduct and deter wrongdoing by top corporate officials. The requirements under Section 406 underscore the importance and enforceability of corporate codes of ethics.

Section 1102 of the Sarbanes-Oxley Act states that tampering with evidence, witnesses, victims, or informants may result in fines and/or imprisonment. Document shredding and whistleblower retribution fall under this section of the Sarbanes-Oxley Act. While not specifically aimed at CEOs, corporate codes of ethics are approved by CEOs and must clearly state that these tampering practices will not be tolerated.

Federal Sentencing Guidelines

As part of the Sarbanes-Oxley Act, effective January 25, 2003, Congress granted emergency authority to the United States Sentencing Commission to increase penalties significantly for corporate fraud and other white-collar fraud offenses. Sentences were enhanced for white-collar offenses that affect a large number of victims or endangered the solvency or financial security of publicly traded corporations, other large employers, or 100 individual victims. Officers and directors of publicly traded corporations were particularly targeted for substantial increases in penalties for the abuse of a position of trust. In most cases sentence length was increased by 50% and financial penalties enhanced by five times or more.

Corporate Social Responsibility (CSR) Reports

Over the past decade, the reporting responsibilities of the CEO have expanded greatly and moved beyond traditional financial reporting. One prominent example is the growth of reporting on corporate social and environmental responsibility. Unlike financial reports and attestation by licensed accounting professionals, there is no common format or auditing process for these reports. This has made the tasks of creating and certifying these reports much more complex. Similar to financial reports, CEOs sign CSR reports as a symbol of their accepted responsibility for the report contents. At this time, there are no penalties for CEOs who file false CSR reports, although there may be negative reputation effects for both the CEO and the company for false or incomplete reports.

Planning

Planning Horizon and Scope

The typical CEO remains on the job for less than 5 years. Because of this short horizon, CEOs may be motivated to focus on short-term objectives. Incentive plans for top corporate officers that focus on achievement of long-term strategic goals are less likely to encourage short-term aggressive earnings management.

The planning function of CEOs is extremely complex. The traditional economic view of the firm is that the CEO's job is to maximize shareholder value. The CEO is an agent of the owners of the corporation. The CEO has a fiduciary responsibility to make corporate investments that enhance the shareholders' investments and periodic returns. Shareholders may consider corporate investments in nonshareholder stakeholder initiatives to be undesired "philanthropy" that is best left to the personal desires of shareholders because corporations are inefficient mechanisms for altruism. CEOs who make investments for social objectives such as improving the environment may be taxing owners by undemocratic procedures.

Contemporary political philosophers argue, however, that wealth maximization can negatively affect nonshareholder constituencies. Even in organizations that embrace the importance of including stakeholders in their strategic planning process, there is controversy about how broadly a firm defines stakeholders and to what extent the stakeholders should affect the goals and objectives of an organization even if they do not have a financial interest in the firm.

The most common stakeholders are shareholders, employees, customers, communities, suppliers, and the government. Corporate decisions can affect persons far removed from the firm that nonetheless can affect the firm's reputation in both negative and positive ways. CEOs must be prepared to publicly address the impact of the organization on its many stakeholders as well as their fiduciary duty as an agent of shareholders. The CEO's obligation to serve shareholders and other stakeholders will be one of the chief ethical dilemmas he or she will face on a routine basis.

Organizational Structure

Part of strategic planning involves organizational design and structure. CEOs must select an organizational structure that facilitates achievement of the corporation's goals and provides accountability. Organizational structures vary across industries and over time have become less hierarchical. Without a good fit between structure and strategy, it is difficult for companies to achieve their corporate goals.

The CEO's choice of organizational structure influences the speed in which decisions are made, the extent of cross-functional integration of ideas and personnel, and the allocation of resources. Organizational structure evolves and expands with the size and scope of an organization. It is the CEO's responsibility to recognize when organizational structure is impeding strategy and to implement an appropriate restructuring response.

Behavior

The "tone at the top" is reflected in the CEO's and key officers' day-to-day behavior. "Walking the talk" is one indicator of the CEO's commitment to the values of an organization. Several companies have sustained substantial financial losses following a decline in corporate reputation. As a result, CEOs now play the role of "chief reputation officer" in addition to having many other job responsibilities. Positive corporate reputations are important because they have been linked to increased profitability from higher employee retention, improved product quality, and increased customer loyalty.

Conflict of Interest

CEOs face a wide range of challenges that may fall under the heading of conflict of interest. These relationships can be social as well as financial. For example, a CEO may have a personal relationship with another employee, which may be a violation of the corporate code of conduct. A CEO may use corporate assets for personal expenditures, such as a private aircraft for personal travel, or receive loans that are forgiven over the period of employment. Both these examples illustrate lack of separation between personal and corporate assets. In firms with publicly traded stock, business and personal assets must not be commingled.

Another potential conflict of interest is when CEOs receive personal tax services or other accounting services from their companies' external auditors. Companies can also no longer extend credit or make personal loans to CEOs, unless this is the company's line of business.

Insider stock trading is another example of conflict of interest. CEOs have access to competitive information that may encourage them to sell stock in advance of general knowledge of this inside information. One way that CEOs can avoid possible accusation of insider trading is through participation in a routine stock purchase and sale program. There are also restrictions on how and when CEOs can trade stock. For example, CEOs may not buy or sell stock during retirement plan "blackout" periods. A blackout period is a period of more than 3 days where more than 50% of U.S. participants cannot purchase or sell company stock.

Compensation

Historically, CEO compensation has been controversial. Many view U.S. CEOs to be greatly overpaid. However, "reasonable" compensation depends on the person making the evaluation. In the past, informal rules concerning the multiplier between the highest and lowest paid employees were measures of fairness. For example, in Japan, the average CEO's salary is 11 times greater than the average worker's salary. In the United States, the average CEO's salary is 475 times greater than the average worker's salary. Today, consultants working with the compensation committees of the board of directors use market rates that can distort historical multiplier rates.

Of greater public concern appears to be the appearance of CEO compensation plans that are not tied clearly to performance, as are compensation plans of other employees. Golden parachutes are coming under increased scrutiny as CEOs leave companies with large severance and benefits packages. In an attempt to address some of these issues, the Sarbanes-Oxley Act now states that incentive-based compensation paid to CEOs based on earnings that are later restated downward must be returned to the company.

In addition, the SEC is requiring increased disclosure for top executives' total compensation rather than the piecemeal approach that has been used in the past. Disclosure should include pay for performance, deferred compensation, retirement benefits, and other special perquisites. CEO incentives may be influenced by their departure packages, whether it is a takeover, termination, or retirement scenario. Expanded disclosure of CEO compensation will provide better visibility to investors and is key to responsible corporate governance.

Recruiting

The CEO must handle employment arrangements carefully. CEOs should be careful of nepotism and violation of noncompete agreements. Hiring former employees of significant competitors must not be contingent on the employee's sharing of confidential competitive information with the new employer.

Bribery

CEOs are also responsible for international operations where acceptable local practices may differ from the country in which the organization is headquartered. Section 104 of the Foreign Corrupt Practices Act forbids bribery of foreign officials to secure an improper advantage. However, company officials may pay a foreign official to expedite or secure the performance of a routine government action. Routine governmental actions include obtaining permits, processing visas, providing police protection, and providing utility services. Corporate officers, including CEOs, who participate in bribery may incur penalties of fines up to $25,000,000 and 20 years imprisonment. In addition, questionable local practices as reported by the media can impair corporate reputation and affect a firm's long-term profitability.

Product Safety

CEOs, who become aware of problems associated with product safety, need to take swift action to avoid significant reputational loss that can easily exceed any costs associated with removing the product from distribution channels. Johnson & Johnson's speedy response to the Tylenol product tampering, spearheaded by the CEO, staved off reputational damage due to the Tylenol poisonings.

Conclusion

CEOs have a large amount of responsibility to direct an organization and can have a tremendous impact on the corporation's success. However, they are under increased scrutiny in all areas of their planning, reporting, and personal behaviors. Clearly, the days of the imperial CEO are numbered, as an increasing number and variety of stakeholders monitor CEOs closely. The Sarbanes-Oxley Act and revised Federal Sentencing Guidelines provide clear incentives for CEOs to behave ethically or suffer severe personal and professional consequences.

Chief Financial Officer (CFO)

A chief financial officer (CFO) is the most senior executive official within a company to have responsibilities for leading the organization's financial affairs, including the direction of its financial and managerial accounting and control functions, and often its treasury functions. He or she oversees the recording, analysis, and reporting of financial information internally and externally; administers its system of internal accounting control; counsels the organization's leadership on financial matters; and represents the organization to external auditors, tax and financial regulatory authorities, capital markets, and contracting entities.

The complex regulatory frameworks that govern the work of a CFO and his or her organization call for (1) principled leadership in conformity with relevant financial, legal, and ethical standards and the organization's mission and identity; (2) prudential decision making and independent professional judgment in assessing, balancing, and managing risks; and (3) a demonstrable commitment to safeguarding and enlarging the organization's financial resources so that it will be capable of growth that can benefit the diverse stakeholder constituencies that contribute these and other resources.

Official Role, Reporting Relationships, and Qualifications

The CFO, as an executive officer of a corporation, is among its chief administrative leaders, and he or she serves at the discretion and pleasure of the chief executive officer (CEO) and the board of directors. By law, the corporate charter, and prudent business practice, the CFO and other officers join with the board of directors to guide the organization's strategic direction and provide important oversight regarding the integrity of its operations and financial reporting and control processes. Officers owe the corporation fiduciary duties of care, loyalty, and good faith in overseeing its affairs. For tax-exempt organizations, these fiduciary duties include as well a duty of conformity to the purposes and activities that form the bases for their exemption before federal and state tax authorities.

The CFO often reports to the CEO or to a chief operating officer. In the case of a large, multisegment organization, each business unit may have a CFO, or the equivalent, who reports to its CEO. Because of the CFO's rank and portfolio of responsibilities, it is common for corporations to confer authority on their CFOs to enter into contracts on their behalf.

Many CFOs have a background in accounting, finance, and related fields, although in the United States this is a matter of business practice and preference rather than a legal or professional requirement. Many large entities select professionals with extensive experience in relevant fields, especially public accounting, and/or service in similar capacities at other business units or organizations for this role. Because of the diversity of recruitment practices, the Sarbanes-Oxley Act of 2002 § 407 requires companies that list securities in public capital markets to disclose whether at least one member of their board audit committee qualifies as a "financial expert." If a company cannot disclose at least one such expert, it must disclose why this is not the case.

The CFO's Scope of Responsibilities: Accounting, Control, and Treasury Functions

The CFO's responsibilities include leading the financial affairs of the organization and administering its related processes, principally the accounting and control functions. Depending on the organization, the CFO's portfolio may include treasury functions as well. Within the accounting and control functions, professional staff oversee managerial and financial accounting roles, the former relating to the collection, analysis, and reporting of financial information about an entity to aid managerial vigilance and decision making and the latter having to do with preparing financial statements in accordance with applicable public- and private-sector standards, including generally accepted accounting principles (GAAP), primarily for external users.

When the CFO's role includes treasury responsibilities, he or she leads corporate processes and systems for safeguarding assets, managing cash and investments, and securing capital resources to maximize the organization's return on investment so that it can grow and add value for shareholders and other stakeholders. In this last role, the CFO often devotes significant time to shareholder relations and to being a public face for the organization.

Accounting and Control Responsibility Functions

The four main accounting and control responsibility functions that typically report to the CFO are general accounting, accounts payable, payroll, and budgeting. The size and complexity of the organization will influence whether these functions reside within dedicated departments. The first three of these functions often report through a "controller," or other chief accounting officer.

The general accounting function coordinates the organization's entries into its financial journals in conformity with a system of internal accounting control; executes regular "closings" of these records to post them to general and subsidiary ledgers; reconciles discrepancies and imbalances; notes variances; prepares consolidations of financial results in multisegment entities; prepares financial statements and other reports; maintains related databases, including schedules of fixed assets; and performs physical inventories, financial account analyses, and other procedures to assist the external auditors in their testing and review procedures.

These financial reporting processes make it possible for the controller to prepare financial statements in accordance with GAAP and enable the CFO to discharge his or her role of taking express written responsibility on behalf of the organization for the representations in the financial statements. This provides the basis for the distinct role of the independent external auditor to express an opinion regarding the fairness of these representations. In a similar way, the CFOs and CEOs of corporations that file quarterly and annual financial information with the Securities and Exchange Commission (SEC) rely on the work of their controllers' staffs in preparing the financial statements when they certify under § 302 of the Sarbanes-Oxley Act that, among other things,

- they have read the statements,
- the statements are free of material untrue statements or omissions, and
- the statements fairly present the financial condition and results of operations for the organization for the applicable dates and periods.

The accounts payable function is responsible for exercising control over the disbursement of funds to pay an organization's obligations, through documentation procedures regarding the identity of the payee, the date of the purchase of the good or service, the amount of the expenditure, the business purpose, and the authorization by the requester and the approver to remit the payment. For payments for personal services, the accounts payable function normally will require documentation of the worker's independent status, for example, in the form of an executed contract, to ensure that the organization does not use the accounts payable system to pay for services by employees, and risk failing to withhold appropriate income and payroll taxes.

In cooperation with the human resources function, the payroll function is responsible for exercising control over the disbursement of funds to compensate an organization's employees for their services through its payroll system, through documentation procedures regarding the following for each employee:

- Identity and employment eligibility
- Job title and salary information
- Social security number or tax identification number
- Tax status for the jurisdiction(s) in which he or she works and lives, and the number of personal exemptions for calculating the withholding of income taxes
- The employee benefits elections that he or she has made

The payroll function also calculates, withholds, and remits to tax authorities income, payroll, and other taxes, and it complies with court orders to garnish wages, for example, for delinquent child support obligations of employees.

Some organizations locate additional accounting and control functions under or alongside the scope for the controller's authority, for example, accounts receivable, fixed asset accounting, and tax compliance services. In addition, large, multisegment organizations may create a controller within each business unit with one or more of the aforementioned functions reporting to him or her to help the organization operate more responsively.

The role of the budget function is to guide the process for assembling information from throughout the organization to compose a financial plan for the entity that will be sufficiently detailed to enable realistic planning for the year and to form a basis for evaluating performance. The financial budget constitutes one of the primary measures of individual and organizational performance and accountability, while the forecasts that budget officers and staff may help prepare throughout the year normally serve as dynamic planning documents.

The internal audit function within an organization generally should *not* report to either the CFO or the treasurer, because the purpose for this role is to provide a level of oversight and control over the operations of these areas. The internal audit staff cannot function effectively, exercise independent professional judgment, or render meaningful oversight if they report to the very people about whose work they must maintain professional skepticism in their testing and review procedures. In the majority of cases, organizations will avoid this conflict by requiring the internal audit function to report to the audit committee, risk management and compliance committee, or governance committee of the board of directors, or perhaps to the board, in its entirety, for small organizations.

Treasury Responsibility Functions

The treasury responsibility functions within an organization, including cash management and investment management services, technically report to the entity's treasurer but, in practice, the person who serves as the CFO may perform the role of treasurer as well. These treasury functions include the following:

- Managing the organization's cash and investment accounts through internal specialists and external investment management firms to preserve and increase their value
- Raising capital sufficient for the organization to achieve its strategic objectives in a cost-effective manner
- Promulgating and enforcing policies and procedures throughout the organization for the secure collection, custody, transfer, and disbursement of cash and other assets

Whether as a dedicated treasurer, or simultaneously in his or her role as CFO, the incumbent will work closely with the leadership of risk management, internal audit, legal counsel, and other key responsibility portfolios within the organization, and likely will solicit feedback from the external auditors as well, to ensure that there are adequate controls in place to protect the entity's assets.

The treasury functions also include efficiently and effectively procuring and managing capital resources for the organization. The most significant source for such capital typically consists of retained earnings, the cumulative store of value that the organization has generated through its operating activities. (This prominent role for retained earnings, and the diversity of constituencies that contribute to this resource, help justify stakeholder theory.) When retained earnings are not sufficient to finance a company's capital needs, then the CFO can help/advise senior leadership regarding alternative sources for capital, including various classes of common stock, preferred stock, bonds, and revolving credit arrangements. For a tax-exempt organization, the analog to retained earnings is the total of "net assets," or the "fund balance," that is typical of fund accounting, and alternative sources for financing include endowment and other investment income; royalty income; program services revenue; and grants and contributions from government agencies, private institutions, and the public.

In seeking such capital resources, a company's leadership must make a credible case to participants in public and private capital markets that the organization will be able to earn a rate of return in excess of its weighted average cost of capital, that is, the blended cost that it incurs for these resources. In performing such an outreach, the leader of the treasury function often must involve himself or herself directly in shareholder relations and serve as an important public face for the corporation, explaining its plans within the limits of corporate confidentiality and eliciting the trust of markets to minimize the organization's cost of capital.

It is in demonstrating the corporation's capacity to earn this *excess* over the weighted average cost of capital that treasury leadership makes the case for the organization's fundamental capacity to *grow.* Regardless of its market share, number of employees, revenues, or scope of activities, if a company is not growing in this basic financial sense, it will not be able to continue as a going concern over the long term. Only if the company is capable of protecting the interests of its sources of capital—a set of constituencies much broader than shareholders, as the discussion above indicates—will it be in a position to benefit other stakeholders.

In this role, treasury leadership assists the rest of senior corporate leadership in evaluating its progress in this process and in assessing alternatives to help it succeed. For the person serving as treasurer to locate and secure sources of capital that are demonstrably conducive to the financial growth of the company, he or she routinely seeks counsel from internal and external advisers, including financial analysts, economists, investment bankers, marketing strategists, accountants, and attorneys. This is particularly the case when dealing with complex transactions or new forms or sources of domestic and international capital.

The CFO's Role in Managing the Risks of Fraud and Misconduct

A key theme for the CFO's stewardship of an organization's resources, and a primary requirement for him or her to discharge the aforementioned statutory and fiduciary duties, is his or her role in implementing policies and procedures to safeguard the organization against the risk of fraud and misconduct by its employees and agents. The traditional taxonomy for fraud in this context has relied on the accounting profession's elements of material misstatements in financial statements and misappropriations of assets. However, it has become common as well to include in the definition of fraud a legal dimension that encompasses material misstatements by employees or agents of an organization that induce reliance by others, to the substantive detriment of the others' financial, legal, reputational, and other interests.

In addition to recognizing these traditional accounting and legal dimensions, organizations increasingly are construing the scope for fraud and misconduct to include behavior that violates standards of the organizations themselves, applicable professional guidelines, or ethical principles and qualities to which members of relevant stakeholder constituencies, including the general public, commonly assent, including honesty, fairness, and transparency.

Examples of recent practices that implicate the role of the CFO and that reflect all three of these dimensions of fraud are the massive financial reporting scandals of the early 2000s involving Enron, WorldCom, Andersen, and other organizations; the secret backdating of stock options to increase executive compensation without authorization; and secret kickbacks from mutual fund administrative vendors to mutual fund advisers in exchange for continuing favorable referrals (a diversion of mutual fund investors' money to the advisers without authorization).

In the context of the increasingly complex regulatory frameworks affecting accounting, finance, and legal professionals, and corporate governance practices, the CFO has had to join with other members of corporate leadership, including legal counsel and ethics and compliance officers, to assume a significant role in managing organizational risk, particularly the risk of fraud and misconduct. In addition to complying with GAAP in reporting financial information, CFOs for companies that fall under the de jure or de facto requirements of the Sarbanes-Oxley Act must take a leading role in preparing reports on their internal controls for their annual reports and in providing the bases for management to recite its responsibility for "establishing and maintaining an adequate internal control structure and procedures for financial reporting" (§ 404). These reports also must contain management's "assessment of the effectiveness of the internal control structure and procedures" of the organization, an assessment to which the external auditor must attest as part of its examination.

On March 9, 2004, the Public Company Accounting Oversight Board (PCAOB) promulgated Auditing Standard No. 2, *An Audit of Internal Control Over Financial Reporting Performed in Conjunction with an Audit of Financial Statements*, to provide guidance for this process by reciting standards for auditors to follow in making such attestations according to the framework of the Committee of Sponsoring Organizations of the Treadway Commission. In response to widespread concern among companies that comply with the Sarbanes-Oxley Act, their auditors, and other interested parties regarding the absence of a materiality standard for discerning a practicable scope for issuing and attesting to such assessments, the SEC announced in May 2006 that it would propose changes to the rules of the PCAOB that would tailor the burdens and effects of complying with these requirements, with particular attention to the size and complexity of the organization under audit. The SEC later signaled the issuance of these proposed changes for public comment and review in late 2006.

The Sarbanes-Oxley Act § 406 also requires that companies that issue securities in public capital markets disclose whether they have adopted a "code of ethics" for their senior financial officers, including their CFOs. These companies similarly must disclose on SEC Form 8-K "any change in or waiver of the code." In the statute, the expression *code of ethics* refers to

> such standards as are reasonably necessary to promote . . . honest and ethical conduct . . . including . . . handling of . . . conflicts of interest . . . ; full, fair, accurate, timely, and understandable disclosure in . . . periodic reports . . . ; and compliance with . . . governmental rules and regulations.

While the legislative intent in drafting such language was admirable for the objective of promoting a culture of integrity and compliance within corporations under Sarbanes-Oxley requirements, the expression *code of ethics* is problematic in that it conflates a feature of legal authority and compliance—a "code"—with ethics, a normative discipline for deliberatively evaluating and reflectively justifying practices on the basis of articulable principles and argumentation. A more descriptively meaningful term in this context would have been *code of conduct*.

In addition to the Sarbanes-Oxley Act, the federal organizational sentencing guidelines for white-collar crime, the listing standards for the New York Stock Exchange and the NASDAQ, and other public sector and private sector frameworks around the world help prescribe practices that CFOs and other members of organizational leadership should follow to

- assess a practicable scope for the risks of fraud and misconduct that the organization faces;
- evaluate, design, and implement antifraud programs and controls, including ethics and compliance programs; and, thereby,
- seek to prevent, detect, and respond to instances of such fraud and misconduct, in a manner that is consistent with, and ideally integrated into, the organization's mission and identity to create value for the entity and to protect the articulable financial, legal, reputational, and ethical interests of its stakeholders.

The Essential Normative Dimension of CFO Leadership

An integral normative element for the executive authority and professional oversight that the CFO contributes to an organization is the principled leadership that he or she demonstrates as an adviser to the CEO and the board and as a guide to others in his or her unit or entity. The profile of the CFO includes not only technical competencies in finance, accounting, and related disciplines but also capacities for strategic thinking, independent professional judgment, and courageous and prudential decision making.

In particular, the CFO, as an executive adviser and a principled leader, must take an intellectually sophisticated and experientially informed approach to assessing the aforementioned dimensions of risk. The CFO's role is not to recommend whether to take risks but rather to make the case for the risks that are worth taking. There is no such thing as zero risk and a wise CFO will not seek to achieve it. Rather, these aforementioned capacities will enable him or her thoughtfully to assess, balance, manage, and advise others regarding the various forms of risk facing an organization, including regulatory, litigation, financial, reputational, and ethical risks.

The CFO monitors the financial and related dimensions of an entity's status and operations, captures this information in the idiomatic—even arcane—language of accounting and finance, and communicates it to the organization's senior leadership, participants in capital markets, and other relevant constituencies. In doing so, he or she discharges not just the aforementioned legal duties but also ethical duties, including *vigilance* in keeping abreast of key trends, issues, and developments that affect the financial and other dimensions of the organization's life, and *respect* for the moral autonomy of the stakeholders who have placed their trust in him or her as a steward of the organization's resources. The CFO abides by these ethical duties by demonstrating in his or her actions qualities of honesty, care, good faith, prudential judgment, courage, fairness, and even temperance, for example, when it comes to promulgating and enforcing policies for reimbursements of expenditures.

At the same time, the CFO remains aware that he or she offers only one of many authoritative voices within the organization and that the decisions that senior leadership makes require balancing the risks and options for action that correspond to the messages that emerge from these channels. Others communicate similarly urgent information regarding the entity's status and operations to senior leadership on matters of litigation and regulatory compliance; information technology; competitive standing and marketing matters; engineering, technological, and operational matters; human resources matters; and other issues. The CFO saliently demonstrates his or her professional judgment and prudential decision making by balancing the duties to (1) remain within his or her sphere of competency and yet (2) act in the best interests of the organization and its stakeholders generally, even when the latter course may mean raising questions or principled objections with the CEO and/or the board of directors over broader organizational policies and practices.

The CFO will maximize his or her effectiveness in balancing these duties and will sustain the conceptual clarity and meaningfulness of his or her recommendations and other contributions to the organization and its stakeholders regarding accounting, financial, and fraud risk management matters, when he or she speaks out of a demonstrable posture of principled leadership, independent professional judgment, and moral autonomy, and integrates this guidance with the ethical principles that underwrite the entity's organizational mission and identity.

In this way, the CFO can exercise oversight commensurate with an executive scope of responsibility in a corporation according to legal, managerial, and ethical guidelines; deploy and support a credible apparatus for a system of internal accounting control and other antifraud measures that will minimize the risk of misappropriation of the organization's assets or misrepresentations on its financial statements; and preserve and enlarge the organization's cash and investments, procure capital resources at the lowest weighted average cost, and create a foundation for the organization's financial growth so that it can continue as a going concern and be capable of benefiting its diverse stakeholder constituencies.

Chief Operating Officer (COO)

A chief operating officer (COO) reports to the chief executive officer (CEO) and usually has responsibility for the daily internal operations of the company. COO is primarily a function, because other titles are sometimes used to designate substantially the same role: chief administrative officer, chief of staff, executive vice-chairman, and president without any further designation. A study in 1964 of 433 large companies in the United States showed no use of the title. By the 1970s, it was gaining popularity.

Although reporting lines in companies vary with their organizational structures, commonly most business units and some staff areas (e.g., information technology, marketing, human resources, and procurement) report to the COO. In a company with operating subsidiaries that have their own presidents, sometimes the presidents of the most significant entities report directly to the CEO.

In organizations that have a CEO/COO structure, the CEO is generally said to be responsible for external matters and for broad corporate issues such as vision, strategy, long-range planning, acquisitions, and corporate governance. In contrast, the COO's role is to function internally as the operational head of the company. As will be discussed later, the COO could also have a significant role in developing a climate of ethical conduct in the company. All this is not to say that the COO has an entirely internal job, because there are situations where he or she must deal with external customers and suppliers. However, these are generally limited to matters that have a significant bearing on operational issues.

Some observers maintain that a stark distinction between external and internal roles does not accurately characterize the actual working team relationship between the two top officers in most companies. Rather, they are more likely to be partners in most things.

Being a COO is sometimes said to be the most difficult job in a corporation because the level of responsibility is high, yet the most senior level of authority still resides with the CEO. This power imbalance can be the source of friction, especially if the COO was hired as the CEO-in-waiting, not a permanent number two in the hierarchy. Many of the qualities that are sought when the COO is recruited are precisely the characteristics that can lead to being impatient or jealous of the CEO.

Given the potential for a mismatch between the CEO and COO, it is important that the recruiting process give due consideration to the need for an alignment of competencies, values, and strategic orientation between the two top executives. As well, the selection process must result in giving the new COO a clear set of expectations with respect to succession planning for the CEO. Since the CEO is normally responsible for recruiting the COO, some commentators recommend that members of the board be involved to provide some independent judgment on the likely fit between the two executives.

An Executive Team as COO

Increasingly, the role of COO is being performed by an executive team that is sometimes called office of the CEO, or office of the chairperson. The composition of the team can vary widely, but frequently it is made up of the heads of the most significant units (e.g., divisions and subsidiaries) and functional areas (e.g., finance, legal, human resources, and marketing). The executive team supports the CEO in providing strategic, operational, and institutional leadership. A well-functioning team is interdependent and interactive. As the surrogate COO, the team can bring synergies to the office by providing improved coordination across units and functional areas. The growth in popularity of the executive team model reflects the increasing complexity of organizational life stemming from globalization, the technology revolution, evolving organization forms, and the increasing pace of change.

Some CEOs favor the executive team model because it both removes the expense of a highly paid senior officer and eliminates a management layer between the CEO and the operating units. As well, it does away with what some think is an artificial distinction between strategy formulation and implementation.

Critics of the executive team model point to the conflict that can arise from bringing together individuals whose prior success in corporate life has come from the ability to lead as an individual, not a team member. Group decision making can be fraught with difficulty if trust, openness, and collaboration give way to self-interest and an absence of concern for the overall corporate good. This is sometimes referred to as cosmetic teamwork—the trappings of teamwork are prominently displayed, but real team decision making is not occurring.

The COO and executive team models both share the CEO succession issue. In fact, the team model is sometimes used precisely to set up a competition for CEO succession. Proponents of the team model point out that it may not be the best approach in all cases, but maintain that where it is appropriate successful teams need to have the right composition of members, work to achieve consensus in decision making, be open and forthright in critiquing the positions taken by other members, and maintain loyalty to the team as a whole.

Ethics and the COO

Not everyone believes that the senior executives of a corporation should explicitly attempt to develop strategies around building a socially responsible and ethically sound organization. However, for those who support the ethical mandate, one question is, "Who should take the managerial lead?" Usually, it is the CEO who is said to be ultimately responsible for setting the moral tone, and it is the job of all managers to ensure good conduct. But because the COO is at the nexus of all daily operations, being a key figure would seem to be reasonable.

From an operational perspective, ethical conduct is driven to a large extent by the myriad laws, regulations, industry standards, and codes of conduct with which the company and its employees must comply. For instance, in many countries there are statutory requirements that cover parts of the ethical terrain such as environmental preservation, workplace health and safety, product safety, whistleblower protection, and privacy. And, there are many regulatory strictures that flow from legislation requiring adherence. Although they can vary by industry, common examples are the requirements in public companies for audited financial statements and financial filings to securities commissions and stock exchanges. In addition, some industries have self-regulatory standards, such as professional codes of conduct for lawyers, accountants, engineers, and architects. Finally, many companies have their own codes of conduct covering prescribed relations between employees and with the company's stakeholders.

In some organizations, the COO devolves responsibility for compliance to other executives. For instance, dealing with complaints or concerns about employee issues, such as privacy, might be delegated to a chief privacy officer, ombudsperson, or vice president, human resources. Alternatively, some organizations employ an ethics officer. A compliance officer, or in-house legal counsel, might be given responsibility for regulatory compliance such as dealing with the securities commission; and the chief financial officer could look after the audit compliance. Whatever the specific organizational arrangement, the COO is ultimately in charge.

Some writers maintain that regulatory compliance is an essential part of being a socially and ethically responsible organization, but only at a base level. Rules and regulations, they say, deal with what we must or should do, but not with what we could do. In their view, simply following the rules does not capture what a company might aspire to do as a socially responsible organization.

According to this view, a company should strive to attain organizational integrity. Such an entity is one in which employees have a sense of responsibility for the way they deal with others; are honest, open, and truthful; keep promises; avoid malicious gossip; and come to the assistance of others when there is no personal gain. Equally, those working in the organization need to feel as though they belong and that they subscribe to the mission and values. The centrality of the COO in bringing this about partly resides in having control over processes such as hiring, promotion, annual review, establishing of objectives, employee development, and compensation. Through these, the COO can set the criteria that reinforce and reward integrity.

This view of the COO's role in developing organizational integrity rests on a theory of the firm that places corporate social responsibility as an important obligation of both the organization and its management. Sometimes, it is argued that because of the enormous size of modern corporations, they have the power to affect the lives of people, not only within the organization but also in communities and society as a whole. With this power comes a responsibility to act in ways that support societal objectives, or at least avoids harming them.

In opposition is the classical theory of the firm that views the corporation merely as an economic entity, which should only be evaluated on the basis of economic criteria, such as efficiency and growth in production of goods and services. Profit is its primary motivation, and the role of management is to increase profits for the benefit of stockholders. Proponents of the theory maintain that efficiently run corporations benefit employees, suppliers, customers, the economy, and society as a whole. There is no room in the theory for management legitimately to engage in non-wealth-generating activities such as pursuing social or ethical objectives. This is a role for other social institutions. Indeed, one of the theory's most famous proponents, Nobel Laureate Milton Friedman, maintains that to spend company funds on social programs is the equivalent of taxing stockholders.

Critics respond by saying that the classical theory is overly restrictive in viewing the corporation as exclusively an economic entity. Rather, they maintain that there are other stakeholders (e.g., employees, customers, suppliers, and communities) to whom it has responsibilities. While governments and other social agencies may have the primary obligation to ensure public well-being, a corporation should lend a hand where needs in close proximity are urgent and where the corporation has the capacity to respond while others do not.

A theory that goes some way to bridging the gap between programmatic agendas of corporate social responsibility and the socially skeletal classical theory is the moral minimum of the market. This position holds that corporations must at least conform to the elementary principles of face-to-face civilized behavior. As one commentator has noted, this leaves a lot of room for virtues such as honesty, openness, fairness, and avoidance of harming others. When taken together, these values come very close to the characterization given to integrity above.

This theory ties back into the role of the COO because it points to another means of fostering integrity that does not involve the more elaborate establishment of ethics programs that use corporate resources. It is the leadership shown by the COO in terms of personal integrity. As the most senior operations officer, this is the person who employees expect to embody the qualities and characteristics that define integrity in their organization. If the COO is not seen to be a leader in this regard or, worse, acts without integrity, ethical language found in mission statements, policies, and codes has little traction.

Chief Privacy Officer (CPO)

The chief privacy officer (CPO) is an executive officer responsible for the balance between consumer and employee demand for privacy and the organizational need for information. The position is generally high-ranking and often reports directly to the chief executive officer (CEO). Depending on the size of the organization, the CPO may need to put together a team of experts and stakeholders in the form of a privacy board. It is not limited to the private sector, and it can also be found in governmental organizations. The position is a recent development in the organizational structure with the first corporate CPOs having been hired in the late in 1990s.

The CPO's job essentially revolves around satisfying the needs of privacy stakeholders and avoiding privacy-related risks while enabling reasonable data collection by the organization. The main deliverables of the job are the so-called privacy policy and the resulting privacy program. Finally, the CPO must conduct periodic audits of the organizational compliance with the privacy policy and laws, the organization's implementation of the privacy program, the media and political environments, and the state of organizational technology. The CPO position is interdisciplinary in nature and involves expert knowledge of legal matters and information systems (IS), especially in the area of security. In addition to understanding these two fields, the CPO must also communicate with marketing, human resources (HR), and public relations (PR) departments.

Privacy Stakeholders

The primary stakeholders that the CPO has to consider in developing the privacy policy and program are the individual consumers, the employees, and business-to-business (B2B) customers.

Individual Consumers

The organization's customers represent an essential source of its marketing data. For example, consider the implementation of grocery store membership card programs. The programs require customers to use their membership cards to get the advertised savings. When the customer scans the card at the checkout stand, the entire purchase list is stored for future analysis. The stores can use the obtained information for marketing trend analysis and to tailor specific offers for that particular customer. Most grocery store customers consider the programs fairly innocuous to their privacy since the system stores only a list of their purchases. However, as additional information, such as credit card numbers and prescription medications, are added to the database, customers might see the program in a different light. Changes in how customers see the organization is of concern to CPOs of both physical and virtual store fronts. After all, while collecting and analyzing such information may be legal, consumers may not always agree that it is ethical. The resulting decrease in trust toward the organization may then not only negatively impact its image but also its revenue.

B2B Customers

Organizations that cater to businesses may face data protection concerns from these types of customers as well. Business clients are primarily concerned about the sharing of insider data and corporate trade secrets. Consider the following service option offered by several companies providing server software for applications such as enterprise performance monitoring. These software makers are offering an option for the customer's server to be linked to the software maker's so that the software maker can quickly analyze problems found on the customer's side. Some software makers have even packaged this option as default on installation. Although the potential for rapid troubleshooting was lucrative, many business customers were concerned about an external source having access to their data. The involvement of the CPO on the software maker's side in such a marketing plan may not only have advised the marketing and the research and development departments on the external perception but may also have helped develop a privacy policy targeted to potential customers of the option, assuring them that their data would not be used by the software maker and that preventative measures would be taken to ensure the safety of the data. In addition, the business customers' CPO may need to be involved to verify that new software installations comply with the privacy policy.

Employees

The CPO must also consider the privacy of the organization's employees. There are a number of U.S. legislative items that regulate the means and the extent of employee surveillance and monitoring in both private and public sectors. In addition, the employees may feel that they have rights to privacy in the workplace although these rights may not be protected legally. When dealing with employees, the CPO must communicate with the HR department to make sure that the organization's privacy policy is in compliance with applicable laws. Otherwise, employees dissatisfied with the surveillance and the use of the surveillance data may sue the organization, leading to negative impacts in terms of finances and PR. In addition, the CPO must make sure that employees in contact with sensitive customer data understand its criticality and do not abuse their access.

Privacy-Related Risks

The discussion of the privacy stakeholders above has alluded to a number of privacy-related risks that the CPO must mitigate. The most obvious risk is that of litigation both by customers and by employees. For example, two U.S. laws have had a very high impact on the privacy of customer information in the financial and health care industries: the Health Insurance Portability and Accountability Act and the Financial Modernization Act (aka the Gramm-Leach-Bliley Act). Businesses with Internet presence have also been affected by the Children's Online Privacy Protection Act, which regulates the online collection of information from children less than 13 years of age. The organization may also come under fire from employees based on the violation of the Fourth Amendment to the U.S. Constitution, which protects against unreasonable searches and seizures, as well as the Electronic Communication Privacy Act (ECPA), which regulates access, use, disclosure, privacy protection, and the interception of electronic communication. If the company does not properly protect itself from litigation it may face severe financial risks as the costs of litigation rise. Finally, the negative information that spreads about the organization in the media poses a significant risk in the areas of PR, customer development, and, finally, sales.

Privacy Policy

A privacy policy states how the organization obtains data, how the collected data are used, and how an individual can access and alter (including withdraw) personal data, as well as what security measures the organization is taking to protect the collected data. In creating the privacy policy, the CPO must communicate with members of the legal, HR, finance, IS, and PR departments. The individuals from these departments can assist the CPO in addressing their departments' unique privacy issues and help with policy decisions in line with the current legal, political, and media environments. The PR department is especially important in this part of the CPO's job as the organization's privacy policy must be communicated to the privacy stakeholders. In communicating the policy, the CPO and the PR personnel must focus on (1) gaining trust toward the organization and (2) training customers and employees with regard to necessary privacy actions. A variety of means can be employed in communicating the policy and its implications, including press releases, meetings, and presentations. In the area of gaining trust among employees, the town hall meeting format can be especially useful as the CPO and other key personnel involved with the privacy policy can answer questions in person with regard to the policy. In training users and employees with respect to privacy-policy-related actions, the CPO, together with the IS and the PR departments, may chose to provide guides via the World Wide Web. This is an especially useful method for organizations with strong Internet and intranet presences.

Privacy Program

The natural next step after creating the privacy policy is the design of the privacy program. A privacy program is essentially the implementation plan for the privacy policy. In designing and implementing a privacy program, U.S. CPOs may follow the Federal Trade Commission's Fair Information Practice Principles. These are notice, choice, access, integrity, and enforcement. In implementing the privacy program and following the above principles, the CPO must communicate with the legal, information technology (IT), and security groups of the organization. The legal group must be involved in phrasing the notice and in creating valid options for notification of consent to the notice and the policy it represents. Such notice may need to be given and consent may need to be received for both customer data collection and for employee surveillance. For example, employees must be informed that they are monitored via closed-circuit television (CCTV), and customers should be told if the data collected about them during their transactions may be sold to third parties.

The CPO must work closely with the organization's IT group to implement the access, integrity, and enforcement principles. The IT group can create a Web site where customers can view, alter, and withdraw their data from the organization's database. The group is also responsible for maintaining the integrity of the data and avoiding unauthorized access to the databases, as well as for enforcing data-monitoring practices such as database audits on employees viewing and altering sensitive data. In resolving situations where the privacy policy was violated, the CPO must work closely with the legal and HR departments to prevent any repercussions to the organization as the violators are apprehended and to ensure that the victims are redressed accordingly.

Auditing

To asses how well the privacy policy is being followed and the extent to which the privacy program has been implemented, the CPO must perform periodic audits. First, the CPO must conduct audits of policy compliance. This audit must cover the communication of the policy to the stakeholders and how well the stakeholders have been trained on the policy. Such an audit should include a review of the company's Internet and intranet Web sites to find out whether the privacy policies have been stated there. In addition, the CPO may need to know whether there are proper notices of CCTV activity and whether any unlawful or undisclosed employee surveillance practices are in place. The CPO should also audit the information stored about customers to identify whether the information is personally identifiable, sensitive, or related to specific statutory requirements. With the help of the legal department, the CPO should audit the privacy policy and program to verify that they are in compliance with the applicable laws. If not, change management programs should be implemented to bring the organization into a state of compliance. The PR department can help the CPO conduct an audit of the media and political environments. For example, if the PR department notifies the CPO that the media has been increasing its watch of companies selling customer data, the CPO may find that the privacy policy needs to be altered to preemptively accommodate the upcoming changes. Finally, the CPO must audit the technology for data collection and protection currently employed by the organization. Technology must be up-to-date and in compliance with the latest legal standards. If necessary, the privacy program may be updated to include new technology to ensure technological compliance.

Conclusion

The CPO must continuously follow the changes in the organization and its environment as new stakeholders, legal requirements, and technological advancements emerge. Continuous communication with the legal, HR, marketing, finance, IT, and PR departments keeps the CPO and the privacy team abreast of new developments and helps them make quick adjustments to the company's privacy policy, keeping it relevant and up-to-date. Updates to the privacy policy must flow through to the privacy program, ensuring that the necessary tools and technologies are employed for the organization to fully comply with the policy.

Child Labor

Child labor is a complex phenomenon that has been complicated further by definitional difficulties. Traditionally, many government officials, union representatives, and social reformers have used the term *child labor* to refer to any wage work by children in the labor market. Oftentimes, they have argued that all such work is harmful to children and, therefore, "child labor" should be prohibited. In recent years, increasing numbers of commentators have come to define child labor more narrowly as that work that is harmful to children as distinct from other forms of work either not harmful or beneficial to their development. The present article uses the terms *child work* or *child employment* to refer to children's engagement in any economic activity with the term *child labor* reserved for their participation in those that are harmful.

Work by children has undoubtedly existed throughout human history. However, it first emerged as a public issue in the early stages of the Industrial Revolution as the locus of their work moved outside the family and into the factory. Changes in technology created jobs requiring few skills in a number of industries, most notably textiles, and mill owners often sought to employ poor children in their factories. The owners, of course, benefited from this cheap labor, but many others also welcomed the growing demands for child factory workers. Poor families viewed their children's wages as vital to their welfare. The upper classes feared the potential for social disruptions by numerous idle children and regarded their employment as preparation for productive roles as adults. It was also argued that nations depended for their welfare on a disciplined, skilled, and healthy population.

Early governmental efforts focused on regulating conditions and hours of factory work rather than prohibiting children from working. Steps were often taken as well to provide schooling for young workers. The measures drew support both from those concerned with children's welfare and others intent on improving conditions for adult workers. Over the course of the 19th century, growing resistance to work by children and concerns about the idleness of many others led many Western nations to adopt compulsory school requirements. These laws enabled states to monitor all children's educational, physical, and psychological development while limiting their access to jobs.

If the Industrial Revolution provoked the earliest debates about children's work, globalization has rekindled old conflicts and posed new problems. Growing exports from developing countries have led to concerns about trade deficits and the loss of jobs in many industrialized countries. Government officials and union leaders attribute part of the problem to the lax labor standards in the developing countries and cite the pervasive employment of children. However, concerns regarding the ethics of work by children are evident as well. Many consumers in the developed world wince at graphic reports of children working under hazardous conditions to produce clothes, rugs, furniture, and other products for their use. Activists have demanded governmental action on humanitarian grounds to ban imports of goods made by children and have pressured retailers such as Nike, Wal-Mart, and the Gap to monitor their foreign contractors' labor practices.

Efforts by governments and activists in the developed world to end work harmful to children in the developing countries have often been taken in concert with the United Nations and its agencies. Founded in 1919, the International Labour Organization (ILO) has, as its mission, the development and promulgation of labor standards including those pertaining to the employment of children. The ILO functions through "conventions" or proposed standards, which nations may voluntarily agree to adopt. One of the most fundamental is the Minimum Age Convention of 1973 (#138), which updated earlier conventions and provides much of the ILO's framework for defining "child labor." For children less than 12 years, any economic activity is taken to be child labor. For those between 12 and 14 years, an economic activity is considered child labor when it is hazardous or the child performs it for more than a few hours per week. For those between 15 and 17 years, child labor is defined as hazardous work. Based on these definitions, the ILO estimated that in 2002 about 186 million 5- to 14-year-olds (about 15% of this cohort) were child laborers plus 59 million 15- to 17-year-olds. The vast majority are found in developing areas, especially Asia and Sub-Saharan Africa. Most work for their families in agriculture or small businesses engaged in commerce or light industry. Significant numbers of girls work in the households of others as domestic servants. Although highly visible in the media, only a small percentage, less than 5%, are found in export industries, most notably apparel, carpets, shoes, textiles, and furniture. Even with some flexibility for poor nations (e.g., children can work full-time at 14 rather than 15 years of age), the aim of this convention to prohibit nearly all work by children has led many developing nations to withhold ratification.

In 1989, with the support of about 140 nations, the General Assembly of the United Nations adopted the Convention on the Rights of the Child. This convention is widely regarded as more child centered and tolerant of cultural and national diversity than the ILO's Minimum Age Convention. It specifies a host of children's rights including the right to be protected from work that harms them, the right to an education, and the right to participate in the formulation of public policies affecting them. Article 3 stipulates that such policies must be based on the best interests of the child rather than those of adult stakeholders. The recognition that not all work is harmful has made this convention more congenial with the perspectives of many developing nations.

Ten years later, the ILO continued efforts to develop global labor standards acceptable to all nations with the Worst Forms of Child Labor Convention (#182). This commits signatories to "take immediate and effective measures" to eliminate child slavery and other forms of forced labor, prostitution, and involvement in drug trafficking as well as "work which . . . is likely to harm the health, safety or morals of children" as determined by the national authorities in consultation with the children involved. Indicative of the widespread support for this convention, 156 nations have already ratified this convention by 2005.

Despite progress in the formulation of global agreements regarding work by children, significant conflicts remain between those seeking universal standards for regulating work by children and those advocating flexible implementation in light of differences in culture, capacity of political institutions, and level of economic development among nations. Many officials, reformers, and unionists in industrialized nations demand adherence to the Minimum Age Convention on the grounds that work typically harms children directly or through reduced time for education. Many representatives of government and civil society in developing countries regard such demands as forms of ethical and cultural imperialism that mask protectionist interests. They are joined by increasing numbers of officials from international agencies (e.g., UNICEF), representatives of nongovernmental organizations (e.g., Save the Children Sweden), and child development specialists who advocate child-centered national policies grounded in the best interests of the children. They contend that blanket prohibitions against all forms of employment by children fail to recognize the diversity of jobs they perform and contexts in which they work. While the worst forms of child labor clearly harm children, other working conditions and contexts, including many formal apprenticeship programs and much work supervised by parents, provide substantial benefits and contribute to their development. However, many and perhaps most jobs performed by children combine a variety of actual and potential benefits with some clear costs and possible risks.

Advocates of regulatory flexibility and child-centered policies argue further that the best interests of children require that the circumstances of working children inform public policies pertaining to their work. Poverty, tradition, poor schools, and governmental incapacity may well justify certain kinds of work by children that, to outside observers, might appear undesirable or even harmful. Because these determinations are complex and because some consequences of work depend on children's interpretation of their experiences, many argue that child workers must participate in policy deliberations regarding their work. Such participation provides a more nuanced view of the workplace, the benefits children derive from it and the hazards they encounter. As a result, authorities may find the option of eliminating harmful practices a better alternative than prohibiting children from working altogether. Finally, child-centered advocates argue that children develop through their participation in the world of work. Through work experiences appropriate to their level of maturity, they encounter problems that challenge them to learn how to cope with risks and protect themselves.

Disputes between those demanding universal standards and those advocating flexibility have stimulated increasing research on work by children. Family poverty has been the most widely adopted explanation for children's work in developing areas. The poor quality of schooling in poor communities is often cited as another explanation for families to seek work for their children. Research by economists suggests that work may reduce children's efforts in school and poor-quality schools may increase the attraction of work.

Whether children find jobs depends on their opportunities to work. Parents with land or businesses often employ their own children, and research in developing areas suggests that most children do, in fact, work for their families. Some analysts argue that globalization forces many businesses in developing nations to compete internationally on lower costs, which some achieve by employing children. However, the few studies to date do not appear to support this thesis.

Cultural explanations of work by children are also advanced. Many argue that traditional cultures regard work by children as fundamental to their socialization. Research does suggest that illiterate parents are more apt to seek jobs for their children. Others attribute work by children to their efforts to escape traditional obligations to perform unpaid domestic work. Similarly, some argue that children's exposure in developing areas to modern, consumer cultures, via the mass media, creates desires for youth-oriented consumer items that they can only purchase by paid employment.

Far less attention has been devoted to the consequences of work by children in developing areas. Available studies focus largely on the implications of work for education and derive from economists' concerns that early work involvements reduce the time available for school and, consequently, the store of human capital available to the society. Their research often reveals that the educational performance of working children is lower than that of nonworkers. However, the rival hypothesis—that children performing poorly in school are more likely to work—is equally plausible. In addition, this literature fails to distinguish between different forms of work that have different implications for child workers' education. Far less research has been done on the implications of work for children's attitudes, values, behavior, and physical or mental health.

Efforts to deal with child work by public policy makers have focused largely on its elimination through legislative means. This approach rests on two controversial assumptions. The first is that much child work is undesirable and should be eliminated because it not only harms children but also undercuts adult employment and wages. The second is that legalistic means are feasible because child work is visible and that government has substantial capacity to monitor employer behavior and apprehend violators. The persistence of work by children throughout the developing world testifies to the insufficiency of this approach. Part of the problem stems from the fact that many in developing nations, including child workers, believe that the benefits to children from working often exceed the costs. In addition, much of the work by children occurs within small, family-run operations that are difficult to monitor. Finally, governments in many developing nations lack the capability to enforce employment laws.

The failure of legal prohibitions on children's work has led to experimentation with other approaches. Because inadequacies in schools often drive children to work, many efforts are being made to make them more attractive to students and their families. Some programs focus on improving the schools themselves—their availability, location, physical structures, materials and equipment, and the teachers. Another approach is to reduce the costs to students of uniforms, books, and other items that sometimes require children to work to be able to afford. A third involves more flexible schedules and curricula better adapted to working children.

Poor families with children working in particularly harmful circumstances are the targets of other programs designed to reduce the opportunity costs of attending school by providing cash transfers to offset income lost by children when they stop work to devote more time to education. Consumers have been the focus of efforts to end work by children by affecting purchasing decisions. Boycotts have followed extensive publicity of child employment by foreign contractors of Nike and other retailers. Other efforts, such as the Rugmark campaign to end child work in the Bangladesh carpet industry, have used labels on products to indicate that no child work was involved in their production. Such labeling initiatives facilitate consumer efforts to apply pressures on producers to end child work.

Difficulties in mobilizing consumers have often led activists in industrialized nations to advocate trade sanctions that would restrict imports of products from industries employing children. Opponents of such policies cite the potential for adverse unintended consequences from such sanctions. In particular, they note the cases of the Bangladesh garment industry and Pakistani soccer ball manufacturers who, when threatened with trade sanctions, fired large numbers of children. Unfortunately, very few returned to school. Most sought work elsewhere with some reportedly becoming prostitutes and others trafficking in drugs. Thus, as with many other efforts to curb child labor, the results of this intervention were different from those intended.

At the core of much of the controversy about child work are ethical considerations. The immediate response of most people in developed countries to work by children is that it is immoral and ought to be eliminated. However, a deeper understanding of the many forms and contexts of such work suggests that the moral issues are more nuanced and complex. Clearly, certain forms of child work are morally indefensible. These are the so-called worst forms of child labor, which include activities such as bonded child labor, drug trafficking, soldiering, and prostitution. These are so dangerous and degrading that no one even attempts to offer a defense for them. The widespread adoption of the ILO convention targeting these forms of child labor bears testament to this.

Opponents of attempts to outlaw work by children have generally supported their position with utilitarian arguments. Thus, even if there are some harms to the child worker, these would be offset by benefits to the child, his or her family, and the society as a whole. These would include providing much needed financial benefits to the child and his or her family, enhancing job skill and character development, keeping the child occupied and out of trouble, and promoting economic and social development nationwide. Yet other defenders of child work (especially so-called child liberation advocates) contend that children should be free to decide for themselves whether or not they want to work in formal work settings.

The ethical case against work by children is usually argued in terms of violations of rights of child workers. Many people feel that children have basic rights of access to adequate shelter, health care, security, education, and other basic amenities of life until they achieve some designated level of maturity. Within this context, work by children is viewed as incompatible with education and, thus, inconsistent with the basic rights of children. Moreover, some forms of child labor are hazardous and further impinge on these basic rights.

Given the many forms, contexts, and consequences of work by children, blanket condemnations or defenses seem inappropriate. Moral judgments on child employment would thus benefit from an in-depth understanding of the nature of the work, its societal context, and the consequences of the work to the children themselves as well as how these relate to basic rights of children. Moreover, children's own views on these matters should be taken into account.

Looking forward, discussions of the ethics of child work and child labor will benefit by more thorough attention to three issues. The first of these has to do with how children develop and, more specifically, how much protection and, conversely, exposure to risk they need to become capable adults. The second has to do with the nature of work and, specifically, the need to acknowledge that invisible and devalued domestic work often poses as many hazards to children as jobs in the labor market. Third and most important is the development of a more balanced view that recognizes the value of some forms of work by children as well as the harm caused by other types.

CHILDREN, MARKETING TO

The marketing of products to children is not a new phenomenon, and certainly, the historical record is rife with examples of popular product campaigns geared toward children. However, recent decades have seen an unprecedented expansion in marketing efforts aimed at children. Such efforts involve both direct and indirect forms of marketing to children. Direct marketing to children involves advertising and related activities geared toward soliciting children's awareness of and interest in specific products. Indirect forms of marketing to children involve similar efforts devoted to creating consciousness of products designed for younger persons among parents and others responsible for purchasing products for children. The average child now views tens of thousands of television and print advertisements every year, and magazines, television shows, and Web sites aimed exclusively at children provide a fertile medium for marketers to appeal to this audience directly. Indeed, the line between entertainment and advertisement is now routinely blurred in the television programs and movies viewed by children, which are often closely connected to marketing campaigns that sell toys, games, and other products centered on the characters and themes of these shows. Furthermore, marketing departments have become increasingly sophisticated in the their attempts to appeal to children, often making use of extensive market research on the buying habits of children and the expertise of child psychologists in developing marketing strategies.

Essentially interconnected with the expansion of marketing to children is the increased disposable wealth of children, who now directly spend billions of dollars every year on toys, games, and other products. Children are also indirectly responsible for influencing billions of dollars in adult expenditures on food, clothing, vacations, and assorted goods and services. There is, thus, no doubt that children represent an important element in the modern consumer economy. In this sense, some have seen the expansion in direct marketing to children as simply responding to the increased purchasing power of this segment of the population. Nonetheless, this proliferation in the number of products marketed to children as well as in the techniques used to market these products has raised a number of concerns about the ethical status of many of these efforts. While some of the concerns raised about marketing efforts directed at children reflect more general questions about marketing ethics, others rest on more specific concerns with the practices of marketing to children. Ethical concerns of the latter type often stem from considerations of the differences between adult and children consumers. Because of these differences, most ethicists argue that higher ethical, and often regulatory, standards are appropriate for the marketing of products to children.

Suitable for Children?

A number of the concerns raised by marketing directed at children turn on the kinds of products that such marketing involves. Questions of an ethical nature have been raised in this direction about marketing campaigns that involve products that are dangerous, inappropriate, or useless. While it may be legitimate to assume that adult consumers have the capacity to rationally evaluate the relative merits and risks of products on their own, children, particularly those of a younger age, lack the understanding and experience necessary to independently judge the worthiness of many products. There is good reason for, thus, believing that even in a market economy children should be provided additional protection against the marketing of harmful products. Differences exist though in terms of the marketing of products of questionable suitability for children and, thus, as to which products, and to what extent, marketers should be restricted or regulated in appealing to children.

The clearest cases of ethically problematic marketing campaigns directed at children are those that involve products that are inherently dangerous. The most notorious cases involve products such as cigarettes and alcohol, which are not only harmful but which children are not legally permitted to purchase either. Despite such legal restrictions, there have, nevertheless, been several cases of marketing campaigns involving such products that were apparently directed toward children and teen-aged youth. A particularly notorious example of such a case was the advertising campaign used to market Camel brand cigarettes through the use of the "cool" cartoon figure Joe Camel. Critics argued the use of this Disney-like cartoon figure to market cigarettes was designed to purposely appeal to a younger audience. Eventually, under pressure from the Federal Trade Commission (FTC) and various interest groups such as the American Medical Association, R. J. Reynolds agreed to discontinue use of the Joe Camel character. In a similar vein, critics have contended that marketers often appeal to children of unsuitable age in advertising movies, video games, and other media that contain sexual and violent content of an age-restricted nature. Certainly, any company that does purposefully market such products to children is engaging in an ethically dubious practice. At a minimum, if a product has been deemed to be inappropriate for persons under a certain age by law or regulation, marketers have a moral and legal responsibility not to target younger persons in their advertising campaigns.

Controversy also exists concerning the marketing of products to children that pose less direct harms. For instance, a number of groups have expressed concerns over the extensive marketing of soft drinks, snacks, sweets, and fast-food products to children. Given the poor nutritional value of most of these products, these critics argue that children are being encouraged to adopt unhealthy eating habits that can have long-term health consequences. Other marketing efforts directed at children have been targeted by critics for selling products that present unhealthy or unrealistic images to children. For example, some critics have argued that many of the dolls marketed to girls present them with a female body image that is unrealistic and that in doing so contribute to the self-image problems that are widespread among young females. Finally, some critics simply express concern over what they see as the widespread marketing of products to children that, while not harmful, have no positive educational, social, or personal value either. These critics argue that high-pressure advertising campaigns often exploit the naivety of children in marketing worthless products to them.

Advertising Techniques

Questions of the last-mentioned sort raise further considerations about the means by which products are marketed to children and, in particular, to the methods of advertising. Here, two issues have been given particular prominence in discussions of marketing to children. One involves the pervasiveness of advertising to children and the other the means by which advertising appeals to children. As to the first point, a number of ethicists have expressed worries about the extent to which advertising has infiltrated nearly every childhood activity. They argue that, on a daily basis, children are bombarded with advertisements on television, the Internet, in public spaces, and even at schools and other community institutions. Defenders of the marketing industry have traditionally pointed to the role of parents in filtering what children see and argued that the primary responsibility for monitoring the consumer habits of children belongs with the family. However, critics suggest that the strength of this argument is weakened by a consideration of the ubiquitous nature of advertising to children in contemporary society that makes it nearly impossible for parents to adequately monitor and counter these commercial influences.

The second issue turns on the kinds of methods that advertisers use to appeal to children. Here, many critics worry about the extent to which emotional appeals and image advertising can influence younger consumers who can be expected to have less maturity and less developed judgment than adult consumers. The FTC, which is responsible for protecting consumers from deceptive advertising practices, has generally recognized this in applying more stringent standards to advertisements directed at children than to those aimed at adults. Despite this more strident regulation by the FTC of advertising to children, a number of critics argue that much of the advertising that is directed at children still makes use of emotionally manipulative techniques in appealing to younger consumers. For example, some critics have charged that advertising directed at children often plays on the fears, insecurities, and unrealistic expectations of children to influence their decisions about products. To the extent that children are more easily swayed by purely emotional appeals, such advertising can be seen as unduly manipulative.

Advances in technology have also raised concerns about the ethics of marketing to children. Of particular prominence here have been questions about the various methods by which marketers target children online, a number of which have come under scrutiny in recent years. Sophisticated marketers have the capability to track the online activities of children and to develop advertising personalized to individual users. Interactive advertising sites for children often also blend entertainment and advertising in a near seamless fashion, and various banner advertisements redirect children who click on them to company-sponsored sites. Such practices tend to intensify questions as to what extent children have the capacities to identify the advertising appeals intermixed with such online activities and to resist their influence. Online marketing techniques can involve the solicitation of various forms of information from and about children and their online habits as well. The collecting and selling of such information raises further ethical questions about protecting the privacy of children online, who are less appreciative of the importance of informational privacy.

Regulatory and Industry Responses

A number of efforts have been made by the government, industry groups, and individual companies to initiate regulations and policies that address some of the specific ethical concerns raised above. At the federal level, the Children's Television Act of 1990 can be seen as a response to the increasing commercialization of children's television programming. The act requires that television stations carry a designated amount of programming for children that contains an educational and information component. In 2000, the Children's Online Privacy Protection Act was also passed. This act requires that commercial Web sites that are aimed at children less than 13 years of age obtain parental permission before collecting personal information from a child. At the industry level, the National Advertising Review Council, an organization formed through the auspices of a number of national advertising trade associations and the Better Business Bureau, established the Children's Advertising Review Unit (CARU) in 1974 to review and evaluate advertising directed toward children. The CARU has developed a set of self-regulatory guidelines to promote honesty and responsibility in advertising to children and also has included special provisions directed toward protecting children in the online environment. Some companies and marketing firms have also sought to adopt specific policies and codes of ethics with regard to marketing to children as well, including a few large corporations that have traditionally had a significant role in marketing their products to children. For instance, in 2005, Kraft Foods announced the adoption of a set of standards for marketing to children that included setting nutritional standards for foods advertised to children between 6 and 11 years of age.

Broader Social Issues

Issues surrounding the proliferation of advertising to children and the uses of associative advertising also spill over into larger debates about the social impact of marketing to children. In this vein, some commentators worry that the tendency by marketers to target younger and younger children and to do so in increasingly numerous and sophisticated ways poses a more general threat to human flourishing and important social values. First, critics of this stripe contend that by inculcating desires for unnecessary and potentially harmful products in children from an early age, particularly through associative and image advertising, marketers threaten the ability of children to develop as fully rational and autonomous persons. Second, some have tied concerns over marketing to children to more general concerns with consumerism. By encouraging children to become fervent consumers at an early age, some contend that rampant marketing efforts directed at children stymies the development of personal virtue and the appreciation of noncommercial social goods.

Others have argued, however, that such social critics overestimate the influence that advertising has on individuals as well as the extent to which the values inherent in such practices are necessarily enemies of human flourishing. They believe that blanket assertions about the manipulative nature of such advertising are overstated and claim that advertising plays an important role in allowing children to become reflective decision makers by providing them with information about available products. In doing so, such defenders argue that advertising can actually aid children in formulating a sense of their own wants and preferences, as well as introduce them to the workings of a free market economy.

Debates over such broader social issues will no doubt continue into the foreseeable future. In attempting to sort them out, though, further research is called for in at least three directions. First, further empirical investigation into the effects of advertising on the psychological and social development of children is needed for a proper evaluation of claims concerning the scope and strength of its influence. Second, from the normative point of view, parties on all sides of the debate need to further explicate and defend the views of human values and social goods that underlie their positions. A complete treatment of the ethics of marketing to children will necessarily depend on a robust account of the nature of personal and social value. Finally, even with regard to unethical marketing practices, care must be taken to distinguish between those cases that pose a serious enough threat to children as to warrant government regulation from those practices that while perhaps ethically dubious are not sufficiently problematic as to call for regulatory restrictions.

Child Safety Legislation

A child is a person who has not reached the age of majority or the age at which a person attains full legal rights. In the United States, this is also the age of capacity defined by statute as 18 years for legally being able to agree to a contract, 16 years for agreeing to marriage, and 14 years for knowing right from wrong. Safety implies freedom from danger, damage, injury, or harm. Safety is security. Legislation refers to an enacted body of laws. Legislation may create agencies and competent authorities that administer regulations pertaining to the law. Regulations are rules that have the force of law. Child safety legislation includes any law or regulation created to protect a child from danger or harm.

Child safety legislation encompasses the categories of health, medicine, and physical safety; family and education; employment; and exploitation. According to human rights advocates, children's status as human beings automatically entitles them to all human rights, including safety. The business legislation on child safety is generally a part of regulations established for the protection of larger classes of people such as workers, consumers, and citizens.

In the United States, child safety regulation is often initiated by public interest groups. Public interest groups lobby in favor of safety regulations in the administrative processes of government agencies such as the Food and Drug Administration (FDA) and the Consumer Products Safety Commission (CPSC). This type of activity resulted in the establishment of product safety standards in child restraint systems, bans on children's jewelry containing lead, and multiple voluntary recalls of products.

Because of their physical and mental immaturity, children are seen as members of a dependent group that needs special safeguards and care, including appropriate legal protection before as well as after birth. However, since the beginning of the 20th century, society's principal concern has been with the physical protection and security instead of the recognition or guarantee of rights. Rather than using a basis of equality, rights here are based on the concept that children are significantly different from adults. They are vulnerable, at risk, and require nurturing and special protection from the adult world. This calls for extra measures from society in law and in practice.

U.S. Legislation

The earliest legal provisions for children in the United States dealt with labor and health issues in the food supply. The following sections address child labor and prominent legislation for food, drugs, and consumer products.

Child Labor

Indenture was an early means of caring for orphans in the United States, dating back to the 1600s in Massachusetts. However, indenture was more often a source of free labor than child protection. In 1866, Ohio established the first law providing public funds for a county orphan's home. In 1935, Congress passed the Child Welfare Provisions of the Social Security Act. In 1938, a key piece of business legislation was passed in the United States. The Fair Labor Standards Act (FLSA) forbids the use of oppressive child labor by restricting employment to nonhazardous jobs, by limiting working hours for those under the age of 18 years, and by forbidding employment for those under the age of 14 years except as newspaper deliverers or child actors. The FLSA establishes minimum wage requirements that apply to children.

Although adults have the capacity to bargain with employers, children generally are not in a position to discuss or negotiate terms of employment. Child work such as delivering newspapers or household chores is differentiated from child labor or waged labor in which a child is exploited by third parties for profit. Exploitation occurs when a child starts work at too early an age, works too long, works in jobs with dangerous or excessive physical demands, works for inadequate remuneration, or is delegated too much responsibility.

Food and Drugs

Regulation of food in the United States dates back to food statutes concerned with bread and meat in early colonial times. Federal controls over the drug supply began in 1848 with a national law requiring inspections and banning the importation of adulterated drugs.

Public outcry over deaths from a poisonous sulfa drug (elixir sulfanilamide) put on the market for children was a major impetus for the passage of the 1938 Food, Drug, and Cosmetic Act. The act is administered by the FDA. The law prohibits false therapeutic advertising. It requires labeling and directions for safe use and premarket approval for new drugs. FDA approval requires that manufacturers prove that the new drug is safe and effective before it can be sold. Amendments to the law in 1962 protected unborn infants in the United States from the risk of deformities produced by the drug thalidomide.

Children are not expected to have the same capacity for judgment as adults. Therefore, they are especially susceptible to the lure of harmful and dangerous products such as alcohol, tobacco, chemicals, and drugs. Legislation bans dispensing these products to children. The FDA also finds that children's developmental processes are easily disrupted, making pesticide content in fruits, vegetables, and juices a concern.

Consumer Products

In 1972, Congress created the CPSC, which took over several programs pioneered by the FDA. The CPSC enforces the Flammable Fabrics Act (1953), the Refrigerator Safety Act (1956), the Child Protection Act (1966) banning hazardous toys and articles for which adequate warning labels cannot be written, the Child Protection and Toy Safety Act of 1969, child safety measures in the Poison Prevention Packaging Act of 1970, and the Toy Safety Act of 1984.

Children are easily influenced by marketing and advertising ploys. For example, medical research has found that the brains of adolescents function in different ways than adult brains in that they underestimate risks, overvalue short-term benefits, and act more impulsively than adults. The American Academy of Pediatrics (AAP) considers advertising to children under the age of 8 years inherently deceptive and exploitative. In addition, developmental processes occurring in children, but not adults, require protection. The AAP already recommends that children between the ages of 0 to 2 years not watch television because early television watching is associated with attention problems at the age of 7 years.

International Legislation

In 1889, the British Parliament passed the "Children's Charter" for the prevention of cruelty to children. However, it was not until after World War II that the matter of the human rights of children, an idea that originated in the West, was recognized as an international issue. The United Nations Convention on the Rights of the Child acknowledges that every child, generally defined as any person under the age of 18 years, has certain basic rights including the right to life, the right to his or her own name and identity, and the right to be reared by parents in a family or cultural group.

The United Nations General Assembly adopted the Convention into international law in 1989. It was the world's first international legal instrument on children's rights. The Convention forbids capital punishment for children. The Convention has been ratified by 191 countries. The laws of several states, authorizing execution as a punishment for crimes committed by minors, have been a barrier to ratification by the United States. However, the 2005 Supreme

Court decision in the case of *Roper v. Simmons* prohibited the execution of defendants who committed a crime when they were minors. The effect of the Supreme Court decision on ratification of the Convention by the United States is uncertain.

The Convention also has two optional protocols adopted by the General Assembly in 2000 that apply to the states that have signed and ratified them. These are the optional protocol on involvement of children in armed conflict and the optional protocol on the sale of children, child prostitution, and child pornography. The Convention does not address child labor, which remains an international issue.

A study by the International Labour Organization in 1997 estimates that 250 million children worldwide are committed to full-time labor. The Social Accountability International organization places the estimate at more than 100 million. Child labor is concentrated in Asia, Africa, and South America. Rising public concern about child labor, sweatshops, and inhumane working conditions in general led to the creation of the Council on Economic Priorities Accreditation Agency in 1997. In 2000, the council established itself as a new entity, Social Accountability International (SAI). The role of SAI is to develop voluntary standards for social responsibility that would forestall the need for more legislation.

Membership in SAI allows retailers to demonstrate their commitments to standards for labor issues by agreeing to do business only with socially responsible suppliers. Certification by SAI requires manufacturers and suppliers to demonstrate compliance with standards governing labor and workplace conditions. SA 8000 is a code of practice that includes nine key areas, the first of which is child labor. Companies that apply for SA 8000 certification must ensure that none of their staffs or those working for suppliers uses or promotes child labor. The remaining eight key areas include forced (prison or slave) labor, health and safety, discrimination, disciplinary practices, working hours, compensation, management practices, and freedom to associate and bargain collectively.

Christian Ethics

Although there are diverse ways to understand Christian ethics, generally it is considered a body of systematic knowledge to guide good human behavior based on the teachings of Jesus of Nazareth (Christ) and the apostles contained in the Bible (Old and New Testaments), and for many, it also includes the living Christian tradition and some developments of Jesus's followers.

Christian ethics is a widespread ethical tradition, starting 2,000 years ago. Although there are different degrees of adherence to and interpretations of these ethics, the great number of Christians—about 2,100 million worldwide—gives an idea of the importance of the Christian ethics tradition. Moreover, Christian ethics has had a practical influence on philosophers and even on ordinary people in many historical periods, opening new horizons to them.

Christian Ethics and Moral Philosophy

The relationship between faith and reason, including ethics, is problematic. One of the problems is related with the *Euthyphro dilemma* presented by Plato

(*The Last Days of Socrates*). Socrates essentially asks whether something is good because God commands it or whether God commands something because it is good. Many Christians defend that a natural order understood through reason cannot be contradictory to God's will as expressed in the Revelation, since God is both the Creator and who explicitly reveals. This position is far from being an understanding of morality as an arbitrary will of God, but it is also far from being a vision in which morality is independent of God's will.

In contrast, a theologian called Ockham (14th century), who has had a great influence, presented morality as only based on an arbitrary will of God expressed in divine commandments. He not only abandoned reason to discover morality but also reduced Christian ethics to a set of obligations, with practically no room for virtue.

Now, some Christians, putting philosophy aside, only recognize biblical teaching freely interpreted by each individual or maybe with the support of churches or communities of believers. However, many other Christians consider that it is reasonable to think that Christian ethics includes both faith and reason.

Augustine of Hippo in the 5th century and Thomas Aquinas in the 13th century are two outstanding examples in joining faith and reason. Augustine employed neo-Platonic and Stoic thought to a great extent, while Aquinas extensively used Aristotle, although both authors did so in a new and creative way.

Currently, there is a well-developed body of moral theology, which accepts and examines divine Revelation and simultaneously responds to the demands of human reason. Moral theology includes philosophy for a sound vision of human nature and society, as well as of the general principles of ethical decision making and other proposals of moral philosophy.

Scrutinizing the Bible and the primitive Christian tradition, one can find that, apart from obligations (moral law, expressed in principles and rules), there are also values and virtues.

Principles are hierarchical issues, such as the priority of people over things, the subordination of economic goals to human dignity and rights, and the priority of seeking God's approval rather than man's. *Rules*, closely related to principles, are moral dictums for human action, for instance, respect for human life and other people's property and the prohibition of lying. *Values* are goals for life or moral goods, such as freedom, love, peace, and truthfulness. *Virtues* are permanent moral habits in the character and dispositions of the individual Christian by the Holy Spirit.

Moral Law: Three Levels of Knowledge

Many Christians understand that moral law has three levels of knowledge. First, the "Natural Law," which comes from God, the Creator, who established a moral order knowable through reason. Natural (moral) law is present in the heart of each human, at least in its more basic prescriptions. Natural law includes respect for the dignity of the person and determines the basis for fundamental human rights and duties.

Jesus presented himself as someone who had come not to abolish the law and prophets but to fulfill them. Thus, the second level of moral law is the moral precepts of the Old Testament, the "Old Law" or "Law of Moses." It is summed up in the "Ten Commandments," or "Decalogue," which forms a coherent whole. It expresses many truths also accessible to reason and, consequently, belonging to the natural law.

The Decalogue contains the obligations to worship God; not to make wrongful use of the name of the Lord; to observe the Sabbath day and keep it holy; to honor one's father and mother; to respect human life, other people's material goods, and the reputation of individuals; to avoid inappropriate sexual intercourse; and not to covet the neighbor's wife or desire anything that belongs to one's neighbor.

The third level is the "New Law," or the "Law of the Gospel," which includes the commandments and the other moral precepts of the Old Testament but goes beyond them. It requires following Christ and imitating him along the path of love and by the working of the Holy Spirit in the soul. It requires not only living in accordance with a set of norms but also reforming the heart, the root of human acts, trying to imitate Jesus. In the "Sermon on the Mount" (Chapter 5 of Matthew's Gospel), which is considered as the Magna Carta of Jesus's morals, are declared blessed those who are poor in spirit (detachment, humility), those who mourn, the meek, those who hunger and thirst for righteousness, the merciful, the pure of heart, the peacemakers, and those who are persecuted for righteousness' sake. These "Beatitudes" have been extensively explained and commented on throughout the centuries by Christian writers.

Christian Ethics in Business

The Bible encourages working and making honest profits but warns against greed, avarice, and envy. Riches should be seen as instrumental, not a supreme good. In practice, serving God rather than riches means putting people first when managing business and considering profits as a necessity and a measure of the results but not as the only end for the business. Profits are not acceptable if they have been gained without respecting people's rights and their well-being.

Christian tradition, for a long time, has been suspicious about capitalist economics and has emphasized wealth distribution rather than its creation. It was considered difficult to harmonize the continuous accumulation of wealth, extolled by capitalism, with the Bible and early Christian writers. The latter were influenced by the economic and cultural context at the beginnings of Christianity. At that time, the economic mechanisms and social benefits of wealth creation were not understood as they now are.

Max Weber held that some Puritan preachers of the 17th century, interpreting Calvinist doctrine regarding predestination, thought that wealth accumulation would be a sign of predestination to eternal salvation. Consequently, they encouraged the development of what has been called the Protestant work ethic, which includes virtues such as being hardworking, frugal, and industrious. According to Weber, these conceptions and habits were indispensable to the emergence of the new capitalist ethos. Now, many Christians and churches see wealth creation and business as a noble task and encourage human virtues, which make work prosperous because business and wealth creation contribute to the common good.

Regarding business ethics, a set of obligations for business can be derived from the Decalogue. Among others, dealing with people in a fair way; providing humane conditions in work; providing safe products; not committing fraud; being truthful in financial reports, product information, and in any corporate communication; not bearing false witness; avoiding calumny, rash judgment, and detraction; and so on. A labor weekly rest and a reasonable working day, which does not prevent duties toward God and family, can also be related with the Ten Commandments.

The Bible is also explicit regarding integrity in honoring promises, observing legitimate contracts, and repairing injustices, and people in power are strongly required to refrain from abuse of those in need. It condemns bribery and extortion, cheating, paying unjust wages, and forcing up prices by taking advantage of the ignorance or hardship of others.

In the Bible, there are two generic moral principles of conduct significant for business: the golden rule and the commandment to love one another. In the New Testament, Jesus is the model for this love.

The commandment of love entails much more than duties of justice. In dealing with others (coworkers, customers, etc.), Christian ethics requires not only being fair but also taking care of others by considering their needs. In this sense, St. Paul directed a Christian master to treat his Christian slave as a brother.

Furthermore, Christian ethics stand for respect and mercy for all human beings, even for those who are not known. Jesus's parable of the Good Samaritan, who took care of an enemy, is quite eloquent in this respect. All humans have been created in the image and likeness of God, and Christ is the Universal Redeemer; all of them are members of a whole family and all deserve an attitude of compassion and solidarity. However, in the Christian tradition it is also stressed that there is a hierarchy of duties in caring for others.

Christian Work Ethics

Christian ethics stresses the rational finding that work is a deliberate and free activity that comes from the person. It not only produces things but also changes the worker. This confers dignity to work. Work needs not only remuneration but also recognition as a personal contribution to society. By working, a person develops his or her capacities, interacts with other people, and finds the opportunity to serve others. The Christian faith gives new horizons to work. The divine commandment to subdue the earth in the beginning of Creation is carried out through work. Jesus himself worked as a craftsman giving labor a great dignity. Christians can work feeling themselves children of God and called to imitate and identify themselves with Jesus Christ. They cooperate in this purpose by working with professional competence, uprightly, and by offering their activity to God.

Work can also be considered in terms of vocation. In the New Testament terminology, *vocation* (κληστζ or *klésis* in Greek) means the calling from God in Jesus Christ addressed to an individual to become a Christian. This calling discloses to each one the deep meaning of his or her life and the mission associated with this calling. Thus, vocation is a sense of dialogue and response between God and each person. It is not a divine calling for a certain elite, as some understood. But neither is it equivalent to "profession," in the sense of professional work, leading to the current secular meaning, which completely sets aside God as the origin of the calling, as some others have interpreted. Christian vocation or calling refers to the whole life of each individual, including work, which certainly is an important part of human life.

Without ignoring the religious roots of this concept, Michael Novak considers that a calling can be entirely secular and has talked about business as a calling. In this way, he overcomes the current view of business, which reduces it to making money.

That labor rights are included in the context of human rights is an outstanding point of Christian ethics. Among other rights we should remember are a fair process of hiring and dismissal, working in healthy and safe conditions, receiving a fair wage, the right of worker association (unions), an appropriate participation in managing business, and harmonizing work and family duties as much as possible.

Social Issues in Christian Ethics

Since the end of the 19th century, Christian churches have presented teachings regarding social issues, starting with Pope Leo XIII and the document *Rerum novarum* (on the new things) on the social question, which dates from the Industrial Revolution. Successive contributions have become an updated doctrinal "corpus" called Catholic Social Teachings on social, economic, and business matters. The Church of England, The Orthodox Church, the Lutherans, the Methodists, and other Christian churches and the Evangelical movement have also developed streams of thought, documents, and actions based on Christian ethics and related to social, economic, and business issues. Generally, they all agree in recognizing the positive contribution of the market economy, but under certain ethical conditions—among others, considering humankind as a whole human family with links of solidarity; wealth creation with social justice; market strength regulated by the interests of the community; safeguard of the natural environment; the social inclusion of all people and groups in prosperity, social structures, and policies to foster the initiative of individual and local communities; and solidarity to eradicate poverty, to contribute to human development, and as a framework for globalization.

Churning

Churning is excessive trading in a client's account by a broker, who has control over the account, with the intent to generate fees or commissions rather than benefit the client. Brokers—who are typically employees of a brokerage or investment banking firm with responsibility for handling the investment portfolios of clients—often occupy a dual role as sellers of securities and trusted advisers. In the former role, brokers have only the obligations of sellers in a market, but in the latter capacity, they have both moral and legal obligations, a fiduciary duty, to act in the interests of a client. Because brokers are compensated by fees and commissions from the sale of securities, they have a conflict of interest when they also serve as an adviser or have control of an account due to the opportunity to enrich themselves at a client's expense. To engage in churning, then, is to violate a fiduciary duty to act in a client's interest as the result of a conflict of interest.

Churning can be legally prosecuted either under the common law doctrines of fiduciary duty and fraud or under various federal and state securities laws. A fiduciary duty may be created by an explicit pledge by a broker to serve as a trusted adviser. Absent such a pledge, a fiduciary duty may be inferred by the "shingle theory," which holds that by offering a professional service ("hanging out a shingle") a broker implies the he or she will deal with clients fairly and honestly. The common law elements of fraud are the willful misrepresentation of a material fact that causes harm to a person who reasonably relies on the misrepresentation. Thus, a broker who willfully misrepresents either his or her trustworthiness as an adviser or the reasons for recommending or executing a trade commits fraud.

Most actions for churning are brought under Rule 10b-5 of the 1934 Securities Exchange Act, which prohibits any manipulative, deceptive, or other fraudulent device or contrivance in connection with the purchase or sale of a security. In addition, the National Association of Securities Dealers (NASD), an industry organization, holds that churning is a violation of its suitability rule, which requires members to recommend only transactions that are suitable for a client. Although an action can be brought by the Securities and Exchange Commission (SEC), state regulators, or the NASD with the aim of imposing penalties, most cases of churning are private suits or arbitration claims brought by individuals seeking restitution.

Individuals who charge a broker with churning are required by the courts to prove three elements: (1) that the broker had control over the account, (2) that the broker engaged in excessive trading given the investment objectives of the client, and (3) that the broker acted with an intent to defraud or acted with a reckless disregard of the client's interests. Although each of these elements raises certain difficulties, the first two are especially problematic.

A broker who is authorized in writing by a client to make transactions without further approval has explicit or formal control. Ordinarily, a broker who is merely executing a trade for a client has no fiduciary duty to serve the client's interest. However, implicit or informal control and an attendant fiduciary duty may be established when an unsophisticated client always or usually follows a broker's advice. Both elements are necessary—a pattern of reliance and a lack of knowledge or experience. The reason for imputing control in the case of an unsophisticated, easily influenced client is that a broker may have the de facto power to control this person's account without being explicitly authorized.

When are a broker's trades for an account excessive? This question is problematic because any trading strategy depends on a client's investment objectives and tolerance for risk, and it may be difficult to distinguish between excessive trading and an aggressive but unsuccessful strategy. Courts have accepted two indicators of excessive trading—turnover ratios and cost-to-equity ratios.

The turnover ratio—which is a measure of the number of times the portfolio is turned over during a certain period of time, usually 1 year—is commonly calculated by dividing the total value of the trades during a year (or some other period) divided by the average value of the portfolio during that time (adjusted, if necessary, to produce an annualized number). Thus, the turnover ratio of a $1 million portfolio for which a broker makes $2 million in trades during a 12-month period is 2. The cost-to-equity ratio is calculated by dividing the total fees and commissions over a period of time by the average value of the portfolio, adjusted, if necessary, to produce an annualized number. Thus, a $1 million portfolio that generates $100,000 in annual revenue for the broker and the firm has a cost-to-equity ratio of 0.1 or 10%.

With both indicators, the courts must establish what number indicates excessive trading. The general rule of thumb for turnover is the 2–4–6 rule, according to which a ratio of 2 indicates possible churning, a ratio of 4 creates a presumptive case of churning, and a ratio of 6 is conclusive evidence of churning. A cost-to-equity ratio of 3% or 4% should raise concern. Such mechanical rules take no account of the soundness of the trading strategy being employed or the gain or loss to the client. Thus, trading that produces a sixfold turnover or has a cost-to-equity ratio of 8% might be the result of a sound strategy that produces little loss, whereas a broker, for no sound reason, might turn over a portfolio only once or trade enough to collect only 2% in fees and commissions.

A third method for determining excessive trading involves the use of modern portfolio theory and sophisticated statistical techniques to compare the expected return of any given broker-managed portfolio with a large number of mutual funds with similar objectives. The assumption of this method is that the turnover ratios and the cost-to-equity ratios of mutual funds, whose managers are compensated solely on the basis of performance, provide benchmarks against which to judge the trading strategies of brokers. Although brokers may have a higher turnover and higher expenses than comparable mutual funds, they should also have a higher expected return, and whether this is the case can be determined using modern portfolio theory and readily available data about comparable mutual funds.

The final issue in churning is the damages that should be awarded to a victim. Justice requires that the victim of a wrongful act be compensated in a manner that corrects the wrong. Courts have applied three standards for awarding damages: (1) the out-of-pocket loss to the client, (2) the gain to the broker from the excess trading, and (3) the difference between the loss to the client and the return that would have been achieved by a properly managed portfolio. The amounts produced by using the first two standards are relatively easy to determine; the third standard typically involves a comparison with mutual fund benchmarks.

Civil Rights

An adequate understanding of civil rights requires that they be set within the broader conceptual framework provided by rights theory. Civil rights are related both to natural rights and positive rights, which are typically characterized as distinct and incompatible accounts of rights. According to natural law theory, natural rights are those rights that are part of the natural, given, moral structure of the universe, not unlike those other natural laws that govern the physical universe (i.e., the law of gravity, the law of constant motion, etc.). As natural rights, civil rights are those that are justified by appeal to the moral structure of the universe rather than to any given political system. What makes civil rights important, on this view, is their relation to this higher moral order. A society is well-ordered when its members enjoy all the rights that inhere in this natural, moral order. Natural rights are also often referred to today as human rights—those rights that all humans are entitled to by virtue of our common human nature. In this sense, civil rights and human rights overlap considerably.

On the other hand, according to positive law theory, rights are granted by a given political system or regime and are justified only by reference to the values and principles espoused by that regime. In this sense, the sort of civil rights one has will depend on one's government. For example, civil rights, understood in this way, may include the right to park in your driveway or the right to vote for judicial officers in your district. However, living in a district that does not appoint justices by popular vote means that no such right exists in that district for those citizens. In this theoretical framework, civil rights may refer to rights as diverse as the natural human right against torture or to the positive right to drive a car in California.

A further important theoretical distinction, which relates to the discussion of civil rights, is the distinction between negative rights and positive rights. Here, the sense of positive rights is slightly different from that found in positive law theory. Here, positive and negative are defined in opposition to one another. A negative right is typically the sort of right that imposes duties of noninterference or nondiscrimination on others. An example of a negative right may be the right to vote, where the right prohibits interference with the exercise or enjoyment of the right. If someone bars a voter from the polling station, or uses their public power to remove an eligible voter from the polling lists, then this amounts to interference with the right to vote and would be considered a violation of that right.

A positive right, on the other hand, is the sort of right that imposes duties of provision on others. Such a duty may be placed on individuals in a position to provide what the right requires or it may be addressed collectively by vesting the duty to provide in government. For example, a child may have a right to be fed, which imposes a duty to provide suitable food for the child. Typically, this duty falls on the child's parent, but it may fall on the society as a whole or on some appropriate social or governmental institution when the parent is unable or unwilling to comply. Another example of a positive right is the right to a minimum level of education; where this exists, it typically imposes a duty on the society as a whole, through the government, to provide either the education directly (as in a system of publicly funded schools) or at least the means to acquire such education (as in a system of grants or loan guarantees to attend various private schools). Civil rights may be of both sorts—negative and positive.

Regulating Relationships

Civil rights play a central role in regulating the relationship among individuals, government, and various social institutions. The concept of civil rights has two distinct, yet interrelated, meanings: (i) rights of citizens to liberty, property, and well-being as members of a particular civil society; (ii) rights as specific legal protections against discrimination, typically on the basis of race or sex, which are legislative or judicial in origin and serve to correct past inequities both in the distribution of educational and employment opportunities and in access to various social or public goods.

For both senses of civil rights, the principal challenge rests in identifying the nature of the right at issue and in finding the proper remedy for its violation. For example, the U.S. Declaration of Independence of 1776 clearly identified the rights at issue—every citizen enjoys the right of political representation. The failure of the British government to respect this right, by levying taxes and denying voting rights to the American colonists, is remediable by wresting governmental authority from Britain and establishing an independent government.

Another example of how this challenge has been met is found in the Civil Rights Act of 1964, which clarified the rights to nondiscrimination and equal protection first articulated in the Thirteenth, Fourteenth, and Fifteenth Amendments to the U.S. Constitution. The Civil Rights Act of 1964 restated and affirmed that the worst impediment to racial equality is continued failure to act affirmatively against pervasive patterns of racial discrimination. The remedy, for the violation of the constitutional rights, is identified in the act as affirmative action that ensures equal opportunity and access to important social goods such as employment and education.

Civil Rights as Civil Liberties

In its broadest meaning, civil rights refers to those moral guarantees accorded to members of a civil society to ensure equality, liberty, and fairness. These values are, according to many political theorists, best achieved through constraints placed on governmental or state power.

Political theorists of the 17th and 18th centuries, most notably John Locke, proposed that the basis for governmental legitimacy is the consent of the people. The only rational basis for the people to consent to government, he argued, is to protect their natural interests in life, liberty, and property. Individuals' rational interest in securing their life, liberty, and property would serve as the legitimating basis for governmental authority and would justify civil rights—the rights that all individuals possess as members of a civil society. Civil society, then, is best when it retains all the positive attributes of the natural human condition, without any of its dangers, namely conflict and strife.

Civil rights, however, were never limited merely to the regulation of state power. Rather, they have always had a prominent place in the regulation of power between individuals. On this view, a legitimate government is one that can protect each individual in the enjoyment of her or his liberties, natural ability, and property from all those other individuals with whom she or he lives in society. This requirement for state action, however, empowers the government to act against individuals who would violate the civil rights of others. The challenge for government is to do so without itself becoming a threat to those very same rights to life, liberty, and property.

Civil rights, in this broad sense, may include rights of individuals to their property and other broadly economic rights, such as the right to contract, to apply for work, and to minimal subsistence, as through social security; rights to security of the person, to security and protection from violence and harms of various preventable sorts, which may include, in some contexts, the right to medical or health services; rights of political participation and representation, including voting for and holding public office; rights to secure various important liberties, such as liberty of conscience, religion, speech, assembly, petition, and privacy; and rights that ensure that these liberties are not arbitrarily alienated or abrogated.

While we may be most familiar with the civil rights encoded in the U.S. Bill of Rights, this should not be taken to mean that civil rights are not important in other historical, political, and legal contexts. In the language of human rights, civil (and political) rights are understood as first-generation human rights—those that flourished under the European Enlightenment and those that came to define the core of liberal democratic government, as ensuring against the abuse of the coercive powers of the state.

Indeed, by presenting such rights as the basis for legitimate government, civil rights serve as the standard by which governmental action may be understood as abusive, arbitrary, or oppressive. The degree to which a government ensures the civil rights of its subjects is the degree to which that government wields its authority, especially its coercive powers, legitimately. The degree to which it fails to do so is the degree to which its authority is illegitimate and, so, properly resisted. As such, many emerging democracies and developing nations are seeing substantial improvements in the recognition and protection of the civil rights of their own citizens and, thus, the civil rights of peoples around the globe.

This broadly moral sense of civil rights is found most clearly expressed in historic documents such as the U.S. Declaration of Independence, the French 1789 Declaration of the Rights of Man and Citizen, and the 1948 Universal Declaration of Human Rights.

Civil Rights as Legal Nondiscrimination and Equality Rights

In its more specific and narrow sense, civil rights refers to the various legal guarantees to equality before the law; due process; and nondiscrimination on the basis of race, sex, ability, age, national origin, religion, and, increasingly, sexual orientation. This sense of civil rights finds its legal roots in a variety of U.S. Civil War–era constitutional amendments and in several key post–World War II judicial and legislative actions.

While civil rights law varies from country to country, from historical period to historical period, and from domestic to international law, the development of civil rights norms and practices owes much to their manifestation in U.S. constitutional law. Examples of the influence of U.S. civil rights law in international law are found in the inclusion of strict due process and nondiscrimination rights in the Universal Declaration of Human Rights, the Convention on the Elimination of All Forms of Discrimination Against Women, and significant portions of the European Declaration of Human Rights. Hence, the remainder of this entry will take, as its primary focus, the development of civil rights law and policy in the U.S. context, with the understanding that this is not exhaustive of the variety and meaning civil rights may have in other national, international, and historical contexts.

History

The period from 1865 to 1875 saw the adoption of several substantive legal correctives to the United States' history of race-based slavery. Two Civil Rights Acts, the first in 1866, followed by the second in 1875, bracket three constitutional amendments whose legal legacy has shaped modern civil rights law. The Thirteenth Amendment of 1865 made slavery and involuntary servitude illegal, except as punishment. Later, this amendment would be interpreted to prohibit the legal continuation of any badges of slavery or markers of past slave status, such as the segregation of public facilities, the denial of economic opportunities or public services, or the enforced segregation of schools in the 1954 *Brown v. Board of Education*. The Fourteenth Amendment of 1868 undid the legal effects of the Dred Scott case, *Scott v. Sandford*, by affirming citizenship for everyone born or naturalized in the United States. It also forbade state governments from depriving any U.S. citizen of life, liberty, or property without the due process of law and guaranteed the equal protection of law to all citizens. These two guarantees—to due process and to equal protection—would find their greatest legal effect 90 years later under the Warren Court's emphasis on civil rights and liberties. The Fifteenth Amendment of 1870 affirmed the right to vote for all citizens and denied state governments the power to deprive this right on the basis of race, color, or previous condition of servitude.

Taken together, these three amendments to the Constitution served as a formal legal corrective to the legacy of slavery in the United States, especially to its legacy of racial discrimination in all aspects of social, economic, political, and personal life—in short, in all regards in which an individual may participate in civil society. These amendments are viewed by some legal scholars as having finally completed the U.S. Constitution's promise of the Enlightenment liberal ideal of equality, freedom, and individual autonomy. These amendments, it is argued, formally extended this ideal to African Americans. These Enlightenment ideals would be further extended to women in 1920, with the adoption of the Nineteenth Amendment's guarantee of women's voting rights, and to the poor in 1964, with the adoption of the Twenty-Fourth Amendment's prohibition on poll taxes and on denials of voting rights for failure to pay taxes. With the adoption of the Americans with Disabilities Act in 1990, these rights would finally be extended to prohibit discrimination against citizens with disabilities to access employment and educational opportunities, criminal justice, and health and human services.

This combination of amendments significantly shaped modern U.S. civil rights law and contemporary understandings of the rights of citizenship. Most significant is the linkage of the legal concepts of due process and equal protection to the elimination of racial discrimination. However, it is important to note that these amendments were no guarantee that equality between the races materialized or that the effects of discrimination were remedied in practice. Indeed, throughout the 19th century and early 20th century, the U.S. Supreme Court impeded various attempts by Congress to enact civil rights legislation (see, e.g., the 1883 *Civil Rights Cases*). These amendments also failed to discourage the Supreme Court from affirming the separate but equal doctrine that legalized and legitimized the policies and practices of Jim Crow segregation (see *Plessy v. Ferguson*). Nor did these amendments discourage the courts from affirming the federal government's policy of interning resident Japanese and Japanese Americans during World War II.

Contemporary U.S. Civil Rights Norms

Not until the mid-20th century, notably with the U.S. Supreme Court's reversal of its prior affirmation of the separate but equal doctrine in *Brown v. Board of Education*, did the era of civil rights—understood primarily through the lens of due process and equal protection—find its legal footing. The period from the 1950s onward would witness an era of legal advances in all aspects of civil rights, mainly through concerted efforts on the part of the courts and Congress. Congress passed Civil Rights Acts in 1964, 1966, 1968, and 1991, which elaborated and clarified important liberties such as equality of opportunity in education and employment, individual privacy, religious freedom, and general nondiscrimination. Guarantees were made, without regard to race, sex, poverty, or religious faith, to due process in the courts and to equal opportunity to access a wide variety of social goods, especially education and employment.

By specifying the necessity for remedial action against pervasive racial discrimination, the Civil Rights Act of 1964 brought into legal parlance the concept of "affirmative action." This act mandated that effective elimination of practices of race and sex discrimination required affirmative action. Affirmative action has at least two competing and, some have argued, incompatible meanings: (1) that positive steps be taken to ensure that decisions awarding employment or educational opportunities, or permitting the enjoyment of various social goods, shall be made without preference at all for any race or sex categories; (2) that positive steps shall be taken to ensure that, all things being equal, preference in decisions awarding employment or educational opportunities, or permitting the enjoyment of various social goods, shall be given to those persons who are members of a minority race or women.

The difference between these two meanings and their effect on contemporary civil rights law is considerable. The first sense of affirmative action is most often referred to as ensuring a formal equality between the races. Formal equality prohibits the use of explicitly or intentionally racist (or sexist) policies, procedures, and criteria in the allocation of social goods such as education and employment opportunities, access to criminal justice, housing, health care, and access to public facilities. In the case of formal equality, the legal emphasis is on prohibiting intentional, individual discriminatory practices and procedures. Formal equality ensures that the policies, procedures, and criteria used to allocate social goods must not themselves employ race-based criteria. For example, a hiring policy that specifies that employees must be white constitutes a violation of formal equality. Similarly, a policy of awarding higher scores to racial minorities on college entry applications violates formal equality requirements. However, where discrimination is unintentional, systemic, or institutionalized, reliance on formal equality may allow such discrimination to go unaddressed and uncorrected, since it fails to recognize this as discriminatory in the legally relevant sense.

The second sense of affirmative action shifts the legal focus from formal equality to substantive equality. Attention is drawn to the effects of policies, procedures, and criteria on the equal status of individuals. Substantive equality is concerned with the exclusionary and discriminatory effect of otherwise racially or sexually neutral procedures, policies, and criteria. Substantive equality draws attention to the effects of formally neutral policies and procedures as they function in a social context that carries the historical residue of race and sex inequality. Where the starting point for the existing distribution of important social goods is not itself equal between men and women or between the races, application of formally neutral policies and procedures risks exacerbating those inequalities. For example, a hiring requirement that police officers must be at least 6 feet tall would effectively exclude the majority of women from becoming police officers. Such policy, while not restricting applicants to males only, in its effect works in the same manner to ensure that police officers are largely, if not exclusively, men. Similarly, college recruitment policies, which are formally neutral between races but which rely heavily on alumni and provide only few and meager need-based scholarships, may effectively deny access to educational opportunities for students who are members of a minority race.

It is important to add that the distinction between formal and substantive equality is not limited to affirmative action. Rather, this distinction arises with regard to all areas of civil rights law: in criminal justice law and procedure, in voting rights law and policy, and with regard to almost every area of civil rights law as it has been developed thus far. The challenge in identifying appropriate remedies to civil rights violations lies in distinguishing between these two seemingly incompatible objectives—formal equality or substantive equality. How should the demands of equality, fairness, and liberty be understood? This is itself a moral question and demands that we consider not only what the law requires as it is currently formulated but also what alternatives are possible. Answering this question will shape much of the future of civil rights law.

Future of Civil Rights and Social Change

In the history of civil rights law, the meaning, definition, and effect of civil rights have depended on changes in social will. Sometimes the courts and legislatures have led social opinion with society following; sometimes social opinion and the desire for change have led legislative and judicial action. The law is never sufficient on its own to guarantee much to any individual. What is always necessary is social will. Perhaps more than other rights, the recognition and enforcement of civil rights have relied on social will because they are so intimately bound to personal, professional, and public relationships among individuals. These are the relationships that give normative shape to our everyday lives, whether at work, in school, or at leisure. Social will and how it changes remains central to the civil rights project.

Some legal scholars have noted that the success of the civil rights cases in the mid-1900s, as compared with those in the late 1800s and early 1900s, rests primarily with changing social opinion about the fairness of the separate but equal doctrine. This changing social opinion reflects a change in people's willingness to carry out legislative and judicial directives in their everyday lives and in the norms they adopt to regulate their behavior toward one another. While this phenomenon is not unique to civil rights law, it is most palpably felt when people apply for work, seek promotion, or apply for university education, as well as in more mundane activities such as making hotel reservations or dining at restaurants. Not long ago in the United States, it was common for African Americans to be denied a table at restaurants, for Chinese Americans to be denied promotion at a job, and for a woman only to be paid as a supplement to her assumed husband's salary. Today, these behaviors are unthinkable. When they do appear, they are not only now violations of federal and state law but they are also viewed as morally corrupt and as socially repugnant. The law and social opinion are intimately connected in the meaning and practice of civil rights.

Consider also the increasingly common practice of employers to adopt policies of nondiscrimination on the basis of sexual orientation (currently, 80% of Fortune 500 companies are reported to have such policies). While some states require that nondiscrimination policies cover sexual orientation, there currently is no federal legal requirement for employers to do this, since federal civil rights law does not extend this far. However, extending civil rights guarantees in this direction seems to make good business sense. Many employers note that employees are more reliable, dedicated, and committed to their jobs when their equality is respected in a nondiscriminatory workplace.

With regard to sexual orientation and equality, businesses are at the forefront, ahead of most of the courts and state and federal legislatures. They may even be leading the majority of the population who may not yet be committed to extending, and thereby guaranteeing, civil rights to gays and lesbians. However, at the very least, the quest for competitive advantage in hiring may mean that ever more employers will voluntarily extend their policies and practices of nondiscrimination to include sexual orientation. Guarantees of civil liberties and enforcement of civil rights are as much a matter of social recognition and affirmation as legal recognition and affirmation. The lead, which major corporations have taken on the voluntary extension of civil rights to gays and lesbians, may make it easier for legislatures and the judiciary to affirm the extension of civil rights law to include nondiscrimination on the basis of sexual orientation.

The future of civil rights, therefore, is not merely about what meaning we give to equality, fairness, and liberty but will also require that we revisit the question "Civil rights for whom?" as we attempt to achieve the Enlightenment ideal of civil rights for everyone.

Clarkson Principles for Business

The Clarkson principles for business are a set of standards intended to guide the decisions and actions of corporate executives and managers. Recognizing that business leaders exercise significant discretion in their roles as corporate agents, the principles seek to create an ethical context for the exercise of managerial authority. They do so by identifying a core set of moral obligations that are incumbent on managers at all levels of the enterprise. These duties address relations with stakeholders, that is, groups and individuals who are affected, positively or negatively, by corporate decisions and operations (e.g., customers, employees, investors, and communities). In brief, the core obligations include engaging proactively in dialogue with stakeholders; disclosing risks stemming from corporate activities; distributing fairly the benefits and burdens that result from business operations; preventing, minimizing, or redressing harm to stakeholders; avoiding activities that entail unacceptable risks; and addressing openly and appropriately conflicts between managers' self-interest and the interests of stakeholders.

The principles are named after the late Max B. E. Clarkson. Clarkson, a management theorist and former corporate executive, significantly influenced the principles' content, as well as the multiyear, multinational project that gave rise to them. Named Redefining the Corporation Project, this collaborative endeavor was undertaken between 1995 and 2001 by an international group of more than 100 scholars. It sought to improve the quality and quantity of managerial and scholarly attention devoted to the nature, purpose, and governance of the corporation, emphasizing a stakeholder view of the firm. Funded by the Alfred P. Sloan Foundation and hosted by the University of Toronto, the project produced five major publications. Clarkson, Lee E. Preston, Thomas Donaldson, and Leonard J. Brooks served as the effort's leaders and developed the principles for business from participants' comments and suggestions.

The text of the Clarkson principles is contained within a statement titled *Principles of Stakeholder Management*. The statement opens with a section devoted to introductory definitions and observations. These comments acknowledge the prominent role large, professionally managed corporations play in the contemporary global economy, as well as criticisms of these organizations. They introduce the stakeholder concept, noting that all stakeholders have something at risk because of corporate activities but that the nature of this risk varies from group to group. Shareholders, it is suggested, are distinguished by the fact that risk is *inherent* to their contractual relationship with the corporation: Whether their investment yields a profit or loss ultimately depends on what remains after all other stakeholder claims have been satisfied. The introductory comments also underscore the need for managers to act transparently and fairly in their dealings with all stakeholders.

The document's second section contains the principles proper. Each of the seven proposed norms is followed by a short explanation. Principle 1 emphasizes managers' responsibility to identify stakeholder groups, actively monitor their concerns, and incorporate these interests appropriately into organizational decisions. Principle 2 directs managers to listen to stakeholders and notify them of any risks that may arise from their association with the firm. Principle 3 urges managers to address stakeholder concerns in a manner that duly considers their differing capacities to understand and evaluate information. Principle 4 calls on managers to recognize stakeholder interdependence and to distribute burdens and rewards fairly among them, given the risks to which the various groups are subject. Principle 5 requires managers to minimize the risks and harms that result from corporate operations. It counsels that partnerships with private organizations and public agencies may be needed to prevent harm or to compensate negatively affected parties. Principle 6 underscores that some corporate activities may entail risks or consequences that are patently unacceptable, for example, loss of life or the impairment of human rights. Managers are called on to modify operations, whether planned or existent, to avoid such possibilities. If this goal cannot be achieved, the operation should be abandoned. Principle 7 requires managers to recognize that they themselves constitute a distinctive stakeholder group. Since their self-interest may conflict with the duties they owe to other stakeholders, managers should welcome and encourage monitoring and oversight. Assiduously implemented, such reporting and review processes help build and sustain managerial credibility.

Complying with these norms, the principles' authors imply, enables managers to address stakeholder interests *ethically* and not merely *strategically*, that is, with an eye only toward how these interests might impede or advance the firm's attainment of its financial or competitive goals. The authors suggest that compliance also leads to trust-based relationships and to enhanced collaboration with stakeholders, two factors that ultimately redound to organizational survival and success.

Like other general standards for corporate conduct, the Clarkson principles provide business leaders with a broad aspirational model—in this case, one that helps managers identify their responsibilities to groups that stand to gain or lose as a result of a firm's activities. The principles also encourage managers to place their professional duties within a broader social context, promoting greater awareness of the diverse constituencies they serve. Considered in their entirety, the principles steer managers toward stakeholder engagements that are responsive, transparent, and respectful. In a sense, then, the Clarkson principles call on managers to deal with stakeholders in light of a quite basic ethical standard, the golden rule, and suggest a set of concrete behaviors that can help them begin to put this standard into practice.

Coalition for Environmentally Responsible Economies (CERES)

Formed in 1989, the Coalition for Environmentally Responsible Economies (CERES) brought together

15 major U.S. environmental groups and a wide array of socially responsible investors and public pension funds. A set of goals and principles for environmental performance was developed by this alliance between business, consumer groups, environmentalists, and other stakeholders. The coalition emerged after the *Exxon Valdez* oil spill, which was not the largest in history but proved to be one of the worst in terms of adverse media coverage, disruption to local business and industry, and long-term environmental damage. However, several positive changes occurred in corporate accountability, shipboard responsibility, environmental cleanup procedures, and environmental awareness and reporting. Among the most significant of these was the development of CERES and its core principles.

The 10 CERES principles include (1) protection of the biosphere, (2) sustainable use of natural resources, (3) reduction and disposal of wastes, (4) energy conservation, (5) risk reduction, (6) safe products and services, (7) environmental restoration, (8) informing the public, (9) management commitment, and (10) audits and reports. All organizations that choose to become members of CERES must adhere to these 10 principles. By adopting the principles, member organizations acknowledge that they have a responsibility to the environment and that they must not jeopardize future generations to sustain themselves in the short run.

Today, more than 80 organizations stand behind the CERES principles. These firms include labor unions, environmental groups, public interest organizations, and investors. The coalition of investors is critical, as these firms explicitly consider environmental criteria in investment decisions. In addition, CERES partners with more than 70 corporations that have a significant commitment to the principles.

Over the years, the coalition has promoted greater corporate responsibility toward the environment and taken a leadership role in standardizing environmental reporting by organizations. CERES was founded with the belief that businesses should take a proactive stance on environmental issues, because their influence over human decisions and behaviors often surpasses that of governments, schools, or religious organizations. To control and provide accountability for environmental performance, however, companies need effective measurement and communication tools. This need brought about initiatives to establish benchmarks for environmental performance and to provide an easier way to report information about environmental performance.

In 1997, CERES launched the Global Reporting Initiative (GRI), which was designed to stimulate change for the companies by allowing them to track their progress and performance among competitors and peers who also adhere to high standards. Although both regulatory and nonregulatory factors are driving enhanced environmental reporting, there is no universally accepted method for reporting and comparison. Each year, more companies voluntarily report information about their environmental performance to the public, but firms may employ different formats, rendering comparison among reports somewhat problematic. These discrepancies in and issues with environmental reporting have generated calls for standardizing and verifying reports. CERES provides such a standard, but there are many different stakeholders in the environmental reporting process. More than 700 companies use the GRI guidelines, which means it has become the de facto international standard for corporate reporting on economic, social, and environmental performance.

Coase, Ronald H. (1910–)

Ronald Henry Coase is a University of Chicago economist who was awarded the 1991 Nobel Prize in Economic Sciences. The prize recognizes Coase's path-breaking work examining the institutional arrangements that govern the process of market exchange. In the citation accompanying his Nobel Prize, the Royal Swedish Academy specifically noted two journal articles that exemplified Coase's Nobel Prize–winning work.

The 1937 article "The Nature of the Firm" addressed the question of why firms exist in a market economy. Coase likened a firm to a little planned society that relies on administrative decisions to internally coordinate production, as opposed to relying on the invisible hand of the external price system. Coase argued that firms exist to mitigate transaction costs, defined as the costs of managing market transactions such as negotiating and enforcing contracts. Coase argued that in a world with positive transaction costs, there would be an efficient mix of production coordinated through a market-driven price system and production coordinated administratively within firms. By explicitly introducing transaction costs into his analysis, Coase was able to explain not only the existence of firms but also the scope of activities coordinated within firms.

The 1960 article "The Problem of Social Cost" cited by the Royal Academy began as a critique of the traditional (i.e., Pigouvian) analysis of externalities defined as the divergence between private and social costs (and benefits). Traditional analysis suggests that government action (a tax or a subsidy) is necessary to induce economic agents to internalize the costs (or benefits) their actions impose on others. Coase exposed flaws in the traditional analysis by considering a regime of zero transaction costs. Under such a regime, Coase argued, market forces will efficiently allocate legal rights (e.g., the right to pollute vs. the right to breathe clean air) and, moreover, the efficient outcome will not depend on the initial assignment of legal rights. That is, even if legal rights are initially misallocated, this misallocation will be corrected by market forces. This argument became known as the "Coase theorem." Coase himself viewed the theorem as a stepping stone to his true interest, which was the analysis of a real-world economy with positive transaction costs. Under a regime of positive transaction costs, an initial misallocation of legal rights may persist, uncorrected by market forces. Coase's analysis suggests a government role in promoting the efficient allocation of legal rights through policies that help lower transaction costs and thereby help facilitate market exchange. These government actions include things such as writing clear laws and enforcing property rights. The insights from Coase's analysis became crucial in the development of the field of law and economics.

Coase was born and raised in England. He emigrated to the United States in 1951 to accept a position at the University of Buffalo. In 1958, he moved to the University of Virginia where he remained until moving to the University of Chicago in 1964, succeeding Aaron Director as editor of the *Journal of Law and Economics.*

Coase Theorem

The "Coase theorem" is a proposition concerning the economic theory of externalities. The proposition states that under a regime of zero transaction costs, market forces will efficiently allocate legal rights (e.g., the right to pollute vs. the right to breathe clean air) and, moreover, the efficient outcome will not depend on the initial assignment of legal rights. That is, even if legal rights are initially misallocated, this misallocation will be corrected by market forces. The proposition, although not the theorem name itself, was introduced by Ronald H. Coase in his 1959 article "The Federal Communications Commission" and elaborated on in his 1960 article "The Problem of Social Cost." The proposition acquired theorem status when the label was applied by economist George Stigler to summarize the thesis of Coase's work on externalities.

To appreciate the power of the Coase theorem, one needs to understand its motivation. Coase's point was to challenge the traditional analysis of externalities, defined as the divergence between private and social costs (and benefits). Traditional analysis suggests that government action (e.g., a tax or a subsidy) is necessary to induce economic agents to internalize the costs (or benefits) their actions impose on others. The absence of such taxes or subsidies, it was argued, would result in a suboptimal allocation of resources as economic agents would overproduce goods causing external harm and underproduce goods producing an external benefit. Coase's analysis exposed flaws in the traditional approach.

Zero Transaction Costs

Coase argued that traditional analysis is directed at solving the wrong problem with respect to externalities. Under the traditional approach, if a factory billowing fumes imposes damages on neighboring homeowners, the analysis is directed at how best to restrain the factory's fumes. Coase argued that the analysis is misdirected because any action aimed at avoiding harm to homeowners necessarily inflicts harm on the owners of the factory. The correct question, in Coase's view, is how to avoid the more serious harm.

Underlying Coase's argument is the view that, in terms of the cold logic of economic analysis, the cause of an externality cannot be attributable to any single party. In almost all cases, the externality is a joint product of decisions made by economic agents. For example, a factory billowing smoke may be a nuisance to the homeowners living downwind. Coase argued that, in the economist's view of causality, the externality would not exist without both the factory producing smoke and the homeowners desiring to breathe clean air. Coase observed that the economic analysis of an externality stands apart from the legal analysis of determining, based on a notion of fairness, who is a victim and who is liable for causing damages.

Coase argued that the notion of economic efficiency under the traditional approach was incomplete because it took for granted the outcome of the legal process. Coase argued that, within the limits of the traditional approach, an efficient solution is produced only if the party assigned liability happens to be the one who can avoid the problem at the lower cost. The approach is incomplete, in Coase's view, because it fails to account for the fact that in a smoothly operating market (i.e., one without transaction costs), economic agents are free to buy and sell rights. If the law assigns the right initially to the wrong person, the person to whom the right is of the most value can still buy it. The Coase theorem states this thesis.

Coase's Example

To illustrate his argument, Coase used an example of straying cattle damaging the crops growing on an adjoining property. When analyzed in the traditional way, the cattle raiser would be required to pay for all damage caused. Failing to require the cattle raiser to pay for damages would mean that the damage to crops would continue because the cattle raiser would have no incentive to prevent the damage. Coase analyzed the problem by comparing the outcome of two liability regimes. In the first regime, the cattle raiser is not liable for the damage to the farmer's crops. In the second regime, the cattle raiser is liable for the damage caused by his straying cattle. Coase showed that in a smoothly operating pricing system, defined as one without transaction costs, the cattle raiser and the farmer would come to a mutually beneficial bargain that would result in the same number of cattle raised and crops damaged under either liability regime.

Using Coase's example, assume that the cattle raiser faces no liability for damaging the farmer's crops. Further assume that adding an additional steer to the herd will result in $3 additional damage to the farmer's crops. If the gain to the cattle raiser of the additional steer is $2, then it is possible for a bargain to be struck that will make both parties better-off. The farmer would be willing to pay the cattle raiser up to $3 to forgo adding the additional steer to his herd, and the cattle raiser would be willing to comply for any amount greater than the $2 he would receive by adding the steer.

Now consider the outcome under a liability regime where the cattle raiser must pay for crops damaged by his herd. Under this liability regime, the cattle raiser would be willing to pay the farmer up to $2 for the right to add a steer to his herd. But the farmer would require at least $3 to agree to the deal. Under these circumstances, the cattle raiser would refrain from adding an additional steer to the herd—the same outcome as when the cattle raiser was not liable for damaged crops.

Coase used this simple example to illustrate that, in a world without transaction costs, the initial delimitation of legal rights does not have an effect on the efficiency with which the economic system operates.

Although the initial delimitation of rights is an essential prelude to market transactions, the optimal allocation of resources will not depend on this delimitation. No matter how rights are initially delimited, both parties will take into account the harmful effect (i.e., the nuisance) when deciding on their course of action. In a smoothly operating price system, the rearrangement of legal rights will be undertaken when an increase in the joint value of production results.

Positive Transaction Costs

Coase himself viewed the theorem as a stepping stone to his true interest, which was the analysis of a real-world economy with positive transaction costs. Under a regime of positive transaction costs, an initial misallocation of legal rights may persist, uncorrected by market forces. One arrangement of rights may bring about a greater value of production than any other. But unless this is the arrangement of rights established by the legal system, the costs of reaching the same result through the market may be so great that this optimal arrangement of rights, and the greater value of production that it would bring, may never be achieved.

Coase also observed that the traditional analysis of externalities led to the conclusion that the government ought to intervene to fix the problem. Coase's analysis suggests a possible role for government, but he showed that, for some problems, there is no legal rule or no form of regulation that will generate a fully efficient solution. Coase argued that direct governmental regulations will not necessarily give better results than leaving the problem to be solved by the market. Coase argued that all solutions have costs and that, in his view, there is no reason to suppose that governmental regulation is called for simply because the problem is not well-handled by the market.

However, Coase noted that on occasion governmental regulation could lead to an improvement in economic efficiency. For example, Coase argued that government intervention may be required when a large number of people are involved, such as with air pollution, and when the costs of handling the problem through market transactions may be high.

Coase's analysis suggests a government role in promoting the efficient allocation of legal rights through policies that help lower transaction costs and thereby help facilitate market exchange. These government actions include things such as writing clear laws and enforcing property rights. Coase's analysis suggests that transaction costs can be reduced when courts, legislatures, and government regulators consider defining property rights in a way that is "vendible," that is, rights that are defined in a way that facilitates market exchange in case the initial allocation of rights is inefficient.

The insights flowing from the Coase theorem has led to a major federal policy initiative to create tradable emission allowances for various types of greenhouse gas pollutants. The federal government allocates emission allowances and firms are permitted to trade these allowances. Firms, such as the Chicago Climate Exchange, have evolved to lower the transaction costs associated with trading these allowances. The result of trading directs the allowances to their highest valued use. Polluting firms can decide whether to devote resources to reducing emissions or buying allowances. Firms choosing to buy allowances must compete with other firms and clean air advocates to obtain the allowances. Clean air advocacy organizations have emerged to buy up and retire emission allowances. The end result is that the allowances are directed by market forces to their highest valued use.

The insights from the Coase theorem have also proved useful in analyzing disputes involving externalities, apart from pollution and other nuisances. For example, the theorem has yielded valuable insights in evaluating disputes involving financial contracts such as when a corporate restructuring, which benefits shareholders, leads to bondholder harm.

The Coase theorem has also been applied to cases involving positive externalities. For example, fruit growers benefit, in terms of higher productivity, when the bees of honey producers are located on their property. Consistent with the Coase theorem, contracts between beekeepers and farmers have been common practice for many years. When the crops were producing nectar and did not need pollenization, beekeepers paid farmers for permission to put their hives in the farmers' fields. When the crops were producing little nectar but needed pollenization, farmers paid beekeepers.

Influence and Criticisms of the Coase Theorem

The insights contained in the Coase theorem greatly influenced the way economists think of externalities. These insights have also caused legal scholars to think more carefully about how legal rights are defined and enforced. Legal scholars have applied the Coase theorem to determine what legal rules lead to the best outcome from the standpoint of economic efficiency. Because the Coase theorem combines thinking about legal rights and economic efficiency, it has been an important spur to the development of the interdisciplinary field of "law and economics."

The circumstances under which the Coase theorem applies have been widely debated by economists and legal scholars. The Coase theorem has never been formally proved or disproved, although it has been subjected to numerous theoretical, empirical, and experimental challenges in the law and economics literature. Medema and Zerbe survey the controversy and discussion surrounding the Coase theorem in an article published in 2000. Although still controversial, the Coase theorem has caused economists and legal scholars to refine their thinking about externalities and the proper role of government in addressing them.

Codes of Conduct, Ethical and Professional

Codes of conduct are statements of values, beliefs, standards, legal compliance, or organizational policy and procedures that are articulated to inform those governed by the codes or hold those affected by the codes accountable to this type of ethical behavior. Every professional association has created and promulgated a code of conduct for its members. There are more than 1,000 codes of ethical conduct developed by business organizations. Recent surveys of Fortune 500 companies report that more than 97% of all large multinational businesses have codes of conduct. Codes are understood as the primary means of institutionalizing ethics into the culture, religion, profession, learned societies, or business organizations. A Touche Ross national survey revealed that their respondents believed that codes are the most effective measure for encouraging ethical behavior at work.

Historically, the *Code of Hammurabi* contained almost 200 paragraphs of rules governing business, moral, and social life reaching back to the third millennium BCE. Other early codes included the Codes of UrNammu (ca. 2060–2043 BCE), the Code of Lipit-Ishtar (ca. 1983–1733 BCE), and the Code of Eshnunnia (ca. 1950 BCE). These codes were compilations of customs, laws, and rules of ancient Mesopotamia, going back to Sumerian times. The United National Universal Declaration of Human Rights (1948) is a contemporary counterpart to these early codes of conduct.

Corporate or Business Codes of Conduct

Nearly every large business organization today has a corporate code of business conduct. Many of these codes were developed in response to some legislative action. For example, in the United States, a plethora of activity manifesting itself in the development or revision of corporate codes followed the passage of the Foreign Corrupt Practices Act in 1977, the creation of the 1991 United States Corporate Sentencing Guidelines (which exonerated businesses to clearly state expected ethical behavior for their employees), and the Sarbanes-Oxley Act of 2002. In other instances, companies or entire industries responded to an ethics scandal by developing or rewriting codes of ethics, such as in the 1980s when the U.S. defense industry and the financial community on Wall Street were rocked with numerous discoveries of unethical behavior. Many non-U.S. businesses have developed codes of conduct so that their employees are in compliance with U.S. law when the company conducts business in the United States.

Types of Corporate Codes

The titles given to ethics policy statements are quite varied. Some are called codes of business conduct or guidelines for ethical behavior. Some companies have unique names for their codes, such as Johnson & Johnson's "Credo" or Hewlett-Packard's "The HP Way." In the 1970s, when many codes were first being developed, they were called corporate directives or administrative practices until the more common terms of *code of ethics*, *code of business conduct*, or similar terminology was adopted.

Max Clarkson and Michael Deck, scholars at the University of Toronto's School of Business, separated ethics policy statements into three categories—codes of conduct, codes of practice, and codes of ethics. Codes of conduct are statements of rules, indicating for the employees what expected or prohibitive behavior is. Often included in codes of conduct are penalties for code infractions, along with a discussion of numerous ethics topics: conflicts of interest, political contributions, the acceptance or offering of gifts and bribes, and so on. These codes intend to ensure a commonality of behavior among the organizational employees or to protect the firm from the likelihood of costly unethical employee behavior.

Next are codes of practice. These codes are interpretations and illustrations of corporate values and principles. These codes typically intend to empower the employee as an ethical decision maker. Rather than provide strict rules for compliance or avoidance, as indicated in codes of conduct, codes of practice identify for the employee "how we do things around here." A code of practice seeks to shape the expression of the corporation's stated values through the practice of its employees, using rules of thumb such as act and disclose or seek advice.

Finally, codes of ethics are statements of values and principles that define the purpose of the company. The intent is to generally define for the organization's employees various responsibilities to stakeholders. These statements also have been identified as corporate mission or constituency obligation statements. The popular Credo from Johnson & Johnson, mentioned earlier, would be considered a code of ethics according to Clarkson and Deck's designations.

Corporate codes are developed to highlight company philosophy or policy; to define employee rights and obligations; and/or to specify certain responsibilities, such as regarding the treatment of employees, the environment, or other company stakeholders. Most codes speak to the purpose, administration, and authority of the code; the nature of the company; employee issues; legal requirements; and civic responsibilities.

Content of Corporate Codes

Many codes cover specific topics to delineate for employees or other stakeholders what is expected of them. There is a growing trend to develop a code of conduct for the company's customers or suppliers. In the case of the company suppliers, these stakeholders are required to comply with the company's expectations of ethical standards or risk losing the business relationship.

Some of the more common topics covered in corporate codes include

- conflicts of interest;
- use of confidential information;
- use of company assets or property;
- sexual harassment;
- employment hiring, promotion, or termination;
- health and safety issues;
- proper reporting of company-incurred expenses, gifts, bribes, and entertainment expenses (especially for global businesses);
- accurate accounting and reporting practices;
- antitrust or other legal compliance issues;
- government contract relationships;
- environmental responsibility;
- intellectual property; and
- political campaign participation or involvement in public office.

Compliance with corporate codes does not have the force of law behind it because compliance with these codes is technically voluntary. However, in most corporate codes, there are sanction provisions that state that if an employee does not follow the rules established in the company's policy the employees could face disciplinary sanctions. These sanctions could include verbal reprisal, suspension, probation, demotion, transfer, or, in the most serious of cases, termination.

Code Drafters

Various business personnel have been entrusted with drafting the company's code of ethics. At times, senior management or the chief executive officer is involved in writing or suggesting content for the corporate code. Involvement by the highest level of management in the organization often signifies for employees the importance of the document and of behaving ethically.

If the code's purpose is primarily to ensure that employees are legally compliant with the law, then the company's general counsel (chief attorney) or staff primarily will be given the responsibility to draft the code. Sometimes the code is burdened by the legalese that accompanies having the legal department write the document.

Finally, the drafting of the company code could be entrusted with the human resources department because many of the important issues are governed by employment law, such as sexual harassment or equal employment.

Communication of Corporate Codes

One of the most important elements for an effective code of conduct is the communication of the document to all employees or other stakeholders governed by the policy. Some companies are negligent in developing frequent means of communicating the code, thus the policy is often filed in a drawer and forgotten. If the document is not a "living document," then it has little effect on the employees or other stakeholders of the company. However, most companies have developed active and extensive communication procedures to ensure that the code is known and followed.

Most companies provide new employees with the company code at an orientation training session or distribute the code to all employees acquired through a merger. Periodic dissemination of the code occurs in some firms annually or after a breach of the code. Rarely is the code circulated more often than annually, but some companies supplement the distribution of the code with a requirement that employees, typically managers, sign-off on a document that attests that the manager has read the code and has reported any violations of the code to the proper company authority. Companies with global operations might translate the company's code into many different languages so that their employees, customers, or suppliers can read the code in their native language.

In nearly all cases, companies distribute their code to all their employees. There is a growing trend to make the code publicly available and to distribute the code to various company stakeholders, such as customers, suppliers, and investors. The posting of the code of ethics to the company's Web site also is increasing as a practice for communicating the ethical standards held by the company.

International Business Codes of Conduct

Attempts to develop international business codes of conduct have been undertaken by various international governmental bodies with minimal success, such as the

- International Chamber of Commerce (1972),
- Organisation for Economic Co-operation and Development (1976),
- International Labour Organization (1984),
- European Social Charter (1996),
- Code of Conduct for European Multinationals (1998), and
- United Nations Global Compact (2000).

Some specialized United Nations agencies have achieved success on industry-specific issues, such as the World Health Organization's code on pharmaceuticals and tobacco. The International Monetary Fund and the World Bank have codified specific industry practices between nations.

Despite these efforts, most international government or nonprofit organizations have had limited successes in developing codes of conduct. Conflicts in ideology—finding common values or practice—and special interests—protecting economic advantages or political influence—often plague these efforts. International efforts also are thwarted by the lack of an international governing body or the ability to prosecute violators of the code.

One organization, comprising Asian, European, and North America business organizations, has drafted an international code of ethics. The Caux Roundtable's code emphasizes two fundamental ethical principles—*kyosei*, working for the common good, and a respect for human rights. While a promising start, this organization, like their predecessors noted above, is finding it difficult to promulgate their code because there is no enforcement body to ensure that the code is being followed or to punish those that violate the international business standard.

Professional Codes of Conduct

As noted earlier, every professional organization has a code of conduct. By definition, a professional organization drafts and enforces expected ethical behavior of its members and typically will banish members from the professional association for gross violations of the association's code.

A professional code, like most corporate codes, provides standards of practice by describing what is expected or prohibited practice by association members. These stipulations do not apply to everyone, just those who are members or seek to be members of the association. For example, in a business organization not all employees are governed by the American Institute for Certified Public Accountants, just those employees who also are certified public accountants (CPAs) in good standing with the association. In some organizations, there may be multiple professional codes governing individuals' activities, such as at a health care facility where doctors and nurses have different professional codes of conduct.

Professionals, through their codes, set a "higher standard" for their members. Professions are more demanding in the conduct of their professional members. This establishes a clear distinction between what is professionally expected and legally compliant. Professionals are often asked to go beyond the law in their behavior and how they treat those they serve. Professional codes often entrust the individual association member to seek the higher purpose or act without compromise to certain ethical principles, such as honesty, integrity, and justice.

In instances where there is a conflict between professional ethical expectations and workplace practice, members of the profession know that the professional standard is the higher and expected rule. For example, in the accounting field, CPAs are often pressured to recommend additional and costly consulting services for their clients to bolster revenues for their companies. But this practice is contrary to their professional standards detailing a responsibility to their clients and acting on behalf of society and now is prohibited by the Sarbanes-Oxley Act.

What Constitutes a Profession?

The service provided by a profession must be of any morally permissible sort from which its practitioners can earn a living. Most professions are a collection of relatively well-educated occupations, such as physicians, nurses, engineers, educators, CPAs, and so on. Members of a profession believe that there is some benefit to belonging to the professional association and being in compliance with the profession's code of conduct. Sometimes, a profession provides collective bargaining strength to acquire better wages or working conditions, as seen with teachers or nurses. Professions might also organize around a sense of prestige or reputation, such as physicians, attorneys, or CPAs, who serve society in a special way through their work. Whatever the reason, the profession possesses a code of conduct to govern its members and to serve society in a special or highly ethical manner.

Examples of Professional Codes of Conduct

One of the more well-known professional codes is the physicians' Hippocratic Oath. This is an oath sworn by all medical doctors where they attest: I swear by Apollo Physician and Asclepius and Hygieia and Panaceia and all the gods and goddesses, making them my witnesses, that I will fulfill according to my ability and judgment this oath and this covenant.

Similarly, there are codes of conduct for lawyers, who belong to the American Bar Association (ABA). Until 1983, lawyers ascribed to the ABA Model Code of Professional Responsibility and since 1983 there is the Model Rules of Professional Conduct. In addition to the federal professional standards, each state has adopted its own—Pledge of Professionalism (Alabama), Ideals and Goals of Professionalism (Florida), Code of Civility (Maryland), and Working Rules for Professionalism (Pennsylvania), among others.

Engineers, as members of the National Society for Professional Engineers (NSPE), commit to the NSPE Code of Ethics for Engineers. The code's preamble states,

> Engineering is an important and learned profession. The members of the profession recognize that their work has a direct and vital impact on the quality of life for all people. Accordingly, the services provided by engineers require honesty, impartiality, fairness, and equity, and must be dedicated to the protection of the public health, safety, and welfare. In the practice of their profession, engineers must perform under a standard of professional behavior which requires adherence to the highest principles of ethical conduct on behalf of the public, clients, employers, and the profession.

Nurses take the Florence Nightingale Pledge and are guided by a number of professional associations and their codes of ethics. The American Nurses Association states that their Code of Ethics for Nurses has three purposes:

1. It is a succinct statement of the ethical obligations and duties of every individual who enters the nursing profession.
2. It is the profession's nonnegotiable ethical standard.
3. It is an expression of nursing's own understanding of its commitment to society.

University and college professors who belong to the Academy of Management have developed a code of ethical conduct to govern their professional activities. In the Academy of Management's code, five responsibilities are delineated to their students, to managerial knowledge, to the Academy of Management association, to practicing managers, and to all people they work with in the world community.

Codes exist for public sector employees, such as the U.S. Code for Federal Civil Servants, as well as codes for city managers, the International City Managers Association Code of Ethics with Guidelines, and public administration officials, the American Society for Public Administration Code of Ethics.

Within business, some function-area professions have developed their own code of conduct. The American Institute for Certified Public Accountants (AICPA) has a Code of Professional Conduct. The AICPA code consists of two sections—the Principles and the Rules. The Principles provide the framework for the Rules, which govern the performance of professional services by members. The Code of Professional Conduct was adopted by the membership to provide guidance and rules to all members—those in public practice, in industry, in government, and in education—in the performance of their professional responsibilities.

For managers practicing in finance, some belong to the Association for Investment Management and Research (AIMR) and are governed by the AIMR's Code of Ethics and Standards of Professional Conduct. The Code states that members of the profession will

- act with integrity, competence, dignity, and in an ethical manner when dealing with the public, clients, prospects, employers, employees, and fellow members;
- practice and encourage others to practice in a professional and ethical manner that will reflect credit on members and their profession;
- strive to maintain and improve their competence and the competence of others in the profession; and
- use reasonable care and exercise independent professional judgment.

In the marketing field, there is the American Marketing Association's Code of Ethics. In this professional code, the members pledge their commitment to ethical professional conduct. This conduct focuses on various responsibilities, the practice of honesty and fairness in their actions, respecting the rights and duties of parties whom they affect, and adherence to numerous organizational responsibilities.

In the ethically volatile information systems domain, the Association for Computing Machinery (ACM) has developed a Code of Ethics and Professional Conduct. This code consists of 24 imperatives formulated as statements of personal responsibility. It contains examples of many of the issues professionals in the field might likely encounter in their performance of their technical duties. The general expectations for ACM members include the following:

- Contribute to society and human well-being
- Avoid harm to others
- Be honest and trustworthy
- Be fair and take action not to discriminate
- Honor property rights, including copyrights and patents
- Give proper credit for intellectual property
- Respect the privacy of others
- Honor confidentiality

All professional associations and many business organizations have codes of conduct to guide their members or employees and to protect the organization from wrongdoing. In general, these statements are important guides to behavior, but their effectiveness depends on the professionals and employees being aware of and adhering to these codes.

COERCION

To be coerced is to be forced to act against one's will. Coercers are unable to use rational persuasion to convince victims of coercion into performing a specified action and so resort to physical force and threats. Coercion is widely understood to undermine individual freedom, and because of this, its use requires justification. Coercion is relevant to the conduct of business in several ways. For example, coerced contractual agreements are typically regarded as invalid both in ethics and in law. But to determine whether or not coercion has taken place, one must first determine what constitutes coercion.

The Nature of Coercion

To know whether or not a person's freedom has been undermined by coercion, it is first necessary to understand the nature of coercion. Coercion may be usefully divided into two categories—physical coercion and psychological coercion. Physical coercion occurs when one's bodily movements are physically forced. In cases where one person physically coerces another person, the victim's body is used as an object or instrument for the purpose of fulfilling the coercer's desires. Physical coercion does occur in business. For example, a factory worker may be physically compelled to remain at work until a quota is met. Nazi Germany used physical coercion to force laborers to work in wartime factories. In Alabama, as recently as 1928, African American men were taken from city streets and brought to mines where they were physically coerced into mining coal for large mining companies. And in workplaces throughout the world, women employees continue to be physically coerced by coworkers, or managers, into complying with sexual demands.

Unlike cases of physical coercion, psychological coercion involves the threat of violence or of some other form of harm such as economic harm. But what, precisely, constitutes coercion? Is someone who must choose between a bad, poorly paid job and no job at all coerced? To answer this question, it is necessary to have a proper understanding of the nature of psychological coercion. Philosophers have produced a substantial literature that seeks to clarify this matter. Two principal views have emerged in the literature—the moralized view of psychological coercion and the empirical view of psychological coercion. The moralized view maintains that the truth conditions of coercion claims rest on prior moral claims. According to this view, we cannot determine whether one person has coerced another person into performing a specified action without first determining whether the alleged coercer has a right to make the supposedly coercive proposal and whether the recipient of the threat has an obligation to resist that proposal. The empirical view maintains that the truth conditions of coercion claims are empirical. According to this view, we cannot determine whether one person has coerced another person without first determining whether the alleged victim is under significant psychological duress, whether the alleged victim is capable of resisting the coercer, or some other fact pertaining to the situation.

The moralized view of coercion is flawed and should be rejected for at least two reasons. First, proponents of the moralized view acknowledge that appeals to rights and obligations assume prior moral judgments. However, such judgments are of little use for adjudicating claims between individuals who disagree over those judgments or the substantive moral claims that support them. What is needed is a morally neutral account of coercion. Second, the moralized view is unable to account for the prima facie wrongness of coercion. Coercion is prima facie harmful because it undermines individual freedom. This judgment is based on a strong moral presumption against the forced restriction of individual freedom. One centrally important task of any adequate theory of coercion is to explain how coercion undermines individual freedom. To analyze coercion primarily in terms of rights and obligations, or other moral considerations such as utility maximization, does not adequately highlight the fact that coercion constrains individual freedom and undermines individual autonomy. For these reasons, it is necessary to provide an empirical rather than a moralized account of coercion.

Denis Arnold provides one plausible account of coercion. According to Arnold, for coercion to take place three conditions must hold. First, the coercer must have a desire about the will of his or her victim. However, this is a desire of a particular kind because it can only be fulfilled through the will of another person. Second, the coercer must have an effective desire to compel his or her victim to act in a manner that makes efficacious the coercer's other-regarding desire. The distinction between an other-regarding desire and a coercive will is important because it provides a basis for delineating between cases of coercion and, for example, cases of rational persuasion. In both instances, a person may have an other-regarding desire, but in the case of coercion, that desire will be supplemented by an effective first-order desire that seeks to enforce that desire on the person, and in cases of rational persuasion, it will not. Third, the coercer must intentionally attempt to compel the victim of coercion to comply with the coercer's preferences. These are necessary, but not sufficient, conditions of coercion. For coercion to take place, the coercer must be successful in getting his or her victim to conform to his or her other-regarding desire. It should be noted that if coercion is morally objectionable, the *attempt* at coercion will be objectionable whether or not the attempt at coercion is successful.

Coercion and Employment

One of the most common circumstances in which coercion is alleged to occur is regarding employment. It is often argued that capitalists coerce workers into accepting wage proposals, especially when people work for low wages in difficult working conditions. In typical cases, people work for low wages because they believe that that is the best available option for them. When a person makes a choice that seems highly undesirable because there are no better alternatives available, is she coerced? On the account of coercion employed here, having to make a choice among undesirable options is not sufficient for coercion. Such a person is not coerced even though she has no better alternative than working for extremely low wages and in undesirable working conditions. This is because in such cases the employer lacks a coercive will.

Nonetheless, coercion does occur in employment. For example, coercion is sometimes used by supervisors to improve worker productivity. Workers throughout the world report that they are coerced into working long overtime hours. In such cases, the supervisors possess a coercive will and are successful at compelling employees to work long overtime hours, typically by threatening to fire the employee. Nearly all developing economies lack the social welfare programs that workers in North America and Europe take for granted. If workers lose their jobs, they may end up without any source of income. Thus, workers are understandably fearful of being fired for noncompliance with demands to work long overtime hours. When a worker is threatened with being fired by a supervisor unless she agrees to work overtime, and when the supervisor's intention in making the threat is to ensure compliance, then the supervisor's actions are properly understood as coercive. Similar threats are used to ensure that workers meet production quotas, even in the face of personal injury. The use of production quotas is not inherently coercive. Given a reasonable quota, employees can choose whether or not to work diligently to fill that quota. Employees who choose idleness over industriousness and are terminated as a result are not coerced. However, when a supervisor threatens workers who are ill or injured with termination unless they meet a production quota that either cannot physically be achieved by the employee or can only be achieved at the cost of further injury to the employee, the threat is properly understood as coercive. In such cases, the employee will inevitably feel compelled to meet the quota.

According to the analysis provided here, workers choose to work for low wages because the alternatives available to them are worse. However, once they are employed, coercion is sometimes used to ensure that they will work long overtime hours and meet production quotas. Respecting workers requires that they be free to decline overtime work without fear of being fired. It also requires that if they are injured or ill—especially as a result of work-related activities—they should be allowed to consult health care workers and be given work that does not exacerbate their illnesses or injuries. Using coercion as a means of getting employees to work overtime, or to meet production quotas despite injury, is incompatible with respect for employees because the coercers treat their victims as mere tools.

Cognitive Moral Development

The basic tenet of moral development, understood as a cognitive process thus also called cognitive moral development, is grounded in the belief that human nature is naturally good. As humans, we lean toward an awareness of the good and have a preference for it rather than for evil and injustice, although we do not always achieve this inclination in our behavior. Human nature is also self-realizing and self-perfecting in our moral understanding. Our morality, or cognitive moral development, grows along with our physical growth and social capabilities. Both individually and in social interaction the human species evolves mature moral conscience and character despite the many potential psychological and social impediments that could slow or derail the process for a time.

Supporting these beliefs are the discoveries made by developmental psychologists, who have found that an individual's cognitive moral development progresses, often correlated with age or education, to a broader and more morally preferable perspective. In the late 19th century, cognitive moral development was revived as a lively research field in social science. This revival was later fueled by the moral developmental approaches espoused by Jean Piaget, Lawrence Kohlberg, Carol Gilligan, James Rest, and Augusto Blasi. For these psychologists, cognitive moral development was not determined wholly by age but was heavily influenced by a natural development involving complex combinations of trial-and-error social interactions. Through these experiences, individuals altered their reasoning processes and typically their behavior to model after the new and morally advanced patterns of cognition. Humans are naturally prone toward moral progress and to strive for the moral ideal.

This entry focuses on the key cognitive moral development frameworks that have been applied to the study of ethical decision making and the field of business ethics. While there have been debates and criticisms regarding these key frameworks and reasoning assessments over the years, these models remain the primary tools for assessing moral reasoning in the business ethics field.

Jean Piaget

Piaget conducted research for more than 40 years into the origins and development of cognitive structures and moral judgments in the early years of life. Piaget rejected the traditional emphasis on linking development either to nature or to nurture by introducing a third factor: a cognitive schema or system that mediated the interplay of biopsychology and socialization—nature or nurture. Piaget asked children to describe their intentions and behavior, their goals and aspirations, and how they made sense of them.

He found that children coconstructed their moral realities and uncovered two cohesive systems of moral thought. The childhood *morality of constraint* or stage of heteronomy focuses on rules as external laws that are sacred because they have been laid down often by adults. This reasoning centers on conformity to approved social conventions by fulfilling them. The child reasons that there are a certain number of commands or rules that must be obeyed whatever the circumstances be. Right is what conforms to these commands, wrong does not.

The adult *morality of cooperation* or stage of autonomy shows greater concern with doing the right thing per se within the framework of mutual purposes. Rules are seen to be the outcome of a free decision and worthy of respect in the measure that they have enlisted mutual consent. The child gradually comes to realize that social rules can be used as instruments for coordinating social activity and that cooperative social arrangements can lead to mutually valued goals. Piaget's two moralities often are characterized as poles of development. They are now seen as rough descriptions of the beginning and the end points of the course of development rather than successive transformations in cognitive development.

Lawrence Kohlberg

Lawrence Kohlberg, a student of Piaget, expanded on the initial construction of two poles of morality into a theoretical model depicting three levels of cognitive moral development, with two stages within each level. Like Piaget, Kohlberg did not concentrate on moral behavior. He did not concern himself with individual actions; rather, he studied the reasons given for why certain actions are perceived as morally just or preferred. These reasons, for Kohlberg, were the indicators of the stages of moral maturity. As Kohlberg's research bears out, when one looks at the reasons people give for their moral judgments or moral actions, significant differences in their moral outlook over time become apparent. These differences are captured in Kohlberg's stages of moral development.

Kohlberg's commitment to a stage concept of cognitive moral development was based on three important traits. First, Kohlberg's analysis of underlying stage structures rests on people's responses to open-ended dilemmas. These stage structures are far more powerful and incisive than Piaget's two stages. Second, the results from Kohlberg's longitudinal study strongly supported the notion of a stage model. During the 20 years in which 58 males were provided moral dilemmas and their responses recorded, subjects seemed to proceed through developmental stages of moral reasoning in a specific sequence. No subject skipped a stage in the sequence or showed a significant downward stage trend. Third, Kohlberg stressed a preference for qualitative analysis over quantitative analysis. The cognitive developmental approach emphasizes ideal-typological constructs that emphasize qualitative organizations or patterns of cognition that lead to behavior rather than focusing on quantitative descriptions, such as frequency, intensity, and others.

Kohlberg's three levels of moral development correspond to three sociomoral perspectives: preconventional and the concrete individual perspective, conventional and the member of society perspective, and postconventional and the prior to society perspective. Within each of the three levels are two stages, with the second stage a more advanced and organized form of the general perspective of each level.

Kohlberg's Stages of Moral Development

At the preconventional level, an individual is responsive to cultural rules and labels of good and bad, right and wrong and understands morality in terms of the personal consequences involved, such as punishment, rewards, or an exchange of favors, or focuses on the imposition of physical power by authority. In Stage 1—the punishment and obedience orientation—the physical consequences associated with an action determine the goodness or badness of a decision regardless of the human meaning or value of these consequences. Avoidance of punishment and unquestioning deference to power are valued in their own right, though not in terms of respect for an underlying moral order supported by punishment and authority.

In Stage 2—the instrumental relativist orientation—right action consists of that which instrumentally satisfies one's own needs. Human relations are viewed in terms of a marketplace. Elements of fairness, reciprocity, and equal sharing are present, but they are always interpreted in a physical or pragmatic way. Reciprocity is a matter of "You scratch my back and I'll scratch yours," not of loyalty, gratitude, or justice.

Reasoning at the conventional level, encompassing Stages 3 and 4, emphasizes performing good or right roles, maintaining traditional or acceptable order as determined by a group or society, or meeting others' expectations. In Stage 3—the interpersonal concordance or good boy–nice girl orientation—good behavior is that which pleases or helps others and is approved by them. There is much conformity to stereotypical images of what is majority or natural behavior. Behavior is frequently judged by intention: He means well—becomes important for the first time. One earns approval by being nice. The individualistic perspective found in Stages 1 and 2 are coordinated into a third-person perspective at this stage. Mutually trusting relationships among people, embodied in a set of shared moral norms according to which people are expected to live, characterize this stage. The justice principle, present in some form in all of Kohlberg's stages, is represented in Stage 3 as the golden rule: Do unto others as you would have others do unto you.

In Stage 4—the law and order or social system orientation—the individual takes the perspective of a generalized member of society. This perspective is based on a conception of the social system as a consistent set of codes and procedures that apply impartially to all members in a society. The pursuit of individual interests is considered legitimate only when it is consistent with the maintenance of the sociomoral system as a whole. A society that includes formal institutions and social roles serves to mediate conflicting claims among its citizens and promote the common good. Thus, there is awareness that there can be conflicts even between socially good citizens, although these conflicts can be resolved due to the presence of a system of roles for the citizenry within the society. The perspective taken is generally that of a societal, legal, or religious system that has been codified into institutionalized laws and practices.

In the postconventional level, the individual defines moral values and principles apart from established moral authority and relies on self-chosen principles, from a set of universally acceptable principles, to guide reasoning. In Stage 5—the social contract legalistic orientation—there is a clear awareness of the relativism of personal values and opinions and a corresponding emphasis on procedural rules for reaching consensus. Apart from what is constitutionally and democratically agreed on, what is right is a matter of personal values and opinion. The result is an emphasis on the legal point of view, but with the possibility of changing law in terms of rational considerations of social utility rather than rigidly maintaining adherence to the law as seen in Stage 4.

In Stage 6—universal ethical principle orientation—right is defined by the decision of conscience in accord with self-chosen ethical principles appealing to logical comprehensiveness, universality, and consistency. These principles are abstract and ethical, such as the categorical imperative, and are not concrete moral rules, such as the Ten Commandments. There are universal principles of justice, of the reciprocity and equality of human rights, and of respect for the dignity of human beings as individual persons.

Traits of Kohlberg's Stage Development

Kohlberg's six stages of moral development manifest a number of traits essential to a full understanding of his cognitive moral development theory. Kohlberg argued that these characteristics were integral to his stage theory of moral development and carried valuable implications for moral education.

First, development is step by step, that is, the stages are invariant. Hence, a Stage 2 person does not leap to Stage 4. Rather, the person gradually moves from Stage 2 through Stage 3 on the way to Stage 4.

Second, development can terminate at any stage. Kohlberg, for example, found in his prison studies that many inmates reason from Stage 2 structures. The majority of adults probably terminate at Stage 4, some develop to Stage 5 in their cognitive capabilities, but rarely to Stage 6.

Third, an individual's reasoning is predominantly one stage. Occasionally Kohlberg found that the individual spills over into one stage above or one stage below the predominant reasoning stage.

Fourth, an individual can be attracted to reasoning one stage higher than the predominant stage. However, an individual is typically not attracted to the stage below the predominant stage.

Fifth, development is not governed by age. The rate of moral development, Kohlberg found, varies among individuals. Some young people achieve higher stages than older adults.

Sixth, cognitive development is a necessary, but insufficient, condition for moral development. Abstract reasoning ability is essential to entertain alternatives in moral reasoning and to order priorities in values. One reason why children under 12 years of age cannot be expected to attain higher stages of moral development is because those stages require more sophisticated cognitive abilities than young children possess, primarily the ability to reason abstractly.

Seventh, empathy is also a necessary, but insufficient, condition for moral development. It is through empathy that one develops an understanding of what a community is and begins to judge actions as right or wrong on the basis of mutual respect. These traits of stage development have been supported through the findings of Kohlberg and his associates.

Carol Gilligan

Kohlberg's theory and stage model of cognitive moral development has achieved substantial notoriety and usage among scholars but the theory and scoring method have not been without their critics. Some of the early and most specific critiques came from feminist scholars, emerging from the findings of Carol Gilligan, a former student and colleague of Kohlberg. Highlighting the all-male population that Kohlberg used for his 20-year longitudinal study, Gilligan argued that Kohlbergian research, like that of Rawls, Piaget, and Freud, reflected a male bias on morality and development. Her critique was particularly timely, as research in many fields was gradually seen to privilege the experience of white males as the norm, to the detriment of women and minorities, whose experience was treated as abnormal and less relevant for empirical analysis or theory building. Kohlberg's all-male research sample gave evidence of a moral orientation toward justice and rights, focusing on foundational moral concepts and universal laws, and in its higher stages, on abstract principles.

Gilligan's research, in contrast, focused on the reasoning of women and girls facing challenging moral issues in their lives. Whereas Kohlberg provided his research participants with hypothetical dilemmas to reason through, Gilligan asked research subjects to describe real-life dilemmas that they faced. In doing so, she argued that Kohlberg's hypothetical scenarios were biased by his own views of what constitutes a moral issue. She was interested in studying how women and men defined and experienced moral issues uniquely and whether their reasoning differed.

Ultimately, Gilligan argued that her research gives evidence of a predominant ethic of care among women, which she contrasted to the ethic of justice articulated by Kohlberg. While she insisted that this was not an absolute gender split, the essentialist association of men being most interested in justice and women being most interested in care was widely and popularly interpreted as the legacy of Gilligan's research on moral reasoning. Her findings gave impetus to a broad range of research on the ethics of care and the reasoning of women and girls.

The ethics of care focuses on moral responsibilities within relationships—on supporting, nurturing, and responding to others in ways that are most valued by them, not on demanding reciprocity or defending rules. Even the golden rule is seen in this contrast to be more reflective of an ethic of justice than an ethic of care. Mature caring shows great competence in attending to others, in listening and responding sensitively to others through dialogue aimed at consensus. As a goodness ethic, caring also emphasizes the sharing of aspirations, joys, and accomplishments of others.

Underlying Gilligan's theory of a caring morality are the research findings of Nancy Chodorow and Janet Lever. Chodorow asserted that the universal role of women as caregivers, for young children as well as other family members, deeply affects the personal and moral development of sons and daughters. Daughters see themselves as similar to their mothers and build their identity in relationship to their mothers, while boys understand early on that they are different from their mothers and must build their identity by separating from their closest caregiver. As a result, in any given society, the female personality comes to define itself in relation and connection to other people more than the male personality does. Chodorow suggested that girls and women are thus defined through attachment and identifying with others in contrast to boys and men who gain their sense of self through individuation. Gilligan drew the further observation and conclusion that more often women perceive the highest morality to be about caring selflessly about others, while men focus more on abstract principles of justice and fairness among equal individuals.

While subsequent research by Gilligan's students supported her findings, other researchers suggested that it is more likely that both women and men have the ability to reason from the perspectives of care and justice, and that if these are distinct moral orientations, they are perhaps on a continuum with most people somewhere in the middle. For example, Robbin Derry's research on moral reasoning in work-related settings proposed that people make choices about which kind of moral reasoning they use, depending on the values within the different environments of their lives.

Cognitive Moral Development as a Field of Managerial Research

From its infancy in the late 1800s to today, cognitive moral development is a research specialty of cognitive and developmental psychology. It has strong associations and implications for anthropology, cognitive science, social and political psychology, law, and education. It is only since the 1980s that cognitive moral development has been applied to business or become an area of concern for management scholars. The key underlying emphasis on morality makes it a natural field of inquiry for moral theorists, philosophers, organizational behavioralists, and business ethicists.

Most cognitive development theorists focus on children as their subjects, measuring the progression of moral reasoning over time. Management scholars, however, often focus on measuring the moral reasoning of adult populations, including managers, typically using the Defining Issues Test developed by James Rest, which builds on and extends Kohlberg's theory of moral development. This analysis specifically measures moral reasoning rather than development, since the subjects are morally mature as adults. Research by Brabeck, Treviño and Youngblood, and Weber and his colleagues has gone beyond simply identifying a manager's moral reasoning stage to characterize or predict how a manager might reason when confronted with an ethical or moral dilemma.

Scholars have found that, when using a managerial population, moral reasoning is heavily influenced by the context or situation confronted by the decision maker or the moral intensity of the dilemma. Frey provides a good summary of this work. Sometimes managers use lower stages of reasoning when resolving familiar situations or dilemmas involving minimal consequences, whereas higher stages of reasoning are evoked when hypothesizing what the decision maker might do or when the situation involves the risk of human life.

Various personal characteristics have been assessed regarding their relationship to an individual's moral reasoning. One study by Ruegger and King, for example, reported that older managers with more work experience actually used lower reasoning stages than young, less experienced managers. This may indicate that the influence exerted on a decision maker by the organization that employs the individual might be a significant influence on moral reasoning.

Research conducted by Brabeck, Treviño and Youngblood, and Green and Weber reports that there is a moderate relationship, when using managers as the sample, between moral reasoning and moral behavior. Managers using higher-order reasoning more often are inclined toward the morally preferred behavior. This finding gives rise to the call for greater attention toward improving managers' moral reasoning through organizational training using moral development schemas.

In exploring the question of how moral understanding and moral action are linked, Augusto Blasi has focused on the integration of morality in identity. The integration metaphor assumes that human personality strives for unity, and while the integration of morality may be driven by reason, it is a fragile process, often at odds with our most natural and instinctual impulses. One aspect of Blasi's research that is particularly relevant to the study of managers is moral self-deception. He proposes that moral self-deception can only occur in a person who understands morality and is genuinely motivated by moral concerns, that is, an individual who has achieved some degree of moral integration. But a corollary is that moral self-deception is less likely to occur when the morality is more strongly integrated with identity and the motivating power of morality is deeply felt. In Blasi's view, moral integration makes self-deception possible, while it also limits and provides a barrier to self-deception.

The investigation of moral development and reasoning is critical to ethics scholars and professors in managerial education, as they suggest that achieving moral understanding is only a partial explanation and determination of one's moral action. Nonetheless, the scholarly understanding of ethical behavior in the workplace is directly related to the field of cognitive moral development. The "why" people reason resulting on "how" they act is an important conundrum confronting moral development scholars.

—James Weber and Robbin Derry

COGNITIVISM AND ETHICS

Cognitivism in ethics maintains that ethical convictions (regarding actions, states of affairs, or character traits) function the same way as other ordinary beliefs in that they are capable of being true or false. Cognitivism, therefore, holds that such convictions have *propositional* content and their correctness or incorrectness is determined by whether they are true or false, respectively. So, for instance, ethical claims such as "it would be unjust to terminate that employee" or "it is dishonorable for him to deceive her like that" are conveying states of mind regarding just and honorable behavior that can be determined to be true or false. In this regard, cognitivism is a metaethical thesis regarding the semantic status of ethical claims that has both ontological and epistemological implications regarding what is true and what we can know to be true.

Cognitivists disagree with noncognitivists who maintain that ethical convictions actually *express* attitudes, feelings, desires, or other affective states of mind and, as such, are not capable of being true or false. This disagreement has significant implications for the supposed objectivity of ethical claims; cognitivist views tend to defend the objectivity of ethical judgment because they ground the correctness of ethical evaluations in what is literally true and false—either about the world or as a matter of reason. Noncognitivists of various stripes are thought to advocate a kind of subjectivism whereby ethical convictions express nothing more than attitudes, feelings, desires, or preferences. One needs to exercise caution here, however, since subtle differences between various forms of cognitivism and noncognitivism may not easily map on to the distinction between objectivism and subjectivism in ethics. One plausible form of cognitivism, for instance, asserts that ethical claims function as *summary reports* of attitudes, desires, or preferences toward a certain kind of act. On this variant of cognitivism, to think that "it would be unjust to terminate that employee" is tantamount to thinking "I (or my group) disapprove of that employee's termination." We can evaluate the truth or falsity of this ethical conviction by simply consulting whether the relevant individual (or group) possesses the attitude, feeling, or desire implied by the claim. This is undoubtedly a cognitivist account of one's convictions, but it remains fundamentally subjectivist because it identifies what is ethically true with prevailing human attitudes, desires, or feelings. In short, there is a fundamental difference between *reporting facts about* what an individual or group prefers (a cognitive, truth-apt matter) and the *expression* of such preferences (a noncognitive, affective matter). Despite this kind of complexity, there is a clear tendency among cognitivist theorists to defend a notion of moral truth that is not reducible to desires, attitudes, and preferences, hence the generalization that cognitivism supports objectivism in ethics.

To the extent that cognitivists assert the truth aptness of ethical claims, an important question immediately arises for cognitivism, "What does ethical truth consist in?" The answer to this question is complicated and will occupy the remainder of this entry.

One avenue that theorists have taken to defend cognitivism in ethics is represented by so-called moral realists. Realists maintain that (1) ethical claims are genuine claims in the sense that they purport to *describe* intrinsic ethical facts found in the world and (2) such ethical facts actually exist. So, in the above examples, there are *facts* about whether certain actions are unjust or dishonorable, independent of our judgments about them. More important, the normative force of such predicates—that we have inescapable *obligations* to refrain from unjust and dishonorable behavior—is irreducibly part of the very nature of unjust and dishonorable actions. Realists assert that actions have an ethical character just as they have other factually identifiable properties.

In what some have taken to be one of the early formulations of realism, G. E. Moore famously wrote that moral "goodness" is a noneliminable, nonnatural property of human action. Moore and others, most notably W. D. Ross and H. A. Prichard, have extended this line of thought to an array of moral claims involving the properties of fairness and beneficence. These so-called intuitionists have been saddled with a particularly challenging epistemological problem: How do we come to *know* such properties given that they seem so radically different (in kind) from natural properties? To say that humans have a special faculty of intuition or direct awareness of these special moral properties seems called for by this form of realism; yet this solution remains very unsatisfying for some due to its seemingly ad hoc nature.

Naturalists have attempted to recast moral realism within a less metaphysically obscure framework. Instead of supposing that moral properties are nonnatural, naturalists believe that moral claims simply describe natural states of affairs. Moral concepts such as goodness can be reduced to other more basic sociological, psychological, or even scientific properties. States of human happiness, for instance, can, in principle, be identified and reported as facts about the mental states of human beings. This form of naturalism asserts that a moral property such as goodness can be reduced to assertions about what will promote the experience of human happiness, individually or collectively. Naturalists are immediately faced with a particularly challenging objection that served as Moore's original motivation for developing the kind of nonnaturalist intuitionism described above. The so-called naturalistic fallacy holds that it is impossible to derive a moral conclusion from nonmoral facts about the world. More common, one cannot derive an "ought" from an "is." This problem is underscored by Moore's famous "open question" argument, which was designed to show that for any naturalist account of moral claims, someone can always intelligibly ask *why* the identified natural property has the moral characteristic identified with it. So, in the above version, the naturalist would find the question "Is happiness good?" unintelligible because she or he has already reduced the meaning of goodness to states of happiness. But Moore believes that such a question is quite intelligible and, therefore, demonstrates how moral properties cannot be reduced to natural states of affairs.

Other cognitivist approaches to ethics rely more on the rationality of ethical claims as opposed to their supposed description of actual properties, whether natural or nonnatural. The historical figure most naturally associated with this way of grounding the cognitive nature of ethics is the Enlightenment German philosopher Immanuel Kant. Kant maintained that the truth of basic ethical claims could be uncovered because humans were rationally autonomous creatures. The basis for our ethical prescriptions rested, for Kant, on our distinctive capacity to seek good *reasons* to act in certain ways. Basic ethical principles, thus, are nothing more than prescriptions and prohibitions derived from the laws that humans set for themselves as rational creatures. This led Kant to construct his famous Categorical Imperative, the most general expression of the law of reason, which maintains that one ought to act only in ways that can be willed to be universally adopted by all others. From the Categorical Imperative, Kant was able to explore what kinds of actions could and could not be universally willed in this manner. The former are permissible, that is, can serve as an acceptable ground for an autonomous will, while the latter were impermissible.

In this way, Kant was able to salvage a universal basis for ethical claims while grounding their truth in the form of reason itself rather than a metaphysics of moral properties.

Collective Choice

Collective choice refers to situations in which two or more individuals jointly pursue a common objective. As such, collective choice is fundamentally a problem of coordination. This is in contrast to instances in which individuals pursue similar or even identical objectives independently; in this case, coordination of individual actions is not expected.

Collective choice exists because humans have an inherent inclination to form and interact in groups. This is because there are many things that people can do collectively that cannot be achieved when acting individually or independently. Generally, collectives form voluntarily. Business firms, social clubs, religious organizations, social movements, caucuses, and governments are examples of collectives that form because individuals desire to achieve a common objective. However, sometimes collective choice arises in situations in which members are brought together involuntarily, as when people are called to jury duty or drafted in the army, or when children are added to families by birth or adoption.

Collective choice is necessary in the case of the public goods problem and the related tragedy of the commons. Public goods are goods or services that cannot be excluded from nonpayers and that do not diminish when consumed. Private firms are often reluctant to provide these goods; hence, their provision and distribution must be accomplished collectively. The tragedy of the commons refers to the tendency for people to overuse or exploit publicly available goods or common property. Sometimes the establishment and enforcement of private property rights can mitigate the exploitation of some common properties but, generally, these are ineffective in the case of goods that have characteristics of public goods. In these instances, collective choice regarding the use of common properties is almost always the most viable means of solving the tragedy of the commons.

Although there are advantages to collective choice, there are also problems that arise when people seek to make decisions and take actions collectively. For instance, members do not always agree on what the collective objective ought to be, and collectives do not always achieve their stated objective. The root cause of problems afflicting collective choice is that individuals interested in their own self-interest do not always behave in ways that support the collective. Two of the most important factors affecting the degree to which individual interests coincide with those of the collective are homogeneity of members and group size. Collectives with members having similar interests or characteristics are more likely to agree on and support collective objectives. Small groups are more likely to consist of members with similar interests when compared with large groups. Furthermore, in small groups individual members generally receive a greater fraction of total group benefits, and small groups also have lower organizational and coordination costs than large groups.

There are several problems that limit the effectiveness and desirability of collective choice. One problem is free riding on the joint efforts of others. Free riding means obtaining a benefit without expending an effort or paying a cost. Free riding is a problem if members join a group to obtain benefits of membership but have little or no intention of contributing to the group effort. For example, businesses using a team-based organizational structure often report difficulty in motivating all members of the team to contribute fairly. Simply, people might shirk if they believe it is difficult for superiors to assess precisely the individual effort of all team members. Another problem is members controlling or influencing the collective choice in their favor. One example of this is when employees spend time and effort currying favor with superiors at the expense of completing their assigned duties.

The coordination of the varied interests of group members is vital to the success of collective choice. Fundamentally, this requires the creation of a collective or social contract among members, in which members agree to participate and contribute to the collective good in exchange for explicit or implied group benefits. There are many mechanisms that can facilitate the process of social contracting, such as formal rules, group norms, stakeholder dialogue and engagement, selective incentives, coercion, monitoring, and the threat of expulsion. Ultimately, collective choice succeeds when members believe that the benefits of participation exceed the costs and when the interests and actions of group members are aligned with the collective's interests.

Collective Punishment and Responsibility

Collective Responsibility

Collective responsibility is to be contrasted with individual responsibility. Here, we shall be focusing on the debate concerning collective *moral* responsibility rather than any legal significance of the term because Western legal systems primarily regard individual humans as the proper subjects before the law. The philosophical debate surrounding the legitimate attribution of moral responsibility is premised on the notion that *individual* humans generally possess certain metaphysical characteristics in virtue of which they qualify as moral agents and may, thus, be legitimately attributed with moral responsibility. The debate concerning *collective* moral responsibility is then couched in terms of discussing whether or not a group of individuals can collectively possess the relevant characteristics of moral agency to be legitimately attributed with moral responsibility collectively.

It is generally accepted that there is an important difference between two types of collectives—an aggregate collective and a conglomerate collective. An aggregate collective (also called a random collective) consists of a group of individuals who together bring about a certain event through the aggregation of their individual efforts. For example, an angry mob of people may cause damage to a neighborhood through the aggregation of each individual's act of destruction. A conglomerate collective, on the other hand, is an organized group of people with an established decision procedure to make collective decisions. The members of a conglomerate collective work concertedly in the pursuit of a common goal. For example, the members of an orchestra each contribute their individual parts to the collective goal of playing a symphony in concert.

It is commonly accepted that there are three necessary conditions for moral agency: to have the ability to *intend* an action, the ability to *perform* an action, and to have the *autonomy* to choose an intentional action. With regard to the attribution of moral responsibility, it is generally acknowledged that an aggregate collective does not possess any of these characteristics as a collective unit, but being a mere aggregation of individual actions each member is distributed moral responsibility for the event in question. However, controversy surrounds whether or not a conglomerate collective can meet the conditions of moral agency. It has been argued (e.g., by Virginia Held) that the entire membership of a collective may be morally responsible as a unit. The idea is that the collective decision structure binds the members and obscures lines of responsibility to the individual members such that only a responsibility attribution to the collective whole is possible. It is the members collectively who are attributed responsibility, but because the structure obscures the lines of individual responsibility, the attribution of responsibility is not distributable to the individual members, but rather the members are held collectively responsible as a unit. The collective whole is considered to satisfy the conditions of moral agency in virtue of the actions of all the individual members (or vicariously by some of the members) who are moral agents, and thus, the collective is deemed to be the legitimate subject of moral responsibility attributions.

Another possibility that has been suggested (e.g., by Peter French) is that the organizational structure of a conglomerate collective might qualify as the principal, in a principal-agent relationship, where the collective's members act as agents on behalf of the organization. The idea is that the structure with its decision procedure and policies qualifies as the *intention* of the organization and then directs the members to act on its behalf. In this case, the moral responsibility attribution is meant to lodge with the collective's structure conceived as logically distinct from the members, and thus, the responsibility is not distributed to the members.

Theories of collective responsibility are of great importance to the debate over corporate moral agency because a corporation may often be represented as a conglomerate collective with decision procedures, lines of authority, and a corporate policy that directs the efforts of members in pursuit of a common goal. However, it should be mentioned that the legitimacy of attributing moral responsibility to conglomerate collectives is controversial. There are strong arguments against it on the basis that collectives do not possess the capacities for moral agency in any morally relevant sense because they do not per se have intentional mental states. For example, a conglomerate structure might causally *explain* a collective event but it does not literally "intend" the event.

Collective Punishment

Collective punishment involves the imposition of a penalty, such as corporal harm, social scorn, the deprivation of personal freedom, or a financial fine, on a collective of individuals. For example, a teacher might decide to collectively restrict the freedoms of an entire class on the basis of the act of one or more children. Collective responsibility bears on collective punishment in that the collective may be regarded as the proper subject of punishment. Theories regarding the justification of punishment are generally considered to be retributive or utilitarian. Being able to maintain that a group is collectively responsible is most important for proponents of retribution because the punishment is based on the subject *deserving* the penalty. Utilitarian justifications for collective punishment tend to be based on some instrumental dimension such as expediency. For example, it may be difficult to discern which member of a collective is responsible for an event, and thus, it is easier to simply punish the collective whole. Irrespective of one's view on whether or not attributions of collective responsibility are distributable to the individual members, it should be clear that collective punishment is always distributive because what affects the collective whole will inevitably affect its members. The attribution of moral responsibility is usually not itself considered a punishment, although such an attribution may often be difficult to separate from a social sanction of disapproval.

Western legal systems generally disapprove of collective punishment. The Geneva Convention (IV) of 1949, Part III, Section I, explicitly prohibits the use of collective punishment. However, legal sanctions imposed on corporations are not considered a form of collective punishment because the corporate legal person is regarded as an entirely separate legal entity from the corporate members.

Collusion

Collusion is an agreement between two or more persons to deprive another person of his or her legal rights or to obtain a benefit forbidden by law. In addition to persons, collusion may involve companies, associations, or countries. Collusion implies the existence of fraud or the use of unlawful means to accomplish an unlawful objective. Collusion implies also secrecy and deception on the part of parties who have obtained a mutual benefit in the form of profit or control and, in the process, have intentionally violated established laws or rules.

Because collusion involves intent to deceive for an unlawful purpose, it differs from cooperation and collaboration. Cooperation and collaboration provide an assumed mutual benefit but they do not involve violation of law or rules. Society and governments desire that companies collaborate and cooperate if the purpose is to enhance products or services for the public good and does not restrain competition. However, given that a legal interpretation must be made as to when legitimate cooperation becomes illegal collusion, prosecution of collusion cases are often time-consuming and heavily reliant on circumstantial evidence.

Collusion is illegal in most countries of the world. In the United States, collusion for criminal misconduct is prosecuted by the Antitrust Division of the Department of Justice under the antitrust provisions of the U.S. Sherman Act of 1890. Civil lawsuits under the Sherman Act are the responsibility of civil trial lawyers, often referred to as "private attorneys general."

The remainder of this entry is organized in four parts. The first section describes the objective of federal antitrust enforcement with respect to collusion. The second section outlines and describes the major forms of collusion. The third section discusses important legal forms of collusion. Finally, the fourth section offers an overview of means and methods to prevent and detect collusion.

Federal Antitrust Enforcement

Collusion interferes with the free flow of trade and commerce in competitive markets, which are expected to provide the best goods and services at the lowest prices. When competitors collude, consumers pay inflated prices, supplier firms may experience depressed prices, and market participants may have fewer choices. The Sherman Act prohibits any agreement among competitors to fix prices, rig bids, or engage in anticompetitive activity. In recent years, the Department of Justice has prosecuted cases, at the regional, national, and international levels, involving construction, agricultural products, manufacturing, service industries, and consumer products. Most criminal antitrust cases involve price-fixing, bid rigging, or market division and allocation schemes.

Because of the nature of secrecy and deception, collusion is rarely overt. The most subtle form of collusion is referred to as tacit collusion. In tacit collusion, parties act for mutual benefit often without meeting or direct communication. The tacit colluders act discreetly at the expense of a third party or the market system in general. An example of tacit collusion that violates the Sherman Act is price signaling. Companies in an industry with few sellers may engage in price signaling in which one company publicly announces a price increase as a signal for other industry participants to mimic the action. In the case of signaling, companies are tacitly colluding to fix or set prices in restraint of trade and fair competition.

The Antitrust Division of the Department of Justice prosecutes collusion among competitors not only under the Sherman Act but also under the mail or wire fraud statute, the false statements statute, and other federal felony statutes. If they occurred at least in part within the last 5 years, collusion cases may be prosecuted as criminal offenses. Proving that a crime has been committed does not require the existence of an agreement to collude. Testimony and circumstantial evidence may be sufficient.

Forms of Collusion

Price-Fixing

Price-fixing is an agreement among competitors to raise, fix, or control the price at which their goods or services are sold. The purpose of price-fixing collusion is to limit supply to generate monopolistic prices and higher than competition-based returns to the colluders. For the collusion to be successful, the colluders must act like a monopoly or oligopoly, that is, have a limited number of providers, large number of purchasers, relatively constant demand, and ease of monitoring others' supply chains. Examples of collusion include Archer Daniels Midland (ADM) and F. Hoffmann-La Roche.

In the late 1990s, ADM and several other companies participated in an international cartel organized to restrict the output of lysine, a livestock and poultry feed additive. The cartel inflated the price of this amino acid product during the course of the conspiracy. ADM pleaded guilty and was fined $100 million. Other participating corporations were also prosecuted and assessed multimillion-dollar fines. In addition, three ADM executives were convicted for their personal roles in the cartel.

F. Hoffmann-La Roche Ltd., a Swiss pharmaceutical company, and a German firm, BASF Aktiengesellschaft, participated in a worldwide, 9-year conspiracy to fix prices and allocate market shares for vitamins. At trial, the firms pleaded guilty and were fined $500 million and $225 million, respectively.

Colluding can not only be very costly on conviction but also extremely embarrassing to high-profile defendants. In France, six of Paris's most prestigious five-star hotels were convicted of illegal price-fixing in 2005 after it was determined that hotel managements made regular exchanges of confidential information in a collusive effort to set floor or minimum prices for luxury rooms. The hotels were convicted and fined. In another embarrassing case in the state of New York, 27 Mercedes Benz dealers were convicted of colluding to fix prices.

Bid Rigging

When colluding to rig bids, competitors agree in advance as to who will win the competitive bid on a contract. Bid rigging may take the form of bid suppression, complementary bidding, bid rotation, or subcontracting. Bid suppression occurs when one or more competitors agree to refrain from bidding. Complementary bidding produces bids that are too high to be accepted or bids that contain unacceptable terms. They give the appearance of legitimate bids, and they have the effect of making otherwise unattractively high bids appear reasonable. Bid rotation involves collusive agreement to take turns at being the low bidder, thus passing the winning bid to a predetermined competitor. Subcontracting is a means of rewarding competitors who have agreed to submit losing bids in bid suppression or bid rotation schemes. All bid-rigging schemes have in common a plan that predetermines the bid winner and eliminates competition among the colluding contractors or vendors.

Small businesses as well as large multinational corporations are subject to prosecution for collusive activities. In 1997, the U.S. Justice Department, in concert with the U.S. Department of Agriculture, successfully prosecuted two cattle buyers in Nebraska for bid rigging and mail fraud in connection with the procurement of cattle for a meat packer. The defendants pleaded guilty and were fined and ordered to make restitution to the victims.

According to the U.S. government, a red flag is signaled when the following occur:

- Contracts are repeatedly awarded to bidders from the same company
- Contracts are repeatedly awarded to bidders from the same geographic area
- Alternating high and low bids are received from the same bidder
- Very low or no participation on certain contracts by bidders who normally bid for work in a given area
- Notable subcontracting between an unsuccessful (or nonbidder) and the award-winning bidder

Research economists have developed sophisticated models to assist in the prosecution of collusion. Researchers refer to an asymmetric model of bidding where bidders in a competitive environment expect other bidders to have relative cost structures, both as advantages and disadvantages, to complete the project under bid. Examples might include physical distance to project, available capacity, age of company, and size of company. For bids to be truly competitive, they must meet two conditions. First, the bids must be conditionally independent. This means that the bids are not positively correlated with one another after adjusting for the impact of all publicly available information. Second, the bids must have exchangeability. This means that companies with similar asset bases and cost structures will offer bids in a reasonably narrow range. Conversely, bids not meeting these conditions indicate the possibility of collusion. Stated another way, the researcher sets the research hypothesis—companies bid competitively—seeking to support the hypothesis. When this hypothesis is accepted, there is a high probability that the bids were entered competitively. When rejected, there is a high probability that the bids were entered collusively.

Market Division or Allocation Schemes

Market division or allocation schemes are collusive agreements in which competitors divide markets among themselves segmented by customer type, product type, or geographic region. Competitors agree in advance to restrict their sales, purchases, or bids on contracts to specific market segments. In 2001, the Antitrust Division prosecuted Akzo Nobel Chemicals BV, a Dutch chemical company, for participating in an international price-fixing and market allocation scheme involving chemicals used to produce herbicides in the United States. The company pleaded guilty, agreed to pay a $12 million criminal fine, and the company executive received a prison sentence and fines. In 2002, Elf Atochem S.A., a French chemical conglomerate, pleaded guilty to the same scheme. In 2003, Empire State News Corporation, Inc. of Buffalo, New York, pleaded guilty to allocating markets for the wholesale distribution of magazines, periodicals, and books in western New York and at the Pittsburg International Airport. A criminal fine of $200,000 was levied against the company. Empire's coconspirator, New York Periodical Distributors Inc. of Massena, New York, was fined $500,000 for its role in the market allocation scheme.

Bribery

Bribery is considered a crime against justice. Bribery involves the offering or giving and soliciting or receiving of any item, privilege, or advantage intended to alter the behavior of a public or legal official. The change in behavior is expected to work to the advantage of the briber. Commercial bribery involves soliciting or accepting a benefit in exchange for violating an oath of loyalty such as one owed by an employee, a partner, a trustee, or an attorney. Bribery may be used to induce a purchasing agent to deal with a specific supplier. Bribery can also influence an appraisal of goods or services.

Paying for the privilege to conduct business is as old as business itself. History shows that criminals, often in concert with government officials, use "shake downs" of legitimate businesses, that is, require a payment to allow normal commerce. A *Gallup* Survey of more than 40,000 people taken in 2003 found that corruption or paying of bribes was perceived to be most prevalent in Argentina, Bulgaria, and Bosnia and Herzegovina. The United States, Canada, and Pakistan were rated as the most vigilant in protecting their business systems from bribes.

Paying a bribe is a special type of collusion, given that in many cases there is an attempt to hide the true nature of the transfer of funds through words such as "commissions" or "fees." Making this form of collusion of greater significance is the fact that it is often the only way to do business in some countries. One of the most infamous scandals in the United States involved a Japanese company, Japanese government officials, and Lockheed Corporation, which paid $12.5 million to obtain a sales contract with the Japanese company. The scandal resulted in the famous Treadway Commission Report, which prompted Congress to pass the Foreign Corrupt Practices Act (FCPA) of 1977. The FCPA prohibits businesses in the United States from paying bribes and requires that sufficient internal controls be established such that if an illegal payment is made, it will be detected.

Collusion by Employees

Collusive actions by employees of the same company are the most common form of collusion. Two trends increase the probability of internal collusion: (1) the complexity of business systems and (2) vendor alliances. Increasing business complexity is irreversible and driven primarily by globalism and technology. Vendor alliances draw purchasers and suppliers into tight and often personal relationships where documentation may be limited and the audit trail intermittent. Productivity increases and cost savings may result from these arrangements, but the risk of collusive fraud increases. Estimates vary, but colluders may account for as much as 50% of all internal frauds.

Company control systems are the first line of defense against employee fraud, but these systems are geared toward individuals acting alone. Consequently, internal controls are not generally effective against colluders. Internal collusion occurs when strategically placed company personnel agree to circumvent or override controls to steal company assets. Although the colluders' actions are difficult to detect when authorizing, custodial, recording, and/or reconciling powers are merged, a strictly enforced rotation and vacation policy in conjunction with ongoing data analysis and keen observation by management should ferret out most internal collusive wrongdoing. External collusion occurs when the colluding parties agree to circumvent rules to defraud a third party, such as in bid rigging or price-fixing. Internal/external collusion occurs when a party or parties inside a company conspire with a party or parties outside the company to defraud the first company, such as in kickback schemes or bribes. Common activities include purchasing schemes and payments for the privilege to conduct business.

A variant of the term *collusion* involves cyber crime and is called "collusion attacks." Collusion attacks occur when multiple users conspire to electronically steal and distribute copyrighted or classified material, diluting or erasing the original digital ID, or fingerprinting, from the stolen multimedia content to avoid implication. Fortunately, an antidote, interdisciplinary digital fingerprinting technology, is available to catch these colluding cyberthieves. The method employed not only detects the crime and the culprits but does so without endangering the integrity of the target material or the medium on which it is stored.

Legal Forms of Collusion

Some forms of collusion are exempted or granted antitrust immunity under the U.S. Sherman Act. Some industries have a safe harbor for their activities. For example, the U.S. agricultural industry has an exception to the prohibition against collusive agreements in restrain of competition by way of the Capper-Volstead Act of 1922. This law allows producers of agricultural commodities to form processing and marketing cooperatives because agriculture is a protected industry. The effect of these associations is to allow members of the cooperative to engage in joint selling at a price agreed to by the producer members of the cooperative. Cooperatives are subject to certain limitations enforced by the U.S. Department of Agriculture.

A cartel is a group of formally independent producers who act cooperatively to gain monopoly benefits in fixing prices, restricting supply, and limiting competition. Although cartels are prohibited by antitrust laws in most countries, they continue to exist in national and international commerce because some can escape antitrust enforcement. When an agreement to control prices is sanctioned by a multilateral treaty or protected by a government, no antitrust actions may be taken.

Cartels represent the most overt type of collusion. Two well-known examples are the Organization of the Petroleum Exporting Countries (OPEC) and the De Beers diamond cartel. The DeBeers diamond cartel, once reputed to be the strongest cartel in the world, was forced to abandon its monopoly in the diamond industry in the early 2000s due to increases in the world supply of diamonds.

Prevention and Detection of Collusion

Two competing legal theories test the boundaries of U.S. antitrust provisions. The parallel conduct doctrine requires that evidence demonstrate, similar if not identical, pricing behaviors leading directly to restraint of trade through noncompetitive actions by companies in the same industry. Under this legal theory, the plaintiff does not have to present evidence of an actual conspiracy, that is, meetings, phone calls, expense reports, e-mails, and so on between and among the parties. The competing legal doctrine, referred to as the plus factor, requires evidence of the conspiracy or evidence that excludes the possibility that the colluders acted independently.

An effective method in preventing and detecting internal/external collusion at the individual company level is to monitor gross profit. Gross profit is the difference between the revenue from selling inventory and the cost of the inventory items sold. Significant fluctuations may signal collusion between sales staff and customers. A common technique of this collusion is to undercharge and/or to falsely issue refunds. Other useful methods to prevent and detect collusion include writing company policy regarding fraud;

requiring disclosure of personal and family relationships, both internally and externally; prohibiting acceptance of gifts from vendors; encouraging vendors and clients to notify management of any suspicious or inappropriate employee behavior; and making a tip hotline available.

In the final analysis, collusions are doomed to fail given the natural workings of the competitive market system and the failings of the human beings orchestrating the collusion. Specifically, the collusions are unable to maintain themselves due to falling demand, entrance of new suppliers, exposure to legal liability, and the inclination to cheat by overproducing. Ultimately, colluders become subject to what is called the Prisoner's dilemma; colluding to restrain trade is in the best interest of all members of the collusion but not in the interest of each individual member. Consequently, cheating and internal rivalries eventually cause even the most carefully planned collusive strategies to fail.

Colonialism

Colonialism is the expansion of one people or nation into the territory of another people or nation to establish a material, economic, political, and cultural presence. Archaeological evidence suggests and textual records confirm that human communities have been colonizing territories for millennia. Sometimes, the original intent has been simply to solve a problem of overcrowding or resource shortage through the peaceful establishment of new settlements with ties to the original community. At other times, the intent has been to establish commercial networks that foster the welfare of both the original and the colonial communities. Frequently, however, the colonial enterprise has been accompanied by military force with the primary purpose of extracting value from the colony to increase wealth, freedom, and power for the ruling class of the colonizers. From the ancient regimes of Mesopotamia, Egypt, China, and Rome to the more recent European colonization of Africa, the Asia Pacific, and the Americas, economic, political, and cultural domination has characterized the colonial experience. It is this form of colonialism, along with the beliefs used to legitimize its practice, that has come under intense moral scrutiny in recent years in a critical reexamination of the past 500 years of European/Western history.

Colonialism as a Social Issue

The seminal modern critical work in colonialism, published by Jean Paul Sartre in 1964, framed discursive parameters of colonialism, neocolonialism, postcolonialism, and postmodernism, generating a robust exploration of European colonialism, influencing Jean-François Lyotard, Frantz Fanon, Pierre Bourdieu, and Jacques Derrida. In his advocacy of violence as an instrument of political goals of freedom, Sartre's work was a touchstone not only for the dissolution of the French colonial empire but also for colonialism itself as a legitimate social concept. Theorists such as Homi

Bhabha, Mikhael Bakhtin, Anne McClintock, Edward Said, Ella Shohat, Gayatri Spivak, Sara Suleri, and others have examined the colonial and postcolonial experience from diverse critical perspectives, giving rise to an interdisciplinary field of colonial/postcolonial scholarship that casts new light on history as well as on the legacy of colonialism embedded in the contemporary global political economy of nation-states and multinational corporations perpetuating structural disparities of wealth, freedom, and power among the world's human communities. The legitimate exercise of power by wealthy, Western nations remains a moral challenge as long as the residual effects of colonialism are experienced by smaller, poorer nations whose interests are not as effectively positioned on the world stage.

Ancient Origins of Colonialism

The antecedents of European colonialism are evident in the classical cultures of the ancient Mediterranean. The linguistic roots of colonialism reflect centuries of practice among early peoples who established settlements, trading networks, and colonies along the Mediterranean coastal areas. The English term *colony*, drawn from the Latin *colonia,* refers to a town or settlement, landed estate, farm, or dwelling. The German city of Cologne bears permanent witness to its origins as a Roman colony established during Julius Caesar's campaign against the Gauls. The semantic field of *colonia* (colony), *colona* (country woman), and *colonus* (farmer) suggests a connection to the land and agriculture. The Romans built their empire by establishing colonies, following the earlier practice of Phoenicians and Greeks, who established colonies throughout the Mediterranean, Aegean, and Black Sea before the end of the second millennium BCE. Rome traces its own mythic history to descendants of the defeated Trojans, and much of the Italian peninsula was settled by Greek colonists in the early first millennium BCE. The Greek term for *colony*, αποικια, linked to the Greek word for household, οικος, suggests a strong original connection to the household and the family. Major ancient cities such as Tunis, Carthage, Syracuse, and Marseille were established as colonies. Greek colonies were typically established as independent city-states, although some of them, such as Syracuse, maintained active economic, cultural, and social ties with their parent cities.

It could be said that Europeans learned colonialism from the Romans. By the first century CE, Rome had colonized vast territories stretching from North Africa to Asia Minor and Britain where Roman styles in language, customs, education, and manners were quickly adopted. Colonial outposts at Trier, Paris, Cologne, London, and major European urban centers were incorporated into a provincial administrative system controlled directly from Rome through the appointment of governors and stationing of military troops. Roman territories paid taxes not only to fill the imperial coffers and support distant military campaigns but also to finance their own provincial governor and his troops. Romans welcomed provincials into the army, civil service, and upper echelons of society; by the second century CE, emperors with provincial origins were commonplace, and in 212, all free persons within Roman territories were granted the universal status of Roman citizenship. Many of the tribal kingdoms emerging after the fifth century CE continued structural foundations of Roman beliefs, customs, and administrative systems as well as the Latin language.

A dominant feature of ancient colonization was the belief systems supporting and legitimating domination of what were considered to be "inferior" peoples. The concept of "barbarian" as an uncivilized less than human creature, so evident in Herodotus, was a hallmark of ancient Mediterranean thought. The Romans appropriated Greek canons of philosophy, learning, arts, and sciences, imposing them onto colonized territories in monumental sculpture and architecture, institutions, literature, religious rituals, entertainment, and art, making cities the centers of Roman cultural norms. The trope of "country bumpkin" and the "city slicker" originated in Roman literature as a contrast between the less Romanized rural areas and the sophisticated urban centers. A millennium after the demise of the Roman Empire, the ancient Roman model of colonization was adopted by Europeans in their encounters with Asia, Africa, and the Americas.

Modern European Colonialism

Colonialism was the established vehicle of expansion used by powerful European regimes from the 15th-century Portuguese and Spanish imperial conquests to the 20th-century Cold War superpowers. During the early age of exploration (1410–1700), fiercely competitive European nation-states sought to enhance their positions in relation to each other through the exploration and acquisition of territories beyond Europe. When Pope Alexander VI mediated the dispute between

Spain and Portugal in 1494 by establishing a line of demarcation in the newly discovered American territories, European claims of ownership were not in question. By the time Ferdinand Magellan successfully circumnavigated the earth in 1522, Europeans had come to regard the entire planet as their own. Quickly realizing the potential value of Africa, Asia, the Pacific, and Americas, Europeans joined in the competitive search to capture the wealth of earth's natural resources through establishment of mercantile enterprises and control of trade routes (1700–1815). Established by Estates-General of the Netherlands in 1602 as the first national joint stock company for international mercantile enterprise, the Dutch East India Company was a dominant global commercial force for nearly two centuries until it was dissolved in 1798 after declaring bankruptcy. The formation of stockholding corporations of shared risk and reward revolutionized global commerce, generating unprecedented pools of capital to fund continuing cycles of enterprise. The British East India Company, Dutch and British West India Companies, the Hudson Bay Company, and other joint venture trading companies were formed to capitalize commercial colonization throughout the world.

By the early19th century, France, England, and Spain had lost possession of American colonial territories and popular sentiment in Europe was turning against slave trade. Spurred by new opportunities for investment, market development, and wealth creation, Europeans turned to Africa, Asia, and the Pacific. The success of global market development in creating wealth for European nations and private investors gave rise to a new form of economic imperialism (1870–1914) by which indigenous local economies were dismantled and replaced with local markets designed to meet the needs of colonial home economies.

The Berlin Conference (1884–1885) on the partitioning of Africa exemplifies the imperialistic worldview of European colonialism. At the time, European colonies were concentrated around coastal areas representing about 20% of the continent. The rest of Africa included more than 1,000 indigenous cultures with traditional languages, social and economic networks, and governing structures. In response to a request from Portugal, German chancellor Bismarck convened major Western powers (Austria-Hungary, Belgium, Denmark, France, Germany, Great Britain, Italy, the Netherlands, Portugal, Russia, Sweden-Norway, Turkey, and the United States) to negotiate control of Africa. France, Germany, Great Britain, and Portugal were the major powers in Africa and exerted the most control in the partition of Africa. The result was 50 gerrymandered nations constructed to serve the interests of colonial powers without regard for established indigenous ethnic, linguistic, or cultural affinities.

By the dawn of the 20th century, Eurocentrism was literally mapped onto the world and Europeans had colonized major portions of its land masses. Australia was totally colonized; more than 90% of territories in Polynesia, Africa, and Asia were 56% colonized; almost a third of the Americas was colonized. World markets built by Europeans with colonial labor and raw materials filled newly wealthy households and cities with everything from exotic luxury goods to daily staples of tea, coffee, and wicker baskets. Because colonies were appropriated, usually by force, they required the constant supervision and military presence of resident European authorities to assure cooperation and compliance. A divisive class structure emerged to reward Europeanized indigenous people with status and privileges unavailable to those who clung to traditional language, dress, and customs and alienating generations of people from their own cultural roots and identities.

The European colonial enterprise was almost entirely one of domination and exploitation. A few individual colonies, such as the United States, were successful in resisting colonial domination early on, but the value and legitimacy of colonialism remained firmly entrenched in the Western political lexicon well into the 20th century. The moral case for colonialism became increasingly difficult to defend, however, as social contract and human rights theories found their way into the political understanding of colonizing European nations. Even in the independent United States of America, however, the champions of independence were themselves transplanted Europeans who applied the values of human rights articulated in the Constitution and Bill of Rights to themselves but not to Native Americans or enslaved African Americans.

The Historical Defense of Colonialism

Advocates of colonialism have argued that colonial rule benefited the colonized by developing the economic and political infrastructure necessary for modernization and democracy, pointing to former colonies of the United States, Canada, Australia, New Zealand, Hong Kong, and Singapore as models of successful postcolonial sovereignty. Most colonies of the modern era were founded for the benefit of the colonizing power, although benefits were thought to accrue as well to the colonized peoples as they developed modern, Western ways. Jules Ferry's 1884 address to the French Chamber of Deputies represents the typical colonial viewpoint of his time, which was that French colonial policy was inspired by the need for safe harbors, defenses, and supply centers such as those found in Tunisia, Saigon, Indochina, and Madagascar. He stated that France would never leave these territories. Contemporary defenders of colonialism point to the benefits of modern technology that centuries of globalized enterprise and wealth generation have made possible: vaccines, air travel, air conditioning, synthetic fabrics, electronics, hybridized food production—a cornucopia of products and services that few citizens of former colonies would choose to live without.

The Critique of Colonialism

Sartre's critique of colonialism galvanized growing anticolonial public sentiment among Europeans following centuries of colonial domination. Dependency theorists, such as Andre, Gunder, and Frank, argue that colonialism actually leads to a net transfer of wealth from the colonized to the colonizer and inhibits successful economic development. Postcolonial critics Frantz and Fanon argue that colonialism does political, psychological, and moral damage to the colonizer as well. Indian writer and political activist Arundhati Roy observes that debating the pros and cons of colonialism/imperialism is comparable to debating the pros and cons of rape. Although many former colonies have become independent nations and some, such as India, have retained strong cultural traditions and built competitive market economies, colonialism continues as a topic of active debate in world affairs. For example, the current military actions in Afghanistan and Iraq are seen by some critics as the perpetuation of a colonial worldview in which some nations, such as the United States, assert their right to infringe on the sovereignty of other nations in the service of their own economic and political interests.

COMMENSURABILITY

Commensurability (or *commensurableness*) is an abstract noun, the adjectival form of which is *commensurable*, and apart from being easier to pronounce, it is easier to define. In defining a concept, the essence or the qualities of the concept are described, that is, saying what makes it what it is and not something else. To say that some things are commensurable is another way of saying that they are capable of being measured by the same standard of values or that they have a common measure.

The meaning of commensurability may be illustrated by showing how the word is used in everyday speech; for example, concepts such as equity and justice and matter and gravity are commensurable because they can be measured by the same set of values. Mind and space are incommensurable because they are not capable of being measured by a common standard. Justice and economic development are incommensurable because there is no common measure to evaluate them.

Commensurability has mathematical connotations, as shown in the following examples. (1) The numbers 12 and 9 are commensurable because they are divisible by 3. (2) A foot and a yard are commensurable because they are capable of being measured by the same unit; that is, they can be translated into inches—namely, 12 inches and 36 inches, respectively. (3) Hours and minutes are also commensurable because they too share a common measure.

With respect to recent research, Thomas Kuhn (1922–1996) and Paul Feyerabend (1924–1994) have both considered *commensurability* and *incommensurability.* Feyerabend (whose career included service in the German Wehrmacht as an officer and then being wounded on the Russian front) argued that the semantic principles of construction underpinning a theory could be replaced by another theory. As a result, theories could not always be compared with their context. Kuhn claimed that science developed in one particular paradigm or in a different era would be incommensurable with science produced in another; that is, there would be no equitable way of comparing them. He identified three kinds of incommensurability: (1) methodological incommensurability, (2) perceptual and observational incommensurability, and (3) semantic incommensurability.

To illustrate the meaning of *commensurability* within a business context, we could ask whether *the value of profits* was commensurable with *the value of distributive justice.* In the example, there seems to be little commensurability between the value of profits and justice (whether it be distributive, interactional, procedural, retributive, or social).

Commerce and the Arts

Today, the arts are a multibillion-dollar industry. Commerce plays a key role in producing or coordinating the physical and financial resources needed for the production of artistic works and for their dissemination to consumers. Nevertheless, the relationship between commerce and the arts can be tense, with the profit motive of commerce at times conflicting with the social, humanistic, and political motives of artists.

Definition: The Arts

Traditionally, the arts include the musical arts (e.g., piano music, symphonies), the literary arts (poetry, novels), the dramatic arts (plays), the musicodramatic arts (opera, ballet), and the visual arts (painting, sculpture, drawing), to which modern times have added, for example, cinema, still photography, and computer graphics. A characteristic of the 20th century was a conscious exploration of the distinction between "arts" and "nonarts," with a consequent blurring of the distinction. As such, it is virtually impossible to find a satisfactory definition of "the arts." Nor is the distinction between "high art" and "popular art" useful. Historically, the distinction was primarily economic but modern forms of reproduction are removing that distinction: the operas of Wagner are now available on DVD; the paintings of Titian are now available as framed prints. Key to the distinction between art and nonart is authorial intention: Did the creator intend the work to be a work of art?

The Purpose of the Arts

The arts have many purposes, of which four may be singled out; however, the reverse is not also true: Just because something fills one of these purposes does not mean that it is a work of art. First, at the most superficial level, the arts entertain and allow for shows of wealth and affluence: But soccer also does this, and like soccer, such arts tend to be commercially viable.

Second, the arts provide social cohesion. Especially in traditional societies, the arts play a key role in national or ethnic identity: They help distinguish Germans from Nigerians, Canadians from Brazilians, and so it is not surprising that government, where it has the funds to do so, usually plays a strong role in supporting such arts. But national costumes and customs also do this. The arts also play a role in other types of social cohesion, such as religion; for example, Martin Luther understood the importance of communal singing in congregational bonding, and so music played a central role in the development of the Reformation church. However, soccer also provides social cohesion in some societies.

Third, the arts give insight into our humanity by getting us to see the world in a different way; for example, a novel or movie from another culture may invite us to place ourselves in the shoes of the principal character.

Finally, the arts give a voice to the politically oppressed and the dispossessed and are a key vehicle for social change. In South Africa, black musicians played a key role in the battle against apartheid. The sexually explicit photographs of Robert Mapplethorpe challenged our views on the human body and the line between art and pornography. Mart Crowley's 1968 play *The Boys in the Band* or the 2005 movie *Brokeback Mountain* challenged entrenched attitudes about homosexuality. The dance group K-PAG Mix, a member of the Kenya Performing Arts Group, has some members who have physical disabilities and some who do not; their dance piece *Crossing* forces the audience to confront their attitudes about disability and people with disabilities. Each of these examples has, at its core, an ethical component: political oppression and racism, censorship, homophobia, and disability discrimination. By its very nature, some art that challenges will be regarded by the majority within a society as unethical if it conflicts with their norms and beliefs and values; but the examination of why the majority believes it to be unethical fulfills its role as art regardless of whether or not it actually leads to social or political change.

Art that challenges is often not commercially successful at the time that it was created. As time passes, however, it generally becomes more and more conventional and ceases to challenge. There were riots at the premiere of Igor Stravinsky's *The Rite of Spring*, and D. H. Lawrence's *Lady Chatterley's Lover* was banned as obscene; both are now regarded by the mainstream as classics and both are commercial successes.

Types of Commercial Involvement in the Arts

There has been a long history of commercial transactions between creative or performing artists and consumers of their product; for most of this time, the consumer has driven the commercial relationship, be it a painter painting a portrait or a musician writing a string quartet for a patron. The way that the relationship has changed, especially in the 20th century, has been the intermediation of business between the artist and the consumer as a third party. Commerce is generally involved in the arts in one of two ways: either directly, where a commercially viable artistic product or service is offered by the business as a product (such as a CD) or a service (such as an artist's agent), or indirectly, for noncommercially viable arts (such as art galleries or major opera companies), through sponsorship or philanthropy.

The types of corporate form used in the arts relate to the extent of the resources that need to be coordinated. Most creative artists, be they writers, musicians, or painters, are entrepreneurs running their own microbusinesses; apart from their talent and time, the resources required for the creation of works of art tend to be minimal, although there are notable exceptions such as the works of Christo. The role of larger organizations is usually not with the creation of art but with its distribution, which requires much larger resources: publishing and recording companies (although the Internet is reducing the capital necessary for undertaking such activities) or companies that arrange large-scale performances (such as major orchestral or operatic presentations or international tours of popular bands). In cinema, although the resources involved in creation are substantial, "art" movies generally require far fewer than "mass entertainment" movies.

Commerce is also involved in the manufacture of resources used by artists, such as musical instruments or artists' paints, and the building and hiring of venues such as playhouses. The price of resources has historically decreased, and in many cases, the quality of those resources has increased, owing to competition between commercial providers of those resources. A clear example of this is the piano. Piano manufacturers have, since the 18th century, made profound technical developments in design and construction, such as the introduction of iron frames, which allow for much greater string tension and, hence, power, and composers and performers responded by exploiting these innovations. The price decreases associated with mass production saw the piano become essential in Western middle-class homes by the end of the 19th century and so opened up the playing of the piano to an unprecedented number of people, which also benefited the music publishing industry and provided increased royalties to composers. The availability of appropriate commercial venues was essential for the rise of the public concert in the 19th century.

The Role of Commerce in the Arts: The Artist

All artists have basic economic needs: At the very minimum, they need housing, food, and the materials with which to create their art. Commerce allows them to benefit financially from their creations and for some brings financial independence. The diversity of contemporary commerce gives artists unprecedented opportunities to fund their work; this funding allows them greater freedom and so enables an ever richer and diverse body of artistic creation. Many artists are entrepreneurs, fulfilling market needs and growing businesses. Rembrandt ran a very successful workshop and, much like an owner-manager, drummed up business for his workshop, personally attending to the most important painting tasks and leaving the lesser tasks to others in his workshop. Commerce allows much wider distribution of artistic creation than was previously possible; recording companies may sell millions of copies of a work, providing significant royalty payments to the artists. Some artists, especially those driven by a desire for social change, are more interested in influence than profit; however, high levels of profit indicate that their message is being spread (but this does not necessarily mean accepted), and they may devote their earnings to pursuing social causes. Despite this, many artists remain among society's lowest income earners.

The Role of Commerce in the Arts: The Consumer

The ever-increasing market for the arts, resulting from economic development, benefits both artists and businesses. The consumer of art will ultimately determine whether or not the artistic product is commercially viable; this is unrelated to whether or not it is great art. Commerce doesn't just supply consumers with the artistic products that they want: It drives that demand through marketing, and so business determines which artistic works will be most widely available, most financially successful, and, importantly, in many cases, most influential. Businesses may distribute works that are clearly unethical, such as those of some rap artists that encourage violence and discrimination, while not distributing works that challenge racism and homophobia. Commerce sits more comfortably with the aims of the arts to entertain and to provide social cohesion, but less so with their humanistic and political aims: People generally are more likely to pay to be entertained than pay to be challenged (as is suggested by the relative box office receipts of *Jaws* and *Another Country*). Here, we see a fundamental clash in values between commerce, which seeks to maximize profit, and the arts, which generally have very different aims.

Protecting Commerce in the Arts: Copyright

Copyright plays an essential role in the relationship between commerce and the arts by securing economic benefits of artistic production. There are two principal international copyright conventions, the Berne Union for the Protection of Literary and Artistic Property and the Universal Copyright Convention; there are also copyright laws enacted by individual nations. Copyright allows its holders to reap *some* of the economic rewards from their labors: If you "create" a house, the economic benefits from that house remain yours to control indefinitely, but if you "create" a song, you have time-limited intellectual property rights. At the beginning of the 21st century, the most prominent ethical issue is piracy, that is, the theft of the intellectual property created by artists; it appears that the average person does not take this sort of theft as seriously as the theft of physical property (e.g., some people illegally download music but would never steal from a supermarket).

The Role of Government in the Arts

Government's role in the arts may be divided into two principal areas. First, government enacts legislation that provides the commercial framework within which the arts operate (such as corporations legislation and tax law); the minimum ethical criteria that all citizens, including artists, must abide by or risk legal sanction (such as legislation on public morality or defamation); and arts-specific legislation, such as that controlling specific arts organizations. Second, government subsidizes especially noncommercially viable arts as part of its social role, such as through the U.S. National Endowment for the Arts. Organizations such as national art galleries invariably require subsidy that, if not from the private sector, can only come from government.

Whether government should be involved in the arts, and especially in the funding of the arts, is an area of contention. Reasons for its interest may be divided into three main areas: sociocultural, political, and economic. First, the arts help define national identity and help provide social cohesion; these are of great interest to government because, among other things, they help provide political stability. New art provides an important impetus for challenging who we are and where we as a society should go, which enables social progress; historical works remind us of where we came from, which is essential given the path dependency of history (i.e., how we have arrived at where we are will constrain our options for going forward).

Second, that the arts are a powerful political tool is clear from the control that nondemocratic governments, such as Nazi Germany or Stalinist Russia, exercised over the arts. Government, for better or worse, is always interested in political tools. The arts can only fulfill their humanistic and political roles where government does not exert undue influence on the arts, such as by imprisoning artists whose work is politically activist. In democratic societies, political impartiality in funding of the arts—especially arts that have a social or political message—has become a major issue.

Third, the arts have a significant impact on the economy. The Australia Council has over many years commissioned numerous reports on the economic impact of the arts on the Australian economy; these reports have shown that government support for the arts has had a positive economic impact.

Despite all this, over the past decade, there has been internationally an increasing shift in arts funding from the government to the private sector, principally driven not only by government funding cuts but also by changes to law on tax deductibility of support for the arts as happened in France in 2003.

Criticisms of Commerce in the Arts

Artistic autonomy, which may be viewed much like academic freedom, is viewed by many as fundamental to the role of the arts and, in particular, the artist's ability to freely challenge established views. Commerce is often believed to undermine artistic autonomy. Professional artists need income to live and that income is often provided by commercial transactions involving sale of their output. Commerce seeks and rewards output that maximizes profit and generally does not support output that is not commercially viable; as such, artists may be pressured to survive, to produce not what they want but what commerce believes to be most profitable, regardless of whether or not the artist is interested in maximizing profit. Attempts to undermine artistic autonomy by treating the artist solely as a means, not an end, violate the second formulation of Kant's categorical imperative. Nevertheless, it is the artist's choice to become involved with commerce. Although commerce may encourage certain types of artistic production, it cannot *prevent* certain types of artistic production (excluding cases where autonomous individuals have bound themselves contractually). However, J. S. Bach's massive output was driven by commercial considerations: As Kantor at St. Thomas's, Leipzig, he had to produce cantatas for Sunday services and passions for Good Friday; could Bach, if it were not for his employment obligations, have produced a series of operas to match or even surpass those of Handel? Commerce may have given him the freedom to do so.

Many people look to the masterworks of the past, compare them with works from the present, conclude that there has been a decline in artistic quality, and blame this on the commercialization of the arts. However, history has effectively filtered out almost all past artistic creation, and only the very best works have survived. More than 10,000 18th-century symphonies survive (and many more may be assumed to have been written), but of these only a handful are known to modern audiences; a majority of Mozart's symphonies are little more than curiosities. The masterworks in this repertoire may be viewed as statistical outliers. Of the vast amount of artistic creation in the present, history has not had time to select the few canonical works.

The argument that financial motives are at variance with great art—that the artist cannot "produce on request" like a machine but is a genius inspired by the muse—is, at least in the West, a 19th-century one imbued with the spirit of romanticism; in music, it is first seen in the works of Beethoven and Schubert. Before that, artists generally saw themselves as artisans, paid to do a job, and that their talent was for God's glory, not their own fame—examples include Josquin, Palestrina, and Bach. Mozart's letters show a great interest in money. Apart from those holding university posts, most freelance composers today rely heavily on commissions for financial survival and have to produce the required work on time and on budget.

A serious criticism, however, relates to the corruption of cultural identity. For example, Australian aboriginal art has become commercially viable owing to international interest. Indeed, in many developing countries, the market for traditional art is driven by tourists who do not understand the significance of the art, but simply appreciate its beauty or "otherness." Commercial interest has led to significant stylistic issues: Consumers of aboriginal art prefer styles particular to certain tribes, and so other tribes whose traditional styles are not desired by consumers have taken to copying the more desired styles. This undermines the copier's sense of tribal heritage. The *didjeridu*, a musical instrument, is indigenous only to northern Australia, but owing to its successful commercialization has become the iconic aboriginal instrument and is now played by aboriginal musicians from all parts of Australia, sometimes replacing their traditional instruments.

Despite the criticisms leveled at commerce's involvement in the arts, it is clear that artists, consumers of artistic output, and the arts themselves have, overall, benefited from the involvement of commerce and that commerce has benefited from its involvement in the arts.

Commodification

Commodification is the social process of rendering something capable of being bought or sold in a market. While the term *commodification* became current only in the 1970s, the idea of commodification and the moral controversies surrounding that idea have a long history, centering on the question of what, if anything, should be commodified. Immanuel Kant, for example, in the *Foundations of the Metaphysics of Morals*, drew a sharp distinction between things that have a price and things that have a dignity. Since persons, being ends in themselves, have a dignity, it was Kant's view that they should not be commodified (i.e., enslaved), although Kant did not object to commodifying their labor. Karl Marx, in the *Communist Manifesto*, objected to any form of commodification, railing that the capitalist bourgeoisie has reduced personal worth and family relations into monetary value. It was Marx's view that the expansion of capitalism was commodifying an ever greater range of human relations that should not be commodified. Marx believed, in fact, that it was wrong to commodify even a person's labor, arguing that commodification produced alienation. Through commodification things are seen as separate from the self and come to be treated as if they have a value and life of their own, a process that Marx called commodity fetishism. Other 19th-century thinkers, such as Thomas Carlyle and John Ruskin, as well as 20th-century thinkers sympathetic to Marx, such as Jean-François Lyotard and Georg Lukacs, have continued to protest commodification. Marx's followers, in particular, have argued that capitalism has continued to expand commodification into ever-widening areas of human life and thought until virtually everything has a price tag.

A great deal of contemporary discussion has centered on whether particular types of things or relationships should be commodified, including children, human organs, blood, semen, ova, sexual services, genes, fetal parts, surrogate motherhood, and intellectual property such as basic scientific discoveries, essential drug formulas, and critical software. At one extreme lie libertarians such as the legal theorist Richard Posner, who see nothing wrong with commodifying virtually everything. At the other extreme lie those such as Karl Marx and many of his followers, who object to any kind of commodification, arguing that market relations should not replace any human relations. Somewhere in the middle lie those who object to the commodification of some things but not of others.

Those who argue in favor of leaving people free to commodify anything they choose generally do so on the grounds that people have a right to liberty and this right implies that people should be left free to engage in whatever market exchanges they choose; or it is argued that the opportunity to buy and sell anything in markets improves people's welfare since markets are not only liberating but can also harness society's resources with the utmost efficiency. Richard Posner, for example, argued in a 1978 article that people would be better-off if parents were allowed to exchange their children for money (i.e., by letting buyers adopt them). A standard criticism of such "universal commodification" is the claim that because many important human goods are incommensurable with each other, there can be no common measure or scale in terms of which every given good can be said to have more or less value than any other good (incommensurability is also a standard objection to utilitarianism, which assumes that there is such a scale and which often underpins the arguments of supporters of commodification). In particular, it is argued, monetary value does not provide a scale for measuring the value of, for example, human life, intense suffering, or the loss of a loved one.

Those who claim that only certain things should not be commodified generally argue on the grounds that commodifying those things in some way dehumanizes persons, treating them, as Kant would have said, as means and not as ends, or as things and not as persons. For Kant, and later for Hegel, the dividing line between what can be commodified and what should not be commodified is the line between what is part of the person and what is external by nature to the person. Thus, Hegel approved of the commodification of labor because labor was external to the person, but he condemned slavery on the grounds that slavery commodified the person. More recently, others have argued against commodifying certain things—such as body parts or sexual services—on the grounds that the desperately poor would be forced into selling such things to their detriment. Finally, those who argue that nothing should be commodified—not even labor—have generally taken a Marxist line, claiming that commodification of any sort is alienating.

It is important to distinguish between what Margaret Radin has termed rhetorical commodification and real commodification. In rhetorical commodification, something is rendered capable of being bought or sold in a market but is so rendered only in thought or in discourse; in real commodification, it is so rendered in reality. When one speaks of sexual interactions in marriage, for example, as "exchanges" in which one party "sells" a sexual "service" in exchange for "financial support" from another, we have an example of rhetorical commodification. However, when a prostitute actually sells her sexual services to a client in exchange for money, we have a case of real commodification. Among economists, Gary Becker and his followers have long argued that virtually all human interactions fruitfully can be understood as "trades" or "sales" of goods that have a "price." While it may seem to many that rhetorical commodification is harmless, others, such as Margaret Radin, have argued that rhetorical commodification can change the way we think of those things that are rhetorically commodified and such changes may be injurious. For example, if persons are rhetorically commodified this can undermine the Kantian conception of the person, by leading us to think of ourselves and others as means or things, and not as ends or persons, and this, she claims, would be deleterious.

A second important distinction, also drawn by Margaret Radin, is the distinction between full and partial commodification, on the one hand, and complete and incomplete commodification on the other. The distinction between full and partial commodification of a thing is the distinction between a situation in which some, but not all, exchanges of a thing are commodified, and a situation in which all or virtually all exchanges of that thing are commodified. For example, while some blood is given freely by donors in noncommodified exchanges, others sell their blood for money and such exchanges are commodified. Blood is, thus, only partially and not fully commodified. On the other hand, because virtually all automobiles are exchanged for money they are fully commodified. Critics of commodification have argued that partial commodification is an unstable situation because partial commodification of a thing tends to devolve along a slippery slope into its full commodification and such full commodification can be bad. Richard Titmuss, for example, argued in *The Gift Relationship* that once blood was partially commodified, it would eventually become fully commodified, and this was bad because it would render communities less altruistic and less unified. Several Marxists have likewise argued or assumed that partial commodification always gives way to full commodification.

The distinction between complete and incomplete commodification of a thing is the distinction between a situation in which that thing can be bought and sold in markets without restriction and a situation in which the thing can be bought and sold but only under certain restricting regulations. For example, tables and chairs are virtually completely commodified since they can be bought and sold with no restrictions on their sale. Labor, however, is incompletely commodified because it is subject to numerous legal restrictions including age laws, minimum wage laws, antidiscrimination laws, and a multiplicity of other labor laws. Margaret Radin has suggested that instead of trying to decide whether to choose between fully commodifying a thing and not commodifying it at all, it is more useful to think in terms of choosing between complete and incomplete commodification. That is, when discussing the desirability of commodifying contested goods such as sexual services, surrogate motherhood, babies, human organs, and so on, it is more useful to think about the regulatory restrictions we would want to impose on the commodification of these goods than to debate the choice between full commodification or full noncommodification of these goods.

Commodity Futures Trading Commission

The Commodity Futures Trading Commission (CFTC) is an agency of the federal government charged with regulating commodity and financial futures and options contracts and markets. The CFTC serves three key functions. Its first mission is to protect market users and the public from fraud, manipulation, and abusive practices related to the sale of these instruments. Second, the CFTC regulates financial practices in the market to ensure that the entire market remains financially sound and that the markets continue to function with financial integrity. Third, the CFTC uses its regulatory powers to help the markets fulfill their key social functions of providing a means for price discovery and the hedging of price risk.

Organized commodity futures markets arose in the United States about 1850 with the establishment of the Chicago Board of Trade and the Chicago Mercantile Exchange, still two of the largest futures exchanges in the world. At their outset, these markets traded futures based exclusively on agricultural commodities such as corn and wheat. These markets first came under federal regulation in the 1920s, and Congress charged the CFTC with the regulation of these markets in 1974.

Since the 1970s, futures and options markets have expanded in size and scope, with trading of futures and options on many nonagricultural commodities. These now include oil, gold, and financial instruments, such as foreign currencies, stock indexes, and Treasury debt instruments. The markets regulated by the CFTC are of huge financial size and importance, with many billions of dollars being traded in these markets annually. The instruments traded in these markets are complex, as are the markets themselves. In addition, the markets are important to the financial system and the economy in general.

Futures and options markets serve two main social functions. First, the markets aid in the process of price discovery, the discernment and communication of information about the future direction of prices for commodities and other goods. The markets serve this function because futures prices prove to be among the best predictors of actual future cash prices for the underlying goods, such as oil, grains, interest rates, and foreign currency values. Thus, transactions in these markets generate observable prices, and the prices reported have a valuable social role because of the information they provide. Second, through a process known as hedging, futures and options prove to be extremely powerful instruments for managing and reducing commercial risks that arise in the ordinary conduct of business. In the classic example of a hedge, a farmer reduces uncertainty about the price to be received for a future harvest by trading in the futures market to establish a certain future sale price for the crop. The same kind of risk-reducing strategy works for financial futures and options to reduce financial risk and uncertainty.

Common Law

The common law is the body of legal rules created over time by judges as they issue written opinions resolving individual lawsuits. The opinions serve as precedents to guide the resolution of future similar cases. The common law is to be contrasted with positive law, which consists of statutes passed by legislatures.

The principal subject areas of the common law are contracts, property, and torts. Common law originated as customary rules of social conduct that came to be enforced in the English courts. It also applied in the British colonies and was adopted by the fledgling United States, whose courts adapted it as necessary to suit the American experience.

The common law has three distinctive features that define it and set it apart from positive law. First, it is not a written code. There is no single source, such as a statute book, that codifies the principles that apply to a given case.

Second, common law develops through the resolution of actual legal controversies, primarily at the appellate level. The judge's opinion typically sets forth the facts and the applicable legal principles and resolves the case by applying the principles to the facts.

Third, the common law develops through the accumulation of these opinions, or precedents, as they are applied to similar cases in the future. The doctrine of precedent is based on the principle of *stare decisis* (to stand by a decision), which binds courts to follow prior judicial decisions unless circumstances (e.g., a change in societal norms) compel a reexamination or overturning of a prior case. The doctrine is intended to ensure that the same legal principles apply to all similarly situated parties. It also establishes the rule of law: Basing decisions on precedent ensures that society is governed by established rules rather than the personal views of each judge.

Contracts

A contract is an agreement between two or more parties. Contracts usually consist of an exchange of promises of future performance; for example, one party promises to paint the other party's house, while the other party promises to pay a certain sum on completion.

The essence of contract is free exchange—each party freely decides what to promise and what to demand in return. Freedom of contract promotes mutually beneficial exchanges by willing parties. In interpreting ambiguous contract terms, courts attempt to determine the intent of the parties to carry out their will.

The question at the heart of contract law is, "Why does society enforce promises?" According to libertarians, the key is free choice: The purpose of the state is to secure individual liberty, and contracts embody the free choice of the parties. Others answer that contract is a form of economic exchange in a free market. Because contracts are free exchanges, each party to a contract believes it has benefited by the exchange—has gotten more than it has given—and, therefore, contracts increase the sum of society's wealth. Indeed, because the enforcement of contracts makes free exchange and, hence, business transactions possible, it is one of the law's most important functions.

Still others believe that society enforces contracts not to promote exchanges but to compensate the injured party in the event of breach. Because a promise induces reliance, a party must be made whole when he or she relies on a promise to his or her detriment. This rationale shifts the focus of contract law from the will of the parties to a notion more like that of tort: The focus is on fairness to the injured party rather than enforcement of a free exchange.

In an influential work, Charles Fried argued that the promise principle is the moral basis of contract law. A person makes a promise to induce the promisee to rely on it, thereby invoking the societal convention under which promises are binding. The utilitarian argues that the ability to rely on promises increases social utility by increasing free exchange. Fried, however, takes a Kantian approach; he asserts that respect for the other party to the contract demands that we fulfill the expectations our promise has created.

Property

Property law defines people's rights to society's wealth. Property rights recognized and enforced by the common law include, among others, the right to possession of property and to its use and income, the right to alienate (transfer), and the right to prevent interference by others. Historically, this last purpose was the essence of property rights, as the law barred almost all interference with enjoyment of property. Thus, for example, the common law disallows trespass to property and developed the concept of "ancient lights," under which one property owner could prevent another from erecting a building that blocked the first owner's view. Some consider property rights the foundation of the common-law system: Property law concerns the ownership of property, contract law the transfer of property, and tort law harm to property (as well as person).

Many believe that private property rights are the basis of a free society. Others champion the instrumental value of private property: Utilitarians believe the law must protect the use and enjoyment of property because social peace and stability depend on security in one's possessions. Still others argue that private property is essential to economic growth; as the common law developed, property rights expanded to include not only the right to use and enjoy property free from interference but also the right to develop it. Property came to be viewed as a productive asset, and in some cases, the law even allowed a property owner to inflict harm, such as by polluting, if the societal benefits of the productive use outweighed the social costs.

Torts

A tort is a civil wrong, other than breach of contract, for which the law will award damages. The law of torts protects a wide variety of interests, including interests in person, property, and reputation. For example, it provides redress for battery (touching or striking another person without the person's consent) and intentional infliction of emotional distress, which protect the person; trespass and conversion (theft), which protect interests in property; libel and slander, which protect reputation; and wrongful interference with business relations (such as inducing another to breach a contract with a business), which protects business interests.

The three bases of liability under tort are intent, negligence, and strict liability. One is guilty of an intentional tort if he or she intentionally inflicts injury on another. One is liable for negligence if he or she fails to act as a reasonable person would in the circumstances and unintentionally injures another. Strict liability imposes liability without fault. Originally, strict liability applied only when a party engaged in an unreasonably dangerous activity, such as blasting. Today, it applies primarily in cases of product liability, when a consumer is harmed by a defective product.

The question at the heart of tort law is why to impose liability on one individual for harm done to another. Reasons for imposing liability have been the subject of much debate. Some argue that the purpose of tort law is retribution: A wrongdoer must be made to pay for his or her actions. This purpose is most clearly reflected in the law of intentional torts, which punishes morally wrong conduct.

However, neither strict liability nor negligence is premised on moral wrongdoing. Because negligence liability is based on the reasonable person standard, a party may be held liable for negligence even if he or she was personally incapable of avoiding the harm. Therefore, some assert that the purpose of tort law is compensation. These observers also note that a theory of retribution does not explain why tort damages are paid to the injured party rather than to a third party such as a state fund.

Still others suggest that the purpose of tort law is deterrence: Punishing conduct of which society disapproves discourages others from engaging in it. It is unclear, however, how a theory of deterrence justifies liability for negligence, in which harm is unintentional.

Though not based on moral wrong, negligence at least retains the concept of fault: One party's carelessness has harmed another. Strict liability dispenses with the notion of fault altogether. Manufacturers and distributors of goods are held strictly liable for harm caused by defective products even if they exercised all due care in manufacturing and inspecting their products. Here, tort law imposes liability on the party better able to bear the loss. Manufacturers can spread the costs of injury among all users of their products by including the costs in the price. Liability also may encourage them to develop new manufacturing techniques or designs that can prevent future injuries. Similar justifications support the doctrine of vicarious liability, under which an employer is liable for torts committed by his or her employees during the course of the employer's business.

Finally, law and economics theorists abandon entirely the traditional focus on the individual tortfeasor and victim in favor of a societal view. They assert that a person should be liable for harm caused by another only if the cost of taking measures to avoid the harm would have been less than the damage caused. According to these theorists, this principle will maximize society's wealth, since people will spend money to avoid injury only when the benefits of avoiding injury outweigh the costs. They also argue that the reasonable person standard implicitly embodies this principle and, therefore, that common-law courts have always applied it, even if not explicitly.

Common Law as Science and Policy

Does the theory of the common law hold: Does the doctrine of precedent result in the consistent application of neutral legal principles to decide like cases? Early commentators on the English common law believed that common-law principles were based on natural law. The great English commentator William Blackstone held that natural law was dictated by God, was therefore superior to all earthly law, and that judges applied preexisting natural law rules to decide cases. According to this theory, judges discovered rather than made law; decided cases were not the law itself but merely evidence of the law. If a judge overturned a precedent, he or she was not changing the law but correcting it. Legal principles were universal and unchanging.

Thus, common-law decision making was both divinely sanctioned and scientific. It was an objective process in which the identity of the judge was irrelevant. This theory prevailed until the early 20th century, when the legal realists turned it on its head. They asserted not only that judges made law but also that the law consisted solely of decided cases. If, for example, a court held a defendant liable for an invasion of property rights, that holding did not mean that the trespasser had violated preexisting property rights. Instead, the judge had created the property right by virtue of his holding. Legal realists believed that precedents were indeterminate: A judge could find a precedent to justify any decision he or she wanted to reach in any case. Therefore, rather than discovering legal principles and applying them to cases, judges decided cases by applying their own moral conceptions and then found precedents to support their decisions.

The realists conceived of the common law as an instrument of social policy in which judges balanced competing interests, just as legislatures did. Many found the realist position troubling because it meant that unelected judges made law: Realism rendered the common law undemocratic. It also challenged the basic claim of the system of precedent, its assurance that similar cases were treated similarly.

According to legal realists, however, judicial decisions were not intended simply to resolve individual controversies. Instead, judges must look beyond the case at hand to determine the best social policy. Legal realism reflected a new view of the common law as an instrument of social progress. This view was reflected, for example, in the changing law of torts, under which courts began to socialize the costs of accidents by imposing strict liability on manufacturers and, in negligence actions, to limit the cases in which the plaintiff's negligence barred recovery (by abandoning the doctrine of contributory negligence, under which any negligence by the plaintiff, no matter how slight, defeated recovery, in favor of comparative negligence, under which the plaintiff's recovery was reduced proportionally by the degree to which his or her negligence contributed to the injury).

In the 1970s, the critical legal studies movement took legal realism a step further, asserting that the law not only reflected the judges' moral and social views but was overtly political. According to this view, advanced by David Kairys among others, judges imposed the elite's policy views on society. Today, many view the common law as a mixture of enduring legal principles, individual and societal moral judgments, and adaptations to social change.

Commons, The

The commons refers to an open-access resource, usually land, which is available for community use. In urban areas, it is often public property, such as Boston Commons or New York's Central Park, where access is unrestricted even for noncitizens. In rural areas, the eligible commoners are generally well-defined. In particular, its agricultural manifestation refers to uncultivated or harvested land with open access for grazing; the gathering of wood, leaves, and bracken; and the digging of peat, leading to the notion of common pool resource (CPR).

The precise difference between these two notions of the commons can be seen with the aid of Figure 1, which gives the standard economic taxonomy of goods according to the properties of excludability and rivalry. A good is excludable if it is feasible for the owner to restrict access. A good is rival if its use or consumption effectively removes the possibility of the same by others. Private goods are both excludable and rival; purchasing a box of breakfast cereal gives the owner the right to determines who eats it (excludability), and on consumption, another consumer cannot enjoy its benefits (rivalry). Public goods such as Boston Commons or Central Park are neither excludable nor rival. The establishment of these areas created access for all passersby, and the use of the area by an individual does not preclude its use by others. If substantial numbers of users are required before crowding effects set in, then rivalry is not an issue of concern. Furthermore, publicness in no way implies that the provider of the good is a government authority. Examples of privately provided public goods include pollution abatement; finding a cure for a disease; and the all-volunteer fire department in Santiago, Chile. In contrast, CPRs are characterized by open access, but individual use (often seriously) deteriorates continued use or availability for use by others. Examples of global CPRs include ocean fisheries, air and water pollution, spamming in cyberspace, and geostationary orbits for satellites.

In his seminal 1968 *Science* article, "The Tragedy of the Commons," Garrett Hardin likened the inevitable ruin of the commons to a situation in which livestock herdsmen have access to a common pasture for grazing. The benefit an individual herdsman receives for adding another animal to the pasture is almost entirely private. In contrast, the cost of the additional

	Excludable	**Nonexcludable [Open Access]**
Rival	Private	Common pool resource (CPR)
Nonrival	Impure public good Partially rival ⇒ Club good Anticommons	Public

Figure 1 Types of Goods

overgrazing created by one animal is public in that it is shared by all herdsmen. So long as the individual benefit exceeds the public cost, an individual will rationally increase his herd without limit—even though the common pasture itself is limited. Individual freedom in the commons, therefore, leads to its ruin. In a reverse way, consider the pollution of a common water source. A rational man finds that his share of the cost of the wastes he discharges into the commons is less than of purifying his waters before releasing them.

For Hardin, the Tragedy of the Commons stands in stark contrast to Adam Smith's invisible hand, in that rational individual action no longer promotes the public interest but, instead, befouls it. Furthermore, many forms of the commons have no technical solution that would demand little in the way of changing human values or ideas of morality. Instead, the commons requires relativist ethical behavior in which the morality of individual action within the commons is a function of its current state.

Finally, the tragedy of the anticommons refers to the underutilization of a common resource. It occurs when multiple individuals have the right of exclusion. This, accompanied by a lack of hierarchy, allows the owners to effectively stand in each other's way. An example is "patent trolling," whereby companies with few actual products of their own acquire obscure patents that are essential to basic research and development and use their rights to extract licensing fees. Another is concern over commercialization of genetic patents that are essential for basic human functioning.

Public Goods

The creation of an area with open access and little or no crowding effects falls under the rubric of public goods. Public goods are important for the functioning of any society. They include national defense, highways, lighthouses, union-negotiated contracts, radio transmissions, and law and order. Public goods exhibit jointness of supply; if one individual receives them, then so do others. For this reason, public goods are also called collective goods.

The properties of nonrivalry and nonexcludability generally imply that public goods are subject to market failure. This is because the public benefit associated with a public good rarely exceeds the individual cost of provision; hence, self-interest results in public goods going unprovided or underprovided. More generally, this phenomenon is known as Olson's free rider problem because individuals have an incentive to enjoy the benefits associated with a public good and let others bear the cost of provision. For many types of public goods the incidence of free riding increases with the size of the population receiving public benefits. Group size often increases the divergence between the level of voluntary provision of a public good and its Pareto efficient (socially optimal) production. Furthermore, the (Nash equilibrium) outcome resulting from voluntary provision is invariant to income transfers among group members. This phenomenon is known as Warr neutrality.

Even when a group is privileged, so that some or all the members receive a benefit that exceeds the individual cost of provision, efficient provision is not guaranteed. If the cost of contribution is associated with individual benefits, then self-interested individuals will not truthfully reveal their true preferences for the public good. Underprovision again results. For this reason, private groups often use selective incentives to overcome both the free rider and the preference revelation problems. Selective incentives are private benefit inducements that accompany contributions to a public good. For example, contributors to the American Association of Retired Persons not only fund lobbying efforts that benefit all retirees but also receive membership discounts on meals, hotels, and insurance. Selective incentives not only include material incentives but also psychological incentives such as the warm glow associated with altruistic behavior and moral incentives for adhering to an ethical norm.

Government intervention is popularly viewed as an effective way to overcome the market failure associated with voluntary provision. As indicated above, however, Warr neutrality implies that the government cannot simply tax contributors to finance further expenditure on the public good. Existing contributors will react by reducing their own expenditure by the amount of the tax, thereby implying that government expenditure financed in this way crowds out private contributions on a dollar-per-dollar basis. Instead, provision will increase if noncontributors are taxed. Such a scheme can be problematic for several reasons. First, if those taxed do not receive the benefits from the public good or do not prefer it, then the tax and finance regime does not necessarily result in an improvement in social welfare. Second, government intervention can come with its own set of restrictions on access and behavior, thereby changing the character of the public good. Third, public goods can be financed by the public sector but produced through private actions (e.g., defense contractors). If more than one government agency is involved, and their knowledge of the private contractor's actions is imperfect, then a common agency problem can arise owing to conflicting aims of the agencies.

The Tragedy of the Commons

Hardin's original article on the Tragedy of the Commons is actually concerned with overpopulation. In his Malthusian metaphor, grazing stands for procreation and the commons for nonrenewable resources to support population growth. In many respects, however, the metaphor itself has become a model for the dire consequences of overutilization of CPRs, particularly the environment. For example, it has been found that water pollution increases in areas closer to the U.S.-Mexican border as compared with areas further from the border in either country. Similarly, the deforestation of Easter Island is an example of resource exhaustion.

Resource exhaustion is not an inevitability, however, and this has turned the analysis of CPRs to the conceptual difference between *res nullius* (open access with no property rights or ownership) versus *res communes* (access rights held by a group of coowners). When a collective with access has the right to exclude nonowners, effective management can result in sustainability. It is important to note that sustainability refers to the ability to continue to put the resource to its most effective use, and not necessarily to restore it to its original unfettered state. Under *res communes*, it is possible for coowners to successfully set voluntary grazing limitations through stinting (setting a maximum amount of livestock each household could graze) or overwintering (free access to as many animals as commoners could sustain with their own resources during the winter). In an alternative context, competing oil companies that hold drilling rights over a common pool of crude can legally form consortia so that their rate of extraction does not exceed the efficient one. In contrast, they cannot legally form cartels to fix gasoline prices. The difference is that efficient extraction from the common oil pool benefits both producers and consumers, whereas price-fixing is welfare reducing for consumers.

The dissolution of the commons through the establishment of private property rights can also lead to efficient and sustainable usage. This principle is known as the Coase theorem, although the distribution of welfare is not independent of the assignment of private property rights. Indeed, a historical debate exists regarding whether enclosure and privatization of commons led to the removal of a social safety net for peasants during adverse agricultural conditions. Marxians assert that dissolution of the commons by this means reduced the independence of subsistence-level poor from the labor market, further contributing to peasants' proletarianization and poverty.

When a commons is truly *res nullius*, it is not possible to assign property rights or establish external governmental control. In such situations, the individuals involved may be able to self-organize and overcome the tragedy. Ostrom provides an example of local fishermen who randomly assign initial fishing sites at an inland lake on a yearly basis, with an agreed-on system of rotation for the remainder of the season. In general, she finds that appropriators are willing to commit themselves to voluntary systems that clearly define the boundaries of the CPR; recognize the current state of the resource; are independent from external authorities, both for monitoring use and resolving conflicts; allow for the alteration of rules via consensus; and involve graduated sanctions for violators.

The Prisoner's Dilemma: A Unifying Model?

Traditionally, both the tragedy of the commons and the voluntary provision of public goods are considered examples of the Prisoner's Dilemma, a metaphor and theoretical model in the social sciences that illustrates the dichotomy between individual self-interest and collective action. Yet this common theoretical construct hides significant differences between the two problems, as can be seen by examining Figure 2.

(a) Voluntary Contribution

↓Row player / Column player→	Contribute	Not
Contribute	1, 1	–1, 2
Not	2, –1	0, 0

(b) Tragedy of the Commons

↓Row player / Column player→	Not	Graze
Not	0, 0	–2, 1
Graze	1, –2	–1, –1

Figure 2 Prisoner's Dilemmas

Figure 2a represents the decision to voluntarily contribute to a public good as a Prisoner's Dilemma. If neither player contributes, then the southeast cell of Figure 2a illustrates a payoff of 0 for each of the players. Suppose that a contribution creates a public benefit of 2 at a private cost of 3. If the row Player 1 contributes and the column does not, then Row 1 receives a payoff of −1 (= 2 − 3), whereas column free rides and receives the public benefit of 2. These payoffs are illustrated in the northeast cell of Figure 2a. The reverse situation—where row free rides and column contributes—is given in the southwest cell. Finally, if both contribute a public benefit of 4 (= 2 + 2) is created. Each player pays a private cost of 3, meaning each receives a net payoff of 1 (= 4 − 3). This outcome is given in the northwest cell. If column contributes, then row is better-off by not contributing (a payoff of 2) as compared with contributing (payoff = 1). If column does not contribute, row is again better-off by not contributing, which earns 0 versus a payoff of −1 for contributing. By similar reasoning, column is always better-off by not contributing, regardless of row's strategy. Acting in individual self-interest results in each player receiving the payoff of 0 in the southeast cell. If they instead act in the interest of the group, they receive a payoff of 1 each in the northwest cell. Individual rationality is, therefore, at odds with group rationality.

In the commons game in Figure 2b, grazing yields an individual benefit of 3 at a public cost of 2. If neither player uses the commons for grazing, each receives the payoff of 0 in the northwest cell. When one player grazes and the other does not, the grazer receives a net payoff of 1 (= 3 − 2), while the inactive player faces only the public cost, resulting in a payoff of −2. These outcomes are given in the southwest and northeast cells of Figure 2b. Finally, if both graze, a total public cost of 4 (= 2 + 2) is created, and each receives a payoff of −1 (= 3 − 4), represented by the southeast cell. Grazing is always in an individual's self-interest. When the other player does not graze, grazing yields a payoff of 1 versus 0. Furthermore, when the other player grazes, a grazer earns −1 versus −2. Individual self-interest results in the southeast cell, whereas acting in a group interest is preferred (the northwest cell).

This dichotomy between individual and group rationality is what has made the Prisoner's Dilemma an important model in the social sciences. Furthermore, the ubiquity of the Prisoner's Dilemma is illustrated by its applicability to both the issue of free riding and the Tragedy of the Commons, which themselves represent a broad spectrum of social interactions. Important differences exist between the two manifestations of the Prisoner's Dilemma, however. For example, in the voluntary contribution game, action is desired over inaction. In contrast, in the commons, inaction is desired over action. Regardless of whether the commons occurs under *res nullius* or *res communes*, its resolution requires participants to relinquish a privilege. This implies a profound difference in policies to remedy situations that are akin to the commons, because studies have shown that incentives must be much stronger to induce individuals to give up their rights to an action versus inducing them to take an action, even when the impact of each is equivalent. The implication of these framing effects is that selective incentives work to encourage voluntary contributions but selective disincentives (punishments) are part of policy prescriptions for the commons. For example, the Montreal Protocol was framed in terms of preserving the stratospheric ozone layer—a public good—whereas the Kyoto Protocol is framed in terms of reducing greenhouse gas emissions—a commons. The Montreal Protocol, therefore, provides for funding to induce developing countries to reduce their use of chlorofluorocarbons, whereas the Kyoto protocol contains a punishment phase of increased abatement of greenhouse gases for any violating country.

Further differences include the ability of underprivileged members to rely on larger privileged members to contribute greater amounts toward the provision of a public good (the exploitation of the large by the small), whereas larger members further degrade the commons as compared with smaller users (the exploitation of the small by the large). In a public goods agreement, the effect of the exit of a member can be made up with additional contributions by remaining members. In contrast, an exiting appropriator may complete offset management efforts in the commons. Furthermore, resolution of the free rider problem via reciprocal altruism often makes perfect sense. Each provides conditional on the other providing. Yet if reciprocal altruism does not work in the commons, the resource is further degraded and sustainability may not be recoverable. Such a dynamic possibility, which is not present in the Prisoner's Dilemma, must be included when modeling potential resolutions to the Tragedy of the Commons. Last, the outcomes of public goods (or "give some") experiments are vastly different from commons ("take some" or "nuts game") experiments, with group-desirable behavior being much more prevalent in the former.

While these considerations indicate that the commons may be a more difficult problem to resolve than public goods provision, other studies focus on self-limits to the exploitation of the commons. The end result of *res nullius* is not ruin, but a level of overutilization that is bounded by the market price of the resource. The public costs of an activity are indeed borne by each appropriator, and these must be compared with the market price when deciding on the individually rational level of appropriation. In contrast, a different type of constraint exists for the misallocation of resources due to free riding; the aggregate-benefit-generated public good is never fully captured by the market price, due to nonrivalry. As a result, there is no guarantee that provision will occur.

No Technical Solution

Hardin's paper has been criticized due to his lack of historical understanding of the management of common land, but in any unmanaged commons his appeal to ethical behavior remains valid. His solution—mutual coercion, mutually agreed on—is meant to denote the limited ability for government intervention or the establishment of property rights to resolve the problem. It advocates the promotion of the common interest in a rational manner rather than the rational promotion of self-interest. In this way, during the 1980s and 1990s, environmentalists rallied around the ethic of sustainability, as presented in the UN-sponsored Brundtland report, *Our Common Future.* Sustainability has a Lockean foundation, advocating that every person should remove resources from the state of nature by mixing his or her labor with them and making them his or her property as long as there is enough, and good enough left in common for others. The idea that these "others" include future generations yet unborn has caused the emphasis on sustainability to give way to stewardship and the precautionary principle, which recognize that there is no single truth about the state of the environment. Instead, one should proceed cautiously to minimize the effects of one's action. Yet difficulties remain in operationalizing these concepts due to differences between competing stakeholder paradigms for valuating the state of nature.

Commonsense Morality

Philosophically, the term *commonsense morality* is used most often to refer to the philosophy of commonsense, sometimes known as the Scottish philosophy after its primary exponents, Thomas Reid and his successors. It should be noted, however, that not all Scottish philosophers followed the philosophy of commonsense, and not all commonsense philosophers were Scottish. Also, other philosophers have used, in their normative ethical theories, notions of commonsense morality; in doing so, they typically are referring to our shared ideas of morality and moral judgment.

Commonsense philosophy as espoused by Reid, in its essence, was a reaction to the idealism espoused by George Berkeley and to David Hume's skepticism. In response, Reid argued that even if the existence of concepts such as real external objects or space are not strictly provable in a logical sense or cannot be learned from experience, their existence remains self-evident to all humans (the doctrine of natural realism). He further held that such principles and concepts are inviolable, since denying them does not rid oneself of them (denying the reality of external objects does not make them disappear).

Reid's realism in such questions carried over to his thoughts on ethics. Morality has principles, Reid argued, and the first principles of morality were as self-evident to people with moral education as were the principles mentioned above. These principles were of several types. One type, referred to as *general*, deals with matters such as whether a person can be blamed for an action over which the person had no control. The second type, referred to as *particular*, contains the more recognizable normative moral principles concerning duties to self, others, and God. For example, Reid gives a version of the Golden Rule as one of the self-evident duties to others; the other duty is that people should act to benefit the society of which they are a part. The latter sounds consequentialist, but Reid is typically considered a deontologist, and commonsense morality, in general, can be considered deontological in that moral rules are fundamental to ethics.

Ordinary commonsense is seen by Reid as containing the self-evident moral principles he discusses. If commonsense and theory are in conflict, then theory must be in error and should be altered to fit commonsense. However, instead of people agreeing to obligations out of self-interest and then recognizing their moral nature, Reid argues people know concepts in similar ways and understand their moral nature before agreeing on rules upholding such concept.

Reid quite rightly notes that the particular principles can conflict with one another. In this he agrees with moral pluralists. His solution is unlike that of pluralists such as W. D. Ross, however, because Reid says we also can see self-evident priorities among the moral principles. If the priorities are self-evident, they are always in a certain order, so context means little, unlike in Ross's pluralism. For example, Reid mentions that between the virtues of (unmerited) generosity, gratitude (generosity in response to another's action), and justice, justice is self-evidently the most important, gratitude the second, and generosity the third. On the other hand, Reid sees greater worth in generosity than in justice. Thus, justice must be instituted, but when one is unencumbered by other considerations, generosity should always appeal to the actor.

The self-evident moral principles noted by Reid are to be directly and immediately perceived by all humans through what he calls a conscience. In part, this is an intellectual power allowing us to perceive self-evident principles and, in part, an active power that might motivate us to act on our perceived duty. All humans have this conscience and so are able to act in morally correct ways. However, conscience needs to be developed over time. Some form of moral education is thus necessary, but Reid seems to indicate that all humans go through the process somewhat naturally—and can be aided or harmed by education.

Contrary to what he believes is Hume's view of morality, Reid argues that morality involves judgment and reason and is not merely a matter of sentiment and passion. Sentiment and judgment are related, but for Reid sentiment changes as judgments are made. Reid acknowledges passion as a motive for action, but he insists that other motives arise from rational principles such as our overall good and our duty (which is superior in authority to interest).

Although Reid's overall philosophy of commonsense was altered over time by his followers to the point that some have argued it became closer to skepticism than to Reid's original thought, his moral philosophy was relatively unchanged. Followers such as Dugald Stewart and James Beattie agreed with Reid's ideas concerning morality, which formed one response to Hume. Kant formed another and different response. Kant's response has been much more influential, although in Great Britain, France, and the United States Reid's followers had influence for much of the 19th century. C. S. Peirce and G. E. Moore developed their ideas in part based on commonsense philosophy.

Other philosophers have invoked commonsense in one way or another in explaining their normative ethical theories. For example, Aristotle uses commonsense (in the sense of common beliefs about the good) as a beginning point for his arguments and as a test of whether his theory passes muster. Kant notes some common ideas concerning morality and seeks to explain philosophically the conditions that must underlie our ordinary ideas of morality, if these ideas are true. Proponents of natural law, such as Saint Thomas Aquinas, believe that the most basic moral principles are self-evident and thus available to all humans. Finally, John Rawls's notion of reflective equilibrium relies on considered judgments that may need to be accepted by all competent judges (in one version this is true; in another version it is not). This notion also speaks to commonsense.

Commonsense morality is an interesting if underexplored approach to business ethics. Several questions might arise in such exploration. For example, how does commonsense morality relate to the decisions businesspeople make on a daily basis? Can commonsense be relied on to guide those decisions, and what is the effect of business school education on commonsense? To what degree are codes of conduct based on commonsense and how is that related to their effectiveness? To what degree do commonsense notions of treating well those with whom one comes in contact (such as colleagues, employees, customers, and suppliers) coincide or conflict with managerial or stakeholder capitalism? Exploration of these questions could prove fruitful for those interested in business ethics.

Communications Decency Act

The Communications Decency Act (CDA) was enacted by the U.S. Congress in 1996 in response to concerns about minors' access to pornography via the Internet. The CDA was Title V of the Telecommunications Act of 1996, but in two separate cases, *Reno v. Shea* of 1997 and *Nitke v. Gonzalez* of 2005, federal judges found that the indecency provisions were found to abridge "the freedom of speech" protected by the First Amendment to the U.S. Constitution. Both decisions were affirmed by the U.S. Supreme Court without comment.

The CDA has become a powerful example of federal regulation in place of an industry's self-regulatory activities. The CDA was enacted on February 1, 1996, as representatives and senators prepared for reelection campaigns the following fall. The CDA was intended to show voters that Congress understood the risks of a rapidly growing emerging technology.

The CDA created a criminal cause of action against those who knowingly transmit "obscene" or "indecent" messages to a recipient under the age of 18 years. It also prohibited knowingly sending or displaying a "patently offensive" message containing sexual or excretory activities or organs to a minor. The CDA did, however, provide a defense to senders or displayers of online "indecent" materials—if they took reasonable good faith efforts to exclude children.

This legislation had numerous problems that affected both Internet service providers (ISPs) and businesses. First, there was no way for senders or displayers to know if they were within the exception. At that time, it was difficult and cumbersome for a sender to screen out minors. The displayers could ask for a credit card number as validation, but it would not allow them to conduct business with those who did not have a credit card and were over the age of 18 years. In addition, the terms *indecent* and *patently offensive* were too ambiguous, and the CDA as a whole placed an undue burden on free speech.

These portions, especially those regarding the phraseology of the CDA, were quickly fought by civil rights groups and free speech advocates and were challenged in a court of law by numerous plaintiffs. The case was ultimately brought to the Supreme Court in *Reno v. ACLU*, which was argued on March 16, 1997, and decided on June 26, 1997. The provisions in Sections 223 of Title 17 U.S. Code Annotated regarding *indecent* and *patently offensive* materials were found to abridge "the freedom of speech" protected by the First Amendment to the U.S. Constitution.

Although the portions of the CDA regarding indecent conduct were overturned, there are provisions within the CDA that remain intact. The portions of Section 223 regarding obscene content were challenged in *Nitke v. Ashcroft*, but Nitke was unable to meet the burden of proof necessary to support her claim. On July 26, 2005, an appeals court ruled that obscene content is not protected by the First Amendment, but that Nitke's challenge was to the reliance on community standards to determine whether her online content was obscene. The U.S. Supreme Court upheld this decision in 2006.

Another distinctly different portion of the CDA can be found at 47 U.S. Code Annotated Section 230. This section had previously been introduced by Representatives Chris Cox and Ron Wyden as the Internet Freedom and Family Empowerment Act and had already passed the House. The text of this bill was added to the CDA during a conference to reconcile differences between the Senate and the House versions of the bill. Section 230 creates a federal immunity to any cause of action that would make service providers liable for information originating with a third-party user of the service. Although this does protect online forums and ISPs from most federal causes of action, it does not exempt providers from criminal, communications privacy, or intellectual property claims, nor does it exempt them from applicable state laws.

In practice, ISPs' immunity from prosecution has itself created problems. While ISPs are protected by the "Good Samaritan" portions of this section, there have been individuals and groups who have sued Internet users and ISPs over libelous Web pages. Some parties maintain that users should be able to sue ISPs in cases where it is appropriate, including situations where an anonymous poster of questionable content in an online forum cannot be identified.

Also, the courts have not clearly defined the line at which a blogger, who may be viewed as an information publisher and a user, becomes an information content provider. Editing a Web page, or posting a comment, so as to create a new, defamatory meaning for the existing content, may cause that user to lose protection under Section 230. Section 230 does not provide immunity from federal criminal law, intellectual property law, and electronic communications privacy law.

Communications Workers of America

The Communications Workers of America (CWA) is America's largest communications and media union. The CWA represents employees in telecommunications, broadcasting, cable TV, journalism, publishing, electronics, and general manufacturing. It also represents employees in airline customer service, public safety, government service, health care, and education.

The CWA is headquartered in Washington, D.C. It is affiliated with the AFL-CIO, the Canadian Labour Congress, Communications Workers Union and the Society of Telecom Executives in the United Kingdom, and the worldwide Union Network International.

As of 2005, the CWA represents more than 700,000 men and women in both private and public sectors who are party to 2,000 collective bargaining agreements on wages, benefits, working conditions, and employment security provisions for its members. Among the major employers of CWA members are AT&T, GTE, the Regional Bell telephone companies, Lucent Technologies/Bell Labs, General Electric, NBC and ABC television networks, the Canadian Broadcasting Corp., *New York Times*, *Wall Street Journal*, *Washington Post*, US Airways, the University of California System, and the state of New Jersey.

Attempts in the early 1900s to unionize the communications industry by groups such as the International Brotherhood of Electrical Workers and the Women's Trade Union League were largely unsuccessful because of the monopolistic powers of the Bell Telephone Company and the nature of the industry, for example, geographically dispersed and transitory workers, and changing technology, that is, the introduction of dial telephones. The ability to unionize grew stronger with the passage of the National Labor Relations Act (commonly known as the Wagner Act) signed by Franklin Delano Roosevelt in 1935. The Wagner Act had three provisions: It prohibited the employer from engaging in certain activities that were defined as unfair labor practices; it protected union and collective activity, protected workers who took part in grievances, on-the-job protests, picketing, and strikes; and it established an agency, the National Labor Relations Board, to enforce the provisions.

The CWA arose from the collapse of The National Federation of Telephone Workers (NFTW). This loosely federated group benefited from stagnant wages and deteriorating working conditions during World War II, which stimulated telephone worker solidarity and union amalgamation, and held a successful strike in 1946, which led to the first national agreement with AT&T. The NFTW could not repeat its success in subsequent years and disbanded. In 1948, the CWA was born. Throughout its history, the CWA has focused on unionizing workers in the telecommunications industry, fighting for wage increases, comparable pay and benefits, fair working hours, and the right to strike. In the 1980s, the CWA began to expand beyond telecommunications. It created a Public Employees Department, which successfully organized 34,000 New Jersey state workers. It merged with or absorbed other unions, including the International Typographical Workers Union, the National Association of Broadcast Employees, and the Newspaper Guild.

At the turn of the 21st century, the CWA enters a critical period. Union membership, particularly in the private sector, has declined in recent decades. Since 1970, the percentage of the U.S. workforce that is organized has dropped from 30% to 12%. The decline in membership comes at a time when managements argue for lower wages and benefits and eliminate job security in the name of efficiency and flexibility and there are threats to jobs from deregulation and global competition. The current issues that the CWA is concerned about include the health risks of working with lasers, for example, in fiber-optic communications systems, telecommunications reform, and consolidation of media ownership.

Communism

Communism is a social philosophy based on the common possession of property and the elimination of private ownership. The moral basis of communism is founded on the belief that private property represents an obstacle to the creation of a genuine human community. By creating inequality and encouraging competition for the possession of scarce resources, private ownership undermines cooperation and creates artificial social hierarchies that benefit the powerful and cause suffering to the poor. By replacing private ownership with the common possession of the productive resources of society, communism aims to overcome social injustice and create a new society based on human cooperation.

History

Among the earliest discussion of communism as a moral concept is Plato's *Republic*, which is an extended meditation on the question of justice. The just society, according to Plato, is one in which those with wisdom rule over the others. Wisdom is embodied in the ruling class of guardians and, ultimately, in a philosophical elite. These "philosopher-kings" would rule justly and disinterestedly, living communally and without private property. Merchants and craftsmen would be permitted some private property but would be barred from governing. In addition to abandoning private property among the ruling class, a just society, according to Plato, would also abolish traditional familial relationships and recruit the ruling class from among the children of all members of society. Plato, thus, proposes a system that is simultaneously egalitarian and elitist, insofar as any child may potentially be drafted to serve as a member of the guardians, but only those deemed to be the "best" among the members of society are permitted to share in its governance.

Unlike many later versions of communism, only the elite abandon private property. Ordinary citizens, incapable of abandoning and transcending their desires to contemplate the good, true, and beautiful, are not expected to live communistically. The rulers, on the other hand, knowing the nature of the good, don't desire material goods and, according to Plato, are not susceptible to the corruption that other, baser political and economic arrangements engender.

Some early Christian communities seem to have subscribed to a communist social arrangement. According to the New Testament account in the Acts of the Apostles, "the whole group of those who believed were of one heart and soul, and no one claimed private ownership of any possessions, but everything they owned was held in common" (Acts 4:32). However, it is not clear how this common possession was administered. The author of Acts relates the story of Ananias and Saphira, a couple who sells a plot of land but keeps some of the proceeds for themselves. Peter admonishes Ananias, "While it remained unsold, did it not remain your own? And after it was sold, were not the proceeds at your disposal?" This would seem to imply that the community of goods was at least somewhat voluntary. Even so, it is noteworthy that the author of Acts discusses these events in the past tense. However, it was that the early Church held property in common; within only a few decades, it appears to have abandoned the practice.

The practice of holding all things in common remained alive in the Church primarily through the discipline of monastic life. The model for monastic communal life is the Rule of St. Benedict. Chapters 33 and 34 of the Rule state that individual monks are not permitted to hold any private possessions without the abbot's permission and prescribe the criteria for the just distribution of goods among the monks.

Thomas More's *Utopia* (a word that means "no place") purports to be the account of the adventures of a sailor named Hythloday in a newly discovered country, the residents of which share all their goods in common and have no distinctions of rank. Each household in Utopia is identical and even the clothing worn by the utopian citizens is identical. Communal ownership of property is taken to such a degree that the citizens rotate among the houses on a regular basis.

Prior to the publication of *The Communist Manifesto* in 1848, *communism* as a political movement had been developing for several decades. The term may have come into official political currency through the work of Emile Babeuf, the French utopian thinker, but it was quickly adopted among the revolutionaries of the period. One can also find criticisms of private property in the works of Jean-Jacques Rousseau, among others.

The term *communism* as it is used today is based on the theoretical groundwork laid by Karl Marx and Friedrich Engels, who together developed communism from a utopian theory of communal life into a political program that proved to be intellectually attractive as well as politically successful through much of the 20th century. What distinguished Marx's communism from its earlier cousins was Marx's determination to understand communism primarily as a scientific, political, and economic program rather than as a moral ideal. This program was rooted in an "historical materialist" description of social conditions. According to this theory, there are no cultural, moral, or political values that exist independently of one's class status. The way to change the values of society was, therefore, to change the economic conditions as they existed by overthrowing the existing ruling class and elevating the proletariat to the ruling class, thereby creating a society whose values were rooted in universal social conditions.

Vladimir Ilyich Lenin, who combined Marx's economic and political theories with a particularly brutal revolutionary strategy, was able to bring the Bolshevik party successfully to power in Russia during the October 1917 revolution. Afterward, the identification of communism with the philosophical and political agenda of what came to be known as "Marxism/Leninism" became a matter of course. This had several effects, not least of which was elimination of any discussion of other, putatively more "utopian," approaches to communism. In addition, moral evaluation of communism became identical with moral evaluation of the totalitarian political and economic system of the Soviet Union. Finally, it established the Leninist interpretation of Marxism as normative for purposes of evaluating its social, political, and moral implications. Nevertheless, there remained an undercurrent of non-Leninist interpretation of the Marxist philosophy that existed throughout the Soviet era and that still exists.

Communist Ethics

While earlier approaches to communism were emphatically moral, even moralistic, in their arguments for the abolition of private property and the establishment of a society rooted in communal values, the communism of Marx, Engels, and Lenin was disdainful of moralistic appeals. By arguing for the "scientific" status of communism, they sought to take the argument out of the field of morality altogether in the name of an ultimately deterministic metaphysical system (Marx's "historical materialism," later modified to "dialectical materialism" by Engels).

Nevertheless, Marx's own writing frequently betrayed an injured tone that decried unjust social conditions as dehumanizing and immoral. In *Das Kapital*, he describes the "vampire like" effects of the capitalist system, which drained workers of their very lifeblood through exploitation. By the same token, he argues that capitalism, through its creation of an alien and alienating system of commodities, dissolves the traditional bonds of civil society, including even the family. The very foundational mechanisms of capital, as Marx understands them, are rooted in the extraction of "surplus value" from workers, essentially robbing them of value that they had rightfully earned.

All this is not to say that Marx was seeking to make a primarily moral argument about the nature of capitalism. However, although Marx's arguments were seldom explicitly moral in their content, they were rooted, as Cornel West has argued, in a moral critique of the social conditions under which he observed workers living.

In "The Tasks of the Youth Leagues," Lenin argued in favor of the idea of communist ethics. According to Lenin, communist morality, contrary to bourgeois morality, is rooted not in the command of God but in the concrete interests of the proletariat. This means, in the first instance, that communist morality is dedicated to overcoming the oppression of the working class through the destruction of capitalist society. In doing so, communism would overcome class divisions in the name of human unity. Morality, determined as it is by class interests, also exists in the service of the interests of that class. The only criterion, thus, becomes whether a particular course of action promotes or hinders the revolutionary ascendancy of the working class.

There is, however, also a positive dimension to Lenin's interpretation of communist ethics. In destroying the bourgeois culture of exploitation, communism seeks to put in its place a system based on cooperation and mutual aid. However, no morality, according to Lenin, rises above the particular historical circumstances in which it exists.

Leon Trotsky strikes similar notes in his 1936 essay "Their Morals and Ours." Like Lenin, he argues that morality is a function of social circumstances and serves class interests. He argues contemptuously against various versions of what he terms "bourgeois" morality, but, in addition, he seeks to distinguish his own approach to morality from Stalinism. As opposed to the class-based morality advocated by Lenin, argues Trotsky, Stalinism is a reactionary reinforcement of the old order. Trotsky distinguishes his interpretation of communist ethics from the idea that the end justifies the means, a view he associates with Stalin, on the grounds that this perspective reflects a reactionary rather than a revolutionary agenda.

With variations, most Marxist-Leninist discussions of morality follow this general outline. Many noncommunist versions of socialism, including those informed by Marx's philosophy, explicitly reject this approach to morality, arguing that a genuinely Marxist ethic may be rooted in larger moral principles while at the same time being conscious of its historical contingency. The lineage that runs from Leninism through Stalinism, Trotskyism, and Maoism, however, affirms the class contingency of all morality and rejects any moral claims that are not rooted directly in the proletarian struggle for supremacy.

Ethical Criticisms of Communism

A number of criticisms can be made against communist ethics in general and the Marxist-Leninist variety in particular. First, communist ethics, in general, may be criticized as unrealistic and utopian, grounding its moral claims not in real human possibilities but in an ideal that human beings are incapable of achieving. This very argument, indeed, was used by Marx and Engels against the so-called utopian socialists with whom they struggled over the socialist agenda in the 19th century. By appealing to a malleable human conscience rather than concrete human possibilities, this objection runs, communist ethics evades genuine responsibility for the world it purports to seek to change.

A second objection is based on the human right to private property. Although Marx's analysis of capitalism was deeply indebted to the work of John Locke and Adam Smith, Marx, unlike them, did not regard property as something over which people had any form of natural right. For Locke and Smith, however, as well as for their many descendants, private property is at the foundation of a just society, insofar as it permits people a realm of personal autonomy that constrains efforts at control by the state or other social institutions.

A third critique of communism is that its social strategy runs contrary to its stated objective, the creation of a classless society. Lenin's justification of Bolshevist activism in the name of the "dictatorship of the proletariat" merely substitutes an ideological and ultimately corrupt bureaucratic elite for a capitalist oligarchy. Communism, as practiced, has proven to be far less economically productive than capitalism and has thus produced a far smaller degree of aggregate social welfare. Communism has been more effective as a critique of capitalism than as a constructive political or economic theory in its own right. By focusing on the maldistribution of wealth under capitalism, without a corresponding understanding of the nature of economic growth, communism never developed effective techniques for sustained economic expansion.

A fourth objection, relevant particularly to the Leninist stream of communist ethics, is that by basing its ethics solely in the concrete interests of the working class, communist ethics becomes hopelessly relativistic, allowing any form of cruelty or barbarity in the name of promoting revolutionary change. Both Lenin and Trotsky sought to address this criticism but neither ever offered a strong rebuttal to the accusation. Indeed, their most developed elaborations of communist ethics seem to support this objection in spite of their best efforts.

In the final analysis, communism as an economic system failed to deliver on its most central promises—the creation of a classless society and the creation of a productive and nonexploitative economic and political system. Whatever its inadequacies, however, communism may still possess some enduring value as a critique of capitalism, particularly in light of the inequities of globalization. While it may provide no prescription for the solution of these problems, it embodies the protest that an economy in which all people participate should, insofar as possible, be an economy from which all benefit.

COMMUNITARIANISM

Communitarianism designates a political theory that reminds us that persons live within a complex web of groups and associations by which they define themselves and take up responsibilities that form the bonds uniting them in common efforts. The modern world is dominated by the great institutions of the state and the market. Communitarians emphasize that in addition to those two great centers of power, there are numerous other communities and associations that people form so as to carve out together meaningful and effective lives together. Indeed, through these associations members can gain the power to influence the state and the market. Communitarianism is, in part, a sustained response to contemporary liberalism's tendency to emphasize the freedom of individuals at the expense of neglecting the role of communities. Communitarianism is best understood, then, as a critique of liberalism, especially of its excessive individualism, largely done as a corrective within—not against—liberalism itself.

Liberalism asserts two universal principles concerning human beings, *autonomy* and the *respect* due to persons because of their autonomy. Communitarians argue that contemporary liberalism holds society to be composed of individuals each of whom seeks his or her good through a political order protective of individual rights and private pursuits. Many liberals champion individuality to the neglect of the complex forms of cooperation that nurture and support all persons' lives; discount the interdependence essential for gaining knowledge and power; and forget the development of self-identity through reciprocally revealing interchanges with, and commitments to, others. Communitarians assert the interdependence of the self with others in numerous associations through which persons become unique individuals with perspectives, talents, and identities of their own with which to pursue the good as they conceive it together. Communitarians acknowledge and encourage the formation of associations, both large and small, in *civil society*, a space for civic action lying between the state and the market, where people discover themselves and their world through accepting the responsibility to act effectively and morally in solidarity with their fellows.

Alasdair MacIntyre emphasizes that communities endure through time because members hand down their beliefs and practices as traditions for newcomers to learn and perform with excellence. A practice, such as medicine, is widely respected because its practitioners are recognized as part of a tradition of education and performance of a widely recognized good upheld by the policing of the practitioners themselves. MacIntyre's emphasis on tradition and continuity through practices led him to turn away from liberalism and toward Aristotle and Thomas Aquinas, philosophers who discussed excellence through traditional practices within authoritative institutions, the *polis* and the Church, respectively.

Liberalism asserts persons' equality due to their freedom of choice. Liberalism is aptly named for it is a doctrine of autonomy, the view that persons have the freedom to *choose* to participate in society's institutions and to determine the goods whose pursuit is at the core of their own lives. *Autonomy* here means freedom as self-assertion and efficacy ranging from individual or private interests to the system of public deliberation, agency, and law. Autonomy includes persons' ability to accept moral obligations they decide they *ought* to perform due to a problematic situation they face. When people decide together the rules they agree to obey for their mutual benefit, they are expressing their freedom, not limiting it. When a person decides that a certain action is an objective moral obligation to which she or he holds herself or himself, she or he is exercising her or his moral freedom. Acting on a decision is an expression of power—the ability to realize in deed one's considered intention rather than to submit to extraneous forces. Due to their autonomy, persons deserve respect from one another, because in their freedom they reveal themselves as one another's equals before the law, engaged in articulating through their words and realizing through their deeds their vision of a common world. Respect requires that persons not use one another as mere instruments, but that they seek to form a common bond with others that opens the way to accord and solidarity in common purposes.

If all are free and equal, their polity should reflect and respect this fact about persons. As a result, numerous liberal theorists have sought through thought experiments to discern those organizational principles that will best enable free and equal persons to construct a fitting civil order for themselves. These experiments can be traced from Thomas Hobbes's and John Locke's "states of nature" and "social contracts" to John Rawls's "original position." These thought experiments all argue for rights due to all members of the imagined order as well as limitations on members' actions for the sake of the security and well-being of all. In return for the limitations on persons' actions, they are free to advance their self-interest in the market rendered secure by the state's oversight.

Liberal theorists, generally, have sought to construct political orders that provide, on the one hand, the equal opportunity to participate in the public realm of politics through the protection of civil rights and, on the other, security in the private realm needed for the pursuit of economic and other personal goods. Liberal theories retain the tradition's two realms: (1) a public realm in which discourse and decisions concerning politics, ethics, and law direct a government dispensing justice and (2) a private realm in which people attend to their own affairs, whether among intimates within the household or among others earning a living in the market. The protections provided to members of society are *rights* that can be claimed against anyone who would violate them while members pursue the *good* as they understand it.

People display *plurality* in their uniqueness, for no one is exactly like any other, and their different views on the good life arise from their singular experiences. Liberalism respects plurality among persons and, so, permits flexibility in choices made for a good life. That is, the polity should be neutral toward goods unless some good's pursuit leads to an injustice. Communitarians spy a problem here, for despite the specificity of persons evident in the goods they seek, the rights specified for them in a liberal state cannot honor that specificity, for justice demands universality—the application of the same rules and procedures to all independently of their uniqueness as persons. Justice in its liberal formulations necessarily treats persons as abstract individuals indistinguishable one from another. Communitarians complain that this liberal ideal provides only for universal justice as obedience to the laws. The good is left to private discernment while the state remains neutral toward citizens' decisions about private goods. Universality of justice and neutrality toward the good, however, is all that can be expected in a polity formed by the strangers in liberal thought experiments who draw up social contracts.

The liberal dedication to public justice and neutrality toward private goods is problematic because liberals do not agree among themselves concerning what are matters of justice and of good. John Rawls, for example, takes poverty to be a question of justice presenting an obligation that social and economic inequalities should be to everyone's advantage, especially the worst off. Rawls's position is an example of egalitarian liberalism. Robert Nozick, in contrast, argues that a just state ought only to protect persons in the security of their property and its legitimate transfer. Beneficence toward the less advantaged is a supererogatory good; that is, persons *may* address poverty on their own initiative but it ought not be required of some for the benefit of others. A requirement of beneficence is nothing short of confiscation of some persons' goods for their redistribution to others. Nozick's position is termed *libertarianism,* which holds the minimum government possible to be the best because it interferes least with the liberty of citizens to accumulate and transfer goods as they choose.

Charles Taylor proposes a communitarian response to Nozick's view that justice concerns only protection of one's property and its transactions alone, rendering assistance to others supererogatory. If we claim that persons have rights, we must presume persons or institutions also have the capacity to acknowledge those rights and act on them. That is, if we claim rights, we presume the capacity in someone or some institution to accept the responsibility to realize those rights. Furthermore, if we claim rights as something worthwhile, we must also affirm the worth of those capacities that enable us to enjoy our rights. We cannot look to ourselves for the source of the knowledge and use of our capacities; the source must initially reside in others. By ourselves we would be helpless to develop our own potential. Even libertarians have need for membership in those groups that enable growth in knowledge and practice. If libertarians take these human capacities as worthwhile, moreover, they have obligations to make them available to others. Standing idly by and allowing these goods to pass away through inaction would indicate that libertarians do not care about them enough to ensure their continuation in the world. Society is richer and fuller if we engage in all the institutions that enable us to become active and effective agents on behalf of our common human world.

The political core of liberalism is the establishment of a state that protects citizens' rights, establishes a rule of law, and enables citizens to enter into agreements with one another for the sake of whatever goods they choose. The public realm in a liberal polity is not the center of citizens' lives, however. Citizens enjoy their private lives while public officials administer the state so that it provides justice and security for all within its borders. Citizens expect their rights to be protected by the government, but there are few responsibilities expected of them in return. The scarcity of public duties enables citizens to concentrate on their private concerns alone. Attentive to public affairs primarily in terms of their own interests, citizens have little encouragement to take up the perspectives of other citizens. Intent on their own interests alone, citizens can mistake their needs for rights; sensitive to any infringement of their rights by injurious actions by others, citizens can become wary and litigious. Liberalism, despite its respect for the rights of all, offers too little encouragement for citizens to move beyond their concentration on their own interests toward the public attitude of citizens intent on comprehending the perspectives of their fellow citizens and participating in resolving political disputes in a way that fosters solidarity and support even for painful but reasonable resolutions of hard problems. Liberal polities are in danger of becoming soft tyrannies, using Alexis de Tocqueville's phrase, of benevolent administrators who oversee persons who have lost control of their government by forgetting how to think and act as citizens. The liberal state unites people as citizens concerned with rights but disperses them again as individuals seeking private goods.

Communitarians criticize liberalism's sharp division between "right" and "good" as artificial. Justice, after all, is itself a good and concerns goods. How can citizens determine what decisions are just until they discuss the goods that they will protect? How can citizens determine a just distribution of goods until they learn what human beings need for a decent life? It is only through the experience of living together that people can determine what is just and, so, good for human beings living within the context of their way of life. One of liberalism's achievements is the assertion and protection of plurality, but this good is best learned through forging familiarity and solidarity with various groups, not through separating oneself off from them. For liberal theory, the enumeration of rights enables people to reflect on what they consider essential components of justice in abstraction from any specific social context. But persons never live abstractly, *unencumbered*, using Michael J. Sandel's term, by particular social roles and expectations binding them together. Concepts of both the good and the right arise within the context of specific persons living together within a personal and group history that clarifies and justifies shared responsibilities and expectations.

To be sure, liberalism has advanced politics through its protection of minorities from oppression under a tyranny of the majority as well as of the majority from well-organized minorities. Living with pluralism and respecting those who disagree with oneself are virtues discovered and nurtured under liberalism in a way never achieved in earlier regimes. Public life in liberal democracies is diminished and precarious nonetheless. Communitarians fear that lack of public engagement presages a loss of democratic temperament that could endanger people's liberal commitment to plurality; liberal citizens are at risk of becoming isolated and self-absorbed even when surrounded by others.

Communitarians attempt to resolve liberalism's problem of citizens preoccupied with their private affairs by recognizing and building on the fact that we are all—always—members of numerous communities. Communitarians join other social theorists in referring to the many associations, whether in service to government and the market or not, that constitute civil society. These associations arise due to a public-minded interest in furthering certain ends, taking a stand with like-minded citizens, enjoying the company of others, and doing something of significance for the larger society. Members of civil society engage in professional work in universities, courtrooms, and hospitals; in civic work, in charities, or other nonprofits supporting the arts, health, and education; or in principled engagement in both domestic and international organizations dedicated to solving political and economic problems concerning human rights violations, famine, and disease. For protection against forces of the market, workers have formed unions, customers have organized boycotts, and environmentalists have presented educational programs and groups to build up political pressure. All these associations constitute and condition who their members become through their interactions within them, just as members participate in fashioning what these groups become through their membership.

Individuals in liberal society face danger because they too often stand alone—or think that they do—before vast political and economic institutions, unable to influence or confront the elites directing these institutions. Due to their isolation, citizens become estranged from a world within which they have no ties other than the abstract, thin ones of a voter or an employee; they come to consider all human interaction to be egoistic, market-like transactions driven by self-interest. Communitarians rely on organizations of civil society to resolve the problem of isolation liberalism produces along with autonomy and respect for plurality. *In so doing, communitarians resolve a liberal problem with a liberal solution.* It is the liberal character of the people that makes them adept at forming civil associations. Civil society organizations enable citizens to take direct action with one another for purposes they recognize as good. In civic action, citizens both learn political skills and put them into practice. One purpose of civic action, then, is to help persons grow as engaged citizens.

Civil society gives its members an alternative to government and the market for achieving social goods. Some purposes are not reducible to the private transactional interests of individuals or to legislated policy holding universally. Some goods, rather, are achieved best by persons acting together for a good held in common. Civic organizations need to require that their members think and act in a democratic way. Democracy requires the exchange of opinion, drawing citizens to consider problems in ways that take them beyond their own perspectives to those of others discovered through deliberation and disclosure. Citizens' commitment to action comes from agreement reached on possibilities none of which could have been reached alone. Liberalism provides the foundation for this communal achievement by instilling in citizens a realization of their right to participate equally with others and respectfully to consider others' points of view. Expositions of liberalism too often fail to clarify the democratic capacity at its heart, however, emphasizing instead individual autonomy. Communitarianism focuses on the vital core of liberal democracy—the community of citizens challenging one another to move beyond private interests for the sake of goods that can be sought together and held in common.

Members of civil organizations do not forsake their independence through participation; they learn to be critical of themselves, of their organizations, and of society and its institutions generally so as to prepare themselves to realize more fully their political freedom. Due to multiple group membership and conversation with their fellows, citizens assess society from many points of view—their interest and their capacity to understand their whole society grow apace. Civil society that makes possible civic engagement in the pursuit of common goods would be undermined were it to create reticent, incurious citizens confined within the horizons of their own groups. The activities essential to effective membership—attention, discussion, disagreement, and compromise—are crucial for good citizenship and are learned only by engaging citizens with different interests and views.

Public action is complicated, sometimes past all compromise. Communitarians seek to remind liberals that social exchange requires patience, experience, forbearance, and care. At times, at an impasse, only their respect for one another holds people together as fellow citizens. Unless citizens are awake to the commitments of community as well as stirred by the promise of rights and autonomy, they will not have the fortitude to be responsible and, as such, truly free.

Community Reinvestment Act of 1977 (CRA)

In 1977, the U.S. Congress enacted the Community Reinvestment Act (CRA) to encourage banks and thrifts to help meet the credit needs of all segments of their communities, including low- and moderate-income neighborhoods, in ways consistent with safe and sound lending practices. The act, which applies to federally insured depository institutions, national banks, thrifts, and state-chartered commercial and savings banks, essentially extends and clarifies the long-standing expectation that banks must serve the convenience and needs of their local communities.

Prior to the passage of the CRA, many bankers were accused of *redlining*, a practice of systematically excluding low-income neighborhoods and people of color from their lending products, investments, and financial services. The term was coined by community activists when they found that the lack of bank loans in some low-income neighborhoods was so geographically distinct it was easy to draw red lines on maps to delineate the practice. Using the Fair Housing Act of 1968, which prohibited discriminatory practices in the housing market, and data on lending patterns made available through the 1975 Home Mortgage Disclosure Act, activists across the country began to create strong pressure on banks to improve their performance in equitable lending to everyone in their communities.

In passing the CRA, the Congress found that (1) regulated financial institutions are required by law to demonstrate that their deposit facilities serve the convenience and needs of the communities in which they are chartered to do business, (2) the convenience and needs of communities include the need for credit services as well as deposit services, and (3) regulated financial institutions have a continuing and affirmative obligation to help meet the credit needs of the local communities in which they are chartered. The act requires the federal financial institution regulators—the Office of the Comptroller of the Currency (for national banks), Board of Governors of the Federal Reserve System (for state-chartered banks that are members of the Federal Reserve System and bank holding companies), Federal Deposit Insurance Corporation (for state-chartered banks that are not part of the Federal Reserve System), and Office of Thrift Supervision (for savings associations and savings and loan holding companies)—to assess the record of each bank and thrift in fulfilling these obligations. The Federal Financial Institutions Examination Council (FFIEC), a formal interagency body empowered to prescribe uniform CRA principles and standards, periodically publishes *Interagency Questions and Answers* and *Interagency Interpretive Letters* in an effort to promote consistency in CRA implementation across these agencies and financial institutions.

The regulators have three basic responsibilities: (1) to *encourage* banks to meet the credit needs of their entire communities, (2) to *assess* the CRA performance of these lenders in meeting community credit needs, and (3) to *consider* this performance when evaluating a bank's application for expansion. As a result, every financial institution covered by the CRA is examined and given a rating, as part of its normal regulatory review, every 2 to 5 years that reflects its record in this area. The ratings range from "outstanding," "satisfactory," and "needs to improve" to "substantial noncompliance." A written performance evaluation of a bank's CRA activities, including its CRA rating, is prepared at the end of each CRA examination and made available to the general public (e.g., the FFIEC publishes the latest CRA ratings of financial institutions on its Web site). Community and civic organizations, local government, and other members of the public are encouraged to express their views about a bank's CRA performance to the bank and the appropriate regulatory agency.

The regulators are required to consider this record in evaluating applications for bank charters, bank mergers and acquisitions, and branch openings and relocations. The CRA provided citizens with standing to intervene in the regulatory process, and a poor CRA record could serve as grounds for denial of an expansion request. Local community groups, nonprofit development organizations, small business associations, and public agencies have used the CRA to air complaints about the lending performance of individual institutions and to seek redress for their grievances.

Over time, the CRA has come to play an increasingly important role in improving access to credit in both urban and rural communities across the country. Yet, although the CRA challenge is a popular grievance procedure for grassroots organizations, it has rarely worked as originally intended. In fact, by the early 2000s only a handful of the estimated 250 or more CRA challenges have resulted in application denials. Generally, the effectiveness of the challenge process rests with the ability of community groups to win commitments directly from the financial institutions themselves, usually in the form of negotiated settlements to the dispute. These agreements are often quite detailed and spell out the specific steps and action plans the banks agree to take to improve their lending record in the low- and moderate-income neighborhoods in question.

Under the impetus of the CRA, many banks and thrifts opened new branches, provided expanded services, and made substantial commitments to increase lending to all segments of their communities. Despite these successes, the CRA examination system has been criticized by both financial institutions and community groups. Financial institutions argued that policy guidance from the regulatory agencies was unclear, examination standards were applied inconsistently, and that the examination process generated excessive paperwork. Community, consumer, and other stakeholders have generally agreed with the industry that there were inconsistencies in CRA evaluations and that examinations placed greater emphasis on process rather than performance (e.g., actual lending). Community and consumer groups have also criticized the agencies for failing to aggressively penalize banks and thrifts for poor CRA performance.

Amendments to the CRA

While there were a number of modifications to the act over the years, in 1996 a new system of CRA regulations was phased in that was developed in response to these criticisms. The final rule sought to emphasize performance (outcomes) rather than process, to promote consistency in evaluations, and to eliminate unnecessary reporting burdens. The new regulations reduced recordkeeping and reporting requirements, especially for small banks, and made other modifications and clarifications. Under the new regulations, for example, separate evaluation systems were developed for small banks (those with assets less than $250 million), large banks (assets more than $250 million), wholesale and limited-purpose banks (generally those that either do not take deposits or do not have branch operations), and banks that choose to develop their own strategic plan. Large banks would be examined on three distinct tests: lending, bank services (especially those targeted to low- and moderate-income individuals), and investment in their surrounding community (e.g., supporting affordable housing, equity investment in small businesses). Large banks were also publicly required to disclose information about their community development lending, mortgage lending in nonmetro areas, and small business lending. Small banks would be tested mostly on lending and have looser reporting requirements. Banks that chose to develop their own strategic plan were expected to detail how they proposed to meet their CRA obligations. By seeking input from community stakeholders, this approach was intended to allow banks to tailor their plans to more effectively meet the specific needs of their local communities.

Under the rule, community development was also expanded to include activities outside of low- and moderate-income areas if (1) the activities provide affordable housing for, or community services targeted to, low- or moderate-income individuals or (2) if they promote economic development by financing small businesses and farms. As part of the final rule, to be considered a community development loan or service, the activity must have community development as its primary purpose. Activities that are not specifically designed for the express purpose of revitalizing or stabilizing a low- or moderate-income area, providing affordable housing for and/or community services targeted to low- or moderate-income persons, or promoting economic development by financing small businesses and farms are not eligible. The fact that an activity provides indirect or short-term benefits to low- or moderate-income persons does not make the activity community development. As an example, a loan for upper-income housing in a distressed area would not qualify on the basis that the activity provided indirect benefits to low- or moderate-income persons from construction jobs or an increase in the local tax base that supports enhanced services to low- and moderate-income area residents.

Future Prospects

When the CRA was first created, banking was predominantly a local business, largely due to restrictions on interstate banking and branching activities, and banks and thrifts were responsible for the vast majority of mortgages. Thus, the CRA's definition of a bank's community—which was essentially where it has branches and takes in deposits—made sense. Over the three decades since the act was passed, however, the mortgage and financial services industries have undergone significant restructuring. Internet banks and mortgage firms literally offer credit everywhere, industry consolidation has spawned banks with customers (but not necessarily branches) across the country, and nonbanks (e.g., credit unions, mortgage companies), which are not subject to the CRA, vie with banks to offer loans.

Given these changes, bank regulators published an Advanced Notice of Proposed Rulemaking, which noted that while CRA regulations are sound, the act must continually be updated to keep pace with the changes in the financial services industry. Questions, for example, have been raised about the necessity of two key provisions of the CRA: (1) the community reinvestment obligation, which stated that banks and thrifts have a specific affirmative obligation to help meet the credit needs of their communities; and (2) the enforcement provision, which dictates penalties against banks and thrifts with substantial noncompliance ratings. In March 2005, the federal banking agencies published a joint notice of proposed rule making in the *Federal Register* intended to further reduce the regulatory burden on community banks while attempting to make the CRA more effective in encouraging banks to meet community needs. Some of the changes being examined include raising the threshold defining large banks from $250m to $1 billion and creating a middle tier of banks with assets between these limits. These mid-tier banks, like the smaller institutions, would face streamlined examination and would be exempt from many reporting requirements as well as exemption from the rigid three-part test in lending, services, and investments that large banks must follow. While regulators would still scrutinize the investment and services activities of these institutions, they would give the banks more flexibility to decide whether or not these activities made any sense in their specific performance context.

Today, most bankers claim they would do the bulk of what the act requires—providing mortgages and small-business lending—without the CRA because it is profitable business. Yet, despite these changes and challenges, the CRA has had an importance influence on the expansion of access to mortgage credit and banking services to low- and moderate-income individuals. Clearly, while the growth of large and diverse lending organizations will continue to pose significant regulatory challenges for the CRA, the act continues to provide significant incentives for regulated financial institutions to expand the provision of credit to lower income and/or minority communities where they maintain deposit-taking operations.

Commutative Theory of Justice

Commutative justice deals centrally with fairness in the exchange of goods and fair participation for buyers and sellers in the system of exchanging goods for payment. Theories of commutative justice articulate the content, processes, social relationships, antecedents, consequences, and boundaries of systems that provide buyers and sellers with fair participation in the exchanges of goods for payment.

Justice is the attribute of being fair to what is properly merited by facts, reasons, and principles. Commutation describes systems of exchange; the economy is a commutative system in which goods are exchanged for payment in a marketplace of buyers and sellers. There is much debate, however, about the content of commutative systems that deserve to be labeled as just. Sellers with significant market power over buyers, for example, may set prices at a level that creates substantial profit but locks out some deserving buyers. One such case is in some segments of the pharmaceuticals industry, where sellers still retain the power to set drug prices but may set them at a level that poor people cannot afford the therapies they need. The counterargument in this debate notes that high prices attract additional sellers and reinvestment so that over time more buyers will be able to participate. In this view, the marketplace adjusts in a dynamic process that is as fair and just as possible.

Some argue that the justice of the buyer-seller exchange can be determined only by the subjective judgment of each participating individual. In this view, free markets based on voluntary exchange are the most just because there is no coercive interference with the individual's subjective perception of what is fair and properly merited by facts, reasons, and principles. This perspective is most notable in the theories of Austrian economics. Seminal thinkers in this tradition include Carl Menger, Ludwig von Mises, and Friedrich Hayek.

Free markets of individuals sometimes are criticized for failing to adequately supply critical social resources such as education, transportation, communication and computing services, nutrition, health care, child care, and clothing. Importantly, each person's ability to access these social resources is likely to enable or hinder their capability to participate as a buyer or seller in the marketplace. Access to these social resources, therefore, is likely to be a significant antecedent of commutative justice, and commutative justice is likely to decrease as the distribution of such resources becomes increasingly narrow. This view emphasizes the sociological and public policy processes that are likely to influence commutative justice. Egalitarianism, utilitarianism, and socialism are normative philosophies often applied by social scientists in this tradition of commutative justice.

It is difficult to develop a positivist science of normative commutative justice consisting of lawful theoretical relationships that can be reliably observed and empirically falsified. This is because justice is an intangible principle of philosophy that is difficult to measure; and each observer's subjectivity and individual normative preferences regarding the definition of justice make reliable and standard measurement very difficult if not impossible. These obstacles to our theoretical understanding may be overcome, in part, by a descriptive approach to commutative justice that focuses on tangible measures of market participation.

COMPARABLE WORTH

Comparable worth is the theory that states that wages for particular occupations, most notably those traditionally filled by women, should be set by an assessment of the meaningfulness of the work in relation to jobs of similar worth rather than through a market-determined process that often results in lower wages for women in certain jobs. Factors such as education, skills, effort, responsibility, experience, and other relevant factors are all part of a formula to determine the relative worth of a job and the employee is paid consistent with that determination. This avoids the issue of paying employees different wages for jobs based on whether the jobs are male or female dominated and would avoid the limitations of the law only permitting comparison of pay among employees with the same jobs.

In the United States, as virtually everywhere in the world, wages earned by men and women for the same or comparable work are not equal. U.S. figures show that women make 77 cents for every dollar men make. A 2003 report by the U.S. Census Bureau found that the average male working full-time, year-round earned $54,803, while the figure for females was $37,123, or 32% less. A June 2, 2004, Bureau of Labor Statistics (BLS) report concluded that women earn less than men with the same education, at all levels. A 2004 study by Stephen J. Rose and Heidi I. Hartmann found that the 77% figure is actually closer to 44% because the BLS statistics consider only full-time, year-round employees, which accounts for only about 25% of female employees. Roughly 75% of female employees work only part time or go in and out of the labor force to bear or care for children and/or elderly parents.

The wage gap is present in every profession. For instance, on average female doctors earn 58% less than male doctors. According to the AFL-CIO, the average 25-year-old woman who works full-time, year-round until she retires at age 65 will earn $523,000 less than the average working man, and if things continue at the rate that they are presently progressing, women's wages will not be equal to men's wages until the year 2050.

There are many reasons for the wage gap, some of which have nothing to do with intentional discrimination, but according to BLS and other researchers, gender discrimination accounts for a portion of it. Even when males and females have comparable education, experience, time on the job, and other relevant factors, women's pay still lags behind. The 1991 Civil Rights Act called for establishment of a Glass Ceiling Commission to investigate this phenomenon. In 1995, the Commission reported that while women had gained entry into the workforce in substantial numbers, once there, they faced a glass ceiling that prevented them from progressing upward in the workplace and glass walls that channeled them into jobs that had little chance of leading to upward mobility.

The Equal Pay Act of 1963 prohibits employers from paying different wages to male and female employees based on gender. The law requires equal pay for jobs of equal skill, effort, and responsibility performed under similar circumstances. The basis for wage differentials can be quantity or quality of work, merit, seniority, or any factor other than gender, but cannot be solely gender. Title VII of the Civil Rights Act of 1964 also prohibits wage discrimination on the basis of, among other things, gender. However, as Title VII did not contain the differentials of Equal Pay Act's exceptions for wages based on quantity or quality of work, merit, seniority, and so on, the Bennett Amendment was passed to incorporate them into Title VII so that the two laws would be consistent.

However, claims under the Equal Pay Act and Title VII do not address the more persistent problem of entire employment categories being systematically undervalued and thus underpaid because they are predominantly female, that is, secretaries, elementary school teachers, nurses, and clerks (traditionally known as "pink collar jobs"). For instance, in many school districts, the predominantly female positions of secretaries and teaching assistants earn less than the predominantly male category of school janitors. In West Islip, New York, pay for the predominantly male category of groundskeeper begins at $29,000, while pay for the predominantly female category of school nurse starts at $27,000. Similarly, in Denver, nurses make less than gardeners. The Equal Pay Act only allows claims for pay discrepancies in the same jobs; therefore, if the jobs are different, there is not a basis for a claim. Comparable worth gained prominence in 1983 when the district court in the state of Washington found for employees who sued the state on the basis of workplace surveys conducted by the state in 1974, which found wage discrimination in that male-dominated jobs of equal skill, effort, and responsibility conducted in similar working conditions paid an average of 20% more than female-dominated jobs.

Under comparable worth, wages are based on the objective criteria of how much the job is worth to the employer rather than what it is worth based on the predominant gender of those holding the jobs. Factors such as education, skills, effort, responsibility, experience, and other relevant factors are all part of a formula to determine the relative worth of a job and the employee is paid consistent with that determination. This avoids the issue of paying employees different wages for jobs based on whether the jobs are male or female dominated and would avoid the limitations of the law only permitting comparison of pay among employees with the same jobs.

In the Washington case, *AFSCME, AFL-CIO v. Washington*, 770 F.2d 1401 (9th Cir. 1985), Washington State conducted studies of prevailing market rates for jobs and wages for state jobs. It found that female-dominated jobs paid lower than male-dominated jobs. It then compared the jobs for comparable worth and after finding the female jobs paid about 20% less than male jobs, legislated it would begin basing its wages on comparable worth rather than the market rate, over a 10-year period. Employees in female-dominated jobs sued the state for gender discrimination under Title VII to have the comparable worth plan begin immediately. Since the jobs compared were not the same, the case could not be brought under the Equal Pay Act. As mentioned above, the lower court found for the employees and ruled that the state's pay scales discriminated on the basis of gender. The appellate court, however, ruled against the employees, finding, among other things, that since the state did not create the competitive market system used to pay employees there was no illegal gender-based consideration that violated Title VII.

After this case, comparable worth virtually lapsed into disuse because of its failure to create the pay equity envisioned. Determining comparability of jobs is complex, time-consuming, and expensive. It is even more expensive to implement once the wage gaps are found. Since the law does not require such an approach, employers found the theory to be of little value. Under the circumstances, many employees saw little use in pushing the issue, though advocacy groups still try to keep it alive.

Comparative Advantage

The theory of comparative advantage in economics states that trade between two countries can benefit both countries if each country exports the goods in which it has a relative comparative advantage. David Ricardo coined the term. The principle explains the benefits of free trade.

The example on which the principle was based is very simple. Let us assume that, given the endowment of factors of production (labor, land, climate, capital, etc.), a worker in a foreign land is able to produce one unit of cloth or one unit of wine per day, whereas in the homeland a worker is able to produce four units of cloth or two units of wine per day. On the face of it, the foreign land seems likely to be excluded from trade, as the homeland has an absolute comparative advantage in both products.

However, the inhabitants of both countries will be better-off if the workers of the homeland specialize in producing the cloth and export a part of their output to the foreign land, while the workers of the foreign land concentrate on producing wine and sell a part to the homeland. In the foreign land, the opportunity cost of wine in terms of cloth is 1 (to produce one unit of wine the foreign land has to forgo one unit of cloth, which is what one worker produces in 1 day), whereas in the homeland the opportunity cost is 2 (four units of cloth for two units of wine). It is more profitable for the homeland workers to produce only cloth, in which they are relatively more productive, even though they are also more productive than the foreign land workers in producing wine.

Trade between two countries benefits both if each specializes in the products in which it has a "relative comparative advantage"—the ones it can produce with a relatively lower cost. This argument can be generalized to many countries, factors, and products; the main conclusion remains the same, though the details get more complicated. For example, the existence of more than one factor of production reduces the tendency toward specialization; and transportation costs may interfere with the direction of trade and with specialization.

A good deal of the theory of international trade derives from the theory of comparative advantage. Examples include the following three. The Heckscher-Ohlin theorem establishes that, under certain conditions, an economy will tend to be relatively effective at producing goods that are intensive in the factors with which the country is relatively well-endowed. The Stolper-Samuelson effect says that trade benefits the scarcest factor. The Lerner-Samuelson factor price equalization theorem establishes that, under fairly restrictive conditions, trade leads to the equalization of factor prices internationally, even if factors are not mobile.

Implications for Labor

The theory of comparative advantage leads to some important conclusions for the welfare of nations. Comparative advantage affects specialization of production, volume and direction of trade, prices nations pay for imports and receive for exports, and the income generated for nation's factors of production. Comparative advantage thus affects the standard of living and its growth and the distribution of wealth among a nation's citizens. The income and wealth effects have economic, social, and ethical consequences.

The theory of comparative advantage is a positive economics theory: It seeks to explain the direction of trade (what products each country exports and imports) and the relative prices of goods and production factors. However, it may also become a normative theory: Countries "must" specialize in the products in which they have relative comparative advantage, provided the recommendation is intended to maximize the value of the goods and services produced and consumed. Comparative advantage is, therefore, an argument in favor of free trade. In the example given earlier, both countries will be able to consume more wine and cloth than if they tried to satisfy their demand for both products exclusively with domestic production. The establishment of trade barriers (tariffs, quotas, taxes, etc.) is, therefore, undesirable.

In practice, what is at issue is not the theory of comparative advantage, but its normative implications—the defense of free trade. Discussions of these issues must be based on a proper understanding of the theory and its consequences. In what follows, we briefly present some of those issues.

The theory has important consequences for wage levels, because the competitive advantage of an industry depends not only on its productivity relative to the foreign country but also on the domestic wage relative to the foreign wage rate. In our example, the foreign land has lower productivity than the homeland and must pay lower wages to make its wine production competitive.

Is it fair that workers in the foreign land should earn lower wages than workers in the homeland? The theory of comparative advantage does not address issues of justice. It merely notes that if a foreign land pays its workers higher wages, its products will lose competitiveness. The homeland may even find it worthwhile to invest in wine production and stop buying it from the foreign land.

It is often said that trade makes a country worse off if its workers receive lower wages than workers in other nations—the exploitation argument. Obviously, there may be social and ethical reasons for that argument. But from the point of view of the theory of comparative advantage, the relevant question is whether the workers and their countries are worse off exporting goods based on low wages than they would be if they refused to enter into such trade, because their wages would be even lower.

Of course, it is legitimate to discuss issues of justice regarding relative wages between countries. In any event, the theory of comparative advantage suggests that we should take into account the consequences of any decisions made regarding relative wages. The foreign land government cannot ignore the consequences of a wage increase in its country. And if the homeland government imposes any kind of labor standard on its imports, it will have to consider the effects that this measure will have on the employment of the less productive foreign land workers. And, of course, there is room here for ethical arguments, such as that it is morally unacceptable to take advantage of child labor in underdeveloped countries.

Let us now look at the problem from the viewpoint of the country with higher productivity: Is the competition from the lower-wage country unfair? This is the pauper labor argument, which tends to be used by unions in the industries hardest hit by competition from cheap labor countries. Yet the theory does not support that argument. In fact, in our example, the homeland is more productive than the foreign land in both industries and, although the foreign land's lower cost in wine production is due to its having lower wages, that wage is irrelevant to the question of whether the homeland gains from the exchange. For the homeland, the relevant fact is that it is cheaper, in terms of its own labor, to produce cloth and trade it for wine than to produce wine itself.

This discussion highlights yet another dimension of the theory of comparative advantage—its impact on the redistribution of wealth. Let us assume that the two countries in our example have been autarkic (i.e., self-sufficient and closed to trade with other countries) and now decide to open up their economy to free trade. The homeland's higher productivity in cloth production means that the cloth industry in the foreign land will disappear, while wine production in the homeland will cease to be profitable. (In practice, specialization will not be absolute. There will be some production of wine in the homeland and some production of cloth in the foreign land, according to their endowments of resources, relative productivities, and demands.)

Both countries will end up better-off under free trade, which means that their aggregate income will be higher, although in each country there will be an industry that suffers and will be opposed to free trade. From the economic point of view, the argument put forward by that industry—its loss of income—will be unsustainable in light of the benefits of free trade for the country as a whole. But we must not forget the social and ethical reasons, partly because the productive resources devoted to wine making in the homeland and to cloth making in the foreign land will not be readily redeployable to other industries. In other words, each industry has "specific" factors. In that case, trade benefits the factor that is specific to the export sector but hurts the factor specific to the import-competing sectors. Effects on mobile factors are ambiguous. Again, the theory of comparative advantage must shed light on the discussion, as well as on whatever economic policy measures are adopted.

Other Implications of the Theory

The theory of comparative advantage has sometimes been presented as an obstacle to economic development. If countries "must" specialize in the products in which they have a comparative advantage, and if it is irrational to try to break away from the pattern of trade dictated by the theory, does that not imply a form of economic determinism?

The answer is no: A country's comparative advantages at any given time are determined by its factor endowment (land, climate, natural resources) and its history (labor, physical and human capital, technology). But they may change as a result of decisions concerning saving and investment in physical and human capital, population growth, openness to foreign capital, and so on. Typically, a poor country starts by specializing in whatever it has in greatest abundance—for example, natural resources and cheap, unskilled labor. Low wages attract investments, which generate employment and income. As a result, domestic saving starts to grow. If the financial system develops properly, that saving will be channeled toward the most productive industries, prompting a process of diversification of production. The growth of the stock of capital will increase labor productivity and wages, worker training and education will intensify, and the new investments will be more capital and technology intensive. Thus, as labor costs rise, the initial comparative advantages will gradually be forfeited, while new advantages will be acquired.

This process is neither linear nor simple, but it is the process that many countries have undergone. Naturally, there are winners and losers, and there is sure to be political pressure to try to halt or divert the growth process to the benefit of the status quo. And the ethical arguments will have to be taken into account, too—for example, arguments about the justice of the situations and the changes that take place, about human rights and the freedom of the agents, about environmental protection and the rights of future generations, the creation of new opportunities, and so on.

What years ago was known as the "new" theory of international trade raised the possibility of using active policies to create "acquired" or "artificial" comparative advantages. For example, a tariff on imports may foster the growth of a domestic industry until it is able to exploit economies of scale, generate spillovers into other industries, and acquire a sustainable comparative advantage. Essentially, this is a variant of the infant industry argument (the need to protect new industries from competition in their early growth phases), the economic rationality of which is seriously questioned.

Last, ethics may help rectify misinterpretations of the theory. For example, it has sometimes been argued that developing countries have a "comparative advantage" in their ability to absorb pollution, due to the nature of their environment, the lack of environmental awareness among their population, and the rigidity of their demand for environmental goods. Ethical arguments, however, may help put in its rightful place what is basically a shortcoming of the economic model of humans.

Compensatory Damages

Compensatory damages are those damages (i.e., a financial judgment) awarded by a court that are intended to reimburse an injured party for the harm caused by the actions of another. These damages are awarded in a wide variety of legal actions (e.g., torts, breach of contract, wrongful termination) and include harm caused to a person's property, personal well-being, and/or financial interests. For example, if a plaintiff is injured in an automobile accident caused by the reckless driving of the defendant, then the defendant may be required to pay an amount intended to place the plaintiff in the same position he or she would have been in had the accident never occurred. That is, the defendant may be required to pay the plaintiff's medical bills, lost wages (from missing work due to the accident), and an amount to cover the plaintiff's intangible pain and suffering. Compensatory damages do not include "punitive damages," which are monetary damages intended to punish the defendant for intentional or grossly negligent actions.

In a breach of contract case, on the other hand, the party breaching the contract (the defendant) must pay damages to the nonbreaching party (the plaintiff) such that the plaintiff is in the same position he or she would have been in had the defendant not breached the contract (also known as giving the plaintiff the "benefit of the bargain"). In some cases, these damages include "consequential damages," which are damages that are indirectly related to the breach of contract but are a foreseeable result of breaching the contract. This is demonstrated by the classic 1854 case of *Hadley v. Baxendale*. In that case, the plaintiff hired the defendant to take a broken crankshaft from his mill into town for repair. The defendant promised to return the crankshaft the following day, but the delivery was delayed for several days. During this time, the plaintiff was unable to operate his mill. The plaintiff filed a lawsuit seeking compensatory damages that would put him in the same position he would have been had the contract not been breached, which included the consequential damages of lost profit due to the mill being shut down for those additional days. In this particular case, however, the defendant was not required to pay the additional, consequential damages because it was not reasonably foreseeable that the entire mill would have to be shut down during his delay (i.e., the defendant may assume that there were other problems with the mill or that the plaintiff had an additional crankshaft). Had the shutdown of the mill been foreseeable, however, then the compensatory damages would include the lost profits.

Compensatory damages play a vital role in ensuring that actors invest in preventative measures efficiently. From a law and economics perspective, the goal of our tort system, for example, is to minimize the total costs of accidents (i.e., harm suffered) and actions to prevent accidents. Society is better-off if the costs of prevention are less than the costs of an accident occurring, but society is worse off if the preventative measures are greater than the benefits they provide. By requiring the defendant to compensate injured parties for the harm caused by their actions, the legal system provides incentives for actors to efficiently invest in preventative measures. Likewise, in contract law, requiring the defendant (the breaching party) to pay compensatory damages to the nonbreaching party allows for so-called efficient breach. Under the idea of efficient breach, if the defendant can benefit more from breaching the contract but also paying the plaintiff his or her expected "benefit of the bargain," then we have reached a Pareto superior result. The concept of efficient breach is not without criticism, however. For example, it may often be the case that the plaintiff is not indifferent between a compensatory damages award and performance of the contract and, therefore, is made worse off by the defendant's breach.

COMPETITION

Competition is a process in which individuals strive to achieve mutually exclusive positions, such as the attainment of a single reward. Competitive processes may be among individuals within a single business, or it may be among businesses. Decision making in a competitive context tends to emphasize the efficient accomplishment of self-interested goals. Governments often intervene in competitive processes with laws and regulations to influence competitive processes and outcomes.

This entry discusses issues of efficiency, justice, human rights, and public policy associated with competition. The trade-offs and debates surrounding these issues are likely to intensify as the global economy becomes increasingly competitive and rival businesses seek to outdo each other by harnessing genomics and nanotechnology for their own advantage.

Competitive Allocation of Resources

A key outcome of competition is the allocation of resources in a marketplace where supplies are limited or scarce. A business conducts its activities in an environment of scarcity—scarce supplies, scarce skills, and scarce channels to the customer—and it may confront other organizations dependent on access to the same scarce inputs. In this context, competition allocates scarce resources among businesses based on the relative advantages of each to create value for potential suppliers and customers.

Businesses that are lucky, skillful, or endowed with advantages in the competitive process expend less capital, time, and effort to operate their value-creating activities. Conversely, competitors with relative disadvantages in an environment of scarcity are not able to operate with comparable scale, scope, efficiency, and quality. In this way, competition between businesses is the conduct of interdependent organizations striving for mutually exclusive positions of advantage to create value so that the success of one comes at the expense of another.

One consequence of competition is that rivals may bid up the prices for valuable and scarce inputs they demand for their activities. In an economy that equilibrates supply and demand, more supply of these inputs is offered as their prices are bid up, and competitors are provided with more inputs to produce a greater quantity of valuable goods and services. The process seemed to Adam Smith as if an invisible hand guided productive resources for social progress.

Another consequence is that competitors strive for relative advantage in forming valuable relationships. For example, competition may cause a rival to invest in product innovation, extend warranty programs, develop new channels for convenient shopping and delivery, customize service, and enhance the postsales customer experience. In competition, a successful seller must remain alert to opportunities for strengthening the unique value it brings to a potential customer relationship.

Business competitors, each motivated by self-interest to capture profit, also strive to outdo each other to form and protect attractive relationships with suppliers. For example, a rival might offer to share proprietary technology with its suppliers, train suppliers' personnel at no cost, enter long-term contracts, or provide suppliers with development funds.

In these ways, competition appears as an intendedly efficient process of struggle for advantageous position to reduce scarcity and strengthen the creation and distribution of value in society. Business competitors, motivated by self-interest to capture profit, constantly strive to outdo rivals by forming and protecting increasingly attractive relationships with customers and suppliers.

Public Policy Issues

At some times in some places unregulated competition may lead to unserved needs and unintended consequences. One function of government is to regulate the actions of business so that their competitive pursuit of advantage is not at the expense of the public good. Typical government regulatory controls on competitive action target the effects on the environment, safety, health, and property. For example, antitrust regulations limit consolidation within industries to encourage the social benefits of competition, commerce regulations govern the actions of competitors within industries to ensure fair trade, and some regulations may be used to raise or lower barriers against the entry of new competitors. In the United States, for example, broadband communications is subject to regulations restricting competitors in the cable industry from either consolidating or realizing exclusive advantage from their own investments in cable assets.

Barriers can be a factor in an industry's competitive structure. In this vein, licensing regulations are an example of a regulatory barrier to competition. In the United States, for example, there are more than 500 occupations that require licensing. Licensing may facilitate honest and fair exchange by monitoring and controlling quality and standards. Conversely, licensing may be a barrier that limits competition, economic opportunity, and wealth creation. For example, occupational licensing has sometimes limited the supply of hairstyling salons for minorities in some areas of the United States because the local certification requirements excluded the hair needs of the minority groups. This is an example of a regulatory limit on competition that affects the fair distribution of goods and services to all segments of the community.

Some businesses may seek to participate in the public-policy-making process to influence the scope and magnitude of the regulatory constraints on their competitive conduct. Mechanisms for their participation include organizing in trade associations and supporting autonomous advocacy groups for research, information dissemination, lobbying, and political donations. Though competitors in business, they may cooperate through these mechanisms to persuade legislators and regulators to pass laws and regulations that are favorable, and to defeat those that are unfavorable, to the special interests of the participating businesses.

Business participation in the public-policy-making process, motivated by the competitive struggle for advantage, may have both good and bad consequences. For example, participation that increases the use of reliable information in the process is likely to enable better policy decisions than could be expected from a relatively uninformed process. Conversely, the pursuit of self-interested advantage may motivate some competitors to corruptly "capture" governments by coercing or compelling the public policy decision makers to align with their special business interests against the interests of other public policy participants and citizens.

Problems of Global Competition

The dynamics of global competition compel business activities to locate in geographic areas where scarce supplies can be acquired and deployed most advantageously. As comparative advantages among geographic areas change and businesses relocate their activities, the changes in the quality of life in local communities may lead to calls for social protection. These dynamics highlight the temporal dimension of social welfare in those areas where competitors are engaged and the need for competitors to demonstrate responsibility in both the short and long terms as the process unfolds across multiple geographic areas.

When competing on a global scale, a significant challenge for managers is to effectively and fairly balance the interests of stakeholders in both the home and host societies. This situation has potential conflicts of interest, created when one individual has an explicit responsibility to one party and simultaneously has an incentive to serve inconsistent interests of another. The efficacy of competition as a process to create value and increase social welfare in this situation is put at risk. Calls for government regulation on business may become more frequent if competition disrupts traditional lifestyles and sustainability of communities.

Other Social Concerns

Competitive conduct arises from the decision making of competitors responding to their perceptions of opportunities to create value. Decision making that is misinformed, grounded in uncertainties, or unable to efficiently adjust to the information of the marketplace may lead to surpluses and shortages. Factors influencing these outcomes include the magnitude of profit that satisfies their motive for competitive conduct and their responsiveness to trade-offs between profit and commonly accepted definitions of basic human rights. The paragraphs below consider issues of just distribution, human rights, and social efforts to lessen the potential harms from competitive failures.

Competition and Distributional Justice

Cognitive constraints on competitive decision makers may, even without unjust intent, produce unjust distributions. For example, self-interested competitors may pursue a "cherry-picking" strategy in which they first rank-order potential customers based on their value and then serve the most valuable in the order until the capacity of the seller is exhausted. This strategy leads to underserving the least attractive segments of need.

Absent any regulatory constraints, for example, private health care providers in a community may compete, but still may leave unsatisfied a portion of the community's need for care (e.g., care for the uninsured) even while abundantly serving another portion (e.g., care for the insured). This situation, common in the United States, focuses attention on the strength of profit and the weakness of distributive justice as motivators of competition in free markets. Furthermore, this example illustrates that the principle of appropriable value embedded in unregulated competition may not consider all social costs in its accounting.

Article 25 of the United Nations' Universal Declaration of Human Rights lists access to health care as a basic human right. In this view, the inability of competition to produce a sufficient supply of health care to satisfy the entire need, including the need of those unable to pay a market price, points out a fundamental deficiency of competition. Related basic human rights include (but are not necessarily limited to) food, housing, clothing, education, information, and transportation. Those who view competition as conduct that does not fairly distribute the basic necessities of human rights often call for constraints on self-interested autonomy in business decision making. Socialism is an alternative system intended to introduce such constraints. There are many forms of socialism, ranging from fully centralized planning of production to more mixed economies, which attempt to blend the benefits of competition with public welfare interests.

Subsidies for Competition

Subsidies, financial assistance given by one person or government to another to serve some private or public purposes, can be one mechanism of a mixed economy to ensure broad participation in competitive processes likely to have beneficial social consequences. For example, a national government may subsidize private sector research and development to ensure the home country's ability to compete in high-technology global markets; or it may subsidize its domestic farm community so that it can compete in world food markets.

The recipient of a subsidy could apply it to reduce its internal cost of business or pass it along to its buyers in the form of lower prices. In markets that are not perfectly competitive, however, either approach may lead to a distortion of the competitive process for determining prices. This calls attention to the ethical issues related to fair bargaining and determining a just price in a marketplace that mixes competition with subsidies.

The justice with which costs and benefits are distributed is a consideration when evaluating government-subsidized competition. For example, a subsidy recipient may externalize environmental and public health impacts and fail to consider the fairness or justice associated with burdening third parties with these costs. Similarly, subsidies may go to businesses with large existing endowments and leave out small poorly endowed businesses that have no other means to enter the competitive arena; or a business may organize strictly to benefit itself by the amount of the subsidy rather than to establish the value-creating competitive activities that were the intended economic purpose of the subsidy.

Competition as Action: The Precautionary Principle

In the 21st century, business competition often takes the form of a race to commercialize innovative technology. Examples of these competitive races include the pursuit of opportunities created by rapid advances in sciences of genetics and nanotechnology to resolve great problems of scarcity in access to food, organ transplants, and pharmaceuticals. Many individuals and organizational stakeholders are concerned, however, that the pace of innovation in these areas exceeds our capabilities to determine the consequences prior to commercialization. There are risks to be first to commercialize innovations. Not only are there potential technical and market failures but also potential costs to litigate and resolve harms to health, safety, or the environment.

These concerns have led some to urge business to voluntarily restrain the pace of competitive action in their strategies for genetic commerce. This "better safe than sorry" approach to competition, called the precautionary principle, lets others try to prove novel approaches, and then quickly copies the ones proven safe, effective, and valuable. The principle, however, is highly contested by some business stakeholders. It has been called antiscientific, forcing business to offer proof against every allegation of harm. Many competitors argue that uncertainties will never be completely resolved, and it is the job of independent scientists to monitor human health and the environment for signs of harm. In competition, businesses strive for positions of advantage. One approach to capture advantage is to act before rivals—to be the innovator—and then to protect the position with patents and long-term contracts.

Advocates on both sides, however, recognize that the precautionary principle's key test will be in the regulatory context and economic incentives of competition. The rapid pace of scientific discovery makes the balance between commercializing innovations and the precautionary principle an increasingly important dimension of business competition.

Intra-Organizational Competition and Legal Compliance

Compliance with law and regulation is important in countries with developed and enforced legal systems governing competition. Competition within organizations also may be governed. For example, the integrity of internal competition for job promotions may need to demonstrate compliance with legal requirements such as equal opportunity rules in the United States. To ensure integrity of competition within a business, formal processes must address the honest reporting of information, fair and diligent analysis according to standard practice, and visibility for independent monitoring. When the intensity of competition within an organization may cause some to violate, or witness violations of, informal standards for integrity, then the desirable traits of trustworthiness and virtue become increasingly important values. Neutral ombudsmen, hotlines, recruiting, training, and codes of ethics are examples of mechanisms that organizations may use to increase alertness, monitoring, and appropriate resolution of threats to competitive integrity.

Competition, Cooperation, and Individual Decision Making

Attention to the competitive context, or "rules of the game," is useful to understand the ethics of strategic decision making in competition. Game theory, an approach for gaining insights into strategies of decision making constrained by rules, offers a widely known model of the context of competition—the prisoner's dilemma. The prisoner's dilemma illustrates that the outcomes of competition may depend on the instrumental ethics embedded in the rules of the competitive processes. These include trade-offs between social accounting and private interests in the governance of competition and competitors' reputations for honesty, integrity, fairness, and virtue.

In this competitive game, two prisoners not yet convicted are held by a judicial system in separate prison cells. They are not allowed to communicate with each other. The prosecutor wants convictions with minimal expense, and she of he offers a reduced sentence for the prisoner who confesses and testifies against the other. At the same time, the prosecutor promises an extremely long sentence for the prisoner who does not confess. If both confess, however, the testimony is not needed and will not be rewarded. The prisoners are given the sentences for each possible decision. The prisoners cannot change their decision once made and they cannot confer with each other.

The prisoners each see that the total time they will spend in prison is the least if they both do not confess (4 years for the first and 4 years for the second equals 8 years total). Prisoner 1 sees a risk of receiving a 15-year sentence if Prisoner 2 decides to confess. Without the benefit of additional communication, Prisoner 1 will receive a lower sentence by confessing no matter what Prisoner 2 decides (10 instead of 15 years for Prisoner 1 if Prisoner 2 confesses; 1 instead of 4 years if Prisoner 2 does not confess). Thus, Prisoner 1, competing for the lowest sentence, confesses.

Prisoner 2 sees the same logic from her or his cell. No matter what Prisoner 1 decides, Prisoner 2 gets a lighter sentence by confessing. Not so regrettably, perhaps, the logic of competition in this game leads both prisoners to confess. From the prosecutor's perspective, the cause of social justice could not have been better served—the criminals will be in prison for the longest combined sentences possible given the alternatives.

In addition to its suggestion of an interesting prosecutorial technique, the game offers two major insights into the ethical principles of self-interested decision making in a competitive context. These principles address the interest of society relative to that of the competitors and the value of reputations for reliable trustworthiness and, surprisingly, for vengeance. The first insight is that more social welfare is created (the longer combined sentences when they both confess) when competitors cannot communicate with one another. If they are permitted to communicate before they make their choice, they may arrange to collude with each other by agreeing "not to confess." Collusion earns the best outcome for the competitors under the circumstances, though it is to society's detriment.

The second insight is that competitors' (i.e., prisoners') mutual interests are best served when they may be trusted to forbear and trade fairly. One may be exploited, however, by a self-interested competitor willing to defect from the position of mutual forbearance. It follows, then, that there are advantages to be gained from cooperation when competitors have known reputations for reliability and trustworthiness.

Conclusion

Competition as a process to allocate scarce resources has been praised for its efficiency and criticized for its amoral focus on short-term self-interest. Some people believe social progress is best served when the smooth functioning and integrity of competition is supported by government institutions and regulation. Others prefer to use public policy and nongovernmental organizations to create alternatives to competition that they believe will better serve the needs of a fair and just society. This debate is likely to intensify as the global economy continues to affect the lives of more of the earth's people.

Comptroller of the Currency

The Office of the Comptroller of the Currency (OCC) is the federal government agency responsible for chartering, regulating, and supervising national banks in the United States. The primary mission of the OCC is to ensure the safety and soundness of the national banking system. The OCC achieves this mission by employing a nationwide staff of examiners who conduct onsite reviews of national banks and continually supervise bank operations. The agency issues rules and legal interpretations concerning bank management, bank investments, bank lending activities, and other aspects of bank operations.

The OCC was established in 1863 under the National Currency Act. This act created a system of nationally chartered banks to issue standardized national bank notes. The OCC was established to administer the new banking system. The law was superseded by the National Bank Act, which authorized the Comptroller of the Currency to hire a staff of national bank examiners to supervise and examine national banks. The act also gave the OCC authority to regulate lending and investment activities of national banks.

The OCC is an agency of the U.S. Department of the Treasury based in Washington, D.C. The OCC is headed by the Comptroller of the Currency, who is appointed by the president, with the advice and consent of the Senate, for a 5-year term. The Comptroller also serves as a director of the Federal Deposit Insurance Corporation (FDIC) and as a director of the Neighborhood Reinvestment Corporation.

The OCC regulates and supervises more than 2,200 national banks and 56 federal branches of foreign banks in the United States. The OCC regulates and supervises only banks with a national charter. Banks chartered by individual states are regulated and supervised by state banking authorities or the FDIC. The Federal Reserve Board regulates and supervises bank holding companies and foreign-based affiliates.

OCC bank examiners review the activities of national banks and assess the safety and soundness of banks. In conducting their safety and soundness reviews, OCC bank examiners assess the bank's exposure to various risks including market risk, credit risk, liquidity risk, and legal risk. OCC examiners review bank lending procedures and bank investment portfolios to ensure that the risks associated with these activities are identified, measured, and managed properly. OCC examiners also review bank funding operations, the level and quality of bank capital, bank underwriting standards, the quality of bank earnings, and compliance with consumer banking laws. OCC examiners also review the bank's internal risk management controls and the bank's performance of fiduciary duties.

In addition to conducting safety and soundness bank exams, the OCC has other regulatory duties. These duties include reviewing applications for new bank charters and branches. The OCC also has the authority to take enforcement actions against banks that do not comply with banking laws and regulations. The OCC has the authority to remove bank officers and directors and can promulgate rules and regulations under the authority of the National Bank Act governing investments, lending, and other practices of national banks. The OCC also provides written guidance to the industry in the form of banking circulars, bulletins, and interpretive releases.

Computing, Ethical Issues in

Computer ethics deals with new ethical issues that distinctly arise out of the use of computer technology. This focus excludes, for instance, the ethical assessment of embezzlement even if carried out with the aid of a computer, since the discussion of computer-based embezzlement hardly differs from traditional discussions of theft. In contrast, an assessment of computer hacking raises some distinctive issues. Although hacking initially resembles a traditional act of misappropriation, it also raises special issues in computer ethics dealing with how one assesses the level of responsibility that lies with the supposed victims that permitted some amount of open access to their computers. That is to say that the open environment for Web-based file sharing has created a context where is it not clear when and to what extent a hacker may assume that a resource may be viewed as open to public use. Hacking draws our attention to distinctive issues in computer ethics concerning the separation of personal and public resources in cyberspace.

Issues in computer ethics typically affect choices in the design of computer technology, in the management of computer systems, or in the formulation of public policy that responds to computer technology. An example of a design issue is the decision by major providers of operating systems to accommodate Web sites that place “cookies” to record personal information on a user’s hard drive, which is then accessed when the user revisits the site. The ubiquitous presence of cookies has a significant impact on the notion of personal privacy in computer use. An example of a management decision would be the establishment of a standard for password access (including length of password and frequency of password revisions) for access to sensitive data, with consequences for the assessment of responsibility when data are compromised. An example of a public policy issue is whether and how online purchases may be subject to local or state sales, with consequences for a wide range of economic practices with socially sensitive consequences. Most issues (for instance, issues of privacy) are also the subject of ethical inquiry on their own.

The issues that are debated under the rubric of computer ethics have evolved in step with the history of the computer industry. The ongoing disputes over the ethical significance of intellectual property claims provide a simple example. As the software industry grew in the1970s, there were doubts about the appropriateness of various forms of property protections. Those debates contributed to the public policy standards that were more or less established in the 1980s as copyrights become the most common form of protection, while patents were accepted under certain conditions and specially customized forms of protection (so-called sui generus protections) were seen as unappetizing. Even though some ethicists still have qualms about the social values inherent in those standards, the debate over the alternatives seemed resolved by statutory law. At the same time as those policy issues were being settled, a rising emphasis on home, desktop computing focused attention on a new set of property issues, including the validity of shrink wrap contracts and the availability of protections for the look of popular user interfaces. In time, policy guidelines again set these issues as well. Not surprisingly, however, new shifts in computer technology continue to raise new sets of property issues. At the present moment, the widespread use of the Web-based file sharing has, for instance, raised the question of secondary responsibility of file sharing facilitators for copyright infringements carried out by their clients. In each instance, ethicists have entered into the public policy debates with concerns for the social values inherent in how policy decisions will structure the new industries. There is every reason to expect that the innovations of this rapidly changing technology will continue to be mirrored in unexpected ethical dilemmas.

The present overview of computer ethics sets out a fairly standard categorization of areas of ethical debate and identifies issues within those categories. It is entirely reasonable to expect that technological developments and changing public policy decisions will alter the boundaries of these categories and shift the focus of “hot topics.”

Access to Resources

The buzzwords *digital divide* and *digital society* draw attention to a potential for ethically sensitive, social inequities in access to computer resources. Computer use is presently essential to all commercial enterprises in industrialized countries, and it is rapidly becoming more of a social necessity than simply a convenience for personal use. In this environment, the inability to use or lack of access to a computer at a reasonably level is a major social handicap. The divide is alternatively based on economic, geographic, and educational resources, raising serious ethical concerns in all areas.

In 2005, in the United States, a home computer with rapid Web access is economically beyond the means of over half of the population. Given that everything from job searches to bill payment is becoming computer based, that portion of the population is seriously cut off from economic opportunities. This digital divide thus aggravates the social inequities that are already present in an industrial culture. A serious ethical argument can thus be made for a personal right to basic computer resources on the same level as a right to a basic education. The divide is further aggravated by geographic constraints. There are, for instance, fewer computer resources available in remote geographic areas or in unindustrialized countries. The divide thus aggravates the disadvantages of the unindustrialized countries.

The ethical dilemmas are highlighted by recent debates over the introduction of wireless Web access in both commercial and public spaces. At present, a number of public advocacy groups have urged communities to provide free wireless access as a way to bridge the divide. This solution, however, is a shift from a commercial service to a public service that both interferes with commercial opportunities valued by private providers and frightens public officials worried about a new category of potentially expensive social entitlements. The argument furthermore depends on a distinction between basic computer services (perhaps deserved as a social entitlement) and premier services (perhaps a commercial product) that is as hard to define for computer uses as it is in the continuing debates over the quality of state-supported education.

The divide also raises ethical issues for those who propose broadening socially sensitive computer uses to include options such as e-voting in public elections. Obviously, that process will be more comfortable and more acceptable to those with computer experience, raising concerns over the effects of e-voting on the makeup of the active electorate. This same issue will be reflected in computer-based publication of public documents, and it is aggravated by concerns for the accuracy of computerized translations of those documents.

Privacy and Surveillance

In the early years of computer use, there was considerable discussion of a potential loss of individual privacy inherent in the maintenance of large computer databases. The fear was that databases of automobile licenses, of educational loans, of tax payments, and so on would be cross-referenced, with the potential for the construction of detailed profiles of individuals. A number of institutions proposed guidelines on access to databases that were intended to prevent the appearance of a data mining "big brother." For instance, the United Kingdom Data Protection Act of 1984 demands that data files be classified by their specified purposes and that those files only be accessed for those specified purposes. Although those issues continue to attract attention, many of the protective guidelines are now routinely ignored without significant public protest, especially when sophisticated data mining has led to the identification of tax evaders, fraudulent charities, and so on.

Recently, the debate over privacy has turned more to issues relating to several varieties of "tracking" software, including highly sophisticated "spyware" programs. The most obvious examples involve the creation of individual profiles from records of credit card or Web use. A leading commentator tells a true story of how a nonpurchase visit to an online cigar vendor led to a challenge from a medical insurance company to an individual's claim to be a nonsmoker. The issues become more sensitive as the Web-based activities become more commonplace. When pornography, for instance, was published in hardcopy magazines and purchased with anonymous cash, it was very hard for censors to identify individual customers. If the Web becomes the primary means for the distribution of pornography, then sophisticated tracking programs make it possible to identify those users. By expansion, there is a real possibility for high-level overview of individual reading preferences.

The issues are complicated by a notable difficulty in drawing a line between public and private life and in identifying the levels of privacy expected in these ill-defined realms. If, as a presently popular argument suggests, privacy is valued as a basic for intimacy that is central in human life, then it becomes much more important to preserve the expectation of privacy in electronic communication between individuals (private life with an expectation of intimacy) than in commercial transactions (public life). The distinction is hard to maintain in practice. Two examples will make this clear. Consider a divorce court asking the operators of a standard Web search engine to release information on a plaintiff's request for maps and driving instructions. It is unclear whether such information is part of private or public life, whether it is owned by the user or by those who offer the map services, or whether an individual's expectation of privacy deserves special recognition. Second, consider the routine corporate practice of reviewing network-based social correspondences between employees. Although there is an intuitive feeling that social correspondence is not the concern of corporate system operators, the practice is justified by the fact that trade secrets can be compromised through uncontrolled social correspondence. These ethical examples show not merely that the issues of surveillance and privacy are especially sensitive in computer contexts but that they raise immediate concerns for the professionals who maintain or manage the computer systems. The issues are even more complex when data files are held in cross-national locations with differing legal codes and ethical traditions.

The issues affect decisions on the production of computer technology, which can be produced to permit or preclude external investigation of individual use at several levels. The new emphasis on wireless Web access promises to raise a new set of issues concerning the expectation of privacy.

Software Property

Although there is a popular prejudice for the recognition of a "natural right" of software producers to their creative efforts, modern analyses of intellectual property policy eschew claims for natural rights and treat software property as public policy designed to encourage a variety of social goods. Whether gaming programs deserve copyright or patent protections is, on the standard analysis, not a question of whether the producer has a natural right to own his or her production, but a question of whether those protections create a legal context that is for the good of society. In the broadest possible terms, the social goods at question typically include an interest in a vibrant economy with a strong commitment to software research and development. Within this broad outline, however, there is obviously a great deal of room for alternative ethical ideals.

As a simple example, we may consider the term of protection under copyright and patent protection in the context of a claim for ownership over a digitized file. With many exceptions and qualifications, copyrights generally provide a lengthy 75-year term of protection while patents provide a mere 17-year term of protection. The historical basis for this difference is that patents cover items of industrial value while copyrights cover items of literary value. The common wisdom is that the economic consequence of long-term protections of industrial items is likely to harm the expansion of industry, while there is little to fear economically from long-term protection for literary items. This tradition suggests that form of protection for a file depends on whether that file has a literary or applied use. But the distinction is impossible to maintain in computer environments. It would create a legal morass of incredible complexity to ask of each interactive program whether it is a pass-time game or a piece of an industrial process. The choice between copyright and patent protection had to be addressed in broad and general terms for the software industry in the 1970s, not for each individual piece of the software. Even though the long-term effect of copyright protection is problematic for software that generally has a short shelf life, other issues, particularly the bureaucratic ones of copyrights application, made copyrights seem the better alternative for the software industry.

The example draws attention to how ethical and social issues underlie the debates over property issues in the computer industry. The example draws attention to the underlying value of industrial progress, with a hidden assumption that progress is encouraged when industrial items enter the public domain fairly rapidly. Taking this argument for short-term protections to the extreme, it has been argued that even 1 year of software ownership restriction has the potential for interfering with software development and that, therefore, all software should be open and free to all users. Taking the argument in the opposite direction, it has been argued that long-term restrictions that enrich successful software developers encourage continuing software development by placing economic resources in the hands of those whose past successes show the potential for further software development. The argument is both an economic dispute over the distribution of wealth and a dispute over free access to inventive science, both issues of long-standing concern to ethicists.

Present debates over the levels of property protection continue to be grounded in economic assessment. But when music, movies, industrial processes, commercial data, and machine designs are all recorded in digital format, it becomes increasingly difficult to design property policies based on distinctions between the level of economic protections that is needed to encourage research, creation, or development. Intuitively, it would seem that a movie industry that invests huge sums in the production of individual works deserves a higher level of protection than the music industry. Intuitively, it would seem that customer lists produced from ordinary business records are protected differently than inventive designs that lead to new industrial products. But when the issue in all cases is access to a digital file, those differences are hard to maintain. The consequence is that public policies cannot appeal to distinctions that seemed intuitively important to past ethicists. For the moment, intellectual property policy is undergoing a deep social and ethical reassessment at many levels.

The issues pertain directly to ongoing technological research and policy studies, creating serious dilemmas for system developers and operators. Under the general rubric of "digital rights management," new techniques are under development for the control of access to digitized information. The developers confront a difficult ethical-technological problem of developing systems that both prevent overzealous infringement of property rights while still permitting the "fair use" rights of the public to appropriately open uses.

Professional Responsibility

Questions of personal and group responsibility for acts are tied to the debates over the definition of the "computer professions" and to proposals for "codes of conduct" for those purported professions. The basic point can be made in a comparison of a computer profession to an established profession such as medicine. In a case of improper medical care, a licensed medical doctor is held to a high standard of malpractice, while a layman is held to a lower standard of negligence, with some intermediate standards applying at intermediate levels of expertise. If computer personnel establish themselves as professionals, presumably they establish a high standard of malpractice against which to judge their failures. The malpractice standard in medicine is justified not merely by the level of technical education that is assumed of medical doctors but moreover by the level of ethical education in matters such as patient expectations, social expectations, and knowledge expectations that are set out in a number of significant medical codes of conduct. If computer programmers are to rise to that standard, it will be, in part, through the formal establishment of a code of conduct for programmers.

Given that it is hard to identify even the various fields of expertise that comprise the still youthful computer industry, it is obviously difficult to sort out who might be seen as a professional in what professional specialization. Are "data analysis" and "knowledge management" distinct professions deserving distinct codes of conduct or are they subsumed under "information technology" with a single code of conduct? Is "Web maintenance" professional practice or nonprofessional labor? Placed in the context of professional responsibility, these questions of categorization have significant ethical content. Insofar as we lack a sense of how to approach these questions, we have a hard time treating computer technology as a profession and a hard time assessing the appropriate level of responsibility to which we hold various computer practitioners. All the same, professionalization must begin somewhere. Several computer societies, including the popular Association for Computer Machinery, explicitly recognize that the formulation of a distinctive code of conduct is a central piece of a claim to be a professional organization.

Most of the large "professional" societies that focus on computer-related practice (notably the Association for Computer Machinery, the British Computer Society, the Institute of Electrical and Electronic Engineers, and the Institute for the Management of Information Systems) have either a "code of ethics" or a "code of conduct." The choice of terminology reflects an ongoing debate over the ethical significance of codes. Although the distinction is often ignored in practice, some ethicists suggest that a code of conduct is akin to a legal system enforced within a jurisdiction, while a code of ethics reflects an assumed personal moral commitment by the organizations members. The specific content of the codes reflects a number of ethical debates. To a certain extent, there is consistency in content across codes. All the codes, for instance, demand recognition of social welfare and forbid acts that cause social harms. This consistency, however, does not diminish the ethical debates inherent in that content. There is serious ethical disagreement over whether a professional status entails a positive duty to provide for social good, or more simply a negative duty to refrain from social harms. A close reading of the codes shows somewhat different attitudes on these duties, reflecting serious debate among the membership involved in authoring or authorizing the codes.

Politeness

There are a range of issues concerning everyday use of computer resources that do not fit neatly into the above categorization, either because they touch on several sorts of issues or because there is disagreement over how they should be viewed. These issues are generally viewed as a matter of computer politeness rather than as deep social problems. It is impossible to give a comprehensive overview of these matters. Two examples can suffice to show the complexity of these matters.

There is debate concerning interference with computer use, from the serious threat of destructive viruses to the nuisance of unwanted computer-based advertising. It is easy enough to condemn the pernicious spread of viruses. It is harder to ethically assess the nuisance of unwanted e-mails. To some extent these issues can be subsumed under the "privacy" rubric. A complaint from a homeowner about a noisy, barking dog or late-night door-to-door salesmen would traditionally be seen as a complaint about an invasion of privacy. Although aggressive pop-up advertising may similarly be seen as an invasion of privacy, it has generally been viewed as an impolite nuisance of secondary importance to more basic privacy issues. This does not mean that "spam" and "pop-ups" are ignored by ethicists. There is need for a sense of the social and ethical limits to such behavior. These issues are most deeply felt by network designers who can either block or permit a certain level of intrusion, and who feel the need to do this at an appropriate, although as-yet-undefined level. A closely related issue concerns the appropriate level of use of computer resources. It is not clear, for instance, if it is appropriate to make use of any unguarded wireless access to Web resources that may happen to be available for whatever reason.

There has been considerable discussion in recent years of censorship or free access to lewd stories, violent or hate speech, and culturally unaccepted levels of nudity. As so many ethical issues, they become aggravated in a Web context that opens speech across national boundaries with very different mores. The most ordinary sort of advertising image from one culture may be shockingly offensive in its nudity when viewed from in another culture. Hate speech that is protected in one country may be banned in another. One special problem for computer ethics is whether cross-cultural availability should be considered when addressing local matters.

Conference Board, The

The Conference Board is a global business membership and research organization that provides its members the opportunity to access pragmatic research and exchange ideas on global business trends, issues, standards, and best practices. Its mission is to create and disseminate knowledge about management and the marketplace to help businesses strengthen their performance and better serve society. It is the Conference Board's commitment to service and to shaping values that is of particular interest to those concerned with business conduct and corporate responsibility.

The Board's current membership, which includes many Fortune 1000 companies, is made up of nearly 2,000 in 61 countries (as of 2005), including the United States, Canada, Latin America, Europe, Asia-Pacific (including China and India), the Middle East, and Africa. The annual subscription fee, which provides members access to global networks of other corporate leaders and research by economic and management experts in business, government, and academia, is based on the size of the company.

History

The Conference Board was founded by business leaders as a nonprofit entity in 1916 in response to the public's lack of confidence in business and rising labor unrest. During the next several decades, the Board established the first Conference Board Council of Human Resources Executives; conducted research on various labor issues in the United States, such as working women and safety in the workplace; and began to track trends in the cost of living across America, directors' compensation, and corporate contributions. From the 1950s through the 1970s, it launched research on the impact of the federal budget on the United States and world economies and engaged in consumer research. From the 1980s to date, the Board has emphasized the study of corporate governance and the economy. Since the 1990s, its perspective has become increasingly global, as reflected in its design of business cycle indicators for eight nations (previously published only for the United States) and the establishment of the Asia Business Initiative and the Conference Board China Center for Business and Economics.

Areas of Focus

The Conference Board lists its areas of focus as follows: corporate citizenship, corporate governance, economics, human resources, marketing/communications, and strategy/planning. Corporate citizenship, which the Board defines as the interaction of corporations with their communities, is closely linked to the concept of social responsibility. The Conference Board includes under this category the environment, health and safety, community relations, corporate contributions, and sustainability. Examples of the Board's corporate citizenship initiatives are the annual Corporate Contributions Report, an analysis of the giving patterns of major corporations, and the Ron Brown Award for Corporate Leadership, an award established by President Clinton in honor of the late U.S. Secretary of Commerce Ron Brown for a company's outstanding achievements in employee and community relations.

Corporate governance, the Conference Board's second area of focus, might be defined as the manner in which a company is directed or controlled; the Board explains the term as encompassing the role of the board of directors and the performance of top management. Key corporate governance initiatives of the Board in recent years include the formation of (1) the Global Corporate Governance Research Center, which is designed to facilitate communication between business leaders and major institutional investors; (2) the Director's Institute, which provides practical governance education for directors; and (3) the Commission on Public Trust and Private Enterprise, which published a highly respected and influential report in 2002 and 2003 on executive compensation, corporate governance, codes of conduct, shareholder relations, and accounting and audit practices.

In its report, the Commission on Public Trust and Private Enterprise concludes that executive compensation has become too disconnected from long-term performance goals, primarily due to use of fixed-price stock options (whose value has related more to short-term stock price gains than to long-term performance goals), skewed relationships between consultants and compensation committees, and lax oversight by boards and compensation committees. Its recommendations include increased independence of the compensation committee, performance-based compensation tied to long-term strategic goals, full disclosure of all executive compensation arrangements in filings with the Securities and Exchange Commission, and expensing of fixed-price stock options.

With regard to corporate governance, the Commission's primary concern is that strong CEOs have exerted a dominant influence over boards, preventing them from carrying out their central oversight role through independent and objective decision making. Recommendations in its report include selection of a board structure designed to assure a balance of power between the CEO and the independent directors, a substantial majority of independent directors, a three-tier director evaluation mechanism (of individual board members, committees, and the board as a whole), board responsibility for oversight of corporate ethics, and development of procedures to receive and consider shareholder nominations for board members and regarding serious business issues.

Finally, the Commission report addresses the audit process and its oversight by noting that audited financial statements must provide an accurate picture of a company's finances to ensure the confidence that the capital markets require. It recommends, for example, vigorous compliance with the Sarbanes-Oxley Act and stock exchange listing standards, an orientation program and continuing education for each member of a company's audit committee, and establishment of an internal audit function that reports to the audit committee. The report also includes recommendations regarding accounting principles, including the Financial Accounting Standards Board and the International Accounting Standards Board, that continue to consider a "principles"-based rather than a "rules"-based approach to audit opinions.

The Conference Board is perhaps most well known for its economic analysis and forecasting and its consumer survey data. Its periodic reports include the Leading Economic Indicators (for the United States, Australia, France, Germany, Japan, Korea, Mexico, Spain, and the United Kingdom), the Help-Wanted Advertising Index, the Consumer Confidence Index, the Consumer Internet Barometer, and the CEO Confidence Survey.

The Conference Board's study of human resources includes compensation, benefits, diversity, leadership, organizational structure, productivity, performance measurement, recruitment, retention, training, development, and work-life. Topical research reports have addressed subjects such as development of global talent, the benefits of and obstacles to using overseas labor, and managing the mature workforce.

As part of its focus on marketing and communications, the Conference Board provides its members information on marketing, sales, corporate communication, image, branding, and customer management. Examples of its publications include a report on improving communications between companies and investors, the Hispanic market in 2010, and employee communication during mergers.

Finally, in the area of strategy and planning, the Board offers assistance to business leaders on management of costs, knowledge, supply chain, mergers, quality, security, outsourcing, finance, taxation, and legal affairs. Examples of resources for members in this area include an enterprise security Web forum and a conference on supplier relationship management.

For each area of focus, the Conference Board produces research reports and other publications, sponsors conferences in various parts of the world, and invites its members to participate on councils and research working groups. More than 100 councils, each consisting of 30 to 35 cross-industry senior executives, meet up to three times a year in the United States, Europe, and Asia. Examples of these councils are the Council of Chief Legal Officers, the Middle East Council, and the Council on Executive Compensation. Research working groups are small networks of executives who come together for a year, working with Board research experts, to share information and collect data on a specific topic, such as off-shoring, best practices in implementing the Sarbanes-Oxley Act of 2002, and strategic workforce planning.

Conclusion

The post-Enron era of corporate scandals, with its resulting loss of public confidence in American capital markets, is reminiscent of the crisis in industry that led to the founding of the Conference Board nearly a century ago. Now, as then, the public (and the regulators) expect business leaders to ensure integrity and transparency in their organizations. Many observers have also sounded the call for business to assume a broader leadership role in society. The Board, through its Commission on Public Trust and Private Enterprise, has expressed its sharing in the public's anger over recent corporate misconduct. Given its membership of prominent corporate leaders, its influence on business policy and the financial markets, and its focus on corporate responsibility, as well as enhancing the bottom line, the Conference Board is well situated to lead the business community in repairing the breakdown of public trust and restoring confidence in corporate America.

Confidentiality Agreements

Confidentiality agreements are contractual arrangements between two parties to keep something private, without external disclosure. For example, if a lawsuit is filed and later settled, a confidentiality agreement might be entered into preventing either party from disclosing to anyone else information about the lawsuit or the settlement. Confidentiality agreements in business can involve various organizational stakeholders. Sometimes confidentiality agreements are necessary for the conduct of business. But sometimes confidentiality agreements work against broader social interests. The main ethical issues with regard to confidentiality in business focus on the intent of maintaining confidentiality and are context specific.

What Is the Intent of Confidentiality?

Often, confidentiality is necessary for a business transaction such as a merger that is being negotiated or for a new business idea that is being developed. A confidentiality agreement in such cases ensures that nonpublic information that would be harmful to that legitimate business activity is not disclosed. At some point, however, confidential information must be often disclosed—the merger is announced or the business idea is patented or introduced. When the intent of a confidentiality agreement is to protect a legitimate business activity until it is ripe for appropriate public scrutiny, then it is likely to be ethical and legitimate.

Sometimes, however, confidentiality agreements constrain legitimate activities or protect illicit behavior. There is no moral obligation for an employee or another organizational stakeholder to maintain confidentiality for unethical behavior. Also, to the extent that confidentiality agreements make it unreasonably difficult for an employee to leave one employer to work for another or for information about an unsafe product to be made public, they may similarly be ethically suspect.

In short, the intent behind confidentiality agreements matters. Confidentiality can support legitimate business activities that would be harmed by premature public disclosure. But confidentiality can also shield businesses from legitimate scrutiny or keep employees from pursuing other job opportunities.

Confidentiality and Duties of Loyalty

Behind legitimate confidentiality agreements are usually duties of loyalty. The employee who is negotiating a merger or working on a new project owes a duty of loyalty to her or his employer. The confidentiality agreement puts this duty of loyalty in writing, but the duty of loyalty precedes the agreement and stands whether or not such an agreement exists.

There are also duties of loyalty owed to shareholders. Mergers and the development of new products have financial implications. When employees, for example, possess nonpublic information, there is a danger that they will engage in inside trading. Such activities violate duties of loyalty owed to their corporations and shareholders in those corporations. Confidentiality agreements are legitimately used to prevent such sorts of opportunistic behavior.

Confidentiality Agreements in Context

Confidentiality agreements are used in a variety of business situations. When there is business value in maintaining confidentiality, then such agreements are useful and legitimate. There will be, however, some situations in which the use of confidentiality agreements leads to ethically problematic outcomes.

Mergers and Acquisitions

When two companies are negotiating a merger or an acquisition, there is generally a desire to keep the negotiations secret. Premature disclosure of such information may lead to a merger being called off, or to a bidding war. When a merger agreement is announced publicly, then there are opportunities for counter bids. But while the agreement is being negotiated, a confidentiality agreement can allow the parties involved an opportunity to examine the financial and business records of each firm—and this information should be held confidential in any case whether or not the agreement come to fruition.

People involved in a merger or acquisition negotiation also have ethical and legal obligations not to use that information to engage in inside trading. Part of the duty of loyalty owed to shareholders includes not using nonpublic information for personal enrichment.

Suppliers and Business Partners

Sometimes suppliers and business partners (such as members of a strategic alliance) will need to share confidential information, such as information about how a product is made or some other trade secret. This information should generally be held in confidence, but a confidentiality agreement in such cases would be ethically and legally binding. While trust can substitute for formal means of governance in such situations, written confidentiality agreements are generally advisable.

New Product Development

Individuals or companies (if there is an alliance) developing new products have similar ethical duties to maintain confidentiality. New products and trade secrets can be sold. Individuals wanting to engage in inside trading might use information about new products for personal gain or might seek to move to a competitor and take information about the product with them. Confidentiality agreements in such cases would serve legitimate business purposes.

Employees

Many of the examples previously discussed involve employee behavior and help delineate when confidentiality agreements reduce to writing existing ethical obligations employees owe employers. An employee working for a company might over time acquire firm-specific knowledge about the company that would be valuable to a competitor. In such cases, a company might ask the employee to sign an agreement agreeing to hold such information confidential, which would include a noncompete clause preventing the employee from working for a competitor for some period of time.

Courts will generally look at the reasonableness for such clauses when deciding whether or not they are legally enforceable. A noncompete clause preventing an employee from ever taking a job with a competitor would likely be unenforceable. Employees who work for one firm and then switch employers still owe duties not to use confidential information (say about business plans) for the benefit of their new employers. A noncompete agreement that includes a confidentiality agreement can be drafted in a way that balances the interests of the employers and the employee.

Finally, confidentiality agreements cannot be used to prevent employees from sharing information about illegal and unethical behavior with the public or with regulators. An employee's duty of loyalty does not extend so far as to include withholding such information. The use of confidentiality agreements to shield such business behavior would be contrary to ethical expectations and public policy.

Product Safety

An example of an ethically problematic confidentiality agreement would involve product safety. When a dangerous product causes harm and leads to a lawsuit that is settled, the settlement agreement might include a confidentiality agreement that prevents information about the agreement—including perhaps information about the defect itself—from being made public.

It is understandable why companies would not want information about product defects to be made public. But companies have prior ethical duties to provide safe products for their consumers. Confidentiality agreement may provide incentives for companies to settle lawsuits. But such agreements can work contrary to public interests by preventing information about unsafe products from reaching the public and business regulators. There may be a role for public policy in preventing the use of confidentiality agreements in such cases.

Confidentiality and Public Policy

There is also a need for public policy to outline when confidentiality agreements are legitimate and when they are not. Common law in the United States has delineated when an employee's confidentiality agreement is fair to that employee and when it is unduly restrictive. In many cases, confidentiality agreements are both ethical and legally enforceable. But sometimes confidentiality and secrecy runs counter to fairness or to broader public goals such as product safety.

In such cases, public policy will need to intervene to delineate when a confidentiality agreement serves a legitimate business purpose and when it would be contrary to social welfare or to values such as fairness. Balancing the interests of business and society is an important role for government, and especially so when businesses want to keep information secret.

Conclusion

Confidentiality and secrecy in business is not always bad. When confidentiality agreements support legitimate business goals, then they are generally ethical and legally enforceable. When such agreements protect illicit behavior or unduly prevent employees from pursuing job opportunities, confidential agreements are ethically and legally suspect. The intent and content of any particular confidentiality agreement therefore matters in making judgments about it.

Conflict of Interest

A conflict of interest is a situation in which a person has an interest that interferes with that person's ability to act in the interest of another when that person has an obligation to act in that other person's interest. This definition contains several crucial elements.

First, there must be an obligation to act in the interest of another. This kind of obligation is characteristic of fiduciaries, agents, and professionals (who are commonly agents and sometimes fiduciaries), all of whom are in positions of trust. A physician or an attorney, for example, like a trustee of a fund or a real estate agent, agrees, usually for a fee, to exercise specialized knowledge and skills for the benefit of another. As a result, there is an obligation, either explicit or implicit, to serve that other person's interest.

Second, there must be an interest that interferes, actually or potentially, with the ability of a person with such an obligation to act in another person's interest or, in other words, to exercise specialized knowledge and skill solely for the benefit of that person. The interest that interferes is usually some prospective financial gain, but it can be anything that a person values, such as family well-being or public recognition. A situation in which an interest actually leads a person to fail in an obligation to serve another's interest is usually called an *actual* conflict of interest, whereas the mere presence of a conflicting personal interest but no failure to fulfill an obligation is called a *potential* conflict of interest.

Third, interference means that the person fails or is likely to fail to serve the interest of another in a manner that meets some expected or required standard. A person with a conflict of interest may fulfill the obligation in question, either in full or in part. A conflict of interest may still be present, though, as long as the ability of the person to serve the interest of another is compromised to a significant extent.

Examples of conflict of interest include a physician who orders a test from a lab in which he or she is an investor; a judge hears a case in which a family member is a party; an executive owns stock in a supplier of her or his company; an accountant audits a company in which he or she holds stock; the administrator of a trust invests funds in a company that she or he owns; and an insurance broker is paid commissions by the insurer he or she recommends to a client. In each case, the person's objectivity or independence is compromised. The ability of that person to fulfill an obligation to serve others is reduced by a countervailing, personal interest.

The inability to fulfill an obligation in a conflict of interest is different from merely having a bias or a conflict of obligations. Thus, a judge who is biased against criminal defendants may fail to render justice, but the interference in this case comes from an attitude rather than some personal interest. The judge's judgment is biased but not influenced. Furthermore, an executive who has an obligation to choose the best supplier and also to favor a minority supplier has a conflict, but the conflict, if there is one, is between obligations that cannot both be fulfilled.

Not only persons but also organizations can be in conflict of interest situations. Law firms, advertising agencies, and investment banks, for example, serve many clients, and an interest in one client may interfere in the organization's ability to exercise unbiased judgment or unstinting diligence on behalf of another. For accounting firms to provide audit and consulting services to the same clients is often cited as a conflict of interest because they have an incentive to perform lenient audits to retain the more lucrative consulting services.

History of the Concept of Conflict of Interest

Although conflict of interest has become a ubiquitous and increasingly important moral concept, it did not come into recognized use until about 1950. No popular English dictionary included the term until 1971, and it first appeared in a law dictionary in 1979. In both cases, the definitions are confined to the public officials in the performance of their duties. Conflict of interest in professional practice started attracting attention in the early 1970s, especially in legal ethics, and the concept began to be included in company codes around the same time. Why the concept came into use when it did and why it has become so prominent are questions that invite speculation. One possible answer is that in the second half of the 20th century, society became much more dependent on fiduciaries and agents, especially those in the professions, while, at the same time, market forces have come to play a larger role in their activities. When the professions—most notably, medicine, law, accounting—began to be practiced more and more in a market economy based on financial incentives, both the benefits and the harms of this development were recognized. To enjoy the benefits, it was necessary to develop a concept that identified the source of the potential harms and to devise means for reducing the harmful consequences.

What Is Wrong With Conflict of Interest?

The moral wrong in conflict of interest is simple: A person in a conflict of interest—a fiduciary, agent, or professional—has failed to fulfill an obligation, one for which he or she has accepted an engagement and, usually, compensation. If such a person acts contrary to the other person's interest or fails to perform up to the expected or required standard because of a conflicting personal interest, then the service that has been contracted and paid for is not being provided. Thus, if a physician orders an unnecessary test to increase his return from the lab he or she owns, then he of she is failing in his or her duty to the patient; he of she is not delivering the service for which he or she is being paid.

Even if the service is up to an acceptable standard, a person in a conflict of interest has failed to deliver a service with the confidence that is expected and, in some cases, demanded of persons in positions of trust. A judge in a case involving a family member might render impartial justice, and an auditor might perform a thorough audit of a company in which he or she owns stock. In each case, though, the confidence that we have a right to expect is eroded. Not only is this confidence part of the service that a person in a conflict of interest has agreed to provide, but when this confidence is compromised, the service itself is diminished. A decision by a judge with a conflict of interest, for example, cannot produce the desired effect of ensuring that justice has been done. Similarly, an audit by a compromised accountant is less effective as an attestation of the company's financial statements.

A further wrong is committed when, as is usually the case, the people who rely on the services of fiduciaries, agents, and professionals are unaware of the conflict of interest. They are deceived with respect to the quality of the service or the confidence they can place in it. The beneficiary of a trust, for example, may be wronged twice if the trustee invests in a company he or she owns. The person is wronged once if the investment is not the best that could be made, and yet again by being deceived about the reliability of the trustee.

Managing Conflict of Interest

Conflict of interest is an ever present feature of professional and organizational life and cannot be easily eliminated. It is not only unreasonable to expect that people in positions of trust would have no conflicting interests, but in some cases, it would be undesirable to avoid such conflicts entirely. For example, medical research, which produces great benefits for everyone, would be severely hampered if practicing physicians were not involved, even though the financial incentives they receive create conflicts of interest. Similarly, auditing and consulting by accounting firms arguably benefits everyone despite the conflicts involved.

Nevertheless, it is important for professions and organizations to manage conflicts of interest to ensure that the harms are minimized and offset by any benefits. Fortunately, there are many means for managing conflict of interest.

Avoidance

The most direct means of managing conflict of interest is to avoid acquiring any interests that would bias one's judgment or otherwise interfere with fulfilling any obligations to serve the interest of others. Federal law prohibits public accountants from holding stock in companies they audit, and company policies often have similar prohibitions on employees' ownership of stock in suppliers or competitors. However, complete avoidance might impose an undue burden on some individuals. It is unreasonable to prevent the manager of a pension or mutual fund from trading for a personal portfolio, for example, since doing so would deprive that person of the ability to accumulate wealth. Complete avoidance is also impossible because the conflicting interests cannot always be identified or anticipated. For example, law firms generally screen new clients for any conflicts they might bring, but undiscoverable conflicts might arise in the course of representing a client. For investment banks, whose business involves large numbers of clients, some conflicts of interest are inevitable.

Alignment

When conflicting interests cannot be avoided for whatever reason, they can be countered by incentives that align the person's interest with the interests of those to be served. High executive compensation is often justified as aligning the executive's interest with that of shareholders. Although lower pay is usually sufficient to induce executives to act generally in the shareholders' interest, they still have personal interests in perquisites such as power and prestige that might lead them to make some trade-offs with profitability. Higher pay linked to performance, especially in the form of stock grants and options, thus creates a strong personal interest in profitability so that their interests are aligned more closely with those of shareholders.

Objectivity

A commitment to be objective serves to avoid being influenced by a conflicting interest. Virtually all professional codes require objectivity as well as independence (which is generally understood as avoidance of or freedom from any undue influence). Thus, a physician with an investment in a lab might still be able to make the patients' interest paramount, as prescribed by the Hippocratic Oath. To be effective, however, objectivity requires both a strong character that resists the temptation to earn more and a reputation for such a character.

Disclosure

Disclosing a conflict of interest to those who would be affected is a common means of managing conflict of interest. Government officials are generally required to disclose all financial investments on appointment and to make annual reports. Managers of pension and mutual funds have similar disclosure requirements. In legal ethics, a conflict of interest is acceptable if an attorney discloses the conflicting interest and affirms that he or she can be objective, and if the client, being fully informed, consents. The rationale behind disclosure is that whoever is potentially harmed by a conflict of interest has the opportunity to disengage or at least to be on guard against any harm from the conflict. In short, forewarned is forearmed. However, research has demonstrated that disclosure can have perverse effects that make conflicts of interest more harmful. Advisers who inform clients of conflicts sometimes feel licensed to pursue personal interests more aggressively, and the clients who receive advice from conflicted advisers often do not discount the advice enough.

Independent Judgment

A commonly employed remedy when one's judgment is impaired by a conflict is to seek the judgment of an independent third party. The standard response of a judge in a case involving a family member is to recuse, that is, to step aside and turn the case over to another judge with no conflicting interest. An executive who is selling personal assets—a piece of land, for example—to the company that employs her or him might seek an independent appraisal of the value of those assets. Such third-party appraisal assures that the price paid is fair and not inflated due to the executive's potentially biased judgment.

Competition

Strong competition provides a powerful incentive to avoid conflicts of interest, both actual and potential.

Insofar as conflicts of interest make organizations less efficient, they pay a price in the market that they may not be able to afford. For example, at one time commercial banks gave their brokerage business to firms that were already bank customers. This practice, know as reciprocation or "recip," has virtually disappeared because of the need for returns on trust accounts to compare favorably with alternative investments. Competition thus dictates that the allocation of brokerage commissions be based on the "best execution" of trades and not on satisfying brokers who are also bank customers. Of course, no firm would use increased competition as a means for managing conflict of interest, but industry regulators should recognize that the power of competition to reduce conflict of interest is another reason to encourage competition.

Rules and Policies

Most professions and organizations have various rules and policies concerning conflict of interest. Many of the restrictions imposed employ other means, such as avoidance and disclosure. Most company codes either prohibit stock ownership in suppliers and competitors (avoidance) or else mandate disclosure. Rules and policies can also operate, however, by prohibiting the kind of conduct that would be an actual conflict of interest. For example, pension and mutual funds impose "blackout periods" during which managers are prohibited from personal trading in stocks that have been bought or sold by the funds they manage. Controls on the flow of information can also limit conflict of interest. Thus, if fund managers have no knowledge of the trading done by other funds in a firm, they have fewer opportunities for acting in a conflict of interest. Priority rules are another means for managing conflict of interest. For example, an investment bank that advises outside funds faces a conflict of interest in deciding which investment opportunities to bring to each fund and which ones to keep for the bank. This kind of case is generally managed by establishing priority rules so that each client knows in advance the order of favor. Thus informed, no client can complain of unfair treatment in the allocation of investment opportunities.

Structural Changes

Because conflicts of interest result from providing many different services to different customers or clients, they can be reduced by compartmentalizing these services. Advertising agencies, for example, form separate creative teams for each account, and commercial banks split trust management from the retail side of the business. Within multifunction institutions, conflicts can be reduced by strengthening the independence and integrity of each unit. For example, instead of treating their investment research divisions as arms of their brokerage units, investment banks are being urged to upgrade their status and insulate them from pressure. Some structural features of American business are dictated by law. Because of the potential conflicts of interest, Congress mandated in 1933 in the Glass-Steagall Act that commercial banks could not also sell stocks or insurance, thereby making investment banking and insurance separate businesses. The repeal of the Glass-Steagall Act in 1999 has permitted the rise of larger banks, which, in turn, not only creates greater potential for conflict of interest but also, arguably, better service. Some have proposed that accounting firms be required to divide into separate auditing and consulting organizations, although the accounting industry has vigorously opposed this measure. Addressing the problem of conflict of interest by structural changes should be done carefully because of the many advantages of combining different services in one firm.

CONFUCIANISM

Confucianism is an ethical system practiced in China and other East Asian countries such as Japan and Korea. Confucian ethics arose in the turbulent "axial age" in ancient China (ca. 600–200 BCE), when warring states violently fought for dominance, creating a climate for Confucius and other scholars to seek answers to questions about human nature, morality, and social harmony. In seeking to build a harmonious society, Confucius found his answer in *Ren*, humaneness, the highest level of virtue encompassing a variety of lesser virtues, such as reverence, tolerance, trustworthiness, keenness, and kindness. Attaining *Ren*, thus, involves achieving other virtues, such as courage, prudence, cautiousness in talking, and propriety. In short, *Ren* is a lofty ideal for people to aspire to. Confucius himself admitted that he had not entirely achieved *Ren.*

Confucianism can be categorized as virtue ethics, a teleological ethical system that inquires about the goal or end of the human person. Western virtue ethics mostly takes its inspiration from Aristotle, the ancient Greek philosopher. Aristotelian virtue ethics, embodied in Aristotle's *Nicomachean Ethics*, aims at achieving personal *eudaimonia*, meaning "flourishing" or "success," through the cultivation of moral traits such as prudence, justice, fortitude, and temperance. Confucianism, however, differs from Aristotelian virtue ethics in significant ways. Instead of *eudaimonia*, Confucianism strives for interpersonal harmony in a hierarchical society. Confucian *Ren*, to a large extent, entails vertical virtues: *Ren* is not expected to be cultivated to an equal extent across social hierarchies. For instance, an emperor is expected to achieve a higher form of *Ren* than his subject does. *Ren* is, therefore, specific to one's social station in the society. Aristotelian virtue ethics, in contrast, having evolved in a democratic society, placed largely equal expectations on the citizens in the city-states in terms of cultivation of virtue ethics, although the citizens with full voting rights did not include women, slaves, foreigners, children, and senior citizens.

What exactly then is *Ren*? Simply put, *Ren*, humaneness (also translated as benevolence), is love. This concept is illustrated in *Lunyu*, one of the four books comprising Confucius's teachings, but *Ren* allows for different interpretations in different contexts.

There exists a convergence between Confucian ethics and Western ethics. A cornerstone of major Western ethical theories is impartiality—one's own interest is placed on a par with the interests of others. Egoism is discouraged and generally denounced. Like Western ethics, Confucian ethics is also built on curbing egoistic impulses. Confucian ethics, thus, is connected to Western ethics through its assertion of overcoming one's self.

Parallel to overcoming one's self is the return to propriety that enables one to achieve *Ren.* Propriety, *Li*, another central value of Confucian ethics, is the code of behavior prescribed to men and women based on their role, social station, and gender. In essence, it is respect for other members of the society and varies in form from one social station to another, and from gender to gender. Though it is also a vertical virtue like *Ren*, *Li* is in many ways similar to Donaldson and Dunfee's hypernorm of respect for human dignity. In fact, it is this form of respect or propriety that helped to build a cohesive and civilized ancient Chinese society.

In sum, the central values of Confucian ethics are *Ren*, humaneness, and *Li*, propriety, with *Ren* being the dominant value. *Ren* and *Li* govern human relationships and underline a civil and harmonious Chinese society.

Over the past 2,000 years, Confucian ideals have gone through modifications and sometimes have even met with resistance. In the Maoist era, for example, attempts were made to purge them, together with petty bourgeois values, and to replace them with revolutionary ideals. In today's largely market economy, the Chinese society itself is experiencing values in tension, with traditional and Western values coexisting and competing against each other. Thus, on the one hand, it is hardly accurate to claim that the Chinese society is governed by purely Confucian ideals. On the other hand, having been dominant values and beliefs in the Chinese society for about 2,000 years, Confucian ideals are indeed deeply ingrained in the Chinese culture.

Confucian Ethics in Business Stakeholder Relationships

In recent years, China has emerged as a major economic player on the world stage, attracting investors and manufacturers from around the world. Accompanying this economic emergence has been an increase in the attention paid to business ethics and corporate social responsibility in China both for Chinese firms and for multinational firms. It is thus of interest to consider the implications of Confucianism to business ethics and corporate social responsibility. Since Confucian ethics is mostly concerned about how to promote harmonious relationships, in this part, we examine Confucian ethics in terms of major stakeholder relationships.

Stakeholder analysis has become the most important tool for modern business entities to approach corporate social responsibility. It recognizes the mutual influences between a business and its stakeholders: A business entity is not an all-powerful entity, free to pursue its profits without regard for its stakeholders. Stakeholder analysis has been justified in the management literature by its descriptive accuracy, instrumental power, and normative validity. Yet stakeholder theory originated in the West, the United States, in particular, and has a Western ethical orientation. Explaining Confucian ethics in the context of stakeholder relations sheds light on how business is conducted (or more precisely how it *should be* conducted) in China. This also provides guidance to multinational firms in terms of how to manage their business relations in China. In the following sections, Confucian ethics is applied to the relationships between a firm and the following primary stakeholders: employees, customers, suppliers, stockholders, partners, the community, and governments.

Employees

Confucian ethics demands that those in power particularly embody *Ren*, humaneness, for subordinates. *Ren* on the part of superiors often takes the form of kindness and protection. A superior with the *Ren* attitude assumes a paternalistic role and takes care of them as if they were his or her children. There is little wonder then that employees in Maoist China needed to obtain permission from their employers for marriage certificates. Employees, on the other hand, in their role, have the responsibility to carry out the duty entrusted to them with reverence and assiduousness—a strong sense of duty and a sense of loyalty are expected of them. Unequal though the roles are, both superiors and subordinates, nevertheless, exercise *Ren* and *Li* in their own ways.

In comparison with the largely rights-based Western stakeholder analysis, Confucian ethics as exemplified in this stakeholder relationship takes on a family tone. Rights and justice are, to some extent, embodied in and replaced by *Ren* and *Li*, in the form of kindness and protection (employers) and loyalty and duty (employees). Yet *Ren* and *Li* do not guarantee rights and justice—power can be a source of abuse. Employees' dependence on an employer for their *Ren*, therefore, rests on precarious grounds. Nevertheless, *Ren* is the ideal to pursue in Confucianism.

Customers

The relationship between a firm and its customers is largely horizontal. The enormous power that a firm may possess, however, can place customers in a disadvantaged position. This unequal power requires a different form of *Ren* for both the firm and its customers. The *Ren* on the part of a firm in this relationship is the Confucian golden rule: One should not do to others what one would not want done to oneself.

This context-independent principle prescribes one's relationship with other members of the society. On the part of the firm, it constrains them from involving themselves in fraudulent and deceptive practices that could place customers at various risks. The golden rule principle also applies to a firm's relationship with arm's-length transaction partners such as suppliers.

Regarding customers, the form that *Ren* takes in this relationship is best represented by *Zhi*, judiciousness. Confucian ethics emphasizes mental keenness and independent decision making. A customer who can judge a corporation's actions accurately and take appropriate actions has, no doubt, achieved *Zhi.* The same can be said of less powerful suppliers, for whom *Zhi* is the proper form of *Ren* to deal with powerful buyers.

Stockholders

The relationship between a business entity and its stockholders is fiduciary: Stockholders entrust the business with the management of their money. A business, in turn, to various degrees, depends on the financial resources from stockholders for its operations. To be able to obtain the financial resources from stockholders, a business needs to establish itself as trustworthy and put the money to good and effective use. In this case, *Xin* (trustworthiness) is the virtue expected of a business. Similarly, a business is like a carriage. It cannot move forward smoothly without the trust of its stockholders, the yoke bars.

Partners

Again, the relationship between a firm and its partners is largely horizontal. Since the success of cooperative relationships depends, to a large extent, on trust building, establishing oneself as trustworthy is necessary. *Xin* (trustworthiness) is again the form of *Ren* in this relationship.

Confucius distinguished between *Junzi,* gentlemen, those morally cultivated and dependable, and *Xiaoren*, small men, those morally dubious and unreliable. Gentlemen pursue *Ren* for its own reward and *Xiaoren* may use *Ren* for self-interest. In the relationship between a business and its partners, therefore, both parties are expected to act as trustworthy gentlemen and not engage in opportunistic behavior to ensure smooth relations and future collaboration. With the distinction between *Junzi* and *Xiaoren*, business entities in Confucian societies have generally preferred long-term cooperative relationships to arm's-length transactions, once they have built trusting relationships.

The Community

Though Confucian ethics does not specifically inform a person on his or her role in the community, in today's world, we can infer the Confucian attitude toward the community from his writings. Given the power a firm has and the wealth it accumulates, Confucians would be in favor of some form of corporate contribution to the community. In this way, the less privileged in the community would benefit from the help of a business, which already benefits from the local community in terms of talent and other resources. The relationship between a business and the community, therefore, is one of mutual advancement.

Governments

Finally, the relationship between a business and the governments is again vertical, like the one between a firm and its employees, though a firm would find itself in an inferior position in this relationship. In today's fiercely competitive market economy, *Ren* for different levels of government entails legal protection of businesses. Businesses, on the other hand, need to comply with the laws created by the governments. *Ren*, for a business firm then, is compliance oriented. Given that China has long been ruled by emperors rather than laws, the governments seem to have a long way to go with regard to establishing adequate laws to protect the corporations. In other words, a sustained effort is needed on the part of the governments for them to achieve *Ren* in today's world.

In summary, the examination of Confucian ethics in the context of stakeholder analysis reveals that the relationships between a business and its various stakeholders in light of Confucian ethics are subtly different from largely rights-based Western stakeholder relationships. Specifically, stakeholder relationships characterized by egalitarian horizontal relationships in the West often turn into vertical relationships in a Confucian society. Such an understanding can especially assist international business entities to place their home values and norms in perspective while doing business in China so that they can make contextually appropriate ethical decisions. In this way, they can fulfill their social contract and demonstrate their global citizenship with more effectiveness.

Confucius (551–479 BCE)

Confucius is regarded as the most influential philosopher and educator in Chinese history. He largely shaped

Chinese civilization and molded its moral beliefs. Confucius is best known for founding the Ru (Confucian) school of Chinese thought, which grew into one of the traditional religions, competing and coexisting with Taoism and Buddhism in Chinese civilization.

He was born into a declining noble family in the state of Lu, in modern Shandong province. His family name was Kong and first name Qiu. He has been traditionally honored as Grand Master Kong (Kong Fuzi in Mandarin Chinese), which has been Latinized as Confucius.

Confucius was about 3 years old when his father died. His mother was determined to provide him with a first-class education; as a result, he was well trained in the classics of Chinese literature, history, poetry, and music. As a young boy, fishing, chariot driving, and archery were among his favorite amusements. At the age of 15, Confucius aspired to be a scholar and teacher. He fulfilled this vocational dream in education at the age of 22. Using his own house as a school, he started to teach history, poetry, government, morality, and music to a few students. He often engaged his students in sustained Socratic exchanges. Passionate and inspiring, he soon attracted some 2,000 gentlemen-scholars around him, many of whom followed him religiously. It was from then on that a Chinese literati class was developed.

Believing in the cultivating effect of education on an individual, Confucius emphasized character development, instead of vocational preparation, in his teaching. Although he upheld the innate goodness of humanity, Confucius also recognized corrupt social influences. In light of this, Confucius distinguished between two types of individuals: gentlemen whose conduct is governed by moral principles and small men whose character is driven by profit. Education, based on sound moral principles, Confucius maintained, can restore and strengthen the virtuousness in us.

Confucius ultimately promoted a society of harmony and order built on virtues. He asserted that the moral basis of social bonds derived from an individual's social station. He delineated five relations of mutual moral responsibility: ruler and minister, father and son, elder brother and younger brother, husband and wife, and one friend and another. For instance, in an emperor-minister relationship, he deemed it proper for an emperor to treat the minister with benevolence, while the minister deferred to the emperor with noble reverence and loyalty. Among the many virtues he advocated, filial piety and brotherly respect remain the two fundamental moral traits that one should possess.

In addition to teaching, Confucius also pursued politics. One legend has it that Confucius was once appointed Minister of Public Works and later Minister of Crime in the state of Lu. He governed by good example rather than coercion. As a result, during his reign, the crime rate substantially dropped and society was peaceful. However, he was later forced out of his position by his enemies. Although he took some minor government posts later, he never again held a significant position.

In terms of his works, Confucius is said to have edited books such as *The Book of Songs* and *Spring and Autumn Annals.* Although there are controversies about which books he wrote or edited, *Analects* is generally considered the most authentic source of his teachings.

Conscience

Bishop Joseph Butler (1692–1752), in his famous *Sermons*, said of conscience that it was a principle in man by which he approves or disapproves his attitudes and actions. He added that this faculty tends to restrain us from doing mischief and incline us toward doing good.

The history of the concept of conscience is instructive as one seeks to understand its contemporary meaning. Originally, according to the *Oxford English Dictionary*, *conscience* was understood as a common quality in which individuals *shared*: A man or a people had more or less conscience, as persons or groups had more or less science, knowledge, intelligence, prudence, and so on. The word came gradually to be used as an individual faculty or attribute, so that *my conscience* and *your conscience* were understood no longer as our respective shares or amounts of the common quality *conscience*, but as two distinct individual consciences, mine and yours.

This individualization of the meaning of *conscience* is significant not only etymologically but also philosophically. It signals a polarity at the core of our moral awareness: On the one hand, conscience is our subjective touchstone for ethical decision making; on the other hand, an appeal to conscience in moral argument (or dialogue) usually lays claim to *common* ground, a warrant for our ethical convictions that reaches *beyond* the merely subjective. Insofar as conscience must respond in actual decision-making situations, it has a certain private authority, both in relation to nonmoral decision guides and in relation to the consciences of others. We can refer to this as the *autonomy dimension* of conscience. But because conscience can be "undeveloped," "neglected," or "out of touch," philosophers have looked to it for a broader kind of authority, less private and more rooted in human nature or reason. We can refer to this as the *discernment dimension* of conscience.

In either of its dimensions, conscience can be effective or not in actually guiding action, a fact that no doubt led Bishop Butler to exclaim that if it had strength, as it has right, and if it had power, as it has authority, it would govern the world. At its strongest, conscience prevents wrongdoing. Accounts of "guilty consciences," "weakness of will" (*akrasia*), and relief at being caught on the part of some criminals also testifies to the influence of conscience subsequent to wrongdoing.

The Autonomy Dimension: Freedom and Dignity

Commentators on conscience often emphasize its role in providing a zone of freedom and dignity around each human person. It is the capacity and the need to decide about right and wrong, good and bad, virtue and vice. But this capacity also calls for respect from others, even if they disagree. The right to "freedom of conscience" is frequently cited as among the most basic of human rights. Most of us believe that a person ought to follow his or her conscience, but just as surely, we believe that a person ought to be *allowed* to follow his or her conscience—at least up to the boundary of respecting the rights and freedoms of others. For example, some societies allow *conscientious objection* to military service (offering alternative forms of service), a practice that indicates the seriousness with which freedom of conscience is taken. And throughout the ages, *civil disobedience* has been practiced to affirm the autonomy and sovereignty of conscience in the face of injustice (e.g., Socrates, Gandhi, Martin Luther King Jr.).

Philosopher Richard M. Hare, in the title of his classic, *Freedom and Reason*, emphasized the centrality of autonomy or freedom in normative ethics. At the same time, however, his title suggested a second central aspect of moral thinking (*reason*), to which we now turn.

The Discernment Dimension: Reason and Wisdom

The polarity or dual dimensionality of conscience springs from the fact that as a human faculty it is as much opposed to *arbitrariness* as to *subordination.* The source and content of conscience has usually been thought to be reason, a shared moral sense with access to a natural law that is independent of both personal wants and civil statutes.

Butler spoke of this dimension of conscience as a superior principle of reflection in every person that reaches beyond the internal promptings of the heart and pronounces some actions to be in themselves just, right, and good, and others to be in themselves evil, wrong, and unjust. Immanuel Kant referred to the deliverances of conscience as categorical (vs. hypothetical) imperatives that were legitimated by their universal nature.

A century later, but in a similar spirit, Philosopher Josiah Royce suggested that conscience discerns through the moral insight, the full realization of one's neighbor and the resulting resolution to treat one's neighbor unselfishly. And while, for Royce, the moral insight was subject to a kind of waxing and waning, it nevertheless provided a solid foundation for conscientious thought and action.

The Reverend Martin Luther King Jr., in his famous "Letter from Birmingham City Jail," appealed to conscience as moral leverage against unjust laws. He believed that an individual who breaks a law that his or her conscience judges to be unjust, willingly accepting the penalty of imprisonment to awaken the conscience of the community, is in reality expressing the very highest respect for the law. King went on to insist against the relativist that the content of conscience was not arbitrary. He believed that just laws are those in accordance with moral law or the law of God—unjust laws do not. He added that any law uplifting human personality is just, while any law degrading human personality is unjust.

King's perspective helps us to see the significance for conscience of what the Declaration of Independence called the laws of nature and nature's God. Without some kind of anchor in human nature, appeals to conscience can lose their traction. If conscience is interpreted as—at best—a personal emotion that may have evolutionary survival value, it is unlikely that it will sustain the principles to which human beings have appealed over the centuries—principles such as caring for the weak, social justice, natural rights, fiduciary duty, and the pursuit of the common good. If conscience is rooted in an awareness of a *natural* law, however, it can function as a source of moral reasoning with some hope of moral progress—and ultimate moral consensus. The authority of conscience, in this way of thinking, lies in an order not *decided on* by each person (the discernment dimension), even if it is ultimately *interpreted by* each person (the autonomy dimension).

The "postmodern" fear may be that in adding *reason* to the private emotional aspects of conscience, we run the risk of having to sacrifice freedom or autonomy. But on this point, we might do well to consider philosopher Richard Norman's observation that the sacrificing of one's own interests need not be thought of as a sacrifice to something *external.* Commitments to our friends or our children, or to causes in which we believe, may be a part of our deepest being, so that the experience of devoting ourselves to them is less like *sacrifice* and more like *fulfillment.*

Norman suggests that the deepest being in each of us reaches for the same moral insight—and ultimately the same basis for conscience. Ethical inquiry, at any rate, is rooted in the presumption of a *shared moral consciousness*, which we can approach in a disciplined way rather than fleeing it as if it were fragile and fragmentary.

Developmentalism: Responsibilities *Of* and *For* Conscience

One of the most famous writers on the development of conscience in the 20th century was Swiss psychologist Jean Piaget. His observations of children were clinically rich and led to contemporary schools of "cognitive developmentalism" in psychology. Piaget spoke of an initial stage of *egocentrism* in which the child guides its decisions primarily out of a concern to satisfy its own desires and interests. This stage was followed, he believed, by a second stage called "moral realism" (*heteronomy*). At this second stage, external factors in the child's environment (e.g., game rules, peer pressure, parental norms) are given full sway as restraints on self-interest. Only in the third stage (*autonomy*) did Piaget see the emergence of genuine conscience. In his view, for actions to be characterized as moral, there had to be something more than compliance with commonly accepted rules. It was necessary that some inward principle (conscience) be capable of appreciating the value of such rules.

The third stage required, according to Piaget, inner direction born not of egocentrism, but of mutual respect, and cooperativeness born not of submission, but of a sense of reciprocity. At the third stage, the individual sees others as deserving of consideration in their own right, whatever the rules may be.

The developmental approach to conscience helps in identifying a distinction between the responsibilities *of* conscience and responsibilities *for* conscience. Responsibilities *of* conscience are the dictates about which Bishop Butler wrote so eloquently in his *Sermons.* But responsibilities *for* conscience, since it is capable of examination and development, signal the need for both moral education (by parents and schools) and personal character cultivation. Without responsibilities *for* conscience, it would be difficult to criticize the decision making of criminals of conviction such as Hitler and Stalin. Cardinal Joseph Ratzinger, who became Pope Benedict XVI in April 2005, has emphasized this point. While it is never wrong to follow one's convictions, he pointed out, it can very well be wrong to have come to certain convictions in the first place by stifling the protests of conscience. The guilt in such cases lies not in the present judgment of conscience, but in the neglect of my obligation to cultivate a healthy conscience, attuned to the internal promptings of truth.

Personal and Corporate Conscience

As Plato observed centuries ago, organizations are in many ways macro versions ("projections") of ourselves as individuals—human beings writ large. Because of this, we can sometimes see more clearly in organizations certain features that we want to understand better in ourselves. And the reverse is often true as well. Sometimes, the management of organizations can profit from what we understand about ourselves as individuals.

The dynamics of goal-directed behavior and conscience are present in both individuals and groups and offer us fruitful comparisons. The basis for exploring organizational conscience in this way comes from the following (occasionally disputed) principle:

> *Moral Projection Principle.* It is appropriate not only to describe organizations and their characteristics by analogy with individuals, it is also appropriate normatively to look for and to foster moral attributes in organizations by analogy with those we look for and foster in individuals.

The implications of applying Piaget's account of conscience to organizations are similar to those of applying it to individual persons: (1) growth consists in a fuller acknowledgment of the reality and dignity of others and (2) external or environmental constraints, while they may be necessary guides, are not morally sufficient. Indeed, just as Piaget saw the moral development of the child as a kind of liberation, so we might suggest that the moral development of the corporation is a kind of liberation.

Concern for stakeholders can evolve from purely instrumental status (e.g., public relations) through the status of an environmental constraint (e.g., legal or regulatory requirements) to being a direct management concern. Such an evolution represents a maturation process analogous to the development of conscience in individuals. Philip Selznick saw this point decades ago when he wrote about the process of "character formation" as an important area of exploration for those who would understand the decision making of organizations. Leadership, according to Selznick, was about institutionalizing values.

Leaders who seek to orient, institutionalize, and sustain ethical values in their organizations—to foster a corporate conscience—often employ mission statements, codes of conduct, ethics officers, executive development seminars, recruitment and promotion practices, and various other forms of communication. As in the case of individuals, organizational character formation (conscience) can lead to a fundamental revision of an organization's understanding of *success.*

Consent

Consensual exchanges and contracts are the foundations of a free market; consent makes a free market free and is essential to any moral justification of the free market.

For an act of consent to have ethical merit, it necessarily has certain characteristics: (a) both parties must be fully informed—they must know and understand what they are consenting to; (b) there must be no coercion of either party; and (c) there must be a clearly performed action that constitutes consent. Actions that signify consent are culturally defined; consent, for example, can be signified by a handshake or other gesture, by signatures, or by simple verbal agreement. There is no ethical significance to these cultural variations.

Ethical concerns about consent to business transactions can arise in any of three ways: (1) apparent consent can fail to be actual consent, (2) the ethical value of consent can be undermined when a person has no or few alternatives, and (3) consent to a transaction within a socioeconomic system may be invalidated ethically because of failure to consent to the system.

Failed Consent

Some agreements in business that appear to be consensual may not be; apparent consent can fail in many ways. For example, suppose a drug company in its advertisements lists the benefits of a drug but does not list the side effects that have shown up in drug trials that only the company has access to. People who buy this drug based on the advertisements may appear to consent to the purchase, but since they do not really know what they have consented to, consent in the moral sense has failed.

Besides raising ethical issues, failures of consent often invite government regulation of business. Indeed, a great many laws, especially labor laws and consumer protection legislation, deal with failures of consent. Such laws should not be viewed as external interference in free markets or as attempts to determine the outcome of market exchanges. Such laws are attempts to ensure that the market is a free market based on consensual exchanges. Some sources of consent failures and regulations meant to deal with them include (1) coercion, regulated by laws against unfair and predatory trading practices; (2) asymmetrical or false information, regulated by transparency and full disclosure laws, consumer product labeling requirements, and antifraud laws that prohibit giving false information; (3) emotional pressure or distraction, regulated by rules such as cooling-off periods; (4) mental incompetence, regulated by laws that prohibit children from making contracts and certain purchases and laws that protect people with mental disabilities, including some elderly people, who cannot make informed decisions; and (5) externalities, regulated by laws that prevent externalities, or force compensation for them.

Lack of Alternatives

If people have no or few alternatives to a transaction, then their consent to it may not be morally significant. People, for example, who consent to a wage below the poverty line may be doing so because they have no other choices. Having alternatives is usually a matter of degree; there may always be some alternatives, but they may be very expensive, excessively time-consuming, or difficult for the person. There is no specific answer to the question of how constrained by the lack of alternatives people must be for us to say their consent was not freely given. The conclusion that follows is that the ethical value of consent is sometimes a matter of degree, not just an either/or situation. Some philosophers, such as Robert Nozick, dispute the claim that alternatives are relevant to the moral worth of consent and argue that only coercion can limit the value of consent.

Those who worry about viable alternatives are often especially concerned with the consent people give to employment because poor people frequently lack alternatives to taking whatever job is offered, sometimes at very low wages. Some people argue that the only way we can be sure consent to employment is always genuine is to make sure everyone has some guaranteed source of income. Defenders of a "universal basic income" (whereby the government pays all citizens enough to live on) frequently use this argument.

Consent to the Economic System

Besides problems with failure of consent to specific transactions, consent can also fail ethically if a person consents to the transaction, but does not consent to the socioeconomic system in which the transaction takes place. This problem can be seen most clearly in extreme situations. For example, if a slave "owner" says "Tow that barge; lift that bail" and the slave says "yes," the slave's "consent" to the specific action is made morally illegitimate by his failure to consent to the system of slavery, and to being a slave within it. The issue of slavery seldom arises for businesses in most developed countries, but it can arise even today when multinational corporations (MNCs) use suppliers in parts of Asia, Africa, and South America, or if an MNC's suppliers use prison labor. However, even if slavery is not involved, the same question of consent to the socioeconomic system arises when MNCs do business in many different societies.

Some thinkers, for example, Robert Nozick, think consent to the social system is irrelevant to the moral value of consent. Those who are concerned with this issue generally take one of three sorts of approaches to the problem: tacit approval, actual democratic consent, and hypothetical consent.

First, John Locke, in his defense of private property, argued that people gave tacit (or implied) consent to social systems whenever they took part in those systems. People give tacit consent to the system of private property whenever they claim anything, especially money, as their property. The problem with this argument is that people cannot avoid the current social system in which they live even if they object to it. For many people in some countries in which MNCs do business, objecting to the social system is unwise, refusing to go along with it can be fatal, and leaving is not possible. Even in free countries, objectors have to live within the current system while they try to change it. Tacit consent does not seem morally adequate.

Second, in free and democratic counties, people have a chance to approve or disapprove of capitalism through the voting process. Some people may complain that they have always voted against capitalism and been outvoted, but this objection is not valid because democratic decision-making processes are the morally appropriate way to make decisions about social and economic systems. More serious objections to democracy conveying moral legitimacy on corporate capitalism are that economic special interests may have disrupted democratic processes; that many aspects of corporate capitalism (including corporate personhood) have been decided by courts or treaty negotiations not elected legislatures; that minorities are not always protected in democracies; and, most important, that many societies are not democratic. But in countries where freedom and democracy have been long established, actual democratic consent lends significant moral legitimacy to capitalism.

Third, hypothetical consent is used by social contract justifications of socioeconomic systems. Its most important use in business ethics is by Donaldson and Dunfee in their integrated social contract theory. Donaldson and Dunfee use hypothetical consent to deal with the invalidity of apparent consent to transactions and norms when people do not consent to the system. Social contract theorists ask the hypothetical question, "Would rational people consent if they were free to do so?" often adding Rawlsian constraints on the question, such as supposing people do not know which positions in society they will occupy. Donaldson and Dunfee use this approach to develop the concept of hypernorms; even if a social or economic system appears to have people's consent, the norm is not legitimate if it fails to have hypothetical consent, in other words, if no reasonable person would agree if given a free choice. Many people believe that hypernorms are a powerful ethical guide when doing business in nondemocratic societies.

Conclusion

Four conclusions can be drawn from this discussion of consent in the business context. First, consent is what makes free markets free, and it is thus essential to the moral justification of free markets. Second, apparent consent to a transaction can fail to be ethically legitimate for a number of reasons. The many laws and regulations that deal with these failures should be seen as supporting the creation and maintenance of free markets. Third, consent can be seen as a matter of degree depending on the alternatives a person has. Fourth, failure to consent to a socioeconomic system may sometimes render ethically void consent to a specific transaction within a system.

Consequentialist Ethical Systems

Consequentialist ethical systems are ethical theories that take the moral status of all actions to depend somehow on the value of their consequences. For example, if a particular action of keeping one's promise is morally obligatory, it is made obligatory by its good consequences, or by the hypothetical good consequences of people accepting a rule that requires it (such as a rule requiring promise keeping). It is *not* made obligatory by God's having commanded us to keep promises, by a self-evident right-making factor that simply inheres in promise keeping, by the fact that we could not consistently will promise breaking to be universalized, or by the fact that a person of good moral character would characteristically keep the promise. Most philosophers count a theory as consequentialist only if it holds that the rightness of actions depends on the *impartially reckoned* overall goodness of their consequences. An example of a business decision that is influenced by consequentialist thinking would be the decision to control a plant's hazardous emissions for the purpose of preserving people's health and quality of life, not just to get good publicity or to be safe from lawsuits.

Some philosophers use the terms *consequentialism* and *utilitarianism* interchangeably, while others define utilitarianism as that species of consequentialism that takes good consequences to be limited to happiness or welfare. (Complicating this terminological choice is the fact that the influential early 20th-century utilitarian G. E. Moore explicitly contends that knowledge, among other things, has value over and above its value as a means to happiness or welfare.) Consequentialist theories are widely agreed to constitute one of the three most influential branches of normative ethics, the other two being deontological theories and virtue ethics.

Contemporary consequentialist theories are mainly divided between act-consequentialism and rule-consequentialism. According to act-consequentialism, each person is morally required on every occasion to act in such a way as to make the greatest possible net contribution to the overall good. The rightness or wrongness of actions is determined not by moral rules, but instead by the net values of the consequences of the actions themselves. In contrast, rule-consequentialism holds that rules are indispensable as determinants of the moral status of actions, for the very function of morality requires that it provide a public system of rules. Moral right and wrong are determined by the most beneficial rules—either by the most beneficial individual rules (according to some forms of rule-consequentialism) or by the most beneficial code of rules (according to others). For example, the most beneficial rules may require every business to control its pollution even if that pollution, considered in itself, is negligible. For the cumulative effects of businesses' controlling their individually negligible pollution could be a great public benefit. A code of rules can be considered to be the most beneficial if the expected overall net value that would result from the general internalization of that code exceeds the expected overall net value that would result from the general internalization of any rival code of rules. It is sometimes further specified that an assessment of the overall value of the consequences should give some priority to the well-being of the worst off.

One aspect of everyday moral views that is rejected by act-consequentialism is moral permission for people to favor their own goals to some extent. Such a permission is sometimes known as an agent-centered option or an agent-centered prerogative. For example, on everyday moral views, rare book lovers are morally permitted to spend money on rare books for themselves despite the fact that they could obviously produce much more overall good by donating the money instead to a worthy charity. Furthermore, it is generally thought that when people do sacrifice their own interests to maximize their contribution to the general good—for example, in the case of saints, heroes, or even self-denying, charitable rare book lovers—these people are going *beyond* what is morally required of them. According to act-consequentialism, however, all such people are just doing what is morally required of them. On this account, Merck and Company was doing no more than fulfilling its moral obligations when, without any hope of making a profit thereby, it decided to research, develop, and manufacture a drug to cure and prevent river blindness to prevent an enormous amount of suffering by poor people living along tropical rivers.

Another way that act-consequentialism departs from everyday moral views is by denying the existence of constraints. A constraint is a prohibition against performing a certain type of action. For example, a constraint against deception would prohibit people from committing a deception, even for the purpose of preventing other people from committing more and bigger deceptions. According to act-consequentialism, however, it may be right to perform any action (such as deception or even murder) to prevent others from causing greater harm (such as bigger deceptions or more murders).

Unlike act-consequentialism, rule-consequentialism does permit people to favor their own goals to some extent. For any rules that did not permit this would require so much sacrifice that they would be costly (in effort and resources) to maintain as internalized rules—and this cost would militate against those rules being the most beneficial. Thus, the most beneficial rules, which determine right and wrong, permit people to favor themselves. Again, unlike act-consequentialism, rule-consequentialism endorses constraints. Since a moral code of rules is by definition public, and since widespread consternation would be caused by public knowledge that moral rules lacked constraints, the most beneficial code of rules will contain constraints. Still, rule-consequentialism's acceptance of permissions and constraints may well fail to satisfy defenders of everyday moral intuitions. For they, unlike rule-consequentialists, attribute to permissions and constraints a status that is not derived from the most beneficial rules. For example, they may see constraints as directly reflecting the basic principle that individuals must not, without their consent, be sacrificed or used to produce good.

Although act-consequentialists take the maximization of good results as the criterion of an action's moral rightness, they do not thereby advise us to aim consciously to maximize good results in our ordinary conduct. They point out that it may be counterproductive always to try to determine which action would produce the most overall good. Since we can produce the most overall good by *not* always trying to figure out which action will produce that good, we ought not always to try to figure it out. For example, an act-consequentialist may think that we normally ought to decide what to do by reference to rules of thumb that are framed in terms of commonly accepted nonconsequentialist moral expectations, such as honesty and loyalty. (Of course, if we are in circumstances where we know that doing what is disloyal and dishonest will produce the best overall consequences, all things considered, then we ought to do what is disloyal and dishonest.) In contrast to act-consequentialism, rule-consequentialism does not posit an important gap between the criterion of rightness and the appropriate procedure of deliberation. According to rule-consequentialism, the rules that determine rightness are the very rules that it is best that we internalize and use in deliberation. Thus, rule-consequentialism need not deal with the charge of "moral schizophrenia" that is sometimes leveled against act-consequentialism.

Objections Against Act- and Rule-Consequentialism

The most common objections against act-consequentialism arise from its departure from confidently held everyday moral views. Two of these departures have already been noted—the rejection of self-favoring permissions and of constraints. To these objections, a common act-consequentialist reply is that the departure from everyday moral views is greatly reduced once the distinction is properly noted between a criterion of moral rightness and a morally appropriate method of deliberation. Except in unusual circumstances—where perhaps our everyday moral intuitions are in fact less trustworthy than usual—act-consequentialism approves of individuals deliberating on the basis of rules of thumb that do contain permissions and constraints. A different act-consequentialist defense of the denial of constraints is to argue that constraints are paradoxical. A constraint against deception, for example, assumes that deception is bad. But if deception is bad, then it stands to reason that less deception is morally preferable to more deception. It would be paradoxical to morally prohibit a person or business from bringing about that morally preferable result. But that is what constraints do. For example, if the only way to prevent one's competitor from deceiving the public very badly were by committing a much milder deception of oneself, one's mild deception would still be prohibited by a constraint against deception.

Another objection against act-consequentialism is that it is inconsistent with human well-being. Human nature being what it is, human well-being requires commitment to particular projects and also loyalty to particular people and groups. Yet, the objection continues, such particular commitments are incompatible with an overriding commitment to impartiality; and an overriding commitment to impartiality is required to accept an act-consequentialist criterion of moral rightness. Act-consequentialists respond that they do and should have real particular commitments and loyalties that are hard to override. A commitment may be real and hard to override, they say, without itself overriding every other commitment. So they may, for example, maintain real loyalty to their spouses and act on many occasions expressly for the good of their spouses. But they are able, in good conscience, to maintain a special loyalty to their spouses because they see that such loyalty is compatible with the greatest impartial good.

An important challenge to rule-consequentialism arises from the fact that there may be partial rather than universal compliance with the most beneficial rules. Obedience to the most beneficial rules may have very bad consequences in some of these cases. To take a simplified example, suppose that a "no first military strike" rule is among the most beneficial rules. Still, obedience to that rule can have disastrous consequences when one's enemies do not accept the rule. So it is counterproductive for rule-consequentialism to require obedience to the most beneficial rules. A rule-consequentialist response to this objection is to posit that the most beneficial code of rules includes a particularly strong requirement not to bring about great harm. Since great harm would be brought about by allowing an evil enemy to strike first, the "no first strike" rule would be overridden in such a case.
